EBN853 / EBN861
Electronic unit for field installation (Contrac)

Introduction
The electronic unit builds the interface between the actuator and the control system. During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced.

High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

For the control of Contrac control actuators in potentially explosive atmospheres

Additional Information
Additional documentation on EBN853 / EBN861 is available for download free of charge at www.abb.com/actuators.

1 Safety

General information and instructions

These instructions are an important part of the product and must be retained for future reference.
Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.
For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer.
The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.
Modifications and repairs to the product may only be performed if expressly permitted by these instructions.
Information and symbols on the product must be observed.
These may not be removed and must be fully legible at all times.
The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

Warnings

The warnings in these instructions are structured as follows:

⚠️ DANGER
The signal word ‘DANGER’ indicates an imminent danger. Failure to observe this information will result in death or severe injury.

⚠️ WARNING
The signal word ‘WARNING’ indicates an imminent danger. Failure to observe this information may result in death or severe injury.

⚠️ CAUTION
The signal word ‘CAUTION’ indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

NOTICE
The signal word ‘NOTICE’ indicates possible material damage.

Note
‘Note’ indicates useful or important information about the product.
1 Safety

Intended use

The electronic units of type EBN853 / EBN861 interconnected as illustrated in this operating instruction are used exclusively to control the RHDE... or RSDE... series control actuators. The electronic unit must only be installed or commissioned outside of potentially explosive atmospheres. Using these actuators for any other purpose will introduce a risk of personal injury and can also damage or impair the device's operational reliability.

Improper use

The following are considered to be instances of improper use of the device:

- For use as a climbing aid, for example for mounting purposes.
- For use as a bracket for external loads, for example as a support for piping, etc.
- Material application, for example by painting over the housing, name plate or welding/soldering on parts.
- Material removal, for example by spot drilling the housing.

Notes on data safety

This product is designed to be connected to and to communicate information and data via a network interface. It is operator’s sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be).

Operator shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and / or theft of data or information.

ABB Automation Products GmbH and its affiliates are not liable for damages and / or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and / or theft of data or information.

Warranty provisions

Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer's warranty null and void.

2 Use in potentially explosive atmospheres

DANGER
Explosion hazard due to improper installation!
An explosion hazard is present when installing the electronic unit in potentially explosive atmospheres.
The electronic unit must only be installed and operated outside of potentially explosive atmospheres.

Before the commissioning of the electronic unit, observe the following points:

• The electronic unit must not be installed or commissioned in an Ex area.
• Check whether the actuator is connected to the right electronic unit, see section Electrical data for inputs and outputs on page 27.
• Check whether the associated electronic unit has been configured using the correct actuator parameters. To do this, check the relevant information on the name plate of the actuator and the electronic unit with respect to actuator type, ambient temperature range of actuator, and NL number, if applicable.
• On delivery, the positioning time-out function of the electronic unit associated with the actuator is activated. Deactivating this setting is not permitted.
• Rapid traverse mode is not allowed to be used on Ex actuators. Therefore, it is not possible to select it via the user interface.
• Activating the breakaway function is not permitted.
• Activating the ‘Position dependent switch-off’ function with 2 × torque/force is not permitted.
• The Contrac electronic unit must be upstream of the motor temperature monitoring unit SD241-B or a similar, certified tripping unit.

Cable harness for the connection of the actuator to the electronic unit

Installation information on the cable harness for actuators in Ex design

The electrical connection between the Contrac electronic unit and the Contrac actuator can be established using the cable set (order code 695). The cable harness is not part of the Ex prototype test certificate and must therefore be tested for safety-relevant functionality within the complete installation by the installer or operator.

If the specified cable harness does not meet all safety-relevant requirements, the proper installation material must be used.

For the specified motor connection cable, the shielding must be connected at both ends and connected with protective ground.

Thermal motor monitoring

In Contrac control actuators for use in potentially explosive atmospheres, additional independent monitoring of motor temperature is required.
Monitoring can be performed using the ABB SD241-B monitoring unit or a comparable certified tripping unit for thermistor temperature sensors.
The motor temperature monitoring unit interrupts the power supply as soon as the motor temperature up-scales the permissible limit value.
## 2 Use in potentially explosive atmospheres

... 2 Use in potentially explosive atmospheres

Overview

Figure 1: Allocation of the Contrac components when using in potentially explosive atmospheres (example)
3 Design and function

Design

The electronic units EBN853 and EBN861 consist of two housing halves, one holding the connection components and the transformer, the other holding the electronics and the commissioning and service field (ISF) for 'local operation' of the actuator.

