1.5.4 ACS/DCS drives libraries - System technology
1.5.4.1 Introduction
1.5.4.1.1 Scope of the document

The purpose of system technology document is to give an overview and explain the overall concepts of the Drives library in V3. The library contains function blocks to establish communication, to control the ABB ACS / DCS drives from AC500 V3 PLCs.
1.5.4.1.2 Safety instructions and preconditions to use drives library

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user’s manuals for the devices you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 in the online help in Automation Builder.
- Read the user information of the devices and functions you are using, see online help in Automation Builder.
- Installation and commissioning of the drive(s) is not part of this document nor the online help of Automation Builder. Installation and commissioning of the drive(s) must be done according to the related drives manuals and safety instructions.

The library package has been released for the software and firmware versions listed in the Readme file of the package only.

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the Drives V3 Library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

The user must follow all applicable safety instructions and the guidelines mentioned in the user documents of the ABB products.

Read the complete safety instructions for the AC500 before installation and commissioning.

CAUTION!

Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

1.5.4.1.3 Comparison of V2 and V3 drives library

The below table compares the FBs in the V2 library package and corresponding adapted FBs in the V3 library package.

The V2 package (PS553-Drives) has different library files for each protocol and the same is replaced with a single library in V3 (ABB_Drives_AC500).

2009
### 1.5.4.1.4 Overview of the drives library for V3 PLC

This document will briefly explain about communication settings between PLCs with drives, how to control the drives from PLC using the control function blocks.

Each input and output of the function blocks are explained in the integrated documentation in the library.

This library is released for the following products:

- **AC500 V3 CPU**
- **ABB Drives:**
  - ACS380, ACS480, ACS580, ACH580, ACQ580, ACSM1, ACS880, DCS550, DCS800, DCS880 other drives may still work, but are not tested.
  - To use the control blocks the Communication Profile must be “ABB Drives Profile” or “ABB Drives Profile enhanced”
- **Fieldbus Adapters:** FENA-01, FENA-11, FENA-21, FSCA-01, FCAN-01, FECA-01, RETA-01, RETA-02, RCAN-01.
  - Fieldbus adapter support is dependent on the drive and for more details refer the corresponding drive manual.

Drives Library in V3 will support following protocols for the communication:

- Modbus TCP (onboard ETH1 and ETH2 ports)
- Modbus RTU (onboard COM1 port)
- PROFINET (using communication module CM579-PNIO)
- EtherCAT (using communication module CM579-ETHCAT)
- CANopen (onboard CAN port)

### Modbus TCP

The following hardware components must be available:

- **AC500 V3 PLC with ETH option.** Configure onboard ETH1 or ETH2 for Modbus TCP.
- **Drive with fieldbus adapter module**
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-01
- **RJ45 Ethernet cable**
ACS drives

To exchange only status word, actual speed, control word and speed reference:
- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block ‘DrvModbusTcp’. For more details see Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2035.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2031.
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:
- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. For more details see Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2035.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2031.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block `DrvModbusRead`. For more details see Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2034.

- **Write the values:**
  Use the function block `DrvModbusWrite`. For more details see Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2035.

- **Read Write the values:**
  Use the function block `DrvModbusReadWrite23`. For more details see Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2055.

### DCS drives

![Fig. 13: FB - Overview of Modbus TCP connection with DCS drives](image)

**DCS drives**

To exchange only status word, actual speed, control word and speed reference:

- **Communication function block in AC500 program:**
  Use function block `DrvModbusTcp`. For more details see Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2035.

- **DrvModbusTcp**

- **Control function block in AC500 program:**
  Use function block `DrvControlModbusDCS`. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.

- **Scaling of the speed or torque (optional):**
  Use function block `DrvScaling`. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2034.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2035.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2055.

### DCS80 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block ‘DrvModbusTcp’. For more details see Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2035.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. For more details see Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2035.
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2034.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2035.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2055.
Modbus RTU

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard COM1 for the Modbus RTU communication.
- Drive with
  - ACS Drives and DCS880: Embedded fieldbus or FSCA-01
  - DCS550 and DCS800: Embedded fieldbus or RMBA-01
  - Twisted pair serial cable

ACS drives

![Modbus RTU Connection Diagram]

Fig. 14: FB - Overview of Modbus RTU connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block ‘DrvModbusRtu’. For more details see Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2042.
-DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2031.
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusRtu’. For more details see Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2042.
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. For more details see Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2031.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2034.
- Write the values:
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2035.
- Read Write the values:
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2055.

DCS drives

Fig. 15: FB - Overview of Modbus RTU connection with DCS drives
To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:
  Use function block ‘DrvModbusRtu’. For more details see Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2042.
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block ‘DrvModbusRead’.
- Write the values:
  Use the function block ‘DrvModbusWrite’.
- Read Write the values:
  Use the function block ‘DrvModbusReadWrite23’.

DCS880 drives

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block ‘DrvModbusRtu’. For more details see Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2042.
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusRtu’. For more details see Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2042.
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusDCS’. For more details see Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2033.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block ‘DrvModbusRead’. For more details see Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2034.

- **Write the values:**
  Use the function block ‘DrvModbusWrite’. For more details see Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2035.

- **Read Write the values:**
  Use the function block ‘DrvModbusReadWrite23’. For more details see Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2055.

**PROFINET**

The following hardware components must be available:

- AC500 V3 PLC with CM579-PNIO (PROFINET Master communication module)
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-02
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- **Communication profile:** ABB Drives Profile
- **Control block:**
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2027.
  - DCS Drives: Use function block ‘DrvControlDCS’. For more details see Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2029.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
ACS drives

![Diagram of ACS drives](image1)

Fig. 16: FB - Overview of PROFINET connection with ACS drives

DCS drives

![Diagram of DCS drives](image2)

Fig. 17: FB - Overview of PROFINET connection with DCS drives

EtherCAT

The following hardware components must be available:

- AC500 V3 PLC with CM579-ETHCAT (EtherCAT Master communication module)
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FECA-01
  - DCS550 and DCS800: RECA-01
- RJ45 Ethernet cable
The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- **Drive → AC500**: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- **AC500 → Drive**: Control word and reference value 1 (speed) and optional reference value 2 (torque).

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.

The following function blocks can be configured in the AC500 program.

- **Communication profile**: ABB Drives Profile
- **Control block**:
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.5.4.2.3.1.2 "DrvControlACS" on page 2027.
  - DCS Drives: Use function block 'DrvControlDCS'. For more details see Chapter 1.5.4.2.3.1.3 "DrvControlDCS" on page 2029.
- **Scaling of the speed or torque (optional)**: Use function block 'DrvScaling'. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.

ACS drives

![Fig. 18: FB - Overview of EtherCAT connection with ACS drives](image)
DCS drives

Fig. 19: FB - Overview of EtherCAT connection with DCS drives

CANopen

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FCAN-01
  - DCS550 and DCS800: RCAN-01
- CANopen communication cable with 120 Ω resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block ‘DrvControlACS’. For more details see Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2027.
  - DCS Drives: Use function block ‘DrvControlDCS’. For more details see Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2029.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. For more details see Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2026.
ACS drives

![ACS drives diagram]

Fig. 20: FB - Overview of CANopen connection with ACS drives

DCS drives

![DCS drives diagram]

Fig. 21: FB - Overview of CANopen connection with DCS drives

CANopen with CAN CiA402 Profile for generic Drives

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Any drive with CAN fieldbus adapter module and CAN CiA402 profile.
- CANopen communication cable with 120 Ω resistor.
The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual speed.
- AC500 → Drive: Control word and reference speed.

The following function blocks can be configured in the AC500 program.

- Communication profile: CANopen device profile CiA402
- Control block: Use function block ‘DrvControlCANCiA402’. For more details see Chapter 1.5.4.2.3.1.13 “DrvControlCANCiA402” on page 2058.

General drives with CAN CiA402 interface

![Diagram](image)

Fig. 22: FB - Overview of CANopen CiA402 with any drives
1.5.4.1.5 Compatibility

To check the compatibility of the drives and their communication modules please refer to the following table, it shows the tested combinations.

<table>
<thead>
<tr>

1.5.4.2 Overview of the library

1.5.4.2.1 Installation

The library is part of the Automation Builder 2.2. or higher. Use the Library manager to add the library into project.

For more details on the package, refer to the release notes of the latest Automation Builder.
### 1.5.4.2.2 Hardware and software requirement

<table>

*Drive configuration tool and fieldbus adapter module support is dependent on the drive used, for the compatible tool details refer to the drive manual.*

### 1.5.4.2.3 Description of the library

This chapter briefly explains the functions, function blocks, structures, enumerations and visualization present in the library.
Fig. 23: FB - Overview of the Drives Library
Function Blocks

DrvScaling

DrvScaling function block is used to scale the speed or torque reference to the drive based on the maximum values defined.

Function block DrvScaling can be used to scale the variables from fieldbus equivalent values to values used in the program. Fieldbus variables are given in fieldbus equivalent values as INT values. With the scaling a conversion from INT (fieldbus) to REAL (program) and vice versa is performed. Reference1 and Actual Value1 (speed) are mostly given in the range of -20000 ... +20000. Reference2 and Actual Value2 (torque) are mostly given in the range of 0 ... +10000.
This function block can be used to control ACS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW has to be send to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

</table>
This function block can be used to control ACS drives with ABB Drives profile or ABB Drives enhanced profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.

Status Word (SW) is read from drive through Modbus communication block using DriveData interface (For more details on the structure refer to Chapter 1.5.4.2.3.3 “Structure: DrvData-Type” on page 2059).
Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for ACS drives using ABB drive (Classic/Enhanced) profile for Modbus protocol only. The data transfer to the ACS drive is realized via the IN_OUT variable DriveData, which must be connected to DrvModbusTcp or DrvModbusRtu function block.
This function block can be used to control DCS drives with ABB Drives profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.

Status Word (SW) is read from drive through Modbus communication block using DriveData interface (For more details on the structure refer to Chapter 1.5.4.2.3.3 “Structure: DrvDataType” on page 2059).

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.
The function block should be used for DCS drives using ABB drive profile for Modbus protocol only. The data transfer to the DCS drive is realized via the IN_OUT variable DriveData, which must be connected to DrvModbusTcp or DrvModbusRtu function block.

### DrvModbusRead

The function block 'DrvModbusRead' reads one or more parameters / values of the drive. The number of data to be read is specified at the input 'Nvar'. The first parameter number is specified at the input 'PrmNum'. All parameters must be accessible from consecutive Modbus registers in the drive. The values of the parameters are stored in the PLC memory area, defined at the input 'Data'.

The values in the PLC memory area are updated when the read job was performed without error. This is indicated by JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Enable is set from TRUE to FALSE.

As long as the Enable = TRUE a new read job is requested each time the further read job is terminated. The Modbus job is started from the Communication Block which is connected to the same 'DriveData' variable. It uses the Modbus function code 03 (read n words). The drive (Modbus device) from which the parameter is read is specified at this Communication Block. The Communication Blocks are available from the library e.g. DrvModbusTcp or DrvModbusRtu.

The function block is activated (Enable = TRUE) or deactivated (Enable = FALSE) via input Enable. If the block is active, the current values are available at the outputs. To start a new read job the input Enable must be set to TRUE. If the input values are valid, a request to perform a Modbus job is sent to the Communication Block via the 'DriveData' variable. If at least 1 input is invalid, no job is generated, and the error is displayed at the outputs Error and ErrorID instead.
DrvModbusWrite

Function block 'DrvModbusWrite' writes 'n' parameters to the drive. The number of parameters to be written must be available in the PLC memory area, defined at the input Data. The write job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

To start a new write job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the Communication Block which is connected to the same DriveData variable. It uses the Modbus function code 16 (write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

DrvModbusTcp

Function block DrvModbusTcp controls the Modbus TCP communication to ACS/DCS drives and provides the basic values (CW, Ref1, Ref2, SW, Act1, Act2) which are used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.
The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable. These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

<table>
<thead>
<tr>
<th>Modbus register address in drive</th>
<th>Mapping configuration in drive</th>
<th>Written in AC500</th>
<th>Condition at function block</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1</td>
<td>DCS550, DCS800</td>
<td>DCS880</td>
<td>Communication module</td>
</tr>
</tbody>
</table>

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.

If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable. These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters.

Using the input NvarRead the function block can be configured to read between 0 and 12 parameters from the drive. All read data is then written to the array at the ReadValue output array. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.
### Modbus register address in drive

</tbody>
</table>

### If 32-bit parameters are mapped to DATA IN,

- The following field in DATA IN must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.
  (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from ReadValues fields must be recombined in the program.

Function block DATA IN has to be configured in drive in the following groups see also FENA-x1 manual.

#### Drive

<table>
<thead>
<tr>
<th>Drive</th>
<th>Parameter Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACS355</td>
<td>54.01 ... 54.10</td>
</tr>
<tr>

</tr>
</tbody>
</table>
### Writing control word and reference value to drives

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.

If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

Apart from these three there parameters there is also an option to write 12 additional drive parameters.

Using the input NvarWrite the function block can be configured to write between 0 and 12 parameters to the drive. The necessary values must be present in the array connected to WriteValues input. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

<table>

</tbody>
</table>

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information then job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.
If 32-bit parameters are mapped to DATA OUT,

- The next/following field in DATA OUT must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.
  (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from WriteValues fields must be recombined in the program.

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

Diagnosis

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information the job is aborted with an error.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModTcpMast job. The ModMastErrorIDLast will keep this Error ID until a new rising edge of the Enable is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusTcp".

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.
### Drive parameter settings

</table>

Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.

For RETA-01/-02 IP address could also be set via hardware Dip-Switches.
If any switch is set (192.168.0.xxx) with xxx = Dip-Switches setting

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set.
For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
**DrvModbusRtu**

Function block DrvModbusRtu controls the Modbus RTU communication to ACS/DCS drives and is used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

**Reading status information from drives**

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable. These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

With input NvarRead the function block can be configured to read in the same job between 0 ... 24 data more from the drive. These additional data are written to the array at the 'ReadValues' output. These data must be configured in the drive and are only accessible if the embedded Modbus is used.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the ACS500.

</table>

More details on the limits for the data read and write is explained in Chapter 1.5.4.2.4 “Limits for the data read and write between AC500 and drives” on page 2060. The value is dependent on the Drive used.

Writing control word and reference value to drives

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

The ABB Drives Profile Enhanced communication profile provides register mapped access to the Control, Status, Reference and Actual Values of the ABB Drives Profile Enhanced. The mapping of the registers has been enhanced to allow additional writing of up to 12 control and reading of up to 12 additional status parameters in a single Modbus job.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters in the same job.

Using the input NvarRead the function block can be configured to read between 1 and 12 more parameters from the drive. All read data is then written to the array at the ReadValues output. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

More details on the limits for the data read and write is explained in Chapter 1.5.4.2.4 “Limits for the data read and write between AC500 and drives” on page 2060. The value is dependent on the Drive used.
The function block checks if there are changes in any of the following values since last write job:
- Control Word (wControlWord),
- Reference Value 1 (iRefValue1),
- Reference Value 2 (iRefValue2) on the DriveData variable,
- values in the input array WriteValues – WriteValues[1..NvarWrite].

If there is a change a write job is requested to send the 3 control values and the values in WriteValues array (WriteValues[1..NvarWrite]) to the ACS/DCS drive starting at Modbus register 400001. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
Reconnection pause

When one or more drives in the Modbus RTU lines are offline, all the other drives have to wait for the TimeOut to elapse until a line token is assigned to next drive. Reconnection pause input helps in skipping the drives which are offline from the next Modbus job and execute Modbus job operations only for the drives which are online.

“ReconnectPause” is time in seconds before next retry to connect after a timeout was detected. Timeout is detected with ModMastErrorIDLast = 16#120 (ERR_TIMEOUT).

This feature can be used with the DrvModbusRtu function block in both ABB Drives Profile and ABB Drives Enhanced Profile. User must configure the reconnect pause input value using the input variable “ReconnectPause”.

For the generic RTU block ModRtuToken (part of AC500_ModbusRtu library), also the value for the reconnect pause must be configured at input variable “ReconnectPause”.

Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.
However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTU”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErrno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErrno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErrno: holds the error number of the last executed read write job.

If several drives are used, for each drive a communication function block such as DrvModbusRtu must be programmed. Also, every other generic Modbus server device on the same Modbus RTU line must be programmed with its own ModRtuToken function block. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive/device, so only one drive/device at a time is communicating with the PLC.

ModRtuToken function block and ModRtuTokenType structure are part of AC500_ModbusRtu library. Kindly refer the same.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

If a Modbus RTU job tries to access a register in the drive which has no valid mapping information then the job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.

Modbus RTU using Embedded Fieldbus:
When embedded fieldbus is used for the Modbus RTU communication, user can read maximum of 24 parameters (based on the limitation in drive) from the DATA I/O parameters in the embedded fieldbus parameter group. These parameters can only be used for reading operation and cannot be configured to write data.

</table>
Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter “PARAMETER SAVE” must be set.

Please see also drive manuals which parameter must be set.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880
   – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
Function block DrvModbusRtuBroadcast is a communication block which sends the broadcast messages via the Modbus RTU communication to all ACS/DCS drives and other Modbus devices connected to the same Modbus RTU line (physical line). The function block can be used with all drives with either ABB Drives Profile or ABB Drives Enhanced Profile but not a mix of both profiles.

As the broadcast job will be received by all devices on the same physical Modbus line it’s highly recommended to use this block only in case there are no other Modbus devices connected to this line and all drives use the same profile.

This function block does not perform any Modbus read operation, hence it does not read any values such as status word, actual value 1 and actual value 2 etc., from any of the drive.

This function block should not be used along with 'DrvModbusRead' and 'DrvModbusReadWrite23' function blocks. They will be ignored showing an error. This function block should be only used independently or in combination with 'DrvModbusWrite' function block for broadcasting write operation.

A successful broadcast message for writing control word, reference values and additional mapped parameters (only in case of Enhanced Profile) is indicated by JobDone = TRUE and ModMastErrorAct = FALSE. A next broadcast job for writing these values can once again started with a fresh rising edge at ‘SendCtrlValues’ input.

Apart from sending control values and up to 12 additional values from WriteValues array (only in case of ABB Drives Enhanced Profile) a normal Modbus write function block “DrvModbusWrite” can be used to send broadcast write messages to specific address on all drives connected to the Modbus RTU line. The requests to process broadcast write Modbus jobs is transferred via the DriveData structure at the InOut variable DriveData which can be connected to multiple instances of write function block 'DrvModbusWrite'.

After each successful broadcast write job a fixed pause of 250 ms is implemented before any other Modbus job within the same line will be started.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

**Writing control word and reference value to drives**

A rising edge from FALSE to TRUE at input ‘SendCtrlValues’ starts sending broadcast message with Control Word and Reference Values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) are taken from DriveData variable for sending broadcast message.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

With the ABB Drives Profile Enhanced profile, along with 3 control values Control Word , Reference Value 1, Reference Value 2 , up to 12 additional values can be sent as broadcast message in a single Modbus job.

Writing control word and reference values to drives

A rising edge from FALSE to TRUE at input ‘SendCtrlValues' starts sending broadcast message with Control Word and reference values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) from DriveData along with values in the input array WriteValues – WriteValues[1..NvarWrite] are taken for sending broadcast message.

For the additional 12 values the configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus broadcast write job and the needed mapping in the drive as well as the area where the data is taken from the AC500.

### Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects an actual error occurred in Modbus job. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTUBroadcast”.

- **iWriteErrCnt**: number of errors in write jobs since Enable = TRUE.
- **wLastWriteErno**: holds the error number of the last executed write job.

---

**For all drives, which are connected to same Modbus RTU line, one instance of broadcast block DrvModbusRtuBroadcast is enough and it must be connected to same LineToken of DrvModbusRtu function blocks which are used for communication between PLC and each drive on Modbus RTU line. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive / device, so only one drive / device at a time is communicating with the PLC.**
All the drives should be configured either in Classic Profile or Enhanced Profile and accordingly the function block DrvModbusRtuBroadcast should be parameterized. Mix of profile with few drives in Classic and few drives in Enhanced should not be used when using DrvModbusRtuBroadcast block, if using such configuration along with DrvModbusRtuBroadcast may lead to incorrect operation.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

The Modbus RTU broadcast job is sent to all devices on the same physical Modbus RTU line.

Therefore, if other Modbus devices than ACS / DCS drives are connected to the same line using the ModRtuToken communication block it’s highly recommended not to use the DrvModbusRtuBroadcast function block.

This might only be used, if the user is aware about the behavior of the connected devices if they receive the Modbus broadcast job.

If a Modbus RTU broadcast job is sent to access a register in the drive which has no valid mapping information then Modbus broadcast job is not aborted but will just send out the broadcast message without any error in the function block. This broadcast message is ignored by drives which have no valid mapping information.

Therefore, the drive parameters in FBA DATA OUT have to be configured according to the used 'NvarWrite' input number respectively.

- Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.
- ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set. For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
The function block 'DrvModbusReadWrite23' reads and writes one or more parameters of the drive via DriveData connected to Modbus TCP / Modbus RTU communication blocks with Modbus function code FCT = 23. This function block internally calls DrvModbusWrite to execute ReadWrite job with FCT = 23, used along with the internal structure for Fct23, DrvModFct23Type.

The number of parameters to be read is specified at the input 'NvarRead'. The first address for read operation is specified at the input 'PmnNumRead'. The values of the data are stored in the PLC memory area, defined at the input 'DataRead'.

The number of parameters to be written is specified at the input 'NvarWrite'. The first address for write operation is specified at the input 'PmnNumWrite'. The values of the data that should be written must be stored in the PLC memory area, defined at the input 'DataWrite'.

To start a new ReadWrite job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the communication block DrvModbusTcp or DrvModbusRtu which is connected to the same DriveData variable. It uses the Modbus function code 23 (Read and write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

The values in the PLC memory area are updated when the ReadWrite job was performed without error. The ReadWrite job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

After termination of this job, even if it was not successful, a next ReadWrite job can once again only be started with a rising edge at 'Execute' input.

Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

---

**Note:** The image contains a large table and a diagram illustrating the variables and control hierarchy of the DrvControlModbusEng function.
The function block DrvControlModbusEng is designed for user specific control of the drive by setting the Control Word (CW) by the user itself in the program.

Therefore, the user should have a detailed knowledge of the ABB Drives Profile handling.

The reference and actual values must be given in fieldbus equivalent, e.g. range -20000 ... +20000.

Inputs RefValue1, RefValue2 and the generated Control Word are written to the DriveData variable which transfers these values to a communication function block, e.g. DrvModbusRtu, DrvModbusTcp or DrvModbusRtuBroadcast communication function block writes to the drive. In the same way ActValue1, ActValue2 and the Status Word are transferred from the communication function block to the DrvControlModbusEng block, where they are written to the outputs.

The Control Word can be generated in 2 ways.

First way is to set the single bits of the Control Word separately at the inputs Off1, Off2 ... ControlWordB15 while the input UseControlWord = FALSE.

Second way is to set the input UseControlWord = TRUE and write the Control Word as a whole word directly to the input Control Word. The generated Control Word is written to the DriveData variable and for diagnosis purpose also available at output UsedControlWord.

The input and output names of the bits in Control Word and Status Word reflect the functions used with ABB Drive Profile. So the block should be used with ABB Drives Profile setting in the drive.

---

The function block does not execute any functionality expect data transfer to and from the DriveData variable. There is no special drive parameter setting necessary to use this block.

The programmer using this block should have a detailed understanding of how to set the Control Word according to the Status Word and the description of the used drive.

For standard speed and torque control application it is recommended to use the DrvControlModbusACS instead.
The function block DrvControlCANCiA402 is used for the control of ABB ACS Drive or non-ABB drives from AC500 using CANCiA402 profile. The CANopen CiA402 function block and visualization from the library can also be used for the 3rd party drives which comply to the CANopen CiA402 profile.
Function: DrvModPara32Bit

Creates the Modbus address for 32-bit parameters of the ACSxxx drives.

To access 32-bit parameters in ACSxxx drives using Modbus a special address calculation must be performed.

This block calculates the 6-digit address out of the 5-digit address used for 16-bit parameters.

Input is the 5-digit address: GGii, where GG = parameter group and ii = the index.

E.g. Par 12.02 ➔ address = 1202.

Output is the calculated address for 32-bit parameters according to the following rule:

\[
\text{DrvModPara32Bit} = 20000 + (200 \times GG) + (2 \times ii) \quad \text{e.g. Par. 14.54 ➔ output = 22908}
\]

This output can be connected directly to the input "PrmNum" of one of the blocks DrvModbusRead or DrvModbusWrite or inputs “PrmNumRead” and “PrmNumWrite” of the block DrvModbusReadWrite23.

Structure: DrvDataType

Structure DrvDataType is used for the DriveData variable to exchange the data for one drive.

Structure DrvDataType is used for the DriveData variable which must be connected to all function blocks related to the same drive.

Besides the element “sName” all variables should not be written by the user directly. They are read and written within the function blocks. The DrvDataType contains some more internal, invisible variables which are used for internal functionality and not meant for user access.

The following table shows the visible variables of DrvDataType.

<table>

1.5.4.2.4 Limits for the data read and write between AC500 and drives

The below table defines the limits for the reading of data from the drive and limits for writing data to drives from AC500.

If fieldbus adapter Plug (FBA) is used, then parameter group FBA DATA IN (e.g. 52) and group FBA DATA OUT (e.g. 53) is accessed in the drive. For the embedded fieldbus (EFB) parameters are used in EFB group (e.g. 58).

According to the table below, limits are defined for the variables 'NVarRead', 'NVarWrite' in DrvModbusRtu and DrvModbusTcp blocks.

<table>
<thead>
<tr>
<th>Drive</th>

1.5.5 BACnet-BC System Technology

1.5.5.1 Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include ‘Who is’, ‘I am’, ‘Who has’ and ‘I have’ for device and object search and identification, “Read Property” and “Write Property” for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:

http://www.bacnet.org

http://www.bacnet.org/Bibliography
1.5.5.2 AC500 and BACnet

A BACnet device can be described by its “BACnet Interoperability Building Blocks” (BIBBs), which are needed to establish services. They are grouped in different areas:

- “Data Sharing” (DS)
- “Alarm and Event Management” (AE)
- “Scheduling” (SCHED)
- “Trending” (T)
- “Device and Network Management” (DM)

“Data Sharing” for example contains two BIBBs which are needed for the “Service Read Property”:

- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. “BACnet Simple Sensor” (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

</table>

The AC500 V2 supports BIBBs qualifying it as “BACnet Application Specific Controller” (B-ASC), by installing the BACnet B-ASC library. More details can be found in the Automation Builder online help.

AC500 V3 supports many more BIBBs qualifying it as “BACnet Building Controller” (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

- DS-COV-A, -B (Change of Value-A, -B)
- DS-COVP-A, -B (Change of Value of Properties-A, -B)
- AE-N-E-B (Alarm and Event-Notification External-B)
A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.

A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as "Analog Input" (AI) object on the MS/TP network.

AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as "Analog Value" (AV) object and as "Trend" object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects "Analog Value" and "Trend" for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.
1.5.5.3 AC500 V3 as BACnet Building Controller (B-BC)

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

1.5.5.3.1 Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS485
- BACnet IP, based on Ethernet / UDP / IP

Different networks can be combined to one common “BACnet internetwork”. The figure above shows an example of some BACnet devices in one “BACnet internetwork”. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example “BACnet internetwork” consists of different BACnet networks:

- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
  "Chapter 1.5.5.3.4.4 “Configuration of datalinks “ on page 2071"
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.
  "Chapter 1.5.5.3.4.4 “Configuration of datalinks “ on page 2071"

To form a common “BACnet internetwork” the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.
The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by “Broadcast Management Devices” (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in Chapter 1.5.5.3.4.4 “Configuration of datalinks” on page 2071.

1.5.5.3.2 Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with “ID 12”. The device contains more objects like the Analog Input object, representing the input of a temperature measurement device. An object contains several properties, like “ID, Description, Present Value, Unit” etc.

Further possible objects of an AC500 B-BC are:
- “Binary Input” for example from connected to a switch
- “Analog / Binary Output” for actuators
- “Analog / Binary Values” for local variables
- “Calendar”
- “Schedule”
- “Trend Log”
- ...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.

Fig. 24: BACnet objects, properties, services and BIBBs
1.5.5.3.3 Supported BIBBs and services

While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 24 BACnet objects, properties, services and BIBBs shows a simple "Service Read Property" which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request "Read Property", asking for the present value of the "Analog Input" of object with "ID 1010".
2. The server answers with an acknowledgment, sending the present value which is 21.89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

1.5.5.3.4 BACnet configuration in Automation Builder

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.

Following objects need to be created:

1. "BACnet Server" root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. Chapter 1.5.5.3.4.1 "Configuration of BACnet server root object" on page 2066
2. BACnet server objects, for example "BACnet Analog Input" Temperature. The properties of the objects must be controlled (written or read) by the PLC logic. Chapter 1.5.5.3.4.2 "Adding BACnet server objects" on page 2067
3. BACnet client objects, represented by a different symbol. For example, "BACnet Client Read Property". The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. Chapter 1.5.5.3.4.3 "Adding BACnet client functionality" on page 2068
4. Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the "BACnet Server" object. In the example above the IP address of ETH1 is automatically retrieved by inserting the "BACnet IP datalink" below the ETH1 port. Chapter 1.5.5.3.4.3 "Configuration of an IP datalink" on page 2072. For MS/TP refer to Chapter 1.5.5.3.4.3 "Configuration of an MS/TP datalink" on page 2072.
Configuration of BACnet server root object

1. Create an empty project with an AC500 V3 CPU type and call it for example “Device_12”.
2. Insert a “BACnet Server” object below the interfaces object in the device tree.
3. Set the device InstanceNumber in the “BACnet Parameters” of the “BACnet Server”, e.g. to 12 and the InstanceName to Device_12 (according to Fig. 24 BACnet objects, properties, services and BIBBs).
4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below ETH1. Default parameters are sufficient if only one datalink is used.

“Configuration of an IP datalink” on page 2072
5. Build the project, download to the PLC and set it to [RUN]. The status of the “BACnet Server” should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select [Show license information] from the Runtime Licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

Chapter 1.6.6.2.2.2 “PLC runtime licensing” on page 3417

6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 24 BACnet objects, properties, services and BIBBs, left part containing a temperature value.

1. Configure a “BACnet Server” root object according to Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object ” on page 2066.

2. Add a “BACnet Analog Input” object below the “BACnet Server”.
3. Rename it to **Temperature**, adjust the parameters: InstanceNumber: 1010, Description: Temperature, Units: UNIT_DEGREES_C.

4. The present value of the objects **Temperature** needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.

5. Download the program and observe the temperature value in the BACnet client.

**Adding BACnet client functionality**

Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 24 **BACnet objects, properties, services and BIBBs**, right part.
1. Add a new controller and configure a “BACnet Server” root object according to § Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object ” on page 2066.

2. Set `InstanceNumber` to 14 and `InstanceName` to Device 14.

3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a “BACnet Server”. Add a “BACnet Client Read Property” below the “BACnet Server” node.
4. The created object “BACnet Client Read Property” generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

In line 1-5 of the code part the function block is called with the following parameter:

- Device ID of the server to read from (12) % Chapter 1.5.5.3.2 “Supported objects and properties” on page 2064
- Object ID of the object to read from (1010 for the “Analog Input”)
- Object type (“Analog Input”)
- Property to read (“present value”)
- triggerRead to start the read operation

When the user (or another program part) sets the variable triggerRead from FALSE to TRUE the edge triggered function block BACnet_Client_Read_Property starts operation and sends the read request to the server device. After receiving the reply from the Server, the output .xDone gets TRUE (line 8) and the temperature value can be read from the output .result (line 14).

5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting triggerRead to TRUE. In online mode the read temperature value can be observed in line 14.

Alternative configuration

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.
There is no BACnet_Client_Read_Property object created below the “BACnet Server”. Instead a function block BACnet_Client_Read_Property must be declared in the PRG (line 6 in the declaration) and initially “connected” to its “BACnet Server” in IEC-code via RegisterToServer(), and thus get activated (line 2 in the code).

More detailed description of the function block BACnetClientReadProperty and all other client function blocks can be found in the documentation inside the “Library Manager”.

Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

﴾ Chapter 1.5.5.3.1 “Supported BACnet networks “ on page 2063

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.
Configuration of an MS/TP datalink

- Add the “BACnet MS/TP COM” object below the COM port.

In fact the empty COM port is replaced by the “BACnet MS/TP COM”. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bit.

- Below the “BACnet MS/TP COM” port object an “BACnet MS/TP datalink” is inserted automatically which can be configured according to the requirements.

- NetworkNumber: Use the default value 1 if no routing is required. For routing, use a unique network number in one controller.

- ConnectionType: Use the default value Master if no routing is required. For routing, use “Master – answering always postponed”.

- Baudrate can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.

- DatalayerAddress: This is the MAC address as described in Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063. The MAC address must be unique in the MS/TP network.

- For all other parameters the default values are recommended for typical applications.

Configuration of an IP datalink

- Add a “BACnet_IP_datalink” object below the Ethernet port ETH1 or ETH2.
- **NetworkNumber**: Use the default value if no routing is required. For routing, use a unique network number in one controller.

- **UPDport**: Use the default value (47808 decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (ETH1 or ETH2); its IP address is set in the communication settings of the CPU node, “Device_14” in the example.

- **ForeignDevice** and **BBMD**: Special configuration is only needed if an internet router is located between two BACnet devices. AC500 can be configured as ForeignDevice or BBMD, but not the combination of both. An example for BBDM can be found in the example folder.

### Configuration of Routing
Routing enables the combination of different BACnet networks to one common “BACnet internetwork”.

- Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063

BACnet devices from different BACnet networks can communicate with each other.

If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

- Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063

For MS/TP the ConnectionType must be set to “Master – answering always postponed”. An example for routing can be found in the example folder.

### Time synchronisation
The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.
Using this workaround, the following time sync mechanisms can be used:

- **Set local time from Automation Builder Tab “PLC Shell”:**
  Set the time by the command “time hh:mm:ss”

- **Read the local time from the Automation Builder Tab “Statistics”:**
  “Current PLC Date and time” shows the PLC time as local time without conversion, if the tab “Show PLC time in UTC” is enabled.

For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab “Statistics”), since this is always converting from local time to UTC time.
BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.

- If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.
  Please contact the PLC support for more information.

### 1.5.5.3.5 Package content

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
  - BACnet plug-in component
  - Device descriptions for “BACnet Server”, BACnet objects, BACnet client and datalinks
    - [Chapter 1.5.5.3.5.1 “BACnet libraries” on page 2075](#)

**Example folder**

- Example folder
  - Examples and example documentation
    - [Chapter 1.5.5.3.5.2 “Application examples” on page 2076](#)
  - Datasheet and FAQ
    BACnet Protocol Implementation Conformance Statement (PICS), acting as a datasheet, describing all BACnet objects, services and communication capabilities.
    BACnet Conformance Certificate
    FAQ – Frequently Asked Questions, including AC500 specific information, performance and limit

**BACnet libraries**

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods. The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application

Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefaultImpl library.

The BACnetDefaultImpl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
- Update of the date/time information of the device object
The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have "facade" functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- Starting and stopping the BACnet stack
  Always use `BACnetServer.StartBACnetStack` and `BACnetServer.StopBACnetStack` or `AutoStart`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetServerInit`.

- Using BACnet server objects and their properties
  Always use the specified function blocks in IEC-lib-BACnet, such as `BACnetAnalogValue`. Never directly use the corresponding functions of the BACnet library, such as `CmpBACnet.BACnetStorePropertyInstance`.

- Triggering of asynchronous requests
  Always use the specified function blocks of the BACnet library, such as `BACnetClientReadProperty`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetReadProperty`. All functions of the CmpBACnet library that require a `BACnetAsyncTransactionToken` belong to this category and should never be used directly.

- Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application
  Always use `IBACnetEventConsumer` and `BACnetServer.RegisterHook/UnregisterHook/RegisterCallback/UnregisterCallback`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetSetHook` or `CmpBACnet.BACnetSetCallback`.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as `BACnet*CbCompletion`, `BACnetIam(Ex)`, or `BACnetIHave(Ex), BACnetUnconf*`.

Most often, you will use `BACnet*CbCompletion` to implement your specific `IBACnetEventConsumer.BACnetEventCallback` functions. But first check whether or not the `BACnetDefaultImpl` library already contains an appropriate standard implementation.

Application examples

- `AC500_V3_BACnet_B-BC_Example_AB230ABxxx.project` including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as "BACnet Server", publish the analog value
  - Use case 3: AC500 as BACnet client and server
- `AC500_V3_BACnet_Routing.project`
- `AC500_V3_BACnet_Trendlog.project`
- Examples from 3S, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing
  - ...
1.5.6 PLCoen libraries

1.5.6.1 Common function block state machine

Most of the V3 function blocks follow the behavior model and style as recommended by PLC Open.

