Busch-priOn® Busch-ComfortTouch®
The new generation of intelligent home control
A whole new quality of life.

Networked structures in buildings are not new. Various systems such as lighting, heating and media technology are moving ever closer together. Today, interfaces between systems are virtually standard in modern buildings. The only difficulty thus far: how can users maintain an overview in these complex systems? New control concepts are required. Busch-Jaeger is now providing the answer with a new generation of intelligent home controls: intuitive to operate and offering a consistent colour concept, they help the user maintain an easy overview of all of the building technology at all times. Menus and buttons that are customized to customer requirements and include texts and icons ensure clarity. This high-performance technology works both reliably and unobtrusively in the background – only high-quality control elements are visible whose functions are custom-tailored to the user. In this way, it is possible to create personalised Living Space® at the touch of a button.
The ABB i-bus® KNX is the basis which makes holistic control of building technology possible. All information, including switching and control commands, is transmitted via a data bus, which can be compared to a computer network. Here, the individual elements can be connected through a special bus line (twisted pair). With a fingertip, it is possible to set whole scenes with lighting, music, heating and other functions. Subsequent changes can be made thanks to easy reprogramming.
An operating concept that is fun

Using the computer or the mobile phone, we get up-to-date information whenever we want it. The on-board computer in a car informs us at all times about current consumption or the outside temperature. Our navigation device receives current traffic information automatically and reacts accordingly for route planning. We appreciate all of this and we would not want to be without these things once we have them. Only in buildings do we often settle for a minimum of comfort and control. The cause of this is frequently the users’ fear of not being able to cope with the operation of such technologies. Busch-Jaeger is now offering a completely new concept, thanks to which such concerns are finally a thing of the past. It is as easy as it is powerful and it maps all building technologies from heating to multimedia in a single user menu. Busch-priOn® and the new Busch-ComfortTouch® – the new generation of home controls make operation as easy as child’s play.

The new operating concept distinguishes itself through its clarity and user-friendliness. Operating fields follow a colour concept developed especially for this purpose; each comfort zone is assigned a special, logically-selected colour:

The colours of intuition

- Light control is yellow, like the sun
- Functions of the blinds are blue, like the sky
- Climate functions are orange, representing warmth
- Living scenes are magenta, representing an awareness of life
The Busch-ComfortTouch® unites the functions of a home control and an information and entertainment centre on a single screen. Using the colour display, it is possible to switch on or dim lights in the entire building, control the blinds or regulate the temperature or scenes using a combination of the functions mentioned above – even using a remote control. The user menu can be customized to suit individual user needs, and thanks to a floor plan or photos, designed so that it is especially clear.

Busch-priOn® was designed to control a room and enables the control of a variety of functions, from temperature regulation on through to setting an alarm clock. Especially user-friendly: the display is switched on only at the touch of a button – if it is inactive, Busch-priOn® acts like a standard switch and triggers a previously-programmed primary function when it is touched. This makes operation easy even for guests.
Control elements were never like this. The new 8,9 cm (3.5") TFT display is as beautiful as it is powerful; it is an informative component of an in-wall combination. Its menu can be adapted individually to any building, and it provides an overview of the power consumption of electrical devices at all times. Here you can regulate the heat, dim the light or call up many scenes which trigger a multitude of previously-defined actions in a jiffy. Meaningful icons guide even inexpert users to their goal in just a few steps. Thanks to the division of the functions into individual areas such as lighting, heating and blinds, every user can find his way here intuitively. However, the possibilities of the Busch-priOn® are not exhausted with the functions of classic building technology. The display can also be used for music control. As special award for „best of the best,” Busch-priOn® received the 2008 red dot communication design award for its interface.
The combination of push button/rotary knob and display presents a universal operating concept. The definition of a primary function makes usage especially easy. The primary function is displayed when somebody approaches the display (there is a special proximity sensor for this) or if somebody touches the rotary knob. In principle, any switching, dimming, blind, scene or sequence function which is stored in the device can be specified as the primary function. Only if the menu button is pressed does the display change to the circuit menu. Here, up to 8 entries can be indicated by an icon. By turning the push-button/rotary knob, the user can bring the desired function into the foreground. A text corresponding to the icon currently displayed appears (e.g. system settings, room control: office, room control: living room), etc. By pressing the , the display changes to reflect the respective list menu, which can contain up to 15 different functions. The user can scroll through these functions by pressing the . The function in question is selected with a press of the button.

**Note 1:**
If the display is in screen-saver mode or in stand-by, the primary function is only called up if the user approaches the device (only possible thanks to an end strip with proximity sensor) or if the is touched. The circuit menu appears only after the menu button has been pressed.

**Note 2:**
The display can display messages such as “Alarm.” If the menu button is pressed or there are several messages in the queue, these messages are displayed before the circuit menu appears.

---

![Scenes](image6)
Furthermore, individuality characterises the Busch-priOn® not just when it comes to the programming of the individual buttons: the combination of Busch-priOn® control elements could hardly be more flexible. For Busch-priOn® is not bound to a frame – instead, up to 3 individual elements are fixed on a carrier and, at the end, provided with end strips above and below. There are four choices of finish for the control elements: studio white, glass white, glass black and stainless steel. Most of the end strips are also available in these colour variants. For the display (style sheets), there are three choices: black, blue and silver.

**Modular concept**

**End strips**

These serve not just to look beautiful – they optionally contain a temperature sensor for room control, an infrared interface for the remote control and a proximity sensor for activating the display or LED of the control elements when somebody approaches. A single-line display is also available. This can be used for controlling the room temperature and/or for displaying messages and also features the IR/proximity function. Please note that the IR/proximity version and the single-line display are only available in the black glass finish (not the other colours).
Combinations as desired

The control elements and end strips can be combined at will in their colours and functions for Busch-priOn®. Up to 3-way combinations are possible, whereby a single bus coupler will suffice. Busch-priOn® is comprised of the bus coupler, the carrier, the control elements and the end strips. Added to these are the labelling icons which map the functions of the individual buttons. If a display is desired, at least a dual carrier is required, as the display plus the element with the rotary knob and the menu button are delivered as a unit.

Many combinations are possible

¹Can only be used in conjunction with the 3fold control element
²Product available via ABB STOTZ-KONTAKT
Not just any KNX control element

Each of the buttons of the Busch-priOn® can be programmed individually, as is usually the case with KNX. The applications range from switching, dimming and blinds on through to scenes. Logic functions are also possible. A display provides additional functions too. Weekly timers, messages and multimedia applications can be integrated here, for example. Furthermore, additional applications can be implemented by assigning internal group addresses. The user menu can be configured in 19 languages.

1 Only in combination with end strip bottom "temperature sensor" or other external sensor
2 Only in combination with end strip top "IR and proximity sensor"
3 Busch-priOn® has one internal temperature controller
Behind every Busch-priOn® combination is needed one bus coupler only. For a 1gang support frame, a Standard Bus coupler will suffice. In the case of the 2gang support frame, the Power Bus coupler must be used, which requires an additional, external power supply for this purpose.

The table to the left describes the corresponding device combinations. Please note: with new Standard Bus couplers and Power Bus couplers the normal KNX line-topology is existing no longer. Please calculate the number of BUS-SUBSCRIBERS (SUB) refer to the table.
**Easy installation**

Busch-priOn® is installed in a flushmounted wall box (German Standard) and by default, at a distance of 71 mm. After installation of the support frame on the wall (see right), the individual modules are fastened to the support frame by snapping them in. Special securing elements prevent removal of the modules.

The support frame is screwed onto the metal mounting plate of the bus coupler located beneath it.

To ensure that Busch-priOn® even lies flat against uneven walls, the support frame features special levelling elements. These can be used to align the support frame so that it is level.

If needed, the support frame can be stabilised with additional screws in the locations provided.

**Busch-priOn®**
- Glass black
- Plastic white
- Stainless steel
- Glass white
- 2gang combination, Glass black

Busch-priOn® is the new generation of intelligent home control.
The support frame serves to hold and make contact with the individual control elements, the 8,9 cm (3,5”) TFT display, the end strips and the flush-mounted bus coupler. The positioning of the control elements can be selected freely for multiple combinations. A special bar must be mounted on top as well as below. Its material can be different than that of the module. The support frame is mounted by screwing it to the flush-mounted bus coupler and, for multiple combinations, also to the wall. Thanks to the anti-fingerprint surface, the stainless steel Busch-priOn® is easy to keep clean and maintains its sophisticated surface finish even when it is in use. Glass surfaces and end strips match the carat® series.

