

## Behind bars - the SMISLINE TP plug-in socket system

### Safety under Power

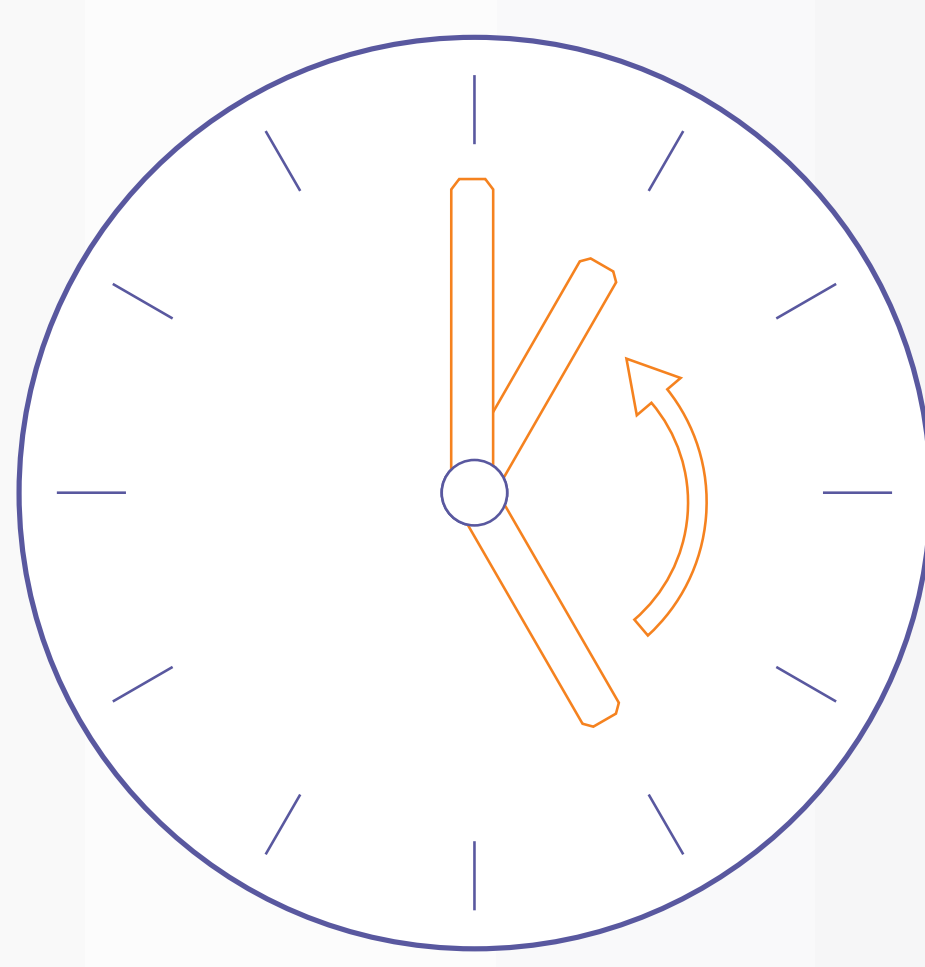

Safety that covers all environments  
5 for 1: five different protective and switching devices for one plug-in socket system

The unique, patented function allows simple plugging of five different protective devices onto a single pluggable socket system with integrated busbars. The SMISLINE touch-proof system thereby permits uncomplicated, modular and flexible power distribution up to a rated current of 200 A.

SMISLINE TP provides added value that pays off.

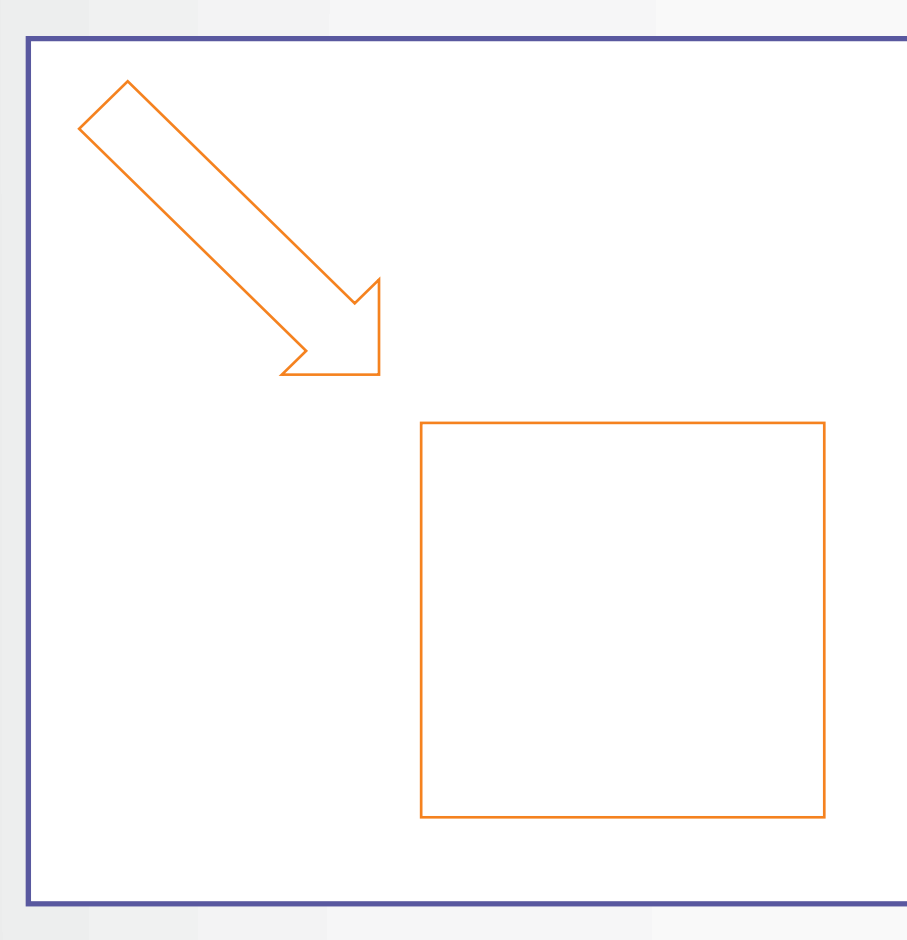

## 4-7 hour time saving

during mounting and setup.

## 20 percent space saving

through integrated input wiring and omission of output terminals with vertical wiring.

## Flexible like a Swiss Army knife

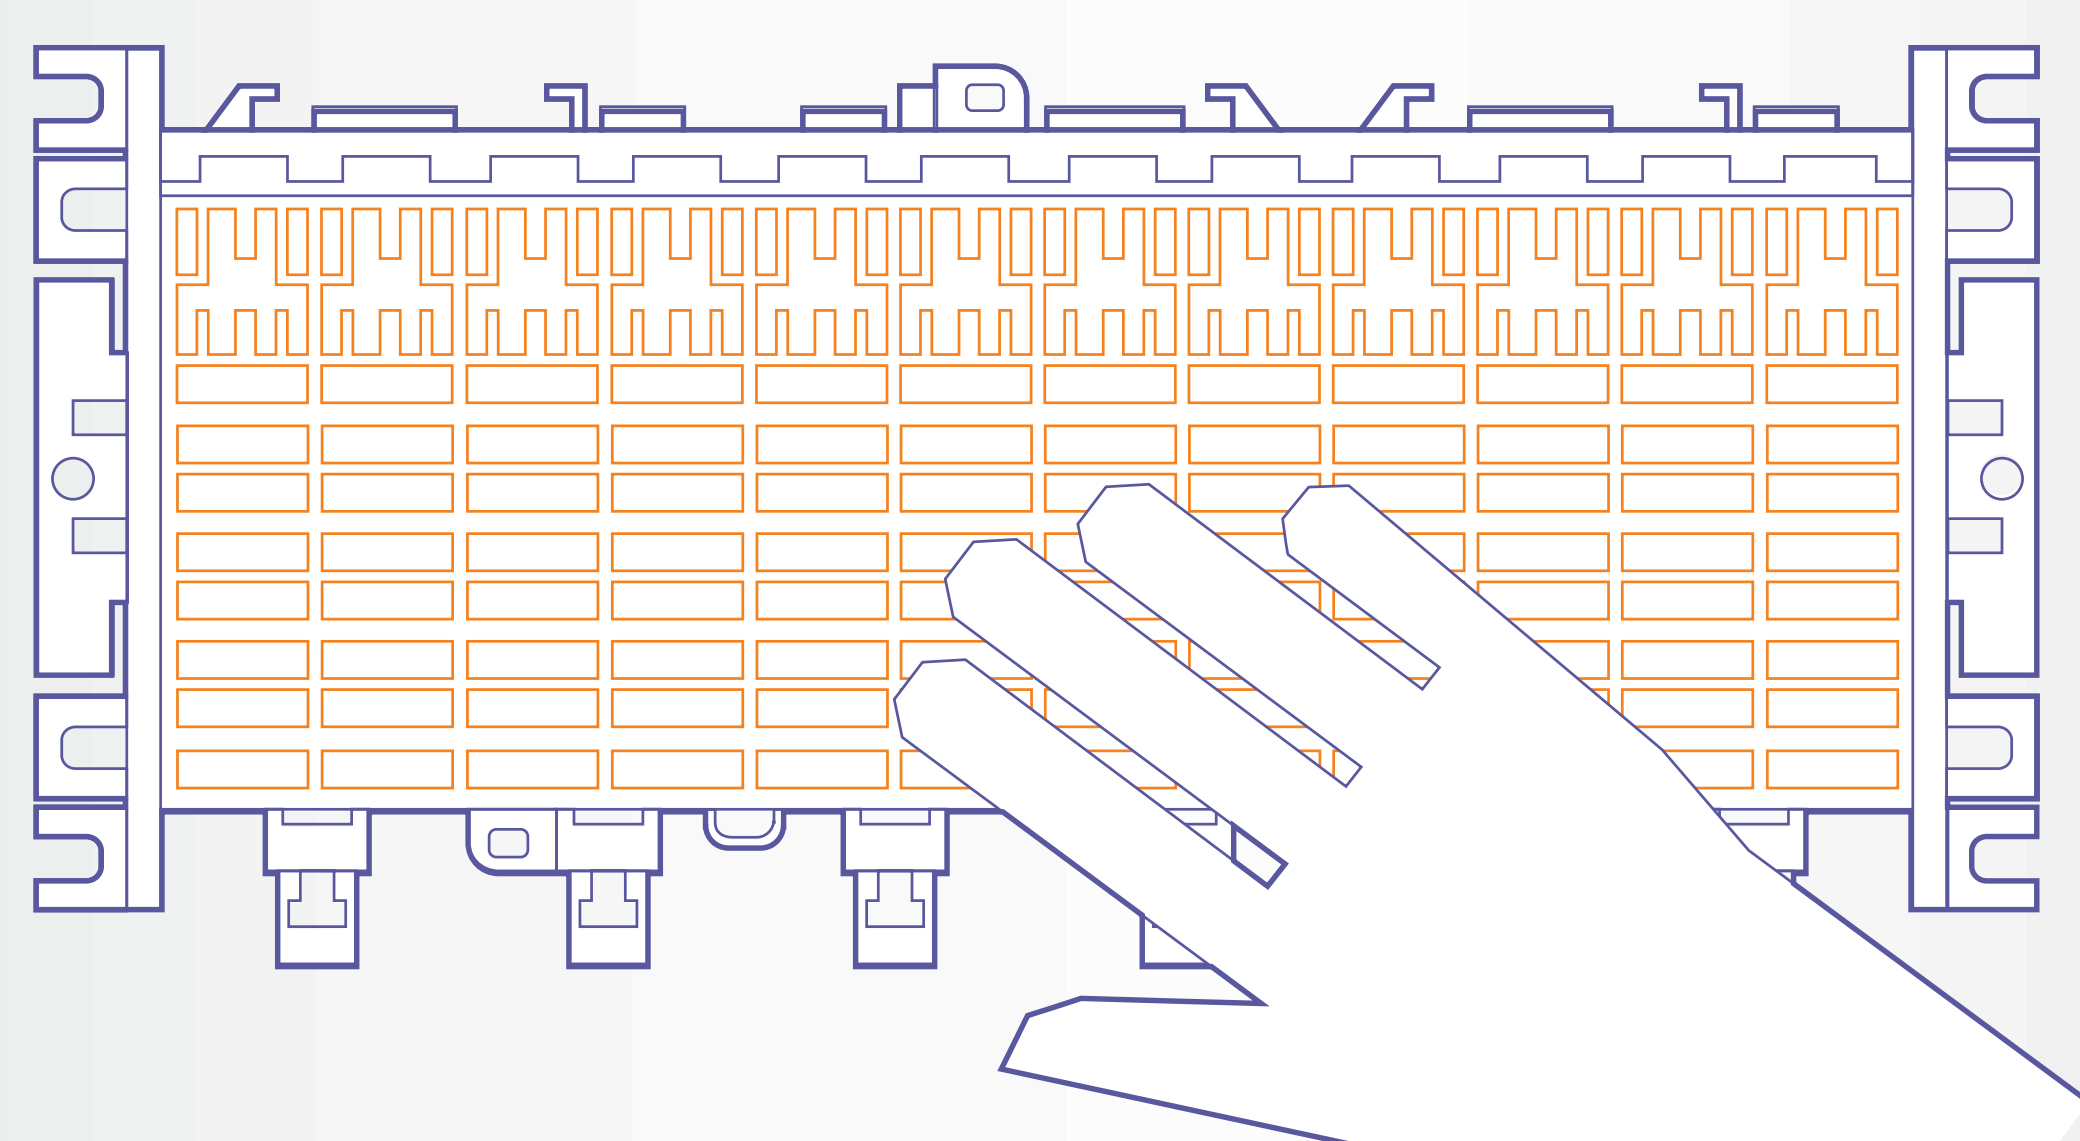

The system is expandable without having to take cross wiring into account.

Devices can be fitted in a different order without impairing the system.

## Finger safety allows device changes on live equipment

No protective equipment is needed for load-free plugging and unplugging of devices under power.

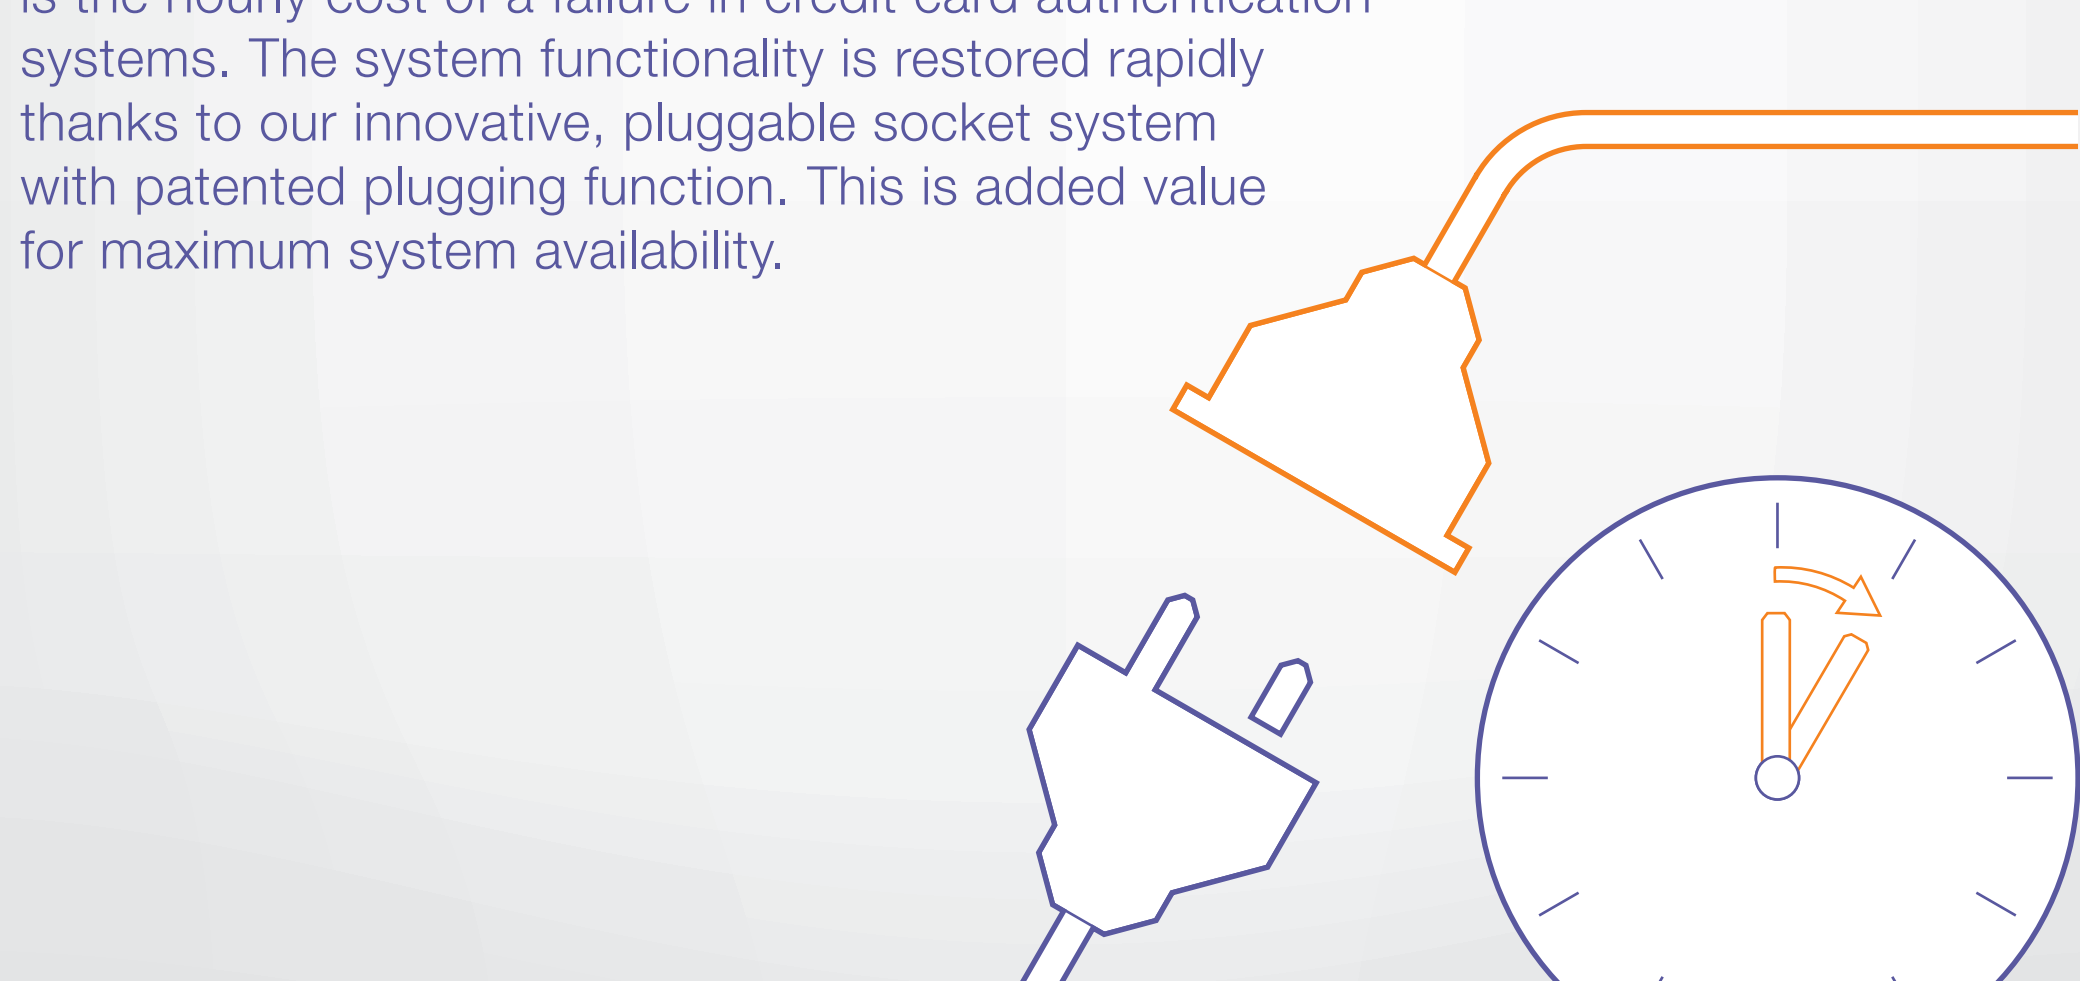

## 40,500 search requests

can be lost if a data center goes offline for one second. The ability to do maintenance on live equipment guarantees power availability. This greatly reduces downtime.

## 2.44 million Euro

is the hourly cost of a failure in credit card authentication systems. The system functionality is restored rapidly thanks to our innovative, pluggable socket system with patented plugging function. This is added value for maximum system availability.
