molded case

circuit breakers

COMPLETE AND PERFECTLY INTEGRATED

In the range of molded case circuit breakers conforming with the UL 489 and CSA C22.2 Standard, ABB proposes an entire range which covers current ratings between 15 A and 2500 A and interrupting ratings, at 480 V AC, which can reach 150 kA.

The ranges available are as follows:

- circuit breakers for power distribution (fitted with thermomagnetic or electronic trip units starting from 100 A)
- circuit breakers with adjustable magnetic only trip units for motor protection (MCP: Motor Control Protection)
- molded case switches for use as isolators or switching devices for lines, busbars or parts of a plant (MCS: Molded Case Switch)

With the introduction of the new Tmax UL series, a single-pole circuit breaker with interrupting rating of 18 kA at 277 V AC is available on the American market for the first time.

480 V

All ABB circuit breakers in accordance with the UL 489 and CSA C22.2 Standard can be used in installations with wye or delta distribution systems since use of the circuit breaker at 480 V AC is guaranteed, even for the smallest Tmax T1 size.

COMPACT DIMENSIONS

ABB molded case circuit breakers ensure high performances in extremely small and compact dimensions. Standardization of the depth of the smaller sizes allows more rational and less deep enclosure to be used than in the past.

DOUBLE INSULATION

Thanks to the double insulation technique, with all ABB molded case circuit breakers* the electrical accessories can be mounted directly on field with the circuit breaker installed: this allows considerable savings in time and therefore in costs.

* Except for Isomax S8.

Tmax

T GENERATION

**TMAX.
BE FREE.**

Tmax has grown. ABB experience in designing and manufacturing molded case circuit breakers has made it possible to create circuit breakers

which, up to 600 A, allow any application to be faced practically and simply.

The new Tmax have been thought up to work together, to help you carry out selections and correct sizing, to make installation simpler, but above all to give you top level performances.

The latest generation technology is present for the first time even in the smallest sizes.

With Tmax you have everything you need at hand to make your job easier, from all types of accessories and terminals. The T Generation grows, and so does freedom.

The Tmax T4 and T5 circuit breakers have obtained the prestigious "INTEL Design 2003 – Augusto Morello award" in the Product Technologies and Production processes section.

Business Tmax

TECHNOLOGY

TMAX. BE FREE TO RIDE THE MOST ADVANCED TECHNOLOGY.

It was not easy to find solutions which would allow the Tmax circuit breakers to achieve such high performances in such limited dimensions, but thanks to the experience which has been recognised to a leader such as ABB for decades, the objectives we had set ourselves have been achieved. So this has meant being able to equip such a small circuit breaker as the T2 with an electronic trip unit, to fit the circuit breakers with new arcing chambers which allow the arc extinction time to be reduced, or, still further, to provide double insulation for ever greater safety right from the smallest size. A complete series of latest generation trip units is available, from the electronic to the thermomagnetic or magnetic only ones - all interchangeable.

The new Tmax T4 and T5 are an example of the great technology expressed by this family of circuit breakers with high breaking capacity and high limitation of the specific let-through energy.

Being free is also all this.

SIZING

**TMAX.
BE FREE TO
CHOOSE
OPTIMAL SIZING.**

All the circuit breakers in the Tmax family come from optimisation of installation sizing. With T1, T2 and T3 you can find the ideal product for sizing an installation up to 225 A, and with T4 and T5 up to 600 A.

Furthermore, with the latter, high selectivity values are obtained for optimal coordination with other circuit breakers. You can also choose the best solution for motor protection with the motor control protection (MCP).

Higher performances in less space. More applications up to 600 A. Easier selection of the circuit breakers and accessories. Optimal sizing of the installation and better protection of cables, busbar ducts and supports. Less space required in the switchgear and in the metal structures.

Less oversizing and therefore lower costs.

Less time for coordinating the installations.

Fewer stock complications. With Tmax, all the solutions needed can be chosen, as well as that of feeling freer to choose.

INSTALLATION

**TMAX.
BE FREE TO
DRIBBLE ROUND
ALL INSTALLATION
DIFFICULTIES.**

Having circuit breakers available with smaller dimensions than all the others on the market undoubtedly offers

great advantages - more space for cabling operations and simpler installation, therefore notable savings in time -

five sizes, just two depths - 2.76 inches (70 mm) for T1, T2, T3 and 4.07 inches (103.5 mm) for T4 and T5, and the latter also have the same height.

They are also available in all the versions: fixed, plug-in and draw out and, thanks to special kits, passing from a fixed circuit breaker to a plug-in/draw out one is child's play. Flexibility of use over the whole series is ensured by the complete range of connection terminals and by the large number of accessories.

Being free also means having much more time for yourself.

from 800 A to

2500 A with ISOMAX

100% UL RATED CIRCUIT BREAKERS

The 100% rated versions for Isomax circuit breakers are available thanks to the excellent thermal sizing of the latter.

ALL THE APPLICATIONS

ABB offers the right solution for any application up to 2500 A thanks to Isomax S6, S7 and S8 circuit breakers, perfectly integrated with the Tmax family:

- MCCB: S6, S7 and S8 molded case circuit breakers for power distribution;
- MCP: S6, S7 and S8 circuit breakers with magnetic only trip unit for motor control protection;
- MCS: S6, S7 and S8 molded case switches for using as isolators or switching devices for lines, busbars or parts of plants.

MAXIMUM VERSATILITY

Isomax circuit breakers can be fitted with a wide range of terminals for every kind of connections. Modular design also makes installation and assembly extremely simple.

COMPLETE RANGE OF ACCESSORIES

Isomax circuit breakers are complemented by a complete range of accessories to satisfy the widely differing operational and automation requirements. Accessories are standardized for groups of circuit breakers to streamline storage logistics and simplify installation.

Isomax circuit breakers can be customized as required under conditions of absolute safety.

All the accessories can be mounted with simple operations without exposing the main contacts (except for the Isomax S8).

28

The ABB family of molded case circuit breakers in conformity with UL 489 and CSA C22.2 No. 5.1 Standard - Tmax and Isomax - is divided into different, perfectly integrated, ranges (Tmax T1B 1p, T1, T2, T3, T4, T5 and Isomax S6, S7, S8), able to cover a range of service currents from 15 to 2500 A.

The power distribution circuit breakers are available, with UL 489 and CSA C22.2 approval, in the fixed, plug-in or draw out, two-pole, three-pole and four-pole versions.

The Tmax T1 circuit breaker is also available in the single pole Tmax T1B 1p version, with an interrupting rating of 18 kA at 277 V AC. The circuit breakers can be selected among different interrupting rating levels from 22 kA to 150 kA at 480 V AC and from 18 kA up to 100 kA at 600 V AC.

Starting from the fixed version circuit breaker, all the other versions used for various requirements are obtained by means of mounting conversion kits.

The following are available:

- kit for converting a fixed circuit breaker into the moving part of a plug-in and draw out one
- circuit breaker fixed parts for plug-in and draw out circuit breakers
- conversion kit for the connection terminals.

Various accessories are also available:

1. Breaking unit ⁽¹⁾
2. Trip units ⁽¹⁾
3. Front
4. Auxiliary contacts - AUX ⁽²⁾
5. Undervoltage release - UVR ⁽²⁾
6. Shunt trip - SOR ⁽²⁾
7. Terminal covers
8. Front for lever operating mechanism - FLD ⁽²⁾
9. Direct rotary handle - RHD ⁽²⁾
10. Stored energy motor operator - MOE ⁽²⁾
11. Key lock - KLF
12. Early auxiliary contact - AUE
13. Transmitted rotary handle - RHE ⁽²⁾
14. Front terminal for copper cable - FC Cu (UL listed for Tmax T1)
15. Front extended terminal - EF
16. Multi-cable terminal (only for T4) - MC
17. Front terminal for copper-aluminium - FC CuAl (UL listed)
18. Front extended spread terminal - ES
19. Rear orientated terminal - R
20. Conversion kit for plug-in/draw out versions ⁽²⁾
21. Guide of fixed part in the draw out version ⁽²⁾
22. Fixed part - FP ⁽²⁾
23. Auxiliary position contact - AUP
24. Phase separators
25. PR010T
26. TT1
27. Racking out crank
28. Residual current release.

1506210142F0023

Compliance with Standards and company Quality System

The Tmax and Isomax circuit breakers and their electrical accessories conform to the UL 489 (Underwriters Laboratories Incorporated) and CSA C22.2 No.5.1 (Canadian Standard Association) North American Standards, and to the international IEC 60947-2 Standards and comply with the EC directive:

- “Low Voltage Directives” (LVD) no. 73/23 EEC
- “Electromagnetic Compatibility Directive” (EMC) no.89/336 EEC.

Certification of compliance with the above-mentioned product Standards is carried out, in respect of the European EN 45011 Standard, by the Italian certification body ACAE (Association for Certification of Electrical Apparatus), a member of the European LOVAG organization (Low Voltage Agreement Group).

The ABB test laboratory is accredited by SINAL (certificate no. 062/2002).

The ABB Quality System complies with the international ISO 9001 - 2000 Standard (model for quality assurance in design, development, construction, installation and service) and with the equivalent European EN ISO 9001 and Italian UNI EN ISO 9001 Standards.

The independent certifying Body is RINA S.p.A. ABB obtained its first certification with three-year validity in 1990, and has now reached its fourth reconfirmation.

The new Tmax series has a hologram on the front, obtained using special anti-imitation techniques, which guarantees the quality and that the circuit breaker is an original ABB product.

Attention to protection of the environment and to health and safety in the work place is another priority commitment for ABB and, as confirmation of this, the company environmental management system has been certified by RINA in 1997, in conformity with the international ISO 14001 Standard. This certification has been integrated in 1999 with the Management System for Health and Safety in the workplace, according to OHSAS 18001 (British Standards), obtaining one of the first certification of integrated management System, QES (Quality, Environment, Safety) issued by RINA. ABB - the first industry in the electromechanical section in Italy to obtain this recognition - thanks to a revision of the production process with an eye to ecology, has been able to reduce the consumption of raw materials and waste from processing by 20%.

ABB's commitment to safeguarding the environment is also shown in a concrete way by the Life Cycle Assessments of its products carried out directly by the ABB Research and Development in collaboration with the ABB Research Center. Selection of materials, processes and packing materials is made optimising the true environmental impact of the product, also foreseeing the possibility of its being recycled.

1SDC2101.45F0023

Double insulation*

This construction characteristic consists of the presence of double insulation between the live power parts (excluding the terminals) and the front parts of the apparatus where the operator works during normal operation of the installation. The seat of each electrical accessory is completely segregated from the power circuit, thereby preventing any risk of contact with live parts, and, in particular, the operating mechanism unit is completely insulated in relation to the powered circuits. As a consequence most accessories are field installable.

Furthermore, the insulation distances, both between the live internal parts and in the terminal connection area, comply with what is foreseen by the UL 489 Standard and are higher than those required by the international IEC Standards.

* Except for Isomax S8

Positive operation

The operating lever always indicates the exact position of the circuit breaker moving contacts, thereby guaranteeing safe and reliable signals in compliance with the prescriptions of the IEC 60417-2 Standard (I = Closed; O = Open; yellow-green line = Open due to release trip). The circuit breaker operating mechanism has trip free operation. Trip unit intervention automatically opens the moving contacts: to close them again, the operating mechanism must be reset by pushing the operating lever from the intermediate position into the lowest open position.

1SDC2101.45F0023

Isolation behaviour

In the open position, the circuit breaker guarantees circuit isolation in compliance with the IEC 60947-2 Standard. The oversized insulating distances guarantee there are no leakage currents and dielectric resistance to any overvoltages between input and output. For plug in and draw out version circuit breakers, in the racked-out position, the power and auxiliary circuits are insulated, guaranteeing that no part is live. By means of special socket-plugs, it is possible to carry out blank tests under these conditions, operating the circuit breaker in complete safety.

1SDC2101.45F0023

Construction characteristics

Distinguishing features of the series

1

Operating temperature

The Tmax and Isomax circuit breakers can be used in ambient conditions where the surrounding air temperature varies between -13°F and $+158^{\circ}\text{F}$ (-25°C and $+70^{\circ}\text{C}$) and stored in ambient with temperatures between -40°F and $+158^{\circ}\text{F}$ (-40°C and $+70^{\circ}\text{C}$). The circuit breakers fitted with thermomagnetic trip unit have their thermal element set for a reference temperature of 104°F (40°C).

For temperatures other than 104°F (40°C), with the same setting, there is a variation of the thermal threshold as shown in the tables on page 4/38 and 4/39.

