AK102 and AK103
Gas analyzer systems for Hydrogen-cooled alternators
The Company

We are an established world force in the design and manufacture of measurement products for industrial process control, flow measurement, gas and liquid analysis and environmental applications.

As a part of ABB, a world leader in process automation technology, we offer customers application expertise, service and support worldwide.

We are committed to teamwork, high quality manufacturing, advanced technology and unrivalled service and support.

The quality, accuracy and performance of the Company’s products result from over 100 years experience, combined with a continuous program of innovative design and development to incorporate the latest technology.

Electrical Safety

This equipment complies with the requirements of EN 61010-1:2010 ‘Safety Requirements for Electrical Equipment for Measurement, Control and Laboratory Use’. If the equipment is used in a manner NOT specified by the Company, the protection provided by the equipment may be impaired.

Symbols

One or more of the following symbols may appear on the equipment labelling:

Information in this manual is intended only to assist our customers in the efficient operation of our equipment. Use of this manual for any other purpose is specifically prohibited and its contents are not to be reproduced in full or part without prior approval of the Technical Publications Department.

Health and Safety

To ensure that our products are safe and without risk to health, the following points must be noted:

1. The relevant sections of these instructions must be read carefully before proceeding.
2. Warning labels on containers and packages must be observed.
3. Installation, operation, maintenance and servicing must only be carried out by suitably trained personnel and in accordance with the information given.
4. Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.
5. Chemicals must be stored away from heat, protected from temperature extremes and powders kept dry. Normal safe handling procedures must be used.
6. When disposing of chemicals ensure that no two chemicals are mixed.

Safety advice concerning the use of the equipment described in this manual or any relevant hazard data sheets (where applicable) may be obtained from the Company address on the back cover, together with servicing and spares information.
The different units of the system are:

1) Model 6553 Display Unit, available in several variants. The inputs to the unit are certified to code [Ex ia Ga] IIC (−20°C ≤ Ta ≤ +40°C) under BAS 01 ATEX 7043 certificate with the unit installed in the safe area only.

2) Model 006539-960K (or J) and 006548-001 Katharometer Units that form part of an intrinsically safe Model 006540-203 and 006548-000 Katharometer Analyzer Panel. These units are certified to code Ex ia IIC T4 Ga (−20°C ≤ Ta ≤ +55°C) under BAS 01 ATEX 1042 certificate for installation in the hazardous area (ZONE 0).

3) Model 4234 500 and 4234 501 constant current Power Supply Unit provides the supply for one Katharometer Unit. These power supply units have their output certified to code [Ex ia Ga] IIC (−20°C ≤ Ta ≤ +55°C) under BAS 01 ATEX 7041 certificate for installation in the safe area only.

If further information or assistance is required contact our specialist staff at one of the addresses shown on the back cover of this manual. Specialist training courses can also be arranged at our Training Centre.
All the various system options comprise one or more of the following units with the further option of fitting the display and power supply units in a cubicle.

**Note.** CO₂ is referred to throughout this manual as the purge gas. However, other gases such as Argon or Nitrogen may be used instead.

---

### 2.1 Model 6553 Display Unit

The 6553 Display Unit must be mounted in a safe area and is suitable for panel mounting or installation into a control cubicile. The 6553 Display Unit houses one or two 4689 (or CM30) digital displays, each equipped with a range selector switch and protected access for zero adjustment – see Fig. 2.1

The AK102 version is a dual 3-range instrument, designed to provide 100% redundancy.

The AK103 version is a single 3-range instrument.

#### 2.1.1 Range Display

A selector switch for each display provides independent parameter selection as follows:

- **Position (1) Percentage of Hydrogen in Air by volume.**
  - This is the hydrogen purity measurement of the coolant gas during normal operation of the system. The display covers a range of 85 to 100% or 80 to 100% hydrogen in air depending on the range selected. An alarm output and a retransmission signal (4 to 20mA) are provided for this switch position only.

- **Position (2) Percentage of Hydrogen in CO₂/Argon by volume.**
  - This range is for use in hydrogen filling or purging operation. Alarm and retransmission signals are inhibited in this switch position.

- **Position (3) Percentage of Air in CO₂/Argon by volume.**
  - This range is for use in carbon dioxide (or argon) filling or purging operations. Alarm and retransmission signals are inhibited in this switch position.

A further option of providing remote indication of range selector switch may be available, depending on the number of alarms specified.

The 4689 (or CM30) digital displays provide software specific to the katharometer systems with relay action of the alarms fixed as ‘fail safe’. All user-programmable data can be protected from unauthorized alteration by a programmable 5-digit security number.

The zero adjustments on the front panel enable remote zeroing of the katharometers mounted in the hazardous area. The adjustment access for a particular 4689 (or CM30) digital display is adjacent to it at the same level.

The 6553 Display Unit has a protective case that can be removed for access to the interior without removing the whole unit from the control panel.

The 6553 Display Unit contains encapsulated zener diode safety barrier devices to limit the electrical energy that can be supplied from the instrument circuits into the hazardous area. These devices are located below the 4689 (or CM30) digital display(s), on a rail that MUST be earthed to a high integrity earth point. A metal screening arrangement segregates the connections made to equipment in the hazardous area. The unit is protected on the mains input side by two fuses, one for each circuit, accessible from the front of the panel.

---

![Fig. 2.1 Model 6553 Display/Control Units](image)
2.2 Model 006540203 or 006548000
Katharometer Analyzer Panel – Fig. 2.2
Refer also to IM/6517-6518 for further details.

Each panel comprises a metering valve, a drying chamber, a thermally lagged katharometer (Model 006539 or 006548) and a flowmeter. These items are mounted on a flat panel suitable for fixing to a vertical surface close to the sample point. The katharometers are calibrated for the hydrogen purity measurement as well as hydrogen in carbon dioxide and air in carbon dioxide.

Each katharometer assembly incorporates a Wheatstone Bridge comprising fine, glass-coated platinum filaments. One pair of parallel arms is sealed in the reference gas and the other pair exposed to the sample gas.

When the intrinsically safe stabilized current from the 4234 power supply unit (Model 4234 500 or 4234 501) is passed through this bridge, the temperature of the platinum filaments rises to a point of thermal equilibrium. Under conditions that are arranged to give minimum radiation and convection heat transfer, the equilibrium temperature depends on the thermal conductivity of the gas surrounding the filament. Thus any difference between the thermal conductivity of reference and sample gases causes an imbalance in the bridge; this imbalance (as a millivolt signal) is indicated by the display unit.

Zener diodes are connected across the input connections from the power supply unit to the katharometer in order to limit the maximum voltage that could be developed across the filament bridge under external fault conditions. Under fault conditions the current is limited to a safe value by the power supply unit.

2.3 Model 4234 500/4234 501
Power Supply Units (PSU) – Fig. 3.3
Refer also to IM/4234500 for further details.

**Caution.** Do not connect the mains supply to the PSU with the output terminals open circuit.

**Caution.** Ensure that the PSU is correct for the mains supply voltage available. A nominal 115V unit cannot be adapted for use with a nominal 230V supply, or vice versa.

