1. About this manual

1.1. Copyrights

The information in this document is subject to change without notice and should not be construed as a commitment by ABB Oy. ABB Oy assumes no responsibility for any errors that may appear in this document.

In no event shall ABB Oy be liable for direct, indirect, special, incidental or consequential damages of any nature or kind arising from the use of this document, nor shall ABB Oy be liable for incidental or consequential damages arising from use of any software or hardware described in this document.

This document and parts thereof must not be reproduced or copied without written permission from ABB Oy, and the contents thereof must not be imparted to a third party nor used for any unauthorized purpose.

The software or hardware described in this document is furnished under a license and may be used, copied, or disclosed only in accordance with the terms of such license.

© Copyright 2006 ABB. All rights reserved.

1.2. Trademarks

ABB is a registered trademark of ABB Group. All other brand or product names mentioned in this document may be trademarks or registered trademarks of their respective holders.

1.3. General

This manual provides thorough information on the Station Computer COM615 and the central concepts related to it. For more information on each topic related to a specific protocol, refer to the list of related documents in 1.8, Related documents.

Information in this operator's guide is intended for operators who perform every-day operations.

1.4. Use of symbols

This publication includes warning, caution, and information icons that point out safety related conditions or other important information. It also includes tip icons to point out useful information to the reader. The corresponding icons should be interpreted as follows.
The electrical warning icon indicates the presence of a hazard which could result in electrical shock.

The warning icon indicates the presence of a hazard which could result in personal injury.

The caution icon indicates important information or warning related to the concept discussed in the text. It might indicate the presence of a hazard which could result in corruption of software or damage to equipment or property.

The information icon alerts the reader to relevant facts and conditions.

The tip icon indicates advice on, for example, how to design your project or how to use a certain function.

1.5. Document conventions

The following conventions are used for the presentation of material:

• The words in names of screen elements (for example, the title in the title bar of a window, the label for a field of a dialog box) are initially capitalized.

• Capital letters are used for the name of a keyboard key if it is labeled on the keyboard. For example, press the ENTER key.

• Lowercase letters are used for the name of a keyboard key that is not labeled on the keyboard. For example, the space bar, comma key, and so on.

• Press CTRL+C indicates that you must hold down the CTRL key while pressing the C key (to copy a selected object in this case).

• Press ESC E C indicates that you press and release each key in sequence (to copy a selected object in this case).

• The names of push and toggle buttons are boldfaced. For example, click OK.

• The names of menus and menu items are boldfaced. For example, the File menu.

• The following convention is used for menu operations: MenuName > Menu-Item > CascadedMenuItem. For example: select File > New > Type.

• The Start menu name always refers to the Start menu on the Windows taskbar.

• System prompts/messages and user responses/input are shown in the Courier font. For example, if you enter a value out of range, the following message is displayed:
Entered value is not valid. The value must be 0 to 30.

- You may be told to enter the string MIF349 in a field. The string is shown as follows in the procedure:

  MIF349

- Variables are shown using lowercase letters:

  sequence name

1.6. Terminology

The following is a list of terms associated with the Station Computer COM615 that you should be familiar with. The list contains terms that are unique to ABB or have a usage or definition that is different from standard industry usage.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm</td>
<td>An abnormal state of a condition.</td>
</tr>
<tr>
<td>Alarms and Events; AE</td>
<td>An OPC service for providing information about alarms and events to OPC clients.</td>
</tr>
<tr>
<td>Data Object; DO</td>
<td>Part of a logical node object representing specific information, e.g., status or measurement. From an object-oriented point of view a data object is an instance of a class data object. DOs are normally used as transaction objects; i.e., they are data structures.</td>
</tr>
<tr>
<td>Device</td>
<td>A physical device that behaves as its own communication node in the network, e.g. protection relay.</td>
</tr>
<tr>
<td>Event</td>
<td>Change of process data or an OPC internal value. Normally, an event consists of value, quality and timestamp.</td>
</tr>
<tr>
<td>Intelligent Electronic Device</td>
<td>A physical IEC 61850 device that behaves as its own communication node in the IEC 61850 protocol.</td>
</tr>
<tr>
<td>LON</td>
<td>A communication protocol developed by Echelon.</td>
</tr>
<tr>
<td>LON Application Guideline for substation automation; LAG</td>
<td>A proprietary method of ABB on top of the standard LON protocol.</td>
</tr>
<tr>
<td>OPC</td>
<td>Series of standards specifications aiming at open connectivity in industrial automation and the enterprise systems that support industry.</td>
</tr>
<tr>
<td>Property</td>
<td>Named data item.</td>
</tr>
<tr>
<td>SPA</td>
<td>ABB proprietary communication protocol used in substation automation.</td>
</tr>
</tbody>
</table>
1.7. Abbreviations

