The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Parameter		Value
Temperature		
	Operating	-40 °C...+70 °C -40 °C...-30 °C: Proper start-up of system; technical data not guaranteed -40 °C...0 °C: Due to the LCD technology, the display might respond very slowly. -40 °C...+40 °C: Vertical mounting of modules possible, output load limited to 50 % per group +60 °C...+70 °C with the following deratings: ● System is limited to max. 2 communication modules per terminal base ● Applications certified for cULus up to +60 °C ● Digital inputs: maximum number of simultaneously switched on input channels limited to 75 % per group (e.g. 8 channels => 6 channels) ● Digital outputs: output current maximum value (all channels together) limited to 75 % per group (e.g. 8 A => 6 A) ● Analog outputs only if configured as voltage output: maximum total output current per group is limited to 75 % (e.g. 40 mA => 30 mA) ● Analog outputs only if configured as current output: maximum number of simultaneously used output channels limited to 75 % per group (e.g. 4 channels => 3 channels)
	Storage / Transport	-40 °C...+85 °C
Humidity		Operating / Storage: 100 % r. H. with condensation
Air pressure		Operating: -1000 m....4000 m (1080 hPa...620 hPa) > 2000 m (< 795 hPa): ● max. operating temperature must be reduced by 10 K (e.g. 70 °C to 60°C) ● I/O module relay contacts must be operated with 24 V nominal only
Immunity to corrosive gases		Operating: Yes, according to: ISA S71.04.1985 Harsh group A, G3/GX IEC 60721-3-3 3C2 / 3C3
Immunity to salt mist		Operating: Yes, horizontal mounting only, according to IEC 60068-2-52 severity level: 1

NOTICE!

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices. *Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3333*

Table 615: Electromagnetic compatibility

Parameter		Value
Device suitable for:		
	Industrial applications	Yes
	Domestic applications	No
Radiated emission (radio disturbances)		Yes, according to: CISPR 16-2-3
Conducted emission (radio disturbances)		Yes, according to: CISPR 16-2-1, CISPR 16-1-2
Electrostatic discharge (ESD)		Yes, according to: IEC 61000-4-2, zone B, criterion B
Fast transient interference voltages (burst)		Yes, according to: IEC 61000-4-4, zone B, criterion B
High energy transient interference voltages (surge)		Yes, according to: IEC 61000-4-5, zone B, criterion B
Influence of radiated disturbances		Yes, according to: IEC 61000-4-3, zone B, criterion A
Influence of line-conducted interferences		Yes, according to: IEC 61000-4-6, zone B, criterion A
Influence of power frequency magnetic fields		Yes, according to: IEC 61000-4-8, zone B, criterion A

In order to prevent malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.

NOTICE!

Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↳ *Chapter 1.6.4.6.5.6 “TA524 - Dummy communication module” on page 3446*.
– I/O bus connectors must not be touched during operation.

Mechanical data

Parameter	Value
Wiring method	Spring terminals
Degree of protection	IP 20
Vibration resistance	Yes, according to: IEC 61131-2 IEC 60068-2-6 IEC 60068-2-64
Shock resistance	Yes, according to: IEC 60068-2-27
Assembly position	Horizontal Vertical (no application in salt mist environment)
Assembly on DIN rail	
DIN rail type	According to IEC 60715 35 mm, depth 7.5 mm or 15 mm
Assembly with screws	
Screw diameter	4 mm
Fastening torque	1.2 Nm

Environmental tests

Parameter	Value

1.6.4.8 AC500-S

The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the *AC500-S safety user manual* is only available on our website.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S / SM560-S-FD-1 / SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

1.6.5 System technology for AC500 V3 products

This chapter provides advanced information on the system technology of AC500 control systems from a general perspective. It provides information to link the details from the hardware descriptions (provided in the device specifications section) with detailed information on configuring/programming a corresponding library (provided in the individual library sections).

Configuration of a specific device with Automation Builder is described in the PLC configuration section.

1.6.5.1 System technology of CPU and overall system

1.6.5.1.1 Handling of remanent variables for AC500 V3 products

The retain / persistent memory must be buffered by a battery TA521 for the PLCs PM56xx-2ETH. Following described functionalities are only working if a battery is inserted. Take care about the handling for TA521 battery.

Chapter 1.6.4.6.5.4 “TA521 - Battery” on page 3441

The AC500-eCo V3 PLCs, PM50xx-ETH PLCs don't need a battery.

All operands supported by CODESYS are described in *Chapter 1.4.1.7 “Configuring I/O Links” on page 213*. For the memory sizes of the different CPUs, see for AC500-eCo V3 *“AC500-eCo V3 processor modules” on page 3457* and for AC500 V3 *“AC500 V3 processor modules” on page 3457*.

This part of the documentation describes the declaration of remanent variables for AC500 V3 products.

Different handling of remanent variables in AC500 FW ≥V3.0.2

- *No more %R memory area (use instead %M with {no_init} Chapter 1.6.5.1.1.5 “Initialization of %M variables” on page 3461)*
- *Creating of addresses for "VAR RETAIN PERSISTENT" variables automatically by IEC Compiler*

It is **NOT** possible to change the structure (e.g. add, delete, change order, ..) of retain / persisten variables of a project and update the project via memory card.

Up to version of SystemFW 3.4.x the boot project will be deleted (renamed into application.err) and the PLC will not load the boot project anymore. Also download of new/other project with Automation Builder failes.

Workaround:

- Automation Builder ➔ PLC Shell ➔ clearsram all ➔ retain persistent / retain area is deleted (not the %M area) ➔ application is running after reboot with initialized / retain / persistent data
- Automation Builder ➔ PLC Shell ➔ clearsram all ➔ retain persistent / retain area is deleted ➔ sram c m (clear %M) ➔ %M area is deleted ➔ reboot ➔ application is running with initialized /retain/persistent/%M data
- Automation Builder empty project ➔ Reset Origin Device ➔ retain persistent / retain area / %M area is deleted ➔ new update via SD card ➔ application is running after reboot with initialized data
- For midrange reboot without battery ➔ application is running after reboot with initialized data

The application is running with initialized persistent and/or retain after updating the application via memory card and rebooting the PLC.

In version of SystemFW 3.5.x the changed retain persistent / retain area is deleted. Application is running after reboot with initialized / retain / persistent data.

In case of trouble use the above described workaround.

Memory sizes

AC500-eCo V3 processor modules

PLC type	system RAM disk	userdisk PlcLogic ...	Retain, ProzM area	flash disk	memory card
PM5012-x-ETH	Dynamically /max. 7.6 MB	30 MB	8 kB Retain and persistent 4 kB (of which 88 byte are reserved for allocation table) ProzM 4 kB	None	see *Chapter 1.6.4.6.5.2 “MC5102 - Micro memory card with micro memory card adapter” on page 3432*
PM5032-x-ETH			32 kB Retain and persistent 16 kB (of which 88 byte are reserved for allocation table) ProzM 16 kB		
PM5052-x-ETH					
PM5072-T-2ETH(W)			100 kB Retain and persistent 36 kB (of which 88 byte are reserved for allocation table) ProzM 64 kB		

AC500 V3 processor modules

PLC type	system RAM disk	userdisk PlcLogic ...	SRAM Retain, ProzM area	flash disk	memory card
PM5630-2ETH	Dynamically /max. 7.6 MB	40 MB 30 MB (as of V3.4.0)	256 kB Retain and persistent 128 kB (of which 24 byte are reserved for allocation table) ProzM 128 kB	None	see *Chapter 1.6.4.6.5.1 “MC502 - Memory card” on page 3428* *Chapter 1.6.4.6.5.3 “MC5141 - Memory card” on page 3437* *Chapter 1.6.4.6.5.2 “MC5102 - Micro memory card with micro memory card adapter” on page 3432*
PM5650-2ETH	Dynamically /max. 16 MB	246 MB (as of V3.0.x) 381 MB (as of V3.1) 285.75 (as of V3.4.0)			
PM5670-2ETH	Dynamically /max. 69 MB	858 MB 643.50 MB (as of V3.4.0)	1536 MB 1 MB retain and persistent (of which 24 byte are reserved for allocation table) 512 kB ProzM		
PM5675-2ETH				8 GB	

> *It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.*

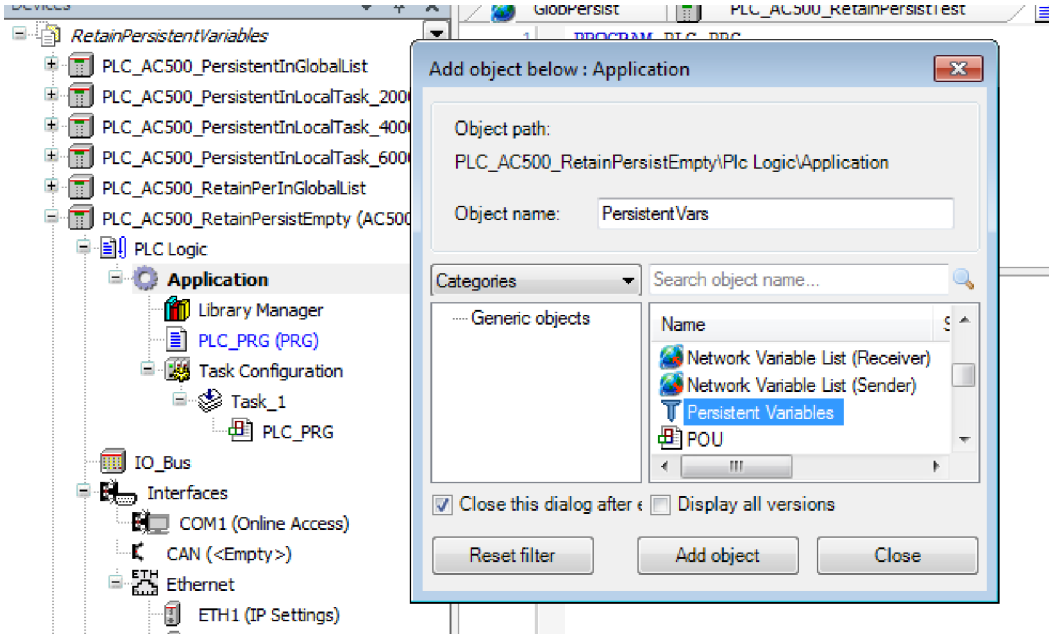
Adding a global list of persistent/retain variables

A global list of persistent variables will be added with the standard definition for persistent variables "VAR RETAIN PERSISTENT" (see Remanent variables ↳ *Chapter 1.4.1.19.2.13 “Retain Variable - RETAIN” on page 537* ↳ *Chapter 1.4.1.19.2.12 “Persistent Variable - PERSISTENT” on page 535*).

First steps:

1. Expand the object path of your PLC
2. After right click on *App* select *Add object* in the context menu.

   The window *Add object below: Application* appears.

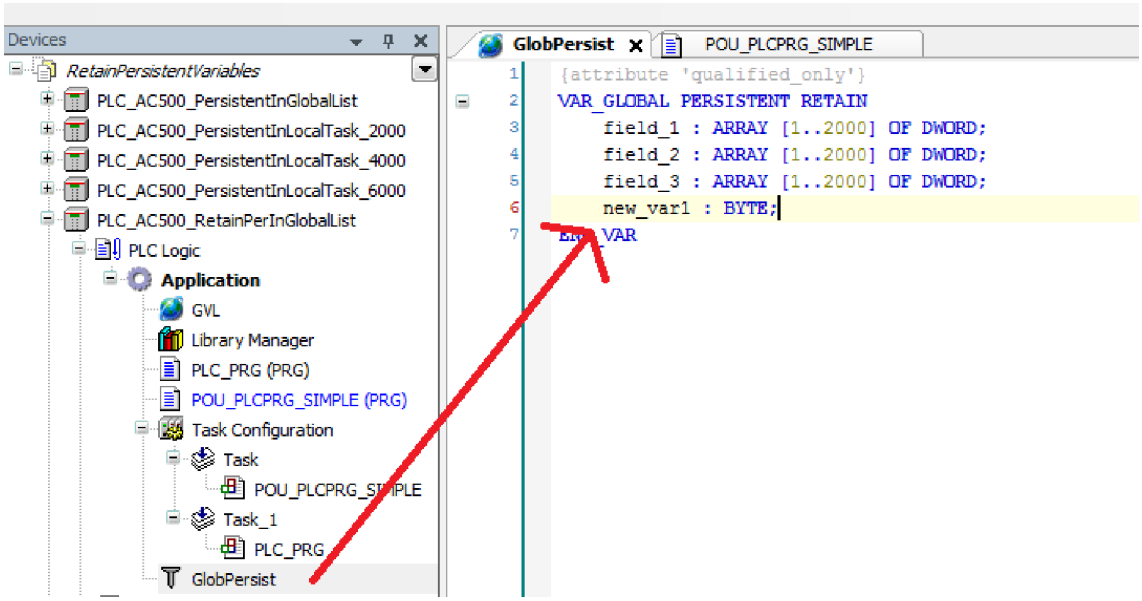


3. Select *Persistent Variables* and click *“Add object”*.

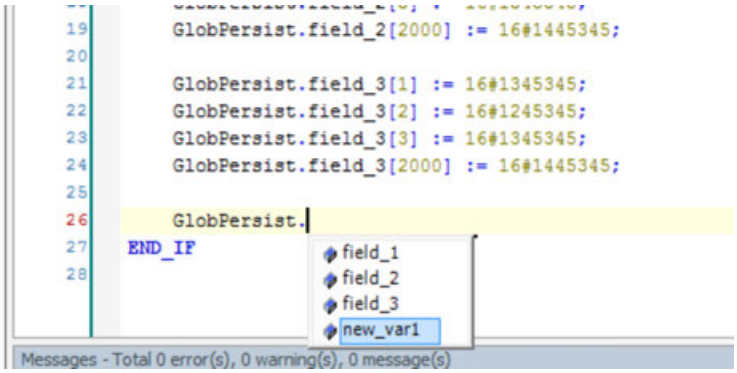
The object name can be chosen freely. In the application it will be reused to reference the persistent variables.

Declaring a new variable in global list

Declare a new variable in the window "*GlobPersist*".



Afterwards the variable can be selected in the program.



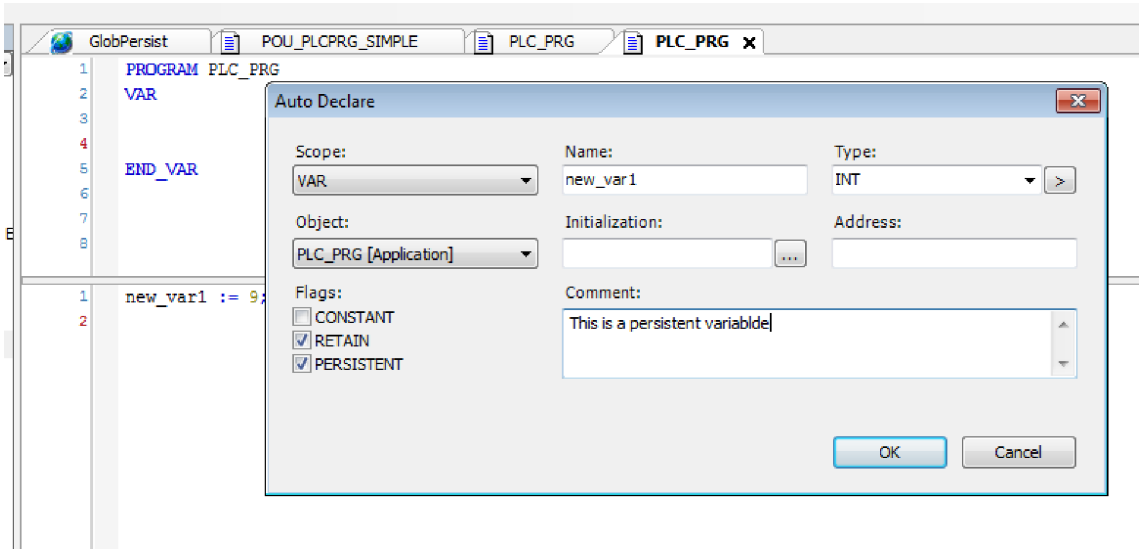
In this way the persistent variable can be accessed directly.

> *Do not use the same persistent variable in different IEC tasks, to avoid problems with consistency.*

Declaring a new persistent/retain variable in local POU

It is also possible to declare a persistent/retain variable in a local POU and not in the global list of persistent variables.

> *It is not recommended to declare a large number of persistent variables locally, due to the potentially effect to performance.*

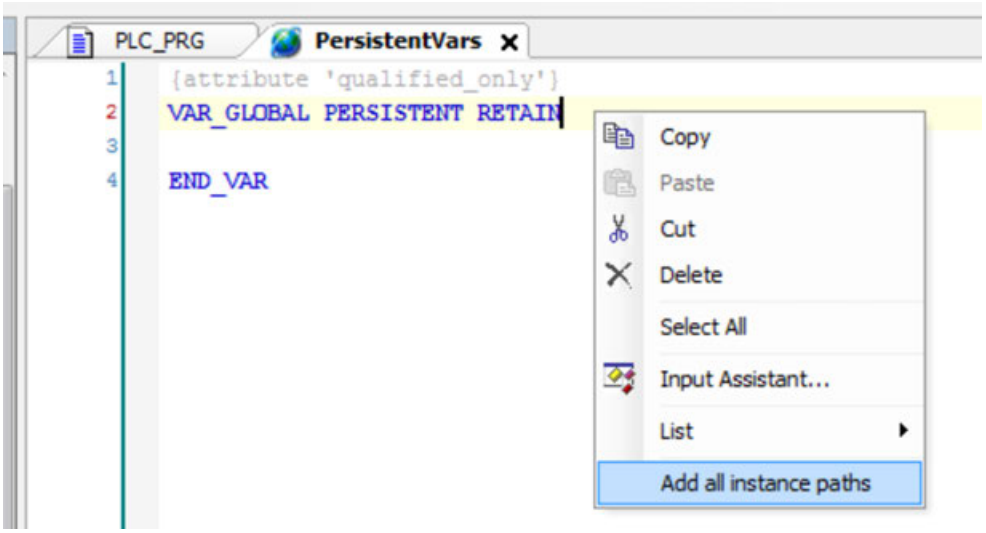


The auto-declare mechanism declares **always** a persistent variable locally and not in the global list. If the program will be executed, the following warning appears in the message window:

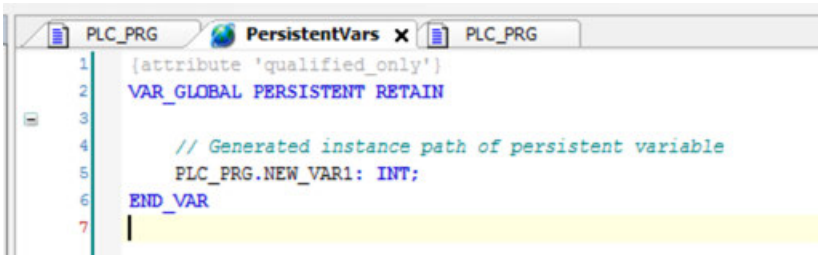
C0244: No VAR_PERSISTENT-list is part of the application to enter instance path for variable PLC_PRG.new_var1

The locally declared persistent variable has to be added to the global list.

> **NOTICE!**
> For the initialization of a Retain/Persistent variable the value of the global list is used NOT the value of the local declaration.
>
> For further information see *"RetainPersistentExample.project"*.



1. Right-click in window "*PersistentVars*".
2. Select option "*Add all instance paths*".
   ⇨ Afterwards the persistent variables are added.



The application can be downloaded to the PLC

> *It is NOT recommended to declare a new persistent variable in the application due to performance problems.*
>
> *For example PM5650-2ETH:*
>
> *1000 DWORD ≈ 600µs additional cycle time of task.*

Initialization of %M variables

After download or restart, all %M variables will be initialized to 0. This can be prevented by setting the "*no_init*" attribute.

In doing so the %M variables behave similar to the "*VAR RETAIN PERSISTENT*" variables.

```
cnt : DWORD := 0;
setvar : BOOL := FALSE;
{attribute 'no_init'}
ProzMivar AT %MW0: WORD;
ProzMivarField AT %MW1: ARRAY [1..1000] OF WORD;
ProzMivar1 AT %MW1001: WORD;
```

In the example above variable "*ProzMivar*" has the attribute "*no_init*". This variable will not be initialized and keeps its last value.

The attribute "*no_init*" is always and only valid for the next following variable (see *Chapter 1.4.1.19.6.2.30 “Attribute 'noinit'” on page 713*).

The following two variables "*Proz MivarField*" and "*Proz Mivar1*" will be further on initialized to 0.

Behavior of retain variables

The declaration of the retain variables strictly follows the 3S standard (see Remanent variables *Chapter 1.4.1.19.2.13 “Retain Variable - RETAIN” on page 537* *Chapter 1.4.1.19.2.12 “Persistent Variable - PERSISTENT” on page 535*).

For retain variables it does not matter if they are declared locally in a program or in the global variable list.

PLC shell command for import and export of retain/persistent variables

The syntax of the command is: *sram <direction><area><path>*

Supported options:	
Direction:	i=import, e=export
Area:	rp=Retain/Persistent, m=%M area
Path:	Any pathname

The file will be stored in the user partition of the PLC. This data can be imported or exported via the FTP-Server or the Files dialog in Automation Builder.

If no path is indicated, the files are saved under *"PlcLogic/<ApplicationName>/<ApplicationName>.ret or .prozm"*.

If a path is indicated, the files are saved under or accessed via *"<path>/<ApplicationName>.ret or .prozm"*.

A non-existing path is created with the exception of the memory card. The path for the memory card must be an existing path. On the memory card a non-existing path leads to an error message.

Data area	File extension	Path
Retain/Persistent	.ret	PlcLogic/<ApplicationName>/<Application-Name>.ret <path>/<ApplicationName>.ret
%M (memory area)	.prozm	PlcLogic/<ApplicationName>/<Application-Name>.prozm <path>/<ApplicationName>.prozm

Examples:

Application	Command	File
myApp	sram e rp	*PlcLogic/myApp/myApp.ret*
	sram e ep data	*data/myApp.ret*
Application	sram i m	*PlcLogic/Application/Application.prozm*
	sram i m data	*data/Application.prozm*

If the path "data" does not exist, tha path is created. The path for the memory card must be an existing path. The path "sdcard/data" leads to an error message if the path "data" does not exists on the memory card.

Only if the application uses Retain or Retain/Persistent variables the command generates an output file.

Attention!
It is recommended to execute the PLC shell command only while PLC is in state STOP, or it is ensured that there is no write access to the %M or the Retain/Persistent area.

Import and export of retain/persistent variables by library functions

It is also possible to import or export the Retain/Persistent variables and the %M markers via system function calls from the PLC Application. The required system functions are implemented in the IEC library *ABB_IntUtils_AC500.library*.

It provides the following Functions or function blocks:

- SRAM_IMPORT
- SRAM_EXPORT
- SRAM_CLEARED

SRAM_IMPORT

The function block *SRAM_IMPORT* is used to import the %M markers and the Retain/Persistent variables from the specified files in the userdisk.

Import only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

It is recommended to import only when the %M and/or the Retain/Persistent area is not accessed by the application.

Otherwise inconsistencies are possible.

For a complete description of the function block see *ABB_IntUtils_AC500.library*.

SRAM_EXPORT

The function block *SRAM_EXPORT* is used to export the %M markers and the Retain/Persistent variables to the specified files in the userdisk.

Export only those %M markers and/or Retain/Persistent variables that are compatible to the application running in the PLC.

It is recommended to export only when the %M and/or the Retain/Persistent area is not accessed by the application.

Otherwise inconsistencies are possible.

For a complete description of the function block see *ABB_IntUtils_AC500.library*.

SRAM_CLEARED

The Function SRAM_CLEARED is used to check if the *SRAM* was deleted.

For a complete description of the Function see *ABB_IntUtils_AC500.library*.

1.6.5.1.2 System processing

System start-up / Program processing

AC500-eCo processor modules do not have an integrated display and keyboard. All functions related to keyboard and display are not applied for those devices.

Definitions: PLC system start-up

Cold start

The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the “cold start” mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see *Chapter 1.4.1.20.3.6.10 “Command 'Reset Cold'” on page 1038*).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start

- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see *Chapter 1.4.1.20.3.6.11 “Command 'Reset Warm'” on page 1038*).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP

- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP

- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for $\geq$ 5 s in STOP mode.

Reset (cold)

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)

- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN

- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START

- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.

Download

- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change

- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process (see *Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3456*).

Start of the user program

The user program (UP) is started according to the following table. It is assumed that a valid user program is stored to the Flash memory.

See *Chapter 1.6.7.1.4 “Storage device details” on page 3997*.

Action	No memory card with UP installed Auto run = ON	No memory card with UP installed Auto run = OFF	Memory card with UP installed Auto run = ON	Memory card with UP installed Auto run = OFF
Voltage ON or Warm start or Cold start	UP is loaded from Flash into RAM and started from Flash.	No UP is loaded from Flash. When logging in, the message "No program available in the controller ..." is displayed.	UP is loaded from the memory card into Flash memory and RAM and then started from RAM.	UP is loaded from the memory card to the Flash memory. RAM remains empty. When logging in, the message "No program available in the controller ..." is displayed.
STOP -> RUN	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.
STOP -> START	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.	UP in RAM is started.
Download [1)]	The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.	The built UP is loaded from the PC into the PLC's RAM.	The UP currently stored in the CPU's RAM is stopped. The built UP is loaded from the PC into the PLC's RAM.	The built UP is loaded from the PC into the PLC's RAM.
Online Change [2)]	Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.	The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.	Processing of the UP currently stored in the CPU's RAM is continued. The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized and processed.	The changes made to the UP are loaded from the PC into the PLC's RAM. The UP is reorganized.

Remarks:

[1)]: After the download is completed, the program is not automatically stored to the Flash memory. To perform this, create a boot project *Chapter 1.4.1.10.6 “Generating boot applications” on page 391*. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON. Start the program either by pressing the RUN/STOP function key or using Automation Builder.

[2)]: After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.

[2)]: After the online change process is completed, the program is not automatically stored to the Flash memory. For this, after reorganization is completed create a boot project *Chapter 1.4.1.10.6 “Generating boot applications” on page 391*. During reorganization and flashing, no further online change command is allowed. If the UP is not stored to the Flash memory, the UP is reloaded from the Flash memory after voltage OFF/ON.

Task configuration

This statement is applicable to PM5032-x-ETH, PM5052-x-ETH and PM5072-T-2ETH(W).

If the main task cycle is faster than 10 ms, remove the onboard inputs I8..I11 and I/O channels of option boards or option boards for serial communication from the main task cycle, but use a separate task cycle.

The task model processes the following kind of tasks:

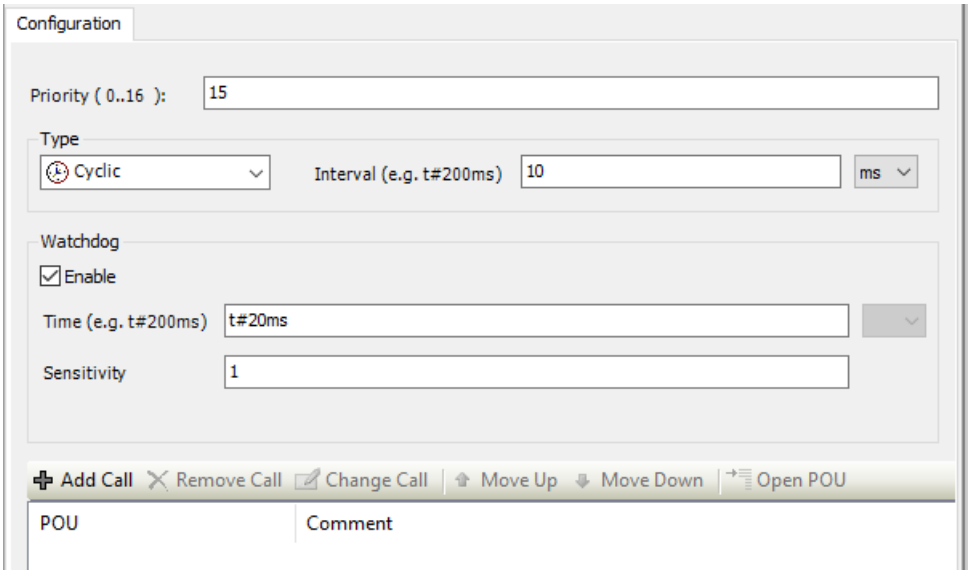
- Non-real-time system tasks: system tasks with no real-time property (e.g. file access, Ethernet communication, OPC UA, …)
- Non-real-time IEC tasks: IEC tasks with no real-time property
- Real-time system tasks: system tasks with real-time property
- Real-time IEC tasks: IEC tasks with real-time property

The possible number of tasks depends on the type of processor module. How to distribute the IEC tasks over multiple CPU cores and on how to use the IEC task configuration for Automation Builder is described in detail in the CODESYS task configuration section.

- Task configuration *Chapter 1.4.1.8.16 “Task Configuration” on page 292*
- Tab 'Configuration' *Chapter 1.4.1.20.2.27.1 “Tab 'Configuration'” on page 942*

Watchdog handling in IEC tasks

If a new project is created or a new task is inserted in the task configuration (*Chapter 1.4.1.8.16 “Task Configuration” on page 292*), the task is created with the “default task settings” priority = 15 and cycle time = 10 ms. The watchdog is activated, set to 20 ms and sensitivity = 1.



The watchdog handling depends also on the setting of the CPU parameter “Missed cycle behavior”:

Parameter	Type	Value	Default Value	Unit	Descripti
Error LED	Enumeration of BYTE	On	On		Error LED:
Check battery	Enumeration of BYTE	On	On		Check bat
Stop on error class	Enumeration of BYTE	Diagnosis of at least error class 2	Diagnosis of at least error class 2		Prevents
Diagnosis - Add PLC name to node name	Enumeration of BYTE	Off	Off		Diagnosis
PLC behaviour after voltage dip	Enumeration of BYTE	Halt	Halt		Behaviour
Diagnosis history	Enumeration of BYTE	On	On		Enables /
Max. diagnosis history entries	WORD(0..50000)	1000	1000		Max. num
Missed cycle behavior	Enumeration of BYTE	Next	Next		Behavior
Communicaton Schema	Enumeration of BYTE	Default	Default		Communic

This parameter configures the behavior of a real-time task if the processing time of the task is longer than the cycle time.

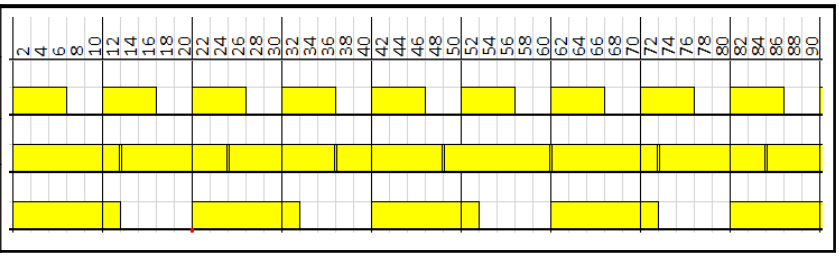
“Next” means – skip the missed cycle and start the task on the next cycle on time. This might result in skipped tasks, but at least the highest priority task is always started on time, if it is not skipped (= default value).

“ASAP” means - start the task immediately when possible.

> *This parameter is valid for all real-time tasks (priorities 0-15) of the PLC application.*

Example 1: default task settings, t_{Task} – processing time of the task in [ms]

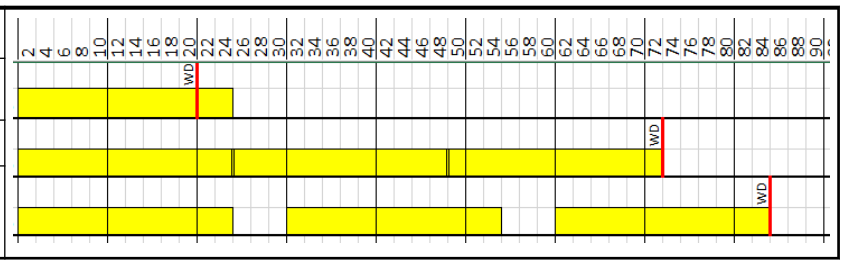
t_{Task}	Par.
6	Next
12	ASAP
12	Next



No watchdog occurs, also if the processing time of the task is longer than the cycle time (cases 2 and 3) since the processing time is shorter than the watchdog time.

Example 2: default task settings, t_{Task} – processing time of the task 24 ms, S_{WD} – sensitivity of the watchdog

S_{WD}	Par.
1	Next
3	ASAP
3	Next



Watchdog occurs in all 3 cases since the processing time of the task is longer than the watchdog time. According to the setting of the sensitivity the watchdog occurs after 1 or 3 cycles.

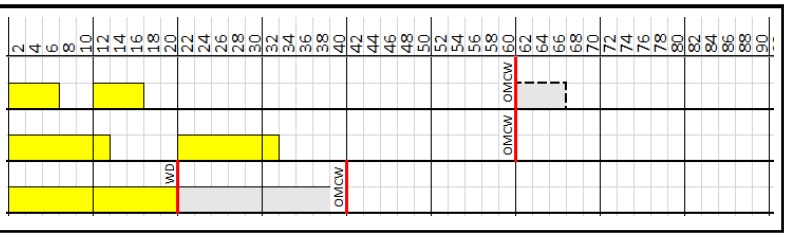
Beside the task watchdog there is the so-called “omitted cycle watchdog” (OMCW). The omitted cycle watchdog is only active if a watchdog has been configured for the task.

The "normal" Watchdog triggers only if the processing time of the task exceeds the set Watchdog value.

The omitted cycle watchdog on the other hand checks completely "failed" cycles. E.g. if the scheduler has a problem and the task never executes its cycle again, then the "normal" watchdog will not be triggered. Therefore, the run time does an additional check, if a task has been executed within the double cycle time or the double watchdog time (the bigger of both is valid). If not, the omitted cycle watchdog is triggered.

Example 3: default task settings, t_{Task} - processing time of the task in ms, C_{lost} - lost cycles

t_{Task}	C_{lost}
6	3-6
12	3-6
∞	2ff

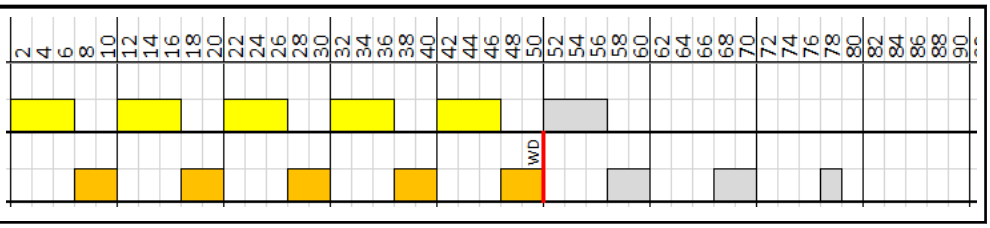


Omitted cycle watchdog occurs after double watchdog time (2 x 20 ms = 40 ms).

Example 4: Two tasks with following settings:

Task	Priority	Cycle time [ms]	Watchdog time [ms]	Sensitivity	Parameter	Task processing time [ms]
1	10	10	20	1	Next	6
2	15	50	50	1		30

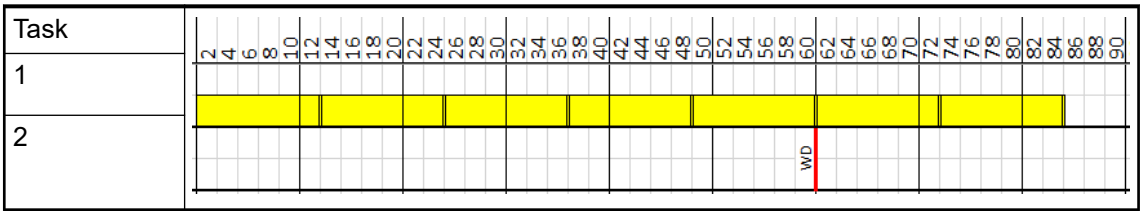
Task
1
2



Watchdog of task 2 is triggered since the task cannot run in the defined task cycle.

Example 5: Two tasks with following settings

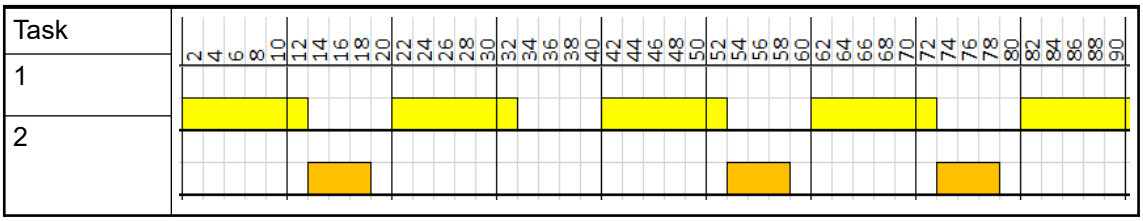
Task	Priority	Cycle time [ms]	Watchdog time [ms]	Sensitivity	Parameter	Task processing time [ms]
1	10	10	20	1	ASAP	12
2	15	30	60	1		6



Watchdog of task 2 is triggered since the task cannot start in the defined task cycle.

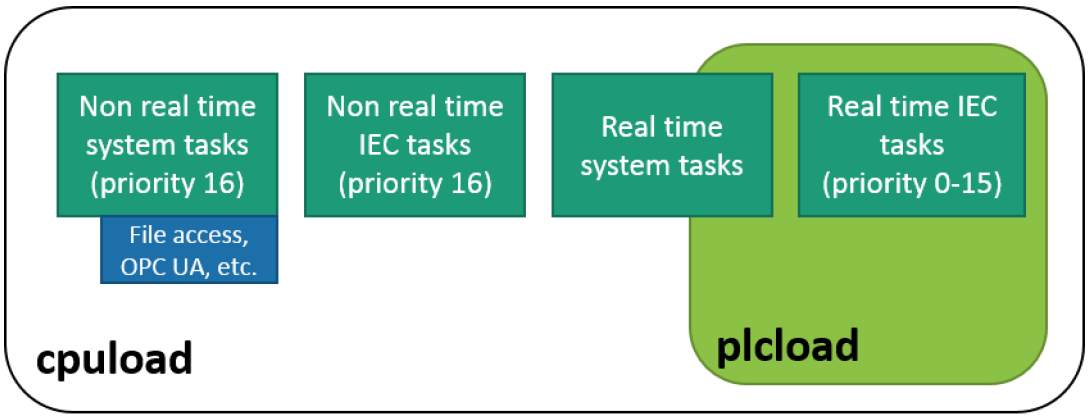
Example 6: Two tasks with following settings

Task	Priority	Cycle time [ms]	Watchdog time [ms]	Sensitivity	Parameter	Task processing time [ms]
1	10	10	20	1	Next	12
2	15	30	60	1		6



No watchdog is triggered, but task 1 is running in 20 ms cycle instead of configured 10 ms cycle. Task 2 is running alternating every 20 ms or 40 ms.

PLC utilization



The parameters `cpuload` and `plcload` represent the actual CPU load or PLC load of the system.

- `cpuload`: This value represents the time the PLC requires to calculate all processes running on the PLC. For a good system performance this value should be less than 80%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC or by reducing the amount of processes.
- `plcload`: This value represents the time the PLC requires to calculate all real-time processes. Real-time processes are either high priority system tasks or IEC tasks with a priority between 0 and 15. For a good system performance this value should be less than 60%. In case of a higher value, the degree of utilization should be reduced by using a more powerful PLC.

During commissioning we recommend to monitor the CPU and PLC values online with one of the following methods:

Automation Builder

- Commissioning via *Chapter 1.6.6.4.4 “PLC shell commands” on page 3950* (command 'plcload' and 'cpuload').
- Commissioning via *Chapter 1.4.1.12.3 “Data Recording with Trace” on page 421*. In order to display the load of the CPU or PLC, create a new Device Trace object in your PLC project. Then upload the data into the views *Chapter 1.4.1.20.3.21.19 “ Command 'Upload Trace'” on page 1146*. .

IEC applications/IEC program

To access the parameters `plcload` and `cpuload` please use system functions as follows:

- `plcload`: SchedGetProcessorLoad() included in library ‘CmpSchedule’.
- `cpuload`: SysMCGetLoad() included in library ‘SysCpuMultiCore’.

Managing priorities by selecting the appropriate communication schema

The AC500 V3 PLCs have an integrated preemptive real-time operating system that supports 100 priorities from 0 (lowest priority) to 99 (highest priority). Hereof 0 ... 49 in the non-real-time area and 50...99 in the real-time area.

For real-time tasks in the IEC user program 16 priorities from 0 (highest priority) to 15 (lowest priority) can be used. They correspond to the operating system priorities 67 (for IEC task priority 0) to 52 (for IEC task priority 15).

The file system, the memory card and flash tasks run on lowest real-time priority 50.

The non-real-time IEC task priority 16 runs in the non-real-time area. Likewise, all Ethernet protocols and the diagnosis system run in the non-real-time area.

As of Automation Builder 2.4.1 and *“SystemFW”* 3.4.1 provides a new PLC boot parameter `Communication Schema` (non-real time vs. real-time Ethernet data) for AC500 V3:

- Name: “Default”
  Description: Balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.
  Further information on page 3472
- Name: “Communication modules”
  Description: Priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.
  Further information on page 3473

- Name: “Onboard Ethernet”
  Description: Priority for onboard Ethernet communication (e. g. via Modbus TCP). Lower priority for communication via communication modules (CMs)
  Further information on page 3473
- Name: “Realtime onboard Ethernet”
  Description: Very high priority for onboard Ethernet communication (e. g. EtherCAT, PROFINET, Ethernet/IP). Low priority for communication via communication modules (CMs)
  Further information on page 3473

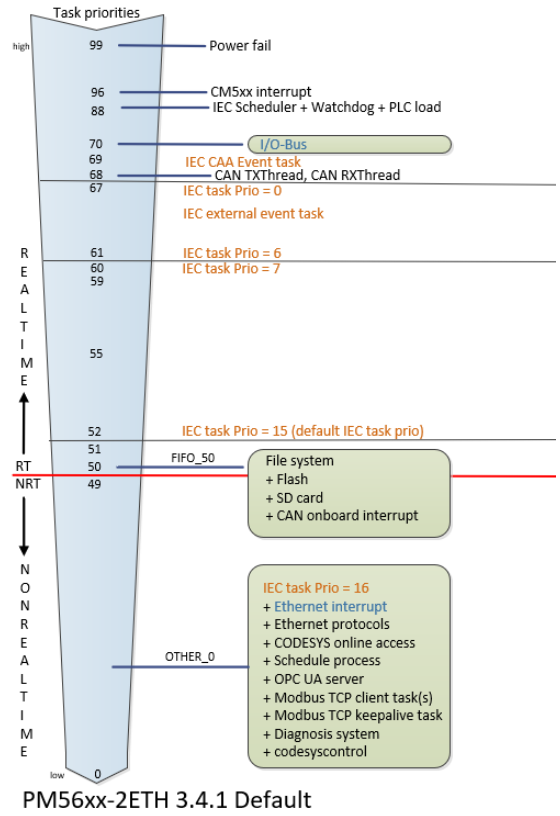
> *The value “Realtime onboard Ethernet” is reserved for later use and has currently the same settings as “Onboard Ethernet” and in addition the I/O bus on the same priority as the Ethernet.*

In version of *“SystemFW”* 3.5.0 the priority of onboard CAN interface has been adapted and is now included in the priority schemas.

In addition the parameter `Communication Schema` is now also available for the eCo-V3 PLCs.

The „Default“ priority schema in *“SystemFW”* 3.4.1

The default value of the boot-parameter `Communication Schema` is the balanced priority for communication via communication modules (CMs) and onboard Ethernet communication. The following figure gives an overview about the main task priorities in the AC500 V3 PLCs.



The highest IEC task priority 0 should be used for high prior functions in the PLC with short execution time.

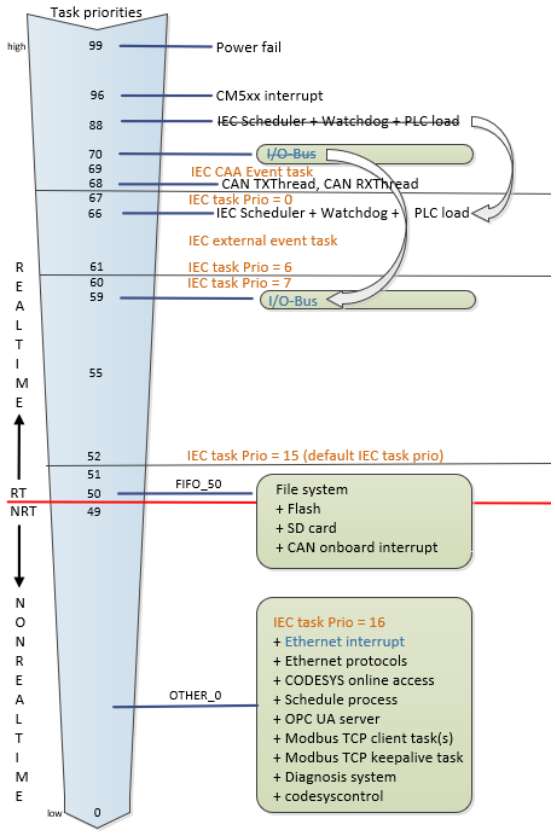
The communication modules interrupts (CM5xx), the local I/O bus, the IEC scheduler observer task and the CAA event task are processed with higher priority than all user IEC tasks.

Ethernet runs on non-real-time priority.

The default setting of the priorities is suitable for most applications and corresponds to the settings in the firmware versions 3.4.0 and before.

The “Communication modules” priority schema in *“SystemFW”* 3.4.1

The communication modules priority schema has been established for priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.



PM56xx-2ETH 3.4.1 Communication modules

The highest IEC task priority 0 should be used for the sync task of the highest priority communication module, e. g. CM579-ETHCAT, priority 1 for the sync task with second highest priority, and so on.

Only the communication modules interrupts (CM5xx) and the CAA event task is processed with higher priority than the IEC tasks.

The IEC scheduler observer task has been moved to priority 66, means below IEC task priority 0 and on the same level as IEC task priority 1.

The priority of the local I/O bus has been moved to priority 59, means inside the IEC task priority area, but below the external event task priorities.

Ethernet runs on non-real-time priority.

The priority schema communication module should be used in applications with one or more communication modules CM5xx with sync mode. As of Automation Builder 2.4.1 these are the CM579-ETHCAT EtherCAT master and CM598-CN CANopen master communication modules.

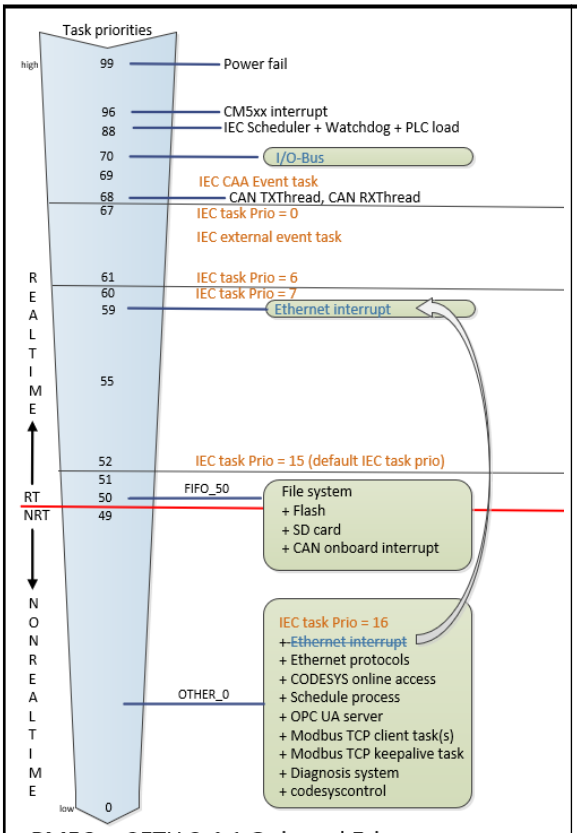
The sync task with priority 0 will be interrupted only by system interrupts. Since the IEC scheduler observer task is located below IEC priority 0, the watchdog for this task is also ineffective. However, this should not interfere with a sync task.

If more than one CM5xx are used in sync mode, the priority order must be defined. The sync task of highest priority CM5xx receives IEC priority 0, the next priority 1 and so on.

In a mixed PLC configuration with communication modules with and without sync mode the interrupts of the communication modules without sync mode will be handled on the priority of the lowest sync task. Currently supported communication modules without sync mode are CM579-PNIO PROFINET IO controller and SM560-S Safety PLC.

The “Onboard Ethernet” priority schema in *“SystemFW”* 3.4.1

The “Onboard Ethernet” priority schema has been established for priority for onboard Ethernet communication (e. g. via Modbus TCP).



PM56xx-2ETH 3.4.1 Onboard Ethernet

The Ethernet interrupt task has been moved from non-real-time area to priority 59, means inside the IEC task priority (real-time) area, but below the external event task priorities.

This priority schema should be used for applications with much Ethernet communication, e. g. Modbus TCP communication with a high number of Modbus TCP clients/servers.

NOTICE!

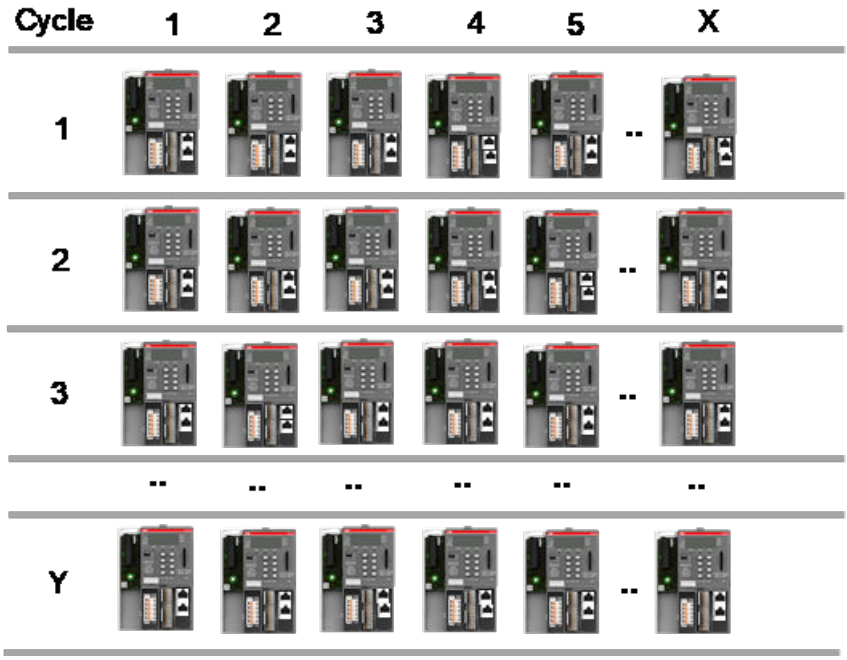
Since the Ethernet interrupt task is running in this mode in the real-time priority area, the Ethernet communication can block IEC tasks with priorities 12-15.

Working with real-time priority at onboard Ethernet and using a high number of Modbus TCP client connections can force high CPU load. To avoid this, it is recommended to call the Modbus function blocks in steps.

Example

100 Modbus TCP client connections shall be used in a 20 ms task.

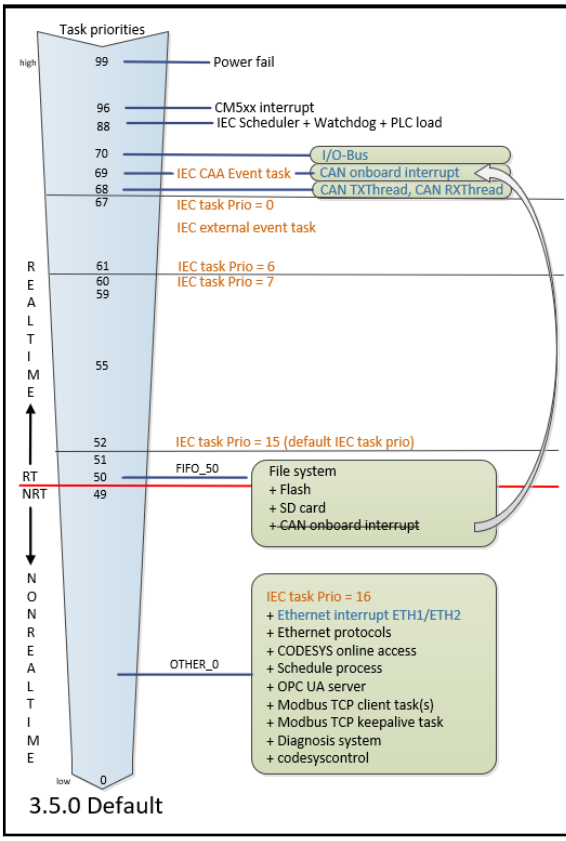
Call 20 function blocks in a first cycle, 20 function blocks in a second cycle and so on.



The „Default“ priority schema in *“SystemFW”* 3.5.0

The default value of the boot-parameter `Communication Schema` is the balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.

The following figure gives an overview about the main task priorities in the AC500 V3 midrange PLCs in version *“SystemFW”* 3.5.0.



The highest IEC task priority 0 should be used for high prior functions in the PLC with short execution time.

The communication modules interrupts (CM5xx), the local I/O bus, the IEC scheduler observer task and the CAA event task are processed with higher priority than all user IEC tasks.

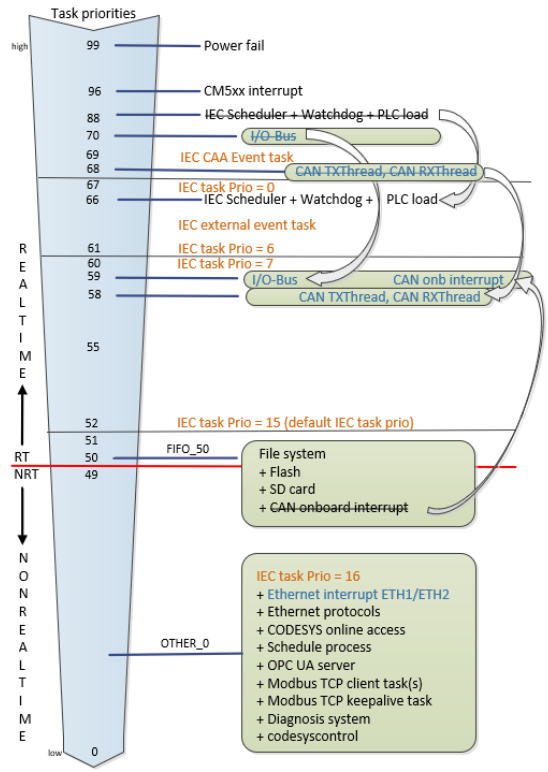
Ethernet runs on non-real-time priority.

The CAN onboard interrupt is moved from non-real-time priority to real-time priority 69, one priority above the CAN transmit and receive threads.

The default setting of the priorities is suitable for most applications and corresponds to the settings in the firmware versions 3.4.0 and before.

The “Communication modules” priority schema in *“SystemFW”* 3.5.0

The communication modules priority schema has been established for priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.



3.5.0 Communication modules

The highest IEC task priority 0 should be used for the sync task of the highest priority communication module, e. g. CM579-ETHCAT, priority 1 for the sync task with second highest priority, and so on.

Only the communication modules interrupts (CM5xx) and the CAA Event task is processed with higher priority than the IEC tasks.

The IEC scheduler observer task has been moved to priority 66, means below IEC task priority 0 and on the same level as IEC task priority 1.

The priority of the local I/O bus has been moved to priority 59, means inside the IEC task priority area, but below the external event task priorities.

The CAN onboard interrupt has the same priority as the I/O bus and the CAN transmit and receive threads one priority below, means 58.

Ethernet runs on non-real-time priority.

The priority schema communication module should be used in applications with one or more communication modules CM5xx with sync mode. As of Automation Builder 2.4.1 these are the CM579-ETHCAT EtherCAT master and CM598-CN CAN master communication modules.

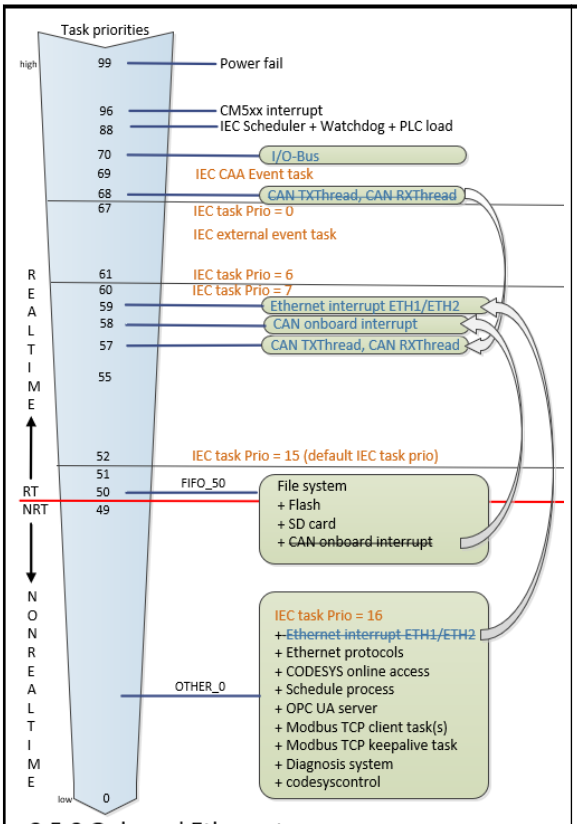
The sync task with Prio 0 will be interrupted only by system interrupts. Since the IEC scheduler observer task is located below IEC Prio 0, the watchdog for this task is also ineffective. However, this should not interfere with a sync task.

If more than one CM5xx are used in sync mode, the priority order must be defined. The sync task of highest priority CM5xx receives IEC Prio 0, the next Prio 1 and so on.

In a mixed PLC configuration with communication modules with and without sync mode the interrupts of the communication modules without sync mode will be handled on the priority of the lowest sync task. Currently supported communication modules without sync mode are CM579-PNIO PROFINET IO controller and SM560-S safety PLC.

The “Onboard Ethernet” priority schema in *“SystemFW”* 3.5.0

The “Onboard Ethernet” priority schema has been established for priority for onboard Ethernet communication (e. g. via Modbus TCP).



The Ethernet interrupt task has been moved from non-real-time area to priority 59, means inside the IEC task priority (real-time) area, but below the external event task priorities.

The CAN onboard interrupt is moved one priority below the Ethernet interrupt to priority 58 and the CAN transmit and receive threads one priority below the CAN onboard interrupt to priority 57.

This priority schema should be used for applications with much Ethernet communication, e. g. Modbus TCP communication with a high number of Modbus TCP clients/servers.

NOTICE!

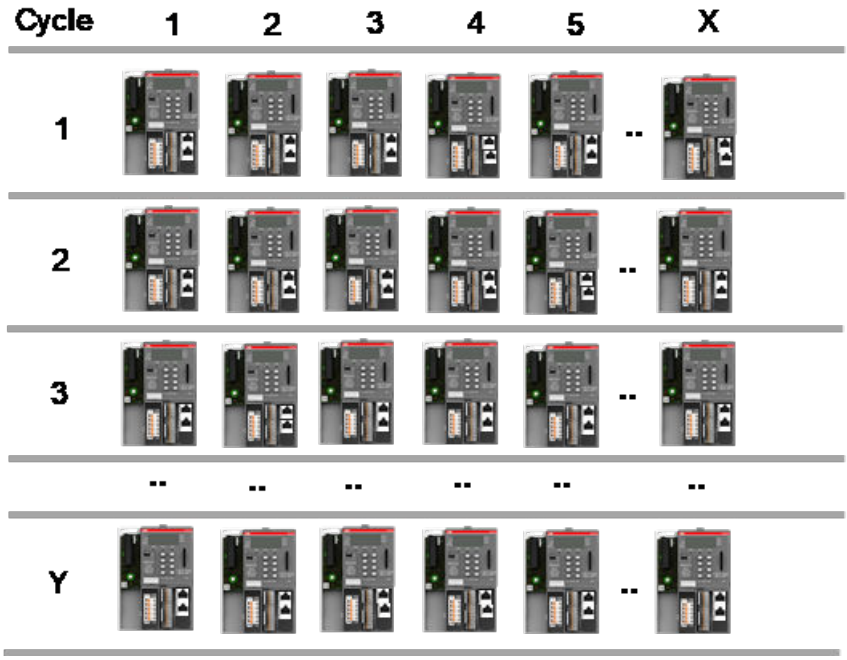
Since the Ethernet interrupt task is running in this mode in the real-time priority area, the Ethernet communication can block IEC tasks with priorities 12-15.

Working with real-time priority at Onboard Ethernet and using a high number of Modbus TCP client connections can force a high CPU Load. To avoid this, we recommend calling the Modbus FB's in steps.

Example

100 Modbus TCP client connections shall be used in a 20 ms task.

Call 20 function blocks in a first cycle, 20 function blocks in a second cycle and so on.



Setting standard configuration

If the target setting configuration is changed, standard configuration can be restored:

1. Open CODESYS.
2. In the *"Resources"* tab, double-click *"PLC Configuration"*.
3. Select *"Menu Extras* ➔ *Standard Configuration"*.

1.6.5.1.3 User Management

With the help of the integrated user management, user groups with different access rights and authorizations can be defined. Configuration and handling of the user managment in Automation Builder and a AC500 V3 is decribed in an *application note*.

1.6.5.1.4 Real-time clock and battery

Notes on real-time clock

The real-time clock is an optional function for AC500-eCo V3 Basic processor modules (e.g. PM5012-x-ETH) and requires a TA5131-RTC. All other AC500-eCo V3 processor modules have an integrated real-time clock.

The real-time clock operates as a PC clock. It saves date and time to a DWORD in DT format (DATE AND TIME FORMAT), i.e., in seconds passed since the start time: 1 January 1970 at 00:00.

For AC500-eCo V3, Basic CPU with TA5131-RTC buffers the real-time clock for 7 days, and Standard/Pro CPU buffers the integrated real-time clock for 20 days. When the CPU is not powered over the buffering time, the real-time clock data will be cleared.

If a battery is connected and full, the real-time clock continues to run even if the control voltage is switched off.

If no battery is inserted or the battery is empty, the real-time clocks starts with the value 0 (=1970-01-01, 00:00:00).

When switching on the control voltage, the system clock of the operating system is set to the value of the real-time clock.

Real-time clock

Real-time clock with PLC browser

The PLC browser/PLC shell commands `date` and `time` are used to set the real-time clock.

The commands `date` <ENTER> or `time` <ENTER> display the current date and time of the real-time clock.

The command: `date yyyy-mm-dd`<ENTER> (year-month-day) sets the date.

The command: `time hh-mm-ss`<ENTER> (hours-minutes-seconds) sets the time.

Example:

The real-time clock should be set to 22 February 2005, 16:50.

1. Enter the date:

   `date 2005-02-22<ENTER>`

   ⇨ Display: `date 2005-02-22 Clock set to 2005-02-22 08:01:07`

   The time remains unchanged.

2. Enter the time:

   `time 16:50<ENTER>`

   ⇨ Display: `time 16:50 Clock set to 2005-02-22 16:50:00`

Real-time clock with user program

The following function blocks located in the folder "Realtime clock" of the system library *ABB_ExtUtils_AC500.lib* can be used to set and display the real-time clock (RTC) with help of the user program:

Function block	Function
CLOCK (V3) *"Library Manager ➔ ABB-AC500 ➔ Use Cases ➔ AC500 Utils ➔ PM<Version> (ABB) ➔ Function Blocks ➔ Realtime clock"*	Sets and displays the real-time clock with values for year, month, day, hours, minutes and seconds. Also the day of week is indicated (Mo=1, Tue=2, Wed=3, Thu=4, Fr=5, Sa=6, Su=0). Note: The week of day cannot be set. It is given by the real-time clock. The input DAY_SET is ignored.
CLOCK_DT (V3) *"Library Manager ➔ ABB-AC500 ➔ Use Cases ➔ AC500 Utils ➔ PM<Version> (ABB) ➔ Function Blocks ➔ Realtime clock"*	Sets and displays the real-time clock in DT format, for example DT#2005-02-17-17:15:00.

Reference for function blocks, functions, structures etc. ↳ *Chapter 1.10 "Reference, function blocks" on page 4292*

AC500 battery

The AC500 battery buffers the following data in case of "control voltage off":

- Retentive variables in SRAM (VAR_RETAIN..END_VAR) ↳ *Chapter 1.6.5.1.1 "Handling of remanent variables for AC500 V3 products" on page 3456*
- Date and time of the real-time clock

Further information:

- *Chapter 1.7.3 “Diagnosis messages” on page 4062*

> *To prevent data loss when using the AC500 battery, the battery status should be periodically monitored by the user program.*

Battery status

The battery status can be monitored either with the help of a user program on the PLC or in Automation Builder.

In the PLC shell of Automation Builder the command "batt" *Chapter 1.6.6.4.4 “PLC shell commands” on page 3950* can be used. *Chapter 1.6.6.4.4 “PLC shell commands” on page 3950*. The following is output:

0	Battery empty
20	Remaining battery charge below 20 %
100	Battery charge OK

In the user program, the battery status can be checked with the function BATT which is available in the folder "Battery" of the system library *ABB_ExtUtils_AC500.lib* (*“Library Manager ➔ ABB-AC500 ➔ Use Cases”*). The following is output:

0	Battery empty
20	Remaining battery charge below 20 %, battery must be replaced
100	Battery charge OK

On the device, the battery status can be checked with the function keys of a processor module. *Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486*

Chapter 1.6.5.1.6.5.4 “Reading out values” on page 3507

AC500-eCo V3 data buffering

The AC500-eCo V3 buffers the following data in case of "control voltage off":

- Retentive variables in FLASH (VAR_RETAIN..END_VAR) *Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3456*
- Date and time of the real-time clock are using an integrated gold-capacitor with a lower retention time as a battery.

> *The AC500-eCo V3 has no battery but stores the remanent data in flash or the real-time clock using a gold-capacitor, there is no battery or gold-capacitor status or survey.*
>
> *In case of “control voltage off”, the real-time clock is buffered for about 7 days for Basic CPU with TA5131-RTC and about 20 days for Standard or Pro CPUs at 40 °C using temperature.*

1.6.5.1.5 AC500-eCo V3 processor module, LEDs, RUN/STOP switch on front panel

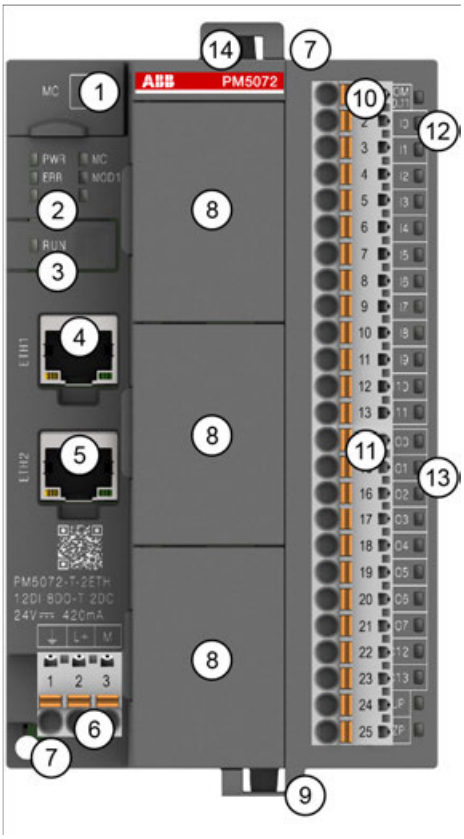


Fig. 304: Example: PM5072-T-2ETH

1 Micro memory card slot
2 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
3 RUN button
4 RJ45 female connector for Ethernet1 connection
5 RJ45 female connector for Ethernet2 connection (available for PM5072-T-2ETH(W))
6 3-pin terminal block for power supply 24 V DC
7 2 holes for screw mounting
8 Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9 Cable fixing
10 13-pin terminal block for onboard I/Os
11 12-pin terminal block for onboard I/Os (not available on PM5012-x-ETH)
12 12 LEDs to display the states of the signals
13 10 LEDs to display the states of the signals
14 Cable fixing accessory TA5301-CFA on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable fixing accessory on the top of the housing is optional.

Please use TA5301-CFA cable fixing accessory to provide strain relief.

It can also be used for AC500-eCo I/O modules.

The PM50x2 processor modules are supplied with option board slot covers as standard.

There are various TA51xx option boards for the processor modules that can be ordered separately.

Which and how many option boards can be plugged, depends on the respective processor module.

State LEDs and operating elements

RUN/STOP button

The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processer modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

State LEDs

The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

LED	State	Color	LED = ON	LED = OFF	LED flashing
PWR	Power supply	Green	Power supply present	Power supply missing	-
MC	Micro memory card indication	Yellow	Micro memory card is in the socket	Micro memory card is not in the socket	Micro memory card is in read/ write state: any file on card is opened, means activity on card
ERR	Error indication	Red	An error occurred	No errors or only warnings encountered (E4 errors). The LED behavior for the error classes 2 to 4 is configurable.	Fast flashing (4 Hz) displays together with the RUN LED a currently running firmware-upgrade or writing data to the Flash-EPROM. Slow flashing (1 Hz) alone displays shutdown of Request To Send. Medium flashing (2 Hz) alone displays at start of PLC if reboot after watchdog.
MOD1	Mode 1 indication	Yellow	Processor module is in mode 1 state	Processor module is not in mode 1 state	-

LED	State	Color	LED = ON	LED = OFF	LED flashing
RUN	RUN/STOP state	Green	Processor module is in state RUN	Processor module is in state STOP	Fast flashing (4 Hz): The processor module is reading/writing data from/to the memory card. If the ERR-LED is also flashing, data is being written to the Flash-EPROM.
					Slow flashing (1 Hz): The firmware update from the memory card has been completed successfully or Boot project is being updated. Slow flashing (0.5 Hz) together with MOD1 LED ON: Mode1: Boot project is not loaded.
Two LEDs below “ERR” and “MOD1”	Configurable	Yellow	Configurable	Configurable	Additional two LEDs are reserved and can be controlled from IEC user code with FB PmLedSet

User configurable LEDs

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.

The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

I/O LEDs

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH) to display the states of the inputs and outputs.

Processor module	LED	State	Color	LED = ON	LED = OFF
PM5012-x-ETH	I0..I5	Digital input	Yellow	Input is ON	Input is OFF
	O0..O3	Transistor output	Yellow	Output is ON	Output is OFF

Processor module	LED	State	Color	LED = ON	LED = OFF
	NO0..NO3	Relay output	Yellow	Output is ON	Output is OFF
PM5032-x-ETH PM5052-x-ETH	I0..I11	Digital input	Yellow	Input is ON	Input is OFF
	O0..O7	Transistor output	Yellow	Output is ON	Output is OFF
	NO0..NO5	Relay output	Yellow	Output is ON	Output is OFF
	C12, C13	Digital configurable input/ output	Yellow	Input/Output is ON	Input/Output is OFF
PM5072-T-2ETH PM5072-T-2ETHW	I0..I11	Digital input	Yellow	Input is ON	Input is OFF
	O0..O7	Transistor output	Yellow	Output is ON	Output is OFF
	C12, C13	Digital configurable input/ output	Yellow	Input/Output is ON	Input/Output is OFF

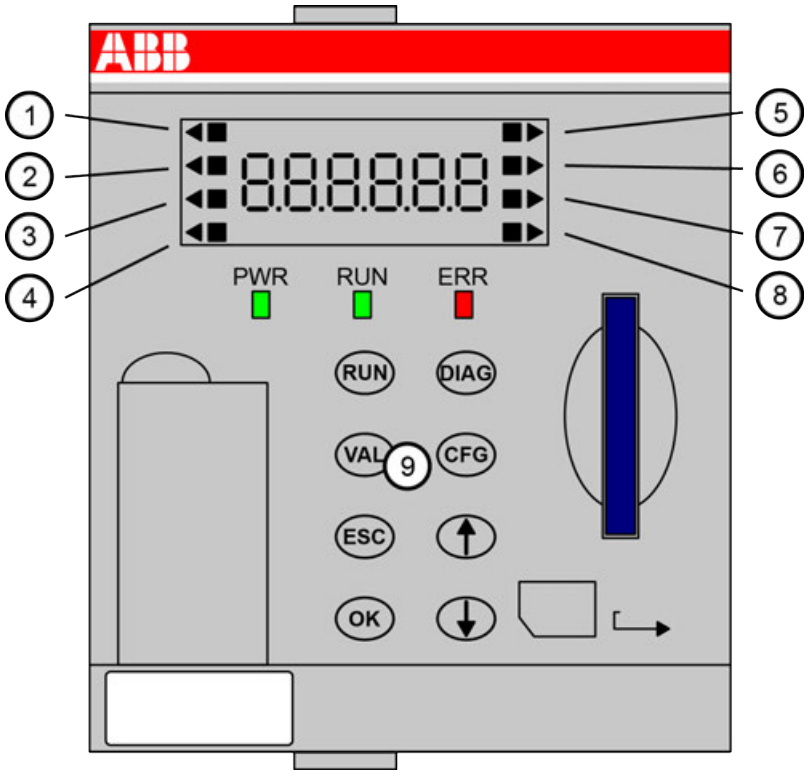
Ethernet state LEDs

Table 617: State LEDs at Ethernet connector

LED	Color	OFF	ON	Flashing
Activity	Yellow	No activity	---	Activity
Link	Green	No link	Link	---

1.6.5.1.6 LEDs, display and function keys on the front panel

Overview



The display of a processor module is equipped with a background-lighted 7-segment display. This display consists of 6 digits for plain text or error codes.

> *Some functionalities may be not yet supported by the product. Please refer to the release notes of the product at time of release.*

Display indicators

- A black square (■) denotes the state/working activity of the corresponding object on the left/right side of the display. The black square flashes according to the device's activity, e.g. during data exchange on ETH1, ETH2, COM1, etc.

> ***MC activity***
> *For the activity of the memory card the black square (■) is shown as long as a file is open on memory card.*

- A black triangle (▶) points to the selected item/interface on the left/right side of the display to be configured or read. Further, it acts as a cursor for the count up/count down function keys.

> *A black triangle (◀) at the BATT item indicates a missing or uncharged battery.*

The indicators point to the following items on the left side of the display:

No.	On the left Side	Description
1	MC (memory card)	Refers to the memory card status.
2	SYS (system)	Refers to the system status.
3	BATT (battery)	Refers to the battery status.
4	I/O bus	Refers to I/O bus connection.

The indicators point to the following items on the right side of the display:

No.	On the right side	Description
5	ETH1	Refers to the first Ethernet interface.
6	ETH2	Refers to the second Ethernet interface.
7	COM1	Refers to COM1 interface.
8	CAN	Refers to CAN interface.

9	Function keys on front panel

Processor module	Display variant	Description
PM56xx-2ETH		Display of a processor module with support for 2 Ethernet interfaces, CAN and COM1.

Text outputs of the display

Display	Description
	Display on system start (power on).
	PLC is in boot mode.
	Is shown on startup after „Boot“, when a wrong DisplayFW is detected, e.g. the old version 3.0. Please update display with DisplayFW 4.1 (or higher).
	PLC is in initialization mode.

Display	Description
	PLC is in STOP mode.
	No system firmware (SystemFW) available. Start update firmware. PLC is waiting for a firmware download via Automation Builder or memory card. See *Chapter 1.6.6.1.4.2 " AC500 V3 firmware installation and update" on page 3653*
	PLC is in RUN mode. **Switch into RUN mode is only possible if a valid boot project is available in the flash memory.**
	Only in RUN mode and as of SystemFW V3.2.0 Reminder: ***demo license*** PLC runs in „Demo mode“, since at least one feature license is missing. Will be displayed for 5 minutes at every license check If „Demo time“ expires, PLC will go to „Stop“.
	Only in RUN mode and as of SystemFW V3.2.0 10 minutes step reminder: ***license was removed*** PLC runs in „Grace mode“, since at least one feature license which has been available disappeard. PLC is waiting for this license. Will be displayed for 5 minutes If „Grace time“ expires, PLC will go to „Stop“.
	New as of SystemFW 3.3.1.103. Text is shown if no communication between CPU and display is possible due do very high CPU load (e.g. endless loop in user program and not activated task watchdog).

Startup procedure of the PLC

Startup procedure of a new PLC from factory

State	Display	Description
0		Display on system start (power on).
1		PLC is in boot mode.

State	Display	Description
2		PLC is in initialization mode.
3		No system firmware (SystemFW) available. Start update firmware. PLC is waiting for a firmware download via Automation Builder or memory card. See *Chapter 1.6.6.1.4.2 " AC500 V3 firmware installation and update" on page 3653*

Startup procedure of a PLC with system firmware

The startup procedure depends on the selected PLC mode.

PLC mode	Display	Startup Behavior
00		The user program will be loaded and run. PLC changes to mode „*RUN*".
01		User program will not be loaded / run. PLC stay in mode „*STOP*".
02		Reserved for further development (currently like Mode 00).

*Mode 01 can be activated via function key **CFG** (see Further information on page 3487), or by pressing function key **RUN** during startup of PLC until Mode 01 is shown on display.*

State	Display	Description
0		Display on system start (power on).
1		PLC is in boot mode (see *Further information on page 3487*).
2		PLC is in initialization mode (see *Further information on page 3487*).
3		PLC is in STOP mode (see *Further information on page 3487*). **Same as status Stop in Automation Builder.**
4		PLC is in RUN mode (see *Further information on page 3487*). **Switch into RUN mode is only possible if a valid boot project is available in the flash memory.**
5		Only in RUN mode and as of SystemFW V3.2.0 Reminder: ***demo license*** PLC runs in „Demo mode“, since at least one feature license is missing. Will be displayed for 5 minutes at every license check If „Demo time“ expires, PLC will go to „Stop“.
6		Only in RUN mode and as of SystemFW V3.2.0 10 minutes step reminder: ***license was removed*** PLC runs in „Grace mode“, since at least one feature license which has been available disappeard. PLC is waiting for this license. Will be displayed for 5 minutes If „Grace time“ expires, PLC will go to „Stop“.

Description of LEDs

The LEDs below the display indicate the status of the processor module:

LED	State	Color	LED = ON	LED = OFF	LED flashes
Power LED (PWR)	Denotes the power supply state of the processor module	Green	Voltage is present (24 V DC)	Voltage is missing	-
Run LED (RUN)	Denotes the activity state of the processor module	Green	Processor module is in RUN mode	Processor module is in STOP mode	If the LED flashes fast (4 Hz) a firmware update is finished with no errors. If the Run LED flashes fast (4 Hz), alternating with a flashing Run LED the firmware is updated. To enforce boot mode 1, keep the RUN function key pressed during the boot procedure. In this case, the Run LED flashes slowly (1 Hz). A subsequent project download (from within Automation Builder) cancels the blinking.
Error LED (ERR)	Denotes an error	Red	An error has occured.	No errors or only warnings have occurred.	If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors. If the Error LED flashes fast with AC500 on display a fatal system error has occurred. If the Error LED flashes fast (4 Hz) alternating with a flashing Run LED the firmware is updated.

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

Description of the function keys

Overview

The processor module can be operated manually using the function keys on the front panel:

Function Key	Description	Description
RUN	Run	Toggles between RUN and STOP mode. **Switching into RUN mode is only possible if an error free project has been created and downloaded with Automation Builder**.
VAL	Value	Shows different state values of the processor module.
ESC	Escape	Quits the current menu, submenu or function without saving.
OK	OK / Acknowledgement	Acknowledges the current value or selects a menu/ submenu. Changes that have been sent to the processor module successfully are confirmed with *donE* on the display.
DIAG	Diagnostic	Allows evaluation of error messages in detail.
CFG	Configuration	Show/set IP configuration, PLC startup mode and Ethernet address. Enters submenus.
↑	Count up / navigate in submenu	Press the function key repeatedly in order to increase the value each time by 1, or navigate in submenu to previous entry Keep the function key pressed in order to count up fast.
↓	Count down / navigate in submenu	Press the function key repeatedly in order to decrease the value each time by 1, or navigate in submenu to next entry. Keep the function key pressed in order to count down fast.

Backlight is switched on for about 20 seconds by pressing any function key.

Start and stop PLC

Function key *RUN*

State	Description Menu level 0	Result on pressing one of the function keys		
		RUN	OK	ESC
0		Short click: State 1 is displayed. Long click (>5 sec): State 2 is displayed.	No action	No action

State	Description Menu level 0	Result on pressing one of the function keys		
		RUN	OK	ESC
1	 PLC only in state RUN if a correct project is in RAM of PLC	State 0 is displayed. STOP - same as *Online stop* in Automation Builder (halt, no init of variables)		
2		***RUN*** LED=ON	Perform RESET same as *Online reset* in Automation Builder (stop and init variables) State 0 is displayed.	No RESET State 0 is displayed.

Configuration

Configuration CPU firmware SystemFW V3.1.x and DisplayFW V3.0

Function key *CFG* main menu with *ETH1 / ETH2 mode*: *"Two separate interfaces"*

(see *Chapter 1.6.6.2.9.2 "Switch functionality of Ethernet interfaces ETH1/ETH2" on page 3736*)

Navigation starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the three function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - Main menu 1	Result on pressing one of the function keys		
		CFG	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed.	Remains in RUN/ STOP mode.	Remains in RUN/ STOP mode.
1		State 2 is displayed.	Return into RUN/ STOP mode.	Refers to sub menu 1
2	 Change the values with the **Count up/Count down** function keys.	State 3 is displayed.	Return into RUN/ STOP mode.	Shows DONE, your settings are saved. Return into RUN/STOP mode.
3		State 4 is displayed.	Return into RUN/ STOP mode.	Refers to sub menu 1

State	Description - Main menu 1	Result on pressing one of the function keys		
4	 Change the values with the **Count up/Count down** function keys.	State 5 is displayed.	Return into RUN/ STOP mode.	Shows DONE, your settings are saved. Return into RUN/STOP mode.
5	 Change the values with the **Count up/Count down** function keys. See also *Further information on page 3489*.	State 1 is displayed.	Return into RUN/ STOP mode.	Shows DONE, your settings are saved. Return into RUN/STOP mode.

