## Building grid capacity and boosting reliability

Substations to help meet growing electricity demand in Saudi Arabia

# contact <sup>2|12</sup>

Mahmoud Shaban Sub-Regional Manager, Arabian Peninsula

#### Dear friends,

I would like to welcome you to the  $2^{\mbox{\scriptsize nd}}$ issue of our customer magazine Contact. In this issue we'll be focusing on solar power, one of the pillars of growth for the renewable sector in ABB.In line with Saudi Arabia's vision for making renewable energy an integral part of the transition into more sustainable methods of power generation; the Saudi Arabian government plans to install 41 GW of solar energy by 2032. It's worth mentioning that peak power demand in Saudi Arabia will nearly triple in the next 20 years, which means that the dependency on oil needs to be reduced dramatically.

With our wide range of products and solutions, ABB has demonstrated its capability as a reliable system integrator in the solar business and will continue to offer its comprehensive solar portfolio of turnkey solutions, including photovoltaic and concentrated solar power solutions.

When solar electric power becomes an important source of energy in our future, we need to make sure that we make it easier for utilities and consumers to select solar power over other forms of energy, while keeping safety and reliability a priority.

ABB is committed to providing safe, clean, reliable renewable power to meet the growing demand in the region. We hope that you find this issue of Contact an interesting read.

**Best Regards** 

Mahmoud Shaban

### Taking up the hospital lighting challenge Flexible control technology

Providing optimized lighting in a demanding hospital environment frees medical staff from unnecessary, tedious tasks and raises the quality of hospital care. The ABB i-bus® KNX DALI Gateway lighting control system keeps the new Prince Naif Center for Dialysis in Riyadh, the capital of Saudi Arabia, running smoothly. Housed in a purpose-built, three-storey building, with a floor space of around 5,000 square meters, the center provides lifesaving treatment for around 200 kidney patients every day.

Lighting is a significant element in the running costs and ambience of a medical center, due to the round-the-clock nature of medical services. Patient care areas, from OPD, through wards, to ICU need both dim and bright lighting. Laboratories and diagnostics' lighting needs differ from administrative, service and public areas' needs. Be it motion sensors or dimmers, the closer lighting systems mirror these needs, the more the energy savings.

Our system provides double-digit energy savings – as much as 40 percent. Energy is saved by enabling individual patients to adjust the lighting intensity in each of the 48 dialysis rooms during their long treatment sessions. It is also saved by using presence detectors in stairwells, brightness sensors for the façade, gardens and external areas, and timers for parking areas – or a combination of all three where needed. The flexibility of our technology enables it to be seamlessly integrated with the dialysis center's building control system creating a truly smart building in which the lighting, climate and other automation systems are digitally monitored and controlled.

Our company was selected by the center's owner, the Ministry of Interior, on the strength of the energy savings achieved and the many applications of our technology in Saudi Arabia, the most recent of which is an award-winning installation for the eight million square meter Princess Noura University – the largest university in Saudi Arabia and the largest women's university in the world.

### First authorized channel partner in Middle East LV drives get a boost

JGB International Company WLL in Bahrain, part of JGB Group, a worldrenowned conglomerate, is our first authorized channel partner in the Middle East and also in Africa and India, to distribute low voltage (LV) products and provide technical expertise for ABB's energy-efficient LV drives, also known as variable frequency converters.

The Group is committed to an extensive range of products, stock availability in the Gulf Cooperation Council (GCC) and an extremely efficient after sales service for clients to satisfy their total projects requirements. It serves the global energy industry by procuring and supplying quality products manufactured and supplied by top international manufacturers.

A leader in the supply of oil and gas, electro-mechanical and industrial insulations, JGB caters to industries like refineries, petrochemicals and oil and gas, where it will distribute our LV drives. LV drives are typically used in a wide range of industrial applications from machine building to controlling comprehensive procession lines. They enable high performance motor control and provide flexible connectivity to automation systems. Our LV drives improve process efficiency, reduce energy consumption and improve productivity.

### Power for productivity Adding 800 MW to the Saudi national grid

"Our prime business objective is to provide our customers with superior quality products that together with customer services, add value to their business," said Abdul Gafoor, Director, JGB Group. "We are very upbeat about being associated with a world renowned brand such as ABB. With the value provider program we will be able to deliver much better value to clients," he concluded.

Our Value Provider Program is designed for distributors, technical distributors, system integrators, service providers and panel builders. It provides the third party partners a unified, consistent solution for our complete portfolio. This is reflected to the end customer in wider offerings, availability of technical expertise and easily recognizable retailer. Our partners are capable of supplying the very best customer service as they work to high, audited standards.

"Via this program, we aim to ensure consistent quality of the network offering and improve the level of the channel management and channel support," said Aki Maenpaa, Manager for ABB's discrete automation and motion division in the Gulf. For more information: www.abb.com/drives

The global demand for aluminum remains strong as it is widely used in industries like transportation, aerospace, automotive and railways, packing, construction as well as for household items. In the second quarter of 2012, ABB won orders worth around \$24 million from Ma'aden Aluminum Company (MAC) to execute a fast-track transmission substation project in northeast Saudi Arabia.

The mandate is to design, engineer and supply a 380-kilovolt (kV) outdoor gasinsulated switchgear (GIS) substation at the Ras Al Khair power plant that will export 800 megawatt (MW) of power from the plant to the national transmission grid to feed a new aluminum smelter. The scope of supply includes high voltage outdoor gasinsulated switchgear, communication and auxiliary systems and IEC 61850-compliant substation automation, control and protection. These containerized systems will be factory assembled and precommissioned to speed up on-site installation.

Ma'aden, in a joint venture with Alcoa, is building an integrated aluminum mining, refining, smelting and rolling mill facility at Ras Al Khair. The multibillion dollar complex will produce 4 million tons per annum (mtpa) bauxite, 1.8 mtpa alumina, 740 kilo tons per annum (ktpa) of aluminum metal and 380 ktpa rolled products, The smelter and rolling mill will commence production in 2013, while the mine and refinery will commence in 2014.

Ma'aden's \$10.8 billion joint venture with Alcoa will be the largest and most efficient vertically integrated aluminium complex in the world. It will use Saudi Arabia's bauxite resources to profitably produce aluminium for domestic and international markets as well as to facilitate the development of domestic downstream industries in the Kingdom.

ABB is the world's leading supplier of turnkey air-insulated, gas-insulated and hybrid substations with voltage levels up to 1,100 kV, facilitating the efficient and reliable transmission and distribution of electricity with minimum environmental impact.