The following is a list of abbreviations associated with the Station Computer COM615 that you should be familiar with. See also 1.6, Terminology.

<table>
<thead>
<tr>

2. Introduction

2.1. Product overview

Station Computer COM615 acts both as an embedded communication gateway between substation automation protection and control devices and Network Control Centers (NCC), and allows easy access to the protection and control devices of a substation either locally or remotely with the HMI functionality.

COM615 uses an embedded operating system and runs in a dedicated industrial computer without moving parts.

The products are configured using a separate engineering PC that is connected via the local area network (LAN). For more information, refer to COM600 User's Guide.

Gateway Functionality

The gateway functionality provides a framework that enables the use of OPC server and client components, such as OPC Client for IEC 60870-5-101 and OPC Server for LON LAG 1.4. For more information, refer to COM600 User's Guide.

HMI

The features of HMI include a Single Line Diagram, Busbar coloring, lists of events and alarms, disturbance data upload, system supervision, control of breakers and switches, parameter settings, measurement display, and user management. For more information, refer to COM600 User's Guide.
3. CET operations

3.1. Opening a project in CET

To open a project in CET:

1. Select File > Open/Manage Project...
2. In the Open/Manage Project dialog, select the required location for the project:
   • Projects on my computer
   • Projects on network
3. Expand the projects list, by clicking on the + symbol, to select the required project.
4. Click Open Project

3.2. Gateway management

The Gateway Management tool enables you to transfer the configurations of the objects to the COM600 computer.

To be able to use the Gateway Management Tool, the engineering computer must be connected to the COM600 computer. The IP address of the used ethernet port in the COM600 computer must be entered to the corresponding Gateway object property. For more information, see COM600 User's guide.

To open the Gateway Management tool, right-click the Gateway object in Communication Engineering Tool (CET) and select Management.

• To copy the configurations of all servers and clients to the Gateway computer, click Update configuration.
• To restart all servers and clients with the latest configurations, click Reload configuration.
• To transfer only the changed configurations and to restart only the changed server or client with new configurations, click Update & reload configuration.

3.3. License handling

The Gateway Management tool displays the license information for COM600 under License Information. The license and the protocols it supports have been predefined before the COM600 computer has been handed over by ABB.

The following information is shown in the window:
• owner of the license
• product revision
• protocols supported by the license.
• number of servers supported by the license.
To update the license with a new set of protocols, order a new license from ABB and update it to COM600 with Communication Engineering Tool.

To update the license:
1. Open the Gateway Management tool.
2. Click **Update License**.
3. Browse for the new license file and click **Open**.

The license is COM600 specific and the COM600 computer verifies the compatibility of the license. Also the servers and clients verify the license.

### 3.4. Diagnostics

#### 3.4.1. General about diagnostics

Communication Engineering Tool (CET) provides comprehensive functions for diagnosing the operation of the Gateway. This includes communication diagnostics with monitoring the communication channel, diagnostic counters and IED specific communication status and diagnostic counters. It is also possible to monitor and control process data and follow the data flow on the Gateway using diagnostic functions of CET. Figure 3.4.1-1 displays a sample view of a diagnostic counter dialog. An example of an event log file is displayed in Figure 3.4.1-2.
Figure 3.4.1-1 An example of a SPA channel diagnostic counter dialog

Figure 3.4.1-2 An example of a SPA event log file
3.4.2. Data object diagnostics

You can monitor and control the data objects under the Gateway’s object tree with Data object diagnostics.