EBN853

1. Connection housing
2. Electronic unit cover
3. Cover for commissioning and service field
4. Cover for terminal compartment
5. Cable gland
6. Tap holes for cable glands
7. Analog input fuse
8. Terminals (signals)
9. Anti-dew heater fuse
10. Terminals (motor cable)
11. Power supply fuse
12. Terminals (power supply)

EBN861

1. Electronic unit cover
2. Lifting eye
3. Commissioning and service field
4. Cover screws
5. Cover hinges
6. Tap holes for cable glands
7. Ground terminal
8. Terminals (power supply)
9. Terminals (motor cable)
10. Binary output fuses
11. Terminals (signals)
12. Lower part of electronic unit

Figure 2: Presentation terminal compartment

The electronic unit is made up of two housing halves (electronic cover / electronic unit lower part) which can be separated for easier assembly.
3 Design and function

Principle of operation

The electronic unit builds the interface between the actuator and the control system. During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced. High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

Electronic units are available for assembly in the field near the actuator, remotely in a mounting rack or for integrated assembly (smallest actuator type). In addition to the terminals, the electronic unit contains the microprocessor, frequency converter for motor control, analog and binary inputs and outputs, PROFIBUS® or HART® communication interfaces, the commissioning and service field and a plug connection to connect a PC.

No matter what the motor power of the respective actuator is, all electronic units are supplied single-phase by 230 V or 115 V mains supply (50 Hz or 60 Hz). The commissioning and service field enables the end positions and direction of rotation to be set on the actuator. Moreover, status information is displayed using LEDs. Push buttons can be used to operate the actuator and set the operating mode (Automatic, Out of Service).

4 Product identification

Note
In electronic units which can be separated for assembly, the name plate for the hardware is located on the lower part of the electronic unit (Figure 1). The name plate for the software (Figure 2) and an additional name plate for the hardware (Figure 3) are located on the electronic unit cover. The lower part of the electronic unit and the electronic cover are independent assemblies, therefore the respective manufacturing numbers can differ.

Scope of delivery
- Metric tap holes for cable entries with IP 66 sealing plugs.
**Delivery status**

The individual actuator configuration may vary from the standard setup above. This information can be displayed via the user interface.

Unless otherwise specified by the user, the electronic units are delivered with the following standard configuration:

5 Transport and storage

Inspection

Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents. All claims for damages must be submitted to the shipper without delay and before installation.

Transporting the device

Safety instructions

⚠️ **DANGER**

Danger to life due to falling or toppling loads.
Risk of death or serious injury due to the device falling down or toppling over!
- Standing under suspended loads is prohibited.
- Do not detach the hoisting equipment until installation is complete.
- Only use the dedicated load pick-up devices (eyebolts) for suspending the components.

Consider the following items during transport:
- Pay attention to the device weight details.
- Do not expose the device to humidity during transport. Pack the device accordingly.
- Pay attention to the permissible transportation temperatures for the device.

Returning devices

For the return of devices, follow the instructions in Returning devices on page 39.

Storing the device

Note

The storage data provided below assumes that the devices are fully closed and thus comply with the IP rating stated in the specification.

When devices are supplied, their IP rating is guaranteed. If the devices have been tested or commissioned, the IP rating needs to be guaranteed before they are put into storage.

The devices may be stored under moist and corrosive conditions for a short time. The equipment is protected against external corrosive influences. However, direct exposure to rain, snow, etc., must be avoided.

The permissible storage and transport temperatures must be observed.

Devices equipped with a heater are also protected by desiccant, which is placed in the following locations where condensation may be a problem:

Position sensor: In connection chamber
Electronic unit: In electrical connection chamber

The desiccant guarantees sufficient protection for approximately 150 days. It can be regenerated at a temperature of 90 °C (114 °F) within 4 h.

Remove the desiccant prior to commissioning the actuator or the electronics.

If you intend to store or transport the device for a prolonged period (> 6 months), we recommend that you wrap it in plastic film and add desiccant.

Protect uncovered metallic surfaces with an appropriate long-term corrosion inhibitor.