For more information: www.abb.com/substations

Meeting growing electricity demand in a sustainable manner

# Building grid capacity and boosting reliability

Substations to help meet growing electricity demand in Saudi Arabia, which accounts for around half of the total electricity consumption in the Gulf Cooperation Council region

conomic growth, led by the oil and gas sector is driving the development of power infrastructure to secure electricity supplies in Saudi Arabia. By 2001, peak loads in Saudi Arabia shot up to about 24 gigawatts (GW), and it is estimated that by 2023 they will approach 60 GW. State policies and projects are now resolutely aimed towards sustainable development of the electricity sector, through waste-toenergy measures, energy efficiency and stricter conservation regulations.

In the first quarter of 2012, on the strength of our track record in the region, ABB won orders worth around \$70 million to execute substation projects for the Saudi Electricity Company (SECO), the country's national power transmission and distribution operator. Saudi Electricity Company is the Gulf's largest utility.

#### Increasing power capacity

The project requirements include design, supply, installation and commissioning of a new 132/13.8 kilovolt (kV) substation at Al-Raas in the Al-Qassim province, and the extension of an existing 380 kV substation at the Princess Nourah bint Abdulrahman University (PNAU) in Riyadh. We have previously built three substations to provide electricity to Saudi Arabia's first university for women and the largest women-only university in the world, comprising some 32 campuses.

"The substations will boost power capacity to address growing electricity demand in the central region," said Brice Koch, head of ABB's Power Systems division. "They will also help to improve grid reliability and power quality while ensuring energy efficiency."

We will also work on a project, through Ewaan Global Residential Company, a local engineering, procurement and construction (EPC) contractor, for the turnkey construction of a 110/13.8 kV substation at Al-Fareeda. This installation will provide power to a new mixed-use development, north of Jeddah city.

Mixed-use development holds a certain appeal by providing a range of commercial and residential unit sizes and options that can reportedly create additional value and outperform standard, single-use real estate developments in terms of increased office and retail prices, rents and occupancy rates, as well as accelerating absorption

#### rates. Scope of work

The projects are scheduled for completion by 2014, and include delivery of products such as gas-insulated switchgear, transformers, medium voltage switchgear, auxiliary systems and cables. We will also supply the supervisory control and data acquisition (SCADA) system, the equipment for automation, control and protection and IEC 61850-compliant communication systems to enable centralized remote monitoring and control of power assets located at multiple sites.

The Al-Fareeda substation is to be equipped with a capacitor bank, to reduce electricity losses and enhance the stability and quality of power supply by improving the network's power factor, which is an indicator of the usable power available in the grid.

Our world-class protection and control solutions ensure reliable power transmission and distribution so we can offer uninterrupted and reliable power to end users, even in harsh environmental conditions.

# Strengthening our power products footprint

New factory in Dammam to produce high voltage gas-insulated switchgear to meet growing power infrastructure demands

n line with its vision of working closer to customers, ABB will invest around \$40 million, to construct a new manufacturing plant for high voltage gas-insulated switchgear (GIS) and a transformer service workshop in Saudi Arabia, to serve the growing power infrastructure needs of the region.

The switchgear plant will initially manufacture 132 kilovolt (kV) GIS, with higher ratings to follow. The transformer service center will support our large installed base in the region and serve customers with a more complete portfolio. The two new facilities will occupy 40,000 square meters of space and will be located in the city of Dammam in the eastern part of the country and home to the largest port in the Arabian Gulf.

Unlike boom towns that grew with the discovery of oil reserves, Dammam has developed in all spheres. While it is undoubtedly the headquarters of the Saudi Arabian oil industry, it is also a modern urban and industrial center. Excellent roads and highways connect it with other urban and industrial centers in the Kingdom.

To encourage the growth of nonoil industries, two industrial cities were established in the open space between the three cities of Dammam, Al-Khobar and Dhahran. Together, they house more than 244 factories with hundreds more under construction. These plants manufacture a variety of consumer and industrial products that are marketed throughout the Kingdom and are exported to other countries around the world.

### Responsive to the high-growth needs of the Arabian peninsula

"Local manufacturing of our GIS range in Saudi Arabia and our transformer service facility will enable us to respond to our customers' needs more efficiently," said Bernhard Jucker, head of ABB's Power Products division. "This decision is in line with ABB's regional 'in country for country' approach and business philosophy to locate production and service facilities closer to our customers."

The economic growth experienced by Gulf countries has highlighted the need for power infrastructure to secure supplies of electricity, both at times of peak demand and in the long term. The Gulf Cooperation Council (GCC) region's total electricity consumption has risen nearly tenfold since 1980. Saudi Arabia is the largest consumer, accounting for around half of the total GCC electricity consumption.

### Meeting the test of technology and terrain

ABB pioneered high voltage GIS in the mid-1960s and as a market leader, continues to drive technology complex switchgear applications in densely populated areas, for aesthetic town planning or in areas under severe environmental stress.

Earlier this year, we introduced our latest generation of 420 kV GIS with a compact design that reduces volume by up to 33 percent and  $SF_6$  insulating gas requirement by as much as 40 percent, making it more environmentally friendly. This product launch is part of our technology and innovation focus and follows the recent launch of the advanced versions of the 245 kV and 72.5 kV range.

For more information: www.abb.com/substations

New manufacturing plant for high voltage gas-insulated switchgear in the offing

and innovation, offering a full-range product portfolio with voltage levels from 72.5 kilovolts (kV) to 1,200 kV. The main features of GIS, like extremely low space requirements and high reliability, offer smart and economic solutions for

# Energy storage – why do we need it?

Delivery of power on demand depends on reliable energy stores to provide power bridges that support short-term gaps, safe shutdown and back-up needs

> t's not that energy storage is a whole new concept, it has, in fact, been an integral component of electricity generation, transmission and distribution systems for more than a century. Traditionally, energy storage needs have been met by physically storing fuels for fossil-fuelled power plants, and by using generated power in pumped hydro storage schemes.

> Recently however, there has been a shift in the power landscape towards using and integrating renewable energy, mostly wind and solar energy. Although renewable power generation is more sustainable in the long run, the delivery of reliable power on demand remains a major challenge.

> Wind and solar power installations are affected by seasonal and diurnal

changes and can only generate power intermittently and with a highly variable output. This is where energy storage plays a crucial part in supporting the grid – when the wind is blowing or the sun is shining, excess power should be stored and made available during both, suboptimal generating conditions and during peak demand.