To monitor and control the data objects:
1. Right-click the Gateway.
2. Select Data object diagnostics from the shortcut menu, see Figure 3.4.2-1. The Data object diagnostic dialog opens.
3. Drag and drop data objects from the object tree to the Data object diagnostics.

or
1. Select a specific data object from the object tree.
2. Select Tools > Online diagnostics.

To change the value of a data object attribute:
1. Select a specific attribute.
2. Write a new value to the text box under the Write value button.
3. Click Write value to change the value.

To filter the displayed data object:
1. Click Excluded items.
2. Notepad opens. Write to Notepad the data object types you want to exclude from the Data object diagnostics view.
3. Save the Notepad file by selecting File > Save.

3.4.3. Diagnostic services of OPC servers and clients

You can control and monitor the server and client channel and device communication in the communication structure of the Project Explorer. You can take channels/subnet-
works and devices into use or out of use via the respective diagnostics function. You can also monitor the channel/subnetwork and device communication with the help of various diagnostic counters, and check the device status information, see Figure 3.4.3-1.

For more detailed information and instructions on controlling and monitoring channel and device communication, refer to the respective user’s guide for the client or server (see 1.8, Related documents).

### 3.4.4. Signal diagnostics

OPC clients have a diagnostic function which makes it possible to monitor the flow of process data changes and commands. Activate the function by marking the Diagnostic Events Enabled check box, located in the Online diagnostics function of the IEC101/IEC104 Device. When the diagnostic function is activated, the IEC101 OPC Client Alarm & Event server generates events with information about data changes and commands.
Figure 3.4.4-1 IEC101 Slave OPC Client Diagnostic AE client

3.4.5. Diagnostic Web Server

The Diagnostic Web Server of the Gateway provides an overall view of the communication status of the Gateway and the possibility to monitor the diagnostic counters of the communication channels/subnetworks and IED communication. Figure 3.4.5-1 displays the gateway objects in a tree view.

A red cross over the Gateway icon in the object tree indicates that there is a fault in the communication structure. Expand the tree to view the hierarchy deeper and to identify the device with a missing configuration or causing the error. The properties of a certain object in the communication structure can be seen on the right when clicking on the object in the tree view.
Figure 3.4.5-1 An example of a web page from the Gateway diagnostic web server
4. **HMI operations**

4.1. **General about HMI**

The HMI interface consists of different views, a menu bar and a tool bar.

You can choose between views by clicking the tabs on the left:

- **Substation**: Shows the substation structure.
- **Communication**: Shows the communication structure.
- **Users**: (Only administrator) Shows the user information. The administrator can manage users in this view.
- **Settings**: (If not administrator) Shows the user information. The user can change the password in this view.

The Menu bar contains the following functions:

- **General**: Shows device information.
- **Single Line Diagram**: Shows the Single Line Diagram view.
- **Events**: Shows the events list.
- **Alarms**: Shows the events list.
- **Help**: Shows the HMI help.
- **Logout**: Logs you out of the window.

4.2. **Predefined user account**

HMI has a predefined user account with administrator rights.

- User name: admin
- Password: adminadmin

When you log in for the first time as an administrator, you have to change the password before you can proceed using HMI. If you forget the new password, restore the factory settings with the Management tool in CET. After the factory settings have been restored, you can only log in with the predefined administrator password mentioned above.

4.3. **User management**

4.3.1. **General about managing users**

COM605 has the following user levels:

- Viewer = Only allowed to view
- Operator = Authorized to make operations
- Engineer = Allowed to change IED parameters, but no operation rights
- Administrator = Full access
The administrator can add users and define access rights with the User Management tool.

The user levels of the selected user are displayed in the User Information view and they can be modified by the administrator.

The purpose of the user groups is mainly to provide customized user interfaces for different users.

### 4.3.2. Adding new users

The administrator can add users in the **Add User** window.

To add a new user:
1. Click on the **Users** tab on the left.
2. Select **Add User**.
3. Type in a new user name. The length of the user name can be 1 - 99 characters and it can only contain characters a - z and 0 - 9.
4. Type in a password and confirm it. The length of the password can be 9 - 99 characters and it can only contain characters a - z and 0 - 9.
5. Select a user group from the drop-down menu.
6. Click **Apply** to save the user information.

