ABB MEASUREMENT & ANALYTICS | DATA SHEET

EasyLine EL3060 Series

Gas analyzers for use in hazardous areas

Measurement made easy

So smart, they're simple

Comprehensive explosion protection

- Design in Category II 2G for measuring flammable and non-flammable gases for use in Zone 1 and Zone 2
- Approvals to ATEX, IECEx, TIIS, NEPSI, KCs, EAC

Compact construction

- Flameproof enclosures for the control unit with one analyzer and the Uras26 infrared analyzer
- Combination of two analyzers with up to five measuring components possible

Easy installation

- No purging of the flameproof enclosures
- Easy and safe connection without opening the flameproof enclosures (Ex-d factory wiring)

Easy handling

- Safe operation by means of touch-sensitive keypads through the glass sight window of the control unit without opening the flameproof enclosure
- Multilingual menu-driven user interface

Simple communication

- Ethernet, Modbus and PROFIBUS interfaces
- Configurable analog outputs and digital inputs/outputs

Overview of the gas analyzers

Measuring technology – Analyzers

The EL3060 series includes the EL3060-CU control unit as well as the following analyzers

- Uras26 infrared photometer for the measurement of infrared-active gas components, e.g. CO, NO, SO_2,
- Magnos206 oxygen analyzer for the measurement of O_2 in process gas or in N_2,
- Magnos28 oxygen analyzer for the measurement of O_2 in process gas or in N_2,
- Caldos27 thermal conductivity analyzer for the measurement of e.g. Ar in O_2, H_2 in Ar, CH_4 in N_2,
- Caldos25 thermal conductivity analyzer for the measurement of e.g. H_2 in N_2 or air or SO_2 in N_2 or air

An EL3060 gas analyzer consists of the control unit and one or two analyzers.

The analyzers Magnos206, Magnos28, Caldos27 and Caldos25 are individually installed in the housing of the control unit. They can also be used in combination with the analyzer Uras26. The analyzer Uras26 is installed in a separate housing; it is connected to the control unit via a data transmission cable and a power supply cable.

Each analyzer has one physical measurement range per sample component. A section of the physical measurement range can be mapped to the current output (analog output) by on-site configuration.

Calibration is always executed in the physical measurement range. The permissible measurement range limits are given by the specification of the smallest and largest measurement ranges for the individual analyzers.

Housing – Explosion protection

The housing of the EL3060-CU control unit is designed as a field housing of die-cast aluminum in the type of protection “Flameproof Enclosure ‘d’” to EN 60079-1 and in the degree of protection for the housing of IP65. The display and operator control unit is installed behind a glass viewing window on the front of the housing.

A terminal housing in the type of protection “Increased Safety ‘e’” to EN 60079-7, in which the terminal strip for the electrical connections is installed, is flange-mounted on the underside of the flameproof housing. Certified electrical conductor bushings are installed between the interior of the explosion housing and the terminal housing in increased safety.

The housing of the Uras26 analyzer is designed as a cylindrical field housing of die-cast aluminum in the type of protection “Flameproof Enclosure ‘d’” to EN 60079-1 and in the degree of protection of housing of IP65 or IP54. The data transmission cable and the power supply cable for connection to the control unit are permanently connected at the factory and led through flameproof cable glands on the underside of the housing.

The housings of the gas analyzers comply with the requirements of the explosion group IIC. As a result, the gas analyzers can also be used in hydrogen- or acetylene-containing atmospheres.

The housing can be purged with air from the non-hazardous area or with inert gas to protect the gas analyzers in a corrosive environment or with corrosive sample or associated gases.

All gas connections are led through flame barriers.

Calibration

The Uras26 infrared photometer can be equipped with gas-filled calibration cells as an option; this allows test gas cylinders to be dispensed with to a large extent.

Owing to their very low sensitivity drift, the Magnos206 and Magnos28 oxygen analyzers can be routinely calibrated solely at the zero point by means of single-point calibration, provided that the measuring range is more than 0–5 vol.-% of O_2. Nitrogen or ambient air is used for this purpose.

Calibration can be performed automatically or manually. Automatic calibration – for all sample components together – is normally started on a cyclically time-controlled basis; it can also be started by an external control signal or via the Modbus as well as manually on the display and operator control unit of the gas analyzer.

Operation

Five touch screen fields accessible through the control unit viewing glass allow safe operation of the gas analyzer without opening the housing. The menu-driven control system is uniform for all gas analyzers.

Control unit

The EL3060-CU control unit performs the following functions:

- Processing and transmitting measured values provided by the analyzer’s sensor electronics,
- Correcting measured values, e.g. cross-sensitivity correction,
- Controlling device functions, e.g. calibration,
- Display and control functions,
- Communicating with external systems.