- Clear separation between “Edge triggered FBs” (“Execute”) or “Level triggered FBs” (“Enable”)
- Binary status outputs: “Done”, “Busy”, “Error” (exclusive)
- Standardized state machine
- CamelCase naming for function block and all inputs and outputs

Example: Edge_Triggered_Function_Block_EthOwnIP according to PLCopen

Currently the following “function block state machines” are used:

- “Edge Triggered” (Input “Execute”), for example EthOwnIP
- “Level Controlled” (Input “Enable”)
- “Level Controlled Continuous” (Input “Enable”, no “Done” output, for example PID)

In contrast to AC500 V2 POUs, either “Done” or “Error” is set, not both outputs at the same time in case of an error.

The state machines are explained in the following chapters.

1.5.6.1.1 Edge triggered (AbbETrig)

After a rising edge at the input “Execute” the state goes from “Dormant” to “Busy”. In the first cycle all inputs are sampled and stored.

When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”.
The states “Done” or “Error” are stable for minimum one cycle and as long as “Execute” is “TRUE”. With a falling edge of “Execute”, the state goes via Reset to “Dormant”.

Description of standard inputs and outputs:

- **“Execute”**
  A rising edge starts the operation, the output “Busy” goes to “TRUE”. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After “Done = TRUE” or “Error = TRUE” and “Execute = FALSE” all outputs will be reset.

- **“Busy”**
  Operation is running (while outputs “Done” and “Error” are “FALSE”).

- **“Done”**
  Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”.

- **“Error”**
  Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”. The output “ErrorID” gives more details about the error.

1.5.6.1.2 Level controlled (AbbLCon)

After a rising edge at the input “Enable” the state goes “Dormant” to “Busy”. All inputs are sampled and considered continuously.

When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”.

The states “Done” or “Error” are stable for minimum one cycle and as long as “Enable is TRUE”. With a falling edge of “Enable”, the state goes via Reset to “Dormant”.

The Busy state can be aborted from outside by setting the “Enable” input to “FALSE”.

After Aborting is done the state goes back to “Dormant”.

Description of standard inputs and outputs:

- **“Enable”**
  A rising edge (“Enable = TRUE”) starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously. A falling edge (“Enable = FALSE”) aborts the operation. During Aborting the Busy is still “TRUE”. Afterward all outputs are reset.

- **“Busy”**
  Operation is running (while outputs “Done” and “Error” are “FALSE”).
● “Done”
Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”).
This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.

● “Error”
Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”).
This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.
The output “ErrorID” gives more details about the error.

Level controlled continuous (AbbLConC)
This state machine is a special case of “Level Controlled”. Only difference is that this function block type is never done, for example a PID which never stops.
Therefore these function blocks have no “Done” output.

Description of standard inputs and outputs:
● “Enable”
  A rising edge (“Enable = TRUE”) starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously.
  A falling edge (“Enable = FALSE”) aborts the operation.
  During Aborting the “Busy” is still “TRUE”. Afterward all outputs are reset.
● “Busy”
  Operation is running (while output “Error is FALSE”)
● “Error”
  Operation is stopped with error (while output “Busy is FALSE”).
  This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.
  The output “ErrorID” gives more details about the error.

1.5.6.1.3 Error_ID
Each library contains an enumeration “ERROR_ID”, which is valid for this library but not across all libraries.

Only the following errors are unique:
● 16#5FFF FATAL_ERROR from state machine
● 16#4000 errors are used for input errors, same scheme like in V2:
4000hex...4FFFhex - Block Input Error

The error 4xxxhex is used in case of detected Function Block input parameter errors. The error is structured as follows:

4  X  X  X  HEX

0 = Invalid value
1 = Value too low
2 = Value too high
3 = Wrong combination of the parameters

1...FF = Number of the input
1.5.6.1.4 Compatibility with V2 function blocks

In order to ensure compatibility with V2 applications a lot of ABB function blocks are delivered together with a compatible version in classic style:

Names in CAPITAL letters, input “EN” and outputs “DONE”, “ERR” and “ERNO”:

The classic blocks internally use the PLCopen style function blocks. The inputs and outputs are mapped in the following way:

1.5.7 Motion control library

1.5.7.1 Preconditions for the use of the libraries

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the drives you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 or chapter § Chapter 1.6.2.4 “Regulations” on page 2209 in the online help.
- Read the Important user Information. See chapter § Chapter 1.6.2.1 “Safety instructions” on page 2200 in the online help.

The version 1.1.0.x of the Motion Control Library Package PS5611-Motion has been released for:

- AC500 V3 PLCs, FW version 3.3.1 or higher § Chapter 1.6 “PLC integration (hardware)” on page 2189
- AC500-eCo V3 PLCs, FW version 3.4.0 or higher § Chapter 1.6.3.3.1.1 “PM50xx” on page 2246
- Automation Builder version 2.3.x or higher
The Motion control package contains following libraries:

- ABB_MotionControl_AC500
- ABB_Ecat_CiA402_AC500 (open library available in Example folder)
- ABB_MathFunctions_AC500
- ABB_MotionControlEco_AC500 (kernel blocks for Eco V3 PLCs)

The PS5611-Motion libraries have been tested with the following product / firmware / software versions:

- CM579-ETHCAT EtherCAT Communication Module firmware 4.4.3.21 or higher
- ABB e190 Drive
- CD522 module

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product / software / firmware versions. The error-free operation of the PS5611 - Motion with other devices / software / firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

**CAUTION!**
Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The Function Blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

### 1.5.7.2 Overview

The PS5611-Motion is a Motion Control library for AC500 V3 CPUs, to create Motion Control applications based on Function Blocks according to the standard of PLCopen Motion Control in *Chapter 1.5.7.3 “PLCopen” on page 2097*. These Function Blocks can be used for PLC-based Motion Control and cover a wide range of possible Motion Control functionalities. Starting from single axis movements to master-follower axes to perform electronic gearing and CAM functions.

This documentation contains the following chapters:

- **Overview**
  - In the subsequent chapters general information are provided for a better understanding of Motion Control with AC500 PLC and PS5611-Motion. There is also a tabular overview of the available PLCopen Function Blocks and their compatibility with PLC-based Motion Control and the provided drive-based Motion Control axis implementations.

- **PLCopen**
  - The principle of the PLCopen Motion Control standard is explained as well as how PLCopen Function Blocks can be used to create PLC Motion Control application programs.

- **PLC-based Motion Control**
  - This chapter explains how PLC-based Motion Control with AC500 can be realized and how it can be used in combination with the available PLCopen Function Blocks.
1.5.7.2.1 Motion control with PS5611-Motion

With PS5611-Motion different Motion Control system structures are possible. Independent of the system structure a typical Motion Control application consists of the following system elements:

- An application program which contains PLCopen Function Blocks that defines the general application behaviour and logics.
- A profile generator which generates a position profile based on the dynamic specifications of the application program to guide the axis to the desired positions.
- A position control loop which outputs a speed reference signal to minimize the following error.

To achieve the best system structure for an application these components can be separated into different devices. Each type of structure has its own kind of interface and type of signals which need to be transferred between the interacting devices.

1.5.7.2.2 PLC-based motion control

With PS5611-Motion the application program and the profile generator are realized in the PLC. The implementation of the profile generator is based on a set of Function Blocks which are named Central Motion Control (CMC).

The profile generator of many possible axes is centrally placed inside the AC500 PLC. Therefore multiaxis motion functionalities become easily available and can be accessed by PLCopen Function Blocks. As a result, Motion Control functionalities are almost drive independent.

Available motion control functionalities:

- Simple axis Movements
- Electronic Gearin
- Electronic CAMs
- Position Profiles
- Velocity Profiles
- Acceleration Profiles

Then the output is a position reference signal which the drive will follow. A new position reference value will be calculated with every cycle of the PLC and has to be transferred to the drive, which demands real time capabilities to the PLC and to the communication channel. A real time fieldbus like EtherCAT is needed. The feedback of the actual position can be used for supervision purposes during operation and is needed to adjust the value of the position reference before the drive will be enabled.
With PLC-based Motion Control it is also possible to include the position control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory.

1.5.7.2.3 Overview of PLCopen function blocks

The following tables give an overview of the defined Function Blocks, divided into administrative (not driving motion) and motion related sets. They give an overview which Function Block could be used for the different possible configurations.

These Function Blocks are part of the library ABB_MotionControl_AC500.library.

If there are restrictions concerning a certain drive ("XXX") which lead to a different or limited behaviour compared to the standard the respective chapter is supplemented with an additional paragraph "Notes for XXX".

The “KERNEL” Function Blocks are available in two variants.

The OBIO_PTOMotionKernel or OBIO_PWMMotionKernel function blocks (part of AC500_MotionControlEco) are solely to be used in AC500-eCo V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs.

For details of the limitations of PTO and PWM in eCo V3 PLCs, refer to Chapter 1.6.3.3.1.1.7.3 “Electrical connection” on page 2259

The CMC_Basic_Kernel block is designed to be used in standard V3 PLCs, and can either work with drives connected to a fieldbus or IOs.

### 1.5.7.2.4 Overview of libraries

- Add the following libraries for the listed applications.
- In some cases by adding a library, there will be other libraries added automatically.

<table>
<thead>
<tr>
<th>Application</th>
<th>Library to be added manually</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLC-based motion control</td>
<td>ABB_MotionControl_AC500 compiled-library</td>
</tr>
<tr>
<td></td>
<td>ABB_MathFunctions_AC500 compiled-library</td>
</tr>
<tr>
<td>PLC-based motion control, optional for EtherCAT</td>
<td>ABB_Ecat_CiA402_AC500 library</td>
</tr>
<tr>
<td>Motion control with eCo V3 (OBIO_PTOMotionKernel &amp; OBIO_PWMMotionKernel)</td>
<td>ABB_MotionControlEco_AC500.library</td>
</tr>
</tbody>
</table>

The features of the Function Blocks provided with PS5611-Motion can be used from the PLC program according to PLCopen standard. Different drives and different Motion Control realizations could be used and can be combined with each other as well as different fieldbuses. ABB_Ecat_CiA402_AC500.library is editable and can be adapted based on the drive configuration and drive type.

### 1.5.7.2.5 Overview of data types

The following data types are used for the Motion Control library. The data types are defined in the library file ABB_MotionControl_AC500 compiled-library. The corresponding elements can be used for the Function Blocks inputs.

### 1.5.7.2.6 Naming of function blocks and data structures

**PLCopen**

All Function Blocks named `MC_xxx` are implemented according to PLCopen definition and follow the PLCopen documentation. They may have additional inputs but according to PLCopen rules.

All Function Blocks named `MCA_xxx` are implemented corresponding to PLCopen rules with adaptations specific to AC500. They are AC500 specific extensions to the PLCopen library.

**PLC-based motion control**

All Function Blocks named `CMC_xxx` belong to the implementation of PLC-based Motion Control.

All data types named `CMC_xxx` belong to the implementation of PLC-based Motion Control.
All function blocks and data types named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation.

All function blocks and data types named MCA_xxx are implemented based on PLCopen definition with customized features for ABB specific functionalities.

All data types named AXIS_xxx exist according to PLCopen definition. The content is ABB specific and not documented.

All Function Blocks named zCMC_xxx belong to the implementation of PLC-based Motion Control. These are not documented and not intended for customer use.

All function blocks and data types named OBIO_xxx in the ABB_MotionControlEco_AC500 library are intended for use with AC500-eCo V3 PLCs only.

All Function Blocks named xxx_APP are not write protected and may be modified for adaptations.

Editable library is available in the Example folder.

### 1.5.7.3 PLCopen

Based on application requirements and project specifications engineers are required to use or select a wide range of Motion Control hardware. In the past this required unique software to be created for each application even though the functions are the same. PLCopen motion standard provide a way to have standard application libraries that are reusable for multiple hardware platforms. This lowers development, maintenance and support costs while eliminating confusion. In addition, engineering becomes easier, training costs decrease, and the software is reusable across platforms. Effectively, this standardization is done by defining libraries of reusable components. In this way the programming is less hardware dependent, the reusability of the application software increased, the cost involved in training and support reduced, and the application becomes scalable across different control solutions. Due to the data hiding and encapsulation, it is usable on different architectures, for instance ranging from centralized to distributed or integrated to networked control. It is not specifically designed for one application, but will serve as a basic layer for ongoing definitions in different areas. As such it is open to existing and future technologies.

ABB is a member of the PLCopen organization. More Information about PLCopen can be read on the [PLCopen website](#).

![PLCopen Motion Control logo](#)
Function Blocks according to PLCopen are designed for controlling axes via the language elements consistent with those defined in the IEC 61131-3 standard. It was decided by the task force that it would not be practical to encapsulate all the aspects of one axis into only one Function Block. The retained solution is to provide a set of command-oriented Function Blocks that have a reference to the axis, e.g. the abstract data type Axis, which offers flexibility, ease of use and reusability.

Implementations based on IEC 61131-3 (for instance via Function Blocks and SFC) will be focused towards the interface (look-and-feel/proxy) of the Function Blocks. This specification does not define the internal operation of the Function Blocks.

PLCopen Motion Control Function Blocks can be used in any IEC 61131-3 programming language. The following picture shows an example of a Function Block used in Function Block Diagram (FBD) language.

![Function Block Diagram](image)

Fig. 29: Command for absolute positioning according to PLCopen standard

Application programs which use the manufacturer independent function blocks according to PLCopen will lead to the following advantages:

- Reusable software structure for different platforms.
- Programming based on Function Blocks.
- Function Blocks can be used in any IEC 61131-3 language.

All function blocks which are defined by PLCopen will have the following qualities independently to the manufacturer of the motion control system:

- Same inputs/outputs
- Same functional behaviour
- Same name

The following parts of the PLCopen motion control definition are completely or partly included in this product:

- Part 1: Function Blocks for Motion Control
- Part 2: Extensions
- Part 3: User Guidelines
- Part 4: Homing Procedures

1.5.7.3.1 Programming guidelines

This chapter explains some rules on the usage of the libraries and the structure Axis_Ref.

- In general, the kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.

- If Axis_Ref is used as input on a user defined Function Block or program or function, always use it as VAR_IN_OUT and never use it as VAR_INPUT or VAR_OUTPUT. The reason is that this would
  - Break the consistency and destroy data.
  - Consume a lot of computing power by copying data.
● Any instance of a Function Block should be called only once per cycle and in only one specific task.
   If the instance is used in several tasks, it has to be checked that is not called several times. Because this could corrupt the handshake from Function Block to Axis_Ref to CMC_Basic_Kernel and vice versa.
● Some PLCopen Function Blocks are only allowed to be called within the same task as the CMC_Basic_Kernel Function Block. This is mentioned in the Function Block descriptions.
● If PLCopen Function Blocks are called from a different task, the cycle time should be at least 2 times the cycle time for CMC_Basic_Kernel Function Block.

Axis data type Axis_Ref

The Axis_Ref is a structure that contains information on the corresponding axis. It is used as a VAR_IN_OUT in all Motion Control Function Blocks defined in this document. The content of this structure is implementation dependent and can ultimately be empty. If there are elements in this structure, the supplier shall support the access to them, but this is outside of the scope of this document. The refresh rate of this structure is also implementation dependent. According to IEC 61131-3 it is allowed to switch the Axis_Ref for an active Function Block, for instance from Axis1 to Axis2. However, the behaviour of this can vary across different platforms, and is not encouraged to do.

Axis_Ref data type declaration:

```plaintext
TYPE Axis_Ref : STRUCT
(Content is implementation dependent)
END_STRUCT
```

Example:

```plaintext
TYPE Axis_Ref : STRUCT
AxisNo: UINT; AxisName: STRING (255);
....... 
END_STRUCT
```

1.5.7.3.2 The single axis state diagram

The following diagram normatively defines the behaviour of the axis at a high level when multiple motion control Function Blocks are simultaneously activated. This combination of motion profiles is useful in building a more complicated profile or to handle exceptions within a program. (In real implementations there may be additional states at a lower level defined). The basic rule is that motion commands are always taken sequentially, even if the PLC had the capability of real parallel processing. These commands act on the axis' state diagram.

The axis is always in one of the defined states (see diagram below). Any motion command that causes a transition changes the state of the axis and, as a consequence, modifies the way the current motion is computed. The single axis state diagram is an abstraction layer of what the real state of the axis is, comparable to the image of the I/O points within a cyclic (PLC) program. A change of state is reflected immediately when issuing the corresponding motion command.

The response time of immediately is system dependent, coupled to the state of the axis, or an abstraction layer in the software.
The diagram is focused on a single axis. The multiple axis Function Blocks, MC_CamIn, MC_GearIn and MC_Phasing, can be looked at, from a single axis state diagram point of view, as multiple single-axes all in specific states. For instance, the CAM-master can be in the state Continuous Motion. The corresponding slave is in the state Synchronized Motion. Connecting a slave axis to a master axis has no influence on the master axis.

The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the Function Blocks. The axis feedback is operational. If the MC_Power Function Block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.

Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating Function Block controls an axis, while the MC_Power Function Block with Enable=FALSE is called, the motion generating Function Block is aborted (CommandAborted).

The intention of the state ErrorStop is that the axis goes to a stop, if possible. There are no further inputs from Function Blocks accepted until a reset has been done from the ErrorStop state.

The transition Error refers to errors from the axis and axis control, and not from the Function Block instances. These axis errors may also be reflected in the output of the Function Blocks' instances errors.

Issuing MC_Home in any other state than StandStill will go to ErrorStop, even if MC_Home is issued from the state Homing itself.

Function Blocks which are not listed in the single axis state diagram do not affect the state of the axis, meaning that whenever they are called the state does not change. They are:

MC_ReadStatus; MC_ReadAxisError; MC_ReadParameter; MC_ReadBoolParameter;
MC_WriteParameter; MC_WriteBoolParameter; MC_ReadActualPosition and MC_CamTable-Select.

Calling the Function Block MC_Stop in state StandStill changes the state to Stopping and back to Standstill when Execute = FALSE. The state Stopping is kept as long as the input Execute is TRUE. The output Done is set when the stop ramp is finished.
1. In this state ErrorStop or Stopping, all Function Blocks can be called, although they will not be executed, except MC_Reset and Error – they will generate the transition to StandStill or ErrorStop respectively.

2. Power.Enable = TRUE and there is an error in the Axis.

3. Power.Enable = TRUE and there is no error in the Axis.

1.5.7.3 Visualizations

For usage with the PLCopen Library, a set of visualization objects is defined. These visualizations use the placeholder concept, which means that they could be used in an actual visualization several times and be instantiated by replacing the “placeholder” with an effective data-structure.

Two types of visualizations exist:

- As placeholder, an instance of Axis_Ref should be used. These are named: MC_VISU_Axis_name. Here the name could be statemachine or its actual.
- As placeholder, an instance of the respective PLCopen Function Block should be used. These visualizations are named MC_VISU_FB_name where "name" could be MoveAbsolute or MoveVelocity, so the complete element is named MC_VISU_FB_MoveAbsolute or MC_VISU_FB_MoveVelocity.

The background colour and the colour for the title of each element could be changed. The colours are defined in some global predefined variables in MC_VISU_COLOR_INFORMATION. By changing these values, different colours will be used.

**MC_VISU_COLOR_INFORMATION (GVL)**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC_VISU_BACKGROUND_COLOR</td>
<td>DWORD</td>
<td>16#FF888888</td>
<td>16#FFRRGGBB (&quot;Color combination for the Grey color&quot;)</td>
</tr>
<tr>
<td>MC_VISU_TITLE_COLOR</td>
<td>DWORD</td>
<td>16#FFFFFF80</td>
<td>16#FFRRGGBB (&quot;Color combination for yellow&quot;)</td>
</tr>
</tbody>
</table>

Below, some existing visualizations are shown.

**MC_VISU_AxisStateMachine**

This shows the statemachine of the axis according to PLCopen definition. The active state is shown green except the ErrorStop which is shown red. Usually, it starts with Disabled. When no remote connection to the drive is available, it will switch to ErrorStop immediately.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

**MC_VISU_Axis_actual**

This object shows some actual values.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.
This object shows the error information connected to the PLCopen Function Blocks. This is NOT a drive error. If no error occurs in the execution of a Function Block, just the name is shown. If an error occurred, it shows the name of the Function Block as well as the error number and a short description. In the example below, the MC_Power Function Block recognized that no fieldbus connection to the drive was available.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

### 1.5.7.3.4 Error codes

Besides the diagnosis information of the drive which is described in the respective drive documentation, there are a number of error codes directly related to the Function Blocks. These error codes are displayed at the output “ErrorID” of the Function Block.

<table>
<thead>

</tr>
</tbody>
</table>
1.5.7.3.5 Error handling

All access to the drive/motion control is via Function Blocks. Internally these Function Blocks provide basic error checking on the input data. Exactly, how this is done is implementation dependent. For instance, if MaxVelocity is set to 6000, and the Velocity input to a Function Block is set to 10,000, a basic error report is generated. In the case where an intelligent drive is coupled via a network to the system, the MaxVelocity parameter is probably stored on the drive. The Function Block must take care of the errors generated by the drive internally. With another implementation, the MaxVelocity value could be stored locally. In this case the Function Block will generate the error locally.

Both centralized and decentralized error handling methods are possible when using the motion control Function Blocks.

Centralized error handling is used to simplify programming of the Function Block. Error reaction is the same independent of the instance in which the error has occurred.

Decentralized error handling gives the possibility of different reactions depending on the Function Block in which an error occurred.

Fig. 31: Function Blocks with centralized error handling
Fig. 32: Function Blocks with decentralized error handling

### 1.5.7.3.6 PLCopen parameter

Additional parameters are available by ReadParameter and WriteParameter Function Blocks.

Following function blocks can be used for the read and write operation. Functionality of these blocks and its variables are explained in the integrated documentation:

- `MC_ReadParameter`
- `MC_WriteParameter`
- `MC_ReadBoolParameter`
- `MC_WriteBoolParameter`

1.5.7.3.8 General restrictions

Restrictions for the available function blocks

- As buffered mode, MC_Aborting is realized as a default. This does NOT mean that the axis stops when another movement is started while an ongoing movement is still active. It means instead that the new movement will take control immediately and change the velocity to its own velocity by using its own acceleration or deceleration.
- The buffered mode MC_Buffered could be reached with using the axis state StandStill as enable signal for the Execute of the next block.
- From the Extended Inputs and Outputs at the Function Blocks, the following are not realized:
  - BufferedMode: The realization just supports the MC_Aborting mode.
  - The following Outputs at ReadStatus are not supported: ConstantVelocity, Accelerating and Decelerating.
  - TorqueLimit for Homing Function Blocks.
The diagram shows the behavior with BufferMode MC_Aborting, which is the only available BufferMode. When the second Block is activated, it will take control and will continue on its own velocity. The velocity is changed by using the acceleration value from the second Function Block. The movement will not be stopped in between. The first Function Block shows CommandAborted when the second Function Block is activated.

A behavior according to BufferMode MC_Buffered could be reached by using the Done output from the first Function Block to enable the Execute of the second Function Block.

### 1.5.7.3.9 Behaviour of the function block inputs and outputs

#### General rules

<table>
<thead>
<tr>
<th>Table 381: General rules</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output exclusivity</strong></td>
</tr>
<tr>
<td><strong>Output status</strong></td>
</tr>
<tr>
<td><strong>Input parameters</strong></td>

<tr>
<td><strong>Missing input parameters</strong></td>
</tr>
<tr>
<td><strong>Position versus distance</strong></td>
</tr>
<tr>
<td><strong>Sign rules</strong></td>
</tr>
<tr>
<td><strong>Error Handling Behavior</strong></td>
</tr>
</tbody>
</table>
The outputs Done, InVelocity, InGear, and InSync mean successful completion so these signals are logically exclusive to Error.

Types of errors:
- Function Blocks (e.g. parameters out of range, state machine violation attempted),
- Communication,
- Drive Instance errors do not always result in an axis error (bringing the axis to StandStill). The error outputs of the relevant Function Block are reset with falling edge of Execute.

<table>
<thead>
<tr>
<th>Function Block Naming</th>
<th>In case of multiple libraries within one system (to support multiple drive/ motion control systems), the Function Block naming may be changed to MC_FunctionBlockName_SupplierID.</th>
</tr>
</thead>
</table>
| Behaviour of Done output | The outputs Done, InGear, InSync... are set when the commanded action has been completed successfully. With multiple Function Blocks working on the same axis in a sequence, the following applies:
When one movement on an axis is interrupted with another movement on the same axis without having reached the final goal, Done of the first Function Block will not be set. |
| Behaviour of CommandAborted output | CommandAborted is set, when a commanded motion is interrupted by another motion command. The reset-behavior of CommandAborted is like that of Done. When CommandAborted occurs, the other output-signals such as InVelocity are reset. |
| Inputs exceeding application limits | If a Function Block is commanded with parameters which result in a violation of application limits, the instance of the Function Block generates an error. The consequences of this error for the axis are application specific and thus should be handled by the application program. |
| Behaviour of Busy output | Every Function Block can have an output Busy, reflecting that the Function Block is not finished. Busy is SET at the rising edge of Execute and RESET when one of the outputs Done, Aborted, or Error is set. It is recommended that this Function Block should be kept in the active loop of the application program for at least as long as Busy is true, because the outputs may still change. For one axis, several Function Blocks might be busy, but only one can be active at a time.
Exceptions are MC_SuperImposed and MC_Phasing, where more than one Function Block related to one axis can be active. |
| Output Active | The output Active is required on buffered Function Blocks. This output is set at the moment the Function Block takes control of the motion of the according axis. For un-buffered mode the outputs Active and Busy can have the same value. |
| Enable and Valid/Status | The input Enable is coupled to output Valid. Enable is level sensitive, and Valid shows that a valid set of outputs is available at the Function Block. The output Valid is TRUE as long as an output value of Valid is available and the input Enable is TRUE. The relevant output value can be refreshed as long as the input Enable is TRUE. If there is a Function Block error, the output is not Valid (Valid set to FALSE). When the error condition disappears, the values will reappear and output Valid will be set again. |
Why is the command input edge sensitive?

The input Execute for the different Function Blocks described in this document always triggers the function with its rising edge. The reason for this is that with edge triggered Execute new input values may be commanded during execution of a previous command. The advantage of this method is a precise management of the instant a motion command is performed. Combining different Function Blocks is then easier in both centralized and decentralized models of axis management. The output Done can be used to trigger the next part of the movement. The example given below is intended to explain the behavior of the Function Block execution.

The following figure illustrates the sequence of three Function Blocks First, Second and Third controlling the same axis. These three Function Blocks could be for instance various absolute or relative move commands. When First is completed the motion its rising output First.Done triggers Second.Execute. The output Second.Done AND In13 triggers the Third.Execute.
Like described in the previous chapter, the input Execute triggers a new movement. With a rising edge of this input the values of the other Function Block inputs are defining the movement. Until version 1.1 of PLCopen there was the general rule that a later change in these input parameters does not affect the ongoing motion.

Nevertheless, there are numerous application examples, where a continuous change of the parameters is needed. The user could retrigger the input Execute of the Function Block, but this complicated the application.

Therefore, the input ContinuousUpdate has been introduced. It is an extended input to all applicable Function Blocks. If it is TRUE, when the Function Block is triggered (rising Execute), it will - as long as it stays TRUE – make the Function Block use the current values of the input variables and apply it to the ongoing movement. This does not influence the general behavior of the Function Block nor does it impact the single axis state diagram. In other words it only influences the ongoing movement and its impact ends as soon as the Function Block is no longer Busy or the input ContinuousUpdate is set to FALSE.
It can be that certain inputs like BufferMode are not really intended to change every cycle. However, this has to be dealt with in the application, and is not forbidden in the specification.

If ContinuousUpdate is FALSE with the rising edge of the input Execute, a change in the input parameters is ignored during the whole movement and the original behavior of previous versions is applicable. The ContinuousUpdate is not a retriggering of the input Execute of the Function Block. A retriggering of a Function Block which was previously aborted, stopped, or completed, would regain control on the axis and modify its single axis state diagram. Opposite to this, the ContinuousUpdate only effects an ongoing movement. Also, a ContinuousUpdate of relative inputs (e.g. Distance in MC_MoveRelative) always refers to the initial condition (at rising edge of Execute).

Example

- MC_MoveContinuousRelative is started at Position 0 with Distance 100, Velocity 10 and ContinuousUpdate set TRUE. Execute is Set and so the movement is started to position 100.
- While the movement is executed (let the drive be at position 50), the input Distance is changed to 130, Velocity 20.
- The axis will accelerate (to the new Velocity 20) and stop at Position 130 and set the output Done and does not accept any new values.

1.5.7.10 Unit of length

The only specification for physical quantities is made on the unit of length (noted as \([\text{u}]\)) that is to be coherent with its derivatives i.e. (velocity \([\text{u/s}]\); acceleration \([\text{u/s}^2]\); jerk \([\text{u/s}^3]\)). Nevertheless, the unit \([\text{u}]\) is not specified (manufacturer dependent). Only its relations with others are specified.

1.5.7.11 Aborting versus buffered modes

Some of the Function Blocks have an input called BufferMode. With this input, the Function Block can either work in a Non-buffered mode (default behavior) or in a Buffered mode. The difference between those modes is when they should start their action:

- A command in a non-buffered mode acts immediately, even if this interrupts another motion,
- A command in a buffered mode waits till the current Function Block sets its output Done (or InPosition, InVelocity...).
- The library just supports the mode "aborting" (MCAborting)

The following examples describe the different behavior of these modes:
Example 1:
Standard behaviour of two following absolute movements

Fig. 35: Basic example with two MC_MoveAbsolute on same axis
Fig. 36: Timing diagram for example above without interference between Function Block 1 and Function Block 2
Example 2: Aborting motion

Libraries and solutions > Motion control library
Fig. 37: Timing diagram for example above with Function Block 2 interrupting Function Block 1 (McAborting Mode)
If an on-going motion is aborted by another movement, it can occur that the braking distance is not sufficient due to deceleration limits.

In rotary axis, a modulo can be added. A modulo axis could go to the earliest repetition of the absolute position specified, in cases where the axis should not change direction and reverse to attain the target position.

In linear systems, the resulting overshoot can be resolved by reversing, as each position is unique and therefore there is no need to add a modulo to reach the correct position.
The following figure shows an example where the Function Block (MC_MoveVelocity) is used to control AxisX with three different values of Velocity. In a Sequential Function Chart (SFC) the velocity 10, 20, and 0 is assigned to V. To trigger the input Execute with a rising edge the variable E is stepwise set and reset.

**Example: A function block instance controls different motions of an axis**

```
K = true
V := 10; E := TRUE;
InVelocity = TRUE
E := FALSE;
L = TRUE
V := 20; E := TRUE;
InVelocity = TRUE
E := FALSE;
M = TRUE
V := 0; E := TRUE;
InVelocity = TRUE
E := FALSE;
```

```
MC_MoveVelocity

Axis X
E
Execute
InVelocity
Y

V
Velocity

K, L, M are Boolean Variables
```

*Fig. 38: Single Function Block with SFC*

The following timing diagram explains how it works:
Fig. 39: Timing diagram for a usage of single Function Block

The second InVelocity is set for only one cycle because the Execute has gone low before the ActualVelocity equals CommandedVelocity.
Different instances related to the same axis can control the motions on an axis. Each instance will then be responsible for one part of the global profile.

**Example: Different function blocks instances control the motions of an axis**

**Fig. 40: Cascaded Function Blocks**

The timing diagram:
Fig. 41: Cascaded Function Blocks timing diagram

A corresponding solution written in LD looks like:

Fig. 42: Cascaded Function Blocks with LD
1.5.7.4 PLC-based motion control

1.5.7.4.1 PLC-based motion control architecture

With the Function Blocks of motion library a Motion Control profiler can be used inside the PLC. As shown in the following figure it is needed to provide the actual position of the drive. The output can be either a position or a velocity reference signal. The used output signal will then be used to move the axis in the desired way.

There are 2 possibilities to send a reference value to the drive:

- When the position control loop is closed by the PLC by a CMC_Basic_Kernel Function Block, the output Speed_Reference should be connected to the drive. The value of Speed_Reference can be scaled with the axis parameters Max_Rpm and Ref_Max.
- When the position control loop is closed by the drive, the output Position_Reference should be connected to the drive. The unit for the output Position_Reference is incremented as well as the input Drive_ActualPosition.

In general the programming of a machine consists of two layers as shown in the figure above. In the application layer Function Blocks according to PLCopen Motion Control are used to program the application sequences with all necessary types of movements and administrational commands. Due to the standard PLCopen Motion Control this can be reused in any other machine programs that used PLCopen Function Blocks.
The axis implementation layer is responsible for the execution of the commands from the application layer and can be programmed for each axis in a different way depending on the used hardware components.

**Table 382: Needed function blocks for an application with PLC-based Motion Control**

In case the velocity reference value is used from the kernel Function Block the position control loop is closed inside the drive. In this case, it is necessary to adjust the related parameters from the parameters Function Block. When the position reference will be used the position control loop is closed inside the drive. In this case, the internal control loop is just used to monitor the position and velocity.

When the position reference is used for the drive the following aspects have to be taken care of:

- It is necessary to use a real time fieldbus, like EtherCAT.
- The PLC cycle has to be synchronized to the fieldbus cycle.
- The task calculation times may not exceed the used cycle time.

The drive’s status should be managed by a specialized Function Block that supports the used type of drive as shown in the figure above. The kernel Function Block is the main Function Block which is needed to operate an axis with PLC-based Motion Control. It must be used with the parameter Function Block which is the interface to input parameters which are used to setup the axis.
The drive has to be accessed outside the CMC_Basic_Kernel Function Block. Actual values and reference values might be transferred by a synchronized fieldbus or by I/Os. The Function Block CMC_Basic_Kernel has to be called every cycle and at least once before any Function Block MC or MCA is activated.

The following figure shows an example with an axis simulation. The main data signals are drawn in bold lines. Here, the drive will receive a speed reference signal which means that the position control loop is closed inside the PLC by the Central Motion Function Blocks. The time behaviour of the simulated drive can be set by the parameter T1 at the axis simulation Function Block. If the time constant is too slow and the axis parameter Control_Time is too short the simulation axis will run into instability – like a real drive. Sample values: § Chapter 1.5.7.4.2.3 “How to use the axis simulation” on page 2133

A different option to create a virtual or simulated axis is to engage the Enable_Virtual input at CMC_Basic_Kernel. This virtual axis will follow the speed reference without additional delay, whereas the CMC_Axis_Simu creates a first order delay.
The following figure shows an example with a CiA402 drive on an EtherCAT network. The main data signals are drawn in bold lines. Here, the drive will receive a position reference signal which means that the position control loop is closed inside the drive.

In this example the main signals are to be transferred via EtherCAT network. The drive control Function Block for the Microflex e190 can be found in the ABB_Ecat_CiA402_AC500.library.

If using the eCo V3 PLCs, use the OBIO_PTMotionKernel function block (separate library ABB_MotionControlEco_AC500.library) instead of CMC_Basic_Kernel for the PTO functionality.

In the eCo V3 PLC, if PWM is used in the configuration, use the kernel function block OBIO_PWMMotionKernel function block instead of CMC_Basic_Kernel function block.
Kernel function block

Kernel Arithmetic

The "KERNEL" Function Blocks are available in two variants.

The OBIO_PTOMotionKernel / OBIO_PWMMotionKernel function blocks are solely to be used in eCo V3 CPUs and to make use of the integrated stepper-iO. It connects automatically to the internal IOs. Use the PTO or PWM specific kernel block based on your configuration \ Chapter 1.6.3.3.1.1.7.2 “Functionality” on page 2257.

The CMC_Basic_Kernel block is designed to be used in any V3 PLCs and can either work with drives connected to a fieldbus or IOs.

How does the parameter for jerk influence the axis movements

![Velocity reference with different jerk values](image)

The diagram shows the result with different jerk values and the same velocity and acceleration.

The time needed for acceleration with jerk=0 is:

Time1=velocity/acceleration=(20/100)s=0.2s

The additional time with jerk=500 will be:

Time2=acceleration/jerk=(500/100)s = 5s

So the total time is:

Time=Time1 + Time2=0.2s + 5s=5.2s

In the last example with jerk=100, the velocity and acceleration values are not reached.
15.7.4.2 Basic functionalities

How to connect a drive

The connection to a drive must be done with the inputs and outputs of the Function Block CMC_Basic_Kernel. All inputs and outputs of the kernel Function Block with the prefix “Drive_” are intended to be used with a drive, but in some cases not all of them are needed. In all cases the input Drive_ActualPosition has to be connected with the actual position of the axis. This value can be received by an IO module of the PLC or via a fieldbus.

Depending on which device closes the position control loop either the output Speed_Reference or Position_Reference output has to be used. The value of Speed_Reference can be connected to an analog output module or be transferred via a fieldbus. The value of Position_Reference should be exclusively sent via a real-time fieldbus like EtherCAT.

Example 1: Analog drive - Motor with incremental encoder

In this example the position control loop will be closed by the PLC, therefore the input Drive_ActualPosition and the output Speed_Reference are to be used.

