1 Safety

**Warning**

**Electric voltage!**
Risk of death and fire due to electrical voltage of 230 V.
- Work on the 230V supply system may only be performed by authorised electricians!
- Disconnect the mains power supply prior to installation and/or disassembly!

2 Intended use

The device is to be used exclusively with the components that are supplied and licensed as described in chapter "Setup and function".

3 Environment

**Consider the protection of the environment!**

Used electric and electronic devices must not be disposed of with domestic waste.
- The device contains valuable raw materials which can be recycled. Therefore, dispose of the device at the appropriate collecting depot.

All packaging materials and devices bear the markings and test seals for proper disposal. Always dispose of the packaging material and electric devices and their components via the authorized collecting depots and disposal companies.

The products meet the legal requirements, in particular the laws governing electronic and electrical devices and the REACH ordinance.

(EU REACH ordinance and law for the implementation of the ordinance (EC) No.1907/2006)
4 Operation

- Briefly touch the left or right operating surface (control element 6545-...) to switch the lighting on or off.
- Pressing the operating surface for a longer period will change the brightness value of the lighting. This process stops when the minimum and maximum brightness value has been reached. When switching the lighting off, this value is stored until the next switch-on.

*Connected load*

- Ambient temperature range: 0 ... 35 °C connected load 100 %
- Ambient temperature range: 35 ... 70°C reduced connected load (Derating)
6  Setup and function

The device is intended for the activation of the following types of loads:

- 230 V incandescent lamps
- 230 V halogen lamps
- Low-voltage halogen lamps with electronic transformers

6.1  Features of function and equipment

- For use in series switches
- For switching and dimming 2 independent loads
- Outputs: 2 independent dimmer channels
- Double button
- Light storage
- The set brightness value is stored even after switching off the lighting system.
- Phase-angle
- Without cover and cover plate
- Not suitable for packet and toroidal-core transformers
- Cannot be combined with push-switch extensions

6.2  Possible combinations
7 Reduction of the connection load (derating)

The dimmer heats up during operation because part of the connected load is lost and converted into heat. The specified rated power is designed for dimmer installation in a solid masonry wall. When installing the dimmer in a wall made of gas concrete, wood, or plasterboard, the maximum connection load must be reduced by 20%.

The connected load must always be reduced when several dimmers are installed one below the other or when other heat sources cause additional heating. In intensely heated-up rooms, the maximum connected load must be reduced according to the diagram.

Use the following formula for the calculation of the nominal power:

Nominal power = transformer losses* + lamp power

* For electronic transformers ~ 5% of nominal power of transformer

![Diagram of Derating]

8 Installation and electrical connection

8.1 Requirements for the electrician

Warning
Electric voltage!
Risk of death due to electrical voltage of 230 V during short-circuit in the low-voltage line.
– Low-voltage and 230 V lines must not be installed together in a flush-mounted socket!

Install the device only if you have the necessary electrical engineering knowledge and experience.
• Incorrect installation endangers your life and that of the user of the electrical system.
• Incorrect installation can cause serious damage to property, e.g. due to fire.

The minimum necessary expert knowledge and requirements for the installation are as follows:
• Apply the “five safety rules” (DIN VDE 0105, EN 50110):
  1. Disconnect from power;
  2. Secure against being re-connected;
  3. Ensure there is no voltage;
  4. Connect to earth and short-circuit;
  5. Cover or barricade adjacent live parts.
• Use suitable personal protective clothing.
• Use only suitable tools and measuring devices.
• Check the supply network type (TN system, IT system, TT system) to secure the following power supply conditions (classic connection to ground, protective earthing, necessary additional measures, etc.).
8.2 Mounting

Warning
Electric voltage!
Risk of death and fire due to electrical voltage of 230 V.
– Work on the 230V supply system may only be performed by authorised electricians!
– Disconnect the mains power supply prior to installation and/or disassembly!

The flush-mounted insert must only be installed in flush-mounted wall boxes according to DIN 49073-1, Part 1, or suitable surface-mounted housings.

Caution
Risk of damaging the device due to overheating!
- When using transformers, ensure that each transformer is fused individually on the primary side or with a thermal fuse according to the manufacturer's specifications.

Caution
Risk of damaging the device due to excessive voltages!
Extended operation of an unloaded transformer (e.g. with a faulty bulb) connected to a dimmer may destroy both the transformer and the dimmer. This is caused by a possible voltage rise which may occur between an unloaded transformer and the dimmer.
- Connect at least two incandescent lamps per transformer or at least two transformers per dimmer.
- Replace defective incandescent lamps immediately.

Note on operating transformers with dimmers
To achieve the same linear rise in the brightness level of halogen lamps over the entire adjusting range from bright to dark, transformers with the same secondary voltage and the same power should be used.
When installing, please bear in mind that transformers, depending on their quality and version, may generate humming noise when used with dimmers.
Use an inrush current limiter if excessive inrush currents occur.
### 8.3 Electrical connection

**Note on adapting the connected load to the ambient temperature**
In intensely heated rooms, the maximum connected load must be reduced according to the following derating diagram.

**Fig 2: Circuit diagram**

**Note**
- The glow lamp serves for orientation when the dimmer is switched off.
- When channel 1 is switched on / dimmed, the brightness of the glow lamp changes.
- Channel 2 has no influence on the orientation light.
