</table>

Summary

ABB is aware of vulnerabilities in the product versions listed above. A firmware update is available that resolves these privately reported vulnerabilities in the product versions listed above.

An attacker who successfully exploited these vulnerabilities could access sensitive information stored inside the device and can access the device with root privileges.

Vulnerability Severity

The severity assessment has been performed by using the FIRST Common Vulnerability Scoring System (CVSS) v3.1. The CVSS Environmental Score, which can affect the vulnerability severity, is not provided in this advisory since it reflects the potential impact of a vulnerability within the end-user organizations’ computing environment; end-user organizations are therefore recommended to analyze their situation and specify the Environmental Score.

<table>
<thead>
<tr>

<th>CVSS 3.1 (<a href="https://www.first.org/cvss/calculator/">https://www.first.org/cvss/calculator/</a>)</th>
<th>CVSS Base Score</th>
<th>Comment</th>
<th>Status</th>
<th>Fixed in version</th>
</tr>
</thead>
</table>
**Recommended immediate actions**

The problem is corrected in the following product versions:

EIBPORT, firmware version: 3.9.1

ABB recommends that customers apply the update at the earliest convenience.

ABB also recommends renewing the system administrator password with reasonable length (e.g. >8 characters) and an appropriate entropy (contains a random sequence of numbers, small/capital/special-characters).

**Vulnerability Details**

**CVE-2021-28909**

EIBPORT V3 3.8.3 and prior allow a brute force attack to the login service. The password could be weak and default username is known as "admin".

**CVE-2021-28910**

EIBPORT V3 3.8.3 and prior contains basic SSRF vulnerability.

**CVE-2021-28911**

EIBPORT V3 3.8.3 and prior allow unauthenticated attackers access to some sensitive data supporting the attacker in a brute force attack.

**CVE-2021-28912**

EIBPORT V3 3.8.3 and prior. A device specific security credential can be obtained.

**CVE-2021-28913**

EIBPORT V3 3.8.3 and prior. A device specific security credential can be obtained.
CVE-2021-28914

EIBPORT V3 3.8.3 and prior allow the user to set a weak password because the strength is shown in configuration tool, but finally not enforced.

Mitigating Factors

Recommended security practices and firewall configurations can help protect a process control network from attacks that originate from outside the network. Such practices include that process control systems are physically protected from direct access by unauthorized personnel, have no direct connections to the Internet, and are separated from other networks by means of a firewall system that has a minimal number of ports exposed, and others that have to be evaluated case by case. Process control systems should not be used for Internet surfing, instant messaging, or receiving e-mails. Portable computers and removable storage media should be carefully scanned for viruses before they are connected to a control system.

More information on recommended practices can be found in the following documents:

Smart Home Guide for network security in building systems control.

Frequently Asked Questions

What is the scope of the vulnerabilities?

An attacker who successfully exploited these vulnerabilities can gain access to the EIBPORT device with root privileges. In this case the attacker has full control to use the device.

What causes the vulnerability?

The device firmware contains a list of vulnerabilities. All these vulnerabilities together provide a set of options an attacker may use to take over control of the device.

What might an attacker use the vulnerability to do?

An attacker who successfully exploited these vulnerabilities can gain access to the EIBPORT device with root privileges. In this case the attacker has full control to use the device.

How could an attacker exploit the vulnerability?

Since the EIBPORT is a device that requires manual steps to install firmware updates, it is expected that it will take some time until all legitimate users have updated their systems to the latest available firmware version. For this reason, the concrete attack options, that a potential attacker benefits from are taken off from this advisory for security reason.

Could the vulnerability be exploited remotely?

Yes, an attacker who has network access to an affected system node could exploit this vulnerability. Recommended practices include that process control systems are physically protected, have no direct connections to the Internet, and are separated from other networks by means of a firewall system that has a
minimal number of ports exposed. Especially it is recommended not to use dynDNS-Services and such alike to remote control a device.

**What does the update do?**

The update removes the vulnerabilities by modifying the way that the device firmware verifies login credentials. Furthermore, it hardens the product configuration wherever possible.

**When this security advisory was issued, had this vulnerability been publicly disclosed?**

No, ABB received information about this vulnerability through responsible disclosure.

**When this security advisory was issued, had ABB received any reports that this vulnerability was being exploited?**

No, ABB had not received any information indicating that this vulnerability had been exploited when this security advisory was originally issued.

**Acknowledgements**

The finder and reporter of the vulnerabilities listed above have chosen to keep themselves anonymous but being mentioned under a pseudonym. ABB respects this decision and thanks these professional working people to help protect customers.

ABB thanks the following for working with us to help protect customers:

Psystester, for describing the findings and helping to verify the resolving implementation

**Support**

For additional information and support please contact your local ABB service organization. For contact information, see [https://new.abb.com/contact-centers](https://new.abb.com/contact-centers).