Such fundamental changes in the architecture and controllability of the grid must be supported by smart, efficient power transmission and distribution networks. For these networks to deliver and distribute power efficiently, the storage of energy at appropriate times and locations becomes vital; both, to balance generation with consumption, and to maintain grid stability.

### The right energy storage solution for the job

ABB has a long history of delivering energy storage solutions, including pumped hydropower schemes that go back over a century and more than a decade's experience in battery energy storage systems.

Our technologies address a wide range of power needs from merely tens of kilowatts up to hundreds of megawatts, thus, utilities, industrial customers and rail operators around the world continue to deploy these technologies. These facilities help balance power demands and supplies, by stabilizing network voltages and frequencies, providing power bridges to support short-term gaps, and safe shutdown and back-up needs. Eventually, our solutions are designed to enhance flexibility, increase energy securities and minimize environmental impacts.

Examples of our recent installations worldwide include Switzerland, Sweden and the UK.

### Switzerland's largest battery energy storage project

ABB recently commissioned the largest battery energy storage project of its kind in Switzerland with EKZ, a leading distribution utility and one of the largest energy companies in Switzerland. To provide additional power to the grid on demand, we supplied and installed a battery energy storage solution using Lithium-ion (Li-ion) batteries that can provide one megawatt of power for a duration of 15 minutes.

The storage facility is integrated with EKZ's power distribution network and is being used to evaluate performance in key areas such as balancing peak loads, intermittent power supply and the viability of the solution for grid optimization.

### Battery energy storage increases the role of renewables in Sweden

Falbygdens Energi is a Swedish utility with a significant portion of wind power connected to the grid in the Swedish city of Falköping.

ABB was selected to supply an innovative dynamic energy storage solution, for the utility's power distribution network, to maximize the integration of renewables into the power chain. For this project, we utilized our battery energy storage expertise to store locally produced energy from wind turbines to create a storage capacity of 75 kilowatts (kW) in cycles of up to 60 minutes. The stored energy will then be used to stabilize the grid and help balance peak loads during the day.

### Dynamic energy storage installation in the UK

ABB recently worked with UK Power Networks, which supplies power to over eight million homes and businesses in the UK, to develop a dynamic energy storage solution. The installation enables renewable energy generated by local wind power plants to be fed into the power network when needed. It also ensures that some of the energy is kept in reserve to regulate power flow to compensate for the intermittence of wind power and to support power quality in the event of a fault.

To meet these needs, we implemented a turnkey DynaPeaQ<sup>®</sup> solution, incorporating SVC Light<sup>®</sup>, which included eight stacks of 13 Li-ion battery modules located in an 11 kV grid.

Together, these high-power density modules can store up to 200 kilowatt hours (kWh) of electrical energy.

The installation provides dynamic voltage control in the distribution system and, at the same time, enables dynamic storage of surplus energy from the wind power plant. This surplus energy is used to level out peaks in grid loading to provide grid stability.

For more information: www.abb.com/energyefficiency

# Shining a light on EURO 2012

60,000 football fans enjoyed ideal lighting conditions throughout the Group matches and during the knockout stages with centralized, intelligent lighting controls for large spaces

s the 14th UEFA European Football Championship EURO 2012, kicked off, all eyes were on Poland, one of the hosts of the event, where 16 teams were battling it out for the coveted trophy.

On June 9, 2012, 30,000 football fans gathered beneath the lights controlled by ABB's i-bus<sup>®</sup> KNX technology at the Arena Lviv stadium in the Ukraine while watching Germany play Portugal at Arena Lviv, a dedicated football stadium and one of eight around the world to host UEFA's Euro 2012.

Although the stadium was reputed to be the smallest venue, rather than its size counting against it, proved to be an added attraction for football fans for an up close look at the action on the pitch. During the three Group B matches, in the evenings, fans and players alike, depended on optimal lighting throughout the stadium, creating bright moments off the field. Our control system ensured that no one had to sit or play in the dark. It provided centralized control of lighting systems and, through its intelligent software provided energy-efficient lighting by optimizing the brightness of the stadium to suit the natural light conditions.

On June 11, Sweden played Ukraine in the first of the tournament matches at the Stadium, in Kiev. At this stadium 60,000 football fans enjoyed ideal lighting conditions throughout the group's matches and during the knockout stages.

One hundred i-bus KNX DALI gateways

connected the lighting systems in the stadium from the locker rooms to the VIP lounge and the KNX-based building control system helped rapidly control the brightness and light so that the fans got the best football experience.

Many English and French football fans had already experienced optimal lighting at the airport of Donetsk, Ukraine, where our modern building system technologies controlled the lights, and guided football fans towards their group matches.

ABB has been part of such big events in stadiums similar to those used in the Euro Cup on earlier occasions, like the 2010 World Cup. At this event we supplied drytype transformers which served the Green Point stadium in Cape Town, which has

Our technologies make us partners in major sports stadiums around the world

a retractable roof and a seating capacity of 68,000. Similar transformers in the 500 to 1000 kVA range have been installed in the Soccer City stadium, located in Soweto, Johannesburg. This stadium, with a seating capacity of around 100,000, was the focal point of the tournament and was chosen as the venue for the opening and closing ceremonies and key matches of the tournament.

For more information: www.abb.com/knx

# KNX: One system. One standard. Many interconnected functions.

- Maximum flexibility
- Offers safety and security for both people and property
- Energy-saving with climate, shutter, heating and lighting control
- Quick and simple adaptation to individual needs and use of premises, such as sports stadiums
- Replaces separate control solutions typical of technology with a single, optimal, energy–efficient system

# Harnessing Italy's solar power potential

Successful delivery of 14 photovoltaic power plants in Italy with a combined generating capacity of 100 MW in just 9 months

011 was a year of intense activity in the solar photovoltaic (PV) market. With new installations adding 29 gigawatts (GW) of solar energy across the globe, the solar PV market marked a tremendous 58 percent year-onyear growth. Italy came to the forefront as the single largest solar market, for the first time overtaking Germany, the world leader in PV. As the engineering, procurement and construction (EPC) partner of 14 PV plants, ABB was ready to step up to the challenge when the window of opportunity appeared. We are proud of having taken part in this defining moment in Italy's solar power industry especially as this is a success we can replicate elsewhere in the world.

