This document is protected by copyright. It assists the user in safe and efficient operation of the device. The contents of this document, whether whole or in part, may not be copied or reproduced without prior approval by the copyright holder.
1 Safety

1.1 General information and notes for the reader

You must read these instructions carefully prior to installing and commissioning the device. These instructions are an important part of the product and must be kept for future reference. These instructions are intended as an overview and do not contain detailed information on all designs for this product or every possible aspect of installation, operation and maintenance. For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer.

The content of these instructions is neither part of any previous or existing agreement, promise or legal relationship nor is it intended to change the same.

This product is built based on state-of-the-art technology and is operationally safe. It has been tested and left the factory in perfect working order from a safety perspective. The information in the manual must be observed and followed in order to maintain this state throughout the period of operation.

Modifications and repairs to the product may only be performed if expressly permitted by these instructions.

Only by observing all of the safety instructions and all safety/warning symbols in these instructions can optimum protection of both personnel and the environment, as well as safe and fault-free operation of the device, be ensured.

Information and symbols directly on the product must be observed. They may not be removed and must be fully legible at all times.

1.2 Intended use

Mass flow measurement of gases and gas mixtures in closed pipelines.

Can be used:
- As a plug-in sensor in the pipe component in pipelines with nominal diameters 1 ... 3”,
- With weld-in adapter directly in pipelines with nominal diameters DN 100 ... DN 250 (4 ... 10”).
- The permissible process temperature range is -25 ... 150 °C (-13 ... 302 °F).

WARNING

These devices are not permitted for use in zone 0 or zone 1 potentially explosive atmospheres.

The device is designed for use exclusively within the values stated on the name plate and in the technical specifications (see the section titled "Specifications").
1.2.1 General information

- The device (including the pipe components) has been designed, produced and approved in accordance with Pressure Equipment Directive 2014/68/EU. The pipe components take the form of:
  - External thread design with integrated measuring section,
  - Flange design with integrated measuring section
  - Weld-on adapter
- The thermal mass flowmeters are a component of the pipeline. A rating of the entire system according to PED is to be carried out by the approved regulatory agency on the customer side.
- The FMT200-D measuring systems are intended exclusively for measuring the flow of gaseous media.
- The device may only be used in accordance with the application specified on the order confirmation; other operating conditions may prevent the device from functioning correctly, cause damage to it or even damage it beyond repair.
- Care must be taken to ensure that the measuring media used do not impair the chemical and physical properties of the components that come into contact with the fluids concerned.
- The threshold value for alternating load cycles corresponds to AD-2000 instruction sheet S1, Section 1.4 and is not calculated or checked by the manufacturer.
- The device should be included in any regular maintenance activities that are carried out on the entire system.
- The materials used must be checked by the user to ensure their suitability for the application concerned.
- The maximum operating conditions relating to pressure and temperature, as stated on the name plate / in the operating instructions, must not be exceeded.
- When installing and disassembling pipe components or flowmeter sensors, ensure that the pipeline has been depressurized.
- Before carrying out installation work on pipelines used to carry aggressive or toxic measuring media, media that may be classed as irritant, or other kinds of hazardous media, the fluids concerned must be adequately flushed out. Compliance with the relevant accident prevention regulations must also be ensured.
- If damaged, components must no longer be used. They must be taken out of circulation and sent to the manufacturer for repair.
- If disassembled components have come into contact with aggressive or toxic measuring media, media that may be classed as irritant, or other kinds of hazardous media, before being sent off they must be cleaned and then packed and labeled accordingly.
- If leaks occur at the measuring point, it must immediately be taken out of service.
- Defective gaskets or O-rings must be removed from use and must be replaced as a matter of urgency.
- The subsequent mechanical labeling or machining of pipe components and flowmeter sensors can result in damage and is prohibited.
  - Exception: Cutting to length and welding onto the pipeline in the case of weld-on adapters.
1.2.2 Installing / Disassembling pipe components

- During installation, it is important to ensure that the flow direction corresponds to the attached label.
- When welding the weld-on adapter, remember to observe the relevant welding instructions. The amount of heat introduced must be kept to an absolute minimum to prevent warping of the mounting flange's sealing surface.
- In the case of flanged connections, flat gaskets must be installed. These must be in perfect condition and resistant to the measuring media.
- Before installing pipe components or flowmeter sensors, check all components and gaskets for damage.
- Pipe components must not be installed under tension, otherwise the pipeline may be subjected to impermissible forces.
- When assembling the flanged connections, use screws that offer the required strength and dimensions.
- The screws must be tightened evenly and to the required torque.
- Once the pipe components have been installed, the insertion connection must be sealed by means of a blind flange plus gasket or by closing a shut-off device (if present).