Electrical interfaces

The electrical interfaces for the output of measured values and communication with external systems include

- The integrated Ethernet-10/100BASE-T interface for gas analyzer configuration with configuration software ECT, data transmission with Modbus TCP/IP protocol (measured values, status signals, control signals) and QAL3 data transfer (option)

as well as the I/O modules

- Profibus module with one RS485 and one MBP interface (also according to VDI 4201 Part 2),
- Modbus module with one RS485 and one RS232 interface (also according to VDI 4201 Part 3),
- Digital I/O module with four digital inputs and four digital outputs,
- Analog output module with four analog outputs.

A maximum of 3 I/O modules can be integrated in the gas analyzer. The following combinations of I/O modules are allowed, depending on the functional range and order:

- 1 analog output module and 1 digital I/O module (standard),
- 1 analog output module and 2 digital I/O modules,
- 1 analog output module, 1 digital I/O module and either 1 Modbus module or 1 Profibus module,
- 1 Modbus module,
- 1 Profibus module.

Measurement principle

Non-dispersive infrared absorption

Sample components and measurement ranges

Sample component [1]	Class 1 range	Class 2 range	Class 2 range with calibration cell	Gas group [2]
CO	0–50 ppm	0–10 ppm	0–50 ppm [3]	A
CO_2	0–50 ppm	0–5 ppm	0–25 ppm [3]	A
NO	0–150 ppm	0–75 ppm	0–75 ppm [3]	A
SO_2	0–100 ppm	0–25 ppm	0–25 ppm [3]	A
N_2O	0–50 ppm	0–20 ppm	0–50 ppm [3]	A
CH_4	0–100 ppm	0–50 ppm	0–50 ppm [3]	A
NH_3	0–500 ppm	0–30 ppm	–	B
C_2H_2	0–200 ppm	0–100 ppm	0–100 ppm	B
C_2H_4	0–500 ppm	0–300 ppm	0–300 ppm	B
C_2H_6	0–100 ppm	0–50 ppm	0–50 ppm [3]	B
C_3H_6	0–250 ppm	0–100 ppm	0–100 ppm [3]	B
C_3H_8	0–100 ppm	0–50 ppm	0–50 ppm [3]	B
C_4H_{10}	0–100 ppm	0–50 ppm	0–50 ppm [3]	B
C_6H_{14}	0–500 ppm	0–100 ppm	0–100 ppm [3]	B
R 134a	0–100 ppm	0–50 ppm	0–50 ppm [3]	B
SF_6	0–2000 ppm	0–1900 ppm	0–2000 ppm	B
H_2O	0–1000 ppm	0–500 ppm	0–500 ppm	C

The smallest measurement ranges shown in the table are based on the first sample component in a beam path.

1) Other sample components on request
2) See price information
3) The smallest measurement range 1 is shown.

Number of sample components
1 to 4 components with 1 or 2 beam paths and 1 or 2 receivers in each beam path

Number of measurement ranges
2 ranges per sample component

Largest measurement range
0 to 100 vol.-% or 0 vol.-% to saturation or 0 vol.-% to LEL. Measurement ranges within ignition limits cannot be provided.

Measurement range ratio
≤ 1:10 to 1:20 depending on measurement range

The following data apply to measurement range 1 in a delivered analyzer.

Stability

The following data apply only if all influence factors (e.g. flow rate, temperature, atmospheric pressure) are constant.

Linearity deviation
≤ 1 % of span

Repeatability
≤ 0.5 % of span

Zero drift
≤ 1 % of span per week; for ranges smaller than Class 1 to Class 2: ≤ 3 % of span per week

Sensitivity drift
≤ 1 % of measured value per week

Output fluctuation (2 σ)
≤ 0.2 % of span at electronic T90 time = 5 sec (Class 1) or = 15 sec (Class 2)

Detection limit (4 σ)
≤ 0.4 % of span at electronic T90 time = 5 sec (Class 1) or = 15 sec (Class 2)

Influence effects

Flow effect
Flow rate in the 20–100 l/h (0.7–3.5 ft^3/h) range: ≤ 1 % of span at a flow rate change of 10 l/h (0.35 ft^3/h)

Associated gas effect/Cross sensitivity
The knowledge of the sample gas composition is necessary for the analyzer configuration.
Selectivity measures to reduce associated gas effect (optional): Incorporation of interference filters or filter cells, internal electronic cross-sensitivity correction for one sample component by other sample components measured with the Uras26.