### The challenge

Setting up the 24 megawatt (MW) Canino PV power plant in Lazio was a test of our mettle in end-to-end project delivery. There were many layers of complexity in the execution of the project: hilly terrain, poor

## ABB solar offerings

- Turnkey solution design, engineering, supply, installation and commissioning
- Quick turnaround qualifies our customers for high feed-in tariff
- Trusted engineering, procurement and construction (EPC) consortium partner
- Best-in-class substation monitoring and control system – efficiently transfers power from plant to grid
- High optimization and low power losses – push peak performance ratio above customer expectations
- Electrical balance of plant (EBoP) solution

- Remote monitoring, operation, diagnostics and maintenance from a dedicated control center in a remote location
- Full range of power and automation equipment – transformers, switchgear, inverters, protection devices, medium voltage cabinets, medium and high voltage cables, distributed control systems and control software, low voltage systems, auxiliary systems (such as lighting and ventilation)

A trusted partner for turnkey solar PV plants

Over a period of 45 years we have successfully completed 300 EPC projects worldwide in diverse industries. soil condition, the magnitude of installation over a 95-hectare site and just as daunting, management of a 500-strong workforce. Civil works, installation and commissioning were carried out simultaneously at different places on the site and the plant was delivered in just five months.

The Canino plant supplies 103,488 modules, making it the largest lease financing PV project ever undertaken in Italy. As a result of high optimization and substantially lower power losses, the site is operating at 87 percent instead of the expected peak performance ratio of 81.5 percent.

In Foggia, three plants with a combined capacity of 39 MW were completed six weeks ahead of schedule. We were responsible for remote monitoring the plants from a dedicated PV control center in Genoa, almost 400 miles distant. Also in Foggia, four plants in a 10-kilometer area were set up three weeks ahead of time, despite delays caused by heavy winter rains. The multi-plant project has a combined capacity of 15 MW.

The Helios ITA-3 parks with two 5 MW plants, in Brindisi and Mesagne were completed in under ten weeks, well ahead of schedule and under budget. Each plant comprises 22,500 polycrystalline modules mounted on single-axis trackers. Remote operation and maintenance are carried out via the control center in Genoa.

In Sicily our company was the EPC contractor for Falck Renewables that operates solar, wind, biomass and wasteto-energy plants in Italy, UK, France and Spain. The three PV power plants at Spinasanta, Cardonita and Sugherotorto with a combined generating capacity of 13.1 MW use almost 57,000 photovoltaic cells and a support structure at a tilt angle of 20 degrees. for a large-scale roof-top PV plant. Located on the roof of a commercial building in the town of Cairo Montenotte, the plant incorporates 3,840 PV panels on fixed structures and provides 0.864 MW of electric power. This power is not used by the facility; instead it is transferred to a 15 kilovolt (kV) distribution network.

#### The success

Our turnkey solutions reduce the cost and risk of constructing and operating photovoltaic power plants, consequently allowing for rapid deployment. It was a real challenge to meet the time constraints on the delivery of all 14 power plants. Even so, 12 were completed ahead of schedule and a 24 MW plant was built and commissioned in five months.

There is good reason why we are second to none in speed and efficiency: for one, as leaders in power and automation, we draw on our vast manufacturing capacity for solutions. Both, procurement channels and supply chain processes are designed for speed and efficiency. Secondly, we meet pressing deadlines by successfully collaborating with local subcontractors in Italy with a proven track record. Lastly, our EPC competence and electrical expertise come into play in managing and executing complex processes on site.

In conclusion, we have a long and successful track record as EPC partners. Over a period of 45 years we have successfully completed 300 EPC projects worldwide in diverse industries – power generation, oil and gas and water, to name a few. With our EPC center of excellence located in Genoa we were perfectly positioned to execute turnkey projects for the local Italian market.

For more information: www.abb.com/solar

In Liguria we provided a turnkey solution

## Did you know?

ABB has long been at the forefront of the solar power industry. In the 1980s ABB developed the plant automation platform for the world's first concentrating solar power (CSP) test facility in Spain, and is now a leading supplier of turnkey CSP plants based on the uniquely cost-effective technology of its partner, Novatec Solar. In 2010 we delivered comprehensive

solutions for the world's first integrated solar and combined cycle power plants in Algeria, Egypt and the United States.

And, in PV power plants we have an extensive reference list of solutions that not only covers the length and breadth of Italy, but much of the northern Mediterranean as well.

# Lethabo plant goes on stream

ABB builds first South African solar power plant in record time as part of a pilot scheme to reduce the national utility's carbon footprint

The inaugural ceremony at the Lethabo solar PV plant in November 2011

ompleting the first South African solar power plant in record time, ABB has surpassed industry expectations. The greenfield photovoltaic (PV) power plant, based adjacent to the Lethabo power station in Gauteng, was completed in just 75 days and will provide power for the plant's administration buildings, while reducing the facility's auxiliary power consumption.

The Lethabo project, which was commissioned by Eskom, South Africa's national utility, was inaugurated in November 2011 by national Public Enterprises Minister, Malusi Gigaba. ABB was tasked with pioneering a single axis tracking solar PV system with a peaking capacity of 575 kilowatts (kW) and an annual production potential of 12.5 million kilowatt hours (kWh).

Similarly, ABB also won the Eskom PV contract for installing a fixed-tilt solar PV power plant at the Kendal station, in Mpumalanga, with a 620 kW capacity and an annual production potential of 11.4 million kWh. This project was successfully launched on November 25, 2011.

Both PV projects form part of a pilot scheme aimed at eventually reducing Eskom's carbon footprint. To optimize productivity, high-efficiency ABB monocrystalline PV panels were selected because of their uniquely efficient concept for PV power plants. The approach combined high levels of customization, rapid turnkey delivery and system optimization technologies that enable the plants to generate around 20 percent more energy than alternative designs.

The PV plants are designed to operate independently to produce electrical power for use by the existing power stations and will be capable of remote operation and monitoring.

The technologies, several of which are patented by us, include a programmable logic controller (PLC) that increases tracker accuracy and an automatic switching system that optimizes the number of panels connected to each inverter enabling the plant to harness more energy at all times, even during periods of poor light like dawn, dusk and cloudy weather.

ABB's turnkey solution included the design, engineering, erection, grid connection and commissioning of the groundbreaking solar plants. The electrical, control and automation equipment as well as the optimization technologies to be deployed were also manufactured by us.

Rapid delivery was facilitated by our well-proven concept of pre-assembled, factory-tested electrical balance of plant modules, and by our expertise in project execution, which, in the case of Lethabo and Kendal, have cut weeks off the conventional delivery time to enable the plants to be fully operational in record time. For more information: www.abb.com/solar

"The world-class technology will give ABB in South Africa the opportunity to transfer skills in solar technology, further complementing and enhancing local capabilities in engineering and project management."

