FTSW100 Process Software
Enabling monitoring and control for industrial process environments

FTSW100 Process Software is used to measure process sample streams using analytical data extracted from ABB FT-IR and FT-NIR spectrometers. Designed for implementation of analytical methods and control sequences, FTSW100 is a complete software solution for spectrometer based process monitoring and control.

24/7 Unattended Operation
Autonomous operation used in continuous mode with sequential acquisition of data, analysis, and reporting.

Intuitive User Display
Comprehensive console interface for display of status, concentrations and trending, I/O status, history, and reporting.

Analysis for FT-IR FT-NIR spectral data
Automated analysis of chemical properties within a process sample stream supporting various chemometric algorithms such as peak height/area, PLSplus, PLSplusIQ™, Simca™, and Unscrambler™ predictors.

Security configuration
Enabling CFR 21 part 11 compliance.

Data management
Full database management for configuration and measurement results.

Configurable and flexible
Configurable and flexible interface with external I/O devices to send or receive digital and analog data supporting variety of protocols such as OPC, ModBus, CanOpen.

Monitor Health of Analyzer or Process
Extensive diagnostics to monitor status for process stream and analyzer.

Remote Access compatible
Remote access option via modem, network link, or via Internet.

Utilities for extended data handling
Intelligent tools for data exportation, reporting and archiving.

Custom configuration
Configurable settings for logic sequence allowing for customization to end need.

Functionalities
FTSW100 offers distinct and extensive set of functionalities required to meet analytical process needs ranging from simple to complicated.
FTSW100 Dedicated to Process

FTSW100 Simple interface
FTSW100 is an exceptionally easy-to-use, graphically-driven package at the operator level, and has very intuitive and user-friendly tools available at the application configuration level, to make setting up on-line FT-IR and FT-NIR analyzer systems as simple as possible.

FTSW100 Benefit to Process
FTSW100 process software combines to provide significant savings for cost of ownership when installing ABB FT-IR and FT-NIR equipment into process environments.

FTSW100 Simple and Secure
The reality of manufacturing plants is that a small team is responsible for a multitude of different equipment. ABB designed the FTSW100 user interface to be fast and easy to use. The use of a large color coded status display allows an operator to know at a glance whether the system is operating normally or not.

The complexity of FT-IR and FT-NIR technology is completely hidden allowing the operators to get their job done rather than worry about running and/or understanding an analyzer. The built-in multilevel security manager provides password protection to all functions and provides different access levels for each operator.

Integration to process
FTSW100 can control all aspects of integration into process environments and is designed to run 24/7 unattended. For example, FTSW100 does not require expensive DCS programming or separate PLC solutions for sample preparation and manipulation. FTSW100 supports industry standard communication links like ModBus (with fully user-configurable addresses) and OPC to control systems.