Function key *CFG* main menu with *ETH1 / ETH2 mode*: *"Switch functionality ETH1-ETH2"*

(see *Chapter 1.6.6.2.9.2 "Switch functionality of Ethernet interfaces ETH1/ETH2" on page 3736*)

Navigation starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the three function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - Main menu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed.	Remains in RUN/ STOP mode.	Remains in RUN/ STOP mode.
1		State 2 is displayed.	Return into RUN/ STOP mode.	Refers to sub menu 1
2	 Change the values with the **Count up/Count down** function keys.	State 3 is displayed.	Return into RUN/ STOP mode.	Your settings are saved. State 2 is displayed.
3	 Change the values with the **Count up/Count down** function keys. See also *Further information on page 3489*.	State 1 is displayed.	Return into RUN/ STOP mode.	Shows DONE, your settings are saved. Return into RUN/STOP mode.

Function key *CFG* sub menu IPETH1 or IPETH2; *DHCP not active*

State	Description - Submenu 1	Result on pressing one of the function keys		
		CFG	ESC	OK
1.1	 IPETH1 or IPETH2	State 2 is displayed.	Return into RUN/ STOP mode.	State 1.2 is displayed.
1.2	 IP Configuration (address, subnet mask, gateway)	State 1.3 is displayed.	Aborts the menu unchanged. Return to State 1.1	State 3.2 is displayed.
1.3	 Reset to production data (default settings)	State 1.4 is displayed.	Aborts the menu unchanged. Return to State 1.1	Activate RESET to default by pressing ***OK*** twice. Shows DONE, your settings are saved. Return into RUN/STOP mode.
1.4	 Activate DHCP Sets a DHCP address.	State 1.2 is displayed.	Aborts the menu unchanged. Return to State 1.1	Activate DHCP to default by pressing ***OK*** twice Shows DONE, your settings are saved. Return into RUN/STOP mode.

Function key *CFG* sub menu IPETH1 or IPETH2; *DHCP active*

State	Description - Submenu 2	Result on pressing one of the function keys		
		CFG	ESC	OK
2.1	 IPETH1 or IPETH2	State 2 is displayed.	Aborts the menu unchanged. Return to State 0.	State 2.2 is displayed.
2.2	 DHCP active	State 2.3 is displayed.	Aborts the menu unchanged. Return to State 2.1.	--
2.3	 IP Configuration (address, subnet mask, gateway)	State 2.4 is displayed.	Aborts the menu unchanged. Return to State 2.1.	State 3.2 is displayed.

State	Description - Submenu 2	Result on pressing one of the function keys		
2.4	 Reset to production data (default settings)	--	Aborts the menu unchanged. Return to State 2.1.	Activate RESET to default by pressing ***OK*** twice Shows DONE, your settings are saved. Return into RUN/STOP mode.

Function key *CFG* sub menu STATIC

State	Description - Submenu 3	Result on pressing one of the function keys		
		CFG	ESC	OK
3.1	 IP Configuration (address, subnet mask, gateway)	State 2.4 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	State 3.2 is displayed.
3.2	 IP address A1-A4 ★ Number is blinking if value has changed and is not yet sent to CPU	State 3.3 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.
3.3	 Subnet mask N1-N4 ★ Number is blinking if value has changed and is not yet sent to CPU	State 3.4 is displayed.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2)	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

State	Description - Submenu 3	Result on pressing one of the function keys		
3.4	 Gateway G1-G4 ★ Number is blinking if value has changed and is not yet sent to CPU	State 3.2 is displayed again.	Aborts the menu unchanged. Return to State 1.1 (sub menu IPETH1 or IPETH2) Aborts the menu unchanged. Return to State 1.	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

Function key *CFG* sub menu ADR

State	Description - Submenu 4	Result on pressing one of the function keys		
		CFG	ESC	OK
4.1		State 4.2 is displayed.	Aborts the menu unchanged. Return to State 1	*DHCP not active*: State 1.2 is displayed *DHCP active*: State 2.2 is displayed
4.2	 Change the values with the **Count up/Count down** function keys starting with current value. ★ Number is blinking if value has changed and is not yet sent to CPU	State 2.3 is displayed.	Aborts the menu unchanged. Return to State 4.1	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

State	Description - Submenu 4	Result on pressing one of the function keys		
4.3	 Subnet mask N1-N4 ★ Number is blinking if value has changed and is not yet sent to CPU	State 4.1 is displayed.	Aborts the menu unchanged. Return to State 4.1	Sends changed values to CPU and go to default menue RUN/STOP Displays: DONE New settings stored in CPU. or: FAIL Failed to write new settings to CPU.

Configuration CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1

Function key *CFG* menu level 1, with *ETH1 / ETH2 mode*: *"Two separate interfaces"*

(see *Chapter 1.6.6.2.9.2 "Switch functionality of Ethernet interfaces ETH1/ETH2" on page 3736*)

Navigation starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the five function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - *CFG* menu level 1	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	The processor module is in RUN/ STOP mode.	State 1 is displayed.			Remains in RUN/STOP mode.	Remains in RUN/STOP mode.
1	 Switch is OFF	Refers to submenu level 2 *"Function key CFG submenu show / set PLC ID " on page 3507*	State 2 is displayed if KNX functionality is active. State 3 is displayed if KNX functionality is inactive.	State 6 is displayed.	Return into RUN/STOP mode.	
2	 KNX program button (appears if functionality is active)		State 3 is displayed.	State 1 is displayed.	Return into RUN/STOP mode.	

State	Description - *CFG* menu level 1	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
3		Refers to submenu level 2 ↳ *"Function key CFG menu level 2 (IPETH1 or IPETH2); " on page 3501*	State 4 is displayed.	State 2 is displayed.	Return into RUN/STOP mode.	Only active if no changes in ***CFG*** menu. Return into RUN/STOP mode.
4		Refers to submenu level 2 ↳ *"Function key CFG menu level 2 (IPETH1 or IPETH2); " on page 3501*	State 5 is displayed.	State 3 is displayed.	Return into RUN/STOP mode.	
5	  Note: COM1 mode RS-232 (default) or RS-485 can only be shown but not changed. This is a PLC boot paramter (see ↳ *Chapter 1.6.6.2.14.3 "Setting up a serial interface" on page 3798*) „“ and must be set in AB ↳ *Chapter 1.6.6.2.14.3.1 "Configuration" on page 3798*. Mode is activated in PLC boot process.		State 6 is displayed.	State 4 is displayed.	Return into RUN/STOP mode.	Return into RUN/STOP mode.
6		Refers to submenu set startup mode of PLC ↳ *"Function key CFG submenu show / set startup mode of PLC " on page 3506*	State 1 is displayed.	State 5 is displayed.	Return into RUN/STOP mode.	

Function key *CFG* menu level 1, with *ETH1 / ETH2 mode*: *"Switch functionality ETH1-ETH2"*

(see ↳ *Chapter 1.6.6.2.9.2 "Switch functionality of Ethernet interfaces ETH1/ETH2" on page 3736*)

Navigation starts with the processor module being in RUN/STOP mode (State 0). By pressing one of the five function keys a certain action is triggered. The result of this action is described in the result columns of the tables.

State	Description - *CFG* menu level 1	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	The processor module is in RUN/ STOP mode.	State 1 is displayed.			Remains in RUN/STOP mode.	Remains in RUN/STOP mode.
1	 Switch is ON		State 2 is displayed if KNX function-ality is active. State 3 is displayed if KNX function-ality is inactive.	State 5 is displayed.	Return into RUN/STOP mode.	Return into RUN/STOP mode.
2	 KNX program button (appears if function-ality is active)		State 3 is dis-played.	State 1 is displayed.	Return into RUN/STOP mode.	Return into RUN/STOP mode.
3		Refers to submenu level 2 ↳ *"Func-tion key CFG menu level 2 (IPETH1 or IPETH2); " on page 3501*	State 4 is dis-played.	State 2 is displayed.	Return into RUN/STOP mode.	Only active if no changes in ***CFG*** menu. Return into RUN/STOP mode.

State	Description - *CFG* menu level 1	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
4	  Note: COM1 mode RS-232 (default) or RS-485 can only be shown but not changed. This is a PLC boot parameter (see *Chapter 1.6.6.2.14.3 "Setting up a serial interface" on page 3798*) „“ and must be set in AB *Chapter 1.6.6.2.14.3.1 "Configuration" on page 3798*. Mode is activated in PLC boot process.		State 5 is displayed.	State 3 is displayed.	Return into RUN/STOP mode.	Return into RUN/STOP mode.
5		Refers to submenu set startup mode of PLC *"Function key CFG submenu show / set startup mode of PLC " on page 3506*	State 1 is displayed.	State 4 is displayed.	Return into RUN/STOP mode.	Return into RUN/STOP mode.

Function key *CFG* menu level 2 *(IPETH1 or IPETH2)*;

State	Description - *CFG* menu level 2	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	 IPETH1 or IPETH2	State 1 is displayed.			Return into RUN/STOP mode.	Return into RUN/ STOP mode.

State	Description - *CFG* menu level 2	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
1	 IP Configuration (address, subnet mask, gateway)	Refers to submenu *StAtIC* ↳ *"Function key CFG menu level 3, show / set STATIC" on page 3503*	State 2 is displayed.	State 4 is displayed.	Case 1, no submenu is entered: Return into RUN/STOP mode. Case 2, no changes: State 0 is displayed.	Send all changes to CPU. State 5 is displayed.
2		Refers to submenu set *dHCP* ↳ *"Function key CFG menu level 2 Show/set DHCP" on page 3504*	State 3 is displayed.	State 1 is displayed.		
3	 Activate DHCP Sets a DHCP address.	Refers to submenu set *Id* ↳ *"Function key CFG menu level 2 Show/set Id" on page 3505*	State 4 is displayed.	State 2 is displayed.	State 1 is displayed.	
4	 Reset to production data (default settings)	Refers to submenu set *rESEt* ↳ *"Function key CFG submenu show / set RESET" on page 3506*	State 1 is displayed.	State 3 is displayed.		Send all changes to CPU. State 5 is displayed.
5					Remain all changes State 1 is displayed.	State 6 is displayed.
6		Changes applied *donE* is displayed for 2 sec. then return into RUN/STOP mode.				
		Changes failed *FAILEd* is displayed for 2 sec. then return into RUN/STOP mode.				

Function key *CFG* menu level 3, *show / set STATIC*

State	Description - Sub-menu STATIC	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	 IP Configuration (address, subnet mask, gateway)	State 1 is dis-played.			Aborts the menu unchanged. Return to IPETH1 or IPETH2	No changes: return to IPETH1 or IPETH2 Changes: (StAtIC blinks) state 5 of previous table is dis-played
1	    IP address A1-A4 **If submenu is entered**: Number is blinking if value has changed and is not yet sent to CPU	Refers to submenu of A1-A4	Count down A1-A4	Count up A4-A1	Aborts the menu unchanged. Return to ***CFG** menu level 2* ***StAtIC***	Take over new values, but don´t send to CPU. Return to ***CFG** menu level 2* ***StAtIC***
2	    Subnet mask N1-N4 **If submenu is entered:** Number is blinking if value has changed and is not yet sent to CPU	Refers to submenu of N1-N4	Count down N1-N4	Count up N4-N1	Aborts the menu unchanged. Return to ***CFG** menu level 2* ***StAtIC***	Take over new values, but don´t send to CPU. Return to ***CFG** menu level 2* ***StAtIC***

State	Description - Sub-menu STATIC	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
3	 Gateway G1-G4 **If submenu is entered:** Number is blinking if value has changed and is not yet sent to CPU	Refers to submenu G1-G4	Count down G1-G4	Count up G4-G1	Aborts the menu unchanged. Return to ***CFG** menu level 2 **StAtIC***	Take over new values, but don´t send to CPU. Return to ***CFG** menu level 2 **StAtIC***

Function key *CFG* menu level 4, Example: *I/P address A4*

State	Description - *CFG* menu level 4	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	 A4 is blinking if sub-menu is entered	No action	Count down value. Value is blinking if changed	Count up value. Value is blinking if changed	Aborts the menu unchanged. Shows unchanged value.	Take over new value, but don´t send to CPU. Go back to menu level 3 (here subnet mask N1)

Function key *CFG* menu level 2 *Show/set DHCP*

State	Description - Show/set DHCP	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0		State 1 is dis-played.			Aborts the menu unchanged.	
1	 IP address A1-A4 ★ Value is blinking if value has changed and is not yet sent to CPU		State 2 is displayed.	State 2 is displayed.	Aborts the menu unchanged. Go back to ***CFG*** menu level 1.	Take over new values, but don´t send to CPU. Text is blinking if value is changed. State 3 is displayed.
2			State 1 is displayed.	State 1 is displayed.	Go to sub-menu ***StAtIC***.	

State	Description - Show/set DHCP	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
3					Remain all changes State 1 is displayed.	State 4 is displayed.
4		Changes applied ***donE*** is displayed for 2 sec. then return into RUN/STOP mode.				
		Changes failed ***FAILEd*** is displayed for 2 sec. then return into RUN/STOP mode.				

Function key *CFG* menu level 2 *Show/set Id*

State	Description - Show/set Id	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0			Count down value: 255 ... 000, starting with current value	Count up value: 000 ... 255, starting with current value	Case 2, no changes: stop blinking, return to menu ↪ *"Function key CFG menu level 2 (IPETH1 or IPETH2); " on page 3501* .	Go to*CFG* menu level 2 *(IPETH1 or IPETH2)* state 5-6.
1	 IP address A1-A4 ★ Number is blinking if value has changed and is not yet sent to CPU		Count down value: 255 ... 000, starting with current value	Count up value: 000 ... 255, starting with current value	Discard the changes. Stop blinking. Show previous value.	Go to*CFG* menu level 2 *(IPETH1 or IPETH2)* state 5-6.
2			Count down value: 255 ... 000, starting with current value	Count up value: 000 ... 255, starting with current value	Discard the changes. Stop blinking. Show previous value.	Go to*CFG* menu level 2 *(IPETH1 or IPETH2)* state 5-6.

Function key *CFG* submenu show / set RESET

State	Description - Sub-menu show / set RESET	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0		State 1 is displayed.	No action	No action	Aborts the menu unchanged. Return to sub-menu level 1	
1	 ★ Display is blinking if value has changed and is not yet sent to CPU				Aborts the menu unchanged. Return to sub-menu level 1	Discard all made changes. Stop blinking. Send command "reset to factory settings" to CPU *Chapter 1.6.5.1.6.3.1 "Startup procedure of a new PLC from factory" on page 3488* „reset Ask confirmation. Go back to default menue RUN/ STOP. State 2 is displayed.
2					Aborts the menu unchanged. Return to sub-menu STATIC	Sends changed values to CPU, displays state 3.
3		Changes applied ***donE*** is displayed for 2 sec. then return into RUN/STOP mode.				
		Changes failed ***FAILEd*** is displayed for 2 sec. then return into RUN/STOP mode.				

Function key *CFG* submenu show / set startup mode of PLC

State	Description - Sub-menu show / set startup mode of PLC	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
Start			Count down value: 02 ... 0, starting with current value	Count up value: 00 ... 02, starting with current value	Aborts the menu. Go back to main menue RUN/STOP	Sends changed values to CPU.

State	Description - Sub-menu show / set startup mode of PLC	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
1	 ★ Text is blinking if value has changed and is not yet sent to CPU		Count down value: 02 ... 00, starting with current value	Count up value: 00 ... 02, starting with current value	Aborts the menu. Go back to main menue RUN/STOP	Displays 2 sec. ***donE*** or ***FAILEd*** Go back to main menue RUN/STOP
2	 ★ Text is blinking if value has changed and is not yet sent to CPU		Count down value: 02 ... 00, starting with current value	Count up value: 00 ... 02, starting with current value	Aborts the menu. Go back to main menue RUN/STOP	

Function key *CFG* submenu show / set PLC ID

State	Description - Sub-menu show / set startup mode of PLC	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
0	 Switch is OFF	State 1 is displayed			Return into RUN/STOP mode.	
1	 PLC ID		State 2 is displayed	State 2 is displayed	Return into RUN/STOP mode.	
2	  ★ Text PLC is blinking if edit mode with keys up/down is enabled ★ Number is blinking if value has changed and is not yet sent to CPU		Count down value: 255→0, starting with current value	Count up value: 000→255, starting with current value	Aborts the menu. Go back to main menue RUN/STOP	Takes over new value, if changed

Reading out values

Reading out values CPU firmware SystemFW 3.1.x and DisplayFW 3.0

The following settings of the processor module can be read out by pressing the function key ***VAL*** repeatedly:

1. Displays time of the processor module (hh.mm.ss).
2. Displays date of the processor module (yy.mm.dd).
3. Displays state of battery (ub 100 = 100%, ub 020 = 20% or ub 000 = empty).
4. Displays version of display firmware (e.g. d 3.0 r (= display version 3.0 release).

5. Displays version of CPU firmware (e.g. C 3.1.0r (= CPU version 3.1.0 release).
6. Displays CPU type.
7. Displays default text (RUN/STOP).

Reading out values CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1

Function key *VAL* By pressing Function Key ***VAL*** state 1 is displayed

State	Description Menu *VAL*	Result on pressing one of the function keys				
		CFG	↓	↑	ESC	OK
1	 Time of the processor module (hh.mm.ss).	No action	State 2 is displayed	State 6 is displayed	Go back to main menue RUN/STOP	
2	 Date of the processor module (yy.mm.dd).		State 3 is displayed	State 1 is displayed		
3	 State of battery (ub 100 = 100%, ub 020 = 20% or ub 000 = empty).		State 4 is displayed	State 2 is displayed		
4	 Version of display firmware (e.g. d 4.1 r (= display version 4.1 release).		State 5 is displayed	State 3 is displayed		
5	 Version of CPU firmware (e.g. C 3.2.0r (= CPU version 3.2.0 release).		State 6 is displayed	State 4 is displayed		
6	 CPU type.		State 1 is displayed	State 5 is displayed		

Reading out diagnosis messages on the CPU

Table 618: Example: no diagnosis message in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1			No action	No action	Return into RUN/STOP mode.	

Table 619: Example: diagnosis messages in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1	 Number of diagnosis messages; here 4		Go to first/ next diagnosis message in status list (e.g., state 2)	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Return into RUN/STOP mode.
2	 Diagnosis message example: *Error battery empty or missing* Toggling between state 2 and 3	Selects displayed diagnosis message and shows details ↻ *Table 620 "Example: error battery empty or missing" on page 3510*	Go to first/ next diagnosis message in status list	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Acknowledge and return into RUN/STOP mode.
3	 Error ID example Toggling between state 2 and 3					

Table 620: Example: error battery empty or missing

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	 E4 = error severity 4 bAt = subdevice battery Toggling between state 0 and 1	State 2 is displayed	State 2 is displayed	State 6 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
1	 Error ID example Toggling between state 0 and 1					
2	 Error number 8 Battery is missing or empty		State 3 is displayed	State 0 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Displays state 0 Return to diagnosis status list
3	 Detail 1 Subdevice 22: battery		State 4 is displayed	State 2 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
4	 Detail 2 Error type 0: device		State 5 is displayed	State 3 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
5	 Detail 3 Error type number 0: device itself		State 6 is displayed	State 4 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
6	 Detail 4 Additional information 0: none		State 1 is displayed	State 5 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list

Enable flashing of display

Blink functionality As of SystemFW 3.1.0 and AB 2.1.0 the Blink functionality is implemented. *"Blink"* means – activate flashing of backlight of AC500 display in Automation Builder via *"IP-Configuration"* tool
↳ *Chapter 1.6.6.2.2.4.2.2.4 "Blink functionality" on page 3685*.

Wink functionality As of SystemFW 3.1.0 and AB 2.0.0 the Wink functionality is implemented. *"Wink"* means – activate flashing of backlight of AC500 display in Automation Builder via communication settings Wink functionality.

Function blocks

PmErrLedSet This function block switches the ERR-LED ON and OFF.

PmDispSetText With this function block a text can be displayed on the CPU.

↳ *Chapter 1.10 "Reference, function blocks" on page 4292*

1.6.5.1.7 Onboard technologies

Ethernet

Ethernet protocols and ports for AC500-eCo V3 processor modules

Supported as of Automation Builder V 2.4.1

Description	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH	≥ CPU firmware
ABB netConfig	x	x	x	x	V3.4.1
Online access with driver 3S UDP BlkDrvUdp	x	x	x	x	V3.4.1
Online access with driver 3S TCP/IP BlkDrvTcp	x	x	x	x	V3.4.1
Modbus TCP server	x	x	x	x	V3.4.1
Modbus TCP client with POU ETHx_MOD_MAST	x	x	x	x	V3.4.1

Default open Ethernet ports of PM50xx-x-xETH

After startup without a PLC project the AC500-eCo V3 PM50xx-x-xETH contains the following Ethernet ports and sockets:

Protocol	Port
ABB NetConfig [1])	UDP 24576
Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)	TCP 11740
OPC UA server [2])	TCP 4840
Remarks: [1]): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2. [2]): The port 4840 for OPC UA server is closed by default as of System FW V3.1.0.	

All other ports are closed by default.

Overview of protocols, sockets and ports

Protocol	Port	Sockets
ABB netConfig	24576	1 permanent socket per interface
3S gateway client (e.g. CODESYS) to gateway server	1217	1 permanent socket
Online access with driver 3S UDP BlkDrvUdp (with scan)	1740	1 socket per connection + 4 listen
Online access with driver 3S block driver TCP/IP (no scan)	11740	1 socket per connection + 1 listen
Modbus TCP server	502 or config-urable	1 socket listen + 1 socket per server connection, number of server connections is configu-rable in AB
Modbus TCP client with POU *ETHx_MOD_MAST*	Random	1 socket per connection with POU *ETHx_MOD_MAST*
UDP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
TCP/IP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
Web server on PLC with web visualization	80	1 listen and 1 per connection
SNTP client	123	1 permanent socket

Protocol	Port	Sockets
IEC60870-5-104 substation	2404	1 per connection
FTP server (See ↳ *Chapter 1.6.6.3.5.1 “Configuration of FTP server” on page 3917*)	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
CODESYS network variables	1202	(UDP broadcast)
OPC DA server (default 3S block driver)	UDP = 1740 or TCP/IP =11740	1 socket per connection
OPC UA server	4840	1 permanent socket
ICMP – ping out of user project with POU ETHx_ICMP_PING DHCP	none	No socket
DHCP	67	1 socket during startup
SNTP (Simple Network Time Protocol) client system solution (See ↳ *Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913*)	123	1 permanent socket
SNTP (Simple Network Time Protocol) server system solution (See ↳ *Chapter 1.6.6.3.4.2.2 “(S)NTP server configuration” on page 3916*)	123	1 permanent socket
HTTPS – secure web server on PLC with CODESYS web visualization (See ↳ *Chapter 1.6.6.3.7.3.2 “Secure web server” on page 3922*) Not for PM5012-x-ETH!	443	1 listen and 1 per connection
FTPS – secure FTP (See ↳ *Chapter 1.6.6.3.7.3.3 “Secure FTP” on page 3923*) Not for PM5012-x-ETH!	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
Secure online access with driver 3S UDP BlkDrvUdp	1740	1 socket per connection + 1 listen
Secure online access with driver 3S TCP/IP BlkDrvTcp	11740	1 socket per connection + 1 listen
ICMP – ping out of user project with POU *ETHx_ICMP_PING* or EthIcmpPing (PLCopen style)	None	No socket
Modbus TCP client (master) with POU *ETHx_MOD_MAST* or *ModTcpMast* (PLCopen style)	Random	1 socket per connection with POU *ETHx_MOD_MAST* or *ModTcpMast*

Limitation of connections per protocol

AC500-eCo V3 processor modules

Protocol	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH	≥ CPU firmware

Remarks: [1]): in preparation [2]): feature is licensed					

Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

Protocol	Port
ABB NetConfig [1])	UDP 24576
Online access with driver 3S UDP BlkDrvUdp (with scan)	UDP 1740
Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)	TCP 11740
OPC UA server [2])	TCP 4840
Remarks: [1]): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2. [2]): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.	

All other ports are closed by default.

Overview of protocols, sockets and ports

Protocol	Port	Sockets
ABB netConfig	24576	1 permanent socket per interface
3S gateway client (e.g. CODESYS) to gateway server	1217	1 permanent socket
Online access with driver 3S UDP BlkDrvUdp (with scan)	1740	1 socket per connection + 4 listen
Online access with driver 3S block driver TCP/IP (no scan)	11740	1 socket per connection + 1 listen
Modbus TCP server	502 or configurable	1 socket listen + 1 socket per server connection, number of server connections is configurable in AB
Modbus TCP client with POU *ETHx_MOD_MAST*	Random	1 socket per connection with POU *ETHx_MOD_MAST*
UDP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
TCP/IP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
Web server on PLC with web visualization	80	1 listen and 1 per connection
NTP/SNTP client	123	1 permanent socket
IEC60870-5-104 control station	Random	1 per connection
IEC60870-5-104 substation	2404	1 per connection
FTP server (See *Chapter 1.6.6.3.5.1 “Configuration of FTP server” on page 3917*)	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
CODESYS network variables	1202	(UDP broadcast)
OPC DA server (default 3S block driver)	UDP = 1740 or TCP/IP =11740	1 socket per connection
OPC UA server	4840	1 permanent socket
ICMP – ping out of user project with POU ETHx_ICMP_PING DHCP	none	No socket
DHCP	67	1 socket during startup
NTP/SNTP ((Simple) Network Time Protocol) client system solution (See *Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913*)	123	1 permanent socket
NTP/SNTP ((Simple) Network Time Protocol) server system solution (See *Chapter 1.6.6.3.4.2.2 “(S)NTP server configuration” on page 3916*)	123	1 permanent socket

Protocol	Port	Sockets
HTTPS – secure web server on PLC with CODESYS web visualization (See *Chapter 1.6.6.3.7.3.2 "Secure web server" on page 3922*)	443	1 listen and 1 per connection
FTPS – secure FTP (See *Chapter 1.6.6.3.7.3.3 "Secure FTP" on page 3923*)	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
Secure online access with driver 3S UDP BlkDrvUdp	1740	1 socket per connection + 1 listen
Secure online access with driver 3S TCP/IP BlkDrvTcp	11740	1 socket per connection + 1 listen
ICMP – ping out of user project with POU *ETHx_ICMP_PING* or EthIcmpPing (PLCopen style)	None	No socket
Modbus TCP client (master) with POU *ETHx_MOD_MAST* or *ModTcpMast* (PLCopen style)	Random	1 socket per connection with POU *ETHx_MOD_MAST* or *ModTcpMast*

Limitation of connections per protocol

Protocol	PM5630-2ETH	PM5650-2ETH	PM5670-2ETH	PM5675-2ETH	≥ CPU firmware
Modbus TCP server (e.g. for SCADA access)	30 40 15	100 40 25	100 40 50	100 40 50	3.0.3 3.1.0 3.1.3

RTV (Remote Target Visualization)		5	5	5	5	3.1.0
Remarks: [1]): in preparation						

The PLC types PM5630-2ETH, PM5670-2ETH and PM5675-2ETH are available as of SystemFW 3.1.0.

Ethernet configuration

Default Ethernet configuration

Module	IP Address	Netmask	Comment
PM5xx2-x-ETH	ETH: 192.168.0.10	255.255.255.0	
PM5072-T-2ETH	ETH1: 192.168.0.10 ETH2: 192.168.1.10	255.255.255.0	The Ethernet ports must be configured in different sub networks.
PM56xx-2ETH	ETH1: 192.168.0.10 ETH2: 192.168.1.10	255.255.255.0	The Ethernet ports must be configured in different sub networks.

For changing the default addresses or the description of the function keys CFG see:

Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675

Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491.

Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC's.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver "BlkDrvTcp" on port 11740
- 1x listen on port 11740 if PLC has established online connection

> *Online access can be established from:*
> – *Automation Builder command 'Login' ↳ Chapter 1.4.1.20.3.6.2 "Command 'Login'" on page 1028*
> – *CODESYS OPC DA server*
> – *Panel CP600 series*

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   ⇨ One socket on port 11740 (listen).
2. Login from Automation Builder via driver "BlKDrvTcp".
   ⇨ 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   ⇨ 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver "BlkDrvTcp".
   ⇨ 4 sockets on port 11740 (3x online, 1x listen)

SNTP client and server

As of version 3.1.0 the SystemFW provides a SNTP Protocol implementation which can be used for time synchronization of PLC clock. It can be used as SNTP Client or / and SNTP Server. But only one instance of each can be executed at the same time on one PLC. See ↳ *Chapter 1.6.6.3.4.2 "Configuration of the (S)NTP protocol" on page 3913*.

> *The SNTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an SNTP server on several Ethernet interfaces.*

To read diagnosis information from the SNTP protocol within an IEC application the function block *PmSntpInfo* can be used. This Function block is part of the library *ABB_Pm_AC500.lib*. It can also be used to determine the synchronization state of the PLC clock.

Using network variables in AC500 V3

When using network variables via UDP broadcast, the default broadcast address is set to *255.255.255.255*.

This will not work on PLCs with multiple Ethernet interfaces, because of undecidable routing.

Set the broadcast address to a matching subnet broadcast address, depending on which interface should be used to send the variables into the network.

Example

- ETH1 with *IP 192.168.0.10* netmask *255.255.255.0*
- ETH2 with *IP 192.168.1.10* netmask *255.255.255.0*

If you want the network variables to be broadcast on ETH1, use broadcast address *192.168.0.255*.

Onboard CAN configuration

AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- CANopen master-slave arrangement (with CM598-CN as a master device)

Table 621: Differences in supported protocols

	Onboard CAN	**CM598-CN**
CANopen Manager	X	
CAN 2A/2B	X	X
J1939	X	

Onboard CAN interface is not available on AC500-eCo V3!

Supported protocols

Onboard CAN interface supports the following protocols

- CANopen Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter ↳ *Chapter 1.6.6.2.11.1.1 “CM598-CAN - CANopen master communication module” on page 3737*.

Further information can be found in chapter ↳ *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

1.6.5.1.8 Hot swap

Preconditions for using hot swap

Hot swap

WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

WARNING!

Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

H = **H**ot swap

Hot swap

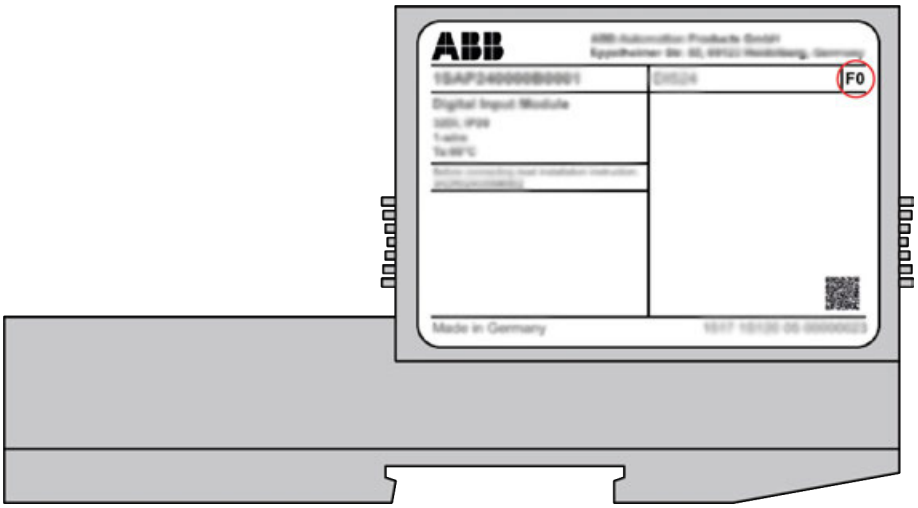
System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

Hot swap is not supported by AC500-eCo V3 CPU!



The index of the module is in the right corner of the label.

NOTICE!

Risk of damage to I/O modules!

Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!

Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

Device	Min. required device index for I/O module as of FW Version 3.0.14
AC522(-XC)	F0
AI523 (-XC)	D2
AI531	D4
AI531-XC	D2
AI561	B2
AI562	B2
AI563	B3
AO523 (-XC)	D2
AO561	B2
AX521 (-XC)	D2
AX522 (-XC)	D2
AX561	B2
CD522 (-XC)	D1

Device	Min. required device index for I/O module as of FW Version 3.0.14
DA501 (-XC)	D2
DA502 (-XC)	F0
DC522 (-XC)	D2
DC523 (-XC)	D2
DC532 (-XC)	D2
DC561	B2
DC562	A2
DI524 (-XC)	D2
DI561	B2
DI562	B2
DI571	B2
DI572	A1
DO524 (-XC)	A3
DO526	A2
DO526-XC	A0
DO561	B2
DO562	A2
DO571	B3
DO572	B2
DO573	A1
DX522 (-XC)	D2
DX531	D2
DX561	B2
DX571	B3
FM562	A1

Compatibility of hot swap

Hot swap is not supported by AC500-eCo V3 CPU!

	Central I/O on V3 CPU
I/O module on TU5xx-H connected to I/O bus master	AC500 V3 CPU types: PM56xx-2ETH
Required version of I/O bus master	Firmware as of V3.2.0
Fieldbus master when used as remote I/O with AC500 V3	-
When used as remote I/O on third party controller (PLC or DCS)	-

Hot swap behavior

The following table describes the behavior in case of I/O attached to the AC500 CPU with firmware supporting hot swap on the I/O bus.

Hot Swap Behavior	Central I/O on V3 CPU
Start-up behavior with unplugged or damaged I/O module on hot swap terminal unit TU5xx-H	System and I/O modules attached to the CPU are starting (except unplugged or damaged module when plugged on hot swap terminal unit). As soon as the correct and operational I/O module is plugged on the terminal unit, the module is configured and ready to start. No specific setting needed.
Start-up behavior with wrong I/O module type on any terminal unit	System and I/O modules are not starting
Diagnosis of presence of hot swap terminal unit	Diagnosis using PLC browser command "io-bus desc" in Automation Builder V3. The PLC browser then provides an overview of the modules on the I/O bus including the position of hot swap terminal units in the I/O bus. In the application program this can be detected with a function block "IoModuleHotSwapInfo" (Library: AC500_Io / Function Blocks / I/O-Bus) . One instance of function block is needed per terminal unit on the I/O bus. The function block provides five outputs delivering information about slut number, hot swap capability and plugged/unplugged state of the I/O module
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	If module is pulled then diagnosis Err 9480 “Module removed from Hot Swap Terminal Unit” is generated
Diagnosis after plugging the I/O module on the hot swap terminal unit	Diagnosis Err 9480 is automatically acknowledged

1.6.5.1.9 KNX IP integration

This document describes the system aspects of AC500 V3 PLCs interface to KNX and its integration into the engineering tools.

It assumes - beneath basic AC500 and Automation Builder know-how at least basic experience and expertise in use of KNX and ETS (engineering software for KNX).

Additional information can be found:

- In the example projects and their documentation (C:\Users\Public\Documents\Automation-Builder\Examples\PS5604-KNX).
- In *ABB products and services*.

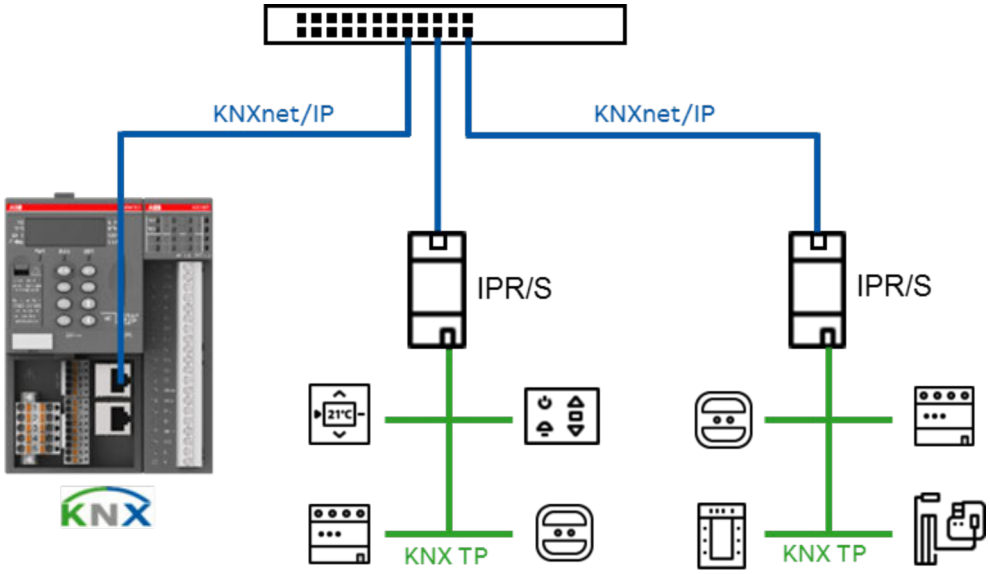
Introduction

KNX is a bus system used more on the room and floor level in buildings (e.g. for lighting, shading and local HVAC devices).

The KNX as such doesn´t necessarily need a dedicated controller for simple connection of sensor/switch to receiving/actuator devices.

The signals exchanged via the protocol are so called “group addresses” (“objects”), which are downloaded via ETS to all the thereby linked (=grouped) devices.

On the room level it typically has a serial wiring called KNX TP (twisted pair), which then is linked to floor or central building or management level via IP routers. On Ethernet it is called KNXnet/IP abbreviated also as KNX IP.



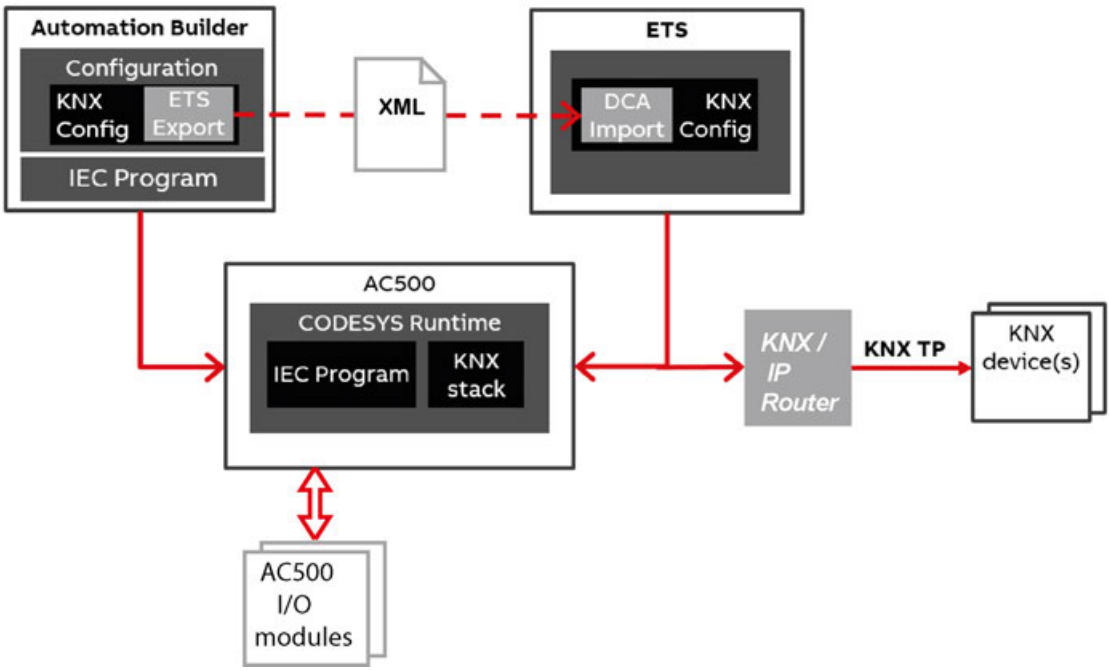
The AC500 V3 PLC is after the Automation Builder engineering step and download a standard KNX device, in which KNX communication is done via the IP network interface. It is arranged topologically on the area / main line of the KNX IP routers and communicates with them via the KNXnet/IP protocol.

Engineering workflow

Both engineering software systems for AC500 V3 PLC (Automation Builder) and KNX (ETS) are directly linked.

A data exchange for the group objects (hereinafter also called communication objects) from the Automation Builder to ETS (via an XML file) and received by a DCA (Device configuration APP) for ETS is available.

The AC500 V3 PLC is integrated into the ETS via a certified KNX “device” with the transferred group objects as configured in Automation Builder and a physical KNX address (transferred via ETS and KNX IP to the AC500 V3 PLC).



Programming and commissioning of the AC500 V3 PLC starts with Automation Builder:

Configuration of the AC500 V3 PLC, its communications, here KNX, and I/O modules and all necessary parameters.

1. Configure programmable KNX controller in CODESYS by adding group objects to the device.
2. Use group objects as inputs and outputs in the IEC application.
3. Download of the above into the AC500 V3 PLC (via the engineering interface)
4. Export of the group objects for ETS via XML file.

   The subsequent linking of the AC500 V3 PLC and the other KNX devices takes place with the vendor independent KNX commissioning software ETS:
5. Install DCA Plugin and the AC500 V3 PLC device description in ETS
6. Connect group objects in ETS and assign group addresses.
7. KNX IP download to AC500 V3 PLC.
8. The physical KNX address of the AC500 V3 PLC must be set before or during download of the KNX configuration.

The programming of the AC500 V3 PLC and the KNX commissioning can be done also by different people at different times and with same or separate engineering PCs. Both projects carry out their own download parts of their respective configurations to the AC500 V3 PLC.

The only data exchange between the two Engineering programs are the details about the KNX group objects defined in the ABB Automation Builder. This is done flexibly via the XML configuration file.

Prerequisites

- PC(s) with Windows 7 or higher with Administrator right(s)
- At least temporary network access to the internet for downloading and installing of:
  - Automation Builder as of version AB 2.1.2, (and e.g. example .project)
  - ETS5 and the necessary additional files (DCA .etsapp, device description .knxprod) plus possibly an matching example .knxproj) to above Automation Builder .project

- Network access to the local network, were the AC500 V3 PLC and KNX devices are connected.
- PS5604-KNX AC500 runtime license for each dedicated AC500 V3 PLC used in KNX networks (see *Chapter 1.6.5.1.9.6.1 “KNX runtime license” on page 3541*).
- The current IP address of the engineering PC(s) where Automation Builder and ETS are located in same Network / masked IP range, as the AC500 V3 PLC to be used.

General settings and system behavior

The KNX interface at the AC500 V3 PLC is only active during the PLC is in *RUN*.

1. Download Automation Builder program.
2. Run PLC.
3. Set physical address or download KNX application Programm via ETS.
   ⇨ The bus status can be viewed in Online View of Automation Builder.

KNX communication is only working after download the matching ETS application to the AC500 V3 PLC. Until then, the AC500 V3 PLC KNX communication is deactivated and marked with a warning symbol.

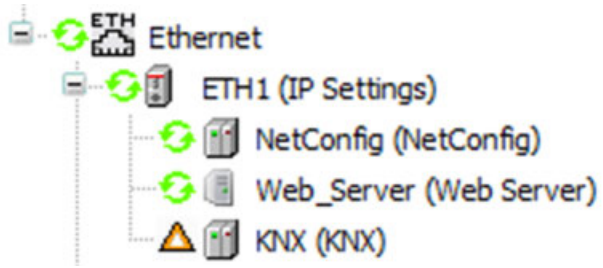


Fig. 305: KNX Interface not ready

However in this state the AC500 V3 PLC can still be switched to the KNX *programming mode* and the physical KNX address can be programmed. Also the device info can be read by ETS.

If the KNX interface is ready, this can be recognized by the green symbol on the KNX interface in the Automation Builder.

Fig. 306: KNX Interface ready

Start-up behavior

Start/Stop PLC

KNX bus works only in RUN mode.

If the PLC is in "STOP" mode the KNX bus and the outputs are reset.

To avoid this behavior in "*STOP*" mode set the following preferences at the PLC_AC500_CPU:

1. Double-click PLC_AC500_V3 <...> and click PLC Settings.
2. Enable checkbox *Update IO while in stop* and select in dropdown-menu *Behavior for Outputs in Stop "Keep current values"*.

Warm start / Cold start

If the PLC is reset also the connected objects will be reset on the KNX bus.

Power ON/Off

After Power ON the KNX Interface need approximately 1 s to start after the PLC program had started. During this period no inputs will be recognized by the PLC and no outputs will be send to the bus.

Engineering of KNX in Automation Builder

Creation of KNX group objects

Attention
This information refers to Automation Builder as of version 2.2.0.

The data exchange with the KNX bus is done via KNX group objects.

1. Double-click node *"KNX"* in the device tree *"click General ➔ click Add"*.
   ⇨ The window *Communication object* appears.
2. Enter your properties:
   - Group Object Number:
     The number of the KNX Group Object must match within the controller. It is displayed in the ETS and influences the display order in the ETS and the Automation Builder.
   - Type:
     Selection of the communication direction.
     – Input means that the controller receives values from the KNX bus.
     – Output means that the controller sends values to the KNX bus.
   - Data Point Type:
     Specification of the KNX data point type (DPT) of the Group Object. This determines the memory size, scaling and unit. For further information see the KNX Standard.
   - Group Object Name:
     The name of the KNX Group Object. It is freely selectable and is displayed in the ETS under the field name.
   - Group Object Function:
     The name of the function of the Group Object. It is freely selectable and is displayed in the ETS under the field Function.

Based on this selection, the flags of the KNX Group Object are set accordingly in the ETS.

You can use the *[Export CSV...]* button in the *"General"* tab menu bar to display the list of KNX group objects in a spreadsheet program such as Excel and edit and extend it flexibly. Then you can import them again via *[Import CSV]*.

After you have created all the required KNX group objects, export them using the *[Export to ETS]* button. This exported file contains the configuration of the KNX group objects of the AC500 V3 PLC and is imported by ETS for linking to other KNX devices. If you have not yet created project information under main menu *"Project ➔ Project Information"*, the default values will be used during the export.

To use these KNX group objects in your application program, you must assign them with IEC61131-3 variables. This additional abstraction layer of an additional variable allows you to create modular automation programs that are independent of the used bus system or input / output modules.

The assignment is possible either via the parameter page *“KNX I/O Mapping”* or *“I/O mapping list”*. Both editors offer the same function in different representations.

On the KNX I/O Mapping page, the KNX variables are shown hierarchically. Each KNX Group Object consists of several channels with additional information. These differ depending on whether it is an input or an output.

The view is structured as follows:

- Variable:
  Enter the name of the IEC 61131-3 variable that you want to assign to this channel (KNX Group Object).
- Mapping:
  Shows if the channel is already linked
- Channel:
  Name of the Channel (Channel name)
- Address:
  The memory address under which the information is stored in the memory of the AC500 V3 PLC. Inputs start with %I and outputs start with %Q.
- Type:
  Specification of the IEC 61131-3 variable type
- Default Value:
  The value used after starting the controller.
  – At a KNX Group Object input, this value is used by the automation program until a value has been received from the KNX bus.
  – At a KNX Group Object output, this value is sent to the bus when the controller is started.
- Unit:
  Specification of the KNX data point type (DPT)
- Description:
  Note text

A KNX Group Object “input” consists of a status and a control part:

The Channel name of the status part consists of: Object Number + Object Name + Object Function and include the following informations:

- UpdateFlag:
  This status flag is set to the value *“true”* for one cycle as soon as a new KNX telegram has been received. Even if the value of the telegram does not differ from the previous one.
- ValueChanged:
  This status flag is set to the value *“true”* as soon as a new KNX telegram has been received and the value differs from the previous one.
- ValueValid:
  This status flag is set to the value *“true”* as soon as a KNX telegram has been received for the first time after the controller has been started.
- WatchdogTimeout:
  As of Automation Builder 2.2.1 it will be possible to define a Watchdog Timeout for each input object. If a timeout occur this flag will be set to the value *“true”* for one cycle.
- Value:
  The current value of the KNX Group Object received from the KNX bus.

The Channel name of the control part consists of: “Control” + Object Number + Object Name + Object Function and include the following control possibilities:

- Reset status flags:
  When this flag is set from *“false”* to *“true”* by the automation program then the above-mentioned status flags of the KNX Group Object are reset to the value *“false”*.
- Send value read:
  When this flag is set from *“false”* to *“true”* by the automation program, a ValueRead telegram is sent to the KNX bus. This causes the KNX remote device to send back its current value.

A KNX Group Object “output” is represented as follows:

The Channel name of the Group Object consists of: Object Number + Object Name + Object Function

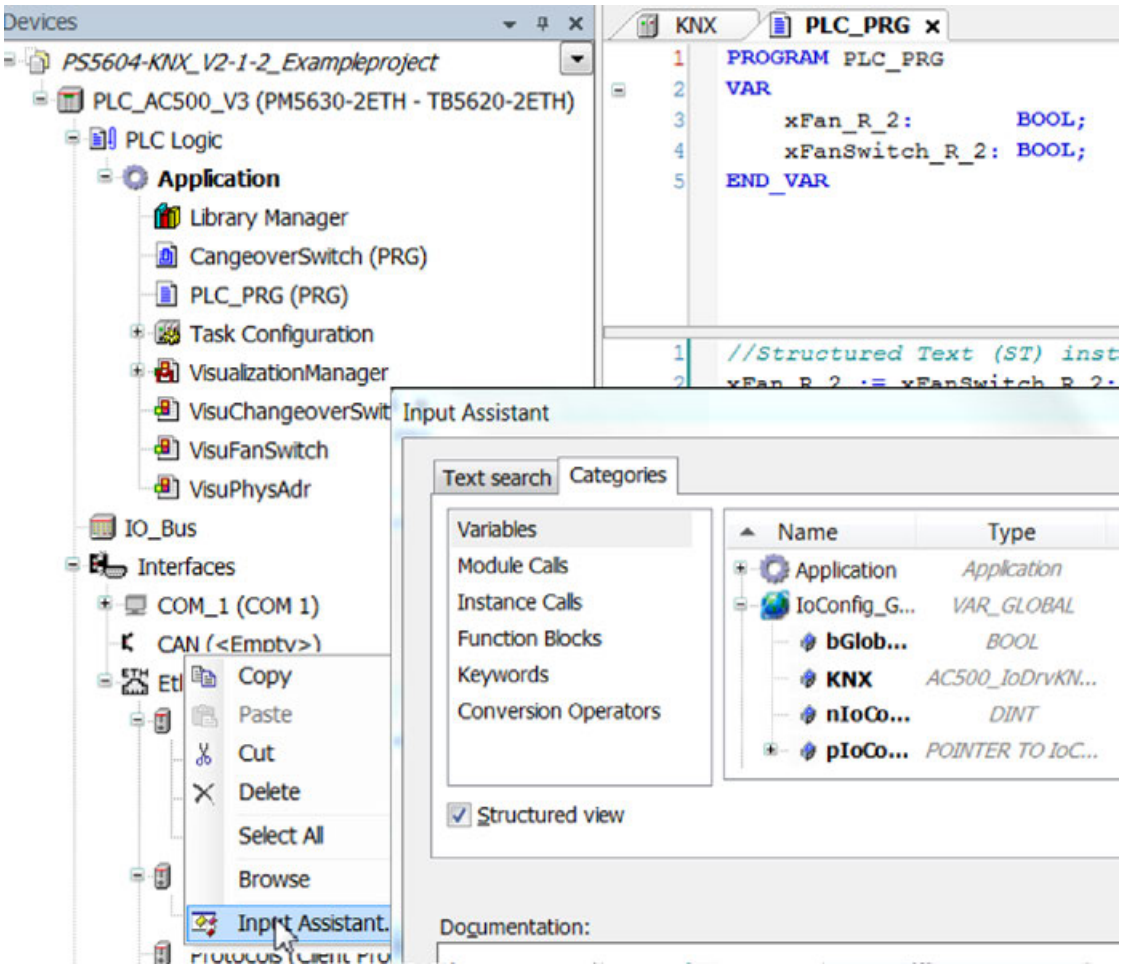
- Trigger Output:
  When this flag is set from *“false”* to *“true”* by the automation program, the current value is sent immediately to the KNX bus. The sending conditions that are may be activated in the ETS (send on change and cyclic sending) will be restarted
- Disable Output:
  As long this flag is set to *“true”* by the automation program, the sending conditions send on change and cyclic sending in the ETS are deactivated.
- Value:
  The current value of the KNX Group Object that is sent to the KNX bus.

The permanently defined Program LED Status represent the function as known in other KNX devices, showing the status of the programming LED.

Create an application program

The KNX variables defined on the KNX I/O Mapping page are available programwide under IoConfig_Globals_Mapping.

These you can see if you click in to the programming window and either via right-click select *“Input Assistant”* or press *F2*.



Export XML file

To exchange the configured KNX group objects the configuration has to be exported via XML file.

If later both projects (from Automation Builder and ETS) are loaded on the PLC, the PLC checks if the two projects have the same source and fit together. This will be done by an automatically calculated Checksum. For calculating the Checksum the following information's from the Project information will be used:

- Company
- Title
- Version
- Timestamp

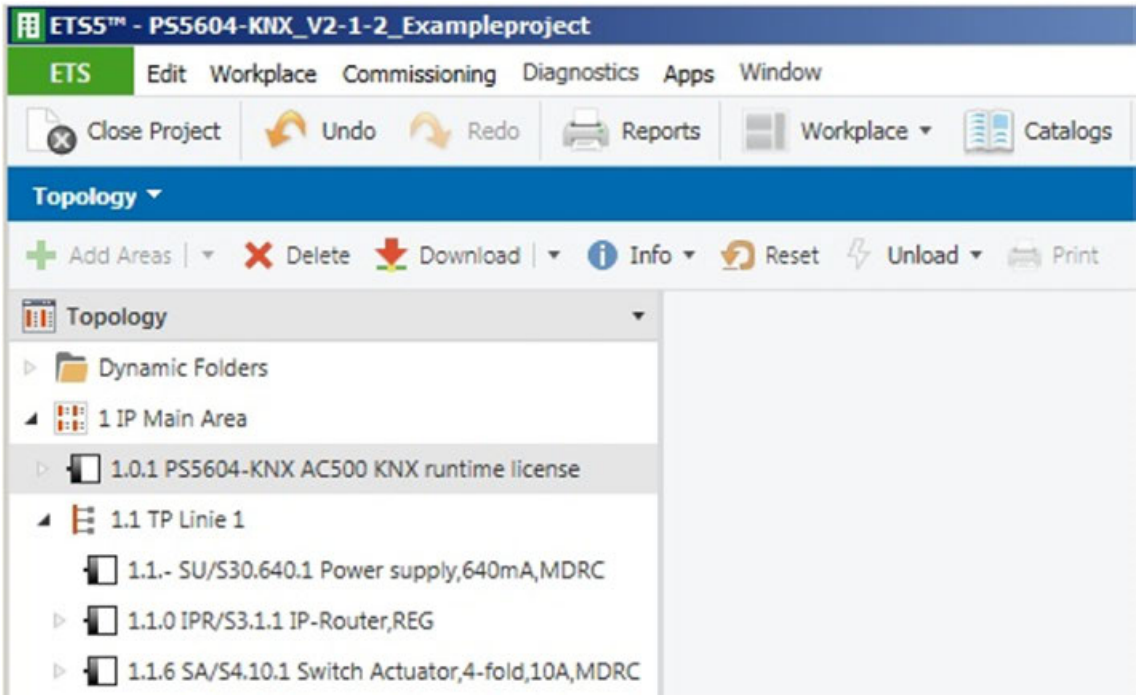
This Information will also be shown in the ETS after loading the XML file. If the user has not entered any project information some default values will be set.

Integration of the PLC in KNX

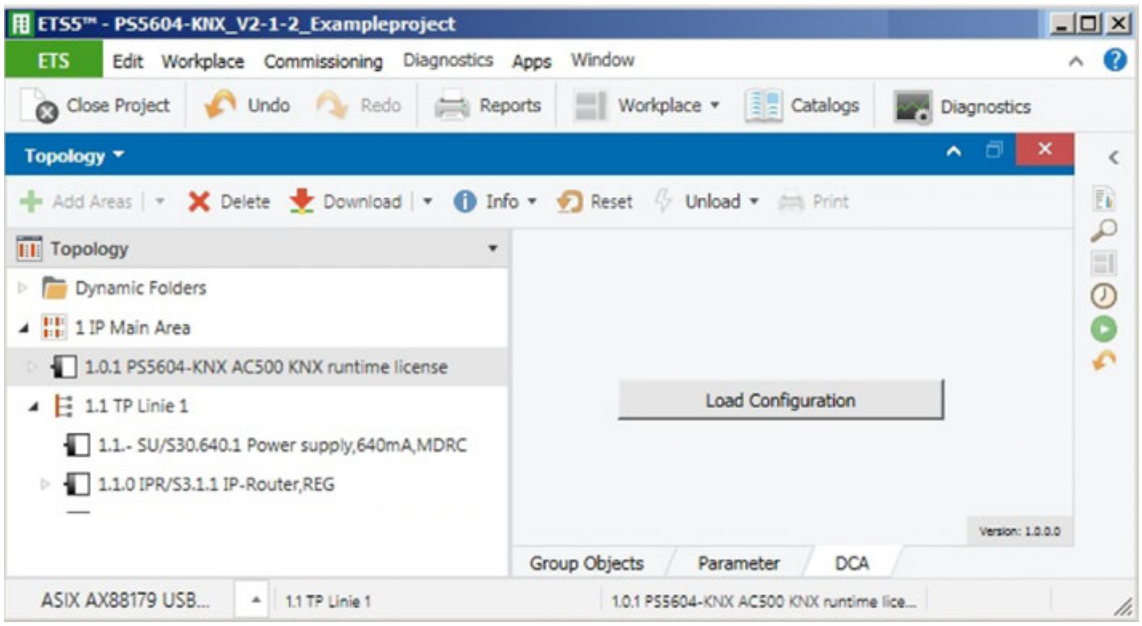
Insert controller

1. Start the ETS and insert the PS5604-KNX AC500 as controller from the ETS device catalog into your ETS project.
2. Assign a physical KNX address to the controller.

   ⇨ The controller is placed topologically on the IP *Main Area*.



Import configuration



1. Select the *"PS5604-KNX AC500"* in the ETS explorer tree and click on *"DCA"* tab in the editor window.
2. Click on Load Configuration and select the configuration XML file.
   ⇨ The KNX group objects defined in AC500 V3 PLC in Automation Builder are displayed in the ETS.

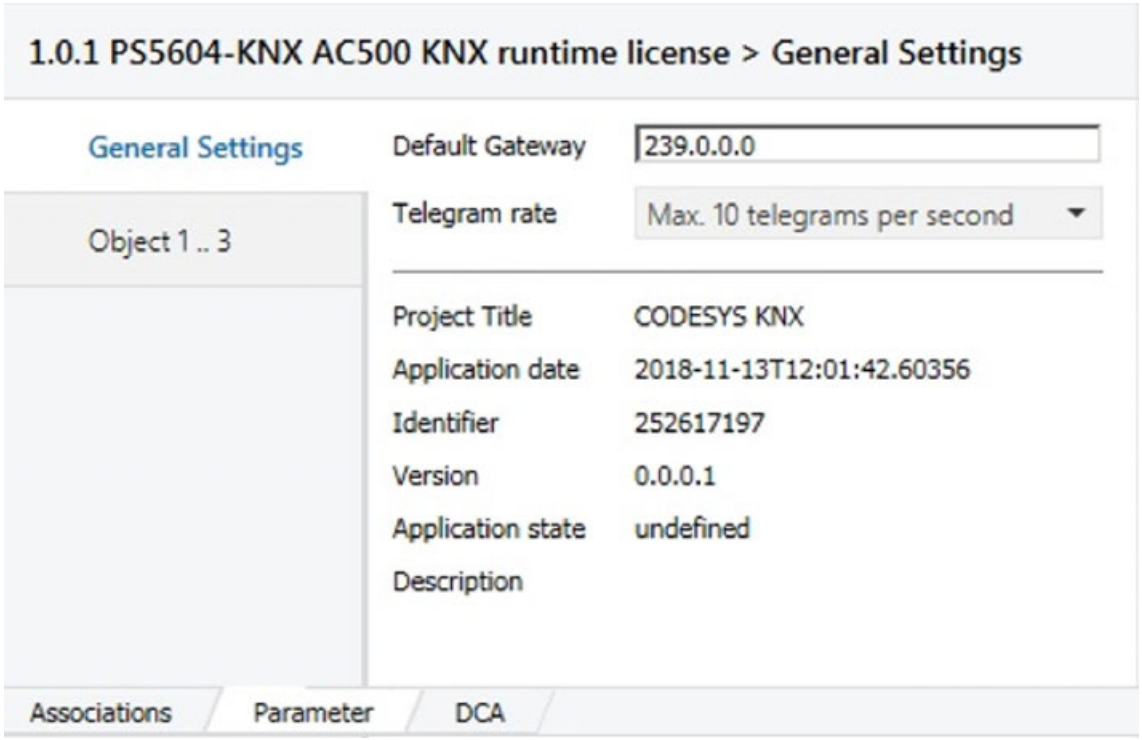
Connect controller with KNX Devices

1. Right-click on a *"PS5604-KNX AC500"* group object and assign a KNX group address or drag and drop from group address window.
2. Interlink group objects by assigning the same KNX Group Address.

Parameters of the device

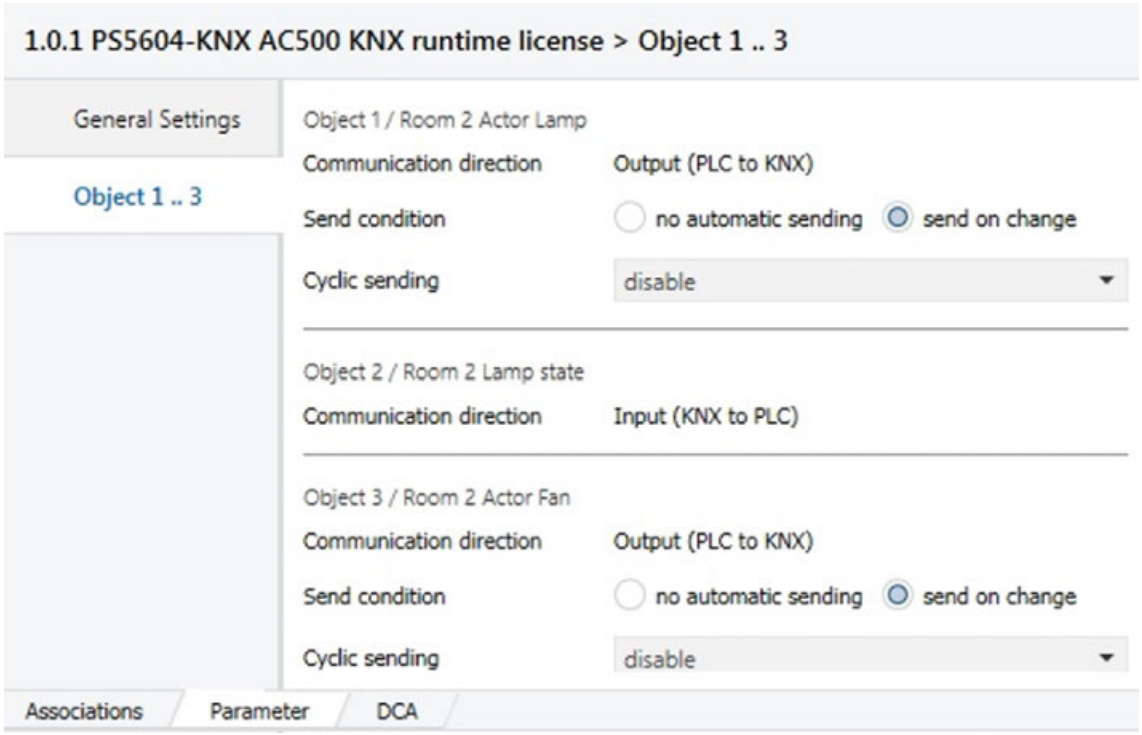
The following settings are possible in the ETS parameters of the *PS5604-KNX AC500*.

Tab *General settings*



- Default Gateway:
  The used KNXnet/IP broadcast address. This must match the KNX system (KNX IP router). It is the default setting that is usually not changed.
  - The entry field *Default Gateway* can contain another IP address for the Multicast communication. The normal Multicast IP address for KNX ist 224.0.23.12.
  - If another Multicast IP address is to be used, it can be chosen in the area from 239.0.0.0 to 239.255.255.255. This alternative Multicast IP address can be defined in the input field *Default Gateway*.
- Telegram rate:
  The maximum transmission rate of the AC500 V3 PLC can be limited in order to prevent an excessive bus load and thus to avoid malfunction of the KNX system.
  The KNX telegrams are buffered until they have been sent. New values which have been calculated by the automation program in the meantime are updating the cached values. The old cached value is discarded and not sent.
- Project Information:
  At this point, the project information of the Automation Builder project is displayed.

Tab *Object 1 .. 3*



For each KNX Group Object of the AC500 V3 PLC an Object entry is displayed in the device parameters. This is named after the number of the KNX Group Object.

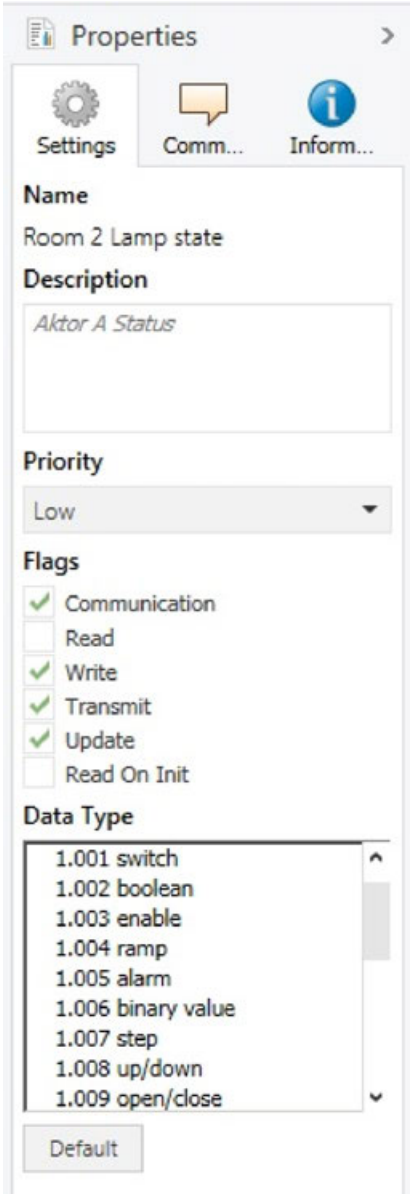
For outputs (controller sends to the KNX bus) the KNX transmission conditions can be set:

- Communication direction:
  Setting of the transmission direction of the object.
  – Input (KNX to PLC): The Controller receives values from the KNX bus.
  – Output (PLC to KNX): The Controller sends values to the KNX bus.
- Send condition (only for outputs):
  Setting whether the Controller sends a telegram to the KNX bus automatically when the object value is changed. The following options are available
  – No automatic sending:
    No automatic sending to the KNX bus. This must be done via the program code by the Trigger Output flag.
  – Send on change:
    Every time the object value changes, a telegram is sent to the KNX bus. No matter how minor this change is.
  – Send on difference (only for group objects which are not DPT 1.* Boolean): Every time the object value changes, this value is only sent to the KNX bus if it differs from the last sent value at least by the settable difference.
- Sending difference (only if Send on difference is active):
  Input of the difference by which the object value must change to be send. You can enter numbers with decimal places.
- Cyclic sending (only for outputs):
  Setting whether in addition the object value is sent cyclically repeatedly to the bus. This also happens if this object value has not changed. Two different range of values for the cycle time can be specified.
- Cycle time (only when Cyclic sending is active):
  Specification of the cycle time for the cyclic transmission.
  Input format:
  hour:minute:second
  Note: The cycle time of the KNX stack depends on the cycle time of the task that executes the stack. A long task time causes long download times from ETS. Consider the CPU load and cycle times of other processes running on the CPU when selecting a cycle time for the KNX stack.

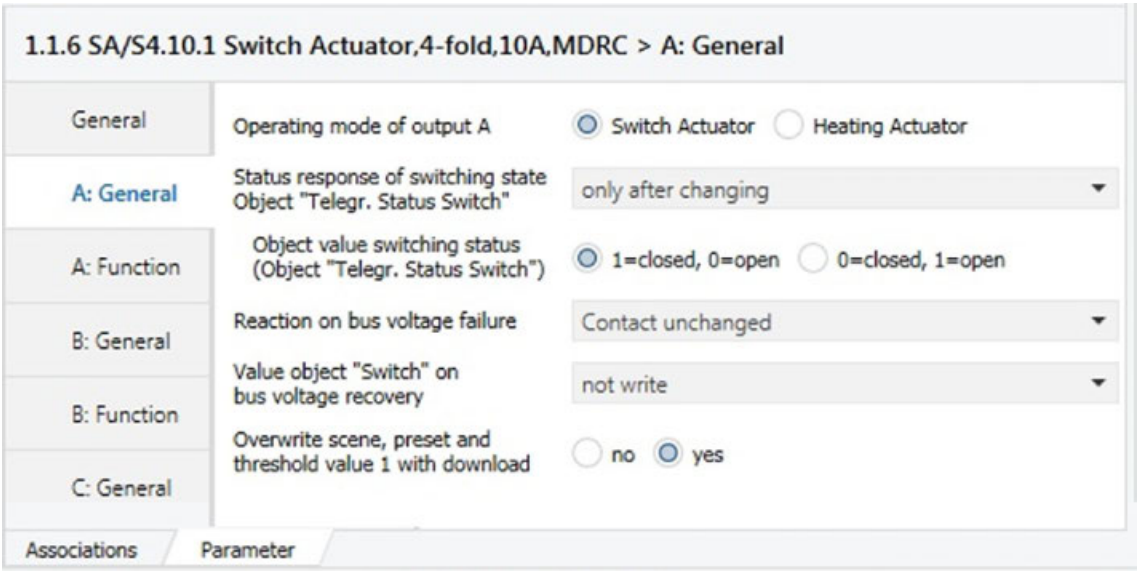
Regardless of the set transmission conditions, the program code can trigger by the flag **Trigger Output** a sending of the value to the KNX bus at any time.

By activating the flag **Read on Init** of the KNX group objects in the right ETS properties panel, the Controller sends a value read query to the connected KNX device at startup. This then responds with its current object value.

In this properties panel you can also select the appropriate subdata point type of the KNX Group Object. This defines the unit of the value in the KNX system. For example DPT 9.001 represents temperature in ° C.



If for example the response of an actuator state is needed for an input "Aktor A Status", this feature can be enabled in the parameter of the Switch Actuator (e.g. 1.1.6 SA/S4.10.1).



The current IP address as well as further information of the AC500 V3 PLC can be read via the ETS Device Info function. For this the physical KNX address is necessary. You can determine the address by the ETS function **Programming Mode**.

With the ETS function **Group Monitor** you can analyze the telegrams on the KNX bus. You can also use it to write/read KNX telegrams.

Download ETS configuration to controller

The download of the ETS configuration to the AC500 V3 PLC is done via the ETS function *"Download"* in the menu bar. This download happens via the KNX interface directly to the AC500 V3 PLC.

Best you select in ETS the network interface of the computer as the bus interface. Thus, a fast data exchange is possible and the data is not routed via the KNX TP bus.

At the first download, the physical KNX address of the controller is programmed. To do this, set the AC500 V3 PLC to KNX programming mode.

This can be done either via the display or functions inside the application program of the controller (e.g. connected to a Webvisu like done in the example program).

Via AC500 display

↳ *Chapter 1.6.5.1.6.5.3.2 "Configuration CPU firmware SystemFW >=V3.2.0 and DisplayFW >=V4.1" on page 3498*

> ***Attention!***
> *The activation of the KNX programming mode via the display only works with Automation Builder as of version 2.2.0.*

> *The KNX configuration of AC500-eCo V3 uses TA5130-KNXPB.*

The AC500 V3 PLC must be in RUN mode.

1. Press the ***CFG*** function key.
   ⇨ Switch is OFF (*S OFF*) is displayed.

2. Press the *Arrow Down* function key
   ⇨ *Pbut 0* is displayed.

   (*Pbut* is standing for progamming button, the 0 (or the 1) showing the status of the programming LED (0=Off; 1 =ON))
3. Press the ***CFG*** function key.
   ⇨ The display shows *Pbut 1* flashing.
4. Confirm this with the ***OK*** function key.
   ⇨ The display permanently shows *Pbut 1*. The AC500 V3 PLC is in KNX programming mode.

AC500-eCo V3 via TA5130-KNXPB

1. Ensure the TA5130-KNXPB is plugged in during power up, PLC is in RUN mode.
2. Ensure that TA5130-KNXPB is configured inside Automation Builder configuration.
3. Push the button on the TA5130-KNXPB.
   ⇨ The LED on the option board should turn ON. The AC500-eCo V3 is in KNX programming mode.

The AC500 V3 PLC automatically terminates the KNX programming mode after the programming of the physical KNX address.

Alternatively you can terminate the programming mode with *Pbut 0* by pressing the ***CFG*** function key.

For AC500-eCo V3: push the button on the TA5130-KNXPB again to terminate the programming mode, the LED should turn OFF.

You can exit the menu at any time with the ***ESC*** function key.

Via AC500 application

Please use the following variable for setting the KNX Program Button:

`AC500_IoDrvKNX.GVL.IoDrvKNXCopyChannels.ProgramButton`

The controller automatically terminates the programming mode after programming the physical address with the ETS.

The AC500 V3 PLC has then besides the Automation Builder configuration also the appropriate ETS configuration and starts its KNX communication.

Download all other linked KNX devices as well as the KNX IP routers. The ETS automatically creates the filter tables of the KNX IP routers so that the KNX telegrams are routed from the KNX TP lines to the IP line of the AC500 Controller.

Make changes

Changes can be made in the Automation Builder as well as in the ETS without the need for a change in the other software or the need for a new data exchange.

Only if changes are made to the KNX group objects in the Automation Builder, a data exchange with the ETS is again necessary. Afterwards, a download is required both in the Automation Builder and in the ETS. Only when these two configurations have been downloaded again to the AC500 V3 PLC, the KNX communication is in operation again.

The DCA detects changes to names and numbers of the KNX group objects when importing the configuration file in the ETS and keeps the already made settings and linked Group Addresses of these changed group objects.

Remarks

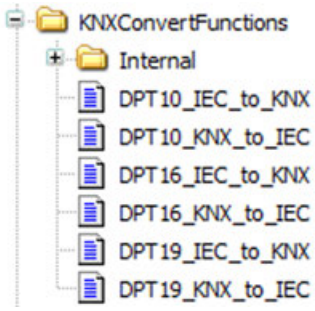
KNX runtime license

The standard V3 AC500 CPUs are shipped from the factory without firmware and need an installed PS5604-KNX runtime license for KNX operation in each CPU. The PS5604-KNX is a license document with activation code and needs to be purchased separately. The license can after a first download to one CPU also be transferred to another CPU via Automation Builder.

Data conversion

The KNX standard defines a big-endian byte order while the IEC 61131-3 is based on the little-endian byte order. Therefore, the controller automatically converts the data point types.

However, if you access the bits of the structured KNX data point types (DPT) for time, date (DPT 10.* , DPT 16.* , DPT 19.*) in your program code, you have to note the reverse byte order. Therefore, as of Automation Builder version 2.2.0, corresponding function libraries are available that provide conversion functions for these data point types.



1.6.5.1.10 Communication with Modbus RTU

Protocol description

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

The Modbus operating mode of a serial interface is set in the PLC configuration See *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*

> *To use Modbus RTU protocol on an AC500-eCo V3 PLC, the CPU must be equipped with an option board for COMx serial communication TA5141-RS232I, TA5142-RS485 or TA5142-RS485I option board. The type of the option board adapter must be selected according to the type of physical serial interface needed.*
>
> *According to the CPU type, up to 3 option boards for COMx serial communication can be used. Following serial interface option boards can be used, see Chapter 1.6.6.2.8.3 “Attach an option board for COMx serial communication” on page 3721*

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the function block *ModRtuMast*.

This function block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus blocks transferred by the server contain the following information:

- Modbus address of the interrogated server (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)
- CRC16 control code (2 bytes)

Modbus server

In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

Function code		Description
DEC	**HEX**	
01 or 02	01 or 02	Read n bits
03 or 04	03 or 04	Read n words
05	05	Write one bit (encoded in one word)
06	06	Write one word
15	0F	Write n bits (encoded in one byte)
16	10	Write n words
22	16	Mask write
23	17	Read/write multiple words in one telegram

The following restrictions apply to the length of the data to be sent:

Function code		Max. length
DEC	**HEX**	
01 or 02	01 or 02	2000 bits
03 or 04	03 or 04	125 words / 62 double words
05	05	1 bit
06	06	1 word
15	0F	2000 bits
16	10	123 words / 61 double words
22	16	Write: 1 word
23	17	Read: 125 words / 62 double words Write: 121 words / 60 double words

Technical data

The Modbus operating mode and the interface parameters are set in the ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*.

Table 622: Description of the Modbus protocol

Parameter	Value
Supported standard	See ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*
Number of connection points	1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol	Modbus
Operating mode	Client/server
Address	Server only
Data transmission control	CRC16
Data transmission speed	From 9,600 bits/s to 115,200 bits/s ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*
Encoding	1 start bit 8 data bits 1 or 2 stop bits 1 parity bit ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*)
Max. cable length for RS-485 on COM1 for AC500 CPU	1.200 m at 19.200 baud

Modbus addresses for AC500-eCo V3 processor modules PM50x2

Modbus address table

A range of maximum 64 kB is allowed for the access via Modbus to the addressable flag area (%M area). Thus, the complete address range 0000hex up to 7FFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

Following values apply:

	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH
Size of the %M area	4 kB	16 kB	16 kB	64 kB
Modbus address range (Word accesses)				
HEX	0000 … 07FF	0000 … 1FFF	0000 … 1FFF	0000 … 7FFF
DEC	0000 … 2047	0000 … 8191	0000 … 8191	0000 … 32767
Byte	%MB0 … %MB4097	%MB0 … %MB16382	%MB0 … %MB16382	%MB0 … %MB65534
Word	%MW0 … %MW2047	%MW0 … %MW8191	%MW0 … %MW8191	%MW0 … %MW32767

Modbus addresses for AC500 V3 processor modules PM56xx

Modbus address table

Table 623: Modbus addresses (word accesses)

Modbus address		Byte	Bit (byte-oriented)	Word	Double word

0022	34		%MX4.2		
...	...	...	...	...	...
0FFF	4095	%MB511	%MX511.7	%MW255	%MD127
1000	4096	%MB512	%MX512.0	%MW256	%MD128

Modbus address		Byte	Bit (byte-oriented)	Word	Double word
HEX	DEC	BYTE	BOOL	WORD	DWORD
...	...	...	...	...	...
7FFF	32767	%MB4095	%MX4095.7	%MW2047	%MD1023
8000	32768	%MB4096	%MX4096.0	%MW2048	%MD1024
...	...	...	...	...	...
FFFF	65535	%MB8191	%MX8191.7	%MW4095	%MD2047

Calculation of the bit variable from the hexadecimal address:

Formula:			
	Bit variable (BOOL) := %MXBYTE.BIT		
where:	DEC	Decimal address	
	BYTE	DEC / 8	
	BIT	DEC mod 8	(Modulo division)

Examples:

- Address hexadecimal = 16#2002
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX1024.2
- Address hexadecimal = 16#3016
  DEC := 12310
  BYTE := 12310 / 8 := 1538,75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX1538.6
- Address hexadecimal = 16#55AA
  DEC := 21930
  BYTE := 21930 / 8 := 2741,25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX2741.2

Calculation of the hexadecimal address from the bit variable:

Examples:

- Bit variable := %MX515.4
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C
- Bit variable := %MX3.3
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B
- Bit variable := %MX6666.2
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052

Peculiarities for accessing Modbus addresses

Peculiarities for bit access:

- A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

Areas protect from read/write access by Modbus client

As described in *Chapter 1.6.6.3.3.1.1 “Configuration of Modbus TCP/IP server” on page 3910*, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the function block *ModRtuMast* at input "Data", via the ADR operator.

For the AC500, the following areas can be accessed using the ADR operator:

- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

The send and receive of telegrams shown in this section are not visible in the PLC. However, the complete telegrams can be made visible using a serial data analyzer connected to the connection line between server and client, if required.

The amount of user data depends on the capabilities of the server and the client.

For the following examples, it is assumed that one AC500 Modbus module is used as client and another one is used as server. There may be different properties if modules of other manufacturers are used.

FCT 1 or 2: Read n bits

Table 625: Client request

Server address	Function code	Server operand address		Number of bits		CRC	
		High	Low	High	Low	High	Low

Table 626: Server response

Server address	Function code	Number of Bytes	...Data...	CRC	
				High	Low

FCT 3 or 4: Read n words

Table 627: Client request

Server address	Function code	Server operand address		Number of words		CRC	
		High	Low	High	Low	High	Low

Table 628: Server response

Server address	Function code	Number of Bytes	Data		CRC	
			High	Low	High	Low

FCT 3 or 4: Read n double words

The function code "read double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer) Same tables as *Chapter 1.6.5.1.10.6.2 “FCT 3 or 4: Read n words” on page 3549*.

FCT 5: Write 1 bit

For the function code "write 1 bit", the value of the bit to be written is encoded in one word.

BIT = TRUE -> Data word = FF 00 HEX

BIT = FALSE -> Data word = 00 00 HEX

Table 629: Client request

Function code	Server operand address		Number of words		CRC	
	High	Low	High	Low	High	Low

Table 630: Server response

Function code	Server operand address		Data		CRC	
	High	Low	High	Low	High	Low

FCT 6: Write 1 word

Table 631: Server request

Server address	Function code	Server operand address		Data		CRC	
		High	Low	High	Low	High	Low

Table 632: Server response

Server address	Function code	Server operand address		Data		CRC	
		High	Low	High	Low	High	Low

FCT 15: Write n bits

Table 633: Client request

Server operand address		Number of bits		Number of bytes	...Data...	CRC	
High	Low	High	Low			High	Low

Table 634: Server response

Server address	Function code	Server operand address		Number of bits		CRC	
		High	Low	High	Low	High	Low

FCT 16: Write n words

Table 635: Client request

Server operand address		Number of words		Number of bytes	...Data...	CRC	
High	Low	High	Low			High	Low

Table 636: Server response

Function code	Server operand address		Number of words		CRC	
	High	Low	High	Low	High	Low

FCT 16: Write n double words

The function code "write double word" is not defined in the Modbus RTU standard. This is why the double word is composed of a low word and a high word (depending on the manufacturer).

Table 637: Client request

Server operand address		Number of words		Number of bytes	...Data...	CRC	
High	Low	High	Low			High	Low

Table 638: Server response

Server address	Function code	Server operand address		Number of words		CRC	
		High	Low	High	Low	High	Low

FCT 22: Mask write register

Table 639: Client request

Server address	Function code	Server operand address		AND Mask		OR Mask		CRC	
		High	Low	High	Low	High	Low	High	Low

Server address	Function code	Server operand address		AND Mask		OR Mask		CRC	
		High	Low	High	Low	High	Low	High	Low

FCT 23: Read/Write n words

Table 641: Client request

Server address	Function code	Operand addr. read		Number of words read		Operand addr. write		Number of words write		Number of bytes write	...Data...	CRC	
		High	Low	High	Low	High	Low	High	Low			High	Low

Table 642: Server response

Server address	Function code	Number of bytes read	...Data...	CRC	
				High	Low

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the *ModRtuMast* inputs are logically correct.

Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

Table 643: Server response

Server address	OR 80HEX	Error code	CRC	
			High	Low

Possible error codes of the client

Code	Description
01DEC	ILLEGAL FUNCTION The server does not support the function requested by the client
02DEC	ILLEGAL DATA ADDRESS Invalid operand address in the server or operand area exceeded
03DEC	ILLEGAL DATA VALUE At least one value is outside the permitted range of values
04DEC	SERVER DEVICE FAILURE An unrecoverable error occurred while the server was attempting to perform the requested action

Code	Description
05DEC	ACKNOWLEDGE Specialized use in conjunction with programming commands. The server has accepted the request and is processing it, but a long duration of time will be required to do so. This response is returned to prevent a timeout error from occurring in the client. The client can next issue a Poll Program Complete message to determine if processing is completed
06DEC	SERVER DEVICE BUSY Specialized use in conjunction with programming commands. The server is engaged in processing a long–duration program command. The client should retransmit the message later when the server is free.
07DEC	NEGATIVE ACKNOWLEDGE Specialized use in conjunction with programming commands. The server cannot perform the programming functions. Client should request diagnostic or error information from server.
08DEC	MEMORY PARITY ERROR Specialized use in conjunction with function codes 20 and 21 and reference type 6, to indicate that the extended file area failed to pass a consistency check. The server attempted to read record file, but detected a parity error in the memory. The client can retry the request, but service may be required on the server device.
10DEC	GATEWAY PATH UNAVAILABLE Specialized use in conjunction with gateways, indicates that the gateway was unable to allocate an internal communication path from the input port to the output port for processing the request. Usually means that the gateway is misconfigured or overloaded.
11DEC	GATEWAY TARGET DEVICE FAILED TO RESPOND Specialized use in conjunction with gateways, indicates that no response was obtained from the target device. Usually means that the device is not present on the network.

Example

Table 644: Example:

Modbus request of the client:			
	Function code:	01	Read n bits
	Server operand address:	4000HEX = 16384DEC	Area for read access disabled in server

Modbus response of the server:			
	Function code:	81HEX	
	Error code:	03	

Processing bits

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type *Chapter 1.4.1.19.5.10 “Data Type 'BIT'” on page 656* must not be mixed up with data type *Chapter 1.4.1.19.5.1 “Data type 'BOOL'” on page 647*. Variables of both types may have values ‘TRUE’ or ‘FALSE’. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

Modbus client

When accessing bits in a *Server*, the local data referred to at *Client* function blocks input data is always expected to be of format BOOL.

```
VAR
abBoolArray : ARRAY [0..15] OF BOOL;
ModMast : ModTcpMast;
END_VAR
```

```
abBoolArray[0]  := TRUE;
abBoolArray[15] := FALSE;

ModMast(Execute:= ModMastExecute,
        Eth:= ETH1,
        IPAdr:= IP_ADR_STRING_TO_DWORD('192.168.0.100'),
        UnitID:= 0,
        Fct:= 15,
        Addr:= 16#0000,
        Nb:= SIZEOF(abBoolArray),
        Data:= ADR(abBoolArray));
```

Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see *Chapter 1.4.1.19.4.9 “Bit Access in Variables” on page 641*).

```
VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR
```

```
awWordVariable[0].0  := TRUE;
awWordVariable[7].15 := FALSE;
```

Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset ↳ *Chapter 1.4.1.19.4.9 “Bit Access in Variables” on page 641*.

```
VAR_GLOBAL CONSTANT
(*bit offsets in awWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in awWordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END_VAR
```

```
VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR
```

```
awWordVariable[0].NameBitOffset_0_00  := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;
```

Defining a data type

A further alternative is to define your own data types (see *Chapter 1.4.1.20.2.6 “Object 'DUT'” on page 835*) according to the requirements of your particular application (see *“Symbolic bit access in structure variables” on page 642*).

```
TYPE ControlWordType :
STRUCT
NameBitOffset_00 : BIT;
NameBitOffset_01 : BIT;
NameBitOffset_02 : BIT;
NameBitOffset_03 : BIT;
NameBitOffset_04 : BIT;
NameBitOffset_05 : BIT;
NameBitOffset_06 : BIT;
NameBitOffset_07 : BIT;
NameBitOffset_08 : BIT;
NameBitOffset_09 : BIT;
NameBitOffset_10 : BIT;
NameBitOffset_11 : BIT;
NameBitOffset_12 : BIT;
NameBitOffset_13 : BIT;
NameBitOffset_14 : BIT;
NameBitOffset_15 : BIT;
END_STRUCT
END_TYPE
```

```
VAR
atTypeVariable AT %MW0 : ARRAY [0..7] OF ControlWordType;
END_VAR
```

```
atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;
```

Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see *“Symbolic bit access in structure variables” on page 642*).

```
TYPE ControlWord0Type :
STRUCT
NameBitOffset_0_00 : BIT;
NameBitOffset_0_01 : BIT;
NameBitOffset_0_02 : BIT;
NameBitOffset_0_03 : BIT;
NameBitOffset_0_04 : BIT;
NameBitOffset_0_05 : BIT;
NameBitOffset_0_06 : BIT;
NameBitOffset_0_07 : BIT;
NameBitOffset_0_08 : BIT;
NameBitOffset_0_09 : BIT;
NameBitOffset_0_10 : BIT;
NameBitOffset_0_11 : BIT;
NameBitOffset_0_12 : BIT;
NameBitOffset_0_13 : BIT;
NameBitOffset_0_14 : BIT;
NameBitOffset_0_15 : BIT;
END_STRUCT
END_TYPE
```

ControlWord1Type

```
1  TYPE ControlWord1Type :
2  STRUCT
3  NameBitOffset_1_00 : BIT;
4  NameBitOffset_1_01 : BIT;
5  NameBitOffset_1_02 : BIT;
6  NameBitOffset_1_03 : BIT;
7  NameBitOffset_1_04 : BIT;
8  NameBitOffset_1_05 : BIT;
9  NameBitOffset_1_06 : BIT;
10 NameBitOffset_1_07 : BIT;
11 NameBitOffset_1_08 : BIT;
12 NameBitOffset_1_09 : BIT;
13 NameBitOffset_1_10 : BIT;
14 NameBitOffset_1_11 : BIT;
15 NameBitOffset_1_12 : BIT;
16 NameBitOffset_1_13 : BIT;
17 NameBitOffset_1_14 : BIT;
18 NameBitOffset_1_15 : BIT;
19 END_STRUCT
20 END_TYPE
```

```
TYPE ControlWordListType :
STRUCT
ControlWord0 : ControlWord0Type;
ControlWord1 : ControlWord1Type;
END_STRUCT
END TYPE
```

```
VAR
atWordListType AT %MW0 : ControlWordListType;
END_VAR
```

```
atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```

Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for packing MEM_Pack_BitsToByte and unpacking MEM_UnpackWord of the CAA_Memory.library, which can be found with the Library Manager ↳ *Chapter 1.5.3 “Library Manager functionality” on page 2146*.

```
VAR
abBoolVariable : ARRAY [0..15] OF BOOL;
wWordVariable0 : AT %MW0 WORD;
wWordVariable1 : AT %MW1 WORD;
END_VAR

VAR
Unpack  : Mem.UnpackWord;
END_VAR
```

```
abBoolVariable[0]  := TRUE;
abBoolVariable[15] := FALSE;

wWordVariable0 := Mem.PackBitsToWord(abBoolVariable[0], abBoolVariable[1], abBoolVariable[2], abBoolVariable[3],
                                     abBoolVariable[4], abBoolVariable[5], abBoolVariable[6], abBoolVariable[7],
                                     abBoolVariable[8], abBoolVariable[9], abBoolVariable[10], abBoolVariable[11],
                                     abBoolVariable[12], abBoolVariable[13], abBoolVariable[14], abBoolVariable[15]);
wWordVariable1 := 1;
Unpack(wValue:= wWordVariable1,
       xBit0=> abBoolVariable[0], xBit1=> abBoolVariable[1], xBit2=> abBoolVariable[2], xBit3=> abBoolVariable[3],
       xBit4=> abBoolVariable[4], xBit5=> abBoolVariable[5], xBit6=> abBoolVariable[6], xBit7=> abBoolVariable[7],
       xBit8=> abBoolVariable[8], xBit9=> abBoolVariable[9], xBit10=> abBoolVariable[10], xBit11=> abBoolVariable[11],

```

Function block ModRtuMast

This function block is only required in the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The function block can be used for the local serial interfaces of the controller. A separate instance of the function block has to be used for each interface.

ModRtuMast is contained in the library *AC500_ModRtuMast*.

1.6.5.1.11 Communication with Modbus TCP/IP

Protocol description

The Modbus TCP protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Each Ethernet interface can work as Modbus client and server interface in parallel if required.

The Modbus operating mode of an Ethernet interface is set in *Modbus on TCP/IP* ↳ *Chapter 1.6.6.3.3 “Modbus protocol” on page 3910*external.

Modbus client

In this operating mode, the telegram traffic with the server(s) is handled via the function block ETHx_MOD_MAST, which can be found through the Library Manager ↳ *Chapter 1.5.3 “Library Manager functionality” on page 2146*. This function block sends Modbus request telegrams to the server(s) via the set interface and receives Modbus response telegrams from the server(s) via this interface.

The Modbus function blocks transferred by the client contain the following information:

- Transaction identifier for synchronization between messages of server and client (2 byte)
- Protocol identifier (0 for Modbus/TCP) (2 byte)
- Length field (Number of bytes in frame) (2 byte)
- Unit identifier (1 byte)
- Function code that defines the request of the client (1 byte)
- Data to be exchanged (n bytes)

Modbus server

In this operating mode, no function block is required for Modbus communication. Sending and receiving Modbus telegrams is performed automatically.

The AC500 CPUs process the following Modbus operation codes:

Function code		Description
DEC	**HEX**	
01 or 02	01 or 02	Read n bits
03 or 04	03 or 04	Read n words
05	05	Write one bit (encoded in one word)
06	06	Write one word
15	0F	Write n bits (encoded in one byte)
16	10	Write n words
22	16	Mask write
23	17	Read/write multiple words in one telegram

The following restrictions apply to the length of the data to be sent:

Function code		Max. length
DEC	**HEX**	
01 or 02	01 or 02	2000 bits
03 or 04	03 or 04	125 words / 62 double words

Function code		Max. length
DEC	**HEX**	
05	05	1 bit
06	06	1 word
15	0F	2000 bits
16	10	123 words / 61 double words
22	16	Write: 1 word
23	17	Read: 125 words / 62 double words Write: 121 words / 60 double words

Technical data

Configuration of Modbus on TCP/IP is described in the chapter ↳ *Chapter 1.6.6.3.3 “Modbus protocol” on page 3910*.

Modbus addresses for AC500-eCo V3 processor modules PM50xx

Modbus address table

A range of maximum 64 kB is allowed for the access via Modbus to the addressable flag area (%M area). Thus, the complete address range 0000hex up to 7FFFhex is available for Modbus.

The availability of the segments depends on the CPU. The size of the %M area can be found in the technical data of the CPUs and in the target system settings.

Inputs and outputs cannot be directly accessed using Modbus.

Following values apply:

	PM5012-x-ETH	**PM5032-x-ETH**	**PM5052-x-ETH**	**PM5072-T-2ETH**
Size of the %M area	4 kB	16 kb	16 kB	64 kB
Modbus address range (Word accesses)				
HEX	0000 … 07FF	0000 … 1FFF	0000 … 1FFF	0000 … 7FFF
DEC	0000 … 2047	0000 … 8191	0000 … 8191	0000 … 32767
Byte	%MB0 … %MB4097	%MB0 … %MB16382	%MB0 … %MB16382	%MB0 … %MB65534
Word	%MW0 … %MW2047	%MW0 … %MW8191	%MW0 … %MW8191	%MW0 … %MW32767

Modbus addresses for AC500 V3 processor modules PM56xx

Modbus address table

Table 645: Modbus addresses (word accesses)

Modbus address		Byte	Bit (byte-oriented)	Word	Double word

...	...	...	...	...	...
7FFF	32767	%MB4095	%MX4095.7	%MW2047	%MD1023
8000	32768	%MB4096	%MX4096.0	%MW2048	%MD1024
...	...	...	...	...	...
FFFF	65535	%MB8191	%MX8191.7	%MW4095	%MD2047

Calculation of the bit variable from the hexadecimal address:

Formula:			
	Bit variable (BOOL) := %MXBYTE.BIT		
where:	DEC	Decimal address	
	BYTE	DEC / 8	
	BIT	DEC mod 8	(Modulo division)

Examples:

- Address hexadecimal = 16#2002
  DEC := 8194
  BYTE := 8194 / 8 := 1024
  BIT := 8194 mod 8 := 2
  Bit variable: %MX1024.2
- Address hexadecimal = 16#3016
  DEC := 12310
  BYTE := 12310 / 8 := 1538,75 -> 1538
  BIT := 12310 mod 8 := 6
  Bit variable: %MX1538.6
- Address hexadecimal = 16#55AA
  DEC := 21930
  BYTE := 21930 / 8 := 2741,25 -> 2741
  BIT := 21930 mod 8 := 2
  Bit variable: %MX2741.2

Calculation of the hexadecimal address from the bit variable:

Examples:

- Bit variable := %MX515.4
  DEC := 515 * 8 + 4 := 4124
  Address hex := 16#101C
- Bit variable := %MX3.3
  DEC := 3 * 8 + 3 := 27
  Address hex := 16#001B
- Bit variable := %MX6666.2
  DEC := 6666 * 8 + 2 := 53330
  Address hex := 16#D052

Peculiarities for accessing Modbus addresses

Peculiarities for bit access:

- A WORD in the %M area is assigned to each Modbus address 0000hex .. FFFFhex.
- Bit addresses 0000hex .. FFFFhex are contained in the word range %MW0 .. %MW4095

Areas protect from read/write access by Modbus client

As described in ↳ *Chapter 1.6.6.3.3.1.1 “Configuration of Modbus TCP/IP server” on page 3910*, one write-protected and one read-protected area can be defined. If you try to write to a write-protected area or to read from a read-protected area, an exception response is generated.

Local data of the Modbus client

The address of the area from which data are to be read or to which data are to be written is specified in the function block ETHx_MOD_MAST or *ModTcpMast* at input "Data", via the ADR operator.

For more information about the function blocks use the Library Manager ↳ *Chapter 1.5.3 “Library Manager functionality” on page 2146*.

For the AC500, the following areas can be accessed using the ADR operator:

- Inputs area (%I area)
- Outputs area (%Q area)
- Area of non-buffered variables (VAR .. END_VAR or VAR_GLOBAL END_VAR)
- Addressable flag area (also protected areas for %M area)
- Area of buffered variables (VAR RETAIN .. END_VAR or VAR_GLOBAL RETAIN .. END_VAR)

Modbus telegrams

For a detailed description of the Modbus TCP telegrams and their elements please see the corresponding specifications on public websites.

Exception response by server

In operating mode Modbus client, the AC500 does only send requests, if the parameters at the MODMAST inputs are logically correct. Nevertheless, it can happen that a server cannot process the request of the client or that the server cannot interpret the request due to transmission errors or in case it's capabilities are exceeded in any way. In those cases, the server returns an exception response to the client. In order to identify this response as an exception response, the function code returned by the server is a logical OR interconnection of the function code received from the client and the value 80HEX.

General telegram description

Table 647: Server response

Error code	CRC	
	High	Low

Possible error codes of the client

Code	Description
01DEC	ILLEGAL FUNCTION The server does not support the function requested by the client
02DEC	ILLEGAL DATA ADDRESS Invalid operand address in the server or operand area exceeded
03DEC	ILLEGAL DATA VALUE At least one value is outside the permitted range of values
04DEC	SERVER DEVICE FAILURE An unrecoverable error occurred while the server was attempting to perform the requested action
05DEC	ACKNOWLEDGE Specialized use in conjunction with programming commands. The server has accepted the request and is processing it, but a long duration of time will be required to do so. This response is returned to prevent a timeout error from occurring in the client. The client can next issue a Poll Program Complete message to determine if processing is completed

Code	Description
06DEC	SERVER DEVICE BUSY Specialized use in conjunction with programming commands. The server is engaged in processing a long–duration program command. The client should retransmit the message later when the server is free.
07DEC	NEGATIVE ACKNOWLEDGE Specialized use in conjunction with programming commands. The server cannot perform the programming functions. Client should request diagnostic or error information from server.
08DEC	MEMORY PARITY ERROR Specialized use in conjunction with function codes 20 and 21 and reference type 6, to indicate that the extended file area failed to pass a consistency check. The server attempted to read record file, but detected a parity error in the memory. The client can retry the request, but service may be required on the server device.
09DEC	UNDEFINED Actually not defined by Modbus specification but might be used by particular servers.
10DEC	GATEWAY PATH UNAVAILABLE Specialized use in conjunction with gateways, indicates that the gateway was unable to allocate an internal communication path from the input port to the output port for processing the request. Usually means that the gateway is misconfigured or overloaded.
11DEC	GATEWAY TARGET DEVICE FAILED TO RESPOND Specialized use in conjunction with gateways, indicates that no response was obtained from the target device. Usually means that the device is not present on the network.

Example

Table 648: Example:

Modbus request of the client:			
	Function code:	01	Read n bits
	Server operand address:	4000HEX = 16384DEC	Area for read access disabled in server

Modbus response of the server:			
	Function code:	81HEX	
	Error code:	03	

Processing bits

Some of the Modbus function codes are used to read or write bits (coils, discrete inputs). While a variable of data type WORD can be accessed easily, accessing a stream of bits is complex.

Data type ↬ *Chapter 1.4.1.19.5.10 “Data Type 'BIT'” on page 656* must not be mixed up with data type ↬ *Chapter 1.4.1.19.5.1 “Data type 'BOOL'” on page 647*. Variables of both types may have values ‘TRUE’ or ‘FALSE’. But while BIT means one single bit only, BOOL requires a byte (8 bit) of memory.

Modbus client

When accessing bits in a *Server*, the local data referred to at *Client* function blocks input data is always expected to be of format BOOL.

```
VAR
abBoolArray : ARRAY [0..15] OF BOOL;
ModMast : ModTcpMast;
END_VAR
```

```
abBoolArray[0]  := TRUE;
abBoolArray[15] := FALSE;

ModMast(Execute:= ModMastExecute,
        Eth:= ETH1,
        IPAdr:= IP_ADR_STRING_TO_DWORD('192.168.0.100'),
        UnitID:= 0,
        Fct:= 15,
        Addr:= 16#0000,
        Nb:= SIZEOF(abBoolArray),
        Data:= ADR(abBoolArray));
```

Modbus server

Using the bit offset

The simplest way to access a certain bit within a larger variable is to directly use the bit offset (0 based; see ↬ *Chapter 1.4.1.19.4.9 “Bit Access in Variables” on page 641*).

```
VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR
```

```
awWordVariable[0].0  := TRUE;
awWordVariable[7].15 := FALSE;
```

Defining symbolic names for the bit offsets

A more convenient way to access bits e.g. within a word is to define a symbolic name for each single offset ↳ *Chapter 1.4.1.19.4.9 “Bit Access in Variables” on page 641*.

```
VAR_GLOBAL CONSTANT
(*bit offsets in awWordVariable[0]*)
NameBitOffset_0_00 : INT := 0;
NameBitOffset_0_01 : INT := 1;
(*...*)
NameBitOffset_0_15 : INT := 15;
(*bit offsets in awWordVariable[7]*)
NameBitOffset_7_00 : INT := 0;
NameBitOffset_7_01 : INT := 1;
(*...*)
NameBitOffset_7_15 : INT := 15;
END_VAR
```

```
VAR
awWordVariable AT %MW0 : ARRAY [0..7] OF WORD;
END_VAR
```

```
awWordVariable[0].NameBitOffset_0_00  := TRUE;
awWordVariable[7].NameBitOffset_7_15 := FALSE;
```

Defining a data type

A further alternative is to define your own data types (see *Chapter 1.4.1.20.2.6 “Object 'DUT'” on page 835*) according to the requirements of your particular application (see *“Symbolic bit access in structure variables” on page 642*).

```
TYPE ControlWordType :
STRUCT
NameBitOffset_00 : BIT;
NameBitOffset_01 : BIT;
NameBitOffset_02 : BIT;
NameBitOffset_03 : BIT;
NameBitOffset_04 : BIT;
NameBitOffset_05 : BIT;
NameBitOffset_06 : BIT;
NameBitOffset_07 : BIT;
NameBitOffset_08 : BIT;
NameBitOffset_09 : BIT;
NameBitOffset_10 : BIT;
NameBitOffset_11 : BIT;
NameBitOffset_12 : BIT;
NameBitOffset_13 : BIT;
NameBitOffset_14 : BIT;
NameBitOffset_15 : BIT;
END_STRUCT
END_TYPE
```

```
VAR
atTypeVariable AT %MW0 : ARRAY [0..7] OF ControlWordType;
END_VAR
```

```
atTypeVariable[0].NameBitOffset_00 := TRUE;
atTypeVariable[7].NameBitOffset_15 := FALSE;
```

Defining a complex data type

In case your application requires some more complex data types you can combine data types (DUT; see *"Symbolic bit access in structure variables" on page 642*).

```
TYPE ControlWord0Type :
STRUCT
NameBitOffset_0_00 : BIT;
NameBitOffset_0_01 : BIT;
NameBitOffset_0_02 : BIT;
NameBitOffset_0_03 : BIT;
NameBitOffset_0_04 : BIT;
NameBitOffset_0_05 : BIT;
NameBitOffset_0_06 : BIT;
NameBitOffset_0_07 : BIT;
NameBitOffset_0_08 : BIT;
NameBitOffset_0_09 : BIT;
NameBitOffset_0_10 : BIT;
NameBitOffset_0_11 : BIT;
NameBitOffset_0_12 : BIT;
NameBitOffset_0_13 : BIT;
NameBitOffset_0_14 : BIT;
NameBitOffset_0_15 : BIT;
END_STRUCT
END_TYPE
```

ControlWord1Type

```
1  TYPE ControlWord1Type :
2  STRUCT
3  NameBitOffset_1_00 : BIT;
4  NameBitOffset_1_01 : BIT;
5  NameBitOffset_1_02 : BIT;
6  NameBitOffset_1_03 : BIT;
7  NameBitOffset_1_04 : BIT;
8  NameBitOffset_1_05 : BIT;
9  NameBitOffset_1_06 : BIT;
10 NameBitOffset_1_07 : BIT;
11 NameBitOffset_1_08 : BIT;
12 NameBitOffset_1_09 : BIT;
13 NameBitOffset_1_10 : BIT;
14 NameBitOffset_1_11 : BIT;
15 NameBitOffset_1_12 : BIT;
16 NameBitOffset_1_13 : BIT;
17 NameBitOffset_1_14 : BIT;
18 NameBitOffset_1_15 : BIT;
19 END_STRUCT
20 END_TYPE
```

```
TYPE ControlWordListType :
STRUCT
ControlWord0 : ControlWord0Type;
ControlWord1 : ControlWord1Type;
END_STRUCT
END TYPE
```

```
VAR
atWordListType AT %MW0 : ControlWordListType;
END_VAR
```

```
atWordListType.ControlWord0.NameBitOffset_0_00 := TRUE;
atWordListType.ControlWord1.NameBitOffset_1_15 := FALSE;
```

Pack/unpack BOOL variables

In case you prefer variables of type BOOL you can use the functions for packing MEM_Pack_BitsToByte and unpacking MEM_UnpackWord of the CAA_Memory.library, which can be found with the Library Manager *Chapter 1.5.3 “Library Manager functionality” on page 2146*.

```
VAR
abBoolVariable : ARRAY [0..15] OF BOOL;
wWordVariable0 : AT %MW0 WORD;
wWordVariable1 : AT %MW1 WORD;
END_VAR

VAR
Unpack  : Mem.UnpackWord;
END_VAR
```

```
abBoolVariable[0]  := TRUE;
abBoolVariable[15] := FALSE;

