4690 series
Turbidity sensor
**Measurement made easy**
Accurate, reliable turbidity measurement

**Flow-through turbidity design**
- fast response to process turbidity changes due to minimal sample residence time

**Automatic sensor cleaning**
- reduces maintenance requirements
- optimizes performance sensitivity

**Secondary standards for calibration**
- accurate, repeatable, simple, safe
- realize significant cost savings by reducing the use of primary standards

**Reliable and accurate measurement**
- ultralow back scatter for accurate measurement of low turbidity values
- automatic bubble rejection to compensate for erroneous readings due to degassing
ABB’s 4690 range of turbidity sensors

The measurement of turbidity is a critical measurement in drinking water as it is used to indicate water quality and filtration effectiveness (for example, whether disease-causing organisms are present).

ABB’s 4690 range of turbidity sensors has been designed specifically for the measurement of turbidity throughout the potable water treatment process.

Whichever of the two measurement ranges you choose, low range (0 to 40 NTU) or higher range (0 to 400 NTU), you can benefit from reliable, accurate turbidity measurement with automatic optical cleaning and dry standard calibration verification.

Applications

Typical applications for the 4690 range of flow-through turbidity sensors in potable water treatment include:

- **Raw water/source monitoring**
  - Provides an indication of the solids loading entering the treatment plant to enable adjustment of the coagulant dose.
- **Monitoring clarified water**
  - Clarifier supernatant turbidity measurement monitors clarifier efficiency to provide early warning of floc blanket break-up or incorrect coagulant dosing.
- **Filter backwashing control**
  - Monitors the filter backwash curve to minimize clean water usage.
- **Monitoring of filtered water**
  - Ensures correct operation of the filters and guards against turbidity breakthrough.
- **Monitoring of final drinking water quality**
  - Provides a final quality check after disinfection before distribution.

---

**Figure 1** Typical turbidity monitoring application
4690 turbidity sensor overview

- **Auto-clean system**
  - Programmable automatic cleaning
  - Reduces operator maintenance
  - Ensures sensor accuracy and reliability

- **Dry secondary standards**
  - Simplifies routine instrument verification
  - Eliminates chemical standard preparation errors
  - Reduces cost-of-ownership

- **Sample flow cell**
  - Flow-through nephelometric design
  - Minimal sample residence time provides fast response to turbidity changes for improved process control

- **Emitter and receiver assemblies**
  - ISO 7027 compliant

- **Integral sample feed and drain valves**
  - Simple installation
  - Quick and easy calibration
Reliable measurement

ABB’s 4690 range of turbidity sensors has been designed for reliability, ease-of-use, and maintenance simplicity.

Measurement technique

The 4690 range of turbidity sensors utilizes a flow-through nephelometric design compliant to the ISO1 7027 standard.

Water flows continually through the sensor body. Light directed by the emitter assembly passes through the sample where it is scattered by any suspended particles present in the sample. This scattered light is detected by the sensor receiver assembly that is placed at a 90° angle to the incident beam.

The ultralow back scatter allows for very accurate readings as only light scattering due to turbidity is measured. This is especially important when measuring low turbidity values. Due to the short sample residence time in the flow cell the system is able to respond much faster than many competing systems.

Automatic cell cleaning

The 4690 range of turbidity sensors features an auto-clean system. This feature consists of a mechanical wiper assembly that physically wipes clean the optical cell at user-programmable intervals from every 15 minutes up to every 24 hours.

The highly efficient automatic cleaning process overcomes the problem of optical fouling and ensures that performance can be maintained for long periods (up to 6 months) without the need for manual intervention.

Automatic bubble rejection

Turbidity readings can be affected by short-term spikes, usually due to the effect of the sample degassing. The 4690 analyzer has an automatic bubble rejection feature that, when enabled, applies a digital filter to the measured results removing any spurious high reading.

Optional external de-bubbler

Any bubbles present in the sample give false turbidity readings. For applications where bubbles are likely, it is recommended that the optional external de-bubbler assembly is used to supply a constant head of de-bubbled sample to the sensor.
---

**Simple to calibrate**

A key feature of the 4690 turbidity systems is the dry secondary calibration standard that simplifies routine instrument verification, and removes the need for the use of chemical standards.

Both low- and high-range secondary standards are available so that the analyzer calibration can be verified at a level that is suited to the application. Each secondary standard is supplied factory-certified against a primary formazine standard.

