OriMaster V
Compact orifice flowmeter
The Company

We are an established world force in the design and manufacture of measurement products for industrial process control, flow measurement, gas and liquid analysis and environmental applications.

As a part of ABB, a world leader in process automation technology, we offer customers application expertise, service and support worldwide.

We are committed to teamwork, high quality manufacturing, advanced technology and unrivalled service and support.

The quality, accuracy and performance of the Company’s products result from over 100 years experience, combined with a continuous program of innovative design and development to incorporate the latest technology.

Electrical Safety

This equipment complies with the requirements of CEI/IEC 61010-1:2001-2 ‘Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use’. If the equipment is used in a manner NOT specified by the Company, the protection provided by the equipment may be impaired.

Symbols

One or more of the following symbols may appear on the equipment labelling:

Information in this manual is intended only to assist our customers in the efficient operation of our equipment. Use of this manual for any other purpose is specifically prohibited and its contents are not to be reproduced in full or part without prior approval of the Technical Publications Department.

Health and Safety

To ensure that our products are safe and without risk to health, the following points must be noted:

1. The relevant sections of these instructions must be read carefully before proceeding.
2. Warning labels on containers and packages must be observed.
3. Installation, operation, maintenance and servicing must only be carried out by suitably trained personnel and in accordance with the information given.
4. Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.
5. Chemicals must be stored away from heat, protected from temperature extremes and powders kept dry. Normal safe handling procedures must be used.
6. When disposing of chemicals ensure that no two chemicals are mixed.

Safety advice concerning the use of the equipment described in this manual or any relevant hazard data sheets (where applicable) may be obtained from the Company address on the back cover, together with servicing and spares information.

1 General Safety Information

1.1 User Guidelines
Correct use includes the following:

- Operation within the technical limit values.
- Observing and following the information provided on permissible media (fluids).
- Observing and following the instructions provided in the operating manuals.
- The following uses are not permitted:
  - Operation as a flexible adaptor in piping; for example, to compensate for pipe offsets, pipe vibrations and/or pipe expansions.
  - Use as a climbing aid; for example, for assembly purposes.
  - Use as a support for external loads; for example, as a support for piping.
  - Material gain; for example, by painting over the type plate or welding or soldering on parts.
  - Repairs, modifications, supplements or the installation of spare parts. These are permitted only if performed as described in the operating manual. More extensive work must be approved by ABB – the Company accepts no liability for unauthorized work.

The operating, maintenance and repair conditions that are stated in this manual must be observed. The Company accepts no liability for damage caused by usage that is incorrect or unprofessional.

Warning.
- The Pressure Equipment described in this manual is supplied, where appropriate, in accordance with the European Directive 97/23/EC and is designed to work in pressurized systems. Take care when installing all equipment and follow the instructions given. Failure to do this could result in damage to equipment and create possible hazards to operators and other equipment. Only use the equipment on the process for which it is designed. Install the equipment into a system that has been designed to allow for venting or draining of the process. For the necessary safety requirements refer to the appropriate instructions in this manual.
- Do not exceed the pipe vibration levels stated in the Specification (see Section 6, page 14). Excessive vibration could result in damage to the equipment and create possible hazards to other equipment and operators.

1.2 Permissible Process Media (fluids)
Process media may be used only if:

- It can be assured that the physical and chemical properties of the pressure-bearing materials that come into contact with the process medium are not reduced from that required for operational safety, during the expected lifetime of the equipment.
- Process media with unknown properties for erosion and/or corrosion may be used only if the operator can perform regular and suitable tests to assure the safe condition of the equipment.

1.3 Technical Limit Values
The equipment is intended for use only within the technical limit values specified on the data plate and in the Specification (see Section 6, page 14), including those for:

- The maximum working pressure.
- The maximum and minimum operating temperatures.
- The maximum vibration level stated in the Specification (see Section 6, page 14).

In addition, all connected pipework must be installed as it was designed, to ensure that there is no possibility of leakage or any undue stresses or strain acting upon it.

1.4 Safety Precautions
Instructions and procedures in this manual may require special precautions to ensure the safety of personnel performing the operations. Explosions could result in death or serious injury; therefore refer to the Warnings in the transmitter operating manuals IM/364 [V Design Level 1] SOI-266-XC-D-05-2011 [V Design Level 2] before performing any operation in this manual.