### 4.3.3. Modifying user properties

The administrator can modify user information by using the tool bar on top of the User Information view.
To remove a user:
1. Click on the Users tab on the left.
2. Select the user you want to remove.
3. Click Remove User and confirm by clicking OK.

To change a user's user group:
1. Click on the Users tab on the left.
2. Select the user whose user group you want to change.
3. Click Change User Group.
4. In the Change User's Group view, select a new group from the drop-down menu.
5. Click Apply.

4.3.4. Changing user's password

To change the password (administrator):
1. Click on the Users tab on the left.
2. Select the user whose password you want to change.
3. Click Change password.
4. Type in a new password and confirm it.
5. Click Apply.

To change your own password:
1. Click on the Settings tab on the left.
2. Click Change password.
3. Type in the old password.
4. Type in a new password and confirm it.
5. Click Apply.

4.4. Connecting HMI to the COM600 computer

To connect HMI to the COM600 computer:
1. Open Internet Explorer.
2. Type in the IP address of the COM600 computer.
3. Accept the certificate.
4. A login window opens. Type in the password and log in.

4.5. Substation and communication structures

4.5.1. Substation structure

You can open the substation view of HMI by clicking on the Substation tab on the left. The substation structure displays the substation and voltage level objects, bays and IEDs, and their functions.
You can see the status of the IEDs in the substation structure. If there is a problem in communication, there is a red cross next to the IED.

Figure 4.5.1-1 The substation view to HMI

Alarm and event information

By clicking on the voltage level and bay objects, you can access their specific alarm lists. To look at a list of events, click on View Events above the Persisting Alarms list.

IED information

By clicking on the IED objects you can view their communication status and information on diagnostic counters. Below each IED in the substation structure you can click on Disturbances, Parameters or Measurements to access the corresponding data.

⚠️ It depends on the IED configuration, whether Disturbances, Parameters or Measurements are shown in the substation structure.
4.5.2. Communication structure

You can open the communication view of HMI by clicking on the Communication tab on the left. The communication structure is displayed in the window on the left. In the communication structure you can see the OPC Server, communication channel objects and the IEDs.

You can see the status of the IEDs in the communication structure. If there is a problem in communication, there is a red cross next to the IED.

![communication_view.jpg](attachment:communication_view.jpg)

Figure 4.5.2-1 The communication view to HMI

Device and diagnostics information

By clicking on the computer name at the top of the structure, you can see its device information, such as the hardware and software versions, in the window on the right side of the tree. By clicking on the OPC Server object name, corresponding device information is displayed on the right. You can view device diagnostics information of the whole subnetwork by clicking on the subnetwork object. To see the communication status or diagnostic counter information of individual devices, click on the IED objects.
4.6. Single Line Diagram

4.6.1. General about Single Line Diagram

A Single Line Diagram (SLD) is a graphical user interface presenting process objects (primary devices) of the substation as graphical symbols. HMI updates the SLD and the substation and communication structures at regular intervals. A sample SLD is shown in Figure 4.6.1-1

Figure 4.6.1-1 An example of the Single Line Diagram

For an explanation of the Single Line Diagram symbols, see Appendix 1, Single Line Diagram symbols.

4.6.2. Switch Device Control

Switches (circuit breakers, disconnectors) can be operated using the Switch Device Control dialog.

⚠️ Only operators and administrators are allowed to control the switches.
The station and bay local/remote switch must be in a position which allows it to be controlled with HMI. The target switch device must also support the operation and it must be configured properly.

To control a switch device (for example circuit breaker), click the object in the single line diagram. The Switch device control dialog opens.

The Switch state tab displays information on the substation, voltage level and bay under operation and the object name of the switch device. Also status information for example on the interlockings and selection state of the object are displayed.

To control a switch:

1. Select the control direction by clicking **Open** or **Close**.
2. Click **Operate** to activate the selection or **Cancel** to cancel the operation. Note that some of the buttons may be disabled depending on the state of the switch.