Temperature effect
Ambient temperature in permissible range
- At zero-point: ≤ 1 % of span per 10 °C (18 °F); for ranges smaller than Class 1 to Class 2: ≤ 2 % of span per 10 °C (18 °F)
- On sensitivity with temperature compensation: ≤ 3 % of measured value per 10 °C (18 °F)
- On sensitivity with thermostat (optional): ≤ 2 % of measured value per 10 °C (18 °F)

Air pressure effect
- At zero-point: No effect
- On sensitivity with pressure correction by means of integral pressure sensor: ≤ 0.2 % of measured value per 1 % barometric pressure change

Dynamic response

Warm-up time
Approx. 30 minutes without thermostat; approx. 2.5 hours with thermostat

90% response time
T_{90} = 2.5 sec for measurement cell length = 200 mm, sample gas flow = 60 l/h (2.12 ft^3/h), electronic T90 time = 0 sec

Calibration

Zero-point calibration
With inert gas, e.g. N_2, or with ambient air that is free of the sample component.

End-point calibration
With gas-filled calibration cells (optional) or with test gas mixtures. It is recommended to verify the calibration cell set values once a year. During calibration of a multi-component analyzer, possible cross-sensitivity and/or carrier gas corrections by internal or external measurement components are switched off. Therefore, corrected measurement components should be calibrated only using a test gas consisting of the measurement component and an inert gas like N_2.

Materials in contact with the sample medium

Analyzer (sample cells)
Tubing: Aluminum or gold-plated aluminum;
Window: CaF_2, option: BaF_2;
Connectors: Stainless steel 1.4571 (AISI 316Ti)

Gas lines, connectors and flame barriers
Stainless steel 1.4571 (AISI 316Ti)

Oxygen analyzer Magnos206

Measurement principle

Paramagnetic behavior of oxygen

Magnetomechanical oxygen analyzer

Sample component and measurement ranges

Sample component
Oxygen (O_2)

Smallest measurement range
0–0.5 vol.-% O_2

Quantity and measurement range limits
2 measurement ranges
Measurement ranges are freely adjustable; they are factory-set to 0–25/100 vol.-% O_2 or per order.

Largest measurement range
0–100 vol.-% O_2
Measurement ranges within ignition limits cannot be provided.

Measurement ranges with suppressed zero-point
Suppression ratio max. 1:10, e.g. 19–21 vol.-% O_2.
Pressure correction with pressure sensor is required.

Stability

The following data apply only if all influence factors (e.g. flow rate, temperature, atmospheric pressure) are constant.

Linearity deviation
≤ 50 ppm O_2

Repeatability
≤ 50 ppm O_2 (time base for gas exchange ≥ 5 minutes)

Zero drift
≤ 0.03 vol.-% O_2 per week

Sensitivity drift
≤ 0.1 vol.-% O_2 per week or ≤ 1 % of measured value per week (not cumulative), whichever is smaller.
≤ 0.25 % of measured value per year

Output fluctuation (2 σ)
≤ 25 ppm O_2 at electronic T90 time (static/dynamic) = 3/0 sec

Detection limit (4 σ)
≤ 50 ppm O_2 at electronic T90 time (static/dynamic) = 3/0 sec

Influence effects

Flow effect
Sample gas N_2: ≤ 0.1 vol.-% O_2 in permissible range; sample gas air: ≤ 0.1 vol.-% O_2 at a flow rate change of 10 l/h (0.35 ft^3/h)

Associated gas effect
Data regarding the effect of associated gases can be found in IEC 61207-3:2002 “Gas analyzers – Expression of performance – Part 3: Paramagnetic oxygen analyzers”.

Temperature effect
Average effect in permissible ambient temperature range
– At zero-point: ≤ 0.02 vol.-% O_2 per 10 °C (18 °F)
– On sensitivity: ≤ 0.1 % of measured value per 10 °C (18 °F)
Thermostat temperature = 64 °C (147.2 °F)

Air pressure effect
– On sensitivity with no pressure correction: ≤ 1 % of measured value per 1 % air pressure change
– On sensitivity with pressure correction using integrated pressure sensor (optional): ≤ 0.1 % of measured value per 1 % air pressure change

Position effect
Zero-point shift ≤ 0.05 vol.-% O_2 per 1° deviation from horizontal orientation. Position has no effect on the hard-mounted unit.

Dynamic response

Warm-up time
< 2 hours

90% response time
T_{90} ≤ 7 sec (≤ 8 sec in the version for measuring gases under positive pressure, see page 12) at a sample gas flow of 90 l/h (3.18 ft^3/h) and electronic T90 time (static/dynamic) = 3/0 sec, gas change from N_2 to air

Calibration

Zero-point calibration
With oxygen-free process gas or substitute gas

End-point calibration
With process gas with a known oxygen concentration or a substitute gas such as dried air

Single-point calibration
For measurement ranges from 0–5 vol.-% O_2 to 0–25 vol.-% O_2
Zero-point calibration with any oxygen concentration, e.g. with nitrogen (N_2) or ambient air, processed through a cooler or H_2O absorber.
Pressure correction by means of pressure sensor is recommended for single-point calibration with air.
Depending on the measurement task involved, the zero- and end-points should be verified periodically (Recommendation: once a year).

