Original instructions

MKey9-series
Safety Interlock Switch with Guard Locking
Read and understand this document

Please read and understand this document before using the products. Please consult your ABB JOKAB SAFETY representative if you have any questions or comments.

WARRANTY

ABB JOKAB SAFETY’s exclusive warranty is that the products are free from defects in materials and workmanship for a period of one year (or other period if specified) from date of sale by ABB JOKAB SAFETY.

ABB JOKAB SAFETY MAKES NO WARRANTY OR REPRESENTATION, EXPRESSED OR IMPLIED, REGARDING NON-INFRINGEMENT, MERCHANTABILITY, OR FITNESS FOR PARTICULAR PURPOSE OF THE PRODUCTS, ANY BUYER OR USER ACKNOWLEDGES THAT THE BUYER OR USER ALONE HAS DETERMINED THAT THE PRODUCTS WILL SUITABLY MEET THE REQUIREMENTS OR THEIR INTENDED USE. ABB JOKAB SAFETY DISCLAIMS ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED.

LIMITATIONS OF LIABILITY

ABB JOKAB SAFETY SHALL NOT BE RESPONSIBLE FOR SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES, LOSS OF PROFITS OR COMMERCIAL LOSS IN ANY WAY CONNECTED WITH THE PRODUCTS, WHETHER SUCH CLAIM IS BASED ON CONTRACT, WARRANTY, NEGLIGENCE, OR STRICT LIABILITY.

In no event shall responsibility of ABB JOKAB SAFETY for any act exceed the individual price of the product on which liability asserted.

IN NO EVENT SHALL ABB JOKAB SAFETY BE RESPONSIBLE FOR WARRANTY, REPAIR, OR OTHER CLAIMS REGARDING THE PRODUCTS UNLESS ABB JOKAB SAFETY’S ANALYSIS CONFIRMS THAT THE PRODUCTS WERE PROPERLY HANDLED, STORED, INSTALLED, AND MAINTAINED AND NOT SUBJECT TO ABUSE, MISUSE, OR INAPPROPRIATE MODIFICATION OR REPAIR.

SUITABILITY FOR USE

ABB JOKAB SAFETY shall not be responsible for conformity with any standards, codes, or regulations that apply to the combination of products in the customer’s application or use of the product. At the customer’s request, ABB JOKAB SAFETY will provide applicable third party certification documents identifying ratings and limitations of use that apply to the products. This information by itself is not sufficient for a complete determination of the suitability of the products in combination with the end product, machine, system, or other application or use.

The following are some examples of applications for which particular attention must be given. This is not intended to be an exhaustive list of all possible uses of the products, nor is it intended to imply that the uses listed may be suitable for the products:

Outdoor use, uses involving potential chemical contamination or electrical interference, or conditions or uses not described in this document.

Nuclear energy control systems, combustion systems, railroad systems, aviation systems, medical equipment, amusement machines, vehicles, and installations subject to separate industry or government regulations.

Systems, machines, and equipment that could present a risk to life or property.

Please know and observe all prohibitions of use applicable to the products.

NEVER USE THE PRODUCTS FOR AN APPLICATION INVOLVING SERIOUS RISK TO LIFE OR PROPERTY WITHOUT ENSURING THAT THE SYSTEM AS A WHOLE HAS BEEN DESIGNED TO ADDRESS THE RISKS, AND THAT THE ABB JOKAB SAFETY PRODUCT IS PROPERLY RATED AND INSTALLED FOR THE INTENDED USE WITHIN THE OVERALL EQUIPMENT OR SYSTEM.

PERFORMANCE DATA

While every effort has been taken to ensure the accuracy of the information contained in this manual ABB JOKAB SAFETY cannot accept responsibility for errors or omissions and reserves the right to make changes and improvements without notice. Performance data given in this document is provided as a guide for the user in determining suitability and does not constitute a warranty. It may represent the result of ABB JOKAB SAFETY’S test conditions, and the users must correlate it to actual application requirements. Actual performance is subject to the ABB JOKAB SAFETY Warranty and Limitations of Liability.

1 Introduction

Scope

The purpose of these instructions is to describe the safety interlock switch MKey9-series, to provide the necessary information required for assembly, installation, checks and adjustments after installation, and maintenance. The instructions also include information necessary to connect MKey9 to a safety circuit.

Audience

This document is intended for authorized installation personnel.