It is possible to perform a forced cancel operation. This is necessary for example if HMI is accidentally closed after you have activated a selection. Normally the object would stay in the selected position until timeout, and the object must be released if any operations have to be performed before timeout. To perform a forced operation, select the Forced operation tab of the Switch device control dialog and click **Cancel**.

To add, edit or delete web links, select the Web links tab and click **Edit**.

To close the Switch device control dialog, click **Exit**.
4.6.3. Tap Changer

Clicking a power transformer with tap changer opens a control dialog. In the dialog you can monitor the voltage and the current tap changer position.
Figure 4.6.3-1 Tap Changer Control dialog

Depending the device and the configuration, you can manually lower or raise the relative position of the tap changer or assign a specific position by entering a numeric value.

⚠️ You must have the required user permissions to perform these changes, and local/remote switch must allow the operation. The tap changer must also be in manual operating mode.

The **Operation mode** tab shows the auto/manual and single/parallel operation modes of the tap changer. You can change the modes of the tap if you have the required user permissions. The operation modes must be supported by the IED support and allowed by the local/remote. If they are not, the options are not available in the dialog.
Busbar coloring

Busbar coloring can be used to indicate the status of busbar sections in several different ways. It can indicate which busbar sections are powered, unpowered or in certain other states, or which voltage level each busbar section has, see Figure 4.6.4-1. Alternatively, each voltage source or voltage source type can have a color that is used for sections they are connected to. Busbar coloring can also be used to indicate if two or more voltage sources form a loop.
Busbar coloring modes can be selected from the drop-down menu on the top of the Single Line Diagram View. There are four modes of busbar coloring:

1. **No busbar coloring**. All sections are displayed in a default color.
2. **Powered/Unpowered based busbar coloring**. One color is used for all powered sections.
3. **Voltage level based busbar coloring**. Different voltage levels have different colors.
4. **Voltage-source based busbar coloring**. The coloring of powered sections depends on the voltage source.

### 4.7. Alarms

#### 4.7.1. General about alarms

The Alarm List displays a summary of the present alarm situation of the supervised process. Each alarm is presented as an alarm text line, which describes the cause of the alarm in the process. The alarm text line includes date, time, bay, device, object text, state and status.

The blinking symbol in the upper right corner of HMI indicates that there are unacknowledged alarms in the substation. There is also an audio alarm, if it has been enabled on workstation. By clicking the symbol, the Alarm view opens. When all alarms have been acknowledged, the alarm indicator disappears and the audio alarm stops.
4.7.2. Monitoring and handling alarms

To monitor and handle alarms in the substation, click Alarms in the menu bar at the top of the screen. To view the alarms concerning a specific bay, click on the appropriate object in the substation tree.

You can also filter the alarms concerning a specific voltage level or bay with the Filter function.

In the Persisting alarms list you can see active alarms. The Fleeting alarms list displays a list of inactive unacknowledged alarms. The alarm list is continuously updated to present the actual state of the alarm signals.

To view the event list, click View events.

4.7.3. Acknowledging alarms

Click Ack to indicate that you have registered and identified the alarm. Acknowledging an alarm does not remove the alarm, but changes the alarm state. An acknowledged alarm is displayed in blue in the Persisting alarms list. Inactive alarms are displayed in the Fleeting alarms list.

To acknowledge alarms:
1. Select the check box of the alarms you want to acknowledge in the Alarms list.
2. Click Ack on the menu bar.
3. To acknowledge all alarms at the same time, click Ack all.

4.7.4. Filtering alarms

Filters can be used when you want to display only specific information.
To filter alarms:
1. Click **Filter** in the toolbar of the Alarms view. A window displaying the substation structure opens.
2. Click on the object whose alarms you want to view. Now the Alarms list displays only the alarms of the object that was selected, and the objects below it.

![HMI_filtering_alarms.jpg](image)

*Figure 4.7.4-1 An example view of filtering alarms*

## 4.8. Events

### 4.8.1. General about events

With the Event List you can monitor the information about events that have occurred in the system. Only a certain number of events is visible, and the number of visible events can be configured in the Communication Engineering Tool. You can also receive information about activities carried out by other users, operations of objects, acknowledging of alarms, logging in, and so on. The Events list includes the following information: date, time, bay, device, object text and event.

### 4.8.2. Monitoring and handling events

You can monitor the events of the substation by clicking **Events** in the command bar at the top of the screen. To monitor the events of specific bays, click on the appropriate object in the substation tree. The event list is updated automatically.
You can filter the events concerning a specific voltage level or bay with the **Filter** function.

You can stop the updating of the event list by clicking **Freeze**. To resume the flow of events, click **Continue**. You can save events locally on your computer by clicking **Save**. The list is saved in .csv format and can be opened in MS Excel.

To view the alarms list, click **View alarms**.

### 4.8.3. Filtering events

Filters can be used when you want to display only specific information.

To filter events:
1. Click **Filter** in the toolbar of the Events view. A window displaying the substation structure opens.
2. Click on the object whose events you want to view. Now the Events list displays only the events of the object that was selected, and the objects below it.
4.9. Disturbance data upload

4.9.1. Disturbance recordings

Most of the IEDs are equipped with a Disturbance recording function that locally stores the values of currents, voltages, frequencies and binary signals and so on in a disturbance file before, during and after a protection event. These disturbance files can be copied to the COM600 computer automatically, if the function has been configured in CET.

You can see the list of disturbance recordings by clicking on Disturbances below the desired IED in the substation structure.
The disturbance recordings list shows you the description, date and time of the disturbance. When you want to save the list locally on your computer, select it and download it by clicking **Save**. The list is saved in .csv format and can be opened in MS Excel. You can also delete disturbance recordings from the COM600 computer by clicking **Delete**.

### 4.10. Parameter setting

#### 4.10.1. Changing parameters

You can view parameter information by clicking on **Parameters** below the desired IED in the substation structure, if this functionality is supported by the IED. In this view you can also change parameter settings.

Click the 
icon next to the parameter to open the corresponding help text for each parameter.

![Parameter Setting view](parameters2.png)

*Figure 4.10.1-1 An example of the Parameter Setting view*

To change parameter settings:

1. Click **Enable Write** on the top of the Parameter Setting view.
2. Select a new value from the drop down menu or type in a value in the **New Value** field. To apply changes, click **Write to IED**. If the new values are accepted, the background of the modified parameters turns green. If the new values are incorrect, a message "Some settings are not in correct range" is displayed and the background of the modified parameters turns red. Type in values that are in the correct value range.
3. To manually update the values, click **Refresh Values**.
4. After you have made all necessary changes, click **Disable Write**. If the IED has been configured with a store option, a store dialog will appear. In the dialog you can store the parameter changes permanently to the IED non volatile memory. If you click **OK**, the parameter changes are stored permanently. If you
click **Cancel**, the parameter changes are only saved temporarily, and they will be lost after next reset of the IED.

When writing parameters to REF 542plus:

- Parameter value changes are not activated immediately when you click **Write to IED**, but only after you have stored the values permanently by clicking **OK** or temporarily by clicking **Cancel** in the store dialog. The store dialog appears when you click **Disable Write** or when you close the parameter setting tool while a write session is open.
- Parameter Set selection will restore the old value until the new value has been stored permanently or temporarily.

**IEC 61850 setting groups and parameters**

Certain IEC 61850 parameters are assigned to setting groups. These parameters can have different values in different groups. Parameters belonging to setting group have # character as a prefix in the name. You can view the parameters of each group by selecting the the Setting group number from the drop down menu. The currently active Setting group number in the IED is indicated with an asterix (*) in the Setting Group selection drop down list.

To change the parameter values in a setting group:

1. Select the **Setting Group** to be edited
2. Click **Enable Write** on the top of the **Parameter Setting** view.
3. Enter the new values for the parameters
4. Write the changed parameter values to IED by clicking **Write to IED**.
5. Store the parameter changes permanently to IED by clicking disable write or closing the tool. Pop-up dialog will prompt for store or cancel.

The active setting group in the IED is changed with Active Setting Group parameter. To change the parameter follow the steps 2 to 5 above.
4.11. Measurements

4.11.1. Viewing measurements

To view measurement information, click on Measurements below the desired IED in the substation structure. HMI updates the measurement information automatically.