To operate a katharometer unit in the hazardous area, one Model 4234 PSU is required for each katharometer. The PSU supplies a stabilized DC current output and must be mounted in the safe area. There are two versions available:

- Model 4234 500 for a nominal 230V AC supply voltage
- Model 4234 501 for a nominal 115V AC supply voltage

The stabilized current output is current and voltage limited to restrict the energy supply into the hazardous area.

The PSU is housed in a metal case fitted with lugs for wall/panel mounting. Cable gland entries are provided at opposite ends of the case for supply voltage input and stabilized current output cables to the hazardous area.

The circuit is protected by cartridge fuses. The fuses (F2 and F3) must have a high breaking capacity (HBC) rating of 1500A to comply with the terms of the certification.

2.4 Remote Indicator/Controllers
The 6553 Display Unit has retransmission outputs for connection to indicator/controllers, providing that they are installed in the safe area and the installation conforms to the requirements given in Section 5.1.

---

**Fig. 2.2 Location of Items – Model 6540 203 and 6548 000 Katharometer Analyzer Panels**
3.1 Identification

It is essential that installers and users clearly identify the various units of the monitoring system as follows:

3.1.1 Model 6553 Display Unit – Fig. 3.1

Several versions of the 6553 Display Unit are available and are defined by the code number explained in Section 3.1.4.

Identification and certification labels are fixed to the outside of the display unit case as shown in Fig. 3.1. Use the ordering code table in Section 3.1.4 to interpret the identification label code and obtain a precise description of the 6553 Display Unit.

Note. Location of the identification label on the 4689 (or CM30) digital display is also shown in Fig. 3.1.

3.1.2 Model 006540 203 or 006548 000

Katharometer Analyzer Panel – Fig. 3.2

Refer also to IM/6517-6518 for further details.

The panel is identified by the reference number label as shown in Fig. 3.2. The identification and certification labels of the individual katharometer units (fixed to the katharometer case)
3.1.3 Model 4234 Power Supply Unit – Fig. 3.3
Refer also to IM/4234500 for further details.
The identification and certification labels are fixed to the outside of the unit case, as shown.

* Two Gas Analysis panels are required for AK101 and AK102
** Check with Factory for availability
*** Two Katharometer Power Supplies are required for AK101 and AK102

The equipment conforms with the requirements of ATEX directive for Class IIC gases to Code Ex ia IIC provided that the equipment is installed in accordance with instructions provided.
4.1 Locating and Mounting System Items
4.1.1 Models AK102 and AK103 Display Unit – Fig. 4.1

Note. The display unit must be located in the safe area of the application plant in a sheltered interior environment.

The display unit is designed for panel mounting in a position to suit reading of the displays and with access to the rear for electrical wiring interconnections. The panel preparation requirements and installation dimensions are shown in Fig. 4.1. The display unit is secured to the panel by four adjustable cam brackets – two each side of the unit chassis.

Fig. 4.1 Installation Dimensions – Model 6553 Display Unit
4.1.2 Katharometer Analyzer Panel – Fig. 4.2
Refer also to IM/6517-6518 for further details.

Note. The panel is located in the hazardous area (Zone 0, 1 or 2) of the application plant in a sheltered interior environment.

Avoid a location that subjects the katharometer unit to direct sunlight. When two katharometer panels are used locate them in positions that have the same ambient temperature.

The katharometer unit is fixed to the panel that has fixing holes at each corner for mounting on a suitable vertical surface close to the sample tapping point. The installation dimensions for the panel are shown in Fig. 4.2.

![Diagram of Katharometer Analyzer Panel](image)

Dimensions in mm (in.)

- 610 (24)
- 572 ± 0.3 (22.5 ± 0.01)
- 19 (0.75)
- 38 (1.5)
- 148 (5.83)
- Gland for Ø7 to Ø10.5 (0.28 to 0.41) Cable
- Outlet
- 4 Fixing Holes Ø10 (0.39)

Note 1. Coupling for Ø6 (0.24) Tube (006548000) or Ø8 (0.31) Tube (006540203)

Note 2. Terminal box fitted only to systems equipped with optional low flow alarm.

Note 3. A different type of flow gauge is fitted to systems not equipped with the optional low flow alarm – see Fig 6.1.

Fig. 4.2 Installation Dimension – Model 006540203 or 006548000 Katharometer Analyzer Panel
4.1.3 Model 4234 Power Supply Unit – Fig. 4.3
Refer also to IM/4234500 for further details.

Note. The unit must be located in the safe area of the application plant in a sheltered interior environment.

The power supply unit has four fixing lugs for mounting on a suitable vertical surface. The installation dimensions are shown in Fig. 4.3.

Ensure a clearance of at least 100 (4) at both ends of the unit for access to the cable glands and to minimize cable bends.

Fig. 4.3 Installation Dimensions – Model 4234 Power Supply Unit
4.1.4 Cubicle Mounted System – Figs 4.4 and 4.5

The cubicle must be located in a safe area of the application plant and mounted either on the base using four M10 fixings or to a vertical surface using the four fixing brackets on the back-plate.

Ensure any vertical surface on which the cubicle is to be mounted is robust and suitable for the purpose. Rawbolts or similar heavy-duty fixings must be used.

Overall dimensions of the cubicle are given in Fig. 4.4 and the principal base case components are shown in Fig. 4.5.

- Intrinsically Safe Earth
- Relays and 4 to 20 mA Outputs Cable Glands
- ø12 (0.47) For use if cubicle is to be mounted on a shelf or similar horizontal surface(s)

Cubicle sealed to IP55

Weight of cubicle assembly 56kg (123lb) max.

Notes:
- Suitable lifting equipment (for example, a crane or 2-man lifting sling) must be used to move the cubicle to its final mounting location.
- MCBs may or may not be fitted to AK102 and AK103 versions.

---

Fig. 4.4 Installation Dimensions – Cubicle
4.2 Sample Gas Interconnections

**Note.** A hazardous mixture of hydrogen in air could develop in the event of leakage from the sample gas system. Mount katharometer analyzer panels in a ventilated area.

The sample pressure must not exceed 0.35 bar (Gauge) for Model 6540 203 or 10 bar (Gauge) for Model 6548 000.

The incoming sample gas temperature must not exceed 55°C (131°F). Ideally the sample gas temperature should be allowed to reach ambient temperature before entry to the Katharometer unit.

If there is a risk of significant particle contamination incorporate a suitable 1μm filter unit in the system before the sample gas enters the analyzer system.

Compression couplings are supplied at the sample inlet and outlet to the katharometer panel. These couplings are suitable for connecting 8mm (0.31 in.) (Model 006540 203) or 6mm (0.24 in.) (Model 006548 000) outside diameter metal tube. It is recommended that stainless steel tube is used.

The complete tubing system should be tested for leaks in accordance with the requirements of the responsible authority.

</table>

Note 3: The cable may be separate cables or may be installed as separate circuits within a type 'A' or a type 'B' multicore cable as defined in EN60079-14: 2008, 12.2.28 (latest edition) subject to the following:

a. Each circuit shall be individually screened within a type 'A' multicore cable.

b. The peak voltage of any other circuit within a type 'B' multicore cable must not exceed 60 volts.

Note 4: The installation must comply with national requirements (e.g. in the UK EN60079-14: latest edition).