Prerequisites

It is assumed that the reader of this document has knowledge of the following:

- Basic knowledge of ABB Jokab Safety products.
- Knowledge of safety devices and safety locks.
- Knowledge of machine safety.

Special notes

Pay attention to the following special notes in the document:

**Warning!** Danger of severe personal injury!
An instruction or procedure which, if not carried out correctly, may result in injury to the technician or other personnel.

**Caution!** Danger of damage to the equipment!
An instruction or procedure which, if not carried out correctly, may damage the equipment.

**NB:** Notes are used to provide important or explanatory information.
2 Overview

General description

MKey9 interlock switches are designed to provide position interlock detection for moving guards. It is designed to fit the leading edge of sliding, hinged or lift off machine guards. The actuator is fitted to the moving part of the guard and is aligned to the switch entry aperture. The possibility to lock the switch in the protective position prevents unwanted access to machinery until dangerous operations have ceased.

The locking is useful when applications include:

- processes which cannot be interrupted, such as welding.
- machinery with a long stopping procedure, such as paper machinery that requires a long braking operation.
- prevention of unauthorised access to a particular area.

Safety regulations

⚠️ Warning!

Carefully read through this entire manual before using the device.

The devices shall be installed by a trained electrician following the Safety regulations, standards and the Machine directive.

Failure to comply with instructions, operation that is not in accordance with the use prescribed in these instructions, improper installation or handling of the device can affect the safety of people and the plant.

For installation and prescribed use of the product, the special notes in the instructions must be carefully observed and the technical standards relevant to the application must be considered.

In case of failure to comply with the instructions or standards, especially when tampering with and/or modifying the product, any liability is excluded.
Function description

Safety interlock switches with guard locking are designed to fit to the leading edge of sliding or hinged guard doors to provide positively operated switching contacts and provide a tamper resistant key mechanism. They are designed to provide robust position interlock detection and to keep closed of moving guards. The switch is rigidly mounted to the frame of the guard or machine. The actuator is fitted to the moving part of the guard, and is aligned to the switch entry aperture, placed on the frame of the guard. The actuator profile is designed to match a cam mechanism within the switch head and provides a positively operated not easily defeatable interlock switch. When the guard is closed, the actuator inserted in the switch and the switch locked, the machine can be able to start. When the solenoid is energised (standard version of MKey9) the safety contacts are positively opened, and the guard door can be opened.

The MKey9 is available in two basic versions, either with a spring lock or an electro-magnetic lock. In the spring lock version, the locking mechanism moves into the locked position directly when the door is closed and the actuator key is pushed into the switch. The actuator key can then only be released and the gate opened by supplying operational voltage to the solenoid (A1-A2).

MKey9M is the electro-magnetic lock variant, the locking mechanism is only in the locked position when the solenoid (A1-A2) is supplied with operating voltage. Release of the actuator key is only possible when the operating voltage is not applied to the solenoid (A1-A2). The solenoid voltage is 24VDC.

The MKey9 has double forced disconnection contacts connected to the actuator key and the locking mechanism. The actuator key designed to prevent tampering with tools, magnets or similar objects. To achieve highest safety level in connection with the machine control system it is recommended that the MKey9 is monitored by an appropriate ABB Jokab Safety safety relay, Pluto safety PLC or Vital system. To obtain the highest level of safety, two switches per gate are required.

⚠️ Warning!

Application consideration must be given to the fixing of the actuator which has to be in a way that prevents disassembly by easy means.

The head can be set in four positions, thus providing the safety device with eight different operation positions. The leading edges of the actuator key are reinforced and bevelled in order to guide it properly into the hole. The safety switch is designed to have a high holding force of 1800N. MKey9 has several types of actuators as options. A standard actuator key is always delivered with interlock switches.

⚠️ Note! Top or side manual release points (not on MKey9M)
3 Connections

See Chapter Installation and Maintenance for more information regarding installation.

# 4 Installation and maintenance

**Installation**

1. The installation of all ABB Jokab Safety interlock switches must be done in accordance with a risk assessment for the individual application. Installation must only be carried out by competent personnel and in accordance with these instructions.

2. M5 mounting bolts must be used to fix the switch and actuator, the tightening torque to ensure reliable fixing is 4.0 Nm. To prevent loosening of the switch after installation, always fix the M5 mounting bolts with a thread-locking compound or secure using self-locking nuts. Tightening torque for the lid screws, conduit entry plugs and cable glands must be 1.5 Nm to ensure IP seal.