The relevant long-term storage temperatures must be observed.
6 Installation

Mounting

**NOTICE**

**Damage to components!**

Damage to components caused by ingress of foreign bodies or humidity.
- Keep all housing covers and terminal compartments closed during installation to prevent the ingress of foreign bodies such as drilling shavings, liquids or dust.

The electronic unit is installed in the vicinity of the drive outside the hazardous area. Screw-type terminals are used to connect the two modules on the actuator side and on the electronics side.

The cables are connected to the actuator through two terminal compartments:
- Motor connection compartment (Ex d)
- Sensor terminal compartment (through Ex e terminals)

The SD241-B motor temperature monitoring unit or a similar, certified tripping unit must be connected to the power supply of the electronic unit.

The motor temperature monitoring unit must be installed outside of the potentially explosive atmosphere.

When installing the electronic unit, observe the following points:
- You must be able to activate the power supply of the electronic unit on-site.
- All signal cables and the motor cable between the actuator and electronic unit must be shielded.
- The cable shield must be placed on both housings when connecting the electronic unit and the actuator.
- The maximum vibration load must be observed during installation, see Device designs on page 11.
- When mounting the electronic unit in work and traffic areas that may be accessed by unauthorized persons, the operator is required to take suited protective measures.

**EBN853**

1. Fasten the electronic unit to a vertical mounting plate using grade 8.8 screws. Tensile strength 800 N/mm² (116032 pounds/square in.), yield strength 640 N/mm² (92826 pounds/square in.).
2. Provide adequate room for installation and ensure easy access.
3. The cable entries must be directed to the left.

**EBN861**

**Note**

The total weight of the electronic unit is 40 kg (88 lbs). For this reason, the electronic unit is equipped with a load-bearing eyelet.

If, for technical reasons, the load-bearing eyelet cannot be used, the two halves of the housing can be installed separately.

**Separating the housing halves**

1. Place the electronic unit on a horizontal surface.
2. Unscrew the cover screws (**Figure 3**).
3. Flip open the electronic unit cover.
4. Disconnect the internal plug connection between the housing halves.
5. Close the electronic unit cover.
6. Unscrew the hinge screw (**Figure 3**).
7. Flip the electronic unit cover forward while lifting it up and off the hinge pin. Precisely guide the cover of the electronic unit cover in the process.

**Mounting**

1. Fasten the electronic unit or the lower part of the electronic unit to the vertical mounting rail of the mounting rack using grade 8.8 screws. Tensile strength 800 N/mm² (116032 pounds/square in.), yield strength 640 N/mm² (92826 pounds/square in.).
2. Provide adequate room for installation and ensure easy access.
3. The cable entries must be directed down.

**Mounting the housing halves**

1. Set the electronic unit cover down on the hinge pin and screw in the hinge screw. Precisely guide the cover of the electronic unit cover in the process.
2. Reconnect the internal plug connection.
3. Close the electronic unit cover and screw in the cover screws (**Figure 3**).

Safety instructions

**WARNING**
Risk of injury due to live parts!
When the housing is open, contact protection is not provided and EMC protection is limited.
- Before opening the housing, switch off the power supply.

**WARNING**
Danger due to electric current!
Danger of electric shock by residual voltage at the terminals after switching off the power supply.
- Before opening the terminal compartment, switch off the power supply and wait for > 2 minutes.

**NOTICE**
Damage to the device due to improper handling!
- When replacing the defective safety fuses, only fuses with types and characteristics should be used (see Fuses on page 40).

The electrical connection may only be established by authorized specialist personnel.
Notices on electrical connection in this instruction must be observed; otherwise, electric safety and the IP-rating may be adversely affected.
Safe isolation of electric circuits which are dangerous if touched is only guaranteed when the connected devices fulfill the requirements of EN 61140 (basic requirements for secure separation).
To ensure safe isolation, install supply lines so that they are separate from electrical circuits which are dangerous if touched, or implement additional isolation measures for them.

General

Each actuator requires a suited Contrac electronic unit with installed actuator-specific software. Observe the information in the operating instruction. The specifications on the name plates of the electronic unit and actuator must match to guarantee correct hardware and software allocation.

