System 800xA - The Power of Integration

System 800xA Batch Management Overview
800xA Batch Management supports dynamic recipe parameters. Master recipe procedures can be configured with one or more formulation parameters established as an expression, rather than a constant value. This enables the control recipe to evaluate one or more variable process conditions and dynamically update the formulation parameter at run-time. Improved product quality and reduced processing time are just two of the potential benefits when using dynamic parameters in control recipes.

Often, operator or supervisor intervention in a batch process means aborting the batch recipe procedure and manually completing the batch. 800xA Batch Management provides the tools to allow user intervention to make the necessary adjustments and continue the processing of the batch through the control recipe procedure. An operator or supervisor can easily re-route the batch path to another allowable unit if the originally selected unit is not available or out-of-service. The most powerful feature, however, is the extensive runtime editing capability. Users with the correct permission level can perform a runtime edit on any currently executing recipe procedure. The runtime edit feature enables the modification of any subsequent operation or phase in the currently executing control recipe without stopping the recipe. Of course, all user-initiated changes are captured in System 800xA audit trail and batch production record.

All process automation systems support interlocking strategies at the control module level. Certainly, interlocks required for safety and preservation of process equipment should reside at the controller level. However, in a flexible batch production facility there could be one or more conditions that are dependent upon the type of material being processed in the unit. Only 800xA Batch Management provides exception procedures as an extension of the ISA88 procedural model to provide the ability to configure recipe-specific error handling logic. An exception procedure monitors for undesirable product related process conditions and contains corrective measures in case the conditions occurs.

800xA Batch Management includes five primary functions:

- Definition management
- Execution management
- Resource management
- Data collection
- Disptaching / scheduling
Definition management

Procedure
The master batch recipe procedure, and all nested procedure levels are configured graphically in 800xA Batch Management. The following information can be specified for each individual batch recipe:

- Procedure
- Formula
- Equipment requirements
- Header and other information

Procedures are configured graphically using the Procedure editor. The diagram is a Procedure Function Chart (PFC) based on ISA88 standards. Strict adherence to the procedure levels specified by ISA88 can be enforced, or, for additional flexibility, the procedure model can be expanded or collapsed. The procedure editor supports the configuration of conditional transitions, logical branching, parallel branching, looping structures and dynamic block labels for superior operational and control capabilities.

The procedure editor supports the creation and management of re-usable procedure building blocks. Unit procedures and operation procedures can be used in multiple higher level procedures. When a modification is made to one of these lower level procedure building blocks, all procedures using that block are updated.

Only System 800xA provides Exception Procedures that provide functionality above and beyond the procedural model of ISA88. Exception procedures provide product recipe specific error handling at the batch procedure level in addition to controller based exception and interlock logic.

All procedures are version managed with revision history for each procedure. In addition to maintaining the approved version online, a user configurable number of previous versions of the procedure are stored and are available online. A procedure revision history includes the User ID, full user name, workstation node name, date/time stamp, comments about the changes made and electronic signatures. The user is prompted to increment the version number each time a development procedure is promoted to an approved procedure. An online comparison of any two versions of a procedure is available via the difference report feature.

Formula
Formula information includes input parameters, process parameters, and output parameters. 800xA Batch Management supports the specification of formula information at any level of the procedure. Formula parameters may also be specified as an expression, rather than a predefined value. This enables the dynamic, real-time calculation of recipe parameters during the batch production execution. The ability to dynamically calculate parameters provides tremendous flexibility.

Equipment
Equipment requirements are specified within the procedure using equipment allocation Batch Manager Action (BMA) blocks. The batch recipe can be configured to reserve equipment for subsequent batch processing, acquire equipment for immediate batch processing, or dynamically select equipment from available equipment based upon configurable selection criteria and attributes.

Header and other information
The procedure header section provides administrative information about the individual procedure. A procedure description as well as free-form header text can be configured. The master recipe version, author, workstation name and creation date are also contained within the header. Standard operating procedures (SOP) can be defined and associated to the procedure. If configured, they can be invoked during the execution of the procedure and display the SOP applicable to the current step in the procedure.
800xA Batch Management supports the simultaneous execution of multiple control recipes in parallel. The configured and approved master recipe procedure becomes the control recipe procedure when the batch has been assigned a Batch ID and dispatched for production. Control recipe execution may proceed in one of three operating modes; automatic, semiautomatic or manual.

