Sensyflow FMT700-P Compact
Thermal Mass Flowmeter

Introduction
The Sensyflow FMT700-P Compact is used for the direct mass flow measurement of air.

The measurement is independent of the operating pressure and temperature. It offers top accuracy with short response time. Used in quality assurance, test bench applications, in research and development.

The measuring system is used as a reference system for intake air measurements by leading automotive manufacturers all over the world.

Additional Information
Additional documentation on Sensyflow FMT700-P Compact is available for download free of charge at www.abb.com/flow.

General information and instructions

These instructions are an important part of the product and must be retained for future reference. Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions. For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer. The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship. Modifications and repairs to the product may only be performed if expressly permitted by these instructions. Information and symbols on the product must be observed. These may not be removed and must be fully legible at all times. The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

Warnings

The warnings in these instructions are structured as follows:

⚠️ **DANGER**

The signal word ‘DANGER’ indicates an imminent danger. Failure to observe this information will result in death or severe injury.

⚠️ **WARNING**

The signal word ‘WARNING’ indicates an imminent danger. Failure to observe this information may result in death or severe injury.

⚠️ **CAUTION**

The signal word ‘CAUTION’ indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

**NOTICE**

The signal word ‘NOTICE’ indicates possible material damage.

Note

‘Note’ indicates useful or important information about the product.
1 Safety

Intended use
This device is intended for the following uses:
- Direct mass flow measurement of air in open and closed pipelines.
- For indirect measurement of volume flows (through standard density and mass current).

The device has been designed for use exclusively within the technical limit values indicated on the identification plate and in the data sheets.

Improper use
The following are considered to be instances of especially improper use of the device:
- Operation as a flexible compensating adapter in piping, for example for compensating pipe offsets, pipe vibrations, pipe expansions, etc.
- For use as a climbing aid, for example for mounting purposes.
- For use as a bracket for external loads, for example as a support for piping, etc.
- Material application, for example by painting over the housing, name plate or welding/soldering on parts.
- Material removal, for example by spot drilling the housing.

Notes on data safety
This product is designed to be connected to and to communicate information and data via a network interface. It is operator’s sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). Operator shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and / or theft of data or information.
ABB Automation Products GmbH and its affiliates are not liable for damages and / or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and / or theft of data or information.

Warranty provisions
Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer’s warranty null and void.

Figure 2: Aluminum transport box

Note
The sensor is delivered in a robust aluminum transport box. Always use the aluminum transport box to transport the sensor.
... 2 Design and function

Device description

The Sensyflow FMT700-P Compact works in accordance with the measuring principle of a hot-film anemometer. This measurement method allows for direct measurement of the gas mass flow. Taking into account the standard density of the air, the standard volume flow can be measured without the need for additional pressure and temperature compensation.

Sensor
The transmitter is integrated in the sensor. The measuring system comprises two components, a sensor and a measuring section. The sensor is designed as a meter tube and accommodates the measuring elements and an electronic transmitter circuit. The meter tube is available in six nominal diameters ranging from DN 25 to DN 200 and is installed in the measuring section by using quick-clamping connectors.

Measuring section
The sensor is installed in a measuring section with the help of quick-clamping connectors. The measuring section itself is made up of sufficiently dimensioned inlet and outlet sections as well as an air filter or flow conditioner. The flow conditioner can be connected to an air duct, for example, using the connection piece on the suction side. The power supply, output signals and serial interface for the sensor are connected via a connection cable. The measuring rate is adjustable according to measuring velocity or signal damping requirements.

Measuring principle

Thermal flow metering procedures use different ways to evaluate the flow dependent cooling of a heated resistor as measuring signal. In a hotfilm anemometer with constant temperature difference control, the heated measurement resistor is maintained at a constant overtemperature in relation to an unheated measurement resistor inside the gas flow. The heating power required for maintaining the overtemperature depends directly on the flow rate and the material properties of the gas. With a known (and constant) gas composition the mass-flow can be determined by electronically evaluating the heater current / mass-flow curve without additional pressure and temperature compensation. Together with the standard density of the gas this results directly in the standard volume flow. Considering the high measuring range value dynamics up to 1:60, an accuracy smaller than 0.8 % of the measured value is achieved.

The gas flows past two temperature-sensitive resistors, measurement resistor and heating resistor, which are part of an electric bridge circuit. Due to the chosen resistance ratio, the heating resistor is heated by the heating current $I_H$. The measurement resistor adopts the same temperature as the gas. The heating current $I_H$ is preset by the electronic control circuit to produce a constant temperature difference between the heated resistor and the temperature of the gas.
The electric power generated in the heating resistor precisely compensates its loss of heat to the gas flow. As this loss of heat is dependent on the number of particles which collide with the surface of the heating resistor, the heating current \( I_H \) represents a measure of the mass flow rate.