1.2.3 Installing / Disassembling the flowmeter sensor

- Installation in the pipe component or weld-on adapter is only possible if the flowmeter sensor data matches the measuring point specifications.
- It is very important to use the O-ring supplied (not a flat gasket). This is resistant to measuring media and should be inserted in the groove provided in the pipe component flange.
- Take care not to damage the measuring elements when inserting the flowmeter sensor into the pipe component, as this is not permitted.
- The flowmeter sensor should be firmly bolted together with the flange of the insertion connection. The screws must be tightened evenly to the required torque.

1.3 Target groups and qualifications

Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator to do so. The specialist personnel must have read and understood the manual and comply with its instructions.

Prior to using corrosive and abrasive materials for measurement purposes, the operator must check the level of resistance of all parts coming into contact with the materials to be measured. ABB Automation Products GmbH will gladly support you in selecting the materials, but cannot accept any liability in doing so.

The operators must strictly observe the applicable national regulations with regards to installation, function tests, repairs, and maintenance of electrical products.

1.4 Warranty provisions

Using the device in a manner that does not fall within the scope of its intended use, disregarding this instruction, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer's warranty null and void.
### 1.5 Plates and symbols

#### 1.5.1 Safety- / warning symbols, note symbols

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
</table>
| ! | **DANGER** – *<Serious damage to health / risk to life>*  
This symbol in conjunction with the signal word “Danger” indicates an imminent danger. Failure to observe this safety information will result in death or severe injury. |
| ! | **DANGER** – *<Serious damage to health / risk to life>*  
This symbol in conjunction with the signal word “Danger” indicates an imminent electrical hazard. Failure to observe this safety information will result in death or severe injury. |
| ! | **WARNING** – *<Bodily injury>*  
This symbol in conjunction with the signal word “Warning” indicates a possibly dangerous situation. Failure to observe this safety information may result in death or severe injury. |
| ! | **WARNING** – *<Bodily injury>*  
This symbol in conjunction with the signal word "Warning" indicates a potential electrical hazard. Failure to observe this safety information may result in death or severe injury. |
| ! | **CAUTION** – *<Minor injury>*  
This symbol in conjunction with the signal word “Caution” indicates a possibly dangerous situation. Failure to observe this safety information may result in minor or moderate injury. This may also be used for property damage warnings. |
| ! | **NOTICE** – *<Property damage>*!
The symbol indicates a potentially damaging situation. Failure to observe this safety information may result in damage to or destruction of the product and/or other system components. |
| ![ ] | **IMPORTANT (NOTE)**  
This symbol indicates operator tips, particularly useful information, or important information about the product or its further uses. It does not indicate a dangerous or damaging situation. |
1.6 Name plates

![Name plates image]

**Fig. 1**

1. Device manufacturer  
2. Labeling, e.g., for CSA approval  
3. Serial number  
4. Type designation  
5. Permissible supply power, frequency  
6. CE mark (EC conformity)  
7. Refer to product documentation  
8. Country of manufacture

1.7 Safety instructions for electrical installation

The electrical connection may only be made by authorized specialist personnel according to the electrical plans.

The electrical connection information in the manual must be observed; otherwise, the electrical protection type may be adversely affected.

Ground the measurement system according to requirements.

1.7.1 Safety instructions for operation

**WARNING**

Touching the surface can lead to burns if the measuring media are hot. This can result in severe injuries or death. Do not touch.

**WARNING**

If the measuring medium is allowed to escape in an uncontrolled manner, this can result in severe injuries or death. Check pipelines and gaskets on a regular basis.
1.8 Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes. Fill out the return form (see the Appendix) and include this with the device.

The EU Directive governing hazardous materials dictates that the owners of any hazardous waste are also responsible for disposing of it. All devices delivered to the manufacturer must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Pipe components and flowmeter sensors contain hollow spaces. If they have been used in conjunction with hazardous materials, they must therefore be rinsed out in order to neutralize any such substances.

The owner will be charged for any costs incurred as a result of the device not having been adequately cleaned or of any failure to dispose of hazardous materials. The manufacturer reserves the right to return a contaminated device.

Please contact Customer Center Service acc. to page 2 for nearest service location.