The electronic PR211/P, PR212/P, PR221DS and the new PR222DS/P electronic trip units do not undergo any variations in performance as the temperature varies but, in the case of temperatures exceeding 104°F (40°C), the maximum setting for protection against overloads, L, must be reduced, as indicated in the derating graphs on page 4/37, to take into account the heating phenomena which occur in the copper parts of the circuit breaker passed through by the phase current. For temperature above 158°F (70°C) the circuit breaker performances are not guaranteed.

1SDC2101.46FC0023

Altitude

Up to an altitude of 6600 ft (2000 m) the Isomax and Tmax do not undergo any alterations in their rated performances. As the altitude increases, the atmospheric properties are altered in terms of composition, dielectric resistance, cooling capacity and pressure. For this reason, the rated voltage and the nominal current at this altitudes must be derated to the values shown in the table.

Altitude [ft]	6600	9900	13200	16500
Rated voltage [V]	600	522	435	348
Continuous current rating %	100	98	93	90

Electromagnetic compatibility

With the use of the PR211/P, PR212/P, PR221DS and PR222DS/P electronic trip units and the RC211, RC212, RC221, RC222 and RC223 electronic residual current releases, operation of the protections is guaranteed in the presence of interferences caused by electronic apparatus, atmospheric disturbances or electrical discharges. No interference with other electronic apparatus near the place of installation is generated either. This is in compliance with the IEC 60947-2 Appendix F Standards and European Directive No. 89/336 regarding EMC – electromagnetic compatibility.

Construction characteristics

Distinguishing features of the series

1

Tropicalization

Circuit breakers and accessories in the ABB family of molded case circuit breakers have been tested in compliance with the IEC 60068-2-30 Standard, carrying out two cycles at 131 °F (55 °C) with the "variant 1" method (clause 6.3.3). The suitability of their use under the most severe environmental conditions is therefore ensured with the hot-humid climate defined in climatograph 8 of the IEC 60721-2-1 Standards thanks to:

- insulating cases made of synthetic resins reinforced with glass fibers;
- anti-corrosion treatment of the main metallic parts
- Fe/Zn 12 galvanization (ISO 2081), protected by a conversion layer mainly consisting of chromates (ISO 4520)
- application of anti-condensation protection for electronic trip units and relative accessories.

150C21048F0023

Resistance to shocks and vibrations

The circuit breakers are unaffected by vibrations generated mechanically and due to electromagnetic effects, in compliance with the IEC 60068-2-6 Standards and the regulations of the major classification organizations:

- ABS (American Bureau of Shipping)*
- RINA
- Det Norske Veritas
- Bureau Veritas
- Lloyd's register of shipping
- Germanischer Lloyd.

The Isomax and Tmax circuit breakers are also tested, according to the IEC 60068-2-27 Standard, to resist shocks up to 12g.

Please contact ABB for information regarding the types of circuit breakers approved, the performances approved and their relative validity.

*Most of ABB circuit breakers are certified with ABS approval, according to IEC 60947-2; the whole Tmax family has ABS approval according both with IEC 60947-2 and UL 489.

Circuit breakers for power distribution

General characteristics

2

General characteristics

The ABB family of molded case circuit breakers, complying with the UL 489 and CSA C22.2 No. 5.1 Standards, is divided into different sizes, with an application range from 15 to 2500 A and interrupting ratings up to 150 kA at 480 V AC.

Selection of the size allows the basic electrical characteristics to be identified simply and immediately, whereas selection of the overcurrent trip unit is made according to the type of application required.

Furthermore, for the first time ABB has also developed a molded case circuit breaker with a single-pole construction characteristic: T1B 1p. This is a 100 A frame size circuit breaker, able to operate at rated voltages up to 277 V AC.

For protection of alternating current networks, the following are available:

- Tmax T1B 1p, T1, T2, T3 and T4 (15 A, 20 A) circuit breakers, equipped with TMF thermomagnetic trip units, with fixed thermal and magnetic threshold ($I_3 = 10 \times I_n$);
- Tmax T4 (up to 50 A) circuit breaker equipped with TMD thermomagnetic trip units with adjustable thermal threshold ($I_1 = 0.7 \dots 1 \times I_n$) and fixed magnetic threshold ($I_3 = 10 \times I_n$).
- T4, T5 and Isomax S6 circuit breakers with TMA thermomagnetic trip units, with adjustable thermal threshold ($I_1 = 0.7 \dots 1 \times I_n$) and adjustable magnetic threshold ($I_3 = 5 \dots 10 \times I_n$).
- T2 with PR221DS electronic trip unit
- T4 and T5 with PR221DS, PR222DS/P and PR222DS/PD-A electronic trip unit
- Isomax S6, S7 and S8 with PR211/P and PR212/P electronic trip unit.

Interchangeability

Tmax T4 and T5 circuit breakers can be equipped either with TMD or TMA thermomagnetic trip units, PR221DS,

PR222DS/P and PR222DS/PD-A electronic trip units. Thanks to their simplicity of assembly, the end customer can,

in fact, change the type of trip unit extremely rapidly, according to their own requirements and needs: in this case, correct

TMF = Fixed thermomagnetic trip unit

TMD = Thermomagnetic trip unit with adjustable thermal and fixed magnetic threshold

TMA = Thermomagnetic trip unit with adjustable thermal and adjustable magnetic threshold

ELT = Electronic trip unit

Tmax T2 and T3 offer a magnetic-only trip unit: $I_3 = 6...12 \times I_n$.

Finally, Tmax T1, T2, T3, T4 and T5 and Isomax S6 circuit breakers fitted with thermomagnetic trip units can also be used in direct current plants, with an application range from 15 to 800 A and a minimum operating voltage of 24 V DC.

assembly is under the customer's responsibility. Above all, this means into increased flexibility of use of the circuit breakers

with considerable savings in terms of costs thanks to better rationalisation of stock management.

Circuit breakers for power distribution

Thermomagnetic trip units

Thermomagnetic trip units

Tmax T1B 1p, T1, T2, T3, T4 and T5, and Isomax S6 circuit breakers can be fitted with thermomagnetic trip unit and are used in protection of alternating current networks or direct current networks with a range of application from 15 A to 800 A. They allow protection against overloads with a thermal device (fixed threshold for T1B 1P, T1, T2, T3, T4 up to 20 A; adjustable threshold between $0.7 \pm 1 \times I_n$ for T4, T5 and S6), made using the bimetal technique, and protection against

Circuit breakers for power distribution

Electronic trip units

2

General characteristics

Tmax T2, T4 and T5 circuit breakers for uses in alternating current can be equipped with PR221DS, the new PR222DS/P and PR222DS/PD-A electronic trip units. On the other hand, Isomax S6, S7 and S8 can be fitted with PR211/P and PR212/P. The electronic technology used to realise these trip units guarantees great reliability, trip precision and immunity to electromagnetic components in compliance with the standards on the matter. The power supply required for correct operation is supplied directly by the trip units current transformers and tripping is always guaranteed, even under single-phase load conditions and in correspondence with the minimum setting.

The protection trip units are made up of the current transformers (three or four depending on the number of conductors to be protected), the protection unit (PR221DS, PR222DS/P, PR222DS/PD-A, PR211/P or PR212/P), and of a trip coil with demagnetisation, which acts directly on the circuit breaker operating mechanism unit. It is possible to test the trip coil by means of the TT1 device. A positive test will trip the breaker.

The current transformers are housed inside the trip unit box and supply the energy required for correct operation of the protection and the signal needed to detect the current. They are available with primary rated current as indicated in the table.

PR221DS - Tmax T2, T4 and T5

The PR221DS trip unit, available for T2, T4 and T5, provides protection functions against overload L, and short-circuit S or I (version PR221DS-LS/I): with this version, you can choose between protection S or I simply by moving the dip-switch. Alternatively, the version with only the function of protection against instantaneous short-circuit I is available (version PR221DS-I).

The PR221DS for Tmax T2 has some differences if compared with the one used with T4 and T5. With Tmax T2, the trip unit is not interchangeable, protection against overload L can be set manually at $I_1 = 0.4 \dots 1 \times I_n$, with 16 thresholds by means of a dip switch on the front of the circuit breaker, and it is possible to select between 2 trip curves 3s at $6 \times I_1$ and 6s at $6 \times I_1$.

On the other side, with Tmax T4 and T5, the trip unit is interchangeable; furthermore, protection L can be set manually at $I_1 = 0.4 \dots 1 \times I_n$ with 16 thresholds by means of a dip switch and it is possible to select between 2 different trip curves 3s at $6 \times I_1$ and 12s at $6 \times I_1$.

PR221DS-LS/I

Protection S

Against short-circuit with delayed trip

Protection L

Against overload

Dip-switches for setting the neutral (only for T4 and T5)

Socket for TT1 test unit

Protection I

Against short-circuit with instantaneous trip

1SDC210173F0023

The protection function against short-circuit with delayed trip S, with inverse short time delay and trip characteristic with inverse time ($I^2t = \text{const}$), can be set to $I_2 = 1...10 \times I_n$ with 15 thresholds. This protection is selectable as an alternative to protection function I. The protection time delay can be selected by adjusting the dip switches on one of the two available curves (0.1s at $8 \times I_n$, 0.25s at $8 \times I_n$).

The protection function against instantaneous short-circuit I can be adjusted to $I_3 = 1...10 \times I_n$ with 15 thresholds.

Concerning to neutral protection, for Tmax T2 the protection of the neutral is set to 100% of the phase protection setting, whereas for T4 and T5 it is possible to select the protection threshold OFF, 50% or 100% directly from the front of the trip unit by means of the specific dip switch.

PR221DS - Protection functions and settings

Protection functions	Trip threshold	Trip curves ⁽¹⁾		
 CANNOT BE EXCLUDED	Against overload with long inverse time delay trip and trip characteristic according to an inverse time curve ($I^2t = \text{constant}$)  $I_1 = 0.40 - 0.44 - 0.48 - 0.52 - 0.56 - 0.60 - 0.64 - 0.68 - 0.72 - 0.76 - 0.80 - 0.84 - 0.88 - 0.92 - 0.96 - 1 \times I_n$ Release between $1.1...1.3 \times I_1$ (IEC 60947-2 and UL 489)	at $6 \times I_1$ $t_1 = 3s$	at $6 \times I_1$ $t_1 = 6s$ only for T2	at $6 \times I_1$ $t_1 = 12s$ only for T4, T5
 CAN BE EXCLUDED	Against short-circuit with inverse short time delay trip and trip characteristic with inverse time ($I^2t = \text{constant}$) (selectable as an alternative to protection function I)  $I_2 = 1 - 1.5 - 2 - 2.5 - 3 - 3.5 - 4.5 - 5.5 - 6.5 - 7 - 7.5 - 8 - 8.5 - 9 - 10 \times I_n$ Tolerance: $\pm 10\%$ (T4-T5) $\pm 10\%$ up to $2 \times I_n$ (T2) $\pm 20\%$ above $2 \times I_n$ (T2)	a $8 \times I_n$ $t_2 = 0.1s$	a $8 \times I_n$ $t_2 = 0.25s$	Tolerance: $\pm 10\%$ up to $6 \times I_n$ (T4-T5) $\pm 20\%$ above $6 \times I_n$ (T4-T5) $\pm 20\%$ (T2)

Electronic trip units

2

PR222DS/P - Tmax T4 and T5

The PR222DS/P trip unit, available for T4 and T5, has protection functions against overload L, delayed S and instantaneous I short-circuit (version PR222DS/P-LSI) and, alternatively, as well as the functions L, S, I also has protection against earth fault G (version PR222DS/P-LSIG).

Function L, which cannot be excluded, can be set manually to $I_1 = 0.4 \dots 1 \times I_n$ with 32 thresholds by means of the dip switches or electronically by means of the PR010T test and configuration unit: in this case the thresholds are 61 (steps of $0.01 I_n$). Furthermore, it is possible to select among 4 different trip curves: 3s at $6 \times I_1$, 6s at $6 \times I_1$, 9s at $6 \times I_1$, 12s at $6 \times I_1$ for T4 $I_n = 250 \text{ A}$ and T5 = 600 A, and 18s at $6 \times I_1$ for all the other settings.

The protection function against short-circuit with delayed trip S, with inverse short time delay and trip characteristic with inverse time ($I^2t = \text{const}$) can be set to $I_2 = 0.6 \dots 10 \times I_n$ with 15 thresholds by means of the dip switches or electronically by means of the PR010T test and configuration unit, with 95 thresholds (steps of $0.1 \times I_n$). The time delay of the protection can be selected either manually by adjusting the dip switch to one of the 4 curves available (with delay of 0.05s at $8 \times I_n$, 0.1s at $8 \times I_n$, 0.25s at $8 \times I_n$ or 0.5s at $8 \times I_n$) or electronically by means of PR010T between 0.05 and 0.5s at $8 \times I_n$ with 46 thresholds (steps of 0.01s).

