The devices must not be opened when in operation. The same applies to the network interfaces.

CAUTION!
Use only ABB approved lithium battery modules!

At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!
Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations

Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.
This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2,000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.4.4 Overall information (valid for complete AC500 product family)

1.6.4.4.1 Serial I/O bus

The synchronized serial I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

Up to 10 I/O terminal units (for 1 I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules.

1 I/O bus connection

The electrical connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 VDC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals
NOTICE!
The I/O bus is not designed for plugging and unplugging modules while in operation. If a module is plugged or replaced while the bus is in operation, the following consequences are possible:
- reset of the station or of the CPU
- system lockup
- damage of the module

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

With its fast data transmission, the I/O bus obtains very low reaction times. Depending on the device and on the version of firmware and Automation Builder, the following numbers of I/O devices can be connected to the I/O bus.

1.6.4.4.2 Mechanical encoding

![Fig. 236: Possible positions for mechanical encoding (1 to 18)](image)

**NOTICE!**

Terminal units and terminal bases have a mechanical coding which prevents that modules are inserted to wrong places for cases that might result in dangerous parasitic voltages or if modules could be destroyed.
The coding either makes it impossible to insert the module to the wrong place or blocks its electrical function (outputs are not activated).

The following figures show the possible encodings.

### Earthing concept (Block diagrams)

**NOTICE!**

**PLC damage due to missing earthing**

- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.
### 1.6.4.4 EMC-conforming assembly and construction

#### General principles

**General considerations** Electric and electronic devices have to work correctly on site. This is also valid when electromagnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.

Advant Controller components have a very high noise immunity.

When the wiring and earthing instructions are met, an error-free operation is given.

High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.
There are three important principles to be especially considered:

- Keep all connections as short as possible (in particular the earthing conductors)
- Use large conductor cross sections (in particular for the earthing conductors)
- Create low-impedance, i.e. good and large-sized contacts (in particular for the earthing conductors)

Pay attention to the following:

- Use vibration-resistant connections
- Clean metallic contact areas
- Use solid plug and screw-type connections
- Use earth cable shields with clips on a well-grounded metallic surface
- Do not use aluminium parts
- Do not use sheath wires
- Do not use toothed lock washers under screw connections

Fig. 244: Assembly: wrong

Fig. 245: Assembly: correct

Make a connection between the DIN rails and PE (Protective Earth). For this, use an earthing wire with a minimum conductor cross section of 10 mm².

The wire is connected to the DIN rail with an M6 screw.

A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behaviour significantly, as the disturbances can be discharged more effective.

Cable routing

- Route cables meeting the standards.
- Sort the cables into cable groups:
  - Power current cables
  - Power supply cables
  - Signal cables
  - Data cables
• Rout signal cables and data cables separately from the power cables.
  – Separate cable ducts or cable bundles.
  – The distance should be 20 cm or greater.
• Lay signal and data cables close to earthed surfaces.

Cable shields

• Use only shielded data cables. The shield should be earthed at both ends.
  A cable shield only earthed at one end can only protect from capacitively coupled interference and low-frequency disturbances (50 Hz hum).
• Avoid parasitic currents flowing through the cable shields.
  This can be done by installing current-carrying equipotential bondings.
• Use only cables with braided shields.
  Foil shields are not robust enough, cannot be contacted well and have poor HF properties.
• Use only metallic or metal-plated plugs for shielded data cables.
• Use only shielded cables for analog signals.
  For small signals earth the shield only at one end.
• Earth the cable shield directly with a clip when entering the switch-gear cabinet.
  Do not cut the shield until the cable reaches the module connected.

The connection between the PE bar and the shield bar must have a low impedance.

Switch-gear cabinet

According to DNV GL mounting in a separate metallic cabinet is required for:
  – SM560-S-FD-1
  – CI521-MODTCP
  – CI522-MODTCP

Connections

The connections between the switch-gear cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

Earthing

Earth the switch-gear cabinet doors with short and highly flexible conductors.

Illumination

Only use filament lamps (bulbs) or fluorescent tubes with interference suppression.

For supplying the PC

Use the mains socket which is located inside the switch-gear cabinet.

Reference potential

• Provide a uniform reference potential in the entire installation and earth all electrical appliances if possible.
• Route your earthing conductors in a star configuration so that no earth loops can occur.
Equipotential bonding

The installation of equipotential bondings is necessary if there are present or expected potential differences between parts of your application.

- The impedance of equipotential bonding must be equal or lower than 10% of the shield impedance of the shielded signal cables between the same points.
- The conductor cross section of an equipotential bonding must be 16 mm² to withstand the maximum possible compensating current.
- Equipotential bondings and shielded signal cables should be laid close to each other.
- Equipotential bondings must be connected to PE with low impedance.

13 Fieldbus connection (e.g. Ethernet)
1.6.4.4.5 Power consumption of an entire station

The power consumption of a complete station consists of the sum of all individual consumptions.

- Consumers over terminals L+ and M on the AC500 terminal base/AC500-eCo CPU:
  - CPU itself
  - I/O modules attached on the I/O bus
  - Communication modules attached (AC500 terminal base)

- Consumers over the process supply voltage terminals ZP and UP of the AC500 Terminal Units / the L+/M or UP/ZP terminals of the AC500-eCo I/O modules:
  - Digital I/O modules
  - Analog I/O modules

The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.

Calculation of the total current consumption

Example

In the example, the AC500 control system consists of the following devices:

- CPU: PM5xx-ETH or PM5xxx-ETH
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units

![Diagram of the AC500 control system]
Because of the high total current consumption of the digital I/O modules (from \( UP = 24 \, \text{VDC} \)), the supply is divided up into several electric circuits fused separately.

The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A.

The total current can be calculated as follows:

\[ I_{\text{Total}} = I_{\text{LOGIC}} + I_{\text{UP}} \]

with the assumptions

\[ I_{\text{LOGIC}} = I_{\text{CPU}} + I_{\text{I/O bus}} + I_{\text{C1}} + I_{\text{C2}} + I_{\text{C3}} + I_{\text{C4}} \] (CPU + communication modules + I/O bus)

\[ I_{\text{I/O bus}} = \text{Number of expansion modules} \times \text{Current consumption through the I/O bus per module} \]

and

\[ I_{\text{UP}} = I_{\text{UP1}} + I_{\text{LOAD1}} + I_{\text{UP2}} + I_{\text{LOAD2}} + I_{\text{UP3}} + I_{\text{LOAD3}} + I_{\text{UP4}} + I_{\text{LOAD4}} + I_{\text{UP5}} + I_{\text{LOAD5}} + I_{\text{UP6}} + I_{\text{LOAD6}} + I_{\text{UP7}} + I_{\text{LOAD7}} \]

If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

<table>
<thead>
<tr>
<th>( I_{\text{CPU}} )^*)</th>
<th>( I_{\text{Cx}} )^*)</th>
<th>( I_{\text{I/O bus}} )^*)</th>
<th>( I_{\text{UPx}} )^*)</th>

^*) All values in this column are exemplary values

Dimensioning of the fuses

To be able to select the fuses for the station correctly, both the current consumption and the inrush currents (melting integral for the series-connected fuse) must be taken into consideration.

### 1.6.4.4.6 Decommissioning

**Secure decommissioning of a functional CPU**

1. Delete the runtime licenses \(\text{Chapter 1.6.6.2.2.4 “Returning a license” on page 3423.}\)
2. Delete certificates available on the CPU \(\text{Chapter 1.8.3.4.1 “View ‘Security-Screen’ - Devices” on page 3817.}\)
3. Delete applications \(\text{Chapter 1.4.1.24.2.6.11 “Command ‘Reset Origin’” on page 964}\) \(\text{Chapter 1.4.1.24.2.6.12 “Command ‘Reset Origin Device’” on page 965.}\)
4. Delete applications from SD memory card, if available \(\text{Chapter 1.4.1.15 “Copying files to/from PLC” on page 422.}\)
5. If available, remove SD memory card and battery from CPU.
6. Delete all user accounts and user data \(\text{Tab ‘User” on page 923.}\)
7. Demount and dispose the hardware modules \(\text{Chapter 1.6.4.5.3 “Mounting and demounting” on page 3127}\) \(\text{Chapter 1.6.4.6.3 “Mounting and demounting” on page 3165}\) \(\text{Chapter 1.6.4.4.7 “Recycling and disposal” on page 3120.}\)

**Secure decommissioning of a not functional CPU**

\(\Rightarrow\) If you can not access the data stored in the CPU, e.g., because the CPU is not functional any more, then physically destroy the device.

\(\Rightarrow\) This ensures that the credentials that are stored in the device, can not be misused.

### 1.6.4.7 Recycling and disposal

Devices of AC500 product family must not be disposed as unsorted domestic waste. The devices contain valuable raw material which can be recycled. Remove the battery - if existing. Dispose the products according to the local regulations.

Devices of AC500 product family are free from pollutants and are no danger for the environment.
1.6.4.5 AC500-eCo
1.6.4.5.1 System data AC500-eCo V3

**Approvals and certifications**

Information on approvals and certificates can be found in the corresponding chapter of the Main catalog, PLC Automation.
1.6.4.5.2 Mechanical dimensions

Switchgear cabinet assembly

Information on EMC-conforming assembly and construction is provided within the overall functions section Chapter 1.6.4.4.4 “EMC-conforming assembly and construction” on page 3114.

PLC enclosure

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and electrical isolation.

It is recommended to mount the modules on an earthed mounting plate, or an earthed DIN rail, independent of the mounting location.
Fig. 247: Installation of AC500-eCo V3 CPU/S500 modules in a switch-gear cabinet

1. Cable duct
2. Distance from cable duct ≥ 20 mm
3. Mounting plate, earthed

**NOTICE!**

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating.

By vertical mounting, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

By high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

**Mechanical dimensions AC500-eCo V3**

All mechanical dimensions are given in millimeters and inches. The value in brackets is the inch-value.
Mechanical dimensions S500-eCo

All mechanical dimensions are given in millimeters and inches. The value in brackets is the inch-value.

Fig. 249: Side, front and back view
1.6.4.5.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

- **During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.**

- **All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.**

### Mounting and demounting of the AC500-eCo CPUs

**Mounting a processor module on a DIN rail**

- **NOTICE!**
  - **Risk of function faults!**
  - The processor module is earthed via DIN rail.
  - The DIN rail must be included into the earthing conception of the plant.

Mount the processor module at the top of the DIN rail, then snap it in below.

See Hardware description of PM55x-xP and PM56x-xP for electrical connection.
1. Remove IO modules if connected.

2. While pressing down processor module pull it away from DIN rail.

NOTICE!
Risk of function faults!
Missing electrical contact by isolating screws or washers!
Use metal screws on the metal plate.
The metal plate must be included into the earthing concept of the plant.
Do NOT use isolating washers!

Mounting a processor module on a metal plate
One TA566 Wall Mounting Accessory is needed per processor module.

1. Snap in the TA566 at the back side of the processor module.

2. Fasten the processor module with two screws (max. diameter: 4 mm) to the metal plate.
Demounting a processor module mounted on a metal plate

1. Remove IO modules if connected.

2. Remove the 2 screws.
Mounting and demounting of the AC500-eCo V3 CPUs

Mounting a processor module on a DIN rail

**NOTICE!**
Risk of function faults!
The processor module is earthed via DIN rail.
The DIN rail must be included into the earthing conception of the plant.

Mount the processor module at the top of the DIN rail, then snap it in below.

See hardware description of PM50xx ¦ Chapter 1.6.3.1.1 “PM50xx” on page 2246 for electrical connection.
Demounting a processor module mounted on a DIN rail

1. Remove I/O modules if connected.

2. While pressing down processor module pull it away from DIN rail.
Mounting a processor module on a metal plate

**NOTICE!**
Risk of function faults!
- Missing electrical contact by isolating screws or washers!
- Use metal screws on the metal plate.
- The metal plate must be included into the earthing concept of the plant.
- Do NOT use isolating washers!

**One TA543 wall mounting accessory is needed per processor module.**

1. Snap in the TA543 at the back side of the processor module.

2. Fasten the processor module with two screws (max. diameter: 4 mm) to the metal plate.
Demounting a processor module mounted on a metal plate

1. Remove I/O modules if connected.

2. Remove the 2 screws.

See hardware description of PM50xx Chapter 1.6.3.3.1.1 “PM50xx” on page 2246 for electrical connection.
Mounting and demounting of S500-eCo I/O modules

S500-eCo I/O-modules can be mounted either on a DIN rail or with screws on a metal plate.

**NOTICE!**

Risk of function faults!
- The S500-eCo I/O modules are earthed via the DIN rail.
- The DIN rail must be included into the earthing concept of the plant.
- Use only metal screws.

1. Mount I/O module at the top of the DIN rail, then snap it in below.

2. Attach I/O module by hand to another module. The serial I/O bus is connected automatically.
Demounting I/O modules mounted on a DIN rail

1. Remove I/O module by hand if connected.

2. While pressing down I/O module pull it away from DIN rail.

NOTICE!
Risk of function faults!

- Missing electrical contact by isolating screws or washers!
- Use metal screws on the metal plate.
- The metal plate must be included into the earthing concept of the plant.
- Do NOT use isolating washers!

Mounting I/O modules on a metal plate
One TA566 wall mounting accessory is needed per S500-eCo I/O module.

1. Snap in the TA566 at the back side of the I/O module.

2. Attach the I/O module by hand to another module. The serial I/O bus is connected automatically.
3. Fasten the I/O module with two screws (max. diameter: 4 mm) to the metal plate.
Demounting I/O modules mounted on a metal plate

1. Remove the 2 screws.

2. Remove the I/O module from the connected module by hand.

1.6.4.5.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device specification of the appropriate device.
NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

Power supply

The processor modules PM50xx can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 565: Removable terminal block for the supply voltage 24 V DC

<table>
<thead>
<tr>
<th>3-pin spring terminal block</th>
<th>3-pin screw terminal block</th>
</tr>
</thead>
<tbody>
<tr>

Terminal block inserted
**Faulty wiring on power supply terminals**

**CAUTION!**

Risk of damaging the AC500-eCo V3 processor module and the connected modules!

Voltages > 30 V DC might damage the processor module and the connected modules.

Make sure that the supply voltage never exceeds 30 V DC.

---

**Processor module interfaces**

**I/O bus**

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128kB input/128kB output variables) and 10 I/O modules for PM5052-x-ETH and PM5072-T-2ETH can be added.

**Option slots interface**

Depending on the processor module variants, additional option board can be connected to the option slot to extend the feature of the processor module.

**Serial interface**

RS232 communication interface is available by using option board:

- TA5141-RS232I (isolated)
  - [Chapter 1.6.3.3.1.2.6 “TA5141-RS232I - RS-232 serial adapter isolated option board” on page 2308](#)

RS485 communication interface is available by using option boards:

- TA5142-RS485I (isolated)
  - [Chapter 1.6.3.3.1.2.7 “TA5142-RS485I - RS-485 serial adapter isolated option board” on page 2311](#)
- TA5142-RS485 (non isolated)
  - [Chapter 1.6.3.3.1.2.8 “TA5142-RS485 - RS-485 serial adapter non isolated option board” on page 2317](#)

**Ethernet**

Ethernet is also used for Modbus TCP connection.

**Ethernet interface**

The Ethernet interface is carried out via a RJ45 jack. The pin assignment of the Ethernet interface:

1.6.4.5.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

TA5300-CVR Option board cover for option slot

Intended purpose

Option board covers for PM50xx processor modules are necessary to protect not used option slots.

The AC500-eCo V3 are delivered with all slot covered with option board cover. The cover have to be removed before inserting an option board. The TA5300-CVR is intended only for spare parts.
1. Press on the option board cover to insert it in the not used option slot of the processor module PM50xx.
2. The option board cover must click into the not used option slot.

Removing of the option board cover

1. Press the side of the inserted option board cover.
2. At the same time, pull the option board cover out of the option slot of the processor module PM50xx.

Pluggable connectors for screw and spring connection

Intended purpose
Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules.
For the AC500-eCo V3 **basic CPU** a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 **standard and pro CPUs** a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw type and a spring type version available.

**TA5400-SIM - Input simulator**

- Input simulator for 6 digital inputs 24 VDC
- For usage with AC500-eCo V3 processor modules

![Electrical diagram of TA5400-SIM]

The input simulator TA5400-SIM is used for test and training purposes with AC500-eCo processor modules PM50xx.

It can simulate 6 digital 24 V DC input signals to the digital inputs I0...I5 of onboard I/Os.

**Intended purpose**

- Contacts to connect to clamps of onboard I/Os
- 6 switches for the digital inputs DI0 ... DI5 (0 means opened switch, 1 means closed switch)
- Screw terminal block for power supply connector of the simulator TA5400-SIM
- Screw terminal block(s) for I/O connectors of processor module PM50xx

**Electrical diagram**

The diagram below shows the electrical connection of the input simulator.
### Mounting

To insert the input simulator follow the procedure shown below.

It is recommended to mount TA5400-SIM on screw terminal block only. TA5400-SIM is not designed for mounting on spring terminals.

1. Make sure, that the power supply of the processor module is turned off.

**CAUTION!**

**Risk of damaging the PLC modules!**

The PLC modules can be damaged by overvoltages and short circuits. Make sure, that all voltage sources (supply and process voltage) are switched off before you are beginning with operations at the system. Never connect any voltages > 24 V DC to the terminal block of input simulator TA5400-SIM.

2. Remove the terminal block for power supply from the processor module by a flat-blade screwdriver.

**CAUTION!**

**Risk of damaging the input simulator or PLC modules!**

The input simulator must only be used with AC500-eCo V3 processor modules PM50xx. Never use the input simulator with other devices.

3. Make sure, that all clamps of the onboard I/Os are totally open.

The input simulator must only be used for test and training purposes. Never use it within productive plants.
4. Use a flat-blade screwdriver to unplug the terminal block for power supply of the processor module.

5. Insert the input simulator as shown in the picture.

6. Tighten all screws of the onboard I/O clamps (max. torque 1.2 Nm).

7. Make sure all switches are in OFF state.

8. Connect 24 V DC to the power supply of the TA5400-SIM.

9. Connect the processor module power supply wires (24 V DC). See PM50xx “Pin assignment” on page 2252.

**Usage**

With input simulator TA5400-SIM, the digital 24 V DC inputs I0...I5 can be turned OFF and ON separately:

- If the lever of the switch is on the right side, the input is ON.
- If the lever of the switch is on the left side, the input is OFF.

**Removal**

To remove the input simulator follow the procedure shown below.

1. Make sure, that the power supply of the processor module is turned off.

2. Disconnect the processor module power supply wires (24 V DC) from the terminal block for power supply.

---

**CAUTION! Risk of damaging the PLC modules!**

The PLC modules can be damaged by overvoltages and short circuits. Make sure, that all voltage sources (supply and process voltage) are switched off before you are beginning with operations at the system.
3. Unplug the terminal block for power supply with a flat-blade screwdriver of the power connector.

4. Loosen all screws of the onboard I/Os.

5. Remove the input simulator by pulling it to the left side.

Allowed interruptions of power supply, according to EN 61131-2

| DC supply                        | Interruption < 10 ms, time between 2 interruptions > 1 s, PS2 |
| AC supply                        | Interruption < 0.5 periods, time between 2 interruptions > 1 s |

NOTICE!
Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system could be destroyed.

NOTICE!
Improper voltage level or frequency range which cause damage of AC inputs:
- AC voltage above 264 V
- Frequency below 47 Hz or above 62.4 Hz

NOTICE!
Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.
### Parameter | Value
--- | ---
Temperature | 
Operating | 0 °C...+60 °C: Horizontal mounting of modules. 0 °C...+40 °C: Vertical mounting of modules. Output load reduced to 50 % per group.
Storage | -40 °C...+70 °C
Transport | -40 °C...+70 °C
Humidity | Max. 95 %, without condensation
Air pressure | 
Operating | > 800 hPa / < 2000 m
Storage | > 660 hPa / < 3500 m
Ingress protection | IP20

#### Creepage distances and clearances
The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

#### Insulation test voltages, routine test

**According to EN 61131-2**

| Parameter | Value | 
--- | --- |
| 230 V circuits against other circuitry | 2500 V | 1.2/50 µs |

Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

1.6.4.6.2 Mechanical dimensions

Switchgear cabinet assembly

Information on EMC-conforming assembly and construction is provided within the overall functions section Chapter 1.6.4.4.4 “EMC-conforming assembly and construction” on page 3114.

PLC enclosure

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.
To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and electrical isolation.

It is recommended to mount the modules on an earthed mounting plate, or an earthed DIN rail, independent of the mounting location.
Fig. 250: Installation of AC500/S500 modules in a switch-gear cabinet

1 Cable duct
2 Distance from cable duct $\geq 20$ mm
3 Mounting plate, earthed

**NOTICE!**
Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating (see *Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3155*).
By vertical mounting, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

By high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

Fig. 253: Terminal units, side view and front view
Fig. 254: Terminal units and S500 modules, side view and front view

Fig. 255: Terminal base (for comparison)
1.6.4.6.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting/Demounting terminal bases and function module terminal bases

Demounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the Terminal Base/Function Module Terminal Base:

⇒ The Terminal Base is put on the DIN rail above and then snapped-in below.
3. The demounting is carried out in a reversed order.

Mounting with screws

If the Terminal Base should be mounted with screws, Wall Mounting Accessories TA526

…”Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098 must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on.

TB560x and TB561x need one TA526, TB562x, TB564x and TB566x need two TA526.

**Fig. 256:** Terminal Bases, Fastening with screws

By wall mounting, the Terminal Base is earthed through the screws. It is necessary that

- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is earthed
- the screws have a good electrical contact to the mounting plate
The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one Terminal Base and two Terminal Units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.
7. Repeat the steps for all remaining modules.

If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

Mounting and demounting the terminal unit

Mounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the Terminal Unit.

The Terminal Unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the Terminal Unit to the left until it fully locks into place creating a solid mechanical and electrical connection.

When attaching the devices, make sure the bus connectors are securely locked together to ensure proper electrical connection. Max. 10 Terminal Units can be attached.
3. Demounting: A screwdriver is inserted in the indicated place to separate the Terminal Units.

Mounting with screws
If the Terminal Unit should be mounted with screws, Wall Mounting Accessories TA526
("Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3098") must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on.

Fig. 258: Fastening with screws

By wall mounting, the Terminal Unit is earthed through the screws. It is necessary that
- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is earthed
- the screws have a good electrical contact to the mounting plate

Practical tip
The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:
1. On a clean work surface, mount no more than 3 modules (e.g. one Terminal Base and two Terminal Units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

7. Repeat the steps for all remaining modules.

Mounting processor modules PM57x, PM58x, PM59x and PM56xx

1. After mounting the Terminal Base on the DIN rail, mount the Processor Module.
2. Press the Processor Module into the Terminal Base until it locks in place.
3. The demounting is carried out in a reversed order. Press above and below, then remove the Processor Module.

Mounting and demounting the I/O modules

After mounting the Terminal Unit, mount the I/O Modules.
1. Press the I/O Module into the Terminal Unit until it locks in place.

2. The demounting is carried out in a reversed order. Press above and below, then remove the module.
Mounting and demounting the communication modules

Communication Modules are mounted on the left side of the Processor Module on the same Terminal Base. The electrical connection is established automatically when mounting the Communication Module.

**NOTICE!**
**Risk of damaging the PLC modules!**
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the Terminal Base, mount the Communication Modules.

1. First insert the bottom nose of the Communication Module into the dedicated holes of the Terminal Base. Then, rotate the Communication Module on the dedicated Terminal Base slot until it is locked in place.

**NOTICE!**
**Risk of malfunctions!**
- Unused slots for communication modules are not protected against accidental physical contact.
  - Unused slots for communication modules must be covered with dummy communication modules ([Chapter 1.6.3.8.2.5 “TA524 - Dummy communication module” on page 3097](#)) to achieve IP20 rating.
  - I/O bus connectors must not be touched during operation.
2. The demounting is carried out in a reversed order.
Press above and below, then rotate the Communication Module and remove it.

1.6.4.6.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device description of the appropriate device.

**NOTICE!**

**Attention:**
The devices should be installed by trained persons with knowledge of wiring electronic devices. In case of bad wiring, the following problems could occur:

- On the Terminal Base, the terminals L+ and M are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the Terminal Base itself could be destroyed.
- The Terminal Bases and all electronic modules and Terminal Units are protected against reverse polarity.
- All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

**NOTICE!**

**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**NOTICE!**

**Attention:**
Due to possible loss of communication, the communication cables should be fixed with cable duct or bracket or clamp during application.
Power supply

**AC500 system power supply**

As soon as the power supply of the Processor Module (CPU) is higher than the minimum Process and supply voltage (see Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3155), the power supply detection is activated and the Processor Module is started. Power supply of Processor Module and I/O modules should be powered on the same time, otherwise the Processor Module will not switch to run after startup.

When during operation the power supply is going down lower than the minimum Process and supply voltage (see Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3155) for more than 10 ms, the Processor Module is switched to safety mode (display shows “AC500”). A restart of the Processor Module only occurs by switching the power supply off and on again.

If an I/O module is disconnected during normal operation from power supply while Processor Module is still powered, the Processor Module will continue its normal operation on all other powered peripherals (I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of I/O Module power supply it will continue normal operation and inputs and outputs were updated.

Logic Controller Supply: AC500 logic controller power supply is provided through terminals L+ / M.

Process Power Supply: S500 process power supply is provided through terminals UP / ZP.

Logic Controller Supply is galvanic isolated from Process Power Supply.

As system power supply for AC500/S500, the ABB CP power supply series can be used.

**Power supply for processor modules**

The supply voltage of 24 VDC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals.

**CANopen field bus**

**Types of bus cables**

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

<table>
<thead>
<tr>
<th>Length of segment [m]</th>
<th>Bus cable (shielded, twisted pair)</th>
<th>Max. transmission rate [kbit/s]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Conductor cross section [mm$^2$]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>0...40</td>
<td>0.25...0.34 / AWG23, AWG22</td>
<td>70</td>
</tr>
<tr>
<td>40...300</td>
<td>0.34...0.60 / AWG22, AWG20</td>
<td>&lt; 60</td>
</tr>
<tr>
<td>Length of segment [m]</td>
<td>Bus cable (shielded, twisted pair)</td>
<td>Max. transmission rate [kbit/s]</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------</td>
<td>-------------------------------</td>
</tr>
<tr>
<td></td>
<td>Conductor cross section [mm²]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>300...600</td>
<td>0.50...0.60 / AWG20</td>
<td>&lt; 40</td>
</tr>
<tr>
<td>600...1000</td>
<td>0.75...0.80 / AWG18</td>
<td>&lt; 26</td>
</tr>
</tbody>
</table>

**NOTICE!**

Risk of telegram and data errors!
The use of wrong cable type and quality could lead to limitations in cable length, causing telegram and data errors.

**NOTICE!**

Risk of damaging the terminating resistor!
A bus-line short-circuit to the 24 VDC power supply can cause damage by exceeding the power rating of the terminating resistor.

**NOTICE!**

Risk of telegram and data errors!
Miss- or unterminated data lines can cause reflections on the bus, leading to telegram and data errors. For maximum cable length and transmission rate, the bus must always be terminated on both ends with the characteristic impedance of the cable type.

**NOTICE!**

Verification of termination (Make sure the power supply on all CAN nodes is turned off)!
To verify the termination, the DC resistance between CAN_H and CAN_L can be measured. The value should be between 50 Ω and 70 Ω.
Check for correct resistor values, short circuits and correct number of terminating resistors, if the measurement is showing deviations.

**Installation hint**

Ensure that the termination and FE connection will not be removed when removing CAN modules from the bus.

Branches are not allowed in a CAN network. Stubs should be avoided or kept as short as possible (< 0.3 m).
When connecting the cable take care to use one dedicated twisted pair for the CAN signals (CAN_L and CAN_H) and another free wire for CAN_GND. CAN_GND must be connected as reference, to avoid common mode problems causing telegram errors.

Keep the CAN bus wiring away from electrical disturbance and close to earth potential to minimize interference.

![Fig. 265: CAN Bus, connection and wiring](image)

**Ethernet connection details**

Ethernet is also used for PROFINET, EtherCAT and Modbus TCP connection.

**Wiring**

**Cable length restrictions**

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEE/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

The following table shows the specified properties of the respective cable types per 100 m.

**Table 580: Specified cable properties:**

<table>
<thead>
<tr>
<th>Parameter</th>

</tbody>
</table>
The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

<table>
<thead>
<tr>
<th>Pairs</th>

</tbody>
</table>

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.

Fig. 266: Pin assignment of RJ45 sockets

Cable types

Crossover cable

*Particular use*

Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase "Classic".

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.
Straight-through cable

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

---

CAUTION!

Risk of communication faults!

When using inappropriate cables, malfunctions in communication may occur. Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

---

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 Processor Modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously. The Modbus client operating mode of an interface is set with the Function Block.

---

Technical data

The Modbus operating mode and the interface parameters are set in the "Configuring Modbus RTU on serial interface" on page 3527.

---

### Bus topology

Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.

For further information on Modbus see chapter *Chapter 1.6.5.1.9 “Communication with Modbus RTU” on page 3293.*

### 1.6.4.6.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

### TA521 - Lithium battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

The TA521 lithium battery is the only applicable battery for the AC500 processor modules *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2323.* It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.
Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

Battery lifetime

The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

</tbody>
</table>

*Note: *) Product life cycle phase
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**Insertion**

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = plus-pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

**Fig. 269: Insertion of the Lithium battery**
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!
Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

MC502 - memory card
- Secure digital card
- Solid state flash memory storage

Memory card overview
All AC500-eCo V3 processor modules have a micro memory card slot.
All other processor modules (AC500 V2, AC500-eCo V2 and AC500 V3) have a memory card slot.
When using the micro memory card for memory card slots in SD size, the supplied micro memory card adapter is required.
Using MC5102 memory card with AC500 V2 or AC500-eCo V2 requires the firmware as of 2.5.x.

1) The memory card MC5102 is in status Classic. Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

2) A MC503 memory card adapter is required for AC500-eCo V2 processor modules.

3) It is possible to use the MC5141 memory card, but the MC5102 memory card is preferred.

**Purpose**

The memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without memory card.

AC500 V3 processor modules are supplied without memory card. It therefore must be ordered separately.

The memory card can be read on a PC with a standard memory card reader.

AC500 V3 processor modules are equipped with a memory card reader.

---

**Extension of the memory card function**

Memory cards contain firmware and application.

Visualizations and all related objects (like text lists) are also added to the memory card.

Export boot project and firmware to the memory card ⇨ Chapter 1.6.7.2.1.1 “Memory card application export” on page 3720.

---

**Insert the memory card**

AC500 V3

Unpack the memory card and insert it into the opening of the front face of the processor module until locked:

![Insertion: PM56xx](image)

*Fig. 270: Insertion: PM56xx*

---

**Remove the memory card**

AC500 V3

The memory card has a write protect switch. In the position "LOCK", the card can only be read.

The use of memory cards other than MC502, MC5102 and MC5141 is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.
NOTICE!

Removal of the memory card
Do not remove the memory card during access. Remove only when the RUN LED does not blink. Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

To remove the memory card, push on the card until it moves forward. By this, the card is unlocked and can be removed.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

The MC502 memory card is in status Classic.

For planning and commissioning of new installations use memory cards in Active status only.

The MC5141 memory card must be used for XC applications with AC500 V3.

For standard applications with AC500 V3 use the MC5102 micro memory card with micro memory card adapter for memory card slot.

For standard applications with AC500-eCo V3 use the MC5102 micro memory card without micro memory card adapter for micro memory card slot. All AC500-eCo V3 processor modules have a micro memory card slot.
MC5102 - micro memory card with micro memory card adapter

- Secure digital card
- Solid state flash memory storage

All AC500-eCo V3 processor modules have a micro memory card slot.

All other processor modules (AC500 V2, AC500-eCo V2 and AC500 V3) have a memory card slot.

When using the micro memory card for memory card slots in SD size, the supplied micro memory card adapter is required.

Using MC5102 memory card with AC500 V2 or AC500-eCo V2 requires the firmware as of 2.5.x.

TA524 - Dummy communication module

1 Type
2 Label

Purpose
TA524 is used to cover an unused communication module slot of a terminal base. Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2236. It protects the terminal base from dust and inadvertent touch.

Handling instructions
TA524 is mounted in the same way as a common communication module. Chapter 1.6.4.6.3.5 “Mounting and demounting the communication modules” on page 3172.

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB’s high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combined with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

NOTICE!

Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices. See Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3102.

In order to prevent malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
### NOTICE!

**Risk of malfunctions!**

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules (☞ Chapter 1.6.3.8.2.5 “TA524 - Dummy communication module” on page 3097) to achieve IP20 rating.
- I/O bus connectors must not be touched during operation.

#### 1.6.4.8 AC500-S

The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the AC500-S safety user manual is only available on our website.
1.6.5 System technology for AC500 V3 products

This chapter provides advanced information on the system technology of AC500 control systems from a general perspective. It provides information to link the details from the hardware descriptions (provided in the device specifications section) with detailed information on configuring/programming a corresponding library (provided in the individual library sections).

Configuration of a specific device with Automation Builder is described in the PLC configuration section.
1.6.5.1 System technology of CPU and overall system

1.6.5.1.1 Handling of remanent variables for AC500 V3 products

All operands supported by CODESYS are described in Chapter 1.4.1.8 “Configuring I/O links” on page 220. For the memory sizes of the different CPUs, see for AC500-eCo V3 “AC500-eCo V3 processor modules” on page 3212 and for AC500 V3 “AC500 V3 processor modules” on page 3213.

This part of the documentation describes the declaration of remanent variables for AC500 V3 products.

---

**Different handling of remanent variables in AC500 FW ≥V3.0.2**

- No more %R memory area (use instead %M with {no_init} Chapter 1.6.5.1.1.5 “Initialization of %M variables” on page 3216)
- Creating of addresses for “VAR RETAIN PERSISTENT” variables automatically by IEC-Compiler

---

</table>

It is not possible to use 100% of a device’s memory space. About 10% of the total available space must remain unused at any time to maintain normal device operation.

Adding a global list of persistent/retain variables

A global list of persistent variables will be added with the standard definition for persistent variables "VAR RETAIN PERSISTENT" (see Remanent variables).

First steps:
1. Expand the object path of your PLC
2. After right click on App select Add object in the context menu.

The window Add object below: Application appears.
3. Select **Persistent Variables** and click “Add object”.

The object name can be chosen freely. In the application it will be reused to reference the persistent variables.

**Declaring a new variable in global list**

Declare a new variable in the window "GlobPersist".

Afterwards the variable can be selected in the program.
In this way the persistent variable can be accessed directly.

Do not use the same persistent variable in different IEC tasks, to avoid problems with consistency.

Declaring a new persistent/retain variable in local POU

It is also possible to declare a persistent/retain variable in a local POU and not in the global list of persistent variables.

It is not recommended to declare a large number of persistent variables locally, due to the potentially effect to performance.

The auto-declare mechanism declares always a persistent variable locally and not in the global list. If the program will be executed, the following warning appears in the message window:

⚠️ C0244: No VAR_PERSISTENT list is part of the application to enter instance path for variable PLC_PRG.new_var1

The locally declared persistent variable has to be added to the global list.
NOTICE!
For the initialization of a Retain/Persistent variable the value of the global list is used NOT the value of the local declaration.
For further information see "RetainPersistentExample.project".

1. Right-click in window "PersistentVars".
2. Select option "Add all instance paths".
   ✤ Afterwards the persistent variables are added.

The application can be downloaded to the PLC

It is NOT recommended to declare a new persistent variable in the application due to performance problems.
For example PM5650-2ETH:
1000 DWORD \(\approx\) 600\(\mu\)s additional cycle time of task.

Initialization of %M variables
After download or restart, all %M variables will be initialized to 0. This can be prevented by setting the "no_init" attribute.
In doing so the %M variables behave similar to the "VAR RETAIN PERSISTENT" variables.
In the example above variable "ProzMivar" has the attribute "no_init". This variable will not be initialized and keeps its last value.

The attribute "no_init" is always and only valid for the next following variable (see Chapter 1.4.1.23.6.2.26 "Attribute 'noinit'" on page 655).

The following two variables "ProzMivarField" and "ProzMivar1" will be further on initialized to 0.

**Behavior of retain variables**

The declaration of the retain variables strictly follows the 3S standard (see Remanent variables).

For retain variables it does not matter if they are declared locally in a program or in the global variable list.

**PLC shell command for import and export of retain/persistent variables**

The syntax of the command is: `sram <direction><area><path>`

<table>
<thead>
<tr>
<th>Supported options:</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction:</td>
<td>i=import, e=export</td>
<td></td>
</tr>
<tr>
<td>Area:</td>
<td>rp=Retain/Persistent, m=%M area</td>
<td></td>
</tr>
<tr>
<td>Path:</td>
<td>Any pathname</td>
<td></td>
</tr>
</tbody>
</table>

The file will be stored in the user partition of the PLC. This data can be imported or exported via the FTP-Server or the Files dialog in Automation Builder.

If no path is indicated, the files are saved under "PlcLogic/<ApplicationName>/<ApplicationName>.ret or .prozm".

If a path is indicated, the files are saved under or accessed via "<path>/<ApplicationName>.ret or .prozm".

A non-existing path is created with the exception of the memory card. The path for the memory card must be an existing path. On the memory card a non-existing path leads to an error message.

<table>
<thead>
<tr>
<th>Data area</th>
<th>File extension</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retain/Persistent</td>
<td>.ret</td>
<td>PlcLogic/&lt;ApplicationName&gt;/&lt;ApplicationName&gt;.ret &lt;path&gt;/&lt;ApplicationName&gt;.ret</td>
</tr>
<tr>
<td>%M (memory area)</td>
<td>.prozm</td>
<td>PlcLogic/&lt;ApplicationName&gt;/&lt;ApplicationName&gt;.prozm &lt;path&gt;/&lt;ApplicationName&gt;.prozm</td>
</tr>
</tbody>
</table>
If the path "data" does not exist, the path is created. The path for the memory card must be an existing path. The path "sdcard/data" leads to an error message if the path "data" does not exist on the memory card.

Only if the application uses Retain or Retain/Persistent variables the command generates an output file.

Attention!
It is recommended to execute the PLC shell command only while PLC is in state STOP, or it is ensured that there is no write access to the %M or the Retain/Persistent area.

Import and export of retain/persistent variables by library functions

It is also possible to import or export the Retain/Persistent variables and the %M markers via system function calls from the PLC Application. The required system functions are implemented in the IEC library ABB_IntUtils_AC500.library.

It provides the following Functions or Function Blocks:

- SRAM_IMPORT
- SRAM_EXPORT
- SRAM_CLEARED

SRAM_IMPORT

The Function Block SRAM_IMPORT is used to import the %M markers and the Retain/Persistent variables from the specified files in the userdisk.

Import only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

It is recommended to import only when the %M and/or the Retain/Persistent area is not accessed by the application. Otherwise inconsistencies are possible.

For a complete description of the Function Block see ABB_IntUtils_AC500.library.
SRAM_EXPORT

The Function Block SRAM_EXPORT is used to export the %M markers and the Retain/Persistent variables to the specified files in the userdisk.

Export only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

It is recommended to export only when the %M and/or the Retain/Persistent area is not accessed by the application. Otherwise inconsistencies are possible.

For a complete description of the Function Block see ABB_IntUtils_AC500.library.

SRAM_CLEARED

The Function SRAM_CLEARED is used to check if the SRAM was deleted.

For a complete description of the Function see ABB_IntUtils_AC500.library.

1.6.5.1.2 System processing

System start-up / Program processing

AC500-eCo processor modules do not have an integrated display and keyboard. All functions related to keyboard and display are not applied for those devices.

Definitions: PLC system start-up

Cold start

The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the “cold start” mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see Chapter 1.4.1.24.2.6.9 “Command ‘Reset Cold’” on page 963).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start

- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see Chapter 1.4.1.24.2.6.10 “Command ‘Reset Warm’” on page 963).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.
RUN -> STOP
- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP
- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for ≥ 5 s in STOP mode.

Reset (cold)
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)
- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN
- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START
- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.

Download
- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.

Variables are set to their initialization values according to the initialization table.

RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!

A download is forced by the following:
- changed PLC configuration
- changed task configuration
- changed library management
- changed compile-specific settings (segment sizes)
- execution of the commands "Project/Clean all" and "Project/Rebuild All".

**Online change**

- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

**Data buffering**

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process (see ).

**Start of the user program**

The user program (UP) is started according to the following table. It is assumed that a valid user program is stored to the Flash memory.

See ☞ Chapter 1.6.7.1.4 “Storage device details” on page 3718.
<table>
<thead>
<tr>
<th>Action</th>

<td>Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.</td>
<td>The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.</td>
</tr>
</tbody>
</table>

Remarks:

1): After the download is completed, the program is not automatically stored to the Flash memory. To perform this, create a boot project Chapter 1.4.1.11.6 “Generating boot applications” on page 370. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON. Start the program either by pressing the RUN/STOP function key or using Automation Builder.

2): After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project Chapter 1.4.1.11.6 “Generating boot applications” on page 370. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.
This statement is applicable to PM5032-x-ETH, PM5052-x-ETH and PM5072-T-2ETH(W).

If the main task cycle is faster than 10 ms, remove the onboard inputs I8..I11 and I/O channels of option boards or option boards for serial communication from the main task cycle, but use a separate task cycle.

The task model processes the following kind of tasks:

- Non-real-time system tasks: system tasks with no real-time property (e.g. file access, Ethernet communication, OPC UA, ...)
- Non-real-time IEC tasks: IEC tasks with no real-time property
- Real-time system tasks: system tasks with real-time property
- Real-time IEC tasks: IEC tasks with real-time property

The possible number of tasks depends on the type of processor module. How to distribute the IEC tasks over multiple CPU cores and on how to use the IEC task configuration for Automation Builder is described in detail in the CODESYS task configuration section.

- Task configuration
- Tab 'Configuration'

Watchdog handling in IEC tasks

If a new project is created or a new task is inserted in the task configuration (Chapter 1.4.1.9.17 “Task configuration” on page 304), the task is created with the “default task settings” priority = 15 and cycle time = 10 ms. The watchdog is activated, set to 20 ms and sensitivity = 1.

The watchdog handling depends also on the setting of the CPU parameter “Missed cycle behavior”: 
This parameter configures the behavior of a real-time task if the processing time of the task is longer than the cycle time.

"Next" means – skip the missed cycle and start the task on the next cycle on time. This might result in skipped tasks, but at least the highest priority task is always started on time, if it is not skipped (= default value).

"ASAP" means - start the task immediately when possible.

This parameter is valid for all real-time tasks (priorities 0-15) of the PLC application.

Example 1: default task settings, $t_{\text{Task}}$ – processing time of the task in [ms]

<table>
<thead>
<tr>
<th>$t_{\text{task}}$</th>
<th>Par.</th>
<th>Value</th>
<th>Default Value</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Next</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>ASAP</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>Next</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

No watchdog occurs, also if the processing time of the task is longer than the cycle time (cases 2 and 3) since the processing time is shorter than the watchdog time.

Example 2: default task settings, $t_{\text{Task}}$ – processing time of the task 24 ms, $S_{\text{WD}}$ – sensitivity of the watchdog

<table>
<thead>
<tr>
<th>$S_{\text{WD}}$</th>
<th>Par.</th>
<th>Value</th>
<th>Default Value</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Next</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>ASAP</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Next</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Watchdog occurs in all 3 cases since the processing time of the task is longer than the watchdog time. According to the setting of the sensitivity the watchdog occurs after 1 or 3 cycles.

Beside the task watchdog there is the so-called “omitted cycle watchdog” (OMCW). The omitted cycle watchdog is only active if a watchdog has been configured for the task.

The "normal" Watchdog triggers only if the processing time of the task exceeds the set Watchdog value.
The omitted cycle watchdog on the other hand checks completely "failed" cycles. E.g. if the scheduler has a problem and the task never executes its cycle again, then the "normal" watchdog will not be triggered. Therefore, the runtime does an additional check, if a task has been executed within the double cycle time or the double watchdog time (the bigger of both is valid). If not, the omitted cycle watchdog is triggered.

Example 3: default task settings, $t_{task}$ - processing time of the task in ms, $C_{lost}$ - lost cycles

<table>
<thead>
<tr>
<th>$t_{task}$</th>
<th>$C_{lost}$</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>3-6</td>
</tr>
<tr>
<td>12</td>
<td>3-6</td>
</tr>
<tr>
<td>$\infty$</td>
<td>2ff</td>
</tr>
</tbody>
</table>

Omitted cycle watchdog occurs after double watchdog time ($2 \times 20\text{ ms} = 40\text{ ms}$).

Example 4: Two tasks with following settings:

<table>
<thead>
<tr>
<th>Task</th>
<th>Priority</th>
<th>Cycle time [ms]</th>
<th>Watchdog time [ms]</th>
<th>Sensitivity</th>
<th>Parameter</th>
<th>Task processing time [ms]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10</td>
<td>10</td>
<td>20</td>
<td>1</td>
<td>Next</td>
<td>6</td>
</tr>
<tr>
<td>2</td>
<td>15</td>
<td>50</td>
<td>50</td>
<td>1</td>
<td>30</td>
<td></td>
</tr>
</tbody>
</table>

Watchdog of task 2 is triggered since the task cannot run in the defined task cycle.

Example 5: Two tasks with following settings

<table>
<thead>
<tr>
<th>Task</th>
<th>Priority</th>
<th>Cycle time [ms]</th>
<th>Watchdog time [ms]</th>
<th>Sensitivity</th>
<th>Parameter</th>
<th>Task processing time [ms]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10</td>
<td>10</td>
<td>20</td>
<td>1</td>
<td>ASAP</td>
<td>12</td>
</tr>
<tr>
<td>2</td>
<td>15</td>
<td>30</td>
<td>60</td>
<td>1</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>
Watchdog of task 2 is triggered since the task cannot start in the defined task cycle.

Example 6: Two tasks with following settings

<table>
<thead>
<tr>
<th>Task</th>
<th>Priority</th>
<th>Cycle time [ms]</th>
<th>Watchdog time [ms]</th>
<th>Sensitivity</th>
<th>Parameter</th>
<th>Task processing time [ms]</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10</td>
<td>10</td>
<td>20</td>
<td>1</td>
<td>Next</td>
<td>12</td>
</tr>
<tr>
<td>2</td>
<td>15</td>
<td>30</td>
<td>60</td>
<td>1</td>
<td></td>
<td>6</td>
</tr>
</tbody>
</table>

No watchdog is triggered, but task 1 is running in 20 ms cycle instead of configured 10 ms cycle. Task 2 is running alternating every 20 ms or 40 ms.

**PLC utilization**

The parameters `cpuload` and `plcload` represent the actual CPU load or PLC load of the system.

- **cpuload**: This value represents the time the PLC requires to calculate all processes running on the PLC. For a good system performance this value should be less than 80%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC or by reducing the amount of processes.

- **plcload**: This value represents the time the PLC requires to calculate all real-time processes. Real-time processes are either high priority system tasks or IEC tasks with a priority between 0 and 15. For a good system performance this value should be less than 60%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC.

During commissioning we recommend to monitor the CPU and PLC values online with one of the following methods:
Managing priorities by selecting the appropriate communication schema

The AC500 V3 PLCs have an integrated preemptive real-time operating system that supports 100 priorities from 0 (lowest priority) to 99 (highest priority). Hereof 0 ... 49 in the non-real-time area and 50...99 in the real-time area.

For real-time tasks in the IEC user program 16 priorities from 0 (highest priority) to 15 (lowest priority) can be used. They correspond to the operating system priorities 67 (for IEC task priority 0) to 52 (for IEC task priority 15).

The file system, the memory card and flash tasks run on lowest real-time priority 50.

The non-real-time IEC task priority 16 runs in the non-real-time area. Likewise, all Ethernet protocols and the diagnosis system run in the non-real-time area.

As of Automation Builder 2.4.1 and SystemFW 3.4.1 provides a new PLC boot parameter Communication Schema (non-real time vs. real-time Ethernet data) for AC500 V3:

- **Name: “Default”**
  - Description: Balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.
  - [Further information on page 3227](#)

- **Name: “Communication modules”**
  - Description: Priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.
  - [Further information on page 3228](#)

- **Name: “Onboard Ethernet”**
  - Description: Priority for onboard Ethernet communication (e.g. via Modbus TCP). Lower priority for communication via communication modules (CMs)
  - [Further information on page 3229](#)

- **Name: “Realtime onboard Ethernet”**
  - Description: Very high priority for onboard Ethernet communication (e.g. EtherCAT, PROFINET, Ethernet/IP). Low priority for communication via communication modules (CMs)

The value “Realtime onboard Ethernet” is reserved for later use and has currently the same settings as “Onboard Ethernet” and in addition the I/O bus on the same priority as the Ethernet.

The “Default” priority schema

The default value of the boot-parameter Communication Schema is the balanced priority for communication via communication modules (CMs) and onboard Ethernet communication. The following picture gives an overview about the main task priorities in the AC500 V3 PLCs.
The highest IEC task priority 0 should be used for high prior functions in the PLC with short execution time.

The communication modules Interrupts (CM5xx), the local I/O bus, the IEC scheduler observer task and the CAA event task are processed with higher priority than all user IEC tasks.

Ethernet runs on non-real-time priority.

The default setting of the priorities is suitable for most applications and corresponds to the settings in the firmware versions 3.4.0 and before.

The “Communication modules” priority schema

The “Communication modules” priority schema has been established for priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.
The highest IEC task priority 0 should be used for the sync task of the highest priority communication module, e.g. CM579-ETHCAT, priority 1 for the sync task with second highest priority, and so on.

Only the Communication modules Interrupts (CM5xx) and the CAA event task is processed with higher priority than the IEC tasks.

The IEC scheduler observer task has been moved to priority 66, means below IEC task priority 0 and on the same level as IEC task priority 1.

The priority of the local I/O bus has been moved to priority 59, means inside the IEC task priority area, but below the external event task priorities.

Ethernet runs on non-real-time priority.

The priority schema “Communication module” should be used in applications with one or more communication modules CM5xx with sync mode. As of Automation Builder 2.4.1 these are the CM579-ETHCAT EtherCAT master and CM598-CN CANopen master communication modules.

The sync task with priority 0 will be interrupted only by system interrupts. Since the IEC scheduler observer task is located below IEC priority 0, the watchdog for this task is also ineffective. However, this should not interfere with a sync task.

If more than one CM5xx are used in sync mode, the priority order must be defined. The sync task of highest priority CM5xx receives IEC priority 0, the next priority 1 and so on.

In a mixed PLC configuration with communication modules with and without sync mode the interrupts of the communication modules without sync mode will be handled on the priority of the lowest sync task. Currently supported communication modules without sync mode are CM579-PNIO PROFINET IO controller and SM560-S Safety PLC.

The “Onboard Ethernet” priority schema

The “Onboard Ethernet” priority schema has been established for priority for onboard Ethernet communication (e.g. via Modbus TCP).
The Ethernet interrupt task has been moved from non-real-time area to priority 55, means inside the IEC task priority (real-time) area, but below the external event task priorities.

This priority schema should be used for applications with much Ethernet communication, e.g. Modbus TCP communication with a high number of Modbus TCP clients/servers.

**NOTICE!**

Since the Ethernet interrupt task is running in this mode in the real-time priority area, the Ethernet communication can block IEC tasks with priorities 12-15.

Working with real-time priority at onboard Ethernet and using a high number of Modbus TCP client connections can force high CPU load. To avoid this, it is recommended to call the Modbus function blocks in steps.

**Example**

100 Modbus TCP client connections shall be used in a 20 ms task.

Call 20 function blocks in a first cycle, 20 function blocks in a second cycle and so on.
Setting standard configuration

If the target setting configuration is changed, standard configuration can be restored:

1. Open CODESYS.
2. In the “Resources” tab, double-click “PLC Configuration”.
3. Select “Menu Extras ➔ Standard Configuration”.

1.6.5.1.3 Real-time clock and battery

Notes on real-time clock

The real-time clock is an optional function for AC500-eCo V3 Basic processor modules (e.g. PM5012-x-ETH) and requires a TA5131-RTC. All other AC500-eCo V3 processor modules have an integrated real-time clock.

The real-time clock operates as a PC clock. It saves date and time to a DWORD in DT format (DATE AND TIME FORMAT), i.e., in seconds passed since the start time: 1 January 1970 at 00:00.

For AC500-eCo V3, Basic CPU with TA5131-RTC buffers the real-time clock for 7 days, and Standard/Pro CPU buffers the integrated real-time clock for 20 days. When the CPU is not powered over the buffering time, the real-time clock data will be cleared.

If a battery is connected and full, the real-time clock continues to run even if the control voltage is switched off.

If no battery is inserted or the battery is empty, the real-time clocks starts with the value 0 (=1970-01-01, 00:00:00).

When switching on the control voltage, the system clock of the operating system is set to the value of the real-time clock.
Real-time clock

The PLC browser/PLC shell commands `date` and `time` are used to set the real-time clock.

The commands `date <ENTER>` or `time <ENTER>` display the current date and time of the real-time clock.

The command: `date yyyy-mm-dd<ENTER>` (year-month-day) sets the date.

The command: `time hh-mm-ss<ENTER>` (hours-minutes-seconds) sets the time.

Example:

The real-time clock should be set to 22 February 2005, 16:50.

1. Enter the date:
   
   date 2005-02-22<ENTER>
   
   Display: date 2005-02-22 Clock set to 2005-02-22 08:01:07
   
   The time remains unchanged.

2. Enter the time:
   
   time 16:50<ENTER>
   
   Display: time 16:50 Clock set to 2005-02-22 16:50:00

Real-time clock with user program

The following Function Blocks located in the folder "Realtime clock" of the system library `ABB_ExtUtils_AC500.lib` can be used to set and display the real-time clock (RTC) with help of the user program:

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOCK (V3) “Library Manager ➔ ABB-AC500 ➔ Use Cases ➔ AC500 Utils ➔ PM&lt;Version&gt; (ABB) ➔ Function Blocks ➔ Realtime clock”</td>
<td>Sets and displays the real-time clock with values for year, month, day, hours, minutes and seconds. Also the day of week is indicated (Mo=1, Tue=2, Wed=3, Thu=4, Fr=5, Sa=6, Su=0). Note: The week of day cannot be set. It is given by the real-time clock. The input DAY_SET is ignored.</td>
</tr>
<tr>
<td>CLOCK_DT (V3) “Library Manager ➔ ABB-AC500 ➔ Use Cases ➔ AC500 Utils ➔ PM&lt;Version&gt; (ABB) ➔ Function Blocks ➔ Realtime clock”</td>
<td>Sets and displays the real-time clock in DT format, for example DT#2005-02-17-17:15:00.</td>
</tr>
</tbody>
</table>

The Function Blocks CLOCK and CLOCK_DT are documented in the “Library Manager” for the system library `Pm<Version>.lib` (in `AC500 Utils`).

AC500 battery

The AC500 battery buffers the following data in case of "control voltage off":

- Retentive variables in SRAM (VAR_RETAIN..END_VAR) $ Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3212
- Date and time of the real-time clock

Further information:

- $ Chapter 1.7.3 “Diagnosis messages” on page 3780
To prevent data loss when using the AC500 battery, the battery status should be periodically monitored by the user program.

**Battery status**

The battery status can be monitored either with the help of a user program on the PLC or in Automation Builder.

In the PLC shell of Automation Builder the command "batt" can be used.

<table>
<thead>
<tr>
<th>Code</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Battery empty</td>
</tr>
<tr>
<td>20</td>
<td>Remaining battery charge below 20 %</td>
</tr>
<tr>
<td>100</td>
<td>Battery charge OK</td>
</tr>
</tbody>
</table>

In the user program, the battery status can be checked with the function BATT which is available in the folder "Battery" of the system library `ABB_ExtUtils_AC500.lib` ("Library Manager ➔ ABB-AC500 ➔ Use Cases"). The following is output:

<table>
<thead>
<tr>
<th>Code</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Battery empty</td>
</tr>
<tr>
<td>20</td>
<td>Remaining battery charge below 20 %, battery must be replaced</td>
</tr>
<tr>
<td>100</td>
<td>Battery charge OK</td>
</tr>
</tbody>
</table>

On the device, the battery status can be checked with the function keys of a Processor Module.

AC500-eCo V3 data buffering

The AC500-eCo V3 buffers the following data in case of "control voltage off":

- Retentive variables in FLASH (VAR_RETAIN..END_VAR) ➔ Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3212
- Date and time of the real-time clock are using an integrated gold-capacitor with a lower retention time as a battery.

The AC500-eCo V3 has no battery but stores the remanent data in flash or the real-time clock using a gold-capacitor, there is no battery or gold-capacitor status or survey.

In case of "control voltage off", the real-time clock is buffered for about 7 days for Basic CPU with TA5131-RTC and about 20 days for Standard or Pro CPUs at 40 °C using temperature.
1.6.5.1.4 AC500-eCo V3 processor module, LEDs, RUN/STOP switch on front panel

Fig. 274: Example: PM5072-T-2ETH

1. 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
2. Micro memory card slot
3. Option board cover for option board slot
4. 13-pin terminal block for I/O connectors
5. 12-pin terminal block for I/O connectors
6. 12 LEDs to display the states of the signals
7. 10 LEDs to display the states of the signals
8. RJ45 female connector for Ethernet1 connection
9. RJ45 female connector for Ethernet2 connection
10. 3-pin terminal block for power supply 24 V DC
11. 2 holes for wall-mounting with screws
12. Cable binding
13. Cable binding accessory on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable binding accessory on the top of the housing is optional. Please use TA5301-CFA accessory.
State LEDs and operating elements

RUN/STOP button

The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

State LEDs

The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

<table>
<thead>
<tr>
<th>LED</th>

</tbody>
</table>

**User configurable LEDs**

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.

The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

**I/O LEDs**

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH) to display the states of the inputs and outputs.

1.6.5.1.5 LEDs, display and function keys on the front panel

Overview

The display of a processor module is equipped with a background-lighted 7-segment display. This display consists of 6 digits for plain text or error codes.

Some functionalities may be not yet supported by the product. Please refer to the release notes of the product at time of release.

Display indicators

- A black square (●) denotes the state/working activity of the corresponding object on the left/right side of the display. The black square flashes according to the device's activity, e.g. during data exchange on ETH1, ETH2, COM1, etc.

  **MC activity**
  
  For the activity of the memory card the black square (●) is shown as long as a file is open on memory card.

- A black triangle (▲) points to the selected item/interface on the left/right side of the display to be configured or read. Further, it acts as a cursor for the count up/count down function keys.

  A black triangle (▲) at the BATT item indicates a missing or uncharged battery.
The indicators point to the following items on the left side of the display:

<table>
<thead>
<tr>
<th>No.</th>
<th>On the left Side</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>MC (memory card)</td>
<td>Refers to the memory card status.</td>
</tr>
<tr>
<td>2</td>
<td>SYS (system)</td>
<td>Refers to the system status.</td>
</tr>
<tr>
<td>3</td>
<td>BATT (battery)</td>
<td>Refers to the battery status.</td>
</tr>
<tr>
<td>4</td>
<td>I/O bus</td>
<td>Refers to I/O bus connection.</td>
</tr>
</tbody>
</table>

The indicators point to the following items on the right side of the display:

<table>
<thead>
<tr>
<th>No.</th>
<th>On the right side</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>ETH1</td>
<td>Refers to the first Ethernet interface.</td>
</tr>
<tr>

**Description of LEDs**

The LEDs below the display indicate the status of the processor module:
### Description of the function keys

#### Overview

The processor module can be operated manually using the function keys on the front panel:

<table>
<thead>
<tr>
<th>LED</th>
<th>State</th>
<th>Color</th>
<th>LED = ON</th>
<th>LED = OFF</th>
<th>LED flashes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power LED (PWR)</td>
<td>Denotes the power supply state of the processor module</td>
<td>Green</td>
<td>Voltage is present (24 V DC)</td>
<td>Voltage is missing</td>
<td>-</td>
</tr>
<tr>
<td>Run LED (RUN)</td>
<td>Denotes the activity state of the processor module</td>
<td>Green</td>
<td>Processor module is in RUN mode</td>
<td>Processor module is in STOP mode</td>
<td>If the LED flashes fast (4 Hz) a firmware update is finished with no errors. If the Run LED flashes fast (4 Hz), alternating with a flashing Run LED the firmware is updated. To enforce boot mode 1, keep the RUN function key pressed during the boot procedure. In this case, the Run LED flashes slowly (1 Hz). A subsequent project download (from within Automation Builder) cancels the blinking.</td>
</tr>
<tr>
<td>Error LED (ERR)</td>
<td>Denotes an error</td>
<td>Red</td>
<td>An error has occurred.</td>
<td>No errors or only warnings have occurred.</td>
<td>If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors. If the Error LED flashes fast with AC500 on display a fatal system error has occurred. If the Error LED flashes fast (4 Hz) alternating with a flashing Run LED the firmware is updated.</td>
</tr>
</tbody>
</table>

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.
<table>

**Reading out values**

**Reading out values CPU firmware SystemFW 3.1.x and DisplayFW 3.0**

The following settings of the Processor Module can be read out by pressing the function key VAL repeatedly:
1. Displays time of the Processor Module (hh.mm.ss).
2. Displays date of the Processor Module (yy.mm.dd).
3. Displays state of battery (ub 100 = 100%, ub 020 = 20% or ub 000 = empty).
4. Displays version of display firmware (e.g. d 3.0 r (= display Version 3.0 release)).
5. Displays version of CPU firmware (e.g. C 3.1.0r (= CPU Version 3.1.0 release)).
6. Displays CPU type.
7. Displays default text (RUN/STOP).

Reading out values CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1

Function key **VAL**  By pressing Function Key **VAL** state 1 is displayed

Enable flashing of display

**Blink functionality**
As of SystemFW 3.1.0 and AB 2.1.0 the Blink functionality is implemented. “Blink” means – activate flashing of background light of AC500 display in Automation Builder via “IP-Configuration” tool (for details see ).

**Wink functionality**
As of SystemFW 3.1.0 and AB 2.0.0 the Wink functionality is implemented. “Wink” means – activate flashing of background light of AC500 display in Automation Builder via communication settings (for details see Wink functionality).

**Function blocks**

**PmErrLedSet**
This Function Block switches the ERR-LED ON and OFF.

**PmDispSetText**
With this Function Block a text can be displayed on the CPU.

Further information is provided in the documentation of the AC500_Pm library. See the function blocks PmErrLedSet and PmDispSetText in the “Library Manager” of Automation Builder.

Default open Ethernet ports of PM50xx-x-xETH

After startup without a PLC project the AC500-eCo V3 PM50xx-x-xETH contains the following Ethernet ports and sockets:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
<th>Sockets</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig ¹)</td>
<td>UDP 24576</td>
<td>1 permanent socket per interface</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/IP BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
<td>1 socket per connection + 1 listen</td>
</tr>
<tr>
<td>OPC UA server ²)</td>
<td>TCP 4840</td>
<td></td>
</tr>
</tbody>
</table>

Remarks:

¹): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.
²): The port 4840 for OPC UA server is closed by default as of System FW V3.1.0.

All other ports are closed by default.

Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig ¹)</td>
<td>UDP 24576</td>
</tr>
<tr>
<td>Online access with driver 3S UDP BlkDrvUdp (with scan)</td>
<td>UDP 1740</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
</tr>
<tr>
<td>OPC UA server ²)</td>
<td>TCP 4840</td>
</tr>
</tbody>
</table>

Remarks:

¹): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.

²): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

All other ports are closed by default.

### Remarks:

1): in preparation

---

The PLC types PM5630-2ETH, PM5670-2ETH and PM5675-2ETH are available as of SystemFW 3.1.0.

---

### Ethernet configuration

#### Default Ethernet configuration

<table>
<thead>
<tr>
<th>Module</th>
<th>IP Address</th>
<th>Netmask</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM5xx2-x-ETH</td>
<td>ETH: 192.168.0.10</td>
<td>255.255.255.0</td>
<td>The Ethernet ports must be configured in different sub networks.</td>
</tr>
<tr>
<td>PM5072-T-2ETH</td>
<td>ETH1: 192.168.0.10, ETH2: 192.168.1.10</td>
<td>255.255.255.0</td>
<td>The Ethernet ports must be configured in different sub networks.</td>
</tr>
<tr>
<td>PM56xx-2ETH</td>
<td>ETH1: 192.168.0.10, ETH2: 192.168.1.10</td>
<td>255.255.255.0</td>
<td>The Ethernet ports must be configured in different sub networks.</td>
</tr>
</tbody>
</table>

For changing the default addresses or the description of the function keys see:

- Chapter 1.6.6.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3427
- Chapter 1.6.5.1.5.5 “Description of the function keys” on page 3243.
**Online access**

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC’s.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

<table>
<thead>
<tr>
<th>Online access can be established from:</th>
</tr>
</thead>
<tbody>
<tr>
<td>– Automation Builder command ‘Login’ ⇨ Chapter 1.4.1.24.2.6.2 “Command ‘Login’” on page 955</td>
</tr>
<tr>
<td>– CODESYS OPC DA server</td>
</tr>
<tr>
<td>– Panel CP600 series</td>
</tr>
</tbody>
</table>

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   - 1 socket on port 11740 (listen).
2. Login from Automation Builder via driver “BlkDrvTcp”.
   - 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   - 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver “BlkDrvTcp”.
   - 4 sockets on port 11740 (3x online, 1x listen)

**SNTP client and server**

As of version 3.1.0 the SystemFW provides a SNTP Protocol implementation which can be used for time synchronization of PLC clock. It can be used as SNTP Client or / and SNTP Server. But only one instance of each can be executed at the same time on one PLC. See ⇨ Chapter 1.6.6.3.4.2 “Configuration of the SNTP protocol” on page 3644.

- The SNTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an SNTP server on several Ethernet interfaces.

To read diagnosis information from the SNTP protocol within an IEC Application the Function Block PmSntpInfo can be used. This Function block is part of the library ABB_Pm_AC500.lib. It can also be used to determine the synchronization state of the PLC clock.

**Using network variables in AC500 V3**

When using network variables via UDP broadcast, the default broadcast address is set to 255.255.255.255.

This will not work on PLCs with multiple Ethernet interfaces, because of undecidable routing.

Set the broadcast address to a matching subnet broadcast address, depending on which interface should be used to send the variables into the network.
Example

- ETH1 with IP 192.168.0.10 netmask 255.255.255.0
- ETH2 with IP 192.168.1.10 netmask 255.255.255.0

If you want the network variables to be broadcast on ETH1, use broadcast address 192.168.0.255.

Onboard CAN configuration

Onboard CAN interface supports the following protocols

- CAN Open Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter "Chapter 1.6.6.2.11.1.1 “CM598-CAN - CANopen master communication module” on page 3486.

Further information can be found in chapter "Chapter 1.6.6.2.16 “CAN-based fieldbuses” on page 3534.

AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- Communication module CM598-CN

Differences in supported protocols can be seen in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Onboard CAN</th>
<th>CM598-CN</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANopen Manager</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>CAN 2A/2B</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>J1939</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Onboard CAN interface is not available on AC500-eCo V3!
1.6.5.1.7 Hot swap

Preconditions for using hot swap

Hot swap

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

**WARNING!**
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

**NOTICE!**
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

**Hot swap**
System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
NOTICE!
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from
the terminal unit in a powered system.

NOTICE!
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than
3.0.14 is part of the I/O configuration.
For min. required device index see table below.

<table>
<thead>
<tr>
<th>Device</th>
<th>Min. required device index for I/O module as of FW Version 3.0.14</th>

</tr>
</tbody>
</table>
Hot swap behavior

The following table describes the behavior in case of I/O attached to the AC500 CPU with firmware supporting hot swap on the I/O bus.

<table>
<thead>
<tr>
<th>Hot Swap Behavior</th>
<th>Central I/O on V3 CPU</th>
</tr>
</thead>
</table>
| Start-up behavior with unplugged or damaged I/O module on hot swap terminal unit TU5xx-H | System and I/O modules attached to the CPU are starting (except unplugged or damaged module when plugged on hot swap terminal unit).  
As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start.  
No specific setting needed. |
| Start-up behavior with wrong I/O module type on any terminal unit                  | System and I/O modules are not starting                                               |
| Diagnosis of presence of hot swap terminal unit                                    | Diagnosis using PLC browser command "io-bus desc" in Automation Builder V3.  
The PLC browser then provides an overview of the modules on the I/O bus including the position of hot swap terminal units in the I/O bus.  
In the application program this can be detected with a function block "IoModuleHotSwapInfo“ (Library: AC500_Io / Function Blocks / I/O-Bus) .  
One instance of function block is needed per terminal unit on the I/O bus. The function block provides five outputs delivering information about slot number, hot swap capability and plugged/unplugged state of the I/O module |
| Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working | If module is pulled then diagnosis Err 9480 “Module removed from Hot Swap Terminal Unit” is generated |
| Diagnosis after plugging the I/O module on the hot swap terminal unit              | Diagnosis Err 9480 is automatically acknowledged                                      |

1.6.5.1.8 KNX IP integration

This document describes the system aspects of AC500 V3 PLCs interface to KNX and its integration into the engineering tools.

It assumes - beneath basic AC500 and Automation Builder know-how at least basic experience and expertise in use of KNX and ETS (engineering software for KNX).

Additional information can be found:
- In the example projects and their documentation (C:\Users\Public\Documents\AutomationBuilder\Examples\PS5604-KNX).
- In ABB products and services.
Introduction

KNX is a bus system used more on the room and floor level in buildings (e.g. for lighting, shading and local HVAC devices).

The KNX as such doesn’t necessarily need a dedicated controller for simple connection of sensor/switch to receiving/actuator devices.

The signals exchanged via the protocol are so called “group addresses” (“objects”), which are downloaded via ETS to all the thereby linked (=grouped) devices.

On the room level it typically has a serial wiring called KNX TP (twisted pair), which then is linked to floor or central building or management level via IP routers. On Ethernet it is called KNXnet/IP abbreviated also as KNX IP.

The AC500 V3 PLC is after the Automation Builder engineering step and download a standard KNX device, in which KNX communication is done via the IP network interface. It is arranged topologically on the area / main line of the KNX IP routers and communicates with them via the KNXnet/IP protocol.

Engineering workflow

Both engineering software systems for AC500 V3 PLC (Automation Builder) and KNX (ETS) are directly linked.

A data exchange for the group objects (hereinafter also called communication objects) from the Automation Builder to ETS (via an XML file) and received by a DCA (Device configuration APP) for ETS is available.

The AC500 V3 PLC is integrated into the ETS via a certified KNX “device” with the transferred group objects as configured in Automation Builder and a physical KNX address (transferred via ETS and KNX IP to the AC500 V3 PLC).
Programming and commissioning of the AC500 V3 PLC starts with Automation Builder:
Configuration of the AC500 V3 PLC, its communications, here KNX, and I/O modules and all necessary parameters.

1. Configure programmable KNX controller in CODESYS by adding group objects to the device.
2. Use group objects as inputs and outputs in the IEC application.
3. Download of the above into the AC500 V3 PLC (via the engineering interface)
   The subsequent linking of the AC500 V3 PLC and the other KNX devices takes place with the vendor independent KNX commissioning software ETS:
5. Install DCA Plugin and the AC500 V3 PLC device description in ETS
6. Connect group objects in ETS and assign group addresses.
7. KNX IP download to AC500 V3 PLC.
8. The physical KNX address of the AC500 V3 PLC must be set before or during download of the KNX configuration.

The programming of the AC500 V3 PLC and the KNX commissioning can be done also by different people at different times and with same or separate engineering PCs. Both projects carry out their own download parts of their respective configurations to the AC500 V3 PLC.

The only data exchange between the two Engineering programs are the details about the KNX group objects defined in the ABB Automation Builder. This is done flexibly via the XML configuration file.

**Prerequisites**
- PC(s) with Windows 7 or higher with Administrator right(s)
- At least temporary network access to the internet for downloading and installing of:
  - Automation Builder as of version AB 2.1.2, (and e.g. example .project)
  - ETS5 and the necessary additional files (DCA .etsapp, device description .knxprod) plus possibly an matching example .knxproj) to above Automation Builder .project
● Network access to the local network, were the AC500 V3 PLC and KNX devices are connected.
● PS5604-KNX AC500 runtime license for each dedicated AC500 V3 PLC used in KNX networks (see Chapter 1.6.5.1.8.6.1 "KNX runtime license" on page 3292).
● The current IP address of the engineering PC(s) where Automation Builder and ETS are located in same Network / masked IP range, as the AC500 V3 PLC to be used.

General settings and system behavior

The KNX interface at the AC500 V3 PLC is only active during the PLC is in *RUN*.

1. Download Automation Builder program.
2. Run PLC.
3. Set physical address or download KNX application Programm via ETS.
   ⇒ The bus status can be viewed in Online View of Automation Builder.

KNX communication is only working after download the matching ETS application to the AC500 V3 PLC. Until then, the AC500 V3 PLC KNX communication is deactivated and marked with a warning symbol.

*Fig. 275: KNX Interface not ready*

However in this state the AC500 V3 PLC can still be switched to the KNX *programming mode* and the physical KNX address can be programmed. Also the device info can be read by ETS. If the KNX interface is ready, this can be recognized by the green symbol on the KNX interface in the Automation Builder.

*Fig. 276: KNX Interface ready*

Start-up behavior

**Start/Stop PLC**

- KNX bus works only in "RUN" mode.
- If the PLC is in "STOP" mode the KNX bus and the outputs are reset.

To avoid this behavior in "STOP" mode set the following preferences at the PLC_AC500_CPU:
1. Double-click PLC_AC500_V3 <...> and click PLC Settings.

2. Enable checkbox Update IO while in stop and select in dropdown-menu Behavior for Outputs in Stop “Keep current values”.

Warm start / Cold start

If the PLC is reset also the connected objects will be reset on the KNX bus.

Power ON/Off

After Power ON the KNX Interface need approximately 1 s to start after the PLC program had started. During this period no inputs will be recognized by the PLC and no outputs will be send to the bus.

Engineering of KNX in Automation Builder

Creation of KNX group objects

**Attention**

This information refers to Automation Builder as of version 2.2.0.

The data exchange with the KNX bus is done via KNX group objects.

1. Double-click node “KNX” in the device tree “click General ➔ click Add”.

   The window Communication object appears.

2. Enter your properties:
   - Group Object Number:
     The number of the KNX Group Object must match within the controller. It is displayed in the ETS and influences the display order in the ETS and the Automation Builder.
   - Type:
     Selection of the communication direction.
     – Input means that the controller receives values from the KNX bus.
     – Output means that the controller sends values to the KNX bus.
   - Data Point Type:
     Specification of the KNX data point type (DPT) of the Group Object. This determines the memory size, scaling and unit. For further information see the KNX Standard.
   - Group Object Name:
     The name of the KNX Group Object. It is freely selectable and is displayed in the ETS under the field name.
   - Group Object Function:
     The name of the function of the Group Object. It is freely selectable and is displayed in the ETS under the field Function.

Based on this selection, the flags of the KNX Group Object are set accordingly in the ETS.

You can use the [Export CSV...] button in the “General” tab menu bar to display the list of KNX group objects in a spreadsheet program such as Excel and edit and extend it flexibly. Then you can import them again via [Import CSV].

After you have created all the required KNX group objects, export them using the [Export to ETS] button. This exported file contains the configuration of the KNX group objects of the AC500 V3 PLC and is imported by ETS for linking to other KNX devices. If you have not yet created project information under main menu “Project ➔ Project Information”, the default values will be used during the export.
To use these KNX group objects in your application program, you must assign them with IEC61131-3 variables. This additional abstraction layer of an additional variable allows you to create modular automation programs that are independent of the used bus system or input/output modules.

The assignment is possible either via the parameter page “KNX I/O Mapping” or “I/O mapping list”. Both editors offer the same function in different representations.

On the KNX I/O Mapping page, the KNX variables are shown hierarchically. Each KNX Group Object consists of several channels with additional information. These differ depending on whether it is an input or an output.

The view is structured as follows:

- **Variable:** Enter the name of the IEC 61131-3 variable that you want to assign to this channel (KNX Group Object).
- **Mapping:** Shows if the channel is already linked
- **Channel:** Name of the Channel (Channel name)
- **Address:** The memory address under which the information is stored in the memory of the AC500 V3 PLC. Inputs start with %I and outputs start with %Q.
- **Type:** Specification of the IEC 61131-3 variable type
- **Default Value:** The value used after starting the controller.
  - At a KNX Group Object input, this value is used by the automation program until a value has been received from the KNX bus.
  - At a KNX Group Object output, this value is sent to the bus when the controller is started.
- **Unit:** Specification of the KNX data point type (DPT)
- **Description:** Note text

A KNX Group Object “input” consists of a status and a control part:

The Channel name of the status part consists of: Object Number + Object Name + Object Function and include the following informations:

- **UpdateFlag:**
  This status flag is set to the value “true” for one cycle as soon as a new KNX telegram has been received. Even if the value of the telegram does not differ from the previous one.
- **ValueChanged:**
  This status flag is set to the value “true” as soon as a new KNX telegram has been received and the value differs from the previous one.
- **ValueValid:**
  This status flag is set to the value “true” as soon as a KNX telegram has been received for the first time after the controller has been started.
- **WatchdogTimeout:**
  As of Automation Builder 2.2.1 it will be possible to define a Watchdog Timeout for each input object. If a timeout occur this flag will be set to the value “true” for one cycle.
- **Value:**
  The current value of the KNX Group Object received from the KNX bus.

The Channel name of the control part consists of: “Control” + Object Number + Object Name + Object Function and include the following control possibilities:
- Reset status flags:
  When this flag is set from “false” to “true” by the automation program then the above-mentioned status flags of the KNX Group Object are reset to the value “false”.

- Send value read:
  When this flag is set from “false” to “true” by the automation program, a ValueRead telegram is sent to the KNX bus. This causes the KNX remote device to send back its current value.

A KNX Group Object “output” is represented as follows:

The Channel name of the Group Object consists of: Object Number + Object Name + Object Function

- Trigger Output:
  When this flag is set from “false” to “true” by the automation program, the current value is sent immediately to the KNX bus. The sending conditions that are may be activated in the ETS (send on change and cyclic sending) will be restarted

- Disable Output:
  As long this flag is set to “true” by the automation program, the sending conditions send on change and cyclic sending in the ETS are deactivated.

- Value:
  The current value of the KNX Group Object that is sent to the KNX bus.

The permanently defined Program LED Status represent the function as known in other KNX devices, showing the status of the programming LED.

Create an application program

The KNX variables defined on the KNX I/O Mapping page are available programwide under IoConfig_Globals_Mapping.

These you can see if you click in to the programming window and either via right-click select “Input Assistant” or press F2.
Export XML file

To exchange the configured KNX group objects the configuration has to be exported via XML File.

If later both projects (from Automation Builder and ETS) are loaded on the PLC, the PLC checks if the two projects have the same source and fit together. This will be done by an automatically calculated Checksum. For calculating the Checksum the following information’s from the Project information will be used:

- Company
- Title
- Version
- Timestamp

This Information will also be shown in the ETS after loading the XML File. If the user has not entered any project information some default values will be set.

Integration of the PLC in KNX

Insert controller

1. Start the ETS and insert the PS5604-KNX AC500 as controller from the ETS device catalog into your ETS project.
2. Assign a physical KNX address to the controller.
   ⇨ The controller is placed topologically on the IP Main Area.
**Import configuration**

1. Select the “PS5604-KNX AC500” in the ETS explorer tree and click on “DCA” tab in the editor window.
2. Click on Load Configuration and select the configuration .xml file.
   - The KNX group objects defined in AC500 V3 PLC in Automation Builder are displayed in the ETS.

**Connect controller with KNX Devices**

1. Right-click on a “PS5604-KNX AC500” group object and assign a KNX group address or drag and drop from group address window.
2. Interlink group objects by assigning the same KNX Group Address.
Parameters of the device

The following settings are possible in the ETS parameters of the PS5604-KNX AC500.

Tab General settings

- **Default Gateway:**
  The used KNXnet/IP broadcast address. This must match the KNX system (KNX IP router). It is the default setting that is usually not changed.
  - The entry field Default Gateway can contain another IP address for the Multicast communication. The normal Multicast IP address for KNX ist 224.0.23.12.
  - If another Multicast IP address is to be used, it can be chosen in the area from 239.0.0.0 to 239.255.255.255. This alternative Multicast IP address can be defined in the input field Default Gateway.

- **Telegram rate:**
  The maximum transmission rate of the AC500 V3 PLC can be limited in order to prevent an excessive bus load and thus to avoid malfunction of the KNX system.
  The KNX telegrams are buffered until they have been sent. New values which have been calculated by the automation program in the meantime are updating the cached values. The old cached value is discarded and not sent.

- **Project Information:**
  At this point, the project information of the Automation Builder project is displayed.
For each KNX Group Object of the AC500 V3 PLC an Object entry is displayed in the device parameters. This is named after the number of the KNX Group Object.

For outputs (controller sends to the KNX bus) the KNX transmission conditions can be set:

- **Communication direction:**
  Setting of the transmission direction of the object.
  - Input (KNX to PLC): The Controller receives values from the KNX bus.
  - Output (PLC to KNX): The Controller sends values to the KNX bus.

- **Send condition (only for outputs):**
  Setting whether the Controller sends a telegram to the KNX bus automatically when the object value is changed. The following options are available
  - No automatic sending:
    No automatic sending to the KNX bus. This must be done via the program code by the Trigger Output flag.
  - Send on change:
    Every time the object value changes, a telegram is sent to the KNX bus. No matter how minor this change is.
  - Send on difference (only for group objects which are not DPT 1.* Boolean): Every time the object value changes, this value is only sent to the KNX bus if it differs from the last sent value at least by the settable difference.

- **Sending difference (only if Send on difference is active):**
  Input of the difference by which the object value must change to be send. You can enter numbers with decimal places.

- **Cyclic sending (only for outputs):**
  Setting whether in addition the object value is sent cyclically repeatedly to the bus. This also happens if this object value has not changed. Two different value ranges for the cycle time can be specified.

- **Cycle time (only when Cyclic sending is active):**
  Specification of the cycle time for the cyclic transmission.
  Input format:
  hour:minute:second
  Note: The cycle time of the KNX stack depends on the cycle time of the task that executes the stack. A long task time causes long download times from ETS. Consider the CPU load and cycle times of other processes running on the CPU when selecting a cycle time for the KNX stack.
Regardless of the set transmission conditions, the program code can trigger by the flag **Trigger Output** a sending of the value to the KNX bus at any time.

By activating the flag **Read on Init** of the KNX group objects in the right ETS properties panel, the Controller sends a value read query to the connected KNX device at startup. This then responds with its current object value.

In this properties panel you can also select the appropriate subdata point type of the KNX Group Object. This defines the unit of the value in the KNX system. For example DPT 9.001 represents temperature in °C.

If for example the response of an actuator state is needed for an input "Aktor A Status", this feature can be enabled in the parameter of the Switch Actuator (e.g. 1.1.6 SA/S4.10.1).
The current IP address as well as further information of the AC500 V3 PLC can be read via the ETS Device Info function. For this the physical KNX address is necessary. You can determine the address by the ETS function **Programming Mode**.

With the ETS function **Group Monitor** you can analyze the telegrams on the KNX bus. You can also use it to write/read KNX telegrams.

**Download ETS configuration to controller**

The download of the ETS configuration to the AC500 V3 PLC is done via the ETS function “Download” in the menu bar. This download happens via the KNX interface directly to the AC500 V3 PLC.

Best you select in ETS the network interface of the computer as the bus interface. Thus, a fast data exchange is possible and the data is not routed via the KNX TP bus.

At the first download, the physical KNX address of the controller is programmed. To do this, set the AC500 V3 PLC to KNX programming mode.

This can be done either via the display or functions inside the application program of the controller (e.g. connected to a Webvisu like done in the example program).

**Via AC500 display**

> Chapter 1.6.5.1.5.5.3.2 “Configuration CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1” on page 3250

**Attention!**

*The activation of the KNX programming mode via the display only works with Automation Builder as of version 2.2.0.*

*The KNX configuration of AC500-eCo V3 uses TA5130-KNXPB.*

1. Press the **CFG** function key.
   - Switch is OFF (S OFF) is displayed.
2. Press the *Arrow Down* function key
   - *Pbut 0* is displayed.
   
   (*Pbut* is standing for programming button, the 0 (or the 1) showing the status of the programming LED (0 = Off; 1 = ON))

3. Press the *CFG* function key.
   - The display shows *Pbut 1* flashing.

4. Confirm this with the *OK* function key.
   - The display permanently shows *Pbut 1*. The AC500 V3 PLC is in KNX programming mode.

AC500-eCo V3 via TA5130-KNXPB

1. Ensure the TA5130-KNXPB is plugged in during power up, PLC is in RUN Mode.
2. Ensure that TA5130-KNXPB is configured inside Automation Builder configuration.
3. Push the button on the TA5130-KNXPB.
   - The LED on the option board should turn ON. The AC500-eCo V3 is in KNX programming mode.

The AC500 V3 PLC automatically terminates the KNX programming mode after the programming of the physical KNX address.

Alternatively you can terminate the programming mode with *Pbut 0* by pressing the *CFG* function key.

For AC500-eCo V3: push the button on the TA5130-KNXPB again to terminate the programming mode, the LED should turn OFF.

You can exit the menu at any time with the *ESC* function key.

Via AC500 application

Please use the following variable for setting the KNX Program Button:

```
AC500_IoDrvKNX.GVL.IoDrvKNXCopyChannels.ProgramButton
```

The controller automatically terminates the programming mode after programming the physical address with the ETS.

The AC500 V3 PLC has then besides the Automation Builder configuration also the appropriate ETS configuration and starts its KNX communication.

Download all other linked KNX devices as well as the KNX IP routers. The ETS automatically creates the filter tables of the KNX IP routers so that the KNX telegrams are routed from the KNX TP lines to the IP line of the AC500 Controller.

Make changes

Changes can be made in the Automation Builder as well as in the ETS without the need for a change in the other software or the need for a new data exchange.

Only if changes are made to the KNX group objects in the Automation Builder, a data exchange with the ETS is again necessary. Afterwards, a download is required both in the Automation Builder and in the ETS. Only when these two configurations have been downloaded again to the AC500 V3 PLC, the KNX communication is in operation again.

The DCA detects changes to names and numbers of the KNX group objects when importing the configuration file in the ETS and keeps the already made settings and linked Group Addresses of these changed group objects.
Remarks

KNX runtime license

The standard V3 AC500 CPUs are shipped from the factory without firmware and need an installed PS5604-KNX runtime license for KNX operation in each CPU. The PS5604-KNX is a license document with activation code and needs to be purchased separately. The license can after a first download to one CPU also be transferred to another CPU via Automation Builder.

Data conversion

The KNX standard defines a big-endian byte order while the IEC 61131-3 is based on the little-endian byte order. Therefore, the controller automatically converts the data point types.

However, if you access the bits of the structured KNX data point types (DPT) for time, date (DPT 10.*, DPT 16.*, DPT 19.*) in your program code, you have to note the reverse byte order. Therefore, as of Automation Builder version 2.2.0, corresponding function libraries are available that provide conversion functions for these data point types.
1.6.5.1.9 Communication with Modbus RTU

Protocol description

The Modbus RTU protocol is implemented in the AC500 Processor Modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

The Modbus operating mode of a serial interface is set in the PLC configuration. See Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3527.

To use Modbus RTU protocol on an AC500-eCo V3 PLC, the CPU must be equipped with a serial interface adapter TA5141-RS232I, TA5142-RS485 or TA5142-RS485I option board. The type of the option board adapter must be selected according to the type of physical serial interface needed. According to the CPU type, up to 3 serial interface adapter option boards can be used. Following serial interface option boards can be used, see Chapter 1.6.6.2.8.3 “Attach serial interface option board” on page 3471.

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the Function Block ModRtuMast.

This Function Block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus blocks transferred by the server contain the following information:

- Modbus address of the interrogated server (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)
- CRC16 control code (2 bytes)

Modbus server

In this operating mode, no Function Block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

<table>
<thead>
<tr>
<th>Function code</th>
<th>DEC</th>
<th>HEX</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 02</td>
<td>01</td>
<td>01</td>
<td>Read n bits</td>
</tr>
<tr>
<td>03 or 04</td>
<td>03</td>
<td>03</td>
<td>Read n words</td>
</tr>
<tr>
<td>05</td>
<td>05</td>
<td>05</td>
<td>Write one bit (encoded in one word)</td>
</tr>
<tr>
<td>06</td>
<td>06</td>
<td>06</td>
<td>Write one word</td>
</tr>
<tr>
<td>15</td>
<td>15</td>
<td>0F</td>
<td>Write n bits (encoded in one byte)</td>
</tr>
<tr>
<td>16</td>
<td>16</td>
<td>10</td>
<td>Write n words</td>
</tr>
<tr>
<td>22</td>
<td>22</td>
<td>16</td>
<td>Mask write</td>
</tr>
<tr>
<td>23</td>
<td>23</td>
<td>17</td>
<td>Read/write multiple words in one telegram</td>
</tr>
</tbody>
</table>

The following restrictions apply to the length of the data to be sent:
<table>
<thead>
<tr>
<th>Function code</th>
<th>HEX</th>
<th>Max. length</th>
</tr>
</thead>
<tbody>
<tr>
<td>01 or 02</td>
<td>01 or 02</td>
<td>2000 bits</td>
</tr>
<tr>
<td>03 or 04</td>
<td>03 or 04</td>
<td>125 words / 62 double words</td>
</tr>
<tr>
<td>05</td>
<td>05</td>
<td>1 bit</td>

Modbus addresses for AC500-eCo V3 processor modules PM50x2

**Modbus address table**
A range of maximum 64 kB is allowed for the access via Modbus to the addressable flag area (%M area). Thus, the complete address range 0000hex up to 7FFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

Following values apply:

<table>
<thead>
<tr>
<th>PM5012-x-ETH</th>
<th>PM5032-x-ETH</th>
<th>PM5052-x-ETH</th>
<th>PM5072-T-2ETH</th>

</table>

Calculation of the bit variable from the hexadecimal address:

**Formula:**

\[
\text{Bit variable (BOOL)} := \%\text{MXBYTE.BIT}
\]

where:

<table>
<thead>
<tr>
<th>DEC</th>
<th>BYTE</th>
<th>BIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal address</td>
<td>DEC / 8</td>
<td>DEC mod 8</td>
</tr>
</tbody>
</table>

**Examples:**

- Address hexadecimal = 16#2002
  
  DEC := 8194
  
  BYTE := 8194 / 8 := 1024
  
  BIT := 8194 mod 8 := 2
  
  Bit variable: %MX1024.2

- Address hexadecimal = 16#3016
  
  DEC := 12310
  
  BYTE := 12310 / 8 := 1538,75 -> 1538
  
  BIT := 12310 mod 8 := 6
  
  Bit variable: %MX1538.6

- Address hexadecimal = 16#55AA
  
  DEC := 21930
  
  BYTE := 21930 / 8 := 2741,25 -> 2741
  
  BIT := 21930 mod 8 := 2
  
  Bit variable: %MX2741.2

Calculation of the hexadecimal address from the bit variable:

**Examples:**

- Bit variable := %MX515.4
  
  DEC := 515 * 8 + 4 := 4124
  
  Address hex := 16#101C

- Bit variable := %MX3.3
  
  DEC := 3 * 8 + 3 := 27
  
  Address hex := 16#001B

- Bit variable := %MX6666.2
  
  DEC := 6666 * 8 + 2 := 53330
  
  Address hex := 16#D052
Peculiarities for accessing Modbus addresses

Peculiarities for bit access:
- A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

Areas protect from read/write access by Modbus client

As described in Chapter 1.6.6.3.1.1 “Configuration of Modbus TCP/IP server” on page 3640, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the Function Block ModRtuMast at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:
- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

The send and receive of telegrams shown in this section are not visible in the PLC. However, the complete telegrams can be made visible using a serial data analyzer connected to the connection line between server and client, if required.