Calibration of measurement ranges with suppressed zero-point
Single-point calibration is possible for suppressed measurement ranges with a suppression ratio ≤ 1:5. The oxygen concentration of the test gas must be within the measurement range.

Materials in contact with the sample medium

Analyzer (sample chamber)
Stainless steel 1.4305 (AISI 303), glass, platinum, rhodium, epoxy resin;
Seals: FPM (Fluorocarbon rubber), Option: FFKM75

Gas lines, connectors and flame barriers
Stainless steel 1.4305 (AISI 303), 1.4571 (AISI 316Ti)

Measurement principle

Paramagnetic behavior of oxygen

Magnetomechanical oxygen analyzer

Sample component and measurement ranges

Sample component
Oxygen (O_2)

Smallest measurement range
0–0.5 vol.-% O_2

Quantity and measurement range limits
2 measurement ranges
Measurement ranges are freely adjustable; they are factory-set to 0–25/100 vol.-% O_2 or per order.

Largest measurement range
0–100 vol.-% O_2
Measurement ranges within ignition limits cannot be provided.

Stability

The following data apply only if all influence factors (e.g. flow rate, temperature, atmospheric pressure) are constant.

Linearity deviation
≤ 0.5 % of span, minimum 0.005 vol.-% O_2

Repeatability
≤ 50 ppm O_2

Zero drift
≤ 3 % of span of the smallest measurement range (per order) per week, minimum 300 ppm O_2 per week

Sensitivity drift
≤ 0.1 vol.-% O_2 per week or ≤ 1 % of measured value per week (not cumulative), whichever is smaller; ≤ 0.15 % of measured value per three months, minimum 0.03 vol.% O_2 per three months

Output fluctuation (2 σ)
≤ 25 ppm O_2 at electronic T90 time (static/dynamic) = 3/0 sec

Detection limit (4 σ)
≤ 50 ppm O_2 at electronic T90 time (static/dynamic) = 3/0 sec

Influence effects

Flow effect
Sample gas N_2: ≤ 0.1 vol.-% O_2 in permissible range; sample gas air: ≤ 0.1 vol.-% O_2 at a flow rate change of 10 l/h (0.35 ft^3/h)

N_2 in He	0–3 vol.-%	98–100 vol.-%

Other sample components on request.

Special version with sample components and measurement ranges for monitoring hydrogen-cooled turbo generators

Sample component and associated gas	Measurement range
CO_2 in air	0–100 vol.-%
H_2 in CO_2	100–0 vol.-%
H_2 in air	100–80/90 vol.-%

Number of sample components
1 to 4 sample components, manual switchover

Quantity and measurement range limits
2 measurement ranges per sample component. Measurement ranges are freely adjustable within the limits shown in the table. They are factory-calibrated for the largest possible measurement range.

Largest measurement range
0–100 vol.-% or 0 vol.-% to saturation.
Measurement ranges within ignition limits cannot be provided.

Measurement ranges with suppressed zero-point
See the adjacent table for spans

Stability

The following data apply only if all influence factors (e.g. flow rate, temperature, atmospheric pressure) are constant. They relate to smallest measurement ranges given in the table. The deviations may be larger for smaller measurement ranges.

Linearity deviation
≤ 2 % of span

Repeatability
≤ 1 % of span

Zero drift
≤ 2 % of smallest possible measurement range per week

Sensitivity drift
≤ 0.5 % of smallest possible measurement range per week

Output fluctuation (2 σ)
≤ 0.5 % of smallest measurement range span at electronic T90 time = 0 sec

Detection limit (4 σ)
≤ 1 % of smallest measurement range span at electronic T90 time = 0 sec

Influence effects

Flow effect
≤ 0.5–2.5 % of span at a flow rate change of 10 l/h (0.35 ft^3/h). At an identical flow rate for test and sample gases the flow rate effect is automatically compensated.

Associated gas effect
The knowledge of the sample gas composition is necessary for the analyzer configuration. If the sample gas contains components in addition to the sample component and associated gas (binary gas mixture), this will result in erroneous measurements.