   Only use the correct size gland for the conduit entry and cable outside diameter.

   Tightening torque for the connection terminal screws is 0,7 Nm, max conductor size is 1,0 mm². The switch head position can be selected by removing the actuator, loosening the 4 head bolts and then rotating the head to the position required. Re-tighten the head bolts and then check actuator insertion and withdrawal.

   Tightening torque for the head bolts is 1.5Nm.

3. Always fit a mechanical stop to the guard to prevent damage to the front of the switch.

   Set the actuator gap to 3 mm when the guard is closed and against the stop. (See illustration).

   Use alignment guides to ensure that the actuator enters the switch without interfering with the sides of the aperture.

   Ensure access to at least one of the manual release points.

   Always fit the aperture plug to the unused entry aperture to prevent debris entering the switch mechanism.

4. Always use the circuits 11-12 and 21-22 to ensure monitoring of the lock.

   For MKey 9: At installation choose the status of Terminals 33 and 34 by setting the slide switch inside the switch housing. (Terminals 33 – 34 are selectable to be used either as power feed to LED2 or as a voltage free auxiliary circuit to indicate lock status).

   If LED2 is used always check for correct DC polarity.

   Terminal 33: 0VDC Terminal 34: +24VDC

   LED1 Status of Solenoid

   LED2 Status of Lock

5. After installation check operation of all control circuits and the locking function. For applications with a run down time after turning off power, ensure that the correct time delay has elapsed before energising the solenoid.

   LED 1 RED will illuminate when power is applied to A1 and A2 (solenoid feed).

   LED 2 GREEN (if used) will be illuminated when the actuator is locked. (Not on MKey 9M)
Warning! All the safety functions must be tested before starting up the system.

Maintenance

Every week: Check correct operation of all circuits. If the actuator shows signs of bending or the switch head housing displays mechanical damage then remove and replace.

Every 6 months: Isolate power and remove cover. Check screw terminal tightness and check for signs of moisture ingress.

Warning! The safety functions and the mechanics shall be tested regularly, at least once every year to confirm that all the safety functions are working properly.

Warning! In case of breakdown or damage to the product, contact the nearest ABB Jokab Safety Service Office or reseller. Do not try to repair the product yourself since it may accidentally cause permanent damage to the product, impairing the safety of the device which in turn could lead to serious injury to personnel.

Caution! ABB Jokab Safety will not accept responsibility for failure of the switch functions if the installation and maintenance requirements shown in this sheet are not implemented. These requirements form part of the product warranty.

Caution! The switch solenoid is rated for continuous duty, and temperature rise will occur if left permanently energised. The temperature will not affect performance of the switch function, life time or damage the housing. As a precaution it is always advised to limit the energised time of the solenoid (not on MKey8M) and where possible and avoid mounting on sensitive surfaces (metal preferred).
Minimum safety distance

When using interlocking guards without guard locking to safeguard a hazard zone, the minimum allowed safety distance between the guarded opening and the hazardous machine must be calculated. In order to ensure that the hazardous machine motion will be stopped before it can be reached, the minimum safety distance is calculated according to EN ISO 13855 (“Positioning of safeguards with respect to the approach speeds of parts of the human body”).

The minimum safety distance is calculated according to the formula:

$$ S = (K \times T) + C $$

Where

- $S$ = minimum safety distance (mm)
- $K$ = approach speed of a human body; 1600 mm/s
- $T$ = the total time from opening of the guard until the hazardous machine movement has stopped, i.e. including control system reaction times and other delays (s)
- $C$ = a safety distance taken from Table 4 or Table 5 of EN ISO 13857:2008, if it is possible to push fingers or a hand through the opening towards the hazard before a stop signal is generated

NB: In some cases, $T$ might be reduced by the opening time of the guard until the opening size permits access of the relevant parts of the body. Refer to EN ISO 13855 for further details and EN ISO 13857 for specified values.
5 Application example

Application example - Door Interlock with guard locking - Dual Channel non monitored

NB: A single MKey9 can achieve performance level PL c according to EN ISO 13849-1 if used correctly with a safety controller. If two MKey9-switches are used for the same safety function, a performance level up to PL e can be achieved. Refer to EN ISO 13849-1 for details on how to achieve this if necessary.