The amount of user data depends on the capabilities of the server and the client.

For the following examples, it is assumed that one AC500 Modbus module is used as client and another one is used as server. There may be different properties if modules of other manufacturers are used.

FCT 1 or 2: Read n bits

FCT 3 or 4: Read n double words

The function code "read double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer). Same tables as Chapter 1.6.5.1.9.6.2 “FCT 3 or 4: Read n words” on page 3300.

FCT 5: Write 1 bit

For the function code "write 1 bit", the value of the bit to be written is encoded in one word.
BIT = TRUE -> Data word = FF 00 HEX
BIT = FALSE -> Data word = 00 00 HEX

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the ModRtuMast inputs are logically correct.

Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Table 613: Server response

</tr>
</tbody>
</table>
| 05DEC  | ACKNOWLEDGE  
Specialized use in conjunction with programming commands.  
The server has accepted the request and is processing it, but a  
long duration of time will be required to do so. This response is  
returned to prevent a timeout error from occurring in the client. The  
client can next issue a Poll Program Complete message to deter-  
mine if processing is completed. |
| 06DEC  | SERVER DEVICE BUSY  
Specialized use in conjunction with programming commands.  
The server is engaged in processing a long-duration program com-  
mand. The client should retransmit the message later when the  
server is free. |
| 07DEC  | NEGATIVE ACKNOWLEDGE  
Specialized use in conjunction with programming commands.  
The server cannot perform the programming functions. Client  
should request diagnostic or error information from server. |
| 08DEC  | MEMORY PARITY ERROR  
Specialized use in conjunction with function codes 20 and 21 and  
reference type 6, to indicate that the extended file area failed to  
pass a consistency check. The server attempted to read record file,  
but detected a parity error in the memory. The client can retry the  
request, but service may be required on the server device. |
| 10DEC  | GATEWAY PATH UNAVAILABLE  
Specialized use in conjunction with gateways, indicates that the  
gateway was unable to allocate an internal communication path  
from the input port to the output port for processing the request.  
Usually means that the gateway is misconfigured or overloaded. |
| 11DEC  | GATEWAY TARGET DEVICE FAILED TO RESPOND  
Specialized use in conjunction with gateways, indicates that no  
response was obtained from the target device. Usually means that  
the device is not present on the network. |

### Example

**Table 614: Example:**

**Modbus request of the client:**

<table>
<thead>
<tr>
<th>Function code:</th>
<th>01</th>
<th>Read n bits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Server operand address:</td>
<td>4000HEX = 16384DEC</td>
<td>Area for read access disabled in server</td>
</tr>
</tbody>
</table>

**Modbus response of the server:**

<table>
<thead>
<tr>
<th>Function code:</th>
<th>81HEX</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error code:</td>
<td>03</td>
</tr>
</tbody>
</table>
Processing bits

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type Chapter 1.4.1.23.5.10 “Data type ‘BIT’” on page 609 must not be mixed up with data type Chapter 1.4.1.23.5.1 “Data type ‘BOOL’” on page 602. Variables of both types may have values ‘TRUE’ or ‘FALSE’. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

Modbus client

When accessing bits in a Server, the local data referred to at Client Function Blocks input data is always expected to be of format BOOL.

```
VAR
abBoolArray : ARRAY [0..15] OF BOOL;
ModMast : ModTcpMast;
END_VAR

abBoolArray[0] := TRUE;

ModMast(Execute:= ModMastExecute,
ETh:= ETH1,
IPAdr:= IP_ADR_STRING_TO_DWORD('192.168.0.100'),
UnitID:= 0,
Fct:= 15,
Addr:= 16#0000,
Nbr:= SIZEOF(abBoolArray),
Data:= ADR(abBoolArray));
```

Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see Chapter 1.4.1.23.4.11 “Bit access to variables” on page 597).

```
VAR
awWordVariable AT %M00 : ARRAY [0..7] OF WORD;
END_VAR

awWordVariable[0].0 := TRUE;
awWordVariable[7].15 := FALSE;
```
Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset (see "Bit access to a variable with a global constant variable" on page 597).

```
VAR GLOBAL CONSTANT
(*bit offsets in awWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in awWordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END VAR

VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END VAR

awWordVariable[0].NameBitOffset_0_00 := TRUE;
avWordVariable[7].NameBitOffset_7_15 := FALSE;
```
Defining a data type

A further alternative is to define your own data types (see Chapter 1.4.1.24.1.14 “Object 'DUT’” on page 767) according to the requirements of your particular application (see “Bit access with BIT data types” on page 598).

```plaintext
TYPE ControlWordType :
  STRUCT
    NameBitOffset_00 : BIT;
    NameBitOffset_01 : BIT;
    NameBitOffset_02 : BIT;
    NameBitOffset_03 : BIT;
    NameBitOffset_04 : BIT;
    NameBitOffset_05 : BIT;
    NameBitOffset_06 : BIT;
    NameBitOffset_07 : BIT;
    NameBitOffset_08 : BIT;
    NameBitOffset_09 : BIT;
    NameBitOffset_10 : BIT;
    NameBitOffset_11 : BIT;
    NameBitOffset_12 : BIT;
    NameBitOffset_13 : BIT;
    NameBitOffset_14 : BIT;
    NameBitOffset_15 : BIT;
  END_STRUCT
END_TYPE

VAR
atTypeVariable AT #MWO : ARRAY [0..7] OF ControlWordType;
END_VAR

atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;
```
Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see “Bit access with BIT data types” on page 598).

```plaintext
TYPE ControlWord0Type : 
STRUCT
NameBitOffset_0_00 : BIT;
NameBitOffset_0_01 : BIT;
NameBitOffset_0_02 : BIT;
NameBitOffset_0_03 : BIT;
NameBitOffset_0_04 : BIT;
NameBitOffset_0_05 : BIT;
NameBitOffset_0_06 : BIT;
NameBitOffset_0_07 : BIT;
NameBitOffset_0_08 : BIT;
NameBitOffset_0_09 : BIT;
NameBitOffset_0_10 : BIT;
NameBitOffset_0_11 : BIT;
NameBitOffset_0_12 : BIT;
NameBitOffset_0_13 : BIT;
NameBitOffset_0_14 : BIT;
NameBitOffset_0_15 : BIT;
END_STRUCT
END_TYPE

TYPE ControlWord1Type : 
STRUCT
NameBitOffset_1_00 : BIT;
NameBitOffset_1_01 : BIT;
NameBitOffset_1_02 : BIT;
NameBitOffset_1_03 : BIT;
NameBitOffset_1_04 : BIT;
NameBitOffset_1_05 : BIT;
NameBitOffset_1_06 : BIT;
NameBitOffset_1_07 : BIT;
NameBitOffset_1_08 : BIT;
NameBitOffset_1_09 : BIT;
NameBitOffset_1_10 : BIT;
NameBitOffset_1_11 : BIT;
NameBitOffset_1_12 : BIT;
NameBitOffset_1_13 : BIT;
NameBitOffset_1_14 : BIT;
NameBitOffset_1_15 : BIT;
END_STRUCT
END_TYPE

TYPE ControlWordListType : 
STRUCT
ControlWord0 : ControlWord0Type;
ControlWord1 : ControlWord1Type;
END_STRUCT
END_TYPE

VAR
atWordListType AT %MW0 : ControlWordListType;
END_VAR

atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```
Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for packing and unpacking.

```plaintext
VAR
  abBoolVariable : ARRAY [0..15] OF BOOL;
  wWordVariable0 : AT WORD;
  wWordVariable1 : AT WORD;
END_VAR

VAR
  Unpack : Mem.UnpackWord;
END_VAR

abBoolVariable[0] := TRUE;
abBoolVariable[15] := FALSE;

wWordVariable0 := Mem.PackBitsToWord(abBoolVariable[0], abBoolVariable[1], abBoolVariable[2], abBoolVariable[3],
  abBoolVariable[4], abBoolVariable[5], abBoolVariable[6], abBoolVariable[7],
  abBoolVariable[8], abBoolVariable[9], abBoolVariable[10], abBoolVariable[11],
  abBoolVariable[12], abBoolVariable[13], abBoolVariable[14], abBoolVariable[15]);

wWordVariable1 := 1;
Unpack(WValue := wWordVariable1,
  xBit0 => abBoolVariable[0], xBit1 => abBoolVariable[1], xBit2 => abBoolVariable[2], xBit3 => abBoolVariable[3],
  xBit4 => abBoolVariable[4], xBit5 => abBoolVariable[5], xBit6 => abBoolVariable[6], xBit7 => abBoolVariable[7],
  xBit8 => abBoolVariable[8], xBit9 => abBoolVariable[9], xBit10 => abBoolVariable[10], xBit11 => abBoolVariable[11],
  xBit12 => abBoolVariable[12], xBit13 => abBoolVariable[13], xBit14 => abBoolVariable[14], xBit15 => abBoolVariable[15]);
```

Function block ModRtuMast

This Function Block is only required in the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The Function Block can be used for the local serial interfaces of the controller. A separate instance of the Function Block has to be used for each interface.

`ModRtuMast` is contained in the library `AC500_ModRtuMast`. 
1.6.5.1.10 Communication with Modbus TCP/IP

Protocol description

The Modbus TCP protocol is implemented in the AC500 Processor Modules. Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s). Each Ethernet interface can work as Modbus client and server interface in parallel if required. The Modbus operating mode of an Ethernet interface is set in .

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the Function Block . This Function Block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus Function Blocks transferred by the client contain the following information:

- Transaction identifier for synchronization between messages of server and client (2 byte)
- Protocol identifier (0 for Modbus/TCP) (2 byte)
- Length field (Number of bytes in frame) (2 byte)
- Unit identifier (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)

Modbus server

In this operating mode, no Function Block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically. The AC500 CPUs process the following Modbus operation codes:

<table>
<thead>
<tr>
<th>Function code</th>
<th>HEX</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEC 01 or 02</td>
<td>01 or 02</td>
<td>Read n bits</td>
</tr>
<tr>
<td>DEC 03 or 04</td>
<td>03 or 04</td>
<td>Read n words</td>
</tr>
<tr>
<td>DEC 05</td>
<td>05</td>
<td>Write one bit (encoded in one word)</td>
</tr>
<tr>
<td>DEC 06</td>
<td>06</td>
<td>Write one word</td>
</tr>
<tr>
<td>DEC 15</td>
<td>0F</td>
<td>Write n bits (encoded in one byte)</td>
</tr>
<tr>
<td>DEC 16</td>
<td>10</td>
<td>Write n words</td>
</tr>
<tr>
<td>DEC 22</td>
<td>16</td>
<td>Mask write</td>
</tr>
<tr>
<td>DEC 23</td>
<td>17</td>
<td>Read/write multiple words in one telegram</td>
</tr>
</tbody>
</table>

The following restrictions apply to the length of the data to be sent:

<table>
<thead>
<tr>
<th>Function code</th>
<th>Max. length</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEC 01 or 02</td>
<td>2000 bits</td>
</tr>
<tr>
<td>DEC 03 or 04</td>
<td>125 words / 62 double words</td>
</tr>
<tr>
<td>DEC 05</td>
<td>1 bit</td>
</tr>
</tbody>
</table>
PLC Automation with V3 CPUs
PLC integration (hardware) > System technology for AC500 V3 products

<table>
<thead>
<tr>
<th>Function code</th>
<th>HEX</th>
<th>Max. length</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEC</td>
<td>HEX</td>
<td></td>
</tr>
<tr>

<td>06</td>
<td>1 word</td>
</tr>
<tr>
<td>15</td>
<td>0F</td>
<td>2000 bits</td>
</tr>
<tr>
<td>16</td>
<td>10</td>
<td>123 words / 61 double words</td>
</tr>
<tr>
<td>22</td>
<td>16</td>
<td>Write: 1 word</td>
</tr>
<tr>
<td>23</td>
<td>17</td>
<td>Read: 125 words / 62 double words</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Write: 121 words / 60 double words</td>
</tr>
</tbody>
</table>

**Technical data**

Configuration of Modbus on TCP/IP is described in the chapter.

**Modbus addresses for AC500-eCo V3 processor modules PM50xx**

**Modbus address table**

A range of maximum 64 kB is allowed for the access via Modbus to the addressable flag area (%M area). Thus, the complete address range 0000hex up to 7FFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

Following values apply:

<table>
<thead>
<tr>
<th>PM5012-x-ETH</th>
<th>PM5032-x-ETH</th>
<th>PM5052-x-ETH</th>
<th>PM5072-T-2ETH</th>
</tr>
</thead>
<tbody>
<tr>
<td>Size of the %M area</td>
<td>4 kB</td>
<td>16 kb</td>
<td>16 kb</td>
</tr>
<tr>
<td>Modbus address range (Word accesses)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>HEX</td>
<td>0000 … 07FF</td>
<td>0000 … 1FFF</td>

Calculation of the bit variable from the hexadecimal address:

**Formula:**

\[
\text{Bit variable (BOOL)} := \%\text{MXBYTE.BIT}
\]

where:

- **DEC**: Decimal address
- **BYTE**: DEC / 8
- **BIT**: DEC mod 8 (Modulo division)
### Examples:

- **Address hexadecimal = 16#2002**
  
  DEC := 8194  
  BYTE := 8194 / 8 := 1024  
  BIT := 8194 mod 8 := 2  
  Bit variable: %MX1024.2

- **Address hexadecimal = 16#3016**
  
  DEC := 12310  
  BYTE := 12310 / 8 := 1538,75 -> 1538  
  BIT := 12310 mod 8 := 6  
  Bit variable: %MX1538.6

- **Address hexadecimal = 16#55AA**
  
  DEC := 21930  
  BYTE := 21930 / 8 := 2741,25 -> 2741  
  BIT := 21930 mod 8 := 2  
  Bit variable: %MX2741.2

- **Calculation of the hexadecimal address from the bit variable:**
  
  - **Bit variable := %MX515.4**
    
    DEC := 515 * 8 + 4 := 4124  
    Address hex := 16#101C
  
  - **Bit variable := %MX3.3**
    
    DEC := 3 * 8 + 3 := 27  
    Address hex := 16#001B
  
  - **Bit variable := %MX6666.2**
    
    DEC := 6666 * 8 + 2 := 53330  
    Address hex := 16#D052

### Examples:

- **Bit variable := %MX515.4**
  
  DEC := 515 * 8 + 4 := 4124  
  Address hex := 16#101C

- **Bit variable := %MX3.3**
  
  DEC := 3 * 8 + 3 := 27  
  Address hex := 16#001B

- **Bit variable := %MX6666.2**
  
  DEC := 6666 * 8 + 2 := 53330  
  Address hex := 16#D052

## Peculiarities for accessing Modbus addresses

- **Peculiarities for bit access:**
  
  - A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.  
  - Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

## Areas protect from read/write access by Modbus client

As described in "Chapter 1.6.6.3.1.1 "Configuration of Modbus TCP/IP server" on page 3640, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

## Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the Function Block or ModTcpMast at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:

- Inputs area (%I area)  
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

**Modbus telegrams**

For a detailed description of the Modbus TCP telegrams and their elements please see the corresponding specifications on public websites.

**Exception response by server**

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MODMAST inputs are logically correct. Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

**General telegram description**

*Table 617: Server response*

**Processing bits**

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.
Data type ⇢ Chapter 1.4.1.23.5.10 “Data type 'BIT'” on page 609 must not be mixed up with data type ⇢ Chapter 1.4.1.23.5.1 “Data type 'BOOL'” on page 602. Variables of both types may have values 'TRUE' or 'FALSE'. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

Modbus client

When accessing bits in a Server, the local data referred to at Client Function Blocks input data is always expected to be of format BOOL.

```plaintext
VAR
  abBoolArray : ARRAY [0..15] OF BOOL;
  ModMast : ModTcpMast;
END_VAR

abBoolArray[0] := TRUE;

ModMast(Execute:= ModMastExecute,
  Eth:= ETH1,
  IPAdr:= IP_ADDR_STRING_TO_DWORD('192.168.0.100'),
  UnitID:= 0,
  Fct:= 15,
  Addr:= #0000,
  Nbr:= SIZEOF(abBoolArray),
  Data:= ADR(abBoolArray));
```

Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see ⇢ Chapter 1.4.1.23.4.11 “Bit access to variables” on page 597).

```plaintext
VAR
  awWordVariable AT #HWO : ARRAY [0..7] OF WORD;
END_VAR

awWordVariable[0].0 := TRUE;
awWordVariable[7].15 := FALSE;
```
Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset (see “Bit access to a variable with a global constant variable” on page 597).

```plaintext
VAR GLOBAL CONSTANT
(*bit offsets in awWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in awWordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END VAR

VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END VAR

awWordVariable[0].NameBitOffset_0_00 := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;
```
Defining a data type

A further alternative is to define your own data types (see Chapter 1.4.1.24.1.14 “Object ‘DUT’” on page 767) according to the requirements of your particular application (see “Bit access with BIT data types” on page 598).

```
TYPE ControlWordType :
  STRUCT
    NameBitOffset_00 : BIT;
    NameBitOffset_01 : BIT;
    NameBitOffset_02 : BIT;
    NameBitOffset_03 : BIT;
    NameBitOffset_04 : BIT;
    NameBitOffset_05 : BIT;
    NameBitOffset_06 : BIT;
    NameBitOffset_07 : BIT;
    NameBitOffset_08 : BIT;
    NameBitOffset_09 : BIT;
    NameBitOffset_10 : BIT;
    NameBitOffset_11 : BIT;
    NameBitOffset_12 : BIT;
    NameBitOffset_13 : BIT;
    NameBitOffset_14 : BIT;
    NameBitOffset_15 : BIT;
  END_STRUCT
END_TYPE

VAR
  atTypeVariable AT %MWO : ARRAY [0..7] OF ControlWordType;
END_VAR

  atTypeVariable[0].NameBitOffset_00 := TRUE;
  atTypeVariable[7].NameBitOffset_15 := FALSE;
```
Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see “Bit access with BIT data types” on page 598).

```plaintext
TYPE ControlWord0Type :
  STRUCT
  NameBitOffset_0_00 : BIT;
  NameBitOffset_0_01 : BIT;
  NameBitOffset_0_02 : BIT;
  NameBitOffset_0_03 : BIT;
  NameBitOffset_0_04 : BIT;
  NameBitOffset_0_05 : BIT;
  NameBitOffset_0_06 : BIT;
  NameBitOffset_0_07 : BIT;
  NameBitOffset_0_08 : BIT;
  NameBitOffset_0_09 : BIT;
  NameBitOffset_0_10 : BIT;
  NameBitOffset_0_11 : BIT;
  NameBitOffset_0_12 : BIT;
  NameBitOffset_0_13 : BIT;
  NameBitOffset_0_14 : BIT;
  NameBitOffset_0_15 : BIT;
  END_STRUCT
END_TYPE

TYPE ControlWord1Type :
  STRUCT
  NameBitOffset_1_00 : BIT;
  NameBitOffset_1_01 : BIT;
  NameBitOffset_1_02 : BIT;
  NameBitOffset_1_03 : BIT;
  NameBitOffset_1_04 : BIT;
  NameBitOffset_1_05 : BIT;
  NameBitOffset_1_06 : BIT;
  NameBitOffset_1_07 : BIT;
  NameBitOffset_1_08 : BIT;
  NameBitOffset_1_09 : BIT;
  NameBitOffset_1_10 : BIT;
  NameBitOffset_1_11 : BIT;
  NameBitOffset_1_12 : BIT;
  NameBitOffset_1_13 : BIT;
  NameBitOffset_1_14 : BIT;
  NameBitOffset_1_15 : BIT;
  END_STRUCT
END_TYPE

TYPE ControlWordListType :
  STRUCT
  ControlWord0 : ControlWord0Type;
  ControlWord1 : ControlWord1Type;
  END_STRUCT
END_TYPE

VAR
  atWordListType AT \$M0 : ControlWordListType;
END_VAR

atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```
Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for packing and unpacking.

```plaintext
VAR
  abBoolVariable : ARRAY [0..15] OF BOOL;
  wWordVariable2 : AT WORD;
  wWordVariable1 : AT WORD;
END_VAR

VAR
  Unpack : Mem.UnpackWord;
END_VAR

abBoolVariable[0] := TRUE;
abBoolVariable[15] := FALSE;

wWordVariable2 := Mem.PackBitsToWord(abBoolVariable[0], abBoolVariable[1], abBoolVariable[2], abBoolVariable[3],
                                     abBoolVariable[4], abBoolVariable[5], abBoolVariable[6], abBoolVariable[7],
                                     abBoolVariable[8], abBoolVariable[9], abBoolVariable[10], abBoolVariable[11],
                                     abBoolVariable[12], abBoolVariable[13], abBoolVariable[14], abBoolVariable[15]);

wWordVariable1 := 1;
Unpack := wWordVariable1,
  wBit0 := abBoolVariable[0], wBit1 := abBoolVariable[1], wBit2 := abBoolVariable[2], wBit3 := abBoolVariable[3],
  wBit4 := abBoolVariable[4], wBit5 := abBoolVariable[5], wBit6 := abBoolVariable[6], wBit7 := abBoolVariable[7],
  wBit8 := abBoolVariable[8], wBit9 := abBoolVariable[9], wBit10 := abBoolVariable[10], wBit11 := abBoolVariable[11],
  wBit12 := abBoolVariable[12], wBit13 := abBoolVariable[13], wBit14 := abBoolVariable[14], wBit15 := abBoolVariable[15]);
```

Function block ETHx_MOD_MAST and ModTcpMast

These Function Blocks are only required for the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The Function Block can be used for the Ethernet interfaces of the controller.

is contained in the library Ethernet_AC500_V10.lib .

*ModTcpMast* is contained in the library ABB_ModbusTcp_AC500.

### 1.6.5.1.11 Fast counters

**Fast counters in AC500 devices**

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50x2 modules, according to the CPU type, the fast inputs have different functionality or frequency.

Integrated fast counters are only available for digital I/O modules.

The digital I/O modules on the I/O bus contain two fast counters each.

If the counter is used, it needs up to 2 digital inputs and one digital output.

If the fast counter is deactivated, the inputs and outputs reserved for the counter can be used for other tasks.

See Chapter 1.6.6.2.13.9 “Fast counter” on page 3512.

A fast counter is available in the following constellations:
- In digital I/O modules, connected to an AC500 processor module.
- In AC500-eCo V3 processor modules PM50x2 with onboard I/Os
- In CANopen communication interface modules.
- In Modbus, PROFIBUS and PROFINET communication interface modules and in the connected digital I/O modules.
- In digital I/O modules, connected to an EtherCAT communication interface module.

The following table shows the S500 modules which contain a fast counter and which of the digital inputs and outputs are reserved for the counter.

<table>
<thead>
<tr>
<th>Module</th>
<th>Assigned inputs 1)</th>
<th>Assigned output</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Channel A</td>
<td>Channel B</td>
<td>Channel C 2) or (CF)</td>
</tr>
<tr>
<td>DA501</td>
<td>DC16</td>
<td>DC17</td>
<td>DC18</td>
</tr>
<tr>
<td>DA502</td>
<td>DC16</td>
<td>DC17</td>
<td>DC18 - in mode 1 and mode 2  DO0 - in mode 101 and mode 102 3)</td>
</tr>
<tr>
<td>DC522</td>
<td>C8</td>
<td>C9</td>
<td>C10</td>
</tr>
<tr>
<td>DC523</td>
<td>C16</td>
<td>C17</td>
<td>C18</td>
</tr>
<tr>
<td>DC532</td>
<td>C24</td>
<td>C25</td>
<td>C26</td>
</tr>
<tr>
<td>DI524</td>
<td>I24</td>
<td>I25</td>
<td>No hardware output available</td>
</tr>
<tr>
<td>DX522</td>
<td>I0</td>
<td>I1</td>
<td>The counter does not activate any relay output</td>
</tr>
<tr>
<td>CI501-PNIO, CI541-DP,</td>
<td>DI0</td>
<td>DI1</td>
<td>DO0</td>
</tr>
<tr>
<td>CI581-CN, CI521-MODTCP</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CI502-PNIO, CI542-DP,</td>
<td>DI8</td>
<td>DI9</td>
<td>DO8</td>
</tr>
<tr>
<td>CI582-CN, CI522-MODTCP</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1) The two hardware inputs (channels A and B) are also and always available within the normal process image, irrespective of the operating mode of the counter.

2) The hardware output channel C is activated by the fast counter only in the operating modes 1 and 2.

3) Especially for module DA502: The counter operating mode 101 is the same as mode 1, but the assigned output is DO0 instead of DC18. Also the counter operating mode 102 is the same as mode 2, but the assigned output is DO0 instead of DC18.

The counter function is performed within the communication interface module and, accordingly, in the digital I/O module(s). It works independently of the user program and is therefore able to respond quickly to external signals. A simultaneous counter operation of several digital I/O modules is possible.

Each module counter can be configured for one out of 10 possible modes. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).
The data exchange to and from the user program is performed using input and output operands. While integrating a module containing a fast counter in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later on does not cause an address shift.

**Features independent of the fast counter operating mode**
- The pulses at the fast counters' inputs or the evaluated signals of the traces A and B in case of incremental position sensors are counted.
- The counting frequencies of the communication interface modules of PROFINET, PROFIBUS and CANopen are max. 200 kHz (in modes 1 to 6), max. 50 kHz (in mode 7), max. 35 kHz (in mode 9), and max. 20 kHz (in mode 10).
- If the modules DA501, DC522, DC523, DC532 are used, each counting input must be circuited externally in series with a resistor of 470 \( \Omega / 1 \, \text{W} \), in order to safely avoid influences from the deactivated module outputs to the connected sensors.
- The positive signal edges are counted, if not noted differently.
- By setting the operating mode 0, the counting function is switched off. In this case, the reserved inputs and outputs can be used for other tasks. Simultaneous use of these terminals for the fast counter and other signals must be avoided.
- The fast counter's actual value is provided as a double word (32 bits).
- The fast counter can count upwards in all operating modes. It counts beginning at the start value (set value) up to the end value (max. from 0 to 4,294,967,295 or hexadecimal from 00 00 00 00 to FF FF FF FF. After reaching 4,294,967,295, the counter jumps with the next pulse to 0. When the counter reaches the programmed end value, the counter output is stored permanently as \( \text{CF} = \text{TRUE} \) (end value reached). Only when the fast counter is set again (set value), \( \text{CF} \) is reset to FALSE.

**Further information**
- Operating modes of the fast counter: Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3515
- Configuration of the fast counter: Chapter 1.6.6.2.13.9 “Fast counter” on page 3512
- Operation with the library Counter_AC500_V<>.lib:

### Onboard I/O on AC500-eCo V3 processor modules

**Onboard I/Os**

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

**Intended purpose**

**Table 619: Numbers and types of the onboard I/Os**

Fast counter in AC500-eCo V3 (Onboard I/O in PM50xx)

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.
1.6.5.1.13 Simple motion

Introduction

The AC500-eCo V3 PLC provide several HW and SW features allowing to realize some motion application.

Specific fast onboard I/O and dedicated SW library function blocks (simple motion) are available and can manage up to 2x Axis on the CPU.

The simple Motion capability is based on a library for the onboard I/O and some motion control blocks allowing point-to-point or velocity control.

All the AC500-eCo V3 PLC from Basic, Standard or Pro type offer dedicated feature according to their performance classes.

Fig. 277: Example: PM5012-T-ETH
Standard and Pro CPU - PM5032-x-ETH / PM5052-x-ETH / PM5072-T-2ETH

Fig. 278: Example: PM5052-T-ETH

For PLC with relay outputs, the input features are identical.
The digital configurable inputs/outputs can be used for PTO/PWM functions.

System technology

The following chapters describe the system technology of the AC500-eCo V3 using motion examples.
The simple motion set of function blocks is standard part of the system libraries for AC500-eCo V3.
Use the onboard I/Os as encoder with A and B signals

Parameter configuration

The onboard I/O accept encoder signal A and B. When configure the encoder track A, the encoder track B will be automatically inserted.

The user can configure the following input channel as encoder input.

- “Encoder 0 Track – A”: Input channel 4
- “Encoder 0 Track – B”: Input channel 5
- “Encoder 1 Track – A”: Input channel 6
- “Encoder 1 Track – B”: Input channel 7

After configuring the encoder input channel, the user can configure the touch/reset for the respective encoder channel.

See also the following chapter: § Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449.

E.g. PM50x2-T-xETH with 2x A/B encoders with Touch/Reset on I0..I3
Function block
OBIOEncoder Counter

If “Enable” is TRUE, the “OBIOEncoderCounter” instruction increments the counter by one based on the input.

If “Set” bit is TRUE, the “OBIOEncoderCounter” instruction moves the “CounterValueSet” to the “CounterValue”.

If “Enable” is TRUE, the “OBIOEncoderCounter” instruction increments the counter by one based on the input.

If “EnableLimit” bit is TRUE, the accumulated value continues incrementing.
After “CounterValue” reaches the “LimitValueMax”, the “OBIOEncoderCounter” instruction writes 0 to the “CounterValue”.

“Encoder Counter Mode”: 0 = “90° Mode”.
In this encoder counter mode, an increasing count results when input B is 90° ahead of input A. The count is initiated on the rising edge of input A, and the direction of the encoder is clockwise (positive).
The module produces a decreasing count when input A is 90° ahead of Input B. The count is initiated on the falling edge of input A, and the direction is counterclockwise (negative).
By monitoring both the number of pulses and the phase relationships of input A and B, you can accurately determine the position and direction of the rotation.

“Encoder Counter Mode”: 1 = “Pulse/Direction”.
In this encoder counter mode, the count increases or decreases based on the state of input B, which can be a random signal.
If input B is high, the counter will count down.
If input B is low the counter counts up.
Counting is done on the leading edge of input A.
If “Enable” is TRUE, the “OBIOEncoderCounter” instruction increments the counter by one based on the input.

If “EnableRef” bit is TRUE, the “OBIOEncoderCounter” instruction is ready to receive the touch/reset input.

If the “Touch/Reset” input is TRUE, the current “CounterValue” will be replaced by the “CounterValueSet”.

If “Enable” is TRUE, the “OBIOEncoderCounter” instruction increments the counter by one based on the input.

If “EnableTouch” bit is TRUE, the “OBIOEncoderCounter” instruction is ready to receive the “Touch/Reset” input.

If the “Touch/Reset” input is TRUE, the current “CounterValue” will be captured and written to the “CounterTouchValue”.
Use the onboard I/Os as forward counter

Parameter configuration

The Onboard I/O accept pulse input as forward counter.

User can configure the following input channel as forward counter.

- “Forward Counter 0”: Input channel 4
- “Forward Counter 1”: Input channel 5
- “Forward Counter 2”: Input channel 6
- “Forward Counter 3”: Input channel 7

E.g. PM50x2-x-xETH with forward counter on fast inputs I4…I7

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449
Function block

OBIOForward Counter

If “Enable” is TRUE, the “OBIOForwardCounter” instruction increments the counter by one based on the input.

If “Set” bit is TRUE, the “OBIOForwardCounter” instruction moves the “CounterSetValue” to the “CounterValue”.

If “Enable” is TRUE, the “OBIOForwardCounter” instruction increments the counter by one based on the input.

If “EnableLimit” bit is TRUE, the accumulated value continues incrementing.

After “CounterValue” reaches the “LimitValueMax”, the “OBIOForwardCounter” instruction writes 0 to the “CounterValue”.

Use the onboard I/Os as interrupt input with dedicated interrupt task

Parameter configuration

The onboard I/O input can be configured as interrupt input to trigger the interrupt task.
The user can configure the following input channel as interrupt input.

- Interrupt input 0: Input Channel 0
- Interrupt input 1: Input Channel 1
- Interrupt input 2: Input Channel 2
- Interrupt input 3: Input Channel 3

E.g. PM50x2-x-xETH with interrupt inputs on digital inputs I0…I3

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

After configuring the parameter, the user needs to create a new task with the “Type” set to “External” and the “External event” set to “OnBoard_Binary_Input”.

![Configuration Diagram](image-url)
The “OBIOInterruptPara” instruction is configured for 4 interrupt inputs. If the “EnableInterrupt” bit is TRUE, the “OBIOInterruptInfo” instruction is ready to receive the interrupt input. If the interrupt input is TRUE, the interrupt task will be executed. If the second interrupt is TRUE with the interval less than 10 ms (as set), the execution of the interrupt task will be ignored. If no interrupt occurred in 50 ms (as set), the interrupt task is executed automatically.

Use the onboard I/Os as output limit switch

Parameter configuration

The user can configure the following output channel as limit switch.

- “LimitSwitch 0”: Output channel 0
- “LimitSwitch 1”: Output channel 1
- “LimitSwitch 2”: Output channel 2
- “LimitSwitch 3”: Output channel 3
- “LimitSwitch 4”: Output channel 4
- “LimitSwitch 5”: Output channel 5
- “LimitSwitch 6”: Output channel 6
- “LimitSwitch 7”: Output channel 7
Function block

If the counter value reaches the “LowerLimitOn” preset, it will write to the LimitSwitch output based on the signal until the “UpperLimitOn” preset is reached.

Use the onboard I/Os as PTO (pulse-train output) with 100 kHz frequency (max. 2 PTO using PTO HW channels)

Parameter configuration

The user can configure the following output channels as PTO (pulse-train output).

- “PTO”: Output channel 4
- “PTO”: Output channel 5
- “PTO”: Output channel 6
- “PTO”: Output channel 7

If the user configures the output 4 as PTO, the output 5 is automatically configured as PTO.
If the user configures the output 6 as PTO, the output 7 is automatically configured as PTO.
The input “CwCCw” of the function block “OBIOPulseTrainOutput” determines the output 5 and 7 as “CounterClockWise” or “Direction” if it is set as PTO.

See also the following chapter: § Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

Function block

If “Set” bit is TRUE, the instruction moves the “CounterSetValue” to the “CounterValue”.

If “EnableLimit” bit is TRUE, the accumulated value continues incrementing.

After “CounterValue” reaches the “LimitValueMax”, the instruction writes 0 to the “CounterValue”.
If the input “CwCCw” of the “OBIOPulseTrainOutput” is set to FALSE, the PTO output channel B is toggled based on the direction.

If the input “CwCCw” of the “OBIOPulseTrainOutput” is set to TRUE. The PTO output channel A will lead by 90° or PTO output channel B will lead by 90° depending on direction.
Use the onboard I/Os as PTO (pulse-train output) with 200 kHz frequency (max. 2 PTO using PTO HW channels) and Simple Motion OBIOMotionPTO function block

Parameter configuration

Only the Standard and Pro processor modules can be used with PTO outputs. The Basic processor modules PM5012 do not have PTO outputs.

The available PTO outputs can be used as PTO with Pulse/Direction or PTO with CW/CCW mode when the channels have been configured as PTO outputs.

The user can configure the following output channels as PTO (pulse-train output).

- “PTO”: Output channel 4
- “PTO”: Output channel 5
- “PTO”: Output channel 6
- “PTO”: Output channel 7

If the user configures the output 4 as PTO, the output 5 is automatically configured as PTO.

If the user configures the output 6 as PTO, the output 7 is automatically configured as PTO.

The input “CwCCw” of the function block “OBIOPulseTrainOutput” determines the output 5 and 7 as “CounterClockWise” or “Direction” if it is set as PTO.

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

Function block
If the input “CwCCw” of the “OBIOMotionPTO” is set to FALSE, the PTO output channel B is toggled based on the direction.

If the input “CwCCw” of the “OBIOMotionPTO” is set to TRUE. The PTO output channel A will lead by 90° or PTO output channel B will lead by 90° depending on direction.

Use the onboard I/Os as PTO (pulse-train output) with 100 kHz frequency (Max. 4 PTO using PWM HW channels) and Simple Motion OBIOMotionPWM function bloc

Parameter configuration

It is possible to have also up to 4 PTO channels only with Pulse/Direction mode on the AC500-eCo V3 CPU by using the fast outputs O4…O7 configured as PWM outputs and using a specific Motion function block and standard outputs for direction channel.

Only the Standard and Pro processor modules can be used with PTO (PWM) outputs. The Basic processor modules PM5012 do not have PTO outputs.

The available software PTO outputs can be used as PTO with Pulse/Direction or PTO with CW/CCW mode when the channels have been configured as PWM outputs.
The user must configure the following output channels as PWM outputs and use the "OBIOMotionPWM" function block.

- "PWM": Output channel 4
- "PWM": Output channel 5
- "PWM": Output channel 6
- "PWM": Output channel 7

If the user configures the output 4...7 as PWM using the "OBIOMotionPWM" function block, up to four Software PTO can be realized offering then only the Pulse/Direction mode.

The Pulse output will always use the fast output channels O4...O7 and the direction output of the function block can be assigned to any other output e.g. O0...O3 or also outputs from a S500 I/O module.

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

Use the onboard I/Os as output PWM (pulse-width modulation)

Parameter configuration

The user can configure the following output channels as PWM (pulse-width modulation).

- “PWM 0”: Output channel 0
- “PWM 1”: Output channel 1
- “PWM 2”: Output channel 2
- “PWM 3”: Output channel 3
- “PWM 4”: Output channel 4
- “PWM 5”: Output channel 5
- “PWM 6”: Output channel 6
- “PWM 7”: Output channel 7

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

Function block

The complete cycle of the “PWM” is based on the “OnTime” and “OffTime”. 
The duty cycle ratio of the "PWM" is based on the formula \( \frac{T_{on}}{T_{on} + T_{off}} \).

**Function block description**

Function block descriptions of all V3 libraries are available in the library manager.
1. Under “Application” open “Library Manager”.
2. Select “Add Library”.

A list of all available libraries is displayed.

- Libraries in folder “ABB - AC500” are created by ABB and tested in combination with Automation Builder.
- We recommend to use libraries of subfolder “Use Cases” for your project.
- Libraries in subfolder “Intern” are necessary for internal procedures.
- All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libraries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.

3. Add a library.
4. Choose the added library in Library Manager to access the documentation.

The function block description is shown as an example as follows.
AC500-eCo V3 option board slots for processor modules PM50xx

Depending on the processor module type, up to three option board slots are available on the CPU for different purpose like digital or analog I/O extension, serial interface or special module for specific functionality.

</tbody>
</table>

1) Can be used only once per CPU

2) In preparation, not yet available

---

The option board slots are not affected to one type of option board and they can be plugged and used on each slot. The only limitation is the number of slot available on the processor module. The following types of option board are available, all type can be mixed on all the slots.

### Option board for serial interface extension

Always needed for serial communication like Modbus RTU. Selection and configuration can be found into the PLC Configuration V3 documentation part: Chapter 1.6.6.2.8.3 “Attach serial interface option board” on page 3471

### Option board for digital I/O extension

Selection and configuration can be found into the PLC Configuration V3 documentation part: Chapter 1.6.6.2.8.2 “Attach a digital input, output or mixed input/output channels option board” on page 3470
Option board for specific function

The TA5130-KNXPB can only be used on AC500-eCo V3 processor modules Pro PM5072-T-ETH(W).
The TA5131-RTC can only be used on AC500-eCo V3 processor modules Basic PM5012-x-ETH.
These two option boards can only be used once on one slot at a time!

1.6.5.2 System technology of the AC500 communication modules

1.6.5.2.1 CANopen communication modules

Triggering of event tasks with CAN-IDs

For CM598-CAN module the execution of a PLC application task can be triggered automatically by a certain event, i.e. by incoming CAN 2.0 A or CAN 2.0 B frames. For this, the PLC application task is to be configured as external event task.

Prerequisites
- PLC firmware version 3.2.5 and Automation Builder as of version 2.2.5.
- Only one PLC application task can be assigned to a communication module.
- Triggering of event tasks is only supported for the communication module CM598-CAN.
Every incoming CAN frame on a CM598-CAN module processes an event in the AC500 PLC. If the parameter "Trigger PLC Task" is set to TRUE, the CAN protocol task checks via the receive buffer configuration and the corresponding CAN-ID of the CAN frame whether a CAN frame is to be executed or not. Only those CAN-IDs that are configured in the protocol configuration will be processed. All other CAN frames will be rejected. If a CAN frame is to be processed, the CAN frame data is copied to the receive buffer and an event on the IEC event task is triggered.

The IEC event task will be executed for one cycle.

The IEC event task will be triggered continuously until all associated receive buffers have been emptied. Hence, ensure that the buffers are emptied by the task, otherwise the task will run into a loop.

Within the task the function block Cm598CanMsgRecEvt must be used to read the CAN frames from the receive buffers. The function block Cm598CanMsgRec is not suitable as it requires several task cycles for execution.

**CAN frame processing**

The following picture shows the sequence CAN frames processing when the triggering of event task is used.
Only one external event task can be assigned to a CM598-CAN.

There is only one common event for an external event task and all selected CAN-IDs. It must be evaluated which CAN-IDs have been received.

It is possible that CAN frames are lost when necessary system resources are in use or when the CAN frames could not be processed in time due to high system load. So, the PLC application must monitor the task which consumes the events of the CAN protocol with a watchdog mechanism or something similar.

Received CAN frames of the same CAN-ID are internally stored in FIFO buffers. Reading and writing of the FIFO buffers is not possible at the same time.

Within an external event task the function block Cm598CanMsgRecEvt must be used to read the received CAN frames. The function block Cm598CanMsgRec is not suitable since its execution needs more than one task cycle.

The CAN-IDs that are enabled to trigger an external event task must be read by the associated task. Otherwise the task is triggered again and again, and the CPU load will be high.

Event task configuration

Add the external event task that should be executed to the task configuration of the PLC application:
1. Right-click on “Task Configuration”. Enter a name for the task and click “Add object”.

2. Right-click on the new task and append a “Program Call”. This contains the program code that is executed by the task.

3. Double-click on the task and setup the task parameters.

A parameter description is given in the Chapter 1.4.1.24.1.38.1 “Tab ‘Configuration’” on page 871. Deviations are described in the following:

<table>
<thead>
<tr>

Configuration of a CM598-CAN module is described in the configuration chapter Chapter 1.6.6.2.11.1 “CANopen” on page 3486.
1.6.5.3 System technology of the communication interface modules
1.6.5.3.1 Modbus communication interface module

Overview

The Modbus TCP bus module CI52x-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

CI521-MODTCP I/O channels properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

<td>8 (24 VDC; delay time configurable via software)</td>
</tr>
<tr>
<td>Digital outputs</td>
<td>8 (24 VDC, 0.5 A max.)</td>
</tr>
<tr>
<td>LED displays</td>
<td>For system displays, signal states, errors and power supply</td>
</tr>
<tr>
<td>External supply voltage</td>
<td>Via terminals ZP, UP and UP3 (process supply voltage 24 VDC)</td>
</tr>
</tbody>
</table>

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels.

The configuration of the inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Modbus TCP registers

Register layout for CI52x-MODTCP

The registers can be divided in 4 sections:
- Information data section 0x0000 to 0x0D50 (for acyclic use)
- I/O data and diagnosis section 0x0FFA to 0x2B00 (for cyclic use)
- Parameter data section 0x3000 to 0x3B00 (for acyclic use)
- Special functionality section 0x5A00 to 0x6A00 (for acyclic use)
Information data section (Acyclic data)

The information data section can be used to read out common and module specific information. This section is read only.

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in two sections:

- The module specific section (containing information for each module CI52x-MODTCP and expansion modules and hot swap terminal units)
- The common device information block

Module specific information registers

For each module (CI52x device, expansion modules and hot swap terminal units) the following data can be read out:

- Device and FW information
  
  This section consists of 20 WORDs per module and contains information on each module using the following structure:

<table>
<thead>
<tr>
<th>Data</th>
<th>DATA TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module ID</td>
<td>WORD</td>
<td>The module ID of the requested module</td>
</tr>
<tr>
<td>Module name</td>
<td>ARRAY [1..10] OF BYTE</td>
<td>The module name of the requested module</td>
</tr>
<tr>
<td>Version 1st processor</td>
<td>ARRAY [1..4] OF BYTE</td>
<td>The version of the 1st processor of the requested module</td>
</tr>
<tr>
<td>Version 2nd processor</td>
<td>ARRAY [1..4] OF BYTE</td>
<td>The version of the 2nd processor of the requested module</td>
</tr>
<tr>
<td>Version 3rd processor</td>
<td>ARRAY [1..4] OF BYTE</td>
<td>The version of the 3rd processor of the requested module</td>
</tr>
</tbody>
</table>
**Data** | **DATA TYPE** | **Description**
--- | --- | ---
Version 4th processor | ARRAY [1..4] OF BYTE | The version of the 4th processor of the requested module
Hardware version 1) | ARRAY [1..4] OF BYTE | The hardware version of the 4 processors
Reserved | ARRAY [1..8] OF BYTE | Reserved
Number input data | WORD | Number of input data of the requested module in BYTES
Number output data | WORD | Number of output data of the requested module in BYTES

1) supported from CI52x firmware version V3.2.0 (device index F0)
2) from CI52x firmware version V3.2.0 (device index F0) “Reserved” is ARRAY [1..4] OF BYTE

- **Production / Traceability data:**
  This section consists of 25 WORDs per module and contains the traceability data for each module using following structure:
  - Article number: Byte 01..15
  - Index: Byte 16..17
  - Name: Byte 18..29
  - Production date: Byte 30..33
  - Key number: Byte 34..38
  - Site: Byte 39..40
  - Year: Byte 41..42
  - Serial number: Byte 41..50 (The serial number implies the year)

- **Production / Traceability data from CI5x2 firmware version V3.2.0 (device index F0):**
  This section consists of 26 WORDs per module and contains the traceability data for each module using following structure:
  - Article number: Byte 01..15
  - Index: Byte 16..17
  - Name: Byte 18..31
  - Production date: Byte 32..35
  - Key number: Byte 36..40
  - Site: Byte 41..42
  - Year: Byte 43..44
  - Serial number: Byte 42..52 (The serial number implies the year)

**Common device information registers**

- **Common device information block**
  This section consists of 80 WORDs (90 WORDs from CI52x firmware version V3.2.0 (device index F0)) and contains cluster wide information (CI52x device and connected expansion modules using the following structure:
<table>

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in three sections:

- Module state (containing the state of connected expansion modules and hot swap terminal units)
- Diagnosis data (containing diagnosis data in AC500 specific format)
- Process data (containing I/O data)
Module state

The module state section consists of 44 WORDs and contains the module state of connected expansion modules and hot swap terminal units using the following structure:

<table>
<thead>
<tr>
<th>Data</th>
<th>DATA TYPE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module ID</td>
<td>WORD</td>
<td>Module ID of the CI52x</td>
</tr>
<tr>
<td>Expected module ID</td>
<td>WORD</td>
<td>Expected (configured) module ID of the CI52x</td>
</tr>
<tr>
<td>Module state</td>
<td>BYTE</td>
<td>The current module state of the CI52x:</td>
</tr>
<tr>

<td>BYTE</td>
<td>Parameter state of the 10&lt;sup&gt;th&lt;/sup&gt; connected expansion module</td>
</tr>
</tbody>
</table>
Diagnosis data

The diagnosis data section contains one diagnostic message with the following structure (according to AC500 diagnosis):

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis Byte, slot number</td>
<td>31 = CI52x-MODTCP (e.g. error at integrated 8 DI / 8 DO)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 = 1st connected S500 I/O Module</td>
</tr>
<tr>
<td></td>
<td></td>
<td>...</td>
</tr>
<tr>
<td></td>
<td></td>
<td>10 = 10th connected S500 I/O Module</td>
</tr>
<tr>
<td>2</td>
<td>Diagnosis Byte, module number</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
<tr>
<td>3</td>
<td>Diagnosis Byte, channel</td>
<td>According to the I/O bus specification passed on by modules to the fieldbus master</td>
</tr>
<tr>
<td>4</td>
<td>Diagnosis Byte, error code</td>
<td>According to the I/O bus specification Bit 7 and Bit 6, coded error class</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0 = E1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1 = E2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2 = E3</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3 = E4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 0 to Bit 5, coded error description</td>
</tr>
<tr>
<td>5</td>
<td>Diagnosis Byte, flags</td>
<td>According to the I/O bus specification</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
<tr>
<td>6</td>
<td>Reserved</td>
<td>0</td>
</tr>
</tbody>
</table>

If a diagnosis message is read out, the next one will be automatically filled in.
If no more diagnosis messages are available the buffer will be reset to zero.
This ensures that each diagnosis message can be delivered to the Modbus TCP client/slave and no diagnosis will be lost.

I/O data

The I/O data section can use two different formats according to the module parameter “I/O Mapping Structure” (see Chapter 1.6.3 “Device specifications” on page 2236 for details).

- Fixed I/O mapping
  In case of fixed I/O mapping each module has a predefined register range for each Inputs and Outputs.
- Dynamic I/O mapping
  In case of dynamic I/O mapping the mapping is build according to the actual configuration.

The dummy output at the end of the I/O data section can be used to retrigger the bus supervision and has no effect on the HW outputs.
In case of fixed I/O mapping the following predefined register table is used:

<table>
<thead>
<tr>
<th>Register (hex)</th>
<th>Description</th>
<th>Readable by Modbus function code</th>
<th>Writeable by Modbus function code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>Inputs CI</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>1100</td>
<td>Inputs 1.EXP</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td>x</td>
</tr>
<tr>
<td>1A00</td>
<td>Inputs 10.EXP</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>2000</td>
<td>Outputs CI</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>2100</td>
<td>Outputs 1.EXP</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2A00</td>
<td>Outputs 10.EXP</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>2B00</td>
<td>Dummy output</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
</tbody>
</table>

If a certain expansion module has no inputs or outputs the corresponding registers remain empty.

In case of dynamic mapping only the start addresses of inputs and outputs are predefined:

<table>
<thead>
<tr>
<th>Register (hex)</th>
<th>Description</th>
<th>Readable by Modbus function code</th>
<th>Writeable by Modbus function code</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>Inputs CI</td>
<td>3, 4, 23</td>
<td>x</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2000</td>
<td>Outputs CI</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2B00</td>
<td>Dummy output</td>
<td>3, 23</td>
<td>6, 16, 23</td>
</tr>
</tbody>
</table>

The register addresses of the connected expansion modules are calculated dynamically based on the number of inputs and outputs of the previous modules (each module starts directly on the next register after the previous module).

The register addresses of each module can be read out via the common device register (see ❘ Chapter 1.6.5.3.1.2.2.2 “Common device information registers” on page 3357).
The difference between fixed I/O mapping and dynamic I/O mapping is shown in the following table.

For this comparison a cluster with CI522, AX522, DC532, AX521, DC523, AO523, AI523, DI524, AX522 and DC523 is used.

<table>

<td>6, 16</td>
</tr>
</tbody>
</table>
For each connected module the following parameter data are defined (the parameters are represented as ARRAY OF BYTE):

- Actual used parameter for each module
  In these sections the actual parameters are stored. This section is also used to write parameters to the module (For a description on how to parameterize see "Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3373.

- Stored parameters for each module
  If the module has stored nonvolatile parameters these can be read out using the corresponding registers.

The controlword/statusword is used to trigger a parameterization process. The single bits have the following meaning:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>End of parameterization use parameters</td>
</tr>
<tr>
<td>1</td>
<td>store parameters temporarily, use stored parameters after bus reconnect</td>

<td>reserved</td>
</tr>
</tbody>
</table>

The direction of the first 8 bits is client to server (master to slave).

The direction of the second 8 bits is server to client (slave to master). A description of the bits can be found in chapter behavior "Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3373.

The parameter register sections (actual and stored parameters) have the structure as explained in the of the corresponding module "Chapter 1.6.3 “Device specifications” on page 2236.

Behavior

IP address assignment

The delivery IP address of the CI52x-MODTCP is 192.168.0.xx (xx is the hardware address switch position of the device.

The devices support BOOTP, DHCP and fixed IP address setting (these can be set individual or together). If BOOTP and DHCP are enabled the following priority takes place:
- If DHCP configuration fails, the device will fall back to BOOTP.
- In case of a BOOTP failure, the fixed IP address will be used.

A new IP address (or changing of BOOTP and DHCP) can be set in two different ways:
- With the address switches of the corresponding module
- With the \(\text{Chapter 1.6.6.2.2.4.2 "Configuration of the IP settings with the IP configuration tool" on page 3427}\)

Using the address switches

With the address switches only the last byte of the IP address can be changed.

The IP address can only be set via the address switches in case of factory default or in case of the last byte of the IP address is set to zero with the \(\text{Chapter 1.6.6.2.2.4.2 "Configuration of the IP settings with the IP configuration tool" on page 3427}\). The not allowed IP addresses are mapped as followed:
- Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings (by IP Configuration Tool).
  This is a backup so the module can always get a valid IP address and can be configured by the IP Configuration Tool.
- Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.
Using the IP configuration tool

With the Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3427 a network scan can be executed, and the found devices can be assigned with new settings, e.g. enable BOOTP or DHCP and set a new fixed IP. If the last byte of the IP address of the CI52x-MODTCP devices is set to 0 with the IP Configuration Tool the address switch position is used instead (see Chapter 1.6.5.3.1.3.1.1 “Using the address switches” on page 3372).

Parameterization

The parameterization is done via the corresponding registers explained in the Modbus TCP registers Chapter 1.6.5.3.1.2.4 “Parameter data (Acyclic data)” on page 3366.

In addition to that the parameters can be directly transferred via Automation Builder (see documentation of Automation Builder for that).

There are two different parameter sections with different behaviour.

**Actual used parameters**

After startup this section contains the following data:

- Default parameters (only module id and parameter length set all others zero) if no valid stored parameters are available (no or invalid parameters stored).
- Actual used / stored parameters if valid parameters are stored nonvolatile.

These parameters can be read out and changed by reading or writing of the corresponding registers, but will not be used automatically after writing them, the use of new written parameters has to be triggered by writing the parameter control word with the corresponding bits set (see below).

**Stored parameters**

This section always contains a copy of the nonvolatile stored parameters, if no parameters are stored nonvolatile this sections will be 0.

**Controlword/statusword parameter**

This parameter can be used to trigger and save new parameters.

The direction of the first 8 bit is client to server (master to slave). The direction of the second 8 bits is server to client (slave to master).
<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Use parameters / start parameterization</td>
<td>If this bit is set the CI Device starts the parameterization with the parameters in the actual parameters registers.</td>
</tr>
</tbody>
</table>
| 1   | Store parameters volatile                                                   | If this bit is set the CI device will use the parameters temporarily, which means after a bus error detection and reconnection the parameters will be used again.  
**This bit should always be set.**  
**This bit is only evaluated when bit 0 is set.** |
| 2   | Store parameters nonvolatile                                                | If this bit is set the CI device will store the parameters nonvolatile, which means after a power cycle the stored parameter data will be used again.  
**This bit is only evaluated when bit 0 is set.** |
| 3   | Reserved                                                                    | -                                                                                              |
| 4   | Delete nonvolatile stored parameters                                        | If this bit is set the CI device will delete its nonvolatile stored parameters.  
**This bit is only evaluated when bit 0 is set.** |
| 5   | Ignore parameter error for nonvolatile parameter storage                    | If this bit is set a parameter error during nonvolatile storage of parameters will be ignored, and the parameters will be stored.  
**This bit can only be set in combination with bit 0 and bit 2.** |
| 6   | Reserved                                                                    | -                                                                                              |
| 7   | Reserved                                                                    | -                                                                                              |
| 8   | New diagnosis available                                                     | The device will set this bit if new diagnosis data are available in the diagnosis data section. |
| 9   | New parameters available                                                    | The device will set this bit if new parameters are available in the actual parameter data section and these were not activated by setting bit 0 in the control word. |
| 10...15 | Reserved                                                                 | -                                                                                              |

**Cyclic I/O data exchange**

The I/O data can be exchanged cyclic by the master by reading, writing the corresponding registers.

I/O data exchange is only possible after successful parameterization of the device.

For writing of outputs **bus failure detection** can be activated by setting the corresponding parameter. This bus failure detection is described in the following chapter.

**Bus failure detection**

If the parameter "timeout" in the module parameters of the CI52x-MODTCP is set, the module will supervise the Modbus TCP "write telegrams".

After the first "write telegram" the bus will be supervised. If no new "write telegram" arrives at the CI52x-MODTCP within the configured time, the module will detect a bus failure and switch off its outputs or switch them to the configured failsafe state (see module parameter CI521  * Chapter 1.6.3.7.4.1.7 “Parameterization” on page 2955 and CI522  * Chapter 1.6.3.7.4.2.7 “Parameterization” on page 2984 for details).
Configurable write restriction

With the module parameters “Master IP”- “Master IP 7” it is possible to set write restrictions on the CI52x-MODTCP device.

If none of the parameters is set, all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device.

All other masters / clients still have read access to the CI52x-MODTCP device.

Diagnosis behavior

Each diagnosis message signals if this error is coming or going, so it is possible to create a list in the master of actual pending diagnosis.

Diagnosis messages will be transferred again after a bus failure detection and reconnection.

Diagnosis messages can be read out with function code 3, 4, 23. Function codes 3 and 4 can always read out diagnosis messages, function code 23 can only read out after successful parameterization of the device. See also table "Chapter 1.6.5.3.1.2.3.2 “Diagnosis data” on page 3362."

Single parameterization

The single parameterization services can be used to read or write parameters during runtime of device without the need of triggering a new parameterization process.

For indexes used for single parameterization services see parameter lists in section Modbus TCP registers of this document.

The read and write parameterization services are explained below, for each module (CI52x-MODTCP and connected expansion modules) a different section for read and write is defined see chapter Modbus TCP registers in this document). Both services are using the following data structure:

The length of the read / write service depends on the count of parameters that should be transferred (length = 4+ count*8).

Reading of single parameters

The read single parameterization works in two steps:

- Writing of a request list containing the indexes that should be read using the structure explained above.
  Only CNT and PARA_IDX has to be set.
  Up to 5 parameters can be requested with one telegram.
  The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).
- Reading of the parameters list with the same length then the previous write request.
  If the internal reading process inside the CI52x-MODTCP device is done the data will be read out.
  If the internal reading process inside the CI52x-MODTCP device is not yet finished the read service will be rejected with Modbus TCP exception code 6 (device busy).
Writing of single parameters

For writing of single parameters only one step is necessary, the parameters are transferred with one write request using the structure described above.

The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).

In case of write of single parameters the following values have to be set:

- CNT: number of parameters to be set
- And for each parameter:
  - Parameter index
  - Parameter length
  - New parameter value

Written single parameters are not stored volatile and not stored nonvolatile. That means after a bus reconnection or power cycle the written parameters will be discarded.

Commissioning example

Set IP Address:

- The setting of the IP address is the first step to integrate the CI52x-MODTCP devices into a running system.
- The setting of the IP address of the CI52x-MODTCP devices is described in the chapter "Chapter 1.6.5.3.1.3.1 "IP address assignment" on page 3372 in this document.

Set Parameters (optional read parameters):

- The second step in configuring the CI52x-MODTCP devices is to set the module and channel parameters.
- A read of parameters is optional but can be used to get the module IDs and the parameter length.
- The reading and or writing of parameters is described in chapter "Chapter 1.6.5.3.1.3.2 "Parameterization" on page 3373.

Set Control Word:

- After setting the parameter data these have to be activated by writing the control word.
- The meaning and usage of the control word is described in chapter "Chapter 1.6.5.3.1.3.2 "Parameterization" on page 3373.

Exchange data:

- After setting and activating the parameters the CI52x-MODTCP device is ready for data exchange.
- The registers for data exchange are described in chapter "Chapter 1.6.5.3.1.2.3 "I/O / Process data and diagnosis section (Cyclic data)" on page 3359.

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during runtime.

Preconditions for using hot swap

Information about preconditions for using hot swap see "Hot swap" on page 2360.
Compatibility of hot swap

<table>
<thead>

<td>Input = ZERO</td>
</tr>
<tr>
<td>Diagnosis after plugging the I/O module on the hot swap terminal unit</td>
<td>Diagnose &quot;diagnosis gone&quot; is available in Modbus registers in the communication interface module</td>
</tr>
</tbody>
</table>
System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to 0 and the module state will be set to the corresponding value (see Chapter 1.6.5.3.1.2.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 3359). A diagnosis message will be created in that case (see hardware description of Chapter 1.6.3.7.4.1 “CI521-MODTCP” on page 2935 / Chapter 1.6.3.7.4.2 “CI522-MODTCP” on page 2975 for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, these parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI52x and failsafe is configured (see Chapter 1.6.5.3.1.3.3 “Cyclic I/O data exchange” on page 3374) the following behavior applies if a module is removed and replugged during failsafe condition:

- **Last value configured for output:**
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is 0 in that case.

- **Substitute value configured for output:**
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.

- **Substitute value for x seconds configured for output:**
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.

- At boot up of CI52x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.

- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the common device information registers. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:
    - Best way for checking if a hot swap terminal unit is available or not, is reading out the common device information registers (see Chapter 1.6.5.3.1.2.2 “Information data section (Acyclic data)” on page 3356). If the CI52x rejects this read out the CI52x doesn’t support hot swap at all.
1.6.5.3.2 PROFINET communication interface module

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during runtime.

Preconditions for using hot swap

Information about preconditions for using hot swap see “Hot swap” on page 2360.

</tr>
<tr>
<td></td>
<td>● Diagnosis in case that a not hot-swap-pable I/O module is plugged on a hot swap terminal unit</td>
</tr>
<tr>
<td></td>
<td>● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration</td>
</tr>
<tr>
<td>Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working</td>
<td>PROFINET channel diagnosis is generated together with standard &quot;pull alarm&quot; which must be acknowledged</td>
</tr>
<tr>
<td>Input state in process image of controller while module is pulled or module is not operational</td>
<td>Input = ZERO</td>
</tr>
<tr>
<td></td>
<td>In addition a standard PROFINET state information is transmitted saying &quot;Inputs not valid&quot;</td>
</tr>
<tr>
<td>Diagnosis after plugging of the I/O module on the hot swap terminal unit</td>
<td>PROFINET channel diagnosis is generated together with standard &quot;plug alarm&quot; which must be acknowledged</td>
</tr>
</tbody>
</table>

**System behavior**

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of "Chapter 1.6.3.7.5.2 “CI501-PNIO” on page 3002 / "Chapter 1.6.3.7.5.3 “CI502-PNIO (-XC)” on page 3040 for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).
If the bus failure detection is active for CI50x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is "0" in that case.

- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.

- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.

- At boot up of CI50x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.

- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the process data area or can be read out via acyclic read. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:
    - Best way for checking if a hot swap terminal unit is available or not, is checking the corresponding information inside the process image.

1.6.6 Configuration in Automation Builder for AC500 V3 products

1.6.6.1 General settings

This chapter describes the device configuration of AC500 product family with Automation Builder. Basic information on Automation Builder handling can be found in the Chapter 1.2 “Getting started” on page 19.

1.6.6.1.1 Project handling

What is a project?

- A project contains the objects that are necessary for the creation of a control program (‘application’):
  - Pure POUs, for example programs, function blocks, functions, GVLs.
  - Objects that are additionally required in order to be able to execute the application on a PLC. For example, task configuration, library manager, symbol configuration, device configuration, visualizations, external files.

- You can program several applications and connect several control devices in a project.

- CODESYS manages device-specific and application-specific POUs in the “Devices” view (‘Device tree’), project-wide available POUs in the “POUs” view.

- For the creation of projects there are templates that already contain certain objects.
• Basic configurations and information for the project are defined in the “Project Settings” and the “Project Information”. For example:
  – Compiler settings
  – User management
  – Author
  – Data for the project file.

There are settings for the version compatibility of the project in the configuration dialog boxes for the “Project Environment”.

• You save a project as a file in the file system. Optionally you can pack it together with project-relevant files and information in a project archive. Saving in a source control system such as SVN is also possible.

• Each project contains the information regarding the CODESYS version with which it was created. If you open it in another version, CODESYS will draw your attention to possible or necessary updates with regard to file format, library versions, etc.

• You can compare, export or import projects and create documentation for them.

• You can protect a project against change and completely, i.e. also against reading. By using a user management system you can purposefully control access to the project and even to individual objects in the project.

Creating a new project

1. Select “File ➔ New Project”.

   If the used Automation Builder version is not the latest version, an information is displayed.
   • Select “Change to newest installed version” to create a project with the latest installed version of Automation Builder.
   • Select “Continue to work with version: XXX” to create a project in the current software version.

2. Select “AC500 project”, enter a project name and specify the storage location for the new project.

   With “Empty project” a project without a PLC is created.
3. Select the device type for the new project and click [Add device].

A new project is created and can be configured.

Opening an existing project

**NOTICE!**
Risk of damaging Automation Builder projects!
Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Do not open projects with CODESYS V2.3.9.x as this can cause corrupted Automation Builder projects.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.
Opening a project

1. Select “File ➔ Open Project”.
   ⇒ The “Open Project” dialog appears.
2. Select a previously saved project from the file system.
   ⇒ Automation Builder switches to the version of the project and opens the project.

Exporting and importing a project

Configuration of a complete PLC or of single devices can be reused within the same project by copy-and-paste the desired nodes in the device tree.

In order to reuse a PLC configuration cross-over projects, the project configuration can be exported and imported afterwards into another project.

An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Project export

From the menu, select “Project ➔ Export ➔ Project”. Select the objects to be exported. The configuration of the selected items will be added to an export file (*.export).

“One file per subtree”: If this option is activated, all objects belonging to the same subtree will be exported into the same export file, otherwise a separate file will be created for each particular object.
Project import

For importing a project a basic and an advanced function is available.

**Basic project import**: Users with a basic or a standard Automation Builder license can perform a basic project import. Command: “Project ➔ Import ➔ Project”.

- A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.
- In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: “Project ➔ Compare”.
- ⇤ Chapter 1.4.1.5 “Comparing projects” on page 202

**Advanced project import**: Users with a premium Automation Builder license can perform an advanced project import. Command: “Project ➔ Import ➔ Project with compare”. This command allows to compare two projects, to check on differences and to adapt single parts of the project configuration easily.

**Basic project import**

1. From the menu, select “Project ➔ Import ➔ Project”.

- A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.
- In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: “Project ➔ Compare”.
- ⇤ Chapter 1.4.1.5 “Comparing projects” on page 202

2. Select the export file from the file system and click [Open] to import the project configuration.

---

**Advanced project import**

Perform an advanced project import in order to compare two projects, to check on differences and to adapt single parts of a previously exported project configuration easily.

1. From the menu, select “Project ➔ Import ➔ Project with compare”.

2. Select the export file from the file system and click [Open] to import the project configuration.

- The project import is started.
3. Once the project file is imported, a compare view is displayed. The left pane represents the current project, the right pane represents the imported project.

- Differences between the current project and the imported project are highlighted in red color.
- Additional modules in the current project that are not available in the imported project are highlighted in green color.
- Additional modules in the imported project or deleted modules in the current project are highlighted in blue color.
- A summary of all differences within the projects is given in the “Comparison statistics” under the device tree.

4. Every highlighted item of both projects can be handled individually and can either be transferred to the current project or skipped.
   - [Accept Block]: All items of the selected node are transferred to the current project with one click. Use this function for example to copy all nodes of a PLC configuration from the imported project to the current project (select “I/O_Bus” node).
   - [Accept Single]: Only a single item from a node is transferred to the current project. Use this function for example to copy certain I/O modules from the imported project to the current project.

- All accepted items are highlighted in the current project in yellow color.
- To undo a selection, again, click [Accept Block] or [Accept Single].
- To accept all changes on the current project, close the “Project Comparison - Differences” tab and confirm the prompted dialog.
5. If in the import project the PLC contains an AC500-S safety module, a security check is performed which requires user authentication:

![Logon](image)

6. After a successful user authentication the AC500-S safety modules are added to the compare view and can be imported to the current project.

![Compare View](image)

### Upgrading/ updating a project to a new Automation Builder version or profile

When upgrading or updating Automation Builder a previously configured project can be converted in order to be used in a new Automation Builder version or with a new Automation Builder profile.

Definition:

- **Automation Builder upgrade**: changing over to a major Automation Builder version (e.g. from version 2.3.1 to version 2.4.1).
- **Automation Builder update**: changing over to a minor Automation Builder version (e.g. from version 2.4.0 to version 2.4.1).

Further, a project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

☞ Chapter 1.2.15 “Converting an AC500 V2 project to an AC500 V3 project” on page 54
Before the upgrade/update

**Project archive**

Create a project archive before updating Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.

☞ Chapter 1.6.6.1.1.7.1 “Creation of an archive ” on page 3392

**RobotStudio station**

RobotStudio integration has been discontinued as of Automation Builder 2.1.0. It is recommended to externally store the link to the RobotStudio station and to remove the RobotStudio station object prior to the upgrade.

**Automation Builder profile**

To use the Automation Builder profile of an older project, the old profile must have been installed. The installation of older Automation Builder profiles can be activated in the device dialog during the upgrade process.

**Upgrading/Updating a project**

1. With opening a project Automation Builder automatically detects the project version. In case of an outdated project version a dialog is prompted.
   
   ⇒ If the update is confirmed, the project is automatically updated to the latest Automation Builder version.
   
   Automation Builder updates the complete project (complete device tree) to the latest version. Success messages, warnings and errors are described in the section “All messages”.
   
   ⇒ If the update is declined, the project is closed unchanged.

   In order to initiate a project update or upgrade later on, select “Project ➔ Update Project”.

   ⇒ To keep an older project, it must be opened with the same Control Builder Plus/ Automation Builder version the project has been created. For this, the appropriate Control Builder Plus/ Automation Builder profile must be selected.

   In this mode, new Automation Builder features cannot be used.

   ⇒ It is not possible to downgrade a project to an earlier Automation Builder version.

   ⇒ Automation Builder performs an integrity check for the PLC configuration before generating the configuration.
2. When upgrading Automation Builder, new available AC500 V2 system libraries are installed automatically. In difference to AC500 V3 libraries the AC500 V2 libraries are not versioned. Hence, after an Automation Builder update login to a PLC might only be possible after a rebuild and with an online change. This might be required although the application has not been changed and the previous version profile is still in use.

To avoid this, add the AC500 V2 libraries to the Automation Builder project. The procedure on how to add a AC500 V2 (system) library to a project is described exemplarily.

☞ Chapter 1.4.1.19.2 “Adding a library to the application” on page 438

3. During the project upgrade, an option for migration of third party devices can be selected. If this option was not selected during the upgrade procedure, migration can be initiated manually after an Automation Builder upgrade in order to migrate all third party devices to the project.

☞ Chapter 1.6.6.1.5 “Migration of third party devices” on page 3409

4. Exception, for the CANopen device CM598-CN:

Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.

As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.

5. After the Automation Builder upgrade login to the PLC from Automation Builder: right-click “Application ➔ App” and select “Login [PLC_AC500_V2]”.

☞ The firmware on the devices is upgraded.

Depending on the currently installed firmware versions, a login from CODESYS V2.3 might be impossible prior to the firmware update.

In case an Automation Builder project contains third party PROFINet devices (e.g. safety encoders or gateways), further information is available in the separate application note

AC500-S safety PLC - Overview of changes in Automation Builder 2.1.x and 2.0.x.

To update all devices of a PLC project, right-click the PLC node and select “Update objects”. In the dialog enable “update subtree” option to update all sub-objects. Otherwise only the processor module object is updated.

To update a specific device only, the command “Update objects” can be executed individually at the specific node.

I/O mapping export and import

Export I/O mapping

To exchange information on I/O mapping only, data can be exported as .csv file. This allows maintenance of I/O data outside Automation Builder, e.g. in MS Excel.
Right-click the “Processor Module” node or “I/O_Bus” node in the device tree and select “Export -> IO mapping”. To export the I/O Mapping for the complete project, e.g. with more than one configured Processor Modules, I/O data of the complete project can be exported “Project -> Export -> I/O mapping”.

Import I/O mapping
A previously exported .csv file can be imported to the project: “Project -> Import -> I/O mapping”.

Comparing projects
You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

Clicking “Project ➔ Compare” opens the “Project Compare” dialog for you to configure and run the comparison. Then the result is shown in the comparison view “Project Compare - Differences” where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view “Project Compare - <object name> Differences” in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.

You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands ➔, ➔, or ➔ in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only). therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

Creating a comparison view
Requirement: You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POUs, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command “Project ➔ Compare”.
   ➔ The “Project Comparison” dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option “Ignore Spaces” as it is.
4. Click on “OK”.
   ➔ CODESYS opens the comparison view. Title: “Project Comparison – Differences”. The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   Click on ➔ “Accept Single”
   ➔ CODESYS adds the object to the tree of the current project (left). The line has a yellow background. ➔ appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   Click on ✅ “Accept Single”
   ⇒ CODESYS removes the object again from the tree of the current project (left). The line has a yellow background. 🟢 appears in the middle column.

7. If CODESYS detects changes in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.

8. Close the comparison view and answer the query whether the changes made are to be saved with “Yes”.
   ⇒ The changes become effective in the project.

Opening the Detailed Compare View

Requirement: For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking “Project ➤ Compare”. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.
   ⇒ The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.

2. Click ✅.
   ⇒ Code lines with changes (red) are extended by two lines: a line with insert (left, green) and a line with delete (right, blue).

3. Click ✅ again.
   ⇒ The code line is marked again as modified.

4. Move the mouse pointer to the code line marked as modified and click ✅ “Accept Single”.
   ⇒ The code line from the reference project is activated for acceptance into the current project.

5. Click 🗑.
   ⇒ The project compare view opens for the entire project. It is write-protected (read-only) to prevent you from activating differences for acceptance. The link highlighted in yellow above the tree view also indicates this.

6. Click the link: “Project compare view is read only because there are uncommitted changes in another view. Click here to switch to the modified view.”
   ⇒ The detailed compare view opens again. The unconfirmed changes are highlighted in yellow.

7. Click ✗ in the tab of the view and confirm that the changes should be saved.
   ⇒ The detail project view is closed and the POU is overwritten. Now it corresponds to the POU of the reference project. The project view is active again so that you can continue working with project compare.

If you do not click the link, but click ✗ instead to close the editor of the project compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare is closed completely.
Project archive

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the project files of the CODESYS and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment.

Creation of an archive

The following steps describe the creation archive file from an Automation Builder project:

1. Select “File ➔ Project Archive ➔ Save/Send Archive”.
2. Select the information which should be included in the archive file from the list box.

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information selection list box</td>
<td>Options</td>
<td>Not supported</td>
</tr>
<tr>
<td></td>
<td>Referenced devices</td>
<td>The referenced devices can be selected by expanding the “Referenced devices” item of the list box. It is strongly recommended to include all devices in the project archive to maintain consistency.</td>
</tr>
<tr>
<td>Additional files</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Comment</td>
<td>-</td>
<td>Opening a control window which allows the input of a comment to the project archive.</td>
</tr>
<tr>
<td>Save</td>
<td>-</td>
<td>Opening a dialog window to determine the path and the file name of the project archive and storing it to the file system.</td>
</tr>
<tr>
<td>Send</td>
<td>-</td>
<td>Not supported</td>
</tr>
<tr>
<td>Cancel</td>
<td>-</td>
<td>Canceling the operation and closing the dialog window.</td>
</tr>
</tbody>
</table>

With [Comment] additional information can be added to the project archive, for example to add a brief description or some information concerning the project.

3. Proceed with [Save...].

It is strongly recommended to keep the default settings.

Section “Options” of the list box is not support. Do not enable this option.
Extraction of an archive

The currently loaded project will be closed automatically when extracting the selected project archive. It is recommended to open a new instance of Automation Builder before starting the extraction process.

The following steps describe the extraction of an archive file and the import to Automation Builder.

1. Select “File ➔ Project Archive ➔ Extract Archive”.
2. Select the desired project file and click [Open].

<table>
<thead>
<tr>
<th>Section/Control</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locations</td>
<td>Extract into the same folder where the archive is located</td>
<td>The project archive will be extracted to the same path where the archive is located.</td>
</tr>
<tr>
<td></td>
<td>Extract into the following folder</td>
<td>Path to which the project archive should be extracted.</td>
</tr>
<tr>
<td></td>
<td>Button ...</td>
<td>Opening a folder selection dialog which allows selecting the desired path.</td>
</tr>
<tr>
<td>Contents</td>
<td>Items</td>
<td>Select the items which should be extracted.</td>
</tr>
<tr>

<td>Displaying comments included inside the Project archive file.</td>
</tr>
<tr>
<td></td>
<td>Extract</td>
<td>Triggering the extraction process. Automation Builder extracts the archive and creates a project from out the archive. After creating the project Automation Builder checks the version of the project. If the project version and the activated Automation Builder version is not identical the workflow is the same as described in &quot;Opening an Existing Project&quot;.</td>
</tr>
<tr>
<td></td>
<td>Cancel</td>
<td>Closing the “Extract Project Archive” dialog and canceling the extraction process.</td>
</tr>
</tbody>
</table>

1.6.6.1.2 User and access rights management

User and access rights

The 'User Management' provide functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group.

User management

Before setting up users and user groups, notice the following: The configuration of users and groups is done in the Project Settings dialog ➔ Chapter 1.6.6.1.2.3 “Project Settings - Users and groups” on page 3397.
- Automatically there is always a group "Everyone" and by default primarily each defined user or other groups are members of this group. Thus each user account at least automatically is provided with default settings. Group "Everyone" cannot be deleted, just renamed, and no members can be removed from this group.
- Also automatically there is always a group "Owner" containing one user "Owner". Users can be added to or removed from this group, but at least one user must remain. This group also cannot be deleted and always has all access rights. Thus it is not possible to make a project unusable by denying the respective rights to all groups. Both group and user "owner" might be renamed.
- When starting the programming system resp. a project, primarily no user is logged on the project. But then the user optionally might log on via a defined user account with user name and password in order to have a special set of access rights.

**Notice that each project has its own user management!**

So, for example to get a special set of access rights for a library included in a project, the user must separately log on to this library. Also users and groups, set up in different projects, are not identical even if they have identical names.

**CAUTION!**

The user passwords are stored irreversibly!

If a password gets lost, the respective user account gets unusable. If the "Owner"-password gets lost, the entire project might get unusable!

---

### Access right management

User management in a project is only useful in combination with the access right management. Notice the following:

- In a new project basically all rights are not yet defined explicitly but set to a default value. This default value usually is: "granted".
- In the further run of working on the project each right can be explicitly granted or denied resp. set back to default. The access right management of a project is done in the Permissions dialog.
- Access rights on objects get "inherited". If an object has a "father" object (example: if an action is assigned to a program object, that is inserted in the structure tree below the program, then the program is the "father" of the action object), the current rights of the father automatically will become the default settings of the child. Father-child relations of objects concerning the access rights usually correspond with the relations shown in the POUs or Devices tree and are indicated in the Permissions dialog by the syntax "<father object>.<child object>".

**Example**

Action ACT is assigned to POU object PLC_PRG. So in the POUs window ACT is shown in the objects tree indented below PLC_PRG. In the Permissions dialog ACT is represented by "PLC_PRG.ACT" indicating that PLC_PRG is the "father" of ACT. If the "modify" right would be denied explicitly for PLC_PRG and a certain user group, the default value of the "modify" right for ACT automatically also would be "denied".

---

### User management commands

The 'User Management UI' plug-in provides commands for command category 'User Management'.
These are used for:

- Configuration of access rights on the project objects
- Logging on or off to/from the project via a defined user account in order to get the access rights which are associated to this account

The configuration of user accounts and groups is done in the Project Settings subdialog User Management \( \text{\textcopyright Chapter 1.6.6.1.2.3 "Project Settings - Users and groups" on page 3397.} \)

By default the following commands are part of submenu 'User Management' in the 'Project' menu: Logon, Logoff, Permissions.

**Logon**

Symbol: \( \text{\textcopyright} \)

This command opens the Logon dialog for logging on to a project or library via a defined user account.

Logging on with a certain user account means to log on with those object access rights which are granted to the group which the user belongs to. The configuration of user accounts and groups is done in the Project Settings subdialog User Management.

To log on select the project or an included library from the selection list in the Project/Library field. Enter User name and Password of a valid user account, noticing that each project or library has its own user and access rights management. Log on with OK.

If already another user is logged on the project, this one will be logged out automatically by the new log-on action.

When you are logged on to a project or library and try to perform an action for which you have no right, automatically a Logon dialog will be opened, giving the possibility to log on with another user account provided with the appropriate rights.

The status bar always displays which user currently is logged on the project.

**Logoff**

Symbol: \( \text{\textcopyright} \)

This command logs off the currently logged on user. If no user had been logged on to the currently opened project or to a referenced library an appropriate message will appear when trying to log off.

If the user currently is logged on to more than one project or referenced library (not necessarily with the same user account) a Logoff dialog will appear when trying to log off.

From the Project/Library selection list choose those project/library for which you want to log off.

The name of the Current user is displayed just for information.

The status bar always displays which user currently is logged on the project.

**Permissions**

This command opens the Permissions dialog, where the rights to work on objects or to perform commands in the current project can be configured.

Any changes made in this dialog will be applied immediately.
The Actions window displays all possible rights, that is all actions which might be performed on any object of the current project.

The tree is structured in the following way:

- Top-level see the names of some categories, which have been set up just for the purpose of optical structuring the rights management.
  They are grouping concerning the execution of Commands, the configuration of User accounts and Groups, the creation of Object Types, the viewing, editing, removing and handling of child objects of Project Objects.

- Below each category node there are nodes for the particular actions which might be performed on the command, user account, group, object type or project object. These nodes also only have optical function. Possible Actions:
  - execute (execution of a menu command)
  - create (creating a new object in the current project)
  - add or remove children (adding or removing of "child" objects to an existing object)
  - modify (editing an object in an editor)
  - remove (deleting or cutting an object)
  - view (viewing an object in an editor)

Below each action node find the possible targets, that is project objects, of the respective action.

The Permissions window provides a list of all currently available user groups (except the "Owner" group) and a toolbar for configuring rights to a group.

Select the group and configure its permissions.

Left to each group name one of the following icons indicates the currently assigned permission concerning the target which is currently selected in the Actions window:

- The action(s) for the target(s) currently selected in the Actions window are granted for the selected group.
- The action(s) for the target(s) currently selected in the Actions window are denied for the selected group.
• The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been granted explicitly, but is granted by default, for example because the corresponding right has been granted to the "father" object. (Example: The group has got the right for object "myplc", thus it by default it also has got it for object "myplc.pb_1".) Basically this is the default setting for all rights which not explicitly have been configured.

• The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been denied explicitly, but is denied by default, for example in case because the corresponding right has been assigned to the "father" object.

If currently multiple actions are selected in the Actions window, which do not have unique settings referring to the currently selected group, no icon will be displayed.

To configure the rights for a group select the desired action(s) and target in the Actions window and the desired group in the Permissions window. Then use the appropriate button in the toolbar of the Permissions window:

+ Grant: Explicit granting.
- Deny: Explicit denying.
× Clear: The currently granted right for the action(s) currently selected in the Actions window will be deleted, that is set back to the default.

Project Settings - Users and groups

The Project Settings dialog in category 'Users and Groups' provides three subdialogs for the user management for the current project: Users, Groups, Settings. For a general description on users and access rights management see help page Chapter 1.6.6.1.2.1 “User and access rights” on page 3393.

Users dialog

The currently registered users are listed in a tree structure. The ownerships of each user is displayed and each user is a member of a group by default Chapter 1.6.6.1.2.1 “User and access rights” on page 3393.

1. Click “Add” to open the “Add User” dialog.
2. Define the user credentials and click OK to set up the new user. If there are incorrect entries (no login name, password mismatch, user already existing) you will get an appropriate error message.

3. Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the “Add User” dialog. The password fields however - for security reasons - will show 32 * characters. After having modified the desired entries close the dialog with OK to get applied the new settings.

Modify a user account

4. Click “Remove” to remove the user from the list. Note that you will get no further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.

Remove user accounts

PLC integration (hardware) > Configuration in Automation Builder for AC500 V3 products

2021/05/12 3ADR010583, 2, en_US 3397
Groups dialog

Add a group  The currently available groups are displayed in a tree structure. A member also might be a group.
1. Click “Add” to open the “Add Group” dialog.
2. Define a name for the new group and enable all entries (single users or groups) which should be members of the new group.
3. Click OK to set up the new group. If there are incorrect entries (no name defined, group already existing, in Members having selected a group which would cause a “group cycle”, you will get an appropriate error message.

Modify a group  Click “Edit” to open the “Edit User” dialog. The entry fields are the same as in the ‘Add Group’ dialog (see above). After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove groups  Enable the entries to be removed in the groups tree and click “Remove”. Note that you will get no further inquiry! The members of the deleted groups will remain unmodified. An error message appears if you try to delete the groups “Everyone” and/or "Owner”.

Settings dialog

The following basic options and settings concerning the user accounts can be made:

- Maximum number of authentication trials: If activated, the user account will be set invalid after the specified number of trials to log in with a wrong password. If not activated, the number of erroneous trials is unlimited. Default: option activated, number of trials: 3; permissible values: 1-10.
- Automatically log out after time of inactivity: If activated, the user account will be logged out automatically after the specified number of minutes of inactivity (no user actions via mouse or keyboard registered in the programming system). Default: option activated, time: 10 minutes; permissible time values: 1-180 minutes.

1.6.6.1.3 Later change-over of a target system

Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:
- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

Target change from a V2 processor module to a V3 processor module

Target change options:
- AC500 V2 processor module ➔ AC500 V3 processor module
- AC500 V2 processor module ➔ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➔ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➔ AC500 V3 processor module
**Procedure:**

1. Close CODESYS.
2. Double-click the PLC_AC500_V2 <...> node and open the “PM5<...> Hardware” tab.
3. Enable “Change to AC500 V3 PLC” and select the desired V3 processor module from the “PM5xx Type” drop-down list.

4. Click [Create V3 PLC].
   - The new V3 processor module is displayed in the navigation tree.
   - Change the node name of the processor module, if desired.

In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.

---

**Target change from a V3 processor module to another V3 processor module**

**Target change options:**
- AC500 V3 processor module ➔ AC500 V3 processor module
- AC500 V3 processor module ➔ AC500-eCo V3 processor module
- AC500-eCo V3 processor module ➔ AC500 V3 processor module
- AC500-eCo V3 processor module ➔ AC500-eCo V3 processor module

**Procedure:**

1. Close CODESYS.
2. Double-click the PLC_AC500_V3 <...> node and open the “PM5<...> Hardware” tab.
3. Select the desired V3 processor module from the “PM5xx Type” drop-down list.

4. Ensure the correct “Terminal Base Type” is selected and click [Change PM / TB type].
   - If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.
   - The device configurations that cannot be kept are listed in a prompted information dialog.

By default, all device configurations which cannot be switched over will be copied to a "device pool" section in the navigation tree (option “Copy all objects that cannot be added to the new PLC into a device pool for further access”). If required, this backuped configuration can be used in another project or in another processor module configuration.

If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.
Target change from AC500-eCo V3 to AC500 V3

- The configuration of the onboard I/Os, the option slots and the onboard RTC cannot be changed-over to the new module.

Target change from AC500 V3 to AC500-eCo V3

- The configuration of COM1, CAN and the extension bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.
- ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.

- Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

Customer libraries

CODESYS for AC500 V2 products contains different types of libraries:

- Standard CODESYS libraries
- Specific AC500 libraries
- Customer libraries

In general, the Standard CODESYS libraries and the AC500 libraries are automatically converted during a target change from AC500 V2 to AC500 V3. Those libraries that cannot be converted (e.g. because there is no matching in V3) are created automatically in the V3 Library Manager and must be manually deleted by the user after the target change.

The customer libraries have to be converted manually using the Library Converter integrated into the Automation Builder installation:

1. In Automation Builder click “File ➔ Open project”.
2. Select the CODESYS library for AC500 V2 products which has to be converted.
3. After conversion of the library, open the view POU in the device navigator and double-click “Project Information”.

---

2021/05/12

3ADR010583, 2, en_US

3401
4. To have the library automatically available in the V3 project, enter “Company”, “Title” and “Version” in the specific fields of the dialog. Then, open the “Properties” tab. For the target change the new “Key” “CoDeSysV2Library” has to be added. Under “value”, enter the name of the CODESYS library and click the “Add” button.

Click “File ➔ Save project” and install into the library repository.

1.6.6.1.4 Firmware identification and update

Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the “Version information” tab.

Remarks:

- The “Version information” tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.
Firmware version on device matches version supplied with Automation Builder.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.

Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

AC500 V3 firmware installation and update

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500 V3 CPU is open.
- CPU is in "stop" mode or shows uPdATe (update) on the display.
- After update the CPU shows either donE or StoP on the display
For new modules: IP address is set. (The default IP address is 192.168.0.10)
1. Double-click CPU “PLC_AC500_V3”.
2. Select “Version information”.
3. Select “Update Firmware”.
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternately.
4. Wait for the PLC to finish the update.
   A completed update is indicated by a message on the display. Either done, or stop.

**NOTICE!**
Do not disconnect the power supply during the update process! The PLC could be damaged.

⇒ stop indicates a restart has been performed by the CPU. When done is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

The CPU display shows "stop" after re-boot. The update process is finished.
5. If necessary, refresh the version information by switching to another tab and back.

⇒ Successful firmware update:

<table>
<thead>
<tr>
<th>LED</th>
<th>LED flashes</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN and ERR</td>
<td>Toggling</td>
<td>Update pending</td>
</tr>
<tr>

<td>Done failed</td>
</tr>
</tbody>
</table>

Behavior of LEDs during firmware update

AC500 V3 firmware installation and update

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning AC500-eCo V3 CPUs.
A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

- An Automation Builder project with an AC500 V3 CPU is open.
- CPU is in "stop" mode without firmware.
- The power LED is ON.
- For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU “PLC_AC500_V3”.
2. Select “Version information”.

![Image of Automation Builder project with PLC_AC500_V3](image)

3. Select [Update Firmware].
   - While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.
4. Wait for the PLC to finish the update.
   - **NOTICE!**
     - Do not disconnect the power supply during the update process! The PLC could be damaged.
5. If necessary, refresh the version information by switching to another tab and back.
   - Successful firmware update:
**Behavior of LEDs during firmware update**

- CPU without firmware, only the power LED is on.
- While the firmware update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

<table>
<thead>
<tr>
<th>LED</th>
<th>LED flashes</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN and ERR</td>
<td>Toggling</td>
<td>Update pending</td>
</tr>
<tr>
<td>RUN</td>
<td>Flashing slow</td>
<td>Done successful</td>
</tr>
<tr>
<td>ERR</td>
<td>Flashing slow</td>
<td>Done failed</td>
</tr>
</tbody>
</table>

- CPU with installed firmware, only the power LED is on.
- If the CPU is running, then the RUN LED is on.
- If the CPU is in STOP mode, the RUN LED is off.

**Update CI52x-modbus firmware**

Requirement: A firmware update file is available, e.g. AC500_CI52x_Firmware_V3.2.8.bin.

*The CI52x Modbus firmware update is only available in the Automation Builder IP Configuration Tool.*

**Installation of the IP configuration tool**

1. In Automation Builder click “Tools ➔ Installation Manager” to start the Installation Manager.
2. Close any other running instances of Automation Builder. Then, click “Modify” in the Installation Manager.
3. Select the option “IP Configuration Tool” from the list and start the installation of the IP Configuration Tool.

**Firmware update procedure**

1. In the IP Configuration Tool click “Scan” to initialize a device scan.
2. From the list select the CI52x-MODTCP device(s) which shall be updated and click “FW Update”.
3. Select the firmware update file (e.g. AC500_CI52x_Firmware_V3.2.8.bin) to initialize a signature check and start the update procedure.
4. After the update, click “Scan” again to retrieve the firmware version of the device.

**Troubleshooting**

After the IP Configuration Tool has been installed, the firmware update of the CI devices can be initialized. If the CI firmware update fails, check the troubleshooting hints and follow the instructions.
General hints

- Close all unused applications on the update PC and do not open Automation Builder or any other applications during the firmware update.
- Stop the communication between AC500 PLC and the CI52x devices and disconnect the Ethernet connection of the update PC and the CI Modbus device(s).
- Do not close the IP Configuration Tool during a firmware update and do not switch off a CI Modbus device during the firmware update.

During a firmware update the operation of the device(s) is stopped. After the update, all outputs are set to zero.

Erroneous firmware update

<table>
<thead>
<tr>
<th>Error</th>
<th>Solution</th>
</tr>
</thead>
</table>
| **Error 1: Package Timeout**  
Due to a primitive firmware update protocol a fast and stable network connection is required. Otherwise the update packages cannot be transferred within the requested time and a timeout occurs. | **Solution**  
Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches. |
| **Error 2: Unable to read device status**  
After the firmware update the IP Configuration Tool reads out the status of the updated device in order to check if the update was successful. | **Solution**  
Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update. |
| **Error 3: IP is not unique**  
If more than one device hold the same IP address, a firmware update is not possible as the update command is IP based. | **Solution**  
Correct the IP address, rescan and repeat the update. If this doesn't work, power cycle the device and retry the update. |
| **Error 4: Internal Error**  
An internal error on the CI52x Modbus device occurred during the firmware update. | **Solution**  
Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update. |
| **Error 5: Cannot connect to device**  
The TCP communication is not sufficient for a connection. Increase the connection quality. | **Solution**  
See Error 1: Package Timeout. |

Signature check failed

After the selection of the firmware file (*.bin) a signature check is performed. If either the firmware file or the signature file is corrupt, the signature check fails. In the event of an erroneous signature check, perform the following steps:

- Ensure the signature file is stored in the same directory as the firmware file.
- Check the file names. The name of the signature file must be the same as the firmware file + attached ".sig".

<table>
<thead>
<tr>
<th>File names</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of the firmware file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin</td>
<td></td>
</tr>
<tr>
<td>Correct name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig</td>
<td></td>
</tr>
<tr>
<td>Wrong name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.sig</td>
<td></td>
</tr>
</tbody>
</table>
Indeterminate device firmware version

If the firmware version of the device cannot be determined, an error occurs. In this case, check that the device and the update PC are located in the same subnet and ping the device. If the ping is successful you can use the IP Configuration Tool to retrieve the device firmware version.

<table>
<thead>
<tr>
<th>PC</th>

</tr>
</tbody>
</table>

1.6.6.1.5 Migration of third party devices

After an update of Automation Builder the device repository contains only ABB devices. The third party devices which were installed into previous versions of Automation Builder are not automatically installed in the newest version profile. This has to be triggered by the user.

```
The feature “Migrate third party devices” is available as of Automation Builder 2.1.1.
```

1. Click “Tools” in the main menu of Automation Builder.
2. Click “Migrate third party devices” in the drop-down list.

→ The window Version profile selection appears.
3. Select a version profile in the drop-down list containing previous Automation Builder / Control Builder Plus profiles. The active profile does not appear in the list.

After selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed.
It is not possible to select or deselect some third party devices. Importing will affect all the third party devices which are listed in the list view.

- Click [Import].

During the migration the message window displays success or failure of device migration.
In case of failure during the migration the affected third party device description has to be installed manually via main menu “Tools ➔ Device Repository ➔ Install”.

In the status bar, the third party device which is on Migrating: <...> is displayed on the left side. The import operation can be cancelled by clicking the “Click here to CANCEL this operation” link on the right side of the status bar. This becomes effective when the migration of the just migrating third party device is finished.

- Click [Close] button of the Version profile selection dialog to close the dialog.

1.6.6.1.6 Advanced IO device handling

Automation Builder provides the Advanced IO Device Handling feature for configuring identical IO device types at multiple instances.

This feature is supported by the following commands that works with IO devices only.

- Generate DUT
- Map to Existing DUT
- Release DUT mapping

These commands work on individual nodes and on CI (communication interface) level nodes.

Generating DUT

Each device generates two DUTs. One for the input and one for the output. Some devices contain only input or output type. In such cases, the device generates only one DUT of the relevant type.

- Right-click on the desired IO device and select “Generate DUT” to generate a DUT for an IO device.

The following example shows how to generate DUTs at CI level node.

- In the device tree, right-click on a master node such as PNIO_Controller and select “Generate DUT” to create DUTs for the child nodes.
- The DUTs of child nodes are generated in “Application ➔ App ➔ IO_Device_Generated_Items” folder.
- Generated DUT considers channels with BYTE datatype as members. If channels with BYTE datatype are not present in the given hierarchy, it adds the members with another higher datatype.
- Channels with BOOL datatype are not considered.

Mapping to existing DUT

This command is enabled for the IO device when the IO device is not mapped and when DUTs of matching size (calculated based on device channel list) are available in “Application ➔ App ➔ IO_Device_Generated_Items” folder.

1. Right-click on an IO device and select “Map to Existing DUT”.
   - Enter Instance Name dialog is displayed.

2. Enter the instance name which satisfies IEC naming validations and unique name in global scope.

3. Click “OK” to create a global variable associated with the mappings in DI (PRG).

   If you want to view mapped instances, double-click “DI (PRG)”.
With the 'Map to Existing DUT' command:

- Any device can be mapped only to one input DUT and one output DUT. If you have already mapped an input DUT, only the output DUT is shown in the options list and vice-versa.
- Mapping is also supported at CI level nodes. To create global variables for CI level nodes, the address of the first child is considered.

Releasing DUT mapping

This command is enabled on an IO device only when an IO device is mapped either to input, output or both DUTs. You can use this command to release (or revert) mappings and to delete global variables created during 'Map to Existing DUT'.

Right-click on an IO device and select “Release DUT Mapping”. The mapped DUT instance is deleted.

Using DUT variables in CODESYS application

1. In the Automation Builder project, double-click “Application” to launch CODESYS application.
   ⇨ CODESYS application is launched. CODESYS application contains mapped DUT instances.
2. Double-click “PLC_PRG” to create DUT variables.
3. Add DUT variables based on mapped DUTs.

For further information on mapping DUTs, see section Chapter 1.6.6.1.6.2 “Mapping to existing DUT” on page 3411.

For example, in the PLC_PRG, add analog I/O and digital I/O. If you insert a dot at a position where an identifier should be inserted, then a selection list is open, offering all the input and output variables which are found in the project.

After adding DUT variables, rebuild the program in CODESYS application using “Project ⇨ Rebuild”.

Support for CI level node

The user can create DUTs for the entire hierarchy of CI level node (for example, IO_BUS), by right-clicking on the desired CI level node and by selecting “Generate DUT”. Further, all the DUTs are generated in “Application ⇨ App ⇨ IO_Device_Generated_Items” folder.

- The command generates DUT for the node itself and also for all child nodes.
- The DUT generated for the CI level node contains generated DUTs for the child nodes as their members.
- For every execution, the command checks, if any new child node is added and generates DUT.

If you delete child nodes in CI level node (for example, IO_BUS), the DUTs generated for these child nodes are not deleted automatically. You should delete the DUTs manually in the “Application ⇨ App ⇨ IO_Device_Generated_Items” folder if desired.
Configuration check

Configuration check for size is enabled to ensure that all devices are mapped with DUTs of the correct size. In case of any changes in the mapped DUT, configuration check verifies the size of the DUT. If it fails, an error message is displayed in Automation Builder messages window and does not allow to launch the application. This check can be performed in “Create configuration data”.

1.6.6.2 PLC devices and components

1.6.6.2.1 Device repository

The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the “Device Repository” dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.
1. Click “Tools ➔ Device Repository”.
   ➔ The “Device Repository” dialog box opens.

   ![Device Repository Dialog Box]

   - **[Edit Locations]**: Changes the default repository location. The devices can be managed at different locations.
   - **[Install] / [Uninstall]**: Installs or uninstalls devices.
   - **[Renew device repository]**: Updates the device list, e.g. after uninstallation of a device.
   - **[Details]**: Provides technical details on the selected device.

2. Select the install location. “System Repository” is set by default.

   The device repository cannot be changed manually, e.g. by copying or deleting files. Use always the Device Repository dialog to add or remove devices.
1. Click [Install] and select the appropriate file format. 
   ⇒ The “Install Device Description” dialog box opens.

![Install Device Description dialog box]

2. Select the file path of the device description.
3. Select the file type filter of the required device description. 
   ⇒ All device descriptions of the selected file type are listed.
4. Select the required device description and click “Open”. 
   ⇒ Automation Builder adds the device description to the matching category of your device repository.
   
   If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the device repository dialog box.

During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.

The changes take only effect after reinstalling the corresponding device(s). The version number shown in the information section of the device should be verified.

Uninstalling devices

Select the device you want to remove and click [Uninstall].

The device is removed from the list.

Uninstalled devices which are used in existing projects are indicated by the symbol . The device will not be configured properly.
1.6.2.2 PLC start-up

A fast online program modification of the user program is possible without interrupting the running operation. If data areas should be saved during power OFF/ON, they can be stored in the Flash EPROM. An optional battery saves data in the RAM.

Initialization of AC500 V3 CPU

To initialize an AC500 V3 CPU, you need to download the firmware in advance.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

☐ An Automation Builder project with an AC500 V3 CPU is open.

1. Switch on the CPU.

⇒ On the CPU display "Init" is shown.

2. Automation Builder: Double-click the node "PLC_AC500_V3" and select the IP address "192.168.0.10":

3. Click “Execute update”.

⇒ Device: The Run and Error LEDs are still blinking.

   Wait until only the Run LED is blinking and the device display shows "Stop".

   Then, reboot the PLC.

   After Power Cycle the PLC ends in Stop mode.

4. Automation Builder: Click “Tools ➔ IP-Configuration” and click “Scan”.

In Automation Builder the activated PLC is not displayed under “Tools ➔ IP-Configuration”.

...
5. Double-click the node “PLC_AC500_V3” and enter the IP address:

- Click “Enter” to start the scan process.

After a successful scan, the IP address is enhanced to "192.168.0.10 (active)".

6. Login to the PLC: “Online ➔ Login”.

7. To read out firmware information, double-click the node “PLC_AC500_V3”. In the tab PLC Shell navigate to the command line and type "rtsinfo".

**PLC runtime licensing**

The use of some libraries and devices require the PLC to have a runtime license. If you purchased such a license, activate the license ➔ Chapter 1.6.6.2.2.2.1 “Activating a runtime license via license key” on page 3417.

If you want to test device functionality or library features in advance, you can activate a demo license in advance ➔ Chapter 1.6.6.2.2.2.2 “Activating a demo license” on page 3421.

The license status of a PLC can be displayed at any time ➔ Chapter 1.6.6.2.2.2.5 “View license information” on page 3424.

**NOTICE!**

After removing a Wibu memory card (which holds the AC500 runtime license), the PLC system moves into 'Stop' mode after 24 h.

Ensure to insert the Wibu memory card at the time.

**Activating a runtime license via license key**

The use of some libraries and devices require the PLC to have a runtime license.

- PC and PLC are connected. In case of no connection, perform the activation via memory card ➔ Chapter 1.6.6.2.2.2.3 “Licensing via memory card” on page 3421.
There is a connection to the Internet. In case of no connection, perform the activation on another PC with internet connection "Chapter 1.6.6.2.2.2.1.1 "Activation without internet connection" on page 3418.

1. Right-click on the PLC and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇒ A wizard starts. Follow the instructions.
2. Enter the license activation key and select “Next” to finish the licensing procedure.
   ⇒ The license is activated on the PLC device.

If the license shall be used on another PLC device, the installed license can be returned "Chapter 1.6.6.2.2.2.4 "Returning a license" on page 3423.

Activation without internet connection

1. If an error occurs when communicating with the ABB license server, or if Automation Builder is running on a PC without internet connection, then it is possible to manually complete the ABB license server interaction by using another PC (with internet connection).

2. In the error dialog select “Next” and save the license activation request file to a storage location the other PC can access, e.g. a file share.
3. In the dialog the web address of the ABB license server is displayed (http://lc.codemeter.com/32838/depot/index.php). From the PC with internet connection, upload the license activation request file.

4. After the upload, download and save the license activation file from the ABB license server. Transfer this file to the PC without Internet connection.

5. Select “Next” to continue the license activation process. Click “Cancel” to continue the license activation process at a later time (see Offline activation Further information on page 3420).
6. Select “Browse” and select the license activation file (*.WibuCmRaU) from the defined storage location.
   ⇨ The license is validated by the ABB license server and afterwards activated on the PLC device.
   If the license shall be used on another PLC device, the installed license can be returned ⇨ Chapter 1.6.6.2.2.2.4 “Returning a license” on page 3423.

7. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.

   Save the license receipt file and upload it manually from a PC with internet connection to http://lc.codemeter.com/32838/depot/index.php.
   ⇨ A license confirmation is returned.

---

**Offline activation**

If the runtime licensing process was closed between saving the license activation request file and obtaining the license activation file from the ABB license server, perform an offline activation:

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇨ A wizard starts. Follow the instructions.

2. Select the option “Complete offline licensing process”.

3. Select “Browse” and select the license activation file (*.WibuCmRaU) from the defined storage location.
   ⇨ The license is activated on the PLC device.
   If the license shall be used on another PLC device, the installed license can be returned ⇨ Chapter 1.6.6.2.2.2.4 “Returning a license” on page 3423.

4. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.

   Save the license receipt file and upload it manually from a PC with internet connection to http://lc.codemeter.com/32838/depot/index.php.
   ⇨ A license confirmation is returned.
Activating a demo license

It is possible to try out device features or library features by using a Demo license on the PLC. With this, you can use the features for a limited time period.

- PC and PLC device are connected. In case of no connection, perform the activation via memory card [Chapter 1.6.6.2.2.2.3 “Licensing via memory card” on page 3421].
- There is a connection to the Internet. In case of no connection, perform the activation on another PC with Internet connection [Chapter 1.6.6.2.2.2.1.1 “Activation without internet connection” on page 3418].

1. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   - A wizard is started. Follow the instructions.
2. Select the option “Create a demo license” and click “Next” to finish the licensing procedure.
   - The demo license is validated by the ABB license server and afterwards activated on the PLC device.

Licensing via memory card

When you have no connection between your PC and the PLC device the licensing procedure can be done via a memory card.

On the PC:
Create a license request

- There is a connection to the internet.
- The memory card can be used with AC500 V3 products.

**NOTICE!**
If a SDCard.ini file is stored on the memory card, the file will be overwritten.

1. Place the memory card in the PC.
2. Right-click on the PLC node and select “Prepare PLC license SD memory card” from the “Runtime Licensing” menu.
3. From the filesystem select the root folder of the memory card.
   - A success message is displayed when the creation of the memory card files is completed.
   - The license request files are stored to the selected folder.

On the PLC:
Transfer the license data

1. Insert the memory card into the PLC device and reboot the PLC.
   - When the license request file is successfully created by the PLC, “done” is shown on the display of the PLC.
2. Remove the memory card from the PLC.
For this action, internet connection is required.

1. Place the memory card into the PC.
2. Open the PLC project in Automation Builder. Ensure the PLC is logged out.
3. Right-click on the PLC node and select “PLC runtime licensing” from the “Runtime Licensing” menu.
   ⇒ A wizard is started. Follow the instructions.
4. Enter the license activation key.
5. From the filesystem, select the root folder of the memory card.
   ⇒ The previously created license request files are sent to the ABB license server. A license activation is created on the memory card.
6. Remove the memory card from the PC.

On the PC: Enter the license activation key

1. Insert the memory card into the PLC device and reboot the PLC.
   ⇒ done is displayed on the PLC if license activation was successful.
2. Remove the memory card from the PLC

On the PLC: Complete license activation for the PLC

Trying to activate a runtime license, that has already been activated (e.g. via an online connection), will result in following error in the sdcard.rdy file:

;Result of license file import
ImportLicense=13;Internal Error (1)

On the PC: Complete license activation on the license server

To complete the licensing process, the license receipt file must be uploaded to the ABB license server.
1. Place the memory card into the PC.

⇒ The license receipt on the memory card is located in the subfolder license

⇒ A license confirmation is returned.
Returning a license

<table>
<thead>
<tr>
<th>NOTICE!</th>
</tr>
</thead>
<tbody>
<tr>
<td>After returning a AC500 runtime license, the PLC system moves into ‘Stop’ mode after 24 h.</td>
</tr>
</tbody>
</table>

A license which has been installed on a PLC device can be returned and installed on another PLC device.

- PC and PLC device are connected. In case of no connection, perform the activation via memory card “Returning a license via memory card” on page 3423.
  1. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
     - A wizard is started. Follow the instructions.
  2. Enter the license activation key and click “Return license”.
     - The results of the return process will be displayed in the dialog.

When the PLC is not connected to the PC (PLC logged out) it is possible to return a license via memory card.

1. Place the memory card into the PC.
2. Right-click on the PLC node and select “Return active license” from the “Runtime Licensing” menu.
   - A wizard is started. Follow the instructions.

Returning a license without memory card

PC and PLC device are connected. In case of no connection, perform the activation via memory card “Returning a license via memory card” on page 3423.
3. Enter the license activation key and click “Return license”.

![Image showing the Return PLC License window]

4. Click “Browse” and select the root folder of the memory card.
   ⇒ Returning of the license is started.

5. Place the memory card in the PLC device and reboot the PLC.
   ⇒ The license from the PLC device is removed and can be used now for another PLC device.

6. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   ⇒ A license confirmation is returned.

**View license information**

To view the license information of AC500 V3 products:

1. In the Automation Builder device tree double-click on the PLC node.
   ⇒ The PLC tab is opened.
2. In the PLC tab select “License Information”.

![PLC tab menu with License Information highlighted]

The project is scanned for required licenses. If you are logged into a PLC, then the licenses available on the PLC are displayed. Missing required licenses are highlighted.
Connection of devices

All installed devices that are available in Automation Builder are listed in the § Chapter 1.2.8 "Device repository" on page 47.

Configuring devices

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.

1. In the device tree, right-click an item node. Select “Add object”.

2. Select the desired object and click [Add object].

3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.

Update of AC500 devices

Perform a firmware update to update AC500 V3 devices. § Chapter 1.2.16.1.2.6 “AC500 V3 firmware installation and update" on page 77
Comparing objects

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select **Compare Objects** to see the differences.

IP settings

Configuration of the IP settings with the LED display

The IP settings for the PLC can be set directly on the processor module via keypad and LED display.

See [Chapter 1.6.5.1.5.5.3 “Configuration” on page 3245](#)

Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following. [Chapter 1.6.6.2.2.4.3 “Configuration of communication via Ethernet (TCP/IP)” on page 3440](#)

As an alternative the IP address can be changed at the hardware device itself. [Chapter 1.6.5.1.5.5 “Description of the function keys” on page 3243](#)

The IP configuration tool can be used

- to set or change the IP address of devices. [Chapter 1.6.6.2.2.4.2.2.2 “Changing the IP address” on page 3432](#)
- to scan the network for available hardware devices. [Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3430](#)
• to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  ☞ Chapter 1.6.6.2.4.2.2.3 “Firmware update” on page 3433
• to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  ☞ Chapter 1.6.6.2.4.2.4 “Blink functionality” on page 3437

The IP configuration tool is part of Automation Builder and can be called via “Tools ➤ IP-Configuration”.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ☞ Chapter 1.6.6.2.4.2.1 “Stand-alone installation” on page 3428.

After the installation, the IP configuration tool is started via .exe file / desktop icon.

---

**Stand-alone installation**

- The IP configuration tool is part of Automation Builder and can be called via “Tools ➤ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.
1. Open the Installation Manager in Automation Builder: “Tools ➤ Installation Manager”.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.
3. Click “Modify” and select the “IP Configuration Tool” from the structure tree.

4. Click “Continue” to start the installation.

   - After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.
1. Start the IP configuration tool in Automation Builder ("Tools ➔ IP-Configuration") or start it stand-alone (.exe).

2. The “IP-Configuration” dialog opens. Define the device type for the network scan by selecting the desired option under “Scan Protocol”:
   - “ABB Net config protocol”:
     Use this option for AC500 devices such as processor modules, Cl5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - “Profinet Dynamic Configuration Protocol (DCP)”: Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579). For the scan, a NPcap driver needs to be installed separately.
     % Step 4 on page 3435
   - “EtherCAT”:
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     “Emergency” option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed. For the scan, a NPcap driver needs to be installed separately.
     % Step 4 on page 3435

3. Click [Scan] to start the scan process.
4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under “IP settings”:
   - “IP Address”: Current IP address of the device.
   - “Conf. IP Address”: Configured IP address of the device. A changed IP address will update this column.
   - “FW Version”: Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.
      
      Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3438

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.
   
   Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3430

2. Select a device from the list and select the appropriate protocol under “Scan protocol”.
   “DHCP” or “BOOTP” option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.
   “IP address”, “subnet mask”, “Std. gateway”: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.
   
   Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3438

Note for CI52x-Modbus devices

Consider the behaviour of CI52x-Modbus devices if the last number of the IP address is set to “0”.
   
   Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3439
3. Change the settings for the IP configuration and click *Send settings* to transmit the data to the device.

![IP Configuration settings](image)

**Note for PROFINET devices**

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:

- Labels must be separated by "."
- Total length: 1 to 240
- Label length: 1 to 63
- Labels can consist of characters [a-z] and numbers [0-9]
- Labels are not allowed to start with "-"
- Labels are not allowed to end with "-"

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

**Firmware update**

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

*Chapter 1.6.6.2.2.4.2.1 “Stand-alone installation” on page 3428*

It is not possible to perform a firmware update out of Automation Builder.

- For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.12.
- For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.
Requirements: Before the firmware update
- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update
- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

Procedure:
1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.
   - Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3430
3. Select the devices that shall be updated from the list and click [Scan] to trigger the scan process.
   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.
4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:

- Click on the displayed link [https://nmap.org/download.html](https://nmap.org/download.html) and download the latest version of the `npcap-X.X.exe` file.

5. Click [Update Firmware] to start the firmware update for the selected devices.
6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

If the signature check fails, check the availability of the *.bin file and the *bin.sig file.

“Signature check” on page 3439

7. A status check followed by a device reboot followed by a second status check is performed automatically.

After the firmware update all outputs of the updated devices are set to '0'.

8. After a successful firmware update the update status or the new firmware version is displayed in the “FW Version” field.

If this field is empty, there possibly is a connection error between the device and the executing PC.

“Error: Can’t connect to device” on page 3440

Exception: For EtherCAT devices an empty “FW Version” field does not indicate a connection error.

If the firmware update fails

- check the requirements for the update procedure.

“Requirements:” on page 3434

- check the hints for trouble-shooting.

Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3438

- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.
**Blink functionality**

This function activates flashing of the background light of an AC500 LED display.

1. From the menu, select “Tools → IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   - A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.

---

**Trouble-shooting for IP configuration tool**

**Firewall exceptions:**

On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

**Windows 7/ Windows 10:**

On the network that is used for communication with the PLC, set “Incoming connections” to “Block all connections to programs that are not on the list of allowed programs”.

---
If a third party firewall is used these exceptions must be configured manually.

Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.

Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).

Trouble-shooting for firmware update

Check the requirements

Ensure that all requirements have been considered before and during the update procedure.

Check subnet configuration

This hint is only valid for Modbus devices and PROFINET devices.

If the “FW Version” field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.
Click [Scan] again to restart the network scan. If the connection is successful a newer firmware version is displayed in the “FW Version” column.

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

**Example:**

<table>
<thead>
<tr>
<th>Automation Builder</th>
<th>AC500 communication interface module (rotary switch)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address: 192.168.14.0</td>
<td>IP address: 6</td>
</tr>
<tr>
<td><a href="#">Scan Protocols</a></td>
<td>I/O-Bus</td>
</tr>
<tr>
<td><a href="#">AABB Net config protocol</a></td>
<td>ADDR x10H</td>
</tr>
<tr>
<td><a href="#">Profinet Dynamic Configuration Protocol (DCP)</a></td>
<td>1.4 Al -</td>
</tr>
<tr>
<td><a href="#">EthenCAT</a></td>
<td>1.5 AO0+</td>
</tr>
<tr>
<td>IP address</td>
<td>ADDR x01H</td>
</tr>
<tr>
<td>192.168.14.0</td>
<td>1.6 AO1+</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>ADDR x01H</td>
</tr>
<tr>
<td>255.255.0.0</td>
<td>1.7 AO-</td>
</tr>
<tr>
<td>Std. gateway</td>
<td>ADDR x01H</td>
</tr>
<tr>
<td>0.0.0.0</td>
<td>1.8 UP</td>
</tr>
<tr>
<td><a href="#">Send settings</a></td>
<td>ADDR x01H</td>
</tr>
</tbody>
</table>

As a result, in the field “IP Address” the last number is set to "6":

**Signature check**

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (*.bin) and a signature file (*.bin.sig) in the same directory. Without a signature file the signature check will fail.

**Example:**

Firmware update file: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin

Signature file: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig
**Error: Package timeout**  
A timeout error may occur due to an unstable network.  
Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

**Error: Unable to read device status**  
A read error may occur due to errors in the firmware update protocol.  
After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful.

**Error: IP is not unique**  
If an IP address is obtained by more than one device an error occurs. A firmware update is not possible.

**Error: Error State**  
Internal device error during the firmware update.  
Solution:  
Step 1: Scan again and repeat the firmware update.  
Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update.

**Error: Can’t connect to device**  
The TCP communication is not sufficient. Increase the connection quality.  
Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

**Configuration of communication via Ethernet (TCP/IP)**  
Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal Ethernet communication module.  
Programming via internal (onboard) Ethernet communication module:
Enter a known PLC IP address

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Enter your PLC IP Address and click [OK].

Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

2. Click [...].
   ⇒ Dialog box Communication Settings <...> appears.
3. Click [Scan], select your desired PLC and click [OK].
   ⇒ Entry is transferred to the dialog box Communication Settings <...>.
   Click [OK].

![Communication Settings dialog box]

4. Click ✋ to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings...] 
If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ⇒ Dialog box Communication Settings <...> appears.

![Advanced Settings dialog box]

2. Enable checkbox Use advanced settings and click [Advanced Settings...].
   ⇒ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇒ Successful connection is indicated by green dot on the gateway icon.
4. **Manual entry of the IP address.**

Check IP address or change if required.

5. Press ENTER to confirm changed IP address.

   - Successful communication is indicated by green dot on the PLC icon.

6. Or instead of the last two steps:

   **Set the IP address via a scan.**

   Click [Scan Network], select your desired PLC and click [OK].

   ![Scan Network](image)

   - Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

### 1.6.6.2.3 Processor modules

#### Configure a processor module in the device tree

1. Add a processor module to your project.

2. In the device tree, double-click the “PLC_AC500_V3 <...>” node.

3. Select the “PM56xx Parameters” tab to configure the parameters for the processor module

   - Chapter 1.6.6.2.4.2 “Floating point values” on page 3447.

Use the “PM56xx Hardware” tab for later on changes of “Terminal Base Type” or “Processor Module Type” (see ).

#### Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:
● between platforms: from V2 platform to V3 platform (and vice versa)
● between module types: from AC500 (standard) to AC500-eCo (and vice versa)
● a combination of changed platform and changed module type

Target change from a V2 processor module to a V3 processor module

Target change options:
● AC500 V2 processor module → AC500 V3 processor module
● AC500 V2 processor module → AC500-eCo V3 processor module
● AC500-eCo V2 processor module → AC500-eCo V3 processor module
● AC500-eCo V2 processor module → AC500 V3 processor module

Procedure:
1. Close CODESYS.
2. Double-click the PLC_AC500_V2 <...> node and open the “PM5<...> Hardware” tab.
3. Enable “Change to AC500 V3 PLC” and select the desired V3 processor module from the “PM5xx Type” drop-down list.
4. Click [Create V3 PLC].
   ⇒ The new V3 processor module is displayed in the navigation tree.
   ⇒ Change the node name of the processor module, if desired.

In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.

Target change from a V3 processor module to another V3 processor module

Target change options:
● AC500 V3 processor module → AC500 V3 processor module
● AC500 V3 processor module → AC500-eCo V3 processor module
● AC500-eCo V3 processor module → AC500 V3 processor module
● AC500-eCo V3 processor module → AC500-eCo V3 processor module
Procedure:
1. Close CODESYS.
2. Double-click the PLC_AC500_V3 <...> node and open the “PM5<...> Hardware” tab.
3. Select the desired V3 processor module from the “PM5xx Type” drop-down list.
4. Ensure the correct “Terminal Base Type” is selected and click [Change PM / TB type].
   ⇒ If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.
   The device configurations that cannot be kept are listed in a prompted information dialog.

By default, all device configurations which cannot be switched over will be copied to a “device pool” section in the navigation tree (option “Copy all objects that cannot be added to the new PLC into a device pool for further access”). If required, this backed up configuration can be used in another project or in another processor module configuration.

If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.
Target change from AC500-eCo V3 to AC500 V3

The configuration of the onboard I/Os, the option slots and the onboard RTC cannot be changed-over to the new module.

Target change from AC500 V3 to AC500-eCo V3

The configuration of COM1, CAN and the extension bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.

ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.

Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

Changing the processor module type for AC500-eCo V3 CPU

It is not possible to change from an AC500 V3 processor module to an AC500-eCo V3 processor module!

Changing an AC500-eCo V3 processor module to another AC500-eCo V3 processor module is possible and the same limitation as listed before are applying, only the available or possible feature from the new processor module will be kept from the old processor module.

☐ Close CODESYS.

1. Double-click the PLC_AC500_V3 <...> node.

   ![Diagram of CODESYS interface]

2. Open the “PM50xx Hardware” tab and select the new “PM50xx Type” from the drop-down list.
Parameters of the processor module

![Image of PLC Automation with V3 CPUs]

PLC behaviour after voltage dip

The parameter “PLC behaviour after voltage dip” allows to set the behavior of the CPU in case of short voltage dips.

![Image of PLC behaviour after voltage dip]

If the default setting “Halt” is used, the CPU is changed to STOP mode if a short voltage dip >10 ms occurs. A new powercycle is required.

If the setting “Reboot” is used, CPU will reboot after power supply has recovered to nominal value.

Floating point values

A calculation with floating points can lead to the following values:

**0 (zero)**

If a calculation results in an underrun, the value is set to 0 (result near 0, but not presentable). Depending on the sign bit, it can be a positive zero or a negative zero. The operator "-" of -0 and 0 returns TRUE.

**Infinity**

If a calculation results in an overrun, the value is set to Infinity (the result is not presentable). Depending on the sign bit, it can be a positive infinity (Infinity) or negative infinity (-Infinity).
If Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#FFFFFFF, into DINT with REAL_TO_DINT: 16#7FFFFFFF).

If -Infinity is converted into another data type it results in the maximum value of the other data type (e.g., conversion into DWORD with REAL_TO_DWORD: 16#00000000, into DINT with REAL_TO_DINT: 16#80000000).

Except for:
TRUE := REAL_TO_BOOL(Infinity);
'#Inf' := REAL_TO_STRING(Infinity);
'¬#Inf' := REAL_TO_STRING(-Infinity);

### Examples:

<table>
<thead>
<tr>
<th>Infinity</th>
<th>-Infinity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Infinity := 1.0 / 0.0</td>
<td>-Infinity := -1.0 / 0.0</td>
</tr>
<tr>
<td>Infinity := Infinity + Infinity</td>
<td>-Infinity := -Infinity -Infinity</td>
</tr>
<tr>
<td>Infinity := Infinity + 1.0</td>
<td>-Infinity := -Infinity + 1.0</td>
</tr>
<tr>
<td>Infinity := LREAL_TO_REAL(Infinity)</td>
<td>-Infinity := LREAL_TO_REAL(-Infinity)</td>
</tr>
</tbody>
</table>

### NaN

If a calculation results in an undefined value the result is set to NaN (Not a Number). The result of each calculation with NaN is NaN. The operators "<", "<=", ">" and ">=" return FALSE if either or both operands are NaN.

Operator "=" returns FALSE if one operand is NaN.
Operator "<>" returns TRUE if one operand is NaN.
If NaN is converted into another data type the result is 0.

Except for:
TRUE := REAL_TO_BOOL(NaN);
'¬#NaN' := REAL_TO_STRING(NaN);

### Examples:

NaN := SQRT(-2.0)
NaN := 0.0 / 0.0
NaN := Infinity -Infinity
NaN := 0.0 * Infinity
NaN := Infinity / Infinity

The result of an operation can be checked with the following program parts:

### Check for NaN (REAL):

rX: REAL;
IF (rX <> rX) THEN
(* rX is a NaN *)
...;
END_IF;

### Check for NaN (LREAL):

lrX: LREAL;
IF (lrX <> lrX) THEN
(* lrX is a NaN *)
...;
END_IF;
Check for Infinity (REAL):

Infinity is represented with sign bit 0, exponent of all 1s and a fraction of all 0s.

-Infinity is represented with sign bit 1, exponent of all 1s and a fraction of all 0s.

rX: REAL;
prX: POINTER TO REAL;
pdwX: POINTER TO DWORD;
prX := ADR(rX);
pdwX := prX;
IF (pdwX^ = 16#7F800000) THEN (* rX is Infinity *)
  ...;
END_IF;
IF (pdwX^ = 16#FF800000) THEN (* rX is -Infinity *)
  ...;
END_IF;

Check for Infinity (LREAL):

lrX: LREAL;
plrX: POINTER TO LREAL;
plwX: POINTER TO LWORD;
plrX := ADR(lrX);
plwX := plrX;
IF (plwX^ = 16#7FF000000000) THEN (* lrX is Infinity *)
  ...;
END_IF;
IF (plwX^ = 16#FFF000000000) THEN (* lrX is -Infinity *)
  ...;
END_IF;

1.6.6.2.4 AC500-eCo V3 onboard I/Os

According to the used AC500-eCo V3 processor module, the onboard I/Os are different and the functionality of the I/Os are adapted to the processor module type.

<table>

**PM5012-x-ETH Basic CPU**

For all CPU versions the configuration of the input channels is the same. The configuration of the output channels is only available on CPU version with transistor output channels:

#### Version with relay outputs, same configuration for the input channels, no configuration for the output channels relay:

The following parameter can be configured:

<table>
<thead>
<tr>
<th>Onboard I/O type</th>
<th>Parameter</th>
<th>Channel name</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs</td>
<td>Input X, input delay</td>
<td>Channel 0..5</td>
<td>8 ms</td>
<td>No delay</td>
<td>Configures input with no delay</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>1 ms</td>
<td>Configures 1 ms input delay</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>8 ms</td>
<td>Configures 8 ms input delay</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>32 ms</td>
<td>Configures 32 ms input delay</td>
</tr>
<tr>
<td>Onboard I/O type</td>
<td>Parameter</td>
<td>Channel name</td>
<td>Default value</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------</td>
<td>--------------</td>
<td>---------------</td>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Input X, channel configuration</td>
<td>Channel 0..3</td>
<td>Input/Interrupt</td>
<td>Input/Interrupt</td>
<td>Configures the channel as normal digital or interrupt input</td>
<td></td>
</tr>
<tr>
<td>The configuration /function of the following channels is realized using function blocks in the program</td>
<td>Channel 4..5</td>
<td>Input</td>
<td></td>
<td>Configures the channel as normal digital input</td>
<td></td>
</tr>
<tr>
<td>Encoder 0 track-A or B</td>
<td></td>
<td></td>
<td></td>
<td>Configures the pair of channels as encoder input track A or B. When that value is configured then both channels are reserved for that functionality</td>
<td></td>
</tr>
<tr>
<td>The configuration of output channel is only available on the CPU with transistor outputs</td>
<td>Digital outputs</td>
<td>Output X, channel configuration</td>
<td>Channel 0..3</td>
<td>Output</td>
<td>Configures the channel as digital output</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Limit switch</td>
<td>Configures the channel as limit switch output</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>PWM</td>
<td>Configures the channel as PWM output</td>
</tr>
</tbody>
</table>

For all CPU versions the configuration of the input channels is the same. The configuration of the output channels is only available on CPU version with transistor output channels, the digital configurable In/Output channels are present on both version (transistor or relay output) but with different features configurable:

**PM5032-x-ETH, PM5052-x-ETH**

**Standard CPU**
For the CPU with relay outputs, the digital configurable Input/Output channels have specific functionalities:

<table>
<thead>
<tr>
<th>Onboard I/O type</th>
<th>Parameter name</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs</td>
<td>Input X, input delay</td>

</tbody>
</table>
1.6.6.2.6 Mapping of the I/O channels

Onboard I/O variable mapping

2. Select “12DI/8DO-T/2DC I/O Mapping”.

Here, you will map variable names (symbols) for the channels you will need in the program.

The suggested name convention is based on "Hungarian notation". A name prefix is describing variable type: e.g., "x" = variable of type BOOL, "w" = WORD, "i" = INT (integer) etc. This increases the code readability and is helpful for program analysis.

Handle the digital input variables

1. Open the list of the digital inputs.
2. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital input DI0</td>
<td>BOOL</td>
<td>xDI_00_OnBoard_IO_I0</td>
</tr>
</tbody>
</table>

Handle the digital output variables

1. Open the list of the digital outputs.
2. Fill in the variable names:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Type</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital output DO0</td>
<td>BOOL</td>
<td>xStartDrilling1</td>
</tr>
</tbody>
</table>

1.6.6.2.7 Configuration of the onboard I/Os of AC500-eCo V3 PLC

Digital inputs from the onboard I/Os

Depending on the processor module used, several configurations are possible for the onboard I/Os mostly different per group of channels.

<table>
<thead>
<tr>
<th>Functionality to be realized</th>
<th>Processor module type</th>
<th>Digital input channels</th>
<th>Configuration of the channel to be selected in Automation Builder</th>
<th>Dedicated function block to be used in the user program</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs</td>
<td>PM5012-x-ETH</td>
<td>I0…I3</td>
<td>Input/Interrupt</td>
<td>Not needed</td>
<td>Input delay can be sometimes configured according to channels type</td>
</tr>
</tbody>
</table>
### Functionality to be realized

<table>

### Fast counters in the onboard I/Os

General details on fast counters see (System Technology) Chapter 1.6.5.1.12.2 “Fast counter in AC500-eCo V3 (Onboard I/O in PM50xx)” on page 3327

Details on the configuration see Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3449

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.
## Functionality to be realized

<table>
<thead>
<tr>
<th>Functionality to be realized</th>

### Configuration of interrupt inputs

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.
<table>
<thead>

Creating an interrupt task

After configuring the parameter, the user needs to create a new task with the “Type” set to “External” and the “External event” set to “OnBoard_Binary_Input”.

![Diagram of PLC parameters](image.png)
Configuration of digital outputs

According to the processor module type, the digital outputs have several functionalities. To use them as digital output and as default configuration the following configuration is needed:

<table>
<thead>
<tr>

Please see the chapter how to use the function in the system technology…
Configuration of outputs as limit switch

The AC500-eCo V33 processor modules provide according to the output variants transistor or relay some output which can be used as limit switch. For the process modules with relay outputs, only the digital configurable channels provide this functionality.

<table>
<thead>
<tr>

Operating the limit switch output with user program

The OBIOLimitSwitch function block of the library must be used to operate the outputs with help of user program.

Configuration of PWM outputs (Pulse Width Modulation)

The AC500-eCo V3 processor modules provide up to 8 PWM output channels with a maximum frequency of 20 KHz. The parameter of PWM output channel of onboard I/O must be configured before it can be used. User should take these steps to configure the PWM output function.

<table>

</tr>
</tbody>
</table>
Operating the PWM output with user program

The OBIOPwm function block of the library must be used to operate the PWM outputs with help of user program.

Configuration of PTO outputs (HW fast outputs for Pulse Train Output)

The AC500-eCo V3 processor modules provide up to 2 PTO hardware dedicated output channels with a maximum frequency of 200 kHz. The parameter of PTO output channel of onboard I/O must be configured before it can be used. User should take these steps to configure the PTO output function.

The PTO outputs can be used with 2 different modes either Pulse / Direction or Cc/Ccw mode. Please refer to the chapter...

The PTO channels are always requiring 2 consecutive output channels for the function.

<table>
<thead>

<tr>
<td></td>
<td></td>
<td>C12…C13</td>
<td>PTO -&gt; automatically for C13 also</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Operating the PTO hardware output with user program

The OBIOPulseTrainOutput function block of the library can be used to operate the PTO outputs with help of user program. This FB allows to control the output in PTO mode. The OBIOMotionPTO function block is a dedicated Motion control block to realize point-to-point movement or velocity control of a motion axis. See the dedicated chapter of the system Info...

Configuration of SW PTO (PWM) outputs (HW fast outputs and standard outputs with software dedicated function block)

The AC500-eCo V3 processor modules could also provide up to 4 PTO (PWM) software output channels with a maximum frequency of 100 kHz. To use that mode, the parameter of output channel of Onboard I/O must be configured before it can be used. User should take these steps to configure this special PTO output function. The PTO outputs channels can be only used as Pulse / Direction mode. Please refer to the chapter...

The PTO channel is using a digital fast output configured as PWM output to generate the Pulse output and a standard digital output to indicate the direction. A dedicated PTO motion block will then control the channel to realize the functionality.

Up to 4 PTO can be then provided each using 2 digital outputs.

A mixed configuration of one HW PTO channel (e.g. Output 04..05) up to 200 kHz and Pulse/Direction or Cc/Ccw mode together with up to 2 other software PTO Channels (e.g. O6, O7 + dedicated output) up to 100 kHz and only Pulse/Direction mode is then possible.

To achieve such a software PTO mode the following channel configuration must be done.
<table>
<thead>
<tr>
<th>Functionality to be realized</th>

</table>

Operating the software PTO output channels with user program

The OBIOMotionPWM function block is a dedicated motion control block to realize point-to-point movement or velocity control of a motion axis. This block will then control the output channels as PTO mode Pulse/Direction only up to 100 kHz. See the dedicated chapter of the system Info…
1.6.6.2 Option board for processor modules PM50xx

Depending on processor module type, up to 3 option slots are available and for each several option board modules are available.

Select the option board

To add an option board on the processor module, select the desired OptionSlot to be configured and attach the needed option board from the list.

There is no limitation on the number of same option board used on the CPU, no dedicated slot for a specific function and no specific order to place the option board module.

Depending on the type of option board selected and attached to the CPU some further configuration of channels or function may be needed.

Attach a digital input, output or mixed input/output channels option board

Just select and attached the module, no other channel configuration is needed. The I/O channels are directly mapped in the I/O mapping and variables can then be defined.
Attach serial interface option board

The desired serial interface option board type for the desired option board slot must be selected and added.

The option board may require some other channel configuration according to your need.

Following example shows how to add a TA5142-RS485I isolated interface and the desired protocol.

The desired protocol has also to be added according to your needs, e.g. Modbus RTU client:

The parameter for the serial interface can also be adapted like baudrate, data bit, stop bit or parity.

1.6.6.2.9 Onboard Ethernet configuration

Onboard Ethernet is provided for device types with -ETH extension.
Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following.
- the ‘Communication Settings’. Chapter 1.6.6.2.2.4.3 “Configuration of communication via Ethernet (TCP/IP)” on page 3440

As an alternative the IP address can be changed at the hardware device itself. Chapter 1.6.5.1.5.5 “Description of the function keys” on page 3243

The IP configuration tool can be used

- to set or change the IP address of devices.
  Chapter 1.6.6.2.4.2.2.2 “Changing the IP address” on page 3432
- to scan the network for available hardware devices.
  Chapter 1.6.6.2.4.2.2.1 “Network scan” on page 3430
- to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  Chapter 1.6.6.2.4.2.2.3 “Firmware update” on page 3433
- to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  Chapter 1.6.6.2.4.2.2.4 “Blink functionality” on page 3437

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager. Chapter 1.6.6.2.4.2.1 “Stand-alone installation” on page 3428.

After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.
1. Open the Installation Manager in Automation Builder: “Tools ➤ Installation Manager”.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.
3. Click “Modify” and select the “IP Configuration Tool” from the structure tree.

4. Click “Continue” to start the installation.
   - After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.
1. Start the IP configuration tool in Automation Builder ("Tools ➔ IP-Configuration") or start it stand-alone (.exe).

2. The "IP-Configuration" dialog opens. Define the device type for the network scan by selecting the desired option under "Scan Protocol":
   - "ABB Net config protocol":
     Use this option for AC500 devices such as processor modules, CI5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - "Profinet Dynamic Configuration Protocol (DCP)":
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.
     Steps 4 on page 3435
   - "EtherCAT":
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.
     Steps 4 on page 3435

3. Click [Scan] to start the scan process.
4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under “IP settings”:

- **“IP Address”**: Current IP address of the device.
- **“Conf. IP Address”**: Configured IP address of the device. A changed IP address will update this column.
- **“FW Version”**: Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.

   \[\text{Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3438}\]

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

### Changing the IP address

1. In order to change the IP address of devices perform a network scan.

   \[\text{Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3430}\]

2. Select a device from the list and select the appropriate protocol under “Scan protocol”.

   \[\text{“DHCP” or “BOOTP” option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.}\]

   \[\text{“IP address”, “subnet mask”, “Std. gateway”: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.}\]

   \[\text{“Check subnet configuration” on page 3438}\]

### Note for CI52x-Modbus devices

\[\text{Consider the behaviour of CI52x-Modbus devices if the last number of the IP address is set to “0”.}\]

\[\text{“Check last number of IP address” on page 3439}\]
3. Change the settings for the IP configuration and click [Send settings] to transmit the data to the device.

![IP-Configuration interface](image)

**Note for PROFINET devices**
The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:
- Labels must be separated by "."
- Total length: 1 to 240
- Label length: 1 to 63
- Labels can consist of characters [a-z] and numbers [0-9]
- Labels are not allowed to start with "-" and end with "-"

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

**Firmware update**
The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

* Chapter 1.6.6.2.2.4.2.1 “Stand-alone installation” on page 3428

It is not possible to perform a firmware update out of Automation Builder.

- For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.12.
- For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.
Requirements: Before the firmware update

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

---

*The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.*

---

Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.
   - *Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3430*
3. Select the devices that shall be updated from the list and click [Scan] to trigger the scan process.
   - A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.
4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:

- Click on the displayed link https://nmap.org/download.html and download the latest version of the npcap-X.X.exe file.

Microsoft Windows binaries

For those who prefer the command-line zip files (Installation Instructions: Usage Instructions), they are still available. The Nmap graphical interface is not included from a DOS/command window. You can download and install a superior command shell such as those included with the free Cygwin system. Also, you need to run 2013 Redistributable Package installers which are included in the zip file. The main advantage is that these zip files are a fraction of the size of the executable install.

Latest stable command line zipfiles: nmap-7.91-win32.zip

Linux RPM Source and Binaries

Many popular Linux distributions (Redhat, Mandrake, Suse, etc.) use the RPM package management system for quick and easy binary package installation. We have RPM packages, though these simple commands usually do the trick:

- After the download, execute the file as administrator and restart the scan process.
- The devices that have been scanned are listed.

5. Click [Update Firmware] to start the firmware update for the selected devices.
6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

If the signature check fails, check the availability of the *.bin file and the *.bin.sig file.

“Signature check” on page 3439

7. A status check followed by a device reboot followed by a second status check is performed automatically.

- After the firmware update all outputs of the updated devices are set to '0'.

8. After a successful firmware update the update status or the new firmware version is displayed in the “FW Version” field.

If this field is empty, there possibly is a connection error between the device and the executing PC.

“Error: Can’t connect to device” on page 3440

Exception: For EtherCAT devices an empty “FW Version” field does not indicate a connection error.

- If the firmware update fails
  - check the requirements for the update procedure.
    “Requirements:” on page 3434
  - check the hints for trouble-shooting.
    Chapter 1.6.6.2.2.4.2.3.1 “Trouble-shooting for firmware update” on page 3438
  - perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.
Blink functionality

This function activates flashing of the background light of an AC500 LED display.

1. From the menu, select “Tools ➔ IP-Configuration”.
2. Click [Scan] to trigger the scan process for devices in the network.
   - A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click [Blink] to activate flashing.

Trouble-shooting for IP configuration tool

Firewall exceptions: On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

Windows 7/ Windows 10: On the network that is used for communication with the PLC, set “Incoming connections” to “Block all connections to programs that are not on the list of allowed programs”.
If a third party firewall is used these exceptions must be configured manually.

Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.

Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).

Troubleshooting for firmware update

Check the requirements
Ensure that all requirements have been considered before and during the update procedure.
☞ “Requirements:” on page 3434

Check subnet configuration
This hint is only valid for Modbus devices and PROFINET devices.
If the “FW Version” field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.
**Example**

<table>
<thead>
<tr>
<th>PC</th>
<th>Device</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.168.10.71 / 255.255.255.0</td>
<td>192.168.14.10 / 255.255.255.0</td>
<td>ERROR</td>
</tr>
<tr>
<td>192.168.10.71 / 255.255.0.0</td>
<td>192.168.14.10 / 255.255.0.0</td>
<td>OK</td>
</tr>
</tbody>
</table>

Click [Scan] again to restart the network scan. If the connection is successful a newer firmware version is displayed in the “FW Version” column.

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

**Example:**

<table>
<thead>
<tr>
<th>Automation Builder</th>
<th>AC500 communication interface module (rotary switch)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address: 192.168.14.0</td>
<td>IP address: 6</td>
</tr>
</tbody>
</table>

As a result, in the field “IP Address” the last number is set to "6":

**Signature check**

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (*.bin) and a signature file (*.bin.sig) in the same directory. Without a signature file the signature check will fail.

**Example:**

Firmware update file: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin

Signature file: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig
| Error: Package timeout | A timeout error may occur due to an unstable network.  
Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches. |
|------------------------|-------------------------------------------------------------------------------------------------|
| Error: Unable to read device status | A read error may occur due to errors in the firmware update protocol.  
After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful. |
| Error: IP is not unique | If an IP address is obtained by more than one device an error occurs. A firmware update is not possible. |
| Error: Error State | Internal device error during the firmware update.  
Solution:  
Step 1: Scan again and repeat the firmware update.  
Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update. |
| Error: Can’t connect to device | The TCP communication is not sufficient. Increase the connection quality.  
Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches. |
Switch functionality of Ethernet interfaces ETH1/ETH2

As of SystemFW 3.1.0 the Ethernet interfaces ETH1/ETH2 can be configured as an Ethernet switch.

The default setting is “Two separate interfaces”.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ETH1 / ETH2 mode</td>
<td>“Two separate interfaces”</td>
<td>Two separate Ethernet interfaces ETH1 and ETH2</td>
</tr>
<tr>
<td></td>
<td>“Switch functionality ETH1-ETH2”</td>
<td>Switch between ETH1 and ETH2</td>
</tr>
</tbody>
</table>

If the Switch functionality ETH1-ETH2 is active, only the Ethernet interface ETH1 is available (see Chapter 1.6.5.1.5.5.3 “Configuration” on page 3245). Any protocols configured under Ethernet interface ETH2 must be deleted. Otherwise a compile error will be created.

The setting of ETH1 / ETH2 mode can be checked on LED display with soft key <CFG> (see Chapter 1.6.5.1.5.5.3 “Configuration” on page 3245).

1.6.6.10 Onboard CAN configuration

Onboard CAN interface supports the following protocols

- CAN Open Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter Chapter 1.6.6.2.11.1.1 “CM598-CAN - CANopen master communication module” on page 3486.

Further information can be found in chapter Chapter 1.6.6.2.16 “CAN-based fieldbuses” on page 3534.
AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- Communication module CM598-CN

Differences in supported protocols can be seen in the table below.

<table>
<thead>
<tr>
<th></th>
<th>Onboard CAN</th>
<th>CM598-CN</th>
</tr>
</thead>
<tbody>
<tr>
<td>CANopen Manager</td>
<td>X</td>
<td></td>
</tr>
<tr>

</tr>
<tr>
<td>J1939</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Onboard CAN interface is not available on AC500-eCo V3!

1.6.6.2.11 Communication modules

CANopen

CM598-CAN - CANopen master communication module

Configuration of the communication module

- Click menu “Tools → Options” and select “Device editor” in the Options window.
- Enable first checkbox “Show generic device configuration views” and click [OK].

Append a CM598-CAN

1. Right-click on your desired Slot below node “Extension_Bus” and click “Add object”.
   ⇒ Dialog “Replace object” appears.
2. Click CM598_CAN in the list and click [Replace object].
3. Double-click “CM598_CAN (CM598-CAN)” to get the “CM598-CAN Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program is started independent of a faulty configuration of the CM598-CAN communication module.</td>
</tr>
<tr>
<td>Bus behavior</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Not yet supported.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

The tab “CM598-CAN IEC Objects” contains the created instance of the IO driver.

**Configuration of the protocols CAN 2.0 A / CAN 2.0 B**

The Communication Module CM598-CAN can be used to realize CAN bus based networks in combination with library ABB_CM598Can_AC500.library.

To enable the support for the desired protocol it must be appended to CM598-CAN.

1. Right-click “CM598_CAN (CM598-CAN)” in the device tree and select “Add device” in the context menu.
   ➤ Window Add object below: CM598_CAN_1 appears.

2. Select “CAN 2.0 A” or “CAN 2.0 B” from the list.

**Parameterization**

The CAN data transmission requires a buffer for the incoming data that can be read with function blocks of library ABB_CM598Can_AC500.library.
1. Right-click “CAN_2_0A_11_bit_identifier_ (CAN 2.0A)” or “CAN_2_0B_29_bit_identifier_ (CAN 2.0B)” and select “Add object”.

2. Select “Buffer for CAN 2A” for CAN 2.0A. Or select “Buffer for CAN 2B” for CAN 2.0B from the list.

3. Double-click on “Buffer_for_CAN_2A (Buffer for CAN2A)” or “Buffer_for_CAN_2B (Buffer for CAN2B)” in the device tree to open the Buffer configuration in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identifier</td>
<td>0</td>
<td>CAN 2A: 0 ... 2047</td>

</tr>
<tr>
<td>Behaviour on receive buffer overflow</td>
<td>Overwrite</td>
<td>Overwrite</td>
<td>The oldest telegram in the buffer is overwritten by the incoming telegram.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Discard</td>
<td>Incoming telegrams discarded as long as the buffer is full.</td>
</tr>
<tr>
<td>Enable triggering of IEC task</td>
<td>No</td>
<td>No</td>
<td>Disables the triggering of the execution of the related IEC task.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>Enables the triggering of the execution of the related IEC task as soon as a CAN frame with the specified CAN-ID arrives.</td>
</tr>
</tbody>
</table>

Configuration of the CANopen master

☞ Chapter 1.6.5.2.1.1 “Triggering of event tasks with CAN-IDs” on page 3350

PROFINET
CM579-PNIO - PROFINET IO controller
For Automation Builder < 2.2.0

Configuration in Automation Builder is described in PROFINET IO configuration.
For Automation Builder >= 2.2.0

PROFINET IO

CM579-PNIO – PROFINET IO communication module

Configuration of the communication module

Configuration is valid as of CPU FW 3.2.0.

Append a CM579-PNIO

1. Right-click on your desired Slot below node “Extension_Bus” and click “Add object”.
   ⇨ Dialog Replace object: appears.

2. Click CM579_PNIO in the list and click [Replace object].

3. Double-click “CM579_PNIO (CM579-PNIO)” to get the “CM579-PNIO Parameters” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of a configuration error, the user program is not started.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program is started independent of a faulty configuration of the CM579-PNIO communication module.</td>
</tr>
<tr>
<td>Bus behavior</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>Asynchronous (IEC bus cycle)</td>
<td>The bus cycle and the IEC Application are running asynchronously. The IO update rate between the Profinet IO Controller and the IEC Application is defined with the bus cycle task.</td>
</tr>
</tbody>
</table>

Configuration of the PROFINET IO controller

The PROFINET IO Controller node appears automatically below the added Communication Module CM579-PNIO.

PROFINET IO controller - Configuration

 Minneapolis Double-click on “PNIO_Controller” and open the tab “General” in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station name</td>
<td>CM579</td>
<td>Up to 240 characters</td>
<td>Network name of the PROFINET IO controller station. Must be a valid hostname.</td>
</tr>
<tr>
<td>IP parameters</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>IP-Address</td>
<td>192.168.0.1</td>
<td>Valid IP address</td>
<td>IP address of the PROFINET IO controller station.</td>
</tr>
</tbody>
</table>
The tab “PROFINET-IO-Controller Parameters” is a generic view of all PROFINET IO controller parameters. It is normally hidden and is normally not needed for configuration.

**PROFINET IO controller - Parameters**

Use tab “PROFINET-IO-Controller Parameters” only, if you need to change a parameter, which is not visible in other dialogs.

**Activating tab**

1. Click “Tools ➔ Options” and select “Device editor”.
   - The Device editor dialog opens.
2. Enable checkbox Show generic device configuration views and click [OK]
   - The tab is now available.

**PROFINET IO controller - I/O mapping**

In this tab the bus cycle task can be specified. It is possible to select a particular task of the IEC application by its name or to use the option “Use the parent bus cycle setting”. In the latter case the setting of the Bus cycle options in “PLC_AC500_V3 ➔ PLC settings” are used.
Configuration of PROFINET IO devices

Add PROFINET IO device

1. Right-click on node “PNIO_Controller (PROFINET-IO-controller)” and click “Add object.”
   - A list with all installed PROFINET IO Devices appears.
2. Select the desired device and click [Add object].
   - The device is added to the Profinet IO Controller in the device tree.

PROFINET IO device - Configuration

Double-click on “PNIO-Device” to open the device configuration in the editor window.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Station name</td>

<tr>
<td>Send clock (ms)</td>
<td>Device-specific</td>
<td>0.25</td>
<td>Parameter Send clock determines the SendCycle. SendCycle = Send clock x Reduction ratio &lt;= 512ms x</td>
<td>Slave parameters -&gt; Reduction ratio</td>
</tr>
<tr>
<td>Reduction ratio</td>
<td>Device-specific</td>
<td>1...16384</td>
<td>The Reduction ratio determines the factor for calculating the cycle time. Cycle time = Send clock x Reduction ratio</td>
<td>Slave parameters -&gt; Reduction ratio</td>
</tr>
<tr>
<td>Phase</td>
<td>1</td>
<td>1...Reduction ratio</td>
<td>Defines the part of the SendCycle at which an IO frame is sent.</td>
<td>Phase</td>
</tr>
<tr>
<td>Watchdog factor</td>
<td>3</td>
<td>1...65535</td>
<td>The Watchdog time is calculated as Watchdog time = SendCycle * Watchdog factor. The transfer of a IO telegram is always checked of the consumer side. Within this time the next IO telegram must be received by a consumer. Otherwise it is checked if the Datahold has been expired too.</td>
<td>Watchdog interval</td>
</tr>
<tr>
<td>RT Class</td>
<td>RT Class 1 Data-RTC-PDU</td>
<td>RT Class 1 Data-RTC-PDU</td>
<td>Defines the Realtime Class of cyclic data. Currently only RT Class 1 (legacy) and RT Class 1 are supported.</td>
<td>Slave parameters -&gt; RT Class</td>
</tr>
</tbody>
</table>
## PROFINET IO device – Timing parameters

In the current implementation are 2 Communication Relations (CR) between the controller and the device defined.

One describes the I/O telegram from the controller to the device (outputs), the other the I/O telegram from the device to the controller (inputs).

The timing of the corresponding I/O telegrams can be defined separately for each device.

Editable timing parameters are:
- **Send clock**
- **Reduction ratio**
- **Phase**

The relation between these parameters is shown in the following drawing.
For each device a SendCycle must be configured, which determines the sending interval of I/O frames. It is based on a time base of 31.25 µs and is calculated as:

\[
\text{SendClock [ms]} = \text{SendClockFactor} \times \frac{31.25 \, \mu \text{s}}{1000}.
\]

The cycle time of an I/O telegram is defined by the SendCyle. It's calculated as:

\[
\text{SendCyle [ms]} = \text{SendClock [ms]} \times \text{Reduction Ratio}.
\]

The values of the individual parameters are limited by the maximum value 512 ms of the SendCycle. The following table summarizes the relation of the timing parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Relation</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>SendCycle</td>
<td>Is the cycle time of a RT telegram.</td>
<td>SendCyle = SendClock * Reduction ratio.</td>
<td>1ms..512 ms</td>
</tr>
<tr>
<td>SendClock</td>
<td>The SendCycle is divided into several time slots. The SendClock defines the size of a time slot within the SendCyle.</td>
<td>SendClock = SendClock factor \times \frac{31.25 , \mu \text{s}}{31.25 , \mu \text{s}}</td>
<td>SendClock * Reduction ratio \leq 512 ms</td>
</tr>
<tr>
<td>SendClock factor</td>
<td>Is multiplied with the time base 31.25 µs to calculate the SendClock.</td>
<td>SendClock factor = SendClock / 31.25 µs</td>
<td>1..128</td>
</tr>
<tr>
<td>Reduction ratio</td>
<td>The reduction ratio defines the number of time slots within the SendCycle.</td>
<td>SendClock * Reduction factor \leq 512 ms</td>
<td>1..16384</td>
</tr>
<tr>
<td>Phase</td>
<td>The time slot in which the IO frame is sent.</td>
<td>A integer value of the range 1 ... Reduction ratio</td>
<td>1..16384</td>
</tr>
</tbody>
</table>
PROFINET IO device – PNIO parameters

The tab “PNIO Parameters” is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

<table>
<thead>
<tr>
<th>Activating tab</th>
<th>1. Click “Tools ➔ Options” and select “Device editor”.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>➞ The Device editor dialog opens.</td>
</tr>
<tr>
<td></td>
<td>2. Enable checkbox Show generic device configuration views and click [OK]</td>
</tr>
<tr>
<td></td>
<td>➞ The tab is now available.</td>
</tr>
</tbody>
</table>

Configuration of non-ABB PROFINET IO devices

Before a Non-ABB PROFINET IO device can be used, the provided GSDML file has to be installed in the Device Repository.

Installation

Go to “Tools ➔ Device Repository ➔ Install”.

Configuration

See Chapter 1.6.6.2.11.2.1.2.1.1.3 “Configuration of PROFINET IO devices” on page 3493.

I/O mapping of the PROFINET IO devices

Open I/O mapping list

1. Double-click on the “PNIO_Controller” or below on the “<...>PNIO-Device” or below on the “I/O-Module” in the device tree.

   2. Select tab “I/O mapping list” to show the list of I/O channels.

The content of the list depends on the selected node.

For instance:

- When the “PNIO_Controller” node is selected all I/O channels of all configured devices are shown.
- When a “PNIO-Device” is selected all I/O channels of the configured modules are shown.

An IEC variable for an I/O channel that is available in the Application can be defined by double-clicking in column Variable.
CM589-PNIO - PROFINET IO slave

Configuration in Automation Builder is described in PROFINET IO Slave configuration.

EtherCAT
CM579-ETHCAT - EtherCAT IO master

Configuration in Automation Builder is described in EtherCAT Master configuration.

EtherCAT-Master - ABB functionality for sync units

With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for a granular input data validation. As soon as a slave is missing in a sync unit group, the input data of all other slaves in the same group becomes invalid.

Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. Unaffected groups remain operable without any interference.

Right click on the “Application” node and press “Create configuration data”.

Automation Builder creates a set of global variables defining the working counter state of a SyncUnit command.

The variables use the following naming scheme:

"SLOT_" + "CouplerSlot_" + "SyncUnitName" + "_CMD_" + "LogicalAccess" + "_FRAME_" + "FrameID CouplerSlot".

CouplerSlot
The coupler slot is the ID of the slot where the coupler is plugged in.

SyncUnitName
The sync unit name is as defined in the “Sync Unit Assignment” tab.

LogicalAccess
The logical access defines the command list of logical access commands:

- Read = 10;
- Write = 11
- Read/Write = 12

FrameID
The frame ID starts with 1 and increments if the cyclic exchanged data is larger than the maximum Ethernet frame boundary.

Values

- **FALSE**: Working counter is as expected (data from slaves is valid)
- **TRUE**: Working counter is different to expected value (data from slaves is invalid)

The variables can be used by conditional consumption of slave data in the application:

```
IF NOT SLOT_1_default_CMD_10_FRAME_1 THEN
(* Consume SyncUnit default slave data *)
END_IF;
```

See Chapter 1.6.6.2.17.1.2 “Tab ‘EtherCAT Master - Sync Unit Assignment’” on page 3551.

EtherCAT diagnosis (V2 PLC and V3 PLC)

Automation Builder 2.3 provides an enhanced diagnosis interface for the EtherCAT fieldbus. The user can get EtherCAT diagnosis information from four different editor views. All these views are accessible within the EtherCAT master device editor and provide information about the master and all configured or connected slaves. The main diagnosis overview is given in the EtherCAT master view “Diagnostics main”.

“Diagnostics main” shows EtherCAT state “Operate”.

“Diagnostics main” shows EtherCAT state “Topology error”.

If the EtherCAT bus state shows “Operate”, the user does not need to check for any more information.

If the “Diagnostics main” shows any error, like “Topology mismatch detected”, the user can continue to the next level of information by opening editor view “Master State Control”.

3498

2021/05/12
“Master State Control” shows EtherCAT state “Operate”.

In editor view “Master State Control” the user can request a master state change or get information about configured parameters as well as events and latest communication errors. In case of any topology error (e.g. slaves are configured in a different order than they exist in hardware) the Automation Builder shows a hint to the user that it might be helpful to execute a bus scan in editor view “Diagnostics live list” to compare the scan result of the real hardware with the configurations slaves in the Automation Builder project.

Bus scan result in editor view “Diagnostics live list” shows the connected hardware.
The bus scan result list shows the following information for each connected slave:

<table>
<thead>
<tr>
<th>“ID”</th>
<th>Position of the found slave device</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type”</td>
<td>Slave identification (name or Vendor/Device ID number)</td>
</tr>
<tr>
<td>“State”</td>
<td>The connection/link state of all ports (0-3) of the given slave</td>
</tr>
<tr>
<td></td>
<td>Connected =&gt; Cable is plugged in</td>
</tr>
<tr>
<td></td>
<td>+ Link =&gt; Physically connected to another slave</td>
</tr>
<tr>
<td></td>
<td>+ Communication =&gt; Communication works fine</td>
</tr>
<tr>
<td>“Name”</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>“Address”</td>
<td>Not used for EtherCAT</td>
</tr>
<tr>
<td>“Details”</td>
<td>E.g. revision number of the slave device</td>
</tr>
</tbody>
</table>

The bus scan shows information about the real connected hardware. Note that a bus scan will always restart the EtherCAT bus. This should not be a problem during commissioning but it might not be applicable in a running system.

For runtime diagnosis the Automation Builder provides cyclic information of all configured slaves and their states in the editor view “Slave diagnosis”.

Slave diagnosis information shows that configured slaves are ok.

“Slave diagnosis” view shows wrong slave at position 1.

The editor view “Slave diagnosis” shows information about the configured slaves. If these slaves are found in hardware, the states of all slaves are ok. If there is a mismatch between hardware and configuration the view shows at which position that mismatch was detected.
The “Slave diagnosis” shows the following information for each configured slave:

<table>
<thead>
<tr>
<th>“Topology Position”</th>
<th>Position of the configured slave device.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Configured Station Address”</td>
<td>Address that is defined by configuration.  This address is not topology dependent.</td>
</tr>
<tr>
<td>“Slave Name”</td>
<td>Configured name of the slave device.</td>
</tr>
<tr>
<td>“Slave State”</td>
<td>The state of the slave. Possible slave states are:</td>
</tr>
<tr>
<td></td>
<td>NOT CONNECTED 1)</td>
</tr>
<tr>
<td></td>
<td>INIT</td>
</tr>
<tr>
<td></td>
<td>PREOP</td>
</tr>
<tr>
<td></td>
<td>SAFEOP</td>
</tr>
<tr>
<td></td>
<td>OP</td>
</tr>
<tr>
<td></td>
<td>INIT ERR</td>
</tr>
<tr>
<td></td>
<td>PREOP ERR</td>
</tr>
<tr>
<td></td>
<td>SAFEOP ERR</td>
</tr>
<tr>
<td>“Port State” 2)</td>
<td>The state of all ports (0-3) of the given slave. Shows how many connections this slave has to other slaves and if the connections are working fine:</td>
</tr>
<tr>
<td></td>
<td>Connected =&gt; Cable is plugged in</td>
</tr>
<tr>
<td></td>
<td>+ Link =&gt; Physically connected to another slave</td>
</tr>
<tr>
<td></td>
<td>+ Communication =&gt; Communication works fine</td>
</tr>
<tr>
<td>“Last Error”</td>
<td>The last error that occurred in this slave. As text, if available, and error number. If this is any topology error, the editor view will show a hint to perform a bus scan.</td>
</tr>
<tr>
<td>“Emergency” [CAN application protocol over EtherCAT (CoE)]</td>
<td>This column contains up to 5 CoE emergency entries. Each entry has</td>
</tr>
<tr>
<td></td>
<td>Error code</td>
</tr>
<tr>
<td></td>
<td>Address of the error register</td>
</tr>
<tr>
<td></td>
<td>Error data (1 byte)</td>
</tr>
<tr>
<td></td>
<td>If there are more than five emergencies reported by the slave, the columns show a hint that some emergency entries have been lost. The column is empty, if no CoE emergencies exist.</td>
</tr>
<tr>
<td>“Frame Error Counters” 2)</td>
<td>Counts transmission errors on frame layer, detected by CRC check of frames. Fast growing values show a serious problem. Possible root causes include damaged cables, high electromagnetic noise or misbehavior of EtherCAT slave devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.</td>
</tr>
<tr>
<td>“Physical Layer Error Counters” 2)</td>
<td>Counts transmission errors on physical layer. Possible root causes include electromagnetic disturbance or faulty devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.</td>
</tr>
</tbody>
</table>
“Link Lost Counters”\(^2\) | Optional feature of EtherCAT slave devices, not supported by every device.
---|---
| Counts loss of physical connection (no link, LED off). Even short interruptions can be detected. Possible root causes include power dips, device reset, poor cables or connectors, loose contact. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.

1\(^)\) Note that columns “Port State”, “Frame Error Counters”, “Physical Layer Error Counters” and “Link Lost Counters” show “LLD: Timeout”, if this state is not CONNECTED, because this information is not accessible.

2\(^)\) Note that this column contains “LLD: Timeout”, if slave state is not CONNECTED.

1.6.6.2.12 Communication interface modules

Configuration of communication interface modules

Automation Builder can be used to configure the parameters of CI5xx devices.

Adding CI5xx device to the device tree

1. Right click in the device tree on the node “Slot1” or “Slot2” of the “Extension_Bus” and click “Add object”.
   ⇒ The window Replace object : Slot <...> opens.

2. Select your CM5xx master module and click [Add object].
   ⇒ The CM5xx master appears in the Slot.

3. Right click on the CM5xx master module and click “Add object”.
   ⇒ The window Add object below : <...>_Master opens.

4. Select your “CI5xx” device and click [Add object].
   ⇒ The “CI5xx” device appears in your device tree.

Adding S500 I/O modules

1. Right click on your “CI5xx” device and click [Add object].
   ⇒ The window Add object below: opens.
2. Select your I/O module and click [Add object].
   ⇒ The I/O module is added.

Configure parameters

⇒ Double-click the “CI5xx” device to open editors and select the “CI5xx_IO Parameters” tab.

This editor shows the parameters that can be set for each device. For more information see Chapter 1.6.3.7 “Communication interface modules (S500)” on page 2822, and Chapter 1.6.3.6 “I/O modules” on page 2375.

**CI521-MODTCP/CI522-MODTCP**

Unbundled CI52x-MODTCP configuration

Automation Builder can be used to configure the parameters of CI52x-MODTCP devices.

| A direct Ethernet connection is required between the PC running Automation Builder and the CI52x-MODTCP module. |

| Configuration of S500 I/O modules can be performed without CI52x-MODTCPs modules connected. |

**Start a project from template**

1. Select “New Project” in menu item “File”.
   ⇒ The window “New Project” appears.

2. Select the “CI52x-MODTCP Configuration Project” and click “OK”.
   ⇒ The window “Select PLC” opens.

3. Select a “CI52x-MODTCP” device and click “Add device”.
   ⇒ A project is created. More modules can be added.

**Add CI52x-MODTCP to a project**

1. Right click in the device tree on the root of the “Project” and click “Add object”.
   ⇒ The window “Add object below” opens.

2. Select “Modbus devices” and click “Add object”.
   ⇒ The node “Modbus_devices” appears in your device tree.

3. Right click on the node “Modbus_devices” and click “Add object”.
   ⇒ The window “Select PLC” opens.

4. Select your “CI52x-MODTCP” device and click “Add device”.
   ⇒ The “CI52x-MODTCP” device appears in your device tree.
Add S500 I/O modules

1. “Add object” to your “CI52x-MODTCP” device.
   ⇒ The window “Add object below: CI52x-MODTCP” opens.
2. Select your I/O module and click “Add object”.
   ⇒ The I/O module is added.

Configure parameters

⇒ Double-click the device to open editors and select the “CI52x-MODTCP Parameters” tab.

This editor shows the parameters that can be set for each device. For more information see ❇ Chapter 1.6.3.7.4.1.7.1 “Parameters of the module” on page 2955 CI521, ❇ Chapter 1.6.3.7.4.2.7.1 “Parameters of the module” on page 2984 CI522 and ❇ Chapter 1.6.3.6 “I/O modules” on page 2375.

Connect to device

To read or write parameters, the CI52x-MODTCP module must be connected to the PC with an Ethernet connection.

See ❇ Chapter 1.6.3.7.4.1.5 “Addressing” on page 2954 CI521 and ❇ Chapter 1.6.3.7.4.2.5 “Addressing” on page 2984 CI522 of the CI52x-MODTCP hardware documentation for information on configuring the IP address of the device.

On the CI52x-MODTCP device editor, the “Connection Settings” tab allows the IP address of the device to be entered.
Read  Reads the parameters from the CI52x-MODTCP and also for the attached S500 I/O modules.
Write  Sends the parameters from the editors to the CI52x-MODTCP and also the S500 I/O modules.

Device checking  The CI52x-MODTCP module knows which I/O modules are attached.
While reading and writing parameters, the project must match the physical hardware. Otherwise an error will be given.
Communication errors will also result in error messages.
When the parameters have been read or written correctly, a message is seen in the “All messages” window:

Attached S500 modules  It is possible to read and write parameters when the S500 I/O modules are not attached to the CI52x-MODTCP module.

A warning will be shown if an I/O module is not detected:

When writing parameters, the CI52x-MODTCP configuration is overwritten so the current configuration of missing (unplugged) modules does not matter.
If the I/O modules are attached, then the project must match the hardware, otherwise an error will be given.

Firmware update  As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware updates for CI52x-MODTCP devices.
1.6.6.2.13 I/O-bus and I/O modules

Hot swap configuration

Parameter configuration

I/O extension modules include the below parameters for hot swap configuration

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Purpose</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot-swap terminal unit required</td>
<td>To include diagnosis for missing hot-swap terminal unit</td>
<td>Yes: Communication Interface provides extended diagnosis for missing hot-swap terminal unit</td>
</tr>
<tr>
<td>Start-up with missing module on hot-swap terminal unit</td>
<td>Ignore missing module during start-up on hot-swap terminal unit. Incomplete I/O configurations must not prevent the system from starting.</td>
<td>Yes: Module is optional, start-up if there is no module available on hot-swap terminal unit</td>
</tr>
</tbody>
</table>

In the Automation Builder projects for V3 PLCs, hot-swap parameters can be configured from Module Parameters tab of respective I/O module.

By default, the Module Parameters tab is not visible for parameter configuration. Follow the below steps to enable this tab:

1. In the Automation Builder menu select “Tools ➔ Options”
2. Select “Device editor” option from “Options” dialog.
3. Enable the option “Show generic device configuration views” (if not already done)
4. To save the settings and close the dialog select “OK”
Parameterization of the I/O bus

Double-click the “IO_Bus” node in the device tree to open the I/O-Bus configuration.

The following parameters are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>No</td>
<td>No</td>
<td>In case of configuration fault the user program will not be launched.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Yes</td>
<td>The user program will be also launched in case of configuration error on the I/O Bus.</td>
</tr>
<tr>
<td>Max wait run</td>
<td>3000</td>
<td>0…120000</td>
<td>Maximum waiting time for valid inputs.</td>
</tr>
</tbody>
</table>

In case of a digital I/O Module, the channels are provided as WORD, BYTE and BOOL. Because the analog inputs can also be configured as digital inputs, bit 0 of each channel is also available as BOOL.

The symbolic name of a channel can be entered in front of the string “AT” in the channel declaration.

All channels should have a symbolic name and only symbolic names should be used in the program code. If the hardware configuration has changed or if you want to download the project to a PLC with another hardware configuration and thus the PLC configuration has to be changed, the addresses of the inputs and outputs can change. In case of symbolic programming (i.e., symbolic names are used), the program code does not have to be changed.
Parameter 'Ignore module'

All I/O devices provide the parameter "Ignore module". This parameter can be used for simulation purposes and determines whether an I/O device is considered or ignored during a PLC configuration check.

This allows to use an existing Automation Builder project/PLC configuration though some hardware devices are not physically available in a hardware installation.

Example

The Automation Builder project for machine A shall be used for machine B. However, the second DC523 device is missing in the hardware installation of machine B. Hence, for machine B the value for 'Ignore module' is set to 'YES'.

I/O-bus - Bus cycle task

As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.
(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus               (8) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

Insertion of S500 I/O devices

1. Right-click "IO_Bus" in device tree and select [Add object].
   -> The Add Device dialog window where all available S500 I/O Devices are listed will open.
2. Append the S500 I/O Devices in the same order as they are mounted on the hardware.
   Input and output modules connected to the I/O bus occupy the I/O following area: %IB0 .. %IB999 or %QB0 .. %QB999.

   AC500 (Standard): PM56xx support up to 10 S500 I/O Devices.

Configuring the input and output modules and channels

The I/O channel configuration depends on the corresponding S500 I/O Device. See hardware documentation of the I/O Device for more information.

The individual configuration parameters can be opened in the editor window via double-click on the corresponding module and are listed in tab [S500 I/O device name] Configuration.
Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an I/O Mapping tab in their configuration editor where the available I/O channels can directly be mapped to a global variable. The corresponding variable declarations are automatically available in the project. All available I/O channels can easily be assigned to a variable.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Mapping</th>
<th>Channel</th>
<th>Address</th>
<th>Type</th>
<th>Default Value</th>
<th>Unit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b_Input_100</td>
<td></td>
<td>Digital inputs 10 - 17</td>
<td>%I100</td>
<td>BYTE</td>

<td>Digital inputs 129 - 131</td>
<td>%I29.3</td>
<td>BYTE</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

AC500 uses Intel Byte Order (Little Endian).

Only entries with a data type set in column “Type” can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

I/O mapping list

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view. Details on the tree structured view is provided in the CODESYS Development System Chapter 1.4.1.8.3 “Configuring devices and I/O mapping” on page 227
Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as cut, copy, paste, delete, and select all within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)

Configuring I/O mapping list

Automation Builder supports tree and list based editors for creating I/O mapping variables.
1. From the Tools menu, select Options.
2. Under Automation Builder, select the Editors tab.
3. Choose your desired mapping dialog and click OK.
   - Choose tree based to display the I/O mapping in tree structure.
   - Choose list based to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose both to display both the tree structure (I/O Mapping tab) and the list view (I/O mapping list tab).

Available channel information

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree. The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.
Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

**Editing I/O mapping list**

1. In the device tree, double-click **IO_Bus** to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.

   Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.

3. Click **Save Project** to save the I/O mapping changes.

**Toolbar**

**Filtering**

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the “**Filter**” icon to display all available criteria for filter options.

When reducing the width of the editor, some filters might be hidden.

**Undo, redo and clear**

- **Undo**: Cancels the last change.
- **Redo**: Repeats the last change.
- **Clear mappings**: Deletes all variables and descriptions.

**Fast counter**

**Configuration for S500 I/O devices**

1. In the device tree, add a digital I/O Module to the “**IO-Bus**” node.
2. Double-click the node for the I/O Module, open the “**Parameters**” tab and set the counting mode
   ☞ Chapter 1.6.6.2.13.9.2.1 “Counting modes” on page 3520 of the “Fast counter” parameter.

<table>
<thead>
<tr>
<th>Fast counter</th>
<th>Enumeration of BYTE</th>
<th>0-No counter</th>
<th>0-No counter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detect short circuit at outputs</td>
<td>Enumeration of BYTE</td>
<td>0-No counter</td>
<td>0-No counter</td>
</tr>
<tr>
<td>Behaviour outputs at comm. error</td>
<td>Enumeration of BYTE</td>
<td>0-No counter</td>
<td>0-No counter</td>
</tr>
<tr>

</tbody>
</table>
Description of the input information | Output information of the user program | Description
--- | --- | ---

**SET**: The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table).

1) Only for CI581-CN/CI582-CN: Control bytes 1 and 2 are available twice on grounds of data consistency. Hence, a Start and End evaluation is only effected if the signals "Control Byte1_0" and "Control Byte1_1" or "Control Byte2_0" and "Control Byte2_1" (process image) are identical.

Table 626: Output information

</tr>
</tbody>
</table>

Operating modes

Inputs and outputs which are not used by the counters, are available for other tasks.

Legend:
- A refers to input channel A
- B refers to input channel B
- C refers to output channel C

<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No counter</td>
<td>none</td>
<td>This operating mode is selected if the integrated fast counter is not necessary.</td>
</tr>
<tr>
<td>1</td>
<td>One up-counter</td>
<td>A = Counting input C = End value reached</td>
<td>The counting input and the output &quot;End value reached&quot; are enabled by the bit EN = TRUE within the control byte.</td>
</tr>
<tr>
<td>Operating mode</td>
<td>Function</td>
<td>Used inputs and outputs</td>
<td>Notes</td>
</tr>
<tr>
<td>---------------</td>
<td>----------</td>
<td>------------------------</td>
<td>-------</td>
</tr>
</tbody>
</table>
| 2             | One up-counter with enable input via terminal | A = Counting input  
B = Enable input  
C = End value reached | The enable input enables the counting input and the output "end value reached". The counter is only enabled if the enable input = TRUE (signal 1) AND the bit EN = TRUE within the control byte. |
| 3             | Two up/down counters | A = Counting input 0  
B = Counting input 1 | With this operating mode, two counters exist, which are independent of each other. The state "End value reached" is only readable from the two status bytes. It is not readable from output terminals. The counting direction is defined by the bit UP/DWN within the control byte. |
| 4             | Two up/down counters (1 counting input inverted) | A = Counting input 0  
B = Counting input 1 | This operating mode equals operating mode 3 with one exception: The counting input B (of counter 1) is inverted. It counts the TRUE/ FALSE edges at input B. |
| 5             | One up/down counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | With this operating mode, one up/down counter is available which has a dynamic set input. Dynamic means that the set operation is performed at the FALSE/ TRUE signal edge (0/1 edge) of the set input and not while the signal is TRUE. The state "End value reached" is only readable from the status byte, not from an output terminal. |
| 6             | One up/down counter with a dynamic set input via terminal | A = Counting input  
B = Dynamic set input | This operating mode equals operating mode 5 with one exception: The dynamic set input operates at the TRUE/ FALSE edge (1-0 edge). |
<table>
<thead>
<tr>
<th>Operating mode</th>
<th>Function</th>
<th>Used inputs and outputs</th>
<th>Notes</th>
</tr>
</thead>
</table>
| 7              | One up/down counter for position sensors | A = Trace A of the position sensor  
B = Trace B of the position sensor | With this operating mode, incremental position sensors can be used which interchange their counting signals on tracks A and B in a 90° phase sequence. Depending on the sequence of the signals at A and B, the counter counts up or down. There is no pulse-multiplier function (e.g. x2 or x4). The position sensor must provide 24 V signals. Signals of 5 V sensors must be converted. Zero traces are not processed. The state "End value reached" is only readable from the state byte 0, not from an output terminal.  
The bit UP/DWN within the control byte must be FALSE. Otherwise, a parameter error occurs.  
In this operating mode, the maximum counting frequency is:  
I/O modules 35 kHz.  
Communication interface modules 50 kHz. |
<p>| 8              | Reserved                          |                         |                                                                                                                                                                                                       |</p>
<table>

| 9              | One up/down counter for position sensors (pulse multiplier x2) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means, that the counter counts both the positive edges and the negative edges of trace A. This results in the double number of counting pulses. The precision increases correspondingly.  
In this operating mode, the maximum counting frequency is:  
I/O modules 30 kHz.  
Communication interface modules 35 kHz. |
| 10             | One up/down counter for position sensors (pulse multiplier x4) | A = Trace A of the position sensor  
B = Trace B of the position sensor | This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means, that the counter counts the positive and negative edges of the traces A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly.  
In this operating mode, the maximum counting frequency is:  
I/O modules 15 kHz.  
Communication interface modules 20 kHz. |
Configuration for onboard I/Os

1. In the device tree, double-click the “Onboard I/O” node (OBIO).

2. In the “Parameters” tab set the counting mode \footnote{Chapter 1.6.6.2.13.9.2.1 “Counting modes” on page 3520} for the fast counter.

3. In the “I/O Mapping” tab channel configuration is displayed. \footnote{Chapter 1.6.6.2.13.9.3 “Control of the fast counter” on page 3524}

**Configuring the fast counter**

The parameter of the Fast Counter channels of the Onboard I/O must be configured before they can be used. User should take these steps to configure the fast counter:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Direction</th>
<th>Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual value X</td>
<td>Input</td>
<td>DWORD</td>
<td>Current value of the Fast Counter.</td>
</tr>
</tbody>
</table>
| State byte X  | Input     | BYTE  | Bit 0 = CF
- If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only, if the counter is set again (set value), CF is reset to FALSE.
- Bit 1 to Bit 7 free |
| Start value X | Output    | DWORD | Each counter can be set to a start value. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X. |
| End value X   | Output    | DWORD | The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously, whether or not their programmed end value is equal to their actual value. If the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently. |
### Counting modes

The fast counter can be configured as one mode out of 10 possible modes. The desired operating mode is selected in the PLC configuration using configuration parameters. Inputs and outputs which are not used by the counter are available for other tasks. In the following table, A means input channel A, B means input channel B and C means output channel C.

<table>
<thead>
<tr>
<th>Channel</th>
<th>Direction</th>
<th>Width</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control byte 1</td>

### 1.6.6.2.14 Serial interface

*Configuring Modbus RTU on serial interface*

To enable Modbus RTU on a serial interface the protocol setup per default has to be replaced by either Modbus RTU Client or Server, depending on required operation mode.

A serial interface supports only one protocol/operation mode at once.

1. Right-click node “CAA_SerialCom” and click “Add object”.
2. Select “Modbus RTU Client” or “Modbus RTU Server” and click “Add object”.
   ⇒ “CAA_SerialCom” is replaced by your selection.

**Parameters**

**Serial**

Serial parameters to be set selecting the interfaces node “COM_1”. They are common for both operating modes client and server.
The parameter “Data bits” always has to be set to “8” for Modbus.

Modbus RTU server

Server specific parameters to be set selecting the protocol’s node “Modbus_RTU_Server”.

Address
Bus address of the PLC as Modbus RTU Server on that interface

Byte Order
Format/Endianess for the transmission of WORD values (register) within the request/response telegram (default: Big Endian)

Disable

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable write to %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access starting at %MBx</td>
</tr>
<tr>
<td>Disable write to %MB to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access up to %MBx</td>
</tr>
<tr>
<td>Disable read from %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access starting at %MBx</td>
</tr>
<tr>
<td>Disable read from %MBx to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access up at %MBx</td>
</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

Modbus RTU client

“Modbus RTU Client” does not have any protocol parameters.

Configuring CAA SerialCom on serial interface

The protocol CAA SerialCom represents the standard serial protocol provided by 3S and allows the users to implement their own custom protocol.

For details on CAA SerialCom, refer to standard 3S V3 documentation.
When creating a new project, the protocol “CAA SerialCom” is automatically attached to the “COM_1” port of a V3 PLC.

Right-click on the node attached to “COM_1” node in the device tree and click “Delete”. The node is switched back to the “CAA SerialCom” protocol.

Since CAA SerialCom doesn’t represent a “real” protocol, there are no specific parameters required. All common settings can be found at the Tab “COM_1” after double-click on the “COM_1” node (see also Chapter 1.6.6.2.14.3 “Setting up a serial interface” on page 3532).

The parameters set up in the Automation Builder device tree are NOT automatically taken over in the PLC.
It is still required to use the 3S IEC POU\text{s} to activate the particular configuration parameters.

ABB provides the library AC500\_Com (“ABB - AC500 / Use Cases / Serial Communication”) which contains a POU called “ComGetCaaSerialComConfig”.

The Function Block can be used to obtain the configuration data which is set up in Automation Builder to directly pass it to CAA SerialCom-POU Open. This avoids manual creation of a parameter list.

The following code snippet shows, how the COM port is identified by its node name and how the parameter list for the Function Block is read from the configuration data of the currently loaded IEC application:

```plaintext
FUNCTION_BLOCK GET_CAA_COM_CFG
VAR_INPUT
ComGetCaaSerialComConfig: ComGetCaaSerialComConfig;
bExecGetCfg: BOOL := FALSE;
bDoneGetCfg: BOOL := FALSE;

END_IF

IF uiStep = STEP_FAILED_GET_CFG_CAA THEN
  bError := TRUE;
END_IF
Setting up a serial interface

General

The configuration for serial interfaces and their protocols is done via two nodes:

- One node represents the common serial parameters related to the hardware port.
- The node below represents the parameterization for the particularly attached protocol.

Protocols supported by AC500 V3 PLCs

- 3S CAA SerialCom (common serial communication, send/receive data  "Chapter 1.6.6.2.14.2 “Configuring CAA SerialCom on serial interface” on page 3528)
- Modbus RTU (client & server  "Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3527)

How to switch between the protocols, see "Default setting" on page 3529.

Configuration

The following parameters are available in the configuration view of the COM port node:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value ranges</th>
<th>Description</th>
</tr>
</thead>
<tbody>

#### Comparison to V2

The following table shows the differences between V2 and V3 PLCs regarding the parameter set for serial interfaces:

<table>
<thead>
<tr>
<th>V2 Parameter</th>
<th>Representation in V3</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Run on config fault</td>
<td>Run on config fault</td>
<td>Exactly the same</td>
</tr>
<tr>
<td>RTS control</td>
<td>Flow control (partially)</td>
<td>Special modes which allow to use PLC as modem and mode implicitly setting RS-485 will not be taken over. Flow control settings will be limited and only support hardware, software or none.</td>
</tr>
<tr>
<td>Transmission rate</td>
<td>Transmission rate</td>
<td>For V3, the transmission rate range will be 9600 to 115200. Low modes will not be supported due to lack of support in Linux. High rates were only realized in V2 to support field bus plug as well as CS31 field bus. Both protocols are not supported anymore in V3, so these transmission rates won’t be available in V3. Approach: Only support most common transmission rates</td>
</tr>
<tr>
<td>Parity</td>
<td>Parity (subset)</td>
<td>A500 V3 doesn’t allow to configure parity modes “mark” and “space”. This means, only “none”, “odd” and “even” are configurable.</td>
</tr>
<tr>
<td>Data Bits</td>
<td>Data Bits</td>
<td>Exactly the same</td>
</tr>

#### 1.6.6.15 Gateway configuration

1. In the Automation Builder project, right-click the topmost PLC tree node and select “Communication Settings”.
   - The dialog window Communication Settings appears.

2. Click “Advanced Settings” to open the Chapter 1.4.1.24.1.19.2 “Tab ‘Communication Settings’” on page 773 dialog.
   - This information will be stored in the project file.
3. Click “Gateway” and select the desired action from the Gateway menu either to change the local gateway (see Chapter 1.4.1.24.2.18.2 “Command ‘Configure the local gateway’” on page 1045) or to add a new gateway channel (see Chapter 1.4.1.24.2.18.1 “Command ‘Add gateway’” on page 1044). Confirm your settings with “OK”.

**Gateway settings on windows server 2012**

**Gateway as a service**
To allow multiple concurrent users from different user sessions on the server to connect to PLCs, the user has to run CODESYS gateway as a system service. This is managed by a service called "CoDeSys V2.3 Gateway Service Wrapper". The service starts on system start-up and launch the gateway.

If you want to restart the gateway, use "Services management console" to restart "CoDeSys V2.3 Gateway Service Wrapper".

**Gateway settings**
You can set the communication settings in the Automation Builder project for every PLC. Otherwise, an error message is displayed while trying to open CODESYS.

See the description for Chapter 1.6.6.2.15 “Gateway configuration” on page 3533 and select "TCP/IP" under “Connection”.

1.6.6.2.16 CAN-based fieldbuses

**CANopen**

**CANopen manager (master)**

**Tab 'CANopen Manager - General'**

<table>
<thead>
<tr>
<th>Table 627: “General”</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Node ID”</strong></td>
</tr>
<tr>
<td><strong>“Check and Fix Configuration”</strong></td>
</tr>
</tbody>
</table>
| **“Autostart CANopen Manager”** | ☑: The CANopen manager starts automatically (switches to OPERATIONAL mode) after all required slaves are ready. ☐: You have to start the CANopen manager from the application. Use the CiA405 NMT function block to do this.  
  Hint: As long as the CANopen manager is not in OPERATIONAL mode, no PDOs are sent (outputs refreshed). |
| **“Polling of optional slaves”** | ☑: When a slave does not respond during the boot sequence, the CANopen manager interrogates it every second until it does respond.  
  Constantly polling the slave increases the bus cycle time, which can interfere with the application (especially motion applications). You can deactivate polling to avoid this behavior. If polling is deactivated, then a slave is detected again when it sends a bootup message. |
| **“Start Slaves”** | ☑: The CANopen manager is responsible for starting the slaves.  
  ☐: You have to start the slaves from the application. Use the CiA405 NMT function block to do this. |
“NMT start all (if possible)”: If the “Start slaves” option is activated, then the CANopen manager starts all slaves with an "NMT Start All" command. The "NMT Start All" command is not executed as long as optional slaves are not yet ready to be started. In this case, the CANopen manager starts each slave individually. The "NMT StartAll" command can be guaranteed only in a project without optional slaves.

“NMT error behavior”: • “Restart Slave”. If an error occurs during slave monitoring (NMT Error Event), then the slave is restarted automatically by the stack (NMT Reset + SDO Configuration + NMT Start).
• “Stop Slave”. If an error occurs during slave monitoring (NMT Error Event), then the slave is stopped. Then you must reset the slave from the application, using the CiA405 NMT function block.

Table 628: “Guarding”

Working with heartbeat messages is an alternative method of monitoring. It can be executed from both master and slave nodes, as opposed to node-guarding. Normally the master sends heartbeat messages to the slaves.

“Enable heartbeat producing” The master sends heartbeat messages that define the time interval in the “Producer Time”. When the slaves are provided with the heartbeat function, a heartbeat consuming entry from the slave is created for the master. Then the node ID and the 1.5x heartbeat interval of the master are applied.

[ ]: Node guarding is enabled for the slaves. The settings from the EDS file of the slaves are used for this. If the values there cannot be used, then default values are used. Note that a CANopen slave device can also be configured as a heartbeat producer.

“Node ID” Unique identification (1-127) of the heartbeat producer on the bus.

“Producer time (ms)” Interval length between successive heartbeats (in milliseconds).

“Redundancy node ID” Requirement: A “Redundancy Configuration” object is inserted below the application.

Unique identification (1-127) of the redundant heartbeat producer on the bus.

“Redundancy wait time (µs)” Requirement: A “Redundancy Configuration” object is inserted below the application.

Duration of how long the passive controller waits for the heartbeat of the active controller. If this time is exceeded, then the passive controller takes on the active role.

Table 629: “SYNC”

“Enable SYNC producing”: (disabled by default) The CANopen manager sends SYNC telegrams. The synchronous PDOs are sent directly after the SYNC telegram.

“COB ID (Hex)” CAN ID of the SYNC telegram. Range of possible values: [1...2047].

“Cycle period (µs)” Interval length (in microseconds) after which the SYNC telegram is sent.

“Window length (µs)” Length of the time frame for synchronous PDOs (in microseconds).

“Enable SYNC consuming”: (disabled by default) Another device must produce the SYNC telegrams that are received by the CANopen manager.

NOTICE! If SYNC producing is enabled for the CANopen manager, then you are not permitted to activate the “Enable Sync Producing” option for all other bus devices.
Table 630: “TIME”

| **Enable TIME producing** | ☑: (disabled by default) The CANopen manager sends TIME messages. |
| **COB ID (Hex)** | (Communication Object Identifier): identifies the time stamp of the message. Default values: [0...2047], preset 16#100. |
| **Producer time (ms)** | Interval (in milliseconds) when the time stamp is sent. This value must be a multiple of the task cycle time. Possible values [0..65535]. |

The runtime system must support high resolution timestamps. If not, then an error message is displayed.

- Chapter 1.6.6.2.16.1.1.2.1 “Tab ‘CANopen Remote Device - General’” on page 3537

Dialog 'Check and Fix Configuration'

If you insert several devices below the CANopen manager, then error messages may report multiple assigned node IDs or invalid COB IDs. The “Check and Fix Configuration” button opens a dialog for solving these conflicts.

For conflicts with node IDs or PDO COB IDs, you can click “Edit Conflicts” to open a dialog with detailed information.

Table 631: “Node ID and COB ID conflicts”

| **Doubled node number** | List of all devices with identical IDs. In the field of the “Node ID” column, you can enter new node numbers for the affected devices. |
| **Incorrect and double assignment of PDO COB IDs** | The COB IDs that are generated automatically from the device description files may not be permitted. All incorrect entries are listed with the respective device names, node IDs, and indexes. There are three options for correcting invalid COB IDs:
  - Correct the displayed formula for calculating the COB IDs so that a valid COB ID results. You can change the formula in the respective table element.
  - Accept the automatic suggestion for the COB ID by clicking the respective button.
  - Accept all automatic suggestions by clicking the “Used suggested COB ID” button. |

Corrected entries are removed from the displayed list automatically.

You can solve timing problems automatically by using the “Automatic Repair”. The command adjusts all timing values to compatible values. (The time should be a multiple of the task time.)

CANopen remote device (Slave)

In CODESYS, a CANopen remote device is a slave device that you insert below a CANopen manager in the device tree of a project. A distinction is made between modular and non-modular slaves:

- **Modular slaves**: You can insert CANopen modules (submodules) below a modular slave. These modules provide a dialog for mapping their inputs and outputs. Modular slaves can also have fixed I/Os. Then these devices also provide the “I/O Mapping” dialog. Modular devices provide the “Configure PDO mapping automatically” option, which we recommend for standard applications. You find this option in the “CANopen Remote Device” dialog in the “General” section.

- **Non-modular slaves**: You cannot insert additional modules below a non-modular device. The inputs and outputs of these devices are mapped in the “I/O Mapping” dialog. Automatic mapping is not possible here.

- Chapter 1.6.6.2.16.1.2.1 “Tab 'CANopen Remote Device - General'” on page 3537

Tab 'CANopen Remote Device - General'

The general settings of the CANopen slave are defined in this dialog box of a CANopen remote device (slave).

Table 632: “General”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Node ID</strong></td>
<td>The node number identifies the CAN module as unique and it corresponds to the number set on the module (value between 1 and 127). You provide the node ID as a decimal.</td>
</tr>
<tr>
<td><strong>Enable expert settings</strong></td>
<td>☑: All settings are displayed that are predefined by the device description (EDS file) for the device.</td>
</tr>
<tr>
<td><strong>SDO channels</strong></td>
<td>Click this button to open a dialog for activating the SDO channels that are predefined in the EDS file. Service data objects (SDOs) allow access to all entries in the CANopen object directory. An SDO creates a peer-to-peer communication channel between two devices (SDO server and client channel).</td>
</tr>
<tr>
<td><strong>Optional device</strong></td>
<td>☑: The slave is optional and not required for starting the CAN network.</td>
</tr>
<tr>
<td><strong>Sync producing</strong></td>
<td>Available only when the “Enable sync producing” option is cleared in the CANopen manager.</td>
</tr>
<tr>
<td></td>
<td>☑: The I/O transmission is synchronized on the bus. The slave works a a sync producer. The parameters of the sync interval are defined in the settings of the CANopen manager.</td>
</tr>
<tr>
<td><strong>No initialization</strong></td>
<td>This option is for non-configurable slave that already start with a valid configuration.</td>
</tr>
<tr>
<td></td>
<td>☑: The master does not send configuration SDOs or NMT start commands to the slave. PDO communication and monitoring (heartbeat, node guarding) are performed when this has been configured in the configurator.</td>
</tr>
<tr>
<td></td>
<td>If the slave does not start automatically, then the user can use the CiA405 NMT function block to send an NMT start command to the slave.</td>
</tr>
<tr>
<td><strong>Presets</strong></td>
<td>The availability of this option depend son the content of the device description file.</td>
</tr>
<tr>
<td></td>
<td>☑: Selected by default. The slave nodes are reset to the default parameters before the configuration is loaded to the device or always when the slave is configured. Which parameters can be set is device-specific. The concrete task is performed from the subindex of the drop-down list.</td>
</tr>
<tr>
<td></td>
<td>● “Sub:001”: All parameters are reset.</td>
</tr>
<tr>
<td></td>
<td>● “Sub:002”: Communication parameters (index 1000h - 1FFFh manufacturer-specific communication parameters) are reset.</td>
</tr>
<tr>
<td></td>
<td>● “Sub:003”: Application parameters (index 6000h - 9FFFh manufacturer-specific application parameters) are reset.</td>
</tr>
<tr>
<td></td>
<td>● “Sub:004” - “Sub:127”: Manufacturer-specific, individual selection of parameters is reset.</td>
</tr>
<tr>
<td></td>
<td>● “Sub:128” - “Sub254”: Reserved for future purposes</td>
</tr>
<tr>
<td><strong>Autoconfig PDO mapping</strong></td>
<td>This option is available for modular devices only.</td>
</tr>
<tr>
<td></td>
<td>☑: PDO mapping is generated automatically from the definitions in the device description and then cannot be changed in the two mapping dialogs. If the automatically generated mapping does not match your application, then you can deactivate the option and configure the mapping manually. We recommend that this option is activated for standard applications.</td>
</tr>
</tbody>
</table>
Node guarding is an outdated monitoring method and should not be used anymore because it uses RTR frames. You should always use heartbeats when possible. In some exceptions, such as for older slaves, you can use only node guarding.

<table>
<thead>
<tr>
<th>Table 633: “Node Guarding”</th>
</tr>
</thead>
</table>
| “Enable node guarding”[
  - The CANopen manager sends a message to the slave in the “Guard time (ms)” interval. If the slave does not respond with the given “Guard COB ID” (Communication Object Identifier), then the CANopen manager resends this message as many times as defined in “Life time factor” or until the slave responds.
  - If the slave does not respond, then it is marked as “unavailable”.
| “Guard time (ms)” Interval for sending messages (default: 200 ms)
| “Life time factor” When the slave does not respond, a node-guarding error is established according to the “Life time Factor” time multiplied by the “Guard Time”.
| “Enable heartbeat producing”[
  - The module sends heartbeats in the time intervals as given in “Producer time (ms)”.
| “Producer time (ms)” The default setting is 200 as long as there is no special entry or the entry in the device description file is 0.
| “Heartbeat consuming” Opens the “Heartbeat Consuming Properties” dialog box where you activate the slaves that you will monitor.
  - The number of possible slaves to be monitored is defined in the EDS file. TO do this, you must select the “Enable” check box and enter the node ID of the slave and the required values in the “Heartbeat time” field (in milliseconds). Then the slave monitors the heartbeats that are sent from the affected slaves (defined by the node ID). When no more heartbeats are received, the slave switches off the I/Os.
  - While a slave is monitoring, a green check mark is shown on the “Heartbeat consuming” switch.
  - Note: When you insert a device with the heartbeat function, its heartbeat settings are harmonized automatically with the master (CANopen manager).

<table>
<thead>
<tr>
<th>Table 634: “Emergency”</th>
</tr>
</thead>
</table>
| “Enable emergency”[
  - When internal errors occur, the slave sends emergency messages with a unique COB ID. You can read these messages by using the function block from the CiA405 library. (RECV_EMCY_DEF, RECV_EMCY).
| “COB ID” CAN ID of the EMCY message. Range of possible values: [1...2047].

<table>
<thead>
<tr>
<th>Table 635: “TIME”</th>
</tr>
</thead>
</table>
| The availability of this function depends on the device description.
| “Enable TIME producing”[
  - The device sends TIME messages.
| “COB ID (Hex)” (Communication Object Identifier): identifies the time stamp of the message.
| “Enable TIME consuming”[
  - The device processes TIME messages.

<table>
<thead>
<tr>
<th>Table 636: “Checks at Startup”</th>
</tr>
</thead>
</table>
| The respective information is read from the firmware of the CANopen slave (0x1018 identity object) and compared to the information from the EDS file. In case of disparities, the configuration is stopped and the slaves are not started.
| “Vendor code”[
  - Check of the vendor ID at startup
| “Product number”[
  - Check of the product number at startup
| “Revision number”[
  - Check of the revision number at startup

- Chapter 1.6.6.2.16.1.1 “Tab 'CANopen Manager - General'” on page 3534

Tab 'CANopen Remote Device - PDOs'

Object: CANopen Remote Device, CANopen Local Device

This dialog is available only in the device editor of a CANopen slave of version V3.5.6.0 or later. It shows all PDOs and their default settings. In this dialog, you can add new objects and delete or edit existing objects.

On the left side, there are the PDOs that the slave receives from the master. On the right side, there are the PDOs that the slave sends to the master.

<table>
<thead>
<tr>
<th>“Add PDO”</th>
<th>Opens the “Select PDO” dialog box where all available PDOs are displayed. In this dialog, you select the PDOs to be added to the “Receive PDOs” or “Transmit PDOs”.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Add Mapping”</td>
<td>Opens the “Select Item from Object Directory” dialog box. Objects are listed there that you can add to the PDO mapping.</td>
</tr>
<tr>
<td>“Edit”</td>
<td>Opens the “PDO Properties” (when a PDO is selected). When a PDO mapping is selected, the “Select Item from Object Directory” dialog box opens.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>Deletes the selected objects from the list</td>
</tr>
<tr>
<td>“Move Up”</td>
<td>Moves the selected object upwards by one entry.</td>
</tr>
<tr>
<td>“Move Down”</td>
<td>Moves the selected object downwards by one entry.</td>
</tr>
</tbody>
</table>

Dialog 'PDO Properties'

<table>
<thead>
<tr>
<th>“COB ID”</th>
<th>Every PDO message must have a COB ID (Communication Object Identifier). You can input explicit values (example: 16#201) or formulas (example: $NODEID+16#200).</th>
</tr>
</thead>
<tbody>
<tr>
<td>“RTR”</td>
<td>Remote Transmission Request. This option is available for transmit PDOs only. You can use an RTR frame for interrogating the PDO externally.</td>
</tr>
<tr>
<td>“Inhibit time (x 100µs)”</td>
<td>You can edit this field only if the device supports this functionality. The inhibit time is the minimum time between two messages of a specific PDO. You can use this setting for preventing PDOs from being sent too often when their values are edited. Default: “0”. Possible values: 0...65535.</td>
</tr>
</tbody>
</table>
| “Transmission type” | “acyclic - synchronous”: When a change is made, the PDO is transmitted synchronously, but not periodically. (default)  
|                 | “cyclic - synchronous”: The PDO is transmitted every nth sync.  
|                 | “synchronous – RTR only”: Available for transmit PDOs only. After a synchronization message, the PDO is updated, but not transmitted. Transmission is by explicit request only (Remote Transmission Request).  
|                 | “asynchronous – RTR only”: Available for transmit PDOs only. The PDO is updated and transmitted by explicit request only (Remote Transmission Request).  
|                 | “asynchronous – manufacturer-specific”: The PDO is transmitted after specific events.  
|                 | “asynchronous – device profile”: The PDO is transmitted according to the CiA device profile.                                                                                                                                   |
**Number of syncs**

For transmission type “cyclic - synchronous” only.
Indicate the interval for transmitting the PDOs. The value is a multiple of the “Cycle period (µs)” of the CANopen manager. Default: 1. Possible values: 1...240.
Example: Number of syncs = 4; cycle period = 1000 µs → transmission interval = 4000 µs.

**Event time (x 1ms)**

Only for transmission types “asynchronous - manufacturer-specific” and “asynchronous - device profile”.
You can edit this field only if the device supports this functionality. Indicate the time frame that should be between two PDO transmissions PDOs (in milliseconds). Default: “0”. Possible values: 0...65535.

**Processing by CANopen Manager**

☑: Default.
☐: The CANopen manager does not process the PDO any longer. It is no longer transmitted or received.

---

**Dialog 'Select Item from Object Directory’**

For modular slave, you must deactivate the “Autoconfig PDO mapping” option to be able to configure the mapping manually.

The table shows all object directory entries from the EDS file of the device. For receive PDOs, CODESYS provides only the objects here with write permission (flag = w); for transmit PDOs, read permission.

<table>
<thead>
<tr>
<th>“Name”</th>
<th>COB ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Index”</td>
<td>Index of the object</td>
</tr>
<tr>
<td>“Subindex”</td>
<td>Subindex of the object</td>
</tr>
</tbody>
</table>
| “Access type” | ● “RW”: read-write  
● “RO”: read only  
● “WO”: write only  
● “RWW”: Read/write per SDO; write permission per PDO (==> RPDO, output from the master viewpoint, input from the slave viewpoint).  
● “RWR”: Read/write per SDO; read permission per PDO (==> TPDO, input from the master viewpoint, output from the slave viewpoint).  
● CONST=constant |
| “Data type” | Data type of the object |
| “Default value” | Default value of the object |
| “Bit length” | Length of the object |

---

**Tab 'CANopen Remote Device - SDOs’**

When initializing the CANbus, CODESYS transmits the current configuration settings by using SDOs (Service Data Objects).
In this tab, you configure the necessary SDOs and determine the transmission order of the objects and the actions taken in case of a transmission error.

The object order in this list corresponds to the transmission order of SDOs to the module.

**NOTICE!**

If the “Expert settings” option is not activated for the current device, then only the user-defined SDOs are shown here.
“Add SDO” Opens the “Select Item from Object Directory” dialog box where all available SDOs are displayed. The chosen object is inserted after the selected object.

“Edit” Opens the “Select Item from Object Directory” dialog box and highlights the respective object. You can modify the object parameters or replace the object with another one.

“Delete” Deletes the selected objects from the list.

“Move Up” Moves the selected object upwards by one entry.

“Move Down” Moves the selected object downwards by one entry.

“Abort If Error” : If an error is detected for this SDO, then the stack stops the configuration phase of the current slave. The slave remains in PREOPERATIONAL mode.

“Jump to Line If Error” : The transmission is continued with the SDO that you indicated in the “Next Line” column.

“Next Line” Line number where processing continues if there an error is detected

“SDO Timeout (ms)” Timeout for the SDO transmission. If the slave does not respond to the SDO request within this time, then the transmission is canceled with a timeout.

“Create all SDOs” : Creates an SDO for all writeable objects starting at index 16#2000 for which a default value is given in the EDS. Only experts should use this option. It should be deactivated for standard use.

“Write complete PDO configuration” : This option forces the writing of all PDO configuration objects. In this way, you make sure that the settings in the project correspond to those of the slave. PDOs are not deactivated explicitly. The requirement is that the “Default settings” option is activated in the common settings of the slave and the PDOs are also deactivated in the EDS. If the default values in the EDS do not match the default settings of the slave firmware, then this procedure may cause problems. In this case, you should activate this option.

Dialog ‘Select Item from Object Directory’ This table shows all object directory entries from the device EDS file for each SDO that are writeable and not larger than 4 bytes. Before you add an SDO for selection in the SDO dialog, you can modify its parameters in the fields below the table. In this way, you can also created an SDO that is not writeable in the EDS file by entering a new index/subindex value.

| “Name” | COB ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory. |
| “Index” | Index of the object |
| “Subindex” | Subindex of the object |
| “Access type” | ● “RW”: Read and write  ● “WO”: Write only  ● “RWW”: Read/write per SDO; write permission per PDO (==> RPDO, output from the master viewpoint, input from the slave viewpoint).  ● “RWR”: Read/write per SDO; read permission per PDO (==> TPDO, input from the master viewpoint, output from the slave viewpoint). |
| “Data type” | Data type of the object |
| “Default value” | Default value of the object |
| “Bit length” | Length of the object |
| “Value” | |
CANopen module

CANopen modules are components that you insert below a CANopen remote device.

J1939

J1939 is a CAN-based protocol (CAN stands for "Controller Area Network"). It was developed for serial data transmission between electronic control units (ECU) in heavy goods vehicles. The CODESYS plug-in 'DeviceEditorJ1939' provides dialogs for configuring J1939 devices according to SAE J1939 standards.

J1939 - Bus cycle task

Behavior of the bus cycle for J1939

(1) Receive single package PG             (4) Receive multi-packages
(2) Transmit PGs, Send data               (3) Input buffer
(5) Output buffer

See also
● Chapter 1.4.1.24.1.19.11 “Tab '<device name> I/O Mapping’” on page 787

J1939 manager

You add the J1939 manager below the CANbus node in the device tree. It supports the CANbus J1939 configuration by means of internal functions. You insert the ECU's below the J1939 manager. You add the devices by means of the "Add Device" command.

The "Scan Devices" command is not available for J1939.
The J1939 manager provides a database that contains all global J1939 standard signals and parameter groups (PG).

The CODESYS installation includes a standard database with default settings. This database is write-protected to prevent losing this catalog due to unintended changes. You should make a writeable copy that you can extend or modify.

All J1939 databases are located in "C:\ProgramData\CODESYS\J1939 Databases".

This database is a SQLite database that can be opened and modified with an appropriate database tool.

---

### Tab 'J1939 Manager - General'

In this dialog box of the J1939 ECU editor, the general parameters of a J1939 ECU can be displayed and modified.
### Table 638: “General”

<table>
<thead>
<tr>
<th>Preferred address</th>
<th>Address of the ECU. If more than one ECU with the same address is present in the network, then all ECUs that permit an address change (“Arbitrary address capable” activated), receive a new address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local device</td>
<td>CODESYS is also an ECU in the J1939 network. For local devices, an additional “RX Signals (P2P)” dialog is provided for configuring received signals. In CODESYS, you can configure any number of local devices.</td>
</tr>
</tbody>
</table>

### Table 639: “ECU NAME”

<table>
<thead>
<tr>
<th>NAME (64 bit): 16#</th>
<th>Hexadecimal 64-bit code that contains complete information about the parameter settings. Each time this code is modified, the respective parameter is also modified. The same is true for the other direction.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arbitrary address capable</td>
<td>If an address conflict occurs, then an address change can be performed for the ECU.</td>
</tr>
<tr>
<td>Industry group</td>
<td>List of industry groups according to the definition from SAE J1939.</td>
</tr>
<tr>
<td>Vehicle system instance</td>
<td>The parameter depends on the “Vehicle system”. The 4-bit value assigns a number to each instance of the “Vehicle system”.</td>
</tr>
<tr>
<td>Vehicle system</td>
<td>The value is defined in the SAE J1939 standard.</td>
</tr>
<tr>
<td>Reserved</td>
<td>Always deactivated and reserved for future SAE definitions.</td>
</tr>
<tr>
<td>Function</td>
<td>The parameter is defined and assigned by SAE. The value range is 0...255, however not all values are assigned. The interpretation of values that are greater than or equal to 127 depends on the “Industry” selection. For example, the value “133” means “Product Flow” in the “Agricultural and Forestry Equipment” industry. If “Construction Equipment” is selected for “Industry”, then the same value means “Land Leveling System Display”. If the value is less than 128 (0 - 127), then there is no dependency to other parameters.</td>
</tr>
<tr>
<td>Function instance</td>
<td>The parameter is related to the “Function” field. A J1939 network can consist of several ECUs with the same “Function”. The 5-bit “Function instance” assigns a number to each instance of the “Function”, where 0 is assigned to the first instance.</td>
</tr>
<tr>
<td>ECU instance</td>
<td>A J1939 network can include several ECUs that have the same task. For example, a vehicle can have two identical ECUs, where one measures vehicle speed and the other measures the trailer speed.</td>
</tr>
<tr>
<td>Manufacturer code</td>
<td>The 11-bit manufacturer code is assigned by SAE and indicates the company that manufactured the ECU. This code is defined in the SAE J1939 document.</td>
</tr>
<tr>
<td>Identity number</td>
<td>The 21-bit identity number is assigned by the manufacturer and should be used for assuring unique names in a product line. The manufacturer can also add more information to the identity number, such as serial number and date of manufacture.</td>
</tr>
</tbody>
</table>

### Table 640: “Communication Watchdog”

| Enable communication watchdog | The stack checks whether the ECU transmits data within the given “Watchdog time”. If this does not happen, then the device is classified as “not available” and highlighted in red in the device tree. |
Tab 'J1939 ECU - TX Signals'

This dialog shows the parameter groups that you defined for transmitting them to all other ECUs (broadcast) or to a specific ECU (P2P). In this dialog box, you can activate and deactivate individual groups and modify their parameters. You can also add new groups or signals to the list.

| “Enable” | ☑: The parameter group is transmitted. ☐: The parameter group is not transmitted for a local device. For a remote device, the PLC does not process this group. |
| “Type” | ● “Broadcast”: The parameter group is transmitted to all ECUs. ● “Peer-to-Peer (P2P)”: The parameter group is transmitted to a specific ECU. |
| “Add PG” | Opens the “Add Parameter Groups” dialog box. |
| “Add Signal” | Opens the “Add Signal” dialog box. The button is enabled only if you have selected a parameter group. |

Parameter group properties

Table 641: “General”

| “PGN” | The “parameter group number” is a unique number for addressing a parameter group. |
| “Name” | Name of the parameter group |
| “Description” | Description of the parameter group |
| “Length” | The length of the message data (0...1785 bytes). Due to the maximum data field length of 8 bytes, messages with over 8 bytes are transmitted as multipackages. |

Table 642: “Transmission settings”

These settings are provided only for the TX parameter groups of local devices.

| “Priority” | Priority of the parameter group (0..7). Priority 0 is the highest and 7 is the lowest. |
| “Destination address” | The target address is needed for P2P parameter groups only. |
| “Transmission mode” | Determines the time when a parameter group is transmitted (for local devices). ● “Mode change”: The PG is transmitted when the value of the signal changes. ● “Cyclic” The PG is transmitted after a specified number of PLC cycles (see cycle time factor). ● “On request”: The PG is transmitted on request of another device. ● “Application-controlled”: The PG is transmitted when triggered by the application. |
| “Cycle time factor” | Number of PLC cycles after which the parameter group is transmitted. Only applies for cyclic transmission. |

Signal parameters

Table 643: “General”

| “SPN” | (Suspect Parameter Number) One of the numbers assigned by the SAE for a specific parameter in a parameter group. |
| “Name” | Name of the parameter |
| “Description” | Description of the parameter |
**Table 644: “Conversion”**

- **“Length (Bits)”** Length of the signal (in bits: 1...14280).
- **“Byte position (0..1784)”** Start byte in the parameter group (0...1784).
- **“Bit position (0..7)”** Bit position of the start byte (0..7).

**Table 644: “Conversion”**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Conversion”</td>
<td>TRUE: The value is calculated with scaling and offset.</td>
</tr>
<tr>
<td>“RAW data type”</td>
<td>Format of the raw data: Unsigned / Signed / Float / Double.</td>
</tr>
<tr>
<td>“Byte order”</td>
<td>Little endian or big endian of the raw signal.</td>
</tr>
<tr>
<td>“Scaling”</td>
<td>The factor (for “Conversion” = TRUE).</td>
</tr>
<tr>
<td>“Offset”</td>
<td>The offset (for “Conversion” = TRUE).</td>
</tr>
<tr>
<td>“Minimum value”</td>
<td>Expected minimum value of the converted signal (for informational purposes only).</td>
</tr>
<tr>
<td>“Maximum value”</td>
<td>Expected maximum value of the converted signal (for informational purposes only).</td>
</tr>
<tr>
<td>“Unit”</td>
<td>Unit of the converted signal.</td>
</tr>
<tr>
<td>“ICE data type”</td>
<td>Resulting data type of the I/O channels.</td>
</tr>
</tbody>
</table>

**Dialog 'Add Parameter Group'**

**Table 645: “Database”**

- **CODESYS** shows all parameters of the database in this tab.
- **“Search”** Character string for filtering the PGN list.
- **“Reset”** Reset the filter for showing the full list.
- **“Filter”** Only PGs of the selected type are shown.
- **“Add PG”** Adds the selected parameter group to the TX signal list. Multiple selection of parameter groups is possible.

**Table 646: “Custom”**

In this tab, you can created user-defined parameter groups.

- **“PGN (18 bit)”** Unique number of the PG (0...262143) that is calculated from the four subsequent parameters. You can type in this value directly into the field.
- **“PDU specific (bit 0-7)”** Evaluation of the value depends on the value in “PDU format”.
  - If “PDU format” is between 0 and 239, then the message is addressable and the field contains the target address.
  - If “PDU format” is between 240 and 255, then the message is a broadcast message and the field contains the group expansion.
- **“PDU format (bit 8-15)”** Protocol Data Unit
  - The format determines whether the message can be transmitted with a target address or always as a broadcast message.
- **“Data page (bit 16)”** Selection of the page for the PDU format (currently always 0).
- **“Expanded data page (bit 17)”** Not used: for future expansions.
- **“Name”** Name of the new parameter group.
- **“Length (bytes)”** Length of the parameter group (in bytes).
**Dialog 'Add Signal'

Table 647: “Database”

Signals are added in the same way as for parameter groups.

Table 648: “Custom”

<table>

</tr>
</tbody>
</table>

**Tab 'J1939-ECU - P2P RX Signals'

This dialog is available for local ECUs only. It shows all PGs (parameter groups) that should be received by other ECUs. In this dialog, individual groups can be activated or deactivated, and their parameters can be modified. In addition, new groups or signals can be added to the list.

The commands and parameters of this dialog are the same as those in the “TX Signals” tab.

See also

- Chapter 1.6.6.2.16.2.3.2 “Tab 'J1939 ECU - TX Signals'” on page 3545

**Command 'Scan for Devices'

**Function:** This command establishes a brief connection to the hardware and determines the devices in the network. You can then adopt the devices found into the device tree of your project.

**Call:** Main menu “Project”, context menu of a device object in the device tree.

**Requirement:** The settings for communication with the control device are correct. The gateway and the PLC are running. The device supports the scan function.

The scan functionality is only available for the onboard Profinet IO controller. To use this feature, you must log in once in order to load the library to the onboard Profinet IO controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.
After scanning, the dialog box “Scan for Devices” appears with the results.

**Dialog 'Scan Devices'**

| Table 649: “Scanned Devices” |
| "Device name, Device type, Address, Station name, etc." | Data about the scanned device depending on network type. When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally. Value that indicate differences between the project and the scanned device are shown in orange. If several device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. Details can be found in the corresponding fieldbus sections. If a device description cannot be found, then the following message is shown: "Attention! The device was not found in the repository." Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description. |

| “Show differences to project” | ☑: The table in the dialog also shows additional configured devices (in the device tree of the project). ☐: The table shows all scanned devices. The configured devices are not shown. |

| “Scan Devices” | Starts a new search. |

| “Copy all devices to project” | The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown. |

**NOTICE!**

If you insert devices, which are available in the device tree, to the device tree with “Copy All Devices to Project”, then the following should be noted. The data of the “Process Data” and “<...> I/O Mapping” tabs of the existing devices can be overwritten with the data of the recently inserted devices.

**Table 650: “Configured Devices”**

This part of the dialog is visible only when you select the “Show differences to project” option. Differences between the scanned and configured devices are color-coded. Devices in green are identical on both sides. Device in red are available only in the view of the scanned or configured devices.

| ! | If you have selected a device in both views, then the scanned devices are inserted above the selected configured device. |
| ! | If you have selected a device in both views, then the scanned devices are inserted below the selected configured device. |
| ! | If you have selected a device in both views, then the configured devices are replaced by the selected scanned device. |
| ! | All scanned devices are copied to the project. |
Deletes the selected configure device.

Tab 'CANbus - General'

Table 651: “General”

| “Network” | Number of the CAN network to be linked via the CANbus interface. Permitted values: 0 to 100. |
| “Baud rate” | Baud rate (in bits per second) for transmitting data on the bus. The default value is used from the device description file (*.devdesc) of the CANbus device. You can select the baud rate from the drop-down list or type it directly into the input field. |

1.6.6.2.17 EtherCAT configurator

Refer to the general description for information about the following tabs of the device editor.

– Chapter 1.4.1.24.1.19.11 “Tab <device name> I/O Mapping” on page 787
– Chapter 1.4.1.24.1.19.12 “Tab <device name> IEC Objects” on page 791
– Chapter 1.4.1.24.1.19.13 “Tab 'Parameters'” on page 778
– Chapter 1.4.1.24.1.19.17 “Tab 'Status'” on page 800
– Chapter 1.4.1.24.1.19.18 “Tab 'Information'” on page 800

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

The configuration of EtherCAT modules is based on the device description files for the master and slave devices employed and can be adapted in the project in configuration dialogs. In order to ensure the simplest and most error-free use possible, we recommend for standard applications that you activate the option for the “Automatic Configuration” of the master, so that the majority of the configuration settings are performed automatically.

Requirements

The requirement for the combination of EtherCAT devices with a CODESYS Control Win V3 is the installation of the program library WinPCap (freely downloadable, e.g. from winpcap.org). Furthermore, add the following entries to the CODESYS configuration file (...\GatewayPLC\CODESYSSP.cfg):

- component.<subsequent number>=CmpEt100Drv
  Required only with the RTE. The RTE requires special network drivers. Available for Realtek RTL81x9/RTL8169, Intel Pro 100 / 1000
- component.<subsequent number>=CmpRTL81x9Mpd
  Required only with the RTE. Available for RTL8139.
- component.<subsequent number>=8169Mpd
  Required only with the RTE. Available for Realtek RTL8169 or RTL8168 (PCIe version)
The bus cycle task is set in the general PLC settings.

Access to the EtherCAT configuration by the application takes place via instances of the EtherCAT master and EtherCAT slave. If the EtherCAT master or EtherCAT slaves are inserted as objects into a project, instances are automatically created for master and slaves that can be addressed in the application program. For example a restart, a stop or a status check of the EtherCAT device can be performed from the application.

Furthermore, the EtherCAT library offers function blocks for the reading and writing of individual parameters, even during bus operation.

1.6.6.2.17.1.3 Tab 'EtherCAT Master - Parameter'................................................. 3552

Tab 'EtherCAT Master - General'

Object: “EtherCAT Master”

This tab is for the configuration of the basic settings for the EtherCAT master. The preset basic settings originate from the device description file.

Settings of the configuration parameters

NOTICE!

The auto-configuration mode (“Autoconfig Master/Slaves” option) is activated by default and is adequate for standard applications. If the mode is not activated, all configuration settings for master and slave(s) must be made manually, for which expert knowledge is required! The auto-configuration mode option must be switched off for the configuration of slave-to-slave communication.

“Autoconfig Master/Slaves”

- The greater part of the master and slave configuration is accomplished automatically, based on the device description file and implicit calculations. The dialog for the FMMU/Sync settings is not available.

Even if this option of the master is activated, an expert mode can be activated explicitly for each individual slave that permits the manual editing of the automatically generated process data configuration.
Table 652: “EtherCAT NIC setting”

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>

- Chapter 1.6.6.2.17.2.1 "Tab 'EtherCAT Slave - General' " on page 3552

Tab 'EtherCAT Master - Sync Unit Assignment'

Object: "EtherCAT Master"

This tab shows all slaves that are inserted below a particular master with an assignment to the sync units.
With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for an improved and more precise error detection. As soon as a slave is missing in a sync unit group, the other slaves in the group are also shown as missing. Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. With the device diagnostics, the missing group can be remedied as quickly as possible.

Unaffected groups remain operable without any interference.

Sync unit support is defined by the device description of the EtherCAT master and can be deactivated for OEM-specific device descriptions. By default, it is provided with a device description of version 3.5.8.0 and later.

<table>
<thead>
<tr>
<th>“Device Name”</th>
<th>Name of the slave</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Sync Unit”</td>
<td>Name of the selected sync unit. You can combine individual devices or whole groups (multiple selection) into one sync unit group.</td>
</tr>
<tr>
<td>“Add”</td>
<td>When you type a name in the text field, you can create a new sync unit.</td>
</tr>
<tr>
<td>“Delete”</td>
<td>Removes the selected sync unit. If slaves are assigned to the group to be deleted, then a warning is displayed. If you confirm the dialog prompt by clicking “Yes”, then these devices are reassigned to the default group.</td>
</tr>
</tbody>
</table>

Tab 'EtherCAT Master - Parameter'

Object: “EtherCAT master”

This tab contains the master parameters that are defined in the device description file. If the auto-configuration mode is activated in the “Master” dialog, then the parameters are set automatically here in accordance with the specifications from the device description file and the network topology. Nothing should be changed in the generic editor, since an invalid configuration can be set here.

<table>
<thead>
<tr>
<th>“Value”</th>
<th>Editable, change is only effective if auto-configuration mode is deactivated. Whether or not the change becomes effective depends on the respective parameter.</th>
</tr>
</thead>
</table>

<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Select distributed clocks”</td>
<td>Drop-down list with all settings for distributed clocks in the device description file</td>
</tr>
<tr>
<td>“Activate”</td>
<td>Cycle time for the data exchange, displayed in the “Sync unit cycle (µs)” input field, is determined by the cycle time of the master. The master clock can thus synchronize the data exchange in the network.</td>
</tr>
</tbody>
</table>

The “Sync0” and “Sync1” settings described below are slave-dependent:

Table 659: “Sync0”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Activate sync 0”</td>
<td>Synchronization unit “Sync0” is used. A synchronization unit describes a set of process data that is exchanged synchronously.</td>
</tr>
<tr>
<td>“Sync unit cycle”</td>
<td>The master cycle time (multiplied by the factor selected from the drop-down list) is used as the synchronization cycle time for the slave. “Cycle time (µs)” displays the cycle time currently set.</td>
</tr>
<tr>
<td>“User defined”</td>
<td>A user-defined cycle time (in microseconds) can be specified in the “Cycle time (µs)” field.</td>
</tr>
</tbody>
</table>

Table 660: “Sync1”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Activate sync 1”</td>
<td>Synchronization unit “Sync1” is used. A synchronization unit describes a set of process data that is exchanged synchronously.</td>
</tr>
<tr>
<td>“Sync unit cycle”</td>
<td>The master cycle time (multiplied by the factor selected from the drop-down list) is used as the synchronization cycle time for the slave. The “Cycle time (µs)” field displays the cycle time currently set.</td>
</tr>
<tr>
<td>“User defined”</td>
<td>A user-defined cycle time (in microseconds) can be specified in the “Cycle time (µs)” field.</td>
</tr>
</tbody>
</table>

Table 661: “Startup Checking”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Check vendor ID”</td>
<td>By default the vendor ID and product ID of the device are checked against the current configuration settings when the system boots up. If they do not agree, then the bus is stopped and no further actions are executed. This is done to prevent an incorrect configuration from being loaded onto the bus system. Options to deactivate the corresponding check.</td>
</tr>
<tr>
<td>“Check product ID”</td>
<td></td>
</tr>
</tbody>
</table>
Table 662: “Timeouts”

By default, time monitoring is not defined for the following actions. If necessary, an appropriate "timeout" time can be specified here (in milliseconds):

<table>
<thead>
<tr>
<th>“SDO access”</th>
<th>Transmits the SDO list at system start. Specified in milliseconds.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“I -&gt; P”</td>
<td>Switch from “Init” mode to “Preoperational” mode. Specified in milliseconds.</td>
</tr>
<tr>
<td>“P -&gt; S / S -&gt; O”</td>
<td>Switch from “Preoperational” mode to “Safe Operational” mode or from “Safe Operational” mode to “Operational” mode. Specified in milliseconds.</td>
</tr>
</tbody>
</table>

Table 663: “DC Cyclic Unit Control: Assign to Local µC”

One or more options for the “Distributed clocks” function can be activated here that should be used on the local microprocessor. The check is performed in the registry at 0x980 in the EtherCAT slave. Possible settings:

| “Cycle unit”   |
| “Latch unit 0” |
| “Latch unit 1” |

Table 664: “Watchdog”

Watchdogs PDI and SM receive their signals from the local terminal clock, divided by the watchdog multiplier

<table>
<thead>
<tr>
<th>“Set multiplier”</th>
<th>Watchdogs PDI and SM receive their signals from the local terminal clock, divided by the watchdog multiplier</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Set PDI watchdog”</td>
<td>This watchdog triggers if there is no PDI communication with the EtherCAT slave controller for longer than the PDI (Process Data Interface) watchdog time that has been set and activated.</td>
</tr>
<tr>
<td>“Set SM watchdog”</td>
<td>This watchdog triggers if there is no EtherCAT process data communication with the terminal for longer than the SM (SyncManager) watchdog time that has been set and activated</td>
</tr>
</tbody>
</table>

Table 665: “Identification”

In this section, you set the device identification of the slave. In this way, you can make the address of the slave independent of its position in the bus.

The following options are visible only if the “Enable expert settings” option or “Optional” option is activated.

<table>
<thead>
<tr>
<th>“Deactivated”</th>
<th>The identification of the slave is not checked.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Configured station alias (ADO 0x0012)”</td>
<td>Address that is stored in the EEPROM of the device. You can change this value in online mode.</td>
</tr>
<tr>
<td>“Write EEPROM”</td>
<td>Visible in online mode only for “Configured station alias”. Writes the defined address for “Value” to the EEPROM of the slave.</td>
</tr>
<tr>
<td>“Explicit device identification (ADO 0x0134)”</td>
<td>The device identification is hard set on the hardware (for example, by DIP switches). It is displayed in “Actual address”.</td>
</tr>
<tr>
<td>“Data word (2 bytes)”</td>
<td>A 2-byte value for the identification is saved in the slave.</td>
</tr>
<tr>
<td>“Value”</td>
<td>Expected value for the check. If the actual value does not match this setting, then an error is issued.</td>
</tr>
</tbody>
</table>
“ADO (hex)”
Initial value from the device description. You can change this value in the “Data word” option.

“Actual address”
Visible in online mode only. Displays the address of the slave. You can use this display for checking the success of the command “Write to EEPROM”.

Tab 'EtherCAT Slave - FMMU/Sync'

Object: “EtherCAT Slave”
The tab shows the FMMUs and Sync Manager of the EtherCAT slave as they are defined in the device description file. There is a possibility to edit the FMMUs and Sync Manager, e.g. for the configuration of slave-to-slave communication.

Requirement: The auto-configuration mode in the EtherCAT master is deactivated.

Note that these are expert settings which are not usually required for standard applications!

Table 666: “FMMU”
Table shows the Fieldbus Memory Management Units of the slave, which are used for handling the process data. In each case the allocation of the logical address (“GlobalStartAdr”) to a physical address (“Ph. Start Address”) is defined. Mapping bit by bit is possible.

<table>
<thead>
<tr>

- Chapter 1.6.6.2.17.1.1 “Tab 'EtherCAT Master - General’” on page 3550

Tab 'EtherCAT Slave - Expert Process Data'

Object: “EtherCAT Slave”

This tab provides a different and more detailed view of the process data that is also displayed in the “Process Data” dialog box. Downloads are also selected here for PDO assignment and PDO configuration.

Requirement: The check box for the expert settings of the slave is selected.

See also:
- Chapter 1.6.6.2.17.2.1 “Tab 'EtherCAT Slave - General' ” on page 3552

Table 670: “Sync Manager”

List of sync managers with data size and PDO type

Table 671: “PDO Assignment (16#1C12)”

List of PDOs that are assigned to the selected “Sync Manager”

If a check box is selected, then the PDOs are activated and I/O channels are created. This is similar to the simple PDO configuration window.

Table 672: “PDO List”

List of PDOs that are assigned to the selected “Sync Manager”

You can add new PDOs or edit or delete existing PDOs by executing the respective commands (“Add”, “Delete”, “Edit”) in the command bar or shortcut menu.

Table 673: “Edit PDO List”

<table>
<thead>
<tr>
<th>“Name”</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Index”</td>
<td></td>
</tr>
</tbody>
</table>
**Direction**
- "TxPDO (Input)" [✓]: The PDO is transmitted from the master to the slave.
- "RxPDO (Output)" [✓]: The PDO is transmitted from the slave to the master.

**Flags**
- "Mandatory": The PDO is required and cannot be deactivated in the "PDO Assignment".
- "Fixed Content": The PDO contents are fixed and cannot be changed. Therefore, it is also not possible to add entries to the "PDO Content".
- "Virtual PDO": Reserved for future use

**Exclude PDOs**
It is possible to define an exclusion list. When one PDO is active in the "PDO Assignment", other PDOs are inactive and cannot be activated.

**Sync unit**
ID of the sync manager where the PDO should be assigned

---

**Table 674: “PDO Content”**
Displays the contents of the PDOs that are selected in the “PDO List”. You can add new entries or edit or delete existing entries by executing the respective commands ("Add", "Delete", "Edit") in the command bar or shortcut menu. You can change the PDO order by clicking “Move Up” and “Move Down”.

**Table 675: “Download”**

| PDO assignment | [✓]: Specific CoE commands for initializing the 0x1cxx objects are generated and written to the slave. |
| PDO configuration | [✓]: The CoE commands for 0x16xx or 0x1axx are generated, loading the PDO mapping to the slave. As a rule, the default values originate from the ESI file and the device must support this functionality. For example, if a device has a fixed configuration, then these commands are seen as flawed. |

Tab 'EtherCAT Slave - Startup Parameters'

Object: “EtherCAT Slave”

The SDOs (Service Data Objects) or IDNs that transmit specified parameters to the device at the system start are defined for the current slave in this tab.

The object directory with the required data objects is described in the EtherCAT-ML description file or in an EDS file which is referenced in the XML file.

Requirement: The device supports CAN over EtherCAT or Servodrive over EtherCAT.

Some modules that are inserted below a slave have their own start parameters. These parameters are then also shown in this list but cannot be edited here. The parameters are changed in the editor of the corresponding module.

Table 678: SDO table

</tr>
</tbody>
</table>

Servodrive over EtherCAT

Table 679: “Select an Entry from the Object Directory”

List of the available object directory entries as defined in the XML file.

<table>
<thead>
<tr>
<th>Column “Idn”</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Base value”</td>
</tr>
</tbody>
</table>
Input fields

**“IDN”**
- “S”
- “P”

**“PSet”**
By specifying new “PSet/Offset” entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all is present.

**“Offset”**
By specifying new PSet/Offset entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all is present.

**“Bit length”**
Drop-down list for the selection of the bit length

**“Value”**
Drop-down list for the selection of the value

**“Channel”**
This drop-down list is automatically displayed if the object has several sub-objects.

**“As list”**
Parameters are loaded as a list. The first four bytes indicate the length.

Table 680: “Select an Entry from the Object Directory”

<table>
<thead>
<tr>
<th>Column “Flags”</th>
<th>Display of access flags: RW (read/write), RO (read only), WO (write only)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column “Base value”</td>
<td>Editable (open with double click)</td>
</tr>
</tbody>
</table>

**“Name”**
Input field for displaying and changing the name

**“Index: 16#”**
By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file.

**“Subindex: 16#”**

**“Bit length”**
Value range of the object

**“Value”**
The size of each value can be maximum one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad).

If the “Byte array” option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4).

**“Full access”**
The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every sub-index has to be transferred individually.

**“Byte array”**
Values can be specified as a comma-separated byte array.

Tab 'EtherCAT Slave - Parameters'

Object: “EtherCAT slave”
This tab contains the slave parameters that are defined in the device description file.

If the auto-configuration mode of the master is activated, then the parameters are set automatically here in accordance with the specifications from the device description file and the network topology. For standard applications it is also normally not required to edit them.
Only a few parameters are editable. Change is only effective if auto-configuration mode is deactivated. In principle the user should not change anything here, since in doing so an invalid configuration could be created, thus preventing the slave from entering the operational state.

Bus cycle task - EtherCAT

As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.
The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: "unspecified" in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

![Diagram of bus cycle task and data flow](image_url)

(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

**Using tasks**

The "Task Deployment" provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

**WARNING!**

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

**Behavior of the bus cycle with EtherCAT**

The pending network messages of the last cycle are read before the IEC inputs are copied.
If the “Send/Receive per Task” option is activated in the settings of the EtherCAT master, additional telegrams are transmitted to the devices employed per task and input or output employed. Channels that are used in a slow task are also transmitted less frequently. The bus load can thus be reduced.

PROFINET IO Configurator

**General information about PROFINET IO**

Refer to the general description for information about the following tabs of the device editor.

- Chapter 1.4.1.24.1.19.11 “Tab ‘<device name> I/O Mapping’” on page 787
- Chapter 1.4.1.24.1.19.12 “Tab ‘<device name> IEC Objects’” on page 791
- Chapter 1.4.1.24.1.19.13 “Tab ‘Parameters’” on page 778
- Chapter 1.4.1.24.1.19.17 “Tab ‘Status’” on page 800
- Chapter 1.4.1.24.1.19.18 “Tab ‘Information’” on page 800

Only in the case of special features is there an additional help page for the specific device editor.

If the “<device name> Parameters” tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

PROFINET IO is based on the working model of PROFIBUS DP, but it uses Ethernet TCP/IP for cyclic communication between the central PLC and the distributed field devices. It is appropriate for fast transmission of I/O data, as well as required data, IT functions, and parameters.

Even though the PROFIBUS master-slave method is replaced in principle by a provider-consumer model for PROFINET IO, the PROFINET IO real-time communication for cyclic transmission of user data requires a defined master-slave configuration. Therefore, there is a master (PROFINET IO controller), slaves (PROFINET IO devices), and I/O modules below the slaves.

### PROFINET IO - Controller

#### PROFINET IO Controller - General

Object: PROFINET IO Controller

<table>
<thead>
<tr>
<th>“Station name”</th>
<th>The station name of the device. It is used for unique identification of the device in the network.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“IP Parameter”</td>

<td></td>
</tr>
<tr>
<td>“IO Provider / Consumer Status”</td>
<td></td>
</tr>
<tr>
<td>“Watchdog”</td>
<td></td>
</tr>
</tbody>
</table>
PROFINET IO devices set their inputs and outputs to predefined substitute values when there is an interruption. These values are defined in the field device in contrast with default values. These values are usually zero, but specific substitute values can also be configured depending on the device.

The substitute values are set in the following cases:

- The connection is interrupted.
- The controller sets the provider state for the incoming data to "BAD".
- Other interruptions occur (for example, exception in host application, incorrect parameterization)

PROFINET IO Controller - Bus Cycle Task

As a rule, for each IEC task the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: “unspecified” in the PLC settings). In this task, the messages are normally transferred on the bus.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.

(1) Read inputs from input buffer       (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                        (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks

The “Task Deployment” provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.
WARNING!
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

PROFINET IO does not provide any additional settings. Its functionality corresponds to the general description.

PROFINET IO - Device
PROFINET IO-Device - General
Object: PROFINET IO Device
In this dialog, you configure a communication link (PROFINET IO: application relation) to a PROFINET IO field device.
For all settings in the present dialog, the device description determines if the values here are editable and the values that are predefined or possible.

<table>
<thead>
<tr>
<th>“Station name”</th>
<th>The station name of the device. It is used for unique identification of the device in the network.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Station status”</td>
<td>32-bit error code compliant with the PROFINET IO specification. In case of error, the status is provided here, for example, when establishing a connection fails or a link is interrupted. For some errors, an additional description is provided.</td>
</tr>
<tr>
<td>“IP Parameters”</td>
<td></td>
</tr>
<tr>
<td>“IP address”</td>
<td>The IP settings of the device; set when establishing a connection to the controller.</td>
</tr>
<tr>
<td>“Subnet mask”</td>
<td></td>
</tr>
<tr>
<td>“Default gateway”</td>
<td></td>
</tr>
<tr>
<td>“Communication”</td>
<td></td>
</tr>
<tr>
<td>“Send clock (ms)”</td>
<td>Send clock time (in milliseconds).</td>
</tr>
<tr>
<td>“Reduction ratio”</td>
<td>Scaling factor. The transmission interval results from the “Send clock” multiplied by the “Reduction ratio”. Therefore, a “Send clock” of 1ms and a “Reduction Ratio” of 4 means that I/O data is sent every 4ms.</td>
</tr>
<tr>
<td>“Phase”</td>
<td>With a “Reduction ratio” of ( n ), the transmission interval is subdivided into phases 1 to ( n ) (where transmission is in one phase only). You can determine the phase for transmission for the purpose of load distribution. If “Send clock” = 1 and “Reduction ratio” = 4 (as in the example above), then you could configure phases 1 - 4. For four slaves with this send clock and reduction ratio settings, you could assign one of the four phases to each of the four slaves. In this way, only one data package is sent in each of the four phases of the clock time and the load is distributed equally.</td>
</tr>
</tbody>
</table>
**Watchdog (ms)**  
Monitoring time. Possible values: 3 ms to 1920 ms. (in steps, depends on “Send clock” * “Reduction ratio”)  
A connection is canceled when the controller or the PROFINET IO device does not receive I/O data from the communication peer within this time period. The device enters error mode and switches the outputs to default values.

**VLAN ID**  
VLAN identifier: Number between 0 and 4095 for VLAN type 802.1Q.  
Please note: For newer devices compliant with PROFINET IOspecification V2.3, only "0" is still permitted.

**RT class**  
if available, you can select the required RT class from the list (real-time communication).

**User Parameters**

**Set All Default Values**  
CODESYS resets all settings to default values (see default value column) from the GSDML file.

**Read All Values**  
CODESYS reads the current values from the device and updates them in the editor.

**Write All Values**  
CODESYS writes the current values from the editor to the I/O device. Not all I/O devices support parameter updates in run mode. If not, then an error message is displayed.

---

**PROFINET IO - Module**

**PROFINET IO Module - General**  
Object: PROFINET IO Module

</tr>
</thead>
</table>

| “Write All Values” | CODESYS writes the current values from the editor to the I/O device. Not all I/O module support parameter updates in run mode. If not, then an error message is displayed. |

---

**PROFINET IO - Slave Device**  
The configuration of the PROFINET IO slave device consists of the device itself as well as the modules inserted below.

CODESYS provides two different PROFINET IO slave devices: A variant especially for Hilscher CIFX adapters and a variant that runs on any Ethernet adapter.
When inserting the Ethernet-based slave devices, two tasks are created implicitly that are required by the PROFINET IO communication stack.

- **“Profinet_CommunicationTask”**: This task includes the acyclic communication services, such as establishing connections and diagnostics. These services are not time-critical due to very weak real-time demands. Therefore the task is low priority.

- **“Profinet_IOTask”**: This is where the actual PROFINET IO real-time data exchange takes place. Pending I/O data packets are processed in each cycle (see Slave Configurator: “Send clock”). Therefore, a cycle time of 1ms is required (for 1ms send clock).

For maximum I/O performance with minimum delay when reading/writing, I/O data can be updated in this task (→ insert own POU that updates I/Os in this task). No blocking or persisting operations should be executed in the I/O task, such as visualization or file access. If the task is blocked too long, then the watchdog cancels the connection for communicating with the slave (see Slave Configurator: “Watchdog”).

![NOTICE!](image)

We recommend that you activate the “Refresh I/Os in Stop” option in the PLC settings. Otherwise the communication is canceled when the application stops at a breakpoint.

PROFINET IO Slave device - General

Object: PROFINET IO Slave Device

The tab shows the basic communication preferences.

According to the Profinet standard, the PROFINET IO slave device is responsible for the IP settings of the used adapter. It must save remanent IP settings and be able to reset or modify at the request of the controller (IP=0.0.0.0). Initial state (Reset to factory) is with deactivated IP suite (IP=0.0.0.0).

However, if the PROFINET IO device is a programmable logic controller and connected with the (CODESYS) programming environment via one and the same Ethernet adapter, then modifying and resetting the IP address is interruptive (connection interruption between IDE and PLC). Therefore, one of the modes is provided that deviates from the standard (“Use project parameters”). You must also use this option for Windows and VxWorks systems.

<table>
<thead>
<tr>
<th>Table 688: “IP and Name Assignment”</th>
</tr>
</thead>
<tbody>

1.6.6.3 Protocols and special servers

1.6.6.3.1 IEC60870-5-104 (Telecontrol)

General information IEC60870

Introduction

The implemented IEC60870-5-104 protocol allows link-ups between AC500 CPUs with onboard Ethernet and external systems. The link-up takes place via the onboard Ethernet interface of the CPU. The telecontrol protocol according to IEC60870-5 is used.

The CPU can work as both control station and substation. In control direction, setpoints and commands can be set; in monitoring direction the control station sends status values, real values and discrete values to the substation. Via general inquiry, the substation requests the control station to send all status values, real values and discrete values. Otherwise, these values are sent by the control station on a change-driven basis, cyclically or when triggered by an application. Status values, real values and discrete values may contain timestamps. These are filled in with the time of the process station when sent. The CPU can time-synchronize the telecontrol link.

A module accepts the configuration of the physical interface (link layer) and the general protocol parts (application layer).

Send and receive blocks are available for data exchange. These blocks exist for the IEC60870-5 data types setpoint value, command value, double command value, status value, double status value, real value and discrete value. The inputs/outputs of the send and receive blocks are combined with the signals to be communicated. See documentation of IEC60870 library for more information.

Limits of supported devices

AC500 V3 (Standard):

- PM5630: Support of 5 control stations and/or substations with 1,000 information objects overall on ETH1 and ETH2.
- PM5650: Support of 10 control stations and/or substations with 5,000 information objects overall on ETH1 and ETH2.
- PM5670: Support of 20 control stations and/or substations with 10,000 information objects overall on ETH1 and ETH2.

Data flow control

Each send or receive block can only process one data message. Ideally, new data are available at each user task run-through or new data can be sent.

If the output OV (send block only) indicates TRUE, the Function Block computes more quickly than the data can be sent. This can happen if the receive block is not computed quickly enough and has thus not collected all the data.

Alternatively, this block sends either cyclically or if the input value is changed. Ideally, the topical data can be sent via the telecontrol link in connection with every user task run-through.

Data integrity

With IEC60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

All data transmissions are acknowledged from the link communication level by the receiver. This acknowledgement is not sent to the sender of the data in every telecontrol link.
For data transmission in control direction, additional acknowledgement (e.g. ACTTERM) is possible. These acknowledgements are not sent by every telecontrol link either. For safe data transmission, it is necessary, in such cases, to configure data readback. The receiver then sends the data received back to the sender via the corresponding send blocks.

Information in the monitoring direction is acknowledged by the receiver on the lowest communication level (link level) when received. This acknowledgement is generated by the telecontrol head itself with some telecontrol heads. In the event of overload/overrun, a data message may be lost. For data in the control direction, so-called ACTTERM acknowledgement can be used. This additional acknowledgement is sent back to the sender when the data have been executed in the process. If data are to be sent in the monitoring direction with guaranteed transmission, it is necessary to read back the sent value via another variable and, after observing a monitoring time, resend in the event of an error.

Data transmission

Send blocks

On the basis of the communication protocol, it is sensible to restrict the data types at one send block to one type. Therefore, there are 5 types of send blocks: send of status values, commands, real values, setpoints and discrete values. These types are mapped to the IEC1131 data types BOOL, REAL and DINT. See documentation of IEC60870 Library for more information.

Operating modes of the send blocks

The send blocks know three operating modes to send their data:

- Caused by request pin (SEND)
- Send in connection with a change of data (AUTO)
- Cyclic send of data (CYCLE)

Send via request pin

The SEND signal is evaluated on the rising edge, the RDY signal remains applied for one computation cycle. If a rising edge is generated again at the SEND signal although no acknowledgement has yet been received from the receiver, the OV pin is set in order to indicate that an overrun has happened. The evaluation of the receive acknowledgement is carried out before the evaluation of whether transmission is to take place. This means, assuming that there is an appropriately fast telecontrol link, that in connection with change-driven and cyclic transmission, a transmission job can be sent in connection with every computation of the block. In connection with send via the request pin it is possible to send only in connection with every second computation (send takes place only with a rising edge).

Change-driven send of data

Data are always sent when the value of the input variables changes. When changes take place, there is an internal simulation that the SEND pin changed from 0 to 1.

In order to prevent unnecessarily frequent send in the event of mild fluctuations in the input value, a threshold value can be configured for real values and setpoints. The input value is not sent until it differs positively or negatively from the value last sent by more than the threshold value.

If the input value changes again although no acknowledgement has yet been received from the receiver, the OV pin is set in exactly the same way as in connection with send via the request pin. If an error occurs during send, the job is automatically retried until the value has been sent without error.
Cyclic send

The data are automatically sent after expiration of a configurable cycle time (SCANDOWN). This cycle time is indicated in multiples of the task cycle time in which the block is computed. In this operating mode, an overrun error can occur if the transmission is faster than the response time of the receiver. For setpoints, it is necessary to ensure that an acknowledgement is generated by the receiver which is not sent until the setpoint is accepted. The send block is not ready for transmission again until after this acknowledgement has been received.

Receive blocks

In receive direction, the jobs enter the device module via the interface. The device module selects the correct receive block using the telecontrol address. To this end, during installation the receive blocks pass their parameterized telecontrol addresses to the device module. The device module stores the data received and the receive blocks make the data available at their output pins in connection with the next computation of the user task.

Configuration

Configuration changes >= Automation Builder 1.1/CBP 2.4

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM595-4ETH and PM591-2ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU. As of Automation Builder Version 1.1 telecontrol is also supported for CPUs that provide more than one Ethernet interface (e.g. PM595-4ETH and PM591-2ETH). This allows to use different Ethernet interfaces for IEC 60870 connections, hence, telecontrol configuration is changed. Further, as of this version terminology is aligned with IEC 60870 standard and provides additional features that are described in this chapter. For a description on principle telecontrol configuration.

For further information on configuration changes, see the following chapters:

Control and Substations ≥ CBP 2.4 Chapter 1.6.6.3.1.2.2 “Control station and substation configuration” on page 3574
Control station and substation configuration

The CPU can work as both, control station and substation.

<table>
<thead>
<tr>
<th>Control station</th>
<th>Client, master, controlling station: Synonyms for a higher-level station (central station, monitors other stations)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control direction</td>
<td>Data transfer direction from the control station to the substation</td>
</tr>
<tr>
<td>Substation</td>
<td>Server, slave, controlled station; synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)</td>
</tr>
<tr>
<td>Monitoring direction</td>
<td>Data transfer direction from the substation to the controlling station</td>
</tr>
</tbody>
</table>

Configure a control station in the device tree PLC -> Interfaces -> Ethernet -> ETHx:

1. Right-click “ETHx ➔ Add objects”.
2. Select the control station from the list and click “Add object”. Configure substations and further control stations in the same way. As of Automation Builder 1.1 any combination of control stations and substations can be configured, in due consideration of a total number of 10 stations.
3. Double-click the new control station node to open parameter configuration. In the Link Layer tab access to the Ethernet interface is configured.

As of Automation Builder 2.2.1 the V3 PLC telecontrol station objects from GVL IEC60870_5_104_Connection_GVL can only be used in structured text by adding the namespace of the GVL as prefix.

Example:

```
byteValue := IEC60870_5_104_Connection_GVL.IEC_60870_5_104_Control-station.Con;
```
Tab link layer

In order to provide flexible usage of control stations and substations as of Automation Builder 1.1 configuration of substations has been changed. As several substations can be operated with several Ethernet interfaces, select the Ethernet interface to be used from the pull-down menu. Enter the IP address to the control station and if required to another control station (redundant connection). If no IP address is defined, the substation accepts connection to any control station.

This field is not available in the Link Layer tab of control stations. Selection of ETH interface is only possible for substations. The control station is always configured on both interfaces by default.

Timeout settings
T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

Buffer settings
This parameter gives the maximum number of outstanding messages and acknowledgement behaviour.
Send buffer (k): Maximum difference receive sequence number to send state variable.
Rec buffer (w): Latest acknowledge after receiving w I format APDUs.

Network settings
Network settings are available for control stations and for substations. The IP address of the control station and if available the IP address of another control station (redundant IP address) can be selected by the user.

For an overview on the configured Ethernet interfaces for the control stations and substations, double-click the “Protocols” node.

Tab application layer

Settings
The application layer is the communication layer with which the send and receive blocks work.
Use ACTTERM

This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output (see ) to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

ForeignAcknowledgment

If this option is not enabled (default), a message that was sent is considered as ok as soon as transmission was successful. If you enable this option, a message that was sent is not considered as ok until a success message (foreign acknowledge) is returned from the receiver.

Application timeout

This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

Station address

The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (Common addr.). The values concerned are as follows:

0: The station address is not used.
1...254: The count is queried on the station defined by the station address.
255: The count is queried on all accessible stations.

Timesync

After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided! Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.
After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

General inquiry
Activated
This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

With parameters
If general inquiry is activated the parameter values are sent.

Without integrated totals
With a general inquiry no integrated total values are sent.

Counter interrogation
Group
General, 1 .. 4: The count inquiry is executed for a specific group of counters (1 .. 4). The count inquiry is executed for all groups of counters.

With reset
The reset quality bit is sent along with the count inquiry.

With relocate
The relocate quality bit is sent along with the count inquiry.

Tab information objects
Open the “Information object” tab to configure so called Information objects and a Common address (known as ‘data points’ and ‘Global address’ in former Automation Builder versions). In this tab different information objects and their services for transmission are defined. A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes.

1. Right-click in the empty view and select “Add Information Object with ASDU” to add a data group. Select the desired object from the list (e.g. M_SP_NA_1).
   ⇒ An information object with a corresponding ASDU (Application Service Data Unit) is created.

2. Configure the settings in the “Information Object” tab to your convenience.

<table>
<thead>
<tr>
<th>ASDU name</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

3. Double-click a table cell to modify pre-set values. For some ASDUs additional sub information objects can be configured. For this, right-click the already existing ASDU and select “Add Information Object” to selected ASDU option. This allows configuration of 16 data points at the most (depending on the ASDU type). With “Remove Information Object” the selected ASDU is deleted.
Description of the columns

- ASDU name: node name of the information object (name of the ASDU).
- Data type: Data type of the ASDU.
- ASDU type: Type of ASDU.
- Common addr: Common address of the ASDU (known as 'Global Address' in former AB Versions). Byte 1/2 of the common telecontrol address of the block (range: 0...255).
- Info obj addr: Together with common address Info obj addr defines the endpoint (range: 0...255).
- Norm start: Low limit (0 %) of the normalized range for real values and setpoints.
- Norm end: High limit (100 %) of the normalized range for real values and setpoints.
- Threshold: Threshold limit beyond which a change of the input value referred to.
- Description: Table cell for free text. Use this field to describe your configuration settings e.g. differences between configuration variants.

Format of common addr and info obj addr

The following address formats of your entries in the columns Common addr and Info obj addr of the Tab Information Objects are possible:

- 1.2 and 3.4.5 (Default format)
- 1-2 and 3-4-5
- 258 or hex 0x102 and 197637 or hex 0x30405
- 513 or hex 0x201 and 328707 or hex 0x50403

Previously you have to choose your preferred address format:
1. Click “Tools” and then “Options…”
   ⇒ The Window Options appears

![Options Window Image]

2. Select IEC 60870-5-104, make your choice and click OK.

Import options of information objects

The User can accept the imported IEC60870 Information Objects as single change or change as block.

![Import Options Image]

IEC60870-5-104 Multiple connections

An AC500 with more than one substation connection must be able to identify the corresponding control station clearly. This identification takes place exclusively via the control station’s IP address. In order to make it possible for a non-redundant control station to have redundant access to a substation with 2 Ethernet connections. The local substation address is ignored during connection establishment.

In the following descriptions, the term station must not be confused with the individual connection. One station can have several connections. An IEC60870-5-104 communication always takes place between a control station and a substation. A control station can manage several substations and also simultaneously be a substation for one or several control stations. However, these must then be realized using different stations.

A PLC may not be configured for another PLC repeatedly as a substation or a control station unless a disjunctive Ethernet infrastructure is used for this.

Redundant connections must be specified as such in the configuration.
An AC500 can be used only once as control station for another AC500, it makes no sense to use the same AC500 repeatedly as a control station for the same substation. Such a structure is configured as a redundant control station as long as only one AC500 exists as a control station per substation. However, this control station may have 2 IP addresses. Therefore, this configuration must either have the IP address 0.0.0.0 entered on the substation for the control station, meaning that all IP addresses are accepted and no other control station can access this AC500 or alternatively the possible control station addresses must be specified (ETH1 and ETH2).

Tree constellation

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

If you plan to control several substations with the AC500, they can be cascaded. This results in a tree structure.

1. 2 control stations
2. Substation and 3 control stations
3. Substation and 3 control stations
4. Substation
5. Substation

Structures of connections

In the following, the notation 192.168.1.0/24 is used for TCP/IP networks. Here, the figure /24 specifies the network mask with 255.255.255.0 and 192.168.1.0 describes the network. The valid addresses for this Class C network are 192.168.1.1 to 192.168.1.254! Only the last byte of the address is provided on the respective devices, with e.g. .10. This means that the respective device has the address 192.168.1.10.
Minimal structure

A control station with an Ethernet interface is connected to a substation with an Ethernet interface.

Configuration at control station

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

The respective substation IP address must be specified at the control station. For this, in the network settings of the control station (1) enter the IP address of the substation (in the example: 192.168.1.25). Option "Enable redundant connection" must be disabled.

Configuration at substation

PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:

Either the control station IP address or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP address of the control station (in the example: 192.168.1.10). Option “Enable redundant connection” must be disabled.

If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.
Minimal redundancy structure

The most simple redundant structure with an AC500 consists of a redundant control station (not AC500) which is connected to the AC500 substation with 2 different IP addresses. These redundant control stations must synchronize which control station is active.

Only one control station can be active at any given time.

Configuration at control stations
The respective substation IP address must be specified at the control stations 1 and 2 (not AC500). For this, in the network settings of both control stations enter the IP address of the substation (in the example: 192.168.1.25).

Configuration at substation
PM57x/- PM58x/- PM59x-ETH, PM5650-2ETH:
Either the control station IP addresses or the general address 0.0.0.0 must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.1.11). Option “Enable redundant connection” must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.
Network redundancy

For network redundancy a control station can reach a substation via 2 paths.

Both the control station and the substation can have 2 different IP addresses. Without special network routing, 2 separate networks should exist, within which both the substation and the control station each have 2 interfaces.

Possible variants of network redundancy are described in the following.

Network redundancy with 2 separate networks

![Diagram showing network redundancy with 2 separate networks](image)

(1) Control station with 2 redundant paths
(2) 1 Substation with 2 Ethernet interfaces

### Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be enabled.

### Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station’s IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

---

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.
Network redundancy with 1 network and 2 Ethernet ports in substation

(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

**Configuration at control stations**

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option “Enable redundant connection” must be enabled.

**Configuration at substation**

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station’s IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

*If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*
Network redundancy with 1 network and 1 Ethernet port in substation

> No online redundancy.
> Only one connection will be established.

(1) Control station with 2 paths to reach substation
(2) 1 Substation with 1 Ethernet interface

**Configuration at control stations**

PM591-2ETH, PM595-4ETH, PM5650-2ETH:
The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 0.0.0.0). Option “Enable redundant connection” must be disabled.

**Configuration at substation**

PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.
Network redundancy with 2 Ethernet ports in substation

1 Substation with 2 Ethernet interfaces

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation’s IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option “Enable redundant connection” must be enabled.

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.11 and 0.0.0.0). Option “Enable redundant connection” must be disabled.

Configuration at substation

*If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*
**Full control station redundancy**

A control station can consist of two fully redundant units (not AC500s), which are connected via a redundancy link. These control stations must ensure that only one of them at a time is actively connected to the substation and communicates with it. The inactive control station, however, can establish non-active connection with a substation and monitor it with keep alive packages.

(1) 2 redundant Control stations (Not AC500)
(2) 1 Substation with redundant Control station and 2 Ethernet interfaces (2nd port)
(3) Redundancy link

**Configuration at control stations**
The substation’s IP address must be specified at the control stations (1) (not AC500). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26).

**Configuration at substation**
PM591-2ETH, PM595-4ETH, PM5650-2ETH:
Either the control station’s IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be enabled.

---

If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.
Multiple control stations on the same network

As of firmware version 2.4, an AC500 can be used as a substation for several control stations. For this, the control stations must be distinguished by their IP addresses. Should a control station have more than one IP address (redundancy), both possible IP addresses should also be entered for the allocated substation connection. As a result, even despite being equipped with several Ethernet interfaces, a device can only be one allocated control station at a time for a determined substation. Thus, several substations can be configured for different control stations on an AC500.

(1) Control station 1
(2) Control station 2
(3) 2 Substations (IEC60870-5-104 2nd Connection)

Configuration at control stations
PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
The substation's IP address must be specified at the control stations. For this, in the network settings of the control station (1 and 2) enter the IP addresses of the substation (in the example: 192.168.1.25). Option "Enable redundant connection" must be disabled.

Configuration at substations
PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:
Both control station's IP addresses must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.1.11). Option "Enable redundant connection" must be disabled.
Multiple control stations on different networks

As of firmware version 2.4, an AC500 can have several local Ethernet interfaces which can be used for separate control station connections. For this, a control station must be identified via its IP address. The substation address used locally is not used to distinguish a connection in order to enable a network and therefore route redundancy. On AC500, the acceptance of IEC60870-5-104 connections on an interface can only be prevented.

(1) Control station 1
(2) Control station 2
(3) 2 Substations with 2 Ethernet interfaces (2nd port and 2nd connection)

**Configuration at control stations**

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1 and 2). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option “Enable redundant connection” must be disabled.

**Configuration at substations**

PM591-ETH, PM595-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3) under both substation connections. For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.2.11). Option “Enable redundant connection” must be disabled.
Double connection

This configuration **does work**.

But it is **senseless**!

It is possible to configure a double connection between 2 stations using 2 separate networks (at least logically separated sub-networks).

However, such a setup has no advantages *via-à-vis* the minimal structure right at the start *✓ Chapter 1.6.6.3.1.2.2.6.1.1 “Minimal structure” on page 3581.*

For this setup, connection data must be double configured and double resources are also required at the stations, not providing any advantages whatsoever.

Rather the opposite is true, because such configurations are highly prone to errors.

(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces
Faulty configuration

This configuration does not work!

If an AC500 is configured as a control station, the interface which is used to reach the substation is not defined.

The decision as to which interface is used for this is taken by TCP/IP when running.

It is also dependent on the current network configuration.

Here, the current link status and the order of link recognition may be decisive for the interface to be used.

Such a scenario would not result in stable communication as both substations cannot clearly distinguish the control stations.

Instead, the connection management for a substation will assume that the control station has lost the connection and then establishes a connection.

(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

Export a CSV file

As an alternative many values can be modified at a time by exporting the configuration to a CSV file. After modifying the file data, import the CSV file ⇨ Chapter 1.6.6.3.1.2.3 “Import/Export functionality ” on page 3592.
Import/Export functionality

As of Automation Builder 1.1 (CBP >= 2.4) configuration of control stations and substations can be exported/imported via CSV file. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and modify the values within the file to your convenience:

1. Export configuration data: right-click the node of the control station or substation to be exported.
2. Click “Export ➔ IEC 60870-5-104 information objects (CSV)” and store the CSV file to a desired directory.
3. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and change the values to your convenience. Added table columns are only accepted after the last column.
4. Import configuration data: right-click the node of the control station or substation that has been exported previously.
5. Click “Import ➔ IEC 60870-5-104 information objects (CSV)” and select the CSV file from the file system. Configuration data is imported.

As of Automation Builder 1.1.1 during file import the project data is compared with the project data that is already available. In order to prevent data from being overwritten inadvertently, you can select the data that shall be imported in the “Project Compare - Differences” window:

Data on the left side of the window refers to already available project data. This data is displayed under “Control station ➔ Information objects” tab. Data on the right side of the window refers to new data that can be imported after your confirmation. Decide whether to import (and overwrite) the data or not.
● Data in black color means the existing data and the data to be imported is identical.
● Data in red color means the existing data and the data to be imported differ. Decide whether to import the new data (and to overwrite the existing data) or not.
● Data in blue color means, the data to be imported is new and will be added to the existing data.
● Data that has been confirmed for the import already is displayed in green color (after clicking the [Accept Single] button).

In order to move data from one side of the window to another, select the data and click the [Accept Single] button. Data is highlighted in yellow.

To confirm the import of all new data, click the top entry (here: All: ASDU name - ASDU type - Common addr - ...). Then, click the [Accept Single] button.

Close the "Project Compare - Differences" tab, save your project and confirm the message. The changes are displayed in the "Information objects" tab.

Validity check of configuration

We recommend you to verify the IEC configuration of control stations and substations: Right-click a control station or substation -> Check configuration.
The check will look for the following topics:

- Duplicate addresses.
- Stations without any Information objects.
- ASDU names, which are not unique.

When a check finds errors or incompatibilities this will be reported in a separate messages view at the bottom of the window:

With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

IEC60870 compatibility list
AC500 V2.4 IEC60870-5-104 Compatibility List

9 Interoperability

This companion standard presents sets of parameters and alternatives from which subsets must be selected to implement particular telecontrol systems. Certain parameter values, such as the choice of "structured" or "unstructured" fields of the INFORMATION OBJECT ADDRESS of ASDUs represent mutually exclusive alternatives. This means that only one value of the defined parameters is admitted per system. Other parameters, such as the listed set of different process information in command and in monitor direction allow the specification of the complete set or subsets, as appropriate for given applications. This clause summarizes the parameters of the previous clauses to facilitate a suitable selection for a specific application. If a system is composed of equipment stemming from different manufacturers, it is necessary that all partners agree on the selected parameters.

The interoperability list is defined as in IEC 60870-5-101 and extended with parameters used in this standard. The text descriptions of parameters which are not applicable to this companion standard are strike-through (corresponding check box is marked black).

NOTE In addition, the full specification of a system may require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

The selected parameters should be marked in the white boxes as follows:

- □ Function or ASDU is not used
- X Function or ASDU is used as standardized (default)
- R Function or ASDU is used in reverse mode
- B Function or ASDU is used in standard and reverse mode

The possible selection (blank, X, R, or B) is specified for each specific clause or parameter.

A black check box indicates that the option cannot be selected in this companion standard.

9.1 System or device
(system-specific parameter, indicate definition of a system or a device by marking one of the following with "X")

- □ System definition
- □ Controlling station definition (Master)
- □ Controlled station definition (Slave)

9.2 Network configuration
(network-specific parameter, all configurations that are used are to be marked "X")

- □ Point-to-point
- □ Multiple-point-to-point
- □ Multipoint
- □ Multipoint-star
### 9.3 Physical layer

*network-specific parameter, all interfaces and data rates that are used are to be marked "X"

**Transmission speed (control direction)**

<table>

</tbody>
</table>

### 9.4 Link layer

*network-specific parameter, all options that are used are to be marked "X". Specify the maximum frame length. If a non-standard assignment of class 2 messages is implemented for unbalanced transmission, indicate the Type ID and COT of all messages assigned to class 2.*

Frame format FT 1.2, single character 1 and the fixed time out interval are used exclusively in this companion standard.

**Link transmission**

- Balanced transmission
- Unbalanced transmission

**Frame length**

- Maximum length L (number of octets)

**Address field of the link**

- not present (balanced-transmission only)
- One octet
- Two-octets
- Structured
- Unstructured
When using an unbalanced link layer, the following ASDU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

- The standard assignment of ASDUs to class 2 messages is used as follows:

<table>
<thead>
<tr>
<th>Type identification</th>
<th>Cause of transmission</th>
</tr>
</thead>
<tbody>
<tr>
<td>9, 11, 13, 21</td>
<td>&lt;1&gt;</td>
</tr>
</tbody>
</table>

- A special assignment of ASDUs to class 2 messages is used as follows:

<table>
<thead>
<tr>
<th>Type identification</th>
<th>Cause of transmission</th>
</tr>
</thead>
</table>

Note: (In response to a class 2 poll, a controlled station may respond with class 1 data when there is no class 2 data available).

9.5 Application layer

Transmission mode for application data

Mode 1 (Least significant octet first), as defined in 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common address of ASDU

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet
- Two octets

Information object address

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet
- Two octets
- Three octets

Cause of transmission

(system-specific parameter, all configurations that are used are to be marked "X")

- One octet

Length of APDU

(system-specific parameter, specify the maximum length of the APDU per system)

The maximum length of APDU for both directions is 253. It is a fixed system parameter.

- Maximum length of APDU per system in control direction

- Maximum length of APDU per system in data direction
AC500 V2.4 IEC60870-5-104 Compatibility List

### Selection of standard ASDUs

**Process information in monitor direction**

(Station-specific parameter, mark each Type ID "X" if it is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

9.6 Basic application functions

Station initialization
(station-specific parameter, mark "X" if function is used)

- Remote initialization

Cyclic data transmission
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions)

- Cyclic data transmission

Read procedure
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions)

- Read procedure

Spontaneous transmission
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions)

- Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous
(station-specific parameter, mark each information type "X" where both a Type ID without time and corresponding Type ID with time are issued in response to a single spontaneous change of a monitored object)

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

- Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- Bitstring of 32 bit M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1 (if defined for a specific project)
- Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- Measured value, short floating point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1
AC500 V2.4  IEC60870-5-104 Compatibility List

Station interrogation
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Global
- Group 1
- Group 2
- Group 3
- Group 4
- Group 5
- Group 6
- Group 7
- Group 8
- Group 9
- Group 10
- Group 11
- Group 12
- Group 13
- Group 14
- Group 15
- Group 16

Information object addresses assigned to each group must be shown in a separate table.

Clock synchronization
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Clock synchronization
- Day of week used
- RES1, GEN (time tag substituted/ not substituted) used
- SU-bit (summertime) used

optional, see 7.6

Command transmission
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Direct command transmission
- Direct set point command transmission
- Select and execute command
- Select and execute set point command
- C_SE ACTTERM used
- No additional definition
- Short-pulse duration (duration determined by a system parameter in the outstation)
- Long-pulse duration (duration determined by a system parameter in the outstation)
- Persistent output
- Supervision of maximum delay in command direction of commands and set point commands
- Maximum allowable delay of commands and set point commands
AC500 V2.4 IEC60870-5-104 Compatibility List

Transmission of integrated totals
(station- or object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Mode A: Local freeze with spontaneous transmission
- Mode B: Local freeze with counter interrogation
- Mode C: Freeze and transmit by counter-interrogation commands
- Mode D: Freeze by counter-interrogation command, frozen values reported

- Counter read
- Counter freeze without reset
- Counter freeze with reset
- Counter reset

- General request
- Request counter group 1
- Request counter group
- Request counter group 3
- Request counter group 4

Parameter loading
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Threshold value
- Smoothing factor
- Low limit for transmission of measured values
- High limit for transmission of measured values

Parameter activation
(object-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Act/deact of persistent cyclic or periodic transmission of the addressed object

Test procedure
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Test procedure
AC500 V2.4 IEC60870-5-104 Compatibility List

**File transfer**
(station-specific parameter, mark "X" if function is used).

- File transfer in monitor direction
  - Transparent file
  - Transmission of disturbance data of protection equipment
  - Transmission of sequences of events
  - Transmission of sequences of recorded analogue values

- File transfer in control direction
  - Transparent file

**Background scan**
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Background scan

**Acquisition of transmission delay**
(station-specific parameter, mark "X" if function is only used in the standard direction, "R" if only used in the reverse direction, and "B" if used in both directions).

- Acquisition of transmission delay

**Definition of time outs**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default value</th>
<th>Remarks</th>
<th>Selected value</th>
</tr>
</thead>
<tbody>
<tr>
<td>t₀</td>
<td>30 s</td>
<td>Time-out of connection establishment</td>
<td></td>
</tr>
<tr>
<td>t₁</td>
<td>15 s</td>
<td>Time-out of send or test APDUs</td>
<td></td>
</tr>
<tr>
<td>t₂</td>
<td>10 s</td>
<td>Time-out for acknowledges in case of no data messages $t_2 &lt; t_1$</td>
<td></td>
</tr>
<tr>
<td>t₃</td>
<td>20 s</td>
<td>Time-out for sending test frames in case of a long idle state</td>
<td></td>
</tr>
</tbody>
</table>

Maximum range for timeouts $t₀$ to $t₂$: 1 s to 255 s, accuracy 1 s. Recommended range for timeout $t₃$: 1 s to 48 h, resolution 1 s. Long timeouts for $t₃$ may be needed in special cases where satellite links or dialup connections are used (for instance to establish connection and collect values only once per day or week).

**Maximum number of outstanding I format APDUs $k$ and latest acknowledge APDUs ($w$)**

<table>
<thead>
<tr>

### RFC 2200 suite

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

- Ethernet 802.3
- Serial X.21 interface
- Other selection from RFC 2200:

1.6.3.2 IEC 61850 Server

IEC 61850 Server

The package CODESYS IEC 61850 Server is a configurator for creating an IEC 61850 Server according to IEC 61850. The IEC 61850 is the communication standard for switchgear automation of medium and high voltage technology.

The essential features of this package are:

- Configuration of data models for IEDs (Intelligent Electronic Device) with logical devices, logical nodes, data objects and data attributes
- Generation of the corresponding IEC 61131-3 code
- Mapping of data attributes to IEC 61131-3 variables
- Configuration of dynamic datasets
- Buffered and unbuffered Reports
- Protocols implemented: MMS and GOOSE
- Import/Export of different SCL formats

Inserting the IEC 61850 Server into the device tree

The IEC 61850 Server is inserted below an Ethernet Adapter in the device tree. For this select the Ethernet Adapter in the device tree and activate the context menu command “Add device...”. In the opened dialog select the IEC 61850 Server in the “Miscellaneous” category and activate the “Add device” button.

The configuration of the IEC 61850 Server takes place in the % Chapter 1.6.6.3.2.3.1 “IEC 61850 Editor” on page 3616.

Quickstart

Here, a project with an IEC 61850 Server is created as an example. After the configuration of the Server, a dataset is created and assigned to a Report. Subsequently the code is generated for the IEC 61850 Server and the project is loaded to the PLC. On the PLC the project can be connected with an IEC 61850 client.

Step 1: Create a new project and insert the IEC 61850 Server

First create a new project. Select the “Standard project” template.

Subsequently the dialog opens for selecting the PLC and the implementation language. Select the CODESYS Control Win V3 PLC and the “Structured Text (ST)” implementation language.

Now the project is created displayed with its objects in the device tree.

In order to add the IEC 61850 Server to the PLC, first add an Ethernet Adapter:

1. Mark the PLC in the device tree and activate the context menu command “Add Device...”
2. In the “Add Device” dialog select the adapter “Ethernet” of the “Fieldbusses ➔ Ethernet Adapter” category and confirm your selection by activating the “Add Device” button.

Subsequently, add the IEC 61850 Server to the Ethernet Adapter as follows:

1. Select the Ethernet Adapter in the device tree and activate the context menu command “Add Device...”.
2. In the “Add Device” dialog select the “IEC 61850 Server” of the “Miscellaneous” category and confirm your selection with the “Add Device” button.
Fig. 279: ‘Add Device’ dialog

Now the IEC 61850 Server is inserted in the device tree.
Step 2: Add the Logical Device to the server

Open the editor for the configuration of the server via a double-click on the IEC 61850 Server in the device tree.

First a “Logical Device” is added to the server. The “Logical Device” is the instance of an IED.

1. Select the “Logical Device”
2. Activate the “>” button

Together with the “Logical Device” the two LNC instances “LLN0” and “LPHD1” are added. These two information objects are elements of every IED and cannot be removed.
Step 3: Add another LNC instance to the Logical Device

1. Select the “Logical Device” below the server
2. On the left-hand side select the “XCBR” LNC instance below “LN [Xxx]-Switchgear”
3. Activate the “>” button

Step 4: Expand the “XCBR” LNC instance with the optional “MaxOpCap” CDC instance

If you select the LNC instance on the right-hand side, all of the optional and obligatory CDCs (data objects) will be displayed on the left-hand side.

1. Select the “XCBR” LNC instance on the right-hand side
2. Select the “MaxOpCap” CDC instance on the left-hand side
3. Activate the “>” button
Fig. 284: XCBR1 with 'MaxOpCap' CDC

Step 5: Link an attribute (DA) of the IEC 61850 Server with a CODESYS variable

1. Select the desired attribute (in the example: “Server ➔ LogicalDevice ➔ XCBR1 ➔ MaxOpCap ➔ DA (ST I INT32) StVal ”)

2. Edit the CODESYS variable name in the input field “Monitoring Var” (in the example Var_stVal) in the “Properties” section

The “Autom. declare” option must be activated, thus the variable is declared automatically as global variable by the IEC 61850 Server. You can edit the initial value in the input field next to the “Monitoring Var” field.
In this step you create a dataset (Compilation of data) for the IEC 61850 configuration created in the previous steps.

1. Open the “DataSet” tab
2. Activate the “New” button. The created “LLN0.dataSet_0” dataset is displayed in the “DataSets” section.
3. Select the “LLN0.dataSet_0” DataSet
4. Select the “MaxOpCap” data object on the left-hand side ("Server ➔ LogicalDevice ➔ LN XCBR1 ➔ FC ST ➔ DO MaxOpCap")
5. Activate the “>” button.
Now the DataSet contains the data object “LogicalDevice/XCBR1.ST.MaxOpCap”

Fig. 286: 'DataSet' tab

Step 7: Create a Report

In this step you assign a report to the defined DataSet. A report transports the data assigned via a dataset to a connected client in the event of a trigger (see Trigger Options).

1. Open the “Report” tab
2. Activate the “New” button. The “RCB_1” is displayed in the “Reports” section. In the “Name:” field you can change the name of the report.
3. Select the “LLN0.DataSet_0” dataset in the “DataSet” selection list

Fig. 287: 'Report' tab with created 'RCB' report

You set options about the reporting behavior in the “General options” section, you select the events that trigger a report in the “Trigger Options” section (for more information about these options see Trigger Options).
Step 8: Generate code and load the application to the PLC

The “Generate code” command of the menu “IEC61850” generates code from the created configuration and puts it into the “IEC61850 Generated POU’s” folder of the device tree.

Fig. 288: device tree with ‘IEC61850 Generated POUs’

The global variable “Var_stVal” created in step 5 is listed in the “IEC61850_Generated_GVL” global variables list.

Fig. 289: IEC61850_Generated_GVL with ‘Var_stVal’

Subsequent compile the application via the “Build ➔ Build” command.

Step 9: Connecting with an IEC 61850 Client

If the application was finished successfully you create a connection to an IEC 61850 client in this step. For this, login to the PLC and start the application via the “Start” command of the “Debug” menu. Now you connect an IEC 61850 client with the IEC 61850 Server. By the client you can read out your IEC 61850 Server configuration and the configured DataSets und Reports, as well as you can receive GOOSE messages and send GOOSE messages to the server.
Editor of the IEC 61850 Server

IEC 61850 Editor

You open the editor of the IEC 61850 Server with the “Edit Object” command of the “File” category or with a double-click on the device in the device tree.

If you move the mouse pointer over buttons, options or names of input fields in this editor more information about the element is displayed by the tooltip.

The tabs of the editor:

- Chapter 1.6.6.3.2.3.2.1 “Configuration” on page 3616
- Chapter 1.6.6.3.2.3.3 “DataSet” on page 3626
- Chapter 1.6.6.3.2.3.4 “Report” on page 3627
- Chapter 1.6.6.3.2.3.5 “GOOSE Publisher” on page 3629
- Chapter 1.6.6.3.2.3.6 “GOOSE Subscriber” on page 3631
- Chapter 1.6.6.3.2.3.7 “Information” on page 3633

Configuration

In the “Configuration” tab of the IEC 61850 editor you create, configure an parametrize the IED from the pool of the existing LNC and CDC types.

Fig. 290: ‘Configuration’ tab

“Configuration” is split in 4 sections:
● Section 1 and section 2 are for creating the IEC 61850 Server. In section 1 all of the choices are displayed, which can be added to the instance currently focused or to the object of the server currently focused in section 2. In the default setting there is the Logical Device (LD) in section 1 and the server (S) in section 2. For more information see Chapter 1.6.6.3.2.3.2.2 “Creation of the IEC 61850 Server” on page 3617.

● In the “Properties” section 3 the following activities can be performed, depending on the selected objects:
  – “Parametrization of the IEC 61850 Server” on page 3620
  – “Entry of a device name for the Logical Device” on page 3621
  – “Connecting an attribute (DA) with a CODESYS variable” on page 3621
  – “Entry of a node prefix for LNC instances” on page 3624

● 4 is the status bar. For a more information see Chapter 1.6.6.3.2.3.2.4 “Status bar” on page 3624.

Creation of the IEC 61850 Server

Adding instances
You add an element to the server or to the marked instance below the server by selecting the element in section 1 and activating the “>” button or by a double-click on the element.

Removing instances
To delete instances below the server, mark the instance and activate the “<” button.

Configure the server

If you create a new configuration, the default settings in the Chapter 1.6.6.3.2.3.2.1 “Configuration” on page 3616 tab are: the Logical Device in section 1 and the server in , section 2.

First the “Logical Device” (LD) is added to the server. The Logical Device is an instance of an IED (intelligent field device). Together with the Logical Device the objects having the option ‘mandatory’ are added automatically. These objects added automatically cannot be removed from the Logical Device.

Fig. 291: Server with Logical Device and objects ‘LLN0’ und ‘LPHD’

Any number of logical nodes (LN) can be added to the Logical Device.
Fig. 292: 'Configuration': List of the available LACS

If you mark a LNC instance in section 2 all mandatory and all optional CDC types (data object DO) will be listed in section 3. The mandatory CDC types (Mod, Beh, Health, NamPit, in the example) are already contained in the LNC instance (LN GGI01) and can not be removed.

Fig. 293: 'Configuration' list of the CDCs (DO) available for the GGI01

The DOs include the attributes (DAs)
The attributes of the server can be connected with CODESYS variables (see "Connecting an attribute (DA) with a CODESYS variable" on page 3621).

Properties

In the "Properties" section of the "Configuration" on page 3616 tab the following functions can be performed dependent on the marked object or the marked instance:

- "Parametrization of the IEC 61850 Server" on page 3620
- "Entry of a device name for the Logical Device" on page 3621
- "Connecting an attribute (DA) with a CODESYS variable" on page 3621
- "Entry of a node prefix for LNC instances" on page 3624

If you move the mouse pointer over an input field or the name of an input field, you get a tooltip with a description in the window below the "Properties" (see the following figure).
Fig. 295: 'Properties' with tooltip of 'Max. client count'

### Parametrization of the IEC 61850 Server

<table>

| Time synchronisation   | Selection: SNTP<br>SNTP (default): SNTP time synchronization. In addition to activation, functionality must be parameterized in the device's web-based management. Currently, the SNTP time telegram does not use milliseconds, which means accuracy is measured in 1 second increments.  
1. Input field **Time zone**: Offset between Greenwich (GMT) and the local time (for Germany 1 h, for example). The value is limited between -12 and +14  
2. Input field **DLS Mode**: Ratio for the mode summer/winter time changeover. Possible values:<br>● 0 = No automatic summertime/wintertime changeover  
● 1 = Timeover from wintertime to summertime on last the Sunday in March, changeover from summertime to wintertime on the last Sunday in October |
| Task Prio I Interval   | Task<br>1. input field: entry of the priority,<br>2. input field: entry of the interval in ms                                                                 |
| TCP KeepAlive[sec]     | The KeepAlive is to check the connection to the client.                                                                                      |

**Entry of a device name for the Logical Device**

Connecting an attribute (DA) with a CODESYS variable

1. Select the attribute of a CDC instance below the server.  
2. Enter the desired CODESYS variable name into the input field “Monitoring Var” in the properties section.  
Entry optionally an initial value into the input field right-side hand of the variable name.

In case of an attribute with RW-access, a “Control Variable” (writing access) can be entered in addition to the “Monitoring Var” variable (reading access). For a more detailed description about reading and writing of variables at the IEC 61850 Server see Chapter 1.6.6.3.2.4 “Reading and Writing from CODESYS Variables” on page 3633. The monitoring and control variables declared in the “Properties” section are displayed next to the respective attribute and at the superordinated node “DO” of the server tree.

By activating the “Autom. declare” checkbox the variable is declared by the IEC 61850 configurator and stored in the “IEC61850_Generated_GVL” (of the “IEC61850 Generated POUs” folder) after Chapter 1.6.6.3.2.5.1.1 “Generate code” on page 3634 of the IEC 61850 Server.

> **If you do not activate the “Autom. declare” checkbox you select the variable via the input assistance ([F2])] or you declare the variable yourself.**

> **“Trigger option:”** With the trigger options you set the attributes to select the events which might trigger a report. The selected trigger option is displayed in the status bar. For a description of the options see status bar.
The trigger option determines whether the Chapter 1.6.6.3.2.3.4 “Report” on page 3627, assigned to the Chapter 1.6.6.3.2.3.3 “DataSet” on page 3626, is sent when the value of this attribute changes.
Fig. 296: 'Properties' for the attribute (DA) 'ctlNum', input fields: 'Monitoring Var' with 'Initvalue'
Fig. 297: 'Properties' of an attribute with RW-access: in addition input: 'Control Variable'

Entry of a node prefix for LNC instances

Fig. 298: 'Properties' of the LNC instance 'GGIO1' with 'Node prefix' input field

Here you enter a prefix for the selected LNC instance. The prefix is put in front of the LN name in the server tree. The prefix is displayed in the Chapter 1.6.6.3.2.3.2.4 "Status bar" on page 3624, too.

Status bar

In the status bar (of the Further information on page 3616) of the IEC 61850 editor you find object-specific detail information about the selected object.

Object information: Server and Logical Device

Fig. 299: Status bar for the Server

Only the information “Name” is displayed for the server and the Logical Device.

Object information: LN

**DataSet**

In this tab of the IEC 61850 editor you create and delete datasets, you assign attributes (DA) and data objects (DO) to a dataset and you delete existing assignments.

**Fig. 303: 'DataSet' tab with 'LLN0.DataSet_0' dataset and DAs 't' and 'ctlNum'**

**Structure of the tab**

Section 1 displays the IEC 61850 Server created in the Chapter 1.6.6.3.2.3.2.1 “Configuration” on page 3616 tab.

The sections 2 and 3 are for creating, editing and deleting of DataSets. In section 2 the datasets are listed. In section 3 the attributes and data objects of the dataset are listed, which is marked in section 2.

For more information about section 4 see Chapter 1.6.6.3.2.3.2.4 “Status bar” on page 3624.
NOTICE!
The order of the attributes of a DataSet is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication. For more information about GOOSE communication see Chapter 1.6.6.3.2.3.5 “GOOSE Publisher” on page 3629 and Chapter 1.6.6.3.2.3.6 “GOOSE Subscriber” on page 3631.

Buttons:
- “New”: Create a new dataset. This is displayed in the “DataSets” section and is named “LLN0.DataSet_Suffix”. The suffix is incremented beginning with 0 (1. DataSet: LLN0.DataSet_0 ...)
- “Delete”: Delete a dataset: Select the desired dataset in the “DataSets” section and activate the “Delete” button.
- “>”: Assign an attribute or a data object to the selected dataset. First select the dataset in section 2 then select the attribute or the data object in section 1 and activate the “>” button.
- “<”: Deletes an element from a dataset. First select the dataset in section 2 then select the attribute or the data object in section 1 and activate the “<” button.
- ▼: Moves the selected entry one row up
- ▴: Moves the selected entry one row down.

Input fields
- “Name: ” Name of the dataset can be edited. The name gets the prefix “LLN0.”.

Report
In this tab of the IEC 61850 editor you create and parametrize buffered und unbuffered reports. A report transports the data, that are assigned to it, to the connected client in the event of a trigger. Each report a dataset must be assigned to.

![Fig. 304: 'Report' tab](image)

In section 1 the created report control blocks (RCB) are listed. The following buttons are available:
- “New”: Create a new report control block.
- “Delete”: Delete the selected report control block

In section 2 you make general settings for the reporting configuration.
Table 690: General settings

<table>
<thead>
<tr>
<th>Setting possibility</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Buffersize&quot;</td>
<td>Buffer size of buffered reports (in bytes).</td>
</tr>
<tr>
<td>&quot;Name&quot;</td>
<td>Unique Report Block name within the logical node.</td>
</tr>
<tr>
<td>&quot;Description&quot;</td>
<td>Description of the report block</td>
</tr>
<tr>
<td>&quot;Integrity Period [ms]&quot;</td>
<td>Stealthy general interrogation. After this time the referenced dataset will be actuated. Time (ms) between two messages. The messages are transferred cyclic, independent from other events.</td>
</tr>
<tr>
<td>&quot;Buffered&quot;</td>
<td>Enable / disable the report buffering. A buffered report stores the data, even if there's no connection to the client. In the case of an unbuffered report, the messages will get lost, if there is no connection to the client.</td>
</tr>
<tr>
<td>&quot;Buffer Time [ms]&quot;</td>
<td>Buffer time is the amount of time that the server waits to transfer a report after a given event occurs. Events that occur during this time period are collected and then transferred as a batch. If the buffer time is 0, the telegram will be sent immediately. For example, if the buffer time 10s the telegram will be sent after this time period or when the value changes the second time.</td>
</tr>
<tr>
<td>&quot;Config Revision&quot;</td>
<td>Versioning is used to identify whether or not a member was deleted from a dataset or whether member order has changed. Such changes cause values to not be transferred, or cause values to be in a different location within the report. Such an event is communicated to the client with a new version number. Since all datasets are firmly defined, this identifier does not apply to the solution described here.</td>
</tr>
<tr>
<td>&quot;DataSet&quot;</td>
<td>Data set reference</td>
</tr>
</tbody>
</table>

Section 3 is for the setting of the following options:

- "General options": Control of the reporting behavior. An activated checkbox means, that the information is transferred by the message
- "Buffered specific options": can be activated, if the option "Buffered:" (in section 2) is activated.
- "Trigger options": Determining of attributes to select the events which may trigger a message.

If the checkbox is activated the information will be transferred by the message.

</tr>
</tbody>
</table>

Create a report control block and assign it to a dataset

1. Activate the “New” button
2. Select the desired dataset from the “DataSet” selection list

GOOSE Publisher

In the “GOOSE Publisher” tab of the IEC 61850 editor you create, edit and delete GOOSE messages. If a value changes in the selected dataset, a GOOSE message is sent.

Fig. 305: ‘GOOSE Publisher’ tab

NOTICE!
The order of the attributes of a DataSet is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.
NOTICE!
To receive a GOOSE message from an IED, sender an recipient must have the identical settings in the following input fields:
- “APPID”
- “GOOSE-ID”
- “Dataset structure (with regard to order and data type of the attributes)"

After the dataset is sent, it is sent again after time interval of 500 ms. The repeat time then doubles and the dataset is sent again. The dataset is sent repeatedly until the value set in the “Repeat Time” input field is reached. The dataset is then sent again at the Repeat Time interval.

Sections of the tab:
1️⃣ List of the GOOSE control blocks (GCB).

A GOOSE control block is a GOOSE message.

Buttons
- “New”: Create a new GOOSE control block
- “Delete”: Delete the selected GOOSE control block.

</tbody>
</table>

List to assign GOOSE messages to global variables.

All attributes within the selected dataset are listed in this list. You can assign incoming GOOSE messages to global CODESYS variables. For this, select the desired attribute in the list and edit the name of a global variable in the “Varname” column. If you edit a new variable name a global variable will be created, if you activate the “Use default name” checkbox, a variable name is generated automatically. This variable will be written by incoming GOOSE messages.

The variables will be stored “IEC61850_Generated_GVL” of the “IEC61850 Generated POU” folder after generating the code of the IEC 61850 Server.

![Fig. 307: Example for the variable list](image-url)
Create a GOOSE control block and assign it to a dataset

1. Activate the “New” button
2. Select the desired dataset from the “DataSet” selection list

Information

This tab of the IEC 61850 editor shows information on the IEC 61850 Server

Fig. 308: ‘Information’ tab’

Reading and Writing from CODESYS Variables

Monitoring direction, reading

For reading in monitoring direction you connect an attribute (DA) with R-access (read) to a CODESYS monitoring variable (see “Parametrization of the IEC 61850 Server” on page 3620).

The following dataflow variants are possible:
- from the IEC 61850 Server to the connected IEC 61850 Client to read a CODESYS monitoring variable
- from an I/O module to the IEC 61850 Server to the connected IEC 61850 client to read an I/O module pin.

Control direction, writing

For writing in control direction you connect an attribute (DA) with W-access (write) to a CODESYS control variable (see “Parametrization of the IEC 61850 Server” on page 3620).

The following dataflow variants are possible:
- from a connected IEC 61850 client to the IEC 61850 Server to write a CODESYS-variable
- from the connected IEC 61850 client to the IEC 61850 Server to an I/O module to write the I/O module pins.

Monitoring direction + control direction, reading an writing

It may be the case that the IEC 61850 client will read the monitoring variable of an attribute and will write the control variable of the same attribute. Monitoring variable and control variable must not be the same CODESYS variable.

In monitoring direction the data flow takes place from the IEC 61850 Server to the connected IEC 61850 client to read the CODESYS monitoring variable.

In control direction the data flow takes place from the connected IEC 61850 client to the IEC 61850 Server to write the CODESYS control variable.
Menu Command sorted by Categories

IEC61850

Generate code

Symbol: 

On activating the “Generate code” command of the “IEC61850” category the code generation is started and the generated IEC 61850 code is stored in the folder “IEC61850 Generated POUs” in the device tree.

Export Server

This command of the “IEC61850” category exports the current configuration. In the “Safe as ” dialog select the format filter:

- XML Files: for IEC 61850 format with all specific data, variable mapping, for example
- SCL-Files: for IEC 61850 format to export data to other IEC 61850 tools

If you have changed the configuration since the latest code generation, you will be asked whether new code should be generated before export.

Import Server

This command of the “IEC61850” category discards the current configuration and imports an new configuration. In the “Save as ” dialog select the format filter:

- XML Files: for IEC 61850 format with all specific data, variable mapping, for example
- SCL Files: for IEC 61850 format to import data from other IEC 61850 tools

Options

The “Options” command of the “IEC61850” category opens a dialog for the setting of different display options for the IEC 61850 configurator.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Show FC besides data attribute”</td>

### 1.6.6.3.3 Modbus protocol

#### Modbus on TCP/IP protocol

**Configuration of Modbus TCP/IP server**

Adding a Modbus TCP/IP server to device tree

A Modbus TCP/IP Server instance can be added to any specific Ethernet interface / IP address. Each interface supports max. one instance of “Modbus TCP/IP Server”. Other protocols can be added in parallel.
1. Right click on ETH interface and click “Add object”.
   ⇒ The window “Add object below: ETH” appears.

2. Select “Modbus TCP/IP Server” and click “Add object”.
   ⇒ The node “Modbus_TCP_IP_Server” is added.

**Byte Order**
Format/Endianess for the transmission of WORD values (register) within the request/response telegram (default: “Big Endian”).

**Port**
TCP Port on which the Server listens.

**Startup Behaviour**
This parameter specifies how the Server behaves when configuration data is loaded (e.g. on download). It’s default value is “Active”. This means the Server is immediately addressable after configuration has been performed. In case the Server should be activated later on during runtime by means of Function Block ModTcpServOnOff this parameter value has to be set to “No activity”. Parameter Behaviour in state inactive then specifies the Server’s behaviour during the inactive phase.

**Behaviour in state inactive**
This parameter specifies how the Server behaves in inactive state. This state may be set at the very beginning (parameter Startup Behaviour = “No activity”) and/or requested during runtime calling Function Block ModTcpServOnOff. It’s default value is “No activity”. This means the Server is not addressable at all (no listening socket on TCP/IP) when it is inactive. Using this setting, any requests by Modbus TCP Clients lead to the result Failed to connect to Server or Timeout. All other parameter values make the Server respond with an exception code to any requests by Modbus TCP Clients.

The presentation of the icon next to the Modbus TCP Server in the device tree depends on the state of the Server:

**Inactive**

**Active**

---

**Attention:**
Exception code 9 is actually not defined by Modbus specification. This may cause problems using a different Modbus TCP Client than AC500 V3.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable write to %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access starting at %MBx</td>
</tr>
<tr>
<td>Disable write to %MB to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable write access up to %MBx</td>
</tr>
<tr>
<td>Disable read from %MB from</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access starting at %MBx</td>
</tr>
<tr>
<td>Disable read from %MBx to</td>
<td>0</td>
<td>0 ... 65535</td>
<td>Disable read access up at %MBx</td>
</tr>
</tbody>
</table>

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

### Configuration of Modbus TCP/IP client

**Adding a Modbus TCP/IP client to the device tree**

1. Right click on the node “Protocols” and click “Add object”.
   ⇒ The window “Add object below: Protocols” appears.
2. Select “Modbus TCP/IP Client” and click “Add object”.
   ⇒ Node “Modbus_TCP_IP_Client” is added.

Depending on a Server’s IP-Address the Client sends it’s requests via the Ethernet interfaces available.

### Modbus TCP/IP Client does not have any parameters.

**Modbus on RTU protocol**

Protocol description can be found in the chapter for Serial interfaces © Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3527.
1.6.3.4 NTP/SNTP protocol

Introduction of the NTP/SNTP protocol

AC500 V3 support the NTP and the SNTP protocol ((Simple) Network Time Protocol). Compared to SNTP, the NTP protocol achieves higher accuracy in time synchronization, meeting advanced requirements for accuracy and reliability of a PLC solution. In case a configured NTP protocol cannot be used, SNTP protocol is used as a fallback solution.

The protocols NTP and SNTP provide the functionality to synchronize the clock of a PLC to an external time source. For further information and specification of the protocol please refer to the document RFC4330.

The following modes are supported by the implementation of the AC500 V3 PLC:

- (S)NTP client
- (S)NTP server
- (S)NTP client and server

The Function Block \textit{PmSntpInfo} can be used to read diagnosis information of the protocol. Refer to the documentation of the library \textit{ABB_Pm_AC500.lib} for further information.

- If a high precision of system time is wanted, use a fully functional NTP server or at least an SNTP server with a high-precision time-source (e.g. DCF-77 receiver). Avoid cascading several levels of (S)NTP server / (S)NTP clients.
- Client requests are normally sent at intervals depending on the frequency tolerance of the client clock and the required accuracy. However, under no conditions requests should be sent at less than one minute intervals (see RFC 4330). Keep that in mind when setting polling-interval of the (S)NTP client, especially if a huge amount of clients use one single server.
- Be sure not to use broadcast or multicast addresses as server or backup-server since current (S)NTP implementation does not support manycast mode.
Configuration of the SNTP protocol

(S)NTP client configuration

Implementation of (S)NTP client and (S)NTP server is based on protocol version 4.

For (S)NTP client configuration add a new object “SNTP Client” under “Protocols (Client Protocols)”.

For a PLC only one instance of an (S)NTP client is possible.

The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.
## Server 1

<table>

<td>3</td>
<td>0 … 4294967295</td>
<td>Specifies the number of first clock updates after that this option is activated</td>
</tr>
<tr>
<td>Ignore after</td>
<td>-1</td>
<td>-1 … 2147483647</td>
<td>Specifies the number of ignored clock updates which exceed the maximum offset. The protocol will be stopped when this value will be exceed. It is never stopped when a negative value is set.</td>
</tr>
</tbody>
</table>

(S)NTP server configuration

Implementation of (S)NTP client and (S)NTP server is based on protocol version 4.

For (S)NTP server configuration add a new object “SNTP Server” under of the available “Ethernet interfaces (ETH1-ETHn)”. For a PLC only one instance of an (S)NTP server is possible.

The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.
### Access control

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>Enables Access Control</td>
</tr>
<tr>
<td>Network address</td>
<td>0.0.0.0</td>
<td>Valid IP address</td>
<td>Network address of allowed clients</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>24</td>
<td>8 ... 32</td>
<td>Subnet mask of the network address</td>
</tr>
</tbody>
</table>

### Local server

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>This option enables the protocol to run as local server. That means without synchronization to an external time source.</td>
</tr>
<tr>
<td>Stratum</td>
<td>10</td>
<td>1 ... 15</td>
<td>Stratum of the server when it is used as local server.</td>
</tr>
<tr>
<td>Distance</td>
<td>1 s</td>
<td>0 ... 3.403e+38</td>
<td>Distances in seconds of the server when it is used as local server.</td>
</tr>
<tr>
<td>Orphan</td>
<td>FALSE</td>
<td>TRUE or FALSE</td>
<td>Enables or disables the orphan mode</td>
</tr>
</tbody>
</table>

### 1.6.6.3.5 FTP server

#### Configuration of FTP server

As of SystemFW 3.1.0 the FTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an FTP server on both Ethernet interfaces.

AC500 V3 PLCs only support explicit authorization. AC500 V3 PLCs do not support implicit authorization.

1. Under “Ethernet -> ETH [1,2,...]” add a new object and select “FTP Server” from the list.
2. Double-click the “FTP_Server” item to open FTP server configuration and change the default settings of the parameters, if required.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Default</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FTP Server</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Port</td>
<td>21</td>
<td>21</td>
<td>Do not change the default setting. The parameter specifies the port which is used to connect to the FTP server on the PLC.</td>
</tr>
<tr>
<td>Sessions</td>
<td>1</td>
<td>1...4</td>
<td>Enter the max. number of allowed simultaneous and parallel connections to the FTP server. Each session uses one socket. Note: Some FTP clients require several connections to work.</td>
</tr>
<tr>

</tbody>
</table>
### 1.6.6.3.6 MQTT client protocol

**System technology**

The MQTT protocol is a lightweight communication protocol which is widely used on the internet to connect embedded device to the cloud.

The MQTT (Message Queuing Telemetry Transport) Client library allows to integrate an AC500 Processor Module to act as a client in the MQTT protocol. Thus, it is possible to exchange data between the AC500 and other devices connected to the MQTT network.

In the figure below, there is an MQTT network with one broker (MQTT broker in the middle) and five clients. The figure shows the main functions of MQTT to send and receive data: publish and subscribe. The clients can publish messages with a specific topic to send data (e.g. the temperature of a connected sensor with a timestamp) to the MQTT broker. For example, the client “AC500_1” publishes a message to topic “topic/2”. On the other hand side clients can also subscribe to topics to receive data. For example, the client “Laptop” has subscribed topic “topic/2”. So all messages with the topic “topic/2” which has been published to the MQTT broker will be sent immediately to the client “Laptop”. This creates a message flow from the client "AC500_1" to the laptop.

![MQTT diagram](image)

To realize the MQTT behavior, there are several function blocks implemented in the Chapter 1.5.10 “MQTT client library” on page 2166.
Table 708: Function blocks overview

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MqttConnectWithCertBuffer, MqttConnectWithCertFile</td>
<td>Every MQTT use case starts with establishing a connection to an MQTT broker. Therefore, a connection structure needs to be created. The connection structure is used to identify the connection for subsequent operations like publish or subscribe. It is possible to establish an SSL connection. Using an SSL connection, at least a certificate for the server is needed. Certificates can be loaded from a buffer (program variable) or a file which is stored on the PLC.</td>
</tr>
<tr>
<td>MqttGetReceivedPacket, MqttPing, MqttPublish, MqttSubscribe, MqttUnsubscribe</td>
<td>These function blocks can be used on an established MQTT connection to realize the desired use case.</td>
</tr>
<tr>
<td>MqttDisconnect</td>
<td>This function block is the end of each use case.</td>
</tr>
</tbody>
</table>

One MQTT send use case could look like this:

* It makes sense for several publish messages in a row (e.g. one message per second) not always open a new connection.

One MQTT receive use case could look like this:

**TLS version**
The MQTT client uses the TLS version 1.2.

**Configuration in Automation Builder**
For the MQTT client no configuration is needed.

**Configuration in CODESYS**
All function blocks have to be called in tasks with cyclically processing.

You can use the function blocks with:

- PLC_PRG with automatic task configuration or manual task configuration.
- One single program or different programs.
- One single task or different tasks.

With different programs assigned to different tasks you can define different cycle times and priorities.
Limitations

- No persistent session. After an interrupted connection, the client needs to subscribe on topics again in case of reconnect.
- One connection (MQTT_CONNECTION) cannot be shared between multiple tasks. Different connections can be used by different tasks or even within the same task.
- Only one FB can operate on a single connection at the same time. Always wait for the FB to complete before calling the next FB. To use two different FB’s in parallel (like publish and receive) it is necessary to have two different connections, otherwise they must be called one after the other.

Hardware

The MQTT protocol requires AC500 devices with integrated Ethernet.

Examples

Example projects for the libraries can be found in the folder: \Users\Public\Documents\AutomationBuilder\Examples.

1.6.6.3.7 AC500 V3 secure protocols

Introduction

The following protocols can be secured using certificates:

- Communication between Automation Builder and the PLC (e.g. Programming, Monitoring)
- Communication between the PLC’s webserver and visualization clients (browsers)
- Communication between the PLC’s FTP server and FTP clients
- Communication between the OPC UA server and OPC UA clients

As a prerequisite to enable secure communication on one or more protocols, the required certificates need to be present on the PLC.

For security reasons ABB does not encourage the use of self-signed certificates. ABB shall not be held liable for any damage or loss that arises due to the use of self-signed certificates on AC500 PLCs.

Self-signed certificates protect against eavesdropping if used correctly. They do not offer any secure means of authentication.

Certificate handling

Automation Builder offers a convenient “Security Screen” to manage certificates on connected PLCs.

It can be accessed through the shield icon on the lower right corner of the main window:
Use the tab “Devices” to manage certificates on the PLC.

It offers to:
- show certificates available on the PLC
- import and export certificates
- create new (self-signed) certificates
- trust or untrust certificates

Configuring secure protocols

Encrypted communication between Automation Builder and the PLC

Via tab “Communication Settings”

Via “Security Screen” in Automation Builder
Install a trusted certificate

Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232 and Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3644).

When trying to log in or when you set the PLC as active path, there will be a one-time pop-up asking you to add the PLC’s certificate to the trusted certificates:

![Certificate pop-up](image)

After trusting the PLC’s certificate, the communication between the Automation Builder and the PLC is now encrypted.

This is shown by additional yellow lines around the communication path on the “Communication Settings” page.

Secure web server

1. Generate or import a certificate for the web server

   Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232 and Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3644).

2. Attach a web server node to either ETH1 or ETH2 or both and configure security mode.
   - This will automatically insert a visualization into the project.
   - The available modes of operation are:
     - http only
     - https only
     - Both (http and https)
     - Redirect http to https

3. Download and set the PLC to RUN.
4. Connect to the web server using the configured method: https://<your PLC’s IP address>/webvisu.htm.

In case you are using a self-signed certificate, your browser will show some warnings. If you are aware of the risks of self-signed certificates, this can be ignored.

Further information on page 3650

Secure FTP

1. Import a certificate to the PLC for FTP or create a self-signed certificate.

Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232 and Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3644).

2. Add an FTP server to either ETH1 or ETH2
3. Set the parameter “Security Mode” to either “BOTH” or “FTPS only”.

You can use any FTP client that supports FTPS explicit mode (FTPES).

In case you are using a self-signed certificate, the FTP client will show some warnings or notice that it does not know the certificate and wants you to check it.

Further information on page 3650

OPC UA secure

OPC UA uses mutual authentication, which means that both partners must have their own certificate and know the other’s certificate, before being able to establish a connection!
1. Create a new certificate in your OPC UA client.

   *Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 1.6.5.1.3.2 “AC500 battery” on page 3232 and Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3644).*

2. Import that certificate to the “Trusted Certificates” in your PLC using the “Security Screen”.
3. Import a certificate for the OPC UA server on the PLC or create a self-signed certificate.
4. Export that cert to the PC and provide it as a trusted certificate to your OPC UA client.
5. Reboot the PLC and check that it is in RUN and both certificates are on the PLC (via the “Security Screen”).
6. Add the PLC as OPC UA server in your OPC UA client.
7. Connect to the OPC UA Server.
   ⊳ You can interact normal with the UA server.

   *In case you are using a self-signed certificate, you will see some warning message (depending on the OPC UA client).*

   *If you are aware of the risks of self-signed certificates, this can be ignored.*

   *Further information on page 3650*

   *The certificate warnings will only go away when using a certificate from a trusted certification authority or a certificate derived from this by an intermediate certification authority (e.g. a company CA).*

   *That process is done via PLCShell command “cert-createcsr”, then getting the file from the PLC via the filebrowser tab in “cert/export” and getting that signing request turned into a real certificate by a certification authority.*

   *Import the certificate generated by your certification authority using the security screen.*

### 1.6.6.3.8 KNX configurator

Refer to the general description for information about the following tabs of the device editor.

- Chapter 1.4.1.24.1.19.11 “Tab ‘<device name> I/O Mapping’” on page 787
- Chapter 1.4.1.24.1.19.12 “Tab ‘<device name> IEC Objects’” on page 791
- Chapter 1.4.1.24.1.19.3 “Tab ‘Parameters’” on page 778
- Chapter 1.4.1.24.1.19.17 “Tab ‘Status’” on page 800
- Chapter 1.4.1.24.1.19.18 “Tab ‘Information’” on page 800

Only in the case of special features is there an additional help page for the specific device editor.

*If the “<device name> Parameters” tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).
With the KNX editor from CODESYS, you define the communication objects of your building automation. The communication objects are exported and made available to the ETS5 program. Linking the communication objects to the different KNX devices is performed exclusively in the ETS5 program. Therefore, only the objects are generated in CODESYS. The objects are linked to variables from the PLC program by means of “I/O mapping”.

You add an Ethernet adapter below the controller. Then you add the KNX device below the adapter. You can insert only one KNX device per controller.

See also
- Chapter 1.4.1.24.3.13.9 “Dialog ‘Options’ - ‘Device Editor’” on page 1113

**ETS5 Software - ‘DCA’ Plug-In**

Linking the communication objects of the different KNX devices is performed exclusively in the ETS5 program. To do this, you need the ETS5 software (light or professional version). You also need the KNX product file available from KNX.

**Programming steps**
1. Create a project in CODESYS.
2. Download the CODESYS project to the controller.
   - The CRC is also downloaded to the controller.
3. Create an export file in CODESYS.
   - The CRC is also saved in the export file.
4. Read the export file into the configuration of ETS5.
5. Parameterize the objects in ETS5.
6. Start the program on the controller.
7. Transfer the KNX configuration to the controller.
   - The CRC is also transferred. The runtime system checks whether or not both CRCs match. When they match, the KNX device is identified as functional by the green arrow. If not, then an error is issued in the logger. In case of error, the process data (inputs/outputs) is not updated.
Tab 'KNX - General'

Object: KNX

The tab in the configurator of the KNX editor shows an overview of all communication objects. The I/Os of the communication objects are applied automatically to the I/O mapping.

Entries can be edited directly in the table or in the “Communication object” dialog. Existing entries can be copied via copy&paste. The next free channel number is used automatically in this case.

### 1.6.6.3.9 BACnet-BC System Technology

#### Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include ‘Who is’, ‘I am’, ‘Who has’ and ‘I have’ for device and object search and identification, “Read Property” and “Write Property” for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:

- [http://www.bacnet.org](http://www.bacnet.org)
- [http://www.bacnet.org/Bibliography](http://www.bacnet.org/Bibliography)

### AC500 and BACnet

A BACnet device can be described by its “BACnet Interoperability Building Blocks” (BIBB)s, which are needed to establish services. They are grouped in different areas:
- “DataSharing” (DS)
- “Alarm and Event Management” (AE)
- “Scheduling” (SCHED)
- “Trending” (T)
- “Device and Network Management” (DM)

“DataSharing” for example contains two BIBBs which are needed for the “Service Read Property”:
- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. “BACnet Simple Sensor” (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

<table>
<thead>

</tbody>
</table>

The AC500 V2 supports BIBBs qualifying it as “BACnet Application Specific Controller” (B-ASC), by installing the BACnet B-ASC library. More details can be found in the Automation Builder online help.

AC500 V3 supports many more BIBBs qualifying it as “BACnet Building Controller” (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

- DS-COV-A, -B (Change of Value-A, -B)
- DS-COVP-A, -B (Change of Value of Properties-A, -B)
- AE-N-E-B (Alarm and Event-Notification External-B)
- AE-ASUM-B (Alarm and Event-Alarm Summary-B)
- SCHED-I-B (Scheduling-Internal-B)
T-VMT-E-B (Viewing and Modifying Trends External-B)
DM-TS-B (Time Synchronization-B)
DM-UTC-B (UTC Time Synchronization-B)
DM-MTS-A (Manual Time Synchronization-A)
DM-LM-B (List Manipulation-B)
DM-OCD-B (Object Creation and Deletion-B)
NM-BBMDC-B (BBMD Configuration-B)

... 

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.

A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as “Analog Input” (AI) object on the MS/TP network.

AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as “Analog Value” (AV) object and as “Trend” object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects “Analog Value” and “Trend” for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.
AC500 V3 as BACnet Building Controller (B-BC)

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS485
- BACnet IP, based on Ethernet / UDP / IP

Different networks can be combined to one common “BACnet internetwork”. The figure above shows an example of some BACnet devices in one “BACnet internetwork”. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example “BACnet internetwork” consists of different BACnet networks:

- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.

To form a common “BACnet internetwork” the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.
The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by “Broadcast Management Devices” (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in Chapter 1.5.5.3.4.4 “Configuration of datalinks” on page 2071.

Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with “ID 12”. The device contains more objects like the Analog Input object, representing the input of a temperature measurement device. An object contains several properties, like “ID, Description, Present Value, Unit” etc.

Further possible objects of an AC500 B-BC are:

- “Binary Input” for example from connected to a switch
- “Analog / Binary Output” for actuators
- “Analog / Binary Values” for local variables
- “Calendar”
- “Schedule”
- “Trend Log”
- ...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.

![Diagram of BACnet objects and properties](image)

Fig. 309: BACnet objects, properties, services and BIBBs
Supported BIBBs and services

While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 24 BACnet objects, properties, services and BIBBs shows a simple “Service Read Property” which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request “Read Property”, asking for the present value of the “Analog Input” of object with “ID 1010”.
2. The server answers with an acknowledge, sending the present value which is 21,89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

BACnet configuration in Automation Builder

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.

Following objects need to be created:

1. “BACnet Server” root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. See Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object” on page 2066
2. BACnet server objects, for example “BACnet Analog Input” Temperature. The properties of the objects must be controlled (written or read) by the PLC logic. See Chapter 1.5.5.3.4.2 “Adding BACnet server objects” on page 2067
3. BACnet client objects, represented by a different symbol. For example, “BACnet Client Read Property”. The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. See Chapter 1.5.5.3.4.3 “Adding BACnet client functionality” on page 2068
4. Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the “BACnet Server” object. In the example above the IP address of ETH1 is automatically retrieved by inserting the “BACnet IP datalink” below the ETH1 port. See “Configuration of an IP datalink” on page 2072. For MS/TP refer to “Configuration of an MS/TP datalink” on page 2072.
Configuration of BACnet server root object

1. Create an empty project with an AC500 V3 CPU type and call it for example “Device_12”.
2. Insert a “BACnet Server” object below the interfaces object in the device tree.
3. Set the device InstanceNumber in the “BACnet Parameters” of the “BACnet Server”, e.g. to 12 and the InstanceName to Device_12 (according to Fig. 24 BACnet objects, properties, services and BIBBs).
4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below ETH1. Default parameters are sufficient if only one datalink is used.

"Configuration of an IP datalink" on page 2072
5. Build the project, download to the PLC and set it to [RUN]. The status of the “BACnet Server” should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select [Show license information] from the Runtime Licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

   Chapter 1.6.6.2.2.2 “PLC runtime licensing” on page 3417

6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 24 BACnet objects, properties, services and BIBBs, left part containing a temperature value.

1. Configure a “BACnet Server” root object according to Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object ” on page 2066.

2. Add a “BACnet Analog Input” object below the “BACnet Server”.
3. Rename it to **Temperature**, adjust the parameters: InstanceNumber: 1010, Description: Temperature, Units: UNIT_DEGREES_C.

4. The present value of the objects Temperature needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.

5. Download the program and observe the temperature value in the BACnet client.

**Adding BACnet client functionality**

Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 24 BACnet objects, properties, services and BIBBs, right part.
1. Add a new controller and configure a “BACnet Server” root object according to § Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object” on page 2066.

2. Set `InstanceNumber` to 14 and `InstanceName` to Device 14.

3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a “BACnet Server”. Add a “BACnet Client Read Property” below the “BACnet Server” node.
4. The created object “BACnet Client Read Property” generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

In line 1-5 of the code part the function block is called with the following parameter:

- Device ID of the server to read from (12, Chapter 1.5.5.3.2 “Supported objects and properties” on page 2064)
- Object ID of the object to read from (1010 for the “Analog Input”)
- Object type (“Analog Input”)
- Property to read (“present value”)
- triggerRead to start the read operation

When the user (or another program part) sets the variable triggerRead from FALSE to TRUE the edge triggered function block BACnet Client Read Property starts operation and sends the read request to the server device. After receiving the reply from the Server, the output .xDone gets TRUE (line 8) and the temperature value can be read from the output .result (line 14).

5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting triggerRead to TRUE. In online mode the read temperature value can be observed in line 14.

Alternative configuration

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.
There is no BACnet_Client_Read_Property object created below the “BACnet Server”. Instead a function block BACnet_Client_Read_Property must be declared in the PRG (line 6 in the declaration) and initially "connected" to its “BACnet Server” in IEC-code via RegisterToServer(), and thus get activated (line 2 in the code).

More detailed description of the function block BACnetClientReadProperty and all other client function blocks can be found in the documentation inside the “Library Manager”.

**Configuration of datalinks**

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

- **Chapter 1.5.5.3.1 “Supported BACnet networks “ on page 2063**

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.
**Configuration of an MS/TP datalink**

- Add the “BACnet MS/TP COM” object below the COM port.

In fact the empty COM port is replaced by the “BACnet MS/TP COM”. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

- Below the “BACnet MS/TP COM” port object an “BACnet MS/TP datalink” is inserted automatically which can be configured according to the requirements.

  - **NetworkNumber**: Use the default value 1 if no routing is required. For routing, use a unique network number in one controller.
  - **ConnectionType**: Use the default value Master if no routing is required. For routing, use “Master – answering always postponed”.
  - **Baudrate**: can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.
  - **DatalayerAddress**: This is the MAC address as described in Chapter 1.5.5.3.1 “Supported BACnet networks ” on page 2063. The MAC address must be unique in the MS/TP network.
  - For all other parameters the default values are recommended for typical applications.

**Configuration of an IP datalink**

- Add a “BACnet_IP_datalink” object below the Ethernet port ETH1 or ETH2.
- **NetworkNumber**: Use the default value if no routing is required. For routing, use a unique network number in one controller.
- **UDPport**: Use the default value (47808 decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in § Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (ETH1 or ETH2); its IP address is set in the communication settings of the CPU node, “Device_14” in the example.
- **ForeignDevice** and **BBMD**: Special configuration is only needed if an internet router is located between two BACnet devices. § Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063 AC500 can be configured as ForeignDevice or BBMD, but not the combination of both. An example for BBDM can be found in the example folder.

### Configuration of Routing
Routing enables the combination of different BACnet networks to one common “BACnet internetwork”.

§ Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063

BACnet devices from different BACnet networks can communicate with each other. If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

§ Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2063

For MS/TP the ConnectionType must be set to “Master – answering always postponed”. An example for routing can be found in the example folder.

### Time synchronisation
The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.
Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab "PLC Shell":
  Set the time by the command "time hh:mm:ss"

- Read the local time from the Automation Builder Tab "Statistics":
  "Current PLC Date and time" shows the PLC time as local time without conversion, if the tab "Show PLC time in UTC" is enabled.

For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab "Statistics"), since this is always converting from local time to UTC time.
● BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.
● If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed. Please contact the PLC support for more information.

Package content

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:
● BACnet runtime component, part of AC500 firmware.
● Automation Builder package: CODESYS BACnet
  – BACnet plug-in component
  – Device descriptions for "BACnet Server", BACnet objects, BACnet client and datalinks
    ☞ Chapter 1.5.5.3.5.1 “BACnet libraries” on page 2075

Example folder

● Example folder
  – Examples and example documentation
    ☞ Chapter 1.5.5.3.5.2 “Application examples” on page 2076
  – Datasheet and FAQ
    BACnet Protocol Implementation Conformance Statement (PICS), acting as a datasheet, describing all BACnet objects, services and communication capabilities.
    BACnet Conformance Certificate
    FAQ – Frequently Asked Questions, including AC500 specific information, performance and limit

BACnet libraries

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods. The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:
● Starting and stopping the BACnet stack
● Using BACnet server objects and their properties
● Triggering asynchronous requests (mainly client service requests) and processing the request transaction
● Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application

Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefaultImpl library.

The BACnetDefaultImpl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:
● Persistence of server objects
● Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
● Update of the date/time information of the device object
The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have “facade” functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- Starting and stopping the BACnet stack
  Always use BACnetServer.StartBACnetStack and BACnetServer.StopBACnetStack or AutoStart. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetServerInit.

- Using BACnet server objects and their properties
  Always use the specified function blocks in IEC-lib-BACnet, such as BACnetAnalogValue. Never directly use the corresponding functions of the BACnet library, such as CmpBACnet.BACnetStorePropertyInstance.

- Triggering of asynchronous requests
  Always use the specified function client blocks of the BACnet library, such as BACnetClientReadProperty. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetReadProperty. All functions of the CmpBACnet library that require a BACnetAsyncTransactionToken belong to this category and should never be used directly.

- Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application
  Always use IBACnetEventConsumer and BACnetServer.RegisterHook/UnregisterHook/RegisterCallback/UnregisterCallback. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetSetHook or CmpBACnet.BACnetSetCallback.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as BACnet*CbCompletion, BACnetIam(Ex), or BACnetIHave(Ex), BACnetUnconf*.

Most often, you will use BACnet*CbCompletion to implement your specific IBACnetEventConsumer.BACnetEventCallback. But first check whether or not the BACnetDefaultImpl library already contains an appropriate standard implementation.

Application examples

- AC500_V3_BACnet_B-BC_Example_AB230ABxxx.project including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as “BACnet Server”, publish the analog value
  - Use case 3: AC500 as BACnet client and server
- AC500_V3_BACnet_Routing.project
- AC500_V3_BACnet_Trendlog.project
- Examples from 3S, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing
  - ...
1.6.6.4 Data transfer and programming
1.6.6.4.1 Source download/upload

Source download

Prerequisites

- Communication settings are correct
- Project is saved on PC
- PLC is connected

1. Click “Online ➔ Source download to connected device”.

⇒ Project archive will be downloaded to PLC.

2. To verify download double-click node “PLC_AC500_V3”, select view “Files” and double-click folder “PlcLogic” of the Runtime view (if necessary click refresh button of Runtime view).

⇒ File Archive.prj will appear if download was successful.
Source upload

Prerequisite

- Project archive on PLC available (from previous source download)
- PLC is connected

1. Open Automation Builder.
2. Click “File ➔ Source upload...”.
   ⇒ Window *Pick the device from where you want to upload the source archive...* appears.
3. Select your PLC with the archive and click [OK].
   ⇒ Dialog *Extract Project Archive* appears.
4. Select your preferred folder and click [Extract].
   ⇒ Then you are prompted to open the project archive.
5. Click [Yes].
   ⇒ The project opens.

Upload was successful.

---

1.6.6.4.2 Programming and testing

For information on programming see

- ☹ Chapter 1.4.1.9 “Programming of applications” on page 236
- ☹ Chapter 1.4.1.11.1 “Configuring the connection to the PLC” on page 360
- ☹ Chapter 1.6.6.2.2.4.3.1 “Enter a known PLC IP address” on page 3441
- ☹ Chapter 1.4.1.11 “Transferring an application to the PLC” on page 360

For Information on testing/debugging see ☹ Chapter 1.4.1.12 “Testing and debugging” on page 374
1.6.6.4.3 Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal Ethernet communication module.

Programming via internal (onboard) Ethernet communication module:

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.

   ➔ Dialog box Communication Settings <...> appears.

2. Enter your PLC IP Address and click [OK].
Enter PLC IP address by scanning devices

1. Right-click the top node “PLC_AC500 <...>” and select “Communication Settings” from the context menu.
   ➞ Dialog box Communication Settings <...> appears.

2. Click [...].
   ➞ Dialog box Communication Settings <...> appears.

3. Click [Scan], select your desired PLC and click [OK].
   ➞ Entry is transferred to the dialog box Communication Settings <...>.
   Click [OK].

4. Click to log in the “PLC_AC500_V3” project.

Enter PLC IP address by [Advanced Settings...]

If a remote gateway instead of a local one has to be used it can be configured in the [Advanced Settings...].
1. Right-click the top node “PLC_AC500 <...>" and select “Communication Settings” from the context menu.
   ⇨ Dialog box Communication Settings <...> appears.

2. Enable checkbox Use advanced settings and click [Advanced Settings...].
   ⇨ Tab “Communication Settings” opens.

3. Check gateway or change if required.
   ⇨ Successful connection is indicated by green dot on the gateway icon.

4. **Manual entry of the IP address.**
   Check IP address or change if required.

5. Press ENTER to confirm changed IP address.
   ⇨ Successful communication is indicated by green dot on the PLC icon.
6. Or instead of the last two steps:

   Set the IP address via a scan.

   Click [Scan Network], select your desired PLC and click [OK].

   Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the “PLC_AC500_V3” project.

1.6.6.4 PLC shell commands

   The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

   Proceed as follows:
   1. Ensure the gateway is configured properly and a connection to the controller can be established.
   2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
   3. Enter “?” in the command line of the tab window. All available PLC commands are listed.

   If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

   The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.

   See:
   - Chapter 1.2.4 “Information on the installed version” on page 43
   - Chapter 1.6.6.1.4 “Firmware identification and update” on page 3402.

1.6.6.5 Watchlists

   - Chapter 1.4.1.13.1.2 “Using watch lists” on page 395
   - Chapter 1.4.1.13.2 “Changing values with recipes” on page 396
1.6.6.6 Reference to libraries

Library configuration is described in the chapter “Chapter 1.5 “Libraries and solutions” on page 2001.

1.6.6.7 Programming in C code

With the C code integration plugin from CODESYS, externally implemented C code files can be included in Automation Builder projects. For further information see CODESYS description “Chapter 1.4.1.9.11 “Integrating C Modules” on page 287.

1.6.5 Server installation

---

If folder C:\ProgramData\ is missing, select “Show hidden files, folders and drives” at “Control Panel ➔ All Control Panel Items ➔ Folder Options ➔ View ➔ Hidden files and folders”. 
Installation of OPC server

Prerequisites

The following applications are closed:
- All OPC clients
- ABB OPC tunnel
- CODESYS gateway server

Ensure termination of the following processes:
- Gateway.exe
- CoDeSysOPC.exe
- WinCoDeSysOPC.exe
- OCTsvc.exe

Installing with Automation Builder

2. Click button of Latest Automation Builder version (recommended) and run the installer.

3. Open “Installer Options and Additional Tools” and click [Install Additional Tools].
4. Agree to the “License Terms”.

![Automation Builder interface](image-url)
5. Select “Version 2 and/or 3” and install.

⇒ All required files are installed for OPC and the OPC server is registered automatically as user application.
Manual registration and unregistration

It is possible to register or to uninstall the OPC server manually either as COM server (user application) or as a service.

- **Register the OPC server as interactive software in the Windows registry:**
  - Command for OPC 3: `WinCoDeSysOPC/RegServer`
  - Register the OPC server as system service:
  - Command for OPC 3: `WinCoDeSysOPC/Service`
  - Unregister the OPC server from the Windows registry and from the service entry:
  - Command for OPC 3: `WinCoDeSysOPC/UnRegServer`

*Please see REF1 chapter 3 (OPC 3) Table on page 3682 for details.*
Register OPC server V3 as a system service

Prerequisites
- All programs, processes and services which connect to the OPC server are closed.
  1. Start the “Command Prompt” with command “cmd” in the “Start ➔ Run...” window.

2. Go to the CoDeSysOPC V2 installation folder.
3. Unregister the OPC server with WinCoDeSysOPC/UnRegServer.
4. Register the OPC server as system service with WinCoDeSysOPC/Service.

OPC clients for tests
Free of charge test clients can be found in the web:

Symbol file
Define symbols
1. Right-click on “Application” in CODESYS V3 project and click “Add Object”.

2. Choose “Symbol Configuration” and click [Add object].
3. Select your programs and/or single symbols and click [Build].
   ⇒ A symbol file will be automatically downloaded to the PLC with Project Download.

With double-click in the device tree to “Symbol Configuration” you can change the “Symbol Configuration” settings.

To restrict traffic and load, choose only symbols you need.

Configure OPC server

Configure OPC Server V3

2. If the configuration is needed furthermore, save the configuration.

The actual configuration at start of OPC server will always be read from `OPCServer.ini`.

### Update rate
- The Update Rate may not be 0 (ms)!
- The default value of 200 ms is a suitable value of many applications.
- The adjustment for the Update Rate depends on the number of symbols (variables).
- For a big number of symbols it can be better to increase the Update Rate.

The checkboxes Sync Init and Enable logging (Defaultevents) must be enabled.
3. Select “PLC_FW3”.

- If the *.sdb files should be loaded from the “Gateway Files” directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.
- If the symbol information should be loaded from AC500 V2.x, the project name is not required and can also be empty.
- The parameters displayed in the screenshot above are recommended default settings.
- The checkbox Active must be enabled.
- Enabled checkbox “Enable logging” allows a later diagnosis.
4. Select “Connection” and click [Edit].

![Image of OPCConfig interface](image)

5. Enter the TCP/IP address of the target PLC at **PLC name or address** and enable **Use Tcp/IP blockdriver**.

6. Enter the TCP/IP address of the target PLC at **IP Address of PLC** and click [OK].

7. Click “File ➔ Save” **OPCserver.ini** and “File ➔ Exit” **OPCConfig**.

**Check OPC function with AC500**

- **It is urgently recommended to check the function of the previous configuration steps.**

- **In order to check the OPC function without AC500, see** .
Check OPC server V3

1. Start OPCExplorer.exe and connect “CoDeSys.OPC.DA”.

2. Add Group, add Items, select available Items in Server “CoDeSys.OPC.DA”.
   Add to Tag List, close the Item browser.
   ⇒ If anything is right, then “CoDeSys.OPC.DA” is connected, is running and the “Quality” of the items is good.

Check processes with windows task manager

Correct configuration: All processes run with the same “User Name” and with the same “Session ID”.
Configure AlarmEvents

Refer to REF2 AeConfigurator_UserGuide.pdf for details  Table on page 3682.

Check AlarmEvents

The function of the “AlarmEvents” can be checked with “MatrikonOPC Explorer”.

The “AlarmEvents” can be simulated by writing the value of the Items.

Configure user account for OPC server

Please refer to REF3 ReadMe.rtf and REF4 ReleaseNotes OPCV3 AE for HA  Table on page 3682.

When running the OPC server V3 on Windows Server 2003/ 2008/ 2012 /2016 multiple sessions need to be supported. Therefore the installation of the OPC server as service running with a dedicated user account is recommended.
Configuration steps

- Create specific user, no administrator account is required
- Register V3 OPC server as service
- Configure V3 OPC server as service

Create specific user

![Create specific user screenshot]

Registration

![Registration screenshot]

Register the OPC Server executable as service from the command line.

With command “WinCoDeSysOPC /Service” WinCoDeSysOPC.exe gets installed as system service.

Started once, the service will stay “started” until the system gets terminated.

The communication to the configured PLCs survives.

Also here the service gets installed in the current position of WinCoDeSysOPC.exe.
At “Computer Management ➔ Services and Applications ➔ Services” open the “Properties” of the “CoDeSysOPCDAService”.

Complete the Service Configuration
Testing

Check Users and Session during Test Cases

Check the “Session ID” and “User Name” of
Potential issues

Session isolation

Situation
With Windows Server 2003, Windows Server 2008, Windows Server 2016 the Windows 7 services are alone in session 0. User applications run in session 1 (2 and so on).

Services:
A Windows service is a computer program that operates in the background.
Windows services can be configured to start when the operating system is started or can be started manually and run in the background as long as Windows is running. They can operate when a user is not logged on.

User applications:
Microsoft Word, Notepad, MatrikonExplorer, ControlBuilderPlus.exe and Codesys.exe

Service and user application are isolated in their session. They can not communicate with each other directly. OPC Server uses, like the CBP and CODESYS, the gateway server from CODESYS (gateway.exe) for the communication with the AC500 and starts the gateway in their session. That creates undefined behavior, if the OPC Server runs as a service. The gateway server is not able to run in multi sessions.

Problem

Resolutions

- Install all OPC clients and OPC Server, which use the gateway server, in the same session.
- The OPC Server as a service (session 0) may not be connected at the same time (in parallel) with an OPC server as a user application or CBP or CODESYS (all in session 1) with the AC500. If this function is necessary, different PC or virtual machines must be used.
- Use tools like OPC tunnel. In a DigiVis 500 setup context the OPC server must not be registered as service. The OPC tunnel itself starts the OPC server within its service.

See also

1.6.6.5.2 OPC UA server for AC500 V3 products

General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2. The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption. The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services

Gateway.exe,
WinCoDeSysOPC.exe and
OPC Client

on different test cases like multi session with terminal service sessions.
● Notification for value changes: subscription and monitored item services
● Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
● Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
● Supported profile: Micro Embedded Device server Profile
● By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
● Sending of events according to the OPC UA standard.

**Application Example**

An Application Example is available to gain a deeper understanding of the OPC UA protocol and to configure AC500 V3 accordingly

How to use OPC Server V3 - for DA and UA. Filter the list of application examples: Subject select 'Ethernet based protocols'.

---

### Creating a project for OPC UA access

1. Click “File ➔ New Project ➔ AC500 project” in Automation Builder 2.1 or newer.
2. Choose a PLC - AC500 V3 and click [Add object].
3. Right-click on node ETH1 or ETH2 and "Add object".
4. Choose OPC UA Server in the dialog and click [Add object].
5. Declare some variables of different types in the program.
6. Right-click “Application ➔ Add object”. Choose Symbol configuration and click [Add object].
7. Enable checkbox Support OPC UA Features in the dialog Add symbol configuration.
8. Double-click “Symbol configuration” in the Devices tree to open the editor Symbol configuration.
9. Click [Build].
   ▶ The variables are displayed in a tree structure.
10. Activate the variables that you want to publish to an OPC UA client. Specify the access rights.
11. Download the project to the PLC.

### Use node name

1. Double-click node “OPC_UA_Server”.
2. Set parameter Use node name to TRUE.
3. Double-click node “PLC_AC500_V3 <...>”.
4. Click “Device” and “Rename active device…”
5. Enter new device name in the following dialog and click [OK].

### Use UaExpert client

The OPC UA client UaExpert is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.
1. Start the *UaExpert* program.

2. Click on the “blue cross symbol”.

4. Enter URL and click [OK].
   - The URL appears in the Add Server dialog.

5. Select “Advanced” tab and click [OK].

6. Click [Connect] button.
7. Expand the project tree in the *Address Space* window.

8. Drag and drop the needed symbols to *Data Access View*.

---

**Working with encryption**

**Creating a certificate for the OPC UA server**

- Prerequisite: A battery is inserted and the clock is set to actual time.
- 1. Double-click the Security symbol in the lower right corner of Automation Builder.
- 2. Select the "Devices" tab.
  - The certificate information opens.
- 3. Select the PLC in the left *Information* view.
  - All services of the PLC that require a certificate are displayed in the right *Information* view.
- 4. Select the service "OPC UA Server".
- 5. Click the icon ![Certificate Settings icon](image) to create a new certificate for the device.
  - *Certificate Settings* dialog appears.
6. Define the certificate parameters according to the image above and click “[OK].

⇒ The certificate is created on the PLC.

7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see Chapter 1.6.3.7.3.4 “OPC UA secure” on page 3653.

Encrypted connection with UaExpert client

1. Start the UaExpert program.

2. Click on the “blue cross symbol”.
4. Enter URL and click [OK].

⇒ The URL appears in the Add Server dialog.
5. Select “Advanced” tab.

6. Choose option “Basic256ha256” of drop-down list Security Policy and “Sign & Encrypt” of drop-down list Message Security Mode and click [OK].
7. Click menu “Settings” and “Manage Certificates”

8. Click [Create new Application Certificate...].
   ⇒ Dialog New Application Instance Certificate opens.
9. Enter the required informations and click [OK].
   
   > Dialog “Manage Certificates” opens

10. Click [Copy Application Certificate To...] your PC.

11. Download the certificate to AC500 via the Security Screen view.

12. Click [Connect] button in the UaExpert client.
Dialog Certificate Validation opens.

Working with a trusted certificate will avoid this error message.

14. Enable checkbox Accept the server certificate temporarily for this session and click [Continue].

Dialog Connect Error opens
15. Click [Ignore]

![Certificate Management Dialog]

16. Check settings in dialog *Manage Certificates.*

**Changing variables via UaExpert client**

1. Expand in view Address Space “Objects ➔ DeviceSet ➔ PM5670 ➔ Resources ➔ Application ➔ PLC_PRG”.
   - The variables of the global variable list are visible.

![UaExpert Client](image-url)
2. Drag and drop the variables to the Data Access View.
3. Change values in the column Value.

## Configuring OPC UA client

### Operating modes

#### Polling
- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

#### Pub/Sub
- Not yet supported

#### Subscription (recommended mode)
- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

### Client defines a group of symbols with

<table>
<thead>
<tr>
<th>Description</th>
<th>Client defines a group of symbols with</th>

**Diagram:**

- Sampling Intervals
- Monitored Item queues
- Data Changes
- Aggregates
- Events
- Publish Interval
- Notifications
Using OPC UA with subscription mode

Recommendations:
– Define only variables you need as symbols
– Do not configure publishing intervals to short (increase load)
– Use different subscriptions with different publishing intervals in order to decrease load
– Do not use sampling intervals faster than publishing intervals as long as AC500 OPC UA server don’t support Queue Size different from 1
– Be careful: Setting „0“ at sampling Interval at client will be interpreted in server as „as fast as possible“, which is 100ms at AC500 and create a high load.
1. Right-Click on an Item in Data Access View and click “Subscription Settings”.

![Subscription Settings](image)

2. Set the recommended values.

- **Life Time Count**: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deleted.

- **Max Keep Alive Count**: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

  Click [OK].

3. Right-Click on an Item in Data Access View and click “Monitored Item Settings”.

![Monitored Item Settings](image)

4. Set the recommended values.

1.6.6 Converting an AC500 V2 project to an AC500 V3 project

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example *Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.*
1.6.7 Storage devices for AC500 V3 products

1.6.7.1 Introduction of AC500 storage devices for AC500 Products

1.6.7.1.1 Overview

AC500 PLCs offer a variety of storage devices. The following table gives a short overview and a description on these storage devices:

IEC access means that the storage device can be accessed by Function Blocks of an IEC program.

FTP access means that the device can be accessed via FTP server on the PLC (if available).

<table>
<thead>
<tr>

<td>V3.1.0</td>
<td>Save persistent data Boot project (size depends on PLC type)</td>
</tr>
</tbody>
</table>

*) Examples for the filename with path (sFileName for FILE.Open) specified by the user (‘mydir’ is optional, but must be an existing directory):

- ’userdisk/myfile.txt’
- ’sdcards/mydir/myfile.txt’
- ’flashdisk/myfile.txt’
The maximum number of files opened at the same time is limited to 1007.
The max. length of the user string (path and filename) is 241 characters.

Unlike the PLC’s memory areas like %M or Retain, where 1 byte actually consumes 1 byte, all storage devices utilize a file system. That means there is a difference between a file’s size and its size on the disk. On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk’s size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

1.6.7.1.3 Memory sizes

<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>
## 1.6.7.1.4 Storage device details

This section contains some details on each storage device. For further details on specific topics please also refer to the following chapters:

<table>
<thead>
<tr>
<th>Storage device sizes</th>
<th>IEC access</th>
<th>FTP access</th>
<th>PLC shell commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>see Chapter 1.6.5.1.1.1 “Memory sizes” on page 3212</td>
<td>see</td>
<td>see</td>
<td>see Chapter 1.6.6.4.4 “PLC shell commands” on page 3680</td>
</tr>
</tbody>
</table>

### SRAM

The SRAM is a battery-buffered, nonvolatile RAM and is used for the retain/persistent and the ProzM variables. If a battery is inserted into the Processor Module, the data stored in the SRAM will not get lost during a power-down cycle.
During PLC startup, the SRAM will be deleted automatically if no or an empty battery is inserted into the Processor Module. In this case the information

```
ABBInitSram_SetupMemory : SRAM cleared
```

and the warning

```
Retain size in config changed, or retain area got corrupted
```

are written into the log file.

Further information see Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3212.

**Memory card**

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3720.

<table>
<thead>
<tr>
<th>Size</th>
<th>Product specific, see table Memory Sizes Chapter 1.6.5.1.1.1 “Memory sizes” on page 3212</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEC access</td>
<td></td>
</tr>
</tbody>
</table>

**Flash disk**

The flash disk is an internal persistent mass storage device and can be used for any application purpose.

It has a memory capacity of 8 GB (preformatted).

The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases. If the performance seems to get insufficient, check the following:

- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.

Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require 10*4 kB disk space, while 1 file with 100 byte requires only 4 kB.

**Number of max. write cycles**

Technically, the flash chip used in V3 flash disk has 20000 Erase-Cycles (Write cycles).

Due to the produced write overhead, the optimum achievable number of write cycles is 10000 (for typical payload sizes of 256 kB).

**Example**

The write overhead is indicated by the **write amplification factor (WAF)**.

\[
WAF = \frac{Flash \text{ Write (in Bytes)}}{Host \text{ Write (in Bytes)}}
\]

**Table 714: Rule of thumb for assessing the flash lifetime for an application:**

<table>
<thead>
<tr>
<th>Typical payload sizes</th>
<th>WAF</th>
<th>Max. write cycles</th>
</tr>
</thead>
<tbody>
<tr>
<td>256 kB</td>
<td>2</td>
<td>10000</td>
</tr>
<tr>
<td>128 kB</td>

<td>&lt; 40</td>
</tr>
<tr>
<td>512 Byte</td>
<td>1024</td>
<td>&lt; 20</td>
</tr>
</tbody>
</table>

For monitoring the status

> It is recommended to use the respective Function Blocks to monitor the status of the flash disk (see Chapter 1.6.7.4 “Health monitoring” on page 3729).

Since FW version 3.3.0, there is also a diagnosis event supported when the flash memory reaches the end of its life cycle.

Lifetime of flash disk will also depend on the operating environment.

E.g. high ambient temperatures will impose stress on the flash memory and reduce the total overwrites achievable.

- Max. write speed is 20 MB/s (continuous write of sequential data)
- Read cycles are unlimited.

### 1.6.7.2 Memory card in AC500 V3

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card.

#### NOTICE!

Do not remove the memory card during access. For MC activity the black square (□) is shown on display as long as a file is open on Memory card. Remove only when the black square for MC activity does not blink. Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

### 1.6.7.2.1 Firmware update with memory card

ABB recommends that users carry out the firmware update with memory card via the chapter Chapter 1.6.7.2.1.1 “Memory card application export” on page 3720. Only advanced users should apply the following sections:

- Chapter 1.6.7.2.1.2 “File content: Firmware version V3.x” on page 3724
- Chapter 1.6.7.2.1.3 “Command file SDCARD.INI for AC500 V3 Products” on page 3725
- Chapter 1.6.7.2.1.4 “Example: SDCARD.INI as of CPU firmware V3.x” on page 3727
- Chapter 1.6.7.2.1.5 “Initializing a memory card using a PC” on page 3728

#### Memory card application export

Memory cards contain firmware and application. Visualizations and all related objects (like text lists) are also added to the memory card.
Memory card

- MC502 for AC500 V3  № Chapter 1.6.3.8.2.1 “MC502 - memory card” on page 3082
- MC5141 for AC500 V3  № Chapter 1.6.3.8.2.3 “MC5141 - memory card” on page 3090
- MC5102 for AC500 V3 and AC500-eCo V3  № Chapter 1.6.3.8.1.1 “MC5102 - micro memory card with micro memory card adapter” on page 3064

The user can choose between 2 application export options:

- Export boot project and firmware
- Export firmware (only)

---

**Export boot project and firmware**

1. Right-click “Application” in the device tree.
2. Select “Export Boot project and firmware (SD card)...”.
3. Click [Make New Folder] and type in "SD".
4. Select [OK] to add the folder.

---

*Fig. 310: Example for AC500 V3 with PM5650-2ETH*

1. Right-click “Application” in the device tree.
2. Select “Export Boot project and firmware (SD card)...”.
3. Click [Make New Folder] and type in "SD".
4. Select [OK] to add the folder.
5. Select folder “SD”

⇒ The SD structure has been created and the firmware and application have been exported.

The created SD folder does not contain user data, remanent data, config data, safety PLC power dip data and safety PLC password!

Please add this data if required by the used application.
Export firmware (only)

Fig. 311: Example for AC500 V3 with PM5650-2ETH

1. Right-click “Application” in the device tree.
2. Select “Export ➔ Firmware (SD card)…”.
3. Click [Make New Folder] and type in "SD".
4. Select [OK] to add the folder.
5. Select folder “SD”
The SD structure has been created and the firmware has been exported.

**File content: Firmware version V3.x**

Only advanced users should apply the instructions in this chapter.

**General update process**

Information on the firmware: Chapter 1.2.16.1.2.6 “AC500 V3 firmware installation and update” on page 77

The main components of the V3 CPU firmware are:

- BootFW (boot firmware): responsible for the starting of the UpdateFW or the SystemFW
- UpdateFW (update firmware): responsible for the update of BootFW, UpdateFW, SystemFW, UpdateHook and boot project
- SystemFW (system firmware, CPUFW): Runtime system of the PLC, additionally responsible for the update of the DisplayFW (display firmware) and the firmware of the coupler
- DisplayFW (display firmware): firmware of the display

Additionally the update process includes the following parts:
● Coupler (coupler firmware): firmware of the different couplers
● UpdateHook: Specific patches for the PLC
● UserProgram: boot project of the application
● License features: Import and export of license files. The license file for the "ImportLicense" is a Wbb or a WibuCmRaU file. The license file of the "ExportLicense" is a WibuCmRaC file.

The firmware updates are triggered by the command file SDCARD.INI. In addition a result file of the firmware update is generated (SDCARD.RDY, identical path as SDCARD.INI). For the group [FirmwareUpdate] the parameters 0, 11, 12 and 13 are defined. For each firmware update two files are necessary. The firmware file and the corresponding signature file.

For example:
AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2
AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2.sig
AC500_V3_DisplayFirmware_V3.0.0.0.app
AC500_V3_DisplayFirmware_V3.0.0.0.app.sig

For the user program the application file and the application CRC are necessary. For example:
Application.app
Application.crc

If the signature file and the firmware file do not match, no update is performed and the corresponding error result is written to the file SDCARD.RDY.

If the update firmware is running the display shows the text update. The blinking of the RUN and the ERR LED’s indicates the update process.

At the end of the update process a “reboot” is executed and the system firmware is started for the finishing of the update process. The positive result of the update process is signaled by the blinking of the RUN LED (ERR LED is off) and the display shows done. A negative result is signaled by the blinking of the ERR LED (RUN LED is off) and the display shows FAIL. The file “SDCARD.RDY” includes the results of the different updates. After an update of a coupler CODESYS Control is started in safe mode (no download or starting of the application is possible) and the PLC needs a reboot (power down/up; the display shows please and reboot alternately).

As of system firmware 3.2 the compatibility file "Version.txt" (with the corresponding signature file "Version.txt.sig", identical path as "SDCARD.INI") is necessary for the update process. The update firmware checked the compatibility of the following parts:
● CPUFW (system firmware)
● BootFW (boot firmware)
● UpdateFW (update firmware)
● DisplayFW (display firmware)

A missing "Version.txt" or a missing/corrupt "Version.txt.sig" file is signalled at the component "CPUFW" (file "SDCARD.RDY").

If the update process would result in incompatible parts of firmware no update is performed in the update firmware. After starting of the system firmware the compatibility of the coupler firmware is checked additionally. The check of the compatibility of the firmware is executed always (independent of the parameter for the component). Incompatibility is signalled at the corresponding component (file SDCARD.RDY)

Command file SDCARD.INI for AC500 V3 Products

Only advanced users should apply the instructions in this chapter.

12 = Update with different version, the update is only performed if the version of the file specified by the component path key “Boot” and/or “Firmware” in module’s section [Coupler0] differs from the current version of the Coupler.  
13 = Update with newer version, the update is only performed if the version of the file specified by the component key “Boot” and/or “Firmware” in module’s section [Coupler0] is newer than the current version of the Coupler. |
| **Coupler1=x**     | 0, 11, 12, 13 | Update module slot 1; see description Coupler0, module section is [Coupler1]*. |
| **Coupler2=x**     | 0, 11, 12, 13 | Update module slot 2; see description Coupler0, module section is [Coupler2]*. |
| **Coupler3=x**     | 0, 11, 12, 13 | Update module slot 3; see description Coupler0, module section is [Coupler3]*. |
| **Coupler4=x**     | 0, 11, 12, 13 | Update module slot 4; see description Coupler0, module section is [Coupler4]*. |
| **Coupler5=x**     | 0, 11, 12, 13 | Update module slot 5; see description Coupler0, module section is [Coupler5]*. |
Coupler6 = x
x = 0, 11, 12, 13

Update module slot 6; see description Coupler0, module section is [Coupler6]*.

UserProgram = x
x = 0, 11

0 = No update.
11 = Update user program always with the file specified in module's section [CPU] and component's path key "UserProgram".

Example: SDCARD.INI as of CPU firmware V3.x

Only advanced users should apply the instructions in this chapter.

[Status]
; FunctionOfCard
; 0 = Perform no function when inserting the card or voltage ON
; 1 = Load user program according to entry in group [UserProg]
; 2 = Start firmware update according to entry in group [FirmwareUpdate]
; 3 = Update firmware according to entry in group [FirmwareUpdate] and load user program according to entry in [UserProg]

FunctionOfCard = 0

[FirmwareUpdate]
; 0 = No update
; 11 = Update with file specified in module's section <modsec>, component's path key <pathkey>
; 12 = Like 11, but check version of file to be updated differs from current one.
; 13 = Like 11, but check version of file to be updated is newer than current one.

[Coupler4]
Firmware= ;Path/file of external coupler's firmware slot 4 to update

[Coupler5]
Firmware= ;Path/file of external coupler's firmware slot 5 to update

[Coupler6]
Firmware= ;Path/file of external coupler's firmware slot 6 to update

Example
SDCARD.INI for memory card PM5650-2ETH for update only the system firmware (SystemFW):
[FirmwareUpdate]
CPUPFW=11
[CPU]
CPUFW=/SystemFirmware/ AC500_V3_SystemFirmware_V3.1.3.zzz.tar.bz2

Initializing a memory card using a PC

Only advanced users should apply the instructions in this chapter.

It is possible to create the above described file structure on the hard disk of a PC with memory card interface. To do this, create the required directories and an ASCII file named SDCARD.INI with Notepad, for example.
1.6.7.3 Flash memory for AC500 V3 products

AC500 Processor Modules for V3 products (PM56xx) are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications. The user flash memory can be accessed from the user program using the .

NOTICE!
The User Flash Memory has a finite number of write cycles.

1.6.7.4 Health monitoring

AC500 V3 products are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications.

Keep the amount of cyclic written data low to assure long availability of the flash memory. The spent/remaining lifetime information of the flash memory can be acquired with the Function Blocks PmDiskStatus and PmDiskLifetimeUsed in the “Library Manager” of Automation Builder.

Further information is provided in the documentation of the AC500_Pm library. See the function blocks PmDiskLifetimeUsed and PmDiskStatus in the “Library Manager” of Automation Builder.

Since FW version 3.3.0, there is also a diagnosis message issued when the flash memory reaches the end of its lifecycle. Please refer to the diagnosis documentation for more info.
1.7 Diagnosis and debugging for AC500 V3 products

1.7.1 The diagnosis system

The diagnosis system enables uniform diagnosis of the CPU and its local interfaces, of the local I/O bus with the connected S500 I/O devices and of the fieldbuses connected via communication modules, considering the special features of the various fieldbuses. The safety CPU is also integrated into the diagnosis system.

Diagnosis data of the devices can be accessed by

- CPU display
- Automation Builder
- IEC application

To forward the information to notify them by, e.g., webserver or OPC UA server, the data retrieved in IEC application can be stored in variables.

![Overview of the diagnosis system](image)

Fig. 312: Overview of the diagnosis system

All diagnosis data is assigned to a device. System diagnosis (e.g., battery low) is coming from the CPU device or one of the child objects (e.g., watchdog diagnosis of a task object).

Diagnosis is available for devices with representation in the Automation Builder device tree.

Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC. \(\text{Chapter 1.7.1.5.1 “Error severity” on page 3763}\)

**Types of diagnosis messages**

- An **event** describes the current state of the device. It does not have to be acknowledged.
- An **alarm** describes that at a certain point of time, there was a diagnosis message. It does not say anything about the current state of the device.

Alarms must be acknowledged by the user. After acknowledging, the alarm disappears for all consumers.

Every diagnosis message has a come time.

**Device state**

With reference to diagnosis, there are different device states:

- Device without events and without unacknowledged alarms.
- Device with events or unacknowledged alarms.
- Device does not respond and is not available for online connection.
Diagnosis messages are always available for all consumers.

- **ABB AC500 V3 devices:**
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location, error number and text.
- **3rd party devices:**
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location and error number.
  - Clear text information if available either from a standard or from the device description.
  - If available: Extended diagnosis: Additional data coming from the device for manual analysis.

Some devices are able to provide extended diagnosis. This additional device-dependant diagnosis will only be collected on request and will be device type specific (e.g. bus scan request on PROFINET I/O controller). Main intention is to cover commissioning use cases, when very specific information is required that typically cannot be stored in error numbers in a reasonable way.

### 1.7.1.1 Access to diagnosis data

- **Access to device state**
  - Error LED on CPU § Chapter 1.7.1.2 “Diagnosis in CPU display” on page 3731
  - Automation Builder device tree § Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 3736
  - IEC application via device name § Chapter 1.7.1.4.3 “Device diagnosis” on page 3753
  - IEC application via list of all available diagnosis § Chapter 1.7.1.4.2 “System diagnosis” on page 3744
  - External access via global IEC variables Fig. 312

- **Access to diagnosis descriptions**
  - CPU display § Chapter 1.7.1.2.2 “Diagnosis descriptions” on page 3732
    (for CPU, local I/O bus and connected S500 I/O modules, not for communication modules and field buses)
  - Automation Builder via “All messages” window § Chapter 1.7.1.3.2 “Diagnosis descriptions” on page 3736:
    - Support for (bulk) acknowledgement of alarm
    - Access to extended diagnosis data of 3rd party devices devices (if available), without any interpretation
  - IEC application via a list of all current diagnosis either of a device (device object from the Automation Builder tree) § Chapter 1.7.1.4.3 “Device diagnosis” on page 3753 or of the complete PLC § Chapter 1.7.1.4.2 “System diagnosis” on page 3744:
    - Navigation chronologically in both directions (starting either from the oldest or newest diagnosis)
    - Access to the diagnosis numerically (evaluation by IEC application), textual (use on HMI) or to extended diagnosis data of 3rd party devices (if available)
    - Acknowledgement of alarms
  - External access via global IEC variables by using the IEC application features for getting all relevant information

**Access to extended diagnosis**

Extended diagnosis data will be displayed in Automation Builder via “All messages” window. The data is displayed as it is provided from the device without any interpretation. Refer to, e.g., the manual of the device to get information about the extended diagnosis data.

### 1.7.1.2 Diagnosis in CPU display

#### 1.7.1.2.1 Device state

If there is at least one active diagnosis message, the error LED ERR is on.
The behavior of the error LED depends on the setting of CPU parameter “Error LED”© Chapter 1.6.6.2.3.4 “Parameters of the processor module” on page 3447.

Diagnosis of AC500-eCo CPUs can only be shown by LED ERR at CPU. No display is available.

General information on the LEDs, the display and the function keys can be found in chapter © Chapter 1.6.5.1.5 “LEDs, display and function keys on the front panel” on page 3238.

1.7.1.2.2 Diagnosis descriptions
© Chapter 1.6.5.1.5.5.5 “Reading out diagnosis messages on the CPU” on page 3261.

</table>

CPU display does not show any communication modules or fieldbus diagnosis. To view these diagnosis messages use Automation Builder © Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 3736 or IEC application © Chapter 1.7.1.4 “Diagnosis in IEC application” on page 3739.

This is valid for:
- all external communication modules incl. safety CPUs, CM574-RS, FM502-CMS
- CANopen on onboard CAN interface
- fieldbuses on Ethernet interfaces ETH1/ETH2 like PROFINET IO controller, EtherCAT master, etc.

For identification of the location of a diagnosis the hardware ID and in addition for CPU diagnosis the SubSysteminfo byte 1 is used.

The location is displayed with 3 characters.

1.7.1.3 Diagnosis in Automation Builder

1.7.1.3.1 Device state

In Automation Builder, colored icons next to the devices’ nodes in the device tree indicate the device state of each single device. Chapter 1.7.2.3 “Project tree in online mode” on page 3766.

1.7.1.3.2 Diagnosis descriptions

Display text

For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.

It is necessary to include a visualization, even if visualization will not be used. Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

Displayed text for 3rd party devices

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22
26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.
Which texts are used, depends on parameter “Selection of diagnosis method”: Double-click on a PROFINET I/O module and open tab “General”.

### 1.7.1.3.3 System diagnosis

In Automation Builder the system diagnosis is activated by default and can be deactivated in: “Tools ➔ Options ➔ Diagnosis ➔ Enable subtree diagnosis”

![Automation Builder interface with options and diagnosis settings](image)

### 1.7.1.3.4 Device diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.

The message consists of:

- **Type** % Chapter 1.7.1.3.5 “Diagnosis history” on page 3738
- **Timestamp** in date and time YYYY-MM-DD hh:mm:ss.ms
- **Error severity**
- **Error code**
- **Diagnosis description**
- **Additional data**

To view the diagnosis message:

1. Double-click on a device.
2. Select the tab “Diagnosis”.

**Example**

Battery empty or missing.

<table>
<thead>
<tr>
<th>Type</th>
<th>Device</th>
<th>Timestamp</th>
<th>Severity</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>PLC_AC500_V3</td>
<td>1970-01-01 12:00:00.000</td>
<td>4</td>
<td>8</td>
<td>Battery, Device, Empty or missing</td>
</tr>
</tbody>
</table>

**Example**

Wrong module configured on I/O bus.

<table>
<thead>
<tr>
<th>Type</th>
<th>Device</th>
<th>Timestamp</th>
<th>Severity</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>DIS24</td>
<td>1970-01-01 12:16:30.623</td>
<td>11</td>
<td>16150</td>
<td>Module 1, Type of present module does not match configuration</td>
</tr>
</tbody>
</table>

Device diagnosis is disabled by default.
To enable/disable device diagnosis:
1. Double-click on the PLC.
2. Select the tab “PLC Settings”.
3. Under “Additional Settings” enable/disable “Diagnosis for devices”.
   ⟷ When the device diagnosis is disabled, this symbol ⚪ will be displayed in the device tree and no diagnosis messages will be shown.

1.7.1.3.5 Diagnosis history

Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

The ‘Diagnosis History’ view provides an overview of the current and past system events that resulted in a diagnosis event.

- Incoming diagnosis events are indicated with ✫.
  After the problem that causes a diagnosis event has been resolved, this diagnosis event is indicated automatically with ⤱.
- Alarm events, e.g. PROFINET alarms are indicated with ⚠.
  In the 'Diagnosis' view the user can acknowledge an alarm. Note that an alarm event can be acknowledged though the problem that causes the alarm still persists.
  The acknowledge action is indicated with ✔ on the concerning event entry. If the icon changes to ✔, the acknowledge action has been completed by the PLC.

The following buttons are available in the 'Diagnosis History' view:
- Start/Stop refresh:
  Enables or disables the automatic refresh mode. In refresh mode new diagnosis events will be displayed automatically. Only the last 100 entries are shown in this view, the latest events on top of the list.
- Get next entries:
  Adds the previous (older) 100 diagnosis events at the bottom of the list.
- Export complete history:
  Creates a csv file with all events from the diagnosis history (not only the visible ones).
1.7.1.4 Diagnosis in IEC application

There are two possibilities for accessing the diagnosis messages in the IEC application:

- System diagnosis: Access to diagnosis messages of the whole PLC
- Device diagnosis: Access to the diagnosis messages of a device

For both possibilities common data types (structures and enumerations) are defined in the library AC500_DiagTypes § Chapter 1.7.1.4.1 "Data types in library AC500_DiagTypes" on page 3740. The library is automatically included in PLC project.

Displayed text

For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.
It is necessary to include a visualization, even if visualization will not be used.

Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

Displayed text for 3rd party devices

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22

26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.

Which texts are used, depends on parameter “Selection of diagnosis method”: Double-click on a PROFINET I/O module and open tab “General”.

1.7.1.4.1 Data types in library AC500_DiagTypes

All data types regarding diagnosis are defined in the library AC500_DiagTypes.

Structure DIAG_VAL_TYPE

This data type specifies the format of all kinds of diagnosis messages in numeric format. It consists of one element for each detail of a diagnosis message.
Diagnosis and debugging for AC500 V3 products > The diagnosis system

Structure DIAG_TXT_TYPE

This data type specifies the format of all kinds of diagnosis messages in textual format. It consists of a single string containing all details of a diagnosis message.

The text consists of the following data, separated by semicolon:
- Timestamp in Date_And_Time (DT) format of eDiagEvent_Occured and added milliseconds
- Error severity
- Device name (max. 80 characters) as defined in Automation Builder device tree
- The error text itself, composed of the interpretation of dwSubSystemInfo and dwAdditional and the error text plus remedy (if available) from Automation Builder text list according dwErrorCode. Displayed as: error text -> remedy.

Example

Battery empty or missing.

Enumeration ERROR_ID

Type of the return values of all methods and functions to request information on diagnosis.
<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERR_NO_TEXT_CONTENT</td>
<td>16#4</td>
<td>Failed to get at least one content from text list</td>
<td></td>
</tr>
<tr>
<td>ERR_COMPETING</td>
<td>16#5</td>
<td>Failed due to competing access of other method</td>
<td>Try again</td>
</tr>
<tr>
<td>ERR_ASYNC</td>
<td>16#6</td>
<td>Failed to create async process</td>
<td></td>
</tr>
<tr>
<td>ERR_INTERNAL</td>
<td>16#7</td>
<td>Any internal error during execution</td>
<td></td>
</tr>
<tr>
<td>BUSY</td>
<td>16#FFF</td>
<td>Busy</td>
<td>Call again to get final result</td>
</tr>
<tr>
<td>NO_ERROR_NO_DATA</td>
<td>16#FFFF</td>
<td>Execution successfully completed, no more diagnosis messages</td>
<td></td>
</tr>
</tbody>
</table>

All values except "BUSY" are final results. In case "NO_ERROR" is returned, the requested action has been successfully performed. "NO_ERROR_NO_DATA" also indicates a successful completion. The only difference to "NO_ERROR" is the fact, that there is one (more) data to be provided. All other return values (except "BUSY") are final error states. In case a method or function returns "BUSY", it has to be called again in the following cycles until it returns a final result.

**Enumeration teClass**

Specifies the error severity of diagnosis messages. "Chapter 1.7.1.5.1 “Error severity” on page 3763.

<table>
<thead>
<tr>
<th>Name</th>
<th>Error severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagClass_2_SeriousError</td>
<td>2</td>
</tr>
<tr>
<td>eDiagClass_3_Error</td>
<td>3</td>
</tr>
<tr>
<td>eDiagClass_4_Warning</td>
<td>4</td>
</tr>
<tr>
<td>eDiagClass_Parameter</td>
<td>11</td>
</tr>
</tbody>
</table>

**Enumeration teEvent**

The enumeration teEvent specifies the severity of diagnosis messages.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagEvent_Occured</td>
<td>DINT</td>
<td>1</td>
<td>Error occurred, remains &quot;active&quot; until eDiagEvent_Disappeared</td>
</tr>
<tr>
<td>eDiagEvent_Disappeared</td>
<td>DINT</td>
<td>2</td>
<td>Error disappeared, became &quot;active&quot; due to eDiagEvent_Occured earlier on</td>
</tr>
<tr>
<td>eDiagEvent_Received</td>
<td>DINT</td>
<td>4</td>
<td>Received a diagnosis message which cannot be analyzed in detail, cannot disappear, needs to be acknowledged</td>
</tr>
<tr>
<td>eDiagEvent_Acknowledged</td>
<td>DINT</td>
<td>8</td>
<td>Acknowledge a diagnosis message which has been received by eDiagEvent_Received, removes diagnosis message from diagnosis system although error may still be present</td>
</tr>
</tbody>
</table>
The enumeration teHwId specifies the hardware component as location of a diagnosis message.

<table>
<thead>
<tr>
<th>Name</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>eDiagHwId_CPU</td>
<td>0</td>
<td>Any diagnosis message regarding CPU itself, like &quot;battery&quot;, &quot;sd card&quot;, etc.</td>
</tr>
<tr>
<td>eDiagHwId_Coupler1</td>
<td>1</td>
<td>Any diagnosis message regarding communication module at slot 1. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_Coupler2</td>
<td>2</td>
<td>Any diagnosis message regarding communication module at slot 2. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>

<td>eDiagHwId_COM2</td>
<td>8</td>
<td>Any diagnosis message regarding COM2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_CAN</td>
<td>9</td>
<td>Any diagnosis message regarding CAN interface. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_OnboardIO</td>
<td>10</td>
<td>Onboard I/O, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard1</td>
<td>11</td>
<td>Option board 1, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard2</td>
<td>12</td>
<td>Option board 2, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_OptionBoard3</td>
<td>13</td>
<td>Option board 3, AC500-eCo only</td>
</tr>
<tr>
<td>eDiagHwId_IOBus</td>
<td>14</td>
<td>I/O bus</td>
</tr>
<tr>
<td>eDiagHwId_ETH1</td>
<td>15</td>
<td>Any diagnosis message regarding ETH1. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
<tr>
<td>eDiagHwId_ETH2</td>
<td>16</td>
<td>Any diagnosis message regarding ETH2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)</td>
</tr>
</tbody>
</table>

The hardware ID HwId is only used for diagnosis output in CPU display to identify the location of a diagnosis message. © Chapter 1.7.1.2 "Diagnosis in CPU display" on page 3731.
1.7.1.4.2 System diagnosis

Library AC500_Diag provides several methods and functions to access the diagnosis messages on all devices in the PLC application. It contains also a function to convert numeric diagnosis into a textual format.

The variables and their assigned values can be referred to within the IEC application as well as they can be used to transfer diagnosis messages to any visualization client.

Device state

The library contains a single function block named "Diag", providing several methods to process the device state.

### Method NumTotal

This method provides the total number of currently active diagnosis messages (including parameter errors, etc.).

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>NumTotal</td>
<td>DWORD</td>
<td>Number of diagnosis messages</td>
</tr>
</tbody>
</table>

```plaintext
VAR
  fbDiag : AC500_Diag.Diag; (* Instance of FB Diag *)
  dwNumTotal : DWORD;
END_VAR

dwNumTotal := fbDiag.NumTotal();
```

### Method NumClass

This method provides the number of currently active diagnosis messages related to the error severity.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>NumClass</td>
<td>DWORD</td>
<td></td>
<td>Error severity of diagnosis message</td>
</tr>
<tr>
<td>Input</td>
<td>DataInVal</td>
<td>AC500_DiagTypes.teClass</td>
<td>eClass.eDiagClass_2_SeriousError</td>
<td></td>
</tr>
</tbody>
</table>
Example

```plaintext
VAR
    fbDiag : AC500_Diag.Diag;
    eDiagClass_4: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_4.Warning; (* 4 *)
    eDiagClass_3: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_3.Error; (* 3 *)
    eDiagClass_11: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_Parameter; (* 11 *)
    dwNumClass_4 : DWORD;
    dwNumClass_3 : DWORD;
    dwNumClass_11 : DWORD;
END_VAR

dwNumClass_4 := fbDiag.NumClass(eDiagClass := eDiagClass_4);
dwNumClass_3 := fbDiag.NumClass(eDiagClass := eDiagClass_3);
dwNumClass_11 := fbDiag.NumClass(eDiagClass := eDiagClass_11);
```
Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

<table>
<thead>
<tr>
<th>Method for system diagnosis</th>

</tr>
</tbody>
</table>
Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get... / DiagGet... method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name for device diagnosis</th>
<th>Name for device diagnosis</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Ack</td>
<td>DiagAck</td>
<td>AC500_DiagTypes.ERROR_ID</td>
<td>Variable containing details of diagnosis alarm to be acknowledged</td>
</tr>
<tr>
<td>Input</td>
<td>Data</td>
<td>Data</td>
<td>AC500_DiagTypes.DIAG_VAL_TYPE</td>
<td></td>
</tr>
</tbody>
</table>

Example

System diagnosis: acknowledge first diagnosis message

```plaintext
VAR
  fbDiag: AC500_Diag.Diag;
  eErrorID_First: AC500_DiagTypes.ERROR_ID; (* instance of FB Diag *)
  sFirstVal: AC500_DiagTypes.DIAG_VAL_TYPE; (* return value *)
END_VAR

eErrorID_First := fbDiag.Ack(Data := sFirstVal);
```

Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxx-ValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required © Chapter 1.7.1.4.2.2.7 “Function DiagValToTxt” on page 3752. Alternatively, the methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel © Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 3750 © Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 3751.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result © Chapter 1.7.1.4.1.3 “Enumeration ERROR_ID” on page 3741.

**All diagnosis messages sorted by time, ascending**

1. Call any GetFirst... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext... method as long as its final result is "NO_ERROR".

**All diagnosis messages sorted by time, descending**

1. Call any GetLast... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev... method as long as its final result is "NO_ERROR".

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name for device diagnosis</th>
<th>Name for device diagnosis</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Get-xxx-Val</td>
<td>DiagGet-xxx-Val</td>

</tbody>
</table>
1.7.1.4.3 Device diagnosis

Activate device diagnosis

While the notification of diagnosis messages at the display and the Automation Builder is enabled by default, the functionality to access diagnosis messages from within the IEC application needs to be explicitly enabled.

1. Double-click on the CPU in the device tree.
2. Select tab “PLC Settings”.
3. Under “Additional Settings” select “Enable Diagnosis for devices”.
   ⇒ Library CAA Device Diagnosis (namespace DED) is automatically included in the project. This library is needed for displaying and processing the device state.

In case the functionality of diagnosis is no longer needed in IEC application, we recommend to disable this setting.
Device state

1. Open one of the IEC application code editors.
2. Type the device's name as it is written in the device tree, followed by a dot (".").
3. Select the method `GetDeviceState` from the context menu or type the name of the method on yourself.

4. Assign the function's parameters.

```c
DeviceState_DC532 := DC532.GetDeviceState(xDiagnosisInfoAvailable => bDiagAvailable, eError => eError);
```

Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

<table>

Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any Get... / DiagGet... method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

<table>
<thead>
<tr>
<th>Scope</th>
<th>Name for device diagnosis</th>
<th>Name for device diagnosis</th>
<th>Type</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Ack</td>
<td>DiagAck</td>
<td>AC500_DiagTypes.ERROR_ID</td>
<td>Variable containing details of diagnosis alarm to be acknowledged</td>
</tr>
<tr>
<td>Input</td>
<td>Data</td>
<td>Data</td>
<td>AC500_DiagTypes.DIAG_VAL_TYPE</td>
<td>Variable containing details of diagnosis alarm to be acknowledged</td>
</tr>
</tbody>
</table>

Example

System diagnosis: acknowledge first diagnosis message

```vbnet
VAR
    fbDiag : AC500_Diag.Diag;
    eErrorID_First : AC500_DiagTypes.ERROR_ID; (* return value *)
    sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE; (* structure of returned values *)
END_VAR

eErrorID_First := fbDiag.Ack(Data := sFirstVal);
```

Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., Get-xxx-Val just provides the basic information in numeric format, Get-xxx-ValExt additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required © Chapter 1.7.1.4.2.2.7 "Function DiagValToTxt" on page 3752. Alternatively, the methods Get-xxx-ValAndTxt and Get-xxx-ValAndTxtExt can be used for numeric and textual format in parallel © Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 3750 © Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 3751.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result © Chapter 1.7.1.4.1.3 “Enumeration ERROR_ID” on page 3741.

All diagnosis messages sorted by time, ascending

1. Call any GetFirst... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetNext... method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, descending

1. Call any GetLast... method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any GetPrev... method as long as its final result is "NO_ERROR".

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

</table>
1.7.1.5 Structure of error numbers

1.7.1.5.1 Error severity

<table>
<thead>
<tr>
<th>Error severity</th>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Fatal errors</td>
<td>Safe operation of the operating system is no longer ensured.</td>
<td>Checksum error in system flash, RAM error</td>
</tr>
<tr>
<td>2</td>
<td>Serious errors</td>
<td>The operating system works correctly, but the error-free execution of the user program is not ensured.</td>
<td>Checksum error in user flash, task cycle times exceeded</td>
</tr>
<tr>
<td>3</td>
<td>Light errors</td>
<td>It depends on the application whether the user program has to be stopped by the operating system or not. The user decides which reaction is to be done.</td>
<td>Flash memory cannot be programmed, I/O module failed</td>
</tr>
<tr>
<td>Error severity</td>
<td>Type</td>
<td>Description</td>
<td>Example</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>4</td>
<td>Warnings</td>
<td>Errors that occur on peripheral devices or that will have an effect only in the future. The user decides which reactions are to be done.</td>
<td>Short circuit in an I/O module, battery empty/not installed</td>
</tr>
<tr>
<td>11</td>
<td>Parameter error</td>
<td>Error occurred during parameter setting</td>
<td>Different I/O devices in PLC configuration and hardware installation</td>
</tr>
</tbody>
</table>

**Errors with error severity 1 - fatal errors**

Errors with error severity 1 are not entered in the diagnosis system. These errors do not allow normal operation of the PLC. These errors are detected during PLC start-up and stop the PLC immediately.

Examples are RAM errors or checksum errors when starting the firmware.
Such errors are indicated by rapid flashing of the ERR LED.

### 1.7.1.6 Diagnosis history file

Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

Diagnosis history is the entry of all diagnoses into a file according to their time of occurrence.

The diagnosis history file is in the root directory of the user disk and has the name “DiagHistory.csv”. The max. number of entries is 5000. When 5000 entries are reached, the oldest entry is overwritten. The max. size of the extended data is 32 bytes.

An entry consists of following data:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Comment</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>timestamp</td>
<td>ARRAYDT OF BYTE</td>
<td>_RTC time of event in milliseconds consists of diTimestamp in DT format and uiMs milliseconds – see ∘ Chapter 1.7.1.4.1.1 “Structure DIAG_VAL_TYPE” on page 3740STRUCT</td>
<td>1603371910177</td>
</tr>
<tr>
<td>event</td>
<td>BYTE</td>
<td>Event type (1=comes, 2=gone) – see ∘ Chapter 1.7.1.4.1.5 “Enumeration teEvent” on page 3742</td>
<td>1</td>
</tr>
<tr>
<td>class</td>
<td>BYTE</td>
<td>Severity of error event – see ∘ Chapter 1.7.1.4.1.4 “Enumeration teClass” on page 3742</td>
<td>4</td>
</tr>
<tr>
<td>compID</td>
<td>UDINT</td>
<td>Component ID</td>
<td>270540802</td>
</tr>
<tr>
<td>conn</td>
<td>UDINT</td>
<td>Connector</td>
<td>0xb17777ac</td>
</tr>
<tr>
<td>connIdx</td>
<td>UDINT</td>
<td>Connector index</td>
<td>0</td>
</tr>
<tr>
<td>sub</td>
<td>DWORD</td>
<td>SubsystemID: Any number describing detail/location within device, device specific</td>
<td>369098752</td>
</tr>
</tbody>
</table>
### Name | Type | Comment | Example
--- | --- | --- | ---
addl | DWORD | AdditionalID: Additional number describing detail/location within device, optional, device specific | 0
error | DWORD | Error code | 9
extended data | ARRAYDT OF BYTE | Extended diagnosis data, max. 32 bytes | |

As shown in the example data of the diagnosis history file is not easily readable. The entries must be interpreted according to device and/or fieldbus. Therefor the Automation Builder consists a special view for diagnosis history

> With the entries CompID, conn and connID, the device generating the event is clearly identified in the device tree.

> If the PLC configuration is changed, the values of this entries may be changed also.

> Therefore, the diagnosis history will be deleted during each download.

---

### 1.7.2 Online diagnosis in Automation Builder

#### 1.7.2.1 Short description and overview

To use the diagnosis system in Automation Builder, login to the online mode is required

> Chapter 1.7.2.2 “Entering/leaving the online mode” on page 3765. The online diagnosis in Automation Builder consists of a set of partly animated, mostly read only views. They can be invoked by a double-click on a project tree element which shows a circle indicating that this element is able to show diagnosis messages

> Chapter 1.7.2.3 “Project tree in online mode” on page 3766.

Available online diagnosis and statistics:

- **Diagnosis messages**
  > When the Automation Builder is switched to online mode, incoming diagnosis messages are displayed as plain-text

> Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 3736.

- **CPU/PLC diagnosis**

- **I/O module diagnosis**
  > Chapter 1.7.2.5 “Live values in views with I/O components” on page 3774.

- **Communication module and fieldbus diagnosis**
  > Chapter 1.7.2.6 “Communication module and fieldbus diagnosis” on page 3775

- **Diagnosis in IEC application**
  > Chapter 1.7.1.4 “Diagnosis in IEC application” on page 3739

For information on the disk status, diagnosis information can be read out with the function blocks PmDiskStatus and PmDiskLifetimeUsed.

> Chapter 1.6.7.4 “Health monitoring” on page 3729

#### 1.7.2.2 Entering/leaving the online mode

Prerequisite: Set the gateway before entering the online mode.

> Chapter 1.6.6.2.15 “Gateway configuration” on page 3533
Enter the online mode

Right-click the “Application” node and select “Login”.

The Automation Builder project login to online mode updates the latest changes of the project.

Leave the online mode

Right-click the “Application” node and select Logout.

When online mode is active, a thread is running on Automation Builder project which sends cyclically a message to the PLC and expects a response. If the PLC does not respond, the online mode is left programmatically.

1.7.2.3 Project tree in online mode

When Automation Builder enters the online mode internally, it shows the state of all configured communication modules.

The connection status can be recognized by a symbol in the device tree:

- Device without diagnosis messages
- Device with diagnosis messages or device diagnosis is disabled
- Device without diagnosis messages, but with diagnosis messages on at least one device in the branch below
- Device with diagnosis messages and with diagnosis messages on at least one device in the branch below
- Device does not respond to identification message and is not available for online connection
The identification is done in online mode.

- Double-click an element of the device-tree and select “Status” tab. Diagnosis information will be available.
The user will be notified in the device tree with an exclamation mark beside the device having diagnosis messages. The diagnosis messages are provided in the "Diagnosis" tab.

Alarms will be presented with a thunderbolt in the first column of the diagnosis grid.

**Acknowledging an alarm**

1. Stop diagnosis refreshment by clicking [Stop refresh].
2. Select one or more alarms and click [Acknowledge selected alarms].
Some diagnosis messages contain additional data. Click [View] button to see the additional diagnosis (in hex) for further analysis. If [View] button is not available, no additional data is available for this diagnosis message.

You can copy the additional data to the clipboard with [CTRL] + [C].

When building an IEC application in Automation Builder, diagnosis text lists will be generated and added to the device tree below the diagnosis folder. These text lists contain the device type specific diagnosis texts which are used by the diagnosis functions in the PLC application to show corresponding texts for error numbers.

The diagnosis text lists will only be downloaded to the PLC when a visualization is present in the project.

The text lists will be downloaded automatically to the PLC with the visualization. If there is a problem with downloading the text lists, make sure that the settings are correct:
1. Right-click on a text list and select “Properties”.
2. Open the “Text List” tab. The check box “Download by visualization” has to be selected.

1.7.2.4 CPU diagnosis views

1.7.2.4.1 Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the “Version information” tab.

Remarks:

- The “Version information” tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.
Firmware version on device matches version supplied with Automation Builder.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0.

Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.

Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.
1.7.2.4 Statistics

The "Statistics" tab shows the following information:

- **Date and time**: The actual date and time of the PLC is shown. It can be set or synchronized with the date/time of the PC via "Set PLC Date & Time" button.
- **Overview resource usage**: This tab shows all the required information (it is collected at latest when the command "Generate Code" is executed, some of the information is not available before then.) For the limitation "User program code and data" a [Details] button will be available. Clicking this button will open a modal window showing a more detailed view of the memory usage.

1.7.2.4.3 Log

You can view the PLC log in this tab. It lists the events that were recorded on the target system. This concerns:

- Events during the startup and shutdown of the system (components loaded, with version)
- Application download and loading of the boot application
- Custom entries
- Log entries from I/O drivers
- Log entries from data sources

</tr>
</thead>
<tbody>
<tr>
<td>&quot;Offline logging&quot;</td>
<td>☐: Default settings&lt;br&gt;☑: The PLC also records actions that are not related to the connection with the controller.</td>
</tr>
<tr>
<td>&quot;UTC time&quot;</td>
<td>☐: Standard setting; the time stamp is converted to the local time on the computer as indicated by the time zone of the operating system.&lt;br&gt;☑: The time stamp of the runtime system is displayed.</td>
</tr>
</tbody>
</table>
There are four categories for the severity of the event:

- ⚠: Message
- ⚠: Warning
- ☢: Error
- 🔧: Debugging

You can show or hide each category with the help of the corresponding button in the bar above the list. Each button shows the number of log entries of the category concerned.

| “Time stamp” | Date and time (example: 12-01-2007 09:48) |
| “Description” | Description of the event, for example Import function failed of |
| “Component” | Name of the runtime system component concerned, e.g. CmpApp |

Drop-down list with component names

The log list displays only events that concern the selected component

Logger

Drop-down list with all available recordings. The standard setting is the <Default Logger> specified by the target system, at present identical to 'PlcLog' for the CODESYS runtime system

Refreshes the log list

Exports the list contents to an xml file. You can select the file name and storage directory.

Imports a log list from an xml file. The list is then displayed in a separate window.

The displayed log list is emptied, i.e. all entries are deleted.

1.7.2.4.4 PLC shell commands

The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab “PLC Shell”.
3. Enter "?" in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.

See:

❖ Chapter 1.2.4 “Information on the installed version” on page 43
❖ Chapter 1.6.6.1.4 “Firmware identification and update” on page 3402.
1.7.2.4.5 Status

This tab displays status information, for example ‘Running’ or ‘Stopped’, and specific diagnostic messages from the respective device, also information about the card used and the internal bus system.

1.7.2.4.6 Diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.

1. Double-click on a device.
2. Select the tab “Diagnosis”.

Example

Battery empty or missing.

Example

Wrong module configured on I/O bus.

1.7.2.5 Live values in views with I/O components

“I/O mapping list” tab: In online mode, all Automation Builder views, which contain I/O component mapping tables, show animated live values which are updated every second.
1.7.2.6  Communication module and fieldbus diagnosis

1.7.2.6.1  Fieldbus commissioning

Common online diagnosis views for all netX-based coupler modules (e.g. CM579-ETHCAT, CM579-PNIO) can be accessed whenever the related PLC is in online mode. Chapter 1.7.2.2 “Entering/leaving the online mode” on page 3765.

Master/controller modules

Master/controller modules like CM579-ETHCAT or CM579-PNIO, provide the following diagnosis views:

- “Diagnostics main”: provides diagnosis messages which are common for all protocols (e.g., protocol state and error)
- “Diagnostics live list”: provides a list of connected slaves/devices and their state. Chapter 1.7.2.6.1.1.1 “PROFINET scan and comparison view” on page 3776
- “Diagnostics eventlog”: provides diagnosis messages from the master/controller and its connected slaves/devices
PROFINET scan and comparison view

PNIO_Controller

1. After going online, double-click on “PNIO_Controller (PROFINET-IO-Controller)” in the device tree.
   - The editor “PNIO_Controller” is displayed.
2. Select tab “Diagnostics live list” and click [Scan] to find all hardware devices that exist.
   - The found devices are listed in a table.
3. Click [Compare] to compare the found hardware I/O devices with the current project configuration.

Unknown hardware

If any I/O hardware device is unknown:
- The devices will be marked with a red exclamation mark.
- A message box will be appear for each unknown device.
- Automation Builder generates a message with information about its vendor ID and device ID.
1. To display the comparison view, install the device description for the unknown device.

2. After installing the device description, click [Scan] and click [Compare].

   The message box informs you, that the application will go offline to display the comparison view.

3. Click [Yes].

   The “Project Comparison - Differences” tab displays the difference between the PROFINET configuration in Automation Builder (left side) and the real hardware configuration (right side).

4. Click [Accept Single] to accept only a part of the differences or [Accept Block] to accept all differences.

   After clicking on the Button [Accept Single] or [Accept Block] the found devices will be moved from the right side to the left side.
5. Close tab “Project Comparison - Differences”.
   ⇒ A message will be displayed to ask if you want to commit the new changes into project.

6. Click [Yes].
   ⇒ The changes will be saved and the devices will be added to the project.
Slave/device coupler modules

Diagnosis views for slave/device coupler modules like CM589-PNIO:

- “Diagnostics main”: provides diagnosis messages which are common for all protocols
- “Diagnostics details”: provides protocol specific diagnosis messages

1.7.2.6.2 CI52x Modbus diagnosis

1. Double-click node “CI52x.MODTCP” in the device tree.
2. Select “CI52x Diagnosis” tab.
   - The button [Get Diagnosis] appears in the tab view.
3. Click on the button [Get Diagnosis].
   - One of the following use cases will be displayed:
     - Device not connected “Device not connected” on page 3779
     - No Errors on the device “No errors on the device” on page 3780
     - Diagnosis list “Diagnosis list” on page 3780

Device not connected

If there is no device connected to the project, the following dialog will be displayed:

1. Select tab “Connection Settings” and enter the IP address for the device.
2. Click again button [Get Diagnosis].
No errors on the device. If there are no errors on the device the following dialog will be displayed:

![Automation Builder 2.2 dialog](image)

Diagnosis list. If the device is not correctly configured the errors will be displayed with “Error Code” and “Code Description”.

![Error Code and Description](image)

### 1.7.3.4.2 CM579-PNIO – PROFINET I/O controller diagnosis

Diagnosis data for CM579-PNIO is not displayed in PLC display. In Automation Builder, we recommend to use methods with text output to get diagnosis messages in clear text format. E.g., `DiagGetFirstValAndTxt`.

Output string:

```
<timestamp>; <error severity>; <device name>; <error location>; error ID <id>: <error text>
```

If you need to access the diagnosis data directly, you have to interpret them manually. Refer to the example to learn how to interpret them correctly. See Chapter 1.7.3.4.2.1 “Manual interpretation of CM579-PNIO diagnosis” on page 3801.

### For experts: manual interpretation

If you need to access the diagnosis data directly, you have to interpret them manually. Refer to the example to learn how to interpret them correctly. See Chapter 1.7.3.4.2.1 “Manual interpretation of CM579-PNIO diagnosis” on page 3801.

</table>

| 3 | Subslot index (0 – 16#9FFF) | Channel index (16#8000) | Alarm type = 13 | 6 (alarm) | Alarm type = 13 | Subslot <subslot idx>, port data changed alarm |

| 3 | Subslot index (0 – 16#9FFF) | Channel index (16#8000) | Alarm type = 31 | 6 (alarm) | Alarm type = 31 | Used module pulled alarm |
Manual interpretation of CM579-PNIO diagnosis

For better understanding, we show the manual interpretation of CM579-PNIO diagnosis with an example.

System: AC500 CM579-PNIO + CI501-PNIO + optional S500 I/O inserted as PROFINET standard device

Error: discrepancy time expired (class 3, error ID 3) at channel 4 of first attached S500 I/O device on CI501-PNIO

For comparison: If a method with text output is used, e.g. DiagGetFirstValAndTxt the text output will be the string: Timestamp; E3; device name; subslot 1, channel 4, extended channel diagnosis; error ID 3: discrepancy time expired (class 3, error ID 3)

In Automation Builder the following error entry data is displayed:

Analyze the data in the following order: Element “dwAdditional” for the type of diagnosis, element “Error Code”; element “SubSysteminfo”.

**Type of diagnosis**

   Convert the given value from decimal to hexadecimal format.
   "dwAdditional" = 131076 = 16#20004

2. Interpretation:
   Word 2 = 2
   Word 1 = 4

3. Generate error text Add_Word 1_Word 2 = Add_4_2

4. Look up which error type it is.
   Add_4_2 = extended channel diagnosis

**Data analysis**

1. Analyze element “Error Code”:
   "dwErrorCode" = 196867 = 16#30103 →
   Word 2 (extended error type) = 16#0003
   Word 1 (error type) = 16#0103

   Error text: Err_Word 1 (hex)_Word 2 (hex)
   Err_0103_0003 →
   Error ID 3 – discrepancy time expired (class 3, error ID 3)

2. Analyze “SubSysteminfo”
   "dwSubSysteminfo" = 65540 = 16#10004 →
   Word 2 (subslot index) = 1
   Word 1 (channel index) = 4
### 1.8 Engineering interfaces and tools

#### 1.8.1 License borrowing manager

The license borrowing manager allows you to borrow a network license for offline use and return it.

The license borrowing manager is not part of the default software distribution, but will be handed out on request.

The license borrowing manager is only supported by Automation Builder 2.2.3 and later.

#### 1.8.1.1 Borrowing a network license

- Network access to the license server required.
- Opened the license borrowing manager.
  1. Select the license you want to borrow.
  2. Select “Borrow License”.
  3. Select the taget CmContainer.
     Alternatively a new CmContainer can be created.
  4. Select the end of the borrowing period.
5. Select “OK”.
   - The license has successfully been borrowed.
   - The list of available licenses has been updated.

1.8.1.2 Returning a network license

**Automatical return of a license**

Network licenses will be returned automatically after the expiration of the maximum borrowing period. No licenses server access is required.
Network licenses can be returned anytime manually.

- Network access to the license server required.
- Opened the license borrowing manager.

1. Select a borrowed license.

2. Select “Return License”

   The license has successfully been returned.

1.8.2 Export and import interfaces

1.8.2.1 Exporting and importing ECAD data (PBF)

Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.

Automation Builder - ECAD interface supports various flexible workflows:

- Enables PLC hardware planning and configuration in the ECAD tool and allows importing the exported data from the ECAD tool through the PBF file (process integration bus interchange format) into the Automation Builder project with diff and merge functionality, providing full control on selective import/merge.
- Enables PLC hardware configuration in Automation Builder and allows exporting the configuration to the ECAD tool through a PBF file.
- Supports bi-directional roundtrip engineering with lossless data exchange between Automation Builder and the ECAD tool.

Automation Builder uses the rack information to identify the relations between:

- PLC and devices plugged to IO bus or extension bus.
- Fieldbus slave and attached IO devices.

It is recommended to assign the PLC, IO devices, communication modules and fieldbus slaves properly to the rack in the ECAD project. If the rack information is missing, devices will be imported to the device pool and must be arranged manually in the Automation Builder project or mapped to already existing devices.
1.8.2.1.1 Requirements on EPLAN electric P8

- EPLAN Electric P8 with PLC and Bus Extension. It is recommended to use version 2.3 or later.
- Use of appropriate part data and macros for ABB devices. This can be achieved by getting the part data and macros from the EPLAN data portal.

1.8.2.1.2 Importing PLC data from the ECAD tool

You can create a new Automation Builder PLC project from the existing PLC hardware configuration in your ECAD tool, by importing the exported PBF file to Automation Builder.

**Import PBF file to Automation Builder**

1. From the main menu, select “Project ➔ Import ➔ ECAD (PBF)”.
2. From the file system, select the PBF file. Automation Builder starts importing the devices and its associated signals from the PBF file. After a successful import, the result is displayed in the Project Compare – Differences view. You can now decide and selectively merge the differences. ⇒ Chapter 1.4.1.24.2.4.18 “Command ‘Compare’” on page 937
3. Select the DevicePool node and click “Accept Block” to accept the complete PLC structure in the ECAD tool.
4. Select the PLC node and click “Accept Block” to accept all child device nodes.

The DevicePool node holds all devices coming from the ECAD tool without any hierarchy information. The missing hierarchy information can be defined after closing the editor.

5. Close the Project Compare – Differences view to accept the changes.

The I/O signals assigned to I/O devices in the PBF file are imported and allocated to IO devices. I/O signals can be viewed in I/O mapping editor of the I/O devices.
1.8.2.1.3 Importing third party devices

Prerequisite: To import third party devices from ECAD to Automation Builder, install third party fieldbus devices (for example, GSD, GSDML and EDS files) using “Tools ➔ Device repository” in Automation Builder.

1. From the main menu, select “Project ➔ Import ➔ ECAD (PBF)”.
2. From the file system, select the ECAD pbf file which consists of third party devices.
   - When the device identifier of the third party device installed in Automation Builder does not match with the device identifier of the device imported from ECAD, an error window is shown with the devices which are failed to import with error ID 14.
   - To import third party devices, it is required to assign ECAD identifier (PLC type designation/order number) in Automation Builder in “Tools ➔ Device ECAD data”. Click the link in the Import window to see the error messages in a text file.
3. Click “Continue” in the Import window to import valid devices to the project that are imported successfully or click “Cancel” to cancel the import process.
4. In Automation Builder, click “Tools ➔ Device ECAD data”.
5. In the Device ECAD data editor, add the ECAD identifier for the devices shown in the import errors window with error ID 14, to enable these devices for export and import.
   - Also, add the ECAD identifiers for all devices which need to support export/import in ECAD.
6. Reimport the pbf file to import the third party devices.

1.8.2.1.4 Exporting PLC data to ECAD tool

1. Open the existing PLC project.
2. In the device tree, right-click “PLC ➔ Export ➔ ECAD (PBF)”.
3. Select the desired location in the file system to save the PBF file.

The ECAD user can import the exported PBF file from Automation Builder and can use the imported PLC data for electrical engineering purpose. If the user modifies imported PLC data in the ECAD project, the data can be imported back to the Automation Builder project which supports the round trip engineering efficiently with loss less synchronization of the data.
1.8.2.1.5 Exporting third party devices

1. Right-click on a PLC device, click “Export” and select “ECAD (PBF)”.
2. Save the file to the desired location in the file system.
   
   If the third party devices does not contain assigned ECAD identifiers, a message is displayed showing which devices cannot be exported.
   
   ⇨ To add ECAD identifiers to the devices, see Importing third party devices ⇨ Chapter 1.8.2.1.3 “Importing third party devices” on page 3807.

   After adding ECAD identifiers to the third party devices, execute “Export” to export the devices including third party devices.

1.8.2.1.6 Importing ECAD PLC data to existing AB project

Automation Builder ECAD interface supports concurrent engineering by importing the ECAD data to the existing Automation Builder PLC project.

1. From the main menu, select “Project ➔ Import ➔ ECAD (PBF)”.
2. Select the PBF file which has been created during the export from the ECAD tool.
3. Select the PLC from the list and click “OK”.
   
   ⇨ A dialog window is displayed if the Automation Builder project provides PLCs of the identical type as defined in the PBF file.

   By selecting “None” in the dialog window a new PLC is defined in the ECAD tool.

4. In the Project Compare – Differences view, click [ ] to merge device signals.
   
   ⇨ The differences between the current PLC hardware configuration in Automation Builder and the ECAD PLC data are displayed.

5. Select the differences as desired and click “Accept Single” to accept the selected difference block.

6. Close the Project Compare – Differences view to accept the changes.

1.8.2.1.7 Arrange or map devices imported to the device pool

Devices that are imported to the device pool because of missing hierarchy information (mainly rack information) must be arranged manually in the Automation Builder project or mapped to already existing devices.

Arrange devices imported to the device pool

Arrange the unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.

Map devices imported to the device pool

If the devices are already added to the Automation Builder project prior to the import, you have to map the instances of the same type manually (one instance in the Automation Builder project tree and one instance in the DevicePool).

After mapping the devices, you can selectively merge the device parameter or signal in the difference view.

To map pool devices, proceed as follows:
1. In the device tree, select the Device Pool node, click “Project” and select “Map pool devices”.

2. Map the device pool instances of identical types in the project from the drop-down list and click “OK”.

Pool devices which are mapped are removed from the device pool and mapped to the corresponding Automation Builder device. Differences between the signals of the mapped I/O devices are displayed. e.g. AI523_1 device:

![Image of device tree and project compare differences](image)

### Limitations

The following limitations are considered when working with the Automation Builder ECAD interface:

- The scope of a PBF file is limited to one single PLC including all connected devices.
- There is no representation of XC variants of devices in Automation Builder. Therefore, always use the standard variant for export. This might lead to part data mismatch when importing into the ECAD tool.
- In reimport or round trip import cases, if any changes are made in ECAD by adding a new communication module with connecting to one of the PLC slot or replacing existing communication module, then those device changes to the communication modules are not displayed as connected to PLC slots during the import in Automation Builder diff and import, instead those CM modules are added under the device pool. After merging and importing is completed, to work with device pool devices see Chapter 1.8.2.1.7 “Arrange or map devices imported to the device pool” on page 3808.
- IO mapping data cannot be imported for IO devices plugged to an EtherCAT slave when they are imported individually to the device pool because of missing hierarchy information. After arranging the devices properly in the device tree, the import can be done again to import also the IO mapping data.

### Exporting and importing I/O mapping (CSV)

The I/O module mappings of an Automation Builder project can be exported to CSV for bulk editing in MS Excel or other documentation purposes. I/O mappings can be exported at single I/O module level or at PLC level.
Further, the I/O module mappings can be imported with the option of displaying differences and merging each single changed or import all signals at once by overwriting existing I/O module signals.

1.8.2.2.1 Exporting IO mapping data to CSV

To export I/O mappings to a CSV signal list, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ IO mapping (CSV)”.
2. Save the IO mappings CSV to the desired location in the file system.

   If the CSV signal list has been exported successfully, a success message is displayed. The status of the export is shown in the dialog.

3. In the export dialog, click the link to open the exported IO mapping CSV file in MS Excel.

   The template can only be opened if MS Excel is installed and configured to open .csv files.

4. In the IO mapping (CSV) file, change Variable and Description fields to edit I/O mappings.

   Do not modify other field’s data in IO mapping (CSV) file.
1.8.2.2 Importing I/O mapping data from CSV

To import an edited I/O mapping (CSV) file, proceed as follows:

1. From the main menu, select “Project ➔ Import ➔ I/O mapping (CSV) ➔ Open”.
2. A CSV signal list import dialog is displayed.
   ➥ With “YES”, all I/O mappings will be imported without difference view. With “NO”, the difference view is displayed with the I/O mapping differences.
3. In the Project Compare – Differences view, click [ ] to merge I/O mappings.
4. Select the signal row for which the difference is to be accepted. Select the Variable field and click “Accept Single” to merge the I/O mappings.
5. Close the Project compare – Differences view to accept the changes and merge the I/O mappings with the Automation Builder project.

1.8.2.3 Exporting and importing device list (CSV)

The Automation Builder project devices can be exported to CSV for bulk device renaming or adding device tag labels to devices in MS Excel or other documentation purposes. A devices export is only possible at PLC level.

Automation Builder provides importing devices in bulk based on device type, instance and hierarchy information provided in the CSV file.

1.8.2.3.1 Exporting device list to CSV

To export a CSV device list, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ Device list (CSV)”.
2. Select the desired location in the file system to save the Device list (CSV).
   If the CSV device list is exported successfully, a success message is displayed.
3. In the Export dialog, click the link to open the exported CSV device list.

The exported CSV device list consists of all devices connected to the PLC that is exported. Each row represents a device with its device type and hierarchy information.

1.8.2.3.2 Creating CSV device list

To create the devices in CSV, use the device list template provided in Automation Builder.

- In the main menu, click “Tools ➔ Create CSV Device list”.

  ➔ The device list template is opened in the MS Excel.

The template can only be opened if MS Excel is installed and configured to open .csv files.

In this file, add each device in a separate row with device information like Device Type (Order Num or Device Type Name) and instance details (name, tag) and hierarchy information (parent Device name, parent Device Tag, position). The mandatory information required to import CSV is only Device Type. All other fields are optional. After editing the device list CSV file, save it in the file system and close.
1.8.2.3.3 Importing a device list from CSV

To import devices from CSV in bulk, proceed as follows:

1. From the main menu, click “Project ➔ Import ➔ Device list (CSV)”.
2. Select the device list CSV file from the file system and click “Open” in the Import dialog.
   
   All devices that are defined in the CSV are imported. The Project Compare – Differences view displays the current project and the project that has been updated by the import file.
3. Select the desired devices and click “Accept Block” to accept all the devices and its child device nodes or “Accept Single” to accept only a single device.
4. After closing the Project Compare – Differences view, the devices are imported to the Automation Builder project.
   
   The devices (except PLC) are placed under the device pool if the valid device hierarchy information is not provided in the CSV device list file. By drag-and-drop devices can be assigned to the desired PLC hardware structure ➕ Chapter 1.8.2.1.7 “Arrange or map devices imported to the device pool” on page 3808.
   
   If a device tag is provided for a device in CSV, it appears next to each device node in the device tree.

1.8.2.3.4 Renaming devices

To rename the devices, proceed as follows:

1. In the device tree, right-click “PLC ➔ Export ➔ Device list (CSV)”.
2. Select the desired location from the file system to save the CSV device list.
3. Rename the device names in the column **Device Name**:

![Device Name table](image)

4. Click “Project ➔ Import ➔ Device list (CSV)”.

5. Select the updated CSV file from the file system.

Open the **Project Compare – Differences** view. If only the device names have been changed in the CSV file, the difference view does not show the changes.

*Device Name changes are not displayed as changes in the difference view.*

6. Close the **Project Compare – Differences** view. The Renamed Devices dialog is displayed with the current name and the new name provided in the CSV file.

7. In the Rename Devices window, select the desired devices and click “OK”. The device names are updated in the Automation Builder project.
1.8.3 CODESYS Security Agent

1.8.3.1 Integration in CODESYS Development System

The CODESYS Security Agent is an add-on product for CODESYS. It simplifies the configuration and control of security-relevant aspects in the development system.

At this time, you can configure and create certificates of the controlling device with the CODESYS Security Agent. After installation, a new "Device" tab is added to the “Security-Screen” view in the development system. You can then configure encrypted communication with the controller, as well as encrypt the boot application, download, and online change.

A description of the standard security functions in CODESYS Development System are located in the standard CODESYS online help under the keywords “security”, “encryption”, and “security screen”.

See also
- Chapter 1.8.3.2 “Encrypted communication with devices via controller certificates” on page 3815
- Chapter 1.8.3.3 “Encrypting boot applications with certificates” on page 3816

1.8.3.2 Encrypted communication with devices via controller certificates

Requirement: A digital signature for certificate exchange is configured. Refer to the standard CODESYS online help “Encryption and Signing with Certificates”.

We assume that the controller still has not certificate that is intended for encrypted communication. With the following steps, you generate this kind of certificate and encrypt communication:

1. Configure the active path to the controlling device.
2. Open the “Security-Screen” view by double-clicking the symbol in the status bar or by clicking “View ➔ Security-Screen”.
3. Click the button to update the list of available devices and their certificate store.
4. Select the corresponding device entry on the left side.
   - On the right side, there is still no license entry for the “Encrypted Communication” use case.
5. Select “Encrypted Communication” on the right side and click the button to generate a new certificate on the device.
   - The certificate is generated and displayed in the table with its properties. The symbol before “Encrypted Communication” appears now as follows: 🛡️.
6. In this step, you activate encrypted communication with the controller:
   - As of now, communication with all controllers is possible only as long as the certificate is valid on the controller and you have a key for it.
     - The connecting line between the development system, the gateway, and the controller is displayed in yellow in the “Communication” tab of the device editor of the controller.
     - As an alternative to the option “Force encrypted communication” that was just described and applies to all controllers, you can also encrypt communication with a specific controller only. To do this, open the “Communication” tab in the device editor of the controller. In the drop-down list “Device”, click “Encrypted communication”.
7. Then log in again to the controller.
   ⇒ A dialog opens, prompting that the certificate of the controller is not signed by a trusted source. In addition, the dialog displays information about the certificate and prompts whether to install it as a trustworthy certificate in the local store in the "Controller certificates" folder.

8. Confirm the dialog.
   ⇒ The certificate is installed in the local store and you log in to the controller.
   In the future, the communication with the controller is encrypted automatically with this control certificate.

● Chapter 1.8.3.1 “Integration in CODESYS Development System” on page 3815

### 1.8.3.3 Encrypting boot applications with certificates

Aim: You want to encrypt the boot application with a certificate from the controller in order to make sure that it cannot be exchanged. To do this, a corresponding certificate must be created on the controller and installed in the Windows Certificate Store of your computer.

Requirement: The active path to the controller is configured. A digital signature for certificate exchange is configured. Refer to the standard CODESYS online help “Encryption and Signing with Certificates”.

1. Open the “Security-Screen” view by double-clicking the symbol in the status bar or by clicking “View ➔ Security-Screen”.
2. Click the button “Refresh the list of available devices and their certificate store”.
3. Select the device entry on the left side.
4. Select “Encrypted Application” on the right side and click the button “Generate a new certificate on the device”.
   ⇒ The certificate is created and listed in the table with the symbol.
5. Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.
   Double-click the certificate entry.
   ⇒ The default Windows “Certificate” dialog opens.
6. Click the “Install certificate” button in the “General” tab.
   ⇒ The “Certificate import assistant” opens.
7. In the “Certificate memory” dialog, select the option “Save all certificates in the following memory location”, and then select the folder “Controller Certificates” as the “Certificate memory”.
   ⇒ The controller certificate is imported to the directory “Controller certificates” and is now available for encryption of download, online change, and boot application.
8. Follow the steps below if you want the boot application of your project, as well as downloads and online changes, to always be encrypted.
9. Open the “Users” tab in the “Security-Screen”. Activate the option “Force encryption of downloads, online changes, and boot applications” in the “Security-Level” area.
10. Open the “Project” tab and double-click the application entry in the area “Encryption of boot application, download, and online change”.
   ⇒ The “Properties” dialog of the application opens.
11. Select the “Encryption” tab and select “Encryption with certificates” as the “Encryption technology”. Then click ![button](image).
   
   Note: If the option “Force encryption of downloads, online changes, and boot applications” is activated in the “Security screen”, then “Encryption with certificates” is already preselected.

12. In the “Certificate selection” dialog, select the corresponding certificate from the “Controller certificates” folder and click ![button](image).

13. Click “OK” to confirm the dialog.
   
   ⇨ The certificate is displayed in the properties dialog.

14. Confirm the “Properties” dialog of the application.
   
   ⇨ The certificate is displayed in the “Security screen” view (“Project ” tab, “Encryption of boot application, download, and online change”): The boot application, download, and online change are encrypted.

15. Now transferring the boot application, download, and online change are possible, as long as the certificate configured for it and the signature are valid.

### 1.8.3.4 Reference User Interface

#### 1.8.3.4.1 View 'Security-Screen' - 'Devices'

**Symbol:** 🗝️

**Function:** This tab allows for the configuration and the transfer of controller certificates for encrypted communication with the controller.

**Call:** Menu bar: “View”.

**Requirement:** The CODESYS Security Agent add-on product is installed.

The “Devices” tab shows all PLC devices configured in the project and their certificate store. If the communication path to the controller is configured, then you see the certificates stored in the memory. Here you can create and configure new certificates on the controller.

<table>
<thead>
<tr>
<th>Left side: “Information”</th>
<th>Devices and certificate store</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shows the individual devices 🗝️ as expandable nodes, each with the controller-specific 🗝️ certificate store below it. For example, there are the following categories for the CODESYS Control Win V3:</td>
<td></td>
</tr>
<tr>
<td>• Individual certificates: Certificates with the associated, private key to which you have access.</td>
<td></td>
</tr>
<tr>
<td>• Trusted certificates: Certificates that have been created by a trusted certificate source.</td>
<td></td>
</tr>
<tr>
<td>• Untrustworthy certificates: Certificates that you have defined specifically as not trusted.</td>
<td></td>
</tr>
<tr>
<td>• Certificates in quarantine: Certificates that do not fulfill the criteria of the categories above.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Toolbar (left side)</th>
<th>🔄: Refresh the display</th>
</tr>
</thead>
<tbody>
<tr>
<td>🔄: Download: Transfer the selected certificate to the PLC</td>
<td></td>
</tr>
</tbody>
</table>
Right side:

If the active path to the controller is set and a device node is selected, then every use case for controller certificates are displayed on the right side.

- "OPC UA Server": Encrypted communication over an OPC UA server
- "Encrypted Communication": Encrypted communication between the development system and the controller
- "Encrypted Application": Encryption of the boot application
- "Web Server": Encrypted communication with the web server

As long as a certificate is not available for one of these use cases, it is displayed with the icon 🚷 and as "(not available)".

When a certificate store is selected on the left side, all certificates in it are displayed on the right side with the following information:

- "Information": Use case (Currently the affected controller component is displayed: for example "CmpSecureChannel")
- "Created for": Name of the computer for which the certificate was created (for example, "MyLocalPC")
- "Created by": Name of the computer on which the certificate was created (for example, "MyLocalPC")
- "Valid as of": Date (for example, "20-07-2017 15:09:29")
- "Valid until": Date (for example, "20-07-2022 00:00:00")
- "Thumbprint": Checksum from specific properties of the certificate for purposes of identification (for example, "279e1a46b86bd636c8e6f19fd51c22249ec49a8")

Double-clicking a certificate entry opens the default Windows “Certificate” dialog. In this way, you can import a controller certificate in the Windows Certificate Store to the directory “Controller certificates” so that it is available for encryption of download, online change, and boot application.

If multiple certificates are available for one use case, then the system follows the steps below to determine the certificate that is used:

- Certificate that was created directly by the user (currently not supported)
- Filtering of existing certificates by:
  - 1. Subject (user of the certificate)
  - 2. Key usage
  - 3. Extended key usage
  - 4. Valid time stamp
- Dividing of detected, valid certificates as "signed" and "self-signed"
- Filtering of signed certificates, and the self-signed certificates by the following criteria:
  - 1. Longest validity period
  - 2. Strongest key

Drag&Drop: Moving of the certificate to another certificate store of the same device

Double-clicking a certificate entry opens the default Windows dialog for displaying all certificate information.

Toolbar (right side)

- 📋: Creation of a new certificate for a specific use case
  - The dialog “Certificate settings” opens for configuring the “Validity period” of the certificate and the “Key length” for the private key. “OK” saves the specified values in the CODESYS options. The values are set again at the next operation.
  - As long as the certificate is being created, "(computing)" is shown after the use case. You cannot cancel the creation operation, but you can close and continue working with the “Security-Screen”.

- 🌐: Upload and save the selected certificate to the local file system.
- ✗: Delete the selected certificate.
1.8.4 CODESYS Static Analysis

CODESYS Static Analysis already helps to write more readable code when programming in CODESYS and to detect contradictory or unsupported settings. In particular, potential sources of error can be identified, such as test code or pointers that have not been checked for 0 before dereferencing. With specific checks, you can make sure that the code is portable. Example: The analysis should report the use of language resources for object orientation because the code is to run on platforms that do not support object orientation.

The analysis checks the source code of the CODESYS project and reports any deviations from certain coding rules, naming conventions, or permitted keywords and identifiers. CODESYS Static Analysis is based on the rule set defined in the PLCopen Coding Guidelines and extends it with additional test options.

You can display the detected deviations as errors or warnings in the message view before the project is downloaded to the target system.

You activate static analysis either explicitly by clicking “Build ➔ Run static analysis”, or you let it execute automatically at each code generation. You activate the automatic execution in the “Static Analysis” dialog of the projects settings. In this dialog, you also configure what is to be checked in detail. You can use pragma statements to exclude individual parts of the code from the check.

To evaluate the code quality, you can also display selected metrics that CODESYS Static Analysis detects in your code in a separate view. An example of this is the McCabe metric, which measures the cyclomatic complexity and indicates the number of execution paths that can be processed during code execution.

NOTICE!
The analysis is performed only for the code of the applications in the current project. Libraries are not taken into consideration.

The CODESYS development system contains a light version of static analysis that is extended by CODESYS Static Analysis.

- § Chapter 1.8.4.3.1 “Pragmas and Attributes” on page 3829

1.8.4.1 Configuring and Running Static Analysis

Using a basic sample project below, you will find the most important steps and options for configuring and running a static analysis.

Requirements: CODESYS Static Analysis is installed.

Sample project
If you want to reproduce the example project, create a standard project and insert the POU below the application in the device tree. Then configure the communication settings for the connection to your local CODESYS Control Win V3.

```plaintext
FUNCTION_BLOCK fb1
VAR_INPUT
   iVar_fb1in1 : INT;
   iVar_fb1in2 : INT;
   rVar_fb1in3 : REAL;
END_VAR
VAR_OUTPUT
   iVar_fb1out:INT;
```

2021/05/12 3ADR010583, 2, en_US 3819
```plaintext
END_VAR
VAR
    f_SampleProperty : INT;
    rVar : REAL;
    PRO : BOOL;
END_VAR
iVar_fb1out:=iVar_fb1in1 + 1;

FUNCTION_BLOCK fb2
VAR_INPUT
    iVar_fb2in:INT;
END_VAR
VAR_OUTPUT
    iVar_fb2out:INT;
END_VAR
VAR
END_VAR
PROGRAM PLC_PRG
VAR
    fb1_inst: fb1;
    fb2_inst: fb2;
END_VAR
fb1_inst(iVar_fb1in1 := 99);
fb2_inst(iVar_fb2in := 22);
fb2_inst(iVar_fb2in := 1);
```

Checking for compliance to rules

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Rules” tab.
   ⇒ A list is displayed containing all possible rule checks. They are organized in a tree structure by topical category. The rule number is added in parentheses (for example, “Unused variables (33)” in category “Unused objects”).
2. Click the check box of the first line a few times (“Rules” node).
   ⇒ Clicking toggles the activation status. The check boxes in the entire tree have a red or orange check mark, or no check mark at all.
3. In this way, activate all entries with a red check mark. This means that CODESYS Static Analysis should report any detected rule violations as errors.
4. Click “Build ➔ Static analysis ➔ Run static analysis”.
   ⇒ Errors are reported in the message view. The message texts are tagged with a § and begin with the error number "SA<rule number>".
5. Double-click the first message SA0033: Unused variables 'iVar_fb2out'.
   ⇒ The focus moves to the declaration part of function block fb2 and the relevant variable is selected. The variable is declared, but not used. This is checked in Rule 33 ("Unused variables"). In the code, the relevant locations are underlined with a wavy line.
6. Now test how to perform static analysis automatically. Click “Project ➔ Project Settings”, “Static Analysis” category. On the “Settings” tab, select the “Perform static analysis automatically” option. Click “OK” to close the dialog.
7. Click “Online ➔ Login”.
   ⇒ A dialog prompt indicates that compile errors exist. The errors reported by the code analysis are displayed again in the message view.
8. Now deactivate all rules for static analysis in the project settings. In the “Unused objects” category, explicitly activate Rule SA0035 (“Unused input variables (35)”) with an orange-colored check mark to report a warning. See the tooltip for the rule text: “This rule corresponds to the following PLCopen rules: CP24”). Click “OK” to close the project settings.

9. Click “Build ➔ Generate code”.
   ↪ The analysis is performed automatically. Two errors are reported in the message view:
   $ SA0035: Unused input variable 'iVar_fb1in2' and $ SA0035: Unused input variable 'iVar_fb1in3'.

10. Double-click the message and comment or remove the declaration. Perform the code analysis again.
   ↪ No error messages are displayed.

See also
   ● % Chapter 1.8.4.2.2.1 “Dialog 'Static Analysis' - 'Settings'” on page 3824
   ● % Chapter 1.8.4.2.2.2 “Dialog 'Static Analysis' - 'Rules'” on page 3825

Checking for compliance to defined naming conventions

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Naming Conventions” tab.
   ↪ You see a table in a tree structure that is divided into expandable categories of variables and program blocks.

2. Expand the “Prefixes for variables” - “Prefixes for types” category: In the “Prefix” column, specify I for “INT (14)”.

   Expand the “Prefixes for POU’s” - “Prefixes for POU type” category: In the “Prefix” column, specify the prog for “PROGRAM (122)” and fb for “FUNCTIONBLOCK (103)”.

3. Click the “Naming conventions (2)” tab. Select the “First character after prefix should be an upper case letter” option. Clear all other options.

4. Click “Build ➔ Static analysis ➔ Run static analysis”.
   ↪ Error messages:
   ● NC0102: Invalid name 'PLC_PRG': Expect prefix 'prog' because PLC_PRG does not have the required prefix
   ● First character after prefix should be uppercase: 'ivar_fb1in2' because ivar_fb1in2 : INT; in fb1
   ● NC0014: Invalid variable name P fSampleProperty: Expect prefix 'i' because this integer variable does not have the required prefix

See also
   ● % Chapter 1.8.4.2.2.3 “Dialog 'Static Analysis' - 'Naming Conventions'” on page 3826
   ● % Chapter 1.8.4.2.2.6 “Dialog 'Static Analysis' - 'Naming conventions (2)’” on page 3828
Checking for forbidden symbols

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Forbidden symbols” tab.
   ⇒ A line editor allows for specifying character strings that should not be used in the code.
2. As an example, double-click the blank line and type in the invalid character string PRO directly. Double-click the next blank line and click [ ] to open the input assistance. From “Standard Types”, select “REAL”. Click “OK” to close the dialog.
3. Click “Build ➔ Static analysis ➔ Run static analysis”.
   ⇒ The error message Forbidden symbol 'REAL' and Forbidden symbol 'PRO' are displayed in the message view. Double-click the message text to jump to the relevant line of code.

See also
- Chapter 1.8.4.2.2.5 “Dialog ‘Static Analysis’ - ‘Forbidden symbols’” on page 3827

Displaying metrics

CODESYS Static Analysis performs selected tests on the code, and you can display the results in a view.

1. Click “Project ➔ Project Settings” and select the “Static Analysis” category. Click the “Metrics” tab.
   ⇒ The metrics that CODESYS Static Analysis applies to the code are listed in a table.
2. For this example, activate the “Number of inputs variables” metric and specify the permitted value range: lower limit 1 and upper limit 2. Activate some more metrics, for example “Code size” and “Number of calls”.
3. Click “Build ➔ Static analysis ➔ View standard metrics”.
   ⇒ The view includes a table with a line for each “Program unit” of the sample program. For each activated metric, there is a column showing the measured values. Values that are outside of the value range defined in the settings are highlighted in red. In the case of this specific example, this is at least the “PLC_PRG/Inputs” field because the number of input variables in this POU is greater than the defined upper limit of 2.

1.8.4.2.1 Menu Commands.................................................................................................................. 3823
1.8.4.2.2 Dialogs..................................................................................................................................... 3824
1.8.4.2.1 Menu Commands

1.8.4.2.1.1 Command 'Run Static Analysis'................................................................. 3823
1.8.4.2.1.2 Command 'View Standard-Metrics'....................................................... 3823

Command 'Run Static Analysis'

Symbol: §

Function: The command starts the static analysis for the active application and displays the results in the message view.

Call: Menu bar: “Build ➤ Static Analysis”

During the code analysis, CODESYS generates code just like the “Build ➤ Generate Code” command. The results of the analysis are displayed as errors § and warnings § in the message view (“Build” category). The numbers refer to the corresponding rules as they are defined in the project settings. The syntax for the displayed messages is “SA<rule number:<rule text>”.

See also

● § Chapter 1.8.4.3.2 “Rules” on page 3834

Command 'View Standard-Metrics'

Symbol: ⬃

Function: The command starts the static analysis for the active application and displays the metrics for all POUs in a table.

Call: Menu bar: “Build ➤ View Standard Metrics”

The metrics (code numbers) to be displayed are activated in the project settings. You can access the configuration by clicking “Configure” in the context menu of the displayed table. If a value is outside of the configured upper and lower limits, then the field in the table is highlighted in red.

See also

● § Chapter 1.8.4.2.2.4 “Dialog 'Static Analysis' - 'Metrics’” on page 3827

Commands in the context menu

The following commands are provided in the context menu of the table:

● “Calculate”: The values are refreshed.
● “Copy Table”: The table is copied to the clipboard. The separators are tabs.
● “Print Table”: The default dialog for setting up a print job opens.
● “Export Table”: The table is exported as a CSV file. The separators are semicolons.
● “Kiviat Diagram”: Requirement: At least three metrics have defined upper and lower limits. A radar chart is created for the selected POU. This visualizes the quality of POU code with respect to a given standard.

Each metric is depicted as an axis with its origin at the center (value 0) which radiates outward into three concentric ring zones. The inner ring zone represents the value range below the lower limit defined for the metric. The outer ring represents the value range above the upper limit. The axes of the metrics are distributed uniformly around the circle.

The current values of the individual metrics on the axes are connected by a line. In the ideal case, the complete line is located in the middle zone.

● “Configure”: The table for selecting the desired metrics opens. This corresponds to the table in the project settings.
● “Open POU”: The POU opens in the editor.
The name of the metric is displayed at the end of the respective axis and the name of the POU is displayed in the upper right corner of the diagram.

Example of a Kiviat diagram for five metrics

1.8.4.2 Dialogs

1.8.4.2.1 Dialog 'Static Analysis' - 'Settings' .................................................. 3824
1.8.4.2.2 Dialog 'Static Analysis' - 'Rules' ......................................................... 3825
1.8.4.2.3 Dialog 'Static Analysis' - 'Naming Conventions' .................................. 3826
1.8.4.2.4 Dialog 'Static Analysis' - 'Metrics' ................................................... 3827
1.8.4.2.5 Dialog 'Static Analysis' - 'Forbidden symbols' .................................... 3827
1.8.4.2.6 Dialog 'Static Analysis' - 'Naming conventions (2)' ........................... 3828

The dialogs for the configuration of static code analysis are located in “Project -> Project Settings”, in the “Static Analysis” category. The requirement is that a CODESYS project has to be open.

Dialog 'Static Analysis' - ‘Settings’

Function: In the dialog, you select automatic static analysis, and save or load the project settings for static analysis as a CSA file.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Settings” tab

Requirement:

● The CODESYS Static Analysis package is installed.
● A project is open.
Table 725

| “Perform static analysis automatically” | CODESYS performs the code check automatically at each code generation (for example, when the “Build ➔ Generate code” command is executed or before a download. |
| “Load” | Opens the “Load Static Analysis Configuration” dialog for selecting the project settings for the static analysis as a CSA file in the file system. When you click the “Open” button, the selected CSA file is loaded. |
| “Save” | Open the “Save Static Analysis Configuration” dialog for saving all project settings in the “Static Analysis” category as a CSA file in the file system. |

See also

- % Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

Dialog 'Static Analysis' - 'Rules'

**Function**: In the dialog, you select the rules that are checked during the static analysis of the source code of a project.

**Call**: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Rules” tab

**Requirement**: A project is open.

This tab shows a tree structure of all rules that can be checked during static analysis. By default, every rule is activated, with the exception of SA0016, SA0024, SA0073, SA0101, SA0105, SA0106, SA0133, SA0134, SA0150, SA0162, and all strict IEC rules.

Each rule has a unique number. When the rule is checked and a violation is detected, the rule number and an error description are shown in the message view in the “Build” category in the following format: **SA<rule number>**, where SA stands for ”Static Analysis” (example: “SA003” for rule 3).

The list of available rules can be extended by specific plug-ins.

Table 726

| Some rules that are activated in the dialog can be deactivated temporarily in the application by applying a pragma. | When you click the check box, the setting toggles between □, ✔️, and 🔴. When you activate or deactivate a parent node, all child rules are also activated or deactivated, respectively. |
| The rule is not checked. | If the result of the check is positive, then an error (§) for the static analysis is displayed in the message view. |
| If the result of the check is positive, then a warning (§) for the static analysis is displayed in the message view. |

See also

- % Chapter 1.8.4.3.2 “Rules” on page 3834
- % Chapter 1.8.4.3.1 “Pragmas and Attributes” on page 3829
- % “Checking for compliance to rules” on page 3820
Dialog 'Static Analysis' - 'Naming Conventions'

**Function:** In the dialog, you define the prefixes for the data types and scopes of variables, as well as prefixes for POUs and user-defined data types (DUTs). Static analysis checks compliance with the naming conventions. When a convention is not observed, the static analysis reports an error message in the "Messages" view.

**Call:** Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Naming Conventions” tab

**Requirement:**
- The CODESYS Static Analysis package is installed.
- A project is open.

The error messages are displayed in the following format: \( \text{NC}<\text{prefix-convention number}><\text{message text}>. \) NC stands for "Naming Convention".

For example, the error message "\( \text{NC0102: Invalid name...} \)" means a violation of naming convention 102 for POUs of type PROGRAM.

---

You can deactivate individual conventions. To do this, the pragma 'analysis' is used in the implementation part and the attribute 'analysis' is used in the declaration part of a POU.

For variables of structured types, you can define a prefix in the data type declaration, also locally by means of the attribute 'nameprefix'.

Also see the “Naming conventions (2)” dialog for additional options in the prefix check.

---

| "Names" | Nodes and elements for which a prefix can be defined. The number in parentheses after each element (for example, “PROGRAM (102)”) is the prefix convention number that is reported in the case of noncompliance with a naming convention. |
| "Prefix" | Input field of the prefix Multiple prefixes can be specified by means of comma separation. Examples of prefixes: prog, func, fu Regular expressions (RegEx) are also possible for prefixes. To do this, an @ must be prepended. Example: @x[a-dA-D]: The name must begin with x and may contain one character from the scope a-dA-D. |
| "Prefixes for variables" | Organizational node for all data types and scopes of variables for which a prefix can be defined |
| "Prefixes for POUs" | Organizational node for all POU types and method scopes for which a prefix can be defined |
| "Prefixes for DUTs" | Organizational node for all DUT data types for which a prefix can be defined |
For variables of type “Alias” and POUs of type “Property”, {datatype} can be defined as a prefix. Then the code analysis reports errors for all variables that do not have the prefix {datatype} for the data type of the alias or property. In the definition, {datatype} can also be combined with other prefixes.

Dialog 'Static Analysis' - 'Metrics'

Function: In the dialog, you select the metrics to be displayed for each POU in the “Standard metrics” view by means of the “Build ➔ Static Analysis ➔ View standard-metrics” command.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Metrics” tab

Requirement:
● The CODESYS Static Analysis package is installed.
● A project is open.

The “Code size”, “Variable size”, “Stack size”, and “Calls” metrics are reported only for POUs from libraries which are integrated in the project.

Violations of the upper and lower limits of the activated metrics can be reported as build errors by means of static analysis rule SA0150.

<table>
<thead>
<tr>
<th>“Metrics”</th>
<th>All selectable metrics are displayed in the column.</th>
</tr>
</thead>

Dialog 'Static Analysis' - 'Forbidden symbols'

Function: In the dialog, you define the keywords and symbols that must not be used in the project code.

Call: Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Forbidden symbols” tab
Requirement:
- The CODESYS Static Analysis package is installed.
- A project is open.

| Input line | Double-clicking the line opens the line editor for specifying a keyword or symbol.  
Note: The Input Assistant opens for selecting the keyword or symbol. |
|------------|--------------------------------------------------------------------------------------------------|

See also
- “Checking for forbidden symbols” on page 3822

**Dialog 'Static Analysis' - 'Naming conventions (2)'

**Function:** In the dialog, you define the check options for using prefixes. The dialog is an extension of the “Naming Conventions” tab.

**Call:** Menu bar: “Project ➔ Project Settings”, “Static Analysis” category, “Naming conventions (2)” tab

**Requirement:**
- The CODESYS Static Analysis package is installed.
- A project is open.

<table>
<thead>
<tr>
<th>“First character after prefix should be an upper case letter”</th>
<th>Static analysis reports an error for a variable when the first character of the variable name after the defined prefix is not an uppercase letter.</th>
</tr>
</thead>
</table>
| “Recursive prefixes for combinable data types”               | Variables of combined data types (for example, POINTER OF POINTER TO INT or REFERENCE TO ARRAY) necessarily have to be combined prefixes that correspond to the naming conventions defined on the “Naming Conventions” tab.  
Example: On the “Naming Conventions” tab, the prefix p was defined for the data type POINTER and the prefix I was defined for the data type INT. Static analysis reports errors for all variables of type POINTER OF POINTER TO INT which do not have the prefix ppi. |
| “Combine scope prefix with data type prefix”                  | As its namespace, a variable must have the prefix defined on the “Naming Conventions” tab followed by the defined prefix for its data type.  
Example 1: On the “Naming Conventions” tab, the following prefixes were defined: g for “VAR_GLOBAL” and r_ for data type “REAL”. The code analysis reports errors for global REAL variables that do not have the prefix gr_.  
Example 2: In the application, there exists an alias s_StringAlias and a variable sMyAlias.  
TYPE s_StringAlias : STRING;  
END_TYPE  
VAR sMyAlias : s_StringAlias;  
END_VAR  
On the “Naming Conventions” tab, the prefix al_{datatype} is defined for the “Alias” type. The prefix s is defined for the “STRING” type.  
The code analysis reports the error NNC0033: Invalid variable name 'sMyAlias'. Expect prefix 'al_s'. |

- “Checking for compliance to defined naming conventions” on page 3821
1.8.4.3 Reference, Programming

1.8.4.3.1 Pragmas and Attributes

CODESYS Static Analysis provides pragmas for activating or deactivating individual rules or naming conventions for static code analysis.

Requirement: The rules or conventions are activated or defined in the project settings.

- Rules that are deactivated in the project settings cannot be activated by means of pragmas or attributes.
- Rule SA0004 cannot be deactivated by means of a pragma.

See also

- Chapter 1.8.4 “CODESYS Static Analysis” on page 3819

Pragma 'analysis'

This pragma is used to deactivate the code rules for individual code lines of a POU. You deactivate code rules by specifying the rule numbers with a prepended minus sign ("-"). A prepended plus sign ("+") activates the rule. You can specify any number of rules in the pragma.

Insert location: Deactivation: With `{analysis - ...}` before the first code line where the code analysis is deactivated. Activation: With `{analysis + ...}` after the last line of the deactivation.

Syntax:

Deactivation of rules:

```plaintext
{analysis -<rule number> ( , -<additional rule number> )* }
```

* : optional none, one or more additional rule numbers

Activation of rules:

```plaintext
{analysis +<rule number> ( , +<additional rule number> )* }
```

* : none, one or more additional rule numbers

Example

Rule 24 is deactivated for two lines and then reactivated. As a result, rule 24 is not checked in these lines so that `nTest:=DINT#99` is allowed for example.

```plaintext
{analysis -24}
nTest := 99;
iVar := INT#2;
{analysis +24}
```

Deactivating multiple rules:

```plaintext
{analysis -10, -24, -18}
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
**Attribute 'analysis'**

The pragma deactivates specific rules for an entire programming object. You deactivate the code rules by specifying the rule numbers with a prepended minus sign ("-". You can specify any number of rules in the pragma.

**Insert location:** In the declaration part of a POU, in the first line.

**Syntax:**

```
{attribute 'analysis' := ' -<rule number> ( , -<additional rule number> )* '}
* : none, one or more additional rule numbers
```

**Example**

Rules 33 and 31 are deactivated for the entire structure:

```
{attribute 'analysis' := '-33, -31'}
TYPE My_Structure :
  STRUCT
    iLocal : INT;
    uILocal : UINT;
    udiLocal : UDINT;
  END_STRUCT
END_TYPE
```

Rule 100 is deactivated for the array:

```
{attribute 'analysis' := '-100'}
PROGRAM PLC_PRG
VAR
  aBigData: ARRAY[1..10000] OF DWORD;
  aBigDATA_2: ARRAY[1..10000] OF DWORD;
END_VAR
```

See also
- § [Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819](#)

**Attribute 'naming'**

The pragma marks the code lines that are excluded from the analysis of naming convention. An `off` is assigned to the pragma attribute before the first code line where the code analysis is deactivated. An `on` is assigned after the last line. When an `omit` is assigned, only the next code line is ignored.

**Insert location:** Deactivation: In the declaration part of POUs and DUTs, above the affected lines. Activation: Below the affected lines.

**Syntax:**

```
{attribute 'naming' := '<switch state>'}
<switch state> : on | off | omit
on : naming is switched on
off : naming is switched off
omit : only next code line is switched off
```
Defined naming conventions: 1) INT variable names must be prepended with "int" as the identifier prefix, for example "intVar1". 2) Program names must begin with "prog".

For the code presented below, the static analysis issues messages only for the following variables: cccVar, aVariable, and bVariable.

```
VAR
{attribute 'naming' := 'off'}
iVarA : INT;
iVarB : INT;
{attribute 'naming' := 'on'}
iVarC : INT;
END_VAR

VAR
...
{attribute 'naming' := 'omit'}
iVarC : INT;
...
END_VAR

{attribute 'naming' := 'omit'}
PROGRAM PLC_PRG
VAR
...
END_VAR

{attribute 'naming' := 'omit'}
PROGRAM DoSomethingA
VAR
{attribute 'naming' := 'on'}
iVarA : INT;
iVarB : INT;
...
VAR_END
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

Attribute 'nameprefix'

The attribute defines a prefix for variables of a structured data type. The prefix must be prepended to the identifier of variables that are declared by this type.

Insert location: In the line before the declaration of a structured data type

Syntax:

```
{attribute 'nameprefix' := '<prefix>'}
```
Example

In the following example, Static Analysis issues a message for pB because the variable name does not begin with "point".

```plaintext
{attribute 'nameprefix' := 'point'}
TYPE DATAPoint :
  STRUCT
    iX: INT;
    iY: INT;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  pointA : DATAPoint;
  pB : DATAPoint;
END_VAR
pointA.iX := 1;
pointA.iY := 10;
pB.iX := 2;
pB.iY := 20;
```

Error message after static analysis: "Invalid variable name 'pB'. Expect prefix 'point'"

See also

- Chapter 1.8.4.1 "Configuring and Running Static Analysis" on page 3819

Attribute 'analysis:report-multiple-instance-calls'

The pragma marks a function block for checking for rule 106: Only function blocks with this pragma are checked whether the function block instances are called more than one time. If rule 105 is deactivated in the project settings, then the pragma does not have any effect.

Insert location: First line in the declaration part of a function block.

Syntax:

```plaintext
{attribute 'analysis:report-multiple-instance-calls'}
```
Example

```plaintext
// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DoA
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iA : INT;
END_VAR
iA := iA + 1;

{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
  iB : INT;
END_VAR
iB := iB + 1;

PROGRAM PLC_PRG
VAR
  fbA : FB_DoA;
  fbB : FB_DoB;
END_VAR

  fbA();
  fbB();    // SA0105
  fbA();
  fbB();    // SA0105

--> SA0105: Instance 'fbB' called more than once
```

- SA0050: Access to program/fb variables from the outside

### Conversions

- Use of Direct Addresses
- Rules for Operators
- Rules for Statements
- Checking Strict IEC Rules
SA0001: Unreachable code

Detects lines of code that are not executed, for example due to a RETURN or CONTINUE statement.

Justification: Unreachable code should always be avoided. The test often indicates that test code still exists which should be removed.

Importance: High

PLCopen rule: CP2

Example

```plaintext
PROGRAM PLC_PRG
VAR
  xReturn_Before_End: BOOL;
  xContinue_In_Loop_FUN: BOOL;
  iCounter: INT;
END_VAR

xContinue_In_Loop_FUN := FALSE;
FOR iCounter := INT#0 TO INT#5 BY INT#1 DO
  CONTINUE;
  xContinue_In_Loop_FUN := FALSE;
END_FOR

--> SA0001: Unreachable code detected in 'PLC_PRG'
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0002: Empty objects

Detects POUs, GVLs, data type declarations, or interfaces that do not contain any code.

Justification: Empty objects should be avoided. They are often a sign that an object has not been implemented completely. Exception: In some cases, no code is specified in the body of a function block when it should be used by interfaces only. In other cases, a method is created only because it is required by an interface without a sensible implementation being possible for the method. No matter the case, this kind of situation should be commented.

Importance: Medium

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0003: Empty statements

Detects lines of code that have a semicolon (;) but not a statement

Justification: An empty statement can be a sign for missing code. Exceptions: There are good reasons for using empty statements. For example, in a CASE statement it could make sense to explicitly program out all cases, even those where there is nothing to do. This would simply be to document that the case was not forgotten.

Importance: Low

Examples

```
CASE value OF
1:DoSomething();
2;; //nothing to do
3:DoSomethingElse();
END_CASE

--> SA0003: Empty statement
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0004: Multiple write access on output

Detects outputs that are written to more than one location

Justification: The maintainability is degraded when an output is written in different locations in the code. Then it is uncertain which write access is the one that actually has an effect in the process. Good practice is to calculate the output variables in auxiliary variables and assign the calculated value at one location at the end of the cycle.

Importance: High

PLCopen rule: CP12

```
An error is not issued when an output variable (VAR_IN_OUT) is written in different branches of IF and CASE statements.

A pragma cannot deactivate this rule.
```
Example

VAR_GLOBAL
    g_xVar AT %QX0.0 : BOOL ;
    g_iTest AT %QW0 : INT ;
END_VAR

PROGRAM PLC_PRG
IF g_iCondition < INT#0 THEN
    g_xVar := TRUE;
    g_iTest := INT#12;
END_IF

CASE g_iCondition OF
    INT#1:
        g_xVar := FALSE;
    INT#2:
        g_iTest := INT#11;
    ELSE
        g_xVar := TRUE;
        g_iTest := INT#9;
END_CASE

--> SA0004: Multiple write access on output '%QX0.0'
--> SA0004: Multiple write access on output '%QW0'

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0006: Write access from several tasks

Detects variables that are written by more than one task
Justification: A variable that is written in multiple tasks may change its value unexpectedly. This can lead to confusing situations. String variables (and on some 32-bit systems also 64-bit integer variables) can even reach an inconsistent state if the variable is written to two tasks simultaneously.
Exception: In specific cases, it may be necessary for several tasks to write a variable. For example, use semaphores to make sure that access does not lead to an inconsistent state.
Importance: High
PLCopen rule: CP10

Example

VAR_GLOBAL
    g_iTemp1: INT;
END_VAR

PROGRAM PLC_PRG // Controlled by MainTask
    g_iTemp1 := g_iTemp1 + INT#2;
END_PROGRAM

PROGRAM PLC_PRG_1 // Controlled by SubTask
    g_iTemp1 := g_iTemp1 - INT#3;
END_PROGRAM

--> SA0006: Concurrent write access to 'g_iTemp1' in Tasks MainTask, SubTask

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0007: Address operator on constants

Detects lines of code where the operator ADR is applied for a constant

Justification: Using a pointer to a constant variables overrides the CONSTANT property of the variable. The variable can be changed by means of the pointer without any notification from the compiler.

Exception: In rare cases, it might be useful to pass a pointer to a constant to a function. However, you have to make sure that this function does not change the transferred value. Whenever possible, use VAR_IN_OUT CONSTANT.

Importance: High

When the “replace constants” option is selected in the “Compiler options” of the project settings, the address operator is not permitted for scalar constants (integer, BOOL, REAL) and a compile error is issued. (Constant strings, structures, and arrays always have an address.)

Example

```plaintext
PROGRAM PLC_PRG
VAR CONSTANT
  c_iValue : INT := INT#15;
END_VAR
VAR
  poiValue : POINTER TO INT;
END_VAR
poiValue := ADR(c_iValue); // SA0007
--> SA0007: Address to constant variable 'c_iValue'
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0008: Check subrange types

Detects out-of-range violations of subrange types. Assigned literals are already checked by the compiler. When constants are assigned, then the values must be within the defined range. When variables are assigned, then the data types must be identical.

Justification: If subrange types are used, then make sure that this subrange is not exited. The compiler checks for these kinds of subrange violations only for assignments of constants.

Importance: Low

The check is not performed for CFC objects because the code structure does not allow for it.
Example

```plc
VAR_GLOBAL
  iVarGlob: INT;
END_VAR

PROGRAM PLC_PRG
VAR
  iSubr1: INT (INT#1..INT#10);
  iSubr2: INT (INT#1..INT#1000);
  iCount: INT;
  by_SubType : BYTE (BYTE#0..BYTE#11);
  iVar : INT (-4095..4095);
END_VAR

iSubr1 := nCount;              // SA0008
iSubr1 := subr2;               // SA0008
iSubr1 := gvl.iVarGlob;        // SA0008
//byter_SubType := BYTE#123;  //already detected by compiler, error "Cannot convert type...

--> SA0008: Subrange variable 'iSubr1' maybe out of allowed range
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0009: Unused return values**

Detected function, method and property calls in which the return value is not used

Justification: When a function or method returns a return value, it should also be evaluated. The return value often indicates whether or not the function was executed successfully. If not, then you will not be able to identify later whether the return value was forgotten or if it is actually not needed.

Exception: If a return value is irrelevant to the call, then you can document this and omit the assignment. Error returns should never be ignored.

Importance: Medium

PLCopen rule: CP7 / CP17

Example

```plc
FUNCTION Return_BOOL : BOOL
VAR_INPUT
END_VAR
VAR
  xTest : BOOL;
END_VAR
xTest := FALSE;
Return_BOOL := xTest;

PROGRAM PLC_PRG
Return_BOOL ();  // SA0009

--> SA0009: Ignoring return value of 'Return_Bool'
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0010: Arrays with only one component

Detects arrays with only one element

Justification: An array with one element can be replaced by a base-type variable. Access to this variable is considerably faster than access by index to the variable.

Exception: The length of an array is often determined by a constant and is a parameter for a program. Then the program can work with arrays of different lengths and does not have to be changed if the length is only 1. This kind of situation should be documented accordingly.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
  aoiEmpty : ARRAY [22..22] OF INT;
  aorEmpty : ARRAY [1..1] OF REAL;
END_VAR

aoiEmpty;
aorEmpty;

--> SA0010: Vacuous array element in variable 'aoiEmpty'
--> SA0010: Vacuous array element in variable 'aorEmpty'
```

See also

- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0011: Useless declarations

Detects structures or enumerations with only one component

Justification: This kind of declaration can be confusing for the reader. A structure with only one element can be replaced by an alias type. An enumeration with only one element can be replaced by an constant.

PLCopen rule: CP22 / CP24

Importance: Low

Example

```
TYPE SingleStruct :
  STRUCT
    iPart : INT;
  END_STRUCT
END_TYPE

TYPE myUnion :
  UNION
    lrValue : LREAL;
  END_UNION
END_TYPE

TYPE SingleEnum :
  (OnlyOne := 1);
END_TYPE

--> Useless declaration 'SingleStruct'
--> Useless declaration 'myUnion'
--> Useless declaration 'SingleEnum'
```
SA0012: Variable which could be declared as constants

Detects variables that are not accessed with write permission and therefore could be declared as constants

Justification: If a variable is written only at the declaration point and is otherwise used only for reading, then the static analysis assumes that the variable should also not be changed. Firstly, a declaration as a constant results in checking that the variable is not changed when the program is changed. Secondly, the declaration as a constant may result in faster code.

NOTICE!

If multiple applications exist in one project, then only the objects below the currently active application are affected. If there is only one application, then the objects in the common POU pool are also affected.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR
   iVar : INT := INT#17;
   iTest : INT;
END_VAR
iTest := iTest + iVar;  // SA0012: iVar could be declared as constant

--> SA0012: Variable 'iVar' could be declared as constant
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0013: Declarations with the same variable name

Detects variables with names that are already used by other variables (for example, global and local variables with the same name). Also detects variables with names of functions, actions, methods, or properties which are used in the same access scope. Variables are also detected that are declared in a GVL in the “Devices” view or in the POUs pool. For this, however, the GVL of the “POUs” view have to be used in the application program.

Justification: The same names can be confusing when reading the code, and they can cause errors if the wrong object is accessed unintentionally. We recommend that you use naming conventions to avoid these situations.

PLCopen rule: N5 / N9

Importance: Medium
Example

VAR_GLOBAL
  xVar1 : BOOL;
  iVar3 : INT;
END_VAR

PROGRAM PLC_PRG
VAR
  xVar1 : BOOL; // SA0013
  iVar3 : INT; // SA0013
END_VAR

  xVar1 := NOT GVL.xVar1;
  iVar3 := iVar3 + INT#2;
  iVar3 := GVL.iVar3;

--> SA0013: Declaration of 'iVar1' hides symbol 'GVL.iVar1'
--> SA0013: Declaration of 'xVar3' hides symbol 'GVL.xVar3'

Example

The function block POU has the action ACT and the method METH.

FUNCTION_BLOCK POU
VAR
  ACT : UINT; // SA0013
  METH : BYTE; // SA0013
END_VAR

--> SA0013: Declaration of 'ACT' hides symbol 'POT.ACT'
--> SA0013: Declaration of 'METH' hides symbol 'POT.METH'

See also

● % Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0014: Assignment of instances

Detects assignments to function block instances. In the case of instances with pointer or reference variables, these assignments are potentially risky.

Justification: This is a performance warning. When an instance is assigned to another instance, all elements and subelements are copied from the one instance to the other instance. Pointers to data are also copied, but not their referenced data, so that the target instance and the source instance contain the same data after the assignment. Depending on the size of the instances, this kind of assignment could last a long time. For example, if an instance should be passed to a function for processing, then it is much more efficient to pass a pointer to the instance. If you want to selectively copy values from one instance to another, then a copy method is useful:

inst_First.Copy_From(inst_Second).

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
  inst_First : My_FB;
  inst_Second : My_FB;
END_VAR
inst_First();
inst_Second := inst_First;  // SA0014

--> SA0014: Assignment of instances

See also

● "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"

SA0015: Access to global data via FB_Init

Detects the access of a function block to global variables by means of the method FB_Init.
The value of this variable depends on the order of initializations.

Justification: Depending on the declaration location of the POU instance, an uninitialized variable could be accessed if the rule is violated.

Importance: High

Example

VAR_GLOBAL
  g_xTest1 : BOOL;
  g_iTest3 : INT;
END_VAR

METHOD PUBLIC fb_init : BOOL
VAR_INPUT
  bInitRetains : BOOL; // If TRUE, the retain variables are initialized (warm start / cold start)
  bInCopyCode : BOOL; // If TRUE, the instance afterwards gets moved into the copy code (online change)
END_VAR

  g_xTest1 := NOT g_xTest1;       // SA0015
  g_iTest3 := g_iTest3 + INT#1;   // SA0015

--> SA0015: FB_Init method of function block 'POU' accesses global data

See also

● "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"

SA0016: Gaps in structures

Detects gaps in structures or function blocks that are caused by the alignment requirements of the currently set target system. If possible, you should remove the gaps by resorting the structure elements or filling them with a dummy element. If this is not possible, then you can deactivate the rule for the affected structures by means of the analysis pragma.

Justification: Due to different alignment requirements on different platforms, there may be a different layout in the memory for these kinds of structures. Then the code can perform differently, depending on the platform.

Importance: Low
Example

PROGRAM PLC_PRG
VAR
    myStruct : Unpadded_Structure;
END_VAR
myStruct.iTest := 0;

TYPE Unpadded_Structure :
    STRUCT
        xTest : BOOL;
        iTest : INT;    // SA0016
        byTest : BYTE;
        wTest : WORD;
    END_STRUCT
END_TYPE

--> SA0016: Structure 'Unpadded_Structure' must be padded (pack-mode=8)

See also

- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0017: Non-regular assignments

Detects assignments to pointers that are neither addresses (ADR operator, pointer variables) nor constants 0

Justification: If a pointer contains a value that is not a valid address, then an access violation exception occurs when dereferencing the pointer.

Importance: High

Example

PROGRAM PLC_PRG
VAR
    pInt : POINTER TO INT;
    dwAddress : DWORD;
END_VAR
    dwAddress := dwAddress + DWORD#1;
    pInt := dwAddress; // SA0017

--> SA0017: Non-regular assignment

See also

- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0018: Unusual bit access

Detects bit access to signed variables. However, the IEC 61131-3 standard permits only bit access and bit shift operations on bit fields. See also the strict rules SA0147 and SA0148.

Justification: Signed data types should not be used as bit fields and the other way around. The IEC 61131-3 standard does not provide for this kind of access, and therefore you should comply with this rule when you write portable code.

Importance: Medium
Exception for flag enumerations: When an enumeration is declared as a flag by means of the {attribute 'flags'} pragma attribute, the SA0018 error is not issued for bit access with the OR, AND or NOT operators.

Example

PROGRAM PLC_PRG
VAR
    iTemp1 : INT;
    diTemp3 : DINT;
    uliTemp4 : ULINT;
    siTemp5 : SINT;
    usiTemp6 : USINT;
    byTemp2 : BYTE;
END_VAR
iTemp1.3 := TRUE;     // SA0018
diTemp3.4 := TRUE;    // SA0018
uliTemp4.18 := FALSE; // no error because this is an unsigned data type
siTemp5.2 := FALSE;   // SA0018
usiTemp6.3 := TRUE;   // no error because this is an unsigned data type
byTemp2.5 := FALSE;   // no error because the byte is a bitfield
--> SA0018: Unusual bit access

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
- § Chapter 1.8.4.3.2.49.12 “SA0147: Unusual shift operation - strict” on page 3894
- § Chapter 1.8.4.3.2.49.13 “SA0148: Unusual bit access - strict” on page 3895

SA0020: Possibly assignment of truncated value to REAL variable

Detects operations on integer variables for which a truncated value could be assigned to a REAL data type variable

Justification: Static analysis issues an error when the result of an integer calculation is assigned to a REAL or LREAL variable. The programmer should be alerted to a possible incorrect interpretation of this kind of assignment: lrealvar := dintvar1 * dintvar2. Because the value range of LREAL is greater than that of DINT, one could assume that the result of the calculation could always be represented in LREAL. But that is not the case. The processor calculates the result of the multiplication as an integer and then casts the result to LREAL. An overflow in the integer calculation would be lost. To work around the problem, the calculation has to be done as a REAL operation: lreal_var := TO_LREAL(dintvar1) * TO_LREAL(dintvar2).

Importance: High

Example

PROGRAM PLC_PRG
VAR
    rx : LREAL;
    di : DINT;
END_VAR
rx := di * di           // SA0020
rx := TO_LREAL(di) * TO_LREAL(di) // No message

--> SA0020: Possibly assignment of truncated value to REAL variable
SA0021: Transporting the address of a temporary variable

Detects address assignments of temporary variables (on the stack) to non-temporary variables

Justification: Local variables of a function or method are created on the stack and they exist only while the function or method is being processed. If a pointer points to this kind of variable after processing the method or function, then you can use this pointer to access undefined memory, or to access an incorrect variable in another function. This situation should be avoided at all costs.

Importance: High

Example

```plaintext
FUNCTION TempVarInFUNC : DWORD
VAR
   uiTemp : UINT;
END_VAR
TempVarInFUNC := ADR(uiTemp);  // SA0021

PROGRAM PLC_PRG
VAR
   dwTest : DWORD;
END_VAR
dwTest := TempVarInFUNC();
--> SA0021: Transporting address of temporary variable to outer scope symbol
```

SA0022: (Possibly) unassigned return value

Detects all functions and methods that include an execution thread without an assignment to the return value

Justification: An unassigned return value in a function or method is an indication of missing code. Even if the return value always has a default value, it is always useful to assign it again explicitly to avoid confusion.

Importance: Medium

Example

```plaintext
FUNCTION FUN : DINT
VAR_INPUT
   bTest : BOOL;
END_VAR

IF bTest THEN
   RETURN;
END_IF
FUN := 99;
--> SA0022: (Possibly) unassigned return value
```
SA0023: Too big return values
Detected structured return values that fill more than 4 bytes of memory and therefore are too large. Moreover, return values of type STRING are identified (regardless of the size of the used memory).

Justification: This is a performance warning. If large values are returned as the result of a function, method, or property, then the processor copies them multiple times when executing the code. This can lead to runtime problems and should be avoided whenever possible. Performance can be improved by passing a structured value as VAR_IN_OUT to a function or method and filling it in the function or method.

Importance: Medium

```plaintext
Example

TYPE LargeStructure :
STRUCT
  a : LINT;
  b : BOOL;
END_STRUCT
END_TYPE

TYPE SmallStructure :
STRUCT
  a : INT;
  b : BYTE;
END_STRUCT
END_TYPE

FUNCTION Large_Return_Value_FUNC : LargeStructure   // SA0023
FUNCTION Small_Return_Value_FUNC : SmallStructure   // OK

---> SA0023: Structured return value

See also

● § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
```

SA0024: Untyped literals / constants
Detected untyped literals and constants

Justification: CODESYS assigns types for literals depending on their use. In some cases, this can cause unexpected problems, which should be resolved better with a typed literal. For example: `dw := ROL(DWORD#1, i)`

Importance: Low
Example

PROGRAM PLC_PRG
VAR
  iTemp1 : INT = 10;     // SA0024
  diTemp2 : DINT;
  liTemp3 : LINT;
  rTemp4 : REAL;
  lrTemp5 : LREAL;
END_VAR
iTemp1 := iTemp1 + INT#34;

\[\text{SA0024: Untyped literal found}\]

See also

- \$ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0025: Unqualified enumeration constants

Detects enumeration constants for which a qualified name does not prepend the enumeration

Justification: Qualified access makes the code more readable and easier to maintain. Without
forcing qualified variable names, an additional enumeration could be inserted when the program
is extended. This enumeration contains a constant with the same name as an existing enumera-
tion (see the example below: "red"). This would result in ambiguous access to this piece of

code. We recommend to always use only enumerations with the {attribute 'qualified-only'}.

Importance: Medium

Example

TYPE COLOR
  (red, green, blue);
END_Type

PROGRAM PLC_PRG
enumVar : COLOR;

enumVar := COLOR.red; // SA0025
enumVar := red;       // SA0025

\[\text{SA0025: Enumeration constant 'red' not qualified}\]

See also

- \$ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0026: Possible truncated strings

Detects string assignments and string initializations that do not use sufficient string length

Justification: When strings of different lengths are assigned, a string could be truncated. This
can have unexpected results.

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
  strVar1 : STRING[10];
  strVar2 : STRING[6];
END_VAR

strVar2 := strVar1;                      // SA0026

--> SA0026: Truncation of string 'abcdefghi'
--> SA0026: Possible truncation of string 'strVar1'

See also
●  Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0027: Multiple uses of identifiers

Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project

Justification: Same names can be confusing when reading the code. They can cause errors if the wrong object is accessed accidentally. Define and follow naming conventions to avoid any situation like this.

The following cases are detected:
● The name of an enumeration is identical to the name of another enumeration in the application or in an integrated library.
● The name of a variable is identical to the name of another object in the application or in an integrated library.
● The name of a variable is identical to the name of an enumeration constant in an enumeration in the application or in an integrated library.
● The name of an object is identical to the name of another object in the application or in an integrated library.

Importance: Medium

Example

The Standard library is integrated in the project and provides the TON function.

PROGRAM PLC_PRG
VAR
  ton : INT;
END_VAR

--> Variable name 'ton' in 'PLC_PRG' already used for an object in library 'standard, ...'

See also
●  Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0028: Overlapping memory areas

Detects the lines of code where two or more variables reserve the same memory

Justification: When two variables reserve the same memory, the code may behave with unexpected results. This situation should be avoided at all costs. If you cannot avoid using a value in different interpretations (for example, one time as DINT and another time as REAL), then you should define a UNION. You can also use a pointer to access a value with a different type without the value being converted.
PROGRAM PLC_PRG
VAR
iVar AT %QB21: INT;
dwVar2 AT %QD5: DWORD;
END_VAR

--> The following variables access the same memory:
--> SA0028: iVar AT %QB21
--> SA0028: dwVar2 AT %QD5

See also
● § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0029: Notation in code different to declaration
Detects the code locations where the notation of an identifier is different from the notation in its declaration

Justification: The IEC 61131-3 standard defines identifiers as not case-sensitive. This means that a variable declared as "varx" can also be used as "VaRx" in the code. However, this is confusing and misleading and should be avoided.

Importance: Medium

Example
A POU PLC_PRG and a POU fnc (function) exist in the device tree.

PROGRAM PLC_PRG
VAR
iVar: INT;
_123test_var_: INT;
END_VAR
ivar := iVar + 1;                   // SA0029
_123TEST_var_ := _123test_var_;        // SA0029
Fnc();                              // SA0029

--> SA0029: Notation in code (ivar) must equal declaration (iVar)
--> SA0029: Notation in code (_123TEST_var_) must equal declaration (_123test_var_)
--> SA0029: Notation in code (Fnc) must equal declaration (fnc)

Unused Objects

<table>
<thead>
<tr>
<th>1.8.4.3.2.28.1</th>
<th>1.8.4.3.2.28.2</th>
<th>1.8.4.3.2.28.3</th>
<th>1.8.4.3.2.28.4</th>
<th>1.8.4.3.2.28.5</th>
</tr>
</thead>
</table>
SA0031: Unused signatures

Detects programs, function blocks, functions, data types, interfaces, methods, properties, and actions that are not called within the compiled program code.

Justification: Unused objects unnecessarily increase the size of the project and can be confusing when reading the code.

Importance: Low

PLCopen rule: CP2

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the POU pool are also affected.

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0032: Unused enumeration constants

Detects enumeration constants that are not used in the compiled program code.

Justification: Unused enumeration constants unnecessarily increase the size of the enumeration definition and can be confusing when reading the program.

PLCopen rule: CP24

Importance: Low

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example

```plaintext
TYPE My_Enum :
  (one := 1, two := 2);
END_TYPEE

--> SA0032: Unused enumeration constant 'one'
--> SA0032: Unused enumeration constant 'two'
```

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0033: Unused variables

Detects variables that are declared but not used within the compiled program code.

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP22 / CP24
For GVL variables:
If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example

PROGRAM PLC_PRG
VAR
  iCounter1 : INT;
  iCounter2 : INT;        // SA0035
END_VAR

  ICCounter1 := 100;
---> SA0035: Unused Variable 'iCounter2'

See also

- ☰ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0035: Unused input variables

Detects input variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP24

Example

FUNCTION_BLOCK AFB
VAR_INPUT
  iIn1: INT;
  iIn2: INT;
END_VAR
VAR_OUTPUT
  iOut1: INT;
END_VAR

PROGRAM PLC_PRG
VAR
  Fb1: AFB;
END_VAR

  Fb1(iIn1 := 99)
---> SA0035: Unused input 'iIn2'

See also

- ☰ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0036:Unused output variables

Detects output variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.
Example

FUNCTION_BLOCK AFB
VAR_INPUT
  iIn1: INT;
  iIn2: INT;
END_VAR
VAR_OUTPUT
  iOut1: INT;
END_VAR
PROGRAM PLC_PRG
VAR
  Fb1: AFB;
END_VAR
Fb1(iIn1 := 99)
--> SA0036: Unused output 'iOut1'

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0034: Enumerations with incorrect assignment

Detects values that are assigned to an enumeration variable. Only defined enumeration constants of an enumeration variable are permitted to be assigned.

Justification: A variable of the enumeration type should have only the intended values, otherwise the code that uses this variable may not work correctly. We recommend to always use enumerations with the \( \text{attribute 'strict'} \). Then the compiler already checks the correct use of the enumeration components.

Importance: High

Example

TYPE COLOR :
{
  Red := 0,
  Green,
  Yellow
}
END_TYPE
PROGRAM PLC_PRG
VAR
  eColor1: COLOR;
END_VAR
  eColor1 := COLOR.Red;
  eColor1 := 1;  // SA0034
--> SA0034: Use enumeration value instead of 'INT#1'

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0037: Write access to input variable

Detected input variables (VAR_INPUT) that are accessed with write permission within the POU.

Justification: According to the IEC 61131-3 standard, an input variable must not be changed within a POU. This kind of access is also a cause for errors and makes the code poorly maintainable. This is an indication that a variable is used as both an input variable and an auxiliary variable. This kind of dual use should be avoided.

Importance: Medium

Example

```
VAR_GLOBAL
  g_xGlob AT %QX0.0 : BOOL;
END_VAR

PROGRAM PLC_PRG
VAR_INPUT
  xVarIn1:BOOL;
  xVarIn2:BOOL;
END_VAR
VAR
  iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
  INT#1:
    g_xGlob := xVarIn1;
  INT#2:
    g_xGlob := xVarIn2;
ELSE
    g_xGlob := FALSE;
    xVarIn1 := FALSE;     // SA0037
END_CASE
```

See also

● % Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0038: Read access to output variable

Detected output variables (VAR_OUTPUT) that are accessed with read permission within the POU.

Justification: According to the IEC 61131-3 standard, it is prohibited to read an output within a POU. This is an indication that the output is not only used as an output but also as a temporary variable for intermediate results. This kind of dual use should be avoided.

Importance: Low
Example

```
VAR_GLOBAL
  g_xGlob AT %QX0.0 : BOOL ;
  g_iGlob AT %QW1 : INT ;
END_VAR

PROGRAM PLC_PRG
VAR_OUTPUT
  xVarOut1:BOOL;
  xVarOut2:INT;
  xVarOut3:INT;
END_VAR
VAR
  iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
  INT#1:
    xVarOut1 := g_xGlob;
    xVarOut2 := g_iGlob;
  INT#2:
    xVarOut3 := xVarOut2;  // SA0038
ELSE
  xVarOut1 := FALSE;
  g_xGlob := xVarOut1;  // SA0038
  xVarOut2 := INT#0;
  xVarOut3 := INT#-1;
END_CASE

--> SA0038: Read access to output variable 'xVarOUT2'
--> SA0038: Read access to output variable 'xVarOUT1'
```

See also

- Chapter 1.8.4.1 "Configuring and Running Static Analysis" on page 3819

SA0040: Possible division by zero

Detects code locations where there is possible division by zero

Justification: Division by zero should never occur, and a variable denominator should always be checked for 0 first.

Importance: High
Example

VAR_GLOBAL
  g_iVar AT %QW1 : INT ;
END_VAR

PROGRAM PLC_PRG
VAR
  iCounter : INT;
  iSumme:INT;
  iMid:INT;
  iVal1:INT := INT#2;
  iVal2:INT;
  iVal3:INT := INT#3;
  iVal4:INT := INT#4;
  iVal5:INT;
END_VAR

IF iVal2 <> 0 THEN
  iVal1 := iVal1/iVal2;   // no error
END_IF;

iMid := iSumme / iCounter; // SA0040
iCounter := iCounter + INT#1;
iSumme := g_iVar + iSumme;
IF iMid < INT#100 THEN
  iVal1 := iVal1 / iVal2;       // SA0040
END_IF

--> SA0040: Possible division by zero
 --> SA0040: Possible division by zero

●   "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"

SA0041: Detect possible loop invariant code

Detects assignments in loops that calculate the same value for each loop cycle. These lines of
code could possibly be inserted outside of the loop.

Justification: This is a performance warning. Code that is executed in a loop, but does the same
thing in each loop cycle, can be executed outside of the loop.

Importance: Medium

Example

PROGRAM PLC_PRG
VAR
  iCounter, iVar1, iVar2: INT;
END_VAR

FOR iCounter := 0 TO 10 DO
  iVar1 := 100;        // SA0041
  iVar2 := iVar2 + iVar1;
END_FOR

--> SAN0041: Possible loop invariant code 'iVar1 := 100'

See also
●   "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"
SA0042: Usage of different access paths

Detects the usage of different access paths for the same variable

Justification: Different access to the same element decreases the readability and maintainability of a program. We recommend the consistent usage of `qualified-only` for libraries, global variable lists, and enumerations. This forces a fully qualified access.

Importance: Low

**Example**

```plaintext
VAR_GLOBAL
  iTemp: INT;
  instPOU: POU;
END_VAR

FUNCTION_BLOCK POU
  VAR
    a: INT;
  END_VAR
  a := INT#1;

PROGRAM SA0042
  VAR
    ptiTemp: POINTER TO INT;
    sTemp: STRING;
  END_VAR
  ptiTemp := ADR(iTemp);
  ptiTemp^ := INT#1;
  iTemp := INT#2;                               // SA0042 - direct access on variable
  GVL.iTemp := INT#3;                            // SA0042 - access on variable via GVL
  sTemp := CONCAT( 'ab', 'cd');                  // SA0042 - direct access on function
  sTemp := Standard.CONCAT( 'ab', 'cd');         // SA0042 - access on function via Standard
  instPOU();                                    // SA0042 - direct access on POU instance
  GVL.instPOU();                                // SA0042 - access via GVL

--> SA0042: Different access paths for 'CONCAT'
--> SA0042: Different access paths for 'Standard.CONCAT'
--> SA0042: Different access paths for 'instPOU'
--> SA0042: Different access paths for 'iTemp'
--> SA0042: Different access paths for 'GVL.iTemp'
```

See also

- *Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819*

SA0043: Use of a global variable in only one POU

Detects the use of a global variable in only a single POU

Justification: A global variable that is used in only one location should also only be declared at this location.

Importance: Medium
Example

```plaintext
VAR_GLOBAL
  g_xVar AT %QX0.0 : BOOL ;
  g_iTest AT %QW1 : INT ;
  g_wTest AT %QW2 : WORD;
END_VAR

PROGRAM prog1
VAR
  iCondition : INT;
  bTemp : BOOL;
END_VAR
iCondition := iCondition + INT#1;
IF iCondition < INT#0 THEN
  bTemp := g_xVar;  // SA0043 - g_xVar only read in this POU
ELSIF iCondition = INT#0 THEN
  bTemp := g_xVar;  // SA0043 - g_xVar only read in this POU
ELSE
  bTemp := g_xVar;  // SA0043 - g_xVar only read in this POU
  g_wTest := WORD#4; // g_wTest used also in prog2 -> OK
END_IF

PROGRAM prog2
VAR
  iCondition : INT;
END_VAR
iCondition := iCondition + INT#1;
CASE iCondition OF
  INT#1:
  g_iTest := WORD_TO_INT(g_wTest); // SA0043 - g_iTest only written in this POU
  INT#2:
  g_iTest := INT#2;                 // SA0043 - g_iTest only written in this POU
  ELSE
  g_iTest := INT#3;                 // SA0043 - g_iTest only written in this POU
END_CASE

--> SA0043: Global variable 'g_xVar' only used in 'prog1'
--> SA0043: Global variable 'g_iTest' only used in 'prog2'
```

See also

- \% Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0044: Declarations with reference to interface

Detects declarations with \texttt{REFERENCE TO} interfaces and declarations of \texttt{VAR_IN_OUT} variables with interfaces (implicitly implemented by means of \texttt{REFERENCE TO})

Justification: An interface type is always implicitly a reference to an instance of a function block that implements this interface. A reference to an interface is therefore a reference to a reference and can result in unwanted behavior.

Importance: High
**Example**

ITF is an interface that is defined in the project.

```plaintext
PROGRAM PLC_PRG
VAR
    inst:POU;
    itf_inst1 : ITF;
    itf_ref : REFERENCE TO ITF; // SA0044
END_VAR
FUNCTION_BLOCK POU
VAR_INPUT
    inst_itf2 : ITF;
END_VAR
VAR_OUTPUT
    inst_itf3 : ITF;
END_VAR
VAR_IN_OUT
    inst_itf4 : ITF;           // SA0044
END_VAR

--> SA0044: Reference to interface 'itf_ref'
--> SA0044: Reference to interface 'itf4_ref'
```

- 1.8.4.3.2.37.5 SA0133: Explicit narrowing conversions................................. 3862
- 1.8.4.3.2.37.6 SA0134: Explicit signed/unsigned conversions....................... 3863

**SA0019: Implicit pointer conversions**

Detects implicitly generated pointer conversions

Justification: In CODESYS, pointers are not strictly typed and they can be assigned to each other in any way. This is often used and therefore not reported by the compiler. However, it can also accidentally cause unexpected access. If you assign a `POINTER TO BYTE` to a `POINTER TO DWORD`, then you can unintentionally overwrite memory using the latter pointer. Therefore, always check this rule and block the message for cases in which you intentionally want to access a value with a different type.

Implicit data type conversions are reported with a different message.

Importance: High

PLCopen rule: CP25

Exception: `BOOL <-> BIT`
Example

PROGRAM PLC_PRG
VAR
  pINT : POINTER TO INT;
  byteVar : BYTE;
END_VAR

pINT := ADR(byteVar);

--> SA0019: Implicit conversion from pointer to 'POINTER TO BYTE'
to pointer to 'POINTER TO INT'

See also

● © Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0130: Implicit expanding conversions

Detects implicit conversions from smaller data types to larger data types

Justification: The compiler permits any assignments of different types when the value range of
the source type is completely contained within the value range of the target type. However, the
compiler will build a conversion into the code as late as possible. For an assignment of type
lint := dint * dint, the compiler performs the implicit conversion only after multiplication:
lint := TO_LINT(dint * dint). An overflow is therefore truncated. To prevent this, you
can already convert the elements: lint := TO_LINT(dint) * TO_LINT(dint). There-
fore, it may be useful to report locations where the compiler implements implicit conversions in
order to check whether these are exactly what is intended. Furthermore, explicit conversions
can be used to improve portability to other systems when those systems have more restrictive
type checks.

Importance: Low
Example

PROGRAM PLC_PRG
VAR
  byTemp : BYTE;
  usiTTemp : USINT;
    uiTemp : UINT;
    iTemp : INT;
    udiTemp : UDINT;
  diTemp : DINT;
  uliTTemp : ULINT;
    liTemp : LINT;
  lwTemp : LWORD;
    lrTemp : LREAL;
END_VAR

liTemp := iTemp;       // SA0130
uliTemp := usiTTemp;    // SA0130
lwTemp := udiTemp;     // SA0130
lrTemp := byTemp;      // SA0130
diTemp := uiTemp;      // SA0130

byTemp.5 := FALSE;     // OK (BIT_BOOL conversion)

---> SA0130: Implicit widening conversion from type 'INT' to type 'LINT'
---> SA0130: Implicit widening conversion from type 'USINT' to type 'ULINT'
---> SA0130: Implicit widening conversion from type 'UDINT' to type 'LWORD'
---> SA0130: Implicit widening conversion from type 'BYTE' to type 'LREAL'
---> SA0130: Implicit widening conversion from type 'UINT' to type 'DINT'

See also

● ¶ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0131: Implicit narrowing conversions

Detects implicit conversions from larger data types to smaller data types

Justification: This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  rTemp : REAL;
  lrTemp : LREAL;
END_VAR

rTemp := lrTemp;    // SA0131

---> SA0131: Implicit narrowing conversion from type 'LREAL' to type 'REAL'

See also

● ¶ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0132: Implicit signed/unsigned conversions

Detects implicit conversions from signed data types to unsigned data types or the other way around.

This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  byTest :BYTE;
  udiTest: UDINT;
  ulktest: ULIINT;
  wTest : WORD;
  lwTest : LWORD;
  siTest : SINT;
  iTest : INT;
  diTest : DINT;
  liTest : LINT;
END_VAR

liTest := ulktest;    // SA0132
udiTest:= diTest;     // SA0132
siTest := byTest;     // SA0132
wTest := iTest;       // SA0132
lwTest := siTest;     // SA0132

--> SA0132: Implicit signed/unsigned conversion from type 'ULINT' to type 'LINT'
--> SA0132: Implicit signed/unsigned conversion from type 'DINT' to type 'UDINT'
--> SA0132: Implicit signed/unsigned conversion from type 'BYTE' to type 'SINT'
--> SA0132: Implicit signed/unsigned conversion from type 'INT' to type 'WORD'
--> SA0132: Implicit signed/unsigned conversion from type 'SINT' to type 'LWORD'

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0133: Explicit narrowing conversions

Detects explicit conversions from a larger data type to a smaller data type

Justification: A large number of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low
Example

```plaintext
PROGRAM SA0133
VAR
   siVar:SINT;
   diVar:DINT;
   liVar:LINT;
   byVar:BYTE;
   uiVar:UINT;
   dwVar:DWORD;
   lwVar:LWORD;
   rVar:REAL;
   lrVar:LREAL;
END_VAR
siVar := LINT_TO_SINT(liVar); // SA0133
byVar := DINT_TO_BYTE(diVar); // SA0133
siVar := DWORD_TO_SINT(dwVar); // SA0133
uiVar := LREAL_TO_UINT(lrVar); // SA0133
rVar := LWORD_TO_REAL(lwVar); // SA0133
```

**SA0134: Explicit signed/unsigned conversions**

Detects explicit conversions from signed data types to unsigned data types and the other way around

Justification: Excessive use of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low
PROGRAM PLC_PRG
VAR
  byVar  : BYTE;
  udiVar : UDINT;
  uliVar : ULINT;
  lwVar  : LWORD;
  wVar   : WORD;
  siVar  : SINT;
  iVar   : INT;
  diVar  : DINT;
  liVar  : LINT;
END_VAR
liVar := ULINT_TO_LINT(uliVar);
udiVar := DINT_TO_UDINT(diVar);
siVar := BYTE_TO_SINT(byVar);
wVar := INT_TO_WORD(iVar);
lwVar := SINT_TO_LWORD(siVar);

--> SA0134: Explicit signed/unsigned conversion from type 'ULINT' to type 'LINT'
--> SA0134: Explicit signed/unsigned conversion from type 'DINT' to type 'UDINT'
--> SA0134: Explicit signed/unsigned conversion from type 'BYTE' to type 'SINT'
--> SA0134: Explicit signed/unsigned conversion from type 'INT' to type 'WORD'
--> SA0134: Explicit signed/unsigned conversion from type 'SINT' to type 'LWORD'

Use of Direct Addresses

1.8.4.3.2.38.1   SA0005: Invalid addresses and data types........................... 3864
1.8.4.3.2.38.2   SA0047: Accesses to direct address.................................. 3865
1.8.4.3.2.38.3   SA0048: AT-declarations on direct addresses...................... 3865

SA0005: Invalid addresses and data types

Detecets invalid addresses and data type specifications. Valid size prefixes in addresses: X for BOOL B for 1-byte data types, W for 2-byte data types, and D for 4-byte data types.

Justification: Variables located on direct addresses should preferably be associated with an address that corresponds to their data type width. It can be confusing for the reader of the code, for example, if a DWORD is assigned to a BYTE address.

Importance: Low
Example

PROGRAM Check_Address_Type_PRG
VAR
   iVar AT %QB0 : INT ;   // OK e. g.: %QW0
   xTest AT %QW1 : BOOL ; // OK e. g.: %QX1.0
END_VAR

iVar := iVar + INT#1;
xTest := NOT xTest;

--> SA0005: Invalid address for data type 'iVar'

See also

● "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"

SA0047: Accesses to direct address

Detects direct address access in the implementation code

Justification: Symbolic programming is always preferable. A variable has a name that can also have a meaning. An address cannot indicate what it is used for.

Importance: High
PLCopen rule: N1 / CP1

Example

PROGRAM PLC_PRG
VAR
   xVar : BOOL;
   byVar : BYTE;
END_VAR

xVar := %IX0.0;
%QX0.0 := xVar;
%Mx0.1 := xVar;
%MB1 := byVar;

--> Access to direct address '%IX0.0'
--> Access to direct address '%QX0.0'
--> Access to direct address '%MX0.1'
--> Access to direct address '%MB1'

See also

● "Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819"

SA0048: AT-declarations on direct addresses

Detects AT declarations on direct addresses

Justification: The use of direct addresses in the code is problematic because the address then appears in multiple locations: first in the controller configuration where the assignment of a physical object to an address is defined, and second in the program where variables are assigned to these addresses. If the addresses are relocated because the configuration is changed, then you have to reassign variables to addresses at a completely different location in the program. This is a cause of error and results in poorer readability and maintainability of the code. Therefore, it is best to perform all assignments in the I/O mapping of the device editor.

Importance: High
PLCopen rule: N1 / CP1

Note: We recommend that you use direct addresses ONLY in the “I/O Mapping” tab of the device editor.

Example

PROGRAM PLC_PRG
VAR
  xVar1 AT %IX0.0 : BOOL;
  byVar1 AT %IB1 : BYTE;
  xVar2 AT %QX0.0 : BOOL;
END_VAR

--> SA0048: Declaration uses direct address '%IX0.0'
--> SA0048: Declaration uses direct address '%IB1'
--> SA0048: Declaration uses direct address '%QX0.0'

1.8.4.3.2.39.15 SA0065: Incorrect pointer addition to base size.................... 3874
1.8.4.3.2.39.16 SA0066: Uses of temporary results...................................... 3875

SA0051: Comparison operations on BOOL variables

Detects comparison operations on variables of type BOOL

Justification: CODESYS permits these kinds of comparison, but they are very unusual and can be confusing. The IEC 61131-3 standard does not provide for these comparisons. By avoiding them, you increase the portability of the code to other development systems.

Importance: Medium
Example

```plaintext
PROGRAM PLC_PRG
VAR
  xBool1, xBool2 : BOOL;
  xResult : BOOL;
END_VAR
xResult := xBool1 > xBool2;  // SA0051
xBool1 := NOT xBool1;           // OK!
xBool2 := xBool2 XOR xBool1;    // OK!
--> SA0051: Comparison operations on BOOL variables
```

See also

- % Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0052: Unusual shift operation

Detects shift operations (bit shift) on signed variables. In the case of shift operations on bit field data types (Byte, DWORD, LWORD, WORD), an error is not reported.

Justification: CODESYS permits shift operations on signed data types. However, these operations are unusual and can be confusing. The IEC 61131-3 standard does not provide for these kinds of operations. Therefore, they should be avoided in order to increase the portability of the code to other development systems.

Importance: Medium

Example

```plaintext
PROGRAM PLC_PRG
VAR
  iTemp : INT;
  dwTemp1 : DWORD;
  byTemp2 : BYTE;
  diTemp3 : DINT;
  siTemp4 : SINT;
  liTemp5 : LINT;
END_VAR

//the following lines each will cause an  SA0052:
  iTemp := SHL(iTemp, BYTE#2);
  diTemp3 := SHR(diTemp3, BYTE#4);
  siTemp4 := ROL(siTemp4, BYTE#2);
  liTemp5 := ROR(liTemp5, BYTE#2);

//no error SA0052 because DWORD and BYTE are bit field data types:
  dwTemp1 := SHL(dwTemp1, BYTE#3);
  byTemp2 := SHR(byTemp2, BYTE#1);

  ---> SA0052: Unusual shift operation
```

See also

- % Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0053: Too big bitwise shift

Detects whether or not the data type width of the operand has been exceeded in the case of a bitwise shift (bit shift) of operands
Justification: If a shift operation exceeds the data type width, then a constant 0 is generated. If a rotation shift exceeds the data type width, then it is difficult to read. Therefore, the rotation value should be shortened.

Importance: High

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
  wTemp2 : WORD;
  dwTemp3 : DWORD;
  lwTemp4 : LWORD;
END_VAR
byTemp1 := SHR(byTemp1, BYTE#25);
wTemp2 := SHL(wTemp2, BYTE#45);
dwTemp3 := ROR(dwTemp3, BYTE#78);
lwTemp4 := ROL(lwTemp4, BYTE#111);

--> SA0053: Too big bitwise shift
```

See also
- § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0054: Comparisons of REAL/LREAL for equality / inequality**

Detects whether or not the comparison operators = (equality) and <> (inequality) compare the operands of type REAL or LREAL

Justification: REAL/LREAL values are implemented as floating-point numbers according to the IEEE 754 standard. This standard implies that specific, apparently simple decimal numbers cannot be represented with precision. As a result, there may be different representations as LREAL for the same decimal number.

Consider the following lines of code:

```plaintext
lr11 := 1.1;
lr33 := 3.3;
lrVar1 := lr11 + lr11;
lrVar2 := lr33 - lr11;
botest := lrVar1 = lrVar2;
```

In this case, `botest` returns FALSE, even if the variables `lrVar1` and `lrVar2` both return the monitoring value of 2.2. This is not an error of the compiler, but a property of the floating point units of all conventional processors. You can avoid this by specifying a minimum value by which the values may differ: `botest := ABS(lrVar1 - lrVar2) < 0.1;`

Exception: A comparison with 0.0 is not reported by this analysis. For the 0, there is an exact representation in the IEEE 754 standard, and therefore the comparison functions normally as expected. Therefore, for better performance, it makes sense to permit a direct comparison here.

Importance: High

PLCopen rule: CP54
Example

PROGRAM PLC_PRG
VAR
  rTest1 : REAL;
  rTest2 : REAL;
  lrTest3 : LREAL;
  lrTest4 : LREAL;
  xResult : BOOL;
END_VAR

//the following lines each will cause an SA0054:
  xResult := rTest1 = rTest1;
  xResult := rTest1 = rTest2;
  xResult := rTest1 <> rTest2;
  xResult := lrTest3 = lrTest3;
  xResult := lrTest3 = lrTest4;
  xResult := lrTest3 <> lrTest4;
//the following lines each will not cause an SA0054:
  xResult := rTest1 > rTest2;
  xResult := lrTest3 < lrTest4;

--> SA0054: Comparisons of REAL/LREAL for equality / inequality

See also
● ☞ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0055: Unnecessary comparisons of unsigned operands

Detects unnecessary comparisons with unsigned operands. An unsigned data type is never less than zero. This can be used as a sign check.

Justification: A comparison detected with this check yields a constant result and is an indication of an error in the code.

Importance: High

Example

PROGRAM PLC_PRG
VAR
  byTest: BYTE;
END_VAR

WHILE byTest >= 0 DO
  byTest := byTest - 1;
END_WHILE;

--> SA0055: Unnecessary comparisons of unsigned operands

See also
● ☞ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0056: Constant out of valid range

Detects literals (constants) outside of the valid range of the operator

Justification: The message is issued for an operation that returns the constant TRUE or FALSE. This is an indication of a programming error.

Importance: High
**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  byTestVar: BYTE;
END_VAR

WHILE byTestVar >= 0 DO
  byTestVar := byTestVar + 1;
END_WHILE

--> SA0056: Constant out of valid range
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0057: Possible loss of decimal places**

Detects statements with possible loss of decimal places

Justification: A piece of code of the following type `(diTemp2 := 1 rTemp1 := TO_REAL(diTemp2 / DINT#2))` can cause a misinterpretation. The author or reader of this line of code can assume that the division would be performed as a REAL operation, and in this case the result would be REAL#0.5. However, this is not true. It is an integer operation. The result is cast to REAL and rTemp1 gets the value REAL#0. To avoid this, use a cast to make sure that the operation is performed as a REAL operation: `rTemp1 := TO_REAL(diTemp2) / REAL#2`.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  rTemp1 : REAL;
  diTemp2 : DINT;
  liTemp3 : LINT;
END_VAR

diTemp2 := diTemp2 + DINT#11;
rTemp1 := DINT_TO_REAL(diTemp2 / DINT#3); // SA0057
rTemp1 := DINT_TO_REAL(diTemp2) / REAL#3.0;
liTemp3 := liTemp3 + LINT#13;
rTemp1 := LINT_TO_REAL(liTemp3 / LINT#7); // SA0057
rTemp1 := LINT_TO_REAL(liTemp3) / REAL#7.0;

--> SA0057: Possible loss of decimal places
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0058: Operations on enumeration variables**

Detects operations on variables of the enumeration data type Assignments are permitted.

Justification: Enumerations should not be used as ordinary integer values. You can also define an alias data type or use a subrange type.

Importance: Medium
Exception: If an enumeration is tagged with the pragma \{attribute 'strict'}\), then the compiler already reports this kind of operation.

If an enumeration is declared as a flag by the pragma \{attribute 'flags'}\), then an error is not issued for AND, OR, NOT, or other XOR operations.

**Example**

```plaintext
TYPE My_Enum :
  (red := 1, blue := 2, green := 3, black := 4);
END_TYPE

PROGRAM PLC_PRG
VAR
  iTemp1 : INT;
  abc : My_Enum;
END_VAR
iTTemp1 := iTTemp1 + INT#1;
abc := My_Enum.red; // OK
iTTemp1 := My_Enum.black / My_Enum.blue; // SA0058
iTTemp1 := My_Enum.green / My_Enum.red; // SA0058
--> SA0058: Operations on enumeration variables
```

**Example with a pragma \{attribute 'flags'}\)

```plaintext
\{attribute 'flags'} // declaring the enumeration as a "flag"
TYPE Flags :
  (Unknown := 16#00000001,
   Stopped := 16#00000002,
   Running := 16#00000004
  ) DWORD;
END_TYPE

PROGRAM PLC_PRG
VAR
  iTTemp1 : INT;
  abc : Flags;
  batate : BYTE;
  dwFlags : DWORD;
  dwState : DWORD;
END_VAR

// OK for the following
IF (dwFlags AND Flags.Unknown) <> DWORD#0 THEN
  dwState := dwState AND Flags.Unknown;
ELSIF (dwFlags OR Flags.Stopped) <> DWORD#0 THEN
  dwState := dwState OR Flags.Running;
END_IF
```

See also

- *Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819*
SA0059: Comparison operations always returning TRUE or FALSE

Detected comparisons with literals that always have the result TRUE or FALSE, and can already be processed during the compile.

Justification: An operation that consistently yields TRUE or FALSE is an indication of a programming error.

Importance: High

Example

```plaintext
PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
END_VAR

WHILE byTemp1 <= 255 DO
  byTemp1 := byTemp1 + 1;
END_WHILE;

--> SA0059: Relational operator '=<' always evaluates 'TRUE'
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0060: Zero used as invalid operand

Detected operations where an operand with the value "0" causes an invalid or a nonsense operation.

Justification: This kind of expression could be an indication of a programming error. In any case, it unnecessarily wastes runtime.

Importance: Medium

Example

```plaintext
PROGRAM PLC_PRG
VAR
  byTemp1 : BYTE;
  wTemp2 : WORD;
  dwTemp3 : DWORD;
END_VAR

byTemp1 := byTemp1 + 0;
wTemp2 := wTemp2 - WORD#0;
dwTemp3 := dwTemp3 * DWORD#0;

--> SA0060: Zero used as invalid operand
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0061: Unusual operation on pointer

Detected operations on variables of type POINTER to which are not = (equality), <> (inequality), + (addition), or ADR.
In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. Therefore, the addition of a pointer with an integer value is considered a common operation on pointers. This makes it possible to use a pointer to process an array of variable length. All other (unusual) operations with pointers are reported with SA0061.

Importance: High

PLCopen rule: E2 / E3

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  piTemp : POINTER TO INT;
  iTemp : INT;
END_VAR

iTemp := iTemp + INT#1;
piTemp := ADR(iTemp);
piTemp := piTemp * DWORD#5;  // SA0061
piTemp := piTemp / DWORD#2;  // SA0061
piTemp := piTemp MOD DWORD#3; // SA0061
piTemp := piTemp + DWORD#1;
piTemp := piTemp - DWORD#1;  // SA0061

--> SA0061: Unusual operation on pointer
```

See also

- *Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819*

**SA0062: Uses of TRUE or FALSE in expressions**

Detects the use of the literals `TRUE` or `FALSE` in expressions

Justification: This kind of expression is obviously unnecessary and may indicate an error. In any case, the expression unnecessarily affects the runtime.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  xTemp1, xTemp2 : BOOL;
END_VAR
xTemp1 := xTemp1 AND NOT TRUE;
xTemp2 := xTemp1 OR TRUE;
xTemp2 := xTemp1 OR NOT FALSE;
xTemp2 := xTemp1 AND FALSE;

--> Uses of TRUE or FALSE in expressions
```

See also

- *Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819*

**SA0063: Possibly not 16-bit-compatible operations**

Detects 16-bit operations with temporary results. Background: On 16-bit systems, 32-bit temporary results can be truncated. Example: `(int+10)` can exceed 16 bits.

Justification: In the very rare case that you have to write code which should run on a 16-bit processor as well as on a 32-bit processor, this message should help to prevent any problems.
Importance: Low

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
END_VAR
iVar := (iVar + 10) / 2;

--> SA0063: Compatibility for 16 Bit - Possible truncated intermediate result
```

See also
- ¶ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0064: Addition of pointer**

Detects the addition of pointers

Justification: In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. However, it is also a source of errors. Therefore, programming rules exist that generally prohibit pointer arithmetic. This test can check such a requirement.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  iTest: INT;
  ariTest: ARRAY[0..10] OF INT;
  {attribute 'analysis':'-111'}
  piTest: POINTER TO INT;
  i: INT;
END_VAR

piTest := ADR(ariTest[0]);            // OK
piTest^:= 0;
piTest := ADR(ariTest) + SIZEOF(INT); // SA0064
piTest^:= 1;
piTest := ADR(ariTest) + 6;           // SA0064
piTest^:= 3;
piTest := ADR(ariTest[10]);
FOR i:=0 TO 10 DO
  piTest^ := i;
  piTest := piTest + 2;                // SA0064
END_FOR

--> SA0064: Addition of pointer
```

See also
- ¶ Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0065: Incorrect pointer addition to base size**

Detects pointer additions for which the value to be added does not match the base size of the pointer. Only literals of the base size can be added. Also multiplication products of the base size cannot be added.
Justification: In CODESYS (in contrast to C and C++), when adding a pointer with an integer value, only this integer value is added as the number of bytes, and not the integer value multiplied by the base size. Example in ST:

```plaintext
def INT := ADR(array_of_int[0])
def INT := def INT + 2 ; // In CODESYS, def INT then points to array_of_int[1]
```

This code would function differently in C:

```plaintext
def* pShort
pShort = &(array_of_short[0])
pShort = pShort + 2;  // In C, pShort then points to array_of_short[2]
```

Therefore, in CODESYS, you should always add a multiple of the base size of the pointer to a pointer. Otherwise, the pointer may point to non-aligned memory which (depending on the processor) can lead to an alignment exception when accessing it.

Importance: High

### Example

```plaintext
VAR
    pudiTest:POINTER TO UDINT;
    udiTest:UDINT;
    prTest:POINTER TO REAL;
    rTest:REAL;
END_VAR

pudiTest := ADR(udiTest) + 4;                  // OK
pudiTest := ADR(udiTest) + ( 2 + 2 );          // OK
pudiTest := ADR(udiTest) + SIZEOF(UDINT);      // OK
pudiTest := ADR(udiTest) + 3;                 // SA0065
pudiTest := ADR(udiTest) + 2*SIZEOF(UDINT);    // SA0065
pudiTest := ADR(udiTest) + ( 3 + 2 );          // SA0065

prTest := ADR(rTest);
prTest := prTest + 4;                          // OK
prTest := prTest + ( 2 + 2 );                  // OK
prTest := prTest + SIZEOF(REAL);               // OK
prTest := prTest + 1;                          // SA0065
prTest := prTest + 2;                          // SA0065
prTest := prTest + 3;                          // SA0065
prTest := prTest + ( SIZEOF(REAL) - 1 );       // SA0065
prTest := prTest + ( 1 + 4 );                 // SA0065

--> SA0065: Incorrect pointer addition to base size
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0066: Uses of temporary results**

Detects the use of temporary results in statements with a data type that is less than the registry size. The implicit cast in this case may lead to unwanted results.

Justification: For performance reasons, CODESYS performs operations on the register width of the processor. Intermediate results are not truncated. This can lead to misinterpretations as in the following case: `usintTest := 0; xError := usintTest - 1 <> 255;`. In CODESYS, `xError` is TRUE in this case because the operation `usintTest - 1` is typically executed as a 32-bit operation and the result is not cast to the byte size. Then the value `16#fffffffe` (not equal to 255) is located in the registry. To avoid this, you have to cast the intermediate result explicitly: `xError := TO_USINT(usintTest - 1) <> 255;`
NOTICE!
If this message is activated, then many less problematic locations in the code will be reported. Although a problem can only occur when the operation produces an overflow or underflow in the data type, the static analysis cannot differentiate between the individual locations.
If you include an explicit typecast in all reported locations, then the code will be much slower and less readable.

Importance: Low

Example

PROGRAM PLC_PRG
VAR
  byTest:BYTE;
  liTest:LINT;
  xError:BOOL;
END_VAR

//type size smaller than register size;
byTest := 0;
IF (byTest - 1) <> 255 THEN //use of temporary result + implicit casting -> SA0066
  xError := TRUE;
ELSE
  xError := FALSE;
END_IF

//type size equal to or bigger than register size;
liTest := 0;
IF (liTest - 1) <> -1 THEN //use of temporary result and no implicit casting -> OK
  xError := TRUE;
ELSE
  xError := FALSE;
END_IF

--> SA0066: Use of temporary result: (byTest - USINT #1)

1.8.4.3.2.40.5  SA0075: Missing ELSE.................................................. 3879
1.8.4.3.2.40.6  SA0076: Missing enumeration constant.............................. 3880
1.8.4.3.2.40.7  SA0077: Type mismatches with CASE expression.................. 3881
1.8.4.3.2.40.8  SA0078: Missing CASE branches..................................... 3881
1.8.4.3.2.40.9  SA0090: Return statement before end of function.................. 3882
SA0072: Invalid uses of counter variable

Detected the use of a counter variable in a FOR loop.

Justification: Manipulation of the counter variable in a FOR loop can easily result in an infinite loop. To prevent the execution of the loop for specific values of the counter variable, use CONTINUE or simply an IF.

Importance: High

PLCopen rule: L12

Example

```plaintext
PROGRAM PLC_PRG
VAR_TEMP
  iIndex : INT;
END_VAR
FOR iIndex := INT#0 TO INT#20 BY INT#1 DO
  iIndex := iIndex - INT#1;
END_FOR
--> SA0072: Invalid use of counter variable 'iIndex'
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0073: Uses of inadequate counter variable

Detected the use of non-temporary variables in FOR loops.

Justification: This is a performance warning. A counter variable is always initialized each time a POU is called. You can create this variable as a temporary variable (VAR_TEMP). Access to it may be faster and the variable does not take up any permanent memory.

Importance: Medium

PLCopen rule: CP21 / L13

Example

```plaintext
PROGRAM PLC_PRG
VAR
  nIndex : INT;
  iVar : INT;
END_VAR
FOR nIndex := INT#0 TO INT#20 BY INT#1 DO
  iVar := iVar + nIndex;
END_FOR
--> SA0073: Inadequate counter variable
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0080: Loop index variable for array index exceeds array range

Detected the FOR statements where the index variable is used to access an array index and exceeds the range of the array index.
Justification: Arrays are typically processed in FOR loops. The start and end value of the counter variable should typically match (or at least not exceed) the upper and lower bounds of the array. A typical cause of error is detected here when array bounds are changed and constants are not carefully used; or when a different value is used accidentally in the FOR loop than in the array declaration.

Importance: High

Example

PROGRAM PLC_PRG
VAR
iIndex1,iIndex2,iIndex3 : INT;
arWord : ARRAY[1..100] OF WORD;
arararINT : ARRAY[1..9,1..9,1..9] OF INT;
arUSINT : ARRAY[0..99] OF USINT;
END_VAR

//1 violation of the rule(lower range is exceeded): SA0080
FOR iIndex1 := INT#0 TO INT#100 DO
    arWord[iIndex1] := INT_TO_WORD(iIndex1);
END_FOR

//6 violations (lower and upper range is exceeded for each array dimension): 3SA0080
FOR iIndex2 := INT#0 TO INT#10 DO
    arararINT[iIndex2, iIndex2, iIndex2] := iIndex2;
END_FOR

//1 violation (upper range is exceeded by the end result of the index), previous expressions on index are not evaluated -> OK
FOR iIndex3 := INT#0 TO INT#50 DO
    arUSINT[iIndex3 * INT#2] := INT_TO_USINT(iIndex3);
END_FOR

--> SA0080: Loop index range of 'Index1' exceeds array range
--> SA0080: Loop index range of 'Index2' exceeds array range

See also
●  § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0081: Upper border is not a constant

Detected the FOR statements where the upper bound is not defined with a constant value

Justification: If the upper bound of a loop is a variable value, then it is no longer possible to see how often a loop is executed. This can result in serious problems at runtime. The worst case is an infinite loop.

Importance: High
Example

PROGRAM PLC_PRG
VAR
  i:INT;
  iBorder1: INT := 10;
  iBorder2: INT := 10;
  iCounter: INT;
END_VAR
VAR CONSTANT
  ciBorder:INT := 10;
END_VAR

FOR i:=0 TO 10 DO    //OK
  iCounter := i;
END_FOR

FOR i:=0 TO ciBorder DO // OK
  iCounter := i;
END_FOR

FOR i:=0 TO iBorder1 DO    // SA0081
  iCounter := i;
END_FOR

FOR i:=0 TO iBorder2 DO    // SA0081
  iCounter := i;
  IF iCounter = 10 THEN
    iBorder2 := 50;
  END_IF
END_FOR

--> SA0081: Upper border of a for loop must be a constant value

● § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0075: Missing ELSE

Detects CASE statements without an ELSE branch

Justification: Defensive programming requires the inclusion of an ELSE branch in every CASE statement. If there is nothing to do in the ELSE branch, then include a comment to indicate this. It is then clear to the reader of the code that the case was not simply forgotten.

Importance: Low

PLCopen rule: L17
Example

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
  xTemp : BOOL;
END_VAR

iVar := iVar + INT#1;
CASE iVar OF
  INT#1:
    xTemp := FALSE;
  INT#2:
    xTemp := TRUE;
END_CASE
```

--> SA0075: Missing ELSE in CASE statement

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0076: Missing enumeration constant**

Detects whether or not an enumeration variable is used as a condition and not all enumeration values are treated as `CASE` branches.

Justification: Defensive programming requires the processing of all possible values of an enumeration. If an action is not required for a particular enumeration value, then you should add a comment to indicate this explicitly. It is then clear to the reader of the code that the value was not simply forgotten.

Importance: Low

Example

```plaintext
TYPE My_Enum :
  (red := 1, blue := 2, green := 3, black := 4);
END_TYPE

PROGRAM PLC_PRG
VAR
  iVar : My_Enum;
  xTemp : BOOL;
END_VAR
iVar := My_Enum.black;
CASE iVar OF
  My_Enum.red:
    xTemp := FALSE;
  My_Enum.blue, My_Enum.green:
    xTemp := TRUE;
  ELSE
    xTemp := NOT xTemp;
END_CASE
```

--> SA0076: Missing enumeration constant 'black' in CASE statement

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819
SA0077: Type mismatches with CASE expression

Detects code locations where the data type of a condition does not match that of the CASE branch.

Justification: If the data types between the CASE variable and the CASE itself do not match, then this could indicate an error.

Importance: Low

**Example**

```plaintext
TYPE My_Enum :
  (eins := 1, zwei := 2, drei := 3, vier := 4);
END_TYPE

PROGRAM PLC_PRG
VAR
diVar : DINT;
xTemp : BOOL;
END_VAR
diVar := diVar + DINT#1;
CASE diVar OF
  DINT#1:
    xTemp := FALSE;
  My_Enum.zwei, DINT#3: //SA0077
    xTemp := TRUE;
  ELSE
    xTemp := NOT xTemp;
END_CASE
```

SA0078: Missing CASE branches

Detects CASE statements without CASE branches and only one ELSE statement.

Justification: A CASE statement without cases wastes execution time and it is difficult to read.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  iVar : INT;
xTemp : BOOL;
END_VAR

iVar := iVar + INT#1;
//in the following the case descriptions are missing:
CASE iVar OF
  ELSE
    xTemp := NOT xTemp;
END_CASE
```

PLC Automation with V3 CPUs
Engineering interfaces and tools > CODESYS Static Analysis

2021/05/12 3ADR010583, 2, en_US 3881
SA0090: Return statement before end of function

Detects whether or not the `RETURN` statement is not the last statement in a function, method, property, or program.

Justification: A `RETURN` in the code results in worse maintainability, testability, and readability of the code. A `RETURN` in the code is easily overlooked. Before each `RETURN`, it is often forgotten to insert code that should always be executed when exiting a function.

Importance: Medium

PLCopen rule: CP14

Example

```plaintext
FUNCTION FUN : DINT
VAR_INPUT
  bTest : BOOL;
END_VAR

IF bTest THEN
  RETURN;
END_IF
FUN := 99;

--> SA0090: Return statement before end of function
```

See also

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0095: Assignments in conditions

Detects assignments in conditions of `IF`, `CASE`, or `REPEAT` constructs

Justification: An assignment (:=) and a comparison (=) can easily be mistaken. As a result, an assignment in a condition can easily be unintentional, and it is therefore reported. This can also confuse the reader of the code.

Importance: High
PROGRAM PLC_PRG
VAR
  iCond1:INT := INT#1;
iCond2:INT := INT#2;
xCond:BOOL := FALSE;
iVar : INT;
END_VAR

IF INT_TO_BOOL(iCond1 := iCond2) THEN // SA0095
  iCond1 := INT#1;
iCond2 := INT#2;
ELSIF (iCond1 := 11) = 11 THEN // SA0095
  iCond1 := INT#1;
iCond2 := INT#2;
END_IF

IF xCond := TRUE THEN // SA0095
  xCond := FALSE;
END_IF

IF (xCond := FALSE) OR (iCond1 := iCond2) = 12 THEN // SA0095
  xCond := FALSE;
iCond1 := INT#1;
iCond2 := INT#2;
END_IF

IF (iVar := iVar + 1) = 120 THEN // SA0095 (can be valid, but is not reparable very well
  iVar := 0;
END_IF

WHILE (xCond = TRUE) OR (iCond1 := iCond2) = 12 DO // SA0095
  xCond := FALSE;
END_WHILE

//Error: assignment in repeat loop
REPEAT
  xCond := FALSE;
UNTIL
  (xCond = TRUE) OR (iCond1 := iCond2) = 12 // SA0095
END_REPEAT

--> SA0095: Assignment in condition: '...'

See also

● "Chapter 1.8.4.1 "Configuring and Running Static Analysis" on page 3819"

SA0100: Variables greater than <n> bytes...

Detects variables that use more than n bytes, where n is defined by the current configuration. Default value: 1024 bytes. The value can be changed by double-clicking the line.

Justification: Some programming guidelines specify a maximum size for a single variable. This can be checked with this.

Importance: Low
Example

PROGRAM PLC_PRG
VAR
    aobyTest : ARRAY [0..1024] OF BYTE;
END_VAR

aobyTest[INT#0] := aobyTest[INT#0] + BYTE#1;

--> SA0100: Variable 'aobyTest' greater 1024 bytes

See also

● § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0101: Names with invalid length

Detects names with invalid lengths. In the “Project Settings”, double-click the rule entry to open a dialog where you can define the length of the name and define any exception.

Justification: Some programming guidelines specify a minimum length for variable names. This analysis can be used to check compliance.

Importance: Low

PLCopen rule: N6

Example

PROGRAM PLC1              // SA0101
VAR
    iVar1: INT;          // SA0101
END_VAR

--> SA0101: Incorrect length of name 'PLC1'

See also

● § Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

SA0102: Access to program/fb variables from the outside

Detects external access to local variables of programs or function blocks

Justification: CODESYS permits external read access to local variables of programs or function blocks. This contradicts the principle of data encapsulation (hiding data) and does not comply with the IEC 61131-3 standard.

Importance: Medium
Example

```plaintext
PROGRAM PLC_PRG
VAR
    iCounter : INT;
    afb_Instance : AFB;
    bfb_Instance : BFB;
END_VAR

iCounter := A_PRG.iLocal;                // SA0102
iCounter := bfb_Instance.iLocal;         // SA0102
A_PRG();

FUNCTION_BLOCK AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iLocal: INT;
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;
END_VAR

FUNCTION_BLOCK BFB EXTENDS AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iLocal: INT;
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;
END_VAR

PROGRAM A_PRG
VAR
    iLocal: INT;
END_VAR

iLocal := iLocal + 1;
```

- Chapter 1.8.4.1 “Configuring and Running Static Analysis” on page 3819

**SA0103: Concurrent access on not atomic data**

**Detects whether or not non-atomic variables (for example, with data type STRING, WSTRING, ARRAY, STRUCT, FB instances, 64-bit data types) are used in more than one task**

**Justification:** When there is no synchronization during access, inconsistent values can be read when reading in one task and writing in another task at the same time.

**Importance:** Medium
For some data types, especially 64-bit integers, it depends on the platform whether or not access is atomic. Static analysis reports a problem only when the controller does not support atomic access to 64-bit integer data types.

This rule does not apply in the following cases:

- If the target system has a floating point unit (FPU), then access of multiple tasks to LREAL variables is not detected.
- If the target system is a 64-bit processor or the corresponding target setting is set for the target device, then the rule does not apply to 64-bit data types.

Example

The project contains both programs, PRG1 and PRG2: The program PRG1 is called by the task MainTask_1. The program PRG2 is called by the task MainTask_2.

```plaintext
GVL
VAR_GLOBAL
lrTest : LREAL; // Since the target system has an FPU, SA0103 does apply.
lint1 : LINT;
sTest : STRING; // SA0103
wsTest : WSTRING; // SA0103
END_VAR

PROGRAM PRG1
GVL.lrTest := 5.0;
GVL.sTest := 'welt';
GVL.wsTest := "welt";
GVL.lint1 := 99;

PROGRAM PRG2
GVL.lrTest := 5.0;
GVL.sTest := 'hallo';
GVL.wsTest := "hallo";
GVL.lint1 := 88;

--> SA0103: Concurrent access on not atomic data 'sTest'
--> SA0103: Concurrent access on not atomic data 'wsTest'
```

See also

- § Chapter 1.8.4.1 "Configuring and Running Static Analysis" on page 3819

SA0105: Multiple instance calls

Detects the instances of function blocks that are called multiple times. To do this, the function blocks have to be marked with the pragma (attribute 'analysis:report-multiple-instance-calls').

Justification: Some function blocks are designed in such a way that they can be called only one time in the cycle. This test checks whether or not a call is made in multiple locations.

Importance: Low

PLCopen rule: CP16 / CP20
Example

```plaintext
// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DoA
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
 iA : INT;
END_VAR
iA := iA + 1;

{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
 iB : INT;
END_VAR
iB := iB +1;

PROGRAM PLC_PRG
VAR
 fbA : FB_DoA;
 fbB : FB_DoB;
ND_VAR
 fbA();
 fbB(); // SA0105
 fbA();
 fbB(); // SA0105

--> SA0105: Instance 'fbB' called more than once
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls”’ on page 3832

SA0106: Virtual method calls in FB_INIT

Detects method calls in the FB_Init method of a base function block, which are overwritten by a function block derived from a base function block.

Justification: In these cases, it could be that the variables in the overwritten methods are not initialized in the base FB.

Importance: High
The function block FB_A includes the methods FB_Init and Meth_MyInit. FB_Init calls Meth_MyInit for initialization. The function block FB_B is derived from FB_A. PLC_PRG calls FB_B.Meth_MyInit and therefore uses its mbMyDintB variable before it has been initialized.

FB_B.Meth_MyInit overwrites FB_A.Meth_MyInit.

FUNCTION_BLOCK FB_A
VAR
   mbMyDintA : DINT;
END_VAR
FUNCTION_BLOCK FB_B EXTENDS FB_A
VAR
   mbMyDintB : DINT;
END_VAR
METHOD FB_Init : BOOL
   VAR_INPUT
      bInitRetains: BOOL;
      bInCopyCode: BOOL;
   END_VAR
   mbMyDintA := 123;
   diDummy := Meth_MyInit();
METHOD Meth_MyInit : DINT
   VAR_INPUT
   END_VAR
   mbMyDintB := 123;  // access to member of FB_B
PROGRAM PLC_PRG
VAR
   g_BInst : FB_B;
   xVar : BOOL;
END_VAR
xVar := g_BInst.fb_init(TRUE, TRUE);
//this instruction causes the following order of initializations:
//FB_A.fb_init
//FB_B.Meth_MyInit // SA0106
//FB_B.fb_init
//FB_B.Meth_MyInit

--> SA0106: Virtual method call 'Meth_MyInit' in FB_INIT

  § Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0107: Missing formal parameters

Detects whether or not formal parameters are missing

Justification: Code becomes more readable when formal parameters are specified in the call.

Importance: Low
FUNCTION FUNA : BOOL
VAR_INPUT
  bDo: BOOL;
  bInit: BOOL;
  bManual : BOOL;
END_VAR
VAR
  iInit: INT;
  iLocal: INT;
  iManual: INT;
END_VAR
IF bInit = TRUE THEN
  iInit := iInit + 1;
END_IF
IF bDo = TRUE THEN
  iLocal := iLocal + 1;
END_IF
IF bManual = TRUE THEN
  iManual:= iManual + 1;
END_IF
FUNA := TRUE;
PROGRAM PLC_PRG
VAR
END_VAR
FUNA(bInit := TRUE, bDo := TRUE, bManual := FALSE);     // OK
FUNA(TRUE, TRUE, bManual:= FALSE);                      // SA0107
--> SA0107: Missing formal parameter for input 'TRUE'

1.8.4.3.2.49.15 SA0124: Pointer dereferences in declarations.......... 3896
1.8.4.3.2.49.16 SA0125: References in initializations.................... 3896
SA0111: Pointer variables

Detects variables of type POINTER TO

Justification: The IEC 61131-3 standard does not permit pointers.

Importance: Low

Example

```
VAR
    piTemp : POINTER TO INT;
    pbyTemp : POINTER TO BYTE;
END_VAR

--> SA0111: Data type POINTER not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0112: Reference variables

Detects variables of type REFERENCE TO

Justification: The IEC 61131-3 standard does not permit references.

Importance: Low

Example

```
VAR
    ref_int : REFERENCE TO INT;
    ref_dw : REFERENCE TO DWORD;
END_VAR

--> Data type REFERENCE not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0113: Variables with data type WSTRING

Detects variables of type WSTRING

Justification: Not all systems support WSTRING. The code is more easily portable without WSTRING.

Example

```
VAR
    wstrTemp : WSTRING;
END_VAR

--> SA0113: Data type WSTRING not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832
SA0114: Variables with data type LTIME

Detects variables of type LTIME.

Justification: Not all systems support LTIME. The code is more easily portable without LTIME.

Importance: Low

Example

```plaintext
VAR
  ltVar : LTIME; // SA0114
END_VAR

--> SA0114: Data type LTIME not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0115: Variables with data type UNION

Detects declarations of a UNION data type and variable declarations of the UNION type.

Justification: The IEC 61131-3 standard does not include unions. The code is more easily portable without unions.

Importance: Low

Example

```plaintext
TYPE u1: UNION
  lrTemp : LREAL;
  liTemp : LINT;
END_UNION
END_TYPE

PROGRAM PLC_PRG
VAR
  uVar: u1;
END_VAR

--> SA0115: Unions not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0117: Variables with data type BIT

Detects variable declarations of data type BIT (possible within structure definitions).

Justification: The IEC 61131-3 standard does not include the data type BIT. The code is more easily portable without BIT.

Importance: Low
Example

```plaintext
TYPE Struct1 :
STRUCT
  bitVar : BIT;
  iVar : INT;
  bVar : BOOL;
END_STRUCT
END_TYPE

--> SA0117: Variables with data type BIT
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0119: Object-oriented features

Detected the use of object-oriented features, such as function block declarations with `EXTENDS` and `IMPLEMENTS`, or property and interface declarations. This rule is useful when you write code that is intended to be ported to other IEC 61131-3-compliant systems.

Justification: Not all systems support object-oriented programming. The code is more easily portable without object-orientation.

Importance: Low

Example

```plaintext
//Function block extended by another and implementing an interface:
FUNCTION_BLOCK POU EXTENDS CTD IMPLEMENTS ITF        //SA0119
...

// Declaration parts of property methods assigned to a function
block:
POU.Prop.Get        //SA0119
POU.Prop.Set        //SA0119

--> SA0119: Object-oriented features not allowed
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0120: Program calls

Detects program calls

Justification: According to the IEC 61131-3 standard, programs can be called in the task configuration only. The code is more easily portable when you do not call programs from other locations.

Importance: Low
Example

PROGRAM prog_control
VAR
END_VAR

PROGRAM PLC_PRG
VAR
END_VAR
prog_control();
--> SA0120: Program call to 'prg_control' not allowed

See also
●  Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3832

SA0121: Missing VAR_EXTERNAL declarations
Detects the use of a global variable in function blocks without them being declared there as “VAR_EXTERNAL”
Justification: According to the IEC 61131-3 standard, access to global variables is permitted only by an explicit import by means of a VAR_EXTERNAL declaration.
Importance: Low
PLCopen rule: CP18

Example

VAR_GLOBAL
  iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
ivar:=iGlob1; // SA0121
--> SA0121: EXTERNAL declaration required for variable ''iGlob1'

Example: Avoid error

VAR_GLOBAL
  iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
ivar:INT;
END_VAR
VAR_EXTERNAL
  iGlob1:INT;
END_VAR
ivar:=iGlob1; // OK
SA0122: Array index defined as expression

Detects the use of expressions in the declaration of array indexes

Justification: Not all systems permit expressions as array limits.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR CONSTANT
  c_iValue : INT := INT#15;
END_VAR
VAR
  arr: ARRAY[0..c_iValue + 1] OF INT;
END_VAR

--> SA0122: Only constants allowed for array definition 'arr'
```

See also

- ¶ Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3832

SA0123: Usages of INI, ADR or BITADR

Detects the use of the CODESYS-specific operators INI, ADR, and BITADR

Justification: CODESYS-specific operators prevent the portability of code.

Importance: Low

Example

```plaintext
PROGRAM PLC_PRG
VAR
  uiTemp: UINT;
  TempVarInFUNC: DWORD;
END_VAR

TempVarInFUNC := ADR(uiTemp);        //SA0123

--> SA0123: Operator 'ADR' not allowed
```

See also

- ¶ Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3832

SA0147: Unusual shift operation - strict

Detects bit shift operations that are not made to bit field data types (BYTE, WORD, DWORD, LWORD)

Justification: The IEC 61131-3 standard permits bit access only to bit field data types. However, the CODESYS compiler also permits bit shift operations with unsigned data types.

Importance: Low
See also the strict rule SA0018.

Example

PROGRAM PLC_PRG
VAR
  in_byte : BYTE := 16#45;  // 2#01000101
  in_word : WORD := 16#0045; // 2#0000000001000101
  in_uint : UINT;
  in_dint : DINT;
  erg_byte : BYTE;
  erg_word : WORD;
  erg_uint : UINT;
  erg_dint : DINT;
  n: BYTE := 2;
END_VAR

  erg_byte := SHL(in_byte,n);  // no error because BYTE is a bit field
  erg_word := SHL(in_word,n);  // no error because WORD is a bit field
  erg_uint := SHL(in_uint,n); // SA0147
  erg_dint := SHL(in_dint,n); // SA0147

--> SA0147: Unusual shift operation - strict

See also

- § Chapter 1.8.4.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls” on page 3832
- § Chapter 1.8.4.3.2.17 “SA0018: Unusual bit access” on page 3844

SA0148: Unusual bit access - strict

Detects bit access that is not made to bit field data types (BYTE, WORD, DWORD, and LWORD). The IEC 61131-3 standard permits only bit access to bit field data types. However, the CODESYS compiler also permits bit access to unsigned data types.

Example

PROGRAM PLC_PRG
VAR
  iTemp1 : INT;
  diTemp3 : DINT;
  uliTemp4 : ULINT;
  siTemp5 : SINT;
  usiTemp6 : USINT;
  byTemp2 : BYTE;
END_VAR

  iTemp1.3 := TRUE;    // SA0148
  diTemp3.4 := TRUE;   // SA0148
  uliTemp4.18 := FALSE; // SA0148
  siTemp5.2 := FALSE;  // SA0148
  usiTemp6.3 := TRUE;  // SA0148
  byTemp2.5 := FALSE;  // no error because BYTE is a bit field

--> SA0148: Unusual bit access - strict
SA0118: Initialisations not using constants

Detects initializations that do not assign constants

Justification: Initializations should be constant if possible and should not refer to other variables. In particular, you should avoid function calls during initialization because this can allow access to uninitialized data.

Importance: Medium

**Example**

```plaintext
PROGRAM PLC_PRG
VAR
  dwTemp : DWORD := 22;
  dwTest : DWORD := dwTemp; // SA0118
  dwVar : DWORD := TempVarInFUNC(); // SA0118
END_VAR

--> SA0118: Initialisations not using constants
```

SA0124: Pointer dereferences in declarations

Detects pointer dereferences that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium

**Example**

```plaintext
FUNCTION_BLOCK FB_Test
VAR_INPUT
  refStruct: REFERENCE TO ST_Test;
END_VAR
VAR
  xPointer : BOOL := refStruct.a; // SA0124
  iCount : INT;
END_VAR

--> SA0124: Dereference access in initialisation
```

SA0125: References in initializations

Detects reference variables that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium
Example

PROGRAM PLC_PRG
VAR
   xRef: REFERENCE TO INT;
   iCount: INT := xRef;
END_VAR

--> SA0125: Reference used in initializations

See also
● $ Chapter 1.8.4.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3832

SA0140: Statements commented out

Detects commented-out statements

Justification: Code is often commented out for debugging purposes. When this kind of comment is released, it is not always clear at a later time whether the code should be deleted, or whether it has been commented out for debugging purposes and unintentionally not uncommented.

Importance: High

PLCopen rule: C4

Example

PROGRAM PLC_PRG
VAR
   iValue1: INT;
   iValue2: INT;
END_VAR

   iValue1 := 100;
   iValue2 := 200;
   // iValue2 := 300;

--> SA0140: Statement commented out:: iValue2 := 300

See also
● $ Chapter 1.8.4.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3832

Possible Use of Uninitialized Variables

1.8.4.3.2.51.1 SA0039: Possible null-pointer deferences............................. 3897
1.8.4.3.2.51.2 SA0046: Possible use of not initialised interface..................... 3898
1.8.4.3.2.51.3 SA0145: Possible use of not initialised reference................... 3899

SA0039: Possible null-pointer deferences

Detects code locations where a null pointer is possibly dereferenced

Justification: A pointer should be checked before each dereferencing to make sure it is not equal to zero. Otherwise an access violation may occur at runtime.

Importance: High
Example

```plaintext
PROGRAM PLC_PRG
VAR
    ptiVar1:POINTER TO INT;
    ptiVar2:POINTER TO INT;
    ptiVar3:POINTER TO INT;
    iVar:INT;
    iCount :INT;
    iCondition: INT;
END_VAR

iCount := iCount + INT#1;
ptiVar1 := ADR(iVar);
ptiVar1^ := iCondition; // OK - valid reference
ptiVar2^ := iCondition; // SA0039 - null pointer dereferenciation
iVar := ptiVar3^;       // SA0039 - null pointer dereferenciation

--> SA0039: Possible null pointer dereference 'ptiVar2^'
--> SA0039: Possible null pointer dereference 'ptiVar3^'
```

See also

- § Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0046: Possible use of not initialised interface

Detects the use of interfaces that were not initialized before being used

Justification: An interface reference should be checked for <> 0 before it is used. Otherwise an access violation may occur during access.

Importance: High
Example

// declaration of INTERFACE ITF and assigned METH2:
METHOD METH2 : BOOL
VAR_INPUT
  iInput2:INT;
END_VAR

// declaration of INTERFACE Master_ITF1 and assigned METH:
METHOD METH : BOOL
VAR_INPUT
  iInput:INT;
END_VAR

PROGRAM PLC_PRG
VAR
  instPOU:POU;
  instITF:ITF;
  instMasterITF1:Master_ITF1;
  instMasterITF2:Master_ITF2;
  iDummy:INT;
  xDummy:BOOL;
  instNoInitITF:ITF;
  instNoInitITF2:ITF;
  instNoInitMasterITF1:Master_ITF1;
  instNoInitMasterITF2:Master_ITF2;
END_VAR

instITF := instPOU;
xDummy := instITF.METH(iInput := iDummy);             // OK
instMasterITF1 := instPOU;
xDummy := instMasterITF1.METH(iInput := iDummy);        // OK

xDummy := instNoInitITF.METH(iInput := INT#1);        // SA0046
xDummy := instNoInitITF2.METH(iInput2 := INT#2);       // SA0046
xDummy := instNoInitMasterITF1.METH(iInput := INT#3);  // SA0046
iDummy := instNoInitMasterITF2.Prop;                    // SA0046

IF instNoInitITF <> 0 THEN
  instNoInitITF.Prop;          // OK, weil das Interface nicht 0
  sein kann
END_IF

 --> SA0046: Possible use of not initialised interface
    'instNoInitITF'
 --> SA0046: Possible use of not initialised interface
    'instNoInitITF2'
 --> SA0046: Possible use of not initialised interface
    'instNoInitMasterITF1'
 --> SA0046: Possible use of not initialised interface
    'instNoInitMasterITF2'

See also

- % Chapter 1.8.4.3.1.5 "Attribute 'analysis:report-multiple-instance-calls'" on page 3832

SA0145: Possible use of not initialised reference

Detects any reference variables that may not be initialized before use and are not checked by
the operator __ISVALIDREF. This rule is applied in the implementation part of POUs. Rule
SA0124 applies to the declaration.
Justification: A reference should be checked for its validity before access because an access violation may occur during access.

Importance: High

**Example**

```plc
PROGRAM PLC_PRG
VAR_INPUT
  ref_iTest : REFERENCE TO INT;
END_VAR

ref_iTest := 99;            // SA0145
IF __ISVALIDREF(ref_iTest) THEN
  ref_iTest := 88;
END_IF

--> SA0145: Possible use of not initialised reference 'ref_iTest'
```

See also

- Chapter 1.8.4.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3832
- Chapter 1.8.4.3.2.49.15 “SA0124: Pointer dereferences in declarations” on page 3896

**SA0150: Violations of lower or upper limits or the metrics**

Detects the POUs that violate the activated metrics at the lower or upper limits

Justification: Code that complies with certain metrics is easier to read, easier to maintain, and easier to test.

Importance: High

PLCopen rule: CP9

**Example**

Initial situation: The “Number of calls” metric is selected in “Project Settings ➔ Static Analysis ➔ Metrics”. Lower limit: 0; upper limit: 3. Prog_1 is called five times.

When running the static analysis, the “SA0150: Metric violation for Prog_1. Report for metric calls (5) > 2” error is issued in the message view, in the “Build” category.

See also

- Chapter 1.8.4.3.1.5 “Attribute ‘analysis:report-multiple-instance-calls’” on page 3832

**SA0160: Recursive calls**

Detects recursive calls in actions, methods, and properties of function blocks. Also detects possible recursions from virtual function calls and interface calls.

Justification: Recursions lead to non-deterministic behavior and are therefore a source of errors.

Importance: Medium

PLCopen rule: CP13
The following method `Call` is assigned to the function block `FB_Test`:

```plaintext
FUNCTION_BLOCK FB_Test
  VAR
    bParameter: BOOL;
  END_VAR

  METHOD Call : BOOL
    VAR_INPUT
    END_VAR
    Call := THIS^.Call();        //SA0160
  END_METHOD
END_FUNCTION_BLOCK
```

The program `PLC_PRG` calls `FB_Test`:

```plaintext
PROGRAM PLC_PRG
  VAR
    fbTest : FB_Test;
    bValue : BOOL;
  END_VAR

  bValue := fbTest.bParameter;
  fbTest.Call();

  --> SA0160: Recursive call detected: 'PLC_PRG -> FB_Test.Call -> FB_Test.Call
```

- “Chapter 1.8.4.3.1.5 "Attribute 'analysis:report-multiple-instance-calls" on page 3832

**SA0161: Unpacked structure in packed structure**

Detects unpacked structures that are used in packed structures

Justification: The compiler typically sets an unpacked structure to an address that allows aligned access to all elements within the structure. If you create this structure in a packed structure, then aligned access is no longer possible. Furthermore, access to an element in the unpacked structure can lead to a misalignment exception.

Importance: High
**Example**

The structure `structSingleDataRecord` is packed, but it contains the unpacked structures `struct4Byte` and `struct9Byte`.

```plaintext
{attribute 'pack_mode' := '1'}
TYPE structSingleDataRecord :
  STRUCT
    str9ByteData: struct9Byte;    (* 9 BYTE *)
    str4ByteData: struct4Byte;    (* 4 BYTE *)
    udi1: UDINT;
    udi2: UDINT;
    udi3: UDINT;
    usi4: USINT;
  END_STRUCT
END_TYPE (* 9 BYTE *)

TYPE struct9Byte :
  STRUCT
    usiRotorSlots: USINT;        (* 1 BYTE *)
    uiMaxCurrent: UINT;            (* 2 BYTE  *)
    usiVelocity: USINT;            (* 1 BYTE  *)
    uiAcceleration: UINT;        (* 2 BYTE  *)
    uiDeceleration: UINT;        (* 2 BYTE *)
    usiDirectionChange: USINT;    (* 1 BYTE *)
  END_STRUCT
END_TYPE

TYPE struct4Byte :
  STRUCT
    //udiDummy : UDINT;
    rRealDummy : REAL;
  END_STRUCT
END_TYPE
```

--> SA0161: Declaration of an unpacked struct 'struct9ByteData'
inside a packed struct 'structSingleDataRecord'

--> SA0161: Declaration of an unpacked struct 'struct4ByteData'
inside a packed struct 'structSingleDataRecord'

**See also**

- § Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

**SA0162: Missing comments**

Detects uncommented locations in the program

Justification: Complete commenting is required by many programming guidelines, and it increases the readability and maintainability of the code.

Importance: Low

PLCopen rule: C2

Comments are required in the following cases:

- Declaration of variables (Comments are located either above the declaration or to the right of the declaration.)
- Declaration of programs, function blocks, or methods (Comments are located above the declaration in the first line.)
Example

```plaintext
PROGRAM PLC_PRG
VAR
  iMaxValue: INT;
END_VAR

---> SA0162: Missing comment for 'PLC_PRG'
---> SA0162: Missing comment for 'iMaxValue'
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832

SA0163: Nested comments

Detects nested comments

Justification: Nested comments should be avoided because they are difficult to read.

Importance: Low

PLCopen rule: C3

Example

```plaintext
{attribute 'do-analysis'}
(* That is
(* nested comment 1 *)
*)
PROGRAM PLC_PRG
VAR
(* That is
// nested comment 2
comment *)
  iVal1: INT;
iVal2: INT;

(* That is
(* nested comment 3 *) *)
pVal3: POINTER TO DWORD;
hugo: INT;
END_VAR

(* That is
// nested comment 4
comment *)
iVal1 := iVal1 + 1;

(* That is
(* nested comment 5 *)
*)
(* Not that one *)

---> SA0163: Nested comment 'nested comment 1'
---> SA0163: Nested comment 'nested comment 2'
---> SA0163: Nested comment 'nested comment 3'
---> SA0163: Nested comment 'nested comment 4'
---> SA0163: Nested comment 'nested comment 5'
```
SA0164: Multiline comments

Detects multiline comments that are coded as (* comment *). Only single-line comments that are coded as // comment are permitted.

Justification: Some programming guidelines prohibit multiline comments in code because the beginning and end of a comment could get lost and the closing comment bracket could be deleted by accident.

Importance: Low

PLCopen rule: C5

Example

```plaintext
{attribute 'do-analysis'}
(*
   This is a multi-line comment // SA0164
*)
PROGRAM PLC_PRG
  VAR
    // This is a single line comment
    a: DINT;
  END_VAR

  (* This is not a single line comment *) // SA0164
  a := a + 1;
```

See also

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls’” on page 3832
SA0166: Max. number of input/output/in-out variables...

Detects whether or not a defined number of input variables (VAR_INPUT), output variables (VAR_OUTPUT) or VAR_IN_OUT variables is exceeded in a POU. In the "Project Settings", double-click the rule entry to open a dialog where you define the maximum number.

Justification: This is about checking individual programming guidelines. Many programming guidelines provide for a maximum number of POU parameters. Too many parameters make the code unreadable and the POUs difficult to test.

Importance: Medium

PLCopen rule: CP23

Example

In the project settings, for Rule 166, you have defined a maximum number of 1 for VAR_IN_OUT variables.

```plaintext
FUNCTION_BLOCK FB1
VAR_INPUT
   xIn : BOOL;
END_VAR
VAR_IN_OUT
   xInOut1 : BOOL;
   xInOut2 : BOOL;
END_VAR

--> SA0166: Too many VAR_IN_OUT variables in POU 'FB1'
```

SA0167: Temporary function block instances

Detects function block instances that are declared as temporary variables. This affects instances that are declared in a method or function or as VAR_TEMP, and therefore are reinitialized in each processing cycle or for each POU call.

Justification: Function blocks have a state that is usually maintained over multiple PLC cycles. An instance on the stack exists only for the duration of the function call. Therefore, it rarely makes sense to create an instance as a temporary variable. Secondly, function block instances are often large and need a lot of space on the stack (which is usually restricted to controllers). Thirdly, the initialization and often also the scheduling of a function block can take a long time.

- Chapter 1.8.4.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 3832
1.8.5 CODESYS Profiler

1.8.5.1 Overview

CODESYS Profiler is a program analysis tool which is integrated in CODESYS for detecting inefficient programming in your application source code.

The term profiling means taking measurements for the runtime behavior of POUs of the application. This is possible by means of the instrumentation of the code, or on multicore systems by means of sampling.

In addition to profiling, CODESYS Profiler also supports a measurement of code coverage, which detects the number of processed statements per POU. This method also works by instrumenting the code.

The measurements for profiling and code coverage have to be activated explicitly.

You can use the measurement data to help plan a course of action for optimizing the source code on both a structural and algorithmic level.

Overview of the integration of CODESYS Profiler in CODESYS:

Insert a “Profiler” object below the application. In the editor of this object, configure the desired measurement method and view the measurement results in online mode. Moreover, in the “Online ➔ Profiler” menu, the “Profiler Watch List” is provided for configuring and displaying the POUs to be measured.
1.8.5.2 Executing the Profiling Measurements

NOTICE!
The implicitly added IEC code for a Profiler measurement method results in a change which slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible.

NOTICE!
POUs from uncompiled libraries are also displayed on the “Online” tab of the Profiler editor and in the “Profiler Watch List”.

CODESYS Profiler provides different profiling methods for measuring the processing times of programs for various kinds of problems.

- **Instrumentation**
  Profiler measures the times by using additional code which is generated into the program. The recording and processing of the measured values takes place on the controller and therefore can also be performed without connecting the development system to the controller (in contrast to the other measuring methods).

- **Sampling (for multicore systems only)**
  This method is not supported yet in V1.3.0.0.
  Profiler pauses a task at random times and evaluates the call stack of the task. The Profiler sampling measures the frequency of the POU execution, not durations of time. The recorded call stacks are transferred in cycles to the development system for processing. Therefore, this method only works when the development system is in online mode.

- **Profiler Watch List**
  Profiler measures the execution time of individual POUs by means of execution points which are set in the POUs while the program is running.

See the help pages for each method to find the right one for your application.

See also

- § Chapter 1.8.5.2.1 “Profiling by Code Instrumentation” on page 3908
- § Chapter 1.8.5.2.3 “Profiling by Sampling” on page 3911
- § Chapter 1.8.5.2.2 “Using the Profiler Watch List” on page 3910
1.8.5.2.1 Profiling by Code Instrumentation

NOTICE!
The implicitly added IEC code for a Profiler measurement method, as well as the breakpoints for POU's in the watch list, result in a change and slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints. There are no restrictions for the watch list in this respect.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible. There are no restrictions for the watch list in this respect.

The recording and processing of the measured values takes place on the controller and therefore can also be performed without connecting the development system to the controller (in contrast to the other measuring methods).

With this profiling method, CODESYS Profiler inserts additional code into the entry and exit of each function in the program. The runtimes of a entire task cycle are measured and stored.

The method is useful for detecting individual outliers in the task runtimes. To do this, select the "Record max cycle" recording mode.

When the entire project is instrumented, this can have a considerable impact on task runtimes and memory consumption. Therefore, select only a part of the application POU's for instrumentation whenever possible. One recommended approach is to first select only those POU's that are called directly by the task. Determine the hot spots of the runtime for these POU's and then based on these select the called POU's for measurement.

NOTICE!
- POU's which are not selected for measurement are not shown on the measurement list, the call tree, or the backtrace tabs. Therefore, it is possible that a call tree "POU1 -> POU3" is displayed, although there is no direct call of POU3 by POU1. This is because there are POU calls which are not selected for measurement between POU1 and POU3.
- The "own time" output in the measurement for a POU can also contain times of called POU's which are not selected for measurement.

Profiling activa-
tion and execu-
tion by means of instrumen-
tation

Requirement:
- A CODESYS project application with multiple POU's is open in offline mode.
- A task is defined to control POU calls.
- The application is the active application and can be compiled without errors.
- A connection to the standard controller is configured in the communication settings, and the controller is running.
- To activate and deactivate profiling programmatically, you define a Boolean variable in the application. (This is optional for the example described here. Activation can also be performed by a menu command.)
- Click "Add Object" to add a "Profiler" object below the application in the device tree.
- Double-click the object.
  ➤ The object editor opens. The "Settings" tab is in focus.
4. Set the “Method” to “Instrumentation”. Select the “Task” with the POU calls that you want to perform time measurements on.

5. Under “Recording”, select the task for controlling the POUs to be instrumented.
   For “Condition”, click \( \text{on} \) and select the Boolean variable from your application that you want to use to switch the value recording on and off. Note: Using this kind of variable is optional. If you leave the field blank, then every cycle is recorded.

6. Under “Instrumentation parameters”, set the “Recording mode” to “Record next cycle”. Leave the required “Buffer size” (the maximum number of POU calls that are recorded per task cycle) as the default “10000”.
   Under “Snapshot appearance”, select the “Time format” for displaying the recording.

7. In “POU selection”, select the POUs that should be instrumented. Note that you could also select “Instrument whole application”, which would include all POUs of the project as well as the POUs of the integrated libraries.

8. Click “Online → Login” to download the application to the controller.
   \( \text{PROFIS} \) in the status bar.

9. Click “Debug → Start” to start the application.
   \( \text{The project runs and you see the current variables values in the usual monitoring view.} \)

10. If you have configured a Boolean variable as a condition to start profiling, then now set this variable to TRUE.

   Background information about recording: Because you selected the “Record next cycle” option in this example, only the first cycle is recorded when the application is started and the profiling. No additional cycle is recorded. An additional measurement is performed only when a recording is uploaded from the controller. This uploading is done either by opening the “Online” tab for the first time or by clicking the “Refresh this snapshot” button. For information about the alternative “Record max cycle” option, see the "Tab 'Settings'" chapter in the reference part of the help.

   Now look at the measurement results. Open the editor of the Profiler object and its “Online” tab.
   \( \text{The “Online” tab includes four subtabs which can be selected from the menu on the left side. In addition, you see an area with buttons and settings for the profiling that is currently running. A description of the tabs is located in the "Tab 'Online'” chapter in the reference part of the help.} \)

   See also
   ● Chapter 1.8.5.5.1.3 “Tab 'Online'” on page 3915
   ● Chapter 1.8.5.5.1.2 “Tab 'Settings'” on page 3914
   ● Chapter 1.8.5.5.2.2 “Command 'Properties'” on page 3920
1.8.5.2.2 Using the Profiler Watch List

**NOTICE!**

The implicitly added IEC code for a Profiler measurement method, as well as the breakpoints for POUs in the watch list, result in a change and slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints. There are no restrictions for the watch list in this respect.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible. There are no restrictions for the watch list in this respect.

In CODESYS, the Profiler Watch List is provided with CODESYS Profiler. In this view, you can combine a selection of POUs or POU instances whose runtimes and calls that you want Profiler to measure. The configuration is possible in both online mode and offline mode.

When you select a POU for the Profiler Watch List, a watch point is set implicitly at the first and last break point position of the POU. The time difference between the two watch points on the controller is measured. In the case of a function block, the measurement is also performed and displayed for all POU instances.

**NOTICE!**

The Profiler Watch List can have a very different impact on the task runtime, depending on how often the implicitly set execution points are started.

When a function block instance is entered in the watch list, the execution points for all instances of the corresponding function block are reached. However, time is measured only for the specified instance.

The Profiler Watch List is suitable for measuring the runtime of individual POUs in runtime mode. The major advantage of this method is that it does not require any special code and it is always available.

**Configuring watch lists**

- Requirement: A project exists with an application which calls different program and function blocks as well as function block instances.
- In this example, you configure the list in offline mode.

1. Open the project and click “Online ➔ Profiler ➔ Profiler Watch List”.
   - The empty “Profiler Watch List” opens.
2. Drag one of the application POUs from the device tree to the watch list.
   - The POU is inserted into the first line of the list. The “POU” column contains the POU name, and the “Application” column contains the name of the respective application.
3. Add all additional required POUs, either by dragging them to the list or by double-clicking a field in the “POU” column to open the Input Assistant.

Now view the list in online mode:

1. Download the project to the controller and start it. Open the “Profiler Watch List”.
   - You see measurement results about the call durations and number of calls for each POU. See the help page for the “Profiler Watch List”.
2. Click “Display Mode” in the context menu of the watch list and change to another data type or unit.
   ⇒ All current results in the list are displayed continuously in the selected format, as is the case for monitoring.
3. Click “Open POU” in the context menu of the watch list.
   ⇒ The POU currently in focus in the list is opened in the editor. You see the solid green circle of the watch point at the beginning and end of the implementation code that is implicitly set to enable the Profiler measurement.
4. Drag another POU to the watch list.
   ⇒ The POU is included immediately in the measurement.

1.8.5.2.3 Profiling by Sampling

This method is not supported yet in V1.3.0.0.

1.8.5.3 Measuring Code Coverage

NOTICE!
The implicitly added IEC code for a Profiler measurement method results in a change which slows down the evaluated program.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible.

In addition to profiling, CODESYS Profiler also supports the measurement of code coverage. This determines which of the statements in a POU are executed when processing. The part of the total number of executed instructions is termed as “coverage”. Coverage is expressed as a percentage.

In the “Code Coverage” view, select the POUs in offline mode that should be used to perform the measurement. In online mode, you will continuously see the current values of the code coverage.

Requirements
- A CODESYS project application with multiple POUs is open in offline mode.
- A task is defined to control POU calls.
- The application is the active application and can be compiled without errors.
- A connection to the standard controller is configured in the communication settings, and the controller is running. The project is in offline mode.

Settings in offline mode
1. In the device tree, double-click the “Profiler” object to open the editor. Set the method to “Code Coverage”.
   ⇒ The POUs of the application are displayed in the editor in a tree structure under “POU selection”.

2021/05/12
2. Select the POUs that should be measured by code coverage.

1. In the device tree, double-click the “Profiler” object to open the editor.
   
   The view opens with the measurement results for each of the instrumented POUs, including the total number of statements and the number of statements not executed. The code coverage is displayed as a percentage with a gray bar in the “Coverage” column.
   
   You can sort the table according to this column either ascending or descending by clicking a column heading.

2. Note the menu bar above the results table.
   - Open POU for opening the POU selected in the results table in its own editor
   - Reset for restarting the measurement
   - Save Snapshot for creating a snapshot
   
   If the open POU is programmed in ST, then the processed code is displayed in green and the unprocessed code is displayed in red.

- Chapter 1.8.5.5.1.4 “Tab ‘Snapshots’” on page 3919
- Chapter 1.8.5.5.2.1 “Command ‘Open POU’” on page 3920

1.8.5.4 Creating Snapshots

In online mode, a snapshot of all current measurement results can be created on the tab during a Profiler measurement. All created snapshots are managed on the “Snapshots” tab of the Profiler editor.

1. For example: Configure a profiling measurement for your application using the instrumentation method.

2. Start the application to the controller, and start the measurement.
   
   The measurement results are displayed in the Profiler editor on the various tabs.

3. Click “Save snapshot”. For the instrumentation and sampling methods, the command button for this is located on the left side of the “Online” tab. For the code coverage method, the command button is located on the toolbar of the tab.
   
   The “Save Snapshot” dialog opens.

4. Type in the name for the snapshot and include an optional description. Click “OK” to confirm.

5. Open the “Snapshots” tab. Note that this tab is available only after the first snapshot has been created.
   
   The recently created snapshot is listed with the “Name” which you assigned to it and the “Timestamp”. It is listed below the node of the name of the applied Profiler method (“Sampling” in the current example).

6. Click the line of the snapshot.
   
   The snapshot opens on the right side of the tab. In this view, the same functionalities (for example, open POU, copy table, and export) are available as on the “Online” tab.

7. On the left side of the tab, right-click the created snapshot.
   
   Here you see the commands for deleting and editing the snapshot.
8. On the "Profiler" - "Snapshots" tab, double-click the line of the snapshot.
   The snapshot opens in a new tab named <name, time stamp> on the same level as
   the Profiler editor. The usual functionalities are available here as well. However, if a
   POU has been modified after the snapshot, then you cannot open it in the red/green
   view.

1.8.5.5 Reference, User Interface
1.8.5.5.1 Objects
1.8.5.5.1.1 Object ‘Profiler’ ............................................................................. 3913
1.8.5.5.1.2 Tab ‘Settings’ ................................................................................ 3914
1.8.5.5.1.3 Tab ‘Online’ ................................................................................... 3915
1.8.5.5.1.4 Tab ‘Snapshots’ ............................................................................ 3919

Object ‘Profiler’
Symbol: $�$

You can insert the “Profiler” object below an application in the device tree. Double-click the
object to open the editor for configuring the settings and viewing the measurement results in
online mode. Created snapshots are also managed on an editor tab.

"Method": Setting of the method of measurement

![The "Sampling" measurement method is not supported yet in V1.3.0.0.]

- No profiling
- Instrumentation
- Code coverage

The "Settings" tab has different contents depending on the selected method. If measurements
have already been saved, then the "Snapshots" tab is also displayed.

In online mode, the “Online” tab is available for showing the measurement results.

</tr>
<tr>
<td>● “Maximum depth of call stack”</td>
</tr>
</tbody>
</table>
Table 728: Snapshot appearance

| "Time format" | "tick": Time unit defined by the processor |
|               | "ms": Milliseconds                      |
|               | "µs": Microseconds                      |
|               | "ms/µs": Milliseconds or microseconds (depending on size) |

Note: Implicit code calculates the approximate assignment of the time formats "ms" and "µs" to system ticks. On the "Online" tab, on the "Overview" subtab, you can see the calculated value displayed in the "Time" entry. Example: 1 ms = 3398810 Ticks.

Determining critical limits

- "Critical limit total time"
- "Critical limit end of call chain"
- "Critical limit high own time"

Critical upper limits for the times measured in the current cycle. If the time of a call in the cycle exceeds the percentage defined here for the total cycle time, then this is indicated in the Profiler results with a symbol at the beginning of the respective lines.

- Total time: Time spent by the POU call, including all calls from this POU
- End of the call chain: Last call in the call tree. In this case: total time = "Own time"
- Own time: Time spent by the POU call, excluding the time spent on all POU calls made by this POU itself

Table 729: POU selection

Tab 'Online'

This tab is displayed in the editor of the Profiler object in online mode only. It displays the measurement results for the selected method. The display is not refreshed automatically. Instead, it shows a "snapshot" on request.

Profiling by instrumentation or sampling

When the profiling method is set to "Sampling" or "Instrumentation", the "Online" tab includes additional subtabs on the left side. In addition, there is an area with buttons for creating snapshots and controlling the current measurement process. The context menu also provides helpful commands.

Table 730: Tab 'Online' - 'Overview'

Table 731: Tab ‘Online’ - ‘Call Tree’

This hierarchical tree structure shows all calls that have been made to the selected task during the measurement period. The top node is the task, and all call chains are displayed below it. Calls in libraries are not displayed.

Each node corresponds to a specific POU call and provides the following information about the current and previous measured times and number of calls.

- Percentage of time that has elapsed in this call to the time that has elapsed in all calls (example: 34.05%)
- Name and type of POU (example: PLC_PRG (PRG))
- Total time elapsed in the call (example: 85.531 µs)
- Number of calls of this POU in this cycle in this call tree (example: 22 Calls)
- Average, minimum, and maximum execution time of this call (example: Avg: 0.254 µs Min: 0.194 µs Max: 0.3µs)

Example:
Table 732: Tab 'Online' - 'List'

All instrumented POUs are listed. For each POU, you see the number of “Samples” and the “Time (ms/μs)” of all recorded calls.

The “Functions called by <POU name>“ list in the lower part of the view always shows the POU calls of the POU currently selected in the list above. Double-clicking a line in the lower list selects the corresponding entry in the upper list.

<table>
<thead>
<tr>
<th>“POU Name”</th>
<th>Name and type of POU (example: PLC_PRG (PRG))</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Time (ms/μs)”</td>
<td>Total time elapsed in the call (example: 85.531 μs)</td>
</tr>
<tr>
<td>“Average time”</td>
<td>Average, minimum, and maximum execution time of this call in &quot;ms&quot; or &quot;μs&quot; (example: Avg: 0.254 μs, Min: 0.194 μs Max: 0.3μs)</td>
</tr>
<tr>
<td>“Min. time (ms/μs)”</td>
<td></td>
</tr>
<tr>
<td>“Max. Time”</td>
<td></td>
</tr>
<tr>
<td>“Own time (ms/μs)”</td>
<td>Time that the POU call has spent, excluding the time spent by all POU calls from this POU</td>
</tr>
<tr>
<td>“Own Time (%)”</td>
<td>Percentage of the own time to the total time</td>
</tr>
<tr>
<td>“Calls”</td>
<td>Number of calls of this POU in this cycle in this call tree (example: 22 Calls)</td>
</tr>
<tr>
<td>“Standard deviation”</td>
<td>Standard deviation of the average execution time (example: 0.128 μs)</td>
</tr>
</tbody>
</table>

Example:
### Table 733: Tab 'Online' - 'Back Traces'

This is a reverse view of the call tree. This means that you can trace all calls from a POU call to the beginning of the call chain.

- Percentage of own time to total time (example: 19.35%)
- Name and type of POU (example: MID (FUN))
- Own time, or portion of the own time of the call to the own time of the node (example: 9.466µs of 9.752µs)
- Number of calls in this call tree in this cycle, and the percentage of calls to the total number of calls (example: 4 Calls of 5)

**Example:**

![Call tree example](image)

### Table 734: Actions for the current measurement

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Refresh this snapshot&quot;</td>
<td>The current measurements are done and displayed. The display is not refreshed automatically.</td>
</tr>
<tr>
<td>&quot;Save snapshot&quot;</td>
<td>The “Save Snapshot” dialog opens for typing in a name and description for the snapshot. After you click “OK”, the current measurement results are saved and can be called again in the “Snapshots” tab.</td>
</tr>
<tr>
<td>&quot;Reset&quot;</td>
<td>For the &quot;Sampling&quot; method only (not supported at this time): The current measurement is reset and can be restarted.</td>
</tr>
<tr>
<td>&quot;Stop&quot;, &quot;Pause&quot;</td>
<td>Button for starting, pausing, and stopping, the measurement process</td>
</tr>
<tr>
<td>&quot;Sampling interval&quot;</td>
<td>Time period between measurements. A random value is generated in the range between 0 and the specified time span. After this time, the task to be measured is paused and recorded. The remaining time until the specified time span elapses until the next random value is generated. This means that it is measured within the time span, but not before the full time span has been reached. At a sampling interval of 1 ms, 100 measurements should be performed in 100 ms.</td>
</tr>
</tbody>
</table>
Measurement of code coverage

When code coverage is used, the “Online” tab shows which of the statements are executed in the selected POUs and which are not. In contrast to the profiling methods, explicit refreshing of the measured values is not necessary here. However, the measurement can be repeated.

Table 735: Table with measurement results

| “Name” | The names of the POUs selected for the measurement are shown in the tree structure. The parent objects act as nodes (for example, the name of the application to which they belong). |
| “Number of statements” | Total number of statements contained in the POU |
| “Statements not executed” | Number of statements contained in the POU but not executed |
| “Coverage (%)” | Percentage of statements in the POU that are executed (example: 75 for 75%) |

Table 736: Buttons above the measurement value table

| “Open POU” | The POU selected in the view is opened in its editor. Statements that have been processed are displayed in green. Statements that have not been processed are displayed in red. The POU editor also opens when you double-click a row in the table. |
| “Reset” | The measurement results are reset to 0 and the measurement is repeated in the next cycle. |
| “Save Snapshot” | The “Save Snapshot” dialog opens for typing in a name and description for the snapshot. After you click “OK”, the current measurement results are saved and can be called again in the “Snapshots” tab. |

Context menu

The following commands are available in the context menu depending on the selected location in the various displays of the measurement results:

- “Open POU”
- “Export”
- “Copy Table”
- “Properties” (in the call tree only)

- Chapter 1.8.5.5.2.4 “Command ’Edit Snapshot’” on page 3921

Tab ‘Snapshots’

This tab is displayed only after a measurement has already been recorded as a snapshot. The “Save snapshot” button on the “Online” tab of the Profiler editor is used to record snapshots.

The recorded snapshots are displayed in a tree structure. The nodes correspond to the profiling method in which they were created.
The recorded measurement results are displayed on the right for the time recording selected in the tree. Double-click the time recording in the tree to display it in a separate window. You can work with the same functionalities and commands as in online mode of the measurement. However, if a POU has been modified after the snapshot, then you cannot open it in the red/green view. If a POU has been deleted, then it cannot be opened ever again.

Commands for deleting and editing (name, description) are available in the context menu of a selected time recording.

Command ‘Open POU’

Symbol: 

**Function:** The command opens the selected POU in its editor.

**Call:** On the “Online” tab, the context menu of a selected line on the “Call Tree” subtab, on the “List” subtab, or on the “Back Traces” subtab

See also
-  Chapter 1.8.5.5.1.3 “Tab ‘Online’” on page 3915

Command ‘Properties’

Symbol: 

**Function:** The “Properties” dialog is opened for the selected POU.

**Call:** On the “Online” tab, the context menu of a selected line on the “Call Tree” subtab

Dialog ‘Properties for '<POU>''

The dialog shows recording results for the call of the POU that is currently selected in the call tree.

“*This call*”: Call of the POU by the POU or task located above in the tree

“*All calls*”: All calls of the POU by the task
“POU Type” | Type of POU (examples: function, program)  
---|---  
“Code Size” | Code size of selected POU  
“Location” | Name of the project that contains the active application  
“Task” | Name of the responsible task  
“Number of calls” | Number of calls of the POU in the current cycle  
“Total time” | Total time for the POU call, including the time for all calls that the POU and its called POUs have performed  
“Own time” | Total time for the POU call, excluding the time for all calls that the POU and its called POUs have performed  
“Average time” | Average total time measured in the current cycle for the call of the selected POU  
“Min. time” | Minimum total time measured in the current cycle for the call of the selected POU  
“Max. Time” | Maximum total time measured in the current cycle for the call of the selected POU  
“Standard deviation” | Standard deviation of the call time in the current cycle from the average time

Command 'Print Table'  
Symbol: 📈  
**Function:** The command opens the default dialog for configuring a print job. You can print the table with the current measurement results of the code coverage.  
**Call:** Context menu of a code coverage measurement on the “Online” tab
Command 'Times'

**Function:** The command opens the dialog "Times for <POU>". The measured time is displayed for each POU call.

**Call:** On the "Online" tab, the context menu of a selected line of a POU which is called multiple times on the "Call Tree" subtab

Dialog 'Times for <POU>'

The dialog shows the measured duration for each individual POU call at the selected position in the call tree.

Additional information includes the following:

- "POU Type": For example, **Function**
- "Code Size": POU size (in bytes), for example, **360 Bytes**
- "Location": Location where the POU is defined (application, library, etc.), for example, **standard, 3.5.5.0 (system)**

See also

- Chapter 1.8.5.5.1.3 “Tab ‘Online’” on page 3915

Command 'Export'

**Function:** The command opens the standard dialog for saving a file to the local file system. You can save the current list of Profiler results as a CSV file.

**Call:** On the "Online" tab, the context menu on the "List" subtab

See also

- Chapter 1.8.5.5.1.3 “Tab ‘Online’” on page 3915

Command 'Copy Table'

**Symbol:** 

**Function:** The command saves the current list of profiler results to the clipboard.

**Call:** On the "Online" tab, the context menu on the "List" subtab

See also

- Chapter 1.8.5.5.1.3 “Tab ‘Online’” on page 3915
Command 'Profiler' - 'Profiler Watch List'

**NOTICE!**
The implicitly added IEC code for a Profiler measurement method, as well as the breakpoints for POU\s in the watch list, result in a change and slows down the evaluated program.

When a profiling or code coverage measurement is active, an online is generally not possible. Moreover, some online features are not available, such as flow control and breakpoints. There are no restrictions for the watch list in this respect.

Enabling or disabling a Profiler measurement method, or changing any settings in the Profiler editor each requires a download. Then an online change is no longer possible. There are no restrictions for the watch list in this respect.

**View ‘Profiler Watch List’**
For each POU and each POU instance of an application in this watch list, CODESYS Profiler detects at runtime the frequency and duration that it is called.

You can fill the list with the required POUs and instances in offline mode or online mode:
- By dragging a POU from the device tree or editor to the list
- By specify an entry manually (supported by the Input Assistant)
- By clicking “Add to Profiler Watch List” in the context menu of a POU in the “Devices” or “POUs” view

**Table 737: “Profiler Watch List”**

1.8.6 Drive composer pro integration

Drive Composer Pro is a start-up and maintenance tool for ABB’s common architecture drives. The tool is used to view and set drive parameters, and to monitor and tune process performance.

Drive Composer Pro provides:

- Setting parameters,
- taking local control of the drive from the PC,
- event logger handling
- control diagrams,
- fast monitoring,
- working with multiple drives on the PC tool network,
- macro script editing for parameters and much more.

1. Add “Drive Composer Pro” object into the tree via add object dialog.
2. Open the “Drive Composer Pro” with double-click on the object.

In the following section important functions are described.
Import of backup files

1. Import of FSO backup files (*.dcsafety) and Drive Parameters backup files (*.dcparamsbak) into Automation Builder project via the Drive Composer Pro object in the device tree.

2. View of integrated FSO backup files and Drive Parameters backup files in Automation Builder project - refer to image below.

Drive Composer Pro can't be launched directly with integrated “FSO backup files” but they have to be loaded manually via context menu on the drive in Drive Composer Pro → “Safety Settings”.

Image description: The image shows a screenshot of Drive Composer Pro with a list of backup files including their details such as name, last modified date, drive type, firmware version, and backup file type.
Export of backup files

1. Select the FSO and Drive Parameters backup files.
2. Export the selected file by clicking [Export].
   - Select the desired storage path.
1. Select the FSO and Drive Parameter backup files from Automation Builder project.
2. Remove the selected files by clicking [Remove].
1. Open the “Crane_follower12.dcparamsbak” with double-click.
2. The “Drive Composer Pro” starts automatically.

**Standard Drive Parameter backup files (*.dcparamsbak) are automatically displayed under “File Drives”.

3. Saved changes in the standard drive parameter backup file are automatically updated in the Automation Builder project.

### 1.8.7 CODESYS SVN

**SVN integration in CODESYS**

CODESYS SVN allows for the development of CODESYS projects under version control by Apache™ Subversion®. CODESYS SVN provides an SVN client integrated in CODESYS. The objects of your project are versioned in a central SVN repository.

As a rule, the SVN repository should be created in a server configuration and located on a server. For testing purposes, you can create a local SVN repository where you can access per file://.

Professional Version Control requires a valid license and can be installed using the Automation Builder Installer or the Automation Builder Installation Manager.
1.8.7.1 Getting Started

The following steps are required in order to develop your CODESYS project with CODESYS SVN with version control by Apache™ Subversion®:

1. Install the CODESYS SVN package in CODESYS.
2. Install an SVN server.
3. Create an SVN repository.
4. Open your CODESYS project in CODESYS.
5. Import the CODESYS project into the SVN project archive.
   ➔ The CODESYS project is saved in the SVN repository.
6. To edit and further develop the project with SVN version control, the project is edited in CODESYS and then committed to the SVN repository.

A detailed description of these individual steps is located in the following sections.

- Chapter 1.8.7.3 “Using an SVN Repository” on page 3929
- Chapter 1.8.7.4 “Using Working Copies” on page 3931

1.8.7.2 Version control

What is version control?

Apache™ Subversion® (SVN) is a tool for version and revision management of current and previous versions of files, such as source code, websites, and documentation. Apache™ Subversion® is a registered trademark of the Apache Software Foundation.

Revision management (also known as version control, version management, and source code management) is the management of changes to documents, programs, and other information that is stored as computer files. Version control is employed frequently in software development when a team of employees works on the same files.

Tasks
- Co-writing of changes in revisions: At any time, you can show who made which changes at which time.
- Restoring of old revisions of individual files: At any time, you can reverse accidental changes to files.
- Archiving of special revisions of a project: At any time, you can revert to older versions.
- Coordination of common access of developers to data
- Development of a project simultaneously in multiple branches

CODSYS SVN provides a scripting-interface for SVN.

1.8.7.3 Using an SVN Repository

An SVN repository usually saves information as a file system tree, a hierarchy of files, and directories. Any number of clients connects to the SVN repository and reads or writes changes to the files in revisions.
Creating an SVN repository

**NOTICE!**
Consult with your IT specialists for more information, for example how to create an SVN repository. For production purposes, we recommend a strictly dedicated administrative SVN server.

We recommend that you create the suggested default directory structure in the SVN repository.

See also

Creating an SVN repository for testing purposes

**NOTICE!**
Use the `file://` access method for testing purposes only.

![Information icon]
You can reach SVN repositories that were created in format 1.8 or 1.9 via the `file://` protocol.

For testing purposes, you can create a local SVN repository without installing your own server. The SVN repository is accessed via `file://` and provides the same functionality as a server.

- Requirement: The SVN client TortoiseSVN 1.9 is installed on the development system.

1. Create a new, empty folder on your local file system. The test repository will be created there.
   - **Example:** D:\SVN repository
2. Click “TortoiseSVN ➔ Create repository here”.
   - The dialog “Create repository” opens.
3. Click “Create directory tree”.
   - The SVN repository is created.

<tr>
<td><strong>svn://</strong></td>
</tr>
<tr>
<td><strong>svn+ssh://</strong></td>
</tr>
</tbody>
</table>

2021/05/12 3ADR010583, 2, en_US 3930
1. Open the CODESYS project that you want to save in the SVN repository.
   ⇒ Example: A.project is open.
2. Click “Project ➔ SVN ➔ Import project to SVN”.
   ⇒ The “Browse SVN repository” dialog opens.
3. Select the directory file:///D:/SVN repository/trunk in the directory tree.
4. Select the command.
   ⇒ The “Create remote directory” dialog opens.
5. Specify the URL for the new directory.
   Note: Because the new directory should contain the CODESYS project, specify the project name with extension here.
   ⇒ file:///D:/SVN%20repository/trunk/A.project
6. Click “OK” to close the dialog.
7. Select the new project and click “OK” to exit the “Browse SVN repository” dialog.
   ⇒ The “Import Project to SVN” dialog opens. The directory file:///D:/SVN repository/trunk/A.project is specified in “URL of SVN repository”.

See also
● Chapter 1.8.7.5.1 “Overlay Icons” on page 3932

1.8.7.4 Using Working Copies
Checking out a project You can copy CODESYS projects to your development system that are saved in the SVN repository.
1. Open CODESYS.
2. Click “Project ➔ SVN ➔ Checkout”.
   ⇒ The “Checkout” dialog opens.
3. Specify the URL of the SVN repository and select a project in the SVN repository tree.
   If a CODESYS project has the extension .project or _project, then it is recognized automatically as a project at checkout. If it has the extension .library or _library, then it is recognized as a library project.
4. In “Checkout to”, specify the name and location of the working copy on your development system.
5. Click “OK” to close the dialog.
   ⇒ The project opens in CODESYS. In the object tree of the project, the SVN link is shown with overlaid icons. Now the project is saved as a working copy on your development system.

See also
● Chapter 1.8.7.5.1 “Overlay Icons” on page 3932
Update the working copy before you start editing, especially if the project is revised by a team. This is how you avoid conflicts.

1. Open the working copy.
2. Click “Project ➔ SVN ➔ Update project” (symbol: ✅).
   ➔ You working copy is current.
3. Revise your project.
4. Click “Project ➔ SVN ➔ Edit SVN working copy”.
   ➔ The dialog opens. There you can browse your changes.
5. Close the dialog.
6. If necessary, you can click “SVN ➔ Revert” in the context menu.
   ➔ The file is reverted back to the base revision and your changes are discarded.
7. If necessary, you can click “Compare” in the context menu of an edited object.
   ➔ The compare dialog opens. You can resolve any conflicts here.
8. Close the compare dialog.
9. Click “Project ➔ SVN ➔ Commit project” (symbol: ✅).
   ➔ The “Commit” dialog opens.
    ➔ Your changes are saved in the SVN repository as a revision with a revision number.

See also
●  Chapter 1.8.7.5.2.1 “Command ‘SVN Repository Browser’” on page 3934

For projects in version CODESYS SVN V4.1.0.0 and later, the working directory (working copy) has a new format.

If you open a project that was created with V4.0.4.0 or earlier, then the project is updated automatically to the new format when it is opened.

If you open a project that was created with V4.0.4.0 or earlier and the project is based on an older SVN version of 1.7.x or earlier, then you are prompted whether or not CODESYS should update the format. If you decline the update, then the SVN link of the project is deactivated. You can still load and edit the project.

The update does not have an effect on saving to the SVN server. You can also checkout projects with earlier versions of the client. The new format affects only the local working directory.

#### Command 'SVN Repository Browser'

**Symbol:** ![Symbol](image)

**Function:** This command opens the SVN repository browser. The contents of an SVN repository is shown in a tree structure here. You can search through the repository in the browser.

**Call:** Menu bar: “Project ➤ SVN”.

Depending on the selected object, the following commands are available in the context menu:

- "Show log"
- "Checkout"
- "Create folder"
- "Copy to"
- "Rename"
- "Delete"

Double-clicking the object with the right mouse button opens the log dialog.
**Dialog 'SVN Repository Browser'**

<table>
<thead>
<tr>
<th><strong>“URL”</strong></th>
<th>URL in SVN repository</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td><a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></td>
</tr>
<tr>
<td><strong>Tip:</strong></td>
<td>As soon as a valid SVN repository is specified, you can browse and select a specific project by means of the adjacent button.</td>
</tr>
</tbody>
</table>

|  | Opens the dialog “Select revision”. |
|  | The button is labeled with the currently selected revision: |
|  | • “HEAD”: Top revision (latest). Preset |
|  | • “3”: Revision number of the selected revision |
|  | • “23.12.2016 11:59:59 (UTC)”: Change date of the selected revision (UTC) |
|  | **Note:** The dialog provides the same options as the “Revision” group. |

|  | Updates the browser view by rescanning the SVN repository. |
|  | Navigates the URL address up by one folder. |

**Left area**

Directory tree in the SVN repository. Project nodes are shown in bold.

**Right area**

List of objects of the selected directory

| “Close” | Closes the dialog |

**Command 'Edit SVN working copy’**

**Symbol:** §

**Function:** This command opens the dialog “Edit SVN working copy” and displays the working copy in a browser from the SVN view.

**Call:** Menu bar: “Project ➔ SVN”.
The functionality of the browser allows for:

- Access to and actions on objects that are not displayed in the “Devices” view.
- Actions on objects that can lead to exceptions in the “Devices” view.
- Editing of global objects that are modified, in conflict, or blocked.

**Dialog ‘Edit SVN working copy’**

Command 'Import project to SVN'

Symbol: 🌐

Function: This command opens the dialog "Import project to SVN" in order to import a CODESYS project to the SVN repository.

Call: Menu bar: "Project ➔ SVN".

Requirement

- You have access to an SVN repository and you know its URL.
- You have read access to the entire project.

</tr>
</thead>
<tbody>
<tr>
<td><strong>“Omit externals”:</strong> ☑: Externals (external objects) are not copied to the working directory.</td>
</tr>
</tbody>
</table>
Table 746: “Revision”

For a description, refer to the section "Dialog 'Select revision'".

Note: The group provides the same options as the “Revision” dialog.

| “OK” | Checks out the project from the SVN repository, saves it locally to the specified location, and opens it in CODESYS as the primary project. |

If files were encrypted when imported to the SVN repository, or if they have been committed, then note the following:

When committing to the SVN repository, the information about an encrypted project file is included. However, the type of encryption is not included (password, Wibu security key, X509 certificate). Therefore, it may be necessary to encrypt the working copy again in the project settings. In this case, a dialog opens when exiting the command to notify you of this. Then you are able to switch directly to the project settings.

Command 'Commit’, Command ‘Commit project’

Symbol: ✩

Function: This command commits changes that were made in CODESYS to the SVN repository. The “Commit” dialog opens for this purpose.

Call:
- Context menu: “SVN” to commit this object exactly.
- Menu bar: “Project ➔ SVN ➔ Commit project” to commit all changes in the project at the same time.

Requirement: At least one object was edited. The edited object is overlaid in the object tree with the icon.

When you execute the command, the block on the objects to be committed is lifted automatically.

Dialog 'Commit'

Table 747: “Commit to: <URL project/object>”

<table>
<thead>
<tr>
<th>URL in SVN repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: file:///D:/SVN repository/trunk/ControlABC.project</td>
</tr>
</tbody>
</table>

“Log message” Comment the change in a log message.

| Example: Bug fix error 123 |

“Recent Messages” Opens the dialog “Recent Messages” to display the last log messages. You can click a log message to accept it.
Table 748: “Changes made (double-click on object for compare, right-click on object for more operations)”

| **Object** | The object is activated for the commit. Example: \(\text{Device/Plc Logic/Application/PLC PRG}\) |
| **Text status** | Object status in CODESYS |
| “Modified” | “Added” |
| “Deleted” | “Non-versioned” |
| “Conflicted” | |
| **Property status** | Status of the metadata of the object |
| “Modified” | “Added” |
| “Deleted” | “Conflicted” |
| “Normal” | |
| **Lock** | If the object has a lock, then it is shown here the user who applied the lock. Example: b.mayer |
| **Description** | Display of the log message |
| **Select/deselect all** | All objects in the list are activated. |
| **Keep locks** | Your locked object keeps remains in lock status after the commit. |
| **Keep change lists** | The change list also remains after the commit. |
| **Update after commit (recommended)** | The object/project is updated after the commit. Select this check box to ensure that the project is up-to-date and to prevent conflicts resulting from mixed revisions of working copies. See also: SVN help |
Button “Update project” Updates the project.
Tip: Prevent conflicts by committing a previously updated project/object.

“OK” Checks the working copy first. Starts the commit of changes when the working copy is current.
Keyboard shortcut [Ctrl]+[Enter] Opens a dialog when the working copy is outdated. You can then select the following:
● “Abort the commit, I want to investigate the issue.”
● “Yes, I want to update this project now.”
● “Continue with the commit, I know what I do.”
Note: The history of the commit is displayed in the “Messages” view.
The messages are highlighted in color.
● Blue: Commit a change
● Green: Add an object
● Dark red: Delete/replace an object
● Black: Other messages (summary)

Handling external objects
If the external object is in the same SVN repository, then changes in this external object are listed in the commit dialog and committed together with the internal project. If an external object is in another SVN repository, then you are notified about changes in the external project and you have to commit these separately.
An external object has the “externals” property.

● § Chapter 1.8.7.5.2.6 “Command ‘Compare’” on page 3943
● SVN help: http://svnbook.red-bean.com/en/1.7/svn.basic.in-action.html#svn.basic.in-action.mixedrevs

Context menu (right-click on object)

“Compare” Opens the compare dialog to compare the working copy with the top-level revision.

“Compare with HEAD version” Opens the compare dialog to compare the working copy with the HEAD revision.

“Compare with revision” The list entries are highlighted in color according to the object status:
● Blue: Modified
● Green: Added
● Dark red: Deleted
● Red: Conflicted
● Black: Non-versioned (not in SVN repository)
  Note: These objects are displayed when the option “Show non-versioned objects” is activated.
● Gray: Excluded from commit
  Note: This is the case when the option “Ignore during commit” is activated for the object.

“Revert” Discards your changes to the working copy. Then the object corresponds to the revision in the SVN repository.

“Show log” Shows the version history of the selected object.
<table>

<tbody>
<tr>
<td>Move to change list</td>
<td>Note: This command has not been implemented yet.</td>
</tr>
</tbody>
</table>

**Command 'Compare'**

Symbol: 📚

**Function:** This command opens a tab that shows the result of the comparison of your working copy and the BASE revision. The base revision is the top-level revision in the SVN repository.

**Call:**
- Menu bar: “Project ➔ SVN”.
- Context menu

**Requirement:** The object is versioned, it was modified locally, and it does not contain any conflicts.

Multiple tabs can be open at the same time with the comparison of different objects.

*Comparison by object type*

The comparison dialog makes use of the functionality of the CODESYS command “Project ➔ Compare”. In this way, objects are compared according to their object type.

See also
- 📖 Chapter 1.4.1.5 “Comparing projects” on page 202

**Command 'Compare with HEAD revision'**

Symbol: 📚

**Function:** This command opens a tab that shows the result of the comparison of your working copy and the HEAD revision. The HEAD revision is the top-level revision in the branch. You can revert specific changes that were committed to the HEAD revision.

**Call:** Context menu: “SVN”

**Requirement:** The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

*Comparison by object type*

The comparison dialog makes use of the functionality of the CODESYS command “Project ➔ Compare”. In this way, objects are compared according to their object type.

See also
- 📖 Chapter 1.4.1.24.2.4.18 “Command ‘Compare’” on page 937

**Command 'Compare with revision'**

Symbol: 📚
Function: This command opens the "Project log" dialog or "Log - <object> " where the version history is displayed from the project or an object of the CODESYS project. Here you can select a revision. A tab opens and shows the result of the comparison of your working copy and the revision.

Call: Context menu: “SVN”

Requirement: The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

Comparison by object type
The comparison dialog makes use of the functionality of the CODESYS command “Project ➔ Compare”. In this way, objects are compared according to their object type.

Dialog 'Select Remote Project for Comparison'

Table 749: “URL of SVN repository”

<table>
<thead>
<tr>
<th>URL of the project in the SVN repository that is compared.</th>
</tr>
</thead>
<tbody>
<tr>
<td>file:///D:/SVN repository/trunk/ControlDEF.project</td>
</tr>
</tbody>
</table>

Example: file:///D:/SVN repository/trunk/ControlDEF.project
As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in “Revision” and select a project.

| 15 |
| 15 |

The label on the button corresponds to the selected revision:
- “HEAD”: Top revision (latest).
- “15”: Revision number of the selected revision
- “23.12.2016 11:59:59 (UTC)”: Change date of the selected revision (UTC)

After clicking the button, the dialog “Select revision” opens.

Note: The dialog provides the same options as the “Revision” group.

| [ ] |

Opens the dialog “Browse SVN repository” to search the SVN repository.

Table 750: “Checkout options”

| “Omit externals”: | [ ]: External objects are not compared. |
Table 751: “Revision”

Options for selecting a specific revision

Note: the current valid selection is also displayed next to the SVN repository URL.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“HEAD”</td>
<td>: The HEAD revision is selected. This is the latest revision (top revision) within a branch.</td>
</tr>
<tr>
<td>“Revision”</td>
<td>: A specific revision is selected by the revision number. Example: 3</td>
</tr>
<tr>
<td>“Date”</td>
<td>: The specific revision is selected by the modification date. Example: 12/23/2016 11:59:59</td>
</tr>
<tr>
<td>“Use UTC Time”</td>
<td>: Modification date in universal time.</td>
</tr>
</tbody>
</table>

Table 752: “compare options”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Ignore Whitespace”</td>
<td>: No comparison of whitespace characters. Semantically relevant whitespaces, such as in strings, are compared anyway.</td>
</tr>
<tr>
<td>“Ignore Comments”</td>
<td>: No comparison of comments.</td>
</tr>
<tr>
<td>“Ignore Properties”</td>
<td>: No comparison of properties. Folders, the property “Exclude from build”, and POU images are not compared. See: Dialog ‘Properties’</td>
</tr>
</tbody>
</table>

“OK” | Compares the SVN project with the working copy.

See also
- Chapter 1.8.7.5.2.1 “Command ‘SVN Repository Browser’“ on page 3934
- Dialog ‘Properties’

Command 'Include externals to project', Command 'Include externals’

Symbol: 

Function: These commands open the dialog “Include externals”.

Call:
- Menu bar: “Project ➔ SVN”.
- Context menu: “SVN”

Requirement: An object is selected in the object tree. The external objects are linked below that. If you have selected nothing or the project root directory, then the command “Include externals to project” is available. If you have selected an object, then the command “Include externals” is available.

The same external objects cannot be linked multiple times at different locations in the same project. This leads to problems in CODESYS because of conflicts with the internal identification of the object.

Dialog 'Include externals'
**Table 753: “URL of SVN repository”**

<table>
<thead>
<tr>
<th>URL of SVN repository</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file:///D:/SVN repo A/trunk/DSTest.project/GlobalTextList</td>
<td>URL of the external object that is linked. The object to be linked is versioned and can have sub-objects. External objects are located at another location in the SVN repository than the project. It can even be in another SVN repository. Example: file:///D:/SVN repo A/trunk/DSTest.project/GlobalTextList</td>
</tr>
</tbody>
</table>

**Note:** The objects that should be linked below the selected object must have a matching object type. For example, only a task can be linked below the “Task configuration” object.

**Table 754: “Revision”**

<table>
<thead>
<tr>
<th>Options for selecting a revision</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“HEAD”</td>
<td>Latest revision (top revision) selected in a branch.</td>
</tr>
<tr>
<td>“Revision”</td>
<td>A specific revision by the revision number. Example: 3</td>
</tr>
<tr>
<td>“Date”</td>
<td>A specific revision by the modification date. Example: 12/23/2016 11:59:59</td>
</tr>
<tr>
<td>“Use UTC Time”</td>
<td>Modification date in universal time.</td>
</tr>
</tbody>
</table>

**OK**

Adds the external object and its sub-objects with the property `<svn:externals` to your project (below the selected object). The working copy is updated and the external object is overlaid with the symbol. Example: ![Source](external device Source)

**Note:** If the linking fails (for example when adding a device below a task configuration), then the complete operation fails and reverts back.

**Note:** Renaming or moving individual external objects is permitted inly within an external tree, whereby it is not permitted to move the top object.

To move a complete tree, you have to remove it and link it to another location.
“... You should seriously consider using explicit revision numbers in all of your externals definitions. Doing so means that you get to decide when to pull down a different snapshot of external information, and exactly which snapshot to pull. Besides avoiding the surprise of getting changes to third-party repositories that you might not have any control over, using explicit revision numbers also means that as you backdate your working copy to a previous revision, your externals definitions will also revert to the way they looked in that previous revision, which in turn means that the external working copies will be updated to match the way they looked back when your repository was at that previous revision. For software projects, this could be the difference between a successful and a failed build of an older snapshot of your complex codebase. ...”

This is a quote from: http://svnbook.red-bean.com/nightly/en/svn.advanced.externals.html.

Command 'Ignore on commit'

Function: This command identifies an object and adds it to the "ignore-on-commit" list. Then it is deactivated in the commit dialog by default.

Call: Menu bar: “SVN”

Requirement: At least one object is available that is not in the change list ignore-on-commit.

Objects of the "ignore-on-commit" list are overlaid with the symbol in the object tree. By default, they are not selected in the commit dialog, unless a dependency of a selected object requires it. These objects can always be selected manually in the dialog.

See also
● $ Chapter 1.8.7.5.2.25 “Command 'Un-Ignore on commit'” on page 3955

Command 'SVN Info'

Function: This command provides information about the selected object in the SVN repository. The “SVN Information” dialog opens for this purpose.

Call: Context menu: “SVN”

Requirement: A versioned object (with SVN link) is selected in the object tree.

Dialog 'SVN Information'

Example

Name: Device_4\Plc Logic\Application\PLC_PRG
URL: file:///D:/SVN repository/trunk/ControlABC.project/Device/Plc Logic/Application/PLC_PRG/svnobj

<tr>
<th>“Recursive”</th>
<th>✅ The lock is stolen by the object and all subordinate child objects.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“OK”</th>
<th>Steals the lock. When the stolen lock is successful, the object (in the object tree) is overlaid with the ♂ symbol.</th>
</tr>
</thead>
</table>

---

Command 'Release lock'

Symbol: ♂

**Function:** This command releases the lock of an object.

**Call:** “Context menu ➔ SVN”

**Requirement:** The object is locked.

---

Command 'Release locks recursively'

Symbol: ♂

**Function:** This command releases the lock of an object explicitly with all of its subordinate objects.

**Call:** “Context menu ➔ SVN”

**Requirement:** The object is locked.

---

Command 'Show log', Command 'Show project log'

Symbol: ☐

**Function:** These commands open the tab “Project log” or “Log - <object>”. The version history of the project or an object of the CODESYS project is displayed in the tab.

**Call:**
- Menu bar: “Project ➔ SVN”.
- “Context menu ➔ SVN”

If you select nothing or the base node in the object tree, then the history of the entire project is displayed (“Show project log”). If you select one or more objects, then the history of these elements is displayed (“Show log”).

Multiple tabs can be open at the same time with the version history of different objects.
Tab 'Project log', Dialog 'Log - <object>''

Upper area
- “Revision”: Revision number
- “Author”
- “Date”
- “Message”: Message entered at commit

List of all revisions of the project or the selected objects in the information. The first 100 revisions are displayed by default. The “Next 100” and “All” buttons are provided for displaying more or all revisions.

Several commands are available in the context menu of each revision. These context menu commands are described below.

Middle area
Display of the “Message” of the revision that is selected in the upper area.

Lower area
- “Action”
- “Path”: Object path in SVN
- “Copy from path”
- “Copy from revision”

List of actions that were performed on the objects of the project in the selected revision:

| “Hide unrelated changed paths” | ☑: All changes of this revision are hidden that do not have any relevance to the object. |
| “Stop on copy/rename” | ☑: If the object was copied from another location in the SVN repository, then no more log messages are retrieved. This is especially beneficial when branches or tags are monitored and only changes within the branch are relevant. |
| “Filter/Range” | Opens the “Filter” dialog |
| “All” | All revisions are listed. |
| “Next 100” | The next 100 revisions are listed. |

Table 756: Dialog “Filter”

| “Revision range” | The displayed revisions can be filtered by “Head”, “Revision”, or “Date”. “Use UTC time”: Date display in universal time. For more detailed information, refer to the description “Dialog ‘Select revision’”. |
| “Message contains” | Display of revision logs that contain a special text in the “Message” |
| “Author contains” | Display of revision logs of the specified author |
| “Path contains” | Display of revision logs of the specified path |

Table 757: Context menu commands of the revisions

| “Compare with base working copy” | Compares the selected revision of the object with the base working copy (without local changes). |
| “Com with working copy” | Compares the selected revision of the object with the working copy. |
| “Compare with HEAD revision” | Compares the selected revision of the object with the HEAD revision. |
| “Compare with previous revision” | Compares the selected revision of the object with the previous revision. |
| “Update item to revision” | Updates the object to the selected revision. Note: Changes of the project by this command cannot be committed. For VSS users: This is comparable to loading an older version without checkout. To revert a previous commit, the command “Revert to this revision” has to be used. |
“Revert to this revision” Reverts the object to the selected revision. This command does not have an effect on the SVN repository as long as the changes are not committed. Internally, SVN reverts the merges for all changes that were made after the selected revision in order to revert the changes of the preceding commits.

“Edit author” Opens a dialog for changing the author of the revision.

“Edit log message” Opens a dialog for changing the log message of the revision.

“Revision properties” Opens the dialog “Revision properties” where the properties are displayed. In the dialog, you can activate the “Add” and “Remove” properties and the option “Show binary properties”.

“Create branch/tag from this revision” Creates a branch or tag from the selected revision.

“Browse SVN repository” Opens the “SVN repository browser” dialog.

“Copy to clipboard” Copies log details of the selected revision to the clipboard. This is the revision number, author, date of revision, log message, and the list of changes objects for each revision.

- Chapter 1.8.7.5.2.1 “Command 'SVN Repository Browser'” on page 3934
- Chapter 1.8.7.5.3.3 “Dialog 'Select revision'” on page 3963

Command 'Revert', Command 'Revert project'

Symbol: ⌃

Function: This command opens the “Revert” dialog. In the dialog, select the objects whose local changes should be reverted, and those that are reverted to the state of the base revision of the working copy.

Call:
- Menu bar: “Project ➔ SVN”.
- “Context menu ➔ SVN”

If you select nothing or the main node in the device tree, then all modified objects are listed in this dialog (“Revert project”). If you selected one or more objects, then only the changes to this object are listed and recursively their sub-objects (“Revert”).

Dialog ‘Revert’

| “Group externals” | ☑: The external definitions are grouped by their external storage locations. |
| “Keep locks” | ☑: The lock is retained for all files that are modified by the revert command. |
| “Select/deselect all” |

When external objects are deleted, CODESYS SVN cannot restore this data in SVN offline mode. The user is prompted how to proceed:
- Switch back to SVN online mode and call the external objects.
- Connect now to the SVN server one time in order to complete the current operation, but afterwards switch back to SVN offline mode.
- Skip the retrieval of the external objects. They can be fetched later by updating the project.
See also

● Chapter 1.8.7.5.2.20 “Command ‘Revert to revision’, Command ‘Revert project to revision’” on page 3952

Command 'Revert to revision', Command 'Revert project to revision'

Symbol: 

Function: This command opens the “Select revision” dialog. In this dialog, you select the revision to which the project or the selected objects revert.

Call:

● “Project ➔ SVN”
● “Context menu ➔ SVN”

If nothing or the base node is marked in the object tree, then the entire project is reverted to a specific revision (“Revert project to revision”). If one or more objects are selected, then these objects and their sub-objects are reverted (“Revert to revision”).

Dialog 'Select revision'

For a description of the dialog, refer to the section "Select revision".

See also

● Chapter 1.8.7.5.3.3 “Dialog 'Select revision’” on page 3963
● Chapter 1.8.7.5.2.19 “Command ‘Revert’, Command ‘Revert project’” on page 3951
● Chapter 1.8.7.5.2.18 “Command ‘Show log’, Command ‘Show project log’” on page 3949

Command 'Update', Command 'Update project'

Symbol: 

Function: This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.

Call:

● Menu bar: “Project ➔ SVN”.
● “Context menu ➔ SVN”

If nothing or the main node is selected, then the entire project is updated (“Update project”). If one or more objects are selected, then these objects and their sub-objects are updated (“Update SVN”).
The following cases are possible:

- Projects are added to the project that are present in the SVN repository, but not in the project. In this case, the message "Added <object>" is issued to the message view.
- Objects that no longer exist in the SVN repository, but are present in the project locally (and not marked as "added"), are treated according to the Subversion standard procedure: If local changes are present, then the object remains in the project as unversioned. If there are no local changes, then the object is also deleted locally because the user can retrieve the object from an older version at any time. In this case, "Deleted object" is issued to the message view.
- Versioned objects that exist in both the SVN repository and the project are updated if they are different. Three cases to observe:
  - No local changes have been made since the last update: In this case, the local object is overwritten by the contents from the SVN repository. The message "Object updated" is issued to the message view.
  - Local changes have been made since the last update and the corresponding object type can be merged. When versions have been merged successfully, the message "Objects merged" is issued to the message view. If the command is not executed successfully, then the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.
  - Local changes have been made since the last update and the corresponding object type cannot be merged. In this case, the object is marked as "Conflicted object" in the object tree and the message "Conflicted object" is issued.

If only some of the objects are updated, it may be that objects with the same name already exist. For example, this situation can come from moving objects to a folder.

For this conflict, you can react in the following ways:

- Do nothing and leave the conflict-causing objects as they are.
- Update (and remove) the conflicting objects in order to correct the conflict.
- Update the entire project in order to remove all conflicting objects and correct the conflict.

- “Chapter 1.8.7.5.2.22 “Command 'Update to revision’” on page 3953

**Command 'Update to revision'**

**Symbol:** ✓

**SFunction:** This command opens the “Update” dialog. In the dialog, the revision is defined for updating the project.

**Call:**

- “Project ➔ SVN”
- “Context menu ➔ SVN”

If you select nothing or the base node in the object tree, then the entire project is updated to a revision (“Update project to revision”). If you select one or more objects, then these objects are updated and their sub-objects are updated recursively (“Update to revision”). As an option, you can define that the sub-objects are not updated.

The behavior of the updating process (for example merging of conflicts) is similar to the “Update project” and “Update” commands.

**Dialog 'Update’**

<table>
<thead>
<tr>
<th>“HEAD”</th>
<th>☑: This command behaves the same as the “Update” and “Update project” commands.</th>
</tr>
</thead>
</table>
| “Revision” | ☑: The revision to which was last updated is selected by the revision number.  
 ☐: Opens the dialog “Log” for selecting the revision. |
“Date”
- The revision to which was last updated is selected by the modification date.
- “Use UTC time”: The date is displayed in universal time.

“Recursive”
- Default setting. The selected part is updated recursively. This means that all elements below the selected object are also updated.

“Omit external objects”
- External objects are not updated.

See also
- Chapter 1.8.7.5.2.21 “Command 'Update', Command 'Update project' ” on page 3952
- Chapter 1.8.7.5.3.3 “Dialog 'Select revision’” on page 3963

Command 'Disconnect project from SVN'
Symbol: ☑

Function: This command deletes all connections of the current project to SVN by converting the project into a non-versioned project.

Call: Menu bar: “Project ➔ SVN”.

Because this operation cannot be reversed, the operation must be confirmed before the command is executed.

Use the command “Connect to existing project” to connect to the SVN repository again at a later time.

See also
- Chapter 1.8.7.5.2.29 “Command ‘Connect to existing project’” on page 3957

Command 'Switch'
Symbol: 🔍

Function: This command opens the “SVN switch” dialog. In this dialog, you specify a URL in the SVN repository to which the current working copy of the project is updated. The command switches a project from a branch or tag to another.

Call: Menu bar: “Project ➔ SVN”.

Requirement: The project is versioned.

Dialog 'SVN switch'

<table>
<thead>
<tr>
<th>“From”</th>
<th>Current SVN URL of the project</th>
</tr>
</thead>
<tbody>
<tr>
<td>“To”</td>
<td>Input field for the target URL in SVN</td>
</tr>
</tbody>
</table>

- “HEAD”: The “Select revision” dialog opens.
- The “SVN Repository Browser” dialog opens. There you select the target URL in the SVN repository.

See also
- Chapter 1.8.7.5.2.1 “Command ‘SVN Repository Browser’” on page 3934
Command 'Un-Ignore on commit'

**Function:** This command removes an unversioned object from the ignore list so that the object is checked by default on commit.

**Call:** Context menu: “SVN”

**Requirement:** The command “Ignore on commit” was executed for the object. The object is marked with the ☰ symbol.

See also
- ☰ Chapter 1.8.7.5.2.11 “Command 'Ignore on commit'” on page 3947

Command 'SVN Cleanup'

**Function:** This command opens the “SVN Cleanup” dialog. In the dialog, you define actions that are performed when cleaning up the SVN working copy.

**Call:** Menu bar: “Project ➔ SVN”.

Dialog 'SVN Cleanup'

Table 758

<table>
<thead>
<tr>
<th>“Internal SVN working copy”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Update time stamps (speeds up SVN status display)”</td>
</tr>
<tr>
<td>“Vacuum cached pristine copies (may reduce the size of your project file)”</td>
</tr>
<tr>
<td>“Clear work queue and force unlock of SVN internal data structures (emergency only)”</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Project contents”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Revert all local changes (use with care!)”</td>
</tr>
<tr>
<td>“Release all locks”</td>
</tr>
<tr>
<td>“Revalidate all locks against the repository (they could have been stolen)”</td>
</tr>
<tr>
<td>“Status caches”</td>
</tr>
<tr>
<td>------------------</td>
</tr>
<tr>
<td>“Clear all caches and refresh status icons”</td>
</tr>
</tbody>
</table>
Command 'Clear authentication data'

**Function:** This command opens the "CODESYS" dialog. In this dialog, define the caches that will be deleted.

**Call:** Menu bar: "Project ➔ SVN".

Dialog 'CODESYS'

The authentication memory contains the authentication data of all SVN repositories for which the user has selected for saving the authorization data. This memory is deleted completely by this command.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Clear the shared on-disk cache.&quot;</td>
<td>The data saved on the computer is deleted.</td>
</tr>
<tr>
<td>&quot;Clear the RAM cache of this instance.&quot;</td>
<td>The data saved in the RAM is deleted.</td>
</tr>
</tbody>
</table>

The authentication data saved on the computer is stored in %APPDATA% \Subversion\auth. This memory path is also used for most other Subversion client applications (for example, TortoiseSVN and AnkhSVN). Therefore, deleting the authentication data affects these applications as well.

Command 'Merge changes'

**Symbol:** [ ]

**Function:** This command opens the "Merge" dialog. In this dialog, you determine the revisions with the changes to be merged with the working copy of the project.

**Call:** Menu bar: "Project ➔ SVN".

**Requirement:** The project is linked to SVN.

Dialog 'Merge’””

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Kind of merge"                 | ● “Sync/Reintegrate/Symmetric merge”: Synchronizes all missing changes from trunk (or a different branch) into this branch.  
                                  | ● “Cherry pick”: Integrates specifically selected revisions from one branch to another branch. This is necessary, for example, if any error trapping has to be ported back to an older version. |
| "Merge source"                  | SVN URL of the SVN repository  
                                  | ● Input field  
                                  | ● "HEAD": HEAD revision  
                                  | ● [ ]: Dialog “SVN Repository Browser” opens for selecting the SVN repository. |
| "Define start and end revision" | Select this option to merge a cohesive range of revisions with the working copy. |
| "Start revision"                | Defines the range of revisions that are merged with the working copy:     |
| "End revision"                  | ● “HEAD”: HEAD revision  
                                  | ● "Revision": Start and end revision of the range  
                                  | ● "Date": Date of the start and end revisions |
“Define revision range”
Select this option to merge individual revisions with the working copy. You can also highlight the individual revisions in the “Log” dialog.
Note: When defining ranges, CODESYS SVN behaves like other graphical clients, such as Tortoise SVN, and not like the command-line client. Example: For a range of 4−7, revisions 4, 5, 6, and 7 are merged.
See also: Merging a Range of Revisions

“Dry run (simulation)”
This command is executed without changing the working copy. Files that are changed during an actual merge are displayed, as well as ranges where conflicts occur.

“Record only”
The revision is marked as "merged" without actually performing the merge.

“Ignore ancestry ”
SVN uses path-based differences only, not history-based differences.

Command 'Connect to existing project'
Symbol: 

Function: This command opens the “Connect to SVN repository” dialog. In the dialog, you define the URL and the revision of the SVN repository with which the unversioned project is connected.
Call: Menu bar: “Project ➔ SVN”.

Requirement: The project is disconnected from SVN.

NOTICE!
Only users who have read access to the entire project (see the CODESYS user and access management) can import the project into the SVN repository or can link to an existing database project.

NOTICE!
This command functions reliably only when the project has already been imported into SVN and then disconnected with the command “Disconnect project from SVN”.

Dialog 'Connect to SVN repository'

“URL of existing project”
URL of the SVN repository

“HEAD”:
Selection of the revision in the “Select revision” dialog

“Checkout options”
“Omit externals”:
External objects are not checked out.

“Revision”
- “HEAD”:
- “Revision”:
- “Date”:
- “Use UTC time”:
  Date display in universal time.
Command 'Resolve conflict'

Symbol:  

**Function:** This command opens the “<object>” dialog. In the dialog, the conflicts are displayed and functions for resolving conflicts are prepared in order to merge changes.

**Call:** Context menu of the object.

**Requirement:** The object has a conflict that has occurred by updating the object with local changes.

**Dialog 'object>'**

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Compare”</td>
<td>The local objects are displayed on the left side, and the version from the SVN repository is displayed on the right side.</td>
</tr>
<tr>
<td>“Use mine”</td>
<td>A local change is used.</td>
</tr>
<tr>
<td>“Use yours”</td>
<td>A change of the version from the SVN repository is changed.</td>
</tr>
<tr>
<td>“Apply”</td>
<td>All changes are accepted that you made in this dialog. The status of the object is changed.</td>
</tr>
<tr>
<td>“Cancel”</td>
<td>Cancels all changes that you made in this dialog. But the object keeps the conflicted status.</td>
</tr>
</tbody>
</table>

Command 'Work in offline mode'

**Function:** This command switches to SVN offline mode. In SVN offline mode, the implicit locking and all commands that access the SVN repository are not possible.

**Call:**

- Menu bar: “Project ➔ SVN”.
- Context menu: “SVN”

**Requirement:** The project is linked to SVN.

When switching back to SVN online mode, all present locks on the working copy are checked against the server. If this locking is invalid, then it is released.

**Uses case**

The user on a machine wants to make changes to the project without disconnecting the connection. At the moment, there is no connection to the server. Despite this, when automatic locking is activated, work is possible because the SVN offline mode deactivates the automatic lock temporarily.

Command 'Copy (Branch/Tag)'

Symbol: 

**Function:** This command opens the “SVN Copy Branch/Tag” dialog. There you can “Branch” or “Tag” a revision of your project. A specific revision of your project is saved there at this position. A branch is normally used in order to save changes isolated in one version. A tag is used for marking a specific state, for example a shipping version. Internally, it is copied not in the actual sense, but more refers to the revision.

**Call:** Menu bar: “Project ➔ SVN”.

See also

- Chapter 1.8.7.5.2.1 “Command 'SVN Repository Browser’” on page 3934
**Requirement:** The project is versioned.

### Dialog 'SVN Copy (Branch/Tag)'

#### Table 759: "SVN repository"

<table>
<thead>
<tr>
<th>From</th>
<th>SVN path of the current project</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td><a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></td>
</tr>
</tbody>
</table>

| To | Target path in the SVN repository for the copy operation |
| Example of tag | https://svnserver/repository/tags/V4.4.4.4/ControlABC.project |

*: Dialog “SVN Repository Browser” opens for selecting the target path.

#### Table 760: "Log message"

<table>
<thead>
<tr>
<th>Input field</th>
<th>Comment the change in a log message.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example</td>
<td>Tag for version 4.4.4.4 created.</td>
</tr>
</tbody>
</table>

| “Recent Messages” | Opens the dialog “Recent Messages” to display the last log messages. You can click a log message to accept it. |

#### Table 761: "Create copy from"

| "Working copy (including local changes)" | The new branch/tag refers to the working copy including all local changes. The local changes are committed to the SVN repository for this purpose. |

| "Base revision of working copy (<revision number>)" | The new branch/tag refers to the base revision of your working copy whose revision number is displayed in the parentheses. If the working copy already contains local changes, then these are not committed to the SVN repository. |

| "HEAD revision of the repository" | The new branch/tag refers to the HEAD revision of your project. |

| "Specific revision in SVN repository" | The new branch/tag refers to a revision that is displayed on the adjacent button. Click the button to change the revision. The “dialog opens.”. |

| "Switch to new location " | After the dialog is confirmed, the working copy switches to the new branch/tag. |

| "OK" | The target path is created (as a new tag ../repository/tags/V4.4.4.4 or as a new branch ../repository/branches/new_feature). Then the revision specified in "Create copy from" is copied there. |

**See also**

- Chapter 1.8.7.5.2.1 “Command ‘SVN Repository Browser’” on page 3934

### Command 'Pending changes'

Symbol: 🔄
Function: This command opens the “Pending changes” view. All objects are listed there that have changed from the base revision.

Call: “View ➔ Pending changes”

View ‘Pending changes’
The modified objects are shown in the lower half of the view. You can use the commands “Commit”, “Revert”, and “Update” on these objects. When you do this, you can select individual objects or all objects. Commands for the comparison and display of the version history are available in the context menu of a selected object.

Double-clicking the object opens the project comparison.

| “Select” | Selection or clearing of all objects |
| “Commit” | Commits local changes to the SVN repository. |
| “Revert” | Resets the local changes to the state of the base revision of the working copy. |
| “Update” | This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision. |
| “Keep locks” | Lock is not released automatically after commit. |
| “Recent Messages” | Shows the last used log messages. You can click a log message to accept it. |
| “Messages” | Comment the change in a log message. Example: Bug fix error 123 |

1.8.7.5.3 Dialogs

1.8.7.5.3.5 Dialog ‘Automatic locking failed’.............................................. 3966

Dialog ‘SVN Settings’

Tab ‘General’

Symbol:  

Function: This tab includes the basic settings for CODESYS SVN.

Call: Menu bar: “Tools ➔ Options”.
Table 762: “Automatic locking and merging”

<table>
<thead>
<tr>
<th>“Merge”</th>
<th>Behavior for the commands “Update”, “Merge”, or “Switch”, when both sides (working copy and SVN repository) have changed from the base version.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>● “Mark all colliding changes as conflicts”: The objects are not merged automatically. All changes with a conflict are marked as “With conflict”, even if some of them can be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>● “Merge mergeable changes, mark the others as conflicts”: Changes that can be merged are merged automatically. All others are marked as “With conflict”.</td>
</tr>
<tr>
<td></td>
<td>● “Merge mergeable changes, ask the user for the others”: Changes that can be merged are merged automatically. The user is prompted for all others.</td>
</tr>
<tr>
<td></td>
<td>● “Always ask the user, even for mergeable changes”: For all changed objects, the user is prompted, even if some of them can be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>“Locks” Behavior such as CODESYS SVN objects when they are changed locally.</td>
</tr>
<tr>
<td></td>
<td>● “Always try to lock before modification”: All objects are locked before they are changed, even if they can be merged.</td>
</tr>
<tr>
<td></td>
<td>● “Only lock the objects which don’t support merging”: Only those objects are locked that cannot be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>● “Never acquire a lock automatically”: No objects are locked, not even if they can be merged automatically.</td>
</tr>
<tr>
<td></td>
<td>“Marker”</td>
</tr>
<tr>
<td></td>
<td>● “Use conflict markers when merging objects”: If objects with conflicts exist that cannot be merged, then these conflicts are marked in the source code with conflict markers. In addition, the object itself is marked as being merged successfully (no conflict).</td>
</tr>
<tr>
<td></td>
<td>● “Leave non-mergeable objects as conflicted”: No conflict marker is set. Objects that cannot be merged remain in the status &quot;With conflict&quot;.</td>
</tr>
<tr>
<td>Prompt the user when automatic locking fails.</td>
<td>☐: If it is not possible, to lock the object, then the dialog “Automatic locking failed” opens (see dialog description).</td>
</tr>
</tbody>
</table>

Example of conflict markers

```plaintext
Foo();
>>>>>>>>>>>>>>>>>>>
I := I + 1;
=====
I := I + 2;
<<<<<<<<<<<
```

Table 763: “Server check”

<table>
<thead>
<tr>
<th>“Check server for updates and locks”</th>
<th>CODESYS SVN checks in the specified time interval that objects have been updated on the server. In addition, it checks whether objects are locked or locks have been stolen.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Check interval (minutes)”</td>
<td>Example: 10</td>
</tr>
</tbody>
</table>

Table 764: “Ignore for comparison”

<table>
<thead>
<tr>
<th>Ignore whitespace</th>
<th>☐: Whitespace differences between the current project and the reference project are ignored.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ignore comments</td>
<td>☐: Comments in the programming code are excluded from the comparison.</td>
</tr>
<tr>
<td>Ignore Properties</td>
<td>☐: Object properties are excluded from the comparison.</td>
</tr>
</tbody>
</table>

Table 765: “Marker”
Some of the SVN options can be overwritten by the project-specific settings.

Project-specific settings are defined in the menu “Project ➔ Project settings”, category “SVN Settings”.

See also

- Chapter 1.8.7.5.3.5 “Dialog 'Automatic locking failed’” on page 3966

Tab 'SSH'

Symbol: 🔒

**Function:** This tab contains the settings for the SSH protocol.

**Call:** Menu bar: “Tools ➔ Options”.

Table 765: “SSH client implementation”

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;libssh2 (recommended)&quot;</td>
<td>CODESYS SVN uses Libssh2 for establishing a connection via SSH protocol. This is the recommended setting.</td>
</tr>
<tr>
<td>“SharpPlink (backwards compatibility)”</td>
<td>CODESYS SVN uses plink.exe for establishing a connection with SSH servers. This option is required only for communication with outdated servers that support the deprecated SSH-1 protocol.</td>
</tr>
</tbody>
</table>

The SSH configuration can be overwritten by means of the environment variable `SVN_SSH` or server-specific by means of the SVN configuration file.

- **Tunneling via SSH**

Dialog 'Project Settings' - 'SVN Settings'

Symbol: 🔒

**Function:** The behavior of the integrated SVN version control system is configured in this dialog.

**Call:** Menu bar: “Project ➔ Project Settings” (“SVN Settings”).

**Requirement:** A project is open.

Table 766: “Automatic locking and merging”

With these settings, you can overwrite the default settings that were made in the dialog “Tools ➔ Options”, category “SVN Settings”.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Merge&quot;</td>
<td>Behavior for the commands “Update”, “Merge”, or “Switch”, when both sides (working copy and SVN repository) have changed from the base version.</td>
</tr>
<tr>
<td>“Locks”</td>
<td>Behavior such as CODESYS SVN objects when they are changed locally.</td>
</tr>
<tr>
<td>“Marker”</td>
<td>Behavior for conflicts</td>
</tr>
</tbody>
</table>
Table 767: “Settings SVN version info"

| “Create SVN_VERSION_INFO constants for IEC access” | ☑: The object SVN_VERSION_INFO is created and includes global constants or variables for the project metadata. |
| | ☐: The object SVN_VERSION_INFO is not available. |
| | When you activate the option, the object is created automatically. When you deactivate the option, the object is removed from the project automatically. |

See also
- ☑ Chapter 1.8.7.5.3.1 “Dialog 'SVN Settings’” on page 3960

Dialog 'Select revision’

Function: This dialog shows the currently selected revision. You can edit the selection there.

| “Revision” |
| “HEAD” | ☑: The latest revision (top revision) within a branch is displayed. |
| “Revision” | ☑: A specific revision is displayed by the revision number. |
| | Example: 3 |
| | Tip: Click \[<][>\] to show the revisions. Then the “Log” dialog opens to display the revisions and the associated actions. The revision that you select there is applied. |
| | ☑: A specific revision is checked out by the modification date. This is the highest revision at the given time (the last revision before that time). |
| | Example: 12/23/2016 11:59:59 |
| “Date” | ☑: Modification date in universal time is used. |
| “Use UTC Time”: | ☑: All objects below the selected object are also reset. |
| “Reset recursively” | The action fails if |
| | ☑: Objects have been moved in or out of the hierarchy below |
| | ☑: Objects outside of the hierarchy would be changed by implicit dependencies |

- "Version control with Subversion", Section "Revision identifier"

Dialog 'Subversion Authentication’

The dialogs are used for authenticating the server/client connection. A server or client authentication is performed depending on the initial situation and protocol.
Overview of possible protocols and dialogs

- **svn://**: The SVN protocol; either unencrypted or SSL/TLS encrypted
  - Can prompt for user name and password (even for an unencrypted connection)
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid (for TLS/SSL encryption)
  - As an alternative or in addition to the user name and password prompt, the client can also be authenticated with client certificates (for TLS/SSL encryption). The dialogs for authentication open with the client certificate.
- **http://**: SVN via http, unencrypted
  - Can prompt for user name and password
- **https://**: SVN via http, SSL/TLS encrypted.
  - Can prompt for user name and password
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid.
  - As an alternative or in addition to the user name and password, the client can also be authenticated with client certificates. The dialogs for authentication open with the client certificate.
- **svn+ssh://**: The SVN protocol, encrypted through an SSH tunnel. SSH (Secure Shell) is the usual networking tool in Linux/Unix for accessing other computers.
  - Can prompt for user name and password
  - Prompts for server certificate in the dialog for authentication if the server is still unknown in order to be sure that it is the correct server.

Initial situation: CODESYS (as a client) receives an unknown or defective server certificate. This dialog shows information about the certificate. There you can confirm the identity of the server.

<table>
<thead>
<tr>
<th>“Authentication area”</th>
<th>Connection that is secured</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: <a href="https://svn">https://svn</a> repository:443</td>
<td></td>
</tr>
</tbody>
</table>

**Table 768: “Certificate information” (for SSL/TLS connections)**

<table>
<thead>
<tr>
<th>“Host name”</th>
<th>Example: svn repository</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Thumbprint”</td>
<td></td>
</tr>
<tr>
<td>“Valid from”</td>
<td></td>
</tr>
<tr>
<td>“Valid to”</td>
<td></td>
</tr>
<tr>
<td>“Issuer”</td>
<td>Example: 3S-Smart Software Solutions GmbH</td>
</tr>
<tr>
<td>“Certificate”</td>
<td></td>
</tr>
</tbody>
</table>

**Table 769: “SSH server key information” (for SSH connections)**

<table>
<thead>
<tr>
<th>“Key type”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Key size (bits)”</td>
</tr>
<tr>
<td>“Key thumbprint”</td>
</tr>
</tbody>
</table>
**Dialog for authentication with a client certificate**

Initial situation: The SVN server requires a client certificate for authentication. In this dialog, you select the client certificate in order to confirm the identity.

| “Save information to RAM” | The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again. |
| “Save to disk” | The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used. |

| “OK” | Authenticates and established the connection. |

**Table 770: “The SSL server requires a client certificate file.”**

| “File” | Client certificate file |

Dialog for authentication with a pass phrase

Initial situation: The SVN server is configured so that it demands a client certificate for authentication. The applied certificate is protected by a pass phrase.

| “Authentication area” | Connection that is secured |
| Example: https://svn repository:443 |

"Save information to RAM" - The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.

"Save to disk" - The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

"OK" - Authenticates and established the connection.

Table 771: “A pass phrase is needed to unlock the certificate.”

<table>
<thead>
<tr>
<th>“Pass phrase”</th>
<th>Example: ***</th>
</tr>
</thead>
</table>

| “Save information to RAM” | ☑️: The pass phrase is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again. |
| “Save to disk” | ☑️: The pass phrase is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used. |

| “OK” | Authenticates with client certificates by means of a pass phrase and establishes the connection. |

Dialog for authentication with a user name and password

Initial situation: The SVN server is configured so that it demands a user name and password for authentication.

| “Authentication area” | Connection that is secured Example: https://svn repository:443 |
| “User name” | Example: a.mayr |
| “Password” | Example: *** |

| “Save information to RAM” | ☑️: Saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again. |
| “Save to disk” | ☑️: Saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used. |

| “OK” | Establishes the connection and authenticates it. |

Dialog 'Automatic locking failed'

The dialog shows a list of all objects for which an automatic locking was not possible. In the options you define how CODESYS SVN will resolve the conflict.
Table 772: “Automatic Locking and Merging”

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Try to steal the lock for the affected objects”</td>
<td>These options are displayed if another user has locked the object.</td>
</tr>
<tr>
<td>“Activate the &quot;Offline Mode&quot; to temporarily suppress locking”</td>
<td></td>
</tr>
<tr>
<td>“Update the affected objects to the newest revision”</td>
<td>These options are displayed if there exists a more current version of the object on the server.</td>
</tr>
<tr>
<td>“Update the whole project to the newest revision”</td>
<td></td>
</tr>
<tr>
<td>“Activate the &quot;Offline Mode&quot; to temporarily suppress locking”</td>
<td>These options are displayed if no connection can be established to the server.</td>
</tr>
<tr>
<td>“Activate the &quot;Offline Mode&quot; to temporarily suppress locking”</td>
<td></td>
</tr>
<tr>
<td>“SVN Project Settings”</td>
<td>Opens the SVN project settings dialog (menu “Project ➔ Project Settings”). There you can change the settings for the automatic locking.</td>
</tr>
<tr>
<td>“SVN Settings”</td>
<td>Opens the general SVN project settings dialog (menu “Tools ➔ Options”).</td>
</tr>
</tbody>
</table>

1.8.7.5.4 Objects

1.8.7.5.4.1 Object ‘SVN_VERSION_INFO’................................................................. 3967

Object ‘SVN_VERSION_INFO’

Symbol:  

The object contains the SVN metadata of the project as global constants or variables in a variable list. It is located in the “POUs” view. You can specifically retrieve the data of the global constants or variables by the application. By calling specific data, you can also reduce the memory usage on the controller.

The SVN metadata is provided for this purpose, subdivided over multiple global variable lists (GVLs):

- “SVN_VERSION_INFO”
- “SVN_Info_Summary”
- “SVN_Info_SummaryW”
- “SVN_Info_URI”
- “SVN_Info_Revisions”
- “SVN_Info_Flags”
- “SVN_info_LastChange”

The SVN_VERSION_INFO object is created automatically when a project is imported to a SVN repository. To do so the option “Create SVN_VERSION_INFO” in the dialog “Import project to SVN” must be activated.

Furthermore you can create the object or remove it from the project with the option “Generate SVN_VERSION_INFO constants for IEC Access” (Dialog “Project ➔ Project Settings”, category “SVN Settings”).
Table 773: Global Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MINREVISION</td>
<td>LINT</td>
<td>Lowest revision number of the working copy</td>
</tr>
<tr>
<td>MAXREVISION</td>
<td>LINT</td>
<td>Highest revision number of the working copy</td>
</tr>
<tr>
<td>PARTIAL</td>
<td>BOOL</td>
<td>TRUE: The working copy is incomplete. Example: Cancellation during the last update due to a network error or a checkout.</td>
</tr>
<tr>
<td>MODIFIED</td>
<td>BOOL</td>
<td>TRUE: Local changes were made.</td>
</tr>
<tr>
<td>SWITCHED</td>
<td>BOOL</td>
<td>TRUE: Parts of the project were branched (with the “Switch” command).</td>
</tr>
<tr>
<td>VERSION</td>
<td>STRING</td>
<td>Version identification, similar to Apache™ Subversion® (subversion.exe) Example: 12:34M, means MINREVISION = 12, MAXREVISION = 34, MODIFIED = TRUE For more information, refer to the documentation for Apache™ Subversion®.</td>
</tr>
<tr>
<td>CLEAN</td>
<td>BOOL</td>
<td>TRUE: The version is clean.</td>
</tr>
<tr>
<td>URL</td>
<td>WSTRING</td>
<td>SVN-URL of the project Example: <a href="https://svnserver/repository/trunk/ControlABC.project">https://svnserver/repository/trunk/ControlABC.project</a></td>
</tr>
</tbody>
</table>

If a controller does not support the data type WSTRING, then a compiler error is issued when accessing the object SVN_VERSION_INFO.

1.8.8 Subversion
1.8.8.1 Project Version Control with Subversion

Introduction

Automation Builder projects can be stored in Subversion (SVN) repositories by using the Project Version Control. The Project Version Control can be used to track changes on a project and to have access to historic versions of the whole project or objects in the project. It is possible to hold different versions of a project in branches and to compare these versions. The Project Version Control enables multiple engineers to work collaboratively on the same project.

Basic knowledge

Make yourself familiar with the concepts of SVN.

This manual about Project Version Control is additionally to the following information and describes mainly the specific behavior of Subversion in Automation Builder.

- Homepage of Subversion: http://subversion.apache.org/
- Online user manual for Subversion: http://svnbook.red-bean.com/
- Documentation on SVN integration in Automation Builder: Refer to subfolder .
1.8.8.1.1 Preconditions

**Automation Builder**
- In Automation Builder, the Project Version Control must be installed.
- A valid license for the Project Version Control must be activated.
- All collaborating users working on the same project need:
  - Automation Builder installed in the same version with the same features.
  - License for same edition.
  - Same set of optional third party device descriptions.
  - Same set of optional customer specific packages.

**SVN server**
The Project Version Control can be used in combination with an SVN server in version 1.6 or newer, the repository format should be 1.5, 1.6 or 1.7. Newer repository formats are not yet supported.

The usage of local repositories in the local file system or even on a network share is strongly discouraged.

1.8.8.1.2 Working with Project Version Control

- All objects in the device tree or POU tree are represented by an object in the SVN repository, there might be hidden objects that are not visible in the tree but that exist in SVN.
- The smallest unit in the SVN repository is one object including all its data like name, parameters, device identification.
- Objects are identified in the SVN repository by their name. Renaming one object in Automation Builder means to delete it from the SVN repository and add a new one to the SVN repository. Renaming an object causes a break in the history of that object.
- By default objects are locked before they are changed to prevent other users from changing the object. The locking strategy can be changed in the user options.
- Objects can be compared to other versions of the same object, many differences/changes between the current object in the Automation Builder project and the compared object can be merged into the object in the Automation Builder project. Merging changes could be used to resolve conflicts in case concurrent changed can not be avoided.

- To ensure consistency it is required and also enforced that some changes can be committed or reverted only together:
  - All changes to device objects in the hardware tree that are sub-nodes to the same top level device. Note: Objects that are not devices are excluded, e.g. the application node.
  - All changes below the AC500 PLC application node.
- Most SVN operations can not be performed while other external applications like CODESYS or Panel Builder work on files that are embedded in Automation Builder project.
- Some operations like changing the target or updating the project to the latest device (description) versions do a recursive lock of the whole AC500 PLC. If the lock can’t be obtained the operation is aborted.
- Some objects contain internal data that has no meaning to the end user but is also important. Changes on such data are not shown in the compare dialog or are summarized by a placeholder like "There are hidden changes".
- Including externals is not supported.
1.8.8.1.3 Recommendations on Working with Project Version Control

Be collaborative
- Multiple users that work collaboratively on the same project should agree on their responsibility for certain parts of the project where they do changes to avoid conflicts and tree conflicts.
- Agree on locking strategy used by all users working on the same project.
- Distribute the work between multiple users meaningfully.
  - It is suggested to setup the hardware structure at first before other users checkout a project to work on it and limit structure changes in the hardware tree to the minimum.
  - Before adding objects, especially top level objects, users should agree that only one user adds objects at top level or below the same parent, or agree on unique names for the objects to add. The default naming scheme for new objects bears the risk of name conflicts. These conflicts could be resolved only by reverting the changes of the user who later tried to commit the changes.

Be careful
- The SVN integration (and also project compare) gives lot of power to the user, users should be sure to do only things they fully understand. Especially by merging changes incomplete it is possible to create inconsistent data.
- Adding devices, removing devices or even changing parameters can have side effects to other devices, do not change objects/parameters to their original state by merging that were not done explicitly.
- Commit changes frequently to SVN.
  - To release locks that you don’t longer need.
  - To reduce the risk of conflict with co-workers.
  - To keep the sets of changes to commit small.
- Do frequent updates when collaborating in a team.
  - To be up-to date.
  - To keep the sets of changes to get from SVN small.
  - To reduce the risk of losing work results in case of conflicts.
- To avoid conflicts, it is suggested to stay with the default setting to automatically lock objects before doing changes. Consider explicit recursive locks of sub-trees where you plan bigger changes.
- Prefer a clean checkout over using the switch command to change between different branches.
- Do not use the switch command to change between unrelated projects, this could corrupt the Automation Builder project (local copy, not in SVN) easily.
- Commit local changes to the SVN repository before creating a branch.

Be effective
- Give objects good/correct names after adding them and use renaming of objects already committed to SVN sparely to maintain a continuous history in the SVN repository.
- The goal to revert only single changes of all changes done that must be committed/reverted together, could be achieved by using project compare or the object compare dialog.
- If changes can’t be committed to the SVN repository because of locks hold by other users, it is possible to create a branch, use the switch command to change to this branch and commit the changes there. The branch and base line could be merged together later.

1.8.8.1.4 Known Issues and Troubleshooting

Not all changes are shown for all objects, but hidden changes are also important.

The device pool may be changed as side effect of several operations, including opening the project.

When a project was corrupted (by performing an update that tried to add an AC500 Communication Module) it is possible to save this project and merge changes to a project that has been cleanly checked out by project compare.
1.8.8.2 SVN Support Examples

1.8.8.2.1 Importing Automation Builder Project to SVN Repository

1. In the Automation Builder main menu, go to “Project ➔ SVN ➔ Import Project to Subversion”.
2. Enter user credentials and click “OK”.
3. Select SVN server repository to import Automation Builder project and click “OK”.
   ⇑ The Automation Builder project is imported into the selected repository and connected automatically to the repository. The imported project nodes are identified with green indicators.

1.8.8.2.2 Logging in User2

1. In the Automation Builder main menu, go to “Project ➔ SVN ➔ Checkout”.
2. Enter user credentials and click OK.
3. Select the repository location, project folder and revision if any and click “OK”.
   ⇑ The project will be checked out of the repository, saved in the selected location and opened as a primary project.

The tables below provide the descriptions of the options available in the check-out dialog.

<table>
<thead>
<tr>
<th>Checkout options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Omit externals</td>
<td>Do not checkout external objects.</td>
</tr>
<tr>
<td>As library project</td>
<td>Saves the project as a CODESYS library file.</td>
</tr>
<tr>
<td>Revisions</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------</td>
</tr>
<tr>
<td>HEAD</td>
<td>Checks out the Head revision.</td>
</tr>
<tr>
<td>Revision</td>
<td>Allows to select the required revision of the project.</td>
</tr>
<tr>
<td>Date</td>
<td>Allows to select a revision date of the project.</td>
</tr>
</tbody>
</table>

The following instances can occur in the workflow.

- If the project contains any updates, the specific project level node is indicated with 🔒.
- If a new object is added to the project, the newly added node is indicated with 📦.
- If the project node is deleted, the specific node is indicated with ❌.

### 1.8.8.2.3 Examples

**Example 1**
If User1 modifies Panel_CP600 project, then the node indicator turns to orange with lock symbols. If User2 need to modify the same Panel_CP600 project, the Panel_CP600 project appears with a lock symbol.

![Diagram](image)

To steal the lock of an affected object, proceed as follows:

1. Double-click “Panel_CP600” project.
   - Automatic lock failed dialog is displayed.
2. Enable “Try to steal the lock for the affected objects” and click “OK” to steal the lock.
3. In the Lock Message window, enter the reason to steal the lock and click “OK”.
4. User2 can modify and commit the project.

**Example 2**
If User1 adds a new object to the project and commit the changes, then User2 can update the project to see the latest modifications.
1.8.9 Python

1.8.9.1 Python script support

Using scripts

Scripting allows python scripts to be used to automate project configuration in Automation Builder. Parameters can be added to scripts, so that a generic script can be customized before execution. The user can add a script to most parts of the device tree. A script can be started either from the user interface (by a command or with the python scripting editor) or from the Windows command line and is saved with the project.

With the scripting feature commands or complex program operations can be automated. Examples of use cases:
- Integration of Automation Builder in automatic build server environments:
  - continuous integration (CI)
  - continuous delivery (CD)
  - continuous testing
- Integration with third-party software, for example:
  - code generators
  - creation of projects that are custom tailored to a specific machine configuration
- Creation of documentation
- Updating of libraries: Setting of project information during the release process
- Automatic testing: Mostly in connection with the Professional Test Manager
- Outputting variables via monitoring APIs

**Licensing**
A valid license is required to use the scripting. If you open a project with the existing script object without a valid license, you are not allowed to add or edit the scripts. However, the scripts are not removed from the project.

**Scripting language**
The Automation Builder scripting language is modular and based on IronPython. For this purpose, the Automation Builder “ScriptEngine” component combines the IronPython interpreter with the Automation Builder development environment which makes the extensive python framework libraries available including file access in networks and much more.

**1.8.9.2 Working with script objects**
Scripts to execute can be added to and stored in the Automation Builder project. Additionally, parameters can be added to scripts, so that generic scripts can be customized before execution.

**Adding a script object to the project**

1. In the device tree, right-click on a node (e.g. a PLC node) and click “Add object”.
2. Under “Scripting category” select “Script ➔ Add object”.
   - The 'Add Script' dialog is displayed.
3. Browse and select a script from the file system or create a new script by clicking [Add].
   A script is added below the selected node and the editor is opened.

4. The default parameter values are read from the script. The user can edit the default values as required.

   Editing scripts within Automation Builder is not supported. You can use an external editor to edit the script and then import it to Automation Builder.

   The script objects can be reused within the project via copy-and-paste around the device tree.

**Execution**

The user can execute the script with the parameter values via the execute button in the editor or via right-click on the script object in the device tree by selecting “Script ➔ Execute”.

**Import**

The user can import the script from the file system. This will replace the contents of the current script object with the contents of the imported file. Optionally, parameter values will be preserved if the imported script has a matching named parameter. In the device tree, right-click on a script object and select “Script ➔ Import”.

**Export**

The user can export the selected script and save it as a new file in the file system. The exported file does not include any edited parameter values. In the device tree, right-click on a script object and select “Script ➔ Export”.

**Parameters**

The following instructions help the user to create parameters in the python script:

- Parameters must be defined in the script.
- Parameters and values are optional.
- The **ParameterName** and the **ParameterValue** must be delimited with symbols. The format must be as follows:
  
  "#AutomationBuilder_Parameter {"ParameterName"} {= "ParameterValue"}
● {ParameterName} is the name given to the parameter. This allows the values to be referenced in the python script.

● {ParameterValue} is the default value given to the parameter. This value can be modified in the editor.

The example below shows the format of the ParameterName and ParameterValue in the script.

- #AutomationBuilder_Parameter "numWidgets": creates a new parameter called numWidgets.
- #AutomationBuilder_Parameter "numWidgets" = "4": creates a new parameter called numWidgets and initializes to the value 4.

Using parameters within the python script:

- Parameters can be used in the script by creating an instance of the parameter helper:
  parameterHelper = AutomationBuilder_Parameters.create()
- Individual parameters are retrieved by calling:
  GetParameter(parameterName). devicename = parameterHelper.GetParameter("Name")

1.8.9.3 Python script editor

In Automation Builder a browser-based python script editor is integrated. This allows the user to modify the existing python script, to create a python script from the scratch and to finally execute the script. Moreover, it assists the user in writing the script with the following features:

- Auto suggest
  - IntelliSense suggestions for the python syntax during typing.
  - IntelliSense for CODESYS script engine and Automation Builder injected script objects.
  - Built-in language service that provides complete code intelligence for objects, properties and methods.
  - Details of the object with [CTRL] + [spacebar].
- Auto completion
  Press the Enter key on a function suggested by IntelliSense in order to insert it.
- Python syntax highlighting (basic syntax colorization)
  The function and its respective namespace is automatically colored in order to match colors.
- Matching brackets
  Matching brackets are highlighted as soon as the cursor is near to one of them using the command palette.
- Zoom
  Changes the font size of the editor's content.
- Find and replace
  Support of 'Find' (search for a keyword) and 'Find and replace' (search and replace a keyword). This feature is supported in the editor, however not integrated in Automation Builder platform.
- Minimap
  High level overview of the script for a quick navigation and code understanding.
- Copy/paste
  Support of 'copy and paste' of the script text within and into the editor.
- Undo/redo
  Support of 'undo/redo' for editing actions. This feature is supported in the editor, however not integrated in Automation Builder platform.
- Keyboard shortcuts
  Keyboard shortcuts allow to perform most tasks directly from the keyboard (e.g. [CTRL] + [Z], [CTRL] + [Y]) including copy and paste. For further keyboard shortcuts refer to the command palette ([F1]).
- Folding
  Support of folding and expanding script regions.
- Comment/uncomment the code
  Support of commenting (\[CTRL\] + \[K\]) and uncommenting (\[CTRL\] + \[C\]) code through shortcuts.
- 'Execution' button
  Executes the script directly in the editor window.
- In order to start a new script from the scratch the user can start with an empty editor. This can be done via the 'Add script' dialog without script file selection.

For further features that can be used in the python script editor refer to the command palette (\[F1\]).

**Limitations with CODESYS script engine IntelliSense**

- No IntelliSense available for return type of a property.
- No support of IntelliSense for keyword "None".
- No IntelliSense support for method overloading.
- No IntelliSense support for methods that return an object.
- Private methods are also part of IntelliSense. Refer to the CODESYS script engine documentation to verify the access modifier.

### 1.9 Human machine interface

#### 1.9.1 Panel Builder interface

This document describes HMI CP600 Control Panel configuration in Automation Builder and starting HMI configuration and programming software Panel Builder 600 from Automation Builder. The Panel Builder project created for the HMI CP600 is stored within the Automation Builder project.
1.9.1.1 Adding desired AC500 PLC to the project

Configuring the Symbol File

1. In the Automation Builder device tree, right-click the “Application” node and click “Add object”

![Add object dialog]

2. Click on “Symbol Configuration” and click “Add object”

⇒ A “Symbol Configuration” object is added to the “Application” node.

3. Double-click on the “Symbol Configuration” object, then click on “Build”

![Symbol Configuration dialog]

⇒ A list of all variables in the project is generated. Single variables or groups of variables can be selected by checking the corresponding item in the list.
4. After the symbols have been configured, download the project or click “Build ➔ Generate code” in the Automation Builder to create an .xml file containing all the variables read to be imported in the Tag Editor.

1.9.1.2 Creating a Panel Builder project

Adding a panel object

1. Right-click in the Automation Builder device tree and click “Add object ➔ Panel-CP600”
2. Click on “CP600 Control Panel” and click “Add object”
   ⇒ A Control Panel object is added to the Automation Builder device tree.

Starting a Panel Builder project

1. In the device tree, double-click “Panel CP600” object to start Panel CP600 screen.

   ![Panel CP600 screen]

2. Select the required PLC and enable the checkbox in the 'Use Standard Connection Settings' column to use it as a standard gateway connection.

   You can set communication settings using the application program or by creating custom communication settings. Custom communication settings can be configured by clicking the button in the 'Details' column.

3. Enable the “Update Panel Builder project on launch” checkbox and click [Launch Panel Builder Editor].

   If you update Automation Builder project with new variables and data types or if there are changes in existing Automation Builder project variables and data types (new, modified, deleted), recompile CODESYS application to refresh the symbol file, then launch Panel Builder editor.

4. Select “New” and click “Open” to create a new HMI project.
   ⇒ A project wizard is displayed.

   If you want to import an already existing Panel Builder project file from the file system, select “Import existing project file” and proceed.
5. Select the required panel type and orientation and click “Finish”.
   - A new project wizard starts only if the Panel project is empty.

The panel projects can be compared in Automation Builder using the “Compare Objects” option.
Changing panel type

1. In the Panel project, double-click “Project properties” to change the panel type to the panel which is used.
   ⇒ The Properties dialog is displayed.

   ![Properties dialog](image)

   - Project Widget: Panel Project
   - Id: Panel Project
   - Full Path: C:\Users\Test\AppData\Local\Temp
   - Version
   - Runtime
   - Plug-in
   - Project
     - Home Page: Page1.png
     - PageWidth: 480
     - PageHeight: 272
     - Display Mode: Landscape
     - Project Type: CP604
     - Panel Memory: 2GB
     - PageRequest
     - CurrentPage
     - SyncOptions: disable
     - Hold Time (ms): 2000
     - Autorepeat Time (ms): 250
     - Background color option: None
     - ComboBox View Mode: Context

   - JS properties:
     - TargetName = getPropertyValue("targetName")
     - setPropertyValue("targetName", TargetName)

2. In the Properties dialog, expand “Project” and click “Project Type”.
   ⇒ A project wizard dialog is displayed.

3. Select the desired panel type and click “Finish”.

Project information

The project information view provides an overview of the Panel Builder project without opening the project. To open the project information, double-click the “Panel_CP600” object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.
The Panel Builder project information shows the list of PLCs added to the project.

### 1.9.1.3 Configuring Panel Builder

#### Configuring communication protocols

The user can configure a panel project manually in Panel Builder editor when there is a need to create individual panel projects. Otherwise, the configuration is updated in the panel project while launching Panel Builder editor in Automation Builder.

1. In the Panel Builder project structure, double-click "Config ➤ Protocols".
2. Click to add a protocol.
3. Select “OPC UA Client” to ensure an encrypted communication between AC500 V3 devices and the control panels. This is necessary to protect passwords and other data in terms of cyber security. Set the IP address, port, protocol type and PLC models. Click [OK].

#### Importing tags

1. In the Panel project view, click “Config ➤ Tags”.
2. Select the protocol from the drop-down list and click to import tags.

*If the Panel Builder contains multiple tag importers, a dialog is displayed to select the required importer type.*
3. Select the symbol file which was exported to the file system.

4. In the lower part of the tag editor, mark the desired tags and click “Import Tag(s)” to import the tags to the Panel Builder project.
4. Right-click on the widget value and select “Attach To” to attach a tag to the widget.

5. Select the desired tag and select the desired option for the authorization “Read Only” or “Read/Write” or “Write Only”. Then, click [OK].

**Downloading a project to panel**

1. In the Panel Builder main menu, click “Run ➔ Download To Target”.
2. Select the CP600 project from the drop-down list and click “Download”.

**Importing an existing Panel Builder project**

1. In the Automation Builder device tree, right-click the Panel project and click “Import ➔ Panel Builder Project”.
   System prompts to overwrite the exiting project object data.
2. Click “Yes” to confirm.
3. Select the existing Panel Builder 600 project from the file system and click “Open”. ➔ The imported project is displayed.
Exporting Panel Builder project

1. In the Automation Builder device tree, right-click the Panel Builder 600 project and click “Export ➔ Panel Builder Project”.
2. Click “Browse” and select the desired location in the file system and save the project file.
   ➔ A success message is displayed, if the project file exports successfully.

When you double-click the Panel Builder project node, the compressed information of the node is extracted into a temporary folder and then the external Panel Builder program is started. After the external Panel Builder program is closed, the corresponding Panel Builder files can be compressed back into the node and saved in the Automation Builder project.

We recommend to edit the Panel Builder project by starting Panel Builder through the Automation Builder. You can also export a Panel Builder project to the file system to edit the project by using the external Panel Builder. Then, reimport it to Automation Builder.

1.9.2 SCADA Integration

Overview

This document describes SCADA integration configuration in Automation Builder using zenon editor. The configured device network address information and variables are synchronized with zenon editor to avoid double entry.

The Automation Builder supports both standard and multi-user functionality.

1.9.2.1 Creating Workspace and Project

1. In the device tree, double-click “zenon_Project”.

   ➔ To launch the zenon editor, click [Launch Zenon Editor].

To update the zenon project with latest changes of application program, click [Update zenon project].
2. Select the required PLC and select the “Use Standard Conn. Settings” option to use as a standard gateway connection.

This enables the user to use the same communication settings that Automation Builder uses to communicate to the PLC.

The configured gateway communication settings made in Automation Builder are displayed in the column 'Connection Type'.

As an alternative you can create custom communication settings: Deselect the “Use Standard Conn. Settings” option and click the button in the 'Details' column.

3. Click [Launch Zenon Editor] to create a new workspace and project.

![](image)

**Fig. 313: Connect to zenon project**

If Zenon Editor is already running, then select the “Use current workspace” option.

4. Select the “Create a new workspace” option and select the file location to create a new workspace.

5. Select the “Create new project” option to create a project.

   ABB zenon editor is displayed.

If you update or change an Automation Builder project with new variables or data types (new, modified, deleted), recompile the application to refresh the symbol file and click [Update zenon project].
After creating the project and workspace in Automation Builder, it is not required to set it again for the zenon object. A double-clicking on the zenon project shows the previously configured zenon project and the workspace.

1.9.2.2 Loading existing Workspace and Project

You can load an existing workspace and project to ABB zenon supervisor.

1. In the zenon_Project screen, click [Update zenon project].
   
   ⇒ Connection to the zenon project dialog is displayed.

2. In the workspace area, enable “Load existing workspace” and select the location.

3. In the project area, enable “Select loaded project” and click [OK].
   
   ⇒ Zenon editor loads the selected existing workspace and the project.

1.9.2.3 Checking the Gateway Settings in a Zenon Project

The gateway settings configured in Automation Builder can be checked in a zenon project. The IP address configured in Automation Builder are displayed in the zenon driver configuration.

In the Project Manager structure of the zenon editor, click “Variables ➔ Drivers” to configure the driver configuration.

The “Settings” tab shows all gateway settings based on the number of configured PLCs in Automation Builder. The IP address should be similar to the project gateway settings in Automation Builder.

In the zenon project window, the Connect column should be checked to transfer the desired number of PLC connection settings to the zenon editor.
1.9.2.4 Generating a Symbol File

Before generating the symbol file, define the variables in the CODESYS application.

1. In the CODESYS application main menu, click “Project ➔ Options”.
2. In the “Options” dialog, click “Symbol configuration”. Enable “Dump symbol entries” and “Dump XML symbol table” and click “Configure symbol file”.
   ⇒ Set object attributes dialog is displayed.
3. Enable “Export variables of object”. If this option has a gray background, double-click on it to activate.
4. In the CODESYS application window, click at the bottom of the window and click “Resources ➔ Tools ➔ Target settings”.
5. In the target settings dialog, open the “General” tab and enable “Download symbol file”.
6. From the CODESYS application main menu, select “Project ➔ Build” to compile the project.

Precondition to generate a symbol file is to create the application and perform a PLC program build in CODESYS application.

The symbol file is generated after the build. The data exchange can be transferred to the zenon project by clicking [Update zenon project] in Automation Builder.

1.9.2.5 Updating Standard Data Types

The standard data types created in CODESYS application can be updated to the zenon project by clicking on “Update zenon project”.

Data types and variables can be updated from the desired number of PLCs configured in the zenon project of Automation Builder.

In the zenon project, double-click “Variables” and check the updated standard data type.
1.9.2.6 Creating Data Types

1. In the CODESYS application open the “Data types” tab. Right-click “Data types ➔ Add object” to create a new data type.

2. Enter the user defined data type name.

3. In “POUs” tab, add the user defined variable data type and compile.

⇒ The user defined data type is created and can be imported in the zenon editor.

If you modify or delete the data types in CODESYS application, compile with “Rebuild all option”.

1.9.2.7 Importing Data Types in zenon Editor

1. In the zenon project, click [Update zenon project] to update the data types.

2. Click “Update” to update the variables and data types to the zenon project.

⇒ The user defined variables and data types are imported to the zenon project.

Fig. 314: User defined variables

1.10 Contact ABB

If you have questions on Automation Builder software you receive further information on http://www.abb.com/automationbuilder.
If you have questions on a PLC product you receive further information on http://www.abb.com/plc.

If you have questions on any ABB product you receive further contact information for your specific device in the ABB global sales contact directory: http://www.abb.com/contacts.

Service - control engineering

ABB operates a technical support center to assist in the case of problems.

- Consultation by phone (helpline)
- Failure analysis and removal at the machine/installation

In order to provide the customer with qualified assistance, customers are requested to provide the following:

- All required application documentation and information.
- Access (if required) to the system being examined.
- Assign key individuals to assist as required.

For inquiries and orders, please contact:

**ABB Automation Products GmbH**

Eppelheimer Str. 82

69123 Heidelberg, Germany

Global sales contact: https://new.abb.com/plc

Phone technical support: +49 6221 701-1444

E-Mail: plc.support@de.abb.com

Repair services and replacement devices

The following services are covered by our activities:

- Delivery of replacement devices
- Repair of defective devices and systems

Please contact your responsible sales office for your inquiry.

Seminars/Workshops

ABB also offers seminars and workshops to support you in planning, commissioning and operation of AC500 devices. If desired, we offer seminars at the customer's facility.

If necessary, it is also possible to arrange the seminar contents according to the customer's wishes. Depending on the special requirements, the training can be held in Heidelberg or at any other location favored by the customer. We are pleased to prepare an individual offer for you according to your special requirements.