1.9 Integrated management system

ABB Automation Products GmbH operates an integrated management system, consisting of:

- Quality management system to ISO 9001
- Environmental management system to ISO 14001
- Occupational health and safety management system to BS OHSAS 18001 and
- Data and information protection management system

Environmental awareness is an important part of our company policy. Our products and solutions are intended to have a minimal impact on the environment and on people during manufacturing, storage, transport, use, and disposal. This includes the environmentally-friendly use of natural resources. We conduct an open dialog with the public through our publications.
1.10 Disposal

This product is manufactured from materials that can be reused by specialist recycling companies.

1.10.1 Information on WEEE Directive 2012/19/EU (Waste Electrical and Electronic Equipment)

This product is not subject to WEEE Directive 2012/19/EU or relevant national laws (e.g., ElektroG in Germany).

The product must be disposed of at a specialist recycling facility. Do not use municipal garbage collection points. According to the WEEE Directive 2012/19/EU, only products used in private applications may be disposed of at municipal garbage facilities. Proper disposal prevents negative effects on people and the environment, and supports the reuse of valuable raw materials.

If it is not possible to dispose of old equipment properly, ABB Service can accept and dispose of returns for a fee.
2 Design and function

The mass flowmeter works according to the thermal measuring principle of a hot-film anemometer. Heat is drawn out of a heated body by a gas circulating around it. This flow-dependent cooling is utilized as a measuring effect. Since the heat loss depends on the number of particles that hit the surface of the heated body, it is possible to directly determine the mass flow rate. This means there is no need for pressure and temperature influences to be compensated.

The calibration of the devices is done on a highly precise flow test machine with air as calibration medium. For standard biogas applications, the calibration data are subsequently converted, whereby a medium gas composition is based on 53 Vol% methane, 45 Vol% carbon dioxide and 2 Vol% air. Devices for applications that clearly deviate from this gas composition must be ordered with a special calibration for biogas. In this case, the exact gas composition is to be specified with the order.

The measuring systems of the FMT200-D series consist of the following components:

- Flowmeter sensor and
- Pipe component of various types.
2.1 Pipe components

Pipe components for nominal diameters 1 ... 3" are available in various designs. In addition it is possible to integrate the flowmeter sensor directly into pipes of DN 100 ... DN 250 (4 ... 6") or into pipes with non-circular cross-sections using a weld-on adapter.

The pipe components and weld-on adapters guarantee the defined installation of the transducer in the pipeline. Moreover, they allow simple removal and installation of the transducer for inspection and/or cleaning. By closing the pipe component with a blind flange, it is possible to use the measuring section even without installed transducer.

The versions available as standard - depending on the respective nominal diameter and the desired adaptation - are shown in chapter 8 Specifications.

2.2 Flowmeter sensor

The flowmeter sensor designed as a plug-in unit contains, besides the sensor unit, the sealed-in transmitter circuitry accommodated in the sensor head. The circuitry mainly consists of the differential temperature control unit for the sensor elements, a memory for all parameters that are specific to the measuring point, a connector for the LCI adapter, and the computing power for creating flow-dependent data records.

In addition, a flow-linearized analog signal of 0/4...20 mA (electrically isolated) is directly provided. No special supply/evaluation device is required. The flowmeter sensor is installed in the pipe component as a plug-in unit with a centering pin in a defined manner. See chapter 8 Specifications.
3 Mounting

3.1 Recommended steadying lengths according to DIN EN ISO 5167-1

To achieve the stated measuring accuracy, the steadying lengths seen above must be provided. For combinations of inlet run disturbances, e.g. valve and reducer, you must always consider the longer inlet run length. In confined spaces at the mounting location the outlet run length can be shortened to $3 \times D$. The reduction of the minimum inlet run length, however, will impact on the achievable accuracy.

High repeatability of the measuring value is still provided. Under certain circumstances, special calibration can be performed for insufficient steadying lengths. For this purpose and in individual cases consulting is necessary.

For gases with extremely low density (hydrogen, helium) the steadying lengths must be doubled.
3.2 Verifying the conditions

IMPORTANT (NOTE)
Before installing and commissioning the device, thoroughly read the operating instructions and observe the following instructions.

For each measuring system a calibration certificate is delivered which contains all the key information such as the measuring medium, measuring range, nominal diameter, serial number and order number. Especially observe the following:

- The operating conditions of the measuring point must fully comply with the specification in the calibration certificate, such as the permissible measuring medium, operating temperature, operating pressure, measuring range, etc.
- Observe the permissible ambient temperatures.
- Correctly install the pipe component or weld-on adapter. Observe the flow direction!
- Ensure compliance with the recommended inflow/outflow sections
- Correctly mount the flowmeter sensor to the pipe component.
- Correctly install all gaskets and check them for perfect condition.
- Correctly install all electrical connections.