Typical applications
Sensyflow FMT700-P Compact for air provide a unique combination of high measuring accuracy, wide measuring range and extremely fast response time. These features especially qualify them for the following application fields:
- Intake air measurements in combustion engines and fuel cells,
- Test benches for turbo chargers,
- Serial testing of flow dependent components like throttle valves, exhaust fans, air filters, etc.
- Quality assurance: Reference device for flowmeters,
- Research and development at universities and institutes.

Notes for ordering
The measuring system consists of the following components, which must be ordered separately:
1. Sensor,
2. Connection cable for the sensor,
3. Measuring section with air filter or flow conditioner,

Note
When using the sensor with modified measuring sections or without measuring sections, influences on measuring accuracy cannot be ruled out.

3 Product identification

Name plate

Note
The name plates displayed are examples. The device identification plates affixed to the device can differ from this representation.

![Name plate (example)](image)
4 Transport and storage

Inspection

Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents. All claims for damages must be submitted to the shipper without delay and before installation.

Transport

The sensor is delivered in a robust aluminum transport box. Always use the aluminum transport box to transport the sensor.

If the original packaging material is no longer available, wrap the device in bubble wrap or corrugated cardboard and place it in a box of sufficient size lined with a shock-absorbing material (e.g., foam rubber). The thickness of the padding should be appropriate for the device weight and type of shipment. The box must be labeled as “fragile”.

For overseas shipment, always add a desiccant (e.g., silica gel) and hermetically seal the device plus desiccant in a layer of polythene that is 0.2 mm thick. Use an amount of desiccant that is appropriate for the packing volume and the expected transport time (at least for three months). You should also line the box with a layer of union paper.

Storing the device

Bear the following points in mind when storing devices:

- Store the device in its original packaging in a dry and dust-free location.
- Observe the permitted ambient conditions for transport and storage.
- Avoid storing the device in direct sunlight.
- In principle, the devices may be stored for an unlimited period. However, the warranty conditions stipulated in the order confirmation of the supplier apply.

Ambient conditions

Refer to Ambient conditions on page 9.

Returning devices

For the return of devices, follow the instructions in Returning devices on page 23.
5 Installation

Safety instructions

⚠️ WARNING
Risk of injury due to live parts.
Improper work on the electrical connections can result in electric shock.
• Connect the device only with the power supply switched off.
• Observe the applicable standards and regulations for the electrical connection.

⚠️ WARNING
Risk of injury due to process conditions.
The process conditions, for example high pressures and temperatures, toxic and aggressive measuring media, can give rise to hazards when working on the device.
• Before working on the device, make sure that the process conditions do not pose any hazards.
• If necessary, wear suited personal protective equipment when working on the device.
• Depressurize and empty the device / piping, allow to cool and purge if necessary.

Installation conditions

Inlet and outlet sections
To achieve the provided measuring accuracy, the sensor needs to be installed in the available ABB measuring sections.

The use of an ABB measuring section with an uninterrupted inlet section of $10 \times D^*$ and an outlet section of $5 \times D^*$ in connection with an air filter or flow conditioner complies with the calibration set and ensures measuring accuracy.

Separate components of the measuring sections are also available in the accessory product range.

Installing the sensor

Before installing the sensor, observe the following points:

- The ambient conditions at the installation site comply with the requirements in Ambient conditions on page 9.
- The operating pressure complies with the requirements in Operating pressure on page 10

Install the sensor:

1. Install the sensor in the measuring section. Make sure that the tapered flange connection is secure (tightness) and observe the flow direction (direction indicated by arrow).

   ![Flow direction](image)

2. Establish the electrical connection in accordance with the requirements Electrical connections on page 11.

Note

For available components to set up the measuring section see Accessories on page 25.
**Electrical connections**

**Terminal layout**
Please use the supplied cable for the electrical connection of the flowmeter sensor. It is connected to the measuring device using the plug. Only 24 VDC supply voltage should be used.

**Parameterize**

The Sensyflow FMT700-P Compact can simultaneously operate one analog output (current 0 / 4 to 20 mA or voltage 0 to 5 / 10 V), one digital output (frequency, pulse, alarm) and a serial RS 232 interface.

Parameterization of the measuring system can also take place via the serial interface. Using a PC or laptop, you can change the output signal used or the adjust the settings of the measuring ranges and signals.

The parameterization program is included in the standard scope of delivery.

For easier connection of the Sensyflow FMT700-P Compact in the test field, a D - SUB female connector and a USB 2.0, serial adapter including USB cable is supplied.

6 Commissioning

Checks prior to commissioning
The following points must be checked before commissioning the device:

- Correct wiring in accordance with Electrical connections on page 11.
- The ambient conditions must comply with the requirements in Ambient conditions on page 9.
- The power supply must meet the requirements set out on the name plate.

