BORDLINE® CC750 DE
For diesel-electric regional trains (DMU) in the North American rail market

BORDLINE® CC750 DE converts diesel generator power into propulsion power for the traction motors and auxiliary power for onboard consumers (AC, DC and battery). The Compact Converter is designed for the North American rail market and fully compliant with the Buy America Act.

Characteristics
- Best fuel efficiency control due to active rectifier function
- Very compact and lightweight due to low voltage IGBT technology
- All power electronics in one unit (propulsion and auxiliary converter, battery charger)
- Modular design allows flexible mechanical layout (machine room, under-floor, roof mounted)

System overview
BORDLINE® CC750 DE employs an active inverter module (IGBT) rectifying the asynchronous generator voltage to feed the DC-link. This completely decouples the DC-link voltage from the engine speed. Hence, the engine always runs at best efficiency. An identical inverter module is used to control the traction motor which greatly simplifies the component set-up.

BORDLINE® CC750 DE Compact Converter contains the following main components:
- Active rectifier
- DC-link filter
- Braking chopper
- Propulsion converter
- Integrated auxiliary converter
- Energy storage chopper (optional)
- Integrated battery charger
- AC 800PEC control

Propulsion converter
BORDLINE® CC750 DE Compact Converter is a compact and solid unit incorporating modern IGBT technology and can control one or two motors in parallel. With a constant high switching frequency of 2 kHz, BORDLINE® CC750 DE generates a quasi-sinusoidal current waveform, which drastically reduces losses, audible noise and mechanical stress on the traction motor.
Braking chopper, energy storage chopper
The braking energy can be dissipated in the brake resistor. Alternatively it can be recuperated into the supercap (option) which allows to reduce the diesel engine motorization of the vehicle.

Auxiliary converter
The auxiliary converter provides a three-phase sinusoidal AC voltage output. It is directly coupled to the main DC-link.

Powerful control platform
ABB traction converters are built on the AC 800PEC control platform, one of the most powerful modular controller for high-speed performance on the market. This control platform is also used in a wide range of industrial applications. The AC 800PEC software is implemented on three performance levels, thus providing an excellent range of control and communication functionality, in cycle times that extend from the sub-microsecond to the millisecond level. Compared to most other commercially available traction control systems, the modular application software in the AC 800PEC reduces train commissioning time significantly.

Cooling system
The equipment is efficiently cooled using service water, allowing a very compact construction. The temperature of the coolant is lowered using an external heat exchanger.

Mechanical design
The unit can be designed for machine room, roof or under-floor mounting. The modular design allows for easy access for maintenance.

Diagnostics and service
The service-friendly modular design with highly standardized components ensures high reliability, excellent spare parts availability, and optimized life-cycle costs. The Compact Converter is delivered with BORDLINE® View, a diagnostic tool that visualizes signals, various parameters and the state of the traction system. It consists of an advanced self-diagnosis function, which provides advice and instructions for service and repair. BORDLINE® View is easy to use and runs on a standard PC.

Application example
The BORDLINE® CC750 DE is used in Stadler’s FLIRT DMU fleet for the Fort Worth Transportation Authority (The T) in Texas, United States.