In automatic mode, procedural elements automatically execute sequentially through the procedure steps when the transition condition following the procedural element is satisfied. 800xA Batch Management communicates parameters, batch mode and state information to the equipment phases executing in the controller. 800xA Batch Management includes a standard phase interface to the AC800M controllers as all of the controllers from the ABB heritage process control systems (e.g. Symphony Harmony, DCI System Six, Advant and Freelance).

800xA Batch Management provides the user with the ability to integrate equipment running on other controllers into the batch control recipe. Function Phase Driver is a user configurable application which maps batch states, commands and parameters between the batch server and user defined OPC points representing the interface to an equipment phase in a PLC or other process controller. This feature is quite useful in process applications that include one or more process equipment skids that are supplied and installed with equipment manufacturer supplied controllers.

Batch execution monitoring
The graphically based recipe procedure is available as a runtime display without any further configuration. During control recipe execution, its progress can be monitored on the PFC. The current status of each procedure step is represented by a unique combination of colors and symbols as the batch executes.

In addition to monitoring, the control recipe PFC display provides a number of navigation and interaction options, depending on the rights and permissions of the currently logged on user including:

- Navigating to a higher or lower level of procedure function chart
- Changing the operating mode (automatic, semiautomatic, or manual) at any level in the procedure
- Changing the state (running, aborted, stopping, etc.) of any active procedure block at any level in the procedure
- Responding to pending messages, or electronic authentication requests
- Viewing formula information
- Viewing header information
- Navigating to pre-configured active equipment phase aspects

System 800xA also provides simple to deploy graphic configuration objects that provide batch specific information on process graphic displays and enable easy navigation to PFC or batch status displays.

Online recipe editing
System 800xA provides unique online recipe editing flexibility during batch execution. Authorized users can modify procedure sequence and equipment assignments as well as recipe parameters without stopping any executing control recipe. All changes made to the control recipe are automatically saved in the batch production record.
Resource management

800xA Batch Management supports network, multi-path and single path equipment configurations. This provides support of complex batch production facilities. The configuration of all units, shared-use equipment modules, and exclusive-use equipment modules is integrated with the common object model of the 800xA system. This makes adding or “cloning” a new process unit as simple as copy and paste. System 800xA is the only system that can use the new unit without having to modify existing master or control recipes. Pseudo-resources can also be configured and used to identify resources, such as an operator, required at specified points in a procedure.

In addition to the equipment allocation BMA procedure blocks, all other resource management functions are accessible from the Equipment Overview display. The following information is presented in tabular format:

- Equipment name and status (available, busy, reserved, acquired)
- Batch, Lot and Campaign ID (when the equipment is allocated to a batch)
- Operating status (normal, disabled)

The equipment information dialog is accessible from the Equipment Overview display. This dialog can be selected for any batch equipment unit appearing on the equipment overview. The equipment information dialog presents current status and provides the user with the ability to manually allocate the equipment, or remove it from service. The equipment specific attributes are also available for viewing from this dialog.
Batch scheduling

The production scheduling and dispatching functions of 800xA Batch Management are accessed from the Batch Overview display. This display provides a summary of all the batches in the current production queue.

The Batch Schedule window is used to add batches to the real-time production schedule or queue, in an efficient and user friendly manner. Functions available from the Batch Schedule window include:

- Select recipe procedure
- Schedule an individual batch or a campaign of multiple batches
- Duplicate a previously run batch
- Automated or manual entry of Batch ID
- Optionally enter Lot & Campaign IDs
- Optionally enter scheduled start time
- Enter batch specific parameter values

Batch web service interface

For many facilities, the production scheduling functionality provided in 800xA Batch Management is used to schedule the batch manufacturing. However, it is recognized that some organizations have supply chain management solutions, enterprise resource planning systems or schedule optimization software packages in place for the determination of shop floor manufacturing requirements. 800xA Batch Management includes a schedule interface function to facilitate the bi-directional transfer of data between 800xA Batch Management and an external application.

