

ABB's Endura pH sensors last longer and need less maintenance. Tough made easy.

There's only one family of pH sensors that last up to 3 times longer in harsh applications, yet need less maintenance, cleaning and calibration. ABB's unique Endura pH sensors have a special design to withstand poisoning and build-up found in industrial installations, they are also compatible with most brands of electronics. The latest addition to the Endura pH product family is the TBX587. This sensor has a one inch process connection and is designed for highly corrosive applications. It even features a t-handle for easy and safe insertion and retraction by the operator. Tough Made Easy! www.abb.com/analytical-instruments