wWordVariable0 := Mem.PackBitsToWord(abBoolVariable[0], abBoolVariable[1], abBoolVariable[2], abBoolVariable[3],
                                     abBoolVariable[4], abBoolVariable[5], abBoolVariable[6], abBoolVariable[7],
                                     abBoolVariable[8], abBoolVariable[9], abBoolVariable[10], abBoolVariable[11],
                                     abBoolVariable[12], abBoolVariable[13], abBoolVariable[14], abBoolVariable[15]);
wWordVariable1 := 1;
Unpack(wValue:= wWordVariable1,
       xBit0=> abBoolVariable[0], xBit1=> abBoolVariable[1], xBit2=> abBoolVariable[2], xBit3=> abBoolVariable[3],
       xBit4=> abBoolVariable[4], xBit5=> abBoolVariable[5], xBit6=> abBoolVariable[6], xBit7=> abBoolVariable[7],
       xBit8=> abBoolVariable[8], xBit9=> abBoolVariable[9], xBit10=> abBoolVariable[10], xBit11=> abBoolVariable[11],
       xBit12=> abBoolVariable[12], xBit13=> abBoolVariable[13], xBit14=> abBoolVariable[14], xBit15=> abBoolVariable[15]);
```

Function block ETHx_MOD_MAST and ModTcpMast

These function blocks are only required for the operating mode Modbus client. It handles the communication (transmission of telegrams to the servers and receipt of telegrams from the servers). The function block can be used for the Ethernet interfaces of the controller.

ETHx_MOD_MAST is contained in the library Ethernet_AC500_V10.lib.

ModTcpMast is contained in the library ABB_ModbusTcp_AC500.

1.6.5.1.12 Fast counters

Fast counters in AC500 devices

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50x2 modules, according to the CPU type, the fast inputs have different functionality or frequency.

Integrated fast counters are only available for digital I/O modules.

The digital I/O modules on the I/O bus contain two fast counters each.

If the counter is used, it needs up to 2 digital inputs and one digital output.

If the fast counter is deactivated, the inputs and outputs reserved for the counter can be used for other tasks.

See *Chapter 1.6.6.2.13.9 “Fast counter” on page 3778*.

A fast counter is available in the following constellations:

- In digital I/O modules, connected to an AC500 processor module.
- In AC500-eCo V3 processor modules PM50x2 with onboard I/Os
- In CANopen communication interface modules.

- In Modbus, PROFIBUS and PROFINET communication interface modules and in the connected digital I/O modules.
- In digital I/O modules, connected to an EtherCAT communication interface module.

Fast counter integrated in S500 modules

The following table shows the S500 modules which contain a fast counter and which of the digital inputs and outputs are reserved for the counter.

Module	Assigned inputs [1])		Assigned output	Remarks
	Channel A	Channel B	Channel C [2]) or (CF)	
DA501	DC16	DC17	DC18	The counter function is not available if the modules are mounted on the communication interface modules CI581-CN or CI582-CN
DA502	DC16	DC17	DC18 - in mode 1 and mode 2 DO0 - in mode 101 and mode 102 [3])	
DC522	C8	C9	C10	
DC523	C16	C17	C18	
DC532	C24	C25	C26	
DI524	I24	I25	No hardware output available	
DX522	I0	I1	The counter does not activate any relay output	
CI501-PNIO, CI541-DP, CI581-CN, CI521-MODTCP	DI0	DI1	DO0	
CI502-PNIO, CI542-DP, CI582-CN; CI522-MODTCP	DI8	DI9	DO8	

[1]) The two hardware inputs (channels A and B) are also and always available within the normal process image, irrespective of the operating mode of the counter.

[2]) The hardware output channel C is activated by the fast counter only in the operating modes 1 and 2.

[3]) Especially for module DA502: The counter operating mode 101 is the same as mode 1, but the assigned output is DO0 instead of DC18. Also the counter operating mode 102 is the same as mode 2, but the assigned output is DO0 instead of DC18.

The counter function is performed within the communication interface module and, accordingly, in the digital I/O module(s). It works independently of the user program and is therefore able to respond quickly to external signals. A simultaneous counter operation of several digital I/O modules is possible.

Each module counter can be configured for one out of 10 possible modes. The desired operating mode is selected in the PLC configuration using module parameters. After that, it is activated during the initialization phase (power-on, cold start, warm start).

The data exchange to and from the user program is performed using input and output operands. While integrating a module containing a fast counter in the PLC configuration, the necessary operands are created and reserved immediately. Thus, a counter implementation carried out later on does not cause an address shift.

Features independent of the fast counter operating mode

- The pulses at the fast counters' inputs or the evaluated signals of the traces A and B in case of incremental position sensors are counted.
- The counting frequencies of the communication interface modules of PROFINET, PROFIBUS and CANopen are max. 200 kHz (in modes 1 to 6), max. 50 kHz (in mode 7), max. 35 kHz (in mode 9), and max. 20 kHz (in mode 10).
- If the modules DA501, DC522, DC523, DC532 are used, each counting input must be circuited externally in series with a resistor of 470 Ω / 1 W, in order to safely avoid influences from the deactivated module outputs to the connected sensors.
- The positive signal edges are counted, if not noted differently.
- By setting the operating mode 0, the counting function is switched off. In this case, the reserved inputs and outputs can be used for other tasks. Simultaneous use of these terminals for the fast counter and other signals must be avoided.
- The fast counter's actual value is provided as a double word (32 bits).
- The fast counter can count upwards in all operating modes. It counts beginning at the start value (set value) up to the end value (max. from 0 to 4,294,967,295 or hexadecimal from 00 00 00 00 to FF FF FF FF. After reaching 4,294,967,295, the counter jumps with the next pulse to 0. When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the fast counter is set again (set value), CF is reset to FALSE.

Further information

- Operating modes of the fast counter: *Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3781*
- Configuration of the fast counter: *Chapter 1.6.6.2.13.9 “Fast counter” on page 3778*

1.6.5.1.13 Onboard I/O on AC500-eCo V3 processor modules

Onboard I/Os

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

Intended purpose

Table 649: Numbers and types of the onboard I/Os

Processor module	No. and type of digital inputs	No. and type of digital outputs	No. and type of configurable inputs/outputs
PM5012-T-ETH	6 24 V DC (one isolation group)	4 0.5 A max., transistor (one isolation group)	None
PM5012-R-ETH	6 24 V DC (one isolation group)	4 2 A max., relay (two isolation groups)	None

Processor module	No. and type of digital inputs	No. and type of digital outputs	No. and type of configurable inputs/outputs
PM5032-T-ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5032-R-ETH	12 24 V DC (one isolation group)	6 2 A max., relay (two isolation groups)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5052-T-ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5052-R-ETH	12 24 V DC (one isolation group)	6 2 A max., relay (two isolation groups)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5072-T-2ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5072-T-2ETHW	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)

Fast counter in AC500-eCo V3 (Onboard I/O in PM50xx)

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.

Further information:

Operating modes of the fast counter: Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3781

Configurarion of the fast counter: Chapter 1.6.6.2.7.2 “Fast counters in the onboard I/Os” on page 3710

1.6.5.1.14 Simple motion

Introduction

The AC500-eCo V3 PLC provide several HW and SW features allowing to realize some motion application.

Specific fast onboard I/O and dedicated SW library function blocks (simple motion) are available and can manage up to 2x Axis on the CPU.

The simple motion capability is based on a library for the onboard I/O and some motion control blocks allowing point-to-point or velocity control.

All the AC500-eCo V3 PLC from Basic, Standard or Pro type offer dedicated feature according to their performance classes.

	Basic		**Standard**		**Pro**
	PM5012-x-ETH		**PM5032-x-ETH / PM5052-x-ETH**		**PM5072-T-2ETH**
	Relay outputs	**Transistor outputs**	**Relay outputs**	**Transistor outputs**	**Transistor outputs**
HSC - High-speed counter	Up to 2 (5 kHz)		Up to 4 (100 kHz)		
Frequency measurement	Up to 2 (5 kHz)		Up to 2 (200 kHz)		
A / B Encoder	1 A/B simple encoder (5 kHz) with sync/reset		Up to 2 A/B encoder 200 kHz with sync/reset inputs		
Interrupt inputs	Up to 4		Up to 4		
PTO - pulse-train output	-		1 Pulse/ Direction or CW/CCW both mode with 200 kHz	Up to 2 Pulse/Direction or CW/CCW both mode with 200 kHz	
				Up to 4 Pulse/Direction with 100 kHz using fast Output channels for Pulse and standard outputs for direction on SW motion function bloc	
PWM - pulse-width modulation	-	Up to 4 (100 Hz)	Up to 2 (30 kHz)	Up to 4 (30 kHz)	
Limit switches	-		Up to 2	Up to 8	

Hardware components for motion control

Basic CPU – PM5012-R-ETH and PM5012-T-ETH

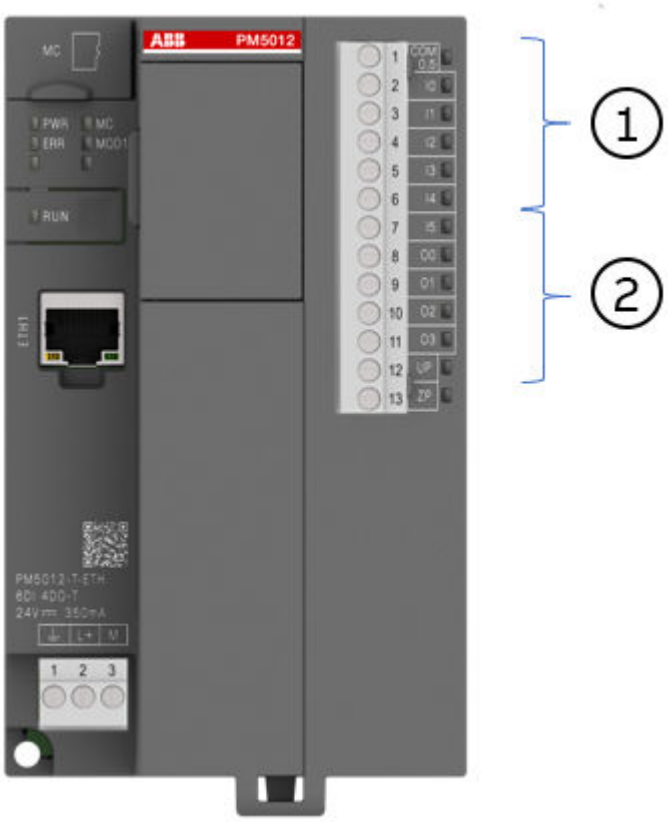

Fig. 307: Example: PM5012-T-ETH

1 HSC 5kHz frequency measurement interrupt I/O
2 PWM output

Standard and Pro CPU - PM5032-x-ETH / PM5052-x-ETH / PM5072-T-2ETH

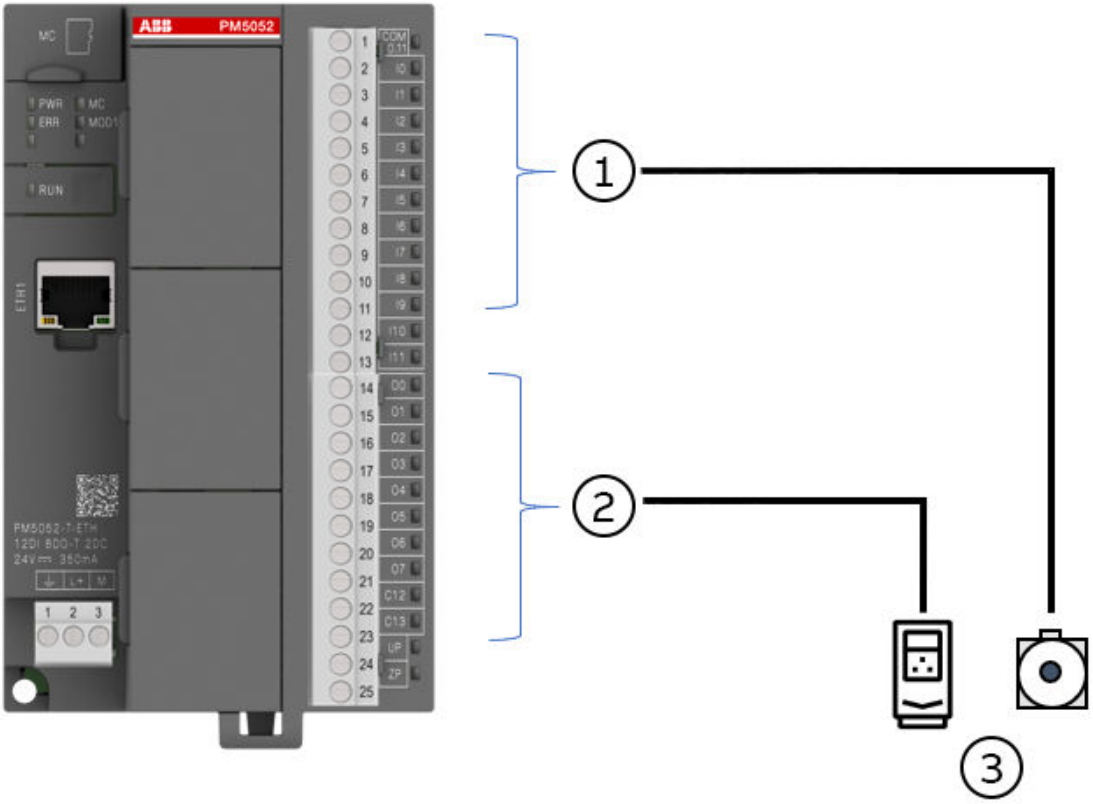

Fig. 308: Example: PM5052-T-ETH

1 HSC 100 kHz and 5 kHz A/B Encoder 200 kHz interrupt I/O standard inputs
2 PTO 100 kHz/200kHz PWM 30 kHz limit switch standard outputs
3 Drives, Encoder, Stepper Motor

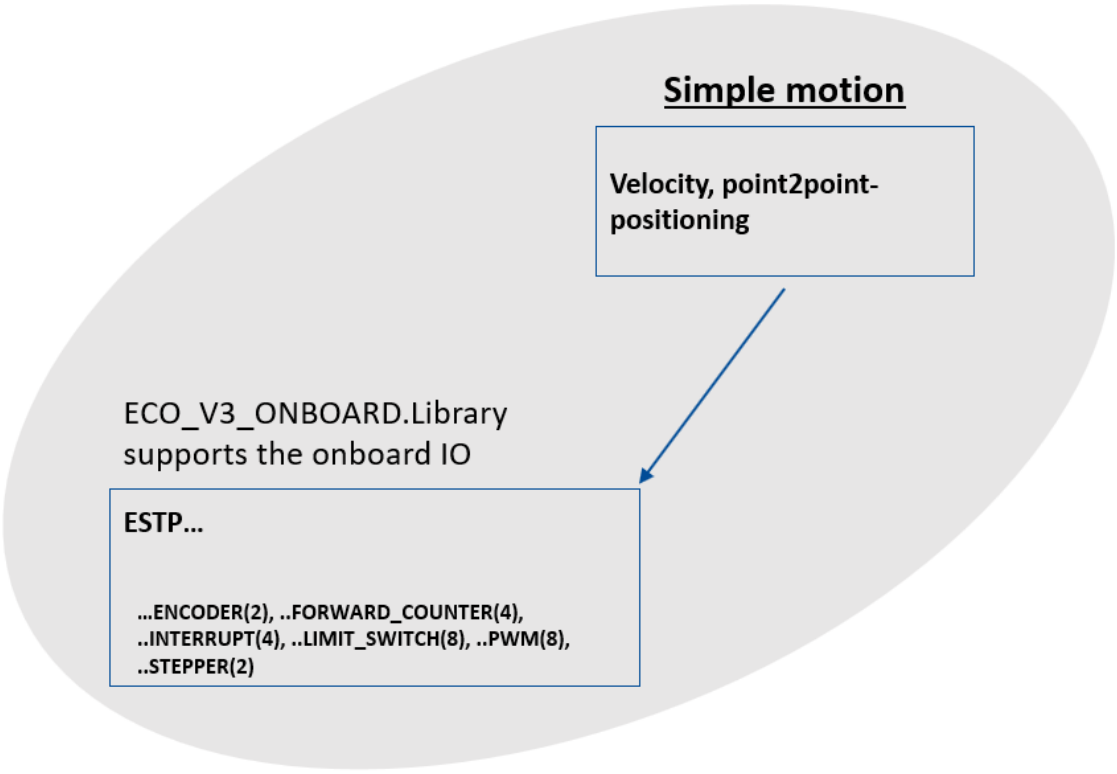
For PLC with relay outputs, the input features are identical.

The digital configurable inputs/outputs can be used for PTO/PWM functions.

System technology

The following chapters describe the system technology of the AC500-eCo V3 using motion examples.

The simple motion set of function blocks is standard part of the system libraries for AC500-eCo V3.



Use the onboard I/Os as encoder with A and B signals

Parameter configuration

The onboard I/O accept encoder signal A and B. When configure the encoder track A, the encoder track B will be automatically inserted.

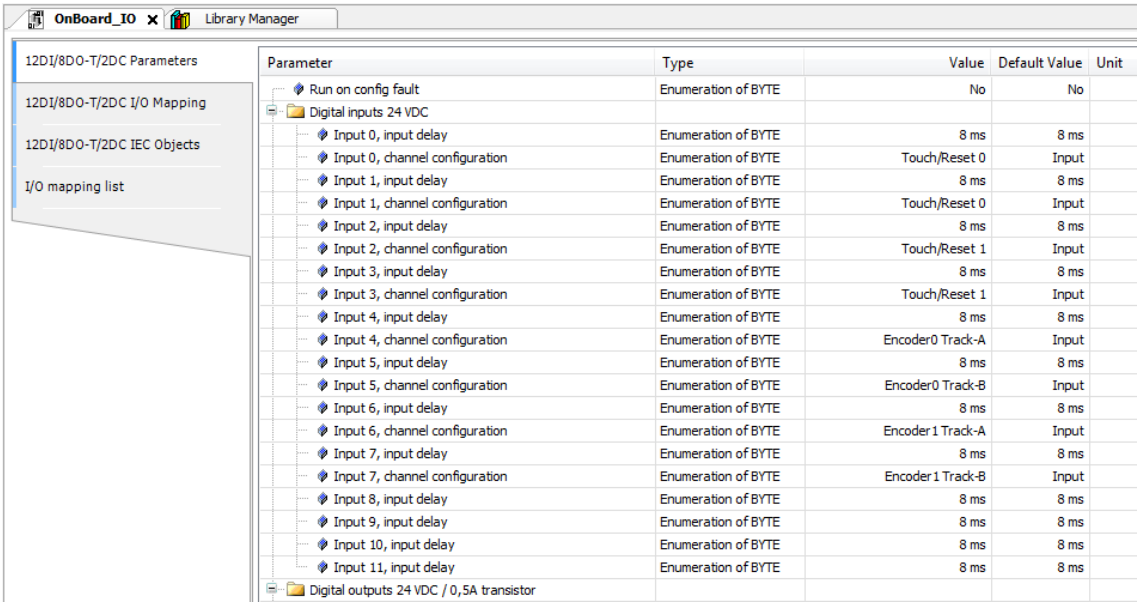
The user can configure the following input channel as encoder input.

- *"Encoder 0 Track – A"*: Input channel 4
- *"Encoder 0 Track – B"*: Input channel 5
- *"Encoder 1 Track – A"*: Input channel 6
- *"Encoder 1 Track – B"*: Input channel 7

After configuring the encoder input channel, the user can configure the touch/reset for the respective encoder channel.

See also the following chapter: ↪ Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700.

E.g. PM50x2-T-xETH with 2x A/B encoders with Touch/Reset on I0..I3



Parameter	Type	Value	Default Value	Unit
Run on config fault	Enumeration of BYTE	No	No	
Digital inputs 24 VDC				
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 0, channel configuration	Enumeration of BYTE	Touch/Reset 0	Input

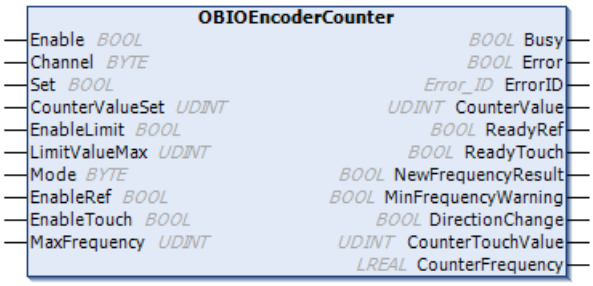
Input 11, input delay	Enumeration of BYTE	8 ms	8 ms	
Digital outputs 24 VDC / 0,5A transistor				

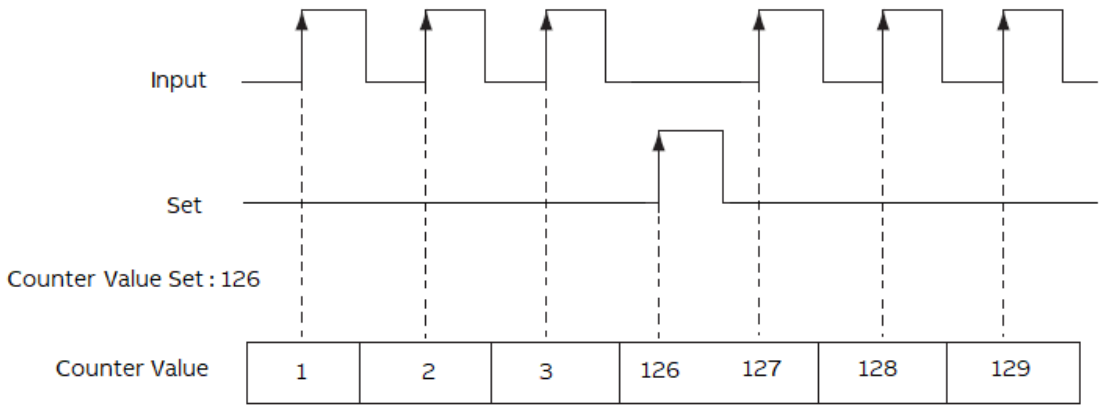
Function block

OBIOEncoder Counter



If *"Enable"* is TRUE, the *"OBIOEncoderCounter"* instruction increments the counter by one base on the input.

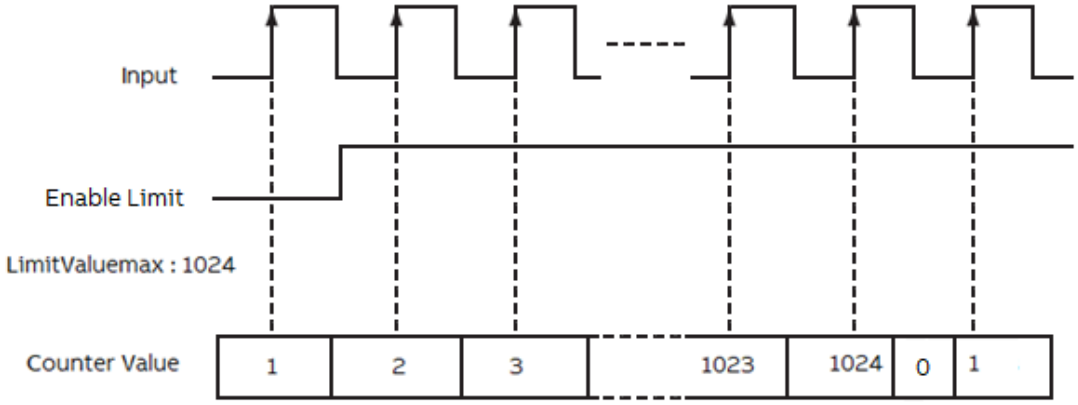
If *"Set"* bit is TRUE, the *"OBIOEncoderCounter"* instruction moves the *"CounterValueSet"* to the *"CounterValue"*.



If *"Enable"* is TRUE, the *"OBIOEncoderCounter"* instruction increments the counter by one based on the input.

If *"EnableLimit"* bit is TRUE, the accumulated value continues incrementing.

After *"CounterValue"* reaches the *"LimitValueMax"*, the *"OBIOEncoderCounter"* instruction writes 0 to the *"CounterValue"*.



"Encoder Counter Mode": 0 = *"90° Mode"*.

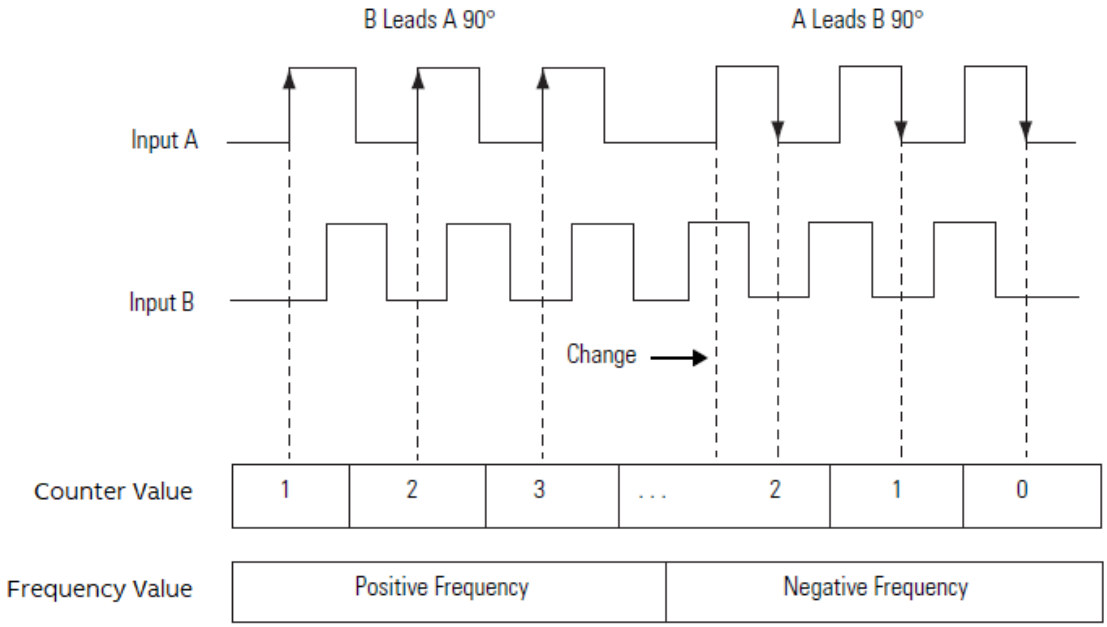
In this encoder counter mode, an increasing count results when input B is 90° ahead of input A.

The count is initiated on the rising edge of input A, and the direction of the encoder is clockwise (positive).

The module produces a decreasing count when input A is 90° ahead of Input B.

The count is initiated on the falling edge of input A, and the direction is counterclockwise (negative).

By monitoring both the number of pulses and the phase relationships of input A and B, you can accurately determine the position and direction of the rotation.



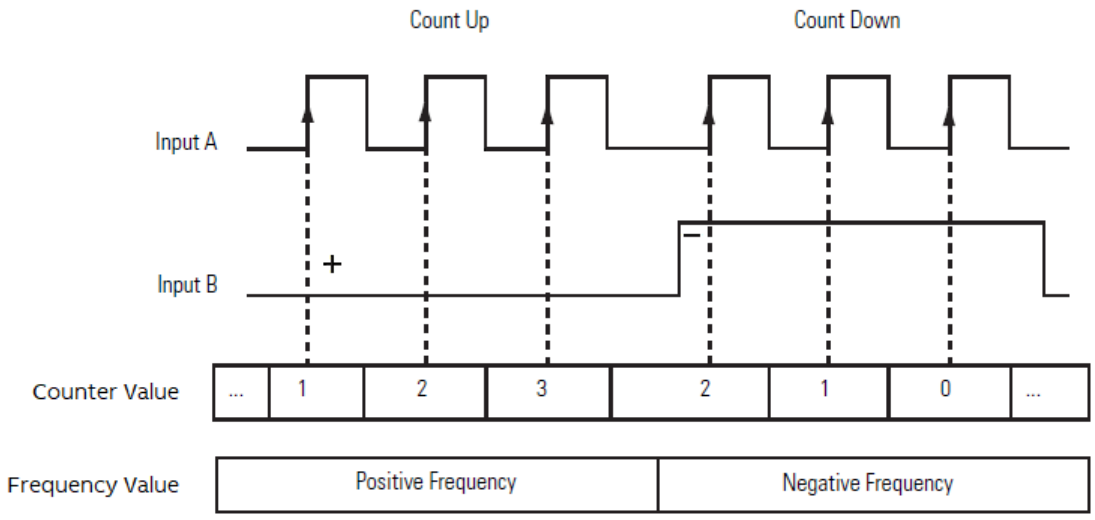
"Encoder Counter Mode": 1 = *"Pulse/Direction"*.

In this encoder counter mode, the count increases or decreases based on the state of input B, which can be a random signal.

If input B is high, the counter will count down.

If input B is low the counter counts up.

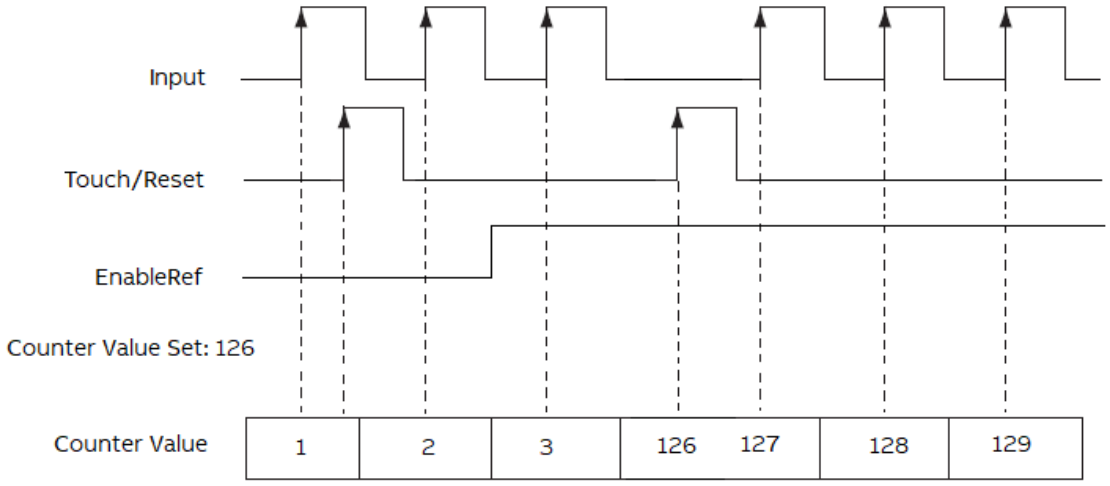
Counting is done on the leading edge of input A.



If *"Enable"* is TRUE, the *"OBIOEncoderCounter"* instruction increments the counter by one based on the input.

If *"EnableRef"* bit is TRUE, the *"OBIOEncoderCounter"* instruction is ready to receive the touch/reset input.

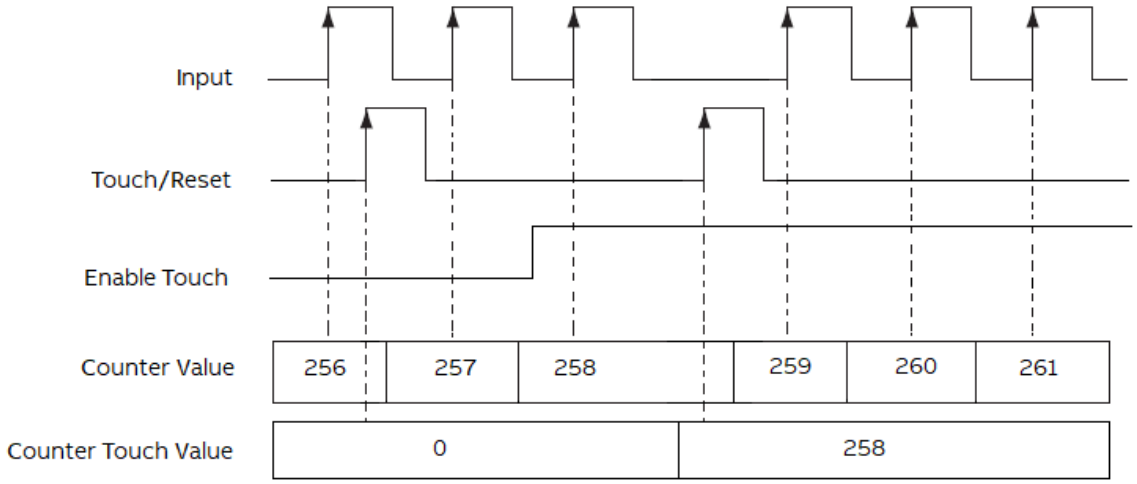
If the *"Touch/Reset"* input is TRUE, the current *"CounterValue"* will be replaced by the *"CounterValueSet"*.



If *"Enable"* is TRUE, the *"OBIOEncoderCounter"* instruction increments the counter by one based on the input.

If *"EnableTouch"* bit is TRUE, the *"OBIOEncoderCounter"* instruction is ready to receive the *"Touch/Reset"* input.

If the *"Touch/Reset"* input is TRUE, the current *"CounterValue"* will be captured and written to the *"CounterTouchValue"*.



Use the onboard I/Os as forward counter

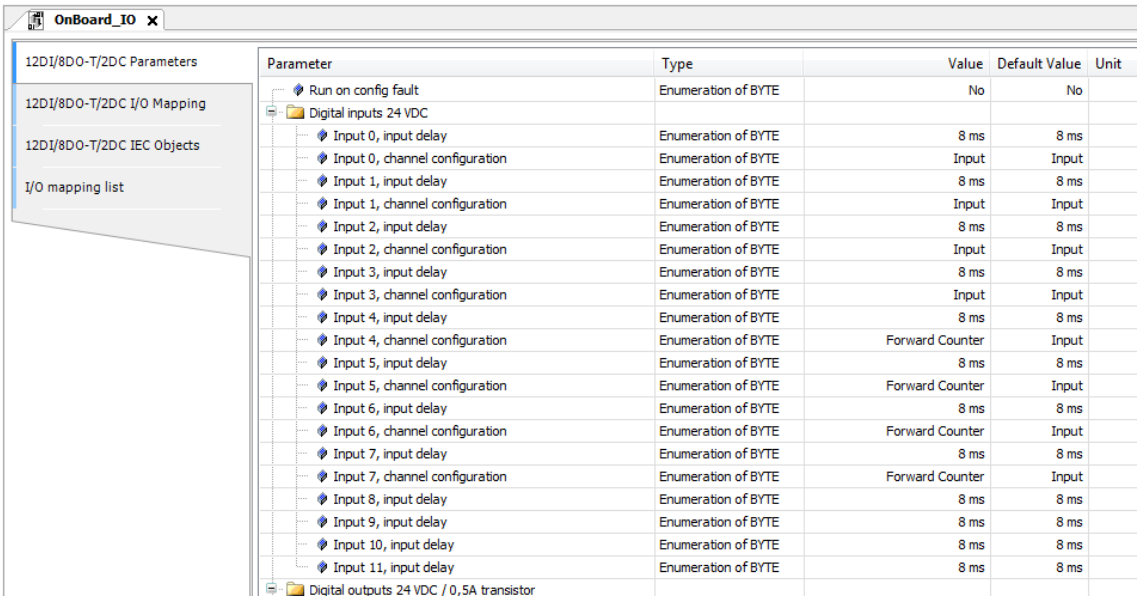
Parameter configuration

The Onboard I/O accept pulse input as forward counter.

User can configure the following input channel as forward counter.

- *"Forward Counter 0"*: Input channel 4
- *"Forward Counter 1"*: Input channel 5
- *"Forward Counter 2"*: Input channel 6
- *"Forward Counter 3"*: Input channel 7

E.g. PM50x2-x-xETH with forward counter on fast inputs I4…I7

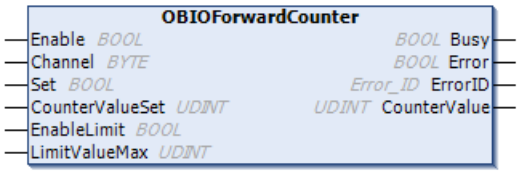


Parameter	Type	Value	Default Value	Unit
Run on config fault	Enumeration of BYTE	No	No	
Digital inputs 24 VDC				
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 0, channel configuration	Enumeration of BYTE	Input	Input	
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 1, channel configuration	Enumeration of BYTE	Input	Input	
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 2, channel configuration	Enumeration of BYTE	Input	Input	
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 3, channel configuration	Enumeration of BYTE	Input	Input	
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 4, channel configuration	Enumeration of BYTE	Forward Counter	Input	
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 5, channel configuration	Enumeration of BYTE	Forward Counter	Input	
Input 6, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 6, channel configuration	Enumeration of BYTE	Forward Counter	Input	
Input 7, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 7, channel configuration	Enumeration of BYTE	Forward Counter	Input	
Input 8, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 9, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 10, input delay	Enumeration of BYTE	8 ms	8 ms	
Input 11, input delay	Enumeration of BYTE	8 ms	8 ms	
Digital outputs 24 VDC / 0,5A transistor				

See also the following chapter: Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700

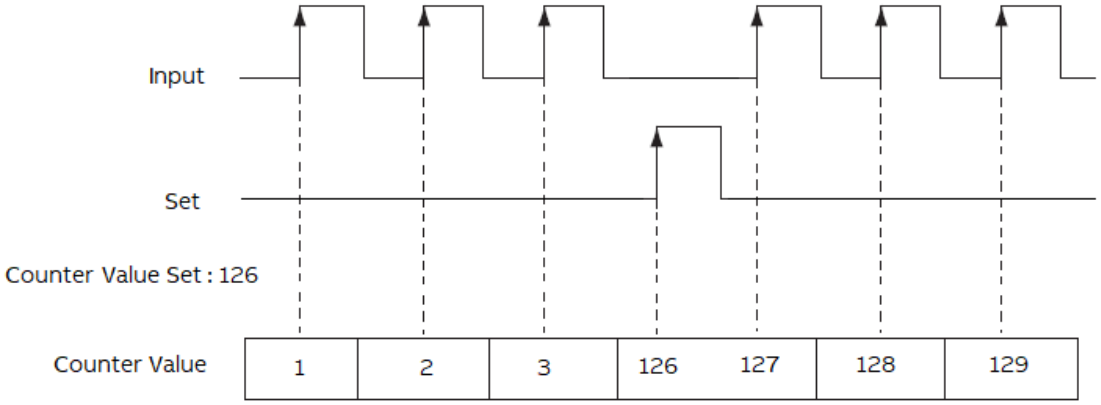
Function block

OBIOForward Counter



If *"Enable"* is TRUE, the *"OBIOForwardCounter"* instruction increments the counter by one based on the input.

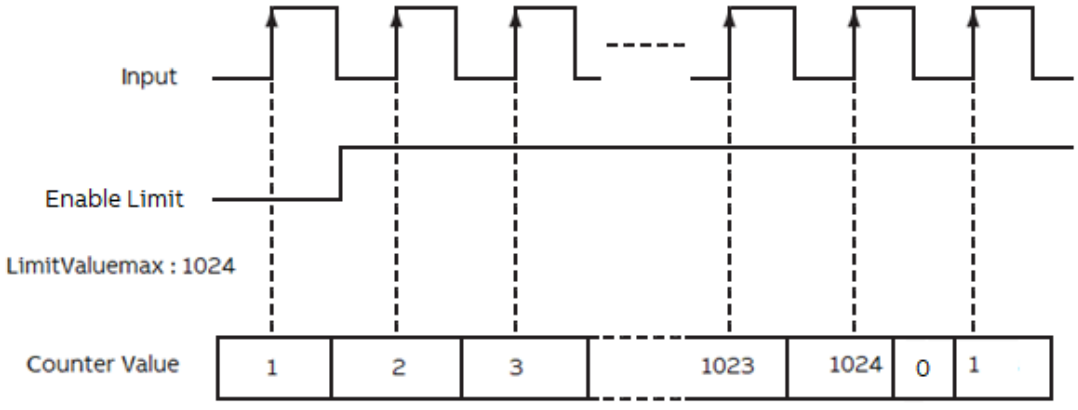
If *"Set"* bit is TRUE, the *"OBIOForwardCounter"* instruction moves the *"CounterSetValue"* to the *"CounterValue"*.



If *"Enable"* is TRUE, the *"OBIOForwardCounter"* instruction increments the counter by one based on the input.

If *"EnableLimit"* bit is TRUE, the accumulated value continues incrementing.

After *"CounterValue"* reaches the *"LimitValueMax"*, the *"OBIOForwardCounter"* instruction writes 0 to the *"CounterValue"*.



Use the onboard I/Os as interrupt input with dedicated interrupt task

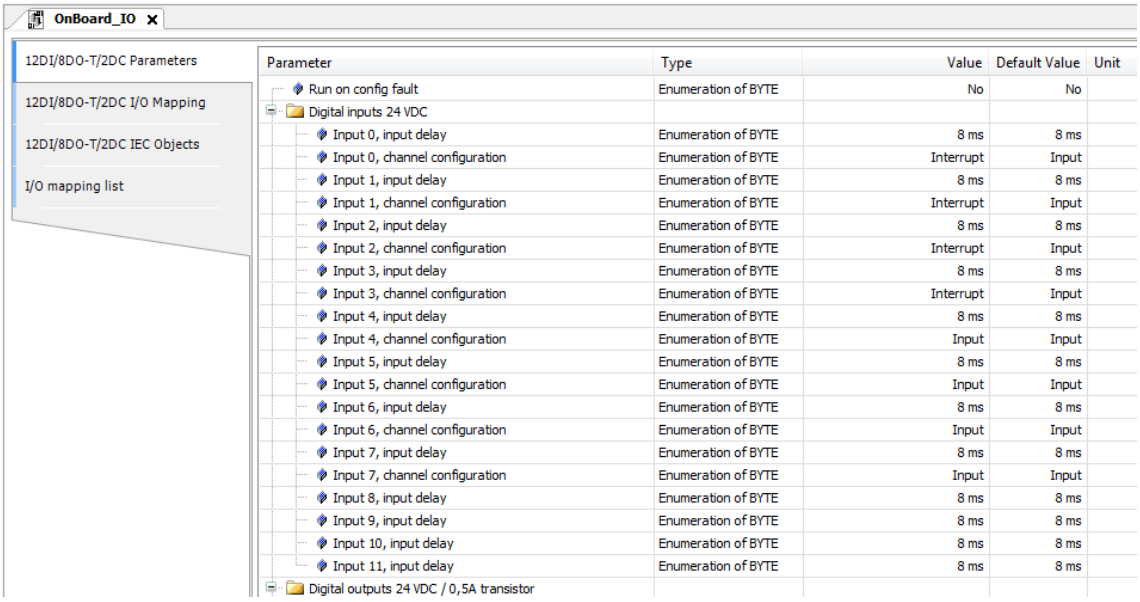
Parameter configuration

The onboard I/O input can be configured as interrupt input to trigger the interrupt task.

The user can configure the following input channel as interrupt input.

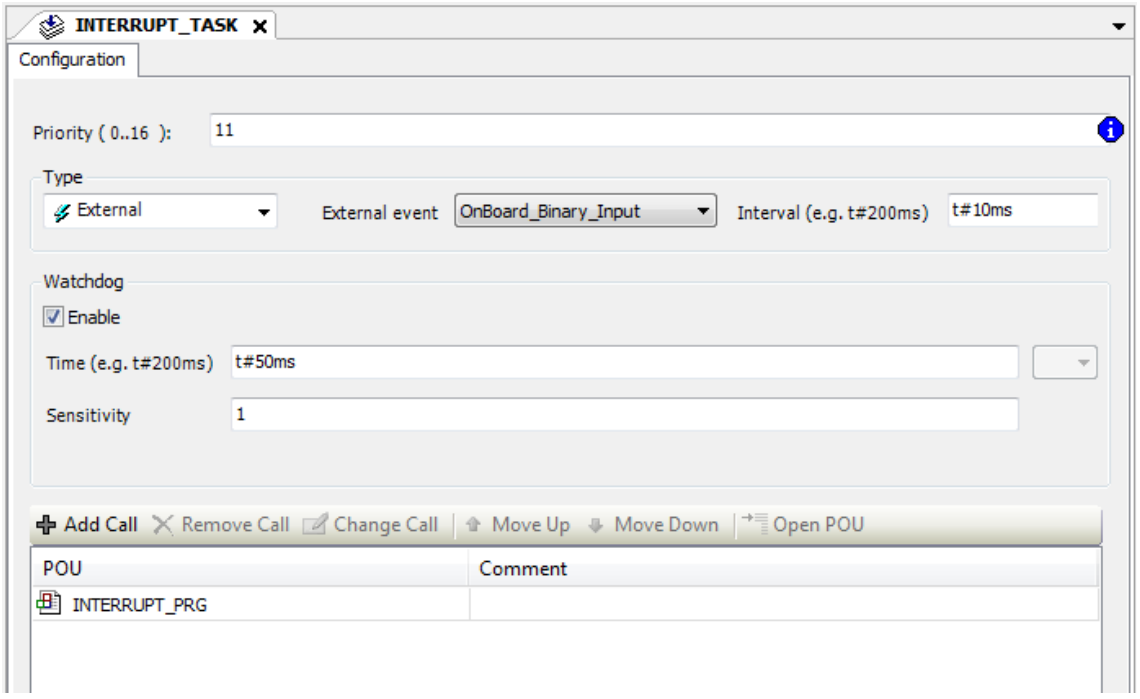
- Interrupt input 0 : Input Channel 0
- Interrupt input 1 : Input Channel 1
- Interrupt input 2 : Input Channel 2
- Interrupt input 3 : Input Channel 3

E.g. PM50x2-x-xETH with interrupt inputs on digital inputs I0…I3

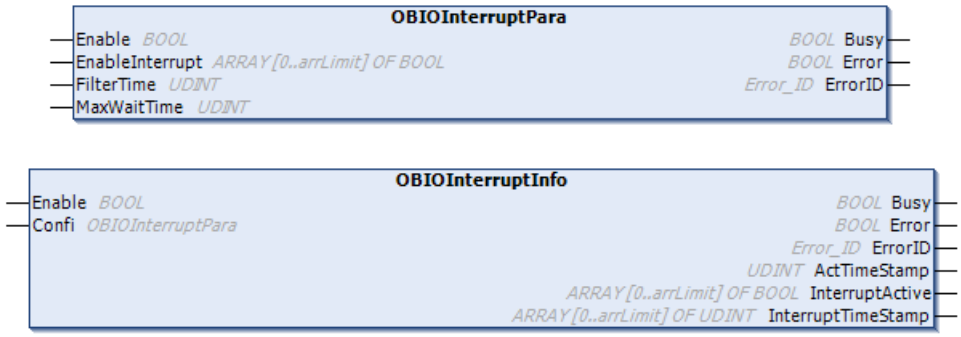


See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3700

After configuring the parameter, the user need to create a new task with the *“Type”* set to *“External”* and the *“External event”* set to *“OnBoard_Binary_Input”*.



Function block



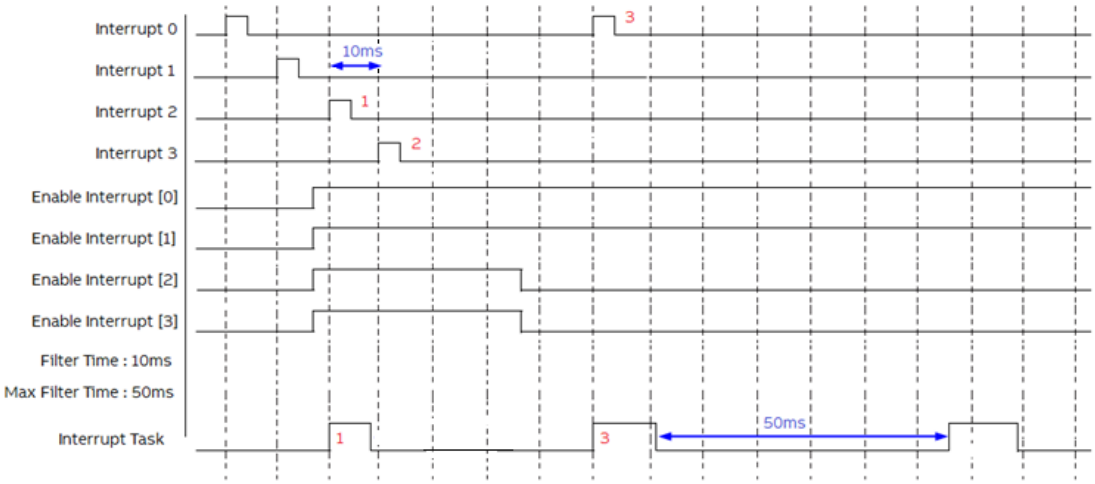
The *"OBIOInterruptPara"* instruction is configured for 4 interrupt inputs.

if *"EnableInterrupt"* bit is TRUE, the *"OBIOInterruptInfo"* instruction is ready to receive the interrupt input.

If the interrupt input is TRUE, the interrupt task will be executed.

If the second interrupt is TRUE with the interval less than 10 ms (as set), the execution of the interrupt task will be ignored.

If no interrupt occurred in 50 ms (as set), the interrupt task is executed automatically.

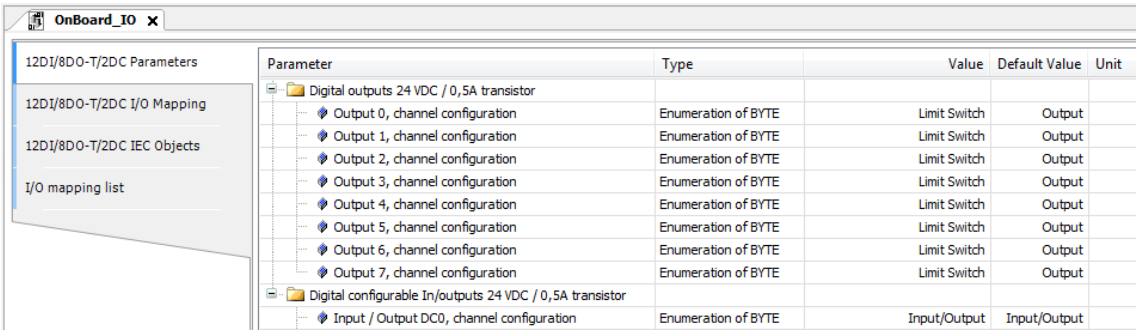


Use the onboard I/Os as output limit switch

Parameter configuration

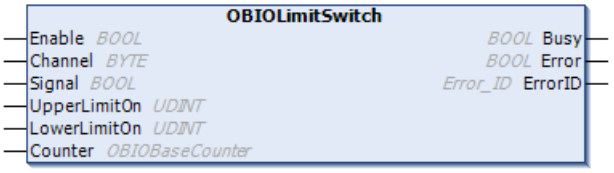
Thje user can configure the following output channel as limit switch.

- *"LimitSwitch 0"*: Output channel 0
- *"LimitSwitch 1"*: Output channel 1
- *"LimitSwitch 2"*: Output channel 2
- *"LimitSwitch 3"*: Output channel 3
- *"LimitSwitch 4"*: Output channel 4
- *"LimitSwitch 5"*: Output channel 5
- *"LimitSwitch 6"*: Output channel 6
- *"LimitSwitch 7"*: Output channel 7

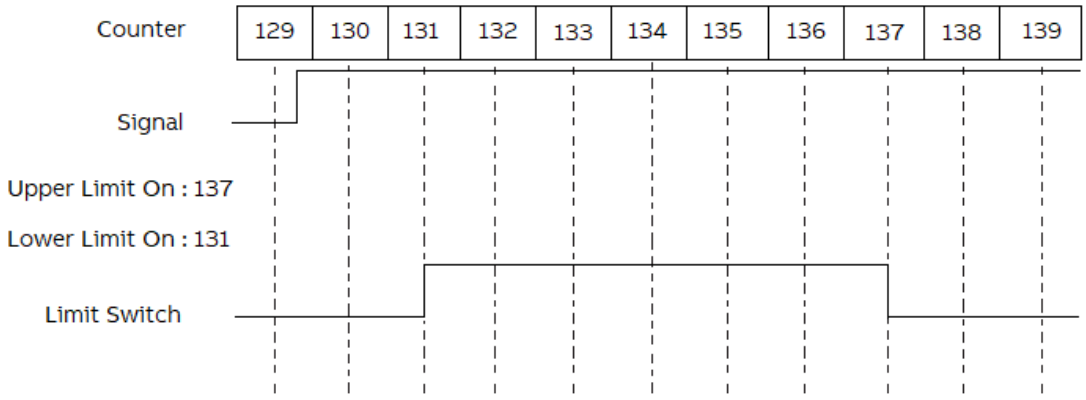


See also the following chapter: Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700

Function block



If the counter value reaches the *"LowerLimitOn"* preset, it will write to the LimitSwitch output based on the signal until the *"UpperLimitOn"* preset is reached.



Use the onboard I/Os as PTO (pulse-train output) with 100 kHz frequency (max. 2 PTO using PTO HW channels)

Parameter configuration

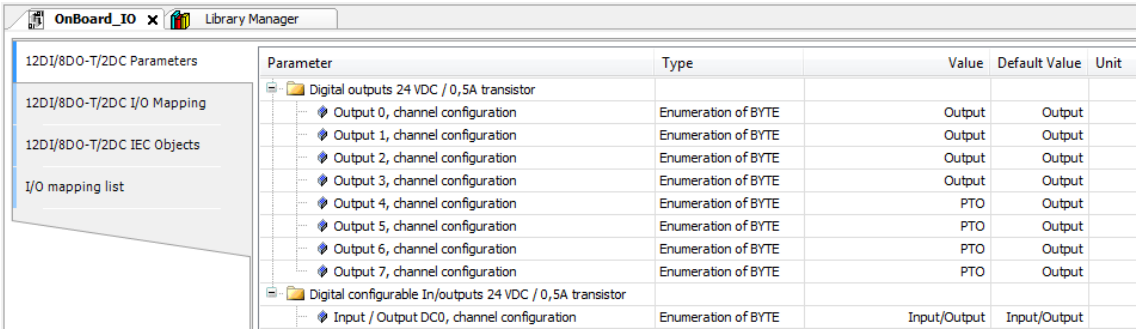
The user can configure the following output channels as PTO (pulse-train output).

- *"PTO"*: Output channel 4
- *"PTO"*: Output channel 5
- *"PTO"*: Output channel 6
- *"PTO"*: Output channel 7

If the user configures the output 4 as PTO, the output 5 is automatically configured as PTO.

If the user configures the output 6 as PTO, the output 7 is automatically configured as PTO.

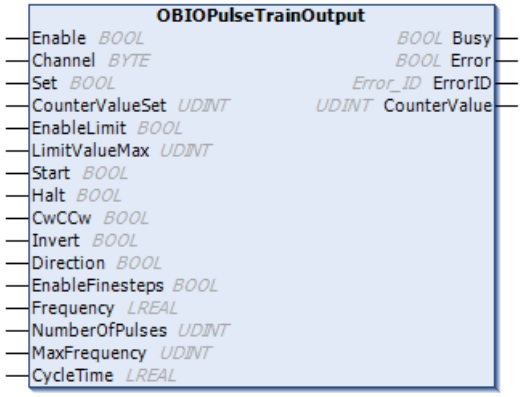
The input *“CwCCw”* of the function block *“OBIOPulseTrainOutput”* determines the output 5 and 7 as *“CounterClockWise”* or *“Direction”* if it is set as PTO.



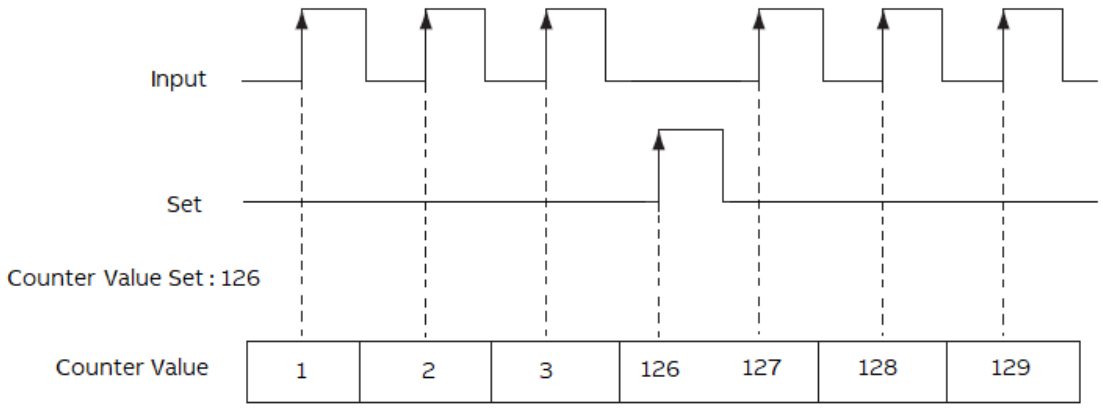
Parameter	Type	Value	Default Value	Unit
Digital outputs 24 VDC / 0,5A transistor				
Output 0, channel configuration	Enumeration of BYTE	Output	Output	
Output 1, channel configuration	Enumeration of BYTE	Output	Output	
Output 2, channel configuration	Enumeration of BYTE	Output	Output	
Output 3, channel configuration	Enumeration of BYTE	Output	Output	
Output 4, channel configuration	Enumeration of BYTE	PTO	Output	
Output 5, channel configuration	Enumeration of BYTE	PTO	Output	
Output 6, channel configuration	Enumeration of BYTE	PTO	Output	
Output 7, channel configuration	Enumeration of BYTE	PTO	Output	
Digital configurable In/outputs 24 VDC / 0,5A transistor				
Input / Output DC0, channel configuration	Enumeration of BYTE	Input/Output	Input/Output	

See also the following chapter: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3700

Function block

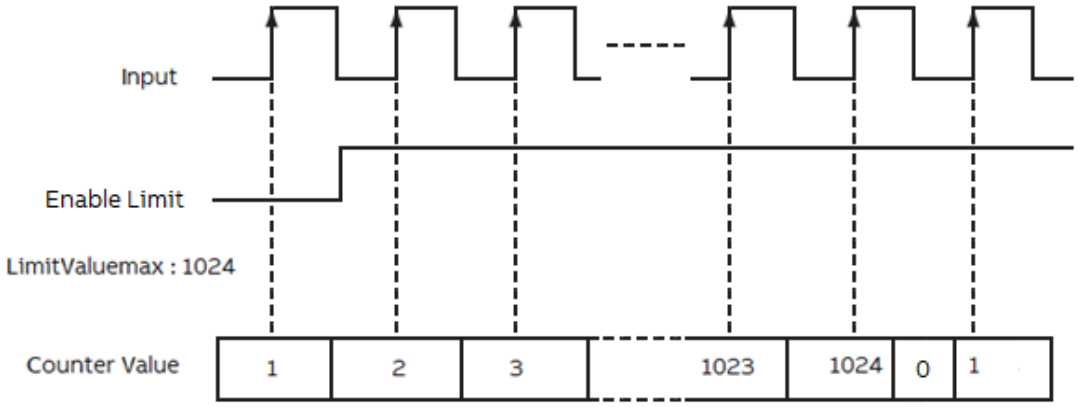


If *“Set”* bit is TRUE, the instruction moves the *“CounterSetValue”* to the *“CounterValue”*.

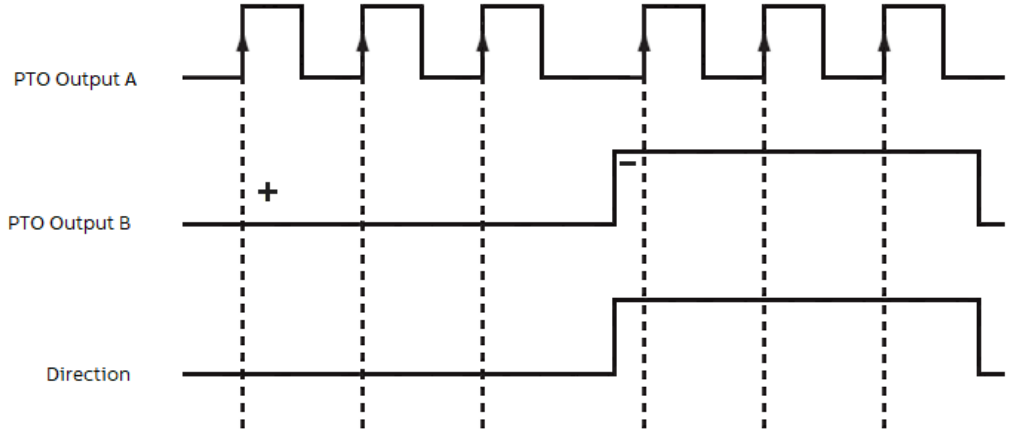


If *“EnableLimit”* bit is TRUE, the accumulated value continues incrementing.

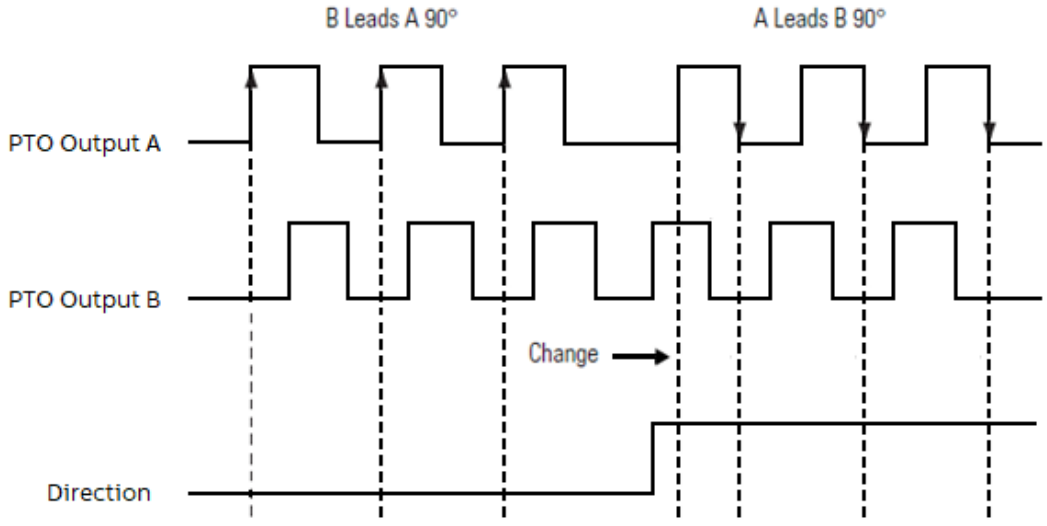
After *“CounterValue”* reaches the *“LimitValueMax”*, the instruction writes 0 to the *“CounterValue”*.



If the input *"CwCCw"* of the *"OBIOPulseTrainOutput"* is set to FALSE, the PTO output channel B is toggled based on the direction.



If the input *"CwCCw"* of the *"OBIOPulseTrainOutput"* is set to TRUE. The PTO output channel A will lead by 90° or PTO output channel B will lead by 90° depending on direction.



Use the onboard I/Os as PTO (pulse-train output) with 200 kHz frequency (max. 2 PTO using PTO HW channels) and Simple Motion OBIOMotionPTO function block

Parameter configuration

Only the Standard and Pro processor modules can be used with PTO outputs. The Basic processor modules PM5012 do not have PTO outputs.

The available PTO outputs can be used as PTO with Pulse/Direction or PTO with CW/CCW mode when the channels have been configured as PTO outputs.

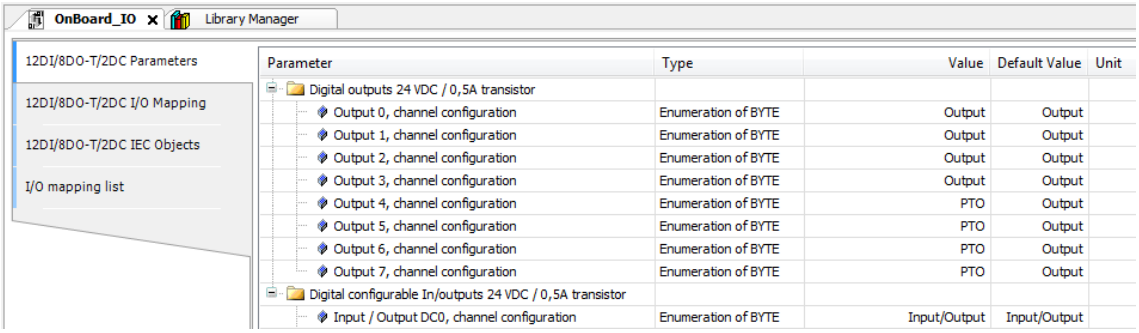
The user can configure the following output channels as PTO (pulse-train output).

- *"PTO"*: Output channel 4
- *"PTO"*: Output channel 5
- *"PTO"*: Output channel 6
- *"PTO"*: Output channel 7

If the user configures the output 4 as PTO, the output 5 is automatically configured as PTO.

If the user configures the output 6 as PTO, the output 7 is automatically configured as PTO.

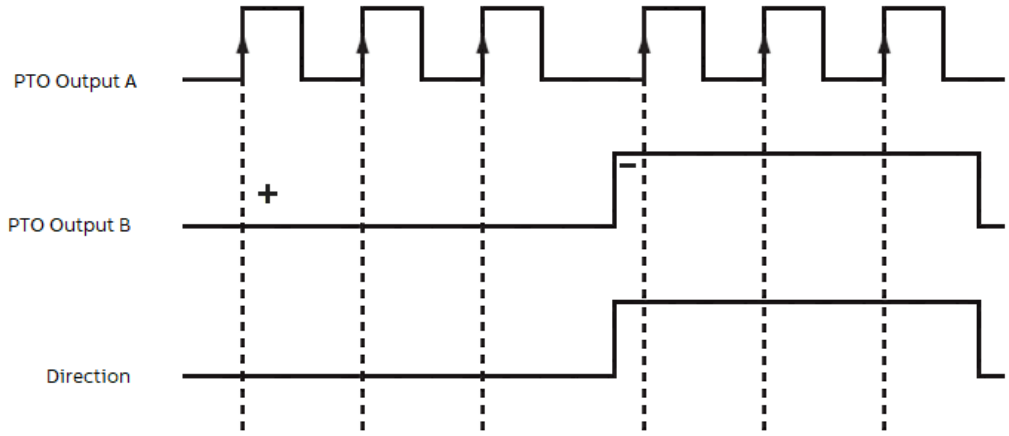
The input *"CwCCw"* of the function block *"OBIOPulseTrainOutput"* determines the output 5 and 7 as *"CounterClockWise"* or *"Direction"* if it is set as PTO.



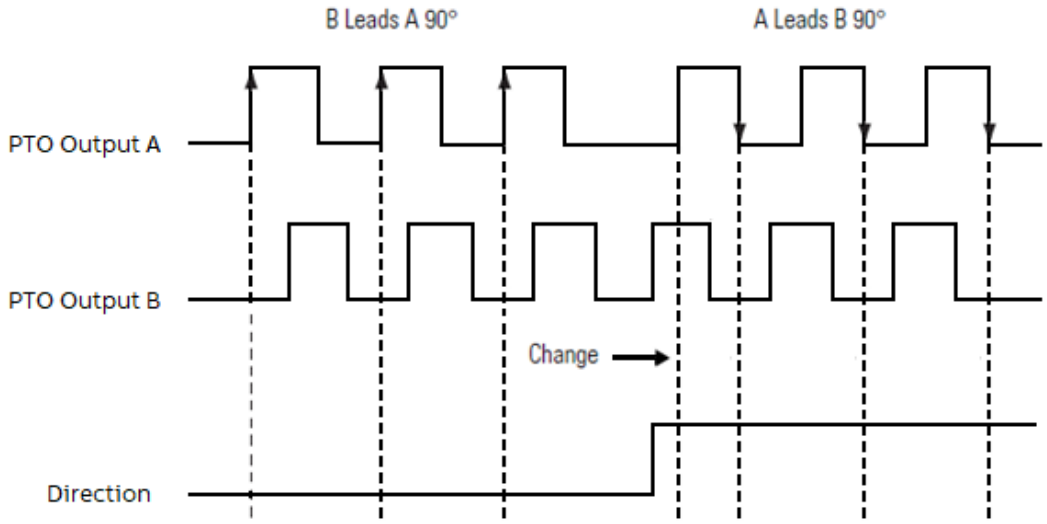
See also the following chapter: Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700

Function block

If the input *"CwCCw"* of the *"OBIOMotionPTO"* is set to FALSE, the PTO output channel B is toggled based on the direction.



If the input *"CwCCw"* of the *"OBIOMotionPTO"* is set to TRUE. The PTO output channel A will lead by 90° or PTO output channel B will lead by 90° depending on direction.



Use the onboard I/Os as PTO (pulse-train output) with 100 kHz frequency (Max. 4 PTO using PWM HW channels) and Simple Motion OBIOMotionPWM function bloc

Parameter configuration

It is possible to have also up to 4 PTO channels only with Pulse/Direction mode on the AC500-eCo V3 CPU by using the fast outputs O4…O7 configured as PWM outputs and using a specific Motion function block and standard outputs for direction channel.

Only the Standard and Pro processor modules can be used with PTO (PWM) outputs. The Basic processor modules PM5012 do not have PTO outputs.

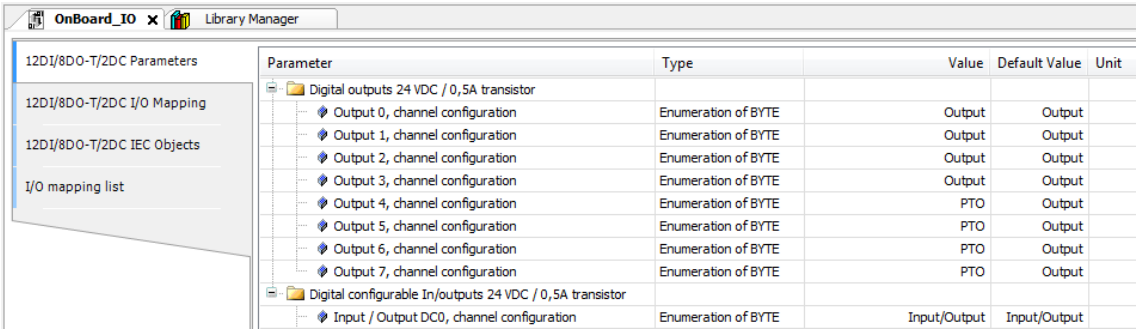
The available software PTO outputs can be used as PTO with Pulse/Direction or PTO with CW/CCW mode when the channels have been configured as PWM outputs.

The user must configure the following output channels as PWM outputs and use the *"OBIOMotionPWM"* function block.

- *"PWM"*: Output channel 4
- *"PWM"*: Output channel 5
- *"PWM"*: Output channel 6
- *"PWM"*: Output channel 7

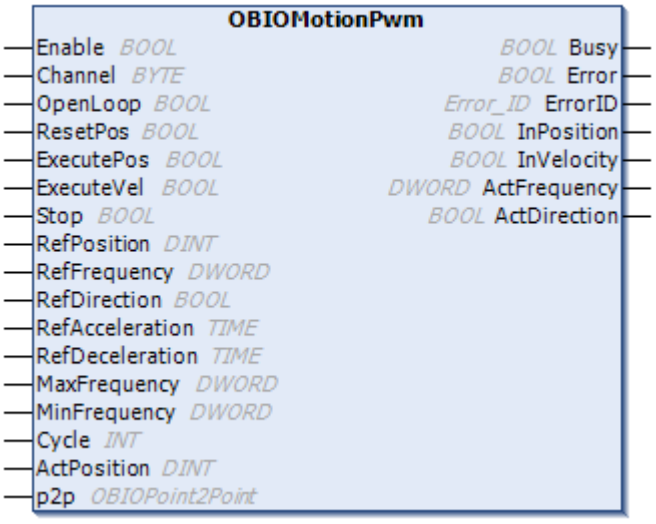
If the user configures the output 4...7 as PWM using the *"OBIOMotionPWM"* function block, up to four Software PTO can be realized offering then only the Pulse/Direction mode.

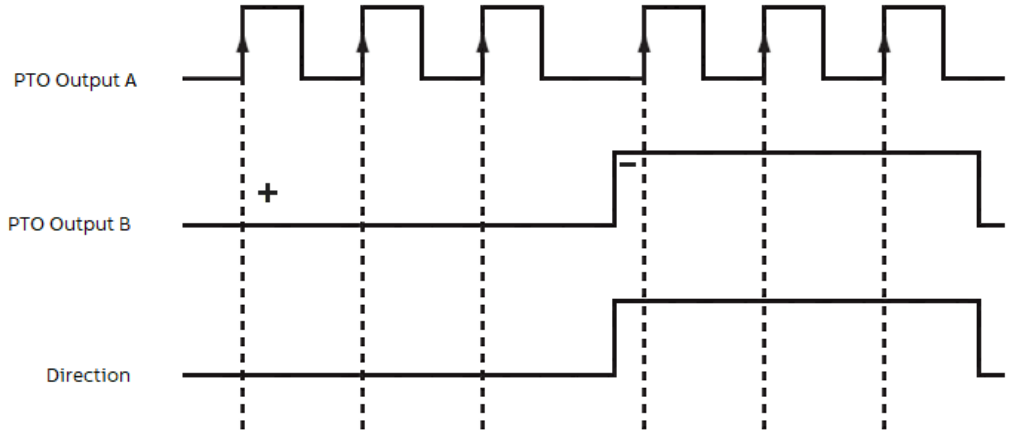
The Pulse output will always use the fast output channels O4…O7 and the direction output of the function block can be assigned to any other output e.g. O0…O3 or also outputs from a S500 I/O module.



See also the following chapter: Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700

Function block



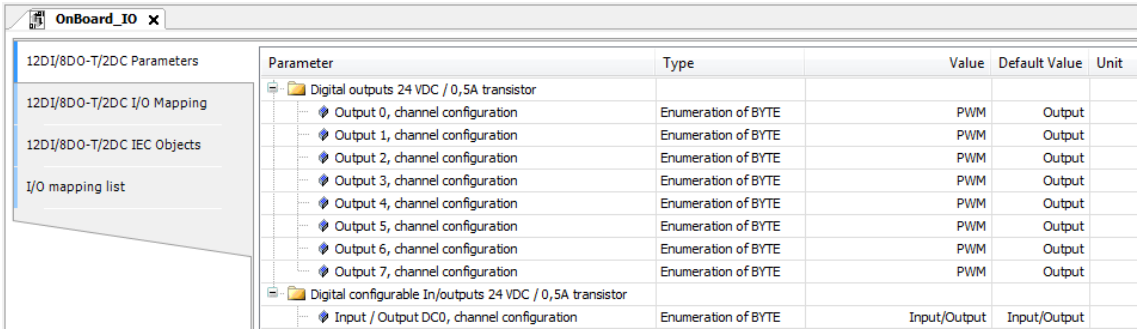


Use the onboard I/Os as output PWM (pulse-width modulation)

Parameter configuration

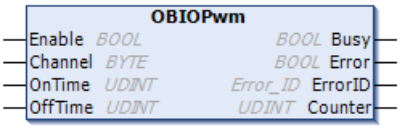
The user can configure the following output channels as PWM (pulse-width modulation).

- *"PWM 0"*: Output channel 0
- *"PWM 1"*: Output channel 1
- *"PWM 2"*: Output channel 2
- *"PWM 3"*: Output channel 3
- *"PWM 4"*: Output channel 4
- *"PWM 5"*: Output channel 5
- *"PWM 6"*: Output channel 6
- *"PWM 7"*: Output channel 7

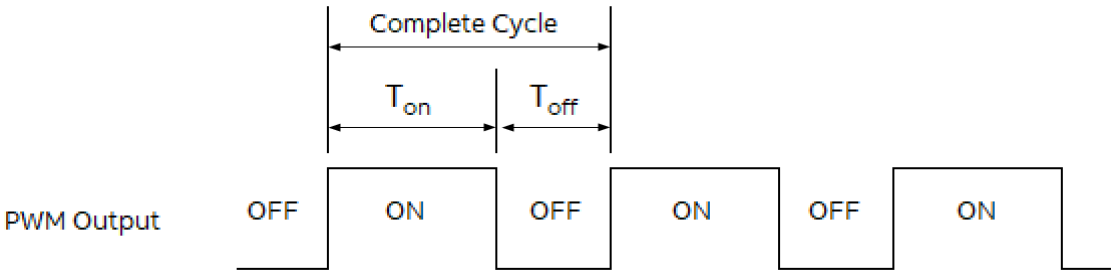


See also the following chapter: Chapter 1.6.6.2.5 "Configure the onboard I/O channel" on page 3700

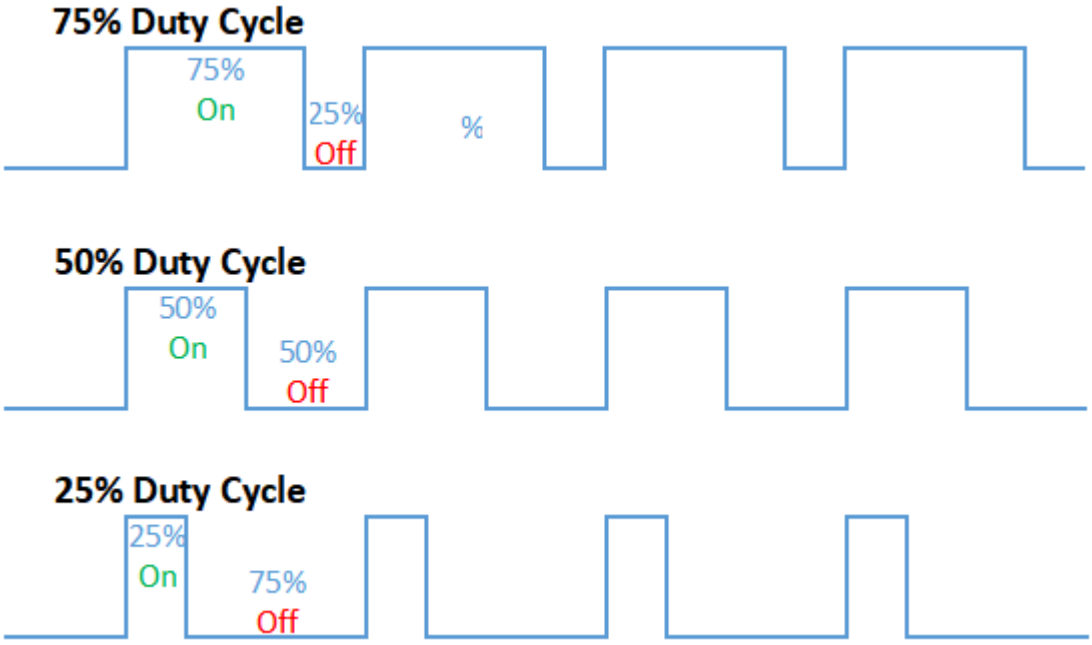
Function block



The complete cycle of the *"PWM"* is based on the *"OnTime"* and *"OffTime"*.



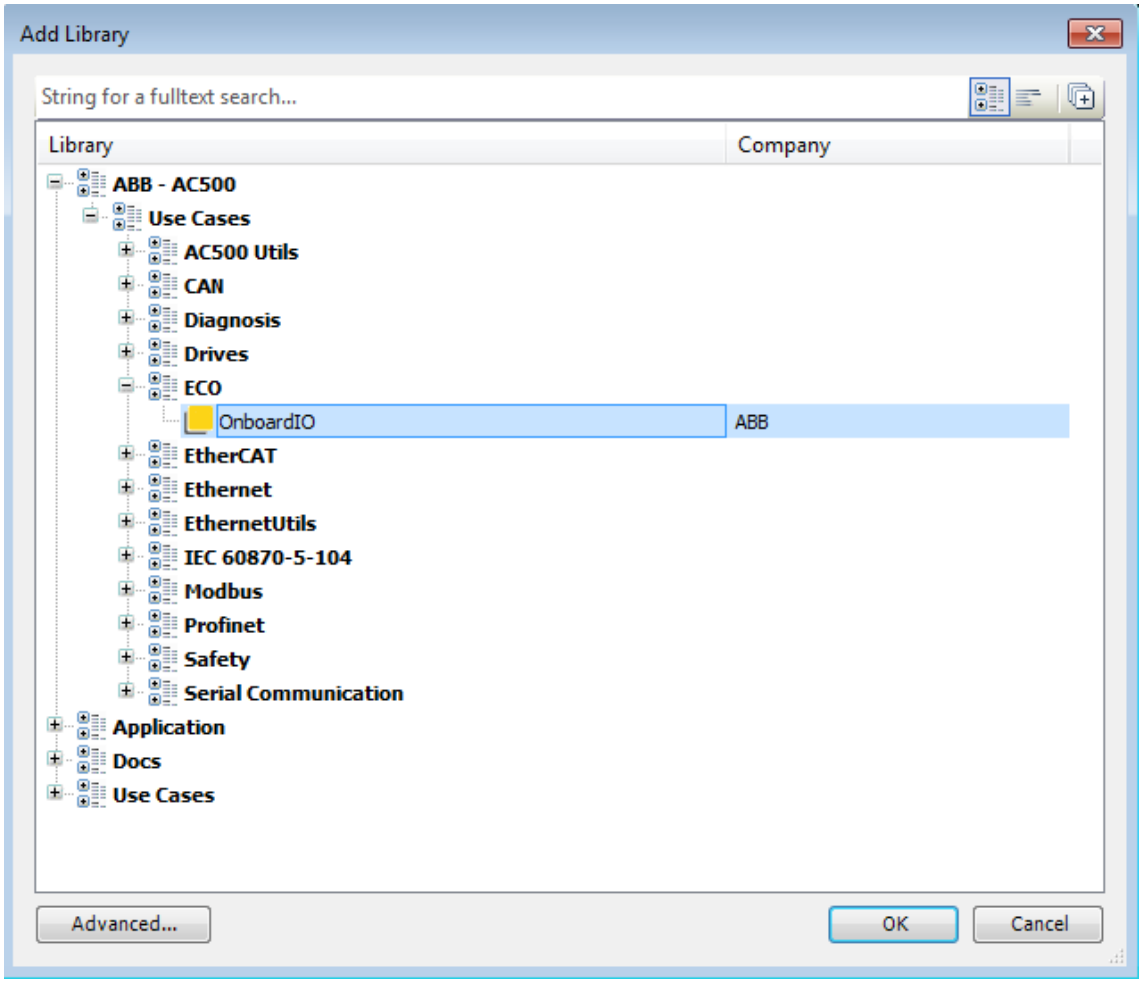
The duty cycle ratio of the *"PWM"* is based on the formula = T_{on} / (T_{on} + T_{off}).



Function block description

Function block descriptions of all V3 libraries are available in the library manager. ↳ *Chapter 1.10 "Reference, function blocks" on page 4292*

1. Under *“Application”* open *“Library Manager”*.
2. Select *“Add Library”*.



⇨ A list of all available libraries is displayed.

Libraries in folder *“ABB - AC500”* are created by ABB and tested in combination with Automation Builder.

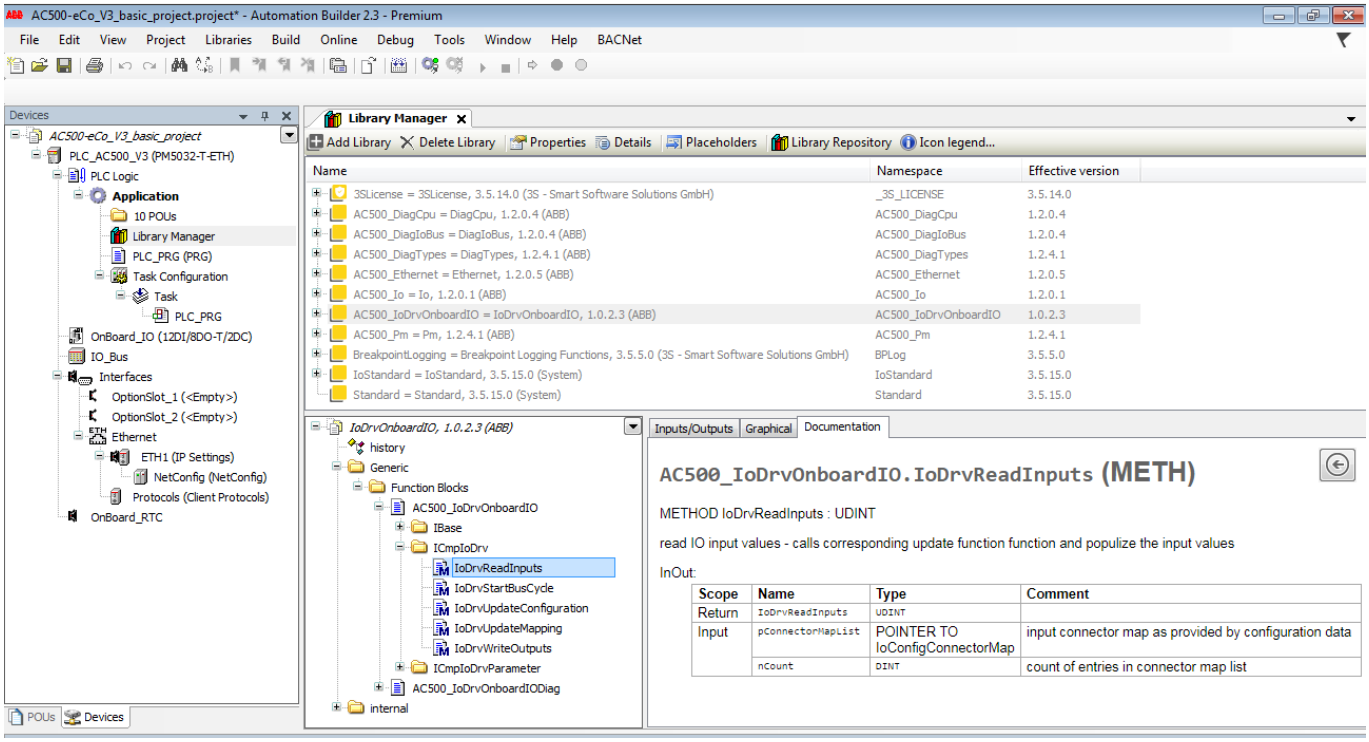
We recommend to use libraries of subfolder *“Use Cases”* for your project.

Libraries in subfolder *“Intern”* are necessary for internal procedures.

All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libraries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.

3. Add a library.
4. Choose the added library in Library Manager to access the documentation.

The function block description is shown as an example as follows.



AC500-eCo V3 option board slots for processor modules PM50xx

Depending on the processor module type, up to three option board slots are available on the CPU for different purpose like digital or analog I/O extension, serial interface or special module for specific functionality.

Option board slots	Basic CPU	Standard CPU		Pro CPU
	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH
Figure • 1: Slot 1 • 2: Slot 2 • 3: Slot 3				
Option board slot 1	X	X	X	X
Option board slot 2	-	X	X	X
Option board slot 3	-	-	X	X

Usable option boards onAC500-eCo V3	Basic CPU	Standard CPU		Pro CPU
	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH
TA5130-KNXPB	-	-	-	X [1])
TA5131-RTC	X[1])	-	-	-

TA5110-2DI2DOT	X	X	X	X
TA5120-2AI-UI [2])	X	X	X	X
TA5122-2AI-TC [2])	X	X	X	X
TA5123-2AI-RTD [2])	X	X	X	X
TA5126-2AO-UI [2])	X	X	X	X
TA5141-RS232I	X	X	X	X
TA5142-RS485I	X	X	X	X
TA5142-RS485	X	X	X	X

[1]) Can be used only once per CPU

[2]) In preparation, not yet available

The option board slots are not affected to one type of option board and they can be plugged and used on each slot. The only limitation is the number of slot available on the processor module. The following types of option board are available, all type can be mixed on all the slots.

Option board for COMx serial communication

Always needed for serial communication like Modbus RTU. Selection and configuration can be found into the PLC Configuration V3 documentation part: ↳ Chapter 1.6.6.2.8.3 “Attach an option board for COMx serial communication” on page 3721

Part no.	Description
1SAP 187 300 R0001	TA5141-RS232I: AC500, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch
1SAP 187 300 R0002	TA5142-RS485I: AC500, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch
1SAP 187 300 R0003	TA5142-RS485: AC500, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch

Option board for digital I/O extension

Selection and configuration can be found into the PLC Configuration V3 documentation part: ↳ Chapter 1.6.6.2.8.2 “Attach an option board for digital I/O extension” on page 3721

Part no.	Description
1SAP 187 000 R0001	TA5101-4DI: AC500, option board for digital I/O extension, 4DI 24 V DC, spring/cable front terminal 3.50 mm pitch
1SAP 187 000 R0002	TA5105-4DOT: AC500,option board for digital I/O extension, 4DO-T 24 V DC / 0.5 A, spring/cable front terminal 3.50 mm pitch
1SAP 187 000 R0003	TA5110-2DI2DOT: AC500, option board for digital I/O extension, 2DI 24 V DC, 2DO-T 24 V DC / 0.5 A, spring/cable front terminal 3.50 mm pitch

Option board for specific function

The TA5130-KNXPB can only be used on AC500-eCo V3 processor modules Pro PM5072-T-ETH(W).

The TA5131-RTC can only be used on AC500-eCo V3 processor modules Basic PM5012-x-ETH.

These two option boards can only be used once on one slot at a time!

Part no.	Description
1SAP 187 200 R0001	TA5130-KNXPB: AC500, option board KNX adress push button
1SAP 187 200 R0002	TA5131-RTC:AC500, real-time clock without battery, option board for AC500-eCo V3 Basic CPU

1.6.5.2 System technology of the AC500 communication modules

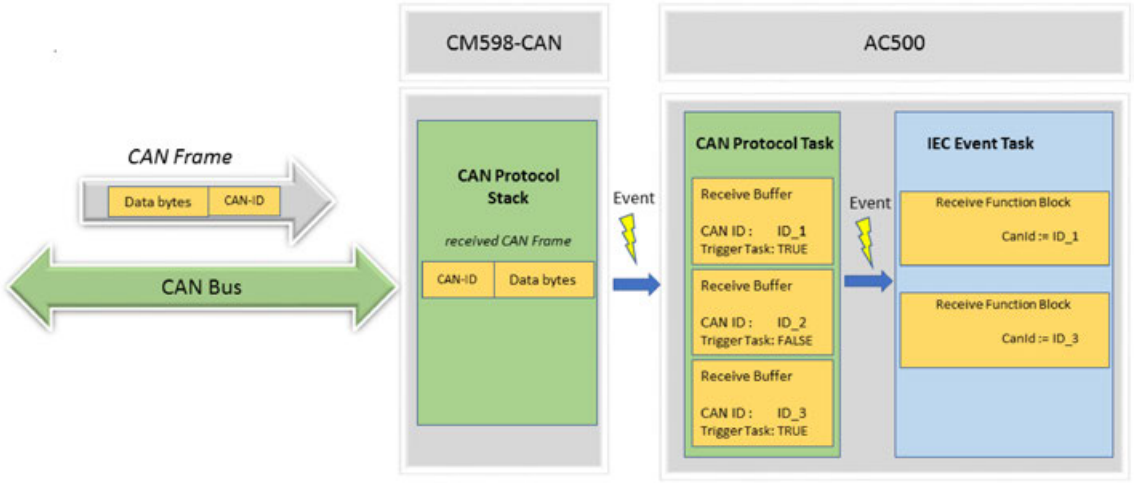
1.6.5.2.1 CANopen communication modules

Triggering of event tasks with CAN-IDs

For CM598-CAN module the execution of a PLC application task can be triggered automatically by a certain event, i.e. by incoming CAN 2.0 A or CAN 2.0 B frames. For this, the PLC application task is to be configured as external event task.

Prerequisites

- *PLC firmware version 3.2.5 and Automation Builder as of version 2.2.5.*
- *Only one PLC application task can be assigned to a communication module.*
- *Triggering of event tasks is only supported for the communication module CM598-CAN.*



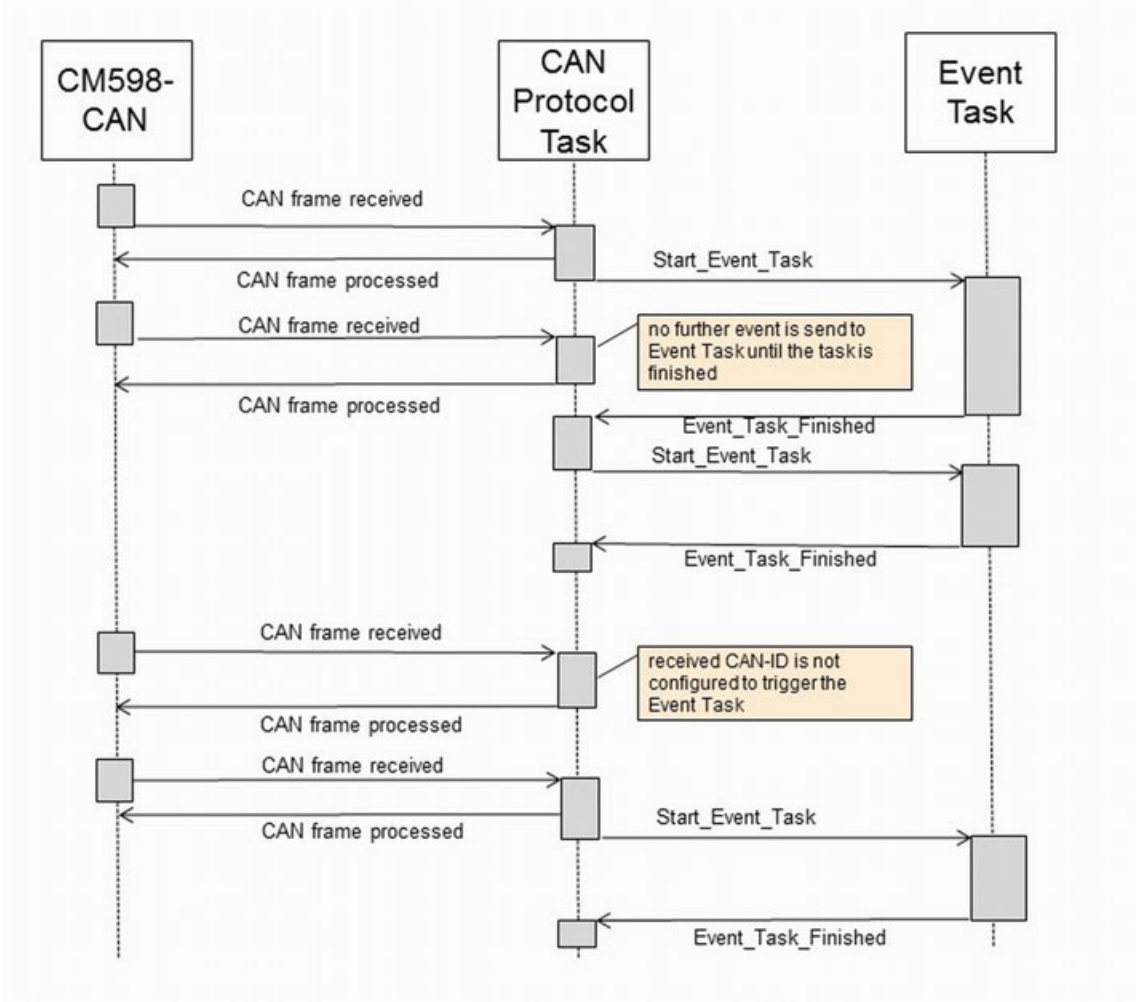
Every incoming CAN frame on a CM598-CAN module processes an event in the AC500 PLC. If the parameter "Trigger PLC Task" is set to TRUE, the CAN protocol task checks via the receive buffer configuration and the corresponding CAN-ID of the CAN frame whether a CAN frame is to be executed or not. Only those CAN-IDs that are configured in the protocol configuration will be processed. All other CAN frames will be rejected. If a CAN frame is to be processed, the CAN frame data is copied to the receive buffer and an event on the IEC event task is triggered.

> *The IEC event task will be executed for one cycle.*
>
> *The IEC event task will be triggered continuously until all associated receive buffers have been emptied. Hence, ensure that the buffers are emptied by the task, otherwise the task will run into a loop.*

Within the task the function block Cm598CanMsgRecEvt must be used to read the CAN frames from the receive buffers. The function block Cm598CanMsgRec is not suitable as it requires several task cycles for execution.

CAN frame processing

The following figure shows the sequence CAN frames processing when the triggering of event task is used.

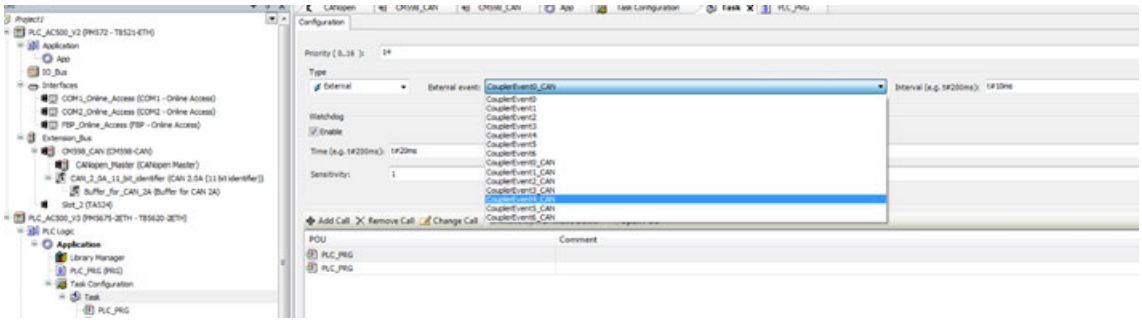


- *Only one external event task can be assigned to a CM598-CAN.*
- *There is only one common event for an external event task and all selected CAN-IDs. It must be evaluated which CAN-IDs have been received.*
- *It is possible that CAN frames are lost when necessary system resources are in use or when the CAN frames could not be processed in time due to high system load. So, the PLC application must monitor the task which consumes the events of the CAN protocol with a watchdog mechanism or something similar.*
- *Received CAN frames of the same CAN-ID are internally stored in FIFO buffers. Reading and writing of the FIFO buffers is not possible at the same time.*
- *Within an external event task the function block Cm598CanMsgRecEvt must be used to read the received CAN frames. The function block Cm598CanMsgRec is not suitable since its execution needs more than one task cycle.*
- *The CAN-IDs that are enabled to trigger an external event task must be read by the associated task. Otherwise the task is triggered again and again, and the CPU load will be high.*

Event task configuration

Add the external event task that should be executed to the task configuration of the PLC application:

1. Right-click on *“Task Configuration”*. Enter a name for the task and click *“Add object”*.
2. Right-click on the new task and append a *“Program Call”*. This contains the program code that is executed by the task.
3. Double-click on the task and setup the task parameters.



A parameter description is given in the ↳ *Chapter 1.4.1.20.2.27.1 “Tab 'Configuration'” on page 942*. Deviations are described in the following:

Parameter	Default	Value	Description
Priority	16	0..16 Value '0' indicates the highest priority	Priority of the task
Type	n.a.	External	Specifies the task type.
External Event	n.a.	CouplerEvent<slot index of the CM>_CAN	Specifies the event that triggers execution of the task.
Interval	n.a.	Cycle time	Not used

Configuration of a CM598-CAN module is desribed in the configuration chapter ↳ *Chapter 1.6.6.2.11.1 “CANopen” on page 3737*.

1.6.5.3 System technology of the communication interface modules

1.6.5.3.1 Modbus communication interface module

Overview

The Modbus TCP communication interface module CI52x-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

CI521-MODTCP I/O channels properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

Functionality

Parameter	Value
Interface	Ethernet
Protocol	Modbus TCP
Power supply	from the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the last BYTE of the IP (00h to FFh)
Analog inputs	4 (configurable via software)
Analog outputs	2 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)

CI522-MODTCP I/O channels properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

Functionality

Parameter	Value
Interface	Ethernet
Protocol	Modbus TCP
Power supply	from the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the last BYTE of the IP (00h to FFh)
Configurable digital inputs/outputs	8 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels.

The configuration of the inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Modbus TCP registers

Register layout for CI52x-MODTCP

The registers can be divided in 4 sections:

- Information data section 0x0000 to 0x0D50 (for acyclic use)
- I/O data and diagnosis section 0x0FFA to 0x2B00 (for cyclic use)
- Parameter data section 0x3000 to 0x3B00 (for acyclic use)
- Special functionality section 0x5A00 to 0x6A00 (for acyclic use)

Information data section (Acyclic data)

The information data section can be used to read out common and module specific information.

This section is read only.

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
0	Device and FW information CI	3	x
50	Production data CI	3	x
100	Device and FW information 1. EXP	3	x
125	Device and FW information 1. Hot swap terminal unit	3 *)	x
150	Production data 1. EXP	3	x
175	Production data 1. Hot swap terminal unit	3 *)	x
...	...		x
A00	Device and FW information 10. EXP	3	x
A25	Device and FW information 10. Hot swap terminal unit	3 *)	x
A50	Production data 10. EXP	3	x
A75	Production data 10. Hot swap terminal unit	3 *)	x
D00	Common device information	3	x

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in two sections:

- The module specific section (containing information for each module CI52x-MODTCP and expansion modules and hot swap terminal units)
- The common device information block

Module specific information registers

For each module (CI52x device, expansion modules and hot swap terminal units) the following data can be read out:

- Device and FW information
  This section consists of 20 WORDs per module and contains information on each module using the following structure:

Data	DATA TYPE	Description
Module ID	WORD	The module ID of the requested module
Module name	ARRAY [1..10] OF BYTE	The module name of the requested module
Version 1st processor	ARRAY [1..4] OF BYTE	The version of the 1st processor of the requested module
Version 2nd processor	ARRAY [1..4] OF BYTE	The version of the 2nd processor of the requested module
Version 3rd processor	ARRAY [1..4] OF BYTE	The version of the 3rd processor of the requested module

Data	DATA TYPE	Description
Version 4th processor	ARRAY [1..4] OF BYTE	The version of the 4th processor of the requested module
Hardware version [1])	ARRAY [1..4] OF BYTE	The hardware version of the 4 processors
Reserved	ARRAY [1..8] OF BYTE ARRAY [1..4] OF BYTE [2])	Reserved
Number input data	WORD	Number of input data of the requested module in BYTES
Number output data	WORD	Number of output data of the requested module in BYTES

[1]) supported from CI52x firmware version V3.2.0 (device index F0)

[2]) from CI52x firmware version V3.2.0 (device index F0) “Reserved” is ARRAY [1..4] OF BYTE

- Production / Traceability data:
  This section consists of 25 WORDs per module and contains the traceability data for each module using following structure:
  – Article number: Byte 01..15
  – Index: Byte 16..17
  – Name: Byte 18..29
  – Production date: Byte 30..33
  – Key number: Byte 34..38
  – Site: Byte 39..40
  – Year: Byte 41..42
  – Serial number: Byte 41..50 (The serial number implies the year)
- Production / Traceability data from CI5x2 firmware version V3.2.0 (device index F0):
  This section consists of 26 WORDs per module and contains the traceability data for each module using following structure:
  – Article number: Byte 01..15
  – Index: Byte 16..17
  – Name: Byte 18..31
  – Production date: Byte 32..35
  – Key number: Byte 36..40
  – Site: Byte 41..42
  – Year: Byte 43..44
  – Serial number: Byte 42..52 (The serial number implies the year)

Common device information registers

Common device information block

This section consists of 80 WORDs (90 WORDs from CI52x firmware version V3.2.0 (device index F0)) and contains cluster wide information (CI52x device and connected expansion modules using the following structure:

Data	DATA TYPE	Description
Device state	BYTE	The actual state of the device: 0: STATE_PREOP (device booting) 1: STATE_OPERATION (device in operational, no bus supervision active) 2: STATE_ERROR (device detected a bus error, bus supervision active) 3: STATE_IP_ERROR (the device has a IP address error) 4: STATE_CYCLIC_OPERATION (device in operational, bus supervision active)
Parameter state	BYTE	The actual parameter state of the device: 0: PARA_STATE_NO_PARA (the device has no parameters) 1: PARA_STATE_PARA_ACTIVE (parameterization process running) 2: PARA_STATE_PARA_DONE (the uses valid parameters) 3: PARA_STATE_ERROR (The device has invalid
Module ID CI device	WORD	Module ID of the CI52x device itself
Module ID 1st expansion	WORD	Module ID of the 1st connected expansion module
Module ID 2nd expansion	WORD	Module ID of the 2nd connected expansion module
...		
Module ID 10th expansion	WORD	Module ID of the 10th connected expansion module
Expansion bus error count	DWORD	Global telegram error count over all expansion modules
Good count onboard I/O	DWORD	Telegram good count onboard I/Os
Good count 1st expansion	DWORD	Telegram good count 1st expansion module
Good count 2nd expansion	DWORD	Telegram good count 2nd expansion module
...		
Good count 10th expansion	DWORD	Telegram good count 10th expansion module
Error count onboard I/O	DWORD	Telegram error count onboard I/Os
Error count 1st expansion	DWORD	Telegram error count 1st expansion module
Error count 2nd expansion	DWORD	Telegram error count 2nd expansion module
...		
Error count 10th expansion	DWORD	Telegram error count 10th expansion module
Input address onboard I/O	WORD	Modbus TCP register address for inputs of the onboard I/Os
Input address 1st expansion	WORD	Modbus TCP register address for inputs of the 1st expansion module
Input address 2nd expansion	WORD	Modbus TCP register address for inputs of the 2nd expansion module

Data	DATA TYPE	Description
...		
Input address 10th expansion	WORD	Modbus TCP register address for inputs of the 10th expansion module
Output address onboard I/O	WORD	Modbus TCP register address for outputs of the onboard I/Os
Output address 1st expansion	WORD	Modbus TCP register address for outputs of the 1st expansion module
Output address 2nd expansion	WORD	Modbus TCP register address for outputs of the 2nd expansion module
...		
Output address 10th expansion	WORD	Modbus TCP register address for outputs of the 10th expansion module
Module ID 1st hot swap terminal unit *)	WORD	Module ID of the 1st connected hot swap terminal unit *)
Module ID 2nd hot swap terminal unit *)	WORD	Module ID of the 2nd connected hot swap terminal unit *)
...		
Module ID 10th hot swap terminal unit *)	WORD	Module ID of the 10th connected hot swap terminal unit *)

*) supported from CI52x firmware version V3.2.0 (device index F0)

I/O / Process data and diagnosis section (Cyclic data)

Table 650: The cyclic data section for CI52x-MODTCP

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
FCE *)	Module state	3,4, 23	x
FFA	Diagnosis	3,4, 23	x
1000	Inputs CI	3, 4, 23	x
1100	Inputs 1.EXP	3, 4, 23	x
...	...		x
1A00	Inputs 10.EXP	3, 4, 23	x
2000	Outputs CI	3, 23	6, 16, 23
2100	Outputs 1.EXP	3, 23	6, 16, 23
...	...		
2A00	Outputs 10.EXP	3, 23	6, 16, 23
2B00	Dummy output	3, 23	6, 16, 23

*) supported from CI52x firmware version V3.2.0 (device index F0)

This section can be divided again in three sections:

- Module state (containing the state of connected expansion modules and hot swap terminal units)
- Diagnosis data (containing diagnosis data in AC500 specific format)
- Process data (containing I/O data)

Module state

The module state section consists of 44 WORDs and contains the module state of connected expansion modules and hot swap terminal units using the following structure:

Data	DATA TYPE	Description
Module ID	WORD	Module ID of the CI52x
Expected module ID	WORD	Expected (configured) module ID of the CI52x
Module state	BYTE	The current module state of the CI52x: 0: NO_MOD (no module detected) 1: MOD_INIT (module detected, module is in initialization phase) 2: MOD_RUN (module detected and running or in failsafe state, input data are valid) 3: WRONG_MOD (wrong module detected, module ID doesn't match expected module ID) 4: MOD_REMOVED (module removed or defective on hot swap terminal unit, no communication to module possible) 5: MOD_ERROR (module defective on hot swap terminal unit, no communication to module possible) 6: MOD_LOST (lost communication to module on not hot swap capable terminal unit) 7: UNKNOWN (module detected but not configured)
Diagnosis flag	BYTE	Diagnosis flag for the CI52x: 0: NO_DIAG (no diagnosis available from CI52x I/O cards) 1: DIAG_AVAILABLE (diagnosis available for CI52x I/O cards)
Terminal unit state	BYTE	Terminal unit state for the CI52x: 0: NO_HOTSWAP_TU (not hot swap terminal unit detected) 1: HOTSWAP_TU_RUNNING (hot swap terminal unit detected and working) 2: HOTSWAP_TU_ERROR (hot swap terminal unit detected, but communication errors for hot swap terminal unit detected)
Parameter state	BYTE	Parameter state of the CI52x: 0: NO_PARA (module is in initialization phase and not ready for parameterization) 1: WAIT_PARA (module awaits parameterization) 2: PARA_RUN (parameterization running) 3: LEN_ERR (length of parameters not correct) 4: ID_ERR (module ID inside parameters not correct) 5: PARA_DONE (parameterization finished without errors)
Module ID	WORD	Module ID of the 1st connected expansion module

Data	DATA TYPE	Description
Expected module ID	WORD	Expected (configured) module ID of the 1st connected expansion module
Module state	BYTE	The current module state of the 1st connected expansion module
Diagnosis flag	BYTE	Diagnosis flag for the 1st connected expansion module 0: NO_DIAG (no diagnosis available for expansion module) 1: DIAG_AVAILABLE (diagnosis available for expansion module)
Terminal unit state	BYTE	Terminal unit state for the 1st connected expansion module
Parameter state	BYTE	Parameter state of the 1st connected expansion module
...		
Module ID	WORD	Module ID of the 10th connected expansion module
Expected module ID	WORD	Expected (configured) module ID of the 10th connected expansion module
Module state	BYTE	The current module state of the 10th connected expansion module
Diagnosis flag	BYTE	Diagnosis flag for the 10th connected expansion module
Terminal unit state	BYTE	Terminal unit state for the 10th connected expansion module
Parameter state	BYTE	Parameter state of the 10th connected expansion module

Diagnosis data

The diagnosis data section contains one diagnosis message with the following structure (according to AC500 diagnosis):

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI52x-MODTCP (e. g. error at integrated 8 DI / 8 DO)
		1 = 1st connected S500 I/O Module
		...
		10 = 10th connected S500 I/O Module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and Bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to Bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error
6	Reserved	0

If a diagnosis message is read out, the next one will be automatically filled in.

If no more diagnosis messages are available the buffer will be reset to zero.

This ensures that each diagnosis message can be delivered to the Modbus TCP client/slave and no diagnosis will be lost.

I/O data

The I/O data section can use two different formats according to the module parameter “I/O Mapping Structure” (see ↬ *Chapter 1.6.3 “Device specifications” on page 2430* for details).

- Fixed I/O mapping
  In case of fixed I/O mapping each module has a predefined register range for each Inputs and Outputs.
- Dynamic I/O mapping
  In case of dynamic I/O mapping the mapping is build according to the actual configuration.

The dummy output at the end of the I/O data section can be used to retrigger the bus supervision and has no effect on the HW outputs.

Fixed I/O mapping

In case of fixed I/O mapping the following predefined register table is used:

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
1000	Inputs CI	3, 4, 23	x
1100	Inputs 1.EXP	3, 4, 23	x
...	...		x
1A00	Inputs 10.EXP	3, 4, 23	x
2000	Outputs CI	3, 23	6, 16, 23
2100	Outputs 1.EXP	3, 23	6, 16, 23
...	...		
2A00	Outputs 10.EXP	3, 23	6, 16, 23
2B00	Dummy output	3, 23	6, 16, 23

If a certain expansion module has no inputs or outputs the corresponding registers remain empty.

Dynamic I/O mapping

In case of dynamic mapping only the start addresses of inputs and outputs are predefined:

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
1000	Inputs CI	3, 4, 23	x
...	...		x
2000	Outputs CI	3, 23	6, 16, 23
...	...		
2B00	Dummy output	3, 23	6, 16, 23

The register addresses of the connected expansion modules are calculated dynamically based on the number of inputs and outputs of the previous modules (each module starts directly on the next register after the previous module).

The register addresses of each module can be read out via the common device register (see ↳ *Chapter 1.6.5.3.1.2.2.2 “Common device information registers” on page 3606*).

Comparative example

The difference between fixed I/O mapping and dynamic I/O mapping is shown in the following table.

For this comparison a cluster with CI522, AX522, DC532, AX521, DC523, DC532, AO523, AI523, DI524, AX522 and DC523 is used.

Fixed Mapping					Dynamic Mapping			
Register (hex)	**Description**	**Type**	**Data**		**Register (hex)**	**Description**	**Type**	**Data**
1000	Inputs CI	8 DC, 8 DI, FC	4 BYTE + 4 WORD		1000	Inputs CI	8 DC, 8 DI, FC	4 BYTE + 4 WORD

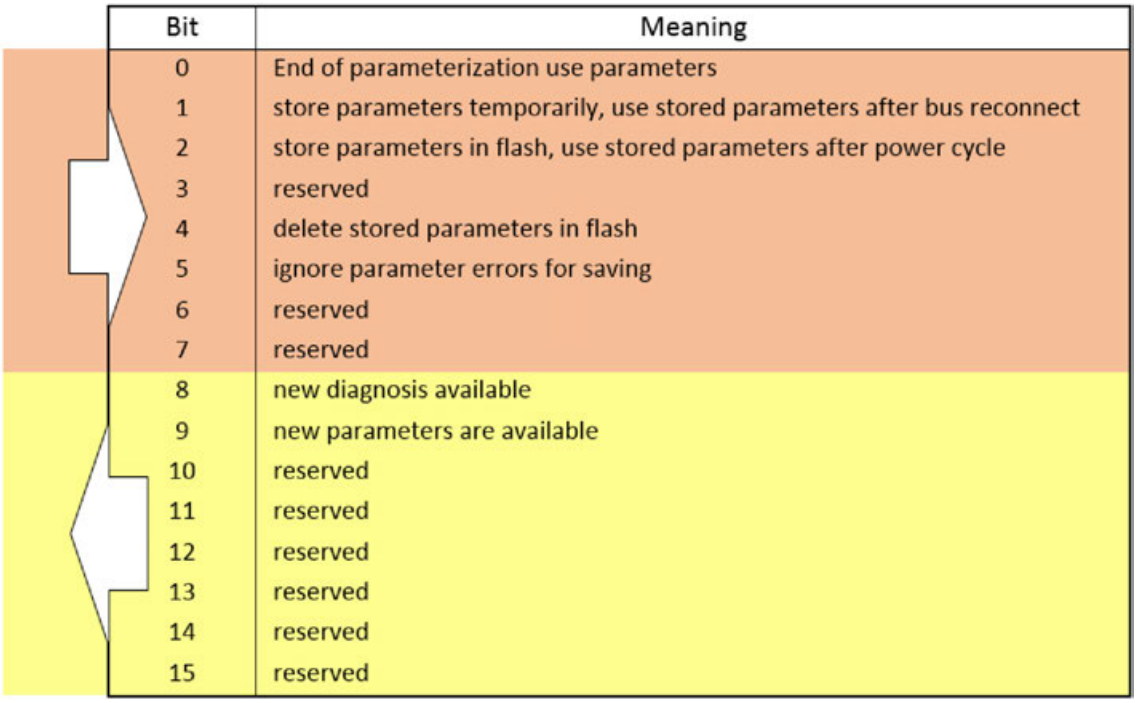
Parameter data (Acyclic data)

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
3000	Parameters CI	3	6, 16
3080	Stored parameters CI	3	x
3100	Parameters 1. EXP	3	6, 16
3180	Stored parameters 10. EXP	3	x
...			
3A00	Parameters 10. EXP	3	6, 16
3A80	Stored parameters 10. EXP	3	x
3B00	controlword/statusword	3	6, 16

For each connected module the following parameter data are defined (the parameters are represented as ARRAY OF BYTE):

- Actual used parameter for each module
  In these sections the actual parameters are stored. This section is also used to write parameters to the module (For a description on how to parameterize see *Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3622*).
- Stored parameters for each module
  If the module has stored nonvolatile parameters these can be read out using the corresponding registers.

The controlword/statusword is used to trigger a parameterization process. The single bits have the following meaning:



Bit	Meaning
0	End of parameterization use parameters
1	store parameters temporarily, use stored parameters after bus reconnect
2	store parameters in flash, use stored parameters after power cycle
3	reserved
4	delete stored parameters in flash
5	ignore parameter errors for saving
6	reserved
7	reserved
8	new diagnosis available
9	new parameters are available
10	reserved
11	reserved
12	reserved
13	reserved
14	reserved
15	reserved

The direction of the first 8 bits is client to server (master to slave).

The direction of the second 8 bits is server to client (slave to master). A description of the bits can be found in chapter behavior *Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3622*.

The parameter register sections (actual and stored parameters) have the structure as explained in the of the corresponding module *Chapter 1.6.3 “Device specifications” on page 2430*.

Short description of the CI521-MODTCP parameters

Parameter	Single parameter index	Description	Additional Info
0		Module ID (high Byte)	Fixed, must be 16#1C
1		Module ID (low Byte)	Fixed, must be 16#E8
2		Ignore Module	Reserved, must be 0
3		Length of following parameter block	Fixed, must be 16#3F
4	0	Error LED / Failsafe	See *Chapter 1.6.3 “Device specifications” on page 2430*

Parameter	Single parameter index	Description	Additional Info
5	1	Master IP Byte 0	IP Address for write restrictions (*“Configurable write restriction” on page 3624*)
6		Master IP Byte 1	
7		Master IP Byte 2	
8		Master IP Byte 3	
9	2	Master IP 1 Byte 0	IP Address for write restrictions (*“Configurable write restriction” on page 3624*)
10		Master IP 1 Byte 1

Parameters of connected expansion modules

The parameters of the connected expansion modules are represented as byte array (the parameters valid for "CPU" in the *Chapter 1.6.3 "Device specifications" on page 2430* of the corresponding module are used):

Parameter	Description	Additional Info
0	Module ID (high byte)	Fixed, see *Chapter 1.6.3 "Device specifications" on page 2430* of corresponding module (the module ID of FBP is used)
1	Module ID (low byte)	Fixed, see of corresponding module (the module ID of FBP is used) *Chapter 1.6.3 "Device specifications" on page 2430*
2	Ignore module	Reserved must be 0
3	Length of following parameter block	Fixed, see *Chapter 1.6.3 "Device specifications" on page 2430* of corresponding module
4...	The rest of the parameter are described in the corresponding module	

Special functionality

This section contains special services like firmware update or single parameterization.

Register (hex)	Description	Readable by Modbus function code	Writeable by Modbus function code
4000	Firmware download	3	16
4100	Firmware download state	3	x
5000	Write single parameterization of CI	x	16
5100	Write single parameterization of 1. EXP	x	16
...			
5A00	Write single parameterization of 10. EXP	x	16
6000	Read single parameterization of CI	3	16
6100	Read single parameterization of 1. EXP	3	16
...			
6A00	Read single parameterization of 10. EXP	3	16

Behavior

IP address assignment

The delivery IP address of the CI52x-MODTCP is 192.168.0.xx (xx is the hardware address switch position of the device.

The devices support BOOTP, DHCP and fixed IP address setting (these can be set individual or together). If BOOTP and DHCP are enabled the following priority takes place:

- If DHCP configuration fails, the device will fall back to BOOTP.
- In case of a BOOTP failure, the fixed IP address will be used.

A new IP address (or changing of BOOTP and DHCP) can be set in two different ways:

- With the address switches of the corresponding module
- With the ↬ *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675*

Using the address switches

With the address switches only the last byte of the IP address can be changed.

The IP address can only be set via the address switches in case of factory default or in case of the last byte of the IP address is set to zero with the ↬ *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675*. The not allowed IP addresses are mapped as followed:

- Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings (by IP Configuration Tool).

  This is a backup so the module can always get a valid IP address and can be configured by the IP Configuration Tool.
- Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

Using the IP configuration tool

With the *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675* a network scan can be executed, and the found devices can be assigned with new settings, e.g. enable BOOTP or DHCP and set a new fixed IP. If the last byte of the IP address of the CI52x-MODTCP devices is set to 0 with the IP Configuration Tool the address switch position is used instead (see *Chapter 1.6.5.3.1.3.1.1 “Using the address switches” on page 3621*).

Parameterization

The parameterization is done via the corresponding registers explained in the Modbus TCP registers *Chapter 1.6.5.3.1.2.4 “Parameter data (Acyclic data)” on page 3615*.

In addition to that the parameters can be directly transferred via Automation Builder (see documentation of Automation Builder for that).