The interface function is deployed as a web service. Web services are technologies that allow applications to communicate with each other in a platform and programming language independent manner. A web service is a software interface that describes a collection of operations that can be accessed over the network through standardized XML messaging. It uses protocols based on the XML language to describe an operation to execute or data to exchange with another web service.

The interface provides pre-defined function calls to provide connectivity with 800xA Batch Management. Read function calls acquire real-time data from the batch system. Write function calls execute limited control over operations in the batch system.

Standard read function calls can be used to retrieve the following types of information:

- List of all active batches
- Details from any batch listed in the batch overview
- Details from any approved procedure
- Tag key (batch) data associated with the batch
- Details from any batch equipment

Standard write function calls can be used to perform the following operations:

- Schedule a batch, including values for some or all top-level recipe parameters
- Change a previously scheduled batch, including start time, priority, mode, and parameter values
- Change attribute values on batch equipment

In addition to the application programming environment provided in the batch schedule interface, System 800xA is available with an optional certified interface to the SAP PP-PI module. The 800xA Enterprise Connectivity Solutions Production Planning Connector facilitates the dispatch of Production Orders from SAP to 800xA Batch Management and monitors the process data to prepare a production response transaction back to SAP.

Simple Batch and Parameter Management

Simple Batch and Parameter Management offers the user an optional way to schedule batches and manage formula parameter information without the need to access the Batch Overview. Using Microsoft Excel a user is able to add and schedule batch recipe procedures within the batch manager. In addition, formula worksheets can be added to the Excel workbook to manage parameter lists.
History and evolution

Batch history / 800xA Information Management
The batch related alarms and events are routed to the 800xA System event system for collection and organization by 800xA Information Management.

The Production Data Log (PDL) history function of 800xA Information Management provides hierarchal history of batch data and events. Often in batch process applications, information relationships cannot be pre-configured because they typically depend on the control recipe execution, rather than on some periodic time basis. The PDL of 800xA Information Management has built-in provisions for the organization, storage, archive and retrieval of this type of information.

The data records stored in 800xA Information Management are exactly accessible to Microsoft Access, Microsoft Excel, and other popular reporting packages like Crystal Reports. Batch Management includes standard report templates that can serve as a basis for configuring detailed, application specific batch production reports.

With batch event data stored hierarchically in PDL, it is easy to perform batch-to-batch analysis of trend data using associations to batch data to select desired batches and trend variables for analysis.

Evolution
ABB has been a pioneer and leader in the design and deployment of batch automation systems on a worldwide basis. ABB has a twenty-five year heritage in the design of batch automation system products and solutions for the fine chemicals, food, beverage and pharmaceutical markets.

800xA Batch Management, like all functional areas within System 800xA, has been designed to support the stepwise evolution of existing process control systems. As part of a facility’s evolution strategy, one option is the introduction of System 800xA while retaining the existing controller and its existing control strategy.

800xA Batch Management can supervise controller phase logic in Harmony Bridge Controllers. The existing equipment phase logic configured using Batch90 and resident in PHASEX function codes can be reused without modification.

800xA Batch Management can supervise controller phase logic configured in TCL resident in either AC460 or SC controllers. The existing TCL equipment phase logic is retrofitted into the S88PHASE TCL template for 800xA Batch Management. This is included with System 800xA for MOD 300.

800xA Batch Management can supervise controller phase logic in DCU controllers. The existing equipment phas logic configured using CCL can be reused without modification.

Functionality to meet regulatory requirements
For manufacturing processes subject to licensing and inspections by regulatory bodies such as FDA, MHRA, TGA, the Industrial IT Extended Automation System 800xA provides the tools needed to achieve compliance. Security, audit trail, change management, electronic signature, automated reporting, archival and retrieval are integral to all operations and system applications. 800xA Management enforces the production sequence necessary to consistently produce on-spec product. In combination with 800xA Information Management complete electronic batch production records that fully document manufacturing compliance are generated.