Switching on the power supply
1. Switch on the power supply.
   - The status LED blinks red during the initialization phase (approx. 30 s).
   - After the initialization phase, the status LED lights up in a continuous green color.
2. Perform parameterization of the flowmeter (see Parameter descriptions on page 14).
   The flowmeter is now ready for operation.

Inspection after power-up of the power supply
The following points must be checked after commissioning the device:

- Parameter configuration must correspond to the operating conditions.

Status LED on the transmitter
The status LED on the transmitter indicates the operating condition of the device and displays possible faults.

<table>
<thead>
<tr>
<th>LED</th>

</tbody>
</table>

Install the parameterization program
The parameterization program is located on the provided USB stick.

The parameterization program must be installed on a PC / laptop:
1. Insert the USB stick into the PC / laptop.
2. Open the USB stick in Explorer.
3. Launch the ‘SETUP.EXE’ file with administrator rights.
4. Follow the instructions in the installation program.
5. Change the preset installation directory as needed.
6. Select the desired language (German, English or French). The language can be changed in the parameterization program only.
... 6 Commissioning

Start the parameterization program

1. Connect the sensor to an open RS232 interface of the PC / laptop using the D-Sub adapter. If no RS232 interface is available, additionally use the USB-RS232 adapter.
2. Power-up the power supply of the sensor.
3. To launch the parameterization program, execute the ‘P_Compact_V100.exe’ file in the installation directory.
   - The COM 1 interface is used by default. If another interface is used, select it in the ‘Connection’ menu.

Parameter descriptions

**NOTICE**

Data loss
Data loss due to the shut-off of power supply during the initialization phase (status LED blinks red) of the device.
  - Do not switch off the power supply until the device is ready for operation (status LED is continuous green).

Saving the parameterization
If any parameterization has been changed in the parameterization program and transferred to the device through the ‘Accept’ button, a save / initialization phase of the device follows and the status LED blinks red.
  - The supply voltage must not be switched off until the status LED is continuous green once more.

The modified parameters will not be saved properly if this rule is not obeyed.
After the repeated power-up of the device, a data inconsistency will be detected during the initialization phase, the status LED will switch to continuous red and the device will no longer function correctly.

Reestablish the parameterization
Once the status LED is continuous red, communication with the parameterization software can be resumed.

1. The parameterization data must be resaved by selecting the ‘Accept’ button.
   - Wait until the symbol indicating that a program is running disappears and the status indication for the ‘initialization phase’ is terminated.
   - The status LED is still continuous red at this stage.
2. Perform a hardware reset by powering down and powering up the power supply.
   - After the initialization phase, the status LED is continuous green and the device is ready for operation.

Note
If operation readiness cannot be reestablished, contact ABB Service.

</tbody>
</table>

Measured value
In the measured value area, the current measured value is displayed in % as a bar graph.

If the digital output of the sensor is configured as a switch output (see ‘Switch output’ option on page 21), the graph displays the up-scale or down-scale of the set limit value:
- If the current measured value down-scales the set lower limit, the bar has a blue color.
- If the current measured value up-scales the set upper limit, the bar has a red color.
- If the current measured value is within the set limits, the bar has a green color.

Standard condition
When a volume unit is selected (e.g. Nm³/h), the unit always makes reference to a defined standard condition.
In the standard condition field, the absolute pressure and reference temperature for the selected volume unit is displayed.
When a mass flow unit is selected (e.g. kg/h) the field remains empty.

Status bar
Display of information and help texts for the current action. In addition, the current date and time are displayed.

Digital output
Display of the digital output configuration.

Frequency output option:
The current measured value is output as a frequency on the digital output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency [min]</td>
<td>Frequency in Hz for ‘0’ flow.</td>
</tr>
<tr>
<td>Frequency [max]</td>
<td>Frequency in Hz for the set upper range value.</td>
</tr>
</tbody>
</table>
... 6 Commissioning

... Parameter descriptions

Impulse output option:

The current measured value is output in impulses/unit on the digital output.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value</td>
<td>Set flow rate per impulse.</td>
</tr>
<tr>
<td>Duration</td>
<td>Set impulse length.</td>
</tr>
<tr>
<td>Polarity</td>
<td>Set polarity (low/high) for the impulse.</td>
</tr>
</tbody>
</table>

Switch option:

The current measured value is monitored for fluctuation either side of an adjustable limit value. The polarity gives the condition of the signal within the set limits.

<table>

</tr>
</tbody>
</table>
‘Analog output’ Registration Tab

This tab is used to configure the analog output. For the sake of transparency, both the current and amended values are displayed at the same time.

- The parameters to be changed should be selected using the check box ✔ and the values changed in the entry field.
- The changed values are saved to the sensor using the ‘Accept’ button.