Please observe the following information when installing the cable set:
- The specific regulations governing the installation of electric systems in potentially explosive atmospheres must be observed during electric installation work. The provisions in accordance with EN 60079-14 must be observed, particularly in respect of installing the shield bonding and potential equalization between the actuator, electronic unit, and motor protection equipment, see Connection of cable shielding on page 30.
- The motor and position sensor may only be connected using IP 66 Ex cable glands in accordance with EN 60079 ff with EU type examination certificate in accordance with Directive 2014/34/EU.
- Use a cable lug or a solid wire, bended to a ‘U’, to connect the motor cable
- Make sure that sufficient strain relief measures are in place for all cable connections.
- Protect all cables in the connection chambers sufficiently against contact with metal components. Guarantee a gap of at least 6 mm (0.24 in) between all conductive components.
- Remove the desiccant in the connection chamber of the motor and position sensor.
- Do not change the factory-set installation position of the motor junction box.
- Close off any cable entries that are not required using ATEX-certified IP 66 sealing plugs.

Signals rigid: 0.5 to 4 mm² (20 to 12 AWG)
flexible: 0.5 to 2.5 mm² (20 to 14 AWG)

Cable glands

DANGER
Risk of explosion!
Risk of explosion due to the use of unsuitable cable glands.
- The cable glands used must be approved for type of protection ‘Ex e – increased safety’.
- The cable glands used must guarantee correct contact of the cable shielding.

The actuators and electronic units are supplied without cable glands. Suited cable glands must be installed on site.

... 7 Electrical connections

... Conductor cross-section on electronic unit

Selection of suited connection cables
Please observe the following information when selecting cables:

- Use suited cables only for the electric connection between the Contrac control actuator in potentially explosive atmospheres and the components outside of the potentially explosive atmospheres.
- Use shielded cables for the motor / brake cable, the sensor cable, and the signal cable to the control system / controller.
- Connect the shielding of the motor / brake cable and the sensor cable on both sides (to the actuator and to the Contrac electronic unit).
- For the connection between the motor and motor temperature monitoring unit and for the power supply, shielded cables are not required.

Installation information on the cable harness for actuators in Ex design
The electrical connection between the Contrac electronic unit and the Contrac actuator can be established using the cable set (order code 695). The cable harness is not part of the Ex prototype test certificate and must therefore be tested for safety-relevant functionality within the complete installation by the installer or operator.

If the specified cable harness does not meet all safety-relevant requirements, the proper installation material must be used. For the specified motor connection cable, the shielding must be connected at both ends and connected with protective ground.

Please observe the following information when installing the cable set:

- The specific regulations governing the installation of electric systems in potentially explosive atmospheres must be observed during electric installation work. The provisions in accordance with EN 60079-14 must be observed, particularly in respect of installing the shield bonding and potential equalization between the actuator, electronic unit, and motor protection equipment, see Connection of cable shielding on page 30.
- The motor and position sensor may only be connected using IP 66 Ex cable glands in accordance with EN 60079 ff with EU type examination certificate in accordance with Directive 2014/34/EU.
- Use a cable lug or a solid wire, bended to a ‘U’, to connect the motor cable
- Make sure that sufficient strain relief measures are in place for all cable connections.
- Protect all cables in the connection chambers sufficiently against contact with metal components. Guarantee a gap of at least 6 mm (0.24 in) between all conductive components.
- Remove the desiccant in the connection chamber of the motor and position sensor.
- Do not change the factory-set installation position of the motor junction box.
- Close off any cable entries that are not required using ATEX-certified IP 66 sealing plugs.

Connection examples

Operation following a continuous set point (standard)
In the standard configuration, the binary inputs are configured as ‘MANUAL OPERATION’.
To switch the actuator to automatic mode (AUT), the following conditions must be met:
• The binary input 1 must be connected with +24 V DC (automatic operation).
• The ‘AUT’ operating mode must be selected through the graphic user interface.

Figure 13: Connection example for operation following a continuous set point (standard configuration)
... 7 Electrical connections

... Connection examples

Operation downstream from step controller

Contrac actuators can be driven using step controller pulses instead of an analog setpoint. The following conditions must be fulfilled in order to implement the step controller pulses:

- The binary inputs must be configured using the ‘STEP CONTROLLER’ function.
- The binary input 1 must be connected with +24 V DC (automatic operation).
- The ‘AUT’ operating mode must be selected through the graphic user interface.