Temperature effect
Ambient temperature in the permissible range
at each point in the measurement range: ≤ 1 % of span per 10 °C (18 °F), based on temperature at the time of calibration

Air pressure effect
≤ 0.25 % of span per 10 hPa (0.145 psi) for the smallest possible ranges given; for larger spans the effect is correspondingly lower.
Option: Operating altitude over 2000 m (6560 ft)

Position effect
< 1 % of span up to 30° deviation from horizontal orientation

Dynamic response

Warm-up time
Approx. 30 minutes

90% response time
T_{90} ≤ 2 sec at sample gas flow of 60 l/h (2.12 ft^3/h)

Calibration

Zero-point calibration
With test gas, measurement component-free process gas or substitute gas

End-point calibration
With test gas, process gas having a known sample gas concentration or substitute gas

Single-point calibration
A single-point calibration can be performed with standard gas, since the zero- and end-points will not drift independently due to the sensor principle employed. This technique leaves out safety-related measurements. Depending on the measurement task involved, the zero- and end-points should be verified periodically (Recommendation: once a year).

Materials in contact with the sample medium

SO_2 in N_2 or air	0–1.5 vol.-%	Air (sealed)

Other sample components on request.

Number of sample components
1 to 3 sample components, manual switchover

Number of measurement ranges
1 measurement range per sample component
The measurement range is factory-set per order and cannot be changed.

Largest measurement range
0–100 vol.-% or 0 vol.-% to saturation
Measurement ranges within ignition limits cannot be provided.

Measurement ranges with suppressed zero-point
Span at least 2 vol.-%, depending on application

Stability

The following data apply only if all influence factors (e.g. flow rate, temperature, atmospheric pressure) are constant.

Linearity deviation
≤ 2 % of span

Repeatability
≤ 1 % of span

Zero drift
≤ 1 % of span per week

Sensitivity drift
≤ 1 % of measured value per week

Output fluctuation (2 σ)
≤ 0.5 % of smallest measurement range span at electronic T90 time = 0 sec

Detection limit (4 σ)
≤ 1 % of smallest measurement range span at electronic T90 time = 0 sec

Influence effects

Flow effect
≤ 1–5 % of span at a flow rate change of 10 l/h (0.35 ft^3/h). At an identical flow rate for test and sample gases the flow rate effect is automatically compensated.

Associated gas effect
The knowledge of the sample gas composition is necessary for the analyzer configuration. If the sample gas contains components in addition to the sample component and associated gas (binary gas mixture), this will result in erroneous measurements.

Temperature effect
Ambient temperature in permissible range
at each point in the measurement range: ≤ 1 % of span per 10 °C (18 °F), based on temperature at the time of calibration

Position effect
< 1 % of span up to 10° deviation from horizontal orientation

Dynamic response

Warm-up time
2–4 hours, depending on measurement range

90% response time
T_{90} = 10–20 sec; optional: T_{90} < 6 sec

Housing purge

Use
To protect the gas analyzers in corrosive environments or when using corrosive sample or associated gases an option is available to allow the housings of the central unit and the Uras26 analyzer unit to be purged.

Purge gas
Clean instrument air from non-explosive areas or inert gas. The purge gas for purging the Uras26 analyzer unit must not contain any sample gas components.

Purge gas pressure
p_{abs} ≤ 1080 hPa (15.66 psi)

Purge gas flow
During operation ≤ 10 l/h (0.35 ft^3/h)

Pressure drop at flame barriers
Approx. 20 hPa (0.29 psi) at a flow rate of 10 l/h (0.35 ft^3/h)

Display and operation

Display
Backlit graphics display with 240 x 160-pixel resolution

Measured value display
– Numerical value with physical unit, also with bar graph indication in single display
– Resolution better than 0.2 % of the measurement span
– Simultaneous display of up to 5 measured values

Status display
Symbols in the display; the active status messages can be accessed directly from the measured value display

Operation
5 keys (cursor cross and OK); menu-assisted operation

Concept of operation
The functions required in normal operation are operated and configured directly on the gas analyzer. The functions which are only seldom required, e.g. during start-up, are configured offline using the software tool ECT (“EasyLine Configuration Tool” on the enclosed DVD-ROM) and then loaded into the gas analyzer.

Measuring range switch-over and feedback
There are three ways of executing the measuring range switch-over:
– Manually on the gas analyzer
– Automatically by means of appropriate configured switch-over thresholds (“autorange”)
– Externally controlled via appropriately configured digital inputs.

The measuring range feedback can be implemented via appropriately configured digital outputs; it is independent of the selected type of measuring range switch-over.
The gas analyzer is set ex works to measuring range 2 and to manual measuring range switch-over.

Limit value monitoring
Limit values can be set using the software tool ECT. The limit value signals (alarms) are output via digital outputs.