Fig. 2.2 OriMaster V (Design Level 2) 3-Valve and 5-Valve Dimensions

Table 2.2 OriMaster V (Design Level 2) 3-Valve and 5-Valve Sizing Table – Dimensions in mm (in.)
2.2 Meter Orientation

**Caution.** When installing OriMaster V, ensure that the drain/vent valves are positioned to direct the process medium away from personnel and equipment when it is removed during drain and vent operations.

For all meter orientations, ensure the arrow on the meter body is aligned correctly with the direction of flow in the pipeline.

2.2.1 Horizontal Pipe Mounting – Gas
To ensure that condensate drains back into the pipe, mount the meter **above** the pipe, at least 30 degrees above the horizontal – see Fig. 2.3.

2.2.2 Horizontal Pipe Mounting – Liquids & Steam
To ensure that gases vent back into the pipe, mount the meter **below** the pipe, at least 45 degrees below the horizontal – see Fig. 2.4.

---

**Fig. 2.3 Horizontal Pipe Mounting – Gas**

**Fig. 2.4 Horizontal Pipe Mounting – Liquids & Steam**
2.2.3 Vertical Pipe Mounting – Liquid & Gas (Upward Flow)

The vent/drain screw valves on the electronics body must be located correctly depending on the medium being measured:

If pipeline contains: | Position vent/drain valves: | To:
---|---|---
Liquid | Higher than meter body | enable trapped gases to vent – see Fig. 2.5
Gas | Lower than meter body | enable condensate to drain – see Fig. 2.6

![Fig. 2.5 Vertical Pipe Mounting – Liquid](image1)

![Fig. 2.6 Vertical Pipe Mounting – Gas](image2)
2.3 Mechanical Installation

To install:

1. Check the Tag Number of the meter to ensure it is the correct unit for the location.

2. Ensure all weld outlines in the pipeline where OriMaster V is to be installed are even. Grind off any protrusions inside the pipe and ensure that the inside of the pipe is smooth and clean.

3. Ensure that any specialized cleaning requirements are performed (for example, those specifically for oxygen/pharmaceutical applications).

4. Examine the meter and the flange faces and ensure that:
   a. the faces of the orifice plate are free from scratches and are not buckled
   b. the square edge of the orifice plate is not worn (no light is reflected from the square edge)
   c. the orifice plate bore is not marked or distorted
   d. the gasket surfaces are clean

Replace defective components as necessary.

5. Fit sufficient bolts in the lower part of the pipeline flanges to retain the meter in place.

6. Locate the centralizing tool on the meter body.

7. Place the correct gaskets on both sides of the meter body and align them correctly to the orifice plate, ensuring they do not protrude into the pipe bore.

8. Insert the meter and centralizing tool between the pipeline flanges ensuring that:
   a. The meter’s equalizing valve is pointing upstream of the fluid flow.
   b. The meter is oriented correctly depending on the type of installation – see Figs. 2.3, 2.4, 2.5 and 2.6.

9. Fit bolts diametrically opposite those fitted in step 5 and evenly tighten all bolts hand-tight.

10. Referring to Fig. 2.7, rotate the centralizing tool to push the bolts against the outer edge of the bolt holes.

11. Fit the remaining bolts and hand-tighten evenly.

12. Determine the maximum tightening torque according to the relevant flange specifications.

13. Tighten each bolt to the correct torque in a diagonally opposing pattern; firstly to 30% of the maximum torque, then 60% and finally to the maximum torque.

Note. Before installation, read Section 1, General Safety Information.

Caution. Neither the transmitter nor the bore of the orifice plate is designed to withstand the weight of the meter. Do not lift the meter by either the orifice plate bore or the transmitter. Lift the meter only by the neck.

Note. Accurate centralization in the pipeline is critical to OriMaster’s performance. For information on the effects of incorrect centralization, refer to standard ISO5167:2003.

Note: One of two types of centralizing tool is supplied with the meter – see Fig. 2.7.
2.4 Integral Display Positioning
If the optional integral display is installed, four connectors located on the back of the display enable it to be mounted in four different positions (in 90° steps) – see Fig. 2.8.

For further information, refer to the transmitter operating manuals IM/364 [V Design Level 1] SOI-266-XC-D-05-2011 [V Design Level 2].

3 Configuration

Note. If the meter has been supplied pre-configured by ABB, do not change parameter settings as this causes erroneous meter readings.

To configure OriMaster V, refer to the transmitter operating manuals IM/364 [V Design Level 1] SOI-266-XC-D-05-2011 [V Design Level 2].