- Goetz-Dietrich Wolff

Manager of Power Generation business in South Africa

# Going green with hybrid power plants

Complementing fuel generation with solar energy for higher output and lower fuel consumption and CO<sub>2</sub> emissions

t present, fossil fuels dominate the electricity generation landscape of the Middle East where, both the costs of inland fuel-burning and the environmental impact of CO<sub>2</sub> emissions have raised concerns.

ABB's integrated solar combined cycle (ISCC) addresses this issue by employing the region's abundant solar irradiance into highly efficient, reliable and environmentallyfriendly hybrid power plants. The concept combines conventional fossil fuel-powered steam turbines and a solar thermal steam generator to provide reliable and clean power.

Unlike classic, open-cycle, gas-fired power plants, releasing high temperature flue gasses directly into the atmosphere, ABB's combined cycle solution makes use of this residual thermal energy, by producing steam in a heat recovery steam generator (HRSG). In parallel to this heat recovery generated steam, ABB Novatec's Fresnel-based solar boilers produce a second stream of superheated steam. Due to the high solar thermal steam parameters achieved in the solar boilers, the two streams can operate independently, resulting in high flexibility.

### Increased energy efficiency – decreased emissions

This solar-augmentation process results in an increase of output power of the otherwise low-efficiency, fossil fuel-fired power plants. In addition, it results in a significant reduction in fuel consumption and  $CO_2$  emissions. This hybrid approach with the integration of solar power helps mitigate the effects of the fluctuant nature of solar irradiation. By modulating the fuel input of the plant, these fluctuations can be compensated, resulting in a permanent coverage of the grid's power needs.

ABB Novatec's power plant in Liddell, Australia, is the world's first integration of solar thermal technology with a traditional coal-fired power station. The project commenced in early 2011 and

World's first solar hybrid coal-fired power station of ABB in Liddell, Australia

was completed in January 2012. The 9.3 megawatt (MW) power station consists of four rows of linear Fresnel reflectors, covering an area of 18,000 square meters, almost the size of three football fields.

#### Enhanced oil recovery

Apart from utility electricity generation, the idea of complementing fuel generation with solar energy can be particularly useful for reducing the fuel consumption of energy-intensive industries. For the major oil producers in the Gulf Cooperation Council (GCC), the solar-based enhanced oil recovery (EOR) displays the potential of significantly increasing the amount of extracted crude oil, while lowering the fuel costs. By injecting solar generated steam into the oil beds and heating them, the viscosity of the heavy crude oil can be reduced and facilitate its pumping to the surface. Already technologically proven, the concept can increase the amount of extractable oil from aging wells by upto

60 percent. The on-site infrastructure, together with the pre-existing operating licenses, further enhance our high-efficient, clean electricity generation concept into a profitable turnkey solution.

ABB innovation and development of hybrid power plants provide a more energyefficient option for electricity generation in the Middle East, which relies heavily on fossil fuels. In addition, the EOR method can increase the amount of oil extracted by using solar generated steam – both technologies are a vital step forward to lowering the environmental impact of CO<sub>2</sub> emissions, which is an increasingly pressing issue, both in the Middle East and around the world.

Power you can rely on in harsh environmental conditions

## Enhancing grid reliability

High voltage gas-insulated switchgear to support expansion of grid capacity in Saudi Arabia and meet the rapidly growing demand for electricity

n the second quarter of 2012, ABB won an order worth over \$40 million for high voltage gas-insulated switchgear (GIS) from the AI Toukhi Group, a leading engineering, procurement and construction (EPC) company.

The 420 kilovolt (kV) GIS equipment supplied will form an integral part of the New Muhayil West and Al Omran substations being built for Saudi Electricity Company (SEC), the country's national power transmission and distribution operator. The substations are scheduled to be energized in June 2014.

### Helping to meet Saudi Arabia's growing energy needs

Al Omran, located in the eastern part of Saudi Arabia, is part of the Qurayyah Independent Power Project (IPP). New Muhayil, connected to the Shuqaiq and Namera North transmission network, is being constructed to meet the rapidly growing demand for electricity in the southwestern part of the country.

"The new substations where this GIS equipment will be installed will enhance power capacity and help meet growing electricity demand to support industrial development in the country," said Bernhard Jucker, head of ABB's Power Products division. of the total electricity consumption in the Gulf Cooperation Council (GCC) region. Economic growth, led by the oil and gas sector is driving the development of power infrastructure to secure electricity supplies.

#### **Closer to customers**

In line with our business philosophy to locate production and service facilities closer to our customers, we recently announced a \$40 million investment for the construction of a new manufacturing plant for high voltage GIS and transformer service workshop in Saudi Arabia.

ABB pioneered high voltage GIS in the mid-1960s and as a market leader, continues to drive technology and innovation, offering a full range in its product portfolio with voltage levels from 72.5 kV to 1,200 kV. The compact, low-weight and robust design features enable the deployment of equipment in constrained spaces and harsh conditions to enhance grid reliability and efficiency with minimum maintenance needs.

http://www.abb.com/gridreliability

# Powering one of India's largest solar plants

40 MW grid-connected solar power plant in Gujarat commissioned in just five months for Adani Group, who made a paradigm shift from thermal to solar power generation

nfrastructure conglomerate, Adani Group, commissioned a 40-megawatt (MW) solar power plant in Bitta in Gujarat's Bhuj district in December 2011. The plant marks Adani Group's foray into the renewable energy sector and was commissioned in a record time of five months. Over four lakh thin film photovoltaic (PV) modules are mounted approximately 21,700 mounting on structures to generate 40 megawatts of electricity. The Group envisions setting up an even bigger 100 MW solar power plant in the future, as a further commitment towards clean and green energy. Currently, the power generated from this solar plant is connected to Netra substation in the same district.

For ABB, this was one of the biggest solar substation orders in India. The scope included supply, erection and commissioning of a 66 kilovolt (kV) switchyard with two 66/11 kV, 25/31.5 megavolt amperes (MVA) power transformers, 11 kV medium voltage indoor switchgear, 10 two-way ring main units (RMU) and 18 three-way RMUs.

Dhinesh D, Project Manager for the Power Systems business, ABB in India said, "Meeting the rigorous parameters set by the customer, within the short time frame specified, proved to be a tremendous challenge. Despite this, we were able to deliver all products, from transformers to RMUs, on time. The solid support of our supply chain and divisions and the overall coordination of effort was critical to the successful execution of this project."We are also executing 765 kV projects for Adani Group in other locations; in Tiroda, Koradi and Akola.