… General data

Pressure sensor

Use
Standard equipment in the Uras26 and Caldos27, optional in the Magnos206 and Magnos28. The pressure sensor measures the air pressure inside the housing as standard. As an option, the connection of the pressure sensor is led outside to a flame barrier; it may not be connected to the sample gas feed path when measuring flammable and corrosive gases. Pressure sensor working range: p_{abs} = 600 to 1250 hPa (8.70 to 18.13 psi)

Materials in contact with the sample medium
Silicone gel, plastics, FPM (fluorocarbon rubber);
Flame barrier: Stainless steel 1.4571 (AISI 316Ti)

Sample gas inlet conditions under atmospheric conditions

Sample gas composition
The standard version of the gas analyzer is capable of measuring flammable and non-flammable gases under atmospheric conditions which can form an explosive environment. The maximum oxygen content of the sample gas mixture should be 21 vol.-%, corresponding to atmospheric conditions. If the sample gas is a mixture only of oxygen and flammable gases and vapors, it must not be explosive under any conditions. As a rule this can be achieved by limiting the oxygen content to a maximum of 2 vol.-%. Flammable gases that are explosive under the conditions encountered in analysis even when oxygen is excluded should be present in the mixture only in concentrations that are not critical to safety. The gas analyzer must not be used to measure gases which attack the materials in contact with the sample medium (e.g. chlorine-containing gases).

Temperature
The sample gas dew point should be at least 5 °C (9 °F) below the temperature throughout the sample gas path. Otherwise a sample gas cooler or condensate trap is required. Water vapor content variations cause volume errors.

Inlet pressure
Absolute pressure max. 1100 hPa or gauge pressure max. 100 hPa (15.95 psi or 1.45 psi)

Flow rate
Uras26: 20–100 l/h (0.7–3.53 ft^3/h),
Magnos206, Magnos28: 30–90 l/h (1.06–3.18 ft^3/h),
Caldos25, Caldos27: max. 100 l/h (3.53 ft^3/h)

Pressure drop at flame barriers
Approx. 40 hPa (0.58 psi) at a flow rate of 50 l/h (1.77 ft^3/h)

Outlet pressure
The outlet pressure must be the same as the atmospheric pressure.

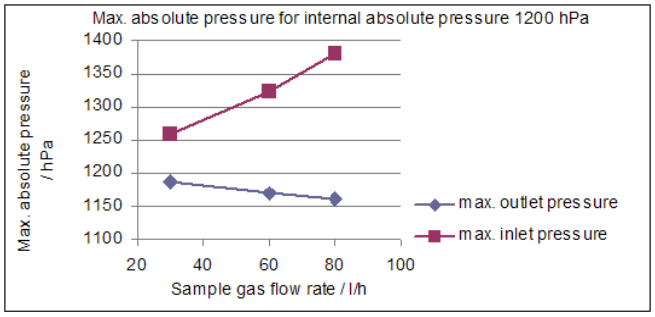
Sample gas inlet conditions with positive pressure in the sample gas feed path

Sample gas composition
A special version of the gas analyzer is suitable for measuring non-flammable and flammable gases under positive pressure. Under no circumstances may the sample gas be potentially explosive. If the sample gas consists of non-flammable gases and vapors, the oxygen content may be max. 21 vol.-% as per atmospheric conditions. If the sample gas consists solely of oxygen and flammable gases and vapors, it is generally not potentially explosive if the oxygen content is safely limited to max. 2 vol.-%. Flammable gases which are potentially explosive under the conditions applicable for the analysis, even without the presence of oxygen, may only be contained in the mixture to be analyzed in non-safety-critical concentrations. The gas analyzer may not be used for measuring gases that attack the materials in contact with the sample medium (e.g. gases containing chlorine).

Sample gas inlet and outlet conditions for Magnos206, Magnos28, Caldos25, Caldos27 analyzers

Temperature
+5 to +50 °C (41 to 122 °F)

Inlet and outlet pressure
The sample gas pressure in the sample gas feed path of the analyzer may be max. 200 hPa (2.90 psi) positive pressure (1200 hPa (17.40 psi) absolute pressure). The pressure drop at the flame barrier at the sample gas inlet means this can be achieved by maintaining max. 200 hPa (2.90 psi) positive pressure (1200 hPa (17.40 psi) absolute pressure) at the sample gas inlet or adhering to the pressure limits for the sample gas inlet and outlet as shown in the following diagram:



Flow rate
Max. 80 l/h (2.83 ft^3/h)

Pressure drop at the flame barriers
Approx. 155 hPa (2.50 psi) at a flow rate of 50 l/h (1.77 ft^3/h)

Sample gas inlet and outlet conditions for Uras26 analyzer

Temperature
+5 to +45 °C (41 to 113 °F)

Inlet pressure
Absolute pressure max. 1200 hPa (17.40 psi) or positive pressure max. 200 hPa (2.90 psi)

Flow rate
Max. 100 l/h (3.53 ft^3/h)

Pressure drop at the flame barriers
Approx. 40 hPa (0.58 psi) at a flow rate of 50 l/h (1.77 ft^3/h)

Housing design of the control unit with an analyzer
The control unit housing must be equipped with a vent if an analyzer (Magnos206 or Magnos28 or Caldos25 or Caldos27) is installed in the control unit.