3.3 Selecting the installation site

- The installation site must fulfill the requirements stated in the chapter “Technical Data: Environmental Conditions”.
- In order to prevent the measuring accuracy from being affected, the appropriate inlet and outlet sections must be provided. These steadying lengths ensure that any disturbances of the flow profile are eliminated before reaching the actual measuring point at the flowmeter sensor.
- Provide straight, undisturbed pipes for steadying. The lengths of these pipes depends on the type of disturbance on the inlet side (see chapter 3.1).
- Components affecting the flow like valves or shut-off devices should be installed on the outlet side, i. e. downstream of the measuring point.
- When using a weld-on adapter to install the flowmeter sensor, observe chapter 9.2.

Make sure that all installed devices can be accessed easily.
3.4 Installing the flowmeter sensor and pipe components

The installation is described using the example of a pipe component. The description analogously also applies to the installation using a weld-on adapter.

![Diagram of pipe component with external thread]

Fig. 3: Schematic representation of the pipe component with external thread

1 Flowmeter sensor
2 Centering pin, outflow side
3 Pipe component

- The flow direction must correspond to the arrow indicated on the pipe component.
- The gaskets used must not alter the cross-section of the opening in the pipeline and must ensure complete tightness once the flowmeter sensor and pipe component have been installed.
- The centering pin on the pipe component or weld-on adapter must be located on the outlet side downstream of the measuring point.
- Check the supplied gasket G according to DIN 11851 between the transducer and the pipe component / weld-on adapter for signs of damage prior to installation.
- When using flange-type pipe components all flange screws must be installed properly.
- Connecting threads are to be connected with the pipelines of the system using suitable sealant. All screw connections are to be checked for tightness.
3.5  Weld-on adapter for Sensyflow FMT200-D

Length of weld-on adapter at delivery: \( L = 117 \text{ mm (4.6")} \).

**For outer pipe diameter 100 ... 150 mm (4 ... 6")**

Prior to welding the weld-on adapter must be shortened to the appropriate length so that it has the length \( L \) after welding. This results in a measuring position in the middle of the pipeline.

\[
L = H1 - \frac{1}{2} \times D_{\text{outer}} \\
\text{with } H1 = 120 \text{ mm (4.72")}
\]

**For outer pipe diameter 150 ... 250 mm (6 ... 10")**

Shorten the weld-on adapter in such a way that the fixed length \( L = 45 \text{ mm (1.77")} \) is achieved after welding. As a result, the measuring position is not in the middle of the pipeline. For a correct calibration it is therefore mandatory to specify the exact inside diameter and wall thickness of the pipe in mm when ordering.

---

**IMPORTANT (NOTE)**

Always mount the weld-on adapter together with the lock nut to the pipeline. Mounting it at a later time is not possible.

Observe thickness of pipeline wall and degree of shrinkage when welding on.

It is essential to maintain a right angle to the pipe axis (max. tolerance: 2°).

The adapter centering pin must be exactly aligned with the pipe axis in the flow direction (outflow side, behind the measuring point).

Once welding is complete, there must be a passage of at least 28 mm (1.10 inches) free for the purpose of mounting the flowmeter sensor; drill to create if necessary.

For outer pipe diameter 100 ... 150 mm (4 ... 6") The distance \( H1 \) from the upper edge of the adapter to the the pipe central axis must be within a tolerance of \( \pm 2 \text{ mm (0.08")} \).
Fig. 5: Weld-on adapter mounted to pipeline, centering pin right (outflow side)
4 Electrical connections

The device must have been installed before the electrical cables are connected. The supply power must be switched off.

Once the steps described below have been completed, the device is ready to be put into operation.

**Fig. 6**

1. Socket for LCI adapter
2. Analog output 0/4 ... 20 mA (electrically isolated)
3. Power supply 24 V AC/DC
4. Terminals
5. Ground
6. Cable entry

1. A shielded, four-core cable (e.g., 4 x 1 mm²) must be used to connect the flowmeter sensor.
2. Release the four screws on the connection head cover of the flowmeter sensor and remove the cover.
3. Connect the four cores to the terminals of the flowmeter sensor electronics.

**NOTICE - Potential damage to parts!**

Electrical isolation is only ensured if terminal 4 is not connected to terminal 2 of the supply power.