There are two different parameter sections with different behavior.

Actual used parameters

After startup this section contains the following data:

- Default parameters (only module id and parameter length set all others zero) if no valid stored parameters are available (no or invalid parameters stored).
- Actual used / stored parameters if valid parameters are stored nonvolatile.

These parameters can be read out and changed by reading or writing of the corresponding registers, but will not be used automatically after writing them, the use of new written parameters has to be triggered by writing the parameter control word with the corresponding bits set (see below).

Stored parameters

This section always contains a copy of the nonvolatile stored parameters, if no parameters are stored nonvolatile this sections will be 0.

Controlword/statusword parameter

This parameter can be used to trigger and save new parameters.

The direction of the first 8 bit is client to server (master to slave). The direction of the second 8 bits is server to client (slave to master).

Bit	Description	
0	Use parameters / start parameterization	If this bit is set the CI Device starts the parameterization with the parameters in the actual parameters registers.
1	Store parameters volatile	If this bit is set the CI device will use the parameters temporarily, which means after a bus error detection and reconnection the parameters will be used again. **This bit should always be set.** **This bit is only evaluated when bit 0 is set.**
2	Store parameters nonvolatile	If this bit is set the CI device will store the parameters nonvolatile, which means after a power cycle the stored parameter data will be used again. **This bit is only evaluated when bit 0 is set.**
3	Reserved	-
4	Delete nonvolatile stored parameters	If this bit is set the CI device will delete its nonvolatile stored parameters. **This bit is only evaluated when bit 0 is set**.
5	Ignore parameter error for nonvolatile parameter storage	If this bit is set a parameter error during nonvolatile storage of parameters will be ignored, and the parameters will be stored. **This bit can only be set in combination with bit 0 and bit 2.**
6	Reserved	-
7	Reserved	-
8	New diagnosis available	The device will set this bit if new diagnosis data are available in the diagnosis data section.
9	New parameters available	The device will set this bit if new parameters are available in the actual parameter data section and these were not activated by setting bit 0 in the control word.
10...15	Reserved	-

Cyclic I/O data exchange

The I/O data can be exchanged cyclic by the master by reading, writing the corresponding registers.

I/O data exchange is only possible after successful parameterization of the device.

For writing of outputs **bus failure detection** can be activated by setting the corresponding parameter. This bus failure detection is described in the following chapter.

Bus failure detection

If the parameter "*"timeout"*" in the module parameters of the CI52x-MODTCP is set, the module will supervise the Modbus TCP "write telegrams".

After the first "write telegram" the bus will be supervised. If no new "write telegram" arrives at the CI52x-MODTCP within the configured time, the module will detect a bus failure and switch off its outputs or switch them to the configured failsafe state (see module parameter CI521 ↳ *Chapter 1.6.3.7.4.1.7 "Parameterization" on page 3176* and CI522 ↳ *Chapter 1.6.3.7.4.2.7 "Parameterization" on page 3206* for details).

Configurable write restriction

With the module parameters “Master IP”- “Master IP 7” it is possible to set write restrictions on the CI52x-MODTCP device.

If none of the parameters is set, all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device.

All other masters / clients still have read access to the CI52x-MODTCP device.

Diagnosis behavior

Each diagnosis message signals if this error is coming or going , so it is possible to create a list in the master of actual pending diagnosis.

Diagnosis messages will be transferred again after a bus failure detection and reconnection.

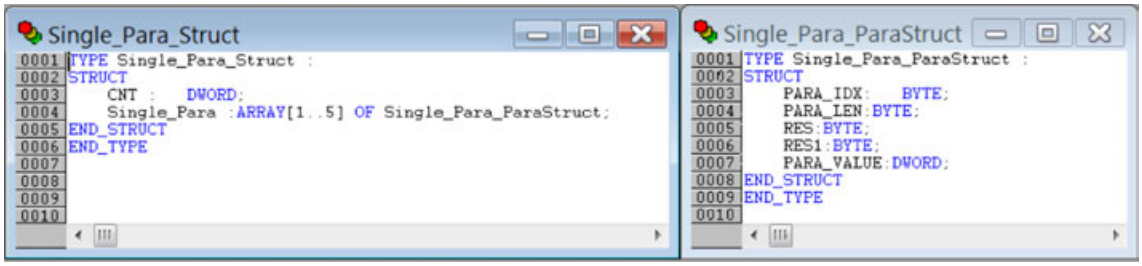
Diagnosis messages can be read out with function code 3,4,23. Function codes 3 and 4 can always read out diagnosis messages, function code 23 can only read out after successful parameterization of the device. See also table *Chapter 1.6.5.3.1.2.3.2 “Diagnosis data” on page 3611*.

Single parameterization

The single parameterization services can be used to read or write parameters during run time of device without the need of triggering a new parameterization process.

For indexes used for single parameterization services see parameter lists in section Modbus TCP registers of this document.

The read and write parameterization services are explained below, for each module (CI52x-MODTCP and connected expansion modules) a different section for read and write is defined see chapter Modbus TCP registers in this document). Both services are using the following data structure:



The length of the read / write service depends on the count of parameters that should be transferred (length = 4+ count*8).

Reading of single parameters

The read single parameterization works in two steps:

- Writing of a request list containing the indexes that should be read using the structure explained above.
  Only CNT and PARA_IDX has to be set.
  Up to 5 parameters can be requested with one telegram.
  The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).
- Reading of the parameters list with the same length then the previous write request.
  If the internal reading process inside the CI52x-MODTCP device is done the data will be read out.
  If the internal reading process inside the CI52x-MODTCP device is not yet finished the read service will be rejected with Modbus TCP exception code 6 (device busy).

Writing of single parameters

For writing of single parameters only one step is necessary, the parameters are transferred with one write request using the structure described above.

The length of the write service depends on the count of parameters that should be transferred (length = 4+ count*8).

In case of write of single parameters the following values have to be set:

- CNT: number of parameters to be set
- And for each parameter:
  Parameter index
  Parameter length
  New parameter value

Written single parameters are not stored volatile and not stored nonvolatile. That means after a bus reconnection or power cycle the written parameters will be discarded.

Commissioning example

Set IP Address:

- The setting of the IP address is the first step to integrate the CI52x-MODTCP devices into a running system.
- The setting of the IP address of the CI52x-MODTCP devices is described in the chapter *Chapter 1.6.5.3.1.3.1 “IP address assignment” on page 3621* in this document.

Set Parameters (optional read parameters):

- The second step in configuring the CI52x-MODTCP devices is to set the module and channel parameters.
- A read of parameters is optional but can be used the get the module IDs and the parameter length.
- The reading and or writing of parameters is described in chapter *Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3622*.

Set Control Word:

- After setting the parameter data these have to be activated by writing the control word.
- The meaning and usage of the control word is described in chapter *Chapter 1.6.5.3.1.3.2 “Parameterization” on page 3622*.

Exchange data:

- After setting and activating the parameters the CI52x-MODTCP device is ready for data exchange.
- The registers for data exchange are described in chapter *Chapter 1.6.5.3.1.2.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 3608*.

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during run time.

Preconditions for using hot swap

Information about preconditions for using hot swap see *“Hot swap” on page 3523*.

Compatibility of hot swap

	Modbus remote I/O
I/O module on TU5xx-H connected to I/O bus master	CI521-MODTCP or CI522-MODTCP
Required version of I/O bus master	Module index as of F0 Firmware as of V3.2.3
Fieldbus master when used as remote I/O with AC500 V3	Any AC500 V3 CPU with on-board Ethernet
When used as remote I/O on third party controller (PLC or DCS)	No limitation known

Hot swap behavior

The following table describes the behavior in case of I/O attached to communication interface module for Modbus TCP, CI521-MODTCP or CI522-MODTCP.

Hot Swap Behavior	Modbus TCP remote I/O
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H	Remote I/O station is not starting As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged I/O module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged. As the Automation Builder checks that all modules are available during configuration process, it is necessary that all I/O modules are available and in working order during configuration via Automation Builder. As the parameters are stored nonvolatile inside the CI52x devices later one the parameters have effect for power cycle or reconnection operations.
Start-up behavior with wrong I/O module type on any terminal unit	Remote I/O station is not starting
Diagnosis of presence of hot swap terminal unit	Information is available in Modbus registers of the communication interface module which can be accessed by the application program As of device index F4 and Automation Builder Version 2.4.1 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	Information can be obtained by reading Modbus registers in the communication interface module. Those Modbus registers contain: ● Diagnosis in case that a not hot-swappable I/O module is plugged on a hot swap terminal unit ● Diagnosis In case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration ● Production data and version index of the modules
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	Diagnosis is available in Modbus registers in the communication interface module
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO
Diagnosis after plugging the I/O module on the hot swap terminal unit	Diagnose "diagnosis gone" is available in Modbus registers in the communication interface module

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value (see *Chapter 1.6.5.3.1.2.3 “I/O / Process data and diagnosis section (Cyclic data)” on page 3608*). A diagnosis message will be created in that case (see hardware description of *Chapter 1.6.3.7.4.1 “CI521-MODTCP” on page 3156* / *Chapter 1.6.3.7.4.2 “CI522-MODTCP” on page 3196* for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI52x and failsafe is configured (see *Chapter 1.6.5.3.1.3.3 “Cyclic I/O data exchange” on page 3623*) the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI52x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the common device information registers. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:

    Best way for checking if a hot swap terminal unit is available or not, is reading out the common device information registers (see *Chapter 1.6.5.3.1.2.2 “Information data section (Acyclic data)” on page 3605*). If the CI52x rejects this read out the CI52x doesn’t support hot swap at all.

1.6.5.3.2 PROFINET communication interface module

Hot swap

With hot swap for AC500 and S500 it is possible to exchange expansion modules (with same type) during run time.

Preconditions for using hot swap

Information about preconditions for using hot swap see *“Hot swap” on page 3523*.

Compatibility of hot swap

	PROFINET remote I/O
I/O module on TU5xx-H connected to I/O bus master	CI501-PNIO or CI502-PNIO
Required version of I/O bus master	Module index as of F0 Firmware as of V3.2.10
Fieldbus master when used as remote I/O with AC500 V3	Not supported
When used as remote I/O on third party controller (PLC or DCS)	Note: alarms must be acknowledged by fieldbus master. GSDML as of version GSDML-V2.3-ABB-S500-CI501-PNIO-20180822.xml or GSDML-V2.3-ABB-S500-CI502-PNIO-20180822.xml needed for full scope of vendor specific diagnosis.

Hot swap behavior

The following table describes the behavior in case of I/O attached to communication interface module for PROFINET, CI501-PNIO or CI502-PNIO.

Hot Swap Behavior	PROFINET remote I/O with third party controller
Start-up behavior with missing or damaged I/O module on hot swap terminal unit TU5xx-H	Remote I/O station is not starting As of device index F1 and Automation Builder Version 2.4.1 it is possible to configure the startup in case of missing modules on hot swap terminal units. If configured, the remote I/O station is starting up with missing or damaged I/O module, if the module is plugged later or replaced it will be automatically parameterized and I/O data will be exchanged.
Start-up behavior with wrong I/O module type on any terminal unit	Remote I/O station is not starting
Diagnosis of presence of hot swap terminal unit	Information is available either: ● via acyclic services or ● as cyclic state information in the process image As of device index F1 and Automation Builder Version 2.4.1 it is possible to configure a list of required hot swap terminal units. If a required hot swap terminal unit is missing (normal one plugged) this will not prevent a normal operation but a diagnosis message will be generated for the corresponding slot.
Diagnosis of hot swap capability of I/O module mounted on hot swap terminal unit	Diagnosis is transmitted as vendor specific PROFINET channel diagnosis: ● Diagnosis in case that a not hot-swap-pable I/O module is plugged on a hot swap terminal unit ● Diagnosis in case that in a mixed configuration with at least one hot swap terminal unit an I/O module, that must not be used in a hot swap configuration, is mounted on any terminal unit of the configuration Production data and version index of the modules is accessible via acyclic services
Diagnosis while hot swap module is pulled or module (mounted on hot swap terminal unit) has stopped working	PROFINET channel diagnosis is generated together with standard "pull alarm" which must be acknowledged
Input state in process image of controller while module is pulled or module is not operational	Input = ZERO In addition a standard PROFINET state information is transmitted saying "Inputs not valid"
Diagnosis after plugging of the I/O module on the hot swap terminal unit	PROFINET channel diagnosis is generated together with standard "plug alarm" which must be acknowledged

System behavior

If an expansion module is removed or defective during run time, the input data of this module will be set to “0” and the module state will be set to the corresponding value. A diagnosis message will be created in that case (see hardware description of *Chapter 1.6.3.7.5.2 “CI501-PNIO” on page 3224* / *Chapter 1.6.3.7.5.3 “CI502-PNIO” on page 3263* for diagnosis messages).

In case a module is replaced, the new module will automatically be parameterized with the last parameters of the removed module (if single parameters were written to the previously removed module, this parameters will be ignored).

During pulling or plugging of a certain module, all other module will continue to operate with one limitation: The reaction time of modules connected to the right of the affected module will be bigger in that case (up to 50 ms).

If the bus failure detection is active for CI50x and failsafe is configured the following behavior applies if a module is removed and replugged during failsafe condition:

- Last value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will remain at its last value.
  - If the module is removed and plugged again, the output will remain off, and not be kept its last value, as the last value of the new module is “0” in that case.
- Substitute value configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again.
- Substitute value for x seconds configured for output:
  - After a bus failure is detected, failsafe will be activated and the output will be according to the configured substitute value for the configured time.
  - If the module is removed and plugged again now, the output will be set according to the configured substitute value again, and the configured time starts again.

Mandatory rules for hot swapping

Mandatory rules for hot swapping:

- Between two pull and / or plug operations of I/O modules a pause of at least 1 second must be observed.
  - That means if a module is pulled or plugged there has to be at least a break of 1 second before the next module is pulled or plugged.
- At boot up of CI50x all configured expansion modules have to be physically available.
  - Start up with missing modules is not supported.
- In the application program it is possible to detect if a hot swap terminal unit is mounted in a specific position on the I/O bus. The information is available in the process data area or can be read out via acyclic read. These can be accessed when the version of the communication interface module supports hot swap.
  - This has to be checked by application:
    Best way for checking if a hot swap terminal unit is available or not, is checking the corresponding information inside the process image.

1.6.6 Configuration in Automation Builder for AC500 V3 products

1.6.6.1 General settings

This chapter describes the device configuration of AC500 product family with Automation Builder. Basic information on Automation Builder handling can be found in the *Chapter 1.2 “Getting started” on page 11*.

1.6.6.1.1 Project handling

What is a project?

- A project contains the objects which are necessary to create a controller program ("application"):
  - Pure POUs, for example programs, function blocks, functions, and GVLs.
  - Objects that are also required to be able to run the application on a PLC. For example, task configuration, Library Manager, symbol configuration, device configuration, visualizations, and external files.
- In a project, you can program multiple applications and connect multiple controller devices.
- CODESYS manages device-specific and application-specific POUs in the *“Devices”* view ("device tree") and project-wide POUs in the *“POUs”* view.
- For the creation of projects, there are templates that already contain certain objects.
- Basic configurations and information for the project are defined in the *“Project Settings”* and *“Project Information”*. For example:
  - Compiler settings
  - User management
  - Author
  - Data about the project file

  There are settings for the version compatibility of the project in the configuration dialogs in the *“Project Environment”*.
- You save a project as a file in the file system. As an option, you can pack it together with project-relevant files and information into a project archive. It is also possible to save files in a source code management system such as SVN.
- Each project contains the information about the CODESYS version with which it was created. When you open it in another version, CODESYS will notify you about possible or necessary updates regarding file format, library versions, etc.
- You can compare, import/export projects, and create documentation for them.
- You can protect a project from being changed, or even completely protect it from being read. By using user management, you can selectively control the access to the project and even to individual objects in the project.

- ↳ *Chapter 1.4.1.20.2 “Objects” on page 818*
- ↳ *Chapter 1.4.1.20.4 “Dialogs” on page 1149*
- ↳ *Chapter 1.4.1.20.3.4.13 “Command 'Project information'” on page 1007*
- ↳ *Chapter 1.4.1.5 “Protecting and Saving Projects” on page 197*

Creating a new project

1. Select *“File ➔ New Project”*.

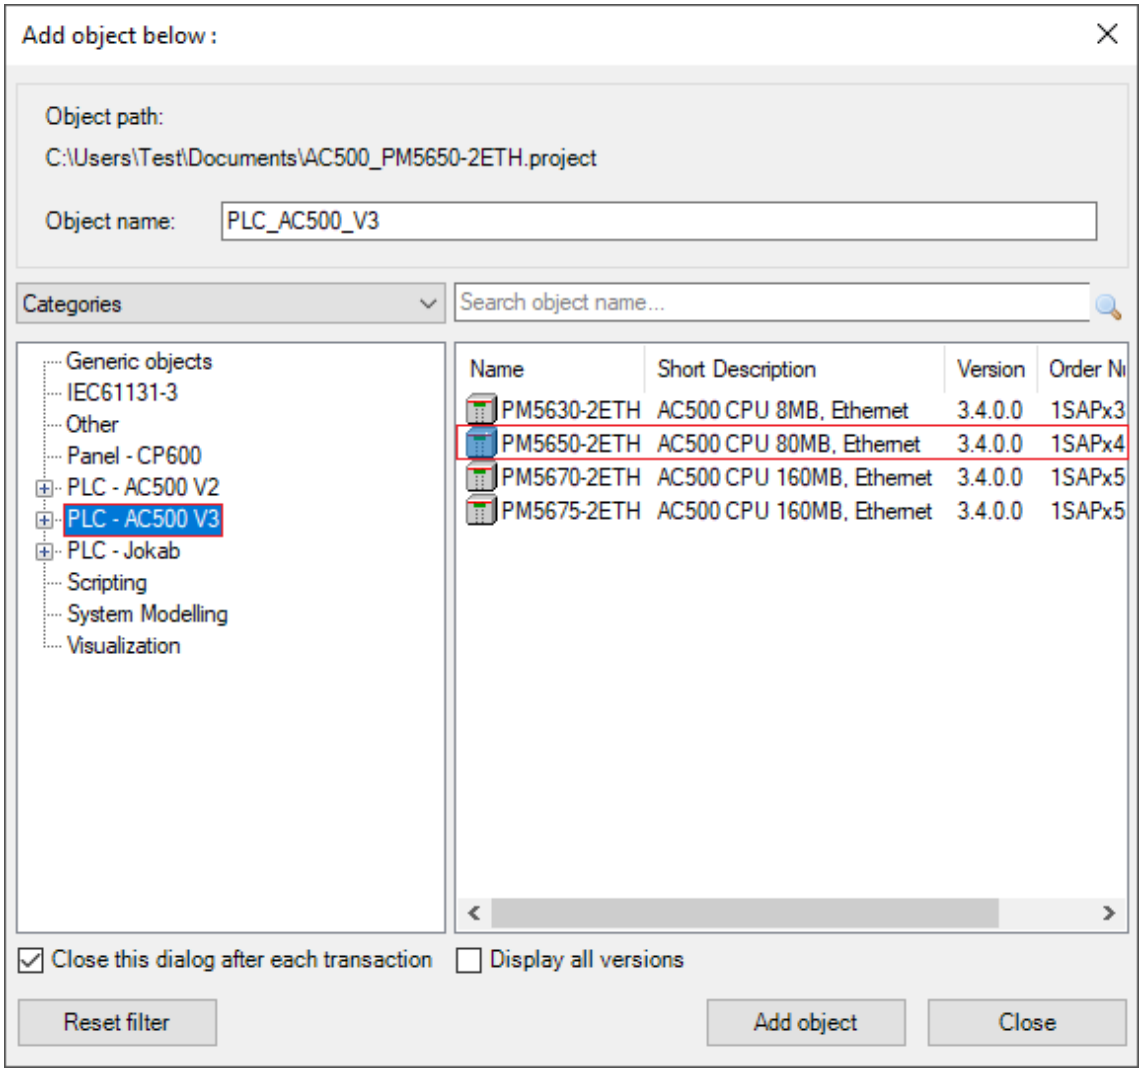
   If the used Automation Builder version is not the latest version, an information is displayed.

   - Select *“Change to newest installed version”* to create a project with the latest installed version of Automation Builder.
   - Select *“Continue to work with version: XXX”* to create a project in the current software version.

2. Select *“AC500 project”*, enter a project name and specify the storage location for the new project.

   With *“Empty project”* a project without a PLC is created.

3. Select the device type for the new project and click *[Add device]*.



⇨ A new project is created and can be configured.

Opening an existing project

NOTICE!

Risk of damaging Automation Builder projects!

Projects created with Automation Builder are incompatible with CODESYS V2.3.9.x. Do not open projects with CODESYS V2.3.9.x as this can cause corrupted Automation Builder projects.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

Opening a project

1. Select *"File ➔ Open Project"*.
   ⇨ The *"Open Project"* dialog appears.
2. Select a previously saved project from the file system.
   ⇨ Automation Builder switches to the version of the project and opens the project.

Exporting and importing a project

Configuration of a complete PLC or of single devices can be reused within the same project by copy-and-paste the desired nodes in the device tree.

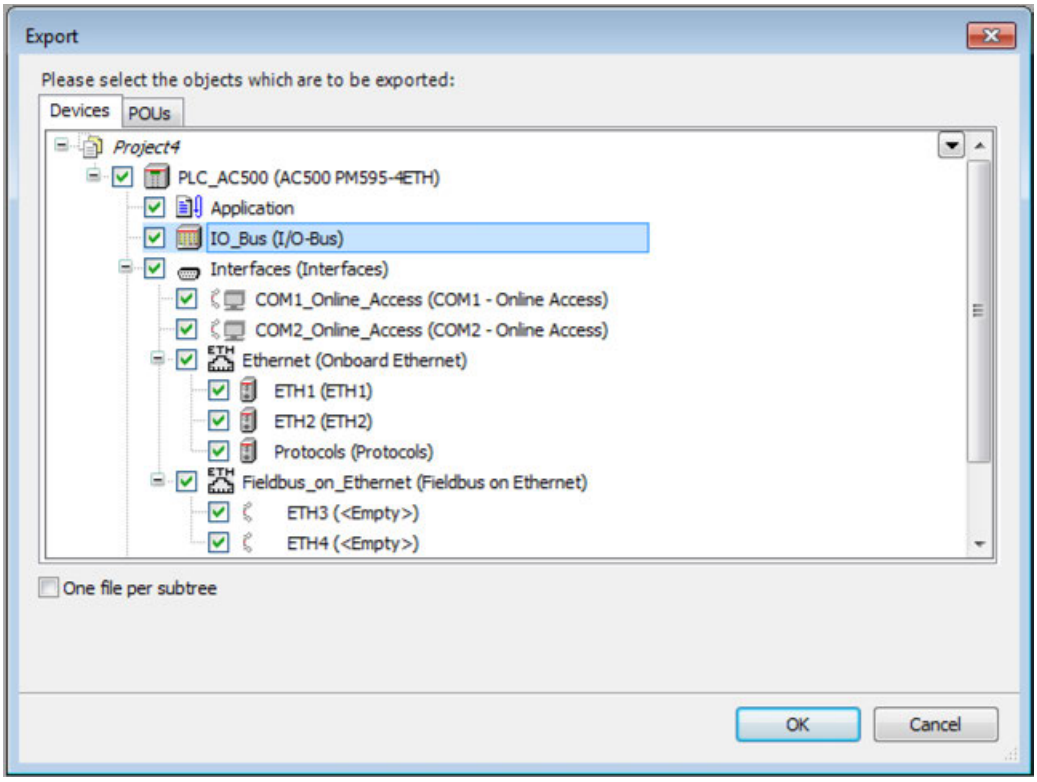
In order to reuse a PLC configuration cross-over projects, the project configuration can be exported and imported afterwards into another project.

> *An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.*

> *Automation Builder performs an integrity check for the PLC configuration before generating the configuration.*

Project export

From the menu, select *"Project ➔ Export ➔ Project"*. Select the objects to be exported. The configuration of the selected items will be added to an export file (*.export).



"One file per subtree": If this option is activated, all objects belonging to the same subtree will be exported into the same export file, otherwise a separate file will be created for each particular object.

Project import

For importing a project a basic and an advanced function is available.

Basic project import: Users with a basic or a standard Automation Builder license can perform a **basic project import**. Command: *"Project ➔ Import ➔ Project"*.

A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.

In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: "Project ➔ Compare".

Chapter 1.6.6.1.1.6 "Comparing projects" on page 3640

Advanced project import: Users with a premium Automation Builder license can perform an **advanced project import**. Command: *"Project ➔ Import ➔ Project with compare"*. This command allows to compare two projects, to check on differences and to adapt single parts of the project configuration easily.

Basic project import

1. From the menu, select *"Project ➔ Import ➔ Project"*.

A previously exported project configuration is imported into the current project. With this, the current project configuration is overwritten.

In order to supplement the current project with the project configuration of a previously exported project, use the compare function. Command: "Project ➔ Compare".

Chapter 1.6.6.1.1.6 "Comparing projects" on page 3640

2. Select the export file from the file system and click *[Open]* to import the project configuration.

An exported project configuration can only be imported to a project with the same Automation Builder version. If the versions are not the same, the import fails with an error message.

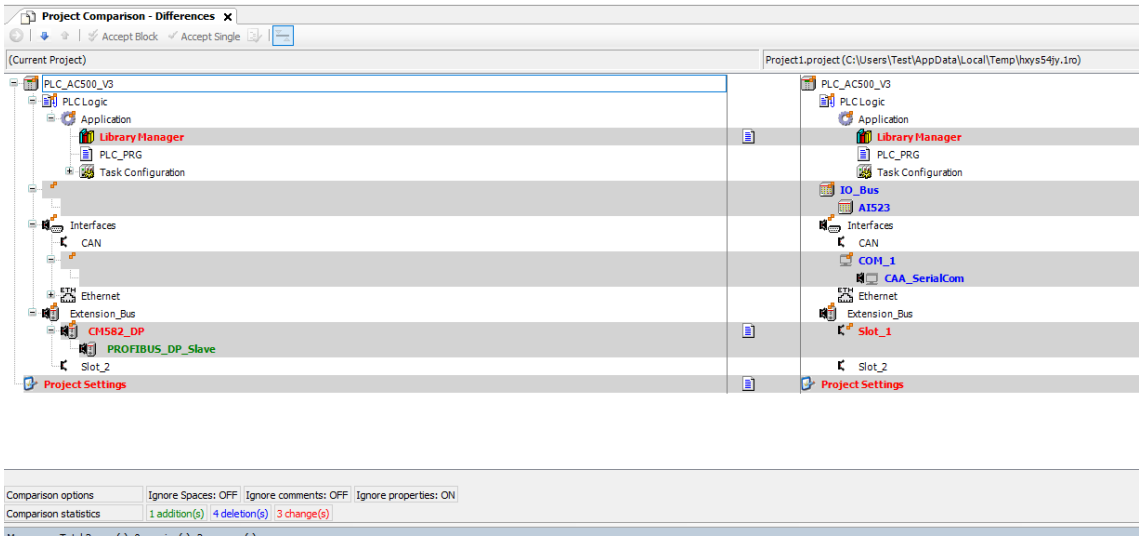
Advanced project import

Perform an advanced project import in order to compare two projects, to check on differences and to adapt single parts of a previously exported project configuration easily.

1. From the menu, select *"Project ➔ Import ➔ Project with compare"*.
2. Select the export file from the file system and click *[Open]* to import the project configuration.

   ⇨ The project import is started.

3. Once the project file is imported, a compare view is displayed. The left pane represents the current project, the right pane represents the imported project.



⇨ Differences between the current project and the imported project are highlighted in red color.

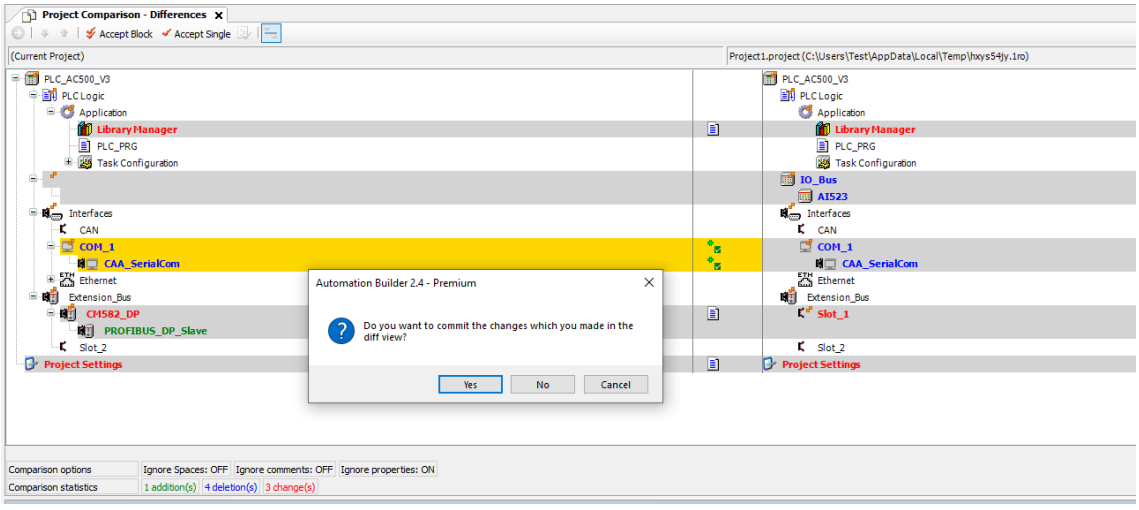
⇨ Additional modules in the current project that are not available in the imported project are highlighted in green color.

⇨ Additional modules in the the imported project or deleted modules in the current project are highlighted in blue color.

⇨ A summary of all differences within the projects is given in the *"Comparison statistics"* under the device tree.

4. Every highlighted item of both projects can be handled individually and can either be transferred to the current project or skipped.

- *[Accept Block]*: All items of the selected node are transferred to the current project with one click. Use this function for example to copy all nodes of a PLC configuration from the imported project to the current project (select *"I/O_Bus"* node).
- *[Accept Single]*: Only a single item from a node is transferred to the current project. Use this function for example to copy certain I/O modules from the imported project to the current project.

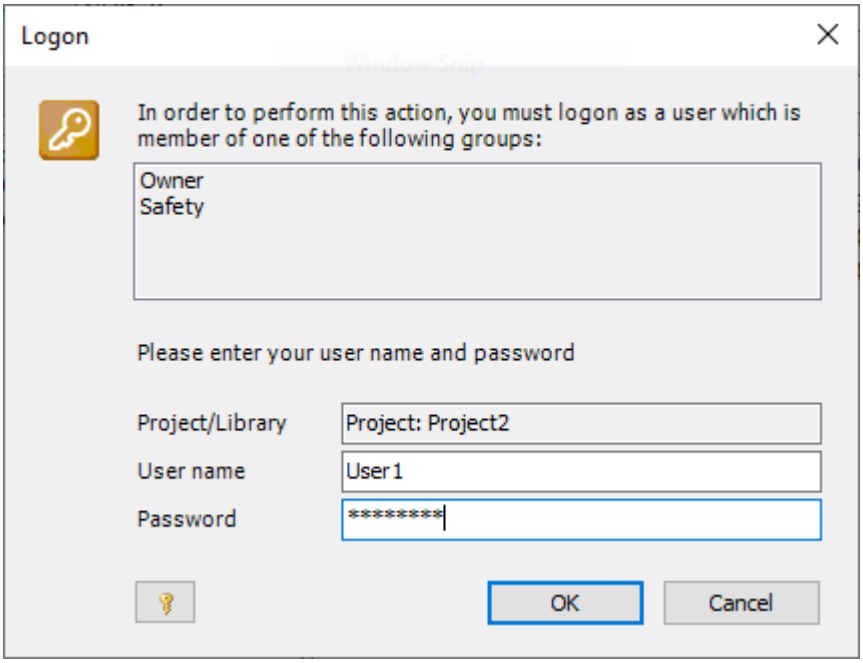


⇨ All accepted items are highlighted in the current project in yellow color.

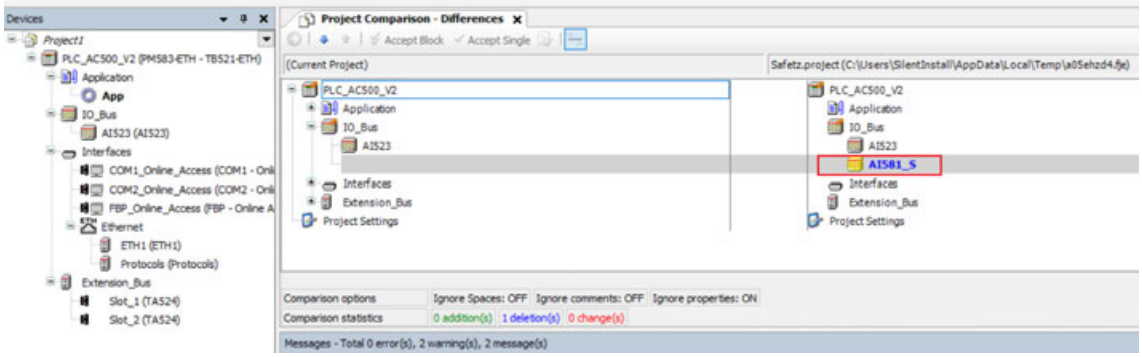
⇨ To undo a selection, again, click *[Accept Block]* or *[Accept Single]*.

⇨ To accept all changes on the current project, close the *"Project Comparison - Differences"* tab and confirm the prompted dialog.

5. If in the import project the PLC contains an AC500-S safety module, a security check is performed which requires user authentication:



6. After a successful user authentication the AC500-S safety modules are added to the compare view and can be imported to the current project.



Upgrading/ updating a project to a new Automation Builder version or profile

When upgrading or updating Automation Builder a previously configured project can be converted in order to be used in a new Automation Builder version or with a new Automation Builder profile.

Definition:

*Automation Builder upgrade: changing over to a major Automation Builder version (e.g. from version 2.**3**.1 to version 2.**4**.1).*

*Automation Builder update: changing over to a minor Automation Builder version (e.g. from version 2.4.**0** to version 2.4.**1**).*

Further, a project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

↳ *Chapter 1.6.6.6 “Converting an AC500 V2 project to an AC500 V3 project” on page 3993*

Before the upgrade/update

Project archive

*Create a project archive before updating Automation Builder. Project archives contain all project data, including data that is not stored with a *.project file, e.g. device description files for third party devices.*

Chapter 1.6.6.1.1.7.1 “Creation of an archive ” on page 3642

RobotStudio station

RobotStudio integration has been discontinued as of Automation Builder 2.1.0. It is recommended to externally store the link to the RobotStudio station and to remove the RobotStudio station object prior to the upgrade.

Automation Builder profile

To use the Automation Builder profile of an older project, the old profile must have been installed. The installation of older Automation Builder profiles can be activated in the device dialog during the upgrade process.

Upgrading/ Updating a project

1. With opening a project Automation Builder automatically detects the project version. In case of an outdated project version a dialog is prompted.

   ⇨ If the update is confirmed, the project is automatically updated to the latest Automation Builder version.

   Automation Builder updates the complete project (complete device tree) to the latest version. Success messages, warnings and errors are described in the section *“All messages”*.

   ⇨ If the update is declined, the project is closed unchanged.

   In order to initiate a project update or upgrade later on, select *“Project ➔ Update Project”*.

   ⇨

To keep an older project, it must be opened with the same Control Builder Plus/ Automation Builder version the project has been created. For this, the appropriate Control Builder Plus/ Automation Builder profil must be selected.

In this mode, new Automation Builder features cannot be used.

It is not possible to downgrade a project to an earlier Automation Builder version.

Automation Builder performs an integrity check for the PLC configuration before generating the configuration.

AC500 V2 libraries

2. When upgrading Automation Builder, new available AC500 V2 system libraries are installed automatically. In difference to AC500 V3 libraries the AC500 V2 libraries are not versioned. Hence, after an Automation Builder update login to a PLC might only be possible after a rebuild and with an online change. This might be required although the application has not been changed and the previous version profile is still in use.

   To avoid this, add the AC500 V2 libraries to the Automation Builder project. The procedure on how to add a AC500 V2 (system) library to a project is described exemplarily.

   ↳ *Chapter 1.4.1.16.2 “Adding a Library to the Application” on page 450*

Migrate third party devices

3. During the project upgrade, an option for migration of third party devices can be selected. If this option was not selected during the upgrade procedure, migration can be initiated manually after an Automation Builder upgrade in order to migrate all third party devices to the project.

   ↳ *Chapter 1.6.6.1.5 “Migration of third party devices” on page 3658*

4. Exception, for the CANopen device CM598-CN:

   > *Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.*
   >
   > *As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.*

Login

5. After the Automation Builder upgrade login to the PLC from Automation Builder: right-click *“Application ➔ App”* and select *“Login [PLC_AC500_V2]”*.

   ⇨ The firmware on the devices is upgraded.

   > *Depending on the currently installed firmware versions, a login from CODESYS V2.3 might be impossible prior to the firmware update.*

Updating PLC devices

To update all devices of a PLC project, right-click the PLC node and select *“Update objects”*. In the dialog enable *“update subtree”* option to update all sub-objects. Otherwise only the processor module object is updated.

To update a specific device only, the command *“Update objects”* can be executed individually at the specific node.

I/O mapping export and import

Export I/O mapping

To exchange information on I/O mapping only, data can be exported as .csv file. This allows maintenance of I/O data outside Automation Builder, e.g. in MS Excel.

Right-click the *“Processor Module”* node or *“I/O_Bus”* node in the device tree and select *“Export -> IO mapping”*. To export the I/O Mapping for the complete project, e.g. with more than one configured processor modules, I/O data of the complete project can be exported *“Project -> Export -> I/O mapping”*.

Import I/O mapping

A previously exported .csv file can be imported to the project: *“Project -> Import -> I/O mapping”*.

Comparing projects

You can compare the currently open project with another project – a reference project. The differences in contents, properties, or access rights are detected and shown in a comparison view.

Clicking *"Project ➔ Compare"* opens the *"Project Compare"* dialog for you to configure and run the comparison. Then the result is shown in the comparison view *"Project Compare - Differences"* where the objects are aligned in a tree structure. Objects that indicate differences from the respective reference object are identified by colors and symbols. This is how you detect whether or not the contents, properties, or access rights are different.

For differences in the contents, you can also open the detailed compare view *"Project Compare - <object name> Differences"* in order to zoom into the object. In the detailed compare view, the contents of the object and reference object are displayed or their source code aligned. The detected differences are marked. Previously opened views are not closed. In this way, you can have any number of comparison views open and read them, in addition to the project compare view.

You can accept the detected differences from the reference project into the current project. This is possible only from the reference project into the open project. To do this, you activate differences (for example in the code) that should be accepted in the current project with the commands , , or in the active comparison view for accepting. These positions are highlighted in yellow. Make sure that any other open compare views are inactive (write-protected, read-only). therefore, you can activate differences to be accepted in exactly one comparison view only. When exiting the active compare view, if you confirm that the differences that are activated for acceptance are actually accepted into the current project, then the current project is modified.

In order to exit the project comparison completely, close the project compare view.

Creating a comparison view

Requirement: You have made changes in your current project and wish, for example, to compare it with the last-saved version. In the meantime, for example, you have added further POUs, removed a POU, changed single lines of code or the object properties in function blocks.

1. Select the command *"Project ➔ Compare"*.
   ⇨ The *"Project Comparison"* dialog box opens.
2. Enter the path to the reference project, for example the path to the last-saved version of your current project.
3. Leave the activation of the comparison option *"Ignore Spaces"* as it is.
4. Click on *"OK"*.
   ⇨ The comparison view opens. Title: *" Project Comparison – Differences"*. The Device trees of the current project and the reference project are displayed alongside each other and the changed objects are marked in color.
5. Select an object marked in blue in the tree of the reference project (right). The current project no longer contains this object.
   Click on *"Accept Single"*
   ⇨ The object is added to the tree of the current project (left). The line has a yellow background. appears in the middle column.
6. Select an object marked in green in the tree of the current project (left). The reference project does not contain this object.
   Click on *"Accept Single"*
   ⇨ The object is removed again from the tree of the current project (left). The line has a yellow background. appears in the middle column.
7. If changes are detected in the content of an object that is contained in both the current project and the reference project, this is indicated by red lettering. You can then switch to the detailed comparison view for the object by double-clicking on the object.

8. Close the comparison view and answer the query whether the changes made are to be saved with *"Yes"*.

   ⇨ The changes become effective in the project.

Opening the detailed compare view

Requirement: For example, a user modified the code in a POU of the current project. You have performed the project comparison by clicking *"Project ➔ Compare"*. The project compare view shows this POU highlighted in red in the aligned in the project tree.

1. Double-click the line of the aligned POU versions.

   ⇨ The compare view switches to the detailed compare view of the POU. The modified code lines are highlighted in gray and written in red.

2. Click  .

   ⇨ Code lines with changes (red) are extended by two lines: an line with insert (left, green) and a line with delete (right, blue).

3. Click  again.

   ⇨ The code line is marked again as modified.

4. Move the mouse pointer to the code line marked as modified and click *"Accept Single"*.

   ⇨ The code line from the reference project is activated for acceptance into the current project.

5. Click  .

   ⇨ The project compare view opens for the entire project. It is write-protected (read-only) to prevent you from activating differences for acceptance. The link highlighted in yellow above the tree view also indicates this.

6. Click the link: *"Project compare view is read only because there are uncommitted changes in another view. Click here to switch to the modified view."*

   ⇨ The detailed compare view opens again. The unconfirmed changes are highlighted in yellow.

7. Click ✕ in the tab of the view and confirm that the changes should be saved.

   ⇨ The detail project view is closed and the POU is overwritten. Now it corresponds to the POU of the reference project. The project view is active again so that you can continue working with project compare.

If you do not click the link, but click ✕ instead to close the editor of the project compare view, then you will also confirm the acceptance of changes into the current project. The detail changes are accepted and then the project compare is closed completely.

Project archive

Automation Builder supports the creation and the import of project archive files. Archive files contain all relevant project data including the PLC configuration, the project files of the CODESYS and all device descriptions. This allows exchanging Automation Builder projects without taking care of the target environment.

Creation of an archive

☑ The following steps describe the creation archive file from an Automation Builder project:

1. Select *“File ➔ Project Archive ➔ Save/Send Archive”*.
2. Select the information which should be included in the archive file from the list box.

Section/Control	Parameter	Description
Information selection list box	Options	Not supported
	Referenced devices	The referenced devices can be selected by expanding the "Referenced devices" item of the list box. It is strongly recommended to include all devices in the project archive to maintain consistency.
Additional files	-	Not supported
Comment	-	Opening a control window which allows the input of a comment to the project archive.
Save	-	Opening a dialog window to determine the path and the file name of the project archive and storing it to the file system.
Send	-	Not supported
Cancel	-	Canceling the operation and closing the dialog window.

With *[Comment]* additional information can be added to the project archive, for example to add a brief description or some information concerning the project.

3. Proceed with *[Save...]*.

It is strongly recommended to keep the default settings.

Section “Options” of the list box is not support. Do not enable this option.

Extraction of an archive

The currently loaded project will be closed automatically when extracting the selected project archive. It is recommended to open a new instance of Automation Builder before starting the extraction process.

☑ The following steps describe the extraction of an archive file and the import to Automation Builder.

1. Select *"File ➔ Project Archive ➔ Extract Archive"*.
2. Select the desired project file and click *[Open]*.

Section/ Control	Parameter	Description
Locations	Extract into the same folder where the archive is located	The project archive will be extracted to the same path where the archive is located.
	Extract into the following folder	Path to which the project archive should be extracted.
	Button ...	Opening a folder selection dialog which allows selecting the desired path.
Contents	Items	Select the items which should be extracted.
	Comment	Displaying comments included inside the Project archive file.
	Extract	Triggering the extraction process. Automation Builder extracts the archive and creates a project from out the archive. After creating the project Automation Builder checks the version of the project. If the project version and the activated Automation Builder version is not identical the workflow is the same as described in "Opening an Existing Project".
	Cancel	Closing the Extract Project Archive dialog and canceling the extraction process.

1.6.6.1.2 User and access rights management

User and access rights

The 'User Management' provide functions for defining user accounts and configure the access rights within a project. The rights to access project objects via specified actions are assigned only to user groups, not to a single user account. So each user must be member of a group.

User management

Before setting up users and user groups, notice the following: The configuration of users and groups is done in the Project Settings dialog *Chapter 1.6.6.1.2.3 "Project Settings - Users and groups" on page 3646*.

- Automatically there is always a group "Everyone" and by default primarily each defined user or other groups are members of this group. Thus each user account at least automatically is provided with defined default settings. Group "Everyone" cannot be deleted, just renamed, and no members can be removed from this group.
- Also automatically there is always a group "Owner" containing one user "Owner". Users can be added to or removed from this group, but at least one user must remain. This group also cannot be deleted and always has all access rights. Thus it is not possible to make a project unusable by denying the respective rights to all groups. Both group and user "owner" might be renamed.
- When starting the programming system resp. a project, primarily no user is logged on the project. But then the user optionally might log on via a defined user account with user name and password in order to have a special set of access rights.

Notice that each project has its own user management!
So, for example to get a special set of access rights for a library included in a project, the user must separately log on to this library. Also users and groups, set up in different projects, are not identical even if they have identical names.

CAUTION!
The user passwords are stored irreversibly!
If a password gets lost, the respective user account gets unusable. If the "Owner"-password gets lost, the entire project might get unusable!

Access right management

User management in a project is only useful in combination with the access right management. Notice the following:

- In a new project basically all rights are not yet defined explicitly but set to a default value. This default value usually is: "granted".
- In the further run of working on the project each right can be explicitly granted or denied resp. set back to default. The access right management of a project is done in the Permissions dialog *"Permissions" on page 3645*.
- Access rights on objects get "inherited". If an object has a "father" object (example: if an action is assigned to a program object, that is inserted in the structure tree below the program, then the program is the "father" of the action object) , the current rights of the father automatically will become the default settings of the child. Father-child relations of objects concerning the access rights usually correspond with the relations shown in the POUs or Devices tree and are indicated in the Permissions dialog by the syntax "<father object>.<child object>".

Example

Action ACT is assigned to POU object PLC_PRG. So in the POUs window ACT is shown in the objects tree indented below PLC_PRG. In the Permissions dialog ACT is represented by "PLC_PRG.ACT" indicating that PLC_PRG is the "father" of ACT. If the "modify" right would be denied explicitly for PLC_PRG and a certain user group, the default value of the "modify" right for ACT automatically also would be "denied".

User management commands

The 'User Management UI' plug-in provides commands for command category 'User Management'.

These are used for:

- Configuration of access rights on the project objects
- Logging on or off to/from the project via a defined user account in order to get the access rights which are associated to this account

The configuration of user accounts and groups is done in the Project Settings subdialog User Management *Chapter 1.6.6.1.2.3 "Project Settings - Users and groups" on page 3646*.

By default the following commands are part of submenu 'User Management' in the 'Project' menu: Logon, Logoff, Permissions.

Logon

Symbol: 

This command opens the Logon dialog for logging on to a project or library via a defined user account.

Logging on with a certain user account means to log on with those object access rights which are granted to the group which the user belongs to. The configuration of user accounts and groups is done in the Project Settings subdialog User Management.

To log on select the project or an included library from the selection list in the Project/Library field. Enter User name and Password of a valid user account, noticing that each project or library has an own user and access rights management. Log on with OK.

If already another user is logged on the project, this one will be logged out automatically by the new log-on action.

When you are logged on to a project or library and try to perform an action for which you have no right, automatically a Logon dialog will be opened, giving the possibility to log on with another user account provided with the appropriate rights.

The status bar always displays which user currently is logged on the project.

Logoff

Symbol: 

This command logs off the currently logged on user. If no user had been logged on to the currently opened project or to a referenced library an appropriate message will appear when trying to log off.

If the user currently is logged on to more than one project or referenced library (not necessarily with the same user account) a Logoff dialog will appear when trying to log off.

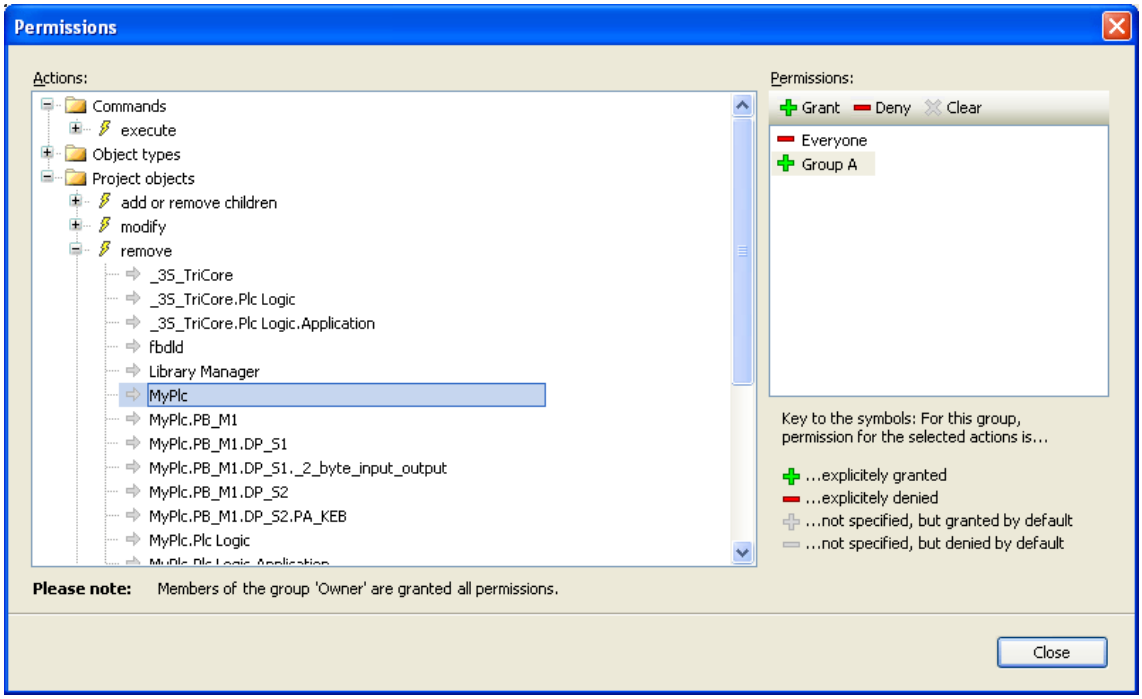
From the Project/Library selection list choose those project/library for which you want to log off. The name of the Current user is displayed just for information.

The status bar always displays which user currently is logged on the project.

Permissions

This command opens the Permissions dialog, where the rights to work on objects or to perform commands in the current project can be configured.

Any changes made in this dialog will be applied immediately.



The Actions window displays all possible rights, that is all actions which might be performed on any object of the current project.

The tree is structured in the following way:

- Top-level see the names of some categories, which have been set up just for the purpose of optical structuring the rights management.
  They are grouping concerning the execution of Commands, the configuration of User accounts and Groups, the creation of Object Types, the viewing, editing, removing and handling of child objects of Project Objects.
- Below each category node there are nodes for the particular actions which might be performed on the command, user account, group, object type or project object. These nodes also only have optical function. Possible Actions:
  - execute (execution of a menu command)
  - create (creating a new object in the current project)
  - add or remove children (adding or removing of "child" objects to an existing object)
  - modify (editing an object in an editor)
  - remove (deleting or cutting an object)
  - view (viewing an object in an editor)

Below each action node find the possible targets, that is project objects, of the respective action.

The Permissions window provides a list of all currently available user groups (except the "Owner" group) and a toolbar for configuring rights to a group.

Select the group and configure it´s permissions.

Left to each group name one of the following icons indicates the currently assigned permission concerning the target which is currently selected in the Actions window:

- : The action(s) for the target(s) currently selected in the Actions window are granted for the selected group.
- : The action(s) for the target(s) currently selected in the Actions window are denied for the selected group.
- : The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been granted explicitly, but is granted by default, for example because the corresponding right has been granted to the "father" object. (Example: The group has got the right for object "myplc", thus it by default it also has got it for object "myplc.pb_1".) Basically this is the default setting for all rights which not explicitly have been configured.
- : The right to perform the action(s) which are currently selected for the selected target(s) in the Actions window, has not been denied explicitly, but is denied by default, for example in case because the corresponding right has been assigned to the "father" object.

If currently multiple actions are selected in the Actions window, which do not have unique settings referring to the currently selected group, no icon will be displayed.

To configure the rights for a group select the desired action(s) and target in the Actions window and the desired group in the Permissions window. Then use the appropriate button in the toolbar of the Permissions window:

Grant: Explicit granting.

Deny: Explicit denying.

Clear: The currently granted right for the action(s) currently selected in the Actions window will be deleted, that is set back to the default.

Project Settings - Users and groups

The Project Settings dialog in category 'Users and Groups' provides three subdialogs for the user management for the current project: Users, Groups, Settings. For a general description on users and access rights management see help page *Chapter 1.6.6.1.2.1 “User and access rights” on page 3643*.

Users dialog

The currently registered users are listed in a tree structure. The ownerships of each user is displayed and each user is a member of a group by default ↬ *Chapter 1.6.6.1.2.1 "User and access rights" on page 3643*.

Define a new user account

1. Click *"Add"* to open the *"Add User"* dialog.
2. Define the user credentials and click OK to set up the new user. If there are incorrect entries (no login name, password mismatch, user already existing) you will get an appropriate error message.

Modify a user account

Click *"Edit"* to open the *"Edit User"* dialog. The entry fields are the same as in the *"Add User"* dialog. The password fields however - for security reasons - will show 32 * characters. After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove user accounts

Enable the entries to be removed in the Users list and click *"Remove"*. Note that you will get no further inquiry! An error message appears if you try to delete all users from a group. At least one entry must remain.

Groups dialog

Add a group

The currently available groups are displayed in a tree structure. A member also might be a group.

1. Click *"Add"* to open the *"Add Group"* dialog.
2. Define a name for the new group and enable all entries (single users or groups) which should be members of the new group.
3. Click OK to set up the new group. If there are incorrect entries (no name defined, group already existing, in Members having selected a group which would cause a "group cycle", you will get an appropriate error message.

Modify a group

Click *"Edit"* to open the *"Edit User"* dialog. The entry fields are the same as in the 'Add Group' dialog (see above). After having modified the desired entries close the dialog with OK to get applied the new settings.

Remove groups

Enable the entries to be removed in the groups tree and click *"Remove"*. Note that you will get no further inquiry! The members of the deleted groups will remain unmodified. An error message appears if you try to delete the groups "Everyone" and/or "Owner".

Settings dialog

The following basic options and settings concerning the user accounts can be made:

- Maximum number of authentication trials: If activated, the user account will be set invalid after the specified number of trials to log in with a wrong password. If not activated, the number of erroneous trials is unlimited. Default: option activated, number of trials: 3; permissible values: 1-10.
- Automatically log out after time of inactivity: If activated, the user account will be logged out automatically after the specified number of minutes of inactivity (no user actions via mouse or keyboard registered in the programming system). Default: option activated, time: 10 minutes; permissible time values: 1-180 minutes.

1.6.6.1.3 Later change-over of a target system

Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:

- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

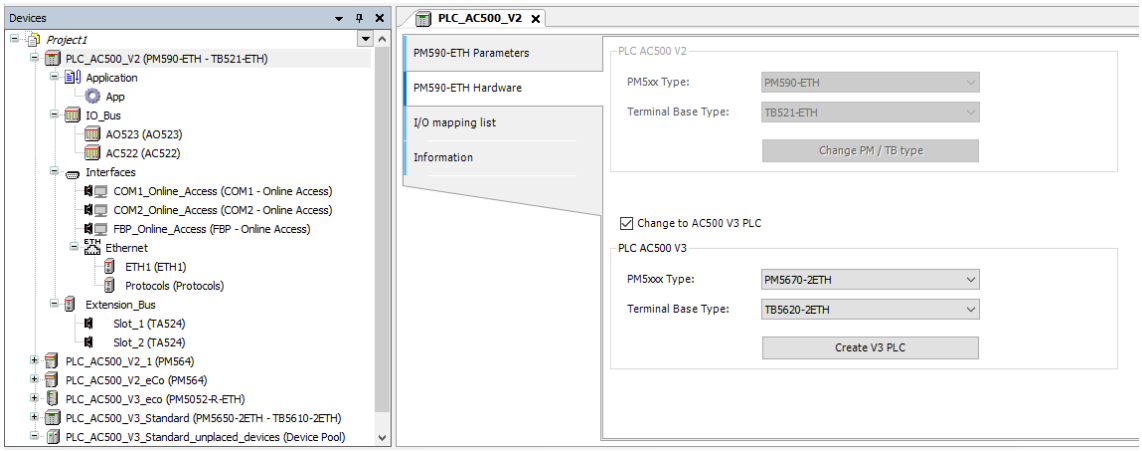
Target change from a V2 processor module to a V3 processor module

Target change options:

- AC500 V2 processor module ➜ AC500 V3 processor module
- AC500 V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500 V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *“PM5<...> Hardware”* tab.
3. Enable *“Change to AC500 V3 PLC”* and select the desired V3 processor module from the *“PM5xx Type”* drop-down list.



4. Click *[Create V3 PLC]*.
   ⇨ The new V3 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

> *In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.*

Target change from a V3 processor module to another V3 processor module

Target change options:

- AC500 V3 processor module ➜ AC500 V3 processor module
- AC500 V3 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V3 processor module ➜ AC500 V3 processor module
- AC500-eCo V3 processor module ➜ AC500-eCo V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V3 <...>* node and open the *“PM5<...> Hardware”* tab.