In combination with the IO module CD522 and the corresponding Function Block CD522Encoder32Bit the position of the encoder can be used. For the effective resolution of the encoder parameter Inc_Per_R of the parameter Function Block has to be used.

The output Speed_Reference can be written directly to the global variable of an output channel of an analog module but can also be transferred via a fieldbus. The scaling of this output value can be done with the parameters Ref_Max and Max_Rpm of the Function Block CMC_Axis_Control_Parameter_Real.

The scaling of the Speed_Reference value can be set with the inputs Ref_Max and Max_Rpm of the parameter Function Block.

In order to finish a homing sequence which is done by the Function Block MC_StepRefPulse the outputs Drive_Set_Ref and Drive_Set_Position from the kernel Function Block have to be connected with the inputs EN_RPI and START_VALUE of the CD552 IO module Function Block. Also the output RdyRpi of the CD552 IO module Function Block has to be connected with Drive_Ref_Ok from the kernel Function Block.

To enable and disable the drive Drive_Release could be connected to a binary output to activate the drive. Drive_InOperation could be connected to a binary input to get the information that Drive_Release was successful.
Example 2: Servo Drive - Microflex e190 via EtherCAT in continuous positioning mode (csp)

In this example the position control loop will be closed by the drive, therefore the input Drive_ActualPosition and the output Position_Reference are to be used. The inputs referring to the position control loop of the parameter Function Block do not have to be set.

For the effective resolution of the motor’s encoder parameter Inc_Per_R of the parameter Function Block has to be adjusted.

To enable and disable the drive Drive_Release and Drive_Inoperation have to be connected to the control Function Block ECAT_CiA402_Control_App of the library ABB_Ecat_CiA402_AC500.library, which controls the status and control word of the drive.

All Function Blocks from this library are not password protected and free to be changed in order to be adapted for different drives. The library and the Function Blocks are marked with the ending _APP.

How to enable and disable a drive

In order to enable a drive the Function Block MC_Power has to be used within the applicational layer. The kernel Function Block will then, if possible, output a rising edge on the output Drive_Release which can be connected to the drive-control Function Block which performs the needed actions on the drives control word to enable the drive. As soon the drive states enabled, this signal can be connected to the input Drive_InOperation of the kernel Function Block. The axis state according to the single axis state diagram of PLCopen will then switch from Disabled to Standstill.

**Fig. 45: Enabling sequence of a drive**
As long as the drive is in state Disabled or ErrorStop the input Drive_Actual_Position will be copied to the output Position_Reference of the kernel Function Block. The output Speed_Reference will be zero.

When the axis is in operation, which means it is not in state Disabled or ErrorStop, then the output Position_Reference will be calculated by the kernel Function Block and the position control loop will be closed, which outputs non-zero value for the output Speed_Reference in case of a following error. The input Actual_Position should then follow the position reference. The difference of both values is the following error and will be supervised by the kernel Function Block.

In case of drive problem, Drive_InOperation should be reset. The Function Block will open the position control loop and Speed_Reference will be set to zero.

For the most drives the status is control by the drives control word whereas the drives status word represents its actual status. In order to enable the drive it might be necessary to pass through several drives states according a defined scheme which depends on the used drive. Therefore the library ABB_Ecat_Cia402_AC500.library is added to PS5611-Motion package which contains Function Blocks to operate with different drives on an EtherCAT network. There is also the PS5605-DRIVES library package which can be used to control the state of other ABB drives and other protocols.

How to use the axis simulation

It is possible to use a simulated axis instead of a real drive.

The axis simulation can be used in the following use cases:

- When the real drive is not available the simulation can be used to test all available motion functionalities to verify the application program.
- The simulation can be used to create a virtual master axis and synchronize other axes to it.

The simulation is realized by the Function Block CMC_Axis_Simu or input Enable_Virtual = TRUE can be used at the KERNEL-block.

Homing will be possible if the limit-switches (data type CMC_Axis_IO) are simulated also. This is not done by CMC_Axis_Simu but could be realized in the PLC program.

![Fig. 46: Example for Simulation](image)

The drive velocity is simulated by PT1-Characteristic. The input T1 gives the time constant for this PT1 as multiple of the cycle time. All other properties are simulated according to the CMC_Axis_Control_Parameter.
The value of the time behaviour from the axis simulation Function Block set by the input \( T1 \) has to be at least four times smaller than the value of the axis parameter \( \text{Control\_Time} \) from the parameter Function Block. If \( \text{Enable\_Virtual} = \text{TRUE} \) is used, no delay will be applied to the simulated drive speed, and it will not be possible to test the position-control loop, but it will be fine to be used as virtual axis.

How to perform a homing

The homing of an axis is a procedure which consists of up to two phases. For each phase there are different Function Blocks available. The available Function Blocks are according to PLCopen and belong to the application layer. Available Function Blocks for each phase are listed in the table below.

<table>
<thead>
<tr>
<th>Phase 1</th>
<th>Phase 2/Finish Homing</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC_StepAbsSwitch</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepDirect</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepLimitSwitch</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepRefPulse</td>
<td>X</td>
</tr>
</tbody>
</table>

In order to create a complete homing sequence one Function Block of each phase can be used.

First phase

The used Function Blocks will change the axis state to Homing and will move the axis to approach installed limit switches or a dedicated absolute switch in the desired directions. No manipulation of a position value will be done in this phase. The use of Function Blocks of this phase is optional for a homing.

The signals of the installed limit switches have to be written to a variable of the data type CMC_Axis_IO.

Second phase

Function Blocks from this phase will also change the axis state to Homing if this has not already happen and will finish the homing. Therefore a new position will be set to the axis. The axis state will then switch back to Standstill.

The use of a Function Block of the second phase is mandatory for a homing.

In general with AC500 PLC-based Motion Control there are two position values: One position value will represent the encoder counts of a drive or the CD522 module which is connected to the input \( \text{Drive\_ActualPosition} \) of the kernel Function Block. The other position is a user defined scaled unit which is used for PLCopen Function Blocks.

There are different ways to finish the homing by manipulate and adjust a position value. Which value should be manipulated depends on the used drive or module and its capabilities. See the following types A, B and C.

Type A

The user defined position unit will be changed only. The Function Block MC_StepDirect must be used here. This type of homing is less complex than the other types but also less precise.
Type B

The Drive or the CD522 module will change its own position value, the encoder counts.

Fig. 47: Homing Type A

Fig. 48: Homing Type B

The process will be started by the execution of the Function Block MC_StepRefPulse. The axis will start to move. The output Drive_Set_Ref of the kernel Function Block will then set the drive to sense for a digital signal. At the same time the kernel Function Block outputs a preset value which will replace the actual encoder count value at the moment the digital signal occurs. This signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In the same cycle when the new position value is set there also has to be a boolean signal stating a new position value at the input Drive_Ref_Ok of the kernel Function Block. The user defined position value will then be shifted accordingly.
Type C

The encoder count position value will not be changed but involves registration capabilities of a drive or the CD522 module.

![Diagram of Homing Type C]

**Fig. 49: Homing Type C**

The process will be started by the execution of the Function Block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library).

The axis will start to move.

The output Drive_Set_Ref of the kernel Function Block will then command the drive or the CD522 module to activate the Touch Probe functionality. This will configure the drive to latch a position at the moment a digital signal occurs. The digital signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In combination with the latched position value there is a boolean signal which states that a new latch value has been received. In case of the module CD522 this encoder count position value has to be converted from encoder counts to equivalent user scaled units by the use of the function “CMC_Get_Units_From_Inc” (ABB_MotionControl_AC500.library) before it can be connected to the Function Block ECAT_HomingOnTouchProbe_APP.

To manage the Touch Probe objects of a drive within the CiA402 profile (e.g. Microflex e190) the Function Block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library) can be used. This will also cover the conversion from encoder counts to user scaled units.

At the end of the process the Function Block ECAT_HomingOnTouchProbe_APP will manipulate the user scaled position value according to the latched position from the drive and the users settings.

For further information see:

*AN00220-001 - AC500 and MicroFlex e190 - EtherCAT Homing Methods*
How to Use a CAM curve

The CAM functionality is only available in combination with the kernel Function Block CMC_Basic_Kernel.

General usage

The usage of a CAM function is based on the following elements:

- CAM table defined with the data type MC_PProfile.
- An instance of the Function Block MC_CamTableSelect.
- An instance of the Function Block MCA_Cam_Extra (optional).
- An instance of Function Block MC_CamIn.
- An instance of Function Block MC_CamOut.

The following steps are necessary to use a CAM table

1. Declare a CAM table as an array of the data type MC_PProfile in the program.
2. Write data to this array.
3. Use the address of the CAM table at the input CamTable of the Function Block MC_CamTableSelect.
4. Execute the Function Block MC_CamTableSelect to process the data of the CAM table with the Function Block's input parameters.
5. Additionally you can execute the Function Block MCA_Cam_Extra for optional parameters after the processing of the Function Block MC_CamTableSelect.
6. Execute the Function Block MC_CamIn to start the slave axis movement according to the CAM table data and parameters.
   - The axis will operate in the axis state Synchronized Motion.
7. To leave the axis state you can execute the Function Block MC_CamOut.
   - The axis state will switch to state Continuous Motion and maintains its last velocity as long as there is no other command.
8. You can also use any other motion command interrupt the Synchronized Motion.

CAM table

CAM data is done with one table (two dimensional – describing master and slave positions together).

The data of the elements (array of data type MC_PProfile) can either be assigned within the declaration or can be assigned during runtime before the execution of the Function Block MC_CamTableSelect.

It can be filled with data in the following ways:

- To use a predefined variable list.
- To calculate the values within the program (before using the MC_CamTableSelect).
- To send values by any communication access to the PLC.

In order to use the new data it is necessary to execute the Function Block MC_CamTableSelect again. In case the CAM table is executed the Function Block MC_CamTableSelect may not be executed.

Elements of the data type MC_PProfile:

The inputs MasterSyncPosition and MasterSyncDistance of the Function Block MC_CamIn can be used to define a distance to synchronize the slave axis onto the CAM table during the start. In case master axis moves with negative velocity the parameter MasterSyncDistance can be negative. The MasterSyncPosition should always be within the range of the CAM table master position.

MasterSyncDistance = 0 will deactivate the synchronization. In this case the slave axis should be moved on the CAM curve before MC_CamIn is executed, otherwise a following error can occur.
The master position in the CAM table must be strictly monotonic rising.

The length of a CAM table is just restricted by the memory size of the PLC. When long tables are used, it is recommended to call CamTableSelect in a task with lower priority as it will need a considerable computing time.

It is possible to hold several CamTables as a pool and to switch from one to another. This has to be done at matching positions as no means for synchronization are available.

The offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

The parameters at MC_CamTableSelect, MC_CamIn and function and MCA_Cam_Extra also modify the behavior:

</tr>
</tbody>
</table>
In this example, the slave will run from 0 to 2000 while the master runs from 0 to 1000. The slave will start and end with velocity 0, no matter which velocity the master has during start. The slave will reach the maximum velocity when it is at position 1000 and the master is at position 500.
How to use an external axis

To use multiaxis PLCopen Function Blocks with an externally sensed axis as master axis the following structure can be used for the axis implementation:

Axis Implementation Layer

![Diagram showing the structure synchronization to an external axis](image)

Fig. 51: Structure synchronization to an external axis

The use of a feed forward filter Function Block is needed if the slave axis has to follow the position of the external axis. In this case there will be a time delay between sensing the position of the external axis and moving the follower axis along the sensed position. The filter Function Block will then add a certain distance to the external axis’ position depending of its speed.

The filter Function Block MATH_LINEAR_REGRESSION from the library ABB_MathFunctions_AC500.library can be used here.
Fig. 52: Filter Function Block to feed forward an externally sensed position

For an axis which is following the external axis, the value “mcActualValue” (from MC_Source enumeration) for the input “MasterValueSource” for multi-axis PLCopen Function Blocks has to be used.

When the filter Function Block MATH_LINEAR_REGRESSION is used to process an actual position, 2 different purposes are fulfilled:

- A jitter or noise can be compensated
- It is possible to calculate a forecast-position to compensate for a delay in position measurement

Process the actual position or any other master axis always before the slave axis.
Otherwise, an additional one cycle-delay is introduced.

The MATH_LINEAR_REGRESSION function block calculates the progress for a variable which is captured in equidistant periods of time and is assumed to follow a linear curve. It uses the Gauss “least squares” -algorithm to do so. The line is calculated in a way that the sum of squares for the distances from the measured points to the assumed straight line is minimized.

A noise or jitter influence of the value is compensated and a predictive value for the variable with an adjustable forecast horizon can be calculated.

Linear equation:

$$\text{Line}[i] = \text{gradient} \times i + \text{offset}$$

Sum of squares:

$$\text{sum} = \sum_{i=1}^{\text{history}} (\text{x}[i] - \text{line}[i])^2$$

The gradient and offset for the line are calculated in a way that “sum” is minimized. Then these 2 values are used to calculate the forecast value:

$$\text{NEXT_VALUE} = \text{gradient} \times \text{FORECAST} + \text{offset}$$

FORECAST=0 would mean: value right now, no future or past considered.

When the ACTUAL value is a modulo value, for example a single turn encoder or a rollover axis, this has to be considered in the calculation. The 2 input values POSITIVE_LIMIT and NEGATIVE_LIMIT can be used to configure this. They define the upper and lower limit for ACTUAL. Also, the NEXT_BINARY will as a result be limited to these borders.
How to use an encoder/drive with <> 32 bit position overrun

The incremental position as actual position at the Function Block CMC_Basic_Kernel is usually assumed as position with a 32-bit position overrun. As well as it is the reference position which is sent to the drive.

Any modulo-axis configuration should be done inside the PLC.

Some drives are requested to correct their positions themselves for a non-linear axis which should constantly run into the same direction.

In this case, the drive has to be configured as a modulo-axis and the Function Block CMC_Basic_Kernel needs some additional Function Blocks to create the 32-bit value

Chapter 1.5.7.4.3.4 “Roll-Over axis” on page 2155.

The Function Block CMC_Modulo2Binary will convert any position with any Modulo_Range to a 32-bit binary position.

The actual_position is assumed to run between 0 to Modulo_Range.

The actual_position should not change > 1/4 Modulo_Range between two scan cycles.

The Function Block CMC_Modulo2Binary will convert the 32-bit binary position reference from CMC_Basic_Kernel to a position reference which runs from 0 to Modulo_Range.
How to do position correction “on the fly”

Sometimes it is required to have a position correction “on the fly”. For example, it can happen that a position is wrong due to mechanical slip and that a switch which is passed by during the movement is used to capture a position value.

In other cases, it is required to synchronize the position to a print mark, so an actual_position has to be corrected, but not the movement of the printed material.

For both applications, the Function Block MCA_SetPositionContinuous can be used. It will use ramps and a limited velocity for the correction, so it will be tolerable to execute it during an ongoing movement and while the axis is activated in a multi-axis movement.

Fig. 55: MCA_Set_PositionContinuous_V3

The block can be used in any axis state except ERRORSTOP and HOMING.

Two different operation modes are possible:

1. SuperImp=FALSE
   - The actual_position will be modified.
   - The block will not cause any movement.
   - If a PLCopen block in DISCRETE_MOTION (positioning) is active during the execution, this block will not reach Done as the actual_position is modified.
   - If a slave axis is coupled to an axis while MCA_SetPositionContinuous is executed (with SuperImp=FALSE) it will follow.
   - This mode is possible while the axis is in state DISABLED.

2. SuperImp=TRUE
   - The actual_position will stay constant.
   - A mechanical movement is executed (without changing the axis state machine).
   - A slave axis will not follow.
   - This behavior is similar to a superimposed movement.
   - It is not possible when the axis is in state DISABLED.

The block can just be aborted by another MCA_SetPositionContinuous.

How to limit the movement

It is possible to limit the movement by position (software limit switches) and by velocity. By default, no software limit switches are activated in PS5611-Motion. It is possible to activate them by accessing some PLCopen parameter.

The functionality described below is just available with linear axes.

</tbody>
</table>

The following different behavior is possible:

- **No limitation at all (default)**
- **Limit position with ERRORSTOP:**
  - Limit position between SWLimitNeg to SWLimitPos, axis to state ERRORSTOP in case the position range is left.
- **Limit velocity and acceleration:**
  - Limit velocity to paraMaxVelocityAppl and acceleration/deceleration to paraMaxDecelerationAppl, create WARNING_VELOCITY, not state changes for axis, abort movement is optional when MaxPositionGap is reached due to limitation.
- **Limit Position with ramp-down:**
  - In addition, it is possible to limit the position between SWLimit2DecNeg and SWLimit2DecPos. paraMaxDecelerationAppl is used to ramp down.

When activated with EnableLimitPos or EnableLimitNeg, the reaction will be as follows:

- When the control position reaches the respective limit switch, the axis will go to state ERRORSTOP, and Drive_Release will be switched off. The actual_position might be behind, depending on the following error. It is assumed that a drive or application specific braking is performed. The axis will be stopped behind the limit.
- The axis could be switched on again by MC_Power. A movement in the opposite direction will be possible.
- The functionality of EnableLimitPos and EnableLimitNeg is unchanged.

You can use the limitation of movement to achieve a soft or adjustable braking in advance before reaching the software limit switch. The limitation is activated by three boolean parameter and will calculate a position distance to the limit switch, which depends on the actual velocity and given deceleration ramp. "paraMaxDecelerationAppl" is used for deceleration. It will decelerate the axis by the given deceleration ramp when the calculated position is reached and stop at the software limit switch. The original behavior is not modified, so if also these software limit-switches are activated, the axis might be set to state ERRORSTOP.
There are 2 different modes:

- **EnableLimitAbort = TRUE**
  Any ongoing motion will be aborted immediately (when the distance to stop is reached, as shown in the above diagram), a warning is shown
  The axis will be decelerated to reach the software limit switch.

- **EnableLimitAbort =FALSE, EnableLimitDecelerate=TRUE**
  A warning is shown and the velocity is reduced, with respect to the given deceleration and position limit.
  The ongoing motion is not aborted. If it was just a "tight fit", e.g. in a master slave movement and the direction is turned soon enough, it might be possible to continue the movement.
  As the ongoing movement is not interrupted, an activated movement might not be completed, for example a MC_MoveAbsolute will never reach its target position. A warning is shown at function block CMC_Basic_Kernel.

When EnableLimitPos = TRUE or EnableLimitNeg = TRUE, and the values for SWLimitPos or SWLimitNeg are set, the axis will be set to state ERRORSTOP when these position limits are reached.

In addition, the function block will allow to limit the velocity. With EnableLimitVelocity = TRUE, it will monitor the velocity demand from the position reference and limit the position reference, so the given velocity limit will not be exceeded. A warning will be shown. The velocity used for limitation is MaxVelocityAppl.

\[ T = \frac{\text{velocity}}{\text{deceleration}} \] (time to stop)

\[ S = \frac{1}{2} \text{velocity} \times T \] (distance to stop)
The velocity limitation can be used to prevent short-term velocity peeks. The limited position will be caught up later, whenever possible. This can result in not-expected behavior. The WARNING issued by CMC_Basic_Kernel can be checked and used to stop a movement. The movement will be aborted automatically when the position is by MaxPositionGap behind.

- For a single axis movement, the commanded velocity is limited at the beginning. No position gap will occur.
- In a multi-axis movement, the slave axis follows a master. This can result in a position gap. A velocity peek from the master axis can be reduced by using the limitation. If the master is too fast because of the value for MaxPositionGap, the movement will be aborted.

When EnableLimit2Decelerate or EnableLimitAbort are used, the velocity is limited to MaxVelocitySystem with EnableLimitVelocity = FALSE. The function modifies the position reference. This modified position reference is used to control the drive. Whenever the limitation interferes the kernel will show a warning or an error. The warning or error message will disappear when the situation is cleared.

The parameters for axis configuration and adjustment are set by the Function Blocks CMC_Axis_Control_Parameter.

Depending on the version of the kernel Function Block the corresponding version of the parameters Function Block has to be used. The instance will then be connected to the kernel Function Block by its instance name.
In this example the control structure is a simple position control loop with just proportional gain. When the application does not require minimized position following error it should be used this way as it is simple to adjust, robust and requires minimal performance. The proportional gain is then adjusted by Control_Time. Just change values at CMC_Axis_Control_Parameter when the position control loop is open (Drive_Release=FALSE, the axis state is Disabled). The values are sending to the control loop with a positive edge at "Enable". The CMC_Basic_Kernel function block needs to be already enabled.

Supervision

Pos_Lag_Percentage

This parameter configures the position window for the supervision of the following error. The default value is 150[%]. A value of 0[%] will deactivate the supervision function.

The size of the position window depends on the setting of the parameters Control_Time and Max_Rpm. 

Position Window [Increments] = (Inc_Per_R) * (Max_Rpm/60) * (Control_Time/1000)

Position Window [Units] = (U_Per_Rev_Nominator/ U_Per_Rev_Denominator) * (Max_Rpm/60) * (Control_Time/1000)

Example

Position Window [Increments] = (10000) * (6000/60) * (50/1000) = 50000 [Increments]

Position Window [Units] = (1/1) * (6000/60) * (50/1000) = 5 [Units]

A value of 100% will result in a position window which corresponds to the expected following error with the giving Control_Time at Max_Rpm. Therefore it is recommended to use values higher than 100[%). In case the parameter FF_Percentage is used smaller values can be used. If the supervised position window is exceeded the axis state will change to ERRORSTOP.

V_Check_Time

After the configured time the drive’s actual velocity has to be at least 50% of the commanded velocity. This function can also be used in case the Position Reference is transferred to the drive.

A value of 0 will deactivate this supervision function.

If the supervised velocity window is exceeded the axis state will change to ERRORSTOP.
Position control loop

Fig. 56: Basic structure of position control loop

Control_Time

The default value is 100 which leads to a proportional gain of 10.

- In case the value of Control Time is too short the position control loop will run into instability.
- In case the position control loop is not used this parameter must not be set to 0.

Fig. 57: Control Time and static following error in case the feed forward of velocity and the integral part of the position control loop is not used.

The static following error depends on the axis velocity and can be calculated easily: Control Time multiplied by the axis velocity (p_error = v * CT).

In general it should be aimed to reach a high position control loop gain with a short Control Time to achieve a small following error. As the reaction times take account in the possible Control Time of the complete system (parameters of the drive control loop, PLC cycle time as well as the communication fieldbus) should be considered.

As a basic rule the Control Time should be at least four times longer than the reaction time between the output of the Speed Reference and the input of actual position.
When the time $T_s$ and $T_t$ is measured, a control time of $4 \times (T_s + T_t)$ will result in an aperiodic damping of the position control loop. It is important to measure the values from inside the PLC (e.g. Trace) to have the complete reaction times included. Practical values for Control_Time might be from 50 - 500ms. The PLC cycle time as well as bus cycle times and mechanical reaction will influence the value.

**FF_Percentage**

The default value is 0.

In case a velocity feedforward has to be configured a value of up to 80 is recommended. For larger values than 80 the parameter Horizon needs to be used as the resulted position will overshoot otherwise.

A value of 100 adds a velocity to the Speed Reference output which corresponds exactly to the ongoing Position Reference value.

![Position and Velocity Graph](image)

**Integral_Part**

The integral part of the position control loop can be used to eliminate a permanent positioning error, e.g. in case of hanging loads.

The time value can be regarded as the time the integrator needs to sum up the input value to reach the same value for its output.

> In case the Integral Part Time is too short the position control loop will run into instability.

**Horizon**

A communication delay of the Speed Reference value to the drive system can cause an overshoot during positioning caused by the velocity feedforward gain.

This function will compensate this communication delay to prevent an overshoot by time shifting the signals Velocity Feed Forward and Position Reference relatively to each other.

The value of Horizon can be approximately assumed to be the time delay of the communication delay.

The delay time might be caused by the cycle time of the control loop and by any delay in sending the speed reference, delay in the drive to build up the torque and delay to receive the actual position. To overcome this delay, a Horizon > 0 might be used. The feed forward reference will be created in advance, while the proportional gain is applied to the original motion profile. The delay is then compensated.

This function should not be used if the feed forward parameter FF_Percentage is 0.

A value of 0 will deactivate this function, which is the default value.

While this function is used, it will increase the needed PLC calculation time for this axis.
### PLC cycle time

**Cycle**

This parameter represents the cycle time in which the kernel Function Block of the axis is called. If the configured cycle time is not correct the resulting acceleration and speed of an axis will be not correct also.

In case the task execution of the axis is synchronized to a fieldbus (e.g. EtherCAT) the cycle time of the fieldbus has to be used.
Roll-Over axis

If the Position Reference value is used, the drive must be able to perform a position over-run after 32 bit. If the drive’s position over-run is different, it can be adapted with the function blocks CMC_Binary2Modulo and CMC_Modulo2Binary from the library ABB_MotionControl_AC500.library. Incompatibility can cause an axis to trip after hours of operation.

The possible position following error has to be smaller than ½ Modulo_Range. Make sure that the modulo range is large enough.

Position following error = (100 - FF_Percentage) * Max_Rpm * Inc_Per_R * Control_Time/6000000. This is the maximum value at constant velocity.

En_Modulo

With this parameter the axis can be configured as a roll-over axis.

Modulo_Range

The modulo range will be defined in drive position counts (DINT). It will result that the scaled unit position which is used by the PLCopen function blocks will stay within the defined range.

Example

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>20000</td>
</tr>
<tr>
<td>Inc_Per_Rev</td>
<td>10000</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>360</td>
</tr>
<tr>
<td></td>
<td>(e.g. degree)</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
</tr>
</tbody>
</table>

The scaled unit's position will cover the range from 0 to 720 (degrees).

In some cases it is not suitable to set the modulo range of an application with the DINT value of the parameter Modulo_Range only. In such cases the parameters 2001 Modulo_Nominator and 2002 Modulo_Denominator can be used to scale the parameter Modulo_Range to a more precise value.

Parameter Modulo_Nominator and Modulo_Denominator (supported with CMC_Basic_Kernel)

These parameters can be used to modify the Modulo_Range in a way that fractions of an increment could be used for 1 modulo (=rollover) distance:

- Default: Modulo_Nominator=1 and Modulo_Denominator=1: the actual position for an axis is limited between 0 and Modulo_Range increments.
- Limitations: Modulo_Range*Modulo_Nominator < 2147483647. Otherwise: default values will be used.
- When modifying these parameters, the position control loop should be opened.
Example:

<table>
<thead>
<tr>
<th>Parameter</th>

<td>80<em>5</em>3</td>
<td>80<em>5</em>3</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>10</td>
<td>10</td>
</tr>
</tbody>
</table>

5mm each tooth

80 teeth

3:10 ratio

1024 counts per revolution

Result of parameters Modulo_Range, Modulo_Nominator and Modulo_Denominator: The modulo range will cover one revolution of the toothed belt wheel.

Result of parameters U_Per_Rev_Nominator and U_Per_Rev_Denominator: One scaled unit corresponds to one mm of the tooth belt.

Example: Gearbox 10.1

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option1</th>
<th>Option2</th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>10240</td>
<td>10240</td>
</tr>
<tr>
<td>Modulo_Nominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Modulo_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Inc_Per_R</td>
<td>1024</td>
<td>1024</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>36</td>
<td>360</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Max_Rpm</td>
<td>3000</td>
<td>300</td>
</tr>
</tbody>
</table>

The two options above describe exactly the same configuration. The Modulo_Range is equivalent to 10 motor revolutions and is 10240 increments. For the position, 1u means 1° and the resolution is 360°/10240inc = 0.035°/Inc = 1°/28.44 Inc.
The two options above describe exactly the same configuration. The gearbox is 10:3, so the Modulo_Range is equivalent to $1024 \times \frac{10}{3} = 3413 + \frac{1}{3}$ increments. For the first option, the resulting modulo range is calculated $1024 \times \frac{10}{3}$, for option 2, it is $10240 \times \frac{1}{3}$. For the position, 1u means 1° and the resolution is $108° / 1024 \text{inc} = 0,105° / \text{inc} = 1° / 9.481 \text{ Inc}.$

### Scaling of the unit of length

**Inc_Per_R**
With this parameter the number of the drive position counts each revolution of the motor (DINT) have to be entered.

**U_Per_Rev_Denominator & U_Per_Rev_Nominator**
With these two parameters the number of units which correspond to one revolution of the motor have to be entered.

The units of length can be scaled to values like: mm, inch, degree, ...

All dynamic parameters of the PLCopen function blocks like velocity, acceleration and jerk are based on seconds. Velocity [units/s], acceleration [units/s²], jerk [units/s³]

#### Example 1

<table>
<thead>
<tr>
<th>Inc_Per_Rev</th>
<th>10000</th>
</tr>
</thead>
<tbody>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>360</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
</tr>
</tbody>
</table>

This will scale one unit to one degrees of the motor shaft. Correspondingly a velocity [units/s] of 360 will turn the motor shaft one revolution per second.

#### Example 2

In this example one unit will be scaled to one millimeter of the conveyor.

5 mm each tooth
80 teeth

Fig. 60: Scaling units

How many units will pass after one revolution of the motor? $(80 \times 5\text{mm}) / 5 = 80$

<table>
<thead>
<tr>

<th>1024</th>
</tr>
</thead>
<tbody>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>80</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
</tr>
</tbody>
</table>
In this example one unit will be scaled to one millimeter of the conveyor.

![Diagram of motor/encoder and gearbox with 5 mm each tooth, 80 teeth, 1:32 ratio, 1024 counts per revolution.]

Fig. 61: Scaling units

How many units will pass after one revolution of the motor? \((80 \times 5 \text{ mm}) / 32 = 12.5 = 125 / 10\)

- \(\text{Inc Per Rev} = 1024\)
- \(\text{U Per Rev Nominator} = 125\)
- \(\text{U Per Rev Denominator} = 10\)

Scaling of the speed reference output

These two parameters are used to scale Speed Reference output of the kernel FB in order to reach the intended velocity by the output value and to limit the highest possible output value.

- Ref Max: Highest possible output value of the Speed Reference output. The Speed Reference value that corresponds to the parameter Max_Rpm should be used.
- Max_Rpm: Maximum speed of the motor in revolutions per minute.

Example

- Analog Drive: 1000 rpm at 2 Volts, 3200 rpm at 6.4 Volts (max.)
- Analog output module: 10 Volts output at digital value 27648
- \(\text{Ref Max} = 17695 (= 27648 / 10 \times 6.4)\)
- \(\text{Max Rpm} = 3200\)

Access and modify parameters

All modifications will be effective immediately. There is no extra plausibility check and values are not checked for limitations.

Use this functionality with care.

Some parameters are collected inside a structure in Axis_Ref, and can be accessed and modified immediately. They are the same parameters as used with function blocks MC_WriteParameter and MC_ReadParameter. Chapter 1.5.7.3.6 “PLCopen parameter” on page 2106.

The differences are:

- Only available with CMC_Basic_Kernel
- The parameter values are LREAL instead of DINT and can be used with decimals.
- The parameters will be effective immediately.
- There is no check for consistency or limits.
- The parameters for position control can be checked and modified by accessing the structure Axis_Parameter.CMC_Pos_Control in addition.
## Parameter for position control

### Possible to use different gain for forward/ backward movement, possible improvement for hydraulic axis or vertical movement

See parameter KP/KP_BACK and KF/KF_BACK.

### Limitation for velocity and acceleration and deceleration

From library version 3.1 on, these values are not limited to the 16-bit value range (32767). The limit for velocity is calculated by the values given at CMC_Axis_Control_Parameter and the acceleration is limited such that this velocity can not be reached faster than 1 cycle.
### Programming guidelines

To achieve the best results for Motion Control the actual position has to be transferred in best possible quality (with minimal jitter) to the PLC. The position feedback is expected to be in increments as the data type is a DINT.

The kernel Function Block (CMC_Basic_Kernel or OBIO_PTOMotionKernel or OBIO_PWMMotionKernel) has to be called every cycle and its task requires a fixed cycle time.

A variable of type Axis_Ref is used to connect to the PLCopen Function Blocks and their kernel Function Block.

The Function Block CMC_Axis_Control_Parameter has to be used for the axis configuration. See Chapter 1.5.7.4.3 “Axis parameters” on page 2150

The signal of the limits switches and the absolute switch should be connected to the elements of the data type CMC_Axis_IO. The signal of the absolute switch must be TRUE in case the axis hits the sensor. The signal of a corresponding limit switch has to be true when the axis leaves the area surrounded by the limit switches. If needed the signal has to be inverted before it is connected to the elements of the data type.

---

### Task configuration

The kernel Function Block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.

In order to save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real-time task with the axis implementation as shown in the figure below.

![Task configuration diagram](image)

Optional:

- Unsynchronized Task Execution
- Synchronized Task Execution

All PLCopen function blocks which must be called in the same task than the kernel function block:

- MC_CombineAxes
- MCA_MoveByExternalReference

In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following pictures show an example for EtherCAT:

![EtherCAT configuration](image)

---

*Fig. 62: Task of axis layer*
1.5.7.4.5 Visualization

The structure of the position control loop is also as visualization element CMC_Visu_FB_Basic_Kernel included in ABB_MotionControl_AC500.library. As placeholder, an instance of CMC_Basic_Kernel has to be used. The visualization shows all numbers as they are really used inside the block, the adjustment for different resolution or cycle times is already included.

1.5.7.4.6 ABB specific data structures

Not all data structures are defined by PLCopen. Some specific structures are described in the following chapter. In addition to the data in these arrays, the movement is modified by offset and scaling values at the respective Function Block. These offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.
PositionProfile

The data type MC_PProfile is used for CamTable. An array has to be defined and provided at MC_CamTableSelect. Several CamTables could be defined and the axis could change between them on the fly. There is no routine of smooth movement from one table to the next so the user has to take care just to switch on appropriate positions. Details are described in the documentation included with the library.

```
ARRAY[1..3] OF MC_PProfile:=
    (Master_position:=    0    ,interpolation_point := 0    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 ),
    (Master_position:=    50    ,interpolation_point := 25    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 ),
    (Master_position:=    100    ,interpolation_point := 0    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 );
```

Declaration example

CAM_table

PositionTimeProfile

This structure is used for time based profiles, e.g. MC_PositionProfile:

Interpolation types for profiles

The curves defined by an array of MC_PProfile hold master position points and according slave positions. When the master position is between 2 points, the according position for the slave is interpolated. Different types of interpolation are possible. The type is defined in MC_ABB_iTypes_Enum. The master could be a real axis or some virtual axis which could be created by just writing values for position and velocity to the Axis_Master variable as shown in the example. The same interpolation types could be used on MC_TProfile.

```
Table 384: Overview of different interpolations

<table>
<thead>
<tr>
<th>Interpolation Types</th>
<th>Requires</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCA_LINEAR</td>
<td>Linear interpolation with constant velocity</td>
</tr>
<tr>
<td></td>
<td>between interpolation points.</td>
</tr>
<tr>
<td></td>
<td>profile.MC_PProfile_Array[x].master_position,</td>
</tr>
<tr>
<td></td>
<td>profile.MC_PProfile_Array[x].interpolation_point</td>
</tr>
<tr>
<td>MCA_SPLINE_NATURAL</td>
<td>Cubic spline interpolation without jerk.</td>
</tr>
<tr>
<td></td>
<td>profile.MC_PProfile_Array[x].master_position,</td>
</tr>
<tr>
<td></td>
<td>profile.MC_PProfile_Array[x].interpolation_point</td>
</tr>
</tbody>
</table>
```
Interpolation Types | Results in | Requires
--- | --- | ---
MCA_SPLINE_COMPLETE | Cubic spline interpolation without jerk, start and end of profile with velocity=0. | profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point
MCA_POLY3 | Polynomial interpolation with linear velocity between interpolation points. | profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio
MCA_POLY5 | Polynomial interpolation with linear acceleration between interpolation points. | profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio, profile.MC_PProfile_Array[x].acceleration_ratio

The interpolations allow to run on smooth curves without the need to define a large number of points. The following chapter shows the results with different interpolation modes for a sinus-curve with 10 interpolation points. The following table gives the mean deviation.

<table>
<thead>
<tr>
<th>Interpolation Type</th>
<th>Mean deviation [ppm]</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCA_LINEAR</td>
<td>19686 = 1.9%</td>
</tr>
<tr>
<td>MCA_SPLINE_NATURAL</td>
<td>151 = 0.0151%</td>
</tr>
<tr>
<td>MCA_SPLINE_COMPLETE</td>
<td>25510 = 2.5%</td>
</tr>
<tr>
<td>MCA_POLY3</td>
<td>131 = 0.0131%</td>
</tr>
<tr>
<td>MCA_POLY5</td>
<td>0.37</td>
</tr>
</tbody>
</table>

The original curve is represented by y_sinus for position and v_sinus for velocity. The diagrams show the result which is achieved by different interpolation types.

**MCA_LINEAR**

Fig. 64: Results from linear interpolation
The velocity is constant between the interpolation points.