Housing design of the Uras26 analyzer unit
The analyzer unit housing must be equipped with two vents. The “flowing reference gas” option is not available.

Power supply

Input voltage
100–240 V AC, – 15/+ 10 %, 50–60 Hz ± 3 Hz

Power consumption
Max. 187 VA

Safety

Tested per EN 61010-1:2010

Protection class
I

Overload category/pollution level
Power supply: II/2

Safe isolation
The power supply is galvanically isolated from other circuits by means of reinforced or double insulation. Operational low voltage (PELV) on low-voltage side

Electromagnetic compatibility

Noise immunity
Tested to EN 61326-1:2013. Inspection severity: Industrial area, fulfills at least the test requirements to table 2 of EN 61326.

Emitted interference
Tested to EN 61326-1:2013. Limit value class B for interference field strength and interference voltage is met.

Mechanical stress

Operation
Vibration test to EN 60068-2-6:1996
Vibrations up to 0.5g/150 Hz have no influence on the measured value. In Uras26, slight transient effects on the measured value can occur in the region of the modulation frequency.

Transport
Vibration test to EN 60068-2-6:1996,
shock test to EN 60068-2-27:1995
In its original packaging, the gas analyzer withstands normal shipping conditions.

Ambient conditions

The gas analyzer is intended for indoor installation only.

Ambient temperature
Control unit
with or without built-in analyzer: +5 to +50 °C (41 to 122 °F)
Uras26
with or without another analyzer: +5 to +45 °C (41 to 113 °F)
Storage and transport: –25 to +65 °C (–13 to 149 °F)
The explosion protection is not impaired if the gas analyzer is operated at temperatures less than +5 °C and down to –20 °C (41 to –4 °F). However in this temperature range the compliance with the metrological data cannot be guaranteed.

Relative humidity
< 75 %, slight condensation allowed

Installation location altitude
Max. 2000 m (6560 ft) above sea level (over 2000 m (6560 ft) on request)

Notes regarding performance characteristics of the analyzers

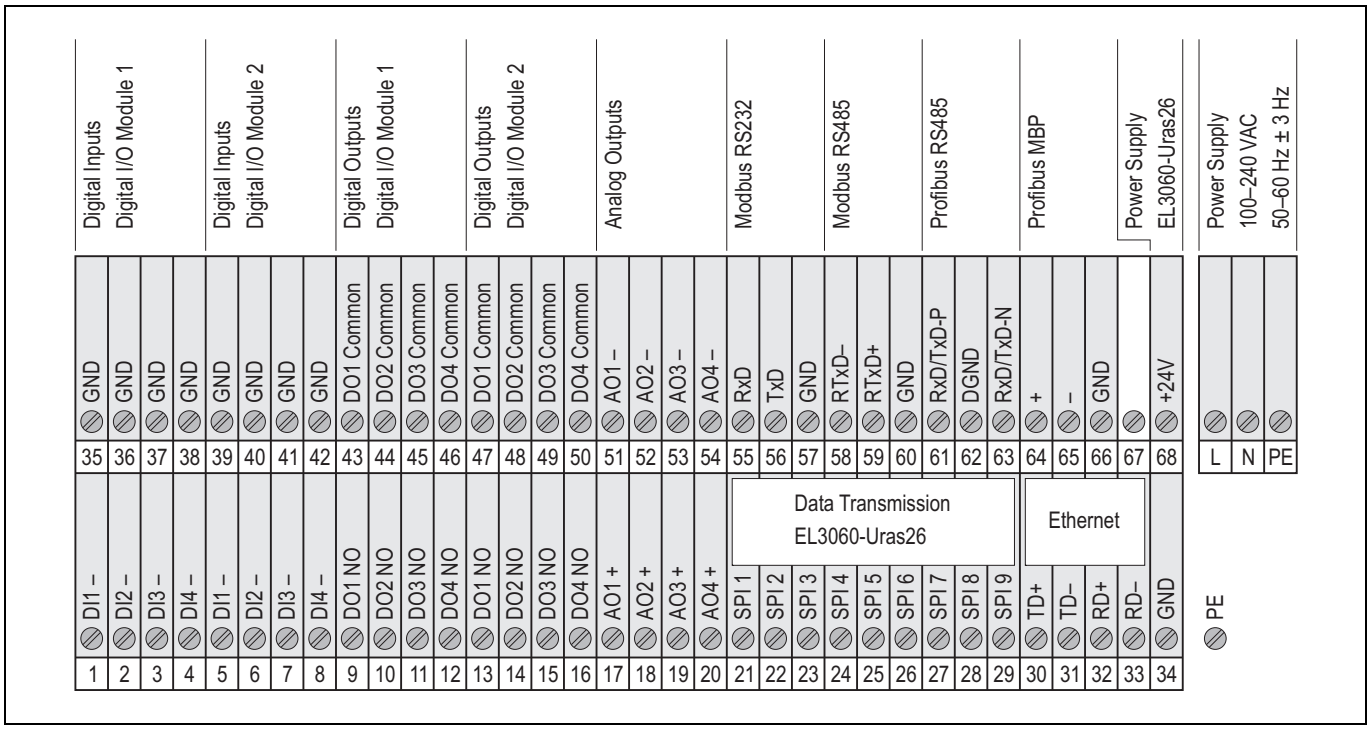
The performance characteristics of the analyzers have been determined according to IEC 61207-1:2010 “Expression of performance of gas analyzers – Part 1: General”. They are based on operation at atmospheric pressure (1013 hPa (14.69 psi)) and nitrogen as the associated gas. Compliance with these characteristics when measuring other gas mixtures can only be assured if their composition is known.