Note 5: The system must be marked with a durable label. The label should appear on or adjacent to the principal item of electrical apparatus in the system or at the interface between the intrinsically safe and non-intrinsically safe circuits.

This marking shall include the word SYST or SYSTEM, e.g. 'BAS SYSTEM No Ex 01E21044' or 'BAS No Ex 01E21044 SYST'.

Note 6: A Junction Box, if used, must satisfy the requirements of Clauses 6.1 and 6.3.1 of EN60079-11 (latest edition).

Note 7: Circuit A or Circuit B may be omitted.

Note 8: Circuit B may be identical to Circuit A.

Note 9: This item may or may not be fitted.

Note 10: Zener barriers (B1, B2 & B3) MTL 7755ac BAS 01 ATEX 7217 & IECEx BAS 04.0025.
Warning.
• Equipment in this system operates on AC mains supply voltage electricity. Suitable safety precautions must be taken to avoid the possibility of electric shock.
• The mains supply to the equipment must be able to isolate the equipment independently. For example, use a switched spur or a mains isolator correctly rated according to the regulations of the country in which the equipment is being used.
• The means of isolation must be located as close to the equipment as possible and must not be obstructed.

Caution.
• Although certain instruments are fitted with internal fuse protection, a suitably rated external protection device, either a 3A fuse or miniature circuit breaker (MCB) must also be fitted by the installer.
• The proper electrical connections and wiring standards must be achieved to establish the intrinsic safety of the system, as certified.
• AC input, intrinsically safe DC output and non-intrinsically safe wiring must all be routed separately.

Fig. 5.1 shows the interconnecting wiring requirements for the AK10x Gas Analyzer system, that must be strictly observed. Details of cable requirements, that must be strictly adhered to, are also given – see Section 5.2.1.

After completing the wiring, check that the continuity earthing (grounding) and isolation of all circuits is to the required local electrical standards for intrinsically safe circuits.

The separate units of the Analyzer system must be interconnected as shown in Sections 5.1.1, 5.1.2 and 5.1.3.

5.1.1 Model 6553 Display Unit – Fig. 5.2

Caution.
• Do not make connections to the hazardous area terminals (Terminal Blocks TB5 & TB6) other than those specified in wiring diagram Fig. 5.3. The appropriate cable requirements must be strictly adhered to.
• The earthing of B1 and B2 via TB-IS Earth must be in accordance with EN 60079-14. The cable must be insulated and the conductor must be 4mm² cross sectional area minimum.

Remove the outer case from the back of the unit to gain access to the terminal blocks.

Make electrical connections through the bottom of the unit into the terminal blocks immediately above them – see Fig. 5.2.

The alarm and signal outputs on terminal blocks TB3 & TB4 may be connected as required. The availability of signal outputs vary with the particular 6553 system – refer to Fig. 5.3 for details.

Continued on page 17.
Fig. 5.3 Interconnection Wiring Diagram – Models AK102 & AK103 Intrinsically Safe Analyzer System using Dual 3-range Displays, as Separate Units
**Warning.**
The case-mounted Intrinsically Safe Earth stud (see Fig. 4.5) must be connected to the plant High Integrity Earth. The maximum resistance from this earth stud to the plant High Integrity Earth must be <0.1 Ω. This earth is essential to the correct operation of the zener safety barrier.

**Note.** Katharometer Panel 1 is connected internally to the Upper Display of the 6553 Display/Control Unit. Katharometer Panel 2 is connected internally to the Lower Display of the 6553 Display/Control Unit.

**Warning.**
The case-mounted System Safety Earth stud (see Fig. 4.5) must be connected to an earth point ensuring that the maximum resistance is <1 Ω. This is to ensure optimum safety for both the system and personnel/operators.

---

Fig. 5.4 Wiring Diagram for Cubicle-Mounted Display/Control Unit
Make the wiring connections in accordance with the information given in the wiring diagram Fig. 5.3 and Section 5.1.

Refer Fig. 5.4 for connections to cubicle-mounted display unit.

---

**Caution.** The integrity of the fail-safe operation of the zener diode safety barrier devices depends on an Intrinsically Safe Earth connection which must not have a resistance greater than 0.1Ω to the application plant earth (ground).

---

Make the Mains and Case Earth (Ground) connection at the stud (TS1) – see Fig. 5.2.

On completion of wiring and checks, replace the outer case and secure the clamping brackets to the mounting panel.

5.1.2 Model 006540 203 and 006548 000 Katharometer Analyzer Panel

Refer also to IM/6517-6518 for further details.

To gain access to the connection terminal block TB1:

1) Remove four screws in the cover of the katharometer unit.

2) Remove cover

Make the electrical connections to the Display Unit in accordance with the information given in wiring diagrams in Figs 5.3, 5.4 and 5.5 and Section 5.2.

The electrical connections are made at the terminal block (TB1) via the cable gland or any replacement gland to suit the intrinsically safe wiring requirements. When the appropriate interconnections have been made, if remote zero is to be used, remove the 510Ω dummy remote zero resistor from across terminals 9 and 10 and set the zero adjustment potentiometer on the katharometer to the approximate mid-point.

Replace the cover when wiring is complete.

---

**Fig. 5.5 Location of Components Inside Case – Model 006539 and 006548 Type Katharometer Unit**
5.1.3 Model 4234 Power Supply Unit – Fig. 5.6

Refer also to IM/4234500 for further details.

**Caution.** Do NOT connect mains supply to the power supply unit with the output terminals on open circuit.

**Note.** Ensure that the power supply unit is correct for the mains supply voltage available. A nominal 115V unit cannot be adapted for use with a nominal 230V supply or vice versa. Check voltage link is set to correct supply voltage – see Fig. 5.6.

Remove the cover of the unit to gain access to the terminal blocks inside.

Identify the terminal block (TB1) adjacent to the transformer T1 and ensure the correct transformer tapping is used for the incoming mains supply, i.e.

- link from tapping 6 to 10 for 230V, or
- link from tapping 8 to 10 for 115V.

Make electrical connections in accordance with the information given in the wiring diagrams Figs 5.1 and 5.3 and the cable details in Section 5.2.1.

The electrical connections are made at terminal blocks TB1 and TB2 through the appropriate cable gland or any replacement gland to suit intrinsically safe wiring requirements. Secure the incoming cable by the cable clips adjacent to the terminal blocks.

Replace the cover when wiring is complete.

---

**Warning.** Hazardous Voltages.

There are no serviceable parts in this unit. Return to the manufacturer if faulty or seek the services of a qualified engineer.

Switch off the mains supply and disconnect it before removing the cover for any reason.

---

*Refer to the 4234 manual for fuse details.

---

**Fig. 5.6 Location of Components Inside Case – Model 4234 Power Supply Unit**
5.2 Intrinsically Safe Requirements
These requirements relate to the interconnecting wiring made to and from Model 6540 203 and 6548 000 Katharometer Analyzer Panels in the hazardous area and those for remote ancillary items connected to the system.

Note. Those cables connecting between the cubicle TB’s and components in the hazardous area (intrinsically safe circuits) enter the cubicle via the blue cable glands and terminate in the appropriate blue terminals on the cubicle DIN rail – see Fig. 4.4.