**MCA_POLY3**

*Fig. 65: Results from polynomial interpolation*

The result looks almost identical to the original curve. The mean deviation shows that MCA_POLY3, MCA_POLY5 and MCA_SPLINE_NATURAL produce results which follow the original curve really good and are almost identical. The spline interpolation produces a jerk-free curve without the need of providing velocity values and acceleration values in advance.

**MCA_COMPLETE**
Fig. 66: Results from complete spline interpolation

In the beginning and the end, the curve does not follow the original curve. The reason is that it starts with velocity=0 and produces a jerk free result.

So the favoured result has to be considered in advance to choose the right interpolation method. With these different methods it is not necessary to provide a large number of interpolation points to get good results and smooth acceleration and deceleration ramps.

1.5.7.5 Examples

Example projects for the libraries can be found in the folder: \Users\Public\Documents\AutomationBuilder\Examples\PS5611-Motion

1.5.8 High Availability Modbus TCP

1.5.8.1 HA-Modbus TCP - System technology

Information on the system technology of HA-Modbus TCP can be found in the file HA-Modbus TCP system technology.pdf which is available in the example folder:

C:\Users\…\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP.

1.5.9 CAA library guidelines

Function block descriptions for the CAA library can be found in the Library Manager.

The guidelines for the CAA libraries correspond to the general guidelines for library development. For a detailed description see help chapter Guidelines for Library Development.
1.5.10 MQTT client library

1.5.10.1 Function blocks

The function blocks in this library can only be executed in RUN mode of the Processor Module, not in simulation mode.

MQTT client library is based on OASIS MQTT specification (v3.1.1).

MQTT client protocol For further information see Chapter 1.6.6.3.6 “MQTT client protocol” on page 3648

1.5.10.1.1 MqttConnectWithCertBuffer

The function block MqttConnectWithCertBuffer establishes a connection to a MQTT broker. This function block only has to be called once per connection. The input parameters of the function block are used to access to the broker.

Comparing to function block MqttConnectWithCertFile it is possible to establish a TLS connection with certificates from buffer.

In this case copy the content of the certificate .pem file into a STRING variable. All line breaks from the file must be replace with the ST specific line break character '$n'.

Each time a TLS connection is established to a broker, the AC500 calculates some key pairs. For AC500-eCo PLCs, this calculation can take up to 7 seconds. Hence, ensure correct configuration of your watchdog.
Input description

### Execute

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

### Conn

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set a reference to the connection.

MQTT_CONNECTION is used for other function blocks to reference to the established connection.

### IpAddress

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the IP address of the MQTT Broker. The IP address needs to be a string like ‘192.168.0.1’.

### Port

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>8883</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the port number of the MQTT broker.

### Secure

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>TRUE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Decide if using secure channel (TLS, Secure := TRUE) for communication.
### ServerCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set server certificate in PEM format. Only necessary if using a TLS connection. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set (optional) client certificate in PEM format. Only necessary if using a TLS connection. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientKey

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set (optional) client certificate in PEM format. Only necessary if using a TLS connection and if using a client certificate. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientId

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_CLIENT_ID_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set client identifier which is used to identify the client to the server. Only necessary if using a TLS connection. MQTT_MAX_CLIENT_ID_LEN is an internal constant which is set to 250.

### Username

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_USERNAME_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set username for MQTT broker. MQTT_MAX_USERNAME_LEN is an internal constant which is set to 250.

### Password

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PASSWORD_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set password for MQTT broker. MQTT_MAX_PASSWORD_LEN is an internal constant which is set to 250.

### LastWill

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Optional Last Will message.
### KeepAlive

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>600</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Time in seconds, which will be passed to the MQTT Broker and which is normally used by the Broker to disconnect clients if no communication was made for 1,5 * KeepAlive.

### Timeout

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>30000</td>
<td>-</td>
<td>Millisecond</td>
</tr>
</tbody>
</table>

Timeout for connect and all subsequent calls (ping, subscribe, unsubscribe, publish with QoS > 0).

### Output description

```plaintext
MODULE MqttConnectWithCertBuffer

Data: BOOL Execute
Data: BOOL Done
Data: POINTER TO MQTT_CONNECTION Conn
Data: STRING(MQTT_MAX_IP_ADDRESS_LEN) IpAddress
Data: WORD Port
Data: BOOL Secure
Data: POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN) ServerCert
Data: POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN) ClientCert
Data: POINTER TO STRING(MQTT_MAX_PEM_KEY_LEN) ClientKey
Data: STRING(MQTT_MAX_CLIENT_ID_LEN) ClientId
Data: STRING(MQTT_MAX_USERNAME_LEN) Username
Data: STRING(MQTT_MAX_PASSWORD_LEN) Password
Data: MQTT_MESSAGE LastWill
Data: WORD KeepAlive
Data: WORD Timeout
```

### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.
### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum)" on page 2185 if an error occurred while processing the function block.

#### 1.5.10.1.2 MqttConnectWithCertFile

The function block MqttConnectWithCertFile establishes a connection to an MQTT broker. This function block only has to be called once per connection. The input parameters of the function block are used to access the broker.

Comparing to function block MqttConnectWithCertBuffer, it is possible to establish a TLS connection with certificates from file.

If your PLC does not have a persistent file storage like sdcard or flashdisk, consider using MqttConnectWithCertBuffer.

#### Parameter Value

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>
</tr>
<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>
Input description

Execute

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

Conn

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set a reference to the connection.

MQTT_CONNECTION is used for other function blocks to reference to the established connection.

IpAddress

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

IP address of the MQTT Broker. The IP address needs to be a string like ‘192.168.0.1’.

Port

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>8883</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the port number of the MQTT broker.

Secure

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>TRUE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Decide if using secure channel (TLS, Secure := TRUE) for communication.
### ServerCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_FILE_PATH_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

File name of server certificate in PEM format. Only necessary if using a TLS connection.

### ClientCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_FILE_PATH_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

File name of client certificate in PEM format. Only necessary if using a TLS connection.

### ClientKey

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_FILE_PATH_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

File name of client private key in PEM format (optional). Only necessary if using a TLS connection and if using a client certificate.

### ClientId

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set client identifier which is used to identify the client to the server. Only necessary if using a TLS connection. MQTT_MAX_CLIENT_ID_LEN is an internal constant which is set to 250.

### Username

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_USERNAME_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set username for MQTT broker. MQTT_MAX_USERNAME_LEN is an internal constant which is set to 250.

### Password

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PASSWORD_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set password for MQTT broker. MQTT_MAX_PASSWORD_LEN is an internal constant which is set to 250.

### LastWill

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Optional Last Will message.

### KeepAlive

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>600</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
Time in seconds, which will be passed to the MQTT Broker and which is normally used by the Broker to disconnect clients if no communication was made for $1.5 \times$ KeepAlive.

**Timeout**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>30000</td>
<td>-</td>
<td>Millisecond</td>
</tr>
</tbody>
</table>

Timeout for connect and all subsequent calls (ping, subscribe, unsubscribe, publish with QoS > 0).

**Output description**

```
MQTTCONNECTWITHCERTFILE
— Execute : BOOL
— Conn : POINTER TO MQTT_CONNECTION
— pAddress : STRING(MQTT_MAX_IP_ADDRESS_LEN)
— Port : WORD
— Secure : BOOL
— ServerCert : STRING(MQTT_MAX_FILE_PATH_LEN)
— ClientCert : STRING(MQTT_MAX_FILE_PATH_LEN)
— ClientKey : STRING(MQTT_MAX_FILE_PATH_LEN)
— ClientId : STRING(MQTT_MAX CLIENT_ID_LEN)
— Username : STRING(MQTT_MAX_USERNAME_LEN)
— Password : STRING(MQTT_MAX_PASSWORD_LEN)
— LastWill : MQTT_MESSAGE
— KeepAlive : WORD
— Timeout : WORD
```

**Done**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**Busy**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

**Error**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.
### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2185 if an error occurred while processing the function block.

### 1.5.10.1.3 MqttDisconnect

#### Input description

The function block MqttDisconnect is used to disconnect from the MQTT Broker. This function block resets the used socket. In case of an error during the connection, the used socket will be reset automatically.

#### Execute

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.
### Output description

#### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

#### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration “MQTT_ERROR_ID (Enum)” on page 2185 if an error occurred while processing the function block.

---

**Conn**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.
1.5.10.1.4 MqttGetReceivedPacket

The function block `MqttGetReceivedPacket` returns the first packet received for any subscribed topic. Done = TRUE with PayloadLen = 0 indicates that nothing new has been received since the last call.

**Input description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>

<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

The function block `MqttGetReceivedPacket` returns the first packet received for any subscribed topic. Done = TRUE with PayloadLen = 0 indicates that nothing new has been received since the last call.

**Execute**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

**Conn**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONN- TION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.
### Payload

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO BYTE</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to the data area where the received packet can be stored.

### MaxPayloadSize

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Size of the data area where the received packet can be stored.

### Output description

#### MQTTGETRECEIVEDPACKET

- **Execute**: BOOL
- **Done**: BOOL
- **Conn**: POINTER TO MQTT_CONNECTION
- **Busy**: BOOL
- **Payload**: POINTER TO BYTE
- **Error**: BOOL
- **MaxPayloadSize**: DWORD
- **ErrorID**: MQTT_ERROR_ID
- **Topic**: STRING(MQTT_MAX_TOPIC_LEN)
- **PayloadLen**: DWORD

#### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

#### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2185 if an error occurred while processing the function block.
### MqttPing

#### Input description

- **Execute**: `BOOL`  
  - `FALSE`  
  - **Range**: `-`  
  - **Unit**: `-`

**MQTT Ping**

- `Execute`: `BOOL`  
  - `FALSE`  
  - **Range**: `-`  
  - **Unit**: `-`

- `Conn`: `POINTER TO MQTT_CONNECTION`  
  - `NULL`  
  - **Range**: `-`  
  - **Unit**: `-`

- `Done`: `BOOL`  
  - `FALSE`  
  - **Range**: `-`  
  - **Unit**: `-`

- `Busy`: `BOOL`  
  - `FALSE`  
  - **Range**: `-`  
  - **Unit**: `-`

- `Error`: `BOOL`  
  - `FALSE`  
  - **Range**: `-`  
  - **Unit**: `-`

- `Errord`: `MQTT_ERROR_ID`  
  - `0`  
  - **Range**: `-`  
  - **Unit**: `-`

**Parameter**

- **Included in library**: `ABB_MqttClient_AC500.lib`
- **Available as of firmware**: `V2.8`
- **Type**: Function block with historical values
- **Group**: C interface

**Description**

MqttPing sends an MQTT Ping request to the broker and waits for the response packet. If output Done is TRUE and output Error is FALSE, the client still reaches the broker.
A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

### Conn

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.

### Output description

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2185 if an error occurred while processing the function block.
1.5.10.1.6 MqttPublish

MqttPublish publishes a MQTT message to MQTT Broker. The properties of the message (Topic, Payload, QOS, Retain Flag) can be set with the message input.

The **Timeout** that was set on the *MqttConnect POU*s is used when a QoS Level of 1 or 2 is set for a message.

This means that this POU will wait for an answer from the broker until the **Timeout** is reached when the message is either QoS Level 1 or Level 2.

It will not wait for any answer when QoS Level is 0.

The application using this FB has to define if the message shall be re-published and how often that shall be done.

### Input description

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>

<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

**Execute**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.
<table>
<thead>
<tr>
<th><strong>Conn</strong></th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.

<table>
<thead>
<tr>
<th><strong>Message</strong></th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MESSAGE</td>
<td>See description of MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

Defines the Message to be published.

**Output description**

```plaintext
DATA MqttPublish
  . Execute : BOOL
  . Conn : POINTER TO MQTT_CONNECTION
  . Message : MQTT_MESSAGE
  . Done : BOOL
  . Busy : BOOL
  . Error : BOOL
  . ErrorID : MQTT_ERROR_ID
```

**Done**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**Busy**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

**Error**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**ErrorID**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration “MQTT_ERROR_ID (Enum)” on page 2185 if an error occurred while processing the function block.
1.5.10.1.7 MqttSubscribe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>
</tr>
<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

The function block MqttSubscribe is used to subscribe to a topic name like 'topic/name'. Wildcard symbols (#/+).

It can be used for subscribing like city/# or city/+temperature. If the connection between the client and the broker is interrupted, the client needs to subscribe again to a topic after a new connect.

**Input description**

<table>
<thead>
<tr>
<th>Execute</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

<table>
<thead>
<tr>
<th>Conn</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.
### Topic

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_TOPIC_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the Topic name as a string. The topic name must look like ‘topic/name’. Wildcard symbols can also be used for subscribing (for example: ‘city/#’ or ‘city/+/temperature’). For further information see the MQTT specification.

### MaxQos

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_QOS</td>
<td>QOS_0</td>
<td>BASC_NORMAL, BASC.Reverse</td>
<td>-</td>
</tr>
</tbody>
</table>

This input is used to signal the server which is the highest QoS level which can be handled. Can be reduced to relieve the client from high network load.

### Output description

- **MQTT_SUBSCRIBE**

- **Done**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

- **Busy**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

- **Error**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

- **ErrorID**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2185 if an error occurred while processing the function block.
1.5.10.1.8 MqttUnsubscribe

The function block MqttUnsubscribe is used to unsubscribe from a topic name like 'topic/name'. Wildcard symbols (#/+ ) can be used for subscribing like city/# or city/+/temperature

**Input description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>
</tr>
<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

**Execute**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

**Conn**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNEC TION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.
**Output description**

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Done</td>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Busy</td>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Error</td>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

- **Done**: Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.
- **Busy**: Operation is running.
- **Error**: Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

<table>
<thead>
<tr>
<th>Output</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>ErrorID</td>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum)" on page 2185 if an error occurred while processing the function block.

### 1.5.10.2 Structures and enumerations

**MQTT_ERROR_ID (Enum)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERR_NO_ERROR</td>
<td>0</td>
<td>No error.</td>
</tr>

<td>-</td>
<td>Simple acknowledgement (At least once delivered).</td>
</tr>
<tr>
<td>QOS_2</td>
<td>-</td>
<td>Complex acknowledgement (Exactly once delivered).</td>
</tr>
</tbody>
</table>

### MQTT_MESSAGE

This structure is used for messages which can be published or used for LastWill on MqttConnect(FB).

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Data type</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sTopic</td>
<td>STRING(MQTT_MAX_TOPIC_LEN)</td>
<td>Empty string</td>
<td>Topic where this message belongs to.</td>
</tr>
<tr>
<td>pbyPayload</td>
<td>POINTER TO BYTE</td>
<td>0</td>
<td>Payload which should be sent.</td>
</tr>
<tr>
<td>dwLen</td>
<td>DWORD</td>
<td>0</td>
<td>Length of the payload.</td>
</tr>
<tr>
<td>eQos</td>
<td>MQTT_QOS</td>
<td>QOS_0</td>
<td>Quality of Service level.</td>
</tr>
<tr>
<td>xRetainFlag</td>
<td>BOOL</td>
<td>FALSE</td>
<td>True = message must be stored by the server, False = server must not store this message.</td>
</tr>
</tbody>
</table>

### MQTT_CONNECTION

Internal data required by the library to operate. This structure allocates memory and it is used to identify the MQTT connection you want to work with.

<table>

### 1.6 PLC integration (hardware)

#### 1.6.1 Product overview and comparison

##### 1.6.1.1 Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:

<table>
<thead>
<tr>
<th>Terminal base compatibility</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600</td>
<td>•</td>
<td>•</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5610</td>
<td>•</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5620</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5640</td>
<td>•</td>
<td>•</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5660</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.
### Table 385: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<table>
<thead>
<tr>
<th>Processor module</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600-2ETH</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>
</tr>
<tr>
<td>TB5610-2ETH</td>
<td>1 slot</td>
<td>1 slot</td>
<td>1 slot</td>
<td>1 slot</td>
</tr>
<tr>
<td>TB5620-2ETH</td>
<td>2 slots</td>
<td>2 slots</td>
<td>2 slots</td>
<td>2 slots</td>
</tr>
<tr>
<td>TB5640-2ETH</td>
<td>-</td>
<td>4 slots</td>
<td>4 slots</td>
<td>4 slots</td>
</tr>
<tr>
<td>TB5660-2ETH</td>
<td>-</td>
<td>-</td>
<td>6 slots 1)</td>
<td>6 slots 1)</td>
</tr>
</tbody>
</table>

**Remarks:**

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index \( \geq C0 \).

### Supported devices

The AC500 V3 terminal bases can be equipped with the following supported devices:

#### Table 386: Comparison: TB56xx

</tbody>
</table>

### Remarks:

¹): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.

²): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

All other ports are closed by default.

For changing the default addresses or the description of the function keys see:

- Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3427
- Chapter 1.6.5.1.5.5 “Description of the function keys” on page 3243.
1.6.1.3.5 Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC’s.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

Online access can be established from:

- Automation Builder command ‘Login’ maktad Chapter 1.4.1.24.6.2 “Command ‘Login’” on page 955
- CODESYS OPC DA server
- Panel CP600 series

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   ➞ One socket on port 11740 (listen).
2. Login from Automation Builder via driver “BlkDrvTcp”.
   ➞ 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   ➞ 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver “BlkDrvTcp”.
   ➞ 4 sockets on port 11740 (3x online, 1x listen)

1.6.2 PLC introduction

1.6.2.1 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.
**NOTICE!**

**Avoidance of electrostatic charging**

PLC devices and equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

**NOTICE!**

**PLC damage due to operation conditions**

Protect the devices from dampness, dirt and damage during transport, storage and operation!

**NOTICE!**

**PLC damage due to wrong enclosures**

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

**Cleaning instruction**

*Do not use cleaning agent for cleaning the device.*

*Use a damp cloth instead.*

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

*Do not operate devices outside of the specified, technical data!*

*Trouble-free functioning cannot be guaranteed outside of the specified data.*

**NOTICE!**

**PLC damage due to missing earthing**

- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.
In the description for the devices (operating manual or AC500 system description), reference is made at several points to earthing, electrical isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the earthing via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the earthing (in this respect, see also VBG 4 and the relevant VDE regulations).

**CAUTION!**

*Do not obstruct the ventilation for cooling!*

The ventilation slots on the upper and lower side of the devices must not be covered.

**CAUTION!**

*Run signal and power wiring separately!*

Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

**WARNING!**

*Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.*

**WARNING!**

*Splaying of strands can cause hazards!*

During wiring of terminals with stranded conductors, splaying of strands shall be avoided.

- Ferrules can be used to prevent splaying.

**WARNING!**

*Removal/Insertion under power*

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
CAUTION!
Use only ABB approved lithium battery modules!
At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!
Risk of explosion!
Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.
Prevent them from heat and fire and store them in a dry place.
Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations
Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2,000 meters without derating.
This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.
This equipment is supplied as “open type” equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.
Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.2.2 Cyber security
Cyber security disclaimer
This product is designed to be connected to and to communicate information and data via a network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.
Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware exchanges, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected. This also applies to the operating system. Security measures (such as but not limited to the installation of latest patches, installation of firewalls, application of authentication measures, installation of anti-virus programs, etc.) are in your responsibility. You have to be aware that operating systems provide a considerable number of open ports that should be monitored carefully for any threats.

It has to be considered that online connections to any devices are not secured. It is your responsibility to assure that connections are established to the correct device (and e.g. not to an unknown device pretending to be a known device type). Furthermore you have to take care that confidential data exchanged with the PLC is either compiled or encrypted.

Security related deployment guidelines for industrial automation

Signed firmware updates

The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

Open ports and services

The AC500 V3 PLC comes with minimal services opened by default. Only the services needed for initial setup and programming are open before any user application is downloaded. See Chapter 1.6.1.3 “Ethernet protocols and ports for AC500 V3 products processor modules” on page 2194.

Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

Secure communication

Whenever possible, use an encrypted communication between AC500 V3 devices and third party devices, such as HMI devices. This is necessary to protect passwords and other data.

1.6.2.2.1 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor’s recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:

- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks
Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

References: CODESYS Security Whitepaper

**Security zones**

IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewalls. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.

**Fig. 1: Security zones**

Fig. 1 shows three security zones, but the number of zones does not have to be as many or as few as three. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.

High-security zones should be kept small and independent. They need to be physically protected, i.e., physical access to computers, network equipment and network cables must be limited by physical means to authorized persons only. A high-security zone should obviously not depend on resources in a less secure zone for its security. Therefore, it should form its own domain that is administered from the inside, and not depend on, e.g., a domain controller in a less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compromised resource that is inside the trusted zone, or by an outside user or resource that succeeds to penetrate the secure interconnection. Trust therefore depends also upon the types of measures taken to detect and prevent compromise of resources and violation of the security policy.

References: Security for Industrial Automation and Control Systems
1.6.2.2.2 Secure operation

The controller must be located in a protected environment in order to avoid accidental or intended access to the controller or the application.

A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers and field devices via standard communication protocols (fieldbus systems) using appropriate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional measures, such as encryption. Open physical or data access to fieldbus systems and their components is a serious security risk.
- Physically protect all equipment, i.e., ensure that physical access to computers, network equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized persons
- When connecting a trusted network zone to outer networks, make sure that all connections are through properly configured secure interconnections only, such as a firewall or a system of firewalls, which is configured for “deny by default”, i.e., blocks everything except traffic that is explicitly needed to fulfill operational requirements.
- Allow only authorized users to log on to the system, and enforce strong passwords that are changed regularly.
- Continuously maintain the definitions of authorized users, user groups, and access rights, to properly reflect the current authorities and responsibilities of all individuals at all times. Users should not have more privileges than they need to do their job.
- Do not use the system for e-mail, instant messaging, or internet browsing. Use separate computers and networks for these functions if they are needed.
- Do not allow installation of any unauthorized software in the system.
- Restrict temporary connection of portable computers, USB memory sticks and other removable data carriers. Computers that can be physically accessed by regular users should have ports for removable data carriers disabled.
- If portable computers need to be connected, e.g., for service or maintenance purposes, they should be carefully scanned for viruses immediately before connection.
- All CDs, DVDs, USB memory sticks and other removable data carriers, and files with software or software updates, should also be checked for viruses before being introduced into the trusted zone.
- Continuously monitor the system for intrusion attempts.
- Define and maintain plans for incident response, including how to recover from potential disasters.
- Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.

A protected local control cabinet could look like in picture 2, page 23. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.
Fig. 68: Isolated automation system

Servers and workplaces that are not directly involved in the control and supervision of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.

Fig. 69: Plant information network connected to an automation system

For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.
1.6.2.2.3 Hardening

System hardening means to eliminate as many security risks as possible. Hardening your system is an important step to protect your personal data and information. This process intends to eliminate attacks by patching vulnerabilities and turning off inessential services. Hardening a system involves several steps to form layers of protection.

Commissioning phase

- Protect the hardware from unauthorized access
- Be sure the hardware is based on a secure environment
- Disable unused software and services (network ports)
- Install firewalls
- Disallow file sharing among programs
- Install virus and spyware protection
- Use containers or virtual machines
- Create strong passwords by applying a strong password policy
- Create and keep backups
- Use encryption when possible
- Disable weak encryption algorithms
- Separate data and programs
- Enable and use disk quotas
- Strong logical access control
- Adjust default settings, especially passwords

Verification phase
- Verification of antivirus - Check antivirus is active and updated
- Verification of the identification - Check that test and unauthorized accounts are removed
- Verification of intrusion detection systems - Check malicious traffic is blocked
- Verification of audit logging - Check audit log is enabled
- You can use the checklist out of the cyber security white paper

Operation phase
- Keep software up-to-date, especially by applying security patches
- Keep antivirus up and running
- Keep antivirus definitions up-to-date
- Delete unused user accounts
- Lock an active session whenever it is unattended, e.g., lock the screen of the PC or of the control panel (HMI)

 Decommissioning phase
- Delete all credentials stored in the device like certificates and user data

1.6.2.3 License and third party information

Information on Automation Builder licensing and Third Party software can be found in the "About" window of the Automation Builder Installation Manager.

See further information on Chapter 1.6.6.2.2.2 "PLC runtime licensing" on page 3417.

1.6.2.4 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.
For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:
- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:
- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.6.2.5 Standardization

EN 61131-2:2007 compliance statement: AC500/S500 products fully comply with all of the requirements contained in all clauses of this standard, such as indicated by reference to this standard without qualification.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:
- Automation technology sector

1.6.2.7 Definitions: PLC system start-up

Cold start

The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the “cold start” mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see Chapter 1.4.1.24.2.6.9 “Command 'Reset Cold'” on page 963).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start

- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see Chapter 1.4.1.24.2.6.10 “Command 'Reset Warm'” on page 963).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP

- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP

- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for \( \geq 5 \) s in STOP mode.

Reset (cold)

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)

- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.
STOP -> RUN

- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in
  STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is
  OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to
  their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes
  from OFF to ON.

STOP -> START

- STOP -> START means continuing the execution of the user program in the PLC’s RAM
  using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to
  their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED"
  changes from OFF to ON.

Download

- Download means loading the complete user program into the PLC’s RAM. This process is
  started by selecting the menu item "Online/Download" in the programming system or after
  confirming a corresponding system message when switching to online mode (menu item
  "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot
  project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory
  addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change

- After a project has changed, only these changes are compiled when pressing the key <F11>
  or calling the menu item "Project/Build". The changed program parts are marked with a blue
  arrow in the block list.
- The term Online Change means loading the changes made in the user program into the
  PLC’s RAM using the programming system (after confirming a corresponding system mes-
  sage when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the
  program is re-organized. During re-organization, no further online change command is
  allowed. The storage of the user program to the Flash memory using the command "Online/
  Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".
Data buffering • Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  – Data in the addressable flag area (%M area)
  – RETAIN variable
  – PERSISTENT variable (number is limited, no structured variables)
  – PERSISTENT area (%R area)

• In order to buffer particular data, the data must be excluded from the initialization process (see ).

1.6.2.9 PLC system description

1.6.2.9.1 AC500 product family

AC500 programmable logic controllers (PLCs)
The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide solutions for small, middle and high-end applications. Our AC500 platform offers different performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

Features of AC500 PLCs
- Scalable and consistently expandable system
- Different performance classes of Processor Modules (CPUs) available
- Several field busses available
- Parallel connection to several field busses which can be combined arbitrarily

The AC500 product family consists of the product groups:
- AC500 (standard):
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- AC500-eCo:
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- AC500-S:
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- AC500-XC:
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206.*

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O Modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

**Extensions in the product name**

AC500 devices support different protocols and technologies (e.g. Ethernet, PROFIBUS etc.) in variable number. AC500 devices with onboard interfaces for support of a certain protocol or technology can be identified easily by the extension in the product name of the AC500 device. For example the AC500 Communication Module PM592-DP provides onboard support for PROFIBUS DP, the AC500 Processor Module PM595-4ETH provides onboard support for four provided Ethernet interfaces.

Further extensions in AC500 device names:

- -ETH: Ethernet
- -ARC: ARCNET
- -DP: PROFIBUS DP
- -CAN: CAN/CANopen
- -ETHCAT: EtherCAT
- -PNIO: PROFINET
- -RCOM: RCOM/RCOM+
- -RS: Serial interface

**1.6.2.9.2 AC500/S500 system structure**

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the CPU with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

Example of an AC500 PLC system:
1 Plug-in communication module
2 Processor module
3 Plug-in I/O module
4 Plug-in function module (AC500-eCo)
   - Plug-in communication module (AC500-S), not displayed
   - Plug-in I/O module (AC500-S), not displayed

**Centralized I/O extension**

*Fig. 71: S500 I/O modules directly connected to a processor module*
1.6.2.9.3 AC500/S500: Short description hardware

Processor modules

AC500 processor modules contains the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the system program to command the PLC for operation.

Its functions include:

- To receive user program and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax error in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user program in the memory one by one and execute it after interpretation
- To update the state of related flag bits and output shadow register contents according to execution results and realize output control by means of output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.

There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.

If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).
AC500 communication modules are required for
- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules
- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.
  A separate voltage source is not required.

I/O modules
The I/O modules are the input/output unit which connects the PLC with the industrial production site. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to realize the control purpose.

External input equipment and output equipment need various signal levels while the information processed by the CPU in the PLC only can be the standard level. In order to realize such conversion, the I/O interface generally shall perform optical isolation and filtering to improve interference immunity of the PLC. In addition, the I/O interface generally can indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interface for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC have the number of input/output signals taken as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system is insufficient in the I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.

The modules can be simply plugged onto a terminal unit for a centralized I/O extension or for a decentralized I/O extension via communication interface modules.

**Function modules**

Function modules extend the PLC system to perform special task control. Those modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus.

It is connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC.

**Communication interface modules**

Communication interface modules enable a decentralized I/O station. It contains embedded digital I/Os and a fieldbus interface.

Communication interface modules act as I/O slave devices within a master-slave-arrangement.
Terminal bases

On a terminal base the processor module and the communication modules are plugged.

For AC500-eCo processor modules and special AC500 (Standard) processor modules the terminal base cannot be removed.

Terminal units

On a terminal unit the I/O modules are plugged.

Terminal units enable simple prewiring without electronics and are available for 24 V DC and 230 V AC, optionally for spring or screw-type terminals.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. The following memory types can be distinguished:

- Volatile memory:
  All saved data will be lost after power failure of the memory but the memory can provide high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- Nonvolatile memory:
  All saved data will not be lost after power failure of the memory, but the memory is subject to low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to get protected from power failure. The programs are exported to the volatile memory under operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access in the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains existing state by using built-in supercapacitors or backup batteries in case of power failure. The memory area for data saving in case of power failure is called the data retention area.
The PLC is equipped with a switch power supply for internal circuit. Compared with ordinary power supply, the PLC power supply has the higher stability and interference immunity. A number of PLC products provide 24 V DC stabilized voltage supply to meet external sensors.

1.6.2.9.4 Short description software

Configuration and programming of all AC500 control systems (CPUs) is done by using Automation Builder software.

Features:
- Standardized programming according to IEC 61131-3 - five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), free graphical function chart (CFC), debugging functions for program test
- Application programming in C/C++
- Online diagnosis
- Debugging functions for the program test: Single step, Single cycle, Breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting

IEC 61131-3 commands can be simulated without a PLC being connected, including the relevant malfunctions. After the program test, the application can be downloaded to the control system.

Timing diagrams for process variables and storage of data in a ring buffer with event trigger.
Recipe management and watch lists
Values of selected variables are displayed. Pre-defined values can be assigned to variables which can then be downloaded to the control system all at once ("Write recipe"). Actual values from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe"). These functions are also helpful, for example, for setting and entering control parameters.

Visualization
Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

Programming
Serial or via Ethernet networks.

Engineering interface
Provides access from the programming system to an external project database in which the program source code of one or several automation projects is managed. Optionally, a version control system, such as Visual Source Safe, can be used in order to ensure data consistency of the program code for several different users and projects.

1.6.2.9.5 Control panels (HMI)

ABB control panels offer a wide range of features and functionalities for maximum operability. The panels are distinguished by their robustness and easy usability, providing all the relevant information from production plants and machines at a single touch.

Human Machine Interfaces - human control and operation of machines and processes.
Individual solutions for each application - this enables an operator at any time to have an overview on a profitable production and intervene manually if necessary.
Control panels with TFT graphical display and touch screen.
Available in various resolutions.

1.6.2.10 AC500-S
The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the AC500-S safety user manual is only available on our website.

1.6.2.11 Converting an AC500 V2 project to an AC500 V3 project
A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.
Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.

### 1.6.3 Device specifications

#### 1.6.3.1 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- **Status LEDs:**
  Indicates the availability of devices/components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- **I/O LEDs:**
  Displays the status of the the inputs and outputs.

- **LED display:**
  Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.

    $\odot$ Chapter 1.6.5.1.5.4 “Description of LEDs” on page 3242

    $\odot$ Chapter 1.7.1.2 “Diagnosis in CPU display” on page 3731

- **Function keys and switches:**
  Allows to change the current operating modes/status manually $\odot$ Chapter 1.6.5.1.5.5 “Description of the function keys” on page 3243.

#### 1.6.3.2 Terminal bases (AC500 standard)

AC500-eCo V3 processor modules do not have a separate terminal base

### 1.6.3.2.1 TB56xx for AC500 V3 products

- TB5600-2ETH: 1 processor module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5610-2ETH: 1 processor module, 1 communication module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5620-2ETH: 1 processor module, 2 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5640-2ETH: 1 processor module, 4 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5660-2ETH: 1 processor module, 6 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- XC version for use in extreme ambient conditions available

Terminal bases TB56xx-2ETH can only be used with processor modules PM56xx-2ETH.
Table 396: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<table>
<thead>
<tr>

<td>-</td>
<td>6 slots</td>
<td>6 slots</td>
</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index $\geq C0$.

The following figure shows the TB5620-2ETH as example.

1 I/O bus (10-pin, female) to electrically connect the I/O terminal units
2 One available slot for the processor module
3 Slots for communication modules
4 Interface for CAN (5-pin terminal block, removable)
5 Power supply (5-pin terminal block, removable)
6 Serial interface COM1 (9-pin terminal block, removable)
7 RJ45 female connector for ETHERNET1 connection
8 RJ45 female connector for ETHERNET2 connection
9 Holes for screw mounting
10 DIN rail
**XC version**  \( \text{XC} = \text{eXtreme Conditions} \)

---

**Extreme conditions**

Terminal bases for use in extreme ambient conditions have no sign for XC version.

*The figure 3 in the Part no. 1SAP3... (label) identifies the XC version.*

---

**Short description**

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.

Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.

The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

**Table 397: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)**

<table>
<thead>

<td>-</td>
<td>6 slots(^1)</td>
<td>6 slots(^1)</td>
</tr>
</tbody>
</table>

Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

\(^1\) PM567x must have an index \( \geq C0 \).

---

**NOTICE!**

Risk of malfunctions!

- Unused slots for communication modules are not protected against accidental physical contact.
  - Unused slots for communication modules must be covered with dummy communication modules ( \( \$ \) Chapter 1.6.3.8.2.5 “TA524 - Dummy communication module” on page 3097) to achieve IP20 rating.
  - I/O bus connectors must not be touched during operation.
Connections

I/O bus

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added (see description for I/O bus in the system assembly chapter *Chapter 1.6.4.4.1 “Serial I/O bus” on page 3107*).

Power supply

The supply voltage of 24 VDC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals, when the ambient temperature never exceeds 60 °C.

Pin assignment

<table>
<thead>
<tr>
<th>Pin Assignment</th>
<th>Label</th>

<tr>
<td>FE</td>
<td></td>
<td>Functional earth</td>
<td></td>
</tr>
</tbody>
</table>

**NOTICE!**

Risk of damaging the processor module and terminal base!

Exceeding the maximum voltage could lead to unrecoverable damage to the system.

The system could be destroyed.

**NOTICE!**

Risk of malfunction!

To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s.

**NOTICE!**

Risk of damaging the terminal base and power supply!

Short circuits might damage the terminal base and power supply.

Make sure that the four clamps L+ and M (two of each) are not wrongly connected (e.g. +/- of power supply is connected to both L+/L+ or both M/M).
NOTICE!
Risk of damaging the terminal base!
Terminal base can be damaged by connecting the power supply terminal block (L+/M) to COM1.
Make sure that the COM1 terminal block is always connected to the terminal base even if you do not use COM1 to prevent this.

NOTICE!
Risk of damaging the terminal base!
Excessive current might damage the clamp and terminal base.
Make sure that the current flowing through the removable clamps never exceeds 8 A (with 1.5 mm² conductor).

NOTICE!
For applications using XC versions!
To ensure reliability and proper function, make sure the ambient temperature never exceeds 60 °C when the current flowing through the removable clamps is 8 A (with 1.5 mm² conductor).

Serial interface COM1
The serial interface COM1 is connected to a removable 9-pin terminal block.
From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).

---

**NOTICE!**

Unused connector!

Make sure that the terminal block is always connected to the terminal base, even if you do not use the interface.

---

For further information on connection and wiring please refer to .

---

**Ethernet interface**

This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.

TB56xx-2ETH for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces.

The two Ethernet interfaces can be configured as independent interfaces or with switch functionality.

In case of two independent interfaces they must be configured to different subnets.

For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.

<td>NC</td>
<td>Not connected</td>
</tr>
</tbody>
</table>

**NOTICE!**

**Unused connector!**

Make sure that the terminal block is always connected to the terminal base, even if you do not use the interface.
Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>
<td>50 m</td>
</tr>
<tr>
<td>500 kbit/s</td>
<td>100 m</td>
</tr>
<tr>
<td>250 kbit/s</td>
<td>250 m</td>
</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

Types of bus cables

Only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. See Chapter 1.6.4.6.6.4.6 “CANopen field bus” on page 3179.

Bus terminating resistors

Both ends of the CAN bus have to be terminated with a 120 Ω \((\geq 1/4 \text{ W, } \leq 5\%\) bus terminating resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L). See Chapter 1.6.4.6.6.4.6 “CANopen field bus” on page 3179.