The physical detection limit is the lower limit of the performance characteristics relative to the measuring range span.

The drift values may be increased during the first few days after initial start-up as well as after prolonged standstill and storage times.

Electrical connections

Power supply and signal lines



Analog outputs
0/4–20 mA (configurable, factory-set to 4–20 mA), common negative pole, galvanically isolated from ground, freely connectable to ground, max. gain relative to protective ground potential 50 V, max. working resistance 750 Ω. Resolution 16 bit. The output signal cannot be lower than 0 mA.

Digital inputs
Optocouplers with internal 24 VDC power supply. Control with floating contacts or with open collector drivers NPN.

Digital outputs
Floating contacts, max. contact load rating 30 VDC/1 A. Relays must at all times be operated within the specified data range. Inductive or capacitive loads are to be connected with suitable protective measures (self-induction recuperation diodes for inductive loads and series resistors for capacitive loads).

Modbus, Profibus
Either the Modbus module or the Profibus module can be installed in the gas analyzer as an option.

Ethernet interface
Communication with configuration software ECT for gas analyzer configuration and software update, data transmission with Modbus TCP/IP protocol (measured values, status signals, control signals) and QAL3 data transfer if the QAL3 monitoring option is integrated in the gas analyzer.

Design of the electrical connections
Terminal blocks with screw connection, conductor size single-core 0.2–4 mm² (24–12 AWG), stranded 0.22–2.5 mm² (24–14 AWG)

Note: Not all signal inputs and outputs are actually used, depending on the configuration of the gas analyzer.

Design of the gas connections
Internal flame barriers of stainless steel 1.4571 (AISI 316Ti) with ⅛ NPT female thread

Space requirements
Note the additional space requirements beneath the analyzer unit for connection lines (approx. 10 cm (4 in)) and above the analyzer unit for opening the housing (approx. 40 cm (16 in)).

Connecting cables
The permanently connected connecting cables for data transmission and 24 V DC supply are integral components of the flameproof enclosure of the analyzer unit. Both of them are 10 m (33 ft) long and may not be shortened to a length of less than 1 m (3.3 ft).

Certifications and approvals

CE conformity

The EL3060 Series gas analyzers satisfy the requirements of the European directives
2014/35/EU Low Voltage Directive
2014/30/EU EMC Directive
2014/34/EU ATEX Directive

SIL conformity

The gas analyzers EL3060-Magnos206 and EL3060-Magnos28 without flow and pressure sensor satisfy the requirements of the European standard for functional safety EN 61508:2010 Part 2 (identical to IEC 61508:2010).

Explosion protection to European standards – ATEX

The EL3060 Series gas analyzers with Uras26, Magnos206, Magnos28, Caldos25 und Caldos27 in category 2G for measurement of flammable and non-flammable sample gas satisfy the requirements of the European standards
EN 60079-0 General requirements,
EN 60079-1 Flameproof enclosures ‘d’ and
EN 60079-7 Increased safety ‘e’.

EL3060-CU without or with analyzer:
Marking: ⟨Ex⟩ II 2G Ex db e IIC T4 Gb
EU-Type Examination Certificate No. BVS 08 ATEX E 048 X

Analyzer EL3060-Uras26:
Marking: ⟨Ex⟩ II 2G Ex db IIC T4 Gb
EU-Type Examination Certificate No. BVS 08 ATEX E 055 X

Explosion protection to IEC standards – IECEx

The EL3060 Series gas analyzers with Uras26, Magnos206, Magnos28, Caldos25 und Caldos27 in the version with EPL Gb for measurement of flammable and non-flammable sample gas satisfy the requirements of the IEC standards
IEC 60079-0 General requirements,
IEC 60079-1 Flameproof enclosures ‘d’ and
IEC 60079-7 Increased safety ‘e’.