Fig. 2.8 Integral Display Positioning
4 Commissioning

4.1 Gas and Liquid Service

Caution. During the following procedure, wear Personal Protection Equipment appropriate for the process.

1. Install OriMaster V as described in Section 2.3:
   - for horizontal pipe mounting – gas, refer to Fig. 2.3.
   - for horizontal pipe mounting – liquid, refer to Fig. 2.4.
   - for vertical pipe mounting – liquid, refer to Fig. 2.5.
   - for vertical pipe mounting – gas, refer to Fig. 2.6.

2. Ensure the pipeline is full.

3. Gradually bring the pipeline up to normal operating pressure, checking for any leaks in the system. If leaks are detected, de-pressurize the pipeline and repair as necessary observing all local health and safety and environmental requirements.

4. When the system is at normal operating pressure and flow established, bleed the OriMaster V impulse lines using the drain/vent valves. Collect and dispose of any bleed liquids in accordance with the local environmental regulations.

Caution. Ensure the drain/vent valves are positioned so that process fluid is directed down and away from personnel when it is removed during the drain/vent operation.

The differential pressure transmitter is normally supplied zeroed at atmospheric conditions (unless otherwise specified). To ensure correct operation, it must be zeroed at the normal operating pressure of the process.

To zero the transmitter:

1. Ensure the pipeline is at the normal operating pressure and that the transmitter power supply is on.

2. Close the high pressure (HP) and low pressure (LP) isolation valves.

3. Open the equalization valve, the transmitter should now indicate a value close to zero.

5. Open the HP and LP isolation valves.

6. Close the equalization valve. The transmitter should now indicate flow. For information on fault diagnosis, refer to Section 5.1, page 12.
4.2 Steam Service

**Note.** Fill the impulse lines with water or condensate to ensure correct operation and to protect the transmitter from excessive temperatures.

1. Referring to Fig. 2.4, install OriMaster V as described in Section 2.3.
2. Ensure the process pipeline is empty and de-pressurized.
3. Connect a suitable water supply to the pipeline.
4. Open the drain/vent valves.

**Caution.** Ensure the drain/vent valves are positioned to direct process fluid down and away from personnel when they are opened during the drain/vent operation.

5. Open the HP and LP isolation valves and allow water to flow slowly into the impulse lines until an air-free flow is obtained from the drain/vent valves, indicating that the impulse lines are full.
6. Close the HP and LP isolation valves.
7. Close the drain/vent valves and disconnect the water supply.
8. Gradually bring the pipeline up to normal operating pressure, checking for any leaks in the system. If leaks are detected, de-pressurize the pipeline and repair as necessary observing all local health and safety and environmental requirements.

The differential pressure transmitter is normally supplied zeroed at atmospheric conditions (unless otherwise specified). To ensure correct operation, it must be zeroed at the normal operating pressure of the process.

To zero the transmitter:

1. Ensure the pipeline is at the normal operating pressure and that the transmitter power supply is on.
2. Close the HP and LP isolation valves.
3. Open the manifold equalization valve, the transmitter should now indicate a value close to zero.
5. Open the HP and LP isolation valves.
6. Close the equalization valve. The transmitter should now indicate flow. For information on fault diagnosis, refer to Section 5.1, page 12.

**Note.** Fill the impulse lines with water or condensate to ensure correct operation and to protect the transmitter from excessive temperatures.

Caution. Ensure the drain/vent valves are positioned to direct process fluid down and away from personnel when they are opened during the drain/vent operation.
5 Operation and Maintenance

5.1 Troubleshooting
Refer to the differential pressure transmitter’s Operating Instructions (IM/364) for procedures to be followed when error messages are shown on the transmitter’s display.

For other suspected problems, complete the following checks to ensure correct installation:

<table>
<thead>
<tr>
<th>Direction of flow</th>
<th>Ensure the flow direction is in accordance with the arrow on the meter. If not, remove and reinstall the meter correctly.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mounting orientation</td>
<td>Ensure the meter is oriented correctly to the pipework with regard to flow direction, pipeline and nature of the fluid. Incorrect orientation can lead to metering errors and, in some cases, may damage the meter.</td>
</tr>
<tr>
<td>Zeroing of the transmitter</td>
<td>Zero the differential pressure transmitter during installation and commissioning – see Section 4, page 10.</td>
</tr>
<tr>
<td>Manifold valves</td>
<td>The meter manifold is fitted with three valves – two on diametrically opposite sides of the meter (the HP and LP isolation valves) and one on the axis of the pipeline (the equalization valve). During measurement, ensure the equalization valve is fully closed and the HP and LP isolation valves are fully open.</td>
</tr>
<tr>
<td>Setup/configuration of the meter</td>
<td>Ensure the 4 to 20 mA output of the meter is set correctly and that any receiving equipment is configured for the same flowrate range. Refer to the differential pressure transmitter’s Operating Instructions (IM/364 [V Design Level 1] and SOI-266-XC-D-05-2011 [V Design Level 2]) for information on how to check the loaded configuration.</td>
</tr>
</tbody>
</table>

Table 5.1 Troubleshooting Checks

5.2 Dismantling

Caution. Neither the transmitter nor the bore of the orifice plate is designed to withstand the weight of the meter. Do not lift the meter by either the orifice plate bore or the transmitter. Lift the meter only by the neck.

Always observe the plant safety regulations. Before beginning work, ensure pipework is depressurized and empty.

To dismantle:

1. If the flanges are fitted with a jacking screw, tighten the screw to remove any free play.
2. Loosen the flange securing bolts and/or nuts and (using the jacking screw, if fitted) partially separate the flanges.
3. Remove sufficient bolts to enable the meter, together with the gaskets, to be lifted clear, ensuring that no part of the meter is damaged.

5.3 Examination

Note.

- The frequency of examination depends upon the abrasive or corrosive nature of the process fluid, for example:
  - Steam – annually
  - Clean fluid – every 2 or 3 years.
- In the case of a new process or plant, examine the meter during each routine maintenance period until the wear of each installation, relative to others, can be assessed.

Examine the meter in accordance with the instructions in Section 2.3, step 4 on page 8.
5.4 Replacing of Removable Plate

1. Remove the OriMaster from the pipeline as per instructions in Section 5.2.
2. Check the removable plate (including the fixings) for damage (as per the criteria of Section 2.3 point 4). If any damage or excess wear is found, it should be replaced.
3. Loosen all 6 fixing screws and remove.
4. Lift the plate out of its location slot.
5. Examine the fixing threads in the OriMaster body checking for damage. If damaged the whole unit should be replaced.
6. Take the new plate out of its protective wrapping and check for damage (again as per the criteria of Section 2.3 point 4).
7. Locate the new plate into the location slot and align the fixing holes with the fixing threads in the OriMaster body.
8. Insert each fixing screw in by hand and loosely tighten.
9. Using a suitably sized screwdriver tighten each fixing screw, working in a diagonally opposing pattern.
10. Check each screw again to ensure they are tight and secure.
11. Reinstall he OriMaster into the pipeline as per Section 5.5.

5.5 Reassembly

Reassemble the meter in accordance with the instructions in Section 2.3, steps 5 to 13 on page 8.
6 Specification – General

Fluids
Liquids, gases and saturated steam

Line sizes
25, 40, 50, 80, 100, 150, 200, 250 and 300 mm
(1, 1½, 2, 3, 4, 6, 8, 10 and 12 in.)

Output signal
- Two-wire, 4 to 20 mA, selected for square-root output
- Low flow cut-off facility
- HART® communication provides digital process variable (% mA or engineering units) superimposed on 4 to 20 mA signal, with protocol based on Bell202 FSK standard
- Optional Profibus PA, Foundation Fieldbus or Modbus communications (OriMaster M only)

Output current limits (to NAMUR standard)

</table>

Standard setting:
- maximum alarm current

Power supply
- The meter operates from 10.5 to 45 V DC with no load and is protected against reverse polarity connection (additional load allows operations over 45 V DC)
- For EEx ia and other intrinsically safe approvals, the power supply must not exceed 30 V DC. Minimum operating voltage is 14 V DC with backlight display.

Load limitations
- \[ R \ (\Omega) = \frac{\text{Supply voltage} - \text{min. operating voltage (V DC)}}{22.5} \]
- A minimum of 250 is required for HART communication

Optional indicators

- Integral display
  - Wide-screen LCD, 128 x 64 pixel, 52.5 x 27.2 mm (2.06 x 1.07 in.) dot matrix.
  - 4 keys for device configuration and management.
  - Easy setup for quick commissioning.
  - Totalized and instantaneous flow indication.
  - Display also indicates in/out transfer function, static pressure, sensor temperature and diagnostic messages and provides configuration facilities.