5.2.1 Cable Requirements
The interconnecting cables between the various units of the gas analysis system are subject to stringent limitations because of the requirements of the intrinsic safety certification. These are listed below and detailed in Fig. 5.1.

Items installed in safe areas must use cable suitably rated according to the regulations of the country in which the equipment is being used.

All cables entering the hazardous area must be kept separate from cables in the safe area. Cables entering the hazardous area must not be run with other cables and terminations must have an earthed screen to separate them from connections for other circuits. The detailed requirements are as follows:

1) Connections between Model 006540 203 or 006548 000 Katharometer Analyzer Panels and the 4234 PSU
   All cables from the Katharometer in the hazardous area must have an inductance/resistance ratio not exceeding 22 μH/Ω (for Group IIC gases). Refer also to Fig. 5.1 Note 2a. Also the maximum loop resistance of this interconnecting cable is limited to 1.5 Ω; this may place a limitation on the length of the total cable run. These wires are indicated by a ▲ in Fig. 5.3.
   Twist single sheathed conducting cables together to reduce their mutual inductance and route them separately from cabling for non-intrinsically safe circuits in the safe area.

2) Connections between Model 006540 203 or 006548 000 Katharometer Analyzer Panels and Model 6553 Display Unit
   Katharometer to display unit cables, carrying the output signals through zener barrier units inside the display unit, are subject to of a maximum inductance/resistance ratio of 79 μH/Ω (for group IIC gases). Refer also to Fig. 5.1 Note 2d. These wires are indicated by a ▲ in Fig. 5.3.

3) Connections between model 006540203 or 006548000 Katharometer Analyzer panels and Model 6553 Display Unit
   Kathrometer 9 and 10 to 6553 Display Unit terminals TB5 and TB6 cables are subject to a maximum inductance/resistance ratio 75 μH/Ω. Refer also to Fig. 5.1 Note 2b. These wires are indicated by a ▲ in Fig. 5.3.

5.2.2 Interconnection Cables
The choice of wiring cable is restricted by the limitations imposed by the certification parameters. Care must be taken to ensure that the specification of the cable required for interconnection lengths is such that the certification parameter limits are not exceeded – see Fig. 5.1 Notes 2a, b, c & d and also Notes 3 & 4.

5.2.3 Installing Remote Ancillary Items
Any indicator/controllers, or other electrical equipment, connected to TB1 of the Model 6553 Display Unit must not be supplied from, nor contain, a voltage source greater than 250V DC or 250V RMS with respect to earth.

5.2.4 Full Intrinsically Safe Requirements
For systems to be modified or used with other gases the full ATEX requirements must be complied with as follows:

1) The total Capacitance and Inductance or Inductance to Resistance ratio (L/R) of the cables connecting the katharometer unit to the hazardous area terminals of the display unit (TB2) and power supply unit terminals (TB1) must not exceed the values in Fig. 5.1.

2) Any junction boxes used in the hazardous or safe areas must conform to ATEX Directive 9/94/EC, specifically clauses 6.1 and 6.3.1 of EN60079–0 (2012) and EN60079–11 (2012).

When the AK10x gas analyzer system has been correctly installed in accordance with the requirements for intrinsic safety in Section 5.2 – refer to Section 6 for system set up.
6 SETTING UP

Note. CO₂ is referred to throughout this manual as the purge gas. However, other gases such as Argon or Nitrogen may be used instead.

6.1 Katharometer Analyzer Panel – Filling the Drying Chamber – Fig. 6.1

1) Remove the drying chamber on the katharometer analyzer panel by unscrewing the large knurled nut at the base of the chamber. Pull the chamber down and out of the sealing groove to remove it from the panel.

Note. The desiccant used in the drying chamber is either granular anhydrous calcium sulphate or calcium chloride and absorbs moisture from the atmosphere. The drying chamber has a capacity of 140ml approx. and requires approx. 100g of desiccant to fill it. Filling and resealing must be carried as quickly as possible.

2) Open a container of fresh desiccant and fill the drying chamber.

3) Replace the drying chamber in its sealing groove and reposition the chamber to enable it to be secured and sealed by hand tightening the knurled nut.

4) Carry out an approved leak testing procedure before passing sample gas through the system.

6.2 Setting Sample Flow

When all tubing interconnections have been made and external parts of the sample system checked for leaks, carry out the following procedure:

1) Supply calibration quality CO₂ or Argon through the gas analyzer system at the normal working pressure of the application plant and within the following limits:
   - Model 6540-203
     125mm H₂O min. to 0.35bar (gauge) max.
   - Model 6548-000
     125mm H₂O min. to 10bar (gauge) max.

Note. In some instances testing for leaks with CO₂ or argon may not be considered an adequate check of gas tight integrity in respect of the more penetrating hydrogen gas. Consideration should be given to the use of a gas, such as helium, which has penetrating properties nearer to that of hydrogen.

2) Slowly open the metering valve to give a nominal flow rate of gas of 100 to 150ml min⁻¹. Do not exceed the maximum flow rate 250ml/min.

3) Set the flowrate and shut off the calibration gas external to the analyzer system.

4) Repeat this procedure for each katharometer analyzer panel, as required.

---

**Fig. 6.1 Location of Components on Katharometer Analyzer Panel**

---
6.3 Electrical Checks
Carry out the electrical checks detailed in Sections 6.3.1 and 6.3.2.

6.3.1 Power Supply Unit Output

**Warning.** This unit is part of the certified intrinsically safe system. Appropriate safety precautions must be taken to prevent any incendive electrical discharges in the hazardous area when carrying out this task.

Testing the output may only be carried out with the hazardous area cable disconnected.

1) Electrically isolate the PSU.
2) Remove the cover from the PSU.
3) Disconnect the output wires to the hazardous area at terminals TB2+ and TB2–.

**Warning.** Ensure that proper electrical safety precautions are taken at all times when undertaking this procedure.

4) Switch on the PSU and check that the output measures 350mA into a 14Ω load.
5) On completion of tests isolate the unit and reconnect the output wires to the hazardous area.

6.3.2 Zener Diode Safety Barrier Devices
Zener diode safety barrier devices are fitted to the katharometer system as detailed in Table 6.1 and are checked at the time of manufacture. To ensure absolute safety, check that the barriers are correctly earthed by carrying out an appropriate test before using the katharometer system.

**Warning.**
- The zener diode safety barrier devices are certified intrinsically safe and form part of the certified intrinsically safe system. Appropriate safety precautions **MUST** be taken to prevent any incendive electrical discharges in the hazardous area when testing the barriers.
- If the tests identify a faulty barrier, it **MUST** be replaced by a new unit **OF THE SAME TYPE** – see Table 6.1. The barriers are sealed units and repairs **ARE NOT** permitted.

6.3.3 Checking Intrinsically Safe Earth
Check that the resistance between the earth terminal connecting zener barriers in the 6553 Display Unit and the application plant system high integrity earth does not exceed 0.1Ω. Also check the low flow alarm zener barrier (if fitted in the cubicle) and the application plant system high integrity earth does not exceed 0.1Ω.
7 CONTROLS & DISPLAYS

7.1 Digital Displays – Fig. 7.1
The 4689 (or CM30) digital display(s) mounted in the 6553 Display Unit comprises a 5-digit, 7-segment digital upper display line and a 16-character dot-matrix lower display line. The upper display line shows actual values of hydrogen purity, hydrogen in air, air in carbon dioxide, alarm set points or programmable parameters. The lower display line shows the associated units or programming information.