Figure 14: Connection example for operation downstream from a step controller
## Electrical data for inputs and outputs

### Power supply

#### EBN853

| Supply voltage (standard actuators) | 115 V AC (94 to 130 V) or 230 V AC (190 to 260 V); 47.5 to 63 Hz; single-phase |
| Supply voltage (Ex actuators) | 115 V AC (94 to 127 V) or 230 V AC (190 to 253 V); 47.5 to 63 Hz; single-phase |
| Current consumption at the electronic unit (AC 115 V / AC 230 V) | Actuator | $I_{\text{max}}$ at 115 V | $I_{\text{max}}$ at 230 V | $I_{\text{pos}}$ (115 V + 230 V): approx. 40 to 50 % of $I_{\text{max}}$ |

... 7 Electrical connections

... Electrical data for inputs and outputs

Connection on the device

Power supply
Observe the following points when connecting the power supply:
- You must be able to activate the power supply of the electronic unit on-site.
- In the power supply, the supplied fuses must be installed for certain electronic units (see External fuses for EBN861 on page 30).
- Connect the power supply to the corresponding terminals of the electronic unit (see electrical connections starting on page 21).

External fuses for EBN861

![Figure 15: External fuses](image)

- External safety fuse 35 A
- External safety fuse 16 A
- Electronic unit

230 V AC

1~

1 2 3

35 A 16 A (8)

1 2 3

Note
The conductor cross-section between the fuses and the electronic unit must be at least 2.5 mm² (AWG 14).

In addition to the internal fuses, the EBN861 electronic unit requires two additional external fuses which are supplied separately with the assembly. The fuses are switched externally in the power supply. The fuses guarantee safe operation under the special starting conditions of the electronic unit.

Connection of cable shielding

![Figure 16: Cable shielding](image)

1. Remove the cover for the terminal compartment.
2. Cut the cable sheath to the required length.
3. Separate the cable shield and pull it back over the outer sheath.
4. Push the cable through the cable gland and fasten it with the clamp.
5. Make sure that the cable shield is in contact with the clip and the housing.
6. Connect the cable (see electrical connections starting on page 21).
7. Check the cable connections for tight fit and fasten the cable gland.
8. Screw the cover of the connection chamber back on tight.

Note
When installing the cover for the connection area, take care not to damage the sealing ring. If the sealing ring is damaged, contact the manufacturer.
8 Commissioning and operation

Note
It is imperative that you observe the operating instruction of the corresponding actuator for the commissioning of the electronic unit!

Note
The operating range of the actuator is not factory-set. Set up the mechanical end stops in accordance with the operating instruction for the relevant actuator.

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

General information

The basic settings ‘Define end positions’ and ‘Initial diagnosis’ can be configured via the commissioning and service field on the electronic unit.

The commissioning and service field is used to adjust the actuator to the working area and set the direction of action without using a PC.

The following configuration types are available for advanced adjustment of the actuator and its parameterization:
- With DTM
  Configuration can be performed within an FDT frame application that is approved for use with the DTM.
- With EDD
  Configuration can be performed within an EDD frame application that is approved for use with the EDD.

Communication with the electronic unit is optionally done through the RS 232 interface on the commissioning and service field or in field electronic units through digital communication with HART® or PROFIBUS®.

Note
For detailed information on the parameterization of the actuator, consult the associated configuration and parameterization instruction.

Engineering Software ECOM688 and ECOM700

Using the ECOM688 / ECOM700 engineering software, the user can read out, store, and write back the actuator-related data from the electronic unit of a Contrac control actuator.

Depending on the software version of the electronic unit, two different engineering software versions are available:
- Contrac electronic units with software version ≥ 2.00 require ECOM700.
- Contrac electronic units with software version < 2.00 require ECOM688.

Data cannot be read or written with an incorrect ECOM version.

Note
For detailed information, observe the corresponding operating instruction of the ECOM688 / ECOM700 Engineering Software.

Checks prior to commissioning

Before powering up the power supply

Before switching on the power supply and commissioning the device, check the following points:
- Correct wiring (see Electrical connections on page 18).
- Close all housing covers and terminal compartments.
- Do not open the housing cover or terminal compartments during operation!
- The actuator must have been installed in accordance with the corresponding operating instruction. The working zone and mechanical end stops must have been adjusted.
- Make sure that there is no danger of injury for persons due to movement of the actuator!

1. Switch on the power supply.

After powering up the power supply

Check the following items after powering up the power supply:
- The write protection switch on the commissioning and service field is in the ‘OFF’ position.
- The electronic unit is in the ‘MAN’ operating mode; there is no +24 V signal on binary input 1.
- No error (if an error is pending, both LEDs on the commissioning and service field will flash alternately at 4 Hz).