4. Attach the shielding to the EMC cable entry.

**IMPORTANT (NOTE)**

If the shielding is routed directly into the housing, it will not have the desired effect (shielding effect will be lost).

5. Attach the connection head cover and screw it tight.
6. Check that the gasket is seated properly.
5 Commissioning

The device may only be started up / opened by qualified operating personnel. The device must be installed and the electrical signal lines must be connected prior to start-up.

5.1 Checking the installation

Prior to start-up, check that the equipment has been installed correctly:

- Is the device securely fastened?
- Have all the electrical signal, control and interface cables been laid and connected correctly?

5.2 Connecting the power supply

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>Check whether the voltage specified on the name plate matches the line voltage.</td>
</tr>
<tr>
<td>2.</td>
<td>Use a supply power line with sufficient dimensions and ratings (circuit breaker).</td>
</tr>
<tr>
<td>3.</td>
<td>Connect the supply line to the supply power.</td>
</tr>
</tbody>
</table>

**WARNING**

When connecting the supply power, the information provided below must be observed. Failure to observe the information provided can result in severe injuries or death.

**IMPORTANT (NOTE)**

In the case of 24 V UC supply power, the device may only be supplied with a safely isolated low voltage (DIN VDE 0106).

Under no circumstances must the line voltage (115 V AC or 230 V AC) be connected to the 24 V UC input. Doing so would damage the device electronics beyond repair.

5.3 Switching on

**WARNING**

Before switching the device on, check that all the tasks described in the previous sections have been carried out correctly.

Failure to observe the information provided can result in severe injuries or death.

Check again to ensure that the set operating voltage matches the supply power voltage.

**WARNING**

Switching the device on while the rear housing cover is open can result in an electric shock; in potentially explosive atmospheres, there is an additional risk of explosion. This can result in severe injuries or death.

Only switch on the supply power when the housing cover is closed.

**Switching on the supply power**

Once the supply power has been switched on, the device starts to run automatically.
6 Parameterization

The configuration of the mass flowmeter can be changed with the aid of an LCI (local communication interface) adapter that has to be connected to the parameterization socket. This adapter is available as a separate accessory and comes supplied together with the relevant software.

The following parameters can be modified or read in:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read device data</td>
<td>Show current settings</td>
</tr>
<tr>
<td>Measurement range</td>
<td>Selection within the calibrated measurement range</td>
</tr>
<tr>
<td>Low flow</td>
<td>Low flow suppression 0...20 % of the upper range limit</td>
</tr>
<tr>
<td>Filter factor</td>
<td>Attenuation, 1 ... 500 can be selected (default: 50)</td>
</tr>
<tr>
<td>Output in the event of an error</td>
<td>Minimum (lower than 3.5 mA) or maximum (greater than 22.5 mA)</td>
</tr>
<tr>
<td>Analog output</td>
<td>0 / 4 ... 20 mA</td>
</tr>
<tr>
<td>Save modified data</td>
<td>Save settings</td>
</tr>
<tr>
<td>Factory setting</td>
<td>Select default setting</td>
</tr>
<tr>
<td>Status</td>
<td>Check function</td>
</tr>
<tr>
<td>Reset</td>
<td>Restart</td>
</tr>
<tr>
<td>Print out</td>
<td>Print out current settings</td>
</tr>
<tr>
<td>Password</td>
<td>For service technicians only</td>
</tr>
</tbody>
</table>

To activate the configuration changes, the device must be restarted. To do so, use the command "restart reset" or briefly interrupt the power supply for approximately 10 seconds.

7 Error messages

If failures occur (e.g., sensor wire break), the 0/4 ... 20 mA output will adopt the configured control value.

In the event of an error, the following settings can be made:
- Minimum < 3.5 mA
- Maximum > 22.5 mA

**IMPORTANT (NOTE)**

Default preset in case of a fault
Maximum 0 ... 20 mA
Minimum 4 ... 20 mA

These settings can be modified using the LC interface and the corresponding configuration software.

Other error messages can be read out via the "status" function ("check function", section 6).

All volume flow rate specifications are referenced to 0 °C / 1013.25 hPa (32 °F/14.696 psi).