Fig. 7.2 Function of the Membrane Switches

7.2 Switch Familiarization – Figs. 7.1 and 7.2

Fig. 7.2 Function of the Membrane Switches
7.3 Main Isolator Switch, Toggle switches and Miniature Circuit Breakers (MCBs)

**Notes.**
All Miniature Circuit Breakers (MCBs) toggle switches and amber indicators are optional variants that may or may not be fitted depending upon the customers’ order code.

1. **MCB 0.5 A rated.** These resettable MCBs provide additional electrical safety protection to personnel and circuits.

2. The toggle switches are fitted to enable the user to independently switch in/out the display, katharometer PSU and Low Flow Alarm of system 1 or the display, katharometer PSU and Low Flow Alarm of system 2 appropriately, from the main electrical supply circuit within the cubicle. When each switch is in the down position (marked ‘I’), the electrical supply is switched ON to the display unit, katharometer PSU and Low Flow Alarm to each system. When each switch is in the up position (marked ‘O’), the electrical supply is switched OFF to the display unit, katharometer PSU and Low Flow Alarm to each system. These switches are for operational use only. If any work is undertaken within the cubicle, the electrical mains isolator must be used to switch off the electrical power.

3. **Amber indicators:** these are illuminated when electrical mains power is present at the respective monitor units, each katharometer PSU and each Low Flow Alarm, as and when fitted.

4. The electrical mains isolator is fitted to enable the user to disconnect the complete cubicle unit from the electrical supply. For safety reasons, the isolator must always be switched to OFF when any work is to be carried out within the cubicle.
Warning. When the apparatus is connected to its supply, terminals may be live and the opening of covers or removal of parts (except those to which access may be gained by hand) is likely to expose live parts.

Note. CO₂ is referred to throughout this manual as the purge gas. However, other gases such as Argon or Nitrogen may be used instead.

8.1 Instrument Start-Up
In normal operation, the range selector switch is set to position 1 and the instrument displays the Range 1 Operating Page – see Section 9.2. This is a general use page in which the alarm set points may be viewed but not altered. To change an alarm set point or program a parameter refer to Section 10. A 5-digit Security Code is used to prevent unauthorized access to programmable parameters. The value is preset at 00000 to allow access during commissioning but should be altered to a unique value, known only to authorized operators, as described in the Setup Outputs Page – see Section 10.3.

When all the required wiring connections and electrical checks have been made correctly, switch on the power supplies to the various units as follows:

1) Switch on the supply to the PSU.
2) Switch on the supply to the 6553 Display Unit.

8.2 Alarm Set Point
8.2.1 Type of Alarm Action
The alarm relay coil is energized during normal non-alarm relay states and is de-energized upon recognition of an alarm condition, thereby providing ‘fail-safe’ alarms. For example, with Alarm 1 set point = 95.0%, when the display is indicating greater than 95.0% (plus hysteresis), Alarm Relay 1 is energized and Alarm 1 LED is OFF. When the display indicates less than 95.0% (minus hysteresis), Alarm Relay 1 is de-energized and Alarm 1 LED is ON. This operating mode ensures that an alarm condition is signalled in the event of a mains power failure. Repeat the above procedure for Alarm Relay 2 set point = 90.0%.

8.2.2 Hydrogen Alarm Set Point
It is recommended that the hydrogen alarm set-points are based on a reducing percentage of hydrogen as it is displaced by air entering the application plant. This can be achieved by setting Alarm 1 and Alarm 2 to give ample warning of the development of a potentially explosive mixture. Factory settings are Alarm 1 = 95.0% and Alarm 2 = 90.0%.

The procedure is as follows:

Access the programming pages (Section 10) and set the alarm set points in accordance with the information in the Set Up Outputs Page. The hydrogen alarm set point can only be set with the selector switch in position 1.

8.3 Electrical Calibration
The instrument is factory calibrated for electrical voltage signal input. No adjustment is normally necessary for correct functioning of the display unit. If electrical calibration is required, a voltage source capable of supplying –250.00mV to 10.00 mV is needed. Disconnect the katharometer input from the display unit and the voltage source signal applied according to the instructions in the Electrical Calibration Page – see Section 10.

Note. The 4689 instruments incorporate a two point calibration sequence requiring both zero and span inputs for a calibration. It is not possible to adjust either the range zero or the range span scale points independently.
8.4 Gas Calibration

8.4.1 Introduction
Before putting the system on-line, it is recommended that a calibration check for the 'zero' reading is made using calibration standard sample gas.

The 'zero gas' is marked permanently on the data plate of the katharometer unit. This gas, when passed through the katharometer, gives a zero millivolt output. To provide a fail-safe condition the zero gas is 85% hydrogen in nitrogen mixture so that, if power is lost to the katharometer, an alarm condition occurs at the display unit.

Full scale output from the katharometer is obtained by a 100% hydrogen gas sample and no adjustment of the katharometer output is normally required. The maximum signal for the full scale reading is sealed during manufacture and must not be altered by users.

With the katharometer adjusted correctly using the 'zero gas' hydrogen in nitrogen mixture, carbon dioxide (or argon) and air mixtures are displayed correctly when the selector switch is in the appropriate position.

8.4.2 Gas Range Calibration

| Note. | Test for leaks in accordance with the requirements of the responsible authority for site safety after making any hydrogen connections. |

| Note. | The procedure outlined here is not normally necessary as the ranges have been set at the factory. |

1) **Select Range 1**
Pass an 85% H₂/15% N₂ gas mixture through the katharometer and allow the reading to stabilize. Adjust the katharometer zero potentiometer or remote zero (if fitted) to give a reading of 85% H₂ in air.

2) **Pass 100% H₂** through the katharometer and allow the reading to stabilize. If necessary adjust the katharometer span potentiometer (R7) to give a reading of 100% H₂.

3) **Select Range 3**
Pass 100% CO₂ or Argon through the katharometer and allow the reading to stabilize. Adjust the katharometer span potentiometer (R7) to give a reading of 0% air in CO₂/Argon.

4) **Pass 100% air** through the katharometer and allow the reading to stabilize. Adjust katharometer span potentiometer (R7) to give a reading of 100% air in CO₂ or argon (only if the reading is greater than 100%).

5) **Select Range 1**
Pass 100% H₂ through the katharometer and allow the reading to stabilize. Adjust the katharometer zero potentiometer or remote zero (if fitted) to give a reading of 100% H₂ in air.

6) **Repeat steps 3) to 5) and adjust as necessary.**
9 OPERATION

### 9.1 Normal

During normal operation the AK10x Gas Analyzer System is used to indicate the purity of hydrogen used as a coolant. The display shows the percentage of hydrogen in air, which should be safely in excess of the explosive limit at the hydrogen rich end.