2. Perform parameterization and basic settings on the electronic unit.

</tbody>
</table>

Basic Setup

Setting the end positions 0 % / 100 %

Note
Once commissioning is complete, set the write protection switch to ‘ON’.

1. Switch the electronic unit to the ‘Adjustment’ operating mode. Press and hold down both travel buttons (Figure 17, pos. 10) for approx. 5 seconds, until both LEDs (Figure 17, pos. 2 and 6) flash in synch at approx. 4 Hz.

2. Use one of the travel buttons to move to the desired position.

3. Press the Accept button to accept the position (Figure 17, pos. 3 or 5); if successful, the corresponding LED flashes at a rate of 1 Hz. The other LED will continue to flash at approx. 4 Hz.

4. Use one of the travel buttons to move to the second position.

5. To accept the position, press the Accept button. If successful, both LEDs will flash at a rate of approx. 1 Hz.

6. Press both Accept buttons to accept the settings. The LEDs will stop flashing after a short period of time and the setup process is complete.

Note
If the range selected for the actuator is too small, both LEDs begin to flash again at 4 Hz and the setup procedure must be repeated with a larger value (min. actuator travel). (Information regarding actuator travel appears on the actuator name plate.)

Correcting your settings
• If after accepting the initial value for the settings you need to make a correction, press the reset button and repeat the setting procedure.
• If you need to make a correction after saving your settings, you will need to repeat the entire setup procedure from the beginning.

After commissioning
After commissioning has been performed, it is recommended that you use the control system to operate the actuator and that you check the actuator’s response and its signaling behavior. In order for the actuator to go into automatic mode after commissioning, there must be a 24 V DC-signal on binary input 1 in actuators with active binary input function (standard setting). If the digital input function is switched off, the actuator will switch to automatic mode immediately on completion of the setup process.
Manual (MAN)- and Automatic Operation (AUT)

Software version 2.00 and higher
In the manual operating mode (MAN), the actuator solely reacts upon actuation of either of the two travel buttons on the commissioning and service field. Any control via the setpoint or digital input will be ignored.
The operating mode is saved in the non-volatile memory of the electronic unit. As a result, the actuator will not start up unintentionally after a power failure.

Activating manual operating mode (MAN) on the commissioning and service field
- Simultaneously press the Accept buttons 100 % / 0 % ([Figure 17 on page 32, 3, 5]) for at least 5 seconds.
The LED for the 0%-Position will begin to flash.

Activating automatic operating mode (AUT) on the commissioning and service field
- Simultaneously press the Accept buttons 100 % / 0 % ([Figure 17 on page 32, 3, 5]) for a brief amount of time.
The LED for the 0%-Position will go out.

Activating the automatic operating mode (AUT) through the binary input or the graphic user interface
- Apply a +24 V DC signal to binary input 1 and / or select the AUT operating mode on the graphic user interface.
With the manual operating mode (MAN) activated, the LED for the 100 % position is continually lit up.

Signaling on the commissioning and service field

<tr>
<td>Switch to Device setup:</td>
<td>After this time, both LEDs will then flash in sync at 4 Hz.</td>
</tr>
<tr>
<td>Press and hold down both travel buttons for approx. 5 s.</td>
<td></td>
</tr>
<tr>
<td>Approach an end position:</td>
<td>Both LEDs will continue to flash at 4 Hz during actuator travel.</td>
</tr>
<tr>
<td>Move to the desired end position by pressing the travel button.</td>
<td></td>
</tr>
<tr>
<td>Save the initial end position:</td>
<td>The corresponding LED will flash at approx. 1 Hz, the other will continue to flash at 4 Hz.</td>
</tr>
<tr>
<td>Press the 0% or 100% button.</td>
<td></td>
</tr>
<tr>
<td>Save the second end position:</td>
<td>The related LED will flash at approx. 1 Hz in sync with the first LED.</td>
</tr>
<tr>
<td>Press the 0% or 100% button.</td>
<td></td>
</tr>
</tbody>
</table>

Special Requirements

- Standard operation: MAN / AUT.
The LEDs are not lit.
- Travel via the operating button on the commissioning and service field takes priority over the control system.
The LEDs are not lit.

