CP500
CONTROL PANELS

CP500 Soft: First Step!
(Example with AC31 40/50 series)
Step3
Summary

1. Material used ...............................................................................................................3
2. New display project .........................................................................................................4
3. Vision from the project and the display screens ...........................................................5
4. Create objects on the screen ..........................................................................................6
5. Transfer the programme ...............................................................................................7
1. **Material used**

In that example we will use a CP555 with an AC31 40 Series (07CR41)
To make the project, we will use:

- CP555  (Reference: 1SBP260179R1001)
- CAB5   (Reference: 1SBN260210R1001) or CAB6 (Reference: 1SBN260211R1001) on RS422 port
- CAB45  (Reference: 1SBN260213R1001)
- CP500Soft (Reference: 1SBS260283R1001)
- 07CR41 (Reference: 1SBN260020R1001)
- 24VDC Power supply
2. **New display project**

1- In Start / Programs / CP500Soft / CP Programmer / Programmer: Open the CP500 Programmer.

2 – Choose File / New

3 – The menu beside appears to choose the CP product and the protocol from the PLC you will use (Driver). Click on Change

4 - Choose the display in the list and valid with OK. Our example: CP555

5 – Same operation for the PLC in choosing the Driver “ABB / Modbus Serial / AC31 40/50 Series” and valid with OK.
3. Vision from the project and the display screens

6 – The first window appears, double click on Blocs (in Project Manager on the left), it represents all the project and all the pages from the application.

On the right, each rectangle represents on screen displayed next you have programmed it. **Main** is the first page, which will appear when you power the product. Arrows represent the links between the different screens.

7 – In the menu Configuration / Peripherals, or with double click on Peripheral, open the window beside. (You will synchronise the communication between the Control Panel and the PLC).

Click right on RS232C next click Properties. Change parameters to correspond to those from the PLC. “Baudrate” 9600, “Parity” None, “Databits” 8, “Stopbits” 1.

On Modbus Serial/AC31 click right and properties. Change Default Station number (choose “1”), valid with OK and close the configuration window.

Double click on « Main », the window beside open.

8 – On the bottom find the toolbar, it contains all the objects possible to use for the model of control panel you use.

When you put the mouse on the different objects (Wait some seconds), there functionality appears.
4. Create objects on the screen

9 – We will visualise the value from Potentiometer N°1 from the PLC.
Click on the object “0.3” (numeric) next click on the screen where you want it to appear. The toolbox below will appear.

Enter the variable address used, in our example the value of the sensor will be an analog signal, address is %IW1062.00 (signed 16 bits).

Put in “Positions”: 4 and “Decimals”: 1, “Gain”: 0.1 (Ex: The value in the PLC will be 150, but we want to see 15.0).

When you click on Apply, you will be able to visualise on the background how will appear what you parameter on the screen. Move the window if necessary.

You can change the aspect of the object in the same window. (Colour of text or Background style…)

10 – We will visualise the value from Potentiometer N°2 from the PLC.
Click on the object (Vu-meter) and click on the screen where you want it to appear. The toolbox beside appears.

Enter the variable address use %IW1062.1

Change the maximum value: 150

You can change the aspect of the object, and see as before the changes, every time when you click on Apply.

11 – We will visualise and change the value from output N°0 from the PLC.
Click on the object (TOR Symbol) next click on the screen where you want it to appear. The toolbox beside appears.

Enter the variable address used %QX62.0

Click on Select choose ROT0, next OK, Put the curser on “Symbol ON” choose ROT1 and OK. Select “Resizable”. Put “X size” 100, “Y size” 100

In “Access” select “Enable operator input”. Valid by OK.
5. **Transfer the programme**

You have created what you want to see on the screen and make the connection between the Control Panel and the PLC. To verify the project, click on the Glasses.

12 – Click on **Send** to transfer the project in the CP555.

The window beside appears, click on Send.

Confirm by “Yes”.

It’s possible just to send a part of the project: unselect “Send complete project”.

Disconnect the CAB5 and connect instead CAB45 with the 07CR41 (Possible to use CAB6 on RS422 connector and the changes are made without to be obliged to disconnect all the time the PLC).

You can now see on the CP555, the values from the potentiometers of the PLC. Click on the selector, it activate or inactivate the output “0” from the PLC (You hear the relay and see the led).