There are no routine adjustments required to the gas analyzer system after completion of start-up procedures and putting on-line in monitoring mode. The system requires only the carrying out of safety routines and minor adjustments to the metering valve to maintain the required flowrate.

A summary of the functions and status of the system for the different range selector switch positions is shown in Table 9.1.

#### 9.1.1 Purging of Hydrogen Coolant Gas

Initially, inert purge gas (CO₂ or argon) is introduced into the system. When the hydrogen concentration is safely below the explosive limit, air is introduced into the system to completely displace the other two gases.

The AK10x Gas Analyzer System provides all the necessary indications and output signals to enable this operation to be carried out safely.

In respect of the operation of the gas analyzer system(s), the procedures are as follows:

1) Select position (2) of the range selector switch on the display unit. The displays and functions are shown in Table 9.1.

2) Commence the purging operation.

3) When the changeover to introduce air into the application plant is made, select position (3) of the range selector switch on the display unit. The displays and functions are shown in Table 9.1.

---

#### 9.1.2 Filling with Hydrogen Coolant Gas

This procedure is a reversal of the purging procedure.

Initially, inert purge gas (CO₂ or argon) is introduced into the application plant until the air content is safely below the explosive limit for air in hydrogen. When this limit is reached, hydrogen is gradually introduced into the system to displace the other two gases.

With respect to the operation of the gas analyzer system, the procedure is as follows:

1) Select position (3) of the range selector switch of the display unit. The displays and functions are shown in Table 9.1.

2) When the changeover to introduce hydrogen into the application plant is made, select range (2) of the range selector switch on the display unit. The displays and functions are shown in Table 9.1.

3) When the display indicates that hydrogen filling is complete, position the range selector switch at (1). The hydrogen measurement analyzer system is now ready for monitoring H₂ concentration on-line – see Section 9.2.

---

**Note.** Suitable safety procedures apply to the operation of gas cooling and sample systems.

**Warning.** Suitable safety precautions apply to the operation of the gas cooling and sample systems.

**Note.** CO₂ is referred throughout this manual as the purge gas. However, other gases such as Argon or Nitrogen may be used instead.

---

Fig. 10.1 Overall Programming Chart for Display Unit

10 PROGRAMMING
10.1 Access to Secure Parameters
A 5-digit code is used to prevent unauthorized access to the secure parameters.

**Security Code**
Enter the required code number, between 00000 and 19999, to gain access to the secure parameters. If an incorrect value is entered, access to subsequent programming pages is prevented and the display reverts to the Operating Page.

*Note.* The security code is preset at '00000' to allow access during commissioning but should be altered to a unique value, known only to authorized operators – see Alter Security Code parameter in Set Up Outputs Page.

10.2 Language Page

**Language Page**
Select the required language for the display.

*Advance to Set Up Outputs Page.*
10.3 Set Up Outputs Page

**Note.** Access to the programming pages is possible only with Range 1 selected.

- **Alarm 1 Set Point**
  The set point band is defined as the actual value of the set point plus or minus the hysteresis value. The hysteresis value is fixed at 0.2% H₂ in Air. Alarm action occurs if the input value is above or below the set point band. If the input moves within the set point band, the last alarm action is maintained.

  The **Alarm 1 Set Point** can be set to any value within the input range being displayed. The decimal point position is set automatically. The alarm LEDs are illuminated in the alarm condition.

- **Alarm 2 Set Point**
  See **Alarm 1 Set Point**.

  Advance to next parameter

- **RTX Range**
  The retransmission signal can be selected to be ranged 85 to 100% H₂ in Air or 80 to 100% H₂ in Air. This option is only available with the range switch in position 1.

  Advance to next parameter

- **Test Retransmission Output**
  The digital display transmits a test signal of 0, 25, 50, 75 or 100% of the retransmission range. The % test signal selected is shown on the upper line of the display.

  **Example** – for the range 4 to 20mA and 50% retransmission test signal, 12mA is transmitted.

  Select the required retransmission test signal.

  Advance to next parameter

- **Alter Security Code**
  Set the security code to a value between 00000 and 19999. This value will then have to be entered to regain access to the secure parameters.

  Advance to **Electrical Calibration Page**.
10.4 Electrical Calibration Page

Note. Access to the programming pages is possible only with Range 1 selected.

Notes.
1) The 4689 (or CM30) digital display incorporates a two point calibration sequence requiring both zero and span inputs for a calibration. It is not possible to adjust the range zero or the range span scale points independently.
2) Each digital display is fully calibrated before despatch and should not normally require further calibration.

Select Calibration
Select the calibration requirement using the or keys.

Calibrate No (default) skips to Adjust RTX Zero frame.

Calibrate Yes enables zero and span electrical calibrations to be carried out. Advance to next parameter

Calibration Range Zero (100% Purge Gas)
Connect a suitable millivolt source (see Section 8.3) and apply a signal input equivalent to range zero (–250.00mV). Allow the instrument display to stabilize.

Advance to next parameter

Calibration Range Span (100% H₂ in Air)
Apply a signal input equivalent to range span (+10.00mV). Allow the instrument display to stabilize.

Advance to next parameter

Adjust Retransmission Zero
Adjust the retransmission zero (e.g. 4.00mA) to the appropriate zero value. The retransmission zero signal is either 85% or 80% H₂ in Air as selected in Set Up Outputs Page. Allow the output signal to stabilize. Advance to next parameter

Adjust Retransmission Span
Adjust the retransmission span (e.g. 20.00mA) to the appropriate maximum value. The retransmission span signal corresponds to 100% H₂ in Air.

Allow the output signal to stabilize.

Return to Operating Page.
11 MAINTENANCE

The katharometer unit and its associated equipment are designed for stable and accurate operation over long periods. This section covers the requirements for fault finding, diagnostic tests and maintenance tasks.

**Warning.**
- Each unit of this system forms an integral part of a certified intrinsically safe system. Appropriate safety precautions must be taken to prevent any incendive electrical discharges in the hazardous area when carrying out any of the following tasks.
- Equipment in this system operates at AC mains supply voltages. Suitable precautions must be taken to avoid the possibility of electric shock.
- The maximum pressure and temperature limits specified for particular parts of the system must not be exceeded.

**Note.** After any service, repair or modification, the suitably qualified personnel involved must certify that the equipment is in a safe state.

11.1 General Maintenance
11.1.1 Pressure
The operation of the katharometer units is not affected significantly by changes in pressure providing that they are within the pressure limits – see Section 13.

11.1.2 Flow
The katharometer zero balance and sensitivity are independent of the sample flowrate, as the sample gas sensing system depends on molecular diffusion. However, the speed of response is affected by the flowrate. This means that the flow resistance of the drying chamber is a compromise between obtaining speed of response and avoiding a rapid degradation of the desiccant.

11.1.3 Leaks
There is an inherent safety requirement that there are no leaks into or out of the sample system. Any leaks could also affect the correct operation of the katharometer unit.

11.1.4 Vibration
The katharometer unit tolerates reasonable levels of mechanically induced vibration. Pulsations due to unsteady sample flow can affect the katharometer filaments and cause errors due to excessive cooling.

11.1.5 Contamination
Contamination in the sample system can arise from oil or suspended particles, or from erosion of material from the sample system upstream of the katharometer unit.