The sensor is restarted and initialized (LED on the transmitter blinks red). No measured values are displayed during initialization.

- The changed values are saved to the sensor using the ‘Accept’ button.

The sensor is restarted and initialized (status LED on the transmitter blinks red). No measured values are displayed during initialization.
Digital output
Configuration of the digital output.

‘Standard Frequency’ option

In the ‘Standard Frequency’ operating mode, you can switch between two frequency ranges 1 to 100 Hz or 10 to 1000 Hz. The lower frequency corresponds to a flow rate of 0 %, while the upper frequency corresponds to a flow rate of 100 % of the set upper range value.

‘Variable Frequency’ option

In the ‘Variable Frequency’ operating mode, you can enter any lower and upper frequency. The lower frequency corresponds to a flow rate of 0 %, while the upper frequency corresponds to a flow rate of 100 % of the set upper range value.

‘Impulse output’ option

The current measured value is output in impulses/unit on the digital output.

<table>

‘No output’ option
Deactivates the digital output.
7 Operation

Note
The device does not have operating elements for parameterization on site. Operation and configuration is performed through the parameterization program, see Parameter descriptions on page 14.

Safety instructions
If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

8 Diagnosis / Troubleshooting

General
Error messages and device disruptions are indicated via the status LED on the sensor.

Status LED on the transmitter
The status LED on the transmitter indicates the operating condition of the device and displays possible faults.

9 Maintenance / Repair

General

All measuring systems are calibrated using in-house calibration equipment. The device does not require any maintenance.

Occasional cleaning may be required where the air contains large amounts of dust or oil. We recommend connecting an upstream air filter for this type of application. Filters guaranteeing air quality in accordance with ISO 8573.1: Class 1-2 have proven especially useful here.

Cleaning

Cleaning the flowmeter sensor will only remove particles; sticky or stubborn stains cannot be removed. If the sensor becomes contaminated with oil or deposits which cannot be blown out using air, the sensor needs to be returned to the manufacturer for cleaning in a special solution. This will also involve a complete recalibration process.

Cleaning through blow-out:
1. Remove the connector of the connection cable from the sensor.
2. Make sure the pipeline is depressurized.
3. Remove the transmitter from the measuring section.
4. Carefully blow-out the sensor using clean pressurized air.
   • If the impurities cannot be removed, send the sensor to the manufacturer for cleaning and calibration.
5. Install the transmitter in the measuring section.
6. Reconnect the connection cable to the sensor.

Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes. Fill out the return form (see Return form on page 31) and include this with the device.

In accordance with the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes:

All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 4 for nearest service location.

NOTICE

Damage to the sensor

Damage to the sensor due to improper handling and cleaning. Under no circumstances should components like the honeycomb or sieve be removed from the flowmeter sensor, nor should they be bent or damaged in any other way.

• Any attempts to clean the sensor that go beyond the steps described above may cause destruction to the sensor.
Dismounting and disposal

### Dismounting

**WARNING**

**Risk of injury due to process conditions.**
The process conditions, for example high pressures and temperatures, toxic and aggressive measuring media, can give rise to hazards when dismantling the device.
- If necessary, wear suited personal protective equipment during disassembly.
- Before disassembly, make sure that the process conditions do not pose any safety risks.
- Depressurize and empty the device / piping, allow to cool and purge if necessary.

Bear the following points in mind when dismantling the device:
- Switch off the power supply.
- Disconnect electrical connections.
- Allow the device / piping to cool and depressurize and empty. Collect any escaping medium and dispose of it in accordance with environmental guidelines.
- Use suited tools to disassemble the device, taking the weight of the device into consideration.
- If the device is to be used at another location, the device should preferably be packaged in its original packing so that it cannot be damaged.
- Observe the notices in **Returning devices** on page 23.

### Disposal

**Note**

Products that are marked with the adjacent symbol may **not** be disposed of as unsorted municipal waste (domestic waste). They should be disposed of through separate collection of electric and electronic devices.

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:
- As of 8/15/2018, this product will be under the open scope of the WEEE Directive 2012/19/EU and relevant national laws (for example, ElektroG - Electrical Equipment Act - in Germany).
- The product must be supplied to a specialist recycling company. Do not use municipal waste collection points. These may be used for privately used products only in accordance with WEEE Directive 2012/19/EU.
- If there is no possibility to dispose of the old equipment properly, our Service can take care of its pick-up and disposal for a fee.

Introduction

The Sensyflow FMT700-P Compact is used for the direct mass flow measurement of air. The measurement is independent of the operating pressure and temperature. It offers top accuracy with short response time. Used in quality assurance, test bench applications, in research and development.

The measuring system is used as a reference system for intake air measurements by leading automotive manufacturers all over the world.

Additional Information

Additional documentation on Sensyflow FMT700-P Compact is available for download free of charge at www.abb.com/flow.