The Group's entry into the solar space was greatly facilitated by Gujarat Government's policies and the preferential tariff regime established to encourage participation of developers in this priority area. This state-specific initiative has set an example at the

Adani's 40 MW solar plant in Bitta

national level. Gujarat's solar capacity today corresponds to two-thirds of the installed capacity of the entire nation. For more information: www.abb.com/solar

## Did you know?

- We are partners in diverse photovoltaic solar plant projects across Gujarat, varying in scale from 1 to 40 MW, and in location from desert to inland waterways.
- In Chandrasan, we supplied the compact substation and ring main unit for SunEdison's 1 MW canaltop solar power plant that covers a one-kilometer stretch of the Narmada Canal.
- In Surendranagar we supplied two PVS 800, 500 kW solar inverters and one 1,250 kVA solar compact substation for Rajesh Power Services Private Limited's 1 MW plant, commissioned ahead of schedule.

HVDC transformer at Songo

## Clean power from Mozambique

Songo-Apollo HVDC link to transmit 2 gigawatts power from the hydro plant on the Zambezi river to neighboring South Africa

small but fast growing economy, Mozambique in southeast Africa is poised to become the largest exporter of coal, and with hydro power and more recently, the discovery of two enormous gas fields in Mozambique waters, a major energy exporter.

The Cahora Bassa hydro plant on the Zambezi river produces 2,075 megawatts (MW), most of which is exported to neighboring South Africa via a 1,400 kilometer (km) high voltage direct current (HVDC) transmission line. Jointly owned by Hidroeléctrica de Cahora Bassa in Mozambique and Eskom, South Africa's public utility, the HVDC transmission system comprises two parallel lines stretching from the Songo converter station in Mozambique to the Apollo station near Johannesburg.

First installed in the late 1970s, the Songo-Apollo link was largely destroyed during 25 years of civil war. Finally, a restoration project repaired or replaced nearly all the 4,200 transmission line towers, bringing the system back online in 1998. In 2006, Eskom contracted ABB to upgrade the Apollo converter station's capacity from 1,920 MW to 2,500 MW, and also lay the groundwork for a future upgrade to 3,960 MW. Now ABB is modernizing Apollo's sister station in Mozambique.

The capacity at Songo station remains the same, but it will get new converter transformers, smoothing reactors, arresters and measuring equipment. The DC equipment will be commissioned in the second half of 2013 and the transformers a year later. As with the Apollo upgrade, this project will enhance availability and reliability, ensuring a steady flow of power from Cahora Bassa.

The two gigawatts of clean, reliable hydropower supplied by Mozambique is critical to South Africa, beset with recurring power shortages. For Mozambique, the energy exports represent an important source of income. The Cahora Bassa plant is already one of the largest generation facilities in the South African power

Cahora Bassa Dam, Mozambique

pool, and the HVDC transmission line linking it to the South African market will provide an efficient highway for the plant's output for years to come.

Demand for clean energy is increasing rapidly and infrastructure projects like Songo will play a vital role in the African continent's economic success story. For more information:

### Hotel Show, Dubai Increasing energy efficiency in hotels

Rising energy demands and energy costs world over have brought more and more people around to the view that energy efficiency is the alternative fuel. At The Hotel Show in Dubai, UAE, ABB showcased the i-bus® KNX technology which encourages efficient energy usage. Meanwhile, the thrice-nominated KNX team from ABB in Egypt walked away with the 2012 KNX Award at the Light and Building Fair in Frankfurt, Germany.

"The hotel industry has started to focus more on automated solutions that provide greater energy efficiency, convenience and ease of use. Buildings with our technology are easier to manage and control, it allows an everyday working or living environment to be easily adapted to the individual's needs while saving energy."

 Tarek Zakaria, regional manager for KNX building technology, Middle East and Africa

Automation solutions for buildings

# Solarcon, Bangalore and Renewable Energy World, New Delhi Capturing the power of the sun

With the world's focus firmly on the need for increasing the proportion of renewables in the energy mix, ABB shared its portfolio of solar energy solutions at Renewable Energy World 2012 exposition in New Delhi and SOLARCON in Bangalore.

"The intensive preparation that went into displaying our solar portfolio and the in-depth discussions that followed with various clients and visitors really paid off. The renewables industry is going through a consolidation phase in India and the demand and opportunities for extending power infrastructure have resulted in an open, professional and specific exchange of information."

Subir Pal, Country Manager, Industry
Segment Initiative (ISI)

SOLARCON, Bangalore

Renewable Energy World, New Delhi

### Aquatech, New Delhi Managing a precious resource

Conservation is the most environmentally sound way of reducing demand for water that is a fast depleting resource all over the globe. ABB shared its contributions to sustainable resource management at Aquatech, the largest international water show in India.

"We rolled out our complete package of solutions for instrumentation, control and electrical (ICE) on a LCD screen, from motors, switchgear and automation, through desalination, water supply, sewage treatment and effluent treatment plants to lift irrigation, canal automation and nonrevenue water. We got great mileage from Aquatech, closing two orders for instrumentation on the spot."

- Ravindra Akki, Country Water ISI, Manager, India

## Forthcoming events in the region

## Southern Gulf and Pakistan

Let ABB present convincing evidence on how we can increase asset performance by 6%.

Ask for proof on how we can achieve the extra output and we will show you how we can lower cost and add more value to your business by focusing on the real issues you are grappling with today:

- Extend asset life and reduce operational expenditure
- Reduce emissions and energy consumption
- Make optimal use of assets and take quick decisions
- Stabilize power input and improve power quality
- Safer operations

Visit us at Adipec 2012, November 11-14, Abu Dhabi National Exhibition Center (ADNEC), Abu Dhabi, UAE.

Visit us at Seatrade Middle East Maritime, November 27-29, 2012, Dubai World Trade Center – UAE, Stand M1.

And find out more on increased uptime on turbochargers and reduced operation cost.

### Central Africa and Egypt

Get to know the latest technology trends at Middle East Power Systems Conference MEPCON '12 from December 23-25. The 15<sup>th</sup> international conference at Alexandria in Egypt will explore power systems in depth, from smart grids and power electronics to FACTS and HVDC transmission systems.

### India

Visit us at ELASIA 2013, the international exhibition on power, electrical and lighting from January 4-6, 2013, at BIEC, Bangalore, where you can see the very latest low voltage product offerings from ABB.

# Solar integration and export

Dedicated solutions for integrating solar power in the utility grid and transcontinental transmission via HVDC enable our customers to optimize operations and boost profitability

e support our customers right from selecting the optimal generation solutions through to enabling the reliable and profitable employment of their solar power. This translates to developing and embedding dedicated solutions for grid integration and commercialization of solar electricity. There are a range of solutions available such as: micro-grid approaches for distributed generation, dedicated energy

(Distributed Power Control and Dispatch Systems), as well as an innovative, fast and highly charged/discharged efficient flywheel storage for grid stabilization.