11.1.6 Ambient Temperature
The calibration of the katharometer is not affected significantly by variations of the ambient temperature. Temperature changes can affect the sensitivity and reduce accuracy on sensitive ranges.

11.1.7 Bridge Current
The working current of the katharometer bridge is 350mA supplied from the PSU. This value must remain stable during normal operation as the katharometer output signal is proportional to the cube of the bridge current.
11.2 Diagnostic Tests

Warning:
- Each of the units in the system are part of the certified intrinsically safe system. Appropriate safety precautions must be taken to prevent any incendive electrical discharges in the hazardous area when carrying out this task.
- Ensure that the proper electrical safety precautions are taken at all times when undertaking this procedure.

11.2.1 Checking Output of the PSU
Carry out the test procedure in Section 6.3.1.

11.2.2 Checking Integrity of Zener Diode Safety Barrier Devices
Carry out the test procedure in Section 6.3.2.

11.2.3 Checking the Katharometer Output
a) Electrically isolate the display unit.

b) Remove the outer cover from the katharometer unit.

c) With the katharometer operating, check if the voltage across terminals TB1 – 1 and TB1 – 4 is not above 4V with 350mA passing. If the voltage is above this value it is likely that one or more filaments of the bridge is broken.

d) With the katharometer operating, check that the voltage across terminals TB1 – 1 and TB1 – 4 is below 2.8V with 350mA passing. If the voltage is below this value and there is no zero adjustment available, it is likely that there is an accumulation of liquid within the katharometer block – see Section 11.4.1.

e) If the reading from the test made at step c) is unstable when the katharometer block is tapped gently, this could indicate that a filament is damaged but not open circuit.

If any of these tests indicate that the katharometer is faulty the complete katharometer unit must be returned for repair or replacement.

The span adjustment of katharometer units are sealed and must not be adjusted unless necessary – see Section 8.4.2.

11.3 Routine Maintenance

11.3.1 Hydrogen Katharometer Calibration
Carry out a calibration check in accordance with Section 8.

Calibration should be carried out at intervals of 3 months of online use.

11.3.2 Purge Gas Katharometer Calibration
Carry out a calibration check in accordance with Section 8.3.

Calibration should be carried out before using the katharometer for monitoring a purging procedure.

11.3.3 Changing Desiccant in Drying Chamber
The need to change the desiccant in the drying chamber on the katharometer Analyzer panel depends on the condition of the sample gas.

It is recommended that the Analyzer system is monitored regularly during the initial phase of operation for indications that the desiccant is exhausted. A suitable maintenance interval for this task can then be established.

As the desiccant degrades, the white grains have a yellowish tinge and the granular form becomes more consolidated. If liquid contamination occurs, the desiccant becomes brown and consolidated.

Warning: Suitable safety precautions apply to the operation of the gas cooling and sample systems.

a) Isolate the sample gas system from the main system. Carry out a limited hydrogen purging operation on the sample system in accordance with the instructions of the responsible authority.

b) Fill the drying chamber – see Section 6.1.

c) After purging any residual air from the sample system in accordance with the requirements of the responsible authority, allow hydrogen to pass through the katharometer again.

This procedure should be undertaken on the basis of instrument response or at intervals of 1 year.
11.4 Repair Maintenance
11.4.1 Removing Liquid from Katharometer Measurement Block – Fig. 11.1
If tests indicate that there is likely to be an accumulation of liquid in the katharometer filament block, remove the liquid using the following procedure:

a) Electrically isolate the defective katharometer at its PSU.
b) Isolate the gas sample system to the particular katharometer from the main gas cooling system. Purge the sample system of hydrogen in accordance with the requirements of the responsible authority.
c) Remove the cover of the katharometer unit and dismantle the internal sample system pipework.
d) Remove the fixing screws securing the mounting pillars to the case – see Fig. 5.5.
e) Disconnect the interconnecting wiring at terminal block TB1.

Caution. Do not insert any type of probe into the gas system of the katharometer filament block assembly or use compressed air to blow through the system.

f) Remove the katharometer filament block assembly from the case and tilt at 45° to the horizontal. This allows any liquid to drain from the measurement block – see Fig. 11.1.
g) Pour a small quantity of rectified spirit (ethanol) through the katharometer filament block. Allow as much liquid as possible to drain out. Assist this by gentle shaking. Repeat this procedure several times until all evidence of contamination is removed.
h) Fit the katharometer filament block assembly into its case. Replace the fixing screws and make the electrical interconnections at terminals TB1 – 1 and TB1 – 4.
i) Fit the internal sample gas tubing.
j) Remake the sample gas tube interconnection couplings.
k) Replace the desiccant in the drying chamber in accordance with the procedure in Section 11.3.3.
l) Carry out a leak test in accordance with the requirements of the responsible authority.
m) Power up the katharometer unit by switching on the appropriate PSU.
n) Pass dry air or another suitable dry gas through the katharometer at the normal sample flowrate for 24 hours.
o) Isolate the katharometer unit at its PSU.
p) Make the remaining electrical connections at TB1 of the katharometer unit – see Fig. 5.5 on page 17.
q) Replace the cover of the katharometer unit.
r) Power up the katharometer unit from its PSU.
s) Carry out a calibration procedure – see Section 8.3.

Note. It is possible that the zero reading may drift for several days after the removal of liquid.

11.4.2 Removal/Replacement of a 4689 (or CM30) Digital Display
a) Electrically isolate the 6553 Display Unit.
b) Release the retaining screw through the display facia and carefully withdraw the chassis from its edge connectors and out through the front panel – see Fig. 3.1 on page 5.
c) To replace the digital display, carefully insert it into the display facia and press firmly into position before tightening the retaining screw.
d) Power up the 6553 Display Unit and carry out a calibration – see Section 8.3.

11.4.3 Error Messages
If the error message ‘NV Memory Error’ is displayed the contents of the non-volatile memory has not been read correctly during power up.

To rectify the fault, switch off, wait 10 seconds and switch on again. If the fault persists, contact the Company.
12.3 Repair Maintenance Parts

**Description**

**Part No.**

**Model 4234 Power Supply Unit**
- Nominal 230V unit: 4234/50000
- Nominal 115V unit: 4234/50100
- Fuses:
  - F2/F3 – T250mA≥1500A 250VAC HBC ceramic cartridge 20 x 5 mm: 0231577
  - F1 – 400mA cartridge: 0231555

**Katharometer unit**
- 006539 960K (or J): 006548 001

**Model 6553 Display Unit**

**Description**

**Part No.**

- Fuse, 500mA 250VAC rated F 20 x 5 mm ceramic cartridge HBC (1500A) 250VAC: 0231 601
- Function selector switch AK103 & AK102 version Upper Switch: 006553 511
- Function selector switch AK102 version Lower Switch: 006553 512
- Potentiometer (1kΩ), zero adjustment: 002569 036

**Katharometer Analyzer Panel**
- Low pressure: 006540 203
- High pressure: 006548 000

**Drying chamber refurbishment kit**
- 006525 605
- 006548 007

**Granular anhydrous CaCl2**
- 006537 580

---

**Warning.** Interference with any unit or its components implies acceptance of responsibility by that person for ensuring the continuing maintenance of intrinsic safety requirements. Unauthorized repair/ use of spare parts or incorrect assembly may render any unit unfit for use in an intrinsically safe application.