![Figure 4 Dry secondary standard](image)

The benefits of using ABB’s secondary standards include:

- **Minimum analyzer downtime**
  - Simple and fast procedure to verify analyzer performance.
- **Low cost-of-ownership**
  - Reduce usage of consumable chemical standards and the time taken to prepare such standards.
- **Minimise employee’s exposure to Formazine**
  - Formazin is highly toxic and a suspected carcinogen.
- **Repeatable and reliable**
  - Removes any chemical standard preparation errors.
- **Simple to use**
  - The secondary standard is simply inserted into the sensor assembly optical light path allowing the pre-calibrated opto-mechanical filter to divert a fixed quantity of light to the detector that corresponds to the calibrated turbidity value. Rotation of the dry standard blocks the light path enabling a zero turbidity calibration to be made.

![Figure 5 Dry standard calibration](image)

---

**Simple to maintain**

The 4690 turbidity sensing systems are designed to be as maintenance-free as possible. The inherent product design and auto-clean feature minimize the amount of maintenance required to external cleaning of sample lines and periodic replacement of the wiper blade and light source.

The sensor features ABB’s patented light replacement system, a unique feature that enables bulb replacement in the field in seconds. Each bulb is supplied fully protected in a patented assembly with integral light guide so you never come into direct contact with the bulb. This not only protects the bulb, ensuring maximum lamp life, but also makes replacement very simple and fast as it just clicks into place.

1. **Calibration verification**
   A procedure used to check whether or not the calibration of the analyzer is within certain limits.

2. **Secondary standards**
   Standards that the manufacturer (or an independent testing organization) has certified provide analyzer calibration results equivalent (within certain limits) to the results obtained when the instrument is calibrated with a primary standard.

3. **Calibration**
   A procedure which checks or adjusts an analyzer’s accuracy by comparison with a defined standard or reference.

4. **Primary standards**
   Turbidity standards that are traceable and equivalent to the reference turbidity standard, within statistical errors. Formazine is the most commonly acceptable form of primary standard. Primary standards are used to calibrate a turbidity meter directly or to calibrate a secondary standard.
Versatile transmitters
The AWT420 four-wire, dual-channel transmitter offers true flexibility for measuring a wide variety of parameters in a single device.

The transmitter that gives you more choice
Offering swappable communications and sensor modules, options for panel-, pipe-, and wall-mountings and general purpose and safety enclosures, the AWT420 is the versatile single box solution for measuring a range of parameters including pH/ORP, conductivity and the 4690 turbidity sensor.

Your data, when you need it
Secure access to your data
Easy and secure access to measurement, diagnostic and audit data.

Keep your analysis up-to-date
Access software updates and sensor information through your smartphone.

Reduce process downtime
Keep track of current and upcoming maintenance tasks.

The AWT420 incorporates several key features to help you find the data you need quickly and easily. An easily navigable full-color TFT display makes it easy to find and access sensor data, while Bluetooth® technology provides up-to-the-minute information and technical support using ABB’s EZLink Connect app.

Available in both corrosion-resistant polycarbonate, or a durable metal version with optional non-incendive approvals for hazardous area installation, it offers a versatile solution for use in utility and industrial process applications.
4690 sensor specification

**Range**
- Low range 0 to 40 NTU
- High range 0 to 400 NTU

**Measurement principle**
- 90° scattered light measurement
- Compliant to ISO 7027

**Maximum linearity**
- Typically <1.0 %

**Accuracy**
- Low range version ±2 % of reading
- High range version ±5 % of reading or 0.3 NTU

**Repeatability**
- 0 to 200 NTU: <1 %
- 200 to 400 NTU: 2 %

**Limit of detection**
- Low range version: 0.003 NTU
- High range version: 0.3 NTU

**Response time**
- T90 < 1 min at 1 l/min (0.26 galUS/min)

**Flow rate**
- 0.5 to 1.5 l/min (0.13 to 0.39 galUS/min)

**Integral wiper cleaning system**
- Programmable operational frequency every 0.25 h,
- 0.5 h, 0.75 h or multiples of 1 h up to 24 h

**Sample operating temperature**
- 0 to 50 °C (32 to 122 °F)

**Sample pressure**
- Up to 3 bar (43.5 psi)

**Ambient operating temperature**
- 0 to 50 °C (32 to 122 °F)

**Ambient operating humidity**
- Up to 95 % RH

**Wetted parts – materials used**
- Cell body unit
  - Black POM (Polyoxymethylene) copolymer
  - Spectrosil 2000 fused silica
  - Nitrile (O-ring)
  - Epoxy preform (cured): Uni-forms 5034-00
  - Polyamide 6
  - Nickel plated brass
  - Teflon

- Wiper unit
  - Black polycarbonate, 10 % glass fiber filled – Lexan 500R
  - Stainless steel (SS 316 S13/S11) w/ chemical black – MIL-C13924 class 4
  - Silicone grease (WRC approved): Unisilkon L 250 L
  - 2-part epoxy adhesive (cured): DELO AD894
  - EPDM (ethylene propylene diene monomer) black