### HVDC the highway for solar export

Favorable trends around solar generation in the Middle East and North Africa (MENA) region have brought the vision of exporting solar electricity, considerably closer to reality. It is ABB's groundbreaking discovery of

Dedicated solutions for grid integration and commercialization of solar power

management tools and high voltage direct current (HVDC) transmission lines for enabling the export of the Middle East's solar power.

### Micro-grids integrate solar power

Depending on the penetration level – share of the total instantaneous power in the grid – the reliable integration of electricity originating from intermittent sources such as solar irradiation requires precise preprocessing steps, voltage and frequency regulation and control. ABB PowerCorp manages to fully integrate solar power into the existing grid, by employing SMART GRID control and automation techniques high voltage direct current transmission that has built the highway that makes this export possible, technically reliable and economically feasible. Through HVDC transmission, large amounts of power can be sent over long distances, with both, low capital expenditures and significantly decreased resistive and capacitive losses. ABB's HVDC Light, specifically designed for underground or underwater transmission, is the ideal candidate for exporting ME solar energy undersea. Together with the other 11 industry founders of the Desertec Solar Initiative, we are focusing on the feasibility, financing and construction of the interconnection plan.

The solar plants to be built in North Africa need to be interconnected, but most of all, the power needs to be transmitted over to Europe through HVDC as it is across the sea.

### Smart energy management

The gradual shift from a centralized power flow, to a multi-actor energy market, calls for a strategic employment of the generated power. Our dedicated tools enable customers to both optimally operate their plants and profitably participate in the energy market. By employing Intelligent Solar Information Systems (ISIS®), the solar plant owner can easily perform a real-time remote monitoring and operation of his installation via Internet Explorer.

Dedicated demand/response management tools facilitate the coordination between the solar plant, other generator types and the loads existing in the grid and thus enable the strategic operation of the plant. Tools such as Ventyx Virtual Power Plant, enable both the utility to incentivize the selling of clean solar energy and the environmentally conscious users to choose it.

For more information: www.abb.com/solar

Highly efficient and cost-effective CSP power plants

# Leading through innovation

Applying a range of efficient and reliable solutions suitable for harsh desert climates, from concentrated solar power to solar steam

e are committed to providing the most efficient, reliable and competitive solar solutions for high direct normal irradiation (DNI) regions between 1,800-2,500 kWh/m²/year and hot climates such as the Middle East. To support this, ABB has established strategic partnerships with the provider of the best performing concentrated solar power (CSP) solution: Novatec Solar.

#### ABB Novatec's CSP solution

In March 2011, ABB acquired 35 percent of Novatec Solar's shares and integrated their innovative Fresnel Linear Collector technology into the company's power generation portfolio, making ABB a turnkey supplier of highly efficient and cost-effective CSP power plants. Linear Fresnel reflectors use long, thin segments of flat mirrors to focus sunlight onto a fixed absorber located at a common focal point of the reflectors. These mirrors are capable of concentrating the sun's energy to approximately 30 times its normal intensity. Novatec Solar is the pioneer developer of the first commercial CSP Plant called Puerto Errado in Murcia, Spain, operating since 2009 at a power plant efficiency of 38 percent.

Employing the Fresnel reflector principle, ABB Novatec's CSP plants achieve performances appreciably higher than the traditional parabolic trough plants. Super thin, flat and light panels are used which are not only inexpensive to manufacture, but also easy to transport, install and maintain. The secondary reflector contributes to the superheating of steam up to 500 degrees centigrade, which translates into a significant efficiency gain, especially in regions with high environmental temperatures.

#### Solar steam and its range of applications

Besides CSP plants for power generation, there are other ways of using process steam generated directly in Novatec's Linear Fresnel Collectors, ABB Novatec's solar boiler can successfully be employed for retrofitting low-efficiency gasfired plants, a predominant component of the current Middle Eastern energy mix. The CSP augmentation employed in the integrated solar combined cycles (ISCC) power plants is based on heat recovery and steam superheating in Fresnel boilers. The integrated solar combined cycle concept is a hybrid power plant. It is a conventional gas turbine combined cycle and a solar thermal steam generator that provides reliable and clean power. Due to the high solar thermal steam parameters achieved in Novatec's Fresnel-based solar boilers ABB's ISCC cycle provides high solar shares at very low cost.

Another clever way of using solar generated steam is for oil recovery

purposes, the so-called Enhanced Oil Recovery. According to a recent report by SBI, conventional oil recovery methods are only able to extract about 10-30 percent of the potential oil from any given reservoir, leaving nearly 70-90 percent of the reservoir's oil in the ground source.

Injecting solar steam into the oil fields, heats the reservoir, reducing the viscosity of the untapped heavy crude oil and facilitating its pumping. EOR technologies can increase the quantity of extractable oil from aging wells up to 60 percent. (Source: US Department of Energy – http:// www.fossil.energy.gov/programs/oilgas/ eor/index.html)

Further applications which are of great interest and focus in the Middle East are solar cooling and solar desalination where ABB's long experience enables the design of all components in a way to reach economical optimum regarding output and efficiency.

For more information: www.abb.com/solar

# Spurring Africa's growth

Custom-made solar solutions expand local engineering capabilities, benefitting both, the people and the environment of the African continent

frica has an abundance of natural resources and many African countries are counted among the fastest growing economies in the world. So, on the one hand the continent continues to grow exponentially, while on the other, the World Bank has estimated that more than 500 million Africans are living without electricity. It is estimated that by 2015 Africa will produce 20 percent of global oil and by 2040 the African population may exceed that of India or China. With growing economies and booming populations, providing reliable electricity is becoming a huge challenge. Transmission and distribution grids in many parts of Africa are operating close to capacity, and although new grids are being built rapidly, many Africans still have no access to electricity.

A lucrative marketplace, Africa has been identified by ABB as a key growth market. With our industry expertise and comprehensive environmentally-conscious portfolio, we are currently operational in more than 15 countries on the African continent: namely Algeria, Angola, Botswana, Côte d'Ivoire, Democratic Republic of Congo, Cameroon, Egypt, Ghana, Ivory Coast, Democratic Republic of Congo, Kenya, Mauritius, South Africa, Uganda, Zambia and Zimbabwe.