**Note.** Although the 4689 digital displays may be marked 4600 on their display facia, they are dedicated variants which are not interchangeable with the Company’s standard 4600 Controller/Display. These dedicated display units are identified (4689 502) as shown in Fig. 3.1 on page 5.

When ordering a katharometer unit, it is necessary to specify the zero gas and range in association with the Company part number. See the typical identification label shown in Fig. 3.2 on page 5.
CE Declaration of Conformity certificates are available from the Company on request or can be downloaded from our website: www.abb.com/analytical.

EC Declaration of Conformity – Gas Monitor type 6553

EC Declaration of Conformity – Type 4234500/501 Power Supply Units

EC Declaration of Conformity – Katharometers type 006539 and 006548
Specification

6553 Gas Monitor

Approvals
- CENELEC approved
- [Ex ia Ga] IIC (-20°C ≤ Ta ≤ +40°C)
- BASEEFA Certificate No. BAS 01 ATEX 7043
- EN61010-1:2010 Compliant

Ranges
- (a) 80% or 85% to 100% H₂ in air
- (b) 0 to 100% H₂ in Purge Gas *
- (c) 0 to 100% air in Purge Gas *

Range Selector Switch Positions (when fitted)
- 1 – percentage by volume, hydrogen in air
- 2 – percentage by volume, hydrogen in purge gas *
- 3 – percentage by volume, air in purge gas *

Accuracy (display units)
- ± 0.25% of scale span

Ambient Temperature Range
- 0 to 40°C (32 to 104°F)

Power Supply
- 110/120V AC or 200/220/240V AC, 50/60Hz
- (two separate versions)

Fuse Rating
- F1 / F2 500 mA, 250 V AC rated 1500 A @ 250 V AC,
- HRC, ceramic, fast blow

Power Consumption
- 30VA approximately

Outline Dimensions
- 290 x 362 x 272mm (11.4 x 14.25 x 10.9 in.)

Weight
- 12kg (26.4lb)

Environment
- Sheltered interior, 0 to 90% RH

* Note. Purge gas options include:
- CO₂ (Carbon dioxide)
- N₂ (Nitrogen)
- Ar (Argon)

Outputs and Set Points

No. of relays
- AK101 – Three (Two for H₂ Purity, One for Purge Gas)
- AK102 – Four (H₂ Purity)
- AK103 – Two (H₂ Purity)
- AK104 – Two (H₂ Purity)

Relay contacts
- Single pole changeover
- Rating: 250V AC  250V DC max.
- 3A AC  3A DC max.
- Loading (non-inductive): 750VA  30W max.
- (inductive): 75VA  3W max.

Insulation
- 2kV RMS contacts to earth (ground)

Remote range indication
- Rating: 250V AC  300V AC max.
- 150mA AC  150mA AC max.

No. of set points
- AK101 – Three (Two for H₂ Purity, One for Purge Gas)
- AK102 – Four (H₂ Purity)
- AK103 – Two (H₂ Purity)
- AK104 – Two (H₂ Purity)

Set point adjustment
- Programmable

Set point hysteresis
- ±1% fixed

Local set point annunciation
- Red LED

Retransmission

No. of retransmission signals
- AK101 – Two fully isolated (One for H₂ Purity, One for Purge Gas)
- AK102 – Two fully isolated
- AK103 – One fully isolated
- AK104 – One fully isolated (H₂ Purity)

Output current
- 0 to 10mA, 0 to 20mA or 4 to 20mA programmable

Accuracy
- ±0.25% FSD ±0.5% reading

Resolution
- 0.1% at 10mA, 0.05% at 20mA

Max. load resistance
- 75Ω (20mA max.)
4234 Power Supply Unit

Approvals
CENELEC approved
[Ex ia Ga] IIC (–20°C ≤ Ta ≤ +55°C)
BASEEFA Certificate No. BAS 01 ATEX 7041
EN61010-1:2010 Compliant

Power Supply
115V AC 50/60Hz (4234501) or
230V AC 50/60Hz (4234500)

Power Consumption
30 W Max.

Fuse Rating
T250mA 250 V AC rated 1500 A HRC ceramic, 250 V AC rated
20 x 5 mm

DC Output
350mA stabilized ±0.14%

Load Conditions
1 Katharometer 13Ω max.
Interconnecting cable 2Ω max.

Ambient Temperature Range
–20 to 55°C (–4 to 131°F)

Supply Variations
±15V (115V supply) or ±30V (230V supply) 46 to 64Hz

Regulation
Within ± 0.5% for:
Load variation of ± 15%
Supply variation of ± 15%
Ambient temperature variation of ± 20°C (36°F)
±4Hz frequency variation

Ripple
Less than 0.5% of set output peak/peak across a 10Ω load

Stability
Within ± 0.7% of initial setting, over period of 1 month with load resistance, supply voltage and ambient temperature at nominal stated values

Overall Dimensions
160 x 170 x 110mm (6.3 x 6.7 x 4.3 in.)

Weight
2.12kg (4.8 lb) approx.

Environment
Sheltered interior

6540–203 and 6548–000
Katharometer Analyzer Panel

Approvals
CENELEC approved
Ex ia Ga IIC (–20°C ≤ Ta ≤ +55°C)
BASEEFA Certificate No. BAS 01 ATEX 1042

Model 6540–203 incorporating Model 6539–960 (H₂) or
Model 6539–960 (Purge Gas) Katharometer Unit

Model 6548–000 incorporating Model 6548–001
(H₂ and Purge Gas) Katharometer Unit

Power Supply
350mA DC, from 4234500 or 4234501 power supply unit

Signal Output
0 to 10mV for each range (Air in N₂: 1.0mV)

Accuracy
± 2% of scale span, each range
± 5% of scale span, Air in N₂

Dead Time
Typically 5s

Response Time
Typically 40s for 90% step change at Katharometer
Tubing and drying chamber introduce extra delays

Ambient Temperature
55°C (131°F) max.
0°C (32°F) min.

Sample Connections
Compression couplings:
6mm OD tube (Model 6548-000)
8mm OD tube (Model 6540-203)

Sample Pressure
Minimum 125mm H₂O
Maximum 0.35bar (Gauge) Model 6540–203
Maximum 10bar (Gauge) Model 6548–000

Sample Temperature
0 to 55°C (32 to 131°F)

Normal Sample Flowrate
100 to 150ml/min.

Maximum Gas Flowrate
250ml/min

Minimum Gas Flowrate
50ml/min

Outline Dimensions
610 x 305 x 152mm (24 x 12 x 6 in.)

Weight
8.6kg (18.9lb)

Environment
Sheltered interior

Client Warranty
Prior to installation, the equipment referred to in this manual must be stored in a clean, dry environment, in accordance with the Company’s published specification. Periodic checks must be made on the equipment’s condition. In the event of a failure under warranty, the following documentation must be provided as substantiation:
— A listing evidencing process operation and alarm logs at time of failure.
— Copies of all storage, installation, operating and maintenance records relating to the alleged faulty unit.