- Wetted materials
  - Orifice assembly, stem and manifold
    - 316L stainless steel
  - Transmitter sensor housing
    - OriMaster V:
      - Aluminum alloy (266DSH transmitter)
      - 304L stainless steel (364DS transmitter)
    - (316L stainless steel optional on all transmitters)
  - Process isolating diaphragms
    - Hastelloy C276 (NACE)
  - Seals
    - Transmitter to manifold:
      - PTFE
    - Manifold:
      - Graphite; PTFE

- Process connections
  - Wafer body to fit between the following flange drillings
    - ASME B16.5 (ANSI) Class 150, 300 or 600
    - DIN PN16, PN25, PN40 or PN100
  - Pipeline centralization assured by centralizing tool(s) supplied with every unit as standard

- Pressure limitations
  - 100 bar (1450 psi) or as flange rating, whichever is the lower

- Temperature limitations
  - Process
    - –20 to 121 °C (–4 to 250 °F)
    - –20 to 230 °C (–4 to 446 °F) for steam applications
  - Ambient
    - –20 to 70 °C (–4 to 158 °F)

Temperature limits

Ambient
Lower limit:
-40 °C (–40 °F)
-20 °C (–4 °F) for LCD indicator

Upper limit:
85 °C (185 °F)
70 °C (158 °F) for LCD indicator

Note. For Hazardous Atmosphere applications refer to the temperature range specified on the certificate/approval relevant to the required type of protection.

Process
Lower limit:
-40 °C (–40 °F)

Upper limit:
121 °C (250 °F) at the transmitter
230 °C (446 °F) at the process

Storage
Lower limit:
-50 °C (–58 °F)
-40 °C (–40 °F) for LCD indicator

Upper limit:
85 °C (185 °F)

Hazardous atmospheres
With or without integral display – combined ATEX, FM and CSA

ATEX approval
Intrinsic safety (Category 1)
- II 1 GD T50 °C, EEx ia IIC T6

Products and customer support

Automation Systems
For the following industries:
— Chemical & Pharmaceutical
— Food & Beverage
— Manufacturing
— Metals and Minerals
— Oil, Gas & Petrochemical
— Pulp and Paper

Drives and Motors
— AC and DC Drives, AC and DC Machines, AC Motors to 1kV
— Drive Systems
— Force Measurement
— Servo Drives

Controllers & Recorders
— Single and Multi-loop Controllers
— Circular Chart and Strip Chart Recorders
— Paperless Recorders
— Process Indicators

Flexible Automation
— Industrial Robots and Robot Systems

Flow Measurement
— Electromagnetic Flowmeters
— Mass Flowmeters
— Turbine Flowmeters
— Wedge Flow Elements

Marine Systems & Turbochargers
— Electrical Systems
— Marine Equipment
— Offshore Retrofit and Refurbishment

Process Analytics
— Process Gas Analysis
— Systems Integration

Transmitters
— Pressure
— Temperature
— Level
— Interface Modules

Valves, Actuators and Positioners
— Control Valves
— Actuators
— Positioners

Water, Gas & Industrial Analytics Instrumentation
— pH, Conductivity and Dissolved Oxygen Transmitters and Sensors
— Ammonia, Nitrate, Phosphate, Silica, Sodium, Chloride, Fluoride, Dissolved Oxygen and Hydrazine Analyzers
— Zirconia Oxygen Analyzers, Katharometers, Hydrogen Purity and Purge-gas Monitors, Thermal Conductivity

Customer support
We provide a comprehensive after sales service via a Worldwide Service Organization. Contact one of the following offices for details on your nearest Service and Repair Centre.

Client Warranty
Prior to installation, the equipment referred to in this manual must be stored in a clean, dry environment, in accordance with the Company’s published specification. Periodic checks must be made on the equipment’s condition. In the event of a failure under warranty, the following documentation must be provided as substantiation:
— A listing evidencing process operation and alarm logs at time of failure.
— Copies of all storage, installation, operating and maintenance records relating to the alleged faulty unit.
Note
We reserve the right to make technical changes or modify the contents of this document without prior notice. With regard to purchase orders, the agreed particulars shall prevail. ABB does not accept any responsibility whatsoever for potential errors or possible lack of information in this document.

We reserve all rights in this document and in the subject matter and illustrations contained therein. Any reproduction, disclosure to third parties or utilization of its contents in whole or in parts – is forbidden without prior written consent of ABB.