Error (both LEDs flashing alternately at 4 Hz)
- Press the RESET button to reset the error messages.
  If there are no other errors pending, both LEDs will go out.
- Reset if the operating range is overshot:
  After approx. 5 seconds, the LEDs will stop flashing briefly. After a ‘reset’, the electronic unit will be in Adjustment Mode!
- Press and hold down both travel buttons for 5 seconds and then press the RESET button.

ECOM Mode

The ECOM688 engineering tool is used to access the electronic unit.
Both LEDs light up continuously.
9 Diagnosis / error messages

Definition – Alarms and Errors

Alarms
The actuator / electronic unit is in a critical state (e.g., high temperature), which currently does not affect the actuator, electronic unit, process or persons.
The actuator functions are available. Previous alarms are stored in the ‘Saved Alarms’ area in the electronic unit. Use the graphic user interface to read out saved alarms.

Errors
The actuator / electronic unit is in a critical state, e.g. control circuit monitoring, which is directly impairing the actuator, electronic unit, process or persons.
The actuator is switched off and the actuator functions are no longer available. Previous error messages are stored in the ‘Saved Errors’ area in the electronic unit. Use the graphic user interface to read out saved errors. Error messages cannot be reset until the cause of the error has been eliminated.

10 Maintenance

Electronic unit

The electronic unit does not require any maintenance if it operated in line with intended use under normal operating conditions.

Note
Manipulation by users shall immediately render the warranty for the device invalid.

Control actuator

Note
For detailed information on the maintenance of the actuator, consult the operating instruction of the actuator!

Contrac actuators feature a robust construction. As a result, they are highly reliable and require minimal maintenance. The maintenance intervals depend upon the effective load and are therefore not specified here.
The built-in microprocessor evaluates the actual load factors (e.g. torques, forces, temperatures, etc.) and derives the remaining operating time until the next routine maintenance is required.
Use the configuration program to view this information.

11 Repair

Repair and maintenance activities may only be performed by authorized customer service personnel.
When replacing or repairing individual components, use original spare parts.

Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes.
Fill out the return form (see Return form on page 42) and include this with the device.
In accordance with the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes:
All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 4 for nearest service location.

* The 35 A safety fuse and the 16 A thermal circuit breaker are included in the scope of delivery. The conductor cross-section between the fuse and the electronic system must be at least 2.5 mm² (14 AWG).
12 Recycling and disposal

Note

Products that are marked with the adjacent symbol may not be disposed of as unsorted municipal waste (domestic waste). They should be disposed of through separate collection of electric and electronic devices.

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:

• As of 8/15/2018, this product will be under the open scope of the WEEE Directive 2012/19/EU and relevant national laws (for example, ElektroG - Electrical Equipment Act - in Germany).
• The product must be supplied to a specialist recycling company. Do not use municipal waste collection points. These may be used for privately used products only in accordance with WEEE Directive 2012/19/EU.
• If there is no possibility to dispose of the old equipment properly, our Service can take care of its pick-up and disposal for a fee.

Notice on RoHS II-Directive 2011/65/EU

As of 7/22/2019, the products provided by ABB Automation Products GmbH fall within the scope of regulations on hazardous substances with restricted uses or the directive on waste electrical and electronic equipment in accordance with ElektroG.

Note

Detailed information on the RoHS Directive is available in the ABB download area.

13 Approvals and certifications

CE mark

The version of the device as provided by us meets the requirements of the following EU directives:

• EMC directive 2014/30/EU
• Machinery Directive 2006/42/EC / 2006/42/EG
• Low Voltage Directive 2014/35/EU
• RoHS II Directive 2011/65/EU (as of 7/22/2019)

14 Additional documents

Note

All documentation, declarations of conformity and certificates are available in ABB's download area.

15 Appendix

Return form

Statement on the contamination of devices and components

Repair and/or maintenance work will only be performed on devices and components if a statement form has been completed and submitted. Otherwise, the device/component returned may be rejected. This statement form may only be completed and signed by authorized specialist personnel employed by the operator.

Customer details:

EBN853 / EBN861  
Electronic unit for field installation (Contrac)  

Introduction  
The electronic unit builds the interface between the actuator and the control system. During continuous positioning, the electronic unit varies the motor torque continuously until the actuator force and the control valve force are balanced. High response sensitivity and high positioning accuracy with short positioning time ensure an excellent control quality and a long actuator life.

Additional Information  
Additional documentation on EBN853 / EBN861 is available for download free of charge at www.abb.com/actuators. Alternatively simply scan this code:
