Operating principle and applications for thermistor motor protection relays
The CM range of thermistor motor protection relays are used to monitor motors equipped with PTC temperature sensors. The PTC temperature sensors are incorporated in the motor windings to measure the motor heating. This enables direct control and evaluation of the following operating conditions:

- heavy duty starting
- rapid cycling
- single-phase operation (phase loss)
- high ambient temperature
- insufficient cooling
- break operation
- unbalanced voltages

The relay is independent of the rated motor current, the insulation class and the method of starting. The PTC sensors are connected in series to the terminals T1 and T2. The number of possible PTC sensors per measuring circuit is limited by the sum of the individual PTC sensor resistances.

\[ RG = R1 + R2 + RN \leq 1.5 \, \text{k}\Omega \]

Under normal operating conditions the resistance is below the trip point. If one of the PTC resistors heats up excessively, the output relay de-energizes.

The output relay re-energizes automatically after the PTC cools.

Further applications:
Temperature monitoring of equipment with PTC sensors integrated, such as

- machine rolling bearings
- hot-air ventilators
- oil
- air
- heating installations