Technical data

The system data of AC500 and S500 are valid for standard version. Chapter 1.6.4.6.1 “System data AC500” on page 3155

The system data of AC500-XC are valid for the XC version. Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

1.6.3.3 Processor modules

The AC500 product family consists of the product groups:
- **AC500 (standard):**
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- **AC500-eCo:**
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- **AC500-S:**
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- **AC500-XC:**
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. 
  
  "Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O Modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

1. 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
2. Micro memory card slot
3. Option board cover for option board slot
4. 13-pin terminal block for I/O connectors
5. 12-pin terminal block for I/O connectors
6. 12 LEDs to display the states of the signals
7. 10 LEDs to display the states of the signals
8. RJ45 female connector for Ethernet1 connection
9. RJ45 female connector for Ethernet2 connection
10. 3-pin terminal block for power supply 24 V DC
11. 2 holes for wall-mounting with screws
12. Cable binding
13. Cable binding accessory on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable binding accessory on the top of the housing is optional. Please use TA5301-CFA accessory.
**Short description**

The processor modules PM50xx series are the central units of AC500-eCo V3 PLC. Their main characteristics are:

- Power supply 24 V DC
- I/O bus (not for PM5012-x-ETH)
- Real time clock (PM5012-x-ETH needs additional RTC option board)
- Option slots for extension on the CPU (1 for PM5012-x-ETH, 2 for PM5032-x-ETH, 3 for PM5052-x-ETH and PM5072-T-2ETH)
- 6 digital inputs (PM5012-x-ETH), 12 digital inputs (PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH)
- 4 transistor outputs (PM5012-T-ETH), 8 transistor outputs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH)
- 4 relay outputs (PM5012-R-ETH), 6 relay outputs (PM5032-R-ETH, PM5052-R-ETH)
- 2 configurable digital inputs/outputs (not for PM5012-x-ETH)

The various processor module variants differ in the following characteristics:

- Type of the digital outputs (transistor or relays)
- Ethernet interface one or two independent interfaces

All processor module variants include a micro memory card slot.

Details and technical data are provided in the technical data section "Chapter 1.6.3.3.1.1.8 "Technical data" on page 2278.

## Connections and interfaces

### I/O bus

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128kB input/128kB output variables) and 10 I/O modules for PM5052-x-ETH and PM5072-T-2ETH can be added.

### Option slots interface

Depending on the processor module variants, additional option board can be connected to the option slot to extend the feature of the processor module.

### Serial interface

RS232 communication interface is available by using option board:
- TA5141-RS232I (isolated)
  - [Chapter 1.6.3.3.1.2.6 “TA5141-RS232I - RS-232 serial adapter isolated option board” on page 2308](#)

RS485 communication interface is available by using option boards:
- TA5142-RS485I (isolated)
  - [Chapter 1.6.3.3.1.2.7 “TA5142-RS485I - RS-485 serial adapter isolated option board” on page 2311](#)
- TA5142-RS485 (non isolated)
  - [Chapter 1.6.3.3.1.2.8 “TA5142-RS485 - RS-485 serial adapter non isolated option board” on page 2317](#)

### Ethernet interface

The Ethernet interface is carried out via a RJ45 jack.

Power supply

The processor modules PM50xx can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

**CAUTION!**
Risk of damaging the AC500-eCo V3 processor module and the connected modules!
Voltages > 30 V DC might damage the processor module and the connected modules.
Make sure that the supply voltage never exceeds 30 V DC.

State LEDs and operating elements

**RUN/STOP button**
The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

**State LEDs**
The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

<table>

</tr>
</tbody>
</table>
The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.

The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

User configurable LEDs

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH) to display the states of the inputs and outputs.

### Diagnosis

The AC500 processor module can display various errors according to the error classes. The following error classes are possible. The reaction of the processor module is different for each type of error.

<table>
<thead>
<tr>
<th>Error class</th>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1</td>
<td>Fatal error</td>
<td>A safe function of the operating system is no longer guaranteed.</td>

<td>Severe error</td>
<td>The operating system is functioning without problems, but the error-free processing of the user program is no longer guaranteed.</td>
<td>Checksum error in the user Flash, independent of the task duration</td>
</tr>
<tr>
<td>E3</td>
<td>Light error</td>
<td>It depends on the application if the user program should be stopped by the operating system or not. The user should determine which reaction is necessary.</td>
<td>Flash could not be programmed, I/O module has failed</td>
</tr>
<tr>
<td>E4</td>
<td>Warning</td>
<td>Error in the periphery (e.g. I/O) which may show an impact in the future. The user should determine which reaction is necessary.</td>
<td>Short-circuit at an I/O module, the battery is run down or not inserted</td>
</tr>
</tbody>
</table>

*) The behaviour if the ERR-LED lights up at error classes E3 or E4 is configurable.

Occurred errors can be displayed with the commands diagshow all in the PLC-Browser of Automation Builder software.
Onboard I/Os

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

Intended purpose

### Electrical connection

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module. Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply. Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

When replacing a processor module, it is recommended to mark each wire connected to the onboard I/O terminal block before disconnecting it. This should make sure that the wires can be reconnected in the same order.

The electrical connection is carried out by using removable 12-pin and 13-pin terminal blocks.

Connection of the digital inputs

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

**Risk of malfunctions in the plant!**

A ground closure, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection of the digital inputs to the PM50xx processor modules:
Connection of the digital transistor outputs (PM50xx-T-ETH only)

Fig. 74: Electrical connection of digital transistor outputs

CAUTION!
Risk of damaging the processor module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast protection fuse for the outputs.

Connection of the digital relay outputs (PM50xx-R-ETH only)
The following figures show the electrical connection of the digital relay outputs to the processor modules:
Fig. 75: Electrical connection of digital relay outputs (24 VDC)

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

**WARNING!**
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.
CAUTION!
Risk of damaging the processor module!
– Never short-circuit or overload the outputs.
– Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
– Never connect voltages > 240 V. All outputs must be fed from the same phase.
– Use an external 5 A fast protection fuse for the outputs.

For AC500 devices the function “fast counter” is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function “fast counter” is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.
Further information:
Operating modes of the fast counter: § Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3515
Configuration of the fast counter: § Chapter 1.6.6.2.7.2 “Fast counters in the onboard I/Os” on page 3459

Option boards

**TA5101-4DI - Digital input module option board**

- 4 digital inputs 24 V DC (I0 to I3) in 1 group
- Module-wise electrically isolated

1. 4 yellow LEDs to display the signal states of the inputs I0 to I3
2. Allocation of signal name
3. 5-pin terminal block for input signals

**Intended purpose**

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).
The inputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs.

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via internal CPU connection</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>

**Electrical connection**

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the system assembly chapter.*

The electrical connection is carried out by using a removable 5-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module’s scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital inputs:
Table 418: Assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>COM 0..3</td>
<td>Input common for signals I0 to I3</td>
</tr>
<tr>
<td>2</td>
<td>I0</td>
<td>Input signal I0</td>
</tr>
<tr>
<td>3</td>
<td>I1</td>
<td>Input signal I1</td>
</tr>
<tr>
<td>4</td>
<td>I2</td>
<td>Input signal I2</td>
</tr>
<tr>
<td>5</td>
<td>I3</td>
<td>Input signal I3</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5101-4DI.

An external power supply connection is not needed.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.
The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

Risk of malfunctions in the plant!
- A ground closure, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection of the digital input module TA5101-4DI:

<table>
<thead>
<tr>
<th>Sink inputs of TA5101-4DI</th>
<th>Source inputs of TA5101-4DI</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Sink inputs diagram" /></td>
<td><img src="image" alt="Source inputs diagram" /></td>
</tr>
</tbody>
</table>

The module provides several diagnosis functions, see Diagnosis "Diagnosis" on page 2288.

The meaning of the LEDs is described in the section State LEDs "State LEDs" on page 2289.

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing optional modules is possible without any re-parameterization via software.

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.
### Table: Module Parameters

</tbody>
</table>

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)
3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.

---

**TA5105-4DOT - Digital output module option board**

- 4 digital outputs 24 V DC (O0 to O3) in 1 group
- Module-wise electrically isolated
The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2). The outputs are group-wise electrically isolated from each other. All other circuitry of the module is electrically isolated from the outputs.

### Functionality

<table>
<thead>
<tr>

<td>Via the terminals ZP and UP (process supply voltage 24 V DC)</td>
</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the system assembly chapter.

The electrical connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module’s scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
Table 419: Assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>NC</td>
<td>Not connected</td>
</tr>
<tr>
<td>2</td>
<td>O0</td>
<td>Output signal O0</td>
</tr>
<tr>
<td>3</td>
<td>O1</td>
<td>Output signal O1</td>

<td>O3</td>
<td>Output signal O3</td>
</tr>
<tr>
<td>6</td>
<td>UP</td>
<td>Process supply voltage UP +24 V DC</td>
</tr>
<tr>
<td>7</td>
<td>ZP</td>
<td>Process supply voltage ZP 0 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5105-4DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital output module TA5105-4DOT:

```

**NOTICE!**

**Risk of malfunctions in the plant!**

Only if L+/M of the CPU is available and the outputs are already configured in the AB program, then as soon as the UP/ZP is available, the outputs will switch on.

This must be considered in the planning of the application.

**NOTICE!**

**Risk of damaging the I/O module!**

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis "Diagnosis" on page 2294.

The meaning of the LEDs is described in the section State LEDs "State LEDs" on page 2295.
I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing optional modules is possible without any re-parameterization via software.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

3 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master
11 / 12 | ADR | 1...10 | | | |

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5110-2DI2DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!

Risk of malfunctions in the plant!
A ground closure, e.g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection for inputs of the digital input/output module TA5110-2DI2DOT:

<table>
<thead>
<tr>
<th>Sink inputs of TA5110-2DI2DOT</th>
<th>Source inputs of TA5110-2DI2DOT</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Sink inputs diagram]</td>
<td>![Source inputs diagram]</td>
</tr>
</tbody>
</table>

The following figure shows the electrical connection for outputs of the digital input/output module TA5110-2DI2DOT:

![Output connections diagram]
NOTICE!
Risk of malfunctions in the plant!
Only if L+/M of the CPU is available and the outputs are already configured in the AB program, then as soon as the UP/ZP is available, the outputs will switch on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis “Diagnosis” on page 2302.
The meaning of the LEDs is described in the section State LEDs “State LEDs” on page 2303.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e. g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

TA5131-RTC option board for real time clock

1 TA5131-RTC option board

Intended purpose

This option board is only for the basic CPUs PM5012-T-ETH and PM5012-R-ETH.

All other AC500-eCo V3 CPUs have the real-time clock already integrated.

Information can be found in the chapter system technology: see Chapter 1.6.5.1.3 “Real-time clock and battery” on page 3231

Functionality

Information can be found in the chapter system technology: see Chapter 1.6.5.1.3 “Real-time clock and battery” on page 3231

### TA5141-RS232I - RS-232 serial adapter isolated option board

1 LEDS for communication state display (TxD and RxD)
2 Allocation of signal name
3 5-pin terminal block for communication interface

### Intended purpose

Serial communication option board TA5141-RS232I is equipped with 1 RS-232 serial interface with handshake.

### Electrical connection

#### Serial interfaces

**NOTICE!**

**Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!**

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a serial communication option board TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.
TA5142-RS485I - RS-485 serial adapter isolated option board

1 2 LEDs for communication state display (TxD and RxD)
2 2 LEDs for termination state display
3 Allocation of signal name
4 5-pin terminal block for communication interface

Intended purpose
Serial communication option board TA5142-RS485I is equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.
Bus terminations are built-in and configurable.

Electrical connection
Serial interfaces

NOTICE!
Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!
If the 5-pin terminal block of the TA5101-4DI option board is plugged into a serial communication option board TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.
Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

### Bus cable

#### Bus line

| Construction                  | 2 cores, twisted, with common shield |
| Conductor cross section       | > 0.22 mm² (24 AWG) |
| Twisting rate                 | > 10 per meter (symmetrically twisted) |
| Core insulation               | Polyethylene (PE) |
| Resistance per core           | < 100 Ω/km |
| Characteristic impedance      | ca. 120 Ω (100 Ω...150 Ω) |
| Capacitance between the cores | < 55 nF/km (if higher, the max. bus length must be reduced) |
| Terminating resistors         | 120 Ω ¼ W at both line ends |

**Remarks**

- Commonly used telephone cables with PE insulation and a core diameter of > 0.8 mm are usually sufficient.
- Cables with PVC core insulation and core diameter of 0.8 mm can be used up to a length of approx. 250 m. In this case, the bus terminating resistor is approx. 100 Ω.

### Cable length

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

**RS-485 for point-to-point or bus connection:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission rate</td>
<td>9.6 kbit/s to 115.2 kbit/s</td>
</tr>
<tr>
<td>Maximum cable length</td>
<td>On request</td>
</tr>
</tbody>
</table>
**Bus termination**

The line ends of the bus segment must be equipped with bus termination resistors. These resistors are integrated in the module TA5142-RS485I. The pull-up and pull-down settings must also be made on the circuit board of the module.

1. Termination resistance settings
2. Pull-up and pull-down settings

The configuration is shown in the table below:

<table>
<thead>
<tr>
<th>Settings on the module</th>
<th>State of LEDs</th>
<th>Internal wiring diagram</th>
<th>Description</th>
</tr>
</thead>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**) The needed spring terminal block is always delivered with the option board. The terminal block listed in the table is for spare part only if needed.
TA5142-RS485 - RS-485 serial adapter non isolated option board

1. 2 LEDs for communication state display (TxD and RxD)
2. 2 LEDs for termination state display
3. Allocation of signal name
4. 5-pin terminal block for communication interface

Intended purpose

Serial communication option board TA5142-RS485 is equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.

Bus terminations are built-in and configurable.

Electrical connection

Serial interfaces

**NOTICE!**

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a serial communication option board TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

</tbody>
</table>

## Bus cable

### Bus line

- **Construction**: 2 cores, twisted, with common shield
- **Conductor cross section**: > 0.22 mm² (24 AWG)
- **Twisting rate**: > 10 per meter (symmetrically twisted)
- **Core insulation**: Polyethylene (PE)
- **Resistance per core**: < 100 Ω/km
- **Characteristic impedance**: ca. 120 Ω (100 Ω...150 Ω)
- **Capacitance between the cores**: < 55 nF/km (if higher, the max. bus length must be reduced)
- **Terminating resistors**: 120 Ω ¼ W at both line ends

**Remarks**

- Commonly used telephone cables with PE insulation and a core diameter of > 0.8 mm are usually sufficient.
- Cables with PVC core insulation and core diameter of 0.8 mm can be used up to a length of approx. 250 m. In this case, the bus terminating resistor is approx. 100 Ω.

## Cable length

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

**RS-485 for point-to-point or bus connection:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>

<td>On request</td>
</tr>
</tbody>
</table>
Bus termination

The line ends of the bus segment must be equipped with bus termination resistors. These resistors are integrated in the module TA5142-RS485. The pull-up and pull-down settings must also be made on the circuit board of the module.

The configuration is shown in the table below:

16 Slot for processor module (processor module mounted on terminal base)
17 Lithium battery TA521
18 Memory card (MC502)
19 I/O bus for connection of I/O modules
**Short description**

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.

Table 421: Comparison: TB56xx

</tbody>
</table>

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1). Chapter 1.6.3.2.1.3 “Technical data” on page 2243

All other V3 processor modules can operate multiple communication modules via their communication module interface.

The communication modules are mounted on the left side of the processor module on the same terminal base.
On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.

Each processor module can be used as:

- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 VDC.

---

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**Connections**

All terminals for electrical connection are available on the terminal base. For information on connection and available interfaces see the descriptions for

- Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2236.

---

Processor modules PM56xx-2ETH can only be used with TB56xx-2ETH terminal bases.

---

**Remarks:**
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

¹) PM567x must have an index ≥ C0.

---

### Storage elements

#### Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery *Chapter 1.6.3.8.2.4 “TA521 - Lithium battery” on page 3093.*

#### Memory card

AC500 processor modules are supplied without memory card. It must be ordered separately. The memory card can be used

- to read and write user files
- to download a user program
- for firmware updates

Detailed information can be found in the system technology chapter. *Chapter 1.6.5.1.2 “System processing” on page 3219*

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards (MC502).

> Only genuine MC502 memory cards are supported.

For more information on the technical data, handling instructions and the insertion/replacement of the memory card, please refer to the chapter memory card MC502. *Chapter 1.6.3.8.2.1 “MC502 - memory card” on page 3082*
LEDs, display and function keys on the front panel

Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding is described in the system technology section "Chapter 1.6.5.1.5 “LEDs, display and function keys on the front panel” on page 3238.

Technical data

The system data of AC500 and S500 are valid for standard version. "Chapter 1.6.4.6.1 “System data AC500” on page 3155

The system data of AC500-XC are valid for the XC version. "Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206

Only additional details are therefore documented below.
The technical data are also valid for the XC version.

1.6.3.4 Communication modules (AC500 standard)

1.6.3.4.1 Overview

AC500 communication modules are required for
- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules
- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.
  A separate voltage source is not required.
WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

For information on mounting and demounting, please refer to the chapter mounting and demounting the communication modules "Mounting and demounting the communication modules" on page 3172.

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- "Chapter 1.6.3.2.1 "TB56xx for AC500 V3 products” on page 2236

There are no restrictions concerning which communication modules can be arranged for a processor module.

Within the AC500 control system, the communication modules can be used as
- bus master or
- slave.

It depends on the
- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:
- CMxyz-ETH: Ethernet
- CMxyz-DP: PROFIBUS
- CMxyz-PNIO: PROFINET
- CMxyz-ETHCAT: EtherCAT
- CMxyz-CN: CANopen
- CMxyz-RCOM: RCOM/RCOM+ protocol (and 2 serial interfaces)
- CMxyz-RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.

1.6.3.4.3 CANopen

CM598-CN - CANopen master

- CANopen master 1 Mbit/s
- XC version for use in extreme ambient conditions available
Purpose

Communication Module CM598-CN enables communication over the CANopen field bus.
For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN. Chapter 1.6.6.2.11.1.1.2 “Configuration of the protocols CAN 2.0 A / CAN 2.0 B” on page 3489.
Support of CANopen protocol is in preparation.
Electrical connection

Field bus interface

<table>
<thead>
<tr>
<th>Interface socket</th>
<th>5-pin COMBICON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission standard</td>
<td>ISO 11898, potential-free</td>
</tr>
<tr>

</tr>
</tbody>
</table>

The CANopen connector has the following pin assignment:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CAN_GND</td>
<td>CAN reference potential</td>
</tr>
<tr>
<td>2</td>
<td>CAN_L</td>

</tr>
<tr>
<td>4</td>
<td>CAN_H</td>
<td>Bus line, receive/transmit line, HIGH</td>
</tr>
<tr>
<td>5</td>
<td>NC</td>
<td>Not connected</td>
</tr>
</tbody>
</table>

**NOTICE!**

Unused connector!

Make sure that the terminal block is always connected to the terminal base, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:
### Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

1.6.3.4.4 EtherCAT
CM579-ETHCAT - EtherCAT master

Intended purpose
Communication module CM579-ETHCAT is for EtherCAT communication. The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved in a non-volatile way on a flash EPROM.

Electrical connection
Field bus interfaces
The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.

1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

Shield   | Cable shield | Functional earth

For further information regarding wiring and cable types see chapter Ethernet, "Chapter 1.6.4.6.4.7 "Ethernet connection details" on page 3181.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.
State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

### 1.6.3.4.5 PROFINET

**CM579-PNIO**

- PROFINET I/O controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available
1 5 LEDs for state display  
2 2 rotary switches for address setting (not used)  
3 Label  
4 2 communication interfaces RJ45 (PNIO1 and PNIO2)  
  Sign for XC version

**Intended purpose**

The communication module is for PROFINET RT communication.

The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved in a non-volatile way on a flash EPROM.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1.6.3.5 Terminal units (AC500 standard)

**Hot swap**

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

**Hot swap**

Further information about hot swap: Chapter 1.6.5.1.7 “Hot swap” on page 3275.

1.6.3.5.1 TU507-ETH and TU508-ETH for Ethernet communication interface modules

- TU507-ETH, Ethernet terminal unit, 24 VDC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 VDC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 VDC, spring terminals, XC version
1 I/O bus (10 pins, female) to electrically connect the first terminal unit
2a Plug (2x 25 pins) to electrically connect the inserted Ethernet communication interface module
2b Plug (3x 19 pins) to electrically connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 2 RJ45 interfaces with indication LEDs for connection with the Ethernet network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the electrical connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.

The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e.g. CI501-PNIO).
**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version.

*The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.*

<table>
<thead>
<tr>

<td>1.5, 1.6, 1.7, 1.8, 1.9</td>
</tr>
<tr>
<td>Screwdriver</td>
<td></td>
<td>(opens terminal)</td>
</tr>
</tbody>
</table>

For information about wiring specifications see the description of the Terminal Units in Chapter 1.6.4.6.4.3 "Terminals at the terminal unit" on page 3175.

For a detailed description of the mounting, disassembly and electrical connection of the terminal units and the I/O modules, please refer to the "System Assembly, Construction and Connection" chapter in Chapter 1.6.4.6.3 "Mounting and demounting" on page 3165.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

The assignment of the other terminals is dependent on the inserted communication interface module.
**NOTICE!**

**Risk of corrosion!**

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices.  

*Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3102*

---

**Technical data**

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3155* are valid for standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206* are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

- TU542-H, I/O terminal unit, hot swap, 24 VDC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 VDC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.
1 I/O bus (10 pins, male) to electrically connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to electrically connect other terminal units
3a Plug (2 25 pins) to electrically connect the inserted I/O modules
3b Plug (2 19 pins) to electrically connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
5 Holes for wall mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White boarder signifies hot swap capability of the terminal unit

**Hot swap**

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!

Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

– make sure the following conditions apply:
  – Digital outputs are not under load.
  – Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  – Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  – Never touch exposed contacts (dangerous voltages).
  – Stay away from electrical contacts to avoid arc discharge.
  – Do not operate a mechanical installation improperly.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

Hot swap

System requirements for hot swapping of I/O modules:

– Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
– I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
**NOTICE!**
**Risk of damage to I/O modules!**
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
**Risk of damage to I/O modules!**
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

1.6.3.5.3 **TU517 and TU518 for communication interface modules**
- TU517, terminal unit, 24 VDC, screw terminals
- TU518, terminal unit, 24 VDC, spring terminals
- TU518-XC, terminal unit, 24 VDC, spring terminals, XC version
1 I/O bus (10 pins, female) to electrically connect the first terminal unit
2a Plug (2 25 pins) to electrically connect the inserted communication interface module
2b Plug (2 19 pins) to electrically connect the inserted communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
4 2 holes for wall mounting
5 10 terminals for connection with the bus system
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.

The terminal units TU517 and TU518 are specifically designed for use with AC500/S500 communication interface modules (e.g. CI581-CN, CI541-DP):

- CANopen communication interface modules
- DeviceNet modules
- PROFIBUS DP communication interface modules
**XC version**

**XC = eXtreme Conditions**

**Extreme conditions**

Terminal units for use in extreme ambient conditions have no \*\*\* sign for XC version. The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

1.6.3.5.4  TU531 and TU532 for I/O modules

- TU531, I/O terminal unit, 230 VAC, screw terminals
- TU532, I/O terminal unit, 230 VAC, spring terminals
- TU532-XC, I/O terminal unit, 230 VAC, spring terminals, XC version
- TU532-H, I/O terminal unit, hot swap, 230 VAC, spring terminals
- TU532-H-XC, I/O terminal unit, hot swap, 230 VAC, spring terminals, XC version

1 I/O bus (10 pins, male) to electrically connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to electrically connect other terminal units
3a Plug (2 25 pins) to electrically connect the inserted I/O modules
3b Plug (3 19 pins) to electrically connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
5 2 holes for wall mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White boarder signifies hot swap capability of the terminal unit

The input/output modules (I/O modules) plug into the I/O terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115-230 VAC inputs and/or 230 VAC relay outputs.

**WARNING!**

Risk of explosion or fire in hazardous environments during hot swaping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!

Electric shock due to negligent behavior during hot swapping!

To avoid electric shock:
- Make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

NOTICE!

Risk of damage to I/O modules!

- Hot swapping is only allowed for I/O modules.
- Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

**Hot swap**

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix **TU5xx-H**.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
The index of the module is in the right corner of the label.

**NOTICE!**
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

</tbody>
</table>

For information about wiring specifications see the description of the Terminal Units in Chapter 1.6.4.6.4.3 “Terminals at the terminal unit” on page 3175.
For a detailed description of the mounting, disassembly and electrical connection of the terminal units and the I/O modules, please refer to the "System Assembly, Construction and Connection" chapter "Mounting and demounting" on page 3165.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted decentralized communication interface module (see the description of the respective module used).

The supply voltage of 24 VDC for the module’s circuitry comes from the I/O expansion bus (I/O bus).

**Technical data**

The system data of AC500 and S500 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1.6.3.6 I/O modules

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules. Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

**Hot swap**

Further information about hot swap: Chapter 1.6.5.1.7 “Hot swap” on page 3275.

1.6.3.6.1 Digital I/O modules

S500-eCo

DC561 - Digital input/output module

- 16 configurable digital inputs/outputs 24 VDC,
- Connection via Interfast
- Module-wise electrically isolated
The digital input/output module DC561 can be connected to the following devices via the I/O bus connector:

- S500 bus modules (e.g. CI501-PNIO, CI541-DP, CI581-CN)
- AC500 CPUs (PM5xx)
- other AC500 I/O modules

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

The module contains 16 digital channels in 1 group, each channel can be used as a digital 24 VDC input or 24 VDC output.
The inputs/outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs/outputs.

### Functionality

</tr>
</tbody>
</table>

### Electrical connection

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter \*Chapter 1.6.4.5 \*AC500-eCo\* on page 3121.

The electrical connection is established out by using the 20-pin Interfast connector. For further information, refer to the Interfast documentation.

The assignment of the terminals:

</tbody>
</table>

The arrow located next to the Interfast connector marks terminal 1.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DC561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

If DC561 with index A0 is used, the process supply voltage must stem from the same source as the power supply voltage of the CPU. The index consists of 1 letter, followed by 1 digit, and can be found on the type plate of the module next to the type designator “DC561”.

---

**PLC Automation with V3 CPUs**

PLC integration (hardware) > Device specifications

2021/05/12

3ADR010583, 2, en_US

2378
The module provides several diagnosis functions \( \text{Chapter 1.6.3.6.1.1.6} \) "Diagnosis" on page 2380.

The meaning of the LEDs is described in the section State LEDs \( \text{Chapter 1.6.3.6.1.1.1.7} \) "State LEDs" on page 2380.

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

\[
\text{If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.}
\]

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

<td>DC561, digital input/output module, 16 configurable inputs/outputs, transistor output, interfast connector</td>
<td>Classic</td>
</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DC562 - Digital input/output module**

- 16 configurable digital inputs/outputs in 1 group, 24 VDC
- Module-wise electrically isolated
1 I/O bus
2 16 yellow LEDs to display the states of the inputs/outputs C0 to C15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input and output signals (9-pin)
6 Terminal block for input and output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs/outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs/outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
## Functionality

</tr>
</tbody>
</table>

## Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
### Table 444: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DC562.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

The following figure shows the electrical connection of the digital input/output module DC562:

In this connection example, the inputs/outputs C0...C7 are connected as inputs and the inputs/outputs C8...C15 are connected as outputs.

The module provides several diagnosis functions. See Chapter 1.6.3.6.1.2 "DC562 - Digital input/output module" on page 2383.

The meaning of the LEDs is described in the section State LEDs. See Chapter 1.6.3.6.1.2.7 "State LEDs" on page 2390.
I/O configuration

The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configu-
ration.

</tbody>
</table>

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using a removable 9-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter terminal blocks for S500-eCo I/O modules. The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

![Block diagram of digital inputs]

#### Table 445: Assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>C0..7</td>
<td>Input common for signals I0 to I7</td>
</tr>
<tr>
<td>2</td>
<td>I0</td>
<td>Input signal I0</td>
</tr>
</tbody>
</table>
The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI561.

An external power supply connection is not needed.

### WARNING!
**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

### NOTICE!
**Risk of malfunctions in the plant!**

A ground closure, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection of the digital input module DI561:

</table>
The module provides several diagnosis functions "Chapter 1.6.3.6.1.3.6 "Diagnosis" on page 2398.

The meaning of the LEDs is described in the section State LEDs "Chapter 1.6.3.6.1.3.7 "State LEDs" on page 2399.

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| 3 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 | ADR | 1...10 |

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e. g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DI562 - Digital input module**

- 16 digital inputs 24 VDC / 24 VAC (I0 to I15) in 2 groups
- Group-wise electrically isolated
1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 to I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.
The other electronic circuitry of the module is electrically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
Functionality

<td>Not necessary</td>
</tr>
</tbody>
</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter "Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

```
C0..7  1
 I0  2
 I1  3
 I2  4
 I3  5
 I4  6
 I5  7
 I6  8
 I7  9
 C8..15 10
 I8  11
 I9  12
 I10 13
 I11 14
 I12 15
 I13 16
 I14 17
 I15 18
 ---  19 ◦
 ---  20 ◦
```

The assignment of the terminals:
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI562. An external power supply connection is not needed.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DI571 - Digital input module**
- 8 digital inputs 100-240 VAC (I0 to I7) in 8 groups
- Module-wise electrically isolated
The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other. All other circuitry of the module is electrically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
Functionality

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:
Table 446: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI571.

An external power supply connection is not needed.

### WARNING!

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital input module DI571:
NOTICE!
Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions 

**Chapter 1.6.3.6.1.1.5.7 “Diagnosis” on page 2415.**

The meaning of the LEDs is described in the section State LEDs 

**Chapter 1.6.3.6.1.1.5.8 “State LEDs” on page 2415.**
Internal data exchange

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>1</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of the modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

---

**DI572 - Digital input module**

- 16 digital inputs 100-240 VAC (I0 to I15) in 2 groups
- Module-wise electrically isolated
1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 to I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
### Functionality

</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter "AC500-eCo" on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI572.

An external power supply connection is not needed.

---

**WARNING!**
Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules will be irreparably damaged if a voltage > 240 V is connected.
Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions ⇑ Chapter 1.6.3.6.1.1.6.6 “Diagnosis” on page 2424.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   module error: I/O bus or PNIO: 31 = module itself;
   COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel “31 = module itself” is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### DO561 - Digital output module

- 8 digital outputs 24 VDC (O0 to O7) in 1 group
- Module-wise electrically isolated
1. I/O bus
2. 8 yellow LEDs to display the signal states of the outputs O0 to O7
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (11-pin)
6. 2 holes for wall-mounting with screws
7. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process supply voltage 24 VDC)</td>
</tr>
</tbody>
</table>

**Electrical connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

```
  10
   o---
   |   O0 11
   |   O1 12
   |   O2 13
   |   O3 14
   |   O4 15
   |   O5 16
   |   O6 17
   |   O7 18
   | UP 19
   | ZP 20
```

**Table 448: Assignment of the terminals:**

</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**
**Removal/Insertion under power**
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
**Risk of damaging the PLC modules!**
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital output module DO561:
**NOTICE!**

**Risk of malfunctions in the plant!**

The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.

---

**NOTICE!**

**Risk of damaging the I/O module!**

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis Chapter 1.6.3.6.1.1.7.6 “Diagnosis” on page 2431).

The meaning of the LEDs is described in the section State LEDs Chapter 1.6.3.6.1.1.7.7 “State LEDs” on page 2432.

---

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| 3 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module
   1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 =
   expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 =
   expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### DO562 - Digital output module

- 16 digital outputs 24 VDC (O0 to O15) in 1 group
- Module-wise electrically isolated
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
### Functionality

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter "AC500-eCo" on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital output module DO562:
NOTICE!

Risk of malfunctions in the plant!

The outputs may switch on for a period of 10 to 50 $\mu$s if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis © Chapter 1.6.3.6.1.1.8.6 “Diagnosis” on page 2441).
The meaning of the LEDs is described in the section Status LEDs © Chapter 1.6.3.6.1.1.8.7 “State LEDs” on page 2441.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1...10 = decentralized communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DO571 - Digital output module**

- 8 digital normally open relay outputs 24 VDC / 24 VAC or 100-240 VAC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise electrically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 to O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*

<tr>
<td>20</td>
<td>L+</td>
<td>Process voltage L+ +24 VDC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DO571.

The external power supply connection is carried out via the L+ (+24 VDC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/bus module and the DO571 must have a common power supply.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:

**WARNING!**
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.
Disconnected any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0..3 and R4..7) does not exceed 8 A.
Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the electrical connection of the module:

**Fig. 79: Connection of 24 VDC actuators**
Fig. 80: Connection of 24 VAC or 100-240 VAC actuators

**NOTICE!**
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

![Connection Diagram](image)

Fig. 81: Power supply - the negative connection is realized via the I/O bus
The L+ connection of the DO571 and the 24 V supply of the CPU/bus module must be connected to the same 24 V power supply.

The module provides several diagnosis functions (see Diagnosis Chapter 1.6.3.6.1.1.9.6 “Diagnosis” on page 2451).

The meaning of the LEDs is described in the section Status LEDs Chapter 1.6.3.6.1.1.9.7 “State LEDs” on page 2452.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1..10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DO572 - Digital output module**

- 8 digital triac outputs (O0 to O7) in 8 groups
- 240 VAC
- Module-wise electrically isolated
1. I/O bus
2. 8 yellow LEDs to display the signal states of the outputs O0 to O7
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (9-pin)
6. Terminal block for output signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
### Functionality

</tr>
</tbody>
</table>

### Electrical connection

> For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter § Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
<table>

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO572.

An external power supply connection is not needed.

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the module:
NOTICE!
Risk of damaging the PLC modules!
The PLC modules will be irreparably damaged if a voltage > 240 V is connected.
Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions (see chapter Diagnosis § Chapter 1.6.3.6.1.10.6 “Diagnosis” on page 2461).
The meaning of the LEDs is described in the section State LEDs § Chapter 1.6.3.6.1.10.7 “State LEDs” on page 2462.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

| 4 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 | ADR | 1...10 |

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DO573 - Digital output module**

- 16 digital normally open relay outputs 24 VDC or 100-240 VAC (NO0 to NO15) in 2 groups, 2 A max.
- Group-wise electrically isolated

![DO573 Digital Output Module Diagram](image)

1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
Table 452: Assignment of the terminals:

</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DO573.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

WARNING!
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:

WARNING!
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..7 and R8..15) does not exceed 10 A.

Never connect total currents > 10 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the electrical connection of the module:
Fig. 82: Connection of 24 VDC actuators
Fig. 83: Connection of 100-240 VAC actuators

The module provides several diagnosis functions (see section Diagnosis ☓ Chapter 1.6.3.6.1.11.6 "Diagnosis" on page 2472).

The meaning of the LEDs is described in the section State LEDs ☓ Chapter 1.6.3.6.1.10.7 "State LEDs" on page 2462.
**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</thead>
<tbody>
<tr>
<td></td>
<td>Outputs NO0...NO15</td>
<td>Digital output</td>
<td>Output is OFF (the output voltage is only displayed if the supply voltage of the module is ON)</td>
<td>Output is ON</td>
</tr>
</tbody>
</table>
### Parameter | Value
---|---
Process supply voltage L+ | 
Connections | Terminals 19 for L+ (+24 VDC) and 20 for M (0 VDC)
Rated value | 24 VDC
Current consumption via L+ | 50 mA
Max. ripple | 5 %
Protection against reversed voltage | Yes
Rated protection fuse for L+ | Recommended; the outputs must be protected by an 5 A fast fuse
Current consumption from 24 VDC power supply at the L+/UP and M/ZP terminals of the CPU/bus module | Ca. 5 mA
Galvanic isolation | Yes, between the output groups and the rest of the module
Isolated groups | 2 (8 channels per group)
Surge-voltage (max.) | 35 VDC for 0.5 s
Max. power dissipation within the module | 2.0 W
Weight | Ca. 160 g
Mounting position | Horizontal or vertical
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

**No effects of multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

### Technical data of the digital outputs

| Parameter | Value |
---|---|
Number of channels per module | 16 normally-open relay outputs
Distribution of the channels into groups | 2 (8 channels per group)
Connection of the channels NO0 to NO7 | Terminals 1 to 8
Connection of the channels NO8 to NO15 | Terminals 10 to 17
Reference potential for the channels NO0 to NO7 | Terminal 9 (signal name R0..7)
Reference potential for the channels NO8 to NO15 | Terminal 18 (signal name R8..15)
Relay coil power supply | Terminals 19 and 20 (signal names L+ and M)
Indication of the output signals | 1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus
Way of operation | Non-latching type
Relay output voltage | 
Rated value | 24 VDC or 120/240 VAC
### Parameter | Value
---|---
Output delay |  
Switching 0 to 1 (max.) | Typ. 10 ms  
Switching 1 to 0 (max.) | Typ. 10 ms  
Output data length | 2 bytes  
Output current |  
Rated current per channel (max.) |  
2.0 A (24 VDC / 24 VAC / 48 VAC / 120 VAC / 240 VAC, only resistive loads)  
2.0 A (24 VAC / 48 VAC / 120 VAC, only pilot duty)  
1.5 A (240 VAC, only pilot duty)  
Rated current per group (max.) | 10 A  
Lamp load (max.) | 200 W (230 VAC), 30 W (24 VDC)  
Spark suppression with inductive AC loads | Must be performed externally according to driven load specification  
Switching Frequencies |  
With resistive loads | Max. 1 Hz  
With inductive loads | On Request  
With lamp loads | Max. 1 Hz  
Output type | Non-protected  
Protection type | External fuse  
Rated protection fuse | 5 A fast  
Short-circuit-proof / Overload-proof | No, should be provided by an external fuse or circuit breaker  
Overload message | No  
Output current limitation | No  
Connection of 2 outputs in parallel | Not possible  
Life time of relay contacts (cycles) | 100,000 at rated load  
Max. cable length |  
Shielded | 500 m  
Unshielded | 150 m

1) Per group in case of group fuse protection. For each channel in case of channel-by-channel fuse protection. The maximum current per group must not be exceeded.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DX561 - Digital input/output module

- 8 digital inputs 24 VDC (I0 to I7) in 1 group
- 8 digital transistor outputs 24 VDC (O0 to O7) in 1 group
- Group-wise electrically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs O0 to O7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs and outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter "Chapter 1.6.4.5 "AC500-eCo" on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**
Risk of malfunctions in the plant!
A ground closure, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.
The following figure shows the electrical connection of the inputs to the digital input/output module DX561:

![Electrical connection diagram of inputs - sink inputs]

**Fig. 85: Electrical connection of inputs - sink inputs**

The following figure shows the electrical connection of the outputs to the module:

![Electrical connection diagram of outputs]

**Fig. 86: Electrical connection of inputs - source inputs**

The following figure shows the electrical connection of the outputs to the module:
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see chapter Diagnosis Chapter 1.6.3.6.1.12.6 “Diagnosis” on page 2484).
The meaning of the LEDs is described in the Displays section Chapter 1.6.3.6.1.12.7 “State LEDs” on page 2485 chapter.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

#### Remarks:

1) In AC500 the following interface identifier applies:
   
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   
   31 = module itself,
   
   1...10 = decentralized communication interface module 1...10,
   
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DX571 - Digital input/output module**

- 8 digital inputs 24 VDC / 24 VAC (I0 to I7) in 1 group
- 8 digital normally open relay outputs 24 VDC / 24 VAC or 100-240 VAC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise electrically isolated
I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs NO0 to NO7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs and outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

### Functionality

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminal L+ (process voltage 24 VDC). The negative pole is provided by the I/O bus.</td>
</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
Table 454: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DX571.

The external power supply connection is carried out via the L+ (+24 VDC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/bus module and the DX571 must have a common power supply.

**WARNING!**
**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
**Risk of damaging the PLC modules!**

- Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0..3 and
R4..7) does not exceed 8 A.
Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the
outputs should be used.

The module provides several diagnosis functions (see Diagnosis “Chapter 1.6.3.6.1.13.6
“Diagnosis” on page 2497).
The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground closure, e. g. caused by a damaged cable insulation, can bridge
switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be
no risks to persons or plant.

The following figures show the electrical connection of the inputs to the digital input/output
module DX571:

![Electrical connection of inputs - sink inputs](image)

Fig. 88: Electrical connection of inputs - sink inputs
Fig. 89: Electrical connection of inputs - source inputs

The following figures show the electrical connection of the outputs to the module:

Fig. 90: Connection of 24 VDC actuators
The L+ connection of the DX571 and the 24 V supply of the CPU/bus module must be connected to the same 24 V power supply.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:
WARNING!
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section "Chapter 1.6.3.6.1.13.7 “State LEDs” on page 2498.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = Module itself,
1...10 = communication interface module 1...10,
ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

State LEDs

<table>
<thead>
<tr>
<th>LED</th>
<th>State</th>

¹) See also the instructions for the use of the power supply for numerous PLC in V3 CPUs.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Parameter | Value
---|---
Current consumption from 24 VDC power supply at the L+/UP and M/ZP terminals of the CPU/bus module | Ca. 5 mA
Galvanic isolation | Yes, between the input group and the output group and the rest of the module
Isolated groups | 3 groups (1 group for 8 input channels, 2 groups for 8 output channels)
Surge-voltage (max.) | 35 VDC for 0.5 s
Max. power dissipation within the module | 2.3 W
Weight | Ca. 150 g
Mounting position | Horizontal or vertical
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
S500
DC522 - Digital input/output module

- 16 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

Intended purpose
The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input/output unit.

- 2 sensor supply voltages 24 VDC, 0.5 A, with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 VDC (C0 to C15) in 1 group (2.0...2.7 and 4.0...4.7), each of which can be used
  - as an input,
  - as a transistor output with short-circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast counter</td>
<td>Integrated, many configurable operating modes (only with AC500)</td>
</tr>
<tr>
<td>LED displays</td>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

### Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 VDC

Terminals 1.9 to 4.9: process voltage ZP = 0 VDC
1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Switch-gear cabinet earth

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.3</td>
<td>+24 V</td>
<td>4 x sensor power supply sources (loadable with 0.5 A in total)</td>
</tr>
<tr>

<td>0 V (reference potential)</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C8 to C15</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>
CAUTION!
The process supply voltage must be included in the earthing concept (e. g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC522.
Connect a 470 Ω / 1 W resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions Chapter 1.6.3.6.1.2.1.7 “Diagnosis” on page 2507.
Internal data exchange

<table>

</tr>
</tbody>
</table>

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

The system data of AC500 and S500 ∋ Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC ∋ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

---

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DC523 - Digital input/output module

- 24 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 VDC / 0.5 A
4 24 yellow LEDs to display the signal states at the digital inputs/outputs (C0 - C23)
5 1 green LED to display the status of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
10 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input/output unit.

- 1 sensor supply voltage 24 VDC, 0.5 A, with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 VDC (C0 to C23) in 1 group (2.0...2.7, 3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

⚠️ **NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

### Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:
Terminals 1.8 to 4.8: process voltage $UP = +24\, \text{VDC}$

Terminals 1.9 to 4.9: process voltage $ZP = 0\, \text{VDC}$

The assignment of the other terminals:

</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C16 to C23</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

---

**CAUTION!**
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC523.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

---

**WARNING!**
**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "Chapter 1.6.3.6 "I/O modules" on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

**NOTICE!**
**Risk of influences to the connected sensors!**

Some sensors may be influenced by the deactivated module outputs of DC523.

Connect a 470 Ω / 1 W resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions "Chapter 1.6.3.6.1.2.2.7 “Diagnosis” on page 2518."
Internal data exchange

</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>

**Technical data**

The system data of AC500 and S500 ° Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC ° Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### NOTIFICATION
**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

---

### Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

<table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DC532 - Digital input/output module

- 16 digital inputs 24 VDC, 16 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the digital inputs (I0 - I15)
4 16 yellow LEDs to display the signal states at the digital inputs/outputs (C16 - C31)
5 1 green LED to display the state of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
10 Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input / output unit.

- 16 digital inputs 24 VDC in 2 groups (1.0...1.7 and 2.0...2.7)
- 16 digital configurable inputs/outputs 24 VDC (C16 to C31) in 1 group (3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter % Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.
Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 VDC
Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Switch-gear cabinet earth

The assignment of the other terminals:
<table>

<td>C24 to C31</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

**CAUTION!**
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC532.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter  Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC532. Connect a 470 Ω / 1 W resistor in series to inputs C24/C25 if using them as fast counter inputs to avoid any influences.

The module provides several diagnosis functions ⇑ Chapter 1.6.3.6.1.2.3.7 “Diagnosis” on page 2530.

Internal data exchange

</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

The system data of AC500 and S500 (Chapter 1.6.4.6.1 “System data AC500” on page 3155) are valid for standard version.

The system data of AC500-XC (Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206) are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.
### Parameter

**Process supply voltage UP**

<table>
<thead>
<tr>
<th>Connections</th>
<th>Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)</th>

</tr>
<tr>
<td>Rated protection fuse on UP</td>
<td>10 A fast</td>
</tr>
<tr>
<td>Galvanic isolation</td>
<td>Yes, per module</td>
</tr>
</tbody>
</table>

**Current consumption**

| From 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module | Ca. 2 mA |
| From UP at normal operation / with outputs | 0.15 A + max. 0.5 A per output |
| Inrush current from UP (at power up) | 0.007 A·s |
| Max. power dissipation within the module | 6 W (outputs unloaded) |
| Weight (without terminal unit) | ca. 125 g |
| Mounting position | Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group) |

**Cooling**
The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

---

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

*No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.*

---

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules* on page 2359. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory* on page 3098).

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)* on page 3155.

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

#### Table 455: Assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>

<td>8 digital inputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>I24 to I31</td>
<td>8 digital inputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
CAUTION!
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The module provides several diagnosis functions *Chapter 1.6.3.6.1.2.4.7 “Diagnosis” on page 2541.*

### Internal data exchange

<table>

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</table>

Remarks:

1) With CS31 and addresses smaller than 70 and FBP, the value is increased by 1

2) Not with FBP

3) For a description of the counter operating modes, please refer to the Fast Counter section "Chapter 1.6.3.6.1.2.9 "Fast counter" on page 2583"

4) With FBP or CS31 without the parameter Fast counter

GSD file:

```
Ext_User_Prm_Data_Len = 5
Ext_User_Prm_Data_Const(0) = 0x03, 0xe9, 0x02,
                             0x01, 0x02;
```

**Diagnosis**

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
### LED States

<table>
<thead>
<tr>
<th>LED</th>
<th>Inputs</th>
<th>State</th>
<th>Color</th>
<th>LED = OFF</th>
<th>LED = ON</th>
<th>LED flashes</th>
</tr>

<td>--</td>
<td>--</td>
</tr>
<tr>
<td>CH-ERR4</td>
<td></td>
<td></td>
<td>Red</td>
<td>--</td>
<td>--</td>
<td>--</td>
</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) All of the LEDs CH-ERR1 to CH-ERR4 light up together.

### Technical data

The technical data are also valid for the XC version.

The system data of AC500 and S500 (Chapter 1.6.4.6.1 “System data AC500” on page 3155) are valid for the standard version.

The system data of AC500-XC (Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206) are valid for the XC version.

Only additional details are therefore documented below.

#### Parameter

<table>
<thead>
<tr>
<th>Process supply voltage UP</th>
<th>Value</th>
</tr>

</tr>
<tr>
<td>Galvanic isolation</td>
<td>Yes, per module</td>
</tr>
</tbody>
</table>

#### Current consumption

- From 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module: ca. 2 mA
- From UP at normal operation: 0.15 A
- Inrush current from UP (at power up): 0.008 A²s

Weight (without terminal unit): ca. 105 g
### Parameter | Value
--- | ---
Mounting position | Horizontal or vertical with derating (output load reduced to 50% at 40 °C per group)

### Cooling
The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

### NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### DO524 - Digital output module

- 32 digital outputs 24 VDC / 0.5 A in 4 groups (1.0...4.7) with short circuit and overload protection
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 32 yellow LEDs to display the signal states at the digital outputs (O0 - O31)
4 1 green LED to display the state of the process supply voltage UP
5 4 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
*:* Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels.
### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via the expansion bus interface (I/O bus)</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 VDC)</td>
</tr>
<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516 (\overset{\circ}{\text{Chapter 1.6.3.5.2 &quot;TU515, TU516, TU541 and TU542 for I/O modules&quot; on page 2359}})</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit \(\overset{\circ}{\text{Chapter 1.6.3.5.2 "TU515, TU516, TU541 and TU542 for I/O modules" on page 2359}}\). Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 \(\overset{\circ}{\text{Chapter 1.6.3.8.2.6 "TA526 - Wall mounting accessory" on page 3098}}\)).

#### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter \(\overset{\circ}{\text{Chapter 1.6.4.6 “AC500 (Standard)” on page 3155}}\).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>00 to O7</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>08 to O15</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>3.0 to 3.7</td>
<td>O16 to O23</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O24 to O31</td>
<td>8 digital outputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DO524.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2375.
The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.
Disconnected any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:

The module provides several diagnosis functions “Diagnosis” on page 2549.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.
### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

---

5. 2 red LEDs to display errors
6. Label
7. Terminal unit
8. DIN-rail

* Sign for XC version

** Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the outputs.

Potential separation between the channel groups.
Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltages</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP, ZP3, ZP4, UP, UP3 and UP4 (process voltage 24 VDC)</td>
</tr>
<tr>
<td>Required terminal unit</td>
<td>TU542 [1] Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359</td>
</tr>
</tbody>
</table>

The output module is plugged on the terminal unit TU542. Properly position the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 [2] Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [3] Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 2.8 and 1.9 to 2.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.8 to 2.8</td>
<td></td>
<td>Process voltage UP = +24 VDC</td>
</tr>
<tr>
<td>1.9 to 2.9</td>
<td></td>
<td>Process voltage ZP = 0 V</td>
</tr>
<tr>
<td>3.8</td>
<td></td>
<td>Process voltage UP3 = +24 VDC</td>
</tr>
<tr>
<td>3.9</td>
<td></td>
<td>Process voltage ZP3 = 0 V</td>
</tr>
<tr>
<td>4.8</td>
<td></td>
<td>Process voltage UP4 = +24 VDC</td>
</tr>
<tr>
<td>4.9</td>
<td></td>
<td>Process voltage ZP4 = 0 V</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus Module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DO526.

The external power supply connection is carried out via the UP, UP3, UP4 (+24 VDC) and the ZP, ZP3, ZP4 (0 VDC) terminals.
NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:

```
1.0  2.0  3.0  O0  4.0  O4
1.1  2.1  3.1  O1  4.1  O5
1.2  2.2  3.2  4.2
1.3  2.3  3.3  4.3
1.4  2.4  3.4  O2  4.4  O6
1.5  2.5  3.5  O3  4.5  O7
1.6  2.6  3.6  4.6
1.7  2.7  3.7  4.7
1.8 UP +24V  2.8 UP +24V  3.8 UP3 +24V  4.8 UP4 +24V
1.9 ZP  0V  2.9 UP  0V  3.9 ZP3  0V  4.9 ZP4  0V
```
1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input; Connected with ZP (load) -> Output
3 Switch-gear cabinet earth

CAUTION!
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The module provides several diagnosis functions ➥ Chapter 1.6.3.6.1.2.6.7 “Diagnosis” on page 2558.
Internal data exchange

<p>| | |</p>
<table>

</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions ≥ 1.2.3.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>
LED | State | Color | LED = OFF | LED = ON | LED flashes |
---|---|---|---|---|---|
CH-ERR3 | Channel Error, error messages in groups (digital outputs combined into the groups 3, 4) | Red | No error or process supply voltage is missing | Severe error within the corresponding group | Error on in the corresponding group |
CH-ERR4 | | Red | -- | Internal error | -- |

1) All of the LEDs CH-ERR3 to CH-ERR4 light up together

2) The state of the LEDs corresponds to the logic state of the output. In case of missing or low process supply voltage UP3 or UP4, the signal on the output terminal is off even though the LED is on.

Technical data

The system data of AC500 and S500 "Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC "Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### DX522 - Digital input/output module
- 8 digital inputs 24 VDC, module-wise electrically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Digital configurable input/output unit.

- 8 digital inputs 24 VDC in 1 group (I0...I7)
- 8 digital relay outputs with one switch-over contact each (R0...R7). All output channels are electrically isolated from each other.
- Fast counter
The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

</tbody>
</table>

The device is plugged on a terminal unit [Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2368]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 [Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098]).

### Electrical connection

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module. Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.6.4.6 “AC500 (Standard)” on page 3155].

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 VDC
Table 456: Assignment of the other terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions (see Diagnosis and State LEDs Chapter 1.6.3.6.1.2.7.7 “Diagnosis” on page 2569).

The following figure shows the electrical connection of the digital input/output module DX522.
Fig. 96: Electrical connection of the module

1. I/O bus
2. Switch-gear cabinet earth

NOTICE!
- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.

CAUTION!
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).
NOTICE!
Risk of damaging the PLC module!
The following things have to be considered when connecting input and output voltages to the module:
- All 230 VAC feeds must be single-phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 VAC and 3-phase loads are not allowed.
- The 8 switch-over contacts of the relays are electrically isolated from channel to channel. This allows to connect loads of 24 VDC and 230 VAC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

<table>

### NOTICE!

**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**No effects of multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

---

</tbody>
</table>
DX531 - Digital input/output module

- 8 digital inputs 120/230 VAC
- 4 relay outputs with one switch-over contact each
- Module-wise electrically isolated

* Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Digital configurable input / output unit.

- 8 digital inputs 120/230 VAC in 1 group (2.0...2.3 and 3.0...3.3)
- 4 digital relay outputs with one switch-over contact each (R0...R3). All output channels are electrically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>

</tr>
</tbody>
</table>

The device is plugged on a terminal unit  Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2368. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526  Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

Electrical connection

**WARNING!**
**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage $UP = +24 \text{ VDC}$
- Terminals 1.9 to 4.9: process supply voltage $ZP = 0 \text{ VDC}$

The assignment of the other terminals:

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DX531. The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter in Chapter 1.6.3.6 "I/O modules" on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the module:

1 I/O bus
2 Switch-gear cabinet earth

NOTICE!
- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.
CAUTION!
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

NOTICE!
Risk of damaging the PLC module!
The following things have to be considered when connecting input and output voltages to the module:
- All 230 VAC feeds must be single phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 VAC and 3-phase loads are not allowed.
- The 4 switch-over contacts of the relays are electrically isolated from channel to channel. This allows to connect loads of 24 VDC and 230 VAC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
- All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 VAC max., not for 400 VAC, not even between two input terminals.
- All neutral conductor connections must be common to the same supply system, since the terminals 4.0 to 4.3 are interconnected within the module. Otherwise, accidental energization could occur.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

The module provides several diagnosis functions (see chapter Diagnosis and State LEDs “Chapter 1.6.3.6.1.2.8.7 “Diagnosis“ on page 2580).

Internal data exchange

---

**NOTICE!**

**Attention:**

- All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

---

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**Fast counter**

Details on fast counters: % Chapter 1.6.5.1.11 “Fast counters” on page 3321

**1.6.3.6.2 Analog I/O modules**

**S500-eCo**

**AI561 - Analog input module**

- 4 configurable analog inputs (I0 to I3) in 1 group
- Resolution: 11 bits plus sign or 12 bits
1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3. Terminal number
4. Allocation of signal name
5. Terminal block for input signals (9-pin)
6. Terminal block for input signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other.

All other circuitry of the module is not electrically isolated from the inputs or from the I/O bus.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
### Functionality

4 analog inputs, individually configurable for

- Not used (default setting)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<table>

</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 "AC500-eCo" on page 3121.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

<table>

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per AI561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

---

**NOTICE!**  
Risk of imprecise and faulty measurements!  
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

---

**NOTICE!**  
Risk of damaging the PLC modules!  
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

---

**NOTICE!**  
Risk of damaging the PLC modules!  
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions § Chapter 1.6.3.6.2.1.1.6 “Diagnosis” on page 2590.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.
**CAUTION!**
Risk of damaging the analog input!
The 250 Ω input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the electrical connection of analog sensors (voltage) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

Connection of active-type analog sensors (voltage)  
Connection of passive-type analog sensors (voltage)

The following figures are an example of the electrical connection of analog sensors (current) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

Connection of active-type analog sensors (current)  
Connection of passive-type analog sensors (current)

The meaning of the LEDs is described in the Displays section "Chapter 1.6.3.6.2.1.1.7 "State LEDs" on page 2591."

**I/O configuration**
The analog input module AI561 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module
   1...10, ADR = hardware address (e.g. of the DC551-CS31)
With "Module" the following allocation applies depending on the master:

Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1..10

In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**AI562 - Analog input module**

- 2 configurable analog resistance temperature detector (RTD) inputs (I0 and I1) in 1 group
- Resolution: 15 bits plus sign
1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
**Functionality**

2 analog RTD-inputs, individually configurable for

- Not used (default)
- Pt100, -50 °C...+400 °C, 2-wire
- Pt100, -50 °C...+400 °C, 3-wire
- Pt1000, -50 °C...+400 °C, 2-wire
- Pt1000, -50 °C...+400 °C, 3-wire
- Ni1000, -50 °C...+150 °C, 2-wire
- Ni1000, -50 °C...+150 °C, 3-wire
- Ni100, -50 °C...+150 °C, 2-wire
- Ni100, -50 °C...+150 °C, 3-wire
- Analog input resistance 0 Ω...150 Ω
- Analog input resistance 0 Ω...300 Ω

</tbody>
</table>

**Electrical connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter “Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The electrical connection is carried out by using a removable 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>

<td>19</td>
<td>UP</td>
<td>Process voltage UP (24 VDC)</td>
</tr>
<tr>
<td>20</td>
<td>ZP</td>
<td>Process voltage ZP (0 VDC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per AI562.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

---

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences. Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions “Diagnosis” on page 2600.
The following figures show the electrical connection of RTDs to the inputs of the analog input module AI562.

With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.

The meaning of the LEDs is described in the Displays section “State LEDs” on page 2601.

I/O configuration
The analog input module AI562 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module
   1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 =
   expansion 1...10
   Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10
   = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

Measuring ranges

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.
Make sure that the analog signal at the connection terminals is always within the signal range.

### Parameter | Value
--- | ---
Galvanic isolation | Against internal power supply and other modules
Input ranges | Pt100, Pt1000, Ni100, Ni1000 150 Ω, 300 Ω
Indication of the input signals | No
Module update time | All channels: < 1 s
Channel input resistance | > 100 kΩ
Input filter attenuation | -3 dB at 3.6 kHz
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. Depending on RTD max. ±0.6 % of full scale (guaranteed for 3-wires connection only) at 25 °C
 | Max. ±2 % of full scale (guaranteed for 3-wires connection only) at 0 °C...60 °C or EMC disturbances
Measuring range | % Chapter 1.6.3.6.2.1.2.8 “Measuring ranges” on page 2601
Analog to digital conversion time | Typ. 140 ms per channel
Unused inputs | Can be left open and should be configured as "unused"
Input data length | 4 bytes
Power dissipation inside the sensor (max.) | 1 mW
Suppression of interference | On request
Maximum input voltage | 30 VDC (sense), 5 VDC (source)
Basic error (resistance) | 0.1 % of full-scale
Repeatability | 0.05 % of full-scale
Overvoltage protection | Yes, up to 30 VDC
Wire loop resistance | < 20 Ω
Max. cable length (conductor cross section > 0.14 mm²) | Unshielded wire 10 m
 | Shielded wire 100 m

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### AI563 - Analog input module

- 4 configurable thermocouple (TC) / -80 mV...+80 mV inputs (I0 to I3) in 1 group
- Resolution: 15 bits plus sign

![DIAGRAM](image)

1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3. Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.

The other electronic circuitry of the module is electrically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*

**Functionality**

4 analog TC inputs, individually configurable for

- Not used (default)
- Voltage -80 mV ... + 80 mV
- Thermocouple J-type -210 °C...+1200 °C
- Thermocouple K-type -270 °C...+1372 °C
- Thermocouple R-type -50 °C...+1768 °C
- Thermocouple S-type -50 °C...+1768 °C
- Thermocouple T-type -270 °C...+400 °C
- Thermocouple E-type -270 °C...+1000 °C
- Thermocouple N-type -270 °C...+1300 °C

**Electrical connection**

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter § Chapter 1.6.4.5 “AC500-eCo” on page 3121.*
After powering up the system, input channels, which are configured will have undefined values /diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET Bus Module, the firmware version of PROFINET Bus Modules must be 1.2 or above.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:

```
\begin{center}
\begin{tikzpicture}
\node[anchor=south east] at (0,0) {\textbf{Block Diagram}};
\node[anchor=south east] at (0,-2) {\textbf{Internal Construction}};
\end{tikzpicture}
\end{center}
```

The assignment of the terminals:

<table>

</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions Chapter 1.6.3.6.2.1.3.6 “Diagnosis” on page 2611.

The following figure shows the electrical connection of thermocouples to the inputs of the module:

The meaning of the LEDs is described in Displays Chapter 1.6.3.6.2.1.3.7 “State LEDs” on page 2612 chapter.
I/O configuration

The analog input module AI563 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:
In AC500 the following interface identifier applies:

14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.

The PNIO diagnosis block does not contain this identifier.

With "Device" the following allocation applies:

31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

With "Module" the following allocation applies dependent of the master:

Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = Module itself" is output.

</tr>
</tbody>
</table>

**Measuring ranges**

AI563 needs 4 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During these 4 seconds, the measurement values are set to ‘0’. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms, a re-initialization is performed by AI563.

Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AO561 - Analog output module

- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bit
**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are not electrically isolated from each other.

The other electronic circuitry of the module is not electrically isolated from the outputs or from the I/O bus.

*The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.*
**Functionality**

2 analog outputs, individually configurable for

- Not used (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<td>Via the terminals L+ (process voltage 24 VDC) and M (0 VDC); the M terminal is connected to the M terminal of the CPU via the I/O bus</td>
</tr>
</tbody>
</table>

**Electrical connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter "AC500-eCo" on page 3121.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The electrical connection is carried out by using a removable 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog outputs:
The assignment of the terminals:

<td>M</td>
<td>Process voltage M (0 VDC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AO561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ≥ Chapter 1.6.3.6.2.1.4.6 “Diagnosis” on page 2622.
The following figures show the electrical connection of analog actuators to the analog output module AO561.

Connection of analog voltage actuators

Connection of analog current actuators

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behaviour and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.
I/O configuration

The analog output module AO561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

**Remarks:**
1) In AC500 the following interface identifier applies:
   \( 14 = \text{i/O bus, } 11 = \text{COM1 (e.g. CS31 bus), } 12 = \text{COM2.} \)
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   \( 31 = \text{module itself, } 1...10 = \text{expansion module } 1...10, \text{ ADR = hardware address (e. g. of the DC551-CS31)} \)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: \( 31 = \text{module itself; } 1...10 = \text{expansion } 1...10 \)
   Channel error: I/O bus or PNIO = module type (3 = AO); COM1/COM2: \( 1...10 = \text{expansion } 1...10 \)

4) In case of module errors, with channel "31 = Module itself" is output.

### AX561 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bits

![AX561 diagram]

1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other.
The outputs are not electrically isolated from each other.
All other circuitry of the module is not electrically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

Functionality

4 analog inputs, individually configurable for
- Not used (default)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

2 analog outputs, individually configurable for
- Not used (default)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<tr>
<td>External supply</td>
<td>Via the terminals L+ (process voltage 24 VDC) and M (0 VDC); the M terminal is connected to the M terminal of the CPU via the I/O bus</td>
</tr>
</tbody>
</table>

**For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter ➥ Chapter 1.6.4.5 “AC500-eCo” on page 3121.**

**If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.**

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, refer to terminal blocks for S500-eCo I/O modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs and outputs:
The assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AX561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

**NOTICE!**

Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**WARNING!**

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
The module provides several diagnosis functions. 

Chapter 1.6.3.6.2.1.5.6 “Diagnosis” on page 2634.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.

![Diagram of AI0](image)

**CAUTION!**

Risk of damaging the analog input!

The 250 Ω input resistor can be damaged by overcurrent.

Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the electrical connection of analog sensors (voltage) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

</table>

Connection of analog current actuators

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behaviour and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter "State LEDs" on page 2635.

I/O configuration

The IO module does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

### State LEDs

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### S500

**AI523 - Analog input module**

- 16 configurable analog inputs (I0 to I15) in 2 groups (1.0...2.7 and 3.0...4.7)
  Resolution 12 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog inputs (I0 - I15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9: Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Functionality

16 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

</tr>
</tbody>
</table>

**Electrical connection**

The modules are plugged on an I/O terminal unit ⚪ Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ⚪ Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter ⚪ Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 V

The assignment of the other terminals:
### Terminals

<table>
<thead>

<tr>
<td>4.0 to 4.7</td>
<td>I8+ to I15+</td>
<td>Positive poles of the following 8 analog inputs</td>
</tr>
</tbody>
</table>

---

**CAUTION!**

The negative poles of the analog inputs are electrically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also electrically connected to each other to form an "Analog Ground" signal.

**CAUTION!**

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be electrically isolated in order to avoid loops via the earth potential or the supply voltage.

**CAUTION!**

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

---

*For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

---

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AI523.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

*Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.*

The following figure shows the electrical connection of the module:
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the 8 analog channels.

The modules provide several diagnosis functions by Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.

Fig. 98: Connection example

The following measuring ranges can be configured by Chapter 1.6.3.6.2.2.1.6 “Parameterization” on page 2652.
The function of the LEDs is described under Displays Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

If several measuring points are adjacent to each other, the return line is necessary only once. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured Chapter 1.6.3.6.2.2.1.6 “Parameterization” on page 2652.
<table>

The function of the LEDs is described under Displays: Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Connection diagram]

**Fig. 102: Connection example**

**CAUTION!**

The potential difference between AGND and ZP at the module must not be greater than 1 V, not even in case of long lines.
If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured ➔ Chapter 1.6.3.6.2.2.1.9 “Measuring ranges” on page 2657

<table>
<thead>
<tr>

*) if the sensor can provide this signal range

The function of the LEDs is described under Displays ➔ Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

![Connection diagram]

Fig. 103: Connection example

The following measuring ranges can be configured ➔ Chapter 1.6.3.6.2.2.1.6 “Parameterization” on page 2652 ➔ Chapter 1.6.3.6.2.2.1.9 “Measuring ranges” on page 2657

| Current        | 4 mA...20 mA              | 1 channel used |

The function of the LEDs is described under Displays ➔ Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.
CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 volt Zener diode (in parallel to I+ and I-). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs
Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The earthing potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

Fig. 104: Connection example

The negative pole of the sensor must be earthed next to the sensor.
The following measuring ranges can be configured: Chapter 1.6.3.6.2.2.1.6 “Parameterization” on page 2652, Chapter 1.6.3.6.2.2.1.9 “Measuring ranges” on page 2657:

<table>
<thead>
<tr>
<th>Voltage</th>

</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays: Chapter 1.6.3.6.2.2.1.7 “Diagnosis” on page 2655.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

![Connection example](image)

**Fig. 105: Connection example**

The following operating mode can be configured: Chapter 1.6.3.6.2.2.1.6 “Parameterization” on page 2652, Chapter 1.6.3.6.2.2.1.9 “Measuring ranges” on page 2657.

</tbody>
</table>
I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500, the following interface identifier applies:
   14 = I/O bus,  11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1..10 = decentralized communication interface module
   1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1..10 =
   expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1..10 =
   expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the
channel LEDs) are ON during this time.

**Technical data**

The system data of AC500 and S500 Section 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC Section 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AI531 - Analog input module

- 8 configurable analog inputs (I0 to I7) in 2 groups (1.0...1.7 and 2.0...2.7 as well as 3.0...3.7 and 4.0...4.7)
  Resolution 15 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

Intended purpose
The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Functionality

8 analog inputs, individually configurable for:
- Unused (default setting)
- 0 V...5 V, 0 V...10 V
- -50 mV...+50 mV, -500 mV...+500 mV
- -1 V...+1 V, -5 V...+5 V, -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- -20 mA...20 mA
- Pt100, -50 °C...+70 °C or 400 °C (2-, 3- and 4-wire)
- Pt100, -200 °C...+850 °C (2-, 3- and 4-wire)
- Pt1000, -50 °C...+400 °C (2-, 3- and 4-wire)
- Ni1000, -50 °C...+150 °C (2-, 3- and 4-wire)
- Cu50 (1.426): -50 °C...+200 °C (2-, 3- and 4-wire)
- Cu50 (1.428): -200 °C...+200 °C (2-, 3- and 4-wire)
- 0 Ω...50 kΩ
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter % Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The modules are plugged on an I/O terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8, 2.8, 3.8, 4.8, 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

</tr>
</tbody>
</table>

**CAUTION!**

Analog sensors must be electrically isolated against the earth. In order to avoid inaccuracy with the measuring results, the analog sensors should also be isolated against the power supply.

The "IxB" clamps (x=0..7) of the analog inputs are electrically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix- may accept a potential difference up to ±20 VDC with regard to the common reference potential IxB (AGND, ZP). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.

For the open-circuit detection (cut wire), each positive analog input channel Ix+ is pulled up to "plus" by a high-resistance resistor and each negative analog input channel Ix- is pulled down to "minus" by a resistor. If cut wire occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AI531.
The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.
Connection of active-type analog sensors (Voltage) with electrically isolated power supply

Standard ranges

Fig. 107: Connection example

The measuring ranges can be configured "Parameterization" on page 2679.

Fig. 106: Terminal assignment of the module

The module provides several diagnosis functions "Diagnosis" on page 2683.

The function of the LEDs is described under Diagnosis and displays \( \text{Chapter 1.6.3.6.2.2.2.7 "Diagnosis" on page 2683.} \)

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

**Standard ranges**

[Diagram showing connection example]

---

**CAUTION!**

If GND is not directly connected to ZP at the sensor, the supply current flows via the GND line to ZP. Measuring errors can only occur caused by voltage differences higher than \( \pm 20 \text{ VDC} \) between GND and ZP.

The measuring ranges can be configured \( \bowtie \) Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679:

<table>

<tr>
<td>4 mA...20 mA</td>
<td></td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays “Diagnosis” on page 2683.

Unused input channels can be left open, because they are of low resistance.

Connection of active-type analog sensors (Current) with electrically isolated power supply and series-connection of an additional input

If series-connection of an additional input is used, the input resistance of the module (ca. 330 Ω) must be added to the input resistance of the second device. Make sure that the maximum permitted load resistance of the analog sensor is not exceeded (see the data sheet of the analog sensor).

The input of the module is not related to ZP. If the input of the second device is related to ZP, the order of sequence in the series-connection must be observed by all means (from the sensor to the module and then to the input of the second device).

The following measuring ranges can be configured “Parameterization” on page 2679:

<table>
<thead>
<tr>
<th>Current</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>-20 mA...20 mA</td>

</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays

\[ \text{Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2683} \]

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 116: Connection example

The following measuring ranges can be configured

\[ \text{Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679} \]
The module linearizes the resistance thermometer characteristics. In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

Fig. 117: Connection example

The following measuring ranges can be configured: "Parameterization" on page 2679:

<table>
<thead>
<tr>
<th></th>
<th>Temperature Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C / +400 °C; -200 °C...+850 °C</td>
<td>1</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>1</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>1</td>
</tr>
<tr>
<td>Cu50</td>
<td>-50 °C...+200 °C (1.426); -200 °C...+200 °C (1.428)</td>
<td>1</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays "Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2683.

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means to have all the involved conductors in the same cable. All the conductors must have the same cross section.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

### Connection of resistance thermometers in 4-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

![Connection of resistance thermometers in 4-wire configuration](image)

**Fig. 118: Connection example**

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C / +400 °C; -200 °C...+850 °C</td>
<td>1 channel used</td>

<tr>
<td>Cu50</td>
<td>-50 °C...+200 °C (1.426); -200 °C...+200 °C (1.428)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means, to have all the involved conductors in the same cable.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

### Connection of resistors in 2-wire configuration

For evaluating resistors, a constant current must flow through them to build the necessary voltage drop. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.
The following measuring ranges can be configured by Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679:

| Resistor | 50 kΩ | 1 channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays by Chapter 1.6.3.6.2.2.7 “Diagnosis” on page 2683.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of a resistance measuring bridge with internal supply**

When resistance measuring bridges are connected, the short-circuit-proof voltage output (internal supply) at pin I0A (or I2A, I4A, I6A) must be used. This supply voltage is activated as soon as "Voltage Measurement" is configured for the relevant channel.
Fig. 120: Connection example

1 Internal supply

All voltage measuring ranges can be configured in Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679.

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

Connection of a resistance measuring bridge with external supply

With the connection of a resistance measuring bridge with external supply, the supply voltage is provided separately.
Bridge to IxB necessary with electrically isolated supply

All voltage measuring ranges can be configured Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679:

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

Connection of thermocouples

<table>
<thead>
<tr>

<td>1 channel</td>
</tr>
<tr>
<td>T type</td>
<td>-270 °C...400 °C</td>
<td>Cu-CuNi</td>
<td>1 channel</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays in Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2683.

The module linearizes the thermocouple characteristics. It supports the following possibilities of temperature compensation and handling with cold junctions:

**Internal compensation**

An internal temperature sensor which is located next to the terminal unit is used to detect the temperature of the cold junction. So the compensating cables must be connected directly to the terminal unit, where the cold junction is located.

The setting "Internal compensation (default)" for the parameter "Compensation channel" should be selected.

To get more precise temperature measurements, the use of an external compensation method is recommended.

**External compensation with temperature input**

The temperature for the cold junction can be determined externally.

A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred to the module via the output data word to all required channels. The possible temperature range is from -25 °C to +60 °C and is monitored by the AI531.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with compensation box**

A compensation box balances the temperature difference between the cold junction and the reference temperature by generating a bridge voltage. The reference temperature is transferred via the output data word.

The compensation box must fit to the type of thermocouple and is located at the end of the compensating cables, where the cold junction is located. The cabling to the AI531 can be carried out with normal cables. The operating manual of the compensation box also has to be considered.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with flanking channel**

A flanking channel of the same input group can be used for compensation, e.g. for channel 3, the channels 0, 1 and 2 can be selected as reference channels. The type of sensor for the reference channel can be selected in the parameters for the flanking channel. For example, a RTD sensor which is located next to the thermocouple terminal can be used as reference point for other channels.
The setting "Channel x" for the parameter "Compensation channel" should be selected. Refer to Channel configuration \& Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2679 for possible settings.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

### Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Analog inputs (words)</td>
<td>8</td>
</tr>
<tr>
<td>Analog outputs (words)</td>
<td>1</td>
</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

This means that replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1...10 expansion module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

States of the LEDs (see also section Diagnosis LEDs in the S500 system data):

### Technical data

The system data of AC500 and S500 ☞ Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC ☞ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

2691
### Parameter | Value
---|---
Input delay | Typ. 2 ms
Indication of the input signals | 1 LED per channel
Input signal voltage | 24 VDC
  - Signal 0 | -30 V...+5 V
  - Undefined signal | +5 V...+13 V
  - Signal 1 | +13 V...+30 V
Input current per channel | 
  - Input voltage +24 V | Typ. 5 mA
  - Input voltage +5 V | Typ. 1 mA
  - Input voltage +15 V | Typ. 3.1 mA
  - Input voltage +30 V | < 7 mA
Input resistance | Ca. 4.8 kΩ

### Ordering data

<table>

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### AO523 - Analog output module

- 16 analog outputs in two groups:
  - 8 channels configurable for voltage or current output
  - 8 channels for voltage output
  - Resolution 12 bits plus sign

- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog outputs (O0 - O15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>

<td>TU515 or TU516 (\text{\textcopyright}) Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359</td>
</tr>
</tbody>
</table>

**Electrical connection**

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter \(\text{\textcopyright}\) Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.*

The modules are plugged on an I/O terminal unit \(\text{\textcopyright}\) Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 \(\text{\textcopyright}\) Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>O0- to O7-</td>

<td>O8- to O15-</td>
<td>Negative poles of the following 8 analog outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O8+ to O15+</td>
<td>Positive poles of the following 8 analog outputs</td>
</tr>
</tbody>
</table>

*For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AO523.
The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "I/O modules" on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the module:
The modules provide several diagnosis functions *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2701.*

Connection of analog output loads (Voltage, current)

*Fig. 123: Connection example*

The following measuring ranges can be configured *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2697:*
Voltage | -10 V...+10 V | Load max. ±10 mA | 1 channel used  
Current | 0 mA...20 mA | Load 0 Ω...500 Ω | 1 channel used  
Current | 4...20 mA | Load 0 Ω...500 Ω | 1 channel used  

Only the channels 0...3 and 8...11 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

The function of the LEDs is described under Displays.

Unused analog outputs can be left open-circuited.

**Internal data exchange**

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>0</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>16</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Channel error**

| 4     | 14        | 1...10 | 3      | 0...15   | 48              | Analog value overflow at an analog output | Check output value |
|       | 11 / 12   | ADR    | 1...10 |         |                 |               |        |

| 4     | 14        | 1...10 | 3      | 0...15   | 7               | Analog value underflow at an analog output | Check output value |
|       | 11 / 12   | ADR    | 1...10 |         |                 |               |        |

**Remarks:**

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.
State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

### Technical data

The system data of AC500 and S500 \(^2\) Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC \(^2\) Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AX521 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group (1.0...2.3)
  Resolution 12 bits plus sign
- 4 configurable analog outputs (O0 to O3) in 1 group (3.0...4.3)
  Resolution 12 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Electrical Connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter \ Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The modules are plugged on an I/O terminal unit \ Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 \ Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>

</tr>
</tbody>
</table>

The negative poles of the analog inputs are electrically connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are electrically connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the earth potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter © Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the I/O module.
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

**Fig. 125: Connection example**
<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire, one channel used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

![Connection example diagram](image)

**Fig. 126: Connection example**

*If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.*

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
<table>
<thead>
<tr>
<th>Sensor</th>
<th>Temperature Range</th>

<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with electrically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the electrically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 "Parameterization" on page 2718 and for AX522 "Parameterization" on page 2742:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Measurement Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V...10 V</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of active-type analog sensors (Current) with electrically isolated power supply

![Diagram of current connection](image)

Fig. 128: Connection example

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Diagram of voltage connection](image)

Fig. 129: Connection example

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).
If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

![Connection diagram](image)

*Fig. 130: Connection example*

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).
The use of differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

---

**CAUTION!**

The earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

---

![Connection example](image)

**Fig. 131: Connection example**

- The negative pole of the sensor must be earthed next to the sensor.

<table>
<thead>
<tr>

</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</tbody>
</table>
### Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

---

## State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

Technical data

The system data of AC500 and S500 in Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC in Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Functionality**

8 analog inputs, individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs, individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs, individually configurable for

- Unused (default setting)
- -10 V...+10 V

4 analog outputs, individually configurable for

</table>

Electrical Connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.6.4.6 “AC500 (Standard)” on page 3155].

The modules are plugged on an I/O terminal unit [Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2359]. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 [Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098]).
The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>

</tr>
</tbody>
</table>

The negative poles of the analog inputs are electrically connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are electrically connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the earth potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter © Chapter 1.6.3.6 "I/O modules" on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the I/O module.
Fig. 134: Terminal assignment

**Connection of resistance thermometers in 2-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

*Fig. 135: Connection example*
<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>2-wire, one channel used</td>

<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire, one channel used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

![Connection diagram](Fig. 136: Connection example)

*If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.*

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with electrically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the electrically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 § Chapter 1.6.3.6.2.4.6 "Parameterization" on page 2718 and for AX522 § Chapter 1.6.3.6.2.5.6 "Parameterization" on page 2742:

<table>
<thead>
<tr>
<th>Sensor Type</th>
<th>Measuring Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
<tr>

<td>3-wire configuration, two channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of active-type analog sensors (Current) with electrically isolated power supply

![Connection diagram](image)

**Fig. 138: Connection example**

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Connection diagram](image)

**Fig. 139: Connection example**

CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).
If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

<table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Connection of passive-type analog sensors (Current)**

![Connection example](image)

4 ... 20 mA

Fig. 140: Connection example

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential inputs**

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).
The use of differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

---

**Fig. 141: Connection example**

The negative pole of the sensor must be earthed next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

---

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.
**Fig. 142: Connection example**

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>

**Connection of analog output loads (Voltage, current)**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA). Unused analog outputs can be left open-circuited.
### Internal data exchange

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>8</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration. Module: Module slot address: $Y = 1...10$

For non-standard applications, it is necessary to adapt the parameters to your system configuration. Module slot address: $Y = 1...7$

Remarks:
In AC500, the following interface identifier applies:

14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.

The FBP diagnosis block does not contain this identifier.

With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1.6.3.6.3 Digital/Analog I/O modules

S500

DA501 - Digital/Analog input/output module

- 16 digital inputs 24 VDC
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  - Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  - Resolution 12 bits plus sign
- Fast counter
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

![DIAGRAM](image.png)

1. I/O bus
2. Allocation between terminal number and signal name
3. 16 yellow LEDs to display the signal states of the digital inputs DI0 to DI15
4. 4 yellow LEDs to display the signal states of the analog inputs AI0 to AI3
5. 2 yellow LEDs to display the signal states of the analog outputs AO0 to AO1
6. 8 yellow LEDs to display the signal state of the configurable digital inputs/outputs DC16 to DC23
7. 1 green LED to display the state of the process supply voltage UP
8. 4 red LEDs to display errors
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Functionality

- 16 digital inputs 24 VDC
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  - Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  - Resolution 12 bits plus sign
- Fast counter

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DA501.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

### WARNING!
**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

### NOTICE!
**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.
**CAUTION!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

---

**Fig. 144: Terminal assignment of the module**

The module provides several diagnosis functions § Chapter 1.6.3.6.3.1.1.7 “Diagnosis” on page 2775.

---

**Connection of the digital inputs**

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI15 in the same way.
The meaning of the LEDs is described in the Displays Chapter 1.6.3.6.3.1.8 “State LEDs” on page 2778 chapter.

Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.
CAUTION!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DA501.
If the inputs are used as fast counter inputs, connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.
The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection of resistance thermometers in 2-wire configuration to the analog inputs](image)

The following measuring ranges can be configured in Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2771:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays in Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2778.

The module DA501 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".
Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

![Diagram showing connection of resistance thermometers in 3-wire configuration to analog inputs](image)

Fig. 148: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured \( \Box \) Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2771:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
**Fig. 151: Connection of active-type sensors (voltage) with no electrically isolated power supply to the analog inputs**

**CAUTION!**

Risk of faulty measurements!

The negative pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured [Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2771]:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter [Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2778].

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured “Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2771:

| Current | 4 mA...20 mA | 1 channel used |

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter “Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2778.

**CAUTION!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

*Fig. 153: Connection of active-type analog sensors (voltage) to differential analog inputs*

The following measuring ranges can be configured "Parameterization" on page 2771:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays chapter "State LEDs" on page 2778.

To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 154: Use of analog inputs as digital inputs

The following measuring ranges can be configured *Chapter 1.6.3.6.3.1.6 “Parameterization” on page 2771:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2778.

**Connection of analog output loads (Voltage)**

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
Fig. 155: Connection of analog output loads (voltage)

The following measuring ranges can be configured, refer to Chapter 1.6.3.6.3.1.6 “Parameterization” on page 2771:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load ±10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter, refer to Chapter 1.6.3.6.3.1.8 “State LEDs” on page 2778.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured 

<table>
<thead>
<tr>
<th>Current</th>
<th>Load</th>
<th>Channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 mA...20 mA</td>
<td>0 Ω...500 Ω</td>
<td>1 channel</td>
</tr>
<tr>
<td>4 mA...20 mA</td>
<td>0 Ω...500 Ω</td>
<td>1 channel</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays chapter on page 2778.

Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the Fast Counter</th>
<th>With the Fast Counter (only with AC500)</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: \(Y = 1\ldots10\)

</tr>
<tr>
<td>Off by E3 + Failsafe</td>
<td>Error LED lights up at errors of error classes E1 and E2, Failsafe mode on *)</td>
</tr>
</tbody>
</table>

#### Remarks:

1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission
2) Not for FBP
3) With FBP or CS31 without the parameter "Fast Counter"

> The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

4) For counter operating modes, please refer to the description of the fast counter ☞ Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2583
5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe mode is ON.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicates the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1

## Technical data

### Technical data of the module

The system data of AC500 and S500 ☞ Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.
The system data of AC500-XC

Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

NOTICE!

Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
DA502 - Digital/Analog input/output module

- 16 digital outputs, 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD, resolution 12 bits plus sign
- 2 analog outputs, voltage and current, resolution 12 bits plus sign
- Fast counter
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

1. 16 yellow LEDs to display the signal states of the digital outputs DO0 to DO15
2. 4 yellow LEDs to display the signal states of the analog inputs AI0 to AI3
3. 2 yellow LEDs to display the signal states of the analog outputs AO0 to AO1
4. 8 yellow LEDs to display the signal states of the configurable digital inputs/outputs DC16 to DC23
5. 1 green LED to display the state of the process supply voltage UP
6. 4 red LEDs to display errors
7. Label
8. Terminal unit
9. DIN rail
10. Sign for XC version
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "Chapter 1.6.3.6 “I/O modules” on page 2375.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

---

**CAUTION!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.
Fig. 158: Terminal assignment of the module

The module provides several diagnosis functions &gt; Chapter 1.6.3.6.3.1.2.7 “Diagnosis” on page 2809.

**Connection of the digital outputs**

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 to DO15 in the same way.

For a description of the meaning of the LEDs, please refer to the Displays chapter &gt; Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 2812.

**Connection of the configurable digital inputs/outputs**

The following figure shows the electrical connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.
**NOTICE!**

**Risk of influences to the connected sensors!**

Some sensors may be influenced by the deactivated module outputs of DA502.

Connect a $470 \Omega$ / 1 W resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of the meaning of the LEDs, please refer to the Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 2812 chapter.

---

**Connection of resistance thermometers in 2-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 159: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured: Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 2805 Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 2812:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 2812.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as “unused”.

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
Fig. 160: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured: Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 2805 Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 2812:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 2812.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 V...10 V</td>
<td>1 channel used</td>
<td></td>
</tr>
<tr>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
<td></td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays “State LEDs” on page 2812.

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs**

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 162: Connection of active-type analog sensors (current) with electrically isolated power supply to the analog inputs

The following measuring ranges can be configured "Chapter 1.6.3.6.3.1.2.6 "Parameterization" on page 2805 "Chapter 1.6.3.6.3.1.2.9 "Measuring ranges" on page 2812:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays "Chapter 1.6.3.6.3.1.2.8 "State LEDs" on page 2812.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
**CAUTION!**

**Risk of faulty measurements!**

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays.

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 164: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured \(\text{Chapter 1.6.3.6.3.1.2.6 "Parameterization" on page 2805 \& Chapter 1.6.3.6.3.1.2.9 "Measuring ranges" on page 2812:}

**Current**  \(4 \text{ mA}...20 \text{ mA}\)  \(1\ \text{channel used}\)

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \(\text{Chapter 1.6.3.6.3.1.2.8 "State LEDs" on page 2812.}

**NOTICE!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to \(I^+\) and \(I^-\).

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference
with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection of active-type analog sensors to differential analog inputs](image)

**Fig. 165: Connection of active-type analog sensors (voltage) to differential analog inputs**

The following measuring ranges can be configured *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 2805* *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 2812*:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 2812*.

To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 V DC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays:

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
Connection of analog output loads (voltage)

The following measuring ranges can be configured: 

- **Voltage**: -10 V...+10 V
- **Load**: ±10 mA max.
- **1 channel used**

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays: "State LEDs" on page 2812.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured "Parameterization" on page 2805 "Measuring ranges" on page 2812:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>Load 0 Ω...500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays "State LEDs" on page 2812.

Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the Fast Counter</th>
<th>With the Fast Counter (only with AC500)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>

<td>0</td>
<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

</tr>
</tbody>
</table>

#### Remarks:

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.

2) With "Device" the following allocation applies:
   - 31 = module itself,
   - 1...10 = decentralized communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus: 31 = Module itself, COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicate the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1
## State LEDs

1. Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.
2. Brightness depends on the value of the analog signal.
3. All of the LEDs CH-ERR1 to CH-ERR4 light up together.

### Technical data

#### Technical data of the module

The system data of AC500 and S500 \(\text{‰} \) Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC \(\text{‰} \) Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

### Parameter | Value
--- | ---
Configurability | -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually)
Output resistance (load), as current output | 0 Ω...500 Ω
Output loadability, as voltage output | ±10 mA max.
Indication of the output signals | 1 LED per channel (brightness depends on the value of the analog signal)
Resolution | 12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance) | Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code | ⇒ Chapter 1.6.3.6.3.1.2.9.3 “Output ranges voltage and current” on page 2814
Unused outputs | Are configured as "unused" (default value) and can be left open-circuited

1.6.3.7 Communication interface modules (S500)

Hot swap

System requirements for hot swapping of I/O modules:

– Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
– I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules. Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping

– Digital outputs are not under load.
– Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
– Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Hot swap

Further information about hot swap: ☞ Chapter 1.6.5.1.7 “Hot swap” on page 3275.

Intended purpose

The CANopen bus module CI581-CN is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0...2.3)
- 2 analog outputs (2.5...2.6)
- 8 digital inputs 24 VDC in 1 group (3.0...3.7)
- 8 digital outputs 24 VDC in 1 group (4.0...4.7)
The inputs/outputs are electrically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Electrical connection

The CANopen bus module is plugged on the I/O terminal units TU517 "Chapter 1.6.3.5.3 "TU517 and TU518 for communication interface modules" on page 2365 or TU518 "Chapter 1.6.3.5.3 "TU517 and TU518 for communication interface modules" on page 2365 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The electrical connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP = +24 VDC
Terminal 4.8: process supply voltage UP3 = +24 VDC
Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter "Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
Do not connect any voltages externally to the digital outputs!

Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This is not the intended use.

---

CAUTION!
Risk of malfunctions by unintended use!

If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7 and DC0..DC7.

---

</tr>
<tr>
<td>1.9</td>
<td>CAN-GND</td>
<td>Ground potential of the CAN bus</td>
</tr>
</tbody>
</table>

At the line ends of a bus segment, termination resistors must be connected. If TU517 or TU518 is used, the bus termination resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external termination resistors are required, see illustration below).

The following figures show the different connection options for the CANopen bus module:

![CANopen bus module connection](image-url)
In the case of TU517/TU518, the termination resistors are not located inside the TU but inside the bus module CI581-CN. Hence, when removing the device from the TU, the bus termination resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The earthing of the shield should take place at the switch-gear cabinet. Please refer to the AC500 System-Data Chapter 1.6.4.6.1 “System data AC500” on page 3155.

**WARNING!**
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

Electrical connection of CANopen bus module CI581-CN:

![Diagram of electrical connection]

Fig. 172: Connection of the bus module CI581-CN

The module provides several diagnosis functions "Diagnosis" on page 2850.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Measuring ranges" on page 2856 and Parameterization "Parameterization" on page 2846.

The meaning of the LEDs is described in the section for the state LEDs "State LEDs" on page 2854.

**Bus length**

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length
<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>

Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.

![Fig. 173: Connection of the digital inputs to the module CI581-CN](image)

Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
<table>
<thead>
<tr>

</tbody>
</table>

For the measuring ranges that can be configured, please refer to sections Measuring Ranges <Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 2856 and Parameterization <Chapter 1.6.3.7.2.2.7 “Parameterization” on page 2846.

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

---

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

![Diagram of 3-wire connection](image.png)

*Fig. 176: Connection of resistance thermometers in 3-wire configuration to the analog inputs*

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection diagram](image)

**Fig. 177: Connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog inputs**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 2856 and Parameterization "Chapter 1.6.3.7.2.2.7 “Parameterization” on page 2846.

To avoid error messages, configure unused analog input channels as "unused".

**Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs**

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Connection of active-type analog sensors (current) with electrically isolated power supply to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>0...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \cite{1.6.3.7.2.2.10} “Measuring ranges” on page 2856 and Parameterization \cite{1.6.3.7.2.2.7} “Parameterization” on page 2846.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

---

\[\begin{array}{|c|c|c|}
\hline
\text{Current} & 0...20 \text{ mA} & 1 \text{ channel used} \\
\hline
\text{Current} & 4...20 \text{ mA} & 1 \text{ channel used} \\
\hline
\end{array}\]

\[\text{For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \cite{1.6.3.7.2.2.10} “Measuring ranges” on page 2856 and Parameterization \cite{1.6.3.7.2.2.7} “Parameterization” on page 2846.}\]

\[\text{Unused input channels can be left open-circuited, because they are of low resistance.}\]

\[\text{Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs}\]

\[\text{The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.}\]
Fig. 179: Connection of active-type sensors (voltage) with no electrically isolated power supply to the analog inputs

**NOTICE!**

Risk of faulty measurements!

- The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).
- Make sure that the potential difference never exceeds ± 1 V.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges § Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 2856 and Parameterization § Chapter 1.6.3.7.2.2.7 “Parameterization” on page 2846.

To avoid error messages, configure unused analog input channels as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 180: Connection of passive-type analog sensors (current) to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
NOTICE!
Risk of faulty measurements!
The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range). Make sure that the potential difference never exceeds ± 1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

</tbody>
</table>
Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen bus module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch’s value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

Parameters of the module

</tbody>
</table>

1) The parameter Behavior digital outputs at communication error is only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. Chapter 1.6.3.7.2.2.3 "Electrical connection" on page 2829. In this case, the start-up is disabled as long as the external voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

**Diagnosis**

Structure of the Diagnosis Block via CANOM_NODE_DIAG.
### Byte Number | Description | Possible Values
--- | --- | ---
1 | Diagnosis byte, slot number | 31 = CI581-CN (e.g. error at integrated 8 DI / 8 DO)
 | 1 = 1st connected S500 I/O module 
 | ... 
 | 10 = 10th connected S500 I/O module 
2 | Diagnosis byte, module number | According to the I/O bus specification passed on by modules to the fieldbus master
3 | Diagnosis byte, channel | According to the I/O bus specification passed on by modules to the fieldbus master
4 | Diagnosis byte, error code | According to the I/O bus specification
 | Bit 7 and bit 6, coded error class
 | 0 = E1
 | 1 = E2
 | 2 = E3
 | 3 = E4
 | Bit 0 to bit 5, coded error description
5 | Diagnosis byte, flags | According to the I/O bus specification
 | Bit 7: 1 = coming error
 | Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:
In AC500, the following interface identifier applies:
“-” = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
The identifier is not contained in the CI541-DP diagnosis block.

With “Device” the following allocation applies: 31 = module itself; 1..10 = decentralized communication interface module

With “Module” the following allocation applies:
31 = module itself
Channel error: module type (1 = AI, 2 = DO, 3 = AO)

This message appears if external voltages at one or more terminals DO0..DO7 cause other digital outputs to be fed by that voltage (voltage feedback, description in Electrical Connection Chapter 1.6.3.7.2.2.3 “Electrical connection” on page 2829). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0..DO7 has overrun the process supply voltage UP3 (description in Electrical Connection Chapter 1.6.3.7.2.2.3 “Electrical connection” on page 2829). Diagnosis message appears for the whole module.

This message appears if the output of a channel DO0..DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

## State LEDs

The state LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

The system data of AC500 and S500  Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC  Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</table>
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**CI582-CN**

- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
11 10 terminals to connect the CANopen bus signals
12 Terminal unit
13 DIN rail
*:* Sign for XC version

**Intended purpose**

The CANopen bus module CI582-CN is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

<td>Inputs and outputs</td>
<td>8 digital inputs (24 VDC)</td>
</tr>
<tr>
<td></td>
<td>8 digital transistor outputs (24 VDC, 0.5 A max.)</td>
</tr>
<tr>
<td></td>
<td>8 configurable digital inputs/outputs (24 VDC, 0.5 A max.)</td>
</tr>
</tbody>
</table>

### Electrical connection

The CANopen bus module is plugged on the I/O terminal units TU517 “TU517 and TU518 for communication interface modules” on page 2365 or TU518 “TU517 and TU518 for communication interface modules” on page 2365 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The electrical connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 VDC
- Terminal 4.8: process supply voltage UP3 = +24 VDC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter “AC500 (Standard)” on page 3155.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

### Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

</tbody>
</table>

At the line ends of a bus segment, termination resistors must be connected. If TU517 or TU518 is used, the bus termination resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external termination resistors are required, see illustration below).

The following figures show the different connection options for the CANopen bus module:
In the case of TU517/TU518, the termination resistors are not located inside the TU but inside the bus module CI581-CN. Hence, when removing the device from the TU, the bus termination resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The earthing of the shield should take place at the switch-gear cabinet. Please refer to the AC500 System-Data Chapter 1.6.4.6.1 "System data AC500" on page 3155.

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Electrical connection of CANopen bus module CI582-CN:

For a description of the meaning of the LEDs, please refer to the section for the state LEDs “Chapter 1.6.3.7.2.3.9 “State LEDs” on page 2880.”
**Bus length**

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>

### Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

> The CANopen bus module reads the position of the rotary switches only during power-up, i.e., changes of the switch position during operation will have no effect until the next module initialization.

> The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

### I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

### Parameterization

#### Parameters of the module

<table>

</tbody>
</table>

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

2) For a description of the counter operating modes, please refer to the Fast Counter section *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2583*.

### Table 516: Error LED / Failsafe function

</thead>
<tbody>
<tr>
<td>Detect voltage overflow at</td>
<td>Off</td>
<td>0</td>
<td>BYTE</td>
<td>Off</td>
</tr>
<tr>
<td>outputs</td>
<td>On</td>
<td>1</td>
<td></td>
<td>0x00</td>
</tr>
</tbody>
</table>

### Remarks:

1) The parameter Behavior DO at comm. error is applied to DC and DO channels and only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears if external voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see Electrical Connection § Chapter 1.6.3.7.2.3.3 “Electrical connection” on page 2866). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters to "OFF". This parameter should only be disabled in exceptional cases as voltage overflow may produce reverse voltage.

### Diagnosis

Structure of the diagnosis block via CANOM_NODE_DIAG.

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis byte, slot number</td>

</tr>
<tr>
<td>3</td>
<td>Diagnosis byte, channel</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
</tbody>
</table>
In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Channel error digital:

| Class | Interface | Device | Module | Channel | Error identifier | Error message | Remedy |
| 4 | - | 31 | 2 | 0...15 | 46 | Externally voltage detected at digital output DO0..DO7 6) | Check terminals |
| 4 | - | 31 | 4 | 0...7 | 46 | Externally voltage detected at digital output DC0..DC7 6) | Check terminals |
| 4 | - | 31 | 2 | 0...7 | 47 | Short circuit at digital output 7) | Check terminals |

Remarks:

1) In AC500, the following interface identifier applies:
   "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
   The identifier is not contained in the CI542-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = module itself, 1..10 = decentralized communication interface module

3) With "Module" the following allocation applies depending on the master:
   Module error: 31 = module itself
   Channel error: module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears if external voltages at one or more terminals DC0..DC7 or DO0..DO7 cause other digital outputs to be supplied by that voltage (voltage feedback, see Electrical Connection Chapter 1.6.3.7.2.3.3 “Electrical connection” on page 2866). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see Electrical Connection Chapter 1.6.3.7.2.3.3 “Electrical connection” on page 2866). A diagnosis message appears for the whole module.
This message appears if the output of a channel DC0..DC7 or DO0..DO7 should be switched on while an external voltage is connected. In this case the start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 [Chapter 1.6.4.6.1 “System data AC500” on page 3155] are valid for standard version.

The system data of AC500-XC [Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206] are valid for the XC version.

Only additional details are therefore documented below. The technical data are also valid for the XC version.

#### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs/outputs if used as inputs

Please refer to the Technical Data of the Digital Inputs "Chapter 1.6.3.7.2.3.10 "Technical data" on page 2881. Deviation:

Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.
Please refer to the Technical Data of the Digital Outputs \( \text{Chapter 1.6.3.7.2.3.10 "Technical data" on page 2881. Deviation:}

1.6.3.7.3 EtherCAT

CI511-ETHCAT

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *) (see also Extended Cam Switch Library)
- Module-wise electrically isolated - Expandability with up to 10 S500 I/O Modules *)

*) Applicable for device index C0 and above.
Intended purpose

The EtherCAT bus module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)
- Cam switch functionality

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

</tbody>
</table>

Electrical connection

The Ethernet bus module CI511-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter \(\leq\) Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
Terminal 3.8: Process supply voltage UP3 = +24 VDC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**CAUTION!**

There is no electrical isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be electrically isolated in order to avoid loops via the earth potential or the supply voltage.
CAUTION!
Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are earthed at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI511-ETHCAT.

---

**Fig. 194: Connection of the bus module CI511-ETHCAT**

1. 4 analog inputs, configurable for 0...10 V, -10...+10 V, 0/4...20 mA, Pt100/Pt1000, Ni1000 and digital signals
2. 2 analog outputs, configurable for -10...+10 V, 0/4...20 mA
3. 8 digital inputs 24 VDC
4. 8 digital outputs 24 VDC, 0.5 A max.
In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

**NOTICE!**
**Risk of faulty measurements!**
The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

**CAUTION!**
The process supply voltage must be included within the earthing concept of the plant (e. g. earthing of the minus pole).

The module provide several diagnosis functions ≈ Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 2906.

The measuring ranges are described in the section Measuring Ranges ≈ Chapter 1.6.3.7.3.1.7 “Parameterization” on page 2900 ≈ Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 2909.

The function of the LEDs is described in the section State LEDs ≈ Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 2906.

**Connection of resistance thermometers in 2-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration.
1. Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The measuring ranges are described in the section Measuring Ranges “Parameterization” on page 2900 and “Measuring ranges” on page 2909.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration.

---

**Fig. 195: Connection of resistance thermometers in 2-wire configuration**

1. Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel
1. Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2. Twisted pair within the cable
3. Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

*) if the sensor can provide this signal range

The measuring ranges are described in the section Measuring Ranges "Parameterization" on page 2900 "Measuring ranges" on page 2909.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)
The following figure shows the connection of passive-type analog sensors (current).
1 analog sensor requires 1 channel

**Fig. 200: Connection of passive-type analog sensors (current)**

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The measuring ranges are described in the section Measuring Ranges Chapter 1.6.3.7.3.1.7 “Parameterization” on page 2900 Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 2909.

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10-volt zener diode (in parallel to I+ and I-). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
Important: The earthing potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

The following figure shows the connection of active-type analog sensors (voltage) to differential inputs.

![Connection diagram](image)

For further information regarding wiring and cable types see chapter Ethernet 
Chapter 1.6.4.4.7 “Ethernet connection details” on page 3181.

The EtherCAT network differentiates between input-connectors (IN) and output- 
connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-con-
nector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has 
to be used. The ETHCAT2 connector is reserved for future extensions.

Addressing

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself.

The analog I/O channels are configured via software.

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e.g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e.g. with the default setting 18 bits the encoder has 196,608 divisions.
### Channel parameters for the cam switch (max. 32x)

</table>

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.
Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

### Remarks:

1) In AC500 the following interface identifier applies:

"." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI511-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:

31 = Module itself or ADR = Hardware address (e. g. of the DC551)
With "Module" the following allocation applies dependent of the master:

| 31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error) |

Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

Diagnosis message appears per channel. The message occurs if the output channel is not active.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 \(\text{Ch.}\) 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC \(\text{Ch.}\) 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

<table>

<tr>
<td>Technology</td>
<td>Hillscher netX100</td>
</tr>
<tr>
<td>Transfer rate</td>
<td>10/100 Mbit/s (full-duplex)</td>
</tr>
</tbody>
</table>
### Parameter | Value
--- | ---
Transfer method | According to Ethernet II, IEE802.3
Ethernet | 100 base-TX, internal switch, 2x RJ45 socket
Expandability (S500 I/O modules) | Up to 10 S500 I/O modules (Index C0 and above), not available (Index below C0)
Indicators | 5 LEDs for state indication
Adjusting elements | 2 rotary switches (used for future topology extensions)
Quantity of input/output data | CI512-ETHCAT: 10 bytes input and 14 bytes output
 | CI511-ETHCAT: 18 bytes input and 18 bytes output
Limit of data for input and output | 144 byte
Acyclic services | SDO (1500 bytes max.)
 | Emergency ECAT_SLV_DIAG
Protective functions (according to CODESYS) | Protected against:
 | ● short circuit
 | ● reverse supply
 | ● overvoltage
 | ● reverse polarity
 | Electrical isolation to network

### Technical data of the module

| Parameter | Value |
--- | --- |
Process supply voltage UP/UP3 |  
 | Rated value | 24 VDC (for inputs and outputs) |
 | Max. load for the terminals | 10 A |
 | Protection against reversed voltage | Yes |
 | Rated protection fuse on UP/UP3 | 10 A fast |
 | Electrical isolation | Ethernet interface against the rest of the module |
 | Inrush current from UP (at power up) | On request |
 | Current consumption via UP (normal operation) | 0.2 A |
 | Current consumption via UP3 | 0.06 A + 0.5 A max. per output |
 | Connections | Terminals 1.8 and 2.8 for +24 V (UP)
 | Terminal 3.8 for +24 V (UP3)
 | Terminals 1.9, 2.9 and 3.9 for 0 V (ZP) |
 | Max. power dissipation within the module | 6 W |
 | Number of digital inputs | 8 |
 | Number of digital outputs | 8 |
 | Number of analog inputs | 4 |
 | Number of analog outputs | 2 |
### Parameter | Value
--- | ---
Reference potential for all digital inputs and outputs | Minus pole of the supply voltage, signal name ZP
Diagnosis | See Diagnosis and Displays § Chapter 6.3.7.3.1.8 “Diagnosis” on page 2906
Operation and error displays | 32 LEDs (totally)
Weight (without terminal unit) | ca. 125 g
Mounting position | Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

**NOTICE!**
**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Ordering data

<table>
<thead>
<tr>
<th>Part no.</th>
<th>Description</th>
<th>Product life cycle phase *)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1SAP 220 900 R0001</td>
<td>CI511-ETHCAT, EtherCAT bus module, 8 DI, 8 DO, 4 AI and 2 AO</td>
<td>Active</td>
</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### CI512-ETHCAT

- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *)
  (see also Extended Cam Switch Library)
- Module-wise electrically isolated
- Expandability with up to 10 S500 I/O modules *)

*) Applicable for device index C0 and above.
The EtherCAT bus module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)
- Cam switch functionality
The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

</tr>
</tbody>
</table>

### Electrical connection

The Ethernet bus module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter \* Chapter 1.6.4.5 “AC500-eCo” on page 3121.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
The assignment of the other terminals:

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figures show the electrical connection of the Ethernet bus module CI512-ETHCAT.
In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

CAUTION!
The process supply voltage must be included within the earthing concept of the plant (e.g. earthing of the minus pole).

The module provide several diagnosis functions § Chapter 1.6.3.7.3.2.9 “Diagnosis” on page 2926.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.
Table 525: Pin assignment RJ45 jack:

<table>
<thead>

</tbody>
</table>

For further information regarding wiring and cable types see chapter Ethernet Chapter 1.6.4.4.7 “Ethernet connection details” on page 3181.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

### Internal data exchange

### Addressing

The Ethernet bus module CI512-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI512-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

</tr>
</tbody>
</table>

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.
Channel parameters for the cam switch (max. 32x)

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Internal value</th>
<th>Internal value, type</th>
<th>Default</th>
</tr>

### Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules perform reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

### Remarks:

1) In AC500 the following interface identifier applies:

"." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O-Bus; 31 = Module itself.

The identifier is not contained in the CI512-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:

31 = Module itself or ADR = Hardware address (e. g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:

31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

4) Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

5) Diagnosis message appears per channel. The message occurs if the output channel is not active.

### State LEDs

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 \(^{\text{7}}\) *Chapter 1.6.4.6.1 “System data AC500” on page 3155* are valid for standard version.

The system data of AC500-XC \(^{\text{7}}\) *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206* are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

5 8 yellow LEDs to display the signal states of the digital outputs (DO0 - DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
*: Sign for XC version
Intended purpose

The Modbus TCP bus module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</tbody>
</table>

Electrical connection

The Ethernet bus module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH ⇐ Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ⇐ Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter "Chapter 1.6.4.6 "AC500 (Standard)" on page 3155.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
Terminal 3.8: Process supply voltage UP3 = +24 VDC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules
All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

<table>

</table>
Do not connect any voltages externally to digital outputs!

Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7.

The assignment of the other terminals:

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI521-MODTCP.

**Fig. 208: Connection of the bus module CI521-MODTCP**

Further information is provided in the System Technology chapter Chapter 1.6.5.3.1 “Modbus communication interface module” on page 3354.

**Connection of the digital inputs**

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.
Fig. 209: Connection of the digital inputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays "Chapter 1.6.3.7.4.1.8.2 “State LEDs” on page 2965."

Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
The meaning of the LEDs is described in Displays \textit{Chapter 1.6.3.7.4.1.8.2 “State LEDs” on page 2965.}

**Connection of resistance thermometers in 2-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

- **Pt100**
  - -50 °C...+70 °C
  - 2-wire configuration, 1 channel used

- **Pt100**
  - -50 °C...+400 °C
  - 2-wire configuration, 1 channel used

- **Pt1000**
  - -50 °C...+400 °C
  - 2-wire configuration, 1 channel used

- **Ni1000**
  - -50 °C...+150 °C
  - 2-wire configuration, 1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays.

The module CI521-MODTCP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

---

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
**Fig. 212: Connection of resistance thermometers in 3-wire configuration to the analog inputs**

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured on page 2955 and on page 2967:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measurement Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>3-wire config., 2 channels used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire config., 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire config., 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire config., 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays on page 2961.

The module CI521-MODTCP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

---

The table above provides the configured measurement ranges for Pt100, Pt1000, and Ni1000 thermometers, with two channels used for each configuration. The module CI521-MODTCP offers a linearization of the resistance characteristic to ensure accurate readings. To prevent error messages from unused channels, they should be set to "unused" configuration.
Connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection diagram](image)

**Fig. 213: Connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog inputs**

The following measuring ranges can be configured in Chapter 1.6.3.7.4.1.7 "Parameterization" on page 2955 and in Chapter 1.6.3.7.4.1.9 "Measuring ranges" on page 2967:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays in Chapter 1.6.3.7.4.1.8 "Diagnosis and state LEDs" on page 2961.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Connection of active-type analog sensors (current) with electrically isolated power supply to the analog inputs

The following measuring ranges can be configured (Chapter 1.6.3.7.4.1.7 “Parameterization” on page 2955 and Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 2967):

<table>
<thead>
<tr>
<th>Current</th>
<th>Range</th>
<th>Channels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0...20 mA</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays (Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 2961).

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
CAUTION!
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ± 1 V).
Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

The following measuring ranges can be configured "Parameterization" on page 2955 and "Measuring ranges" on page 2967.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "Diagnosis and state LEDs" on page 2961.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

- Current: 4...20 mA
- 1 channel used

The function of the LEDs is described under Diagnosis and displays:

- Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 2961.

CAUTION!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

---

**CAUTION!**
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

---

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

---

**Fig. 217: Connection of active-type analog sensors (voltage) to differential analog inputs**

The following measuring ranges can be configured  

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>With differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>With differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays  

Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 2961.
To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs [Chapter 1.6.3.7.4.1.10.5 “Technical data of the analog inputs if used as digital inputs” on page 2973](#). The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Fig. 218: Use of analog inputs as digital inputs](image)

The following measuring ranges can be configured [Chapter 1.6.3.7.4.1.7 “Parameterization” on page 2955](#) and [Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 2967](#):

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays [Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 2961](#).

**Connection of analog output loads (Voltage)**

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
Fig. 219: Connection of analog output loads (voltage)

The following measuring ranges can be configured "Parameterization" on page 2955 and "Measuring ranges" on page 2967.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load ±10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "Diagnosis and state LEDs" on page 2961.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured on page 2955 and on page 2967:

<table>
<thead>
<tr>
<th>Current</th>
<th>Load</th>
<th>Channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0...20 mA</td>
<td>0...500 Ω</td>
<td>1 channel</td>
</tr>
<tr>
<td>4...20 mA</td>
<td>0...500 Ω</td>
<td>1 channel</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays on page 2961.

Unused analog outputs can be left open-circuited.

**Assignment of the Ethernet ports**

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RJ45</td>
<td>1</td>

<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

### Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The IP address of the CI521-MODTCP Module can be set with the "ABB IP Configuration Tool". ⇐ Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3427

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the "ABB IP Configuration Tool".

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

### I/O configuration

The CI521-MODTCP stores configuration parameters (IP address configuration, module parameters).

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization ⇐ Chapter 1.6.3.7.4.1.7 “Parameterization” on page 2955.
### Parameterization

</tbody>
</table>
1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission.

2) Counter operating modes, see description of the Chapter 1.6.5.1.11 "Fast counters" on page 3321.

3) Fixed Mapping means each module has its own Modbus registers for data transfer independent of the IO bus constellation. For details see Chapter 1.6.5.3.1.2 "Modbus TCP registers" on page 3355.

Dynamic mapping means the structure of the IO Data is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.

4) If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</table>

1) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0..DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

## Diagnosis and state LEDs

### Structure of the diagnosis block

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
</table>
| 1           | Diagnosis Byte, slot number        | 31 = CI521-MODTCP (e. g. error at integrated 8 DI / 8 DO)  
1 = 1st connected S500 I/O Module  
...  
10 = 10th connected S500 I/O Module |
| 2           | Diagnosis Byte, module number      | According to the I/O bus specification passed on by modules to the fieldbus master |
| 3           | Diagnosis Byte, channel            | According to the I/O bus specification passed on by modules to the fieldbus master |
| 4           | Diagnosis Byte, error code         | According to the I/O bus specification  
Bit 7 and bit 6, coded error class  
0 = E1  
1 = E2  
2 = E3  
3 = E4  
Bit 0 to bit 5, coded error description |
| 5           | Diagnosis Byte, flags              | According to the I/O bus specification  
Bit 7: 1 = coming error  
Bit 6: 1 = leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

*For diagnosis firmware version $\geq$ 3.2.6 is required.*

Channel error digital

| 4 | - | 31 | 2 | 0...7 | 46 | Externally voltage detected at digital output DO0...DO7 6) | Check terminals |
| 4 | - | 31 | 2 | 0...7 | 47 | Short circuit at digital output 7) | Check terminals |

Channel error analog

| 4 | - | 31 | 1 | 0..3 | 48 | Analog value overflow or broken wire at an analog input | Check value or check terminals |
| 4 | - | 31 | 1 | 0..3 | 7 | Analog value underflow at an analog input | Check value |
| 4 | - | 31 | 1 | 0..3 | 47 | Short circuit at an analog input | Check terminals |
| 4 | - | 31 | 3 | 0..1 | 4 | Analog value overflow at an analog output | Check output value |
| 4 | - | 31 | 3 | 0..1 | 7 | Analog value underflow at an analog output | Check output value |

Remarks:
1) In AC500 the following interface identifier applies:
".-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
The identifier is not contained in the CI521-MODTCP diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself; 1..10 = Expansion module

3) With "Module" the following allocation applies:
31 = Module itself
Module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage ¥ Chapter 1.6.3.7.4.1.3 “Electrical connection” on page 2937. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3 ¥ Chapter 1.6.3.7.4.1.3 “Electrical connection” on page 2937. Diagnosis message appears for the whole module.

6) This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

7) Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.

8) In case of an I/O module doesn’t support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

9) Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

The system data of AC500 and S500 © Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC © Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

Intended purpose

Modbus TCP bus module CI522-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</tbody>
</table>
Electrical connection

The Ethernet bus module CI522-MODTCP is plugged on the I/O terminal unit TU507-ETH

Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355 or TU508-ETH Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

**Do not connect any voltages externally to digital outputs!**

*This is not intended usage.*

**Reason:** Externally voltages at one or more terminals DC0...DC7 or DO8...DO15 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0..DI7.

---

**CAUTION!**

**Risk of malfunction by not intended usage!**

If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO8...DO15 and DC0...DC7.

---

The assignment of the other terminals:

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the Ethernet bus module CI522-MODTCP.

![Connection of the bus module CI522-MODTCP](image)

*Fig. 222: Connection of the bus module CI522-MODTCP*
Further information is provided in the System Technology chapter \textit{Chapter 1.6.5.3.1 “Modbus communication interface module” on page 3354.}

**Connection of the digital inputs**

The following figure shows the electrical connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.

![Connection diagram](image)

\textit{Fig. 223: Connection of the digital inputs to the module CI522-MODTCP}

The meaning of the LEDs is described in Displays \textit{Chapter 1.6.3.7.4.2.8.1 “State LEDs” on page 2992.}

**Connection of the digital outputs**

The following figure shows the electrical connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.
The meaning of the LEDs is described in Displays "Chapter 1.6.3.7.4.2.8.1 "State LEDs" on page 2992.

Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!

If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device "Chapter 1.6.3.7.4.2.3 "Electrical connection" on page 2977."
The meaning of the LEDs is described in Displays "Chapter 1.6.3.7.4.2.8.1 "State LEDs" on page 2992.

Assignment of the Ethernet ports

The terminal unit for the Communication Interface Module provides two Ethernet interfaces with the following pin assignment:

Table 538: Pin assignment RJ45 jack:

Addressing

The IP address of the CI5221-MODTCP Module can be set with the “ABB IP Configuration Tool”. \(\Rightarrow\) Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3427.

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

\[\text{The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.}\]

I/O configuration

The CI522-MODTCP stores configuration parameters (IP address configuration, module parameters).

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization \(\Rightarrow\) Chapter 1.6.3.7.4.2.7 “Parameterization” on page 2984.

Parameterization

Parameters of the module

<td>1</td>
</tr>
<tr>
<td>Fast counter</td>
<td>0 : 10 2)</td>
<td>0</td>
<td>10</td>
<td>BYTE 0</td>
</tr>
</tbody>
</table>

Remarks:

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

2) Counter operating modes Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2583
Fixed Mapping means each module has its own Modbus registers for data transfer independent of the I/O bus constellation description. For details see Chapter 1.6.5.1.2 "Modbus TCP registers" on page 3355.

Dynamic mapping means the structure of the I/O Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.

If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

Table 539: Table Error LED / Failsafe function

<td>Detect voltage overflow at outputs 3)</td>
<td>Off</td>
<td>0</td>
<td>BYTE</td>
<td>Off</td>
</tr>
<tr>
<td></td>
<td>On</td>
<td>1</td>
<td></td>
<td>0x00</td>
</tr>
</tbody>
</table>

Remarks:

1) The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3. Chapter 1.6.3.7.4.2.3 "Electrical connection" on page 2977 (see description in section). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

Diagnosis

Structure of the Diagnosis Block
<table>
<thead>
<tr>

| 5           | Diagnosis Byte, flags              | According to the I/O bus specification  
|             |                                    | Bit 7: 1 = coming error  
|             |                                    | Bit 6: 1 = leaving error                                                                                                                     |
| 6           | Reserved                            | 0                                                                                                                                             |

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version \( \geq 3.2.6 \) is required.

</tbody>
</table>

### Remarks:

- Reverse voltage from digital outputs DO8...DO15 to UP3 4).
- No response during initialization of the I/O module.
- Process voltage UP3 too low.
- Process voltage UP3 gone.
- Voltage overflow at outputs (above UP3 level) 5).

Check terminals.

Replace I/O module.

Check process supply voltage.

Check process supply voltage.

Check terminals/ check process supply voltage.
1) In AC500 the following interface identifier applies:

"." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI502-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module

3) With "Module" the following allocation applies dependent of the master:

Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO8...DO15 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in Electrical Connection Chapter 1.6.3.7.4.2.3 “Electrical connection” on page 2977. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3 Chapter 1.6.3.7.4.2.3 “Electrical connection” on page 2977. Diagnosis message appears for the whole module.

6) This message appears, if the output of a channel DC0...DC7 or DO8...DO15 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

7) Short circuit: After a detected short circuit, the output is deactivated for 2000ms. Then a new start will be executed. This diagnosis message appears per channel.

8) In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

9) Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Technical data**

The system data of AC500 and S500 © Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.
The system data of AC500-XC ❧ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

1.6.3.7.5 PROFINET

Comparison of the C1xyz-PNIO modules

The PROFINET IO devices combine the advantages of decentralized I/O modules with the reaction time of AC500 mounted central I/O modules. The devices for PROFINET provide the extension -PNIO in the device name.
The Communication Module CM579-PNIO acts as IO Controller in a PROFINET network. It is connected to the Processor Module via an internal communication bus. Depending on the Terminal Base, several Communication Modules can be used for one Processor Module.

The Communication Interface Modules Clxyz-PNIO act as IO Devices in a PROFINET network. Additionally the communication module CM589-PNIO(-4) can be used to setup a AC500 PLC to act as IO Device in a PROFINET network.

The difference of the Clxyz-PNIO devices can be found in their input and output characteristics. Chapter 1.6.3.7.5.1.1.1 “Characteristics of CI50x-PNIO” on page 3000. The characteristics for CM589-PNIO(-4) can be found in the device description for CM589-PNIO.

*) Priorization with the aid of VLAN-ID including priority level
Input/Output characteristics of CI501-PNIO

The PROFINET Bus Module CI501-PNIO is used as decentralized I/O module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the Terminal Unit. The Bus Module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3), configurable as:
  - -10 ... +10 V
  - 0 ... +10 V
  - -10 ... +10 V (differential voltage)
  - 0 ... 20 mA
  - 4 ... 20 mA
  - Pt100, Pt1000, Ni1000 (for each 2-wire and 3-wire)
  - 24 V digital input function
- 2 analog outputs (1.5...1.6), configurable as:
  - -10 ... +10 V
  - 0 ... 20 mA
  - 4 ... 20 mA
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital transistor outputs 24 V DC (0.5 A max.) in 1 group (3.0...3.7)
- Resolution of the analog channels: 12 bits

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Input/Output characteristics of CI502-PNIO

- 8 digital inputs 24 V DC
- 8 digital transistor outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise electrically isolated
- XC version for usage in extreme ambient conditions available

CI501-PNIO

- 4 analog inputs, 2 analog outputs, 8 digital inputs, 8 digital outputs
- Resolution 12 bits plus sign
- Module-wise electrically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

1. I/O bus
2. Allocation between terminal number and signal name
3. 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 - AI3, AO0 - AO1)
4. 8 yellow LEDs to display the signal states of the digital inputs (DI0 - DI7)
5. 8 yellow LEDs to display the signal states of the digital outputs (DO0 - DO7)
6. 2 green LEDs to display the process supply voltage UP and UP3
7. 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8. 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9. Label
10. 2 rotary switches for setting the I/O device identifier
11. Ethernet interfaces (ETH1, ETH2) on the terminal unit
Intended purpose

The PROFINET bus modules CI501-PNIO and CI502-PNIO are used as communication interface modules in PROFINET networks. The network connection is performed by Ethernet cables which are inserted in the RJ45 connectors in the terminal unit. An Ethernet switch in the communication interface module allows daisy chaining of the network.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

The bus module contains 22 I/O channels with the following properties:

- 4 configurable analog inputs (2-wire / single-ended) or 2 configurable analog inputs (3-wire / differential) (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC, 0.5 A max. in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the PROFINET network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Electrical connection

The Ethernet bus module CI501-PNIO is plugged on the I/O terminal unit TU507-ETH or TU508-ETH § Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 § Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).
The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter "Chapter 1.6.4.6 "AC500 (Standard)" on page 3155.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
Terminal 3.8: Process supply voltage UP3 = +24 VDC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0...DO7.

The assignment of the other terminals:

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI501-PNIO.

Further information is provided in the System Technology chapter.

Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.
The meaning of the LEDs is described in Displays \textsuperscript{°} Chapter 1.6.3.7.5.2.8.2 “State LEDs” on page 3030.

Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
The meaning of the LEDs is described in Displays © Chapter 1.6.3.7.5.2.8.2 “State LEDs” on page 3030.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:  

- **Pt100**: -50 °C...+400 °C, 2-wire configuration, 1 channel used.
- **Pt1000**: -50 °C...+400 °C, 2-wire configuration, 1 channel used.
- **Ni1000**: -50 °C...+150 °C, 2-wire configuration, 1 channel used.

The function of the LEDs is described under Diagnosis and displays.  

The module CI501-PNIO performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

### Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. channel 1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured \( \text{\textcopyright Chapter 1.6.3.7.5.2.7 "Parameterization" on page 3019 \textcopyright Chapter 1.6.3.7.5.2.9.1 "Input ranges voltage, current and digital input" on page 3032.} \\

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3019* *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3032*:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3025.*

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

**Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs**

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
CAUTION!
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).
Make sure that the potential difference never exceeds ±1 V (also not with long cable lengths).

The following measuring ranges can be configured "Parameterization" on page 3019:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays "Diagnosis and state LEDs" on page 3025.
To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured: Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3019; Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3032:

| Current       | 4 mA...20 mA | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays: Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3025.

**CAUTION! Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**

Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>With differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>

</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays in Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3025.
To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Diagram of analog input connections]

</tbody>
</table>

### Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

### I/O configuration

The CI501-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3019.

Remarks:
With a faulty ID, the modules reports a "parameter error" and does not perform cyclic process data transmission.

As for device index C0 the parameter is no longer evaluated.

Counter operating modes, see description of the Fast counter Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2583.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</tr>
</tbody>
</table>

1) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. Chapter 1.6.3.7.5.2.3 "Electrical connection" on page 3003. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

### Diagnosis and state LEDs

**Structure of the diagnosis block via PNIO_DEV_ALARM function block**

<table>
<thead>
<tr>

</tr>
<tr>
<td>3</td>
<td>Diagnosis Byte, channel</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
</tbody>
</table>
In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Channel error digital
### Remarks:

1) In AC500 the following interface identifier applies:

```
"." = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the communication module; 14 = I/O bus; 31 = Module itself
```

The identifier is not contained in the CI501-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself; 1...10 = Expansion module

3) With "Module" the following allocation applies:

```
31 = Module itself  
Module type (1 = AI, 2 = DO, 3 = AO)
```
This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage. Chapter 1.6.3.7.5.2.3 “Electrical connection” on page 3003. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3. Chapter 1.6.3.7.5.2.3 “Electrical connection” on page 3003. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 100 ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

---

State LEDs

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

The system data of AC500 and S500  % Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC % Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### Parameter | Value
---|---
Extended ambient temperature (XC version) | >60 °C on request
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

**NOTICE!**
**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Parameter | Value
---|---
Bus connection | 2 x RJ45
Switch | Integrated
Technology | Hilscher netX100
Transfer rate | 10/100 Mbit/s (full-duplex)
Transfer method | According to Ethernet II, IEE802.3
Ethernet | 100 base-TX, internal switch, 2x RJ45 socket
Expandability | Max. 10 S500 I/O modules
Adjusting elements | 2 rotary switches for generation of an explicit name
Supported protocols | RTC - real time cyclic protocol, class 1 *)
| RTA - real time acyclic protocol
| DCP - discovery and configuration protocol
| CL-RPC - connectionless remote procedure Call
| LLDP - link layer discovery protocol
| MRP - MRP Client
Acyclic services | PNIO read / write sequence (max. 1024 bytes per telegram)
| Process-Alarm service
Supported alarm types | Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm
Min. bus cycle | 1 ms

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### CI502-PNIO (-XC)
- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- Module-wise electrically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available

Intended purpose

The PROFINET bus module CI502-PNIO is used as communication interface module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.
For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

The CI502 Bus Module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs
- 8 digital inputs: 24 VDC
- 8 digital outputs: 24 VDC, 0.5 A max.

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

### Electrical connection

The Ethernet bus module CI502-PNIO is plugged on the I/O terminal unit TU507-ETH \* Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355 or TU508-ETH \* Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2355. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 \* Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter § Chapter 1.6.4.6 “AC500 (Standard)” on page 3155.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V.

The assignment of the other terminals:

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
This is not intended usage.
Reason: Externally voltages at one or more terminals DC0..DC7 or DO0..DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.
This limitation does not apply for the input channels DI0..DI7.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0...DO7 and DC0...DC7.

The assignment of the other terminals:

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the Ethernet bus module CI502-PNIO.

Further information is provided in the System Technology chapter PROFIBUS.

**Connection of the Digital inputs**

The following figure shows the electrical connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.
The meaning of the LEDs is described in Displays Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3056.
Connection of the Digital outputs

The following figure shows the electrical connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.

The meaning of the LEDs is described in Displays § Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3056.
Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!
If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device. % Chapter 1.6.3.7.5.3.3 “Electrical connection” on page 3042.

The meaning of the LEDs is described in Displays % Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3056.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Table 551: Pin assignment RJ45 jack:

</tbody>
</table>

Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI502-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization

Chapter 1.6.3.7.5.3.7.5 “Parameterization” on page 3049.

<th>Internal value, type</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input delay</td>
<td>0.1 ms, 1 ms, 8 ms, 32 ms</td>
<td>0, 1, 2, 3</td>
<td>BYTE</td>
<td>0.1 ms, 0x00</td>
</tr>
<tr>
<td>Detect short circuit at outputs</td>
<td>Off, On</td>
<td>0, 1</td>
<td>BYTE</td>
<td>Off, 0x00</td>
</tr>
<tr>
<td>Behaviour DO at comm. error 1)</td>
<td>Off, Last value, Last value 5 sec, Last value 10 sec, Substitute value, Substitute value 5 sec, Substitute value 10 sec</td>
<td>0, 1, 6, 11, 2, 7, 12</td>
<td>BYTE</td>
<td>Off, 0x00</td>
</tr>
<tr>
<td>Substitute value at output</td>
<td>0...65535, 0000h...FFFFh</td>
<td>0</td>
<td>WORD</td>
<td>0, 0x0000</td>
</tr>
<tr>
<td>Preventive voltage feedback monitoring for DC0..DC7 2)</td>
<td>Off, On</td>
<td>0, 1</td>
<td>BYTE</td>
<td>Off, 0x00</td>
</tr>
<tr>
<td>Detect voltage overflow at outputs 3)</td>
<td>Off, On</td>
<td>0, 1</td>
<td>BYTE</td>
<td>Off, 0x00</td>
</tr>
</tbody>
</table>

Remarks:
1) The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3 

Diagnosis

Channel error digital

| 4       | - | 31 | 2 | 8...15 | 46 | Externally voltage detected at digital output DO0..DO7 6) | Check terminals |
| 4       | - | 31 | 4 | 0...7 | 46 | Externally voltage detected at digital output DC0..DC7 6) | Check terminals |
| 4       | - | 31 | 2 | 0...7 | 47 | Short circuit at digital output 7) | Check terminals |

Remarks:
1) In AC500 the following interface identifier applies:
"-" = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the Communication Module; 14 = I/O-Bus; 31 = Module itself
The identifier is not contained in the CI502-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module

3) With "Module" the following allocation applies dependent of the master:
Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO0...DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in Electrical Connection § Chapter 1.6.3.7.5.3.3 “Electrical connection” on page 3042. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3 § Chapter 1.6.3.7.5.3.3 “Electrical connection” on page 3042. Diagnosis message appears for the whole module.

6) This message appears, if the output of a channel DC0...DC7 or DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

7) Short circuit: After a detected short circuit, the output is deactivated for 2000 ms. Then a new start up will be executed. This diagnosis message appears per channel.

8) In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

9) Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDS are located at the front of module. There are 2 different groups:
- The 5 system LEDS (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDS (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Technical data**

The system data of AC500 and S500 ❖ Chapter 1.6.4.6.1 “System data AC500” on page 3155 are valid for standard version.

The system data of AC500-XC ❖ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206 are valid for the XC version.
Only additional details are therefore documented below.
The technical data are also valid for the XC version.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.
**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

### 1.6.3.8 Accessories

#### 1.6.3.8.1 AC500-eCo

**MC5102 - micro memory card with micro memory card adapter**

- Secure digital card
- Solid state flash memory storage

1. Micro memory card
2. Micro memory card adapter
All AC500-eCo V3 processor modules have a micro memory card slot.

All other processor modules (AC500 V2, AC500-eCo V2 and AC500 V3) have a memory card slot.

When using the micro memory card for memory card slots in SD size, the supplied micro memory card adapter is required.

Using MC5102 memory card with AC500 V2 or AC500-eCo V2 requires the firmware as of 2.5.x.

</tbody>
</table>

1) The memory card MC5102 is in status Classic. Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

2) A MC503 memory card adapter is required for AC500-eCo V2 processor modules.

3) It is possible to use the MC5141 memory card, but the MC5102 memory card is preferred.

Purpose

The MC5102 micro memory card is prohibited for XC applications. The MC5102 micro memory card can only be used for standard applications with AC500 V3 or AC500-eCo V3.

The micro memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without micro memory card.

Processor modules are supplied without micro memory card. It therefore must be ordered separately.

The micro memory card can be read on a PC with a standard memory card reader. Processor modules are equipped with a memory card reader.

For AC500 V3 the MC5102 micro memory card has to be used with the micro memory card adapter for memory card slot.

For AC500-eCo V3 processor modules the MC5102 micro memory card has to be used without the micro memory card adapter. All AC500-eCo V3 processor modules have a micro memory card slot.
The micro memory card has a write protect switch. In the position "LOCK", the card can only be read.

The use of other micro memory cards than MC5102 micro memory card is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

**Extension of the memory card function**

Memory cards contain firmware and application. Visualizations and all related objects (like text lists) are also added to the memory card.

Export boot project and firmware to the memory card % Chapter 1.6.7.2.1.1 “Memory card application export” on page 3720.

**Insert the micro memory card**

AC500-eCo V3

Unpack the micro memory card and insert it into the micro memory card slot of the processor module PM50xx until locked:
Unpack the micro memory card and insert it into the supplied micro memory card adapter. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked:

**AC500 V3**

*Fig. 229: Insertion: PM50xx*
Fig. 230: Insertion: PM56xx

1 MC5102 micro memory card
2 Micro memory card adapter
   Slot for memory card

**NOTICE!**

**Removal of the micro memory card**

- Do not remove the micro memory card during access. Remove only when the RUN LED does not blink. Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

**AC500-eCo V3**

To remove the micro memory card, push on the micro memory card until it moves forward. By this, the micro memory card is unlocked and can be removed.
AC500 V3

To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward. By this, the micro memory card adapter is unlocked and can be removed.

It is not possible to use 100 % of a device’s memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the micro memory card in AC500 PLCs is provided in the chapter \ Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3720.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

For XC applications with AC500 V3 the MC5102 micro memory card is prohibited. Use the MC5141 memory card.

For standard applications with AC500 V3 use the MC5102 micro memory card with micro memory card adapter for memory card slot.

For standard applications with AC500-eCo V3 use the MC5102 micro memory card without micro memory card adapter for micro memory card slot. All AC500-eCo V3 processor modules have a micro memory card slot.

### TA5300-CVR Option board cover for option slot

**Intended purpose**

Option board covers for PM50xx processor modules are necessary to protect not used option slots.

![TA5300-CVR Option board cover](image-url)
The AC500-eCo V3 are delivered with all slot covered with option board cover. The cover have to be removed before inserting an option board. The TA5300-CVR is intended only for spare parts.

Inserting of the option board cover

1. Press on the option board cover to insert it in the not used option slot of the processor module PM50xx.
2. The option board cover must click into the not used option slot.
Removing of the option board cover

1. Press the side of the inserted option board cover.
2. At the same time, pull the option board cover out of the option slot of the processor module PM50xx.

### Pluggable connectors for screw and spring connection

**Intended purpose**

Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules.
For the AC500-eCo V3 **basic CPU** a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 **standard and pro CPUs** a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw type and a spring type version available.

**TA5400-SIM - Input simulator**

- Input simulator for 6 digital inputs 24 VDC
- For usage with AC500-eCo V3 processor modules

1. Contacts to connect to clamps of onboard I/Os
2. 6 switches for the digital inputs DI0 ... DI5 (0 means opened switch, 1 means closed switch)
3. Screw terminal block for power supply connector of the simulator TA5400-SIM
4. Screw terminal block(s) for I/O connectors of processor module PM50xx

**Intended purpose**

The input simulator TA5400-SIM is used for test and training purposes with AC500-eCo processor modules PM50xx.

It can simulate 6 digital 24 V DC input signals to the digital inputs I0...I5 of onboard I/Os.

**Electrical diagram**

The diagram below shows the electrical connection of the input simulator.
Mounting

To insert the input simulator follow the procedure shown below.

It is recommended to mount TA5400-SIM on screw terminal block only. TA5400-SIM is not designed for mounting on spring terminals.

1. Make sure, that the power supply of the processor module is turned off.

CAUTION!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overvoltages and short circuits. Make sure, that all voltage sources (supply and process voltage) are switched off before you are beginning with operations at the system. Never connect any voltages > 24 V DC to the terminal block of input simulator TA5400-SIM.

CAUTION!
Risk of damaging the input simulator or PLC modules!
The input simulator must only be used with AC500-eCo V3 processor modules PM50xx.
Never use the input simulator with other devices.

The input simulator must only be used for test and training purposes. Never use it within productive plants.

2. Remove the terminal block for power supply from the processor module by a flat-blade screwdriver.

3. Make sure, that all clamps of the onboard I/Os are totally open.
4. Use a flat-blade screwdriver to unplug the terminal block for power supply of the processor module.
5. Insert the input simulator as shown in the picture.

6. Tighten all screws of the onboard I/O clamps (max. torque 1.2 Nm).
7. Make sure all switches are in OFF state
8. Connect 24 V DC to the power supply of the TA5400-SIM.
9. Connect the processor module power supply wires (24 V DC). See PM50xx “Pin assignment” on page 2252.

Usage
With input simulator TA5400-SIM, the digital 24 V DC inputs I0...I5 can be turned OFF and ON separately:
- If the lever of the switch is on the right side, the input is ON.
- If the lever of the switch is on the left side, the input is OFF.

Removal
To remove the input simulator follow the procedure shown below.
1. Make sure, that the power supply of the processor module is turned off.

**CAUTION!**
**Risk of damaging the PLC modules!**
The PLC modules can be damaged by overvoltages and short circuits. Make sure, that all voltage sources (supply and process voltage) are switched off before you are beginning with operations at the system.

2. Disconnect the processor module power supply wires (24 V DC) from the terminal block for power supply.
3. Unplug the terminal block for power supply with a flat-blade screwdriver of the power connector.
4. Loosen all screws of the onboard I/Os.
5. Remove the input simulator by pulling it to the left side.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1.6.3.8.2 AC500 (standard)
MC502 - memory card

- Secure digital card
- Solid state flash memory storage

Memory card overview

All AC500-eCo V3 processor modules have a micro memory card slot.
All other processor modules (AC500 V2, AC500-eCo V2 and AC500 V3) have a memory card slot.

When using the micro memory card for memory card slots in SD size, the supplied micro memory card adapter is required.

Using MC5102 memory card with AC500 V2 or AC500-eCo V2 requires the firmware as of 2.5.x.

¹) The memory card MC5102 is in status Classic. Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

²) A MC503 memory card adapter is required for AC500-eCo V2 processor modules.

³) It is possible to use the MC5141 memory card, but the MC5102 memory card is preferred.
The memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without memory card.

AC500 V3 processor modules are supplied without memory card. It therefore must be ordered separately.

The memory card can be read on a PC with a standard memory card reader.

AC500 V3 processor modules are equipped with an memory card reader.

The memory card has a write protect switch. In the position "LOCK", the card can only be read.

The use of memory cards other than MC502, MC5102 and MC5141 is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Memory cards contain firmware and application.

Visualizations and all related objects (like text lists) are also added to the memory card.

Export boot project and firmware to the memory card % Chapter 1.6.7.2.1.1 “Memory card application export” on page 3720.

Unpack the memory card and insert it into the opening of the front face of the processor module until locked:

**NOTICE!**

Removal of the memory card

Do not remove the memory card during access. Remove only when the RUN LED does not blink. Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

AC500 V3

Fig. 231: Insertion: PM56xx
To remove the memory card, push on the card until it moves forward. By this, the card is unlocked and can be removed.

### Technical data

<table>
<thead>
<tr>
<th>Parameter</th>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

The MC502 memory card is in status Classic.

For planning and commissioning of new installations use memory cards in Active status only.

The MC5141 memory card must be used for XC applications with AC500 V3.

For standard applications with AC500 V3 use the MC5102 micro memory card with micro memory card adapter for memory card slot.

For standard applications with AC500-eCo V3 use the MC5102 micro memory card without micro memory card adapter for micro memory card slot. All AC500-eCo V3 processor modules have a micro memory card slot.

### MC5102 - micro memory card with micro memory card adapter

- Secure digital card
- Solid state flash memory storage
Micro memory card adapter

**Memory card overview**

All AC500-eCo V3 processor modules have a micro memory card slot.

All other processor modules (AC500 V2, AC500-eCo V2 and AC500 V3) have a memory card slot.

When using the micro memory card for memory card slots in SD size, the supplied micro memory card adapter is required.

Using MC5102 memory card with AC500 V2 or AC500-eCo V2 requires the firmware as of 2.5.x.

1) The memory card MC502 is in status Classic. Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

2) A MC503 memory card adapter is required for AC500-eCo V2 processor modules.
3) It is possible to use the MC5141 memory card, but the MC5102 memory card is preferred.

**Purpose**

The MC5102 micro memory card is prohibited for XC applications. The MC5102 micro memory card can only be used for standard applications with AC500 V3 or AC500-eCo V3.

The micro memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without micro memory card.

Processor modules are supplied without micro memory card. It therefore must be ordered separately.

The micro memory card can be read on a PC with a standard memory card reader. Processor modules are equipped with a memory card reader.

For AC500 V3 the MC5102 micro memory card has to be used **with** the micro memory card adapter for memory card slot.

For AC500-eCo V3 processor modules the MC5102 micro memory card has to be used **without** the micro memory card adapter. All AC500-eCo V3 processor modules have a micro memory card slot.

---

**The micro memory card has a write protect switch. In the position “LOCK”, the card can only be read.**

**The use of other micro memory cards than MC5102 micro memory card is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.**

---

**Extension of the memory card function**

Memory cards contain firmware and application.

Visualizations and all related objects (like text lists) are also added to the memory card.

Export boot project and firmware to the memory card % Chapter 1.6.7.2.1.1 “Memory card application export” on page 3720.

**Insert the micro memory card**

**AC500-eCo V3**

Unpack the micro memory card and insert it into the micro memory card slot of the processor module PM50xx until locked:
Fig. 232: Insertion: PM50xx

AC500 V3

Unpack the micro memory card and insert it into the supplied micro memory card adapter. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked:
Fig. 233: Insertion: PM56xx

1. MC5102 micro memory card
2. Micro memory card adapter
Slot for memory card

**NOTICE!**

**Removal of the micro memory card**

- Do not remove the micro memory card during access. Remove only when the RUN LED does not blink. Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

**AC500-eCo V3**

To remove the micro memory card, push on the micro memory card until it moves forward. By this, the micro memory card is unlocked and can be removed.
AC500 V3

To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward. By this, the micro memory card adapter is unlocked and can be removed.

The MC5141 memory card must be used for XC applications with AC500 V3. The MC5141 memory card can be used for standard and XC applications with AC500 V3.

---

**TA521 - Lithium battery**

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

The TA521 lithium battery is the only applicable battery for the AC500 processor modules. It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. "AC500 battery" on page 3232

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.
Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and do not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

Battery lifetime

The battery lifetime is the time the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the processor module is under power, then the battery is correctly recognized and will not shortly discharged.

Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**Insertion**

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = plus-pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

*To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.*
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

TA524 - Dummy communication module

1 Type
2 Label

Purpose

TA524 is used to cover an unused communication module slot of a terminal base. Chapter 1.6.3.2.1 "TB56xx for AC500 V3 products" on page 2236. It protects the terminal base from dust and inadvertent touch.

Handling instructions

TA524 is mounted in the same way as a common communication module. Chapter 1.6.4.6.3.5 "Mounting and demounting the communication modules" on page 3172.

1.6.3.8.3 S500

TA523 - Pluggable marker holder

For labelling the channels of S500 I/O modules.

1. Pluggable Marker Holder TA523
2. Marking stripes to be inserted into the holder
3. Pluggable Marker Holder, snapped on an I/O module

Purpose

The Pluggable Marker Holder is used to hold 4 marking stripes, on which the meaning of the I/O channels of I/O modules can be written down. The holder is transparent so that after snapping it onto the module the LEDs shine through.

Handling instructions

The marking stripes can be printed out from TA563.doc

http://new.abb.com/products/ABB1SAP180500R0001

**TA525 - Plastic markers**

Accessory to label AC500 and S500 modules.

1 Module without Plastic Marker TA525
2 Module with Plastic Marker TA525

**Purpose**
The Plastic Markers are suitable for labelling AC500 and S500 modules (CPUs, communication modules and I/O modules). The small plastic parts can be written with a standard waterproof pen.

**Handling instructions**
The Plastic Markers are inserted under a slight pressure. For disassembly, a small screwdriver is inserted at the lower edge of the module.

1.6.4 System assembly, construction and connection
1.6.4.1 Introduction
This chapter provides information on assembly, construction and connection of control systems of the product family AC500.

The AC500 product family consists of the sub-families:
- AC500 (standard): standard PLC that offers a wide range of performance levels and scalability.
- AC500-eCo: cost-effective PLC that offers total inter-operability with the core AC500 range.
- AC500-S: PLC for special safety requirements in all functional safety applications.

AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. Those devices operate mainly identical to the appropriate AC500 product family, however, can be operated under extreme conditions. Chapter 1.6.4.7.1 “System data AC500-XC” on page 3206.

AC500 product family is characterized by functional modularity, i.e. the devices of all AC500 sub-families can be combined flexible.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section. Details that are only valid for a specific AC500 sub-family are described in separate sections.
As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section “Chapter 1.6.4.4 "Overall information (valid for complete AC500 product family)” on page 3107. Details that are only valid for a specific AC500 sub-family are described in separate sections.

Consider the safety instructions

In the description, special attention must be paid to designs using electrical isolation, earthing and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family “Chapter 1.6.2.1 “Safety instructions” on page 2200.

1.6.4.2 Regulations

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for over-voltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).
1.6.4.3 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

PLC specific safety notices

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!
Avoidance of electrostatic charging
- PLC devices and equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:
  - Touch a grounded object to discharge potential static.
  - Wear an approved grounding wrist strap.
  - Do not touch connectors or pins on component boards.
  - Do not touch circuit components inside the equipment.
  - If available, use a static-safe workstation.
  - When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!
PLC damage due to operation conditions
- Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!
PLC damage due to wrong enclosures
- Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction
- Do not use cleaning agent for cleaning the device.
- Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.
Do not operate devices outside of the specified, technical data!

Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!

PLC damage due to missing earthing
- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.

In the description for the devices (operating manual or AC500 system description), reference is made at several points to earthing, electrical isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the earthing via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the earthing (in this respect, see also VBG 4 and the relevant VDE regulations).

CAUTION!

Do not obstruct the ventilation for cooling!
The ventilation slots on the upper and lower side of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!
Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

WARNING!

Splaying of strands can cause hazards!
During wiring of terminals with stranded conductors, splaying of strands shall be avoided.
- Ferrules can be used to prevent splaying.
WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