To accommodate the growth on the African continent, South Africa and Egypt have been identified as centers of excellence in an initiative called the Focus Africa Re-wire strategy. The two countries will continue to drive sales in Africa by recruiting and training additional sales engineers who will be active in the market

with existing customers while developing and extending our customer base.

As a center of excellence, South Africa provides support to Angola, Congo, Kenya, Tanzania and Mozambigue. These countries form part of the sub-Saharan region. Predictions in the World Bank's latest 'Global Economic Prospects' report indicate that the sub-Saharan African region is expected to record a 5.3 percent growth in 2013 as global firms and domestic demands remain robust. Despite a slower projected growth, developing countries are expected to account for more than half of the global growth from 2012 to 2014. Huge investments in infrastructure are an integral part of the springboard for economic growth for both South Africa and for the whole southern African region. The reliable supply of electricity, therefore, remains a pressing issue on the continent.

While globally coal remains the main source for the production of electricity (40 percent), with natural gas accounting for more than 20 percent, almost half of the electricity-producing countries of the world have an emission factor of below 500 g  $CO_2$  / kWh in 2009. However, Africa, with its large share of coal in the power mix, continues to be a very high  $CO_2$  emission producer, presenting both challenges and opportunities for the introduction of greater

levels of energy efficiency through the deployment of alternative and renewable sources.

Through energy efficiency, companies – and countries – can improve their sustainability significantly, allowing them to focus their effort on other important elements such as staff and skills development.

Globally, the energy efficiency of thermal power plants alone has improved by three percentage points since 1990. However, strong disparities still exist between developed countries and the developing world, where efficiency is low, mainly due to aging plants and the large share of coal in thermal generation. Africa in particular needs to be smart and forward thinking with its technology and automation investments.

With its recognized expertise in power grid efficiency improvements, ABB has worked with many power companies and authorities around the world to reduce the rate of transmission and distribution losses. However, most of these improvements were effected in developed countries, mainly through the use of low-loss conductors and transformers, the standardization and upgrading of transmission and distribution voltages, and reactive power control. It is now our aim to play an even bigger part in driving the fast-track developmental agenda for Africa, particularly south of the Sahara by strategically deploying the most suitable of our many innovations.

ABB recently launched a new concept for turnkey concentrating solar power (CSP) plants based on a low-cost, highly efficient and highly scalable technology that uses considerably less material, land and water than any other CSP technology. The ABB-Novatec Solar concept can be used to generate energy in a wide range of applications including stand-alone or hybrid power plants, as fuel-savers in existing power plants, in desalination and district cooling plants, and in industrial processes that require steam. This is a fine example of a solution ideally suited to the African continent's requirements.

Expanding local engineering capabilities and working with customers to develop custom-made solutions that will benefit the people and the environment while making the business more sustainable is ABB's key objective for Africa. It has the technology, the expertise and the experience to leverage its footprint with production in all five divisions.

One of sub-Sahara's most recent wins is the five-year Full Service® contract with Namibia Custom Smelters (NCS). ABB will manage all maintenance to improve productivity and equipment reliability at the

Enhancing local engineering capability

copper smelting and converting plant in Tsumeb, some 425 kilometers north of the capital, Windhoek. We will also provide process optimization, energy consulting and equipment life cycle services, mainly through the retained maintenance staff and management who will be further trained to meet our performance standards.

The plant houses two primary smelting furnaces and three converters. It has an annual production capacity of 200,000 tons of copper concentrate from the treatment of complex copper concentrates containing gold, silver and arsenic. The smelter is one of only a few in the world which is able to treat arsenic-bearing copper concentrates.

Another exciting project is the Rand Water project in South Africa. This project includes the supply, delivery, installation and cold commissioning of 78 switchgear panels to four Rand Water sites namely, Amazimtoti, Vereeniging, Lethabo and Palmiet. Rand Water is an organ of state, reporting to the Department of Water and Environmental Affairs. Their distribution network includes over 3,056 kilometers of large diameter pipeline, feeding 58 strategically located service reservoirs. Its customers include metropolitan municipalities, local municipalities, mines and industries and it supplies, on average, 3,653 million liters of water to these customers daily. In order to ensure continuity of supply, Rand Water invests huge resources to expand, upgrade and maintain its infrastructure. An important aspect of this infrastructure development program involves the security and quality supply of its electrical energy to the various treatment, pumping and distribution stations. In order to achieve the safe and reliable supply of electrical energy, they have embarked on a medium voltage switchgear replacement project which spans across the various areas of its operation. ABB in South Africa was awarded phase one of the switchgear replacement project in February 2012 at a value of R21.5 million. Our superior technology and compliance to the IEC 62271 standard, coupled with extensive experience and credibility in the water industry, were some of the key factors in winning us this order. The estimated date of completion for phase one is June 2013, and once complete, it will assist in enabling Rand Water to continue to supply high quality potable water to the Gauteng region.

A pioneer project in the region involves a 2 x 300 megawatt (MW) interconnection between a converter station in the Caprivi strip in Namibia, close to the border of Zambia, and another converter station, about 300 kilometers north of Windhoek. Known as the Caprivi Link Interconnector, the project spans over a distance of 950 kilometers, with AC voltages of 320 kilovolt (kV) and 400 kV on the two ends of a bipolar 350 kV DC overhead line. This is the first HVDC Light® project to be built with overhead lines. ABB was responsible for system engineering including design, supply and installation of the two converter stations and earth electrodes. This is the first time that this technology will be used for overhead transmission lines. The Caprivi Link Interconnector will increase grid reliability and enable the establishment of power trading in the southern African region.

The African continent certainly has established itself as the world's current focus for business growth opportunities and ABB is poised to leverage those opportunities, while contributing in a significant way to the sustainable development of a great continent.

## Energy Efficiency – doing more while lowering costs and emissions

ABB has been in the energy business for 120 years. Using energy more efficiently will not only contribute the lion's share of emissions reductions needed, it is arguably the most sustainable and cheapest way to reduce emissions and address global energy security. Energy-efficient systems can pay for themselves in energy saving, sometimes within months, and further reduce operation and maintenance costs in the long term. Plug in to the next issue of Contact to understand how we help our customers squeeze the most value from each unit of energy they use.

## Connect renewable power to the grid?

Electricity generated by water, sun and wind is most abundant in remote areas like mountains, deserts or far out at sea. ABB's leading power and automation technologies help renewable power reach about 70 million people by integrating it into electrical grids, sometimes over vast distances. Our effort to harness renewable energy is making power networks smarter, and helping to protect the environment and fight climate change. www.abb.com/betterworld

## Naturally.