The protection function against instantaneous short-circuit I can be adjusted to $I_3^{(1)} = 1.5 \dots 12 \times I_n$ with 15 thresholds, by means of the dip switches or electronically by means of the PR010T test and configuration unit, with 86 thresholds (steps of $0.1 \times I_n$).

The function of protection against earth fault G is adjustable either manually, by means of dip switches, to $I_4 = 0.2 \dots 1 \times I_n$, with 7 thresholds or electronically with PR010T, with 81 thresholds (steps of $0.01 I_n$). It is also possible to select among 4 different trip curves: 0.1 s at $3.25 \times I_4$, 0.2s at $2.25 \times I_4$, 0.4s at $1.6 \times I_4$ and 0.8s at $1.25 \times I_4$, or to set the trip time electronically between 0.1 and 0.8s with 71 thresholds (steps of 0.01s).

Concerning to neutral protection, it is possible to select the protection threshold OFF, 50% or 100% directly from the front of the release by means of the specific dip switch.

Furthermore, on the front of the trip unit, signalling of pre-alarm and alarm of protection L is available. The pre-alarm threshold value is equal to $0.9 \times I_1$ (cannot be modified or excluded).

⁽¹⁾ For T5 $I_n = 600 \text{ A} \Rightarrow I_{3,\text{max}} = 10 \times I_n$

PR222DS/PD-A

Apart from the protection functions against overload L, delayed S and instantaneous I short-circuit (version PR222DS/PD-A-LSI) or, alternatively,

plus the extra protection G (version PR222/PD-A-LSIG), the PR222DS/PD-A trip unit, available for T4 and T5, also has the dialogue unit integrated with

Modbus RTU protocol.

PR222PD allows Tmax T4 and T5 circuit breakers to be integrated in a communication network based on the Modbus RTU protocol. The devices use the EIA RS485 standard as the physical means for data transmission at a maximum transmission speed of 19200 bit/sec. If the power for protection function is supplied directly by the current transformers of the release, communication is only possible with an auxiliary power supply of 24 V DC.

All the information provided by the trip unit (measurement functions, alarms, maintenance data, state of the circuit breaker) can be consulted both locally, directly on the front of the circuit breaker, and remotely by means of supervision and control systems.

The PR222DS/PD-A trip unit can be associated with the AUX-E auxiliary contacts in electronic version, to know the state of the circuit breaker (open/closed).

PR211/P - Isomax S6 and S7

PR211/P trip unit (available for Isomax S6 and S7) provides protection functions against overload L and instantaneous short-circuit I, and is available in the versions with functions I and LI.

Function L, which cannot be excluded, can be set manually to $I_1 = 0.4 \dots 1 \times I_n$ by means of the dip switches on the front of the circuit-breaker. Furthermore, it is possible to select among 4 different trip curves: 3s at $6 \times I_1$, 6s at $6 \times I_1$, 12s at $6 \times I_1$ and 18s at $6 \times I_1$.

The protection function against instantaneous short-circuit I can be adjusted to $I_3 = 1.5 \dots 12 \times I_n$ by means of the dip switches.

Neutral protection is set to 50% of the phase protection. Ask ABB for the 100% version.

PR212/P - Isomax S6, S7 and S8

PR212/P trip unit (available from Isomax S6 to S8) provides protection functions against overload L, delayed short-circuit S and instantaneous short-circuit I, and against earth fault G. It is available in the versions PR212/P with functions LSI and LSIG.

Selection for electronic or manual setting

Function L, which cannot be excluded, can be set manually to $I_1 = 0.4 \dots 1 \times I_n$ by means of the dip switches on the front of the circuit-breaker. Furthermore, it is possible to select among 4 different trip curves: 3s at $6 \times I_1$, 6s at $6 \times I_1$, 12s at $6 \times I_1$ and 18s at $6 \times I_1$.

The protection function against short-circuit with delayed trip S, with inverse short time delay and trip characteristic with inverse time ($I^2t = \text{const}$), can be set to $I_2 = 1 \dots 10 \times I_n$ by means of the dip switches or electronically by means of the PR010T test and configuration unit. The time delay of the protection can be selected either manually by adjusting the dip switch to one of the 4 curves available (with delay of 0.05s at $8 \times I_n$, 0.1s at $8 \times I_n$, 0.25s at $8 \times I_n$ or 0.5s at $8 \times I_n$) or electronically by means of PR010T between 0.05 and 0.5s at $8 \times I_n$. The protection functions against instantaneous short-circuit I and earth fault G can be adjusted respectively to $I_3 = 1.5 \dots 12 \times I_n$ and $I_4 = 0.2 \dots 1 \times I_n$, by means of the dip switches or electronically by means of the PR010T.

For four-pole circuit breakers, protection of the neutral can be set to 50% or 100% of the phase protection setting, by means of dip-switches on the front of the trip unit.

Setting the adjustment parameters of the protection functions is carried out directly from the front of the trip unit or remotely, thanks to the use of the PR212/D (IEC only) dialogue unit, available with Modbus or LON communication protocols.

Motor control protection circuit breakers: MCP

Magnetic and electronic trip units

2

General characteristics

MCP circuit breakers are used to protect three phase asynchronous motors.

The traditional system used for this purpose is based on three different devices: a circuit breaker for protection against short-circuit, a thermal relay for protection against overload and phase loss or unbalance of phase, and a contactor for motor switching. All this has to take into account the problems that arise at the moment of the motor starting.

In particular, when selecting these devices, different factors must be taken into consideration, such as:

- the motor power
- the diagram and type of starting
- the type of motor: with cage rotor or with wound rotor
- the fault current at the point of the network where the motor is installed.

ABB offers two different protection types:

- a magnetic only trip unit (MA) for Tmax T2 and T3, with adjustable threshold between $6...12 \times I_n$
- an electronic trip unit with only an instantaneous short-circuit protection function I, PR221DS-I for Tmax T2, T4 and T5, and PR211/P-I for Isomax S6, S7 and S8. For PR221DS-I, protection I is adjustable between $1...10 \times I_n$, whereas the range for PR211/P is $1.5...12 \times I_n$.

Molded case switches: MCS

Electrical characteristics

2

General characteristics

The MCS can be used as general circuit breakers in sub-switchboards, as switching and isolation parts for lines, busbars or groups of apparatus, or as bus-ties. They can be part of general isolation devices of groups of machines or of complexes for motor operation and protection.

The MCS are derived from the corresponding circuit breakers, of which they keep the overall dimensions, versions, fixing systems and the possibility of mounting accessories.

The MCS up to 1200 A are available in three-pole and four-pole versions, whereas the 2500 A size is only available in the three-pole version.

All the molded case switches in accordance with UL 489 and CSA C22.2 Standards are self protected.

Accessories

Versions and types

Fixed

Fixed ABB molded case circuit breakers, in accordance with UL/CSA standards up to 2500 A, are available in the two-pole, three-pole and four-pole version up to 1200 A and only in the three-pole version from 1600 A up to 2500 A.

The circuit breakers have:

- single depth of 2.76" (70 mm) up to 225 A and 4.07" (103.5 mm) from 150 to 800 A
- standardized front 1.77" (45 mm) up to 225 A
- possibility of assembly on back plate or on DIN rail up to 225 A (except T1B 1p)
- thermomagnetic or electronic trip units
- UL file: E93565 for circuit breakers and MCP; CSA file: LR54280
- UL file: E116595 for MCS; CSA file: LR54280.

Plug-in

The plug-in version circuit breaker consists of:

- fixed part to be installed directly on the back plate of the cubicle
- moving part, obtained from the fixed circuit breaker with addition of the isolating contacts (in correspondence with the connection terminals), of the rear frame (for fixing the fixed part), and of the terminal covers.

Circuit breaker removal is carried out by unscrewing the top and bottom fixing screws. A special lock prevents circuit breaker racking in and racking out with the contacts in the closed position.

Tmax T2 T3, T4 and T5 circuit breakers, starting from the fixed version, can be changed into the various types using the conversion kits.

When the circuit breaker has electrical accessories mounted (SOR, UVR, MOS, MOE, AUX, AUX-E, AUE and RC222), the socket-plug connectors or the adapters for isolation of the relative auxiliary circuits must also be ordered.

Accessories

Versions and types

Draw out

The draw out version circuit breaker consists of:

- fixed part to be installed directly on the back plate of the cubicle with the side group mounted on the fixed part to allow the racking-out/racking-in movement
- moving part, obtained from the fixed circuit breaker with addition of the isolating contacts (in correspondence with the connection terminals), of the rear frame (for fixing the fixed part), and of the terminal covers
- accessory to be mounted on the front of the circuit breaker, with selection between front flange for lever operating mechanism, motor operator and rotary handle operating mechanism; application of one of these accessories allows the circuit breaker lock to be made in the withdrawn position.

Racking-in/racking-out of the moving part is carried out by means of the special crank supplied with the conversion kit of the fixed circuit breaker into moving part of draw out circuit breaker. The special mechanism allows the circuit breaker to be racked out in the isolated position (with power and auxiliary circuits disconnected) with the compartment door closed, increasing the safety of the operation.

Once racked out or removed, the circuit breaker can be operated in open or closed position and, by means of the special connectors, blank operating tests of the auxiliary control circuits can be carried out.

The draw out version T4 and T5 circuit breaker can only be fitted with pre-cabled electrical accessories, provided with ADP adapters suitable for isolation of the relative auxiliary circuits.

Conversion kit into part of plug-in for T2, T3, T4 and T5

(UL file: E116596)

Allows conversion of a fixed circuit breaker with front terminals into the moving part of a plug-in circuit breaker. The kit consists of:

- isolating contacts
- anti-racking out safety device
- assembly nuts and screws
- terminals covers.

The circuit breaker is completed with the fixed part.

T2-T3

T4-T5

T2-T3

T4-T5

Conversion kit into moving part of draw out circuit breaker for Tmax T4, T5 and Isomax S6 and S7 (UL file: E116596 for Tmax)

This allows the fixed circuit breaker with front terminals to be converted into the moving part of a draw out circuit breaker. The kit consists of isolating contacts, frame, and assembly nuts and screws. The circuit breakers in the draw out version must be completed, alternatively, with one of the following accessories:

- front for lever operating mechanism
- rotary handle operating mechanism
- motor operator
- terminal covers

in order to prevent the racking-out operation with the circuit breaker closed. The circuit breaker is completed with the fixed part.

Accessories

Versions and types

1SDC21021BF0023

Fixed part

(UL file: E116596 for Tmax)

The fixed part completes the circuit breaker in the plug-in or draw out version. For plug-in or draw out version circuit breakers, different positions are available:

- plug-in: plugged-in, unplugged
- draw out version: racked-in/racked-out, removed.

The fixed part for draw out version is fitted with a guide for supporting the moving part during the isolation or withdrawal operations. For Isomax S6 and S7 circuit breakers, there are two guides. For Tmax T2 and T3 circuit breakers, the fixed parts are available, in the standard version, with front terminals (F): a distinguishing characteristic of these two sizes of circuit breakers is the possibility of equipping the fixed parts with the same kit of terminals, terminal covers and phase separators, used for the fixed circuit breakers. With Tmax T4 and T5, codes of fixed parts are available with different types of terminals (EF, HR, VR). The fixed parts with EF terminals, moreover, can be also equipped with ES, FC Cu and FC CuAl terminals.

3

1SDC210211F0023

Conversion kit for fixed part of plug-in into fixed part of draw out for Tmax T4 and T5 (UL file: E116596)

A guide for converting the fixed part of a plug-in version circuit breaker into the fixed part of a draw out version circuit breaker is available for Tmax T4 and T5 circuit breakers.

1SDC21021PR023

Racking out crank

This allows racking out and racking in of the circuit breaker in the draw out version into the fixed part, with the door closed. The crank handle is the same for the whole range of circuit breakers and is automatically supplied with the fixed part of draw out circuit breakers or with the conversion kit for fixed part of plug-in into fixed part of draw out.

Accessories

Connection terminals

The basic version of the circuit breakers is supplied with:

- lugs for copper and aluminium cables (FC CuAl) or lugs for copper cables (FC Cu) for the Tmax T1 circuit breaker
- front terminals (F) for Tmax T2, T3, T4, T5 and Isomax S6, S7 and S8 circuit breakers.

Different types of terminals are also available and these can be combined in various ways (top of one type, bottom of a different type), allowing the circuit breaker to be connected to the plant in the most suitable way for the installation requirements.

The following distinctions can be made between:

- **front terminals**, which allow connection of cables or busbars by acting directly from the front of the circuit breaker
- **rear terminals**, which allow installation in switchboards with rear access to both cable and busbar connections. For Tmax T2, T3, T4 and T5 the rear terminals are adjustable.

Terminals are available for direct connection of bare copper or aluminium cables (UL listed) and terminals for connection of busbars or cables terminated with cable terminals.

An important feature of the Tmax T2 and T3 circuit breakers is that all the different types of terminals can be mounted either on the fixed version circuit breaker or on the fixed part of the plug-in circuit breaker. On the other hand, T4 and T5 fixed part can mount EF, HR or VR terminals, and, moreover, fixed part with EF terminals can be equipped also with ES, FC Cu and FC CuAl terminals.

The information needed to make the connections is given for each type of terminal on page 3/9 and following. The minimum and maximum cross-section of the cables, which can be tightened in the terminals and the diameter of the terminal, are indicated for connection with bare cables. Flat bars of different size and composition are recommended for connections with busbars. The required minimum depth is also indicated, if it is different to the one recommended.

The torque values to be applied to the tightening screws for cable terminals and to the screws used to connect the busbars to the flat bar terminals are given.

3

Insulating terminal covers

The terminal covers are applied to the terminals of the circuit breaker to prevent accidental contact with live parts.

The following are available:

- low terminal covers (LTC), which guarantee IP40 degree of protection for fixed circuit breakers with rear terminals and for moving parts of plug-in or draw out circuit breakers
- high terminal covers (HTC), for fixed circuit breakers with front, front extended, front for cables and rear terminals; guarantee IP40 degree of protection
- terminal covers for fixed parts, of plug-in or draw out circuit breakers for T4, T5, S6 and S7 circuit breakers, guarantee IP40 degree of protection on the front with moving part connected. They are available in a single version. The fixed parts of plug-in T2 and T3 circuit breakers can use the same terminal covers as the corresponding fixed circuit breakers. For fixed parts of T4 and T5 400, the proper terminal covers (TC-FP) are available.

The degrees of protection indicated are valid for circuit breaker installed in switchboards.

Accessories

Connection terminals

3

1SDC210215F0023

Phase separating partitions

These allow the insulation characteristics between the phases at the connections to be increased. They are mounted from the front, even with the circuit breaker already installed.

Two versions are available for Tmax circuit breakers:

- 3.94" (100 mm) high
- 7.87" (200 mm) high.

The H = 3.94" (100 mm) phase separators are supplied as standard with front extended type terminals (EF), whereas those with H = 7.87" (200 mm) are standard with the front extended spread type of terminals (ES).

They are incompatible with both the high and low insulating terminal covers.

The fixed parts of plug-in Tmax circuit breakers can use the same phase separating partitions as the corresponding fixed circuit breakers. With the phase separating partitions mounted, a special kit is available on request to reach IP40 degree of protection from the front of the circuit breaker.

Moreover, it is possible to mount the phase separating partitions between two circuit breakers or fixed parts side by side.

Phase separating partitions must always be requested for Isomax S6 and S7 circuit breakers. They are always an alternative to the high or low terminal covers.

1SDC210216F0023

Screws for sealing the terminal covers

These are applied to the terminal covers of fixed circuit breakers or to the moving parts of plug-in or draw out circuit breakers. They prevent removal of both the high and low terminal covers and can be locked with a wire and lead seal.

1SDC210217F0023

Kit for taking up the auxiliary power supply

Special kits are available with the Tmax T2, T3, T4 and T5 circuit breakers for taking up the auxiliary power supply directly from the connection terminals. They can only be combined with the front terminals for copper cables (FC Cu) or with the front terminals (F) for T3, T4 and T5.

Accessories

Service releases

The shunt trip and undervoltage releases, housed and fixed in a slot on the left-hand side of the circuit breaker, are always alternative to each other. They are supplied in the pre-cabled version with 39.4" (1 m) long cables for Tmax T1, T2 and T3 circuit breakers, or socket-plug connectors, still with 39.4" (1 m) long cables, for T4 and T5. For Isomax S6 and S7, the power supply is made by means of special connectors.

Assembly is carried out by pressure into the appropriate seat located in the left-hand part of the circuit breaker and fixing with the screw provided.

1SDC210241F0023

SOR - Shunt trip

(UL file: E116596)

This allows circuit breaker opening by means of an electrical command. Operation of the release is guaranteed for a voltage between 75% and 110% of the value of the rated power supply voltage U_n , both in AC and DC. It is always fitted with an auxiliary limit contact.

Furthermore, PS-SOR opening coils with permanent operation are also available for T4 and T5, with a much lower power consumption and these can be continuously supplied: in this case they are not, in fact, fitted with an auxiliary limit contact. Again for these coils, either the pre-cabled or uncabled version can be selected.

UVR - Undervoltage release

(UL file: E116596)

This opens the circuit breaker due to a power supply failure of the release or to voltage drops to values of less than $0.7 \times U_n$ with a trip range from 0.69 to $0.35 \times U_n$.

After tripping, the circuit breaker can be closed again starting from a voltage higher than $0.85 \times U_n$. With the undervoltage release de-energized, it is not possible to close the circuit breaker.

UVD - Time delay device for undervoltage release

The undervoltage release can be combined with an external electronic power supply time delay device, which allows circuit breaker opening to be delayed in the case of a drop or failure in the power supply voltage of the release itself, according to preset and adjustable delays, in order to prevent unwarranted trips caused by temporary malfunctions. The delay device must be combined with an undervoltage release with the same corresponding voltage. This time delay device can also be combined either with the Tmax T1...T5 or Isomax circuit breakers.

Extension for testing releases

Available for Tmax T4 and T5 and Isomax S6 and S7 circuit breakers, this allows supply to the service releases with the circuit breaker in the racked out position. It is therefore possible to carry out blank operating tests of the circuit breaker in safe conditions, i.e. isolated in relation to the power circuits.

Connectors for service releases for Isomax

These allow the shunt trip or undervoltage release to be connected to the power supply circuit. They are available in the following versions:

- for Isomax S6 and S7 fixed circuit breakers
- for Isomax S6 and S7 draw out circuit breakers.

Assembly is by means of pressure into special slots in the left side of the circuit breaker.

Cables of different lengths (UL/CSA) are available.

Socket-plugs with 3, 6 or 12 poles and cable kit (UL/CSA) with a length of 78.8' (2 meters) are available for Tmax: the socket-plugs are necessary only for plug-in version.

Accessories

Electrical signals

These allow information relative to the circuit breaker status to be taken outside the circuit breaker. Installation of these accessories takes place directly from the front of the circuit breaker, in special slots on the right-hand side of the circuit breaker, completely segregated from the live parts, with increased operator safety.

They are supplied in the pre-cabled version with 39.4" (1 m) long cables for the T1, T2 and T3 circuit breakers, or socket-plug connectors, still with 39.4" (1 m) long cables, for T4 and T5. For Isomax S6 and S7, the power supply is made by means of special connectors.

AUX - Auxiliary contacts and bell alarm

(UL file: E116596)

These carry out electrical signalling of the operating state of the circuit breaker:

- **open/closed**, which indicates the position of the main contacts
- **bell alarm**, which signals the circuit breaker open due to one of the following reasons:
 - overload or short circuit
 - shunt trip
 - UVR
 - residual current release
 - emergency opening pushbutton of the motor operator
 - operation of the circuit breakers test pushbutton.

Auxiliary contacts can be supplied (according to the type) in the pre-cabled version with 1 m long cables for T1, T2 and T3 or with connectors, still with 1m long cables, for T4, T5, S6 and S7.

AUX - Electrical characteristics

AUX 250 V - T1, T2, T3, T4 and T5

The auxiliary contacts are available for use with different voltages either in direct or alternating current:

T1, T2, T3, T4 and T5 (AUX) – 250 V AC/DC (UL file: E116596)

In the pre-cabled version:

- 1 contact for signalling (on changeover) open/closed plus 1 contact (on changeover) for bell alarm
- 3 contacts for signalling (on changeover) open/closed plus 1 contact (on changeover) for bell alarm.

T4 and T5 (AUX) – 400 V AC (UL file: E116596)

Only in the pre-cabled version:

- 1 contact for signalling (on changeover) open/closed plus 1 contact (on changeover) for bell alarm
- 2 contacts for signalling (on changeover) open/closed.

T1, T2, T3, T4 and T5 (AUX) – 24 V DC

Gold-plated in the pre-cabled and uncabled version for T4 and T5 and only in the uncabled version for T1, T2 and T3:

- 3 contacts for signalling (on changeover) open/closed plus 1 contact (on changeover) for bell alarm.

T2 with PR221DS electronic trip unit - 250 V AC/DC

In the pre-cabled version:

- a contact for signalling alarm which signals intervention of one of the protection functions of electronic trip unit plus a contact for signalling (on changeover) open/closed plus a contact for signalling (on changeover) release tripped
- two open/closed signalling contacts (on changeover) plus one release tripped signalling contact (on changeover).

T4 and T5 with PR221DS, PR222DS/P and PR222DS/PD-A (AUX-SA) – 250 V AC

Only in the pre-cabled version:

- 1 contact for bell alarm.

T4 and T5 (AUX-MO)

Only in the uncabled version, to be combined with the MOE or MOE-E motor operator:

- 1 contact for signalling the operating mode of the circuit breaker with the motor operator: manual or remote.

T4 and T5 with PR222DS/PD-A electronic trip unit (AUX-E)

Only in the uncabled version and only combined with the PR222DS/PD-A, they communicate the state of the circuit breaker to the electronic trip unit.

- 1 contact for signalling (on changeover) open/closed + 1 contact (on changeover) for bell alarm.

S6 and S7 (AUX) – 400 V AC/250 V DC (UL file: E116596)

In the pre-cabled and uncabled version:

- 1 contact during open/closed changeover + 1 bell alarm
- 2 contacts for signalling (on changeover) open/closed
- 1 open signal +1 closed signal +1 bell alarm.

S8 (AUX) – 500 V AC/220 V DC (UL file: E116596)

In the pre-cabled version:

- 3 contacts during open/closed changeover
- 1 bell alarm.

Accessories

Electrical signals

A change-over contact signalling residual current protection trip is always supplied for the Tmax circuit breakers combined with the RC221 and RC222 residual current releases (in accordance with IEC 60947-2 Standard). Two change-over contacts for signalling pre-alarm and alarm are also available with RC222.

T1-T2-T3

T4

AUX-C 250 V AC/DC

S6-S7

1SDXC210266F0023

Connectors for auxiliary contacts for Isomax

These allow the auxiliary contacts to be connected to the relative power supply circuit.

For Isomax S6 and S7 circuit breakers, the auxiliary contacts (fitted with plug connector) can only be supplied by means of the specific connectors to be ordered specifying the size and version of the circuit breaker (fixed or plug-in/draw out).

Assembly is carried out by mounting into special slots on the right side of the circuit breaker.

Socket-plugs with 3, 6 or 12 poles and cable kit (UL/CSA) with a length of 78.8" (2 m) are available. For Tmax: the socket-plugs are necessary only for plug-in version.

1SDXC210261F0023

1SDXC210262F0023

1SDXC210263F0023

Extension for testing auxiliary contacts

Available for Tmax T4 and T5, and Isomax S6 and S7 circuit breakers, this allows the auxiliary contacts to be connected to the relative power supply circuit with the circuit breaker in the withdrawn position. With the circuit breaker in safe conditions, i.e. isolated in relation to the power circuits, blank tests of circuit breaker operation can be carried out.

Accessories

Electrical signals

1SDC210264F0023

AUE - Early auxiliary contacts

One auxiliary contact for Isomax S6 and S7 and two contacts for Tmax T1, T2, T3, T4 and T5 allow the undervoltage release or a control device to be supplied in advance, in relation to closing of the main contacts, in compliance with the IEC 60204-1, and VDE 0113 Standards. They are mounted inside the direct rotary handle operating mechanism.

For Isomax S6 and S7, the contact is supplied complete with a socket connector with double slide for simultaneous connection of the undervoltage release and of the consent contact itself. With Tmax T1, T2 and T3, the early contacts are supplied in the cabled version with cables 39.4" (1 m) long, complete with socket-plug with 6 poles, whereas for T4 and T5 early contacts are provided with socket-plug connectors with 39.4" (1 m) cables.

T1-T5

1SDC210265F0023

S6...S7

1SDC210266F0023

1SDC210267F0023

AUP - Auxiliary position contacts

For the fixed part of circuit breakers Tmax T2, T3, T4 and T5, and Isomax S6 and S7 they provide electrical signalling of the circuit breaker position in relation to the fixed part: racked-in, drawn out and removed. They can only be connected by means of free wires and are available in the following versions:

- contacts signalling circuit breaker racked-in for Tmax and Isomax circuit breakers
- contacts signalling circuit breaker racked-out for Tmax T4 and T5 for the draw-out version
- contacts signalling circuit breaker racked-in for Tmax T4 and T5 in 24 V DC
- contacts signalling circuit breaker racked-out for Tmax T4 and T5 in 24 V DC for the draw-out version.

A maximum of three contacts for Tmax and a maximum of five contacts for S6 and S7, in any combination, can be installed on the fixed part.

The circuit breaker position contacts are also available in the gold-plated version for digital signals, also suitable for use for $U_n < 24$ V voltages with the same type of signaling and versions (for Isomax).

T2-T3

T4-T5

S6-S7

Accessories

Remote controls

These allow remote control of circuit breaker opening and closing and are particularly suitable for use in electrical network supervision and control systems.

A selector allows changeover from automatic to manual operation. They are always fitted with a padlock in the open position.

MOS - Solenoid operating mechanism for Tmax T1, T2 and T3

(UL file: E116596)

1SDC210273F0023

This operates both opening and closing of the circuit breaker, acting directly on its lever. It is proposed in two versions, one "side-by-side" (IEC only), with T1 and T2, for installation on a panel or DIN rail, the other on the front of the circuit breaker (UL file: E116596), with T1, T2 and T3. The latter is complete with operating handle. The front version can also be used with plug-in circuit breakers.

Coupling with the residual current release is only allowed for a circuit breaker with solenoid operator side-by-side, to allow access to the user interface of the residual current release from the front of the switchgear. In fact, using the solenoid operator superimposed would imply the circuit breaker position on the rear of the door and its residual current release and the interface would no longer be ac-

cessible. This combination can only be installed directly on the back plate of the switchboard. Both versions can be used either in the three-pole or four-pole version.

The solenoid operator is supplied complete with free cables 39.4" (1 m) long and socket-plug connector with 3 poles just for the superimposed version. The table gives the power supply voltage values U_n [V].

Rated voltage, U_n		
AC	[V]	110...250
DC	[V]	48...60 / 110...250
Operating voltage		85...110% U_n
Inrush power consumption		1800 [VA] / 1000 [W]
Time	opening [s]	< 0.1
	closing [s]	< 0.1
Mechanical life	[no. Operations]	25000
	[no. Operations/h]	240 (T1 and T2); 120 (T3)
Degree of protection, on the front		IP30
Minimum control impulse time on opening and closing		[ms] >100

Note: with the MOS in the 110...250 V AC/DC version, it is necessary to use the MOS-A adapter (supplied) for $220 \text{ V} \leq U_n \leq 250 \text{ V}$ service voltage

1SDC210274F0023

Stored energy motor operator for Tmax T4 and T5 – MOE

(MOE: UL file: E116596)

1SDC210275F0023

With the stored energy motor operator, it is possible to control both opening and closing of the circuit breaker on which it is installed. During opening of the circuit breaker, the spring system is recharged automatically: the stored energy is exploited in this way to close the circuit breaker. The motor operator is always supplied complete with socket-plug connectors with 39.4" (1m) long cables and is always fitted with a padlock. The connectors, once inserted in the special slot on the right-hand side of the circuit breaker, extend in relation to the outline of the circuit breaker itself.

The device can be fitted both with a key lock in the open position (with the same MOL-S keys for groups of circuit breakers or different MOL-D keys) and with a MOL-M key lock against manual operation: in the former case, the lock in the open position is both of electrical and mechanical type, in the latter case, only of mechanical type, i.e. only closing from the front of the circuit breaker (remote closing is allowed).

The motor operator is always fitted with an auxiliary contact to signal "auto" or "manual (not on changeover)". On request, it can also be fitted with an AUX-MO auxiliary contact (on changeover), which provides a signal of its service state: "auto" (remote control of the circuit breaker) or "manual".

Adapters - ADP

For the pre-cabled electrical accessories, it is necessary to use the adapters to be coupled with the plug, which will then be connected to the socket located on the cradle for the moving parts of the plug-in or draw out version of Tmax T4 and T5.

Depending on the electrical accessories required, it will be necessary to ask for one or two adapters to be mounted on the left side and/or on the right side of the moving part

There are four types of adapters available:

- 5-way adapters
- 6-way adapters
- 10-way adapters
- 12-way adapters.

The table below indicates the adapters which must be used for the various possible configurations of electrical accessories:

ADP adapters for T4 and T5 cabled accessories

Stored energy motor operator for Isomax S6 and S7 circuit breakers

(UL file: E116596)

With the stored energy operating mechanism, during circuit breaker opening the release mechanism automatically pre-charges a system of springs: the stored energy is used for closing the circuit breaker. It is supplied complete with shunt opening release ($P_s=100\text{VA}/100\text{W}$) and flange for the compartment door. The table shows the power supply voltages values U_n [V].

In case of interlocked circuit breakers, the key lock against manual operation is necessary.

Motor operator for S6, S7

		AC	DC
Rated voltage, U_n	[V]		24
	[V]		48
	[V]	120	125
	[V]	240	250
Operating frequency		50...60	
Operating voltage		85...110% U_n	85...110% U_n
Power consumption on inrush P_s		660 VA	600 W
Power consumption in service P_c		180 VA	180 W
Time constant	[ms]	22	
Duration	opening [s]	1.2	
	closing [s]	0.09	
Mechanical life	[no. operations]	10000 (S6) - 5000 (S7)	
Degree of protection, on the front		IP30	
Minimum duration of the opening and closing command impulse		[ms] ≥ 100

Remote controls

1SDC210280F0023

Geared motor for Isomax S8 circuit breaker

This allows the springs of the circuit breaker closing mechanism to be charged automatically, immediately following a closing operation. It includes a limit microswitch for electrical signalling of closing springs charged.

1SDC210281F0023

Connectors for Isomax S6 and S7 motor operators

The motor operators for S6 and S7 can only be supplied by means of the specific connectors. They are of the slide type and allow simultaneous connection of both the motor operator and the auxiliary contacts to the relative power supply circuit. They are an alternative to the corresponding connectors for the auxiliary contacts only since they are housed in the same seat. They must be ordered specifying the size and version of the circuit breaker (fixed or plug-in/draw out).

1SDC210282F0023

Extension for testing motor operators

1SDC210283F0023

For Tmax T4 and T5 and Isomax S6 and S7 circuit breakers, this allows both motor operators and the auxiliary contacts to be connected to the relative power supply circuit with the circuit breaker in the racked-out position. With the circuit breaker in safe conditions, i.e. isolated in relation to the power circuits, blank operating tests of the circuit breaker can be carried out. It must be ordered specifying the size and version of the circuit breaker (fixed or plug-in/draw out) and automatically excludes the corresponding extension for testing the auxiliary contacts.

Accessories

Operating mechanisms with locks

Rotary handle operating mechanism – RHD/RHE

(UL file: E116596 for Tmax)

The rotary handle operating mechanism facilitates operation thanks to its ergonomic handle. It is always fitted with a padlock in the open position, which prevents the circuit breaker being closed. The padlock slot can take up to three padlocks – stem Ø 0.27" (7 mm) for T1, T2, T3 T4 and T5, and 0.24" (6 mm) for S6 and S7 (not supplied).

The rotary handle operating mechanism for Tmax is always fitted with a compartment door lock and, on request, can be supplied with a key lock in the open position; for S6 and S7, on request, it can be supplied with a compartment door lock or key lock in the open position.

Application of the rotary handle operating mechanism is an alternative to the motor operator and to the front interlocking plate for Tmax T1, T2, T3 and to the front flange for the lever operating mechanism for Tmax T4, T5 and Isomax S6 and S7.

The rotary handle operating mechanism is available in either the direct version and in the transmitted version on the compartment door. The trip unit settings and the nameplate data remain accessible to the user.

For Isomax S6 and S7 circuit breakers, the direct rotary handle operating mechanism on the circuit breaker is always supplied complete with flange for the compartment door.

The rotary handle operating mechanism in the emergency version, complete with red-yellow handle and yellow plate, suitable for machine tool control, is also available for all the circuit breakers. For Tmax circuit breakers, the rotary handle operating mechanisms can be ordered by building up by ordering the following three devices:

- rotary handle on the compartment door
- transmission rod (19.68" / 500 mm)
- base for circuit breaker

or, alternatively, by using the code of the ready-configured version.

Type of RH operating mechanism		T1, T2, T3		T4, T5		S6, S7

IP54 protection for rotary handle

(UL file: E116596 for Tmax T4-T5)

Allows IP54 degree of protection to be obtained. It is available for the transmitted rotary handle operating mechanism on the compartment door (RHE) for the Tmax and Isomax circuit breakers.

1SDC21028TF0023

1SDC210298F0023

S6-S7

1SDC210294F0023

Front flange for lever operating mechanism – FLD (UL file: E116596 for Tmax)

This can be installed on Tmax T4 and T5, and on Isomax S6 and S7 fixed, plug-in or draw out circuit breakers. In case of draw out circuit breakers installed in compartments, it allows higher degree of protection to be maintained for the whole isolation run of the circuit breaker.

It is always fitted with a padlock in the open position (stem $\varnothing 0.24"$ - 6 mm up to three padlocks - not supplied) which prevents closing of the circuit breaker.

On request, it can be fitted with a key lock in the open position for one or more circuit breakers and with the compartment door lock.

It is available in the following versions:

- for fixed or plug-in circuit breaker
- for draw out circuit breaker.

The front flange for lever operating mechanism is always an alternative to the motor operator, to the rotary handle and, for T4 and T5, to the front display unit FDU.

For Isomax S6 and S7 circuit breakers, it is always supplied complete with flange for the compartment door.

1SDC210295F0023

1SDC210298F0023

Key lock in open position

This allows the mechanical closing operation of the circuit breaker to be locked.

The following versions are available:

- lock with different key for each circuit breaker
- lock with the same key for groups of circuit breakers.

For Isomax S6 and S7 circuit breakers, different locks are supplied, for stored energy motor operator, for rotary handle or front for lever operating mechanism.

For Tmax T1, T2 and T3, the key lock is available for the rotary handle operating mechanism (RHL). Furthermore, it is also available in the version which allows the lock both in the open and in the closed position: the lock in the closed position does not prevent tripping of the mechanism following a fault or a remote control command.

For T4 and T5 key locks in the open position are available either with different keys (KLF-D) or with the same keys (KLF-S): in this case, up to four different key numbering codes are available.

Operating mechanisms with locks

1SDC210299F0023

KLC - Key lock on the circuit breaker

Available for Tmax T1, T2 and T3, the key lock on the circuit breaker allows the mechanical closing operation of the circuit breaker to be locked and is installed directly on the front inside the slot in correspondence with the left pole. It cannot be mounted with a front operating mechanism, a rotary handle operating mechanism, a motor operator, or RC221/RC222 residual current releases and, only in the case of three-pole circuit breakers, with service releases (UVR, SOR).

The key lock is the Ronis 622 type and is available in two versions:

- standard type, with key only removable with the circuit breaker locked (KLC)
- special type, with key removable in both positions (KLC-S).

3

1SDC210300F0023

Compartment door lock

This prevents the compartment door being opened with the circuit breaker closed. It can be used with Isomax S6 and S7 circuit breakers in the fixed, plug-in or draw out version and fitted with rotary handle operating mechanism or front for lever operating mechanism. It consists of two elements: one applied to the rotary handle operating mechanism or to the front for the lever operating mechanism, the other, consisting of a metal striker, to be applied onto the compartment door.

For Tmax circuit breakers, the door lock is always supplied with the rotary handle operating mechanism.

1SDC210301F0023

Lock for fixed part of draw out circuit breakers - Tmax T4, T5 and Isomax S6, S7

Key locks or padlocks are available to be applied to the guide of the fixed part of a draw out circuit breaker to prevent the moving part from being racked-in. The following different versions are available:

- padlock, which can take up to three padlocks with stem $\varnothing 0.24"$ - 6 mm (not supplied);
- key lock in the open position with different key for each circuit breaker;
- key lock in the open position between two or more circuit breakers with the same key for groups of circuit breakers;
- key lock of Ronis type (without key).

For T4 and T5 draw out circuit breakers, key or padlocks-locks are available to be applied onto the rail of the fixed part, to prevent racking-in of the withdrawable part.

Selection can be made among the following:

- key lock with different keys (KLF-D FP)
- key lock with the same keys for groups of circuit breakers (KLF-S FP)
- padlock, which can take up to three padlocks with 6 mm stem $\varnothing$, not supplied (PLL FP).

PLL - Padlock for operating lever for Tmax T1, T2, T3

This is applied to the Tmax T1, T2 and T3 covers to prevent the lever closing or opening operations. It allows installation of up to a maximum of three padlocks Ø 0.24" - 7 mm (not supplied).

It is available in the following versions:

- locking device only of the closing operation (it is applied with circuit breaker ON/OFF)
- locking device on the closing and opening operation according to its assembly position. The lock on the opening operation does not prevent release of the mechanism following a fault or remote control command.

Mechanical interlock between circuit breakers (for Tmax UL file E116596)

Tmax T1, T2, T3

For Tmax T1, T2 and T3 circuit breakers a front mechanical interlock (MIF) is available, which can be applied on the front of two (UL file E116596) both three-pole and four-pole fixed version circuit breakers, preventing simultaneous closing of the two circuit breakers. Fixing is carried out directly on the back plate of the switchboard. The front interlocking plate allows installation of a padlock in order to fix the position (possibility of fixing the O-O position as well). It is also possible to interlock three circuit breakers, even of different sizes, by using a special plate, making the following interlocking combinations: IOO-OIO-OOI-OOO.

Tmax T4, T5

The mechanical interlock for Tmax T4 and T5 allows installation of two circuit breakers on a single support and, by means of special lever mechanism, makes them mechanically interdependent. Unlike the interlock used with T1, T2 and T3 which is frontal, this is a rear interlock consisting of a vertical or horizontal frame group (MIR-HB or MIR-VB), made up of a metal frame and of the leverisms to interlock, and of two plates (MIR-P) on which the circuit breakers are housed. Types of back plates:

Interlock

Type			
A	T4 (F-P-W)	+	T4 (F-P-W)
B	T4 (F-P-W)	+	T5 400 (F-P-W) or T5 630 (F)
C	T4 (F-P-W)	+	T5 630 (P-W)
D	T5 400 (F-P-W) or T5 630 (F)	+	T5 400 (F-P-W) or T5 630 (F)
E	T5 400 (F-P-W) or T5 630 (F)	+	T5 630 (P-W)
F	T5 630 (P-W)	+	T5 630 (P-W)

Isomax S6, S7

For Isomax S6 and S7 circuit breakers, the rear mechanical interlock allows installation of two circuit breakers on a single support and, by means of a walking beam mechanism, makes them mechanically inter-dependent. It prevents operation in parallel of two power supply sources (e.g.: normal - emergency). It consists of a kit with levers and assembly accessories and a metallic support.

The mechanical interlock is available in the version for side-by-side circuit breakers and for superimposed circuit breakers. Only circuit breakers of the same size and in the same version can be interlocked.

Accessories

Residual current releases - IEC only

All the Tmax series of circuit-breakers are preset for combined assembly with residual current releases. In particular, the Tmax T1, T2 and T3 circuit-breakers can be combined with the new version of the SACE RC221 or RC222 series of residual current releases and four-pole T4 and T5 with RC222 or RC223 to be installed below the circuit-breaker.

Apart from the protection against overloads and short-circuits typical of automatic circuit-breakers, the residual current circuit-breakers derived from them also guarantee protection of people and protection against earth fault currents, thereby ensuring protection against direct contacts, indirect contacts and fire hazards. The residual current releases can also be mounted on the Tmax T1D, T3D, T4D and T5D switch-disconnectors. In that case, the derived apparatus is a “pure” residual current circuit-breaker, i.e. one which only guarantees residual current protection and not the protections typical of circuit-breakers. “Pure” residual current circuit-breakers are only sensitive to the earth fault current and are generally applied as main switch-disconnectors in small distribution switchboards towards end users.

The use of “pure” and “impure” residual current circuit-breakers allows continual monitoring of the state of plant insulation, ensuring efficient protection against fire and explosion hazards and, when the devices have $I\Delta n \leq 30$ mA, ensure protection of people against indirect and direct earth contacts to fulfil the compulsory measures foreseen by the accident prevention regulations and prescriptions. The residual current releases are constructed in compliance with the following Standards:

- IEC 60947-2 appendix B
- IEC 60255-3 (SACE RCQ and RC223) and IEC 61000: for protection against unwarranted release
- IEC 60755 (SACE RCQ): for insensitivity to direct current components.

RC221 and RC222 residual current releases for T1, T2 and T3

The RC221 and RC222 residual current releases can be installed either on the Tmax T1, T2 and T3 circuit-breakers, or on the T1D and T3D switch-disconnectors. The versions available make their use possible both with three-pole and four-pole circuit-breakers, in the fixed version.

They are constructed using electronic technology and act directly on the circuit-breaker by means of a trip coil, supplied with the residual current release, to be housed in the special slot made in the left-hand pole area. They do not require an auxiliary power supply as they are supplied directly by the network and their operation is guaranteed

even with only a single phase plus neutral or only two phases supplied with voltage and in the presence of unidirectional pulsating currents with direct components.

All the possible connection combinations are allowed, except for guaranteeing, in the four-pole version, connection of the neutral to the first pole on the left.

The RC221 and RC222 residual current releases can either be supplied from above or from below.

The operating conditions of the apparatus can be continually controlled by means of the electronic circuit test pushbutton and the magnetic indicator of

residual current trip.

A disconnection device of the power supply during the insulation test is available.

The four-pole circuit-breaker complete with residual current release can be fitted with the electrical accessories normally available for the circuit-breaker. The shunt opening and under-voltage releases are housed in the special slot made in the neutral pole for the four-pole circuit-breakers, whereas they are incompatible with the three-pole circuit-breakers.

1SDC210316R0023

1SDC210317F0023

The residual current releases are supplied complete with:

- a trip coil to be housed in the area of the third pole, complete with an auxiliary contact signalling residual current release trip
- dedicated flange.

The bracket for fixing onto DIN 50022 rail is available on request.

The configuration foresees insertion of the circuit-breaker on the structure of the corresponding residual current release, making access to the adjustments on the left-hand side of the circuit-breaker available, whilst the toroid is in the underneath position.

A distinguishing characteristic is provided by the type of cable connection which is made directly on the circuit-breaker, once the residual current release has been mounted, thereby ensuring simplification and rationalisation of the installation procedure.

With Tmax T2 and T3, only front terminals for copper cables (FC Cu) at the bottom are mounted on the residual current releases. For this reason, when the residual current release is ordered, the FC Cu terminal semi-kit is always supplied (consult the code section on page 7/36). On the other hand, for four-pole Tmax T1, it is also possible to

mount the rear horizontal flat terminal kit below (HR for RC221/RC222).

Furthermore, still for four-pole T1, a version of the RC222 residual current release is available in 200 mm modules. This release keeps the same technical characteristics as the normal RC222 for T1, T2 and T3 but, thanks to its reduced height, allows installation in 200 mm modules. Its special shape also allows a reduction in the overall dimensions when two or more units are placed side by side.

1SDC210318F0023

1SDC210319F0023

RC222 residual current release for T4 and T5

With T4 and T5, in the four-pole version, it is possible to use an RC222 residual current release below the circuit-breaker.

This RC222 residual current release, in the fixed version, can easily be converted into plug-in by adding the special conversion kit.

The RC222 release is constructed using electronic technology and acts directly on the circuit-breaker by means of a trip coil, supplied with the residual current release, to be housed in the special slot made in the left-hand pole area.

It does not require an auxiliary power supply as they are supplied directly by the network and their operation is guaranteed even with only a single phase

plus neutral or only two phases supplied with voltage and in the presence of unidirectional pulsating currents with direct components.

All the possible connection combinations are allowed as long as there is that of the neutral to the first pole on the left.

The RC222 residual current release can either be supplied from above or from below.

The operating conditions of the apparatus can be continually controlled by means of the electronic circuit test pushbutton and the magnetic indicator of residual current trip.

A disconnection device of the power supply during the insulation test is available.

The four-pole circuit-breaker

complete with residual current release can be fitted with the electrical accessories normally available for the circuit-breaker. The shunt opening and under-voltage releases are housed in the special slot made in the neutral pole for the four-pole circuit-breakers.

The residual current release is supplied complete with:

- a trip coil to be housed in the area of the third pole, complete with an auxiliary contact signalling residual current release trip
- dedicated flange.

The release is supplied with standard front terminals, but it can also be combined with all the terminals available for the corresponding circuit-breaker.

⁽¹⁾ Operation up to 50 V Phase-Neutral

RC223 (B type) residual current release for T4

1SDC210320R0023

Along with the family of residual current releases illustrated previously, ABB SACE is developing the RC223 (B type) residual current release, which can only be combined with the Tmax T4 four-pole circuit-breaker in the fixed or plug-in version. The range of operation of the primary line-to-line voltage of this residual current release varies between 110 V and 440 V, with operation starting from 55 V phase-neutral. It is characterised by the same types of reference as the RC222 (S and AE type) release, but can also boast conformity with type B opera-

tion, which guarantees sensitivity to residual fault currents with alternating, alternating pulsating and direct current components. The reference Standards are: IEC 60947-1, IEC 60947-2 Appendix B, and IEC 60755. Apart from the signals and settings typical of the RC222 residual current release, the RC223 also allows selection of the maximum threshold of sensitivity to the residual fault frequency (3 steps: 400 – 700 – 1000 Hz). It is therefore possible to adapt the residual current device to the different requirements of the industrial plant ac-

cording to the prospective fault frequencies generated on the load side of the release. Typical installations which may require frequency thresholds different from the standard ones (50 – 60 Hz) are the welding plants for the automobile industry (1000 Hz), the textile industry (700 Hz), airports and three-phase drives (400 Hz). All the functions of the apparatus - even the most advanced ones - can be checked by the user by means of a careful watchdog test which is carried out by a series of simple successive steps.

SACE RCQ residual current relay

The Tmax T1, T2, T3 T4 and T5, and Isomax S6 and S7 circuit breakers can be combined with the RCQ relay with separate toroid (to be installed externally on the line conductors) and these fulfill requirements with thresholds up to 30 A trips and times up to 5 s or when the installation conditions are particularly restrictive, such as with circuit breakers already installed, or limited space in the circuit breaker compartment.

Thanks to the wide range of settings, the RCQ relay is suitable for applications where a system of residual current protection coordinated with the various distribution levels. It is particularly recommended when low sensitivity residual current protection is required, such as in partial (current) or total (chronometric) selective chains, and for high sensitivity applications (physiological sensitivity). In case of drops in the auxiliary power supply voltage, the opening control intervenes after a minimum time of 100 ms and after the time set plus 100 ms.

The RCQ relay is suitable for use in the presence of alternating currents only (Type AC), for alternating and/or pulsating current with direct components (Type A) and allows residual current selectivity to be set up.

The RCQ relay is of the type with indirect action and acts on the circuit breaker release mechanism by means of the shunt trip of the circuit breaker itself (to be ordered by the user), to be housed in the special slot made on the left-hand pole of the circuit breaker.

SACE PR212/D-M Modbus and PR212/D-L Lon dialogue unit for S6 and S7- (IEC only)

The dialogue unit is a device which allows two-way communication from the circuit breaker to the outside and vice versa. ABB has built two distinct dialogue units able to support two different communication protocols: PR212/D-M (Modbus RTU protocol) and PR212/D-L (LonTalk protocol by Echelon). Both units are housed in external modules, which can be installed on DIN rails, and can be used with the Isomax S6 and S7 circuit breakers fitted with PR212/P electronic trip unit, both in the LSI and LSIG versions. They must be supplied with a stabilized voltage of 24 V DC ($\pm 20\%$ with maximum ripple $\pm 5\%$) and be earthed. Communication towards the outside is generally addressed to a supervision and control unit, which has the task of collecting and storing the information regarding the part of the plant controlled.

In the case of an error in the serial communication due to a fault in the dialogue unit or lack of auxiliary power supply, the PR212/P protection unit works according to the last parameters set and, in any case, in accordance with what has been set manually. The PR212/D-M and PR212/D-L dialogue units are always fitted in combination with the PR212/T actuator unit, which allows remote closing or opening operation of the circuit breaker (Remote Control) by means of two digital outputs which can be disabled thanks to the dip-switch (LOC/REM) positioned on LOC.

Information available

- State of the circuit breaker: open; closed; tripped
- installation alarms: pre-alarm L; tripped L-S-I-G-R-V-PTC
- measurements: currents; N° operations; N° trips
- reading and writing curves and trip thresholds: only manual reading (MAN), electronic or remote reading and writing (ELT)
- circuit breaker commands: opening; closing; reset.

1SDC210322F0023

SACE PR212/T actuator unit for S6 and S7

The PR212/T actuator unit allows circuit breaker opening and closing by means of the motor operator mounted on the circuit breaker. It is always supplied in combination with the PR212/D dialogue unit for Isomax S6 and S7. An auxiliary power supply with a stabilized voltage of 24 V DC ($\pm 20\%$, with maximum ripple $\pm 5\%$) and earthed is required for operation of the unit.

The PR212/D dialogue unit sends the digital opening and closing commands, received from the supervision and control system, to the inputs of the PR212/T actuator unit, which carries out circuit breaker closing and opening by means of a power relay. The motor operator of the circuit breaker (use the versions with power supply voltage at 110 V AC/DC or 220 V AC) must be connected to these relays.

1SDC210323F0023

SACE TT1 Test unit

This allows control of tripping of the PR211/P, PR212/P, PR221DS, PR222DS/P and PR222DS/PD-A electronic trip unit and the trip test of the trip coil. The device is supplied by means of a 12 V replaceable battery and is fitted with a two-pole polarized connector-tracer point housed on the bottom of the box, which allows connection of the device to the test input bushings located on the bottom of the electronic trip unit.

The limited dimensions of the accessory make it practically pocket-type.

1SDC210324F0023

SACE PR212/K signalling unit for S8

The PR212/K signalling unit, only available for Isomax S8, is able to convert the digital signals supplied by the PR212/P - (LSIG) protection unit into electric signals by means of normally open electrical contacts. An auxiliary power supply is needed to operate the unit. It is connected to the internal bus of the protection unit by means of a dedicated serial line over which the information regarding the state of activation of the protection functions passes, on the basis of which the relative power contacts are closed to signal:

- pre-alarm for protection function L ($I > 0.9 \times I_1$)
- protection function L, S, I, G trip
- trip indication
- communication error with protection unit.

Accessories

Accessories for electronic trip units

SACE PR021/K signalling unit

The SACE PR021/K signalling unit can convert the digital signals supplied by the PR222DS/PD-A (LSI or LSIG) protection unit into electrical signals, via normally open electrical contacts.

The unit is connected to the protection release by means of the Modbus RTU standard serial changeover line, on which all the information about the activation status of the protection functions flows. The corresponding power contacts are closed based on this information.

In particular, the following signals are available:

- the alarm signal remains active throughout the overload, until the release is tripped
- the trip signals of the protections remain active during the timing phase, and even after the release is tripped.

PR021/K (PR222DS/PD-A)

Maximum changeover power (resistive load)	100W / 1250 VA (resistive load)
Maximum changeover voltage	130 V DC / 250 V AC
Maximum changeover current	5 A
Breaking capacity (resistive load) @ 30 V DC	3.3 A
Breaking capacity (resistive load) @ 250 V AC	5 A
Contact/coil insulation	2000 V eff (1 min @ 50 Hz)

Note: the PR021/K unit is an alternative to any supervision and control systems.

A reset pushbutton allows the state of all the signals to be reset.

The unit also has ten LEDs to visually signal the following information:

- “Power ON”: auxiliary power supply present
- “TX (Int Bus)”: flashing synchronised with dialogue with the internal Bus
- eight LEDs associated with the internal contacts.

The table indicates the characteristics of the signalling relays available in the SACE PR021/K unit.

Available signals

1SDC210325P0023

SACE PR010/T Test and Configuration Unit

The PR010/T unit is an instrument able to carry out the Test, programming and parameter readout functions for the protection units which equip the Tmax, the Isomax S molded case circuit breakers and the Emax air circuit breakers.

In particular, for circuit breakers fitted with PR212/P and PR222DS/P trip units, the test, programming and readout parameter functions are available. All the functions mentioned can be carried out ON BOARD by connection of the PR010/T unit to the multipin front flange connector on the protection unit; connection is guaranteed by means of special interfacing cables supplied as standard with the unit.

The human-machine interface is guaranteed by using a membrane keyboard and a multi-line alphanumeric display.

There are also two LEDs on the unit which signal the following respectively:

- POWER-ON and STAND BY situation
- situation of the battery charging state.

Two different types of Test are provided: automatic and manual.

By means of connection to the PC (software provided), it is also possible to upgrade the SW of the PR010/T unit to allow adaptation of the Test unit to evolution of new products.

The most relevant test results can also be stored in the unit itself and sent to the Personal Computer on explicit request for "issue of report".

Both in automatic and manual mode, the PR010/T unit is able to test the following:

- protection functions L, S, I, G
- monitoring of correct operation of the microprocessor.

The same Tests can also be repeated using the manual method.

The PR010/T unit is of the portable type and operates with re-

chargeable batteries and/or with an external power supply.

In its standard supply, the unit includes:

- PR010/T Test unit complete with rechargeable batteries
- TT1 Test unit;
- 100...240 V AC/12 V DC external power supply
- connection cables between the unit and the multipin connector present on the ranges of releases which equip the Isomax S and the Emax series
- connection cable between the unit and the PC (serial RS232)
- power supply cable
- instruction manual and software
- plastic case.

3

1SDC210325P0023

EP 010 - FBP

It is the "e-plug" interface which can connect T4 and T5, equipped with the PR222DS/PD-A electronic trip unit, to the field bus plug system, allowing user to choose among several field bus system (ASI, Device Net, Profibus).

It must be connected to the trip unit by means of the specific X3 connector.

Accessories

Accessories for electronic trip units

1SDC210327F0023

Front display unit - FDU

The front display is a display unit of the setting currents, alarms and parameters of the PR222DS/P and PR222DS/PD-A electronic trip units of T4 and T5. The display unit can operate correctly with self-supply with $I \geq 0.35 \times I_n$ on at least one phase. If the display is used in combination with the PR222DS/PD-A trip unit, and therefore with an auxiliary power supply, it is also possible to detect the protection, which has caused the trip unit intervention and the fault current. It is not compatible with the front accessories: rotary handle operating mechanism, motor operator and front for lever operating mechanism.

CT for external neutral (UL file: E116596)

This is mounted onto the external neutral conductor and allows protection against earth faults with three-pole circuit breakers. The circuit breaker must be fitted with PR212/P – LSIG, PR222DS/P or PR222DS/PD-A trip units. The transformer must be connected to the trip unit by means of the specific X3-X4 connectors, selected according to the version of the circuit breaker and the type of protection trip unit used.

CT ext

T4	T5	S6	S7	S8
100	300	600	1000	1600
150	400	800	1200	2000
250	600			2500

Connectors

Connectors X3 and X4 allow connection of the electronic trip unit with external plant units or components. In fact, they are used to make the L alarm signal available outside or to realise connection to the PR021/K signalling unit. Both connectors are available for fixed and plug-in or draw out version circuit breakers.

Connector	Function	Trip unit
X3	PR021/K	PR222DS/PD-A and PR211/P, PR212/P
	L alarm signal	PR222DS/P, PR222DS/PD-A, PR211/P, PR212/P
	Dialogue	PR222DS/PD-A, PR212/D
	Auxiliary supply	PR222DS/P, PR222DS/PD-A
	EP 010	PR222DS/PD-A
X4	External neutral	PR222DS/P, PR222DS/PD-A, PR212/P

Accessories

Installation and testing accessories

Bracket for fixing on DIN rail

This is applied to the fixed circuit breaker and allows installation on DIN rails (1.38"/35 mm).

It simplifies assembly of circuit breakers up to 225 A (Tmax T1, T2 and T3, except for T1B 1p) in standard switchboards.

The bracket for fixing onto DIN rails is also available for Tmax circuit breakers combined with RC221 and RC222 residual current releases or with the solenoid operating mechanism of the side-by-side type.

1SDC210328F0023

1SDC210329F0023

Flange for compartment door

For Isomax S6 and S7 circuit breakers with the rotary handle operating mechanism, front for lever operating mechanism and motor operator, a special flange is supplied for the purpose.

All the flanges of the Tmax series (to be ordered) are of new conception and do not require the use of screws for their installation: fixing is greatly simplified by means of a simple dove-tailing operation.

In the case of use of a rotary handle operating mechanism, solenoid operating mechanism or residual current releases, a special dedicated flange is supplied.

For T4 and T5 draw out circuit breakers, the flange supplied with the conversion kit must be used instead of the one supplied with the fixed circuit breaker.

Accessories

Spare parts

Spare parts

With Tmax series, the following spare parts are available:

- opening solenoid for the RC221 and RC222 residual current releases
- opening solenoid for PR221DS electronic trip unit
- kit with washers, screws and plugs for assembly of the front terminals (F)
- flange for compartment door.

For further details, please ask the Service Division of ABB for the spare parts catalogue.

Accessories

Controller for automatic transfer switch - ATS010

Control for automatic transfer switch - ATS010 (IEC only)

The ATS010 controller is the new network-group switching device offered by ABB. It is based on microprocessor technology in compliance with the leading electromagnetic compatibility and environmental standards (EN 50178, EN 50081-2, EN 50082-2, IEC 60068-2-1, IEC 60068-2-2, IEC 60068-2-3).

The device is able to manage the entire switching procedure between the normal line and emergency line circuit breakers automatically, allowing great flexibility of settings.

In case of fault in the normal line voltage, in accordance with the delays set, the normal line circuit breaker is opened, the generator started and the emergency line circuit breaker closed. Similarly, when the normal line returns to range, the reverse switching procedure is automatically controlled. It is especially suited for use in all emergency power supply systems requiring a solution that is ready to install, easy to use and reliable.

Some of the main applications include: power supply for UPS (Uninterrupted Power Supply) units, operating rooms and primary hospital services, emergency power supply for civilian buildings, airports, hotels, data banks and telecommunications systems, power supply of industrial lines for continuous processes.

The switching system consists of the ATS010 unit connected to two motor-driven and mechanically interlocked circuit breakers. Tmax T4 and T5, and Isomax S6 and S7 circuit breakers can be used. The built-in main sensor of the ATS010 device makes it possible to detect faults in the mains voltage. The three inputs may be directly connected to the three phases of the normal power supply line for networks with rated voltage up to 500 V AC. Networks with a higher voltage require the insertion of potential transformers (PT), setting a rated voltage for the device that matches their secondary voltage (typically 100 V).

Two change-over contacts for each circuit breaker connect directly to the motor operator. The circuit breaker connection is completed by wiring the status contacts: Open/Closed, Relay tripped, Racked-in (for draw out/plug-in circuit breakers).

That is why on every circuit breaker connected to the ATS010 unit, the following are included in addition to the mechanical interlock accessories:

- motor operator from 48 V to 110 V DC or up to 250 V AC
- open/closed contact
- relay tripped contact
- racked-in contact (for draw out versions)
- signal and mechanical lock for protection relay tripped.

On the motor operator for S6 and S7, the key lock is needed.

The ATS010 device is designed to ensure extremely high reliability for the system it controls. It contains various safety systems intrinsically related to software and hardware operation.

For software safety, a special logic prevents undesired operations, while a constantly operative watchdog system points out any microprocessor malfunctions via a LED on the front of the device.

Hardware safety allows integration of an electrical interlock via power relay, so that there is no need to use an external electrical interlock system. The manual selector on the front of the device can also control the entire switching procedure, even in the event of a microprocessor fault, by working electromechanically on the control relays.

Examples of curve readout

Example 1

Trip curves for distribution (thermo-magnetic trip unit)

Considering a S6N 800 TMD $I_n = 800$ A circuit breaker. By means of the thermal adjustment trimmer, the current threshold I_1 is selected, for example at $0.8 \times I_n$ (640 A); the magnetic trip threshold I_3 , adjustable from 5 to $10 \times I_n$, we select at $8 \times I_n$, equal to 6400 A.

It can be noted that, on the basis of the conditions in which the overload is presented, i.e. with the circuit breaker at thermal running or not, the thermal relay trip varies considerably. For example, for an overload current of $2 \times I_1$, the trip time is between 31 and 141.6 s for hot trip, and between 141.6 and 885 s for cold trip.

For fault current values higher than 6400 A, the circuit breaker trips instantaneously with the magnetic protection.

4

Example 2

Current-limiting curves

The following figure shows the trend of the Tmax T2H 100, $I_n = 100$ circuit breaker current-limiting curves. The r.m.s. of the prospective symmetrical short-circuit current is indicated on the abscissa of the diagram, whereas the peak short-circuit current value is indicated on the ordinates. The current-limiting effect can be assessed by comparing, at the same symmetrical short-circuit current value, the corresponding peak value at the prospective short-circuit current (curve A) with the limited peak value (curve B).

The T2H 100 circuit breaker with I_n 100 thermomagnetic trip unit at a voltage of 480 V, limits the short-circuit current to 12.2 kA for a fault current of 30 kA, with a reduction of about 50.8 kA compared with the peak value of the 63 kA prospective short-circuit current.

Example 3

Specific let-through energy curve

An example of reading the graph of the specific let-through energy curve of the T4V 250 In = 80 circuit breaker at a voltage of 490 V is given aside.

The prospective symmetrical short-circuit current is indicated on the abscissa of the diagram, whereas the ordinates show the specific let-through energy values expressed in $[\text{kA}]^2\text{s}$.

In correspondence with a short-circuit current of 100 kA, the circuit breaker lets through a value of I^2t equal to 0.7 $[\text{kA}]^2\text{s}$ (700000 A^2s).

Abbreviations used

- In = Ampère rating of the thermomagnetic or electronic trip unit
- I_1 = Long-time pick-up setting
- I_3 = instantaneous pick up setting
- I_{rms} = prospective symmetrical short-circuit current

Wiring diagrams

Information for reading – Tmax T1...T5

State of operation represented

The diagram is shown in the following conditions:

- fixed, plug-in or draw out version circuit breaker (depending on type of circuit breaker), open and racked-in
- contactor for motor starting open
- circuits de-energized
- releases not tripped
- motor operator with springs charged (for T4 and T5).

Version

The diagram shows a circuit breaker or MCS in the plug-in version (only T2, T3, T4 and T5), but is also valid for the fixed and draw out version circuit breakers or MCS.

With the fixed version circuit breakers or MCS, the applications indicated in figures 26-27-28-29-30-31 and 32 cannot be provided.

Caption

- = Figure number of the diagram

Wiring diagrams

Information for reading – Tmax T1...T5

Incompatibility

The circuits indicated by the following figures cannot be supplied at the same time on the same circuit breaker:

1 - 2 - 3 - 4 - 5 - 6

5 - 6 - 11

10 - 11

10 - 12

21 - 22 - 23

24 - 25

26 - 32

Notes

- A) The circuit breaker is supplied fitted with the applications specified in the ABB order confirmation.
- B) The undervoltage release is supplied for power supply branched on the supply side of the circuit breaker or from an independent source: circuit breaker closing is only allowed with the release energised (the lock on closing is made mechanically).
- C) The S4/1 and S4/2 contacts shown in figures 5-6 open the circuit with the circuit breaker open and close it again when a manual closing command is given by means of the rotary handle, in accordance with the Standards regarding machine tools (in any case, closing does not take place if the undervoltage release is not supplied).
- D) For connection of the EIA RS485 serial line, see the following documentation:
 - ITSCE-RH0199 for MODBUS communication.
- E) Connectors XA1, XA2, XA5, XA6, XA7, XA8 and XA9 are supplied on request. They are always supplied with T2 and T3 circuit breakers in the plug-in version.
Connectors X1, X2, X5, X6, X7, X8 and X9 are supplied on request. They are always supplied with circuit breakers in the plug-in version and with T4 and T5 circuit breakers in the fixed version.
- F) Additional external resistor for undervoltage release supplied at 250 V DC, 380/440 V AC and 480/500 V AC.
- G) In the case of fixed version circuit breaker with current transformer on external neutral conductor outside the circuit breaker, when the circuit breaker is to be removed, it is necessary to short-circuit the terminals of the TI/N transformer.
- H) With MOS 110...250 V AC, only use MOS-A for $200\text{ V} \leq U_n \leq 250\text{ V}$.
- I) SQ and SY are opto-insulated contacts.

Information for reading – Isomax S6, S7 and S8

State of the operation represented

The circuit is shown in the following conditions:

- fixed, plug in or draw out circuit breaker (depending on type of circuit breaker), open and racked in
- circuits de-energized
- releases not tripped
- motor operator with springs loaded (for S6-S7 circuit breakers).

Versions

The diagram indicates a circuit breaker or a MCS in draw out version but it may be applied to circuit breaker or a MCS in the fixed version too.

Circuits given in figures 21-22-23-24-25-31-32-33-34-35 cannot be supplied with circuit breaker or MCS in fixed version.

Fig. 48	= Auxiliary circuits of the electronic trip unit PR212/P connected to the dialogue unit type PR212/D-L or PR212/D-M and to the actuating unit type PR212/T
Fig. 49	= Auxiliary circuits of the electronic trip unit PR212/P connected to the dialogue unit type PR212/D-L or PR212/D-M, to signalling unit type PR021/K and to the actuating unit type PR212/T
Fig. 50	= Auxiliary circuits of the electronic trip unit PR212/P connected to signalling unit type PR021/K.

Note: figures are always valid for S6 and S7; figures 1, 4, 41, 48, 49 and 50 are also valid for S8.

Wiring diagrams

Information for reading – Isomax S6, S7 and S8

Incompatibility

The combinations of circuits given in the figures below are not possible on the same circuit breaker:

1 - 4 - 6
11 - 12 - 13
21 - 31
22 - 32
23 - 33
24 - 34
25 - 35
48 - 49 - 50

Notes

- A) Circuit breaker is supplied complete with the accessories listed in the ABB order acknowledgement only.
- B) Undervoltage release is suitable for circuit breaker supply side feeding or for feeding from an independent source: circuit breaker closes only if the undervoltage release is energized (lock on closing is achieved mechanically)
- D) Circuit breaker can be equipped with S75I and S75S position contact, in whatever combination, with a maximum of 5 total contacts
- E) To connect the serial communication line to the remote supervision and control system, see following documentation:
 - ITSCE-RH0298.001 for Modbus
 - ITSCE-RH0297.001 for Lon
- F) In case of circuit breaker in fixed version with current transformer on external conductor, in order to remove the circuit breaker it is necessary to short-circuit the terminals of TI/N current transformer
- G) Contact signalling electronic trip unit operated (see fig. 41) has the following electrical characteristics:
 - rated voltage = 24 V
 - breaking capacity (resistive load) = 3 W/VA
 - maximum current interrupted = 0.5 A.

T5	160/6.30

Note: The dimensions shown apply for operating voltage U_b up to 690 V. The dimensions to be respected must be added to the maximum dimensions of the various different versions of the circuit breakers, including the terminals.

Overall dimensions

Distances to be respected - Isomax

[mm/in]

Insulation distances for installation in metal compartment with wall to chassis ground or wall to chassis ground protected with insulating plate

Wall to chassis ground [mm/in]

	A ($U_b \leq 415$ V)	A(*) ($U_b \geq 440$ V)	B	C
S6	35 1.38	100 3.94	25 0.98	20 0.79
S7	50 1.97	100 3.94	30 1.18	20 0.79
S8	200 7.87	200 7.87	30 1.18	120 4.72

(*) These distances are valid for operating voltages of > 440 V and for circuit breakers with breaking capacity level L

1SDC210768F0023

Insulation distances for installation in insulated compartment

Insulated wall [mm/in]

	A	B	C
S6	35 1.38	10 0.39	20 0.79
S7	50 1.97	10 0.39	20 0.79
S8	120 4.72	15 0.59	120 4.72

The dimensions shown apply for operating voltages U_b of up to 690 V.

The dimensions to be respected must be added to the maximum dimensions of the various different versions of the circuit breakers, including the terminals.

Overall dimensions

Distances to be respected - Isomax

[mm/in]

Minimum distance between centres for two horizontally or vertically-installed circuit breakers

For horizontal or vertical installation, make sure that the connection busbars or cables don't reduce the air insulation distances.

Minimum distance between centres for horizontally-installed circuit breakers

	Circuit breaker width [mm/in]		I [mm/in]	
	3 poles	4 poles	3 poles	4 poles
S6	210 8.27	280 11.02	210 8.27	280 11.02
S7	210 8.27	280 11.02	210 8.27	280 11.02
S8	435 17.13	585 23.03	435 17.13	585 23.03

(*) these are the distances to be respected for circuit breakers fitted with a flange for the compartment door or side conductor outlets.

The distances between centres are for the installation of fixed and plug in circuit breakers. When installing draw out S6 or S7 circuit breakers you should also take into account the dimensions of the metal supporting channel that needs to be fitted between the guides of the fixed parts of two adjacent circuit breakers.

Minimum distance between centres for vertically-installed circuit breakers

	H [mm/in]
S6	180 7.09
S7	180 7.09
S8	300 11.81

- 1 Connection not insulated
- 2 Insulated cable
- 3 Cable terminals

	F = Front terminals		EF = Front extended terminals		ES = Front extended spread terminals
	FC Cu = Front terminals for copper cables		FC CuAl = Front terminals for Cu/Al cables		FC CuAl = Front terminals for Cu/Al cables (housed externally)
	RC CuAl = Rear terminals for Cu/Al cables		R = Rear terminals		MC = Multi-cable terminals
	HR for RC221/222 = Rear flat horizontal terminals		HR = Rear flat horizontal terminals		VR = Rear flat vertical terminals
HR/VR = Rear flat terminals					
	Is = Magnetic trip current [A]	Iu	Rated uninterrupted current of the circuit breaker [A]		
	In = Rated current of the thermomagnetic trip unit [A]	Icu	Rated ultimate short-circuit breaking capacity [A]		
		Icw	Rated short-time withstand current for 1s		
TMF	= Thermomagnetic trip unit with fixed thermal and magnetic threshold	TMA	= Thermomagnetic trip unit with adjustable thermal and magnetic threshold	MF	= Fixed magnetic only trip units
TMD	= Thermomagnetic trip unit with adjustable thermal and fixed magnetic threshold	TMG	= Thermomagnetic trip unit for generator protection	MA	= Adjustable magnetic only trip units
				PR22_	= Electronic trip units
				PR23_	= Electronic trip units
				PR33_	= Electronic trip units

Ordering codes

Instructions for ordering

Ordering circuit breakers fitted with the accessories indicated in the catalogue means that these must be indicated by means of the relative sales codes expressly associated with the circuit breaker code. The following examples are of particular importance for correctly loading orders for circuit breakers fitted with accessories.

All circuit breakers in this section and all accessories identified by UL symbol conform to UL 489 and CSA C22.2 Standard.

1) T4-T5 electrical accessories on moving part of plug-in circuit breaker

Fitting the moving parts of plug-in T4-T5 circuit breakers with i.e. in the case of cabled electrical accessories SOR-C, UVR-C, AUX-C, MOE, MOE-E and AUE accessories, always requires the appropriate ADP adapters indicated in the catalogue.

a) Tmax T4L 250 moving part of plug-in circuit breakers with cabled auxiliary contacts

	1SDA...R1
T4L 250 F F P221DS-LS/I 100 3p	055438
Kit P MP T4 3p	054839
AUX-C 3Q 1SY 250 V AC/DC	054911
ADP – 12 pin adapter	054923

b) Tmax T4L 250 moving part of plug-in circuit breaker with SOR-C, MOE and AUX-C

	1SDA...R1
T4L 250 F F P221DS-LS/I 100 3p	055438
Kit P MP T4 3p	054839
SOR-C 220...240 V AC – 220...250V DC	054873
MOE T4-T5 220...250 V AC/DC	054897
ADP – 10 pin adapter	054924
AUC 1Q 1SY 250 V AC/DC	054910
ADP – 6 pin adapter	054922

2) T4-T5 electrical accessories on moving part of draw out circuit breaker

Fitting the moving parts of T4-T5 draw out circuit breakers can only take place using electrical accessories in the cabled version, i.e. SOR-C, UVR-C, AUX-C, MOE, MOE-E and AUE with ADP adapter.

a) Tmax T5N 400 3p moving part of draw out circuit breaker with UVR-C and MOE

	1SDA...R1
T5N 400 F F TMA 400 3p	060631

SOR-C 220...240 V AC / 220...250 V DC	054873
ADP – 10 pin adapter	054924

Ordering codes

Instructions for ordering

3) T4-T5 mechanical interlock

The rear interlock for T4 and T5, consisting of the MIR-HB or MIR-VB frame unit and the MIR-P plates, allows use of all the front accessories compatible with the circuit breakers used. To be able to receive the circuit breakers mounted directly on the interlock plate, code 1SDA050093R1 must be specified regarding the second circuit breaker (or cradle) which is to be interlocked.

Horizontal mechanical interlock made between T4H 250 and T5L 400

		1SDA...R1
POS1	T4H 250 PR221DS-LS/I 250 3p F F	055431

Note:

The trip coil of the T2 circuit breaker with PR221DS electronic trip unit is housed in the right slot.

For T2 with PR221DS the following groups of auxiliary contacts are available:

- 1SDA053704R1 Aux-C 1S51-1Q-1SY
- 1SDA055504R1 Aux-C 2Q-1SY