Flush-mounted actuators are available for integration into the system with immediate effect: the switch/blind actuator 2/1fold, universal dimming actuator 1fold, switch actuator 1fold and series/shutter actuator modules. When using the Busch-priOn® flush-mounted actuators, a bus coupler appropriate for the medium concerned must always be connected at one point on the support frame. (This means you can connect two actuators and one bus coupler on one 3gang support frame.)
The Busch-ComfortTouch® unites the functions of a home control and an information and entertainment centre with a beautiful masterpiece. Using the 23 cm (9”) colour display in 16:9 format, it is possible to switch on or dim lights, control the blinds or regulate the temperature or scenes using a combination of the functions mentioned above – even using a remote control. An audio player for replaying MP3 files is also integrated into the Busch-ComfortTouch®. All of this is of interest not just for homes – the device is also used in medical practices, offices, restaurants and shops in order to create appropriate lighting, provide soft background music or keep the room climate comfortable and tailored to your needs. A presence simulation and the display of fault messages provide additional security. E-mails can be displayed without a separate computer. It is also easy to answer e-mails with graphics and voice messages. Incorporation into a network can be accomplished via LAN or WLAN without additional cabling.

As special award for „best of the best,” Busch-ComfortTouch® received the 2008 red dot communication design award for its interface.
**Outer beauty and inner values**

**Video player:**
If you provide video files via the network, you can also access these via the panel and play them back on the display.

**MP3 player:**
The MP3 player provides background music for activities such as cooking, reading the newspaper, and can create a mood, e.g. at a party or during a festive meal. MP3s can be played back via the built-in loudspeakers or in stereo via the line-out output on Busch-AudioWorld® or active speakers. The USB flash drive, SD card or an approved drive on the LAN can serve as the source for the music files.

**Feed reader:**
The "feed reader" enables users to read news feeds from the Internet in a compact format, e.g. the current news, weather or traffic information. The "feed reader" can appear as a compact application on the start page.

**Telephone (VoIP):**
The Telephone (VoIP) application page allows you to use Busch-ComfortTouch® as Voice over Internet Protocol (VoIP) phone. However, the following requirements must be fulfilled:

- There must be a broadband Internet connection with a transfer rate of at least 100 kbits/s in both directions.
- The Internet provider must allow VoIP.
- For the Busch-ComfortTouch® to be reachable via a conventional call number, an SIP account must be obtained from the Internet provider.

**Web Radio / Web TV:**
Busch-ComfortTouch® can stream Internet radio directly on the panel using the Web Radio feature. Audio can be provided by the integrated speaker or in stereo via the line-out output with a connection to an external sound system or active speakers. Up to ten streams can be set via IP Project. The Busch-ComfortTouch® enables the user to stream Internet TV directly on the panel using the Web TV feature. Audio can be provided by the integrated speaker or in stereo via the line-out output with a connection to an external sound system or active speakers. The image can be displayed in reduced size at the upper left or in full screen mode.
Home control – including multimedia

In addition to the control of classic building technology functions, the design of the Busch-ComfortTouch® enables the integration of networks via LAN or WLAN. Here, the device can be used as a gateway between IP networks and KNX networks. For incorporation into a LAN, the network settings can be set statically or the DHCP function can be used.

The bus is connected to the panel via a pluggable KNX coupler and screw terminals. The panel also has audio outputs, a USB interface and a slot for a SD card. Important: the panel must be able to receive the WLAN signals – how far away it may be installed depends first and foremost on the capability of the WLAN network. The WLAN password can be read in via the SD card or the USB interface.

The Busch-ComfortTouch® can display and control WLAN-based applications. Surveillance cameras offer quick visual information about what is taking place within their detection range. They can be activated individually and the image recorded can be displayed on the panel. To do this, the surveillance cameras must be IP-capable. The wireless connection of a computer to the Busch-ComfortTouch® is also of benefit.
Various menu categories

A menu customized individually for the user with meaningful buttons ensures intuitive, clear operation. Pictures of the individual rooms can also be imported and provided with buttons. This makes operation even easier and allows messages to be assigned immediately. For the display, there are three basic page types. The start page serves as an entry into the system with favourite functions on the first level. Using the jump functions on the navigation bar, it is easy to reach operating pages for individual rooms or building sectors with their respective functions. Concrete settings for applications such as the MP3 player can then be made via the application pages.

Functional start page
Operating functions and applications can be called up directly here. The various corresponding buttons can be arranged on a grid of maximum 4x4 elements. The same applies for the operating pages. Furthermore, the start page allows an application to be displayed in compact form; the RSS feed is shown here.

Operating pages with image of room
Thanks to the stored photo, the user can see which operating functions are available in the respective room as well as the status of each consumer. Another option is to trigger functions directly using operating elements. The positioning of the buttons on the image is not completely without restriction; they must be arranged in a grid of 3x4 elements. In order to provide different views of a room, it is possible to store up to 5 additional operating pages with images.

Operating pages
With the buttons, you can control the room functions. Here too, various operating elements can be combined in a grid of maximum 4x4 elements. Furthermore, it is possible to store up to 2 sub-pages so that a total of 36 operating functions per room are available. These sub-pages are visualized using so-called swap elements and they indicate the current status. For better orientation, a miniature view (image/photo) of the room can also be inserted instead of a sub-page.

Start page with floor plan
Another possibility for designing the start page: with a floor plan, it is possible to navigate directly to the operating pages for individual rooms. Up to 6 floor plans are possible. Up to 2 consumers states per room depicted can be displayed. However, it is not possible to activate directly from the floor plan view.

Application pages
These map the individual applications in full-page mode. All application-specific functions can be activated via these pages, e.g. temperature control or MP3 player.

Calendar
The user can use the calendar to define times on specific days during the year when special scenes are triggered. These presets can be repeated every year.
Many easy-to-operate functions

The Busch-ComfortTouch® forms the switching centre for the whole house, thus replacing individual devices such as timers, logic modules and temperature controller. Functions have been integrated which not only make you more comfortable, but also mean greater security and more economical operation for the building.

Temperature control:
The Busch-ComfortTouch® contains a local temperature controller inside the unit. Various rooms can be controlled centrally using the unit. For this, the unit must only know the actual temperature of the other rooms – for example, as determined by an external temperature sensor. The controlling itself is handled on the panel. The control of external temperature controllers is also possible.

Time/date display:
The navigation bar always displays the current time and date. The switching between summer and winter time occurs automatically.

Voice messages:
With this application, it is possible to leave voice messages and listen to them later on. The microphone for this is integrated into the Busch-ComfortTouch®. If the application is called up, the screen displays an overview of all addressees known to the system. The user can then select an addressee. If there are graphic messages present which have not yet been read, then a corresponding symbol which indicates the new message appears on the status line.

Scenes and sequences:
Scenes and sequences can be combined as required to then simultaneously call up, one after another, all functions provided by the panel. However, these scenes and sequences must first be created by the electrical installer with the commissioning tool. Later, users can combine them individually on the panel and make changes to them. In total, 64 scenes and sequences can be stored in the unit. In contrast to scenes the time-delayed processing of sequential actions is possible with sequences. Different pause times can be inserted between actions for sequences and sequences can also be interrupted or stopped.

Baby Phone
Using the Baby Phone application, cameras and microphones of other Busch-ComfortTouch® in the network can be used, for example, to monitor a sleeping baby in a children’s room. If the sound levels there exceed a set value, the Baby Phone application establishes an audio/video connection to other selected panels. The connection allows parents to see and talk with the child.

Data logger
The data logger integrated in the Busch-ComfortTouch® can graphically display data for up to eight communication objects. If these communication objects are linked with sensors via group addresses, the energy consumption of a house, the power output of a photovoltaic system or the fill level of an oil tank can be visualised, for example. To ensure that these values can be processed, the Busch-ComfortTouch® stores the data in a predefined directory.
Presence simulations, the interface to LAN and WLAN and the storage of complex scenarios that also include multimedia functions are just a few advantages of this device. End customers can trigger individual actions with the touch of a button and set and change functions themselves as needed.

User languages:
In an international environment with various languages (hotel, ship), the complete labelling can be changed very easily. Up to 255 operating languages are possible via a translation table.

System languages:
The description and labelling of the system settings on the panel can be switched to different administrator languages. Up to 19 administrator languages are available.

Malfunction and alarm display:
It offers protection and information about malfunctions and faults. Signal contacts, sensors and their proper function can be monitored as required. The user can choose how the message is actually output. The possibilities include a signal tone, e-mail and the running of a scene.

Access control:
Various user groups are available; each of these can be assigned a password. This protects particular operating buttons, applications and pages (e.g. video surveillance or operating pages) against access. 8 such user groups can be created.

Presence simulation:
It scares away burglars because it makes the house look lived-in even if nobody is home. The processes and times for up to 20 objects are grouped according to day of the week and recorded to the minute and they can be called up automatically upon presence. This way, the light switches on and off, the blinds move, music plays, and this not exactly the same way every day, but individually on each day of the week according to the user’s habits.
Entirely practical installation

The Busch-ComfortTouch® also consists of several components. A special installation box for flush mounting or cavity-wall installation forms the basis. The touch display is screwed tight and then provided with a design frame. There are 2 variants in black or white glass from which you can choose. They correspond to the design of the carat® series, so that the panel can be combined with switches and sockets from this programme. To complete the look, a design bar can also be fastened on the bottom edge. It is available in aluminium or chrome and makes the connection to interior designs where metal elements dominate.

Before installation, the CF card and – if desired – the KNX interface are inserted in the slots provided. While the CF card is included in the scope of delivery, the KNX interface must be ordered separately.

Next, all required terminals can be connected.
1 LAN connection
2 SD card slot
3 USB slot
4 KNX/TP connection and audio out
5 Power supply, 230 V, 50Hz

For flush mounting of the panel, Busch-Jaeger offers a special mounting box which is installed flush in the wall. The display is inserted and screwed in at the corners. Finally, the design frame is fastened by plugging it in.
The high-performance 16:9 touch display with 23 cm (9") screen offers a resolution of 800 x 480 pixels.

You can also add video functionality to the base station by adding the new camera module. With the state-of-the-art videophone, you’ll enjoy a live video image during station-to-station calls at home.

The aluminum or chrome designer bar is an aesthetic element and optional.
Busch-Jaeger's new operating solutions are not isolated islands – they are based on KNX and thus can be combined with many devices. However the individual components have more to offer than just the bus connection.

Via USB or a SD card, it is easy to read in data. Wireless interfaces such as WLAN and infrared minimise the cabling effort and ensure users maximum comfort.

Via WLAN, the building technology and the Internet can be connected to one another wirelessly. Whether RSS information or e-mails: the panel can display all of this without additional cabling.

Bang & Olufsen and Busch-Jaeger have been cooperating with one another for a long while now. The result is products which communicate smoothly with one another. Thus, the panel can be controlled not just with the Busch-Jaeger remote control, but also with the B&O Beo4 and Beo5 remote controls; complete home cinema scenarios can be called up with the touch of a button.

Busch-priOn® can be controlled with the Busch-Jaeger IR remote control and the B&O Beo5 remote control – infrared interfaces in the end strips make this possible. This way, scenarios which create the appropriate atmosphere in the room can be called up with the touch of a button.
New paths to commissioning

What is the point if the occupant can operate the system easily but the technician despairs during the installation? The new, simple approach for the user does not stop short of the people who install and start up the Busch-Jaeger solutions.

Therefore, there are new paths available – so that work proceeds quickly and easily.

The planning of Busch-priOn® occurs, as is generally the case with KNX, using the software solutions ETS 3F. In order to minimise the download times, a special commissioning adapter can be used, which will replace the RS232 and USB interfaces for the new generation of bus couplers. After transferring the data from the laptop to a micro SD card, the coupler can be programmed directly locally using the adapter. This device can also be used to update the firmware of the bus coupler as well as other KNX components with a 10-pin commissioning port such as the 6197/12 etc.

Remote Desktop
When this icon is displayed, the ComfortTouch is being accessed by an external device.

The Busch-ComfortTouch® is started up using a special tool which imports KNX data from the ETS 3F. The assignment to the buttons is made with simple drag&drop functions. Floor plans and graphics can be stored.