Output

Analog output signal
0/4 … 20 mA, switchable

Load
< 750 Ω, electrically isolated

Characteristics

Measurement deviation
Air, nitrogen <1.5 % of rate plus ± 0.05 % of end value
Biogas <1.8 % of rate plus ± 0.1 % of end value under calibration conditions in specified flow range

Reproducibility
< ± 0.25 % of rate, t<sub>meas</sub> = 10 s

Response time
T<sub>63</sub> = 500 ms

Influences

Temperature effect
< 0.05 % / K of measured value

Pressure effect
± 0.2 % / 100 kPa (bar [14.5 psi]) of measured value

Pressure drop
< 1 kPa (10 mbar [0.145 psi]) at full scale decreasing quadratically for smaller flow rates

Ambient conditions

Ambient temperature for flowmeter sensor
-25 … 70 °C (-13 ... 158 °F)

Ingress protection
IP 65, NEMA 4X

Storage temperature
-25 … 85 °C (-13 ... 185 °F)

Measured medium conditions

Measured medium temperature, operating temperature
-25 … 150 °C (-13 ... 302 °F)

Measured medium pressure, maximum
Standard 1 MPa (10 bar [145 psi])

- Integrator with indicator (current pulse transformer)

Parameterize

The output signal of the Sensyflow FMT200-D flowmeter can be toggled between 0 … 20 mA and 4 … 20 mA. Additionally, a measuring range window can be expanded in such a way that a smaller span corresponds to a 20 mA current signal. A current < 3.5 mA or > 22 mA can be selected for the failure signal.

An LCI adapter is used to parameterize the device. It is possible to change the output signals or the settings of the measuring ranges and signals by using a standard PC or laptop.

\(^1\) As a result, the measuring position is not in the middle of the pipeline
10 Appendix

10.1 Decommissioning and packaging

Packaging the device ready for transport or return to the manufacturer

If the original packaging material is no longer available, wrap the device in bubble wrap or corrugated cardboard and place it in a box of sufficient size lined with a shock-absorbing material (e.g., foam rubber). The thickness of the padding should be appropriate for the device weight and type of shipment. The box must be handled with care and labeled accordingly.

For overseas shipment, always add a desiccant (e.g., silica gel) and hermetically seal the device plus desiccant in a layer of polythene that is 0.2 mm thick. Use an amount of desiccant that is appropriate for the packing volume and the expected transport time (at least sufficient for 3 months). You should also line the box with a layer of union paper.

All devices returned to the manufacturer must be accompanied by a completed and signed decontamination certificate (see Appendix). Without this, ABB will not be able to process the return.

10.2 Approvals and certifications

Calibration Certificate

for Characteristic No. 1

Customer Muster F-No. Serial-No.

12346879 X001 00123456

Object of Calibration

Pipe Diameter Sensyflow FMT200-D Insertion Length/Version 120 mm
Supply Voltage 24 V AC/DC Output Signal 4...20mA
ID 33551801 Software Version V 2.5

Application Data

Gas Composition Volume %
Inside Pipe Diameter 3 inch Air 100.0
Operating Temperature 0...60 °C
Operating Pressure 1.16 bar abs.
Customer Measuring Range 0...1800 kg/h
Maximum Measuring Range 0...1800 kg/h
Standard Conditions 0 °C, 1013 mbar abs.

Calibration

Best measurement capability of the testing PS0051 U = 0.3% and PS0052 U = 0.4%.
The measurement standards used for the calibration (critically operated venturi nozzles) are traceable to the representation of the SI-units.

Test Stand DN50/Filter+15°D Testing PS0052
Calibration Medium Air Calibration Pressure 994 mbar abs.
Calibration Temperature 19.6 °C

With the calibration data the adaptation to the customer application was performed.

Final Test

We herewith certify that the instrument mentioned above has been calibrated in air in accordance with DIN ISO 5167:2006.
The specifications according to the data sheet were fulfilled.

Inspector:
Statement on the contamination of devices and components

Repair and/or maintenance work will only be performed on devices and components if a statement form has been completed and submitted. Otherwise, the device/component returned may be rejected. This statement form may only be completed and signed by authorized specialist personnel employed by the operator.

Device details:

Type: Serial no.:
Reason for the return/description of the defect:

Was this device used in conjunction with substances which pose a threat or risk to health?

☐ Yes ☐ No

If yes, which type of contamination (please place an X next to the applicable items)?

Biological ☐ Corrosive / irritating ☐ Combustible (highly/extremely combustible) ☐
Toxic ☐ Explosive ☐ Other toxic substances ☐
Radioactive ☐

Which substances have come into contact with the device?

1. 

2. 

3. 

We hereby state that the devices/components shipped have been cleaned and are free from any dangerous or poisonous substances.