3. Select the desired V3 processor module from the *“PM5xx Type”* drop-down list.

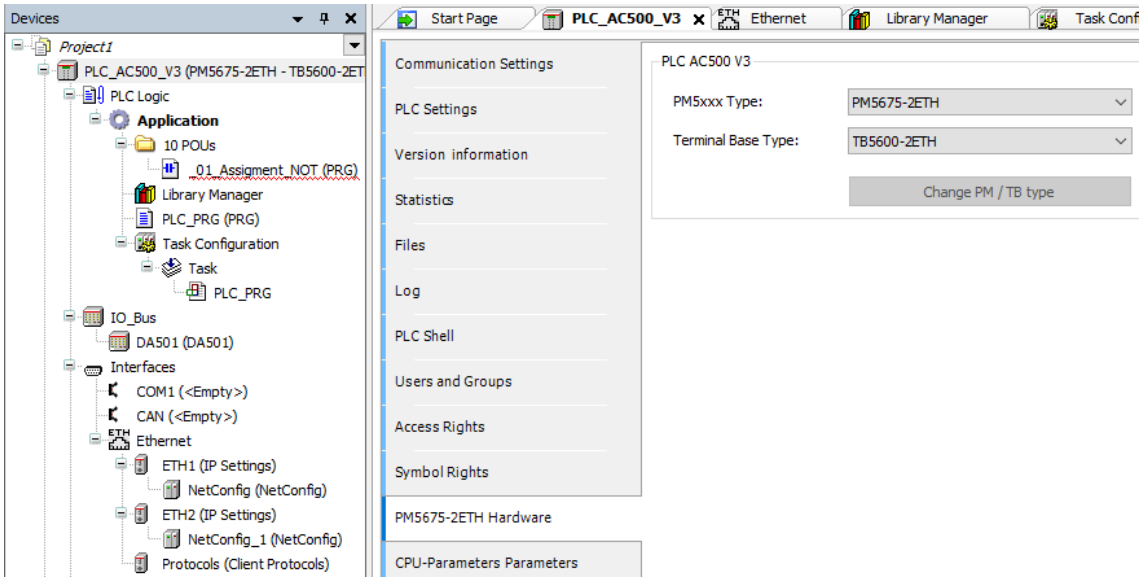


Fig. 309: Change_Hardware_V3

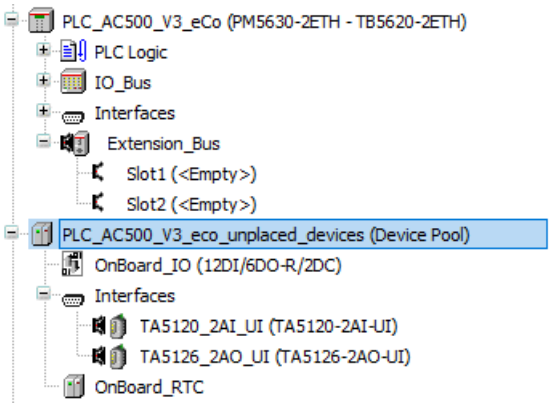
4. Ensure the correct *"Terminal Base Type"* is selected and click *[Change PM / TB type]*.

   ⇨ If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.

   The device configurations that cannot be kept are listed in a prompted information dialog.

   By default, all device configurations which cannot be switched over will be copied to a "device pool" section in the navigation tree (option "Copy all objects that cannot be added to the new PLC into a device pool for further access"). If required, this backuped configuration can be used in another project or in another processor module configuration.

   If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.



Target change from AC500-eCo V3 to AC500 V3

The configuration of the onboard I/Os, the option board slots and the onboard RTC cannot be changed-over to the new module.

Target change from AC500 V3 to AC500-eCo V3

The configuration of COM1, CAN and the I/O bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.

ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.

Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

Customer libraries

CODESYS for AC500 V2 products contains different types of libraries:

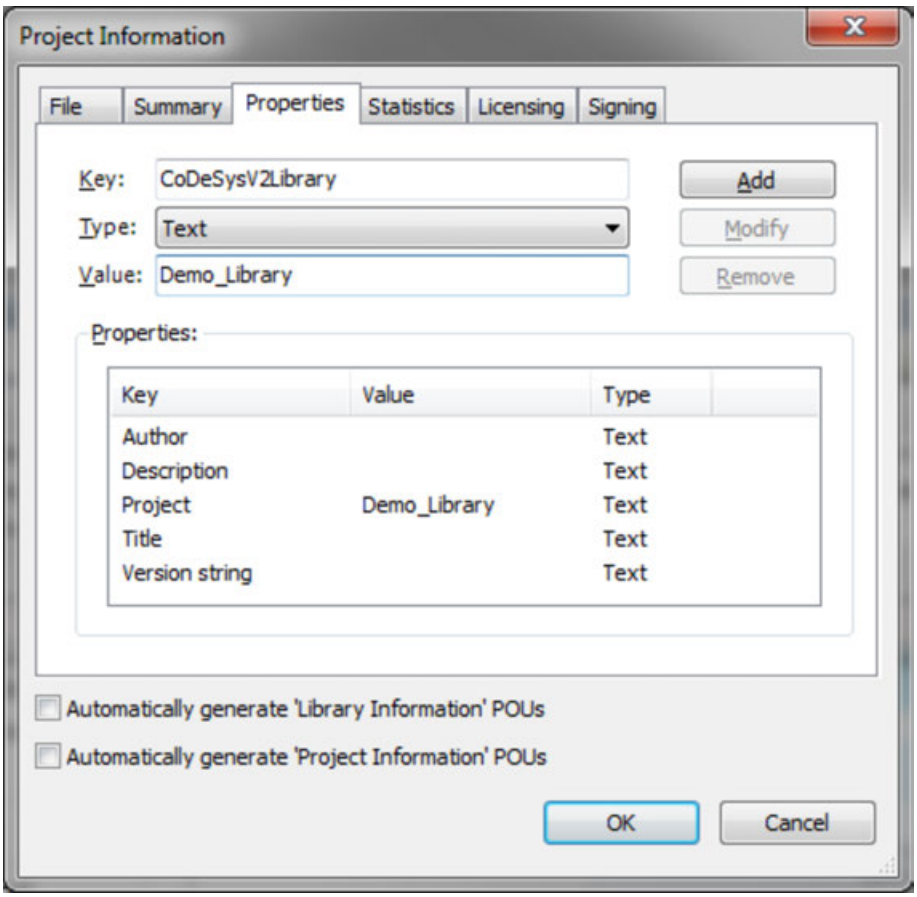
- Standard CODESYS libraries
- Specific AC500 libraries
- Customer libraries

In general, the Standard CODESYS libraries and the AC500 libraries are automatically converted during a target change from AC500 V2 to AC500 V3. Those libraries that cannot be converted (e. g. because there is no matching in V3) are created automatically in the V3 Library Manager and must be manually deleted by the user after the target change.

The customer libraries have to be converted manually using the Library Converter integrated into the Automation Builder installation:

1. In Automation Builder click *“File ➔ Open project”*.
2. Select the CODESYS library for AC500 V2 products which has to be converted.
3. After conversion of the library, open the view POUs in the device navigator and double-click *“Project Information”*.
4. To have the library automatically available in the V3 project, enter “Company”, “Title” and “Version” in the specific fields of the dialog.

   Then, open the *“Properties”* tab. For the target change the new *“Key”* "CoDeSysV2Library" has to be added. Under *“value”*, enter the name of the CODESYS library and click the *“Add”* button.



Click *"File ➔ Save project"* and install into the library repository.

1.6.6.1.4 Firmware identification and update

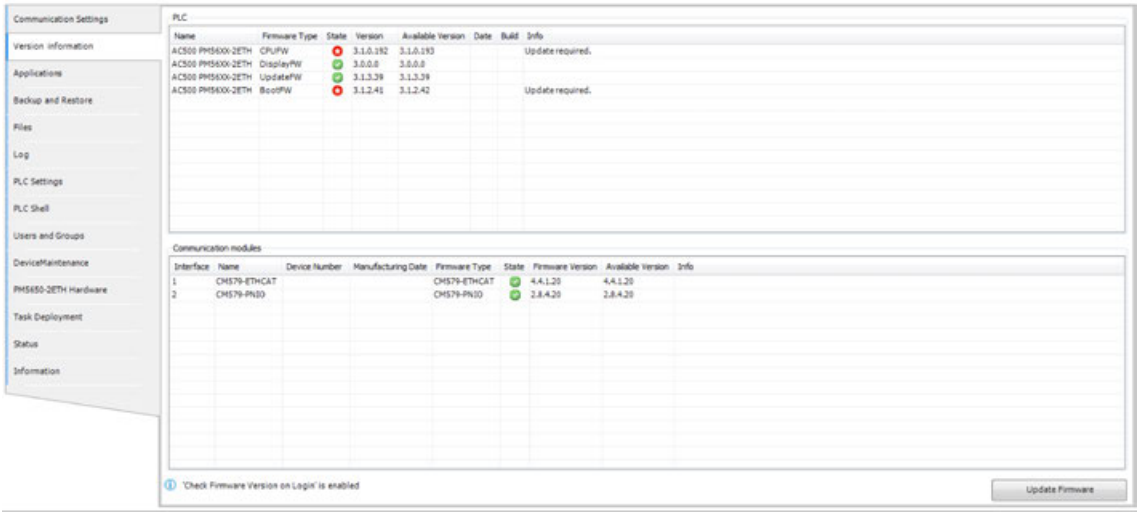
> *Without direct access to the internet, a firmware update with the memory card is also possible.* *Chapter 1.6.7.2 "Memory card in AC500 V3" on page 3999*

Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the *"Version information"* tab.

Remarks:

- The *"Version information"* tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.



State icons

	Firmware version on device matches version supplied with Automation Builder.
	Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.

	Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.
No icon	Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

AC500 V3 firmware installation and update

The PLC firmware can be updated via Automation Builder.

This is also necessary for commissioning V3 CPUs.

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500 firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

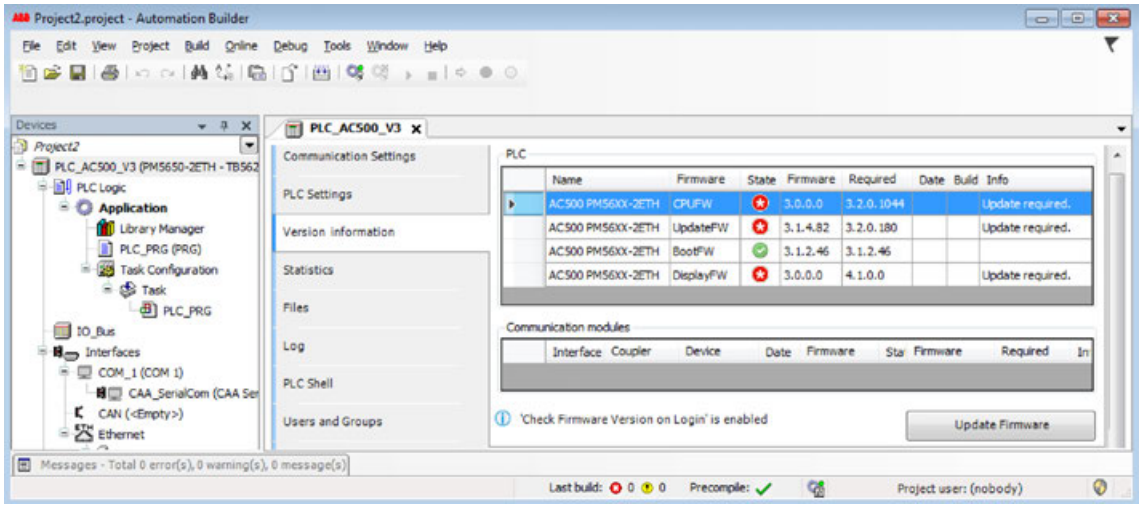
☑ An Automation Builder project with an AC500 V3 CPU is open.

☑ CPU is in "stop" mode or shows **uPdAtE** (update) on the display.

☑ After update the CPU shows either **donE** or **StoP** on the display

☑ For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU *"PLC_AC500_V3"*.
2. Select *"Version information"*.



3. Select *"Update Firmware"*.

   ⇨ While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

4. Wait for the PLC to finish the update.

   A completed update is indicated by a message on the display. Either **donE**, or **StoP**.

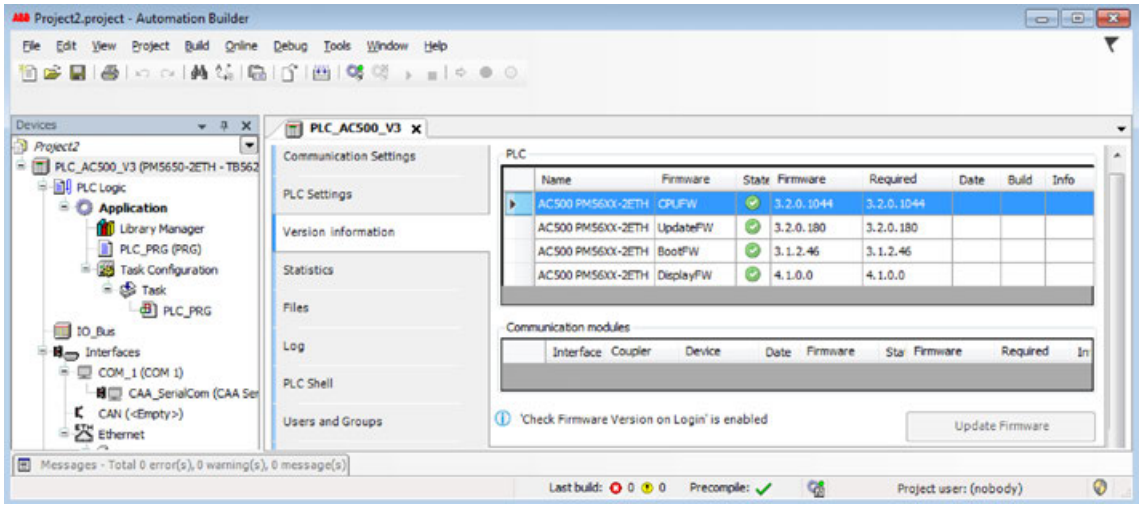
> **NOTICE!**
> Do not disconnect the power supply during the update process! The PLC could be damaged.

   ⇨ **StoP** indicates a restart has been performed by the CPU. When **donE** is displayed sometimes it is necessary to re-boot the CPU manually, e.g., by powering-off. Manual re-boot might be, e.g., for some older CPU versions or if downgrading to an older firmware version according to application settings.

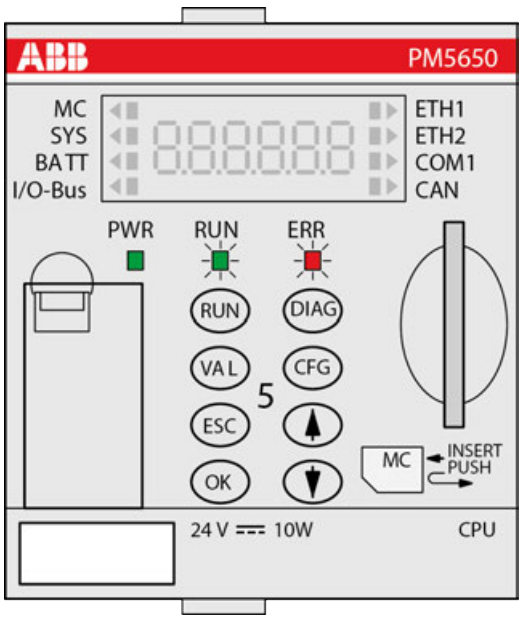
   The CPU display shows "stop" after re-boot. The update process is finished.

5. If necessary, refresh the version information by switching to another tab and back.

   ⇨ Successful firmware update:



Behavior of LEDs during firmware update



LED	LED flashes	Status
RUN and ERR	Toggling	Update pending
RUN	Flashing slow	Done successful
ERR	Flashing slow	Done failed

AC500-eCo V3 firmware installation and update

The PLC firmware can be updated via Automation Builder.

> *This is also necessary for commissioning AC500-eCo V3 CPUs.*

A very new CPU has no pre-installed firmware. To guarantee the authenticity of delivered AC500-eCo firmware, V3 CPUs are delivered with a boot loader only. You need to download a valid firmware to the CPU. After download, the functionality of the CPU is given.

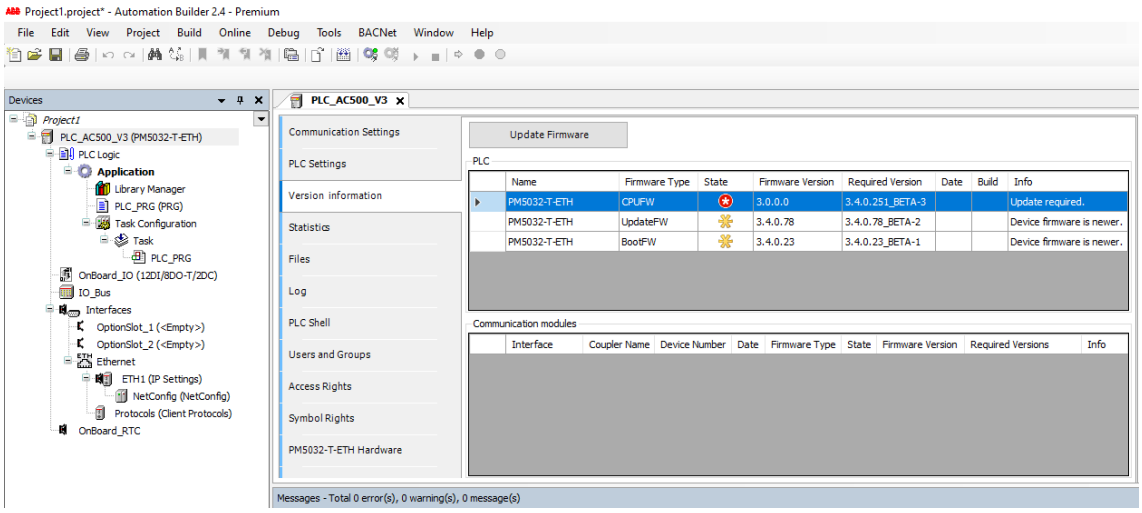
☑ An Automation Builder project with an AC500-eCo V3 CPU is open.

☑ CPU is in "stop" mode without firmware.

☑ The power LED is ON.

☑ For new modules: IP address is set. (The default IP address is 192.168.0.10)

1. Double-click CPU *"PLC_AC500_V3"*.
2. Select *"Version information"*.



3. Select *[Update Firmware]*.

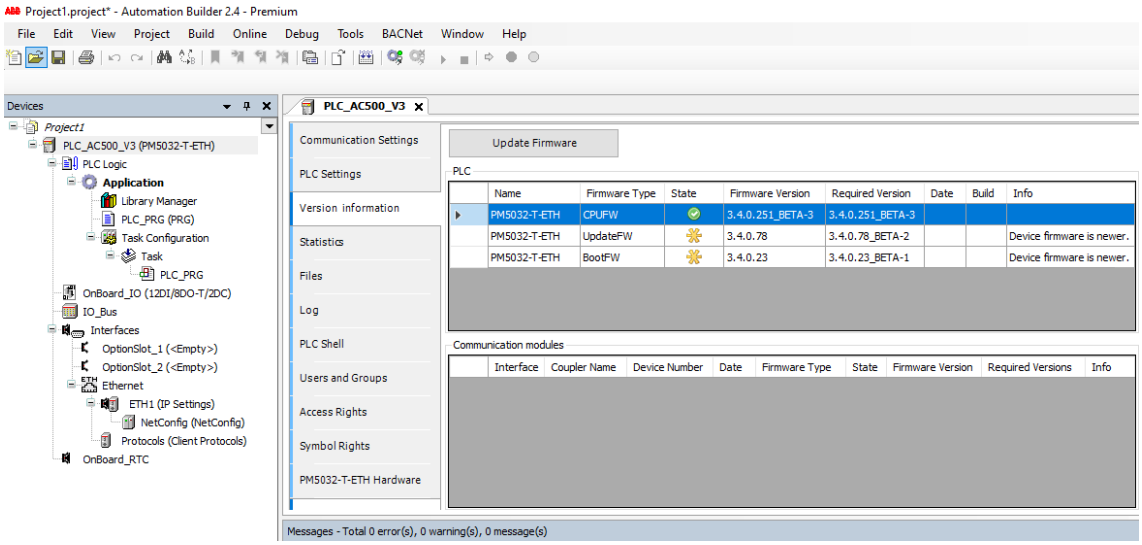
   ⇨ While the update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

4. Wait for the PLC to finish the update.

> **NOTICE!**
> Do not disconnect the power supply during the update process! The PLC could be damaged.

5. If necessary, refresh the version information by switching to another tab and back.

   ⇨ Successful firmware update:



Behavior of LEDs during firmware update

- CPU without firmware, only the power LED is on.
- While the firmware update process is running, the RUN and ERR LEDs are toggling, i.e., they are flashing alternating.

LED	LED flashes	Status
RUN and ERR	Toggling	Update pending
RUN	Flashing slow	Done successful
ERR	Flashing slow	Done failed

- CPU with installed firmware, only the power LED is on.
- If the CPU is running, then the RUN LED is on.
- If the CPU is in STOP mode, the RUN LED is off.

Update CI52x-Modbus firmware

Requirement: A firmware update file is available, e.g. AC500_CI52x_Firmware_V3.2.8.bin.

> *The CI52x Modbus firmware update is only available in the Automation Builder IP Configuration Tool.*

Installation of the IP configuration tool

1. In Automation Builder click *"Tools ➔ Installation Manager"* to start the Installation Manager.
2. Close any other running instances of Automation Builder. Then, click *"Modify"* in the Installation Manager.
3. Select the option *"IP Configuration Tool"* from the list and start the installation of the IP Configuration Tool.

Firmware update procedure

1. In the IP Configuration Tool click *“Scan”* to initialize a device scan.
2. From the list select the CI52x-MODTCP device(s) which shall be updated and click *“FW Update”*.
3. Select the firmware update file (e.g. AC500_CI52x_Firmware_V3.2.8.bin) to initialize a signature check and start the update procedure.
4. After the update, click *“Scan”* again to retrieve the firmware version of the device.

Troubleshooting

After the IP Configuration Tool has been installed, the firmware update of the CI devices can be initialized. If the CI firmware update fails, check the troubleshooting hints and follow the instructions.

General hints

- Close all unused applications on the update PC and do not open Automation Builder or any other applications during the firmware update.
- Stop the communication between AC500 PLC and the CI52x devices and disconnect the Ethernet connection of the update PC and the CI Modbus device(s).
- Do not close the IP Configuration Tool during a firmware update and do not switch off a CI Modbus device during the firmware update.

During a firmware update the operation of the device(s) is stopped. After the update, all outputs are set to zero.

Erroneous firmware update

Error	Solution
Error 1: Package Timeout Due to a primitive firmware update protocol a fast and stable network connection is required. Otherwise the update packages cannot be transferred within the requested time and a timeout occurs.	Locate the PC on which the update is performed as near as possible to the stationed CI Modbus devices. Avoid network switches.
Error 2: Unable to read device status After the firmware update the IP Configuration Tool reads out the status of the updated device in order to check if the update was successful.	Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 3: IP is not unique If more than one device hold the same IP address, a firmware update is not possible as the update command is IP based.	Correct the IP address, rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 4: Internal Error An internal error on the CI52x Modbus device occurred during the firmware update.	Rescan and repeat the update. If this doesn't work, power cycle the device and retry the update.
Error 5: Cannot connect to device The TCP communication is not sufficient for a connection. Increase the connection quality.	See Error 1: Package Timeout.

Signature check failed

After the selection of the firmware file (*.bin) a signature check is performed. If either the firmware file or the signature file is corrupt, the signature check fails. In the event of an erroneous signature check, perform the following steps:

- Ensure the signature file is stored in the same directory as the firmware file.
- Check the file names. The name of the signature file must be the same as the firmware file + attached ".sig".

File names	Name of the firmware file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin
	Correct name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.sig
	Wrong name of the signature file: c:\AC500\AC500_CI52x_Firmware_V3.2.8.sig

Indeterminate device firmware version

If the firmware version of the device cannot be determined, an error occurs. In this case, check that the device and the update PC are located in the same subnet and ping the device. If the ping is successful you can use the IP Configuration Tool to retrieve the device firmware version.

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

1.6.6.1.5 Migration of third party devices

After an update of Automation Builder the device repository contains only ABB devices. The third party devices which were installed into previous versions of Automation Builder are not automatically installed in the newest version profile. This has to be triggered by the user.

The feature “Migrate third party devices” is available as of Automation Builder 2.1.1.

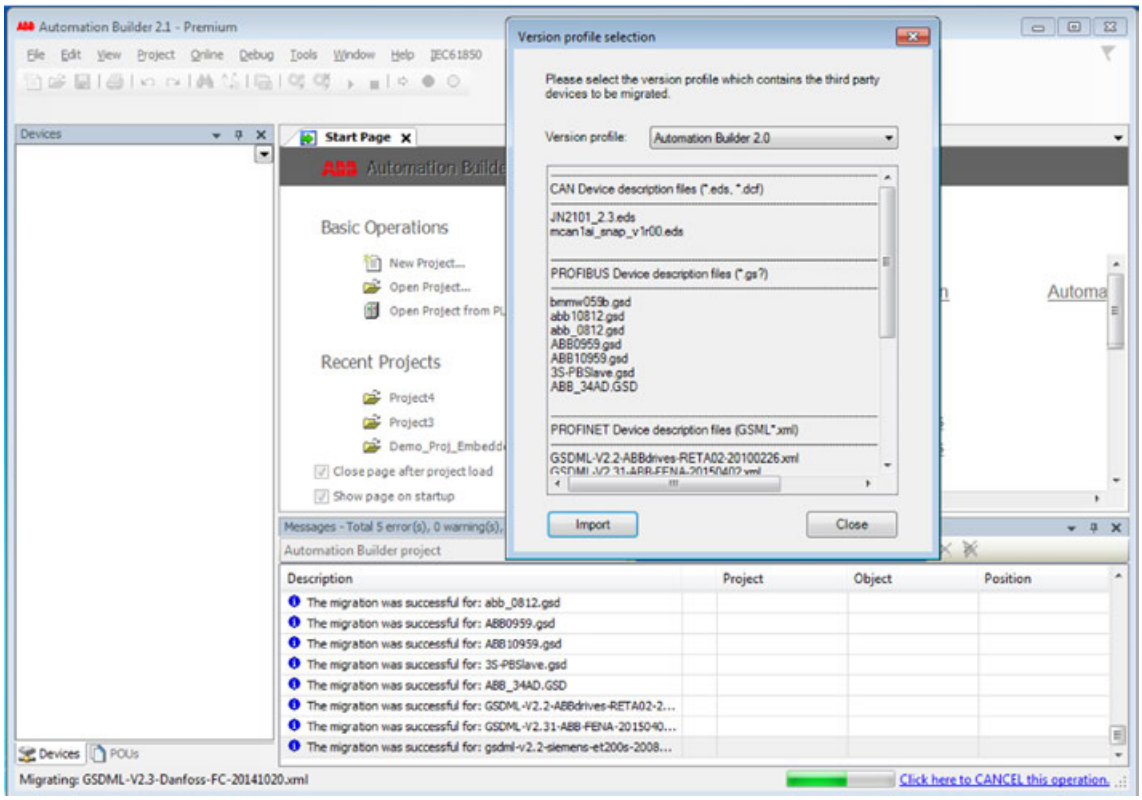
1. Click *“Tools”* in the main menu of Automation Builder.
2. Click *“Migrate third party devices”* in the drop-down list.
   ⇨ The window *Version profile selection* appears.

3. Select a version profile in the drop-down list containing previous Automation Builder / Control Builder Plus profiles. The active profile does not appear in the list.

   ⇨ After selection of a previous version profile, all the third party devices which have been installed inside this version profile are listed.

   It is not possible to select or deselect some third party devices. Importing will affect all the third party devices which are listed in the list view.

4. Select *[Import]*.



⇨ During the migration the message window displays success or failure of device migration.

> *In case of failure during the migration the affected third party device description has to be installed manually via main menu "Tools ➔ Device Repository ➔ Install".*

In the status bar, the third party device which is on *Migrating:* <...> is displayed on the left side.

The import operation can be cancelled by clicking the *"Click here to CANCEL this operation"* link on the right side of the status bar. This becomes effective when the migration of the just migrating third party device is finished.

5. To close the dialog select the *[Close]* button of the *Version profile selection*.

1.6.6.1.6 Advanced IO device handling

Automation Builder provides the Advanced IO Device Handling feature for configuring identical IO device types at multiple instances.

This feature is supported by the following commands that works with IO devices only.

- Generate DUT
- Map to Existing DUT
- Release DUT mapping

These commands work on individual nodes and on CI (communication interface) level nodes.

Generating DUT

Each device generates two DUTs. One for the input and one for the output. Some devices contain only input or output type. In such cases, the device generates only one DUT of the relevant type.

- Right-click on the desired IO device and select *"Generate DUT"* to generate a DUT for an IO device.

The following example shows how to generate DUTs at CI level node.

- In the device tree, right-click on a master node such as PNIO_Controller and select *"Generate DUT"* to create DUTs for the child nodes.
- The DUTs of child nodes are generated in *"Application* ➔ *App* ➔ *IO_Device_Generated_Items"* folder.
- Generated DUT considers channels with BYTE datatype as members. If channels with BYTE datatype are not present in the given hierarchy, it adds the members with another higher datatype.
- Channels with BOOL datatype are not considered.

Mapping to existing DUT

This command is enabled for the IO device when the IO device is not mapped and when DUTs of matching size (calculated based on device channel list) are available in *"Application* ➔ *App* ➔ *IO_Device_Generated_Items"* folder.

1. Right-click on an IO device and select *"Map to Existing DUT"*.
   ⇨ Enter Instance Name dialog is displayed.
2. Enter the instance name which satisfies IEC naming validations and unique name in global scope.
3. Click *"OK"* to create a global variable associated with the mappings in DI (PRG).
   If you want to view mapped instances, double-click *"DI (PRG)"*.

With the 'Map to Existing DUT' command:

- Any device can be mapped only to one input DUT and one output DUT. If you have already mapped an input DUT, only the output DUT is shown in the options list and vice-versa.
- Mapping is also supported at CI level nodes. To create global variables for CI level nodes, the address of the first child is considered.

Releasing DUT mapping

This command is enabled on an IO device only when an IO device is mapped either to input, output or both DUTs. You can use this command to release (or revert) mappings and to delete global variables created during 'Map to Existing DUT'.

Right-click on an IO device and select *"Release DUT Mapping"*. The mapped DUT instance is deleted.

Using DUT variables in CODESYS application

1. In the Automation Builder project, double-click *"Application"* to launch CODESYS application.
   ⇨ CODESYS application is launched. CODESYS application contains mapped DUT instances.
2. Double-click *"PLC_PRG"* to create DUT variables.
3. Add DUT variables based on mapped DUTs.

For further information on mapping DUTs, see section *Chapter 1.6.6.1.6.2 "Mapping to existing DUT" on page 3661*.

For example, in the PLC_PRG, add analog I/O and digital I/O. If you insert a dot at a position where an identifier should be inserted, then a selection list is open, offering all the input and output variables which are found in the project.

After adding DUT variables, rebuild the program in CODESYS application using *"Project ➔ Rebuild"*.

Support for CI level node

The user can create DUTs for the entire hierarchy of CI level node (for example, IO_BUS), by right-clicking on the desired CI level node and by selecting *"Generate DUT"*. Further, all the DUTs are generated in *"Application ➔ App ➔ IO_Device_Generated_Items"* folder.

- The command generates DUT for the node itself and also for all child nodes.
- The DUT generated for the CI level node contains generated DUTs for the child nodes as their members.
- For every execution, the command checks, if any new child node is added and generates DUT.

If you delete child nodes in CI level node (for example, IO_BUS), the DUTs generated for these child nodes are not deleted automatically. You should delete the DUTs manually in the *"Application ➔ App ➔ IO_Device_Generated_Items"* folder if desired.

Configuration check

Configuration check for size is enabled to ensure that all devices are mapped with DUTs of the correct size. In case of any changes in the mapped DUT, configuration check verifies the size of the DUT. If it fails, an error message is displayed in Automation Builder messages window and does not allow to launch the application. This check can be performed in *"Create configuration data"*.

1.6.6.2 PLC devices and components

1.6.6.2.1 Device repository

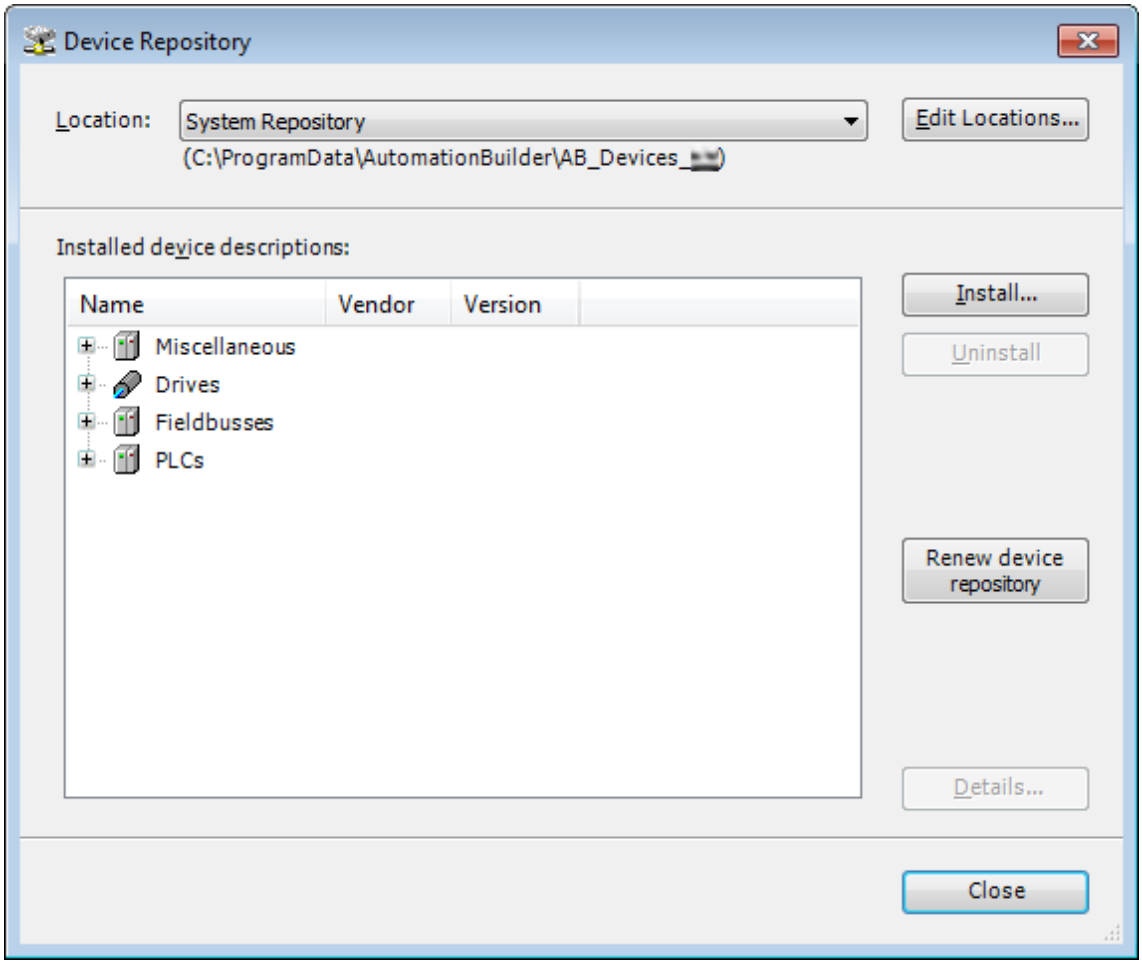
The Device Repository of Automation Builder manages the pool of devices that can be used in the PLC configuration.

You install or uninstall devices in the *"Device Repository"* dialog box. The system installs a device by reading the device description files, which define the device properties for configurability, programmability, and possible connections to other devices.

You can use the devices provided in the device repository by adding them to the device tree of your project.

Dialog device repository

1. Click *"Tools ➔ Device Repository"*.
   ⇨ The *"Device Repository"* dialog box opens.



[Edit Locations]: Changes the default repository location. The devices can be managed at different locations.

[Install] / *[Uninstall]*: Installs or uninstalls devices.

[Renew device repository]: Updates the device list, e.g. after uninstallation of a device.

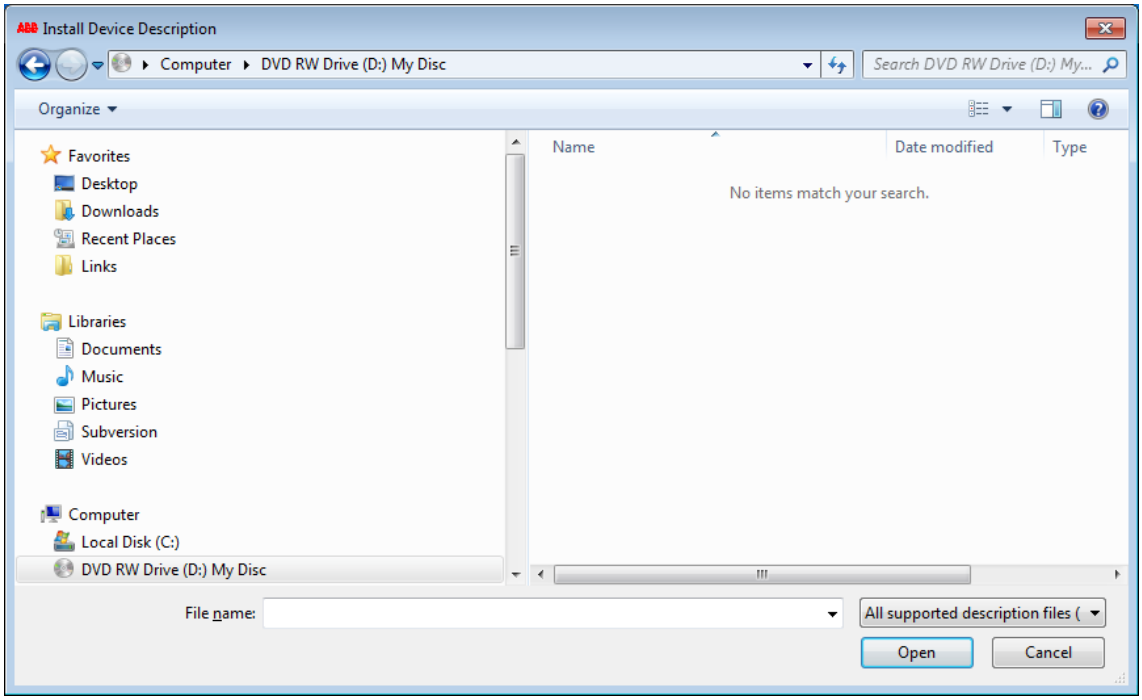
[Details]: Provides technical details on the selected device.

2. Select the install location. *"System Repository"* is set by default.

Installing devices

The device repository cannot be changed manually, e.g. by copying or deleting files. Use always the Device Repository dialog to add or remove devices.

1. Click *[Install]* and select the appropriate file format.
   ⇨ The *"Install Device Description"* dialog box opens.



2. Select the file path of the device description.
3. Select the file type filter of the required device description.
   ⇨ All device descriptions of the selected file type are listed.
4. Select the required device description and click *"Open"*.
   ⇨ Automation Builder adds the device description to the matching category of your device repository.

   If errors occur during installation (for example, missing files that are referenced by the device description), then Automation Builder displays them in the lower part of the device repository dialog box.

> *During the installation the device description files and all additional files referenced by that description will be copied to an internal location. Altering the original files will have no further effects to an internal location.*
>
> *The changes take only effect after reinstalling the corresponding device(s). The version number shown in the information section of the device should be verified.*

Uninstalling devices

Select the device you want to remove and click *[Uninstall]*.

The device is removed from the list.

> *Uninstalled devices which are used in existing projects are indicated by the symbol ❓. The device will not be configured properly.*

1.6.6.2.2 PLC start-up

A fast online program modification of the user program is possible without interrupting the running operation. If data areas should be saved during power OFF/ON, they can be stored in the flash EPROM. An optional battery saves data in the RAM.

Initialization of AC500 V3 CPU

To initialize an AC500 V3 CPU, you need to download the firmware.

A new CPU has no pre-installed firmware, it is delivered with a boot loader only. You need to download a valid firmware to the CPU. See *Chapter 1.6.6.1.4.2 " AC500 V3 firmware installation and update" on page 3653*. After download, the functionality of the CPU is given.

PLC runtime licensing

The use of some libraries and devices require the PLC to have a runtime license. If you purchased such a license, activate the license *Chapter 1.6.6.2.2.2.1 "Activating a runtime license via license key" on page 3665*.

If you want to test device functionality or library features in advance, you can activate a demo license in advance *Chapter 1.6.6.2.2.2.2 "Activating a demo license" on page 3669*.

The license status of a PLC can be displayed at any time *Chapter 1.6.6.2.2.2.5 "View license information" on page 3672*.

NOTICE!

After removing a Wibu memory card (which holds the AC500 runtime license), the PLC system moves into 'Stop' mode after 24 h.

Ensure to insert the Wibu memory card at the time.

Activating a runtime license via license key

The use of some libraries and devices require the PLC to have a runtime license.

☑ PC and PLC are connected. In case of no connection, perform the activation via memory card *Chapter 1.6.6.2.2.2.3 "Licensing via memory card" on page 3669*.

☑ There is a connection to the Internet. In case of no connection, perform the activation on another PC with internet connection *Chapter 1.6.6.2.2.2.1.1 "Activation without internet connection" on page 3666*.

1. Right-click on the PLC and select *"PLC runtime licensing"* from the *"Runtime Licensing"* menu.

   ⇨ A wizard starts. Follow the instructions.

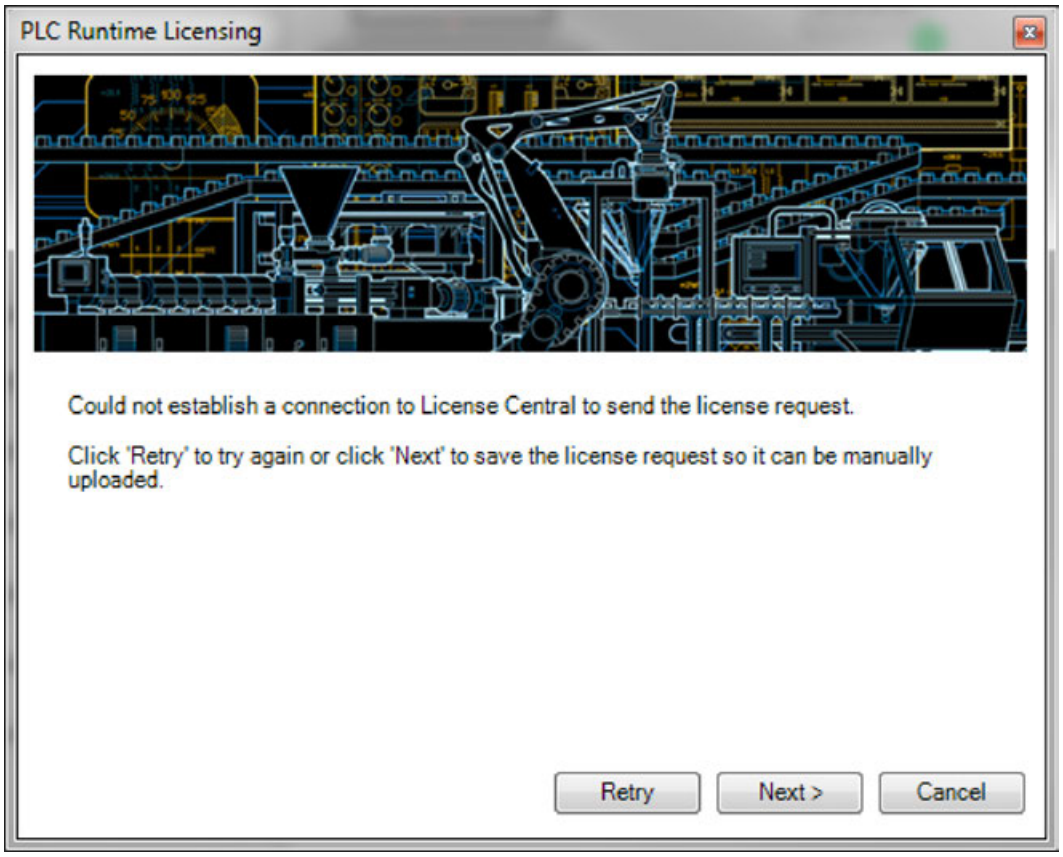
2. Enter the license activation key and select *"Next"* to finish the licensing procedure.

   ⇨ The license is activated on the PLC device.

   If the license shall be used on another PLC device, the installed license can be returned *Chapter 1.6.6.2.2.2.4 "Returning a license" on page 3671*.

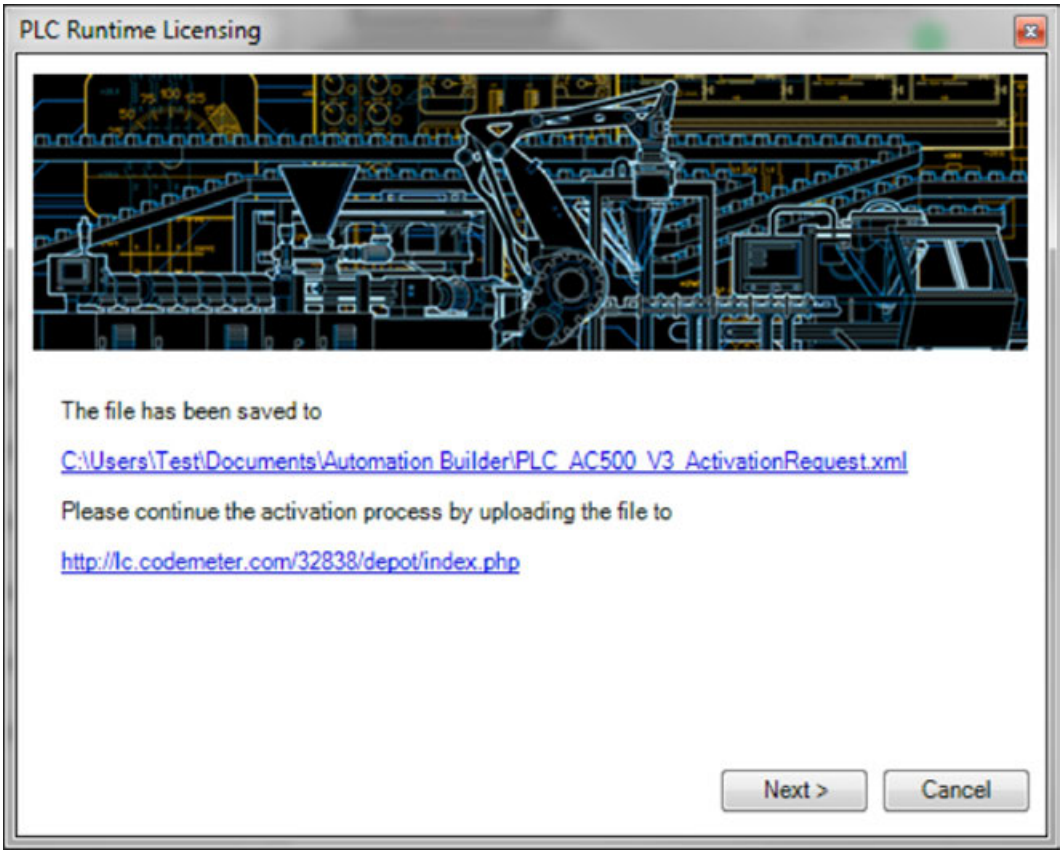
Activation without internet connection

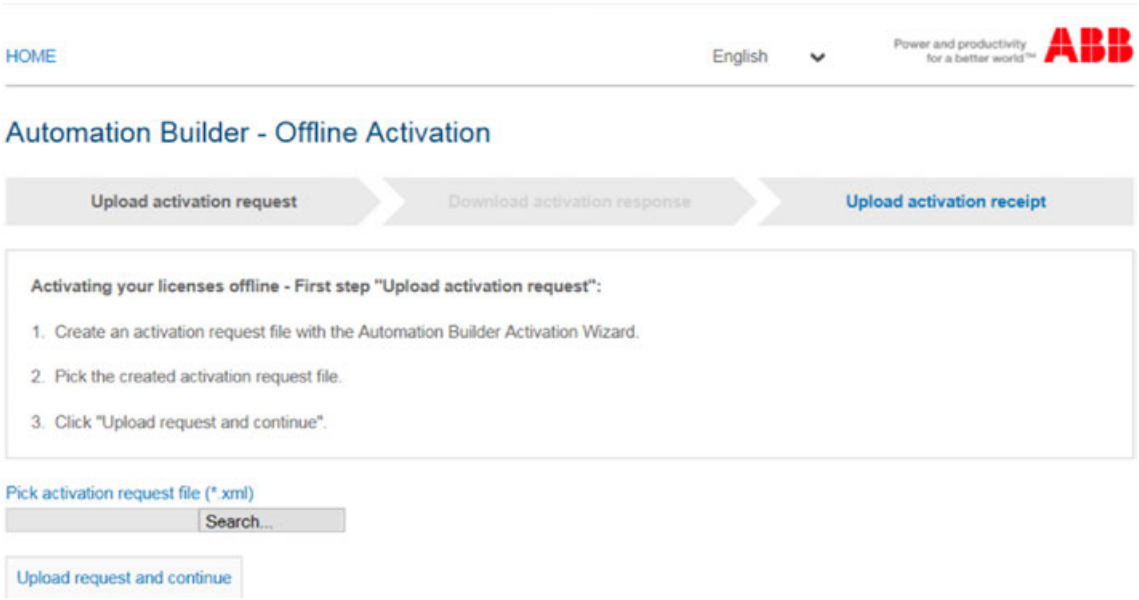
1. If an error occurs when communicating with the ABB license server, or if Automation Builder is running on a PC without internet connection, then it is possible to manually complete the ABB license server interaction by using another PC (with internet connection).



2. In the error dialog select *“Next”* and save the license activation request file to a storage location the other PC can access, e.g. a file share.

3. In the dialog the web address of the ABB license server is displayed (*http://lc.codemeter.com/32838/depot/index.php*). From the PC with internet connection, upload the license activation request file.





4. After the upload, download and save the license activation file from the ABB license server. Transfer this file to the PC without Internet connection.
5. Select *"Next"* to continue the license activation process. Click *"Cancel"* to continue the license activation process at a later time (see Offline activation ↳ *Further information on page 3668*).

6. Select *"Browse"* and select the license activation file (*.WibuCmRaU) from the defined storage location.

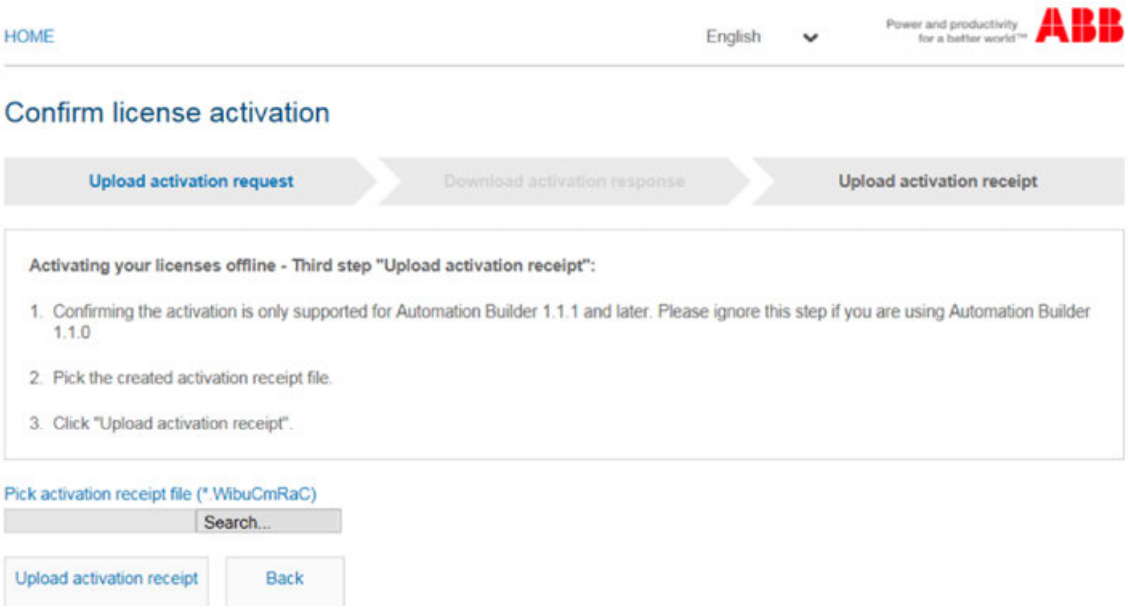
   ⇨ The license is validated by the ABB license server and afterwards activated on the PLC device.

   If the license shall be used on another PLC device, the installed license can be returned ☞ *Chapter 1.6.6.2.2.2.4 "Returning a license" on page 3671*.

7. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.

   Save the license receipt file and upload it manually from a PC with internet connection to *http://lc.codemeter.com/32838/depot/index.php*.

   ⇨ A license confirmation is returned.



Offline activation

If the runtime licensing process was closed between saving the license activation request file and obtaining the license activation file from the ABB license server, perform an offline activation:

1. Right-click on the PLC node and select *"PLC runtime licensing"* from the *"Runtime Licensing"* menu.

   ⇨ A wizard starts. Follow the instructions.

2. Select the option *"Complete offline licensing process"*.

3. Select *"Browse"* and select the license activation file (*.WibuCmRaU) from the defined storage location.

   ⇨ The license is activated on the PLC device.

   If the license shall be used on another PLC device, the installed license can be returned ☞ *Chapter 1.6.6.2.2.2.4 "Returning a license" on page 3671*.

4. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.

   Save the license receipt file and upload it manually from a PC with internet connection to *http://lc.codemeter.com/32838/depot/index.php*.

   ⇨ A license confirmation is returned.

Activating a demo license

It is possible to try out device features or library features by using a Demo license on the PLC. With this, you can use the features for a limited time period.

☑ PC and PLC device are connected. In case of no connection, perform the activation via memory card ↯ *Chapter 1.6.6.2.2.2.3 "Licensing via memory card" on page 3669*.

☑ There is a connection to the Internet. In case of no connection, perform the activation on another PC with Internet connection ↯ *Chapter 1.6.6.2.2.2.1.1 "Activation without internet connection" on page 3666*.

1. Right-click on the PLC node and select *"PLC runtime licensing"* from the *"Runtime Licensing"* menu.

   ⇨ A wizard is started. Follow the instructions.

2. Select the option *"Create a demo license"* and click *"Next"* to finish the licensing procedure.

   ⇨ The demo license is validated by the ABB license server and afterwards activated on the PLC device.

Licensing via memory card

When you have no connection between your PC and the PLC device the licensing procedure can be done via a memory card.

On the PC: Create a license request

☑ There is a connection to the internet.

☑ The memory card can be used with AC500 V3 products.

> **NOTICE!**
> If a SDCard.ini file is stored on the memory card, the file will be overwritten.

1. Place the memory card in the PC.
2. Right-click on the PLC node and select *"Prepare PLC license SD memory card"* from the *"Runtime Licensing"* menu.
3. From the filesystem select the root folder of the memory card.

   ⇨ A success message is displayed when the creation of the memory card files is completed.

   The license request files are stored to the selected folder.

On the PLC: Transfer the license data

1. Insert the memory card into the PLC device and reboot the PLC.

   ⇨ When the license request file is successfully created by the PLC, "done" is shown on the display of the PLC.

2. Remove the memory card from the PLC.

On the PC: Enter the license activation key

For this action, internet connection is required.

1. Place the memory card into the PC.
2. Open the PLC project in Automation Builder. Ensure the PLC is logged out.
3. Right-click on the PLC node and select *"PLC runtime licensing"* from the *"Runtime Licensing"* menu.
   ⇨ A wizard is started. Follow the instructions.
4. Enter the license activation key.
5. From the filesystem, select the root folder of the memory card.
   ⇨ The previously created license request files are sent to the ABB license server. A license activation is created on the memory card.
6. Remove the memory card from the PC.

On the PLC: Complete license activation for the PLC

1. Insert the memory card into the PLC device and reboot the PLC.
   ⇨ *done* is displayed on the PLC if license activation was successful.
2. Remove the memory card from the PLC

Trying to activate a runtime license, that has already been activated (e.g. via an online conncetion), will result in following error in the sdcard.rdy file:

;Result of license file import
ImportLicense=13;Internal Error (1)

On the PC: Complete license activation on the license server

For this action, internet connection is required.

To complete the licensing process, the license receipt file must be uploaded to the ABB license server.

1. Place the memory card into the PC.
2. Upload the license receipt file manually from a PC with internet connection to *http://lc.codemeter.com/32838/depot/index.php*.

   The license receipt on the memory card is located in the subfolder license

   ⇨ A license confirmation is returned.

Returning a license

NOTICE!
After returning a AC500 runtime license, the PLC system moves into 'Stop' mode after 24 h.

Returning a license without memory card

A license which has been installed on a PLC device can be returned and installed on another PLC device.

☑ PC and PLC device are connected. In case of no connection, perform the activation via memory card ↳ *"Returning a license via memory card" on page 3671*.

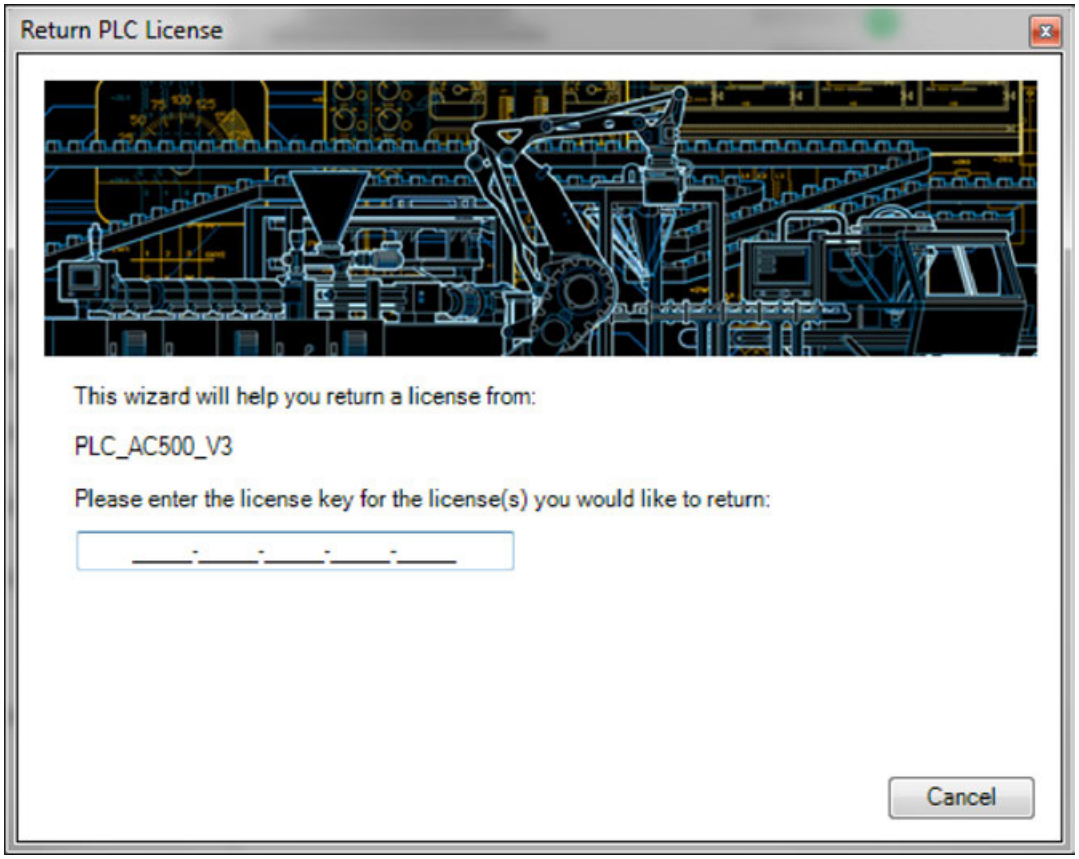
1. Right-click on the PLC node and select *"Return active license"* from the *"Runtime Licensing"* menu.
   ⇨ A wizard is started. Follow the instructions.
2. Enter the license activation key and click *"Return license"*.
   ⇨ The results of the return process will be displayed in the dialog.
   The license from the PLC device is removed and can be used now for another PLC device.

Returning a license via memory card

When the PLC is not connected to the PC (PLC logged out) it is possible to return a license via memory card.

1. Insert the memory card in the PC and execute *"Runtime Licensing ➔ Prepare PLC license SD card "* on the PLC node.
2. Place the memory card into the PLC.
3. Perform *"power cycle"* after a successful update reboot the PLC and connect to the PLC.
   ⇨ The License is removed from the PLC.
4. Place the memory card into the PC.
5. Right-click on the PLC node and select *"Return active license"* from the *"Runtime Licensing"* menu.
   ⇨ A wizard is started. Follow the instructions.

6. Enter the license activation key and click *“Return license”*.



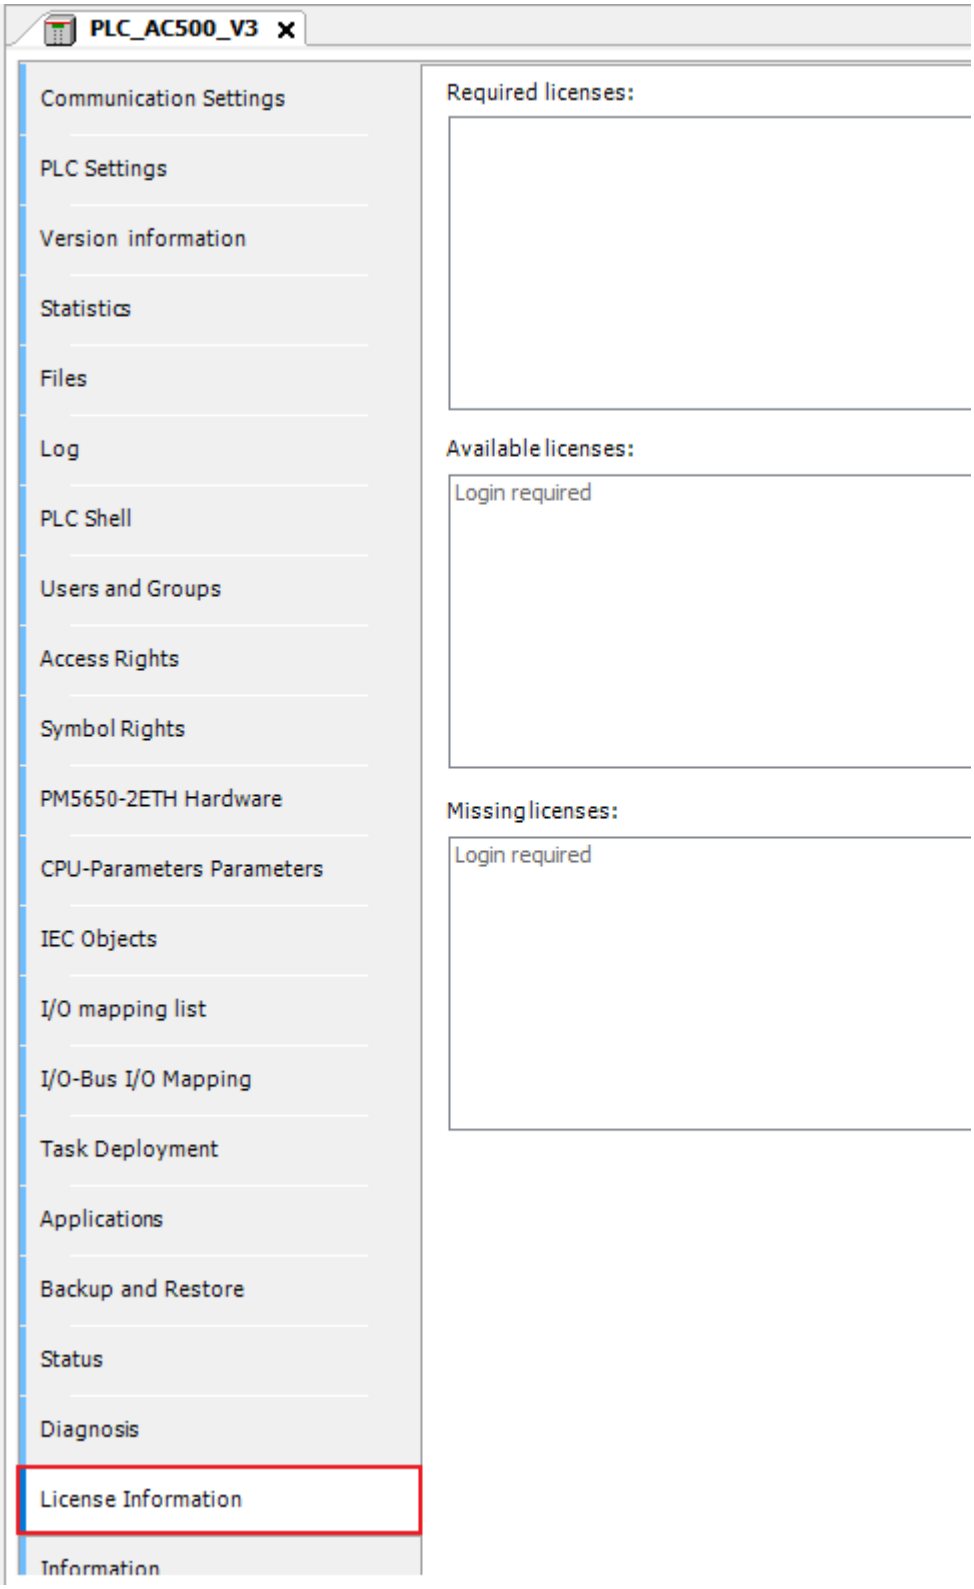
7. Click *“Browse”* and select the root folder of the memory card.
   ⇨ Returning of the license is started.
8. Place the memory card in the PLC device and reboot the PLC.
   ⇨ The license from the PLC device is removed and can be used now for another PLC device.
9. To complete the licensing process, a license receipt file must be uploaded to the ABB license server.
   Save the license receipt file and upload it manually from a PC with internet connection to *http://lc.codemeter.com/32838/depot/index.php*.
   ⇨ A license confirmation is returned.

View license information

To view the license information of AC500 V3 products:

1. In the Automation Builder device tree double-click on the PLC node.
   ⇨ The PLC tab is opened.

2. In the PLC tab select *“License Information”*.



⇨ The project is scanned for required licenses.

If you are logged into a PLC, then the licenses available on the PLC are displayed.

Missing required licenses are highlighted.

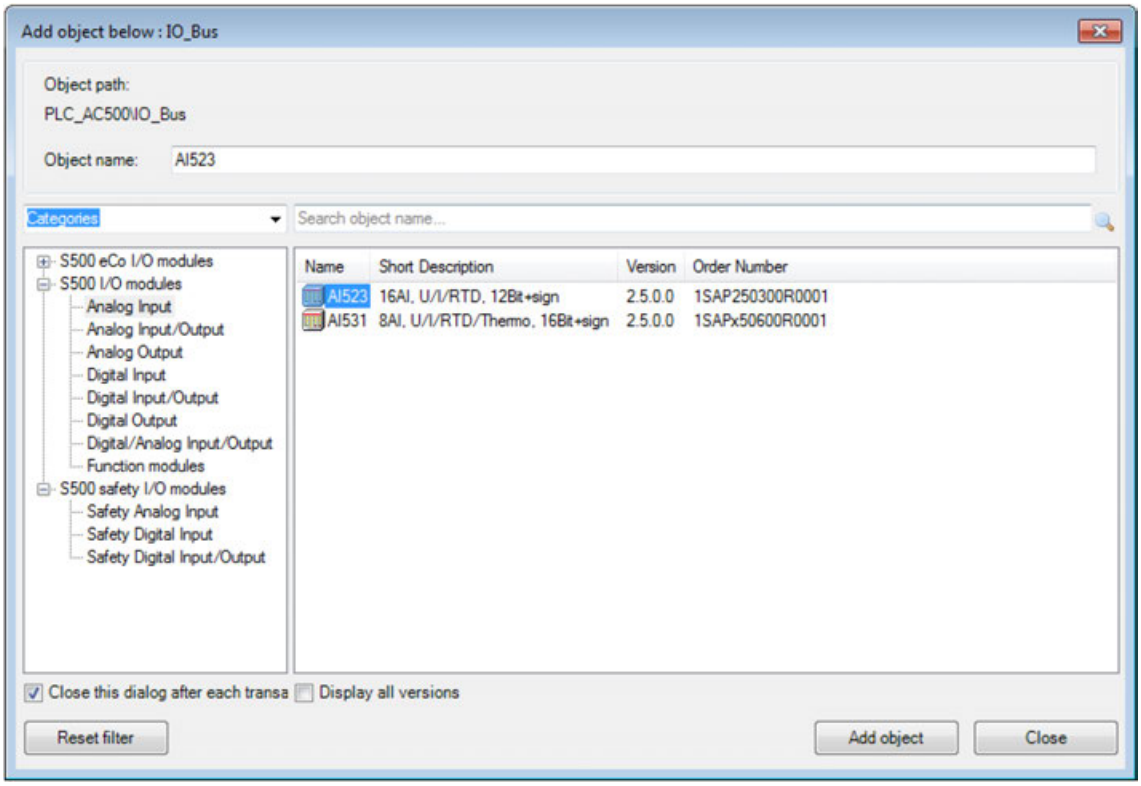
Connection of devices

All installed devices that are available in Automation Builder are listed in the *Chapter 1.6.6.2.1 “Device repository” on page 3662*.

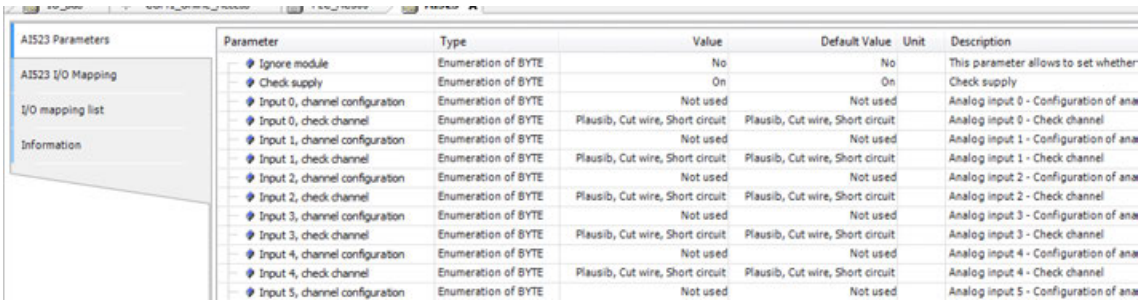
Configuring devices

Modify your Automation Builder project by adding device objects. Preset items can be replaced in the same way.

1. In the device tree, right-click an item node. Select *“Add object”*.



2. Select the desired object and click *[Add object]*.
3. Double-click the new object in the device tree to configure the device settings. Depending on the selected item different configuration tabs are available.

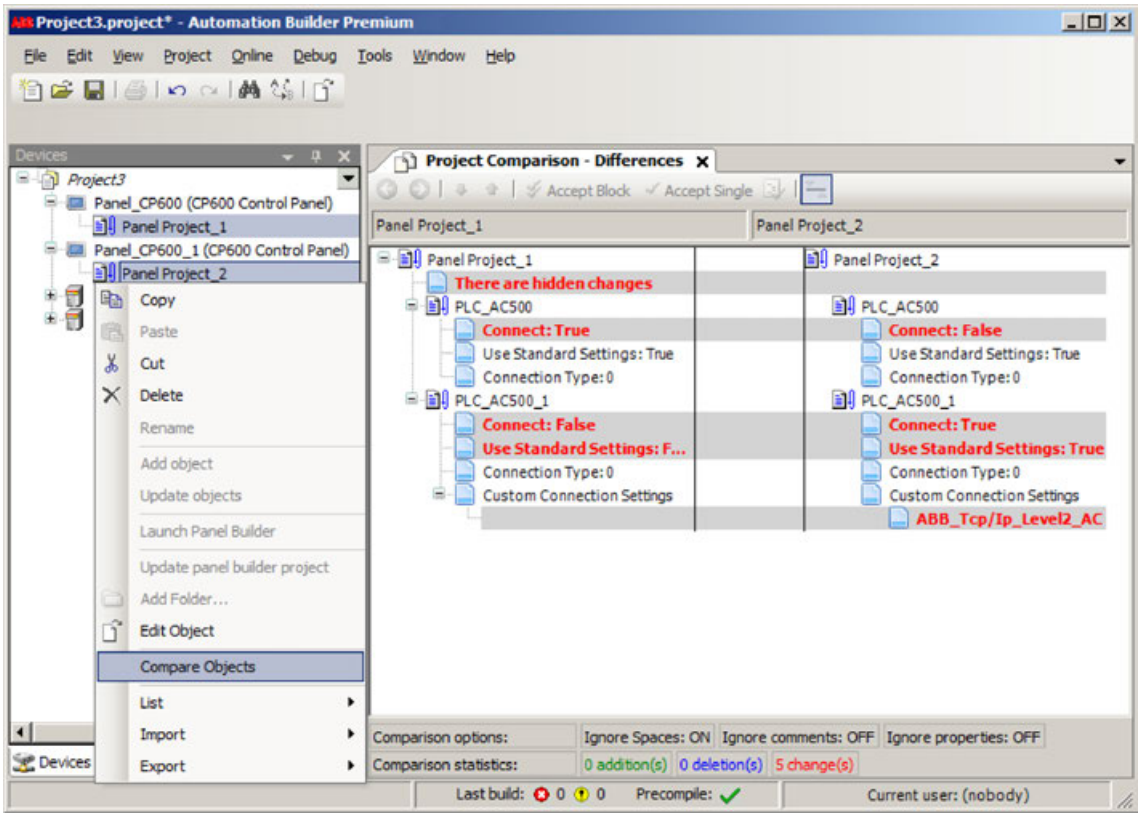


Update of AC500 devices

Perform a firmware update to update AC500 V3 devices. *Chapter 1.6.6.1.4.2 “ AC500 V3 firmware installation and update” on page 3653*

Comparing objects

To compare similar objects within a project (such as the project configuration) select both objects. Right-click and select **Compare Objects** to see the differences.



IP settings

Configuration of the IP settings with the LED display

The IP settings for the PLC can be set directly on the processor module via keypad and LED display.

See *Chapter 1.6.5.1.6.5.3 “Configuration” on page 3493*

Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following.
- the 'Communication Settings'. *Chapter 1.6.6.2.2.4.3 “Configuration of communication via Ethernet (TCP/IP)” on page 3688*

As an alternative the IP address can be changed at the hardware device itself. *Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491*

The IP configuration tool:

The IP configuration tool can be used

- to set or change the IP address of devices.
  Chapter 1.6.6.2.2.4.2.2.2 “Changing the IP address” on page 3680
- to scan the network for available hardware devices.
  Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3678

- to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  ↳ *Chapter 1.6.6.2.2.4.2.2.3 “Firmware update” on page 3681*
- to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  ↳ *Chapter 1.6.6.2.2.4.2.2.4 “Blink functionality” on page 3685*

The IP configuration tool is part of Automation Builder and can be called via *“Tools ➔ IP-Configuration”*.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ↳ *Chapter 1.6.6.2.2.4.2.1 “Stand-alone installation” on page 3676*.

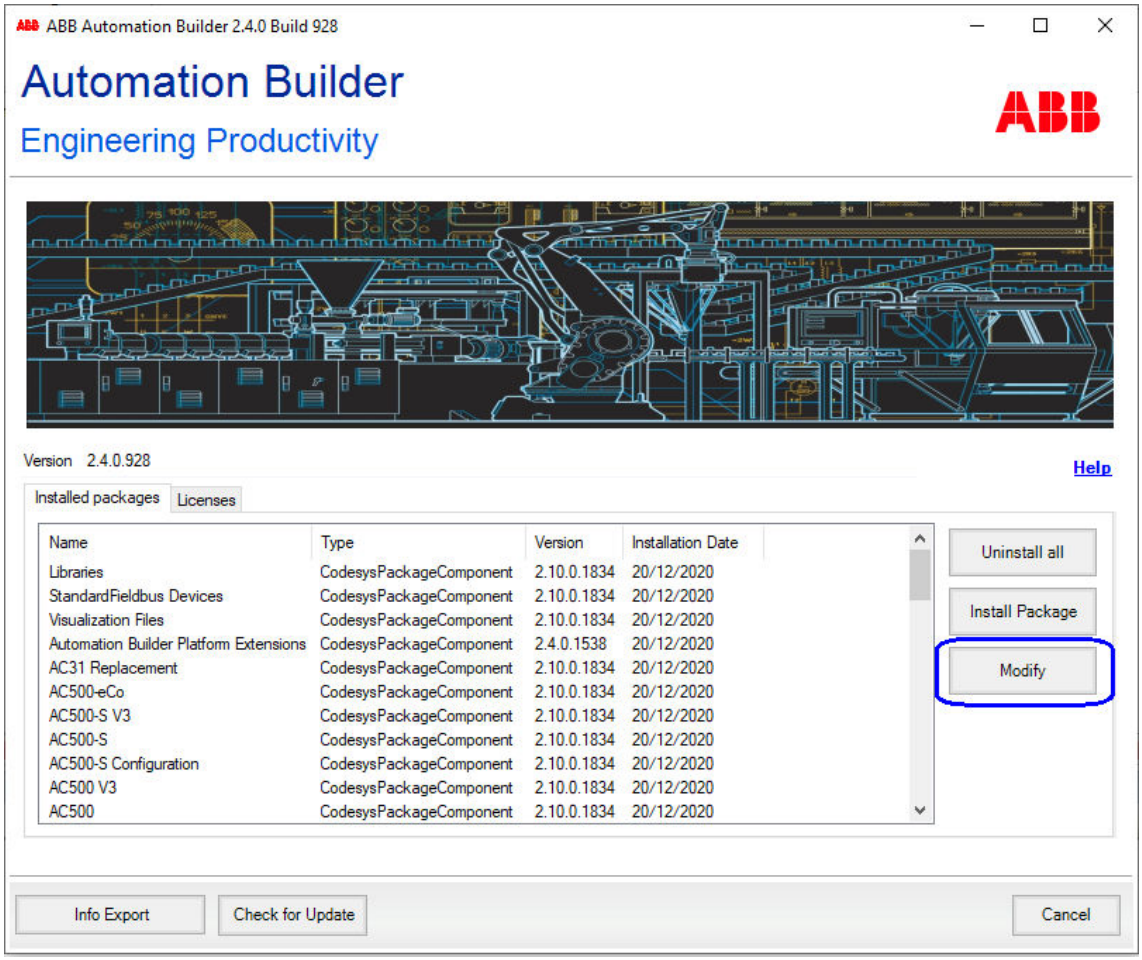
After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

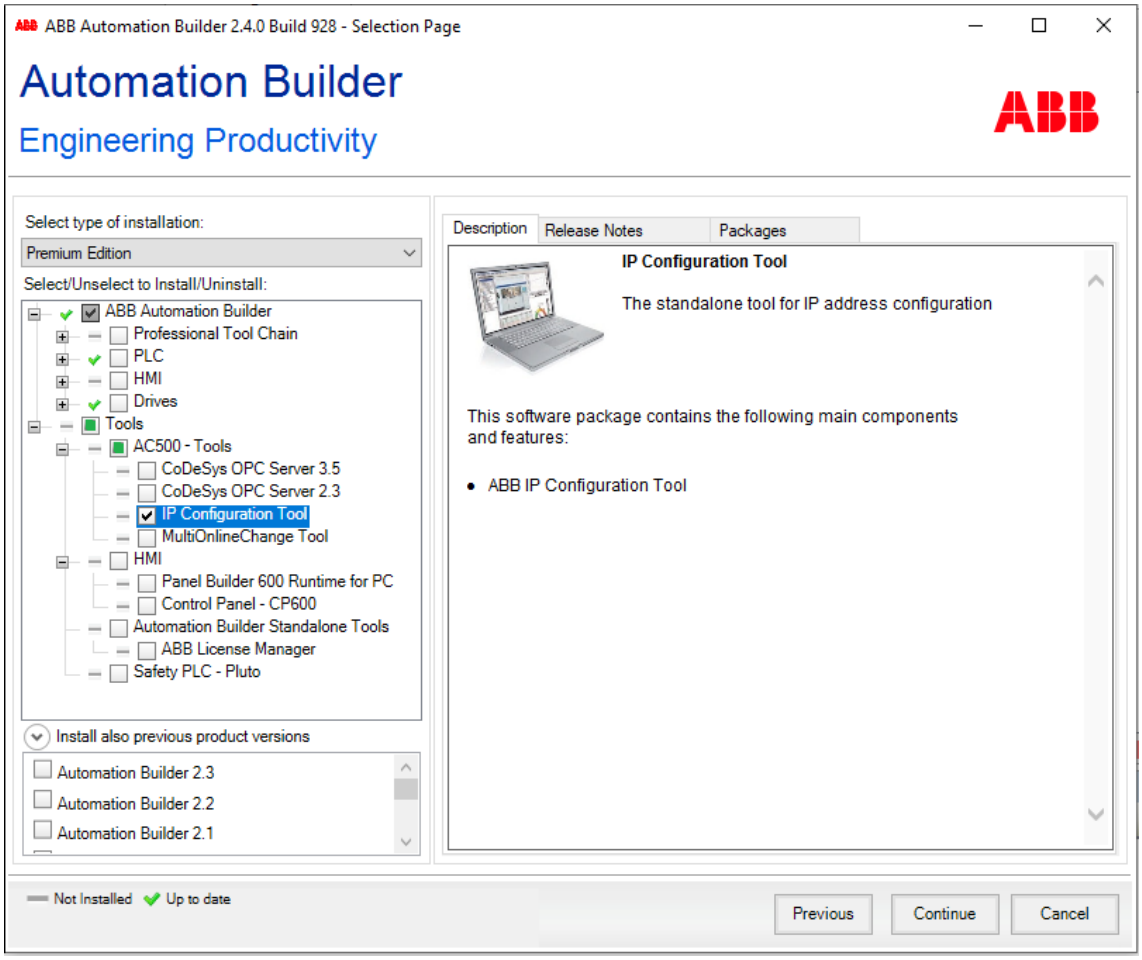
Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.

1. Open the Installation Manager in Automation Builder: *"Tools ➔ Installation Manager"*.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.



3. Click *"Modify"* and select the *"IP Configuration Tool"* from the structure tree.



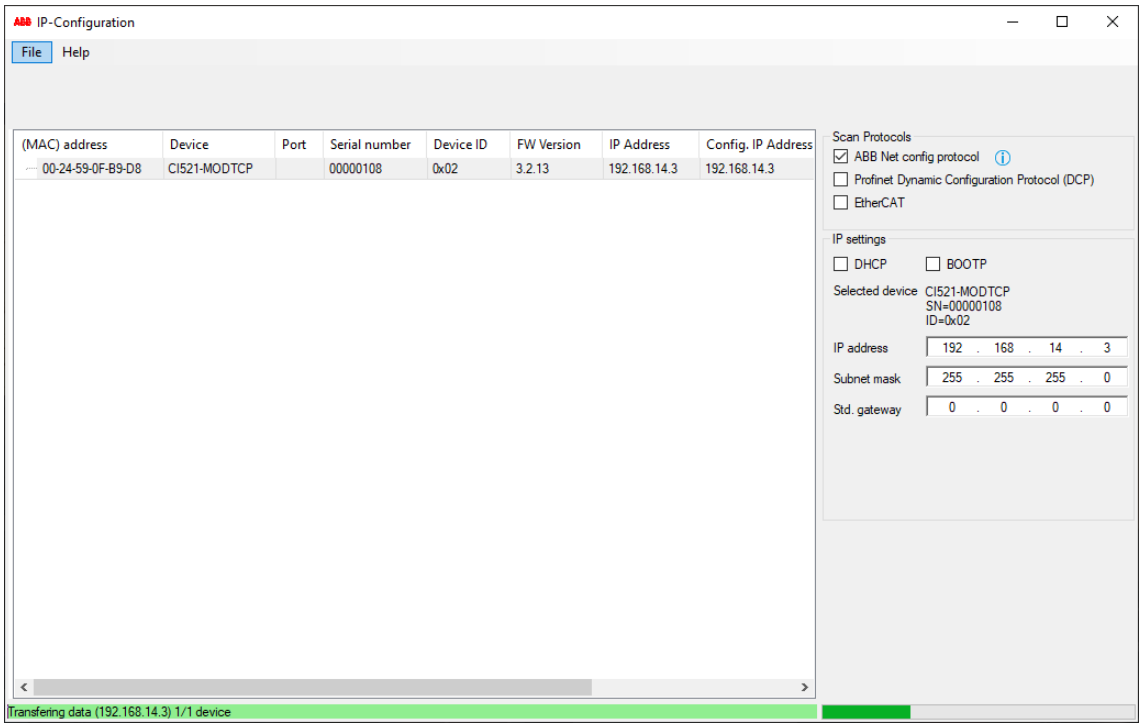
4. Click *"Continue"* to start the installation.
   - ⇨ After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - ⇨ To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.

1. Start the IP configuration tool in Automation Builder (*"Tools ➔ IP-Configuration"*) or start it stand-alone (.exe).
2. The *"IP-Configuration"* dialog opens. Define the device type for the network scan by selecting the desired option under *"Scan Protocol"*:
   - *"ABB Net config protocol"*:
     Use this option for AC500 devices such as processor modules, CI5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - *"Profinet Dynamic Configuration Protocol (DCP)"*:
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 3683
   - *"EtherCAT"*:
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 3683
3. Click *[Scan]* to start the scan process.



4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under *"IP settings"*:

   ⇨ ● *"IP Address"*:
   Current IP address of the device.
   ● *"Conf. IP Address"*:
   Configured IP address of the device. A changed IP address will update this column.
   ● *"FW Version"*:
   Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.
   Chapter 1.6.6.2.2.4.2.3.1 "Trouble-shooting for firmware update" on page 3686

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.

   Chapter 1.6.6.2.2.4.2.2.1 "Network scan" on page 3678

2. Select a device from the list and select the appropriate protocol under *"Scan protocol"*.

   "DHCP" or *"BOOTP"* option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.

   "IP address", *"subnet mask"*, *"Std. gateway"*: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

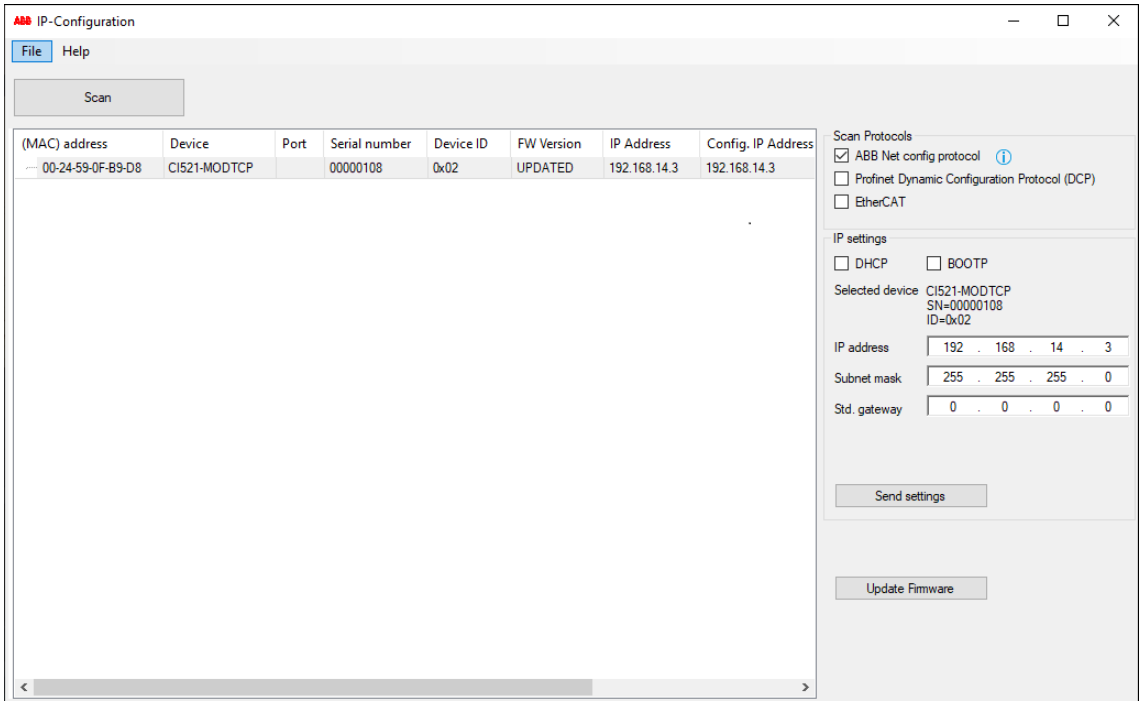
   "Check subnet configuration" on page 3686

Note for CI52x-Modbus devices

Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to "0".

"Check last number of IP address" on page 3687

3. Change the settings for the IP configuration and click *[Send settings]* to transmit the data to the device.



⇨

Note for PROFINET devices

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:

- *Labels must be separated by "."*
- *Total length: 1 to 240*
- *Label length: 1 to 63*
- *Labels can consist of characters [a-z] and numbers [0-9]*
- *Labels are not allowed to start with "-"*
- *Labels are not allowed to end with "-"*

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

Firmware update

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

↳ *Chapter 1.6.6.2.2.4.2.1 “Stand-alone installation” on page 3676*

It is not possible to perform a firmware update out of Automation Builder.

- *For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.*
- *For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.*
- *For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.*

Requirements: **Before the firmware update**

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

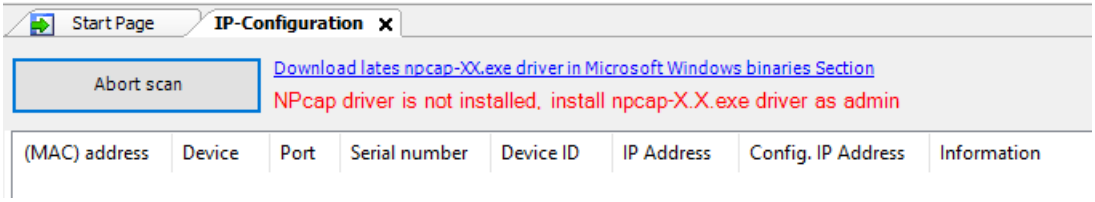
Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.

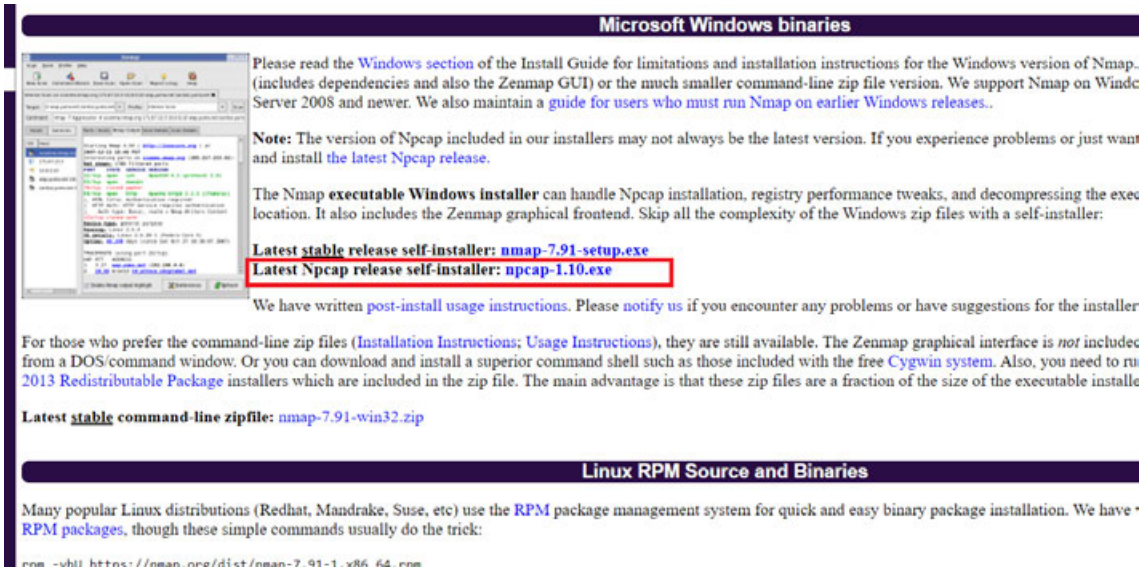
   Chapter 1.6.6.2.2.4.2.2.1 “Network scan” on page 3678
3. Select the devices that shall be updated from the list and click *[Scan]* to trigger the scan process.

   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.

4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:



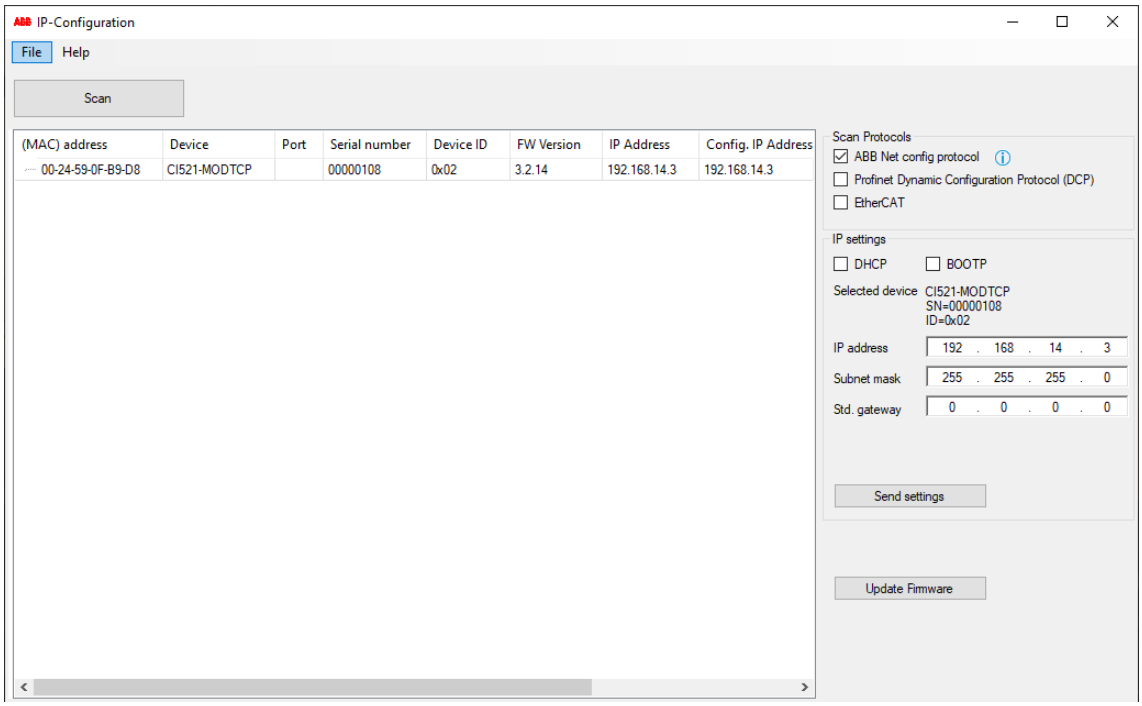
⇨ Click on the displayed link *https://nmap.org/download.html* and download the latest version of the *npcap-X.X.exe* file.



⇨ After the download, execute the file as administrator and restart the scan process.

⇨ The devices that have been scanned are listed.

5. Click *[Update Firmware]* to start the firmware update for the selected devices.



6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

   After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

   If the signature check fails, check the availability of the *.bin file and the *bin.sig file.

   ↳ *"Signature check" on page 3687*

7. A status check followed by a device reboot followed by a second status check is performed automatically.

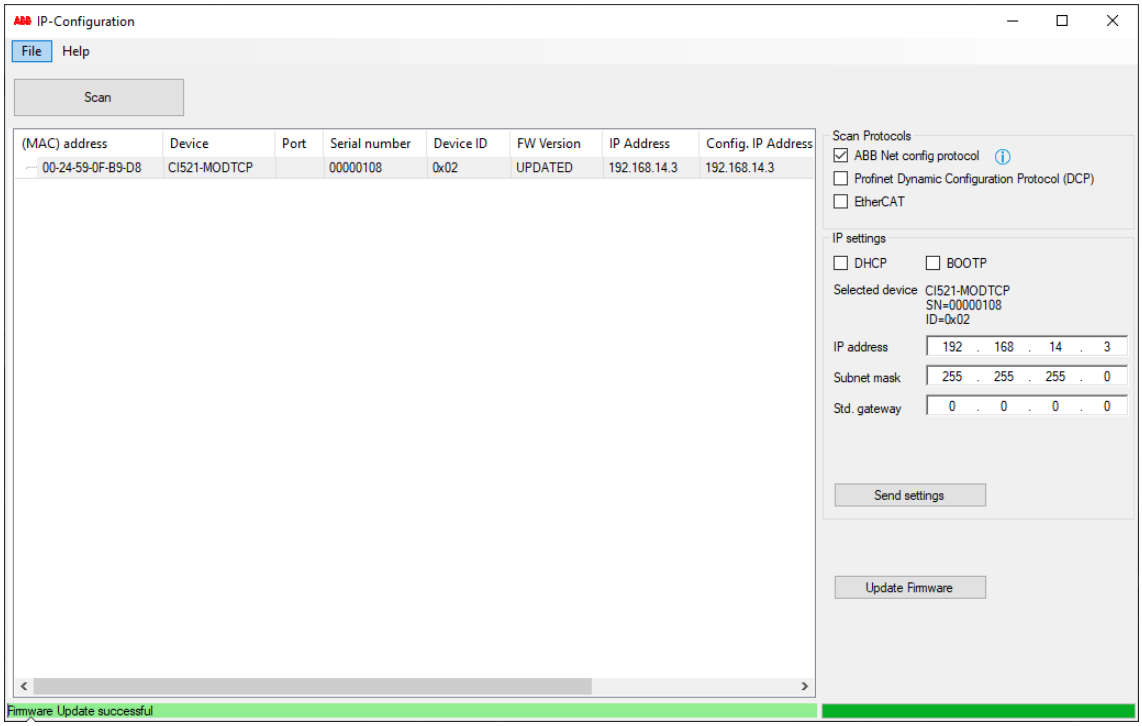
   > *After the firmware update all outputs of the updated devices are set to '0'.*

8. After a successful firmware update the update status or the new firmware version is displayed in the *"FW Version"* field.

   If this field is empty, there possibly is a connection error between the device and the executing PC.

   ↳ *"Error: Can't connect to device" on page 3688*

   Exception: For EtherCAT devices an empty *"FW Version"* field does not indicate a connection error.



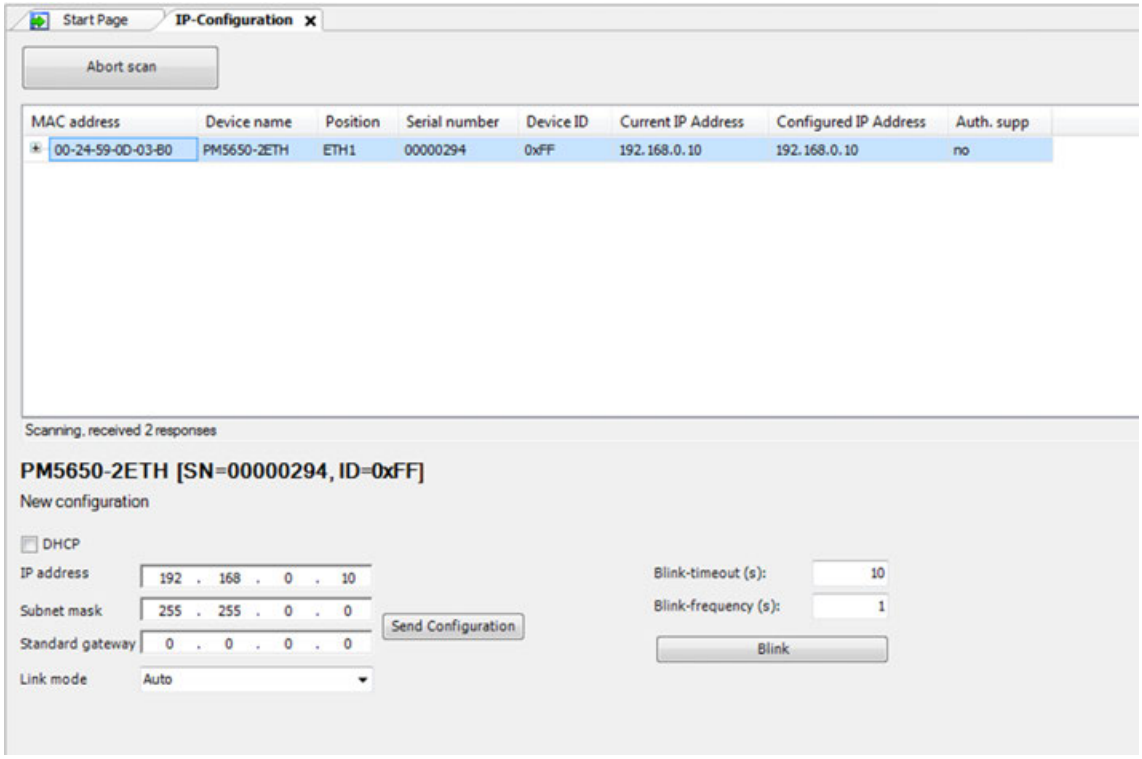
⇨ If the firmware update fails

- check the requirements for the update procedure.
  ↳ *"Requirements:" on page 3682*
- check the hints for trouble-shooting.
  ↳ *Chapter 1.6.6.2.2.4.2.3.1 "Trouble-shooting for firmware update" on page 3686*
- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.

Blink functionality

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select *"Tools ➔ IP-Configuration"*.
2. Click *[Scan]* to trigger the scan process for devices in the network.
   ⇨ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click *[Blink]* to activate flashing.



Trouble-shooting for IP configuration tool

Firewall exceptions:

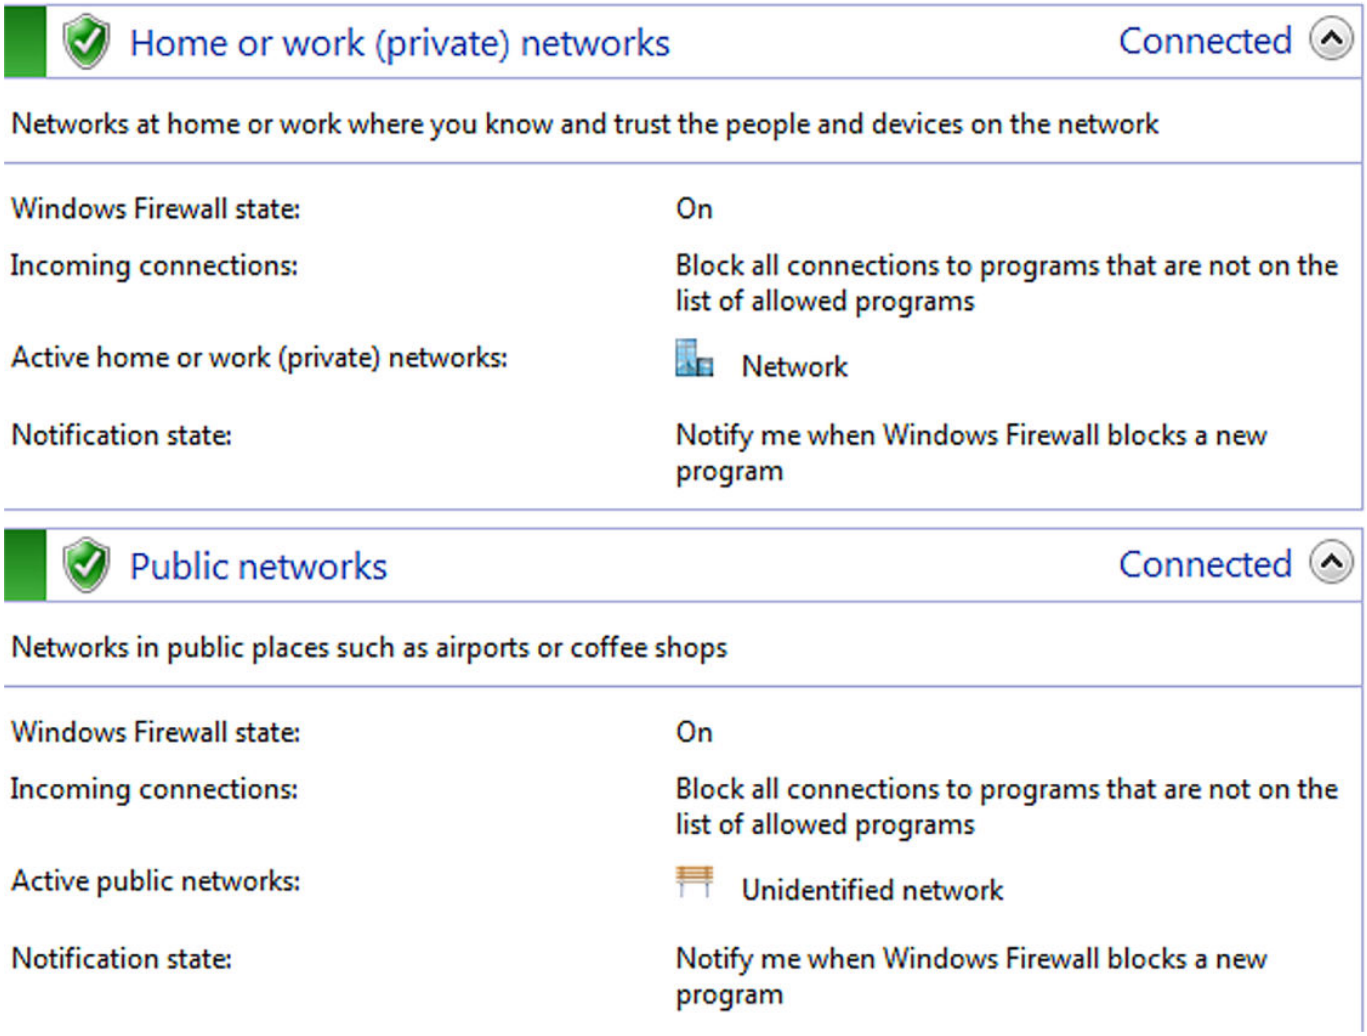
On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

Windows 7/ Windows 10:

On the network that is used for communication with the PLC, set *"Incoming connections"* to "Block all connections to programs that are not on the list of allowed programs".



If a third party firewall is used these exceptions must be configured manually.

> *Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.*
>
> *Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).*

Trouble-shooting for firmware update

Check the requirements

Ensure that all requirements have been considered before and during the update procedure.
“Requirements:” on page 3682

Check subnet configuration

This hint is only valid for Modbus devices and PROFINET devices.

If the *“FW Version”* field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.

Example

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

Click *[Scan]* again to restart the network scan. If the connection is successful a newer firmware version is displayed in the *"FW Version"* column.

Check last number of IP address

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

Example:

Automation Builder	AC500 communication interface module (rotary switch)
IP address: 192.168.14.0	IP address: 6
	As a result, in the field *"IP Address"* the last number is set to "6": 	

Signature check

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (**.bin*) and a signature file (**.bin.sig*) in the same directory. Without a signature file the signature check will fail.

Example:

Firmware update file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin***

Signature file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin.sig***

Error: Package timeout

A timeout error may occure due to an instable network.

Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

Error: Unable to read device status

A read error may occure due to errors in the firmware update protocol.

After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful.

Error: IP is not unique

If an IP address is obtained by more than one device an error occures. A firmware update is not possible.

Error: Error State

Internal device error during the firmware update.

Solution:

Step 1: Scan again and repeat the firmware update.

Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update.

Error: Can't connect to device

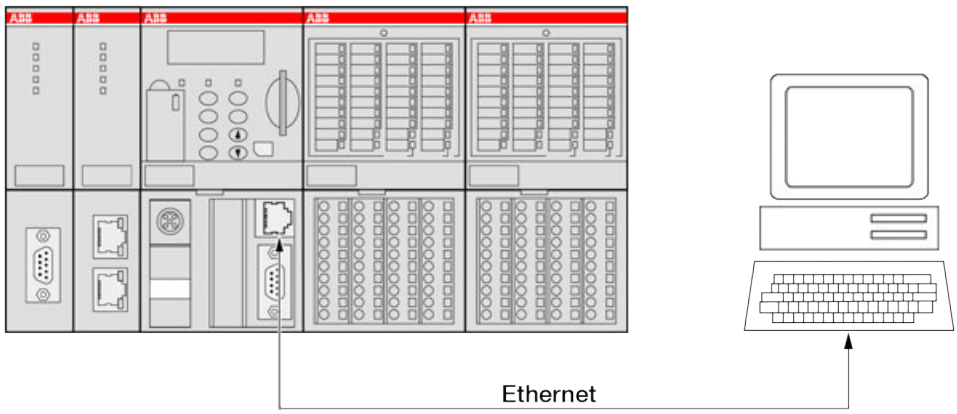
The TCP communication is not sufficient. Increase the connection quality.

Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal (onboard) Ethernet communication module.

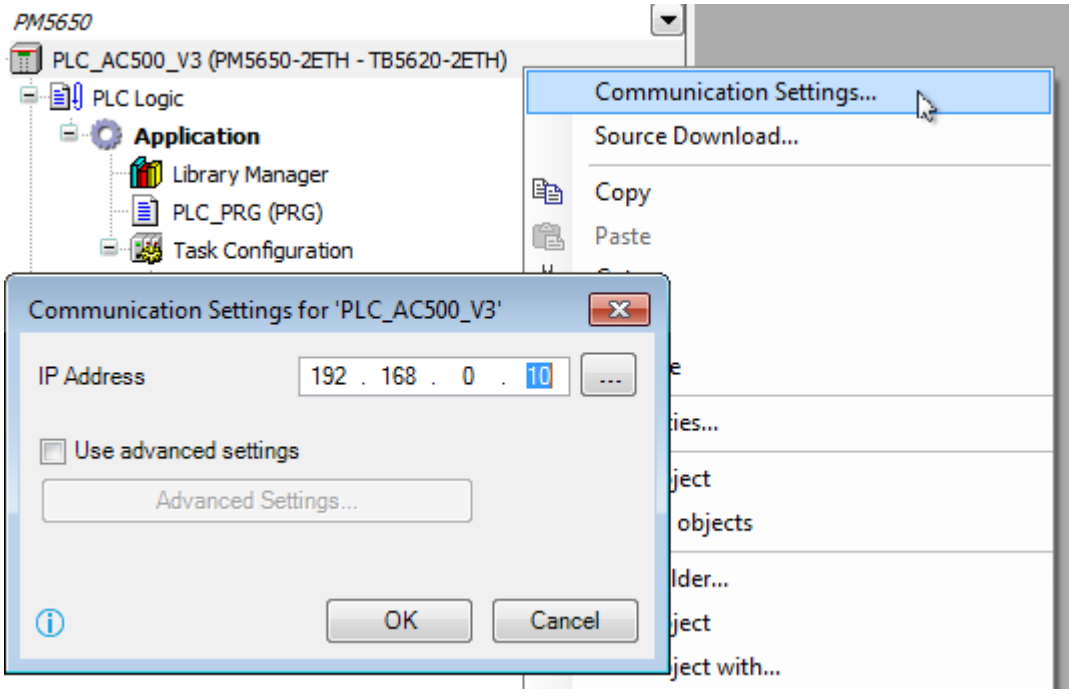
An application note describes the configuration of an AC500 V3 PLC for *EtherNet/IP communication* ↳ *Chapter 1.4.2.4 "EtherNet/IP Configurator" on page 1220*.



Enter a known PLC IP address

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.

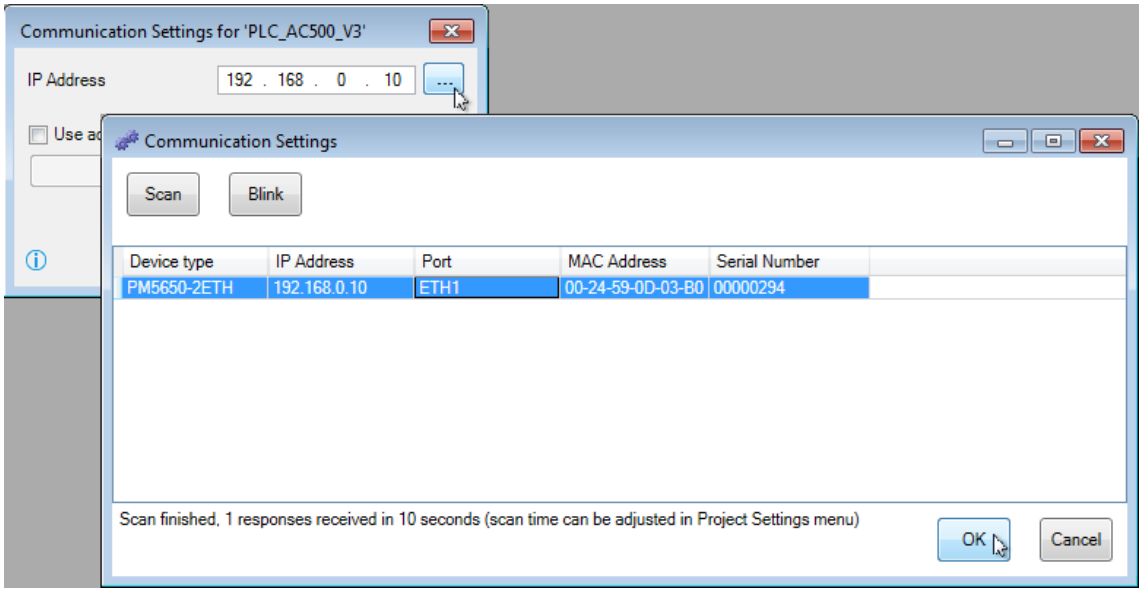


2. Enter your PLC *IP Address* and click *[OK]*.

Enter PLC IP address by scanning devices

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.

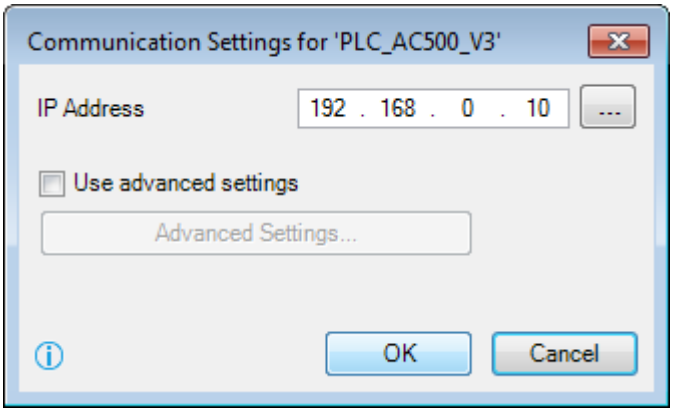


2. Click *[...]*.

   ⇨ Dialog box *Communication Settings <...>* appears.

3. Click *[Scan]*, select your desired PLC and click *[OK]*.
   ⇨ Entry is transferred to the dialog box *Communication Settings* <...>.

   Click *[OK]*.

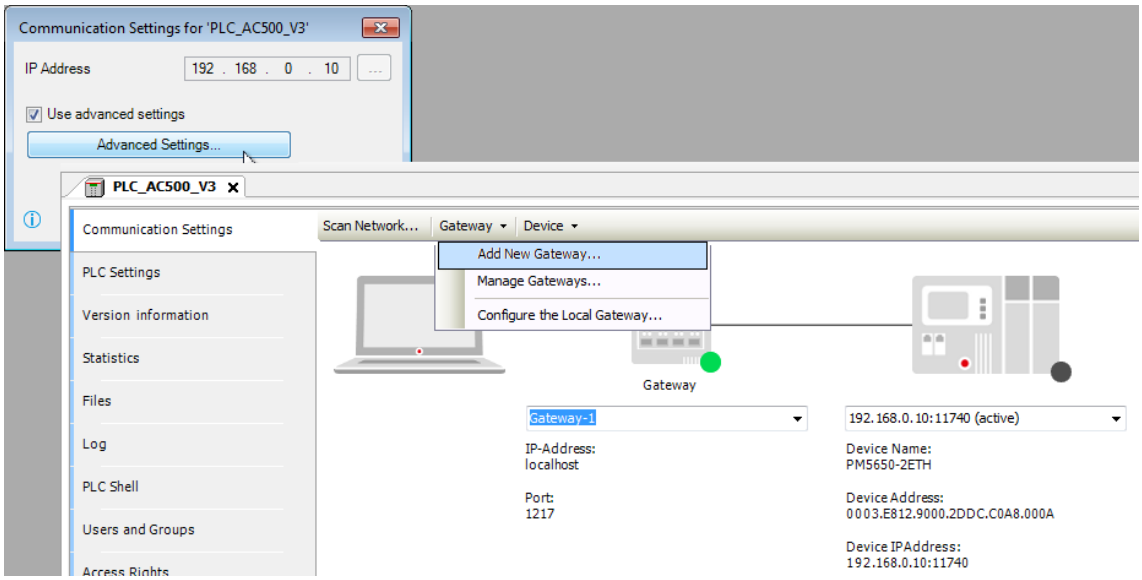


4. Click to log in the *"PLC_AC500_V3"* project.

Enter PLC IP address by *[Advanced Settings...]*

If a remote gateway instead of a local one has to be used it can be configured in the *[Advanced Settings...]*.

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.
   ⇨ Dialog box *Communication Settings* <...> appears.



2. Enable checkbox*Use advanced settings* and click *[Advanced Settings...]*.
   ⇨ Tab *"Communication Settings"* opens.
3. Check gateway or change if required.
   ⇨ Successful connection is indicated by green dot on the gateway icon.

4.

Manual entry of the IP address.

Check IP adress or change if required.

5. Press ENTER to confirm changed IP address.

   ⇨ Successful communication is indicated by green dot on the PLC icon.

6. Or instead of the last two steps:

Set the IP address via a scan.

Click *[Scan Network]*, select your desired PLC and click *[OK]*.

   ⇨ Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the *"PLC_AC500_V3"* project.

1.6.6.2.3 Processor modules

Configure a processor module in the device tree

1. Add a processor module to your project. ↳ *Chapter 1.6.6.1.1.1 “Creating a new project ” on page 3632*
2. Double-click the PLC node in the device tree.
   ⇨ This will open a new window with tabs for the device configuration:
   - *“Communication Settings”* ↳ *Chapter 1.4.1.20.2.8.2 “Tab 'Communication Settings'” on page 840*
   - *“PLC Settings”* ↳ *Chapter 1.4.1.20.2.8.9 “Tab 'PLC Settings'” on page 850*
   - *“Version information”* ↳ *Chapter 1.6.6.1.4.1 “Version information” on page 3652*
   - *“Statistics”* ↳ *Chapter 1.7.2.4.2 “Statistics” on page 4053*
   - *“Files”* ↳ *Chapter 1.4.1.20.2.8.7 “Tab 'Files'” on page 848*
   - *“Log”* ↳ *Chapter 1.7.2.4.3 “Log” on page 4053*
   - *“PLC Shell”* ↳ *Chapter 1.6.6.4.4 “PLC shell commands” on page 3950*
   - *“Users and Groups”* ↳ *Chapter 1.4.1.20.2.8.13 “Tab 'Users and Groups'” on page 860*

7. Select the *“Diagnosis”* tab to know what errors have occurred in the project. ↳ *Chapter 1.7.1.3.4 “Device diagnosis” on page 4018*

Parameter	Default	Value	Description
Error LED	On	On	The error LED lights up for errors of all classes, no fail-safe function activated.
		Off by E4	Warnings (E4) are not indicated by the error LED, no fail-safe function activated.
		Off by E3	Warnings (E4) and minor errors (E3) are not indicated by the error LED, no fail-safe function activated.
		POU control	Control LED ERR with POU PmErrLedSet
Check battery	On	On	The presence of the battery and the battery status are checked. If no battery is available or the battery is empty, a warning (E4) is generated and the ERR LED lights up.
		Off	The presence of the battery is not checked. No warning (E4) is generated. The LCD display "Batt" (triangle) can not be acknowledged! This also applies if a battery is installed but empty.
Stop on error class	Diagnosis of at least error class 2	Diagnosis of at least error class 2	In case of a fatal or severe error (E1-E2), the user program is stopped.
		Diagnosis of at least error class 3	In case of a fatal, severe or minor error (E1-E3), the user program is stopped.
		Diagnosis of at least error class 4	In case of a fatal, severe or minor error (E1-E3) or a warning (E4) the user program is stopped.
Diagnosis - Add PLC name to node name	Off	Off	Diagnosis - Add PLC name to node name.
		On	
PLC behavior after voltage dip	Halt	Halt	Behavior of the PLC after short voltage dip: reboot or halt.
		Reboot	
Diagnosis history	On	On	Enable the diagnosis history.
		Off	Disable the diagnosis history.
Max. Diagnosis history entries	1000	1000	Max. number of entries kept by the diagnosis history.
Missed cycle behavior	Next	Next	Skip the current cycle and start task in time on next cycle.
		ASAP	Start the task immediately.
Communication Schema	Default	Default	Balanced priority for communication via communication modules (CMs) and onboard Ethernet communication.
		Communication modules	Priority and high performance for communication module (CM) based communication via sync tasks. Lower priority for onboard Ethernet and local I/O bus.
		Onboard Ethernet	Priority for onboard Ethernet communication (e.g. via Modbus TCP). Lower priority for communication via communication modules (CMs).

Parameter	Default	Value	Description
		Real time onboard Ethernet	Very high priority for onboard Ethernet communication (e.g. EtherCAT PROFINET Ethernet). Low priority for communication via communication modules (CMs).
Automated reboot after E2 error	Off	Off	Not automated reboot after E2 error.
		On	Automated reboot after E2 error.

Changing the processor module type

In a project, you can change the target system by changing the type of processor module or terminal base type. If possible, the device configuration of fieldbusses and interfaces is kept and switched over to the device configuration of the new module.

Target change options:

- between platforms: from V2 platform to V3 platform (and vice versa)
- between module types: from AC500 (standard) to AC500-eCo (and vice versa)
- a combination of changed platform and changed module type

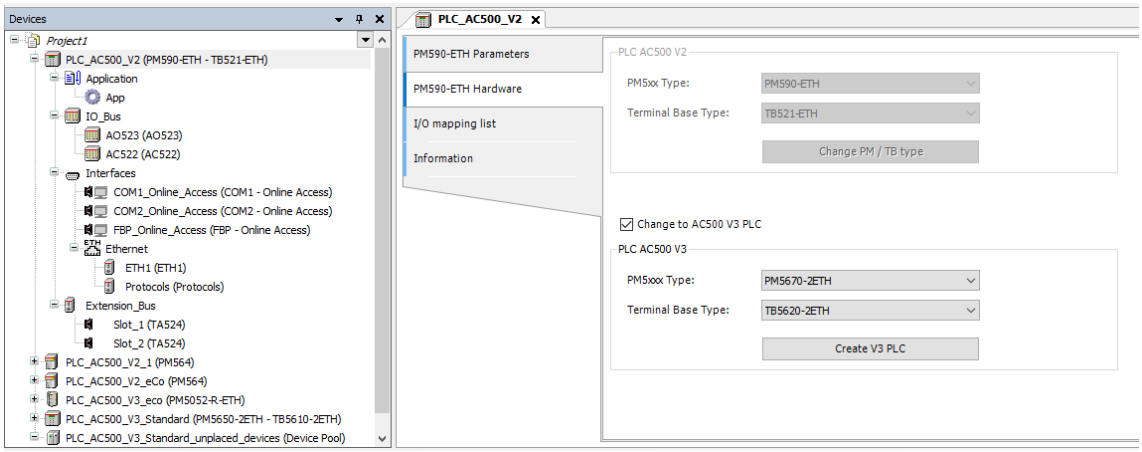
Target change from a V2 processor module to a V3 processor module

Target change options:

- AC500 V2 processor module ➜ AC500 V3 processor module
- AC500 V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V2 processor module ➜ AC500 V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V2 <...>* node and open the *“PM5<...> Hardware”* tab.
3. Enable *“Change to AC500 V3 PLC”* and select the desired V3 processor module from the *“PM5xx Type”* drop-down list.



4. Click *[Create V3 PLC]*.
   ⇨ The new V3 processor module is displayed in the navigation tree.
   ⇨ Change the node name of the processor module, if desired.

> *In case of a target change from AC500-eCo V2 to AC500-eCo V3, the I/O bus and Ethernet configuration is kept.*

Target change from a V3 processor module to another V3 processor module

Target change options:

- AC500 V3 processor module ➜ AC500 V3 processor module
- AC500 V3 processor module ➜ AC500-eCo V3 processor module
- AC500-eCo V3 processor module ➜ AC500 V3 processor module
- AC500-eCo V3 processor module ➜ AC500-eCo V3 processor module

Procedure:

1. Close CODESYS.
2. Double-click the *PLC_AC500_V3 <...>* node and open the *"PM5<...> Hardware"* tab.
3. Select the desired V3 processor module from the *"PM5xx Type"* drop-down list.

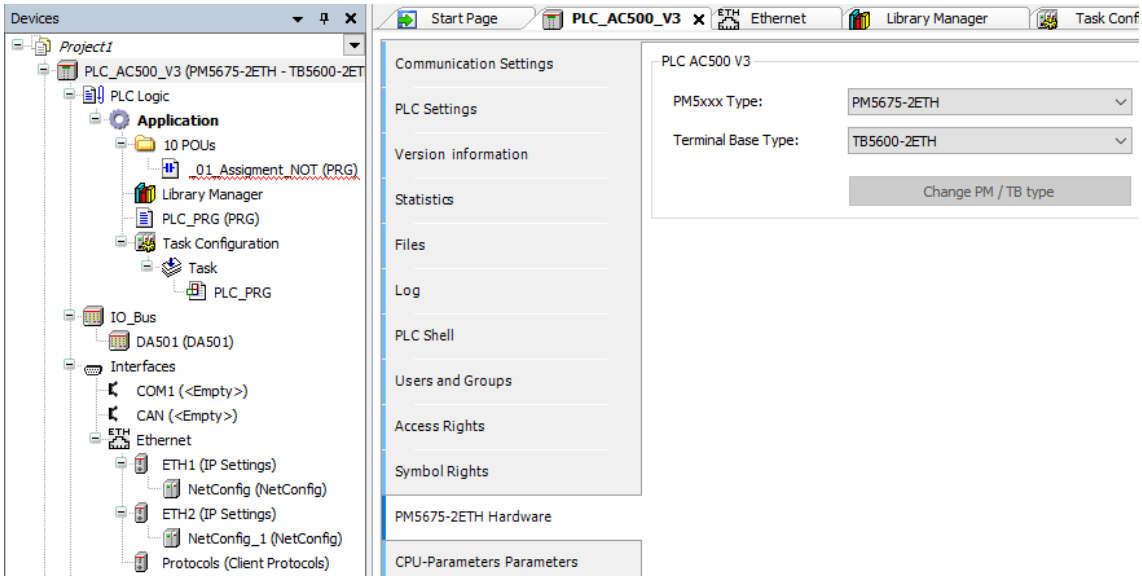


Fig. 310: Change_Hardware_V3

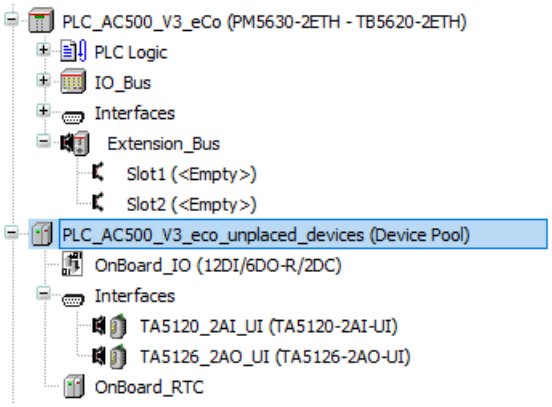
4. Ensure the correct *"Terminal Base Type"* is selected and click *[Change PM / TB type]*.

   ⇨ If possible, the device configurations from the previous processor module will be kept and switched over to the new processor module.

   The device configurations that cannot be kept are listed in a prompted information dialog.

   By default, all device configurations which cannot be switched over will be copied to a "device pool" section in the navigation tree (option "Copy all objects that cannot be added to the new PLC into a device pool for further access"). If required, this backuped configuration can be used in another project or in another processor module configuration.

   If the checkbox is deactivated all device configurations that cannot be switched will be lost after the execution of the target change.



Target change from AC500-eCo V3 to AC500 V3

The configuration of the onboard I/Os, the option board slots and the onboard RTC cannot be changed-over to the new module.

Target change from AC500 V3 to AC500-eCo V3

The configuration of COM1, CAN and the I/O bus cannot be changed-over to the new module. Depending on the selected target, also the I/O bus configuration and ETH2 configuration cannot be switched.

ETH1 configuration is kept even if the configured protocols are not allowed for the selected AC500-eCo V3 PLC. In this case error messages are displayed in the messages window.

Libraries which are not used anymore are not deleted with the target change. Libraries of option boards are kept in the Library Manager even if no longer available at the target module.

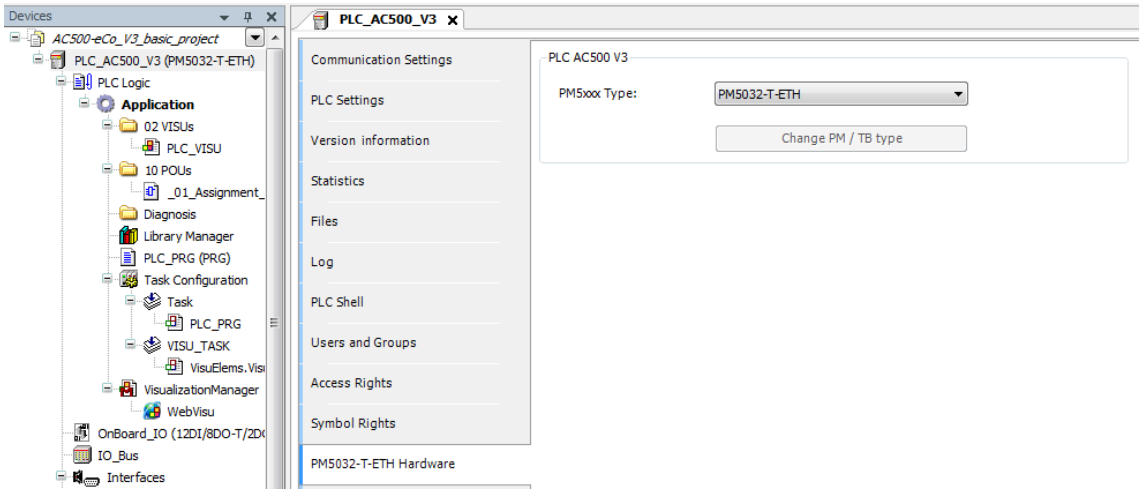
Changing the processor module type for AC500-eCo V3 CPU

It is not possible to change from an AC500 V3 processor module to an AC500-eCo V3 processor module!

Changing an AC500-eCo V3 processor module to another AC500-eCo V3 processor module is possible and the same limitation as listed before are applying, only the available or possible feature from the new processor module will be kept from the old processor module.

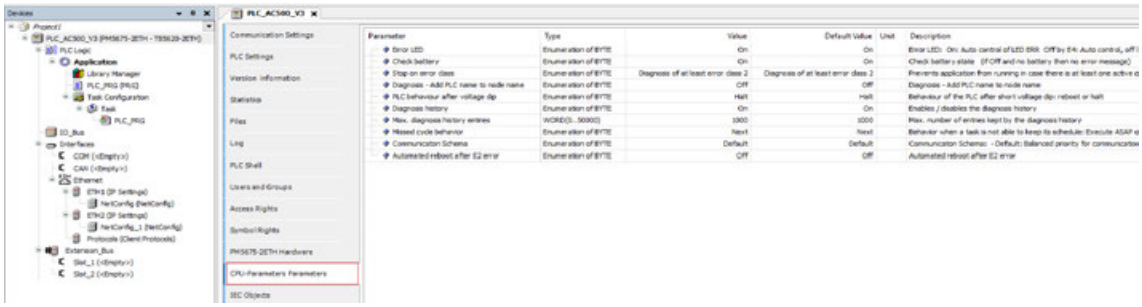
☑ Close CODESYS.

1. Double-click the *PLC_AC500_V3 <...>* node.



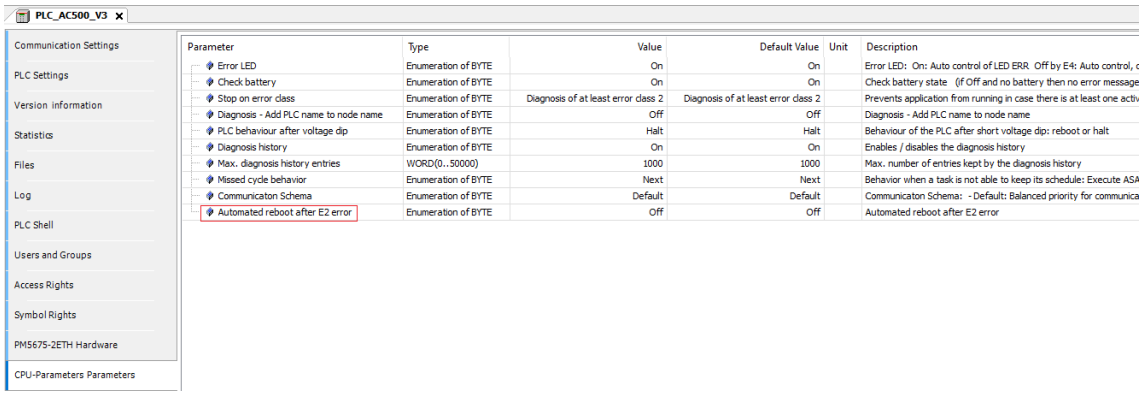
2. Open the *“PM50xx Hardware”* tab and select the new *“PM50xx Type”* from the drop-down list.

Parameters of the processor module



Automated reboot after E2 error

The parameter *“Automated reboot after E2 error”* allows to set the behavior of the CPU in case of severe errors (class E2).

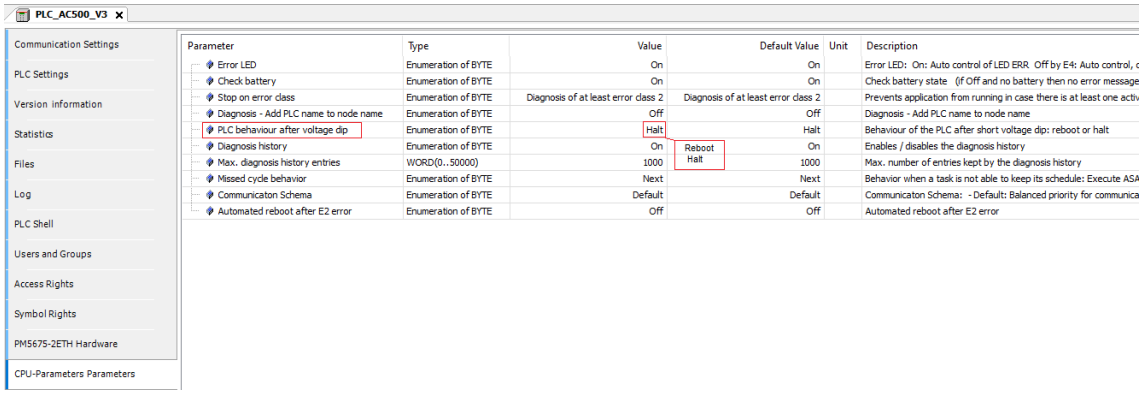


If the default setting *“Off”* is used, no automated reebot after an E2 error is performed.

If the setting *“On”* is used, an automated reebot after an E2 error is performed.

PLC behaviour after voltage dip

The parameter *“PLC behaviour after voltage dip”* allows to set the behavior of the CPU in case of short voltage dips.



If the default setting *“Halt”* is used, the CPU is changed to STOP mode if a short voltage dip >10 ms occurs. A new powercycle is required.

If the setting *“Reboot”* is used, CPU will reboot after power supply has recovered to nominal value.

Floating point values

A calculation with floating points can lead to the following values:

0 (zero)

If a calculation results in an underrun, the value is set to 0 (result near 0, but not presentable). Depending on the sign bit, it can be a positive zero or a negative zero. The operator "=" of -0 and 0 returns TRUE.

Infinity

If a calculation results in an overrun, the value is set to Infinity (the result is not presentable). Depending on the sign bit, it can be a positive infinity (Infinity) or negative infinity (-Infinity).

If Infinity is converted into another data type it results in the maximum value of the other data type (e.g.. conversion into DWORD with REAL_TO_DWORD: 16#FFFFFFFF, into DINT with REAL_TO_DINT: 16#7FFFFFFF).

If -Infinity is converted into another data type it results in the maximum value of the other data type (e.g.. conversion into DWORD with REAL_TO_DWORD: 16#00000000, into DINT with REAL_TO_DINT: 16#80000000).

Except for:

```
TRUE := REAL_TO_BOOL(Infinity);
'#Inf' := REAL_TO_STRING(Infinity);
'-#Inf' := REAL_TO_STRING(-Infinity);
```

Examples:

Infinity	-Infinity
Infinity := 1.0 / 0.0	-Infinity := -1.0 / 0.0
Infinity := Infinity + Infinity	-Infinity := -Infinity -Infinity
Infinity := Infinity + 1.0	-Infinity := -Infinity + 1.0
Infinity := LREAL_TO_REAL(Infinity)	-Infinity := LREAL_TO_REAL(-Infinity)

NaN

If a calculation results in an undefined value the result is set to NaN (Not a Number). The result of each calculation with NaN is NaN. The operators "<", "<=", ">" and ">=" return FALSE if either or both operands are NaN.

Operator "=" returns FALSE if one operand is NaN.

Operator "<>" returns TRUE if one operand is NaN.

If NaN is converted into another data type the result is 0.

Except for:

```
TRUE := REAL_TO_BOOL(NaN);
'#NaN' := REAL_TO_STRING(NaN);
```

Examples:

NaN := SQRT(-2.0)

NaN := 0.0 / 0.0

NaN := Infinity -Infinity

NaN := 0.0 * Infinity

NaN := Inifnity / Infinity

The result of an operation can be checked with the following program parts:

Check for NaN (REAL):	Check for NaN (LREAL):

`rX: REAL;`
`IF (rX <> rX) THEN`
(* rX is a NaN *)
`...;`
`END_IF;`
	`lrX: LREAL;`
	`IF (lrX <> lrX) THEN`
	(* lrX is a NaN *)
	`...;`
	`END_IF;`

Check for Infinity (REAL):	Check for Infinity (LREAL):
Infinity is represented with sign bit 0, exponent of all 1s and a fraction of all 0s. -Infinity is represented with sign bit 1, exponent of all 1s and a fraction of all 0s.	

rX: REAL;
prX: POINTER TO REAL;
pdwX: POINTER TO DWORD;
prX := ADR(rX);
pdwX := prX;
IF (pdwX^ = 16#7F800000) THEN
(* rX is Infinity *)
...;
END_IF;
IF (pdwX^ = 16#FF800000) THEN
(* rX is -Infinity *)
...;
END_IF;
	lrX: LREAL;
	plrX: POINTER TO LREAL;
	plwX: POINTER TO LWORD;
	plrX := ADR(lrX);
	plwX := plrX;
	IF (plwX^ = 16#7FF0000000000000) THEN
	(* lrX is Infinity *)
	...;
	END_IF;
	IF (plwX^ = 16#FFF0000000000000) THEN
	(* lrX is -Infinity *)
	...;
	END_IF;

1.6.6.2.4 AC500-eCo V3 onboard I/Os

According to the used AC500-eCo V3 processor module, the onboard I/Os are different and the functionality of the I/Os are adapted to the processor module type.

Onboard I/O combination	PM5012-x-ETH	PM5032-x-ETH	PM5052-x-ETH	PM5072-T-2ETH
6 DI, digital input 24 V DC / 4 DO, digital output transistor 24 V DC / 0.5 A	X			
6 DI, digital input 24 V DC / 4 DO, digital output relay 240 V AC / 2 A	X			
12 DI, digital input 24 V DC / 8 DO, digital output transistor 24 V DC / 0.5 A / 2 DC, digital in/out configurable 24 V DC, 24 V DC / 0.5 A		X	X	X
12 DI, digital input 24 V DC / 6 DO, digital output relay 240 V AC / 2A / 2 DC, digital in/out configurable 24 V DC, 24 V DC / 0.5 A		X	X	

1.6.6.2.5 Configure the onboard I/O channel

The onboard I/Os support the following channels functions according to the processor module type:

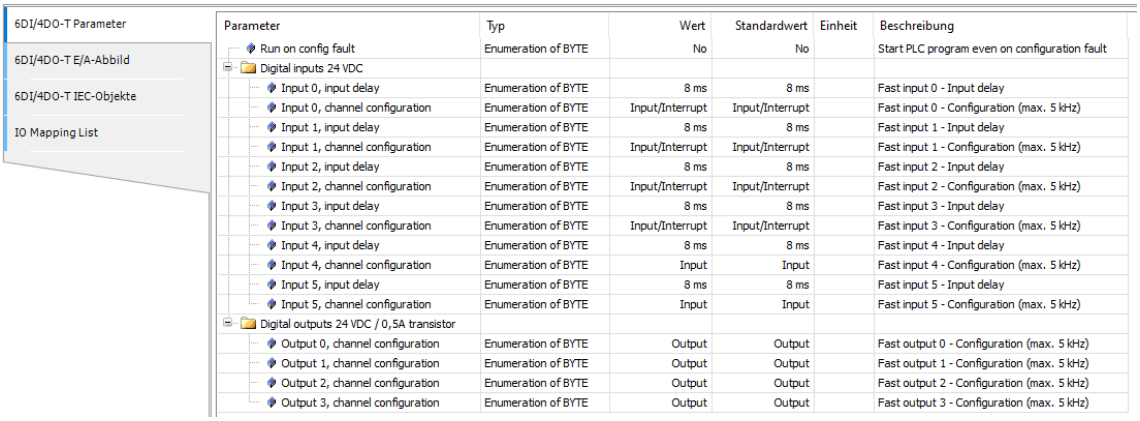
Onboard I/O type	Channel function	PM5012-T-ETH	PM5012-R-ETH	Channel name when available
Digital input channel total thereof as	Digital input	6	6	DI0 … DI5
Fast input x, max. 5 kHz	Digital input	6	6	DI0 … DI5
	Interrupt input	4	4	DI0 … DI3
	Fast counter	2	2	DI4 … DI5
Digital output channel total thereof as	Digital output	4	4	DO0 … DO3
Fast output x, max. 5 kHz	Digital output	4	4	DO0 … DO3
	Limit switch	4	-	DO0 … DO3
	PWM output	4	-	DO0 … DO3

Onboard I/O type	Channel function	PM5032-T-ETH PM5052-T-ETH PM5072-T-2ETH	PM5032-R-ETH PM5052-R-ETH	Channel name when available
Digital input channel total thereof as	Digital input	12	12	DI0 … DI11
Fast input x, max. 5 kHz	Digital input	4	4	DI0 … DI3
	Interrupt input	4	4	DI0 … DI3
	Touch/Reset	4, together with dedicated encoder	4, together with dedicated encoder	DI0 … DI3
Fast input x, max. 100 kHz	Digital input	4	4	DI4 … DI7
	Interrupt input	2, with A/B tracks	2, with A/B tracks	DI4 … DI7
	Fast counter	4	4	DI4 … DI7
Standard input	Digital input	4	4	DI8 … DI11
Digital output channel total thereof as	Digital output	8	6	DO0 … DO7 DO0 … DO5
Fast output x, max. 5 kHz	Digital output	4	-	DO0 … DO3
	Limit switch	4	-	DO0 … DO3
	PWM output	4	-	DO0 … DO3
Fast output x, max. 100 kHz	Digital output	4	-	DO4 … DO7
	Limit switch	4	-	DO4 … DO7
	PWM output	4	-	DO4 … DO7
	PTO output	2, pair of output	-	DO4 … DO7
Digital in/output configurable channel total thereof as	Digital in/output	2	2	DC12 … DC13
Standard dig. channel	Digital In/output	2	2	DC12 … DC13

Onboard I/O type	Channel function	PM5032-T-ETH PM5052-T-ETH PM5072-T-2ETH	PM5032-R-ETH PM5052-R-ETH	Channel name when available
Fast output, max. 100 kHz	Limit switch	-	2	DC12 … DC13
	PWM output	-	2	DC12 … DC13
	PTO output	-	2	DC12 … DC13

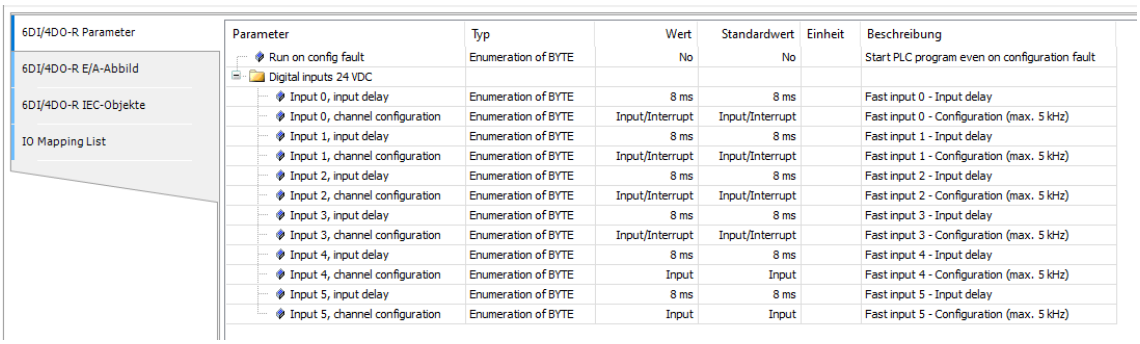
PM5012-x-ETH Basic CPU

For all CPU versions the configuration of the input channels is the same. The configuration of the output channels is only available on CPU version with transistor output channels:



Parameter	Typ	Wert	Standardwert	Einheit	Beschreibung
Run on config fault	Enumeration of BYTE	No	No		Start PLC program even on configuration fault
Digital inputs 24 VDC					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 0 - Input delay
Input 0, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 0 - Configuration (max. 5 kHz)
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 1 - Input delay
Input 1, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 1 - Configuration (max. 5 kHz)
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 2 - Input delay
Input 2, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 2 - Configuration (max. 5 kHz)
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 3 - Input delay
Input 3, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 3 - Configuration (max. 5 kHz)
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 4 - Input delay
Input 4, channel configuration	Enumeration of BYTE	Input	Input		Fast input 4 - Configuration (max. 5 kHz)
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 5 - Input delay
Input 5, channel configuration	Enumeration of BYTE	Input	Input		Fast input 5 - Configuration (max. 5 kHz)
Digital outputs 24 VDC / 0,5A transistor					
Output 0, channel configuration	Enumeration of BYTE	Output	Output		Fast output 0 - Configuration (max. 5 kHz)
Output 1, channel configuration	Enumeration of BYTE	Output	Output		Fast output 1 - Configuration (max. 5 kHz)
Output 2, channel configuration	Enumeration of BYTE	Output	Output		Fast output 2 - Configuration (max. 5 kHz)
Output 3, channel configuration	Enumeration of BYTE	Output	Output		Fast output 3 - Configuration (max. 5 kHz)

Version with relay outputs, same configuration for the input channels, no configuration for the output channels relay:



Parameter	Typ	Wert	Standardwert	Einheit	Beschreibung
Run on config fault	Enumeration of BYTE	No	No		Start PLC program even on configuration fault
Digital inputs 24 VDC					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 0 - Input delay
Input 0, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 0 - Configuration (max. 5 kHz)
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 1 - Input delay
Input 1, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 1 - Configuration (max. 5 kHz)
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 2 - Input delay
Input 2, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 2 - Configuration (max. 5 kHz)
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 3 - Input delay
Input 3, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 3 - Configuration (max. 5 kHz)
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 4 - Input delay
Input 4, channel configuration	Enumeration of BYTE	Input	Input		Fast input 4 - Configuration (max. 5 kHz)
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 5 - Input delay
Input 5, channel configuration	Enumeration of BYTE	Input	Input		Fast input 5 - Configuration (max. 5 kHz)

The following parameter can be configured:

Onboard I/O type	Parameter	Channel name	Default value	Value	Description
Digital inputs	Input X, input delay	Channel 0..5	8 ms	No delay	Configures input with no delay
				1 ms	Configures 1 ms input delay
				8 ms	Configures 8 ms input delay
				32 ms	Configures 32 ms input delay

Onboard I/O type	Parameter	Channel name	Default value	Value	Description
	Input X, channel configuration	Channel 0..3	Input/Interrupt	Input/Interrupt	Configures the channel as normal digital or interrupt input
	The configuration /function of the following channels is realized using function blocks in the program	Channel 4..5	Input	Input	Configures the channel as normal digital input
				Encoder 0 track-A or B	Configures the pair of channels as encoder input track A or B. When that value is configured then both channels are reserved for that functionality
				Forward counter	Configures the channel as forward counter
The configuration of output channel is only available on the CPU with transistor outputs					
Digital outputs	Output X, channel configuration	Channel 0..3	Output	Output	Configures the channel as digital output
				Limit switch	Configures the channel as limit switch output
				PWM	Configures the channel as PWM output

PM5032-x-ETH, PM5052-x-ETH Standard CPU

For all CPU versions the configuration of the input channels is the same. The configuration of the output channels is only available on CPU version with transistor output channels, the digital configurable In/Output channels are present on both version (transistor or relay output) but with different features configurable:

12DI/8DO-T/2DC Parameter
12DI/8DO-T/2DC E/A-Abbild
12DI/8DO-T/2DC IEC-Objekte
IO Mapping List

Parameter	Typ	Wert	Standardwert	Einheit	Beschreibung
Run on config fault	Enumeration of BYTE	No	No		Start PLC program even on configuration fault
Digital inputs 24 VDC					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 0 - Input delay
Input 0, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 0 - Configuration (max. 5 kHz)
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 1 - Input delay
Input 1, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 1 - Configuration (max. 5 kHz)
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 2 - Input delay
Input 2, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 2 - Configuration (max. 5 kHz)
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 3 - Input delay
Input 3, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 3 - Configuration (max. 5 kHz)
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 4 - Input delay
Input 4, channel configuration	Enumeration of BYTE	Input	Input		Fast input 4 - Configuration (max. 100 kHz)
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 5 - Input delay
Input 5, channel configuration	Enumeration of BYTE	Input	Input		Fast input 5 - Configuration (max. 100 kHz)
Input 6, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 6 - Input delay
Input 6, channel configuration	Enumeration of BYTE	Input	Input		Fast input 6 - Configuration (max. 100 kHz)
Input 7, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 7 - Input delay
Input 7, channel configuration	Enumeration of BYTE	Input	Input		Fast input 7 - Configuration (max. 100 kHz)
Input 8, input delay	Enumeration of BYTE	8 ms	8 ms		Standard input 8 - Input delay
Input 9, input delay	Enumeration of BYTE	8 ms	8 ms		Standard input 9 - Input delay
Input 10, input delay	Enumeration of BYTE	8 ms	8 ms		Standard input 10 - Input delay
Input 11, input delay	Enumeration of BYTE	8 ms	8 ms		Standard input 11 - Input delay
Digital outputs 24 VDC / 0,5A transistor					
Output 0, channel configuration	Enumeration of BYTE	Output	Output		Fast output 0 - Configuration (max. 5 kHz)
Output 1, channel configuration	Enumeration of BYTE	Output	Output		Fast output 1 - Configuration (max. 5 kHz)
Output 2, channel configuration	Enumeration of BYTE	Output	Output		Fast output 2 - Configuration (max. 5 kHz)
Output 3, channel configuration	Enumeration of BYTE	Output	Output		Fast output 3 - Configuration (max. 5 kHz)
Output 4, channel configuration	Enumeration of BYTE	Output	Output		Fast output 4 - Configuration (max. 100 kHz)
Output 5, channel configuration	Enumeration of BYTE	Output	Output		Fast output 5 - Configuration (max. 100 kHz)
Output 6, channel configuration	Enumeration of BYTE	Output	Output		Fast output 6 - Configuration (max. 100 kHz)
Output 7, channel configuration	Enumeration of BYTE	Output	Output		Fast output 7 - Configuration (max. 100 kHz)
Digital configurable In/outputs 24 VDC / 0,5A transistor					
Input / Output DC12, channel configuration	Enumeration of BYTE	Input/Output	Input/Output		Digital configurable channel 12 - Configuration
Input / Output DC13, channel configuration	Enumeration of BYTE	Input/Output	Input/Output		Digital configurable channel 13 - Configuration

For the CPU with relay outputs, the digital configurable Input/Output channels have specific functionalities:

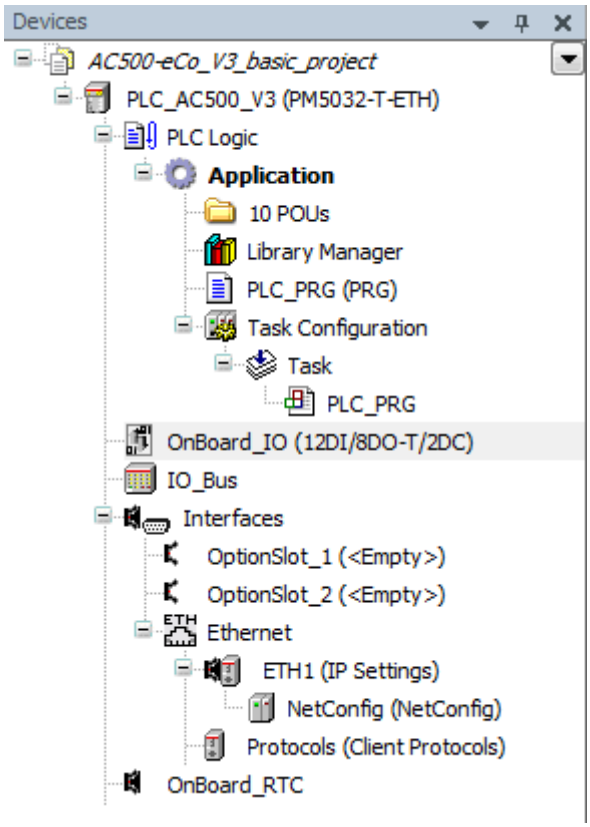
Onboard I/O type	Parameter	Channel name	Default value	Value	Description
Digital inputs	Input X, input delay	Channel 0..11	8 ms	No delay	Configures input with no delay
				1 ms	Configures 1 ms input delay
				8 ms	Configures 8 ms input delay
				32 ms	Configures 32 ms input delay
Fast inputs max. 5 kHz	Input X, channel configuration	Channel 0..1	Input/Interrupt	Input/Interrupt	Configures the channel as normal digital or interrupt input
				Touch/Reset 0	Configures the pair of adjacent channels as Touch/Reset inputs together with encoder 0
		Channel 2..3	Input/Interrupt	Input/Interrupt	Configures the channel as normal digital or interrupt input
				Touch/Reset 1	Configures the pair of adjacent channels as Touch/Reset inputs together with encoder 1
Fast inputs max. 100/200 kHz	The function of the following channels is realized using function blocks in the program	Channel 4..5	Input	Input	Configures the channel as normal digital input
Max. frequency 200 kHz	When that value is configured then both channels are reserved for that functionality			Encoder 0 track-A or B	Configures the pair of adjacent channels as encoder 0 input track A or B.
Max. frequency 100 kHz				Forward counter	Configures the channel as forward counter
Fast inputs max. 100/200 kHz		Channel 6..7	Input	Input	Configures the channel as normal digital input

Onboard I/O type	Parameter	Channel name	Default value	Value	Description
Max. frequency 200 kHz	When that value is configured then both channels are reserved for that functionality			Encoder 1 track-A or B	Configures the pair of adjacent channels as encoder 1 input track A or B.
				Touch/Reset	Configures the pair of adjacent channels as Touch/Reset inputs together with encoder 0
Max. frequency 100 kHz				Forward counter	Configures the channel as forward counter
The following configuration of output channel is only available on the CPU with transistor					
Fast outputs, max. 5 kHz	Output X, channel configuration	Channel 0..3	Output	Output	Configures the channel as digital output
	The configuration / function of the following channels is realized using function blocks in the program			Limit switch	Configures the channel as limit switch output
				PWM	Configures the channel as PWM output
Fast outputs max. 100/200 kHz	Output X, channel configuration	Channel 4..7	Output	Output	Configures the channel as digital output
	The function of the following channels is realized using function blocks in the program			Limit switch	Configures the channel as limit switch output
Max. frequency 100 kHz				PWM	Configures the channel as PWM output
Max. frequency 100/200 kHz	Depending on the OBIOMotionPTO or OBIOMotionPWM function block used			PTO	Configures the pair of adjacent channels as PTO output
Digital configurable input/outputs	Output X, channel configuration	Channel DC12..DC13	Input/Output	Input/Output	Configures the channel as digital input/output
The following configuration of output channel is only available on the CPU with relay outputs					

Onboard I/O type	Parameter	Channel name	Default value	Value	Description
Digital configurable input/outputs	Output X, channel configuration	Channel DC12..DC13	Input/Output	Input/Output	Configures the channel as digital input/output
	The function of the following channels is realized using function blocks in the program			Limit switch	Configures the channel as limit switch output
Max. frequency 100 kHz				PWM	Configures the channel as PWM output
Max. frequency 100/200 kHz	Depending on the OBIOMotionPTO or OBIOMotionPWM function block used			PTO	Configures the pair of channels as PTO output

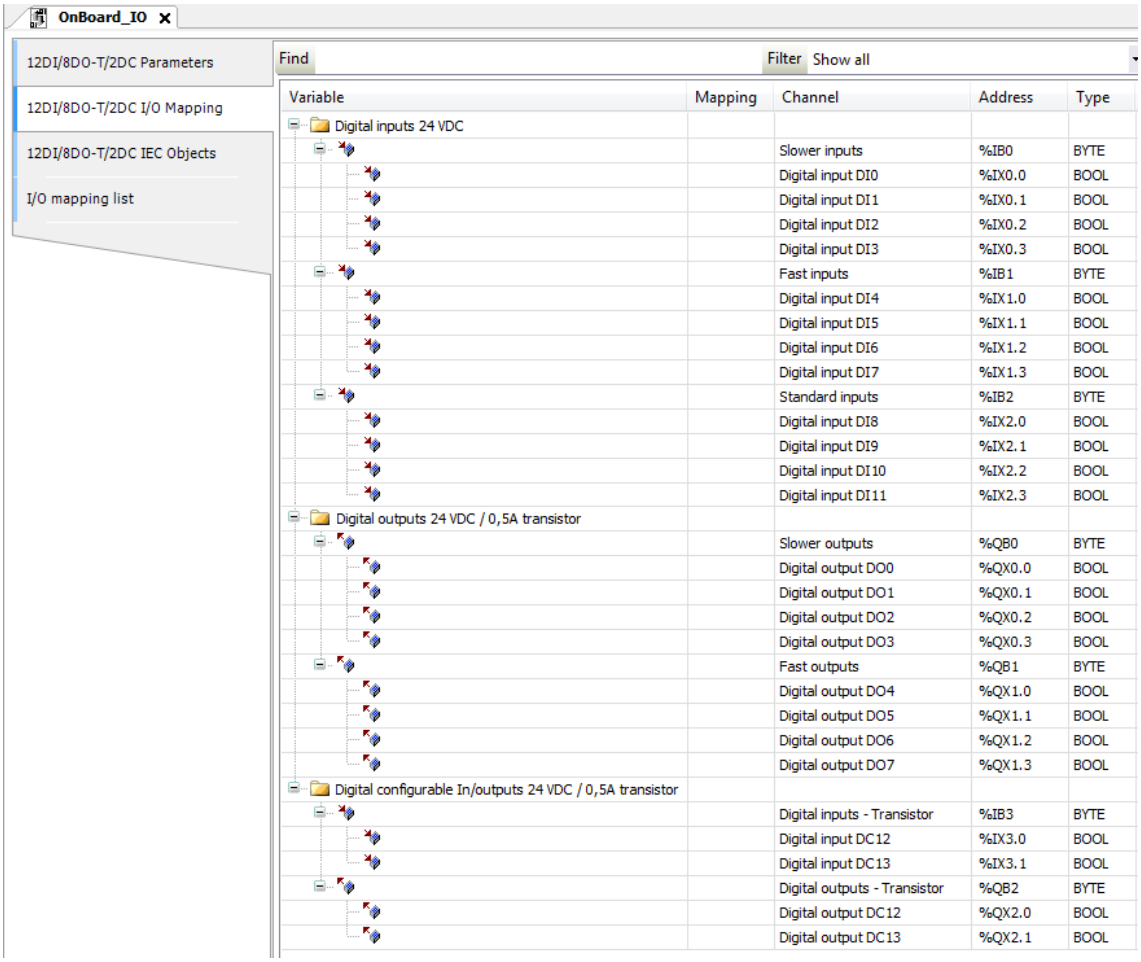
1.6.6.2.6 Mapping of the I/O channels

Onboard I/O variable mapping



1. Double-click *“OnBoard_IO”* in the device tree.

⇨ A tab opens in the editor view.

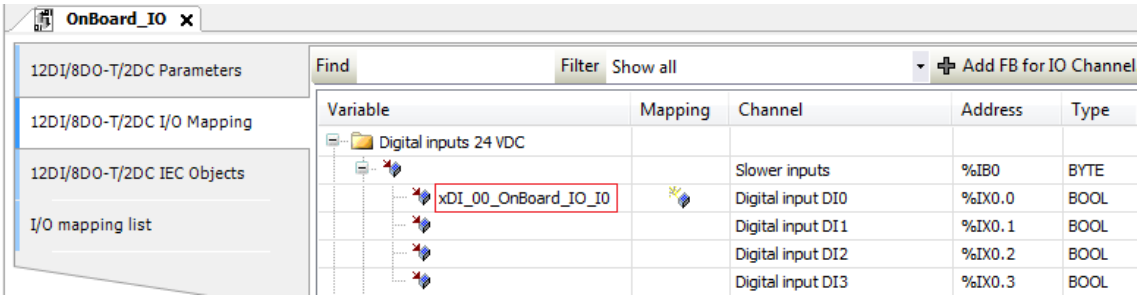


2. Select *“12DI/8DO-T/2DC I/O Mapping”*.

⇨ Here, you will map variable names (symbols) for the channels you will need in the program.

The suggested name convention is based on "Hungarian notation". A name prefix is describing variable type: e.g., "x" = variable of type BOOL, "w" = WORD, "i" = INT (integer) etc. This increases the code readability and is helpful for program analysis.

Handle the digital input variables

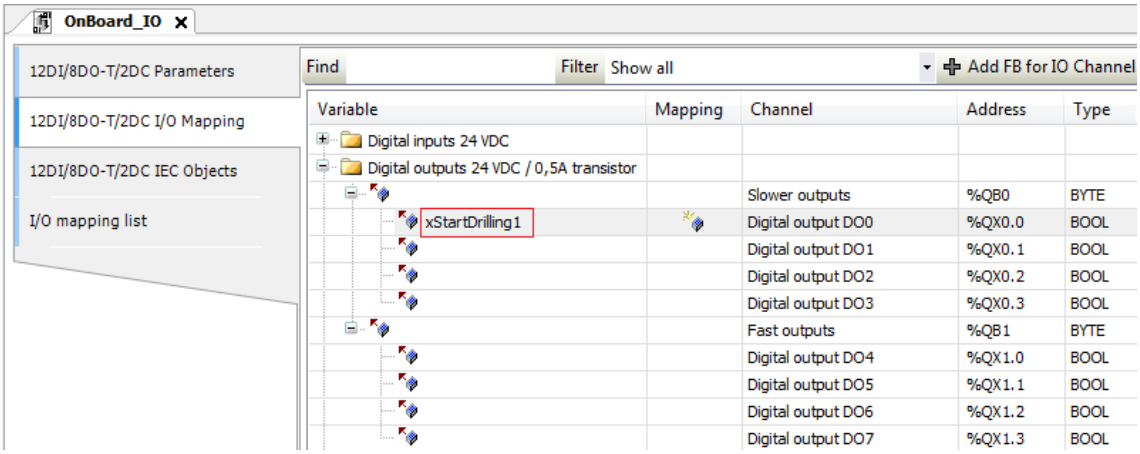


1. Open the list of the digital inputs.

2. Fill in the variable names:

Channel	Type	Variable
Digital input DI0	BOOL	xDI_00_OnBoard_IO_I0

Handle the digital output variables



1. Open the list of the digital outputs.
2. Fill in the variable names:

Channel	Type	Variable
Digital output DO0	BOOL	xStartDrilling1

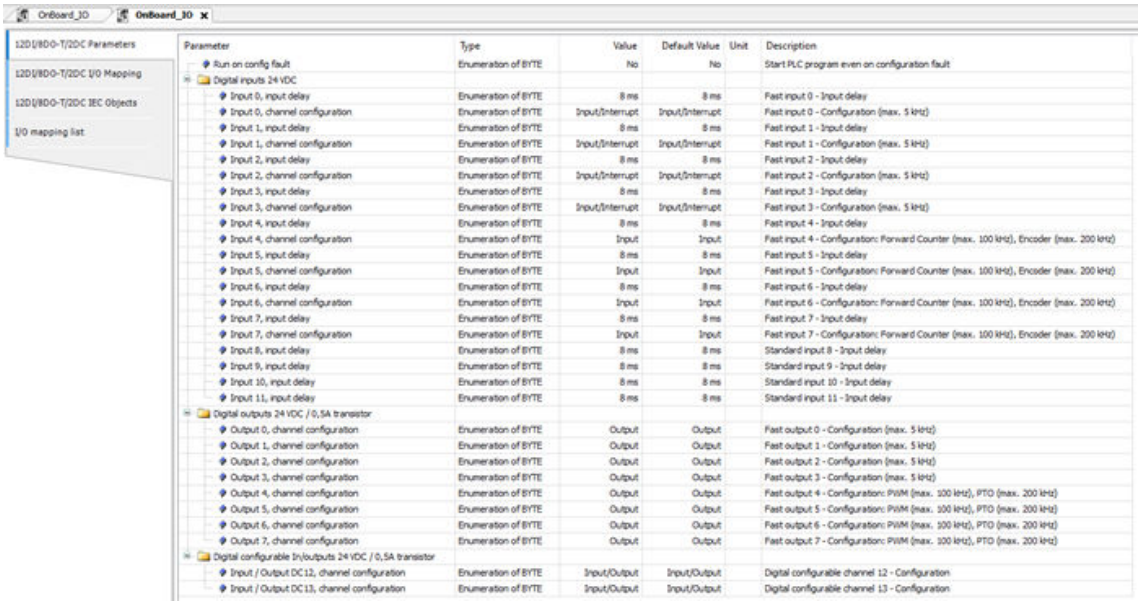
1.6.6.2.7 Configuration of the onboard I/Os of AC500-eCo V3 PLC

Digital inputs from the onboard I/Os

Depending on the processor module used, several configurations are possible for the onboard I/Os mostly different per group of channels.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
Digital inputs	PM5012-x-ETH	I0…I3	Input/Interrupt	Not needed	Input delay can be sometimes configured according to channels type
		I4…I5	Input		
	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	I0…I3	Input/Interrupt	Not needed	Input delay can be sometimes configured according to channels type, for the PLC with relay outputs,
		I4…I7	Input		

Functionality to be realized	Processor module type	Digital input channels	Configura-tion of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
		I8...I11	- (Always inputs)		the digital configurable channels have some other configu-rable features.
		C12…C13	Input/Output		



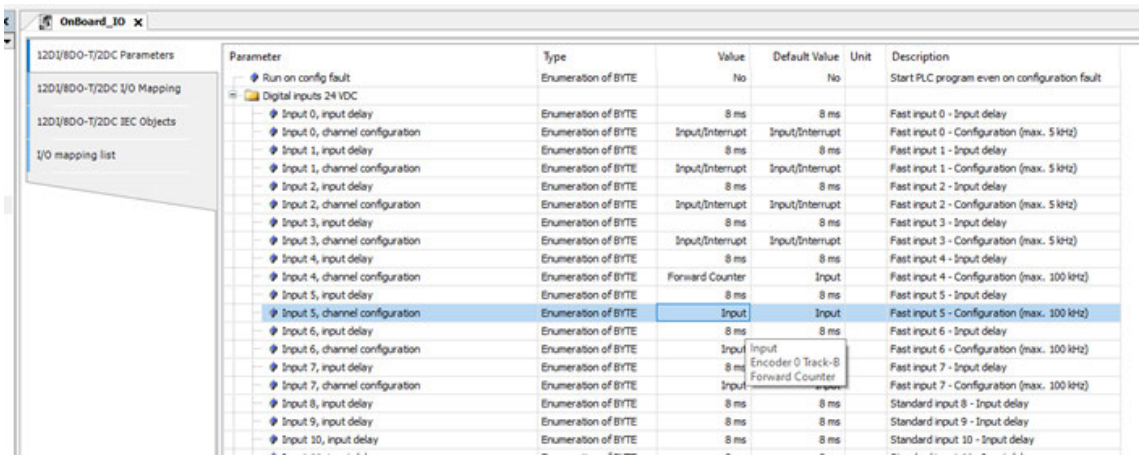
Fast counters in the onboard I/Os

General details on fast counters see (System Technology) ↳ *Chapter 1.6.5.1.13.2 “Fast counter in AC500-eCo V3 (Onboard I/O in PM50xx)” on page 3576*

Details on the configuration see ↳ *Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3700*

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
Forward counter	PM5012-x-ETH	I0…I3	Not relevant for the functionality	OBIOForwardCounter	Up to 2 forward counters with up to 5 kHz can be used, the other inputs can be used for other purpose
		I4...I5	Forward counter		
	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	I0…I3	Not relevant for the functionality	OBIOForwardCounter	Up to 4 forward counters with up to 100 kHz can be used, the other inputs can be used for other purpose
		I4…I7	Forward counter		
		I8...I11	Not relevant for the functionality		



A/B Encoder in the onboard I/Os

Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
A/B encoder 5 kHz with touch/reset inputs	PM5012-x-ETH	I0	Touch/Reset0	OBIOEncoderCounter	The functionality uses the 4 digital inputs, the other can be used for other purpose
		I1	Touch/Reset0		
		I2…I3	Not relevant for the functionality		
		I4	Encoder 0 Track A		
		I5	Encoder 0 Track B		
Up to 2x A/B encoders 200kHz possible with touch/reset standard inputs	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	I0	Touch/Reset0	OBIOEncoderCounter	The functionality uses up to the 4 digital fast inputs 200 kHz and the 4x 5 kHz, the other inputs can be used for other purpose. Select encoder x track A for an input (I4 or I7) automatically selects the adjacent input for B track
		I1	Touch/Reset0		
		I2	Touch/Reset1		
		I3	Touch/Reset1		
		I4	Encoder 0 Track A		
		I5	Encoder 0 Track B		
		I6	Encoder 1 Track A		
		I7	Encoder 1 Track B		
		I8...I11	Not relevant for the functionality		
One A/B encoder 200 kHz with touch/reset	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	I0	Not relevant for the functionality	OBIOEncoderCounter	The functionality uses the 4 digital fast inputs 200 kHz, the other inputs can be used for other purpose. Select encoder x track A for the input (I4) automatically selects the adjacent input for B track
		I1	Not relevant for the functionality		
		I2	Not relevant for the functionality		
		I3	Not relevant for the functionality		
		I4	Encoder 0 Track A		
		I5	Encoder 0 Track B		
		I6	Touch/Reset		
		I7	Touch/Reset		
		I8...I11	Not relevant for the functionality		

Example with one encoder

Parameter	Type	Value	Default Value	Unit	Description
Run on config fault	Enumeration of BYTE	No	No		Start PLC program even on configuration fault
Digital inputs 24 VDC					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 0 - Input delay
Input 0, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 0 - Configuration (max. 5 kHz)
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 1 - Input delay
Input 1, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 1 - Configuration (max. 5 kHz)
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 2 - Input delay
Input 2, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 2 - Configuration (max. 5 kHz)
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 3 - Input delay
Input 3, channel configuration	Enumeration of BYTE	Input/Interrupt	Input/Interrupt		Fast input 3 - Configuration (max. 5 kHz)
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 4 - Input delay
Input 4, channel configuration	Enumeration of BYTE	Encoder 0 Track-A	Input		Fast input 4 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 5 - Input delay
Input 5, channel configuration	Enumeration of BYTE	Encoder 0 Track-B	Input		Fast input 5 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 6, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 6 - Input delay
Input 6, channel configuration	Enumeration of BYTE	Reset 0	Input		Fast input 6 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 7, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 7 - Input delay
Input 7, channel configuration	Enumeration of BYTE	Touch 0	Input		Fast input 7 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)

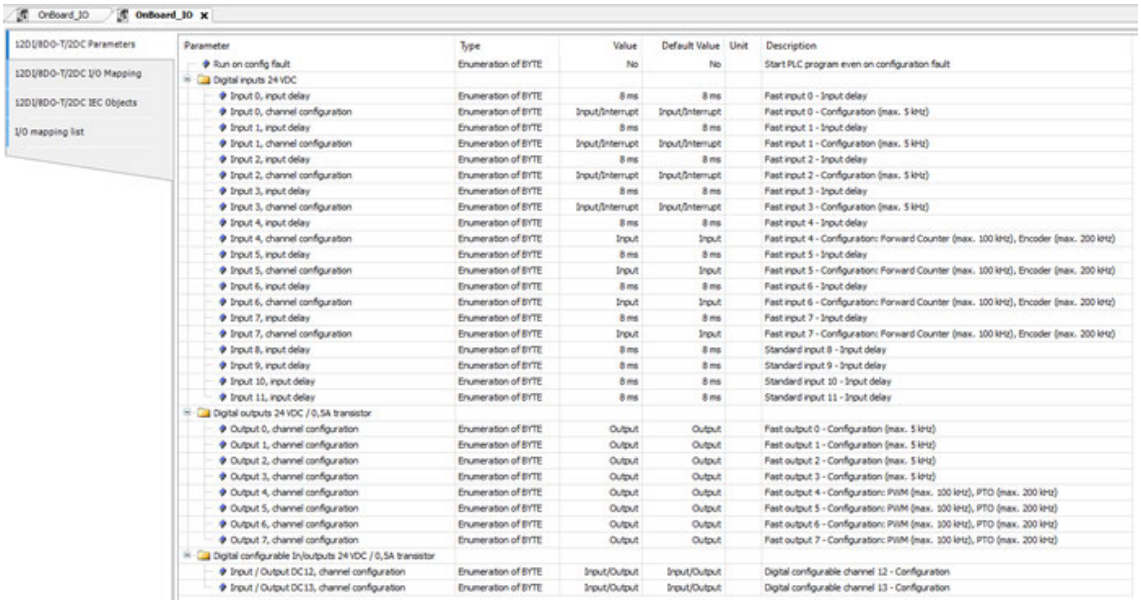
Example with two encoders

Parameter	Type	Value	Default Value	Unit	Description
Run on config fault	Enumeration of BYTE	No	No		Start PLC program even on configuration fault
Digital inputs 24 VDC					
Input 0, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 0 - Input delay
Input 0, channel configuration	Enumeration of BYTE	Reset 0	Input/Interrupt		Fast input 0 - Configuration (max. 5 kHz)
Input 1, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 1 - Input delay
Input 1, channel configuration	Enumeration of BYTE	Touch 0	Input/Interrupt		Fast input 1 - Configuration (max. 5 kHz)
Input 2, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 2 - Input delay
Input 2, channel configuration	Enumeration of BYTE	Reset 1	Input/Interrupt		Fast input 2 - Configuration (max. 5 kHz)
Input 3, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 3 - Input delay
Input 3, channel configuration	Enumeration of BYTE	Touch 1	Input/Interrupt		Fast input 3 - Configuration (max. 5 kHz)
Input 4, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 4 - Input delay
Input 4, channel configuration	Enumeration of BYTE	Encoder 0 Track-A	Input		Fast input 4 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 5, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 5 - Input delay
Input 5, channel configuration	Enumeration of BYTE	Encoder 0 Track-B	Input		Fast input 5 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 6, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 6 - Input delay
Input 6, channel configuration	Enumeration of BYTE	Encoder 1 Track-A	Input		Fast input 6 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)
Input 7, input delay	Enumeration of BYTE	8 ms	8 ms		Fast input 7 - Input delay
Input 7, channel configuration	Enumeration of BYTE	Encoder 1 Track-B	Input		Fast input 7 - Configuration: Forward Counter (max. 100 kHz), Encoder (max. 200 kHz)

Configuration of interrupt inputs

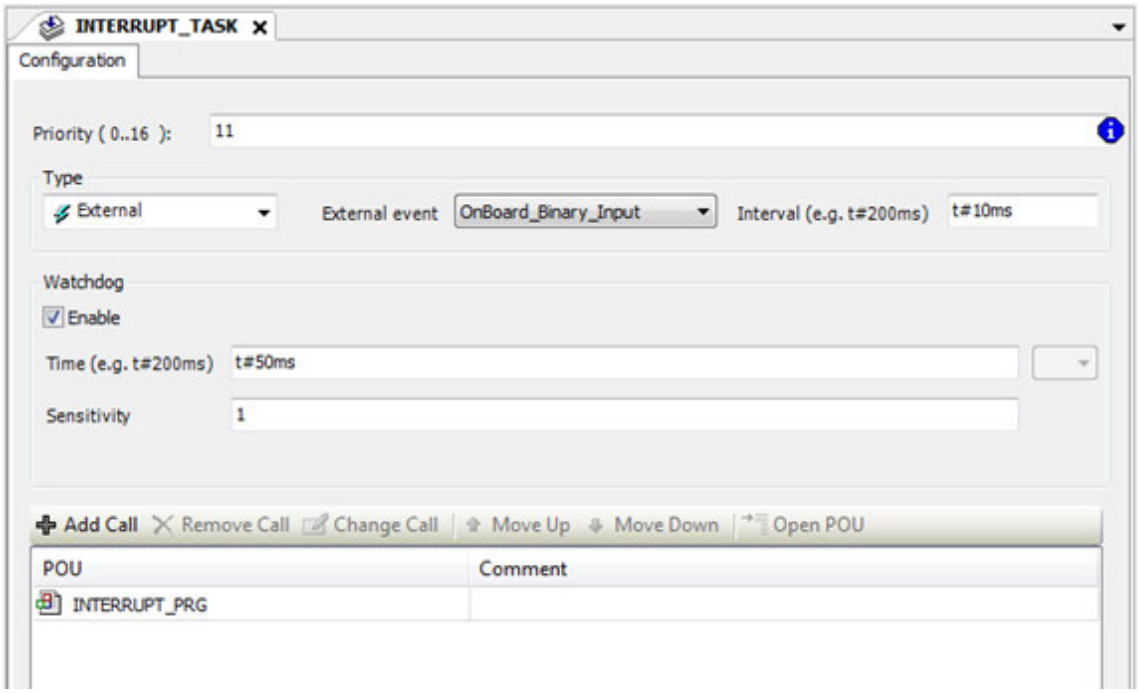
Depending on the configuration for the input channels of the onboard I/O from the processor module different functionality are possible which must be used together with the dedicated function block of the user program.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
Interrupt inputs	PM5012-x-ETH	I0…I3	Input/Interrupt	OBIO InterruptInfo OBIOInterruptPara	Up to 4 interrupt input channels can be used, the other inputs can be used for other purpose
		I4...I5	Not relevant for the functionality		
	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	I0…I3	Input/Interrupt	OBIO InterruptInfo OBIOInterruptPara	Up to 4 interrupt input channels can be used, the other inputs can be used for other purpose
		I4…I11	Not relevant for the functionality		



Creating an interrupt task

After configuring the parameter, the user needs to create a new task with the *“Type”* set to *“External”* and the *“External event”* set to *“OnBoard_Binary_Input”*.

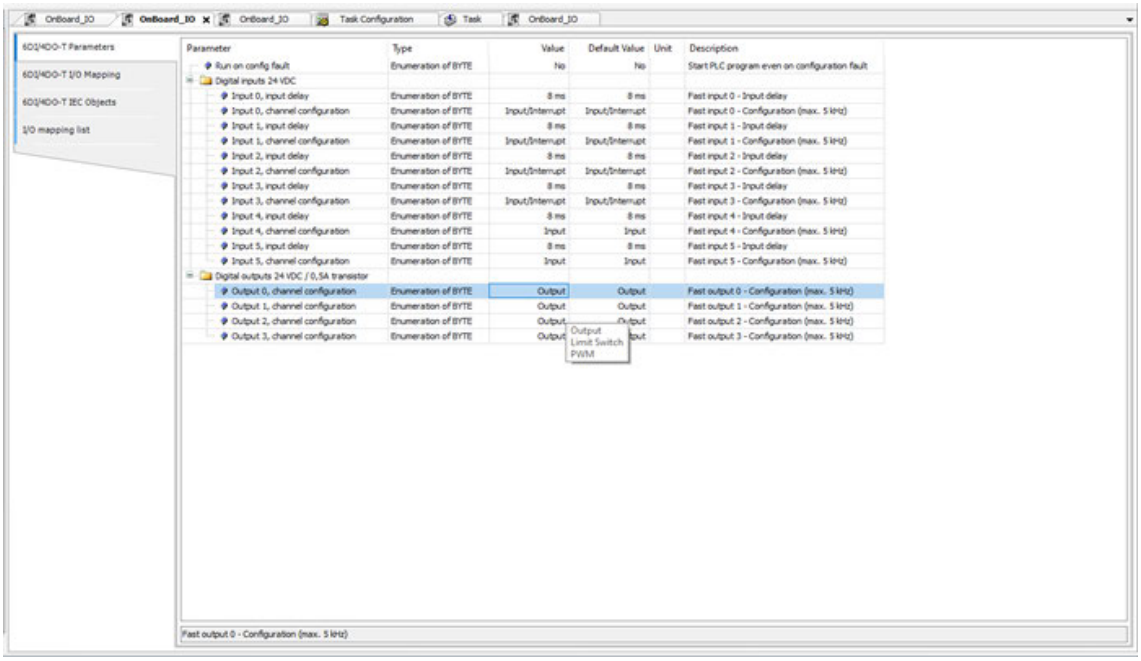


Please see the chapter how to use the function in the system technology…

Configuration of digital outputs

According to the processor module type, the digital outputs have several functionalities. To use them as digital output and as default configuration the following configuration is needed:

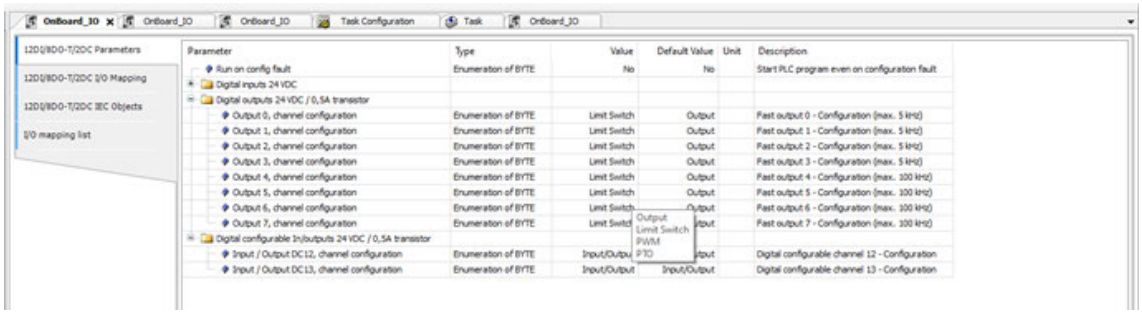
Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
Digital Outputs	PM5012-x-ETH	O0…O3	Output	Not needed	-
	PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH	O0…O3	Output	Not needed	No other configuration needed
		O4…O7	Output		
		C12…C13	Input/Output		



Configuration of outputs as limit switch

The AC500-eCo V33 processor modules provide according to the output variants transistor or relay some output which can be used as limit switch. For the process modules with relay outputs, only the digital configurable channels provide this functionality.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
Limit switch	PM5012-x-ETH	O0…O3	Limit Switch	OBIO-LimitSwitch	Up to 4 limit switches
	PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH	O0…O3	Limit Switch	OBIO-LimitSwitch	Up to 8 limit switches
		O4…O7	Limit Switch		
		C12…C13	Not relevant for the functionality		
	PM5032-R-ETH, PM5052-R-ETH	O0…O2	Not relevant for the functionality	OBIO-LimitSwitch	Relay outputs without other functions
		O3…O5	Not relevant for the functionality		
		C12…C13	Limit Switch		Up to 8 limit switches



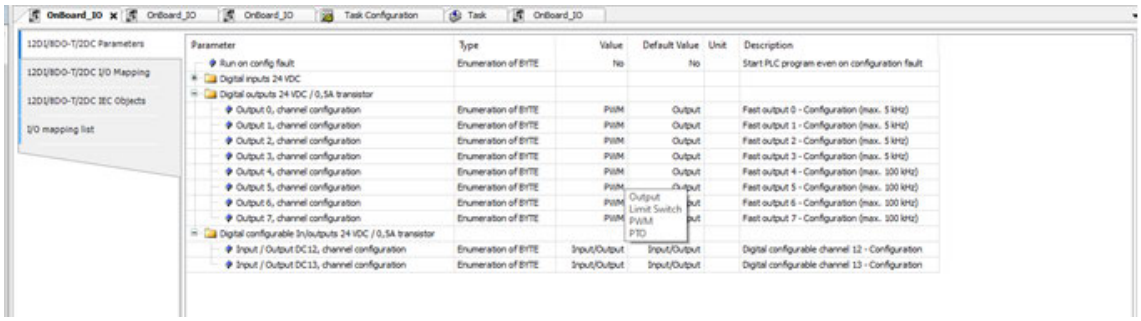
Operating the limit switch output with user program

The OBIOLimitSwitch function block of the library must be used to operate the outputs with help of user program.

Configuration of PWM outputs (Pulse Width Modulation)

The AC500-eCo V3 processor modules provide up to 8 PWM output channels with a maximum frequency of 20 KHz. The parameter of PWM output channel of onboard I/O must be configured before it can be used. User should take these steps to configure the PWM output function.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
PWM outputs	PM5012-x-ETH	O0…O3	PWM	OBIOPwm	Up to 4 PWM 100 Hz
	PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH	O0…O3	PWM	OBIOPwm	Up to 4 PWM with 100 Hz and 4 PWM 30 kHz
		O4…O7	PWM		
		C12…C13	Not relevant for the functionality		
	PM5032-R-ETH, PM5052-R-ETH	O0…O2	Not relevant for the functionality	OBIOPwm	Relay outputs without other functions
		O3…O5	Not relevant for the functionality		
		C12…C13	PWM		Up to 2 PWM 30 kHz only on these channels



Operating the PWM output with user program

The OBIOPwm function block of the library must be used to operate the PWM outputs with help of user program.

Configuration of PTO outputs (HW fast outputs for Pulse Train Output)

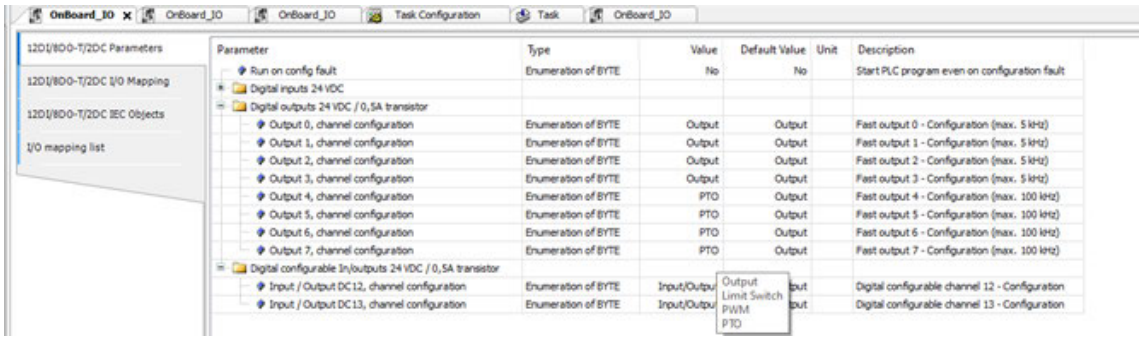
TheAC500-eCo V3 processor modules provide up to 2 PTO hardware dedicated output channels with a maximum frequency of 200 kHz. The parameter of PTO output channel of onboard I/O must be configured before it can be used. User should take these steps to configure the PTO output function.

The PTO outputs can be used with 2 different modes either Pulse / Direction or Cc/Ccw mode.

Please refer to the chapter…

The PTO channels are always requiring 2 consecutive output channels for the function.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
PTO outputs	PM5012-x-ETH	O0…O3	Not possible	-	No PTO available
	PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH	O0…O3	Not relevant for the functionality	OBIOPulseTrainOutput OBIOMotionPTO	Up to 2 PTO 200 Hz with Pulse/Direction or Cc/Ccw mode
		O4…O7	PTO -> automatically for O5 also		
		C12…C13	PTO -> automatically for O7 also		
	PM5032-R-ETH, PM5052-R-ETH	O0…O2	Not relevant for the functionality	OBIOPulseTrainOutput OBIOMotionPTO	Up to 2 PTO 200 Hz with Pulse/Direction or Cc/Ccw mode
		O3…O5	Not relevant for the functionality		
		C12…C13	PTO -> automatically for C13 also		



Operating the PTO hardware output with user program

The OBIOPulseTrainOutput function block of the library can be used to operate the PTO outputs with help of user program.This FB allows to control the output in PTO mode. The OBIOMotionPTO function block is a dedicated Motion control block to realize point-to-point movement or velocity control of a motion axis. See the dedicated chapter of the system Info…

Configuration of SW PTO (PWM) outputs (HW fast outputs and standard outputs with software dedicated function block)

The AC500-eCo V3 processor modules could also provide up to 4 PTO (PWM) software output channels with a maximum frequency of 100 kHz. To use that mode, the parameter of output channel of Onboard I/O must be configured before it can be used. User should take these steps to configure this special PTO output function. The PTO outputs channels can be only used as Pulse / Direction mode. Please refer to the chapter…

The PTO channel is using a digital fast output configured as PWM output to generate the Pulse output and a standard digital output to indicate the direction. A dedicated PTO motion block will then control the channel to realize the functionality.

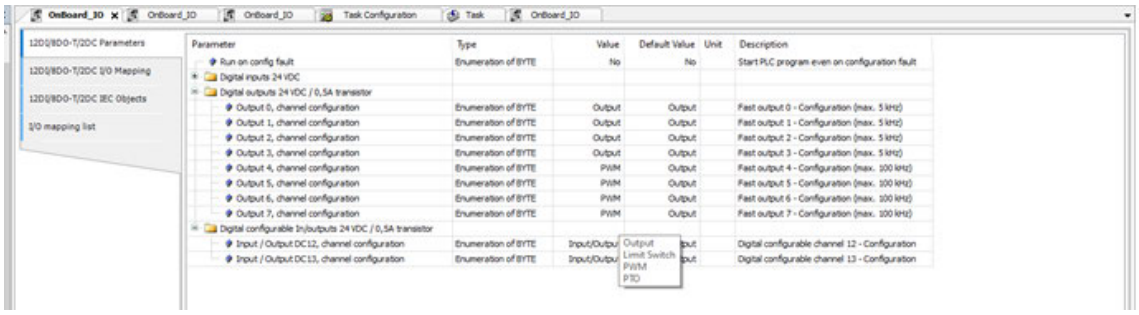
Up to 4 PTO can be then provided each using 2 digital outputs.

A mixed configuration of one HW PTO channel (e.g. Output 04..05) up to 200 kHz and Pulse/Direction or Cc/Ccw mode together with up to 2 other software PTO Channels (e.g. O6, O7 + dedicated output) up to 100 kHz and only Pulse/Direction mode is then possible.

To achieve such a software PTO mode the following channel configuration must be done.

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
PTO outputs (HW fast outputs PWM and software PTO)	PM5012-x-ETH	O0…O3	Not possible	-	No PTO available
	PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH	O0	Output	OBIOMotionPWM	The 4 software PTO channels will use the fast outputs O4…O7 PWM to generate the Pulse signal of each SW PTO and the
		O1	Output		
		O2	Output		
		O3	Output		
		O4	PWM		
		O5	PWM		
		O6	PWM		

Functionality to be realized	Processor module type	Digital input channels	Configuration of the channel to be selected in Automation Builder	Dedicated function block to be used in the user program	Comments
		O7	PWM		outputs O0…O3 will generate the direction signals
		C12…C13	Not relevant for the functionality		
	PM5032-R-ETH, PM5052-R-ETH	O0…O2	Not relevant for the functionality	OBIOMotionPWM	Relay outputs without other functions
		O3…O5	Not relevant for the functionality		
		C12…C13	PWM		Theoretically possible up to 2 software PTO 100 Hz with Pulse/Direction but need an additional digital ouput module for the direction signal



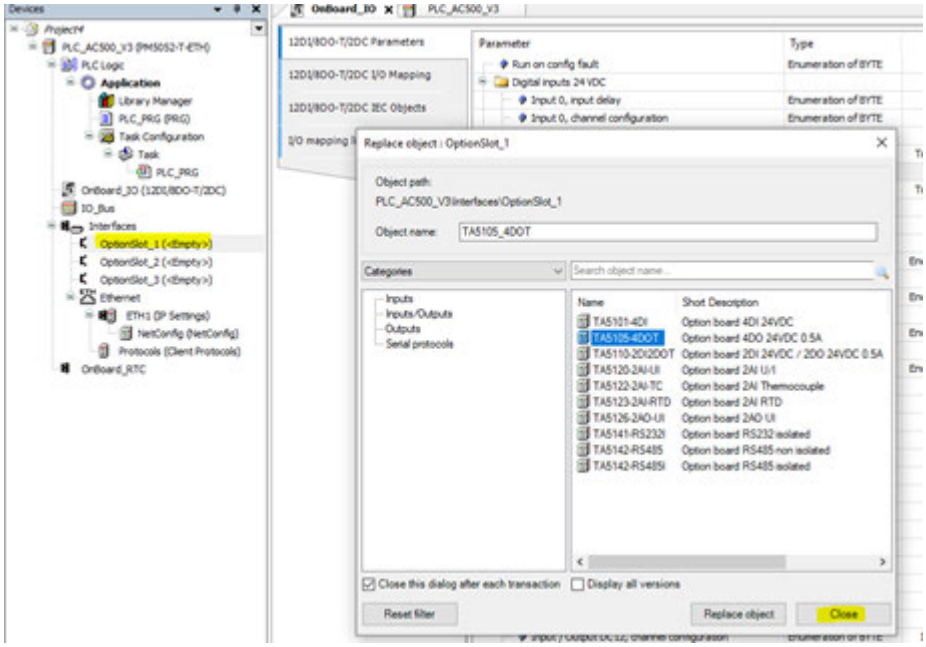
Operating the software PTO output channels with user program

The OBIOMotionPWM function block is a dedicated motion control block to realize point-to-point movement or velocity control of a motion axis. This block will then control the output channels as PTO mode Pulse/Direction only up to 100 kHz. See the dedicated chapter of the system Info…

1.6.6.2.8 Option board for processor modules PM50xx

Depending on processor module type, up to 3 option board slot are available and for each several option board modules are available.

Select the option board

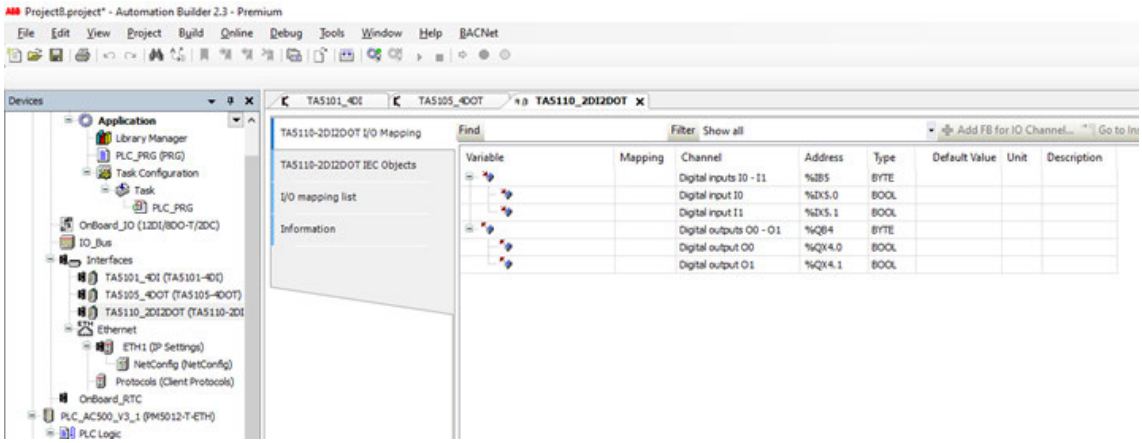


To add an option board on the processor module, select the desired OptionSlot to be configured and attach the needed option board from the list.

There is no limitation on the number of same option board used on the CPU, no dedicated slot for a specific function and no specific order to place the option board module.

Depending on the type of option board selected and attached to the CPU some further configuration of channels or function may be needed.

Attach an option board for digital I/O extension



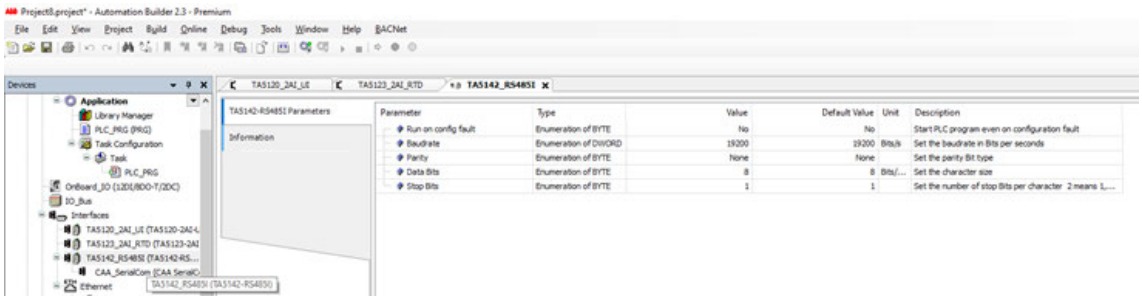
Just select and attached the module, no other channel configuration is needed. The I/O channels are directly mapped in the I/O mapping and variables can then be defined.

Attach an option board for COMx serial communication

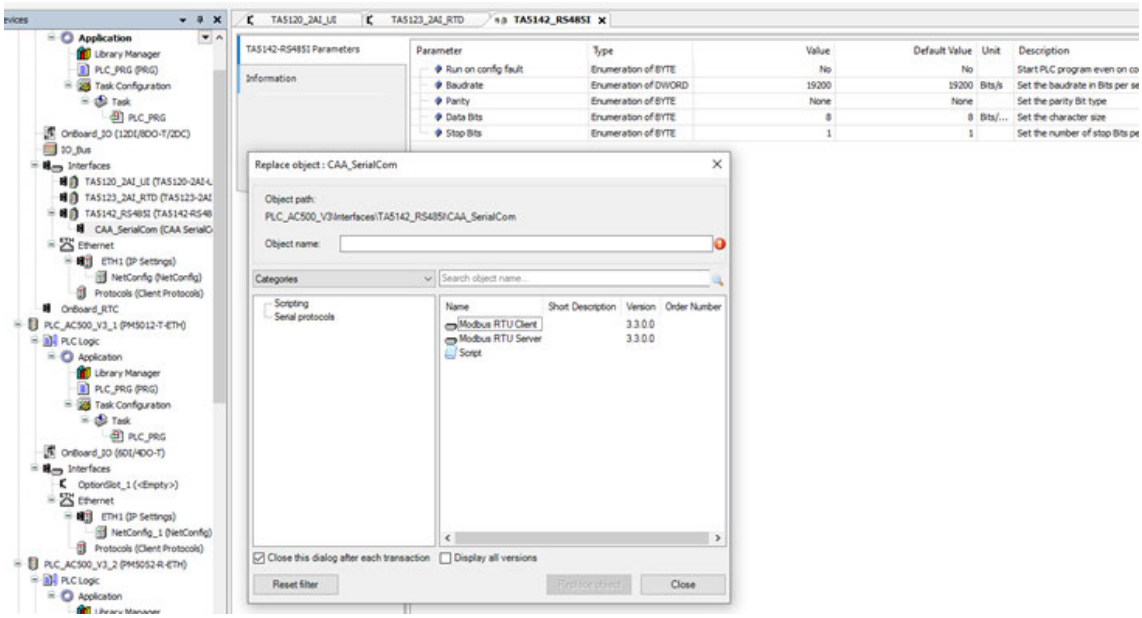
The desired serial interface option board type for the desired option board slot must be selected and added.

The option board may require some other channel configuration according to your need.

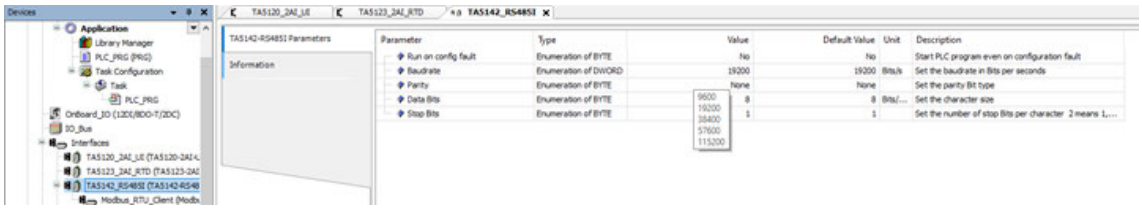
Following example shows how to add a TA5142-RS485I isolated interface and the desired protocol.



The desired protocol has also to be added according to your needs, e.g. Modbus RTU client:



The parameter for the serial interface can also be adapted like baudrate, data bit, stop bit or parity.



1.6.6.2.9 Onboard Ethernet configuration

Onboard Ethernet is provided for device types with -ETH extension.

Configuration of the IP settings with the IP configuration tool

The IP address for AC500 devices can be set or changed in Automation Builder using

- the IP configuration tool which is described in the following.
- the 'Communication Settings'. ↳ *Chapter 1.6.6.2.2.4.3 “Configuration of communication via Ethernet (TCP/IP)” on page 3688*

As an alternative the IP address can be changed at the hardware device itself. ↳ *Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491*

The IP configuration tool:

The IP configuration tool can be used

- to set or change the IP address of devices.
  ↳ *Chapter 1.6.6.2.9.1.2.2 “Changing the IP address” on page 3727*
- to scan the network for available hardware devices.
  ↳ *Chapter 1.6.6.2.9.1.2.1 “Network scan” on page 3725*
- to update the firmware of devices.
  This functionality is only supported if the IP configuration tool is used stand-alone.
  ↳ *Chapter 1.6.6.2.9.1.2.3 “Firmware update” on page 3728*
- to activate certain functionality on hardware devices.
  This feature is only available on AC500 V3 devices.
  ↳ *Chapter 1.6.6.2.9.1.2.4 “Blink functionality” on page 3732*

The IP configuration tool is part of Automation Builder and can be called via *“Tools ➔ IP-Configuration”*.

Further the IP configuration tool can be used stand-alone without an Automation Builder application running. The stand-alone variant requires a separate installation via the Installation Manager ↳ *Chapter 1.6.6.2.9.1.1 “Stand-alone installation” on page 3723*.

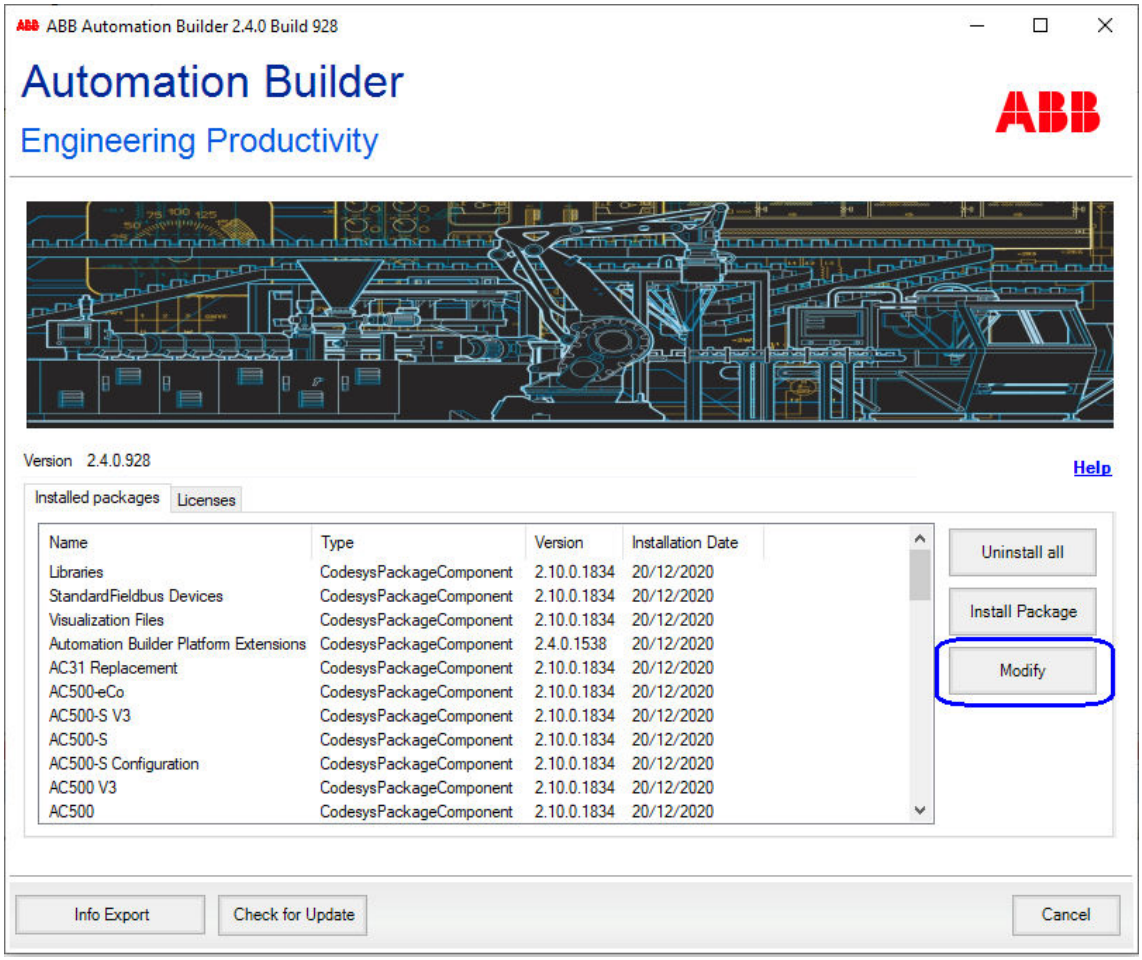
After the installation, the IP configuration tool is started via .exe file / desktop icon.

Some functionality is only supported if the IP configuration tool is used stand-alone, e.g. for firmware updates for communication interface devices.

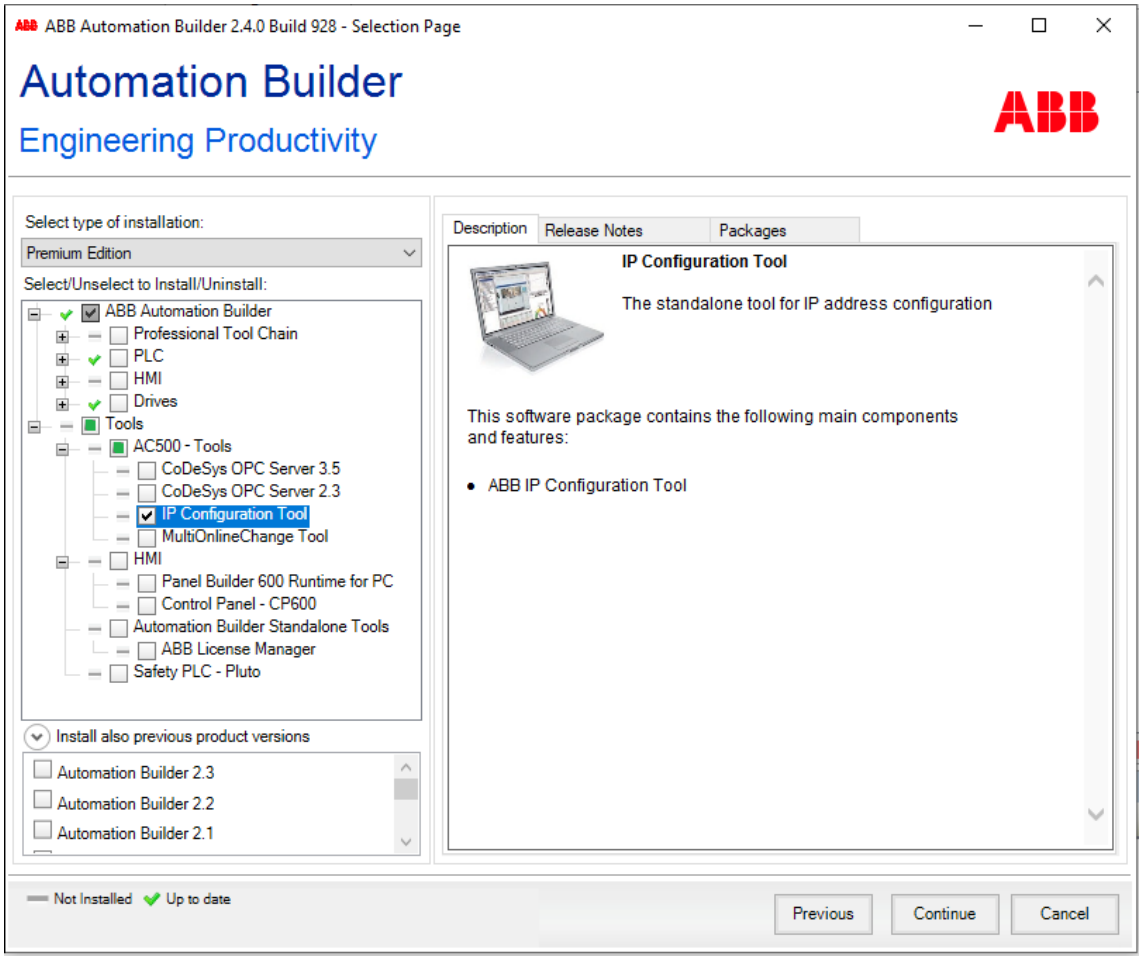
Stand-alone installation

The IP configuration tool is part of Automation Builder and can be called via “Tools ➔ IP-Configuration”. A separate installation is only required if the IP configuration tool shall be used stand-alone.

1. Open the Installation Manager in Automation Builder: *"Tools ➔ Installation Manager"*.
2. Close all other instances of Automation Builder as only one instance of the program can be executed at a time.



3. Click *"Modify"* and select the *"IP Configuration Tool"* from the structure tree.



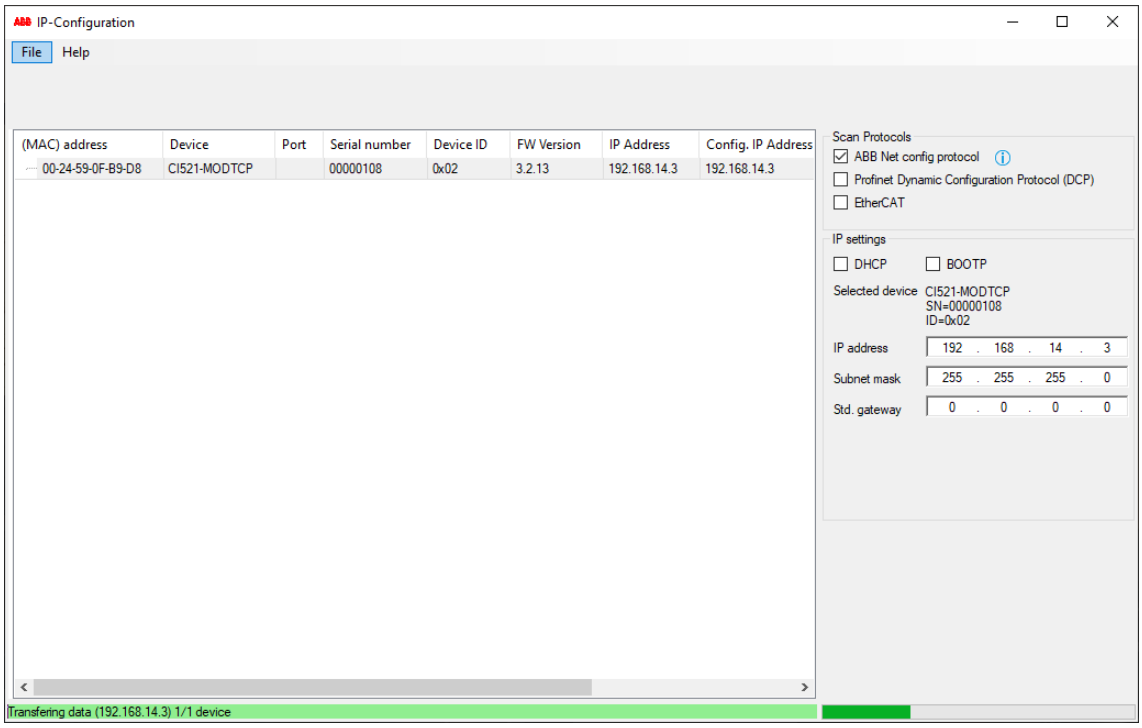
4. Click *"Continue"* to start the installation.
   - ⇨ After a successful installation the IP configuration tool is available as stand-alone tool (.exe).
   - ⇨ To start the IP configuration tool, click the new created desktop icon.

Using the tool functions

Network scan

With a network scan all devices that have been found in the network by the scan process are listed, i.e. ABB devices such as AC500 processor modules, AC500 communication interface modules or ABB Drives.

1. Start the IP configuration tool in Automation Builder (*"Tools ➔ IP-Configuration"*) or start it stand-alone (.exe).
2. The *"IP-Configuration"* dialog opens. Define the device type for the network scan by selecting the desired option under *"Scan Protocol"*:
   - *"ABB Net config protocol"*:
     Use this option for AC500 devices such as processor modules, CI5xx-Modbus devices or ABB Drives. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection.
   - *"Profinet Dynamic Configuration Protocol (DCP)"*:
     Use this option for PROFINET communication interface modules. The device(s) to be scanned must be connected to the PC via a direct Ethernet connection (not via CM579).
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 3730
   - *"EtherCAT"*:
     Use this option for EtherCAT communication interface modules. The Ethernet cable must be connected directly to the first EtherCAT slave device of the EtherCAT fieldbus. Ensure that no EtherCAT master device is available on the bus when a scan is performed.
     "Emergency" option: Enable this option to check on failures in the EtherCAT assembly during the scan process, i.e. a frame loss or interchanged ports. Errors are displayed.
     For the scan, a NPcap driver needs to be installed separately.
     Step 4 on page 3730
3. Click *[Scan]* to start the scan process.



4. All devices that have been found in the network are listed including hardware and connection details. The following details can be changed under *"IP settings"*:

   ⇨ ● *"IP Address"*:
   Current IP address of the device.
   ● *"Conf. IP Address"*:
   Configured IP address of the device. A changed IP address will update this column.
   ● *"FW Version"*:
   Current installed firmware version of the device. This field is visible not until a first network scan. If this field is still empty after a network scan, check on connection errors.
   Chapter 1.6.6.2.9.1.3.1 "Trouble-shooting for firmware update" on page 3733

The IP address of some devices, e.g. EtherCAT devices cannot be changed.

Changing the IP address

1. In order to change the IP address of devices perform a network scan.

   Chapter 1.6.6.2.9.1.2.1 "Network scan" on page 3725

2. Select a device from the list and select the appropriate protocol under *"Scan protocol"*.

   "DHCP" or *"BOOTP"* option: If required, DHCP or BOOTP can be used to receive the IP address for the device from the server.

   "IP address", *"subnet mask"*, *"Std. gateway"*: Use these fields to change the IP address settings including the settings for the subnet mask and the standard gateway. Ensure that the combination of connection settings is correct.

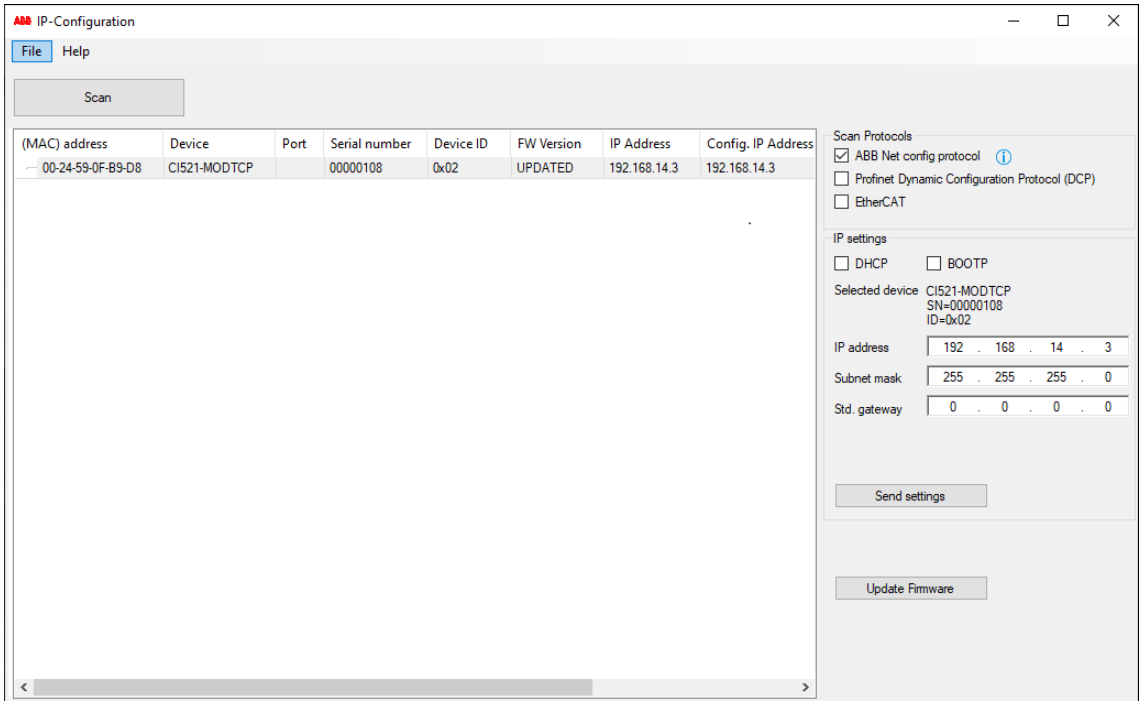
   "Check subnet configuration" on page 3733

Note for CI52x-Modbus devices

Consider the behavior of CI52x-Modbus devices if the last number of the IP address is set to "0".

"Check last number of IP address" on page 3734

3. Change the settings for the IP configuration and click *[Send settings]* to transmit the data to the device.



⇨

Note for PROFINET devices

The device name of PROFINET devices can be edited. If changing the name, ensure the following rules apply:

- *Labels must be separated by "."*
- *Total length: 1 to 240*
- *Label length: 1 to 63*
- *Labels can consist of characters [a-z] and numbers [0-9]*
- *Labels are not allowed to start with "-"*
- *Labels are not allowed to end with "-"*

4. In order to keep all IP changes after a power cycle, the settings can be stored permanently. Confirm the prompted message during the scan process.

Firmware update

The firmware of AC500 communication interface modules can be updated with the IP configuration tool.

For this, the IP configuration tool must be used as stand-alone variant.

↳ *Chapter 1.6.6.2.9.1.1 “Stand-alone installation” on page 3723*

It is not possible to perform a firmware update out of Automation Builder.

- *For PROFINET communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.3.3.*
- *For EtherCAT communication interface modules a firmware update is only supported for devices with firmware version ≥ 2.1.4.*
- *For Modbus communication interface modules a firmware update is only supported for devices with firmware version ≥ 3.2.13.*

Requirements: **Before the firmware update**

- Ensure a fast and stable network connection
- Close all unused applications on the executing PC
- Stop the communication between AC500 PLC and the communication interface module that shall be updated

During the firmware update

- Do not close the IP configuration tool
- Do not open Automation Builder software or any other application
- Do not switch-off the communication interface module that shall be updated
- Do not disconnect the Ethernet connection of a communication interface module or the executing PC

The firmware update will stop the operation of the affected device(s). Hence, the device(s) will become unresponsive for 1 - 2 minutes.

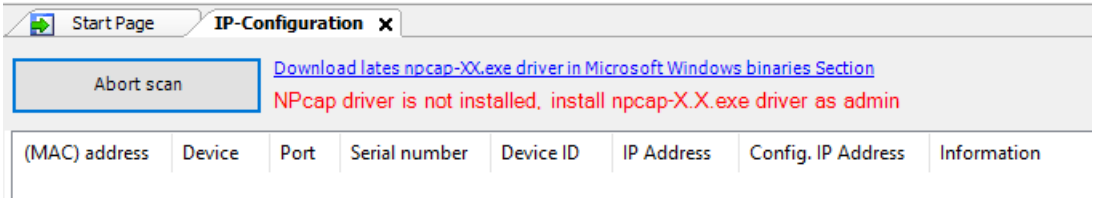
Procedure:

1. Start the IP configuration tool stand-alone (.exe).
2. Perform a network scan.

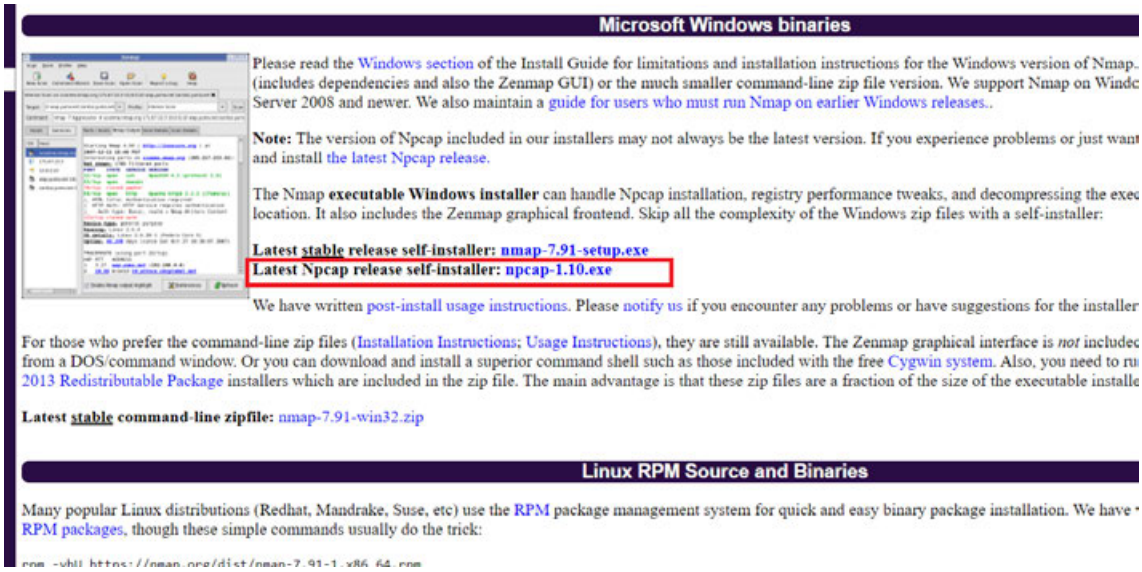
   Chapter 1.6.6.2.9.1.2.1 “Network scan” on page 3725
3. Select the devices that shall be updated from the list and click *[Scan]* to trigger the scan process.

   A multiple selection of several devices is possible via control key, however, ensure to select only devices of the same protocol at a time. Otherwise the firmware update fails.

4. This step is only required for devices that require an installed NPcap driver. In this case an appropriate message including a download link is prompted in the IP-Configuration dialog:



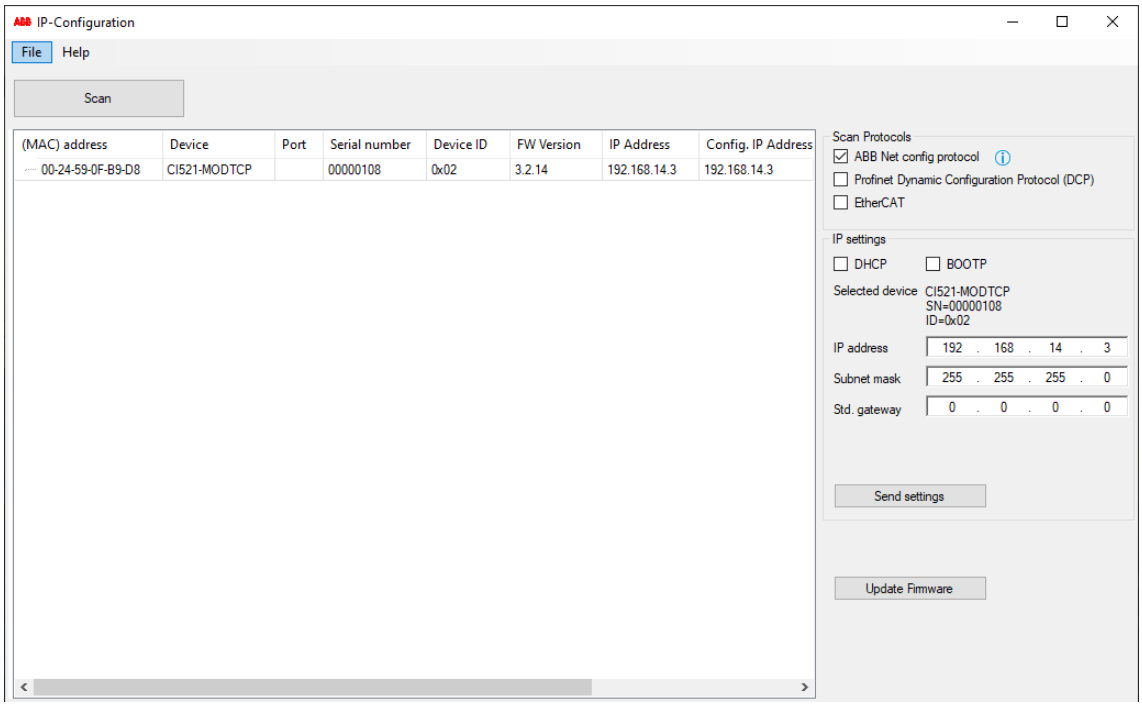
⇨ Click on the displayed link *https://nmap.org/download.html* and download the latest version of the *npcap-X.X.exe* file.



⇨ After the download, execute the file as administrator and restart the scan process.

⇨ The devices that have been scanned are listed.

5. Click *[Update Firmware]* to start the firmware update for the selected devices.



6. For CI50x, CI51x and CI52x devices a signature check is started. Select the appropriate firmware update file (*.bin) for the device(s). Example: C:\AC500\AC500_CI52x_Firmware_V3.2.8.bin.

   After a successful signature check the firmware update file (*.bin) and the respective signature file (*.bin.sig) are transferred to the device. This can last up to 3 minutes.

   If the signature check fails, check the availability of the *.bin file and the *bin.sig file.

   ↳ *"Signature check" on page 3734*

7. A status check followed by a device reboot followed by a second status check is performed automatically.

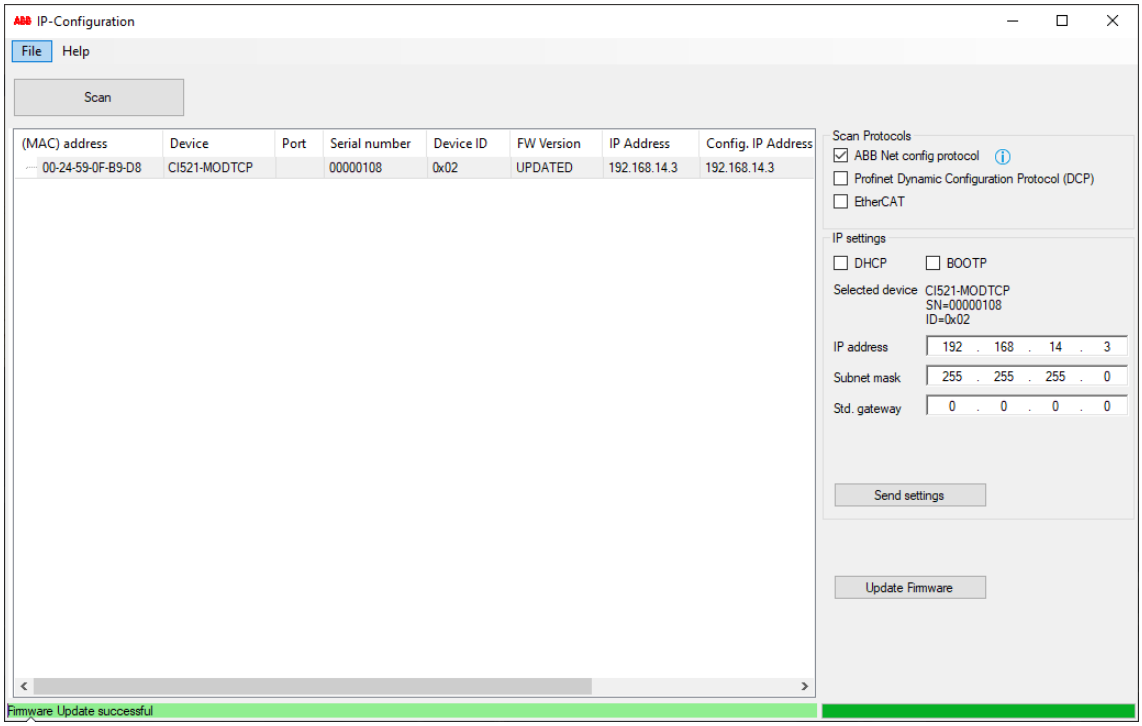
   > *After the firmware update all outputs of the updated devices are set to '0'.*

8. After a successful firmware update the update status or the new firmware version is displayed in the *"FW Version"* field.

   If this field is empty, there possibly is a connection error between the device and the executing PC.

   ↳ *"Error: Can't connect to device" on page 3735*

   Exception: For EtherCAT devices an empty *"FW Version"* field does not indicate a connection error.



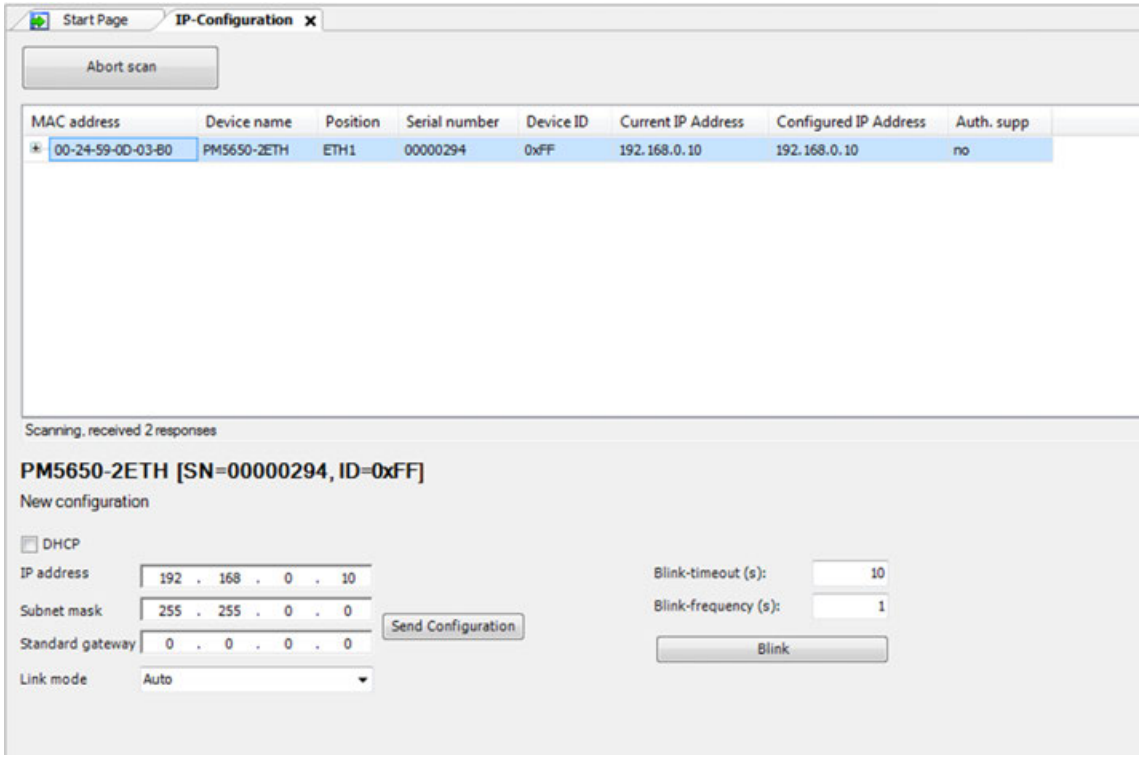
⇨ If the firmware update fails

- check the requirements for the update procedure.
  ↳ *"Requirements:" on page 3729*
- check the hints for trouble-shooting.
  ↳ *Chapter 1.6.6.2.9.1.3.1 "Trouble-shooting for firmware update" on page 3733*
- perform a network scan and repeat the update. If the error still persists power cycle the device and try the update again.

Blink functionality

This function activates flashing of the backlight of an AC500 LED display.

1. From the menu, select *"Tools ➔ IP-Configuration"*.
2. Click *[Scan]* to trigger the scan process for devices in the network.
   ⇨ A progress bar shows the progress. The IP settings of a selected device is displayed below the list and can be edited.
3. Adjust your desired time and click *[Blink]* to activate flashing.



Trouble-shooting for IP configuration tool

Firewall exceptions:

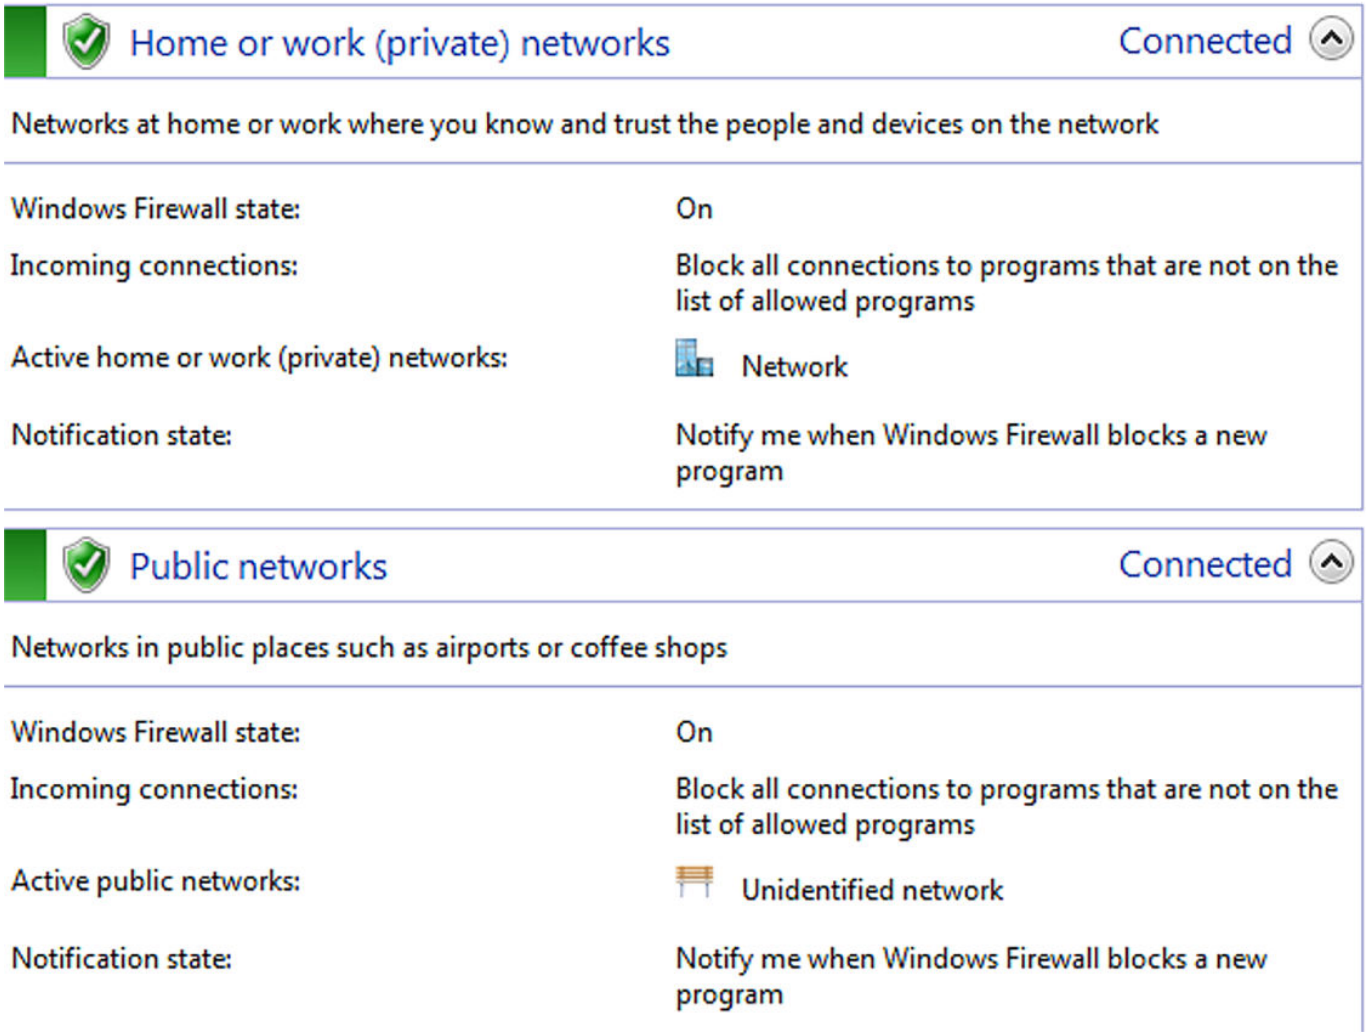
On a standard Windows 7 installation without third party firewall or security tools installed the IP configuration tool should work properly.

The Automation Builder setup installs rules or exceptions for the built-in Windows firewall to allow IPConfig to receive the responses for the IPConfig scan.

To check the Windows firewall is set correctly check the firewall settings.

Windows 7/ Windows 10:

On the network that is used for communication with the PLC, set *"Incoming connections"* to "Block all connections to programs that are not on the list of allowed programs".



If a third party firewall is used these exceptions must be configured manually.

> *Either exceptions for applications can be entered: Automation Builder and IP configuration tool must be added as application.*
>
> *Or the protocol and the port number must be given (for IPConfig: UDP protocol and port number 24576).*

Trouble-shooting for firmware update

Check the requirements

Ensure that all requirements have been considered before and during the update procedure.
↳ *"Requirements:" on page 3729*

Check subnet configuration

This hint is only valid for Modbus devices and PROFINET devices.

If the *"FW Version"* field is empty after the network scan or if the firmware version has not been updated after the update procedure, there possibly is a connection error between the device and the executing PC.

Ping the device from the executing PC. If no connection can be established, check whether the device and the PC are in the same subnet.

Example

PC	Device	Result
192.168.14.71 / 255.255.255.0	192.168.14.10 / 255.255.255.0	OK
192.168.**10**.71 / 255.255.**255**.0	192.168.**14**.10 / 255.255.**255**.0	ERROR
192.168.10.71 / 255.255.0.0	192.168.14.10 / 255.255.0.0	OK

Click *[Scan]* again to restart the network scan. If the connection is successful a newer firmware version is displayed in the *"FW Version"* column.

Check last number of IP address

This hint is only valid for CI52x-Modbus devices.

Check the last number of the IP address. If it is set to "0", the IP address setting for this last number will be used from the rotary switches on the hardware device.

Example:

Automation Builder	AC500 communication interface module (rotary switch)
IP address: 192.168.14.0	IP address: 6
	As a result, in the field *"IP Address"* the last number is set to "6": 	

Signature check

During the firmware update of CI50x, CI51x and CI52x devices a signature check is started.

The update procedure expects a firmware update file (**.bin*) and a signature file (**.bin.sig*) in the same directory. Without a signature file the signature check will fail.

Example:

Firmware update file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin***

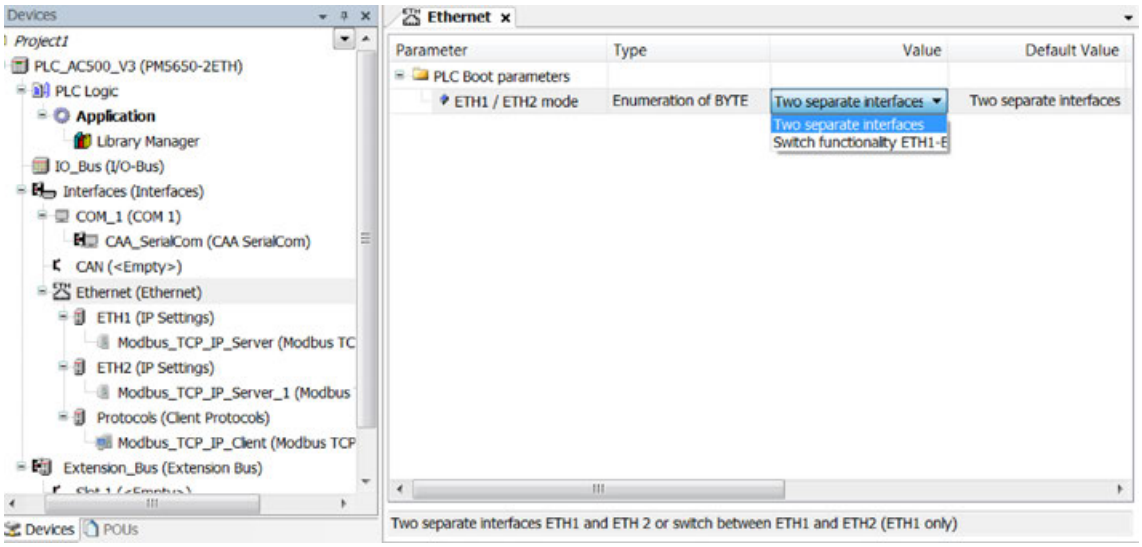
Signature file:
*C:\AC500\AC500_CI52x_Firmware_V3.2.8.**bin.sig***

Error: Package timeout	A timeout error may occure due to an instable network. Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.
Error: Unable to read device status	A read error may occure due to errors in the firmware update protocol. After the firmware update the IP configuration tool reads out the status of the updated device in order to check if the update was successful.
Error: IP is not unique	If an IP address is obtained by more than one device an error occures. A firmware update is not possible.
Error: Error State	Internal device error during the firmware update. Solution: Step 1: Scan again and repeat the firmware update. Step 2: If this does not work, power cycle the device, scan again and repeat the firmware update.
Error: Can’t connect to device	The TCP communication is not sufficient. Increase the connection quality. Solution: Keep the executing PC as near as possible to the devices that shall be updated. Avoid network switches.

Switch functionality of Ethernet interfaces ETH1/ETH2

As of SystemFW 3.1.0 the Ethernet interfaces ETH1/ETH2 can be configured as an Ethernet switch.

The default setting is *“Two separate interfaces”*.



The change of the PLC Boot parameter ETH1 / ETH2 mode will become active after a PLC reboot.

Create and download a Boot project before rebooting the PLC!

Parameter	Value	Description
ETH1 / ETH2 mode	Two separate interfaces	Two separate Ethernet interfaces ETH1 and ETH2
	Switch functionality ETH1-ETH2	Switch between ETH1 and ETH2

If the Switch functionality ETH1-ETH2 is active, only the Ethernet interface ETH1 is available (see Chapter 1.6.5.1.6.5.3 “Configuration” on page 3493). Any protocols configured under Ethernet interface ETH2 must be deleted. Otherwise a compile error will be created.

The setting of *ETH1 / ETH2 mode* can be checked on LED display with soft key <CFG> (see *Chapter 1.6.5.1.6.5.3 “Configuration” on page 3493*).

1.6.6.2.10 Onboard CAN configuration

AC500 V3 PLCs provide the following methods for CAN integration:

- Onboard CAN interface
- CANopen master-slave arrangement (with CM598-CN as a master device)

Table 655: Differences in supported protocols

	Onboard CAN	CM598-CN
CANopen Manager	X	
CAN 2A/2B	X	X
J1939	X	

Onboard CAN interface is not available on AC500-eCo V3!

Supported protocols

Onboard CAN interface supports the following protocols

- CANopen Manager: Connection of CI581 and CI582 without additional I/O modules
- CAN 2A/2B
- J1939

Configuration in Automation Builder is described in chapter *Chapter 1.6.6.2.11.1.1 "CM598-CAN - CANopen master communication module" on page 3737*.

Further information can be found in chapter *Chapter 1.6.6.2.16 "CAN onboard" on page 3800*

1.6.6.2.11 Communication modules

CANopen

CM598-CAN - CANopen master communication module

Configuration of the communication module

– *Click menu "Tools ➔ Options" and select "Device editor" in the Options window.*
– *Enable first checkbox Show generic device configuration views and click [OK].*

Append a CM598-CAN

1. Right-click on your desired *Slot* below node *"Extension_Bus"* and click *"Add object"*.
   ⇨ Dialog *Replace object:* appears.
2. Click *CM598_CAN* in the list and click *[Replace object]*.
3. Double-click *"CM598_CAN (CM598-CAN)"* to get the *"CM598-CAN Parameters"* in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the CM598-CAN communication module.
Bus behavior	Asynchronous (IEC bus cycle)	Asynchronous (IEC bus cycle)	Not yet supported.

Parameter	Default value	Value	Description
		Synchronous (start of bus cycle)	Not yet supported.
Node ID	1	1 - 127	Identifier of the device within CANopen.

The tab *“CAN Bus”* contains the basic settings of the CAN bus and special settings for the CAN 2.0 B protocol.

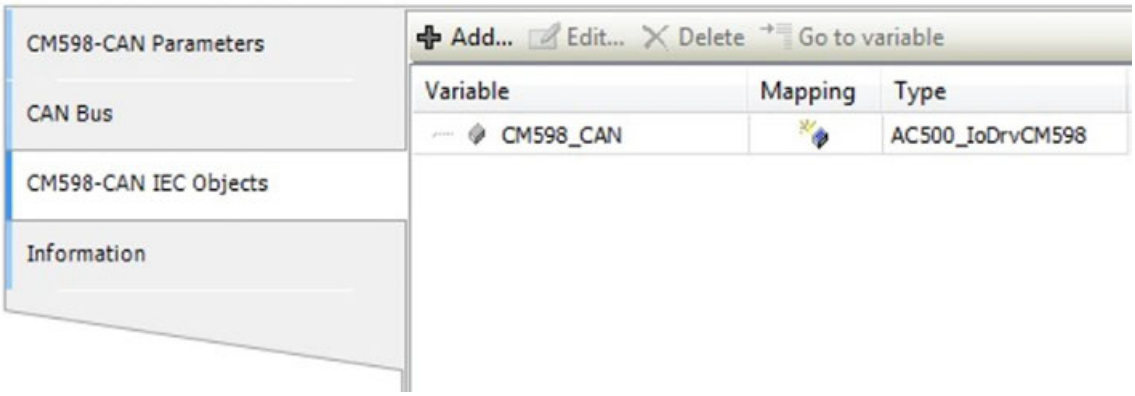
The settings at “29 Bit COB-ID” are only valid for CAN 2.0 B protocol. Ensure the option “Enable 29 Bit COB-ID” is enabled. Otherwise no CAN 2.0 B frames can be received. With the other parameters at “Enable 29 Bit COB-ID” the receive filter is configured.

Possibilities for using the SAE J1939 protocol in AC500 V3 PLCs are described in the *application example*.

Parameter	Default value	Value	Description
Bus parameters			
Transmission rate	250 kBit/s	10 kBit/s 20 kBit/s 50 kBit/s 100 kBit/s 125 kBit/s 250 kBit/s 500 kBit/s 800 kBit/s 1000 kBit/s	Transmission speed in [kBit/s]
Node settings			
Stop in case of monitoring error	Disabled	Disabled	The manager does not stop in case of a monitoring error (Node Guarding or Heartbeat Error). A loss of communication to one node has no influence to other nodes. The manager tries to reestablish the communication to the error affected nodes.
		Enabled	If this function is enabled, the manager will also stop the communication to all responding and active nodes. Not yet supported.
Send "Global Start Node"	Enabled	Disabled	No "Global Start Node" message is sent after configuring the nodes.
		Enabled	A "Global Start Node" message is sent after configuring the nodes. This synchronize all Nodes again. Not yet supported.

Parameter	Default value	Value	Description
29 Bit COB-ID			
Enable 29 bit COB-ID	Disabled	Disabled	29 bit CAN-IDs are disabled, but 11 bit CAN-IDs are still enabled.
		Enabled	29 bit CAN-IDs are additional enabled.
Acceptance mask	0	29 bit	Specifies the bits of a CAN-ID which will be evaluated by the filter. For instance, with an acceptance mask = 0x1FFFFFFF all bits are evaluated.
Acceptance code	0	29 bit	Specifies the bits of a CAN-ID which has to be set to pass the filter. Only those bits which are set in the acceptance mask are relevant.

The tab *"CM598-CAN IEC Objects"* contains the created instance of the IO driver.



Configuration of the protocols CAN 2.0 A / CAN 2.0 B

The Communication Module CM598-CAN can be used to realize CAN bus based networks in combination with library ABB_CM598Can_AC500.library.

To enable the support for the desired protocol it must be appended to CM598-CAN.

1. Right-click *"CM598_CAN (CM598-CAN)"* in the device tree and select *"Add device"* in the context menu.
   ⇨ Window *Add object below: CM598_CAN_1* appears.
2. Select *"CAN 2.0 A"* or *"CAN 2.0 B"* from the list.

Parameterization

The CAN data transmission requires a buffer for the incoming data that can be read with function blocks of library ABB_CM598Can_AC500.library.

1. Right-click *“CAN_2_0A_11_bit_identifier_ (CAN 2.0A)”* or *“CAN_2_0B_29_bit_identifier_ (CAN 2.0B)”* and select *“Add object”*.
2. Select *“Buffer for CAN 2A”* for CAN 2.0A. Or select *“Buffer for CAN 2B”* for CAN 2.0B from the list.
3. Double-click on *“Buffer_for_CAN_2A (Buffer for CAN2A)”* or *“Buffer_for_CAN_2B (Buffer for CAN2B)”* in the device tree to open the Buffer configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Identifier	0	CAN 2A: 0 ... 2047 CAN 2B: 0 ... 536870911	The value of the CAN identifier that is compared with the identifier of the incoming telegrams. The telegrams will be added to the buffer if the identifier matches.
Number of receive buffers	1	1 ... 16	The size of the buffer in number of telegrams.
Behaviour on receive buffer overflow	Overwrite	Overwrite	The oldest telegram in the buffer is overwritten by the incoming telegram.
		Discard	Incoming telegrams are discarded as long as the buffer is full.
Enable triggering of IEC task	No	No	Disables the triggering of the execution of the related IEC task.
		Yes	Enables the triggering of the execution of the related IEC task as soon as a CAN frame with the specified CAN-ID arrives ↳ *Chapter 1.6.5.2.1.1 “Triggering of event tasks with CAN-IDs” on page 3599*.

Configuration of the CANopen master

↳ *Chapter 1.6.6.2.16.1.1 “CANopen manager (master)” on page 3800*

PROFINET

CM579-PNIO - PROFINET IO controller

For Automation Builder < 2.2.0

Configuration in Automation Builder is described in PROFINET IO configuration ↳ *Chapter 1.6.6.2.18 “PROFINET IO Configurator” on page 3832*.

For Automation Builder >= 2.2.0

PROFINET IO

CM579-PNIO – PROFINET IO communication module

Configuration of the communication module

Configuration is valid as of CPU FW 3.2.0.

Append a CM579-PNIO

1. Right-click on your desired *Slot* below node *“Extension_Bus”* and click *“Add object”*.
   ⇨ Dialog *Replace object:* appears.
2. Click *CM579_PNIO* in the list and click *[Replace object]*.
3. Double-click *“CM579_PNIO (CM579-PNIO)”* to get the *“CM579-PNIO Parameters”* in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the CM579-PNIO communication module.
Bus behavior	Asynchronous (IEC bus cycle)	Asynchronous (IEC bus cycle)	The bus cycle and the IEC Application are running asynchronously. The IO update rate between the Profinet IO Controller and the IEC Application is defined with the bus cycle task.

Configuration of the PROFINET IO controller

The PROFINET IO Controller node appears automatically below the added Communication Module CM579-PNIO.

PROFINET IO controller - Configuration

▷ Double-click on *“PNIO_Controller”* and open the tab *“General”* in the editor window.

The following parameters are available:

Parameter	Default	Value	Description	Parameter
Station name	CM579	Up to 240 characters	Network name of the PROFINET IO controller station. Must be a valid hostname.	Station name
IP parameters				
IP-Address	192.168.0.1	Valid IP address	IP address of the PROFINET IO controller station.	IP address

Parameter	Default	Value	Description	Parameter
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO controller station.	Subnet Mask
Default gateway	0.0.0.0	Valid gateway address	Gateway address of the PROFINET IO controller station.	Default gateway
Station name	controller	Up to 240 characters	Network name of the PROFINET IO controller station. Must be a valid hostname.	Station name
Address settings for devices				
First IP-Address	192.168.0.2	Valid IP address	First IP address of the PROFINET IO devices. This parameter determines the address range of the PROFINET IO devices in combination with parameter Last IP address.	First IP address
Last IP-Address	192.168.0.254	Valid IP address	Last IP address of the PROFINET IO devices. This parameter determines the address range of the PROFINET IO devices in combination with parameter First IP address.	Last IP address
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO devices.	Default subnet mask
Default gateway	0.0.0.0	Valid gateway	Gateway address of the PROFINET IO devices.	Default gateway address

PROFINET IO controller - Parameters

The tab *“PROFINET-IO-Controller Parameters”* is a generic view of all PROFINET IO controller parameters. It is normally hidden and is normally not needed for configuration.

Use tab “PROFINET-IO-Controller Parameters” only, if you need to change a parameter, which is not visible in other dialogs.

Activating tab

1. Click *“Tools ➔ Options”* and select *“Device editor”*.
   ⇨ The *Device editor* dialog opens.
2. Enable checkbox *Show generic device configuration views* and click *[OK]*
   ⇨ The tab is now available.

PROFINET IO controller - I/O mapping

In this tab the bus cycle task can be specified. It is possible to select a particular task of the IEC application by its name or to use the option *“Use the parent bus cycle setting”*. In the latter case the setting of the *Bus cycle options* in *“PLC_AC500_V3 ➔ PLC settings”* are used.

Configuration of PROFINET IO devices

Add PROFINET IO device

1. Right-click on node *“PNIO_Controller (PROFINET-IO-controller)”* and click *“Add object.”*
   ⇨ A list with all installed PROFINET IO devices appears.
2. Slelect the desired device and click *[Add object]*.
   ⇨ The device is added to the Profinet IO Controller in the device tree.

PROFINET IO device - Configuration

Double-click on *“PNIO-Device”* to open the device configuration in the editor window.

The following parameters are available:

Parameter	Default	Value	Description	Parameter
Identification				
Station name	Device-specific	Up to 240 characters	This is a system wide unique name for addressing the device. Must be a valid hostname.	Slave parameters -> Identification -> Station name
Communication Parameter				
Send clock (ms)	Device-specific	0.25 0.5 1 2 4	Parameter Send clock determines the SendCycle. SendCycle = Send clock x Reducation ratio <= 512ms x	Slave parameters -> Reduction ratio
Reduction ratio	Device-specific	1...16384	The Reduction ratio determines the factor for calculating the cycle time. Cycle time = Send clock x Reducation ratio	Slave parameters -> Reduction ratio
Phase	1	1…Reduction ratio	Defines the part of the SendCycle at which an IO frame is sent.	Phase
Watchdog factor	3	1...65535	The Watchdog time is calculated as Watchdog time = SendCycle * Watchdog factor. The transfer of a IO telegram is always checked of the consumer side. Within this time the next IO telegram must be received by a consumer. Otherwise it is checked if the Datahold has been expired too.	Watchdog interval
RT Class				
RT Class	RT Class 1 Data-RTC-PDU	RT Class 1 Data-RTC-PDU	Defines the Realtime Class of cyclic data. Currently only RT Class 1 (legacy) and RT Class 1 are supported.	Slave parameters -> RT Class

Parameter	Default	Value	Description	Parameter
		RT Class 2 Data-RTC-PDU		
		RT Class 3 Data-RTC-PDU		
		RT Class UDP-RTC-PDU		
VLAN ID	0	0..4095 or 0..32767	In case of VLAN usage the parameter VLAN ID represents the ID of the virtual network. For VLAN type 802.1Q the range is 0..4095 while VLAN type ISL accepts values from 0 to 32767. The supported type depends on the used device.	Slave parameters -> VLAN ID
IP Parameter				
IP-Address	192.168.0.8	Valid IP address	IP address of the PROFINET IO Controller station.	Slave parameters -> Identification -> IP address
Subnetmask	255.255.255.0	Valid subnet mask	Network mask of the PROFINET IO Controller station.	Slave parameters -> Identification -> Subnet mask
Default gateway	0.0.0.0	Valid gateway address	Default gateway address of the PROFINET IO Controller station.	Slave parameters -> Identification -> Default gateway address

PROFINET IO device – Timing parameters

In the current implementation are 2 Communication Relations (CR) between the controller and the device defined.

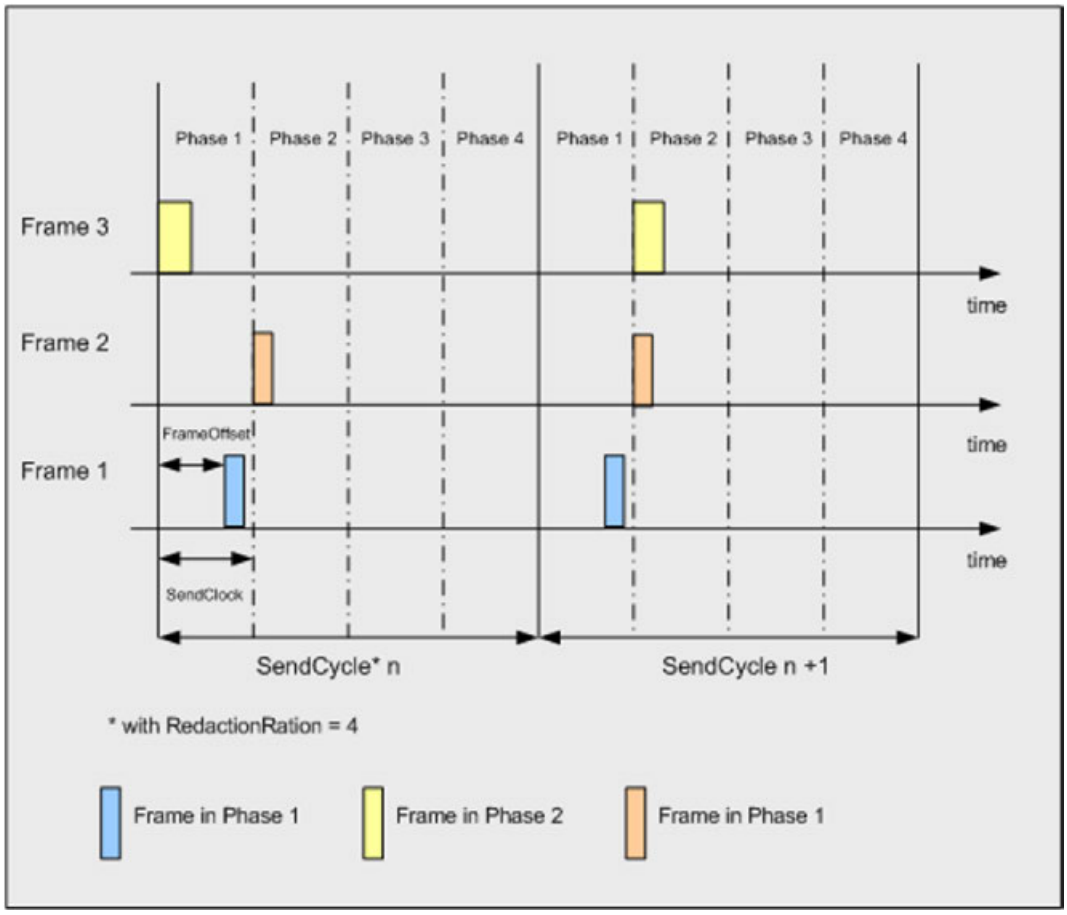
One describes the I/O telegram from the controller to the device (outputs), the other the I/O telegram from the device to the controller (inputs).

The timing of the corresponding I/O telegrams can be defined separately for each device.

Editable timing parameters are:

- Send clock
- Reduction ratio
- Phase

The relation between these parameters is shown in the following drawing.



For each device a SendCycle must be configured, which determines the sending interval of I/O frames. It is based on a time base of 31.25 µs and is calculated as:

SendClock [ms] = SendClockFactor * 31.25 µs / 1000.

The cycle time of an I/O telegram is defined by the SendCyle.

It's calculated as:

SendCyle [ms] = SendClock [ms] * Reduction Ratio.

The values of the individual parameters are limited by the maximum value 512 ms of the SendCycle. The following table summarizes the relation of the timing parameters.

Parameter	Description	Relation	Range
SendCycle	Is the cycle time of a RT telegram.	SendCyle = Send-Clock * Reduction ratio.	1ms..512 ms
SendClock	The SendCycle is divided into several time slots. The SendClock defines the size of a time slot within the SendCyle.	SendClock = SendClock factor * 31.25 µs;	SendClock * Reduction ratio ≤ 512 ms
SendClock factor	Is multiplied with the time base 31.25 µs to calculate the SendClock.	SendClock factor = Send-Clock / 31.25 µs	1..128
Reduction ratio	The reduction ratio defines the number of time slots within the SendCyle.	SendClock * Reduction factor ≤ 512 ms	1..16384
Phase	The time slot in which the IO frame is sent.	A integer value of the range 1 … Reduction ratio	1..16384

PROFINET IO device – PNIO parameters

The tab *"PNIO Parameters"* is a generic view of all PROFINET IO device parameters. It is normally hidden and is normally not needed for configuration.

> *Use tab "PNIO Parameters" only, if you need to change a parameter, which is not visible in other dialogs.*

Activating tab

1. Click *"Tools ➔ Options"* and select *"Device editor"*.
   ⇨ The *Device editor* dialog opens.
2. Enable checkbox *Show generic device configuration views* and click *[OK]*
   ⇨ The tab is now available.

Configuration of 3rd party PROFINET IO devices

Before a 3rd party PROFINET IO device can be used, the provided GSDML file has to be installed in the *Device Repository*.

Installation Go to *"Tools ➔ Device Repository ➔ Install"*.

Configuration See *Chapter 1.6.6.2.11.2.1.2.1.1.3 "Configuration of PROFINET IO devices" on page 3744*.

I/O mapping of the PROFINET IO devices

Open I/O mapping list

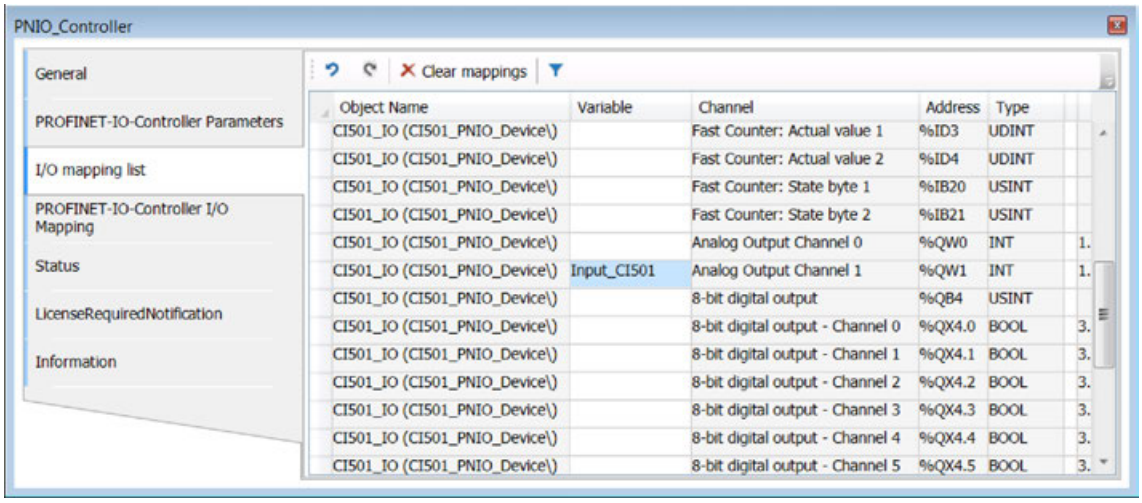
1. Doube-click on the *"PNIO_Controller"* or below on the *"<...>PNIO-Device"* or below on the *"I/O-Module"* in the device tree.
2. Select tab *"I/O mapping list"* to show the list of I/O channels.

The content of the list depends on the selected node.

For instance:

- When the *"PNIO_Controller"* node is selected all I/O channels of all configured devices are shown.
- When a *"PNIO-Device"* is selected all I/O channels of the configured modules are shown.

An IEC variable for an I/O channel that is available in the Application can be defined by double-clicking in column *Variable*.



CM589-PNIO PROFINET IO device communication module

> *Configuration is valid as of CPU FW 3.5.0 and "CM589-PNIO" FW 1.6.2.20.*

The configuration of the *"CM589-PNIO"* PROFINET IO device module has to be done in the following steps:

- Parameterization of the AC500 communication module interface *"Parameterization - CM interface" on page 3748*
- Parameterization of the PROFINET IO device protocol stack *"Parameterization - PROFINET IO stack" on page 3749*
- Configuring PROFINET IO device module structure *"Configuring PROFINET IO structure" on page 3749*
- Parameterization of the PROFINET IO device modules *"Parameterization - PROFINET IO device modules" on page 3750*

Parameterization - CM interface

For connecting a PLC as *"PROFINET IO device"*, plug *"CM589-PNIO"* at the *"Extension_Bus"* node.

Double-click on *"CM589-PNIO"* to open the *"CM589-PNIO"* configuration in the editor window.

The following parameter is available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started even in case of configuration error.

Click on tab *[CM589-PNIO I/O Mapping]* to get *"Bus Cycle Options"* in the editor window.

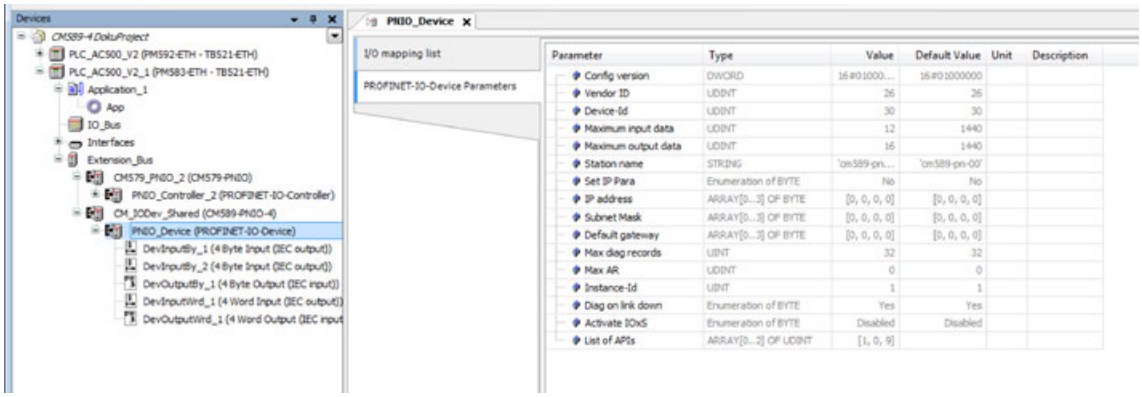
The following parameter is available:

Parameter	Default value	Value	Description
Bus cycle task	Use parent bus cycle settings	Use parent bus cycle settings	Settings from “PLC settings” tab are used.
		Name of task	Name of task that triggers the bus cycle

Click on tab *[CM589-PNIO IEC-Objects]*. Here the IO driver instance of communication module is specified.

Parameterization - PROFINET IO stack

“PROFINET IO device” protocol does not need user configuration. All needed parameters are set automatically by Automation Builder. Double-click on *“PROFINET IO device”* in tree view will show the parameter set in tab *“PROFINET IO device parameters”*. The parameters are displayed just for information and in read-only mode.

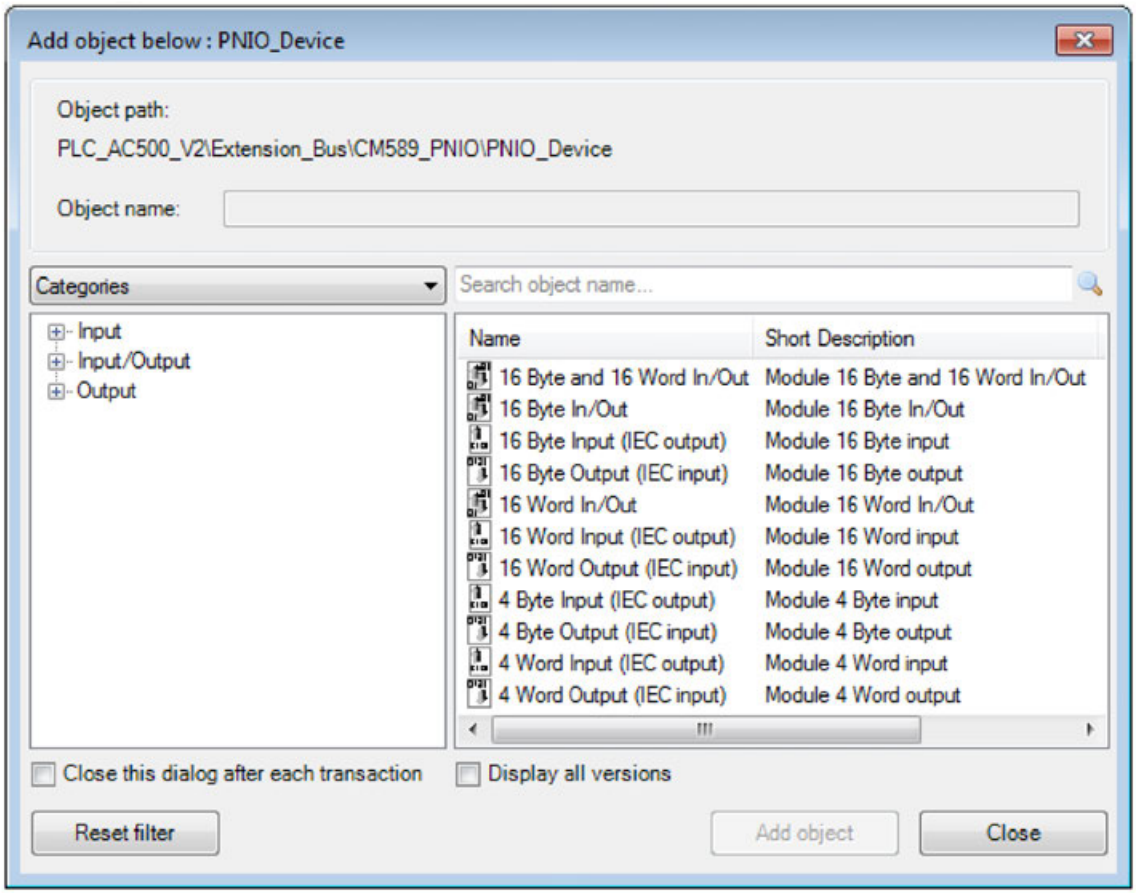


– *Station name: the default name is displayed. The real name used on acting at the field bus is combined out of this default name and the used setting of the rotary switches at the CM589 module (“cm589-pnio-00”, “00” will be replaced by rotary switch value) or the name set via PROFINET set name service.*
– *Parameter “IP address”, “Subnet Mask”, “Default Gateway”: the default values are displayed here. These values are not used as communication settings. “PROFINET IO controller” supplies the IO devices with IP settings on communication establishing.*

Configuring PROFINET IO structure

“CM589-PNIO” provides I/O data as modules with different data types and directions. Create an application specific I/O structure by compiling an appropriate combination of modules.

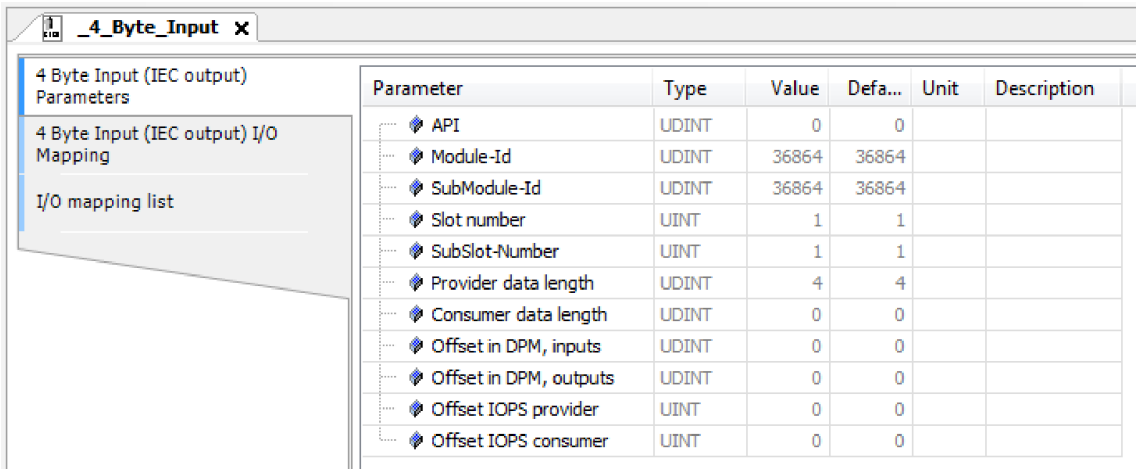
To assign I/O modules to *“PROFINET-IO-device”* node open *“Add Object”* dialog.



If *“CM589-PNIO”* module does not support the number of I/O data configured, download configuration will fail. Currently 1440 bytes are supported for inputs and 1440 bytes for outputs. See *“Calculating size of I/O data” on page 3751* how to calculate number of I/O data occupied by certain configuration.

Parameterization - PROFINET IO device modules

PROFINET-IO device modules do not need user configuration. All needed parameters are set automatically by Automation Builder. Double-click on a module node shows the parameter set just for information. This parameter set is identical for all module types and is displayed in read-only mode.



- *API: shows the API which is used by the CM589-PNIO modules. As API 0 is supported only CM589-PNIO modules do not provide configuration capabilities for this parameter*
- *Slot number, Sub-Slot-Number, Offset in DPM, inputs/outputs: will be set to default values on inserting a module. On creating configuration data Automation Builder calculates real values and overwrites the defaults*
- *Offset IOPS provider/consumer: not used and set to 0 values*

Calculating size of I/O data

PROFINET defines IO data and status information to be exchanged between IO controller and IO device. The status information is called *“Provider Status”* and *“Consumer Status”*. Both (IO data and status information) have to be considered on calculating allocated memory in input and output image.

- The number of status bytes depends on the type of module used.
- The different types of modules input, output and in/output have to be considered different.
- Some status bytes are reserved for predefined submodules have to be considered additionally.

A configured IO module allocates memory space at the corresponding IO image for data and status bytes. Additionally memory is allocated at the opposite directions IO image to store further status bytes. E.g. an input module allocates memory at the input image but additionally it allocates one byte for status at the output image. Summarized size of input and output data and status has to fit to the corresponding image.

See following table for an overview of IO module types and corresponding status bytes:

Module Type	**Input Data**			**Output data**		
	Inputs	**Provider Status Inputs**	**Consumer Status Outputs**	**Outputs**	**Provider Status Outputs**	**Consumer Status Inputs**
Reserved	0 Input Bytes	4 Bytes	0 Bytes	0 Bytes	0 Bytes	4 Bytes
Input Module	n Input Bytes	1 Byte	0 Bytes	0 Bytes	0 Bytes	1 Byte
Output Module	0 Input Bytes	0 Bytes	1 Byte	n Output Bytes	1 Byte	0 Bytes
Input/ Output Module	n Input Bytes	1 Byte	1 Byte	n Output Bytes	1 Byte	1 Byte

Following expressions calculate allocated sizes of input and output data:

Size Input =	**Input + Status + 4 bytes (reserved status)**
Size Output =	**Output + Status + 4 bytes (reserved status)**

- Input = summarized number input bytes all modules
- Output = summarized number output bytes all modules
- Status = count input modules + count output modules + 2 * count input/output modules

Mapping of the I/Os

Double-click on the desired *“PROFINET-IO-device”* module object in the device tree to show current I/O mappings connected to this module.

See chapter Symbolic Names for Variables, Inputs and Outputs ↳ *Chapter 1.6.6.2.13.7 “Symbolic names for variables, inputs and outputs” on page 3776* for further details on mapping inputs and outputs.

Diagnosis and debugging for AC500 V3 products

“CM589-PNIO” – PROFINET device diagnosis

The diagnosis messages of Communication module *“CM589-PNIO”* are displayed in tab *[Diagnosis]* of node CM589-PNIO in device tree of Automation Builder. Within PLC application they can be read with the diagnosis methods of IO driver or *“Function Block Diag”*.

↳ *Chapter 1.7.1.4.3.2 “Device state” on page 4035*

↳ *Chapter 1.7.1.4.2.2.1 “Method Ack / DiagAck: acknowledgement” on page 4029*

In PLC display the diagnosis messages of *“CM589-PNIO”* are not shown.

The following diagnosis messages are signaled by *“CM589-PNIO”*:

Error severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	1000	No communication module or wrong type found	Plug the correct communication module
3	0	0	1001	Type of CM589-PNIO not supported	Exchange the communication module
3	0	0	1002	Firmware version of CM589-PNIO not supported	Update firmware of CM589-PNIO
3	0	0	1003	Identification of communication module failed	Exchange the communication module or plug the correct communication module
3	0	0	2000	Watchdog error	
3	0	0	2001	CM589-PNIO is not communicating	Check bus connection and configuration
3	0	0	2002	CM589-PNIO signals communication error	Check bus connection and configuration
3	0	0	2003	Starting of CM589-PNIO's protocol stack failed	Check bus connection and configuration
3	0	0	2004	Stopping of CM589-PNIO 's protocol stack failed	
3	0	0	2005	PLC cannot be set to run due to an error of CM589-PNIO	Check error log and correct errors
3	0	0	3000	Configuration error	Check configuration and correct errors
3	0	0	3001	Configuration version mismatch	Use matching CPU firmware version
3	0	0	4000	Ethernet link down	Check Ethernet cable connection

CM589-PNIO - PROFINET IO slave

Configuration in Automation Builder is described in PROFINET IO Slave configuration ↬ *Chapter 1.6.6.2.18 “PROFINET IO Configurator” on page 3832*.

EtherCAT

CM579-ETHCAT - EtherCAT I/O master

Configuration in Automation Builder is described in EtherCAT master configuration ↬ *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*.

Parameterization of the CM579-ETHCAT communication module interface

- Double-click on *“CM579_ECAT (CM579-ECAT)”* to open the CM579-ECAT configuration in the editor window.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the EtherCAT Communication Module.
Broken slave behavior	Leave all broken slaves down	Leave all broken slaves down	Broken slaves will not be served.
		Leave addressless slaves down	Only slaves without address will be left down.
		Leave no slaves down	Broken slaves will be ignored.
Distributed clocks	Inactive	Inactive	Distributed clocks are inactive.
		Active	Distributed clocks are active.
Bus Target State	Operational, OP	Operational, OP	Target state of the EtherCAT bus at application start.
		Safe-Operational, SAFEOP	
		Pre-Operational, PREo	
Bus behavior	Asynchronous (IEC bus cycle)	Asynchronous (IEC bus cycle)	Type of bus behavior (asynchronous/synchronous)
		Synchronous (Sync mode 1)	Minimum lag (1 bus cycle) between input and output values.
		Synchronous (Sync mode 2)	Extended application time, higher lag (2 bus cycles) between input and output values.
Optimize I/O update	Off	On	When activated, consecutive I/Os are merged in one block to optimize the performance.
		Off	

EtherCAT-Master - ABB functionality for sync units

With the EtherCAT sync units, several slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for an granular input data validation. As soon as a slave is missing in a sync unit group, the input data of all other slaves in the same group becomes invalid.

Detection occurs immediately in the next bus cycle, as the working counter is continuously checked. Unaffected groups remain operable without any interference.

Right click on the *“Application”* node and press *“Create configuration data”*.

Automation Builder creates a set of global variables defining the working counter state of a SyncUnit command.

The variables use the following naming scheme:

"SLOT_" + "CouplerSlot_ " + "SyncUnitName" + "_CMD_" + "LogicalAccess" + "_FRAME_" + "FrameID CouplerSlot".

CouplerSlot

The communication module slot is the ID of the slot where the communication module is plugged in.

SyncUnitName

The sync unit name is as defined in the *“Sync Unit Assignment”* tab.

LogicalAccess

The logical access defines the command List of logical access commands:

- Read = 10;
- Write = 11
- Read/Write = 12

FrameID

The frame ID starts with 1 and increments if the cyclic exchanged data is larger than the maximum Ethernet frame boundary.

Values

- FALSE : Working counter is as expected (data from slaves is valid)
- TRUE : Working counter is different to expected value (data from slaves is invalid)

The variables can be used by conditional consumption of slave data in the application:

```
IF NOT SLOT_1_default_CMD_10_FRAME_1 THEN
(* Consume SyncUnit default slave data *)
END_IF;
```

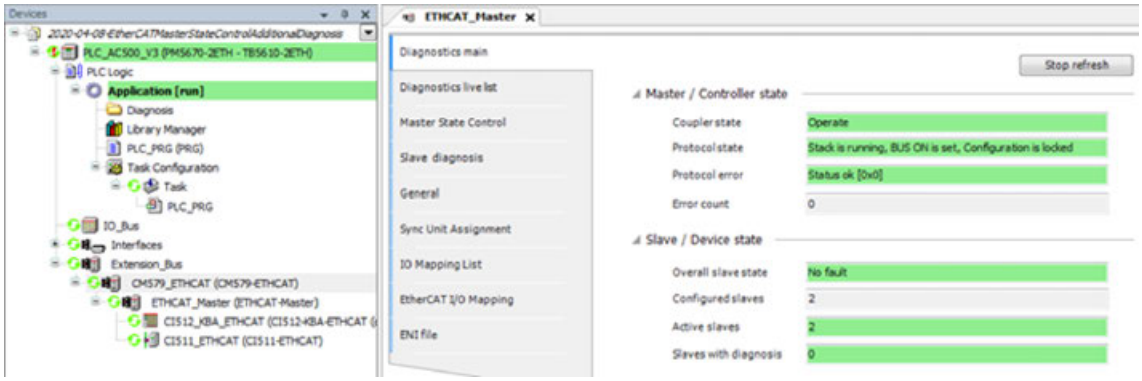
See Chapter 1.6.6.2.17.1.2 “Tab 'EtherCAT Master - Sync Unit Assignment' ” on page 3818.

EtherCAT diagnosis (V2 PLC and V3 PLC)

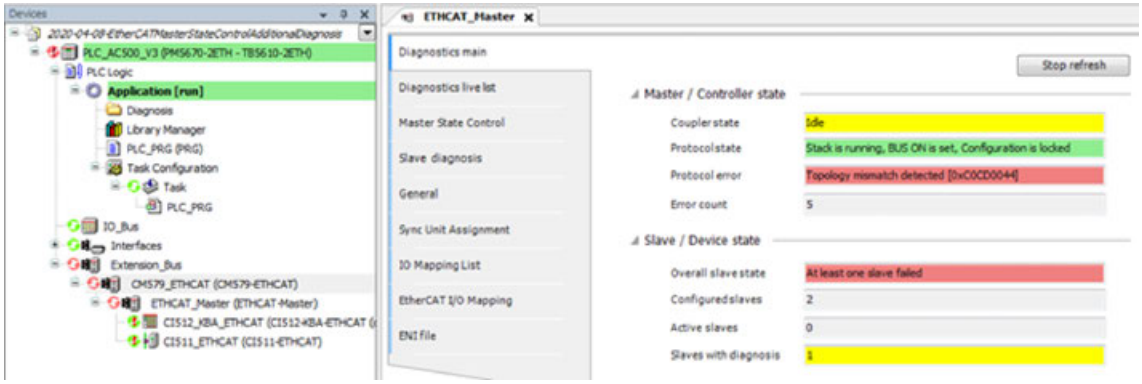
Automation Builder 2.3 provides an enhanced diagnosis interface for the EtherCAT fieldbus. The user can get EtherCAT diagnosis information from different editor views. All these views are accessible within the EtherCAT master device editor and provide information about the master and all configured or connected slaves. The main diagnosis overview is given in the EtherCAT master view *“Diagnostics main”*.

The *application example* shows how to integrate and use the function blocks to receive diagnosis messages in the CODESYS program of an AC500 V3 PLC.

“Diagnostics main” shows EtherCAT state *“Operate”*.



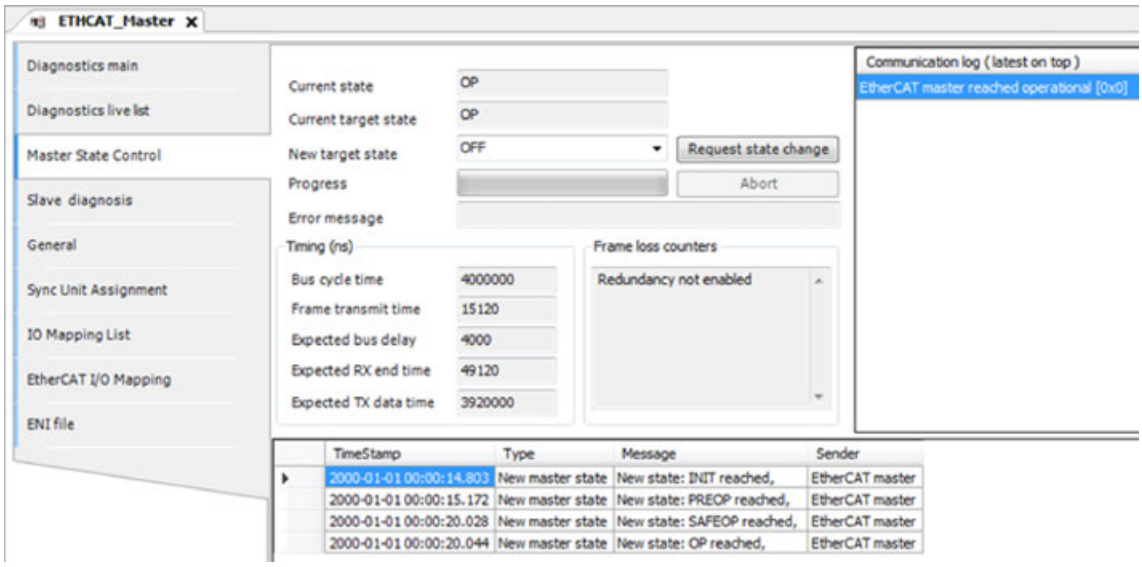
“Diagnostics main” shows EtherCAT state *“Topology error”*.



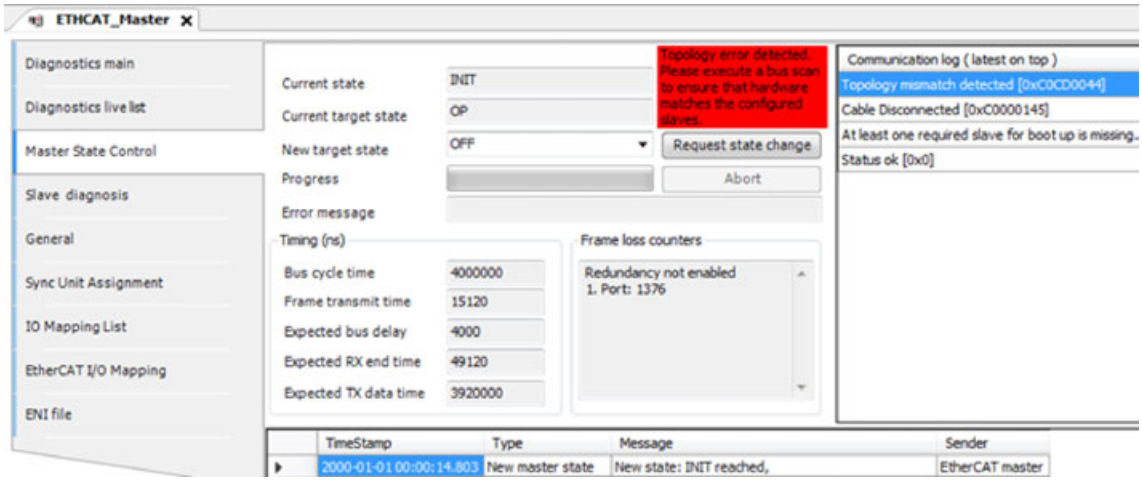
If the EtherCAT bus state shows *“Operate”*, the user does not need to check for any more information.

If the *“Diagnostics main”* shows any error, like *“Topology mismatch detected”*, the user can continue to the next level of information by opening editor view *“Master State Control”*.

“Master State Control” shows EtherCAT state *“Operate”*.

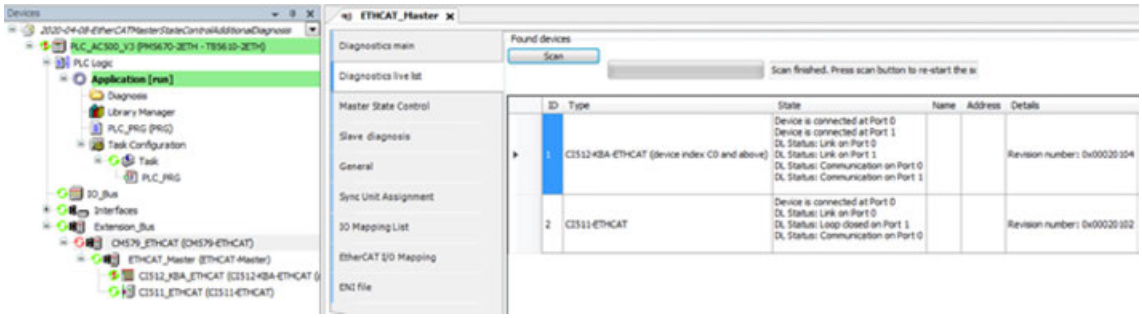


“Master State Control” shows EtherCAT state *“Toplogy error”*.



In editor view *“Master State Control”* the user can request a master state change or get information about configured parameters as well as events and latest communication errors. In case of any topology error (e.g. slaves are configured in a different order than they exist in hardware) the Automation Builder shows a hint to the user that it might be helpful to execute a bus scan in editor view *“Diagnostics live list”* to compare the scan result of the real hardware with the configures slaves in the Automation Builder project.

Bus scan result in editor view *“Diagnostics live list”* shows the connected hardware.



The bus scan result list shows the following information for each connected slave:

ID		Position of the found slave device
Type		Slave identification (name or Vendor/Device ID number)
State		The connection/link state of all ports (0-3) of the given slave
	Connected	=> Cable is plugged in
	+ Link	=> Physically connected to another slave
	+ Communication	=> Communication works fine
Name		Not used for EtherCAT
Address		Not used for EtherCAT
Details		E.g. revision number of the slave device

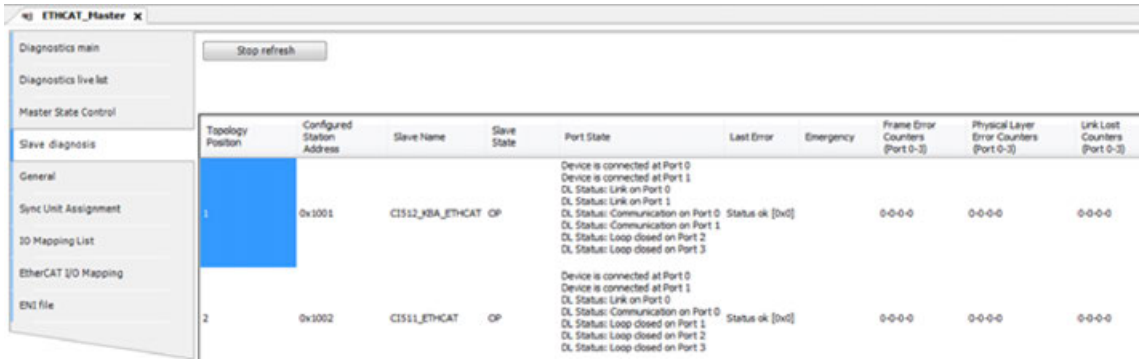
The bus scan shows information about the real connected hardware.

Note that a bus scan will always restart the EtherCAT bus.

This should not be a problem during commissioning but it might not be applicable in a running system.

For runtime diagnosis the Automation Builder provides cyclic information of all configured slaves and their states in the editor view *"Slave diagnosis"*.

Slave diagnosis information shows that configured slaves are ok.



"Slave diagnosis" view shows wrong slave at position 1.

The editor view *"Slave diagnosis"* shows information about the configured slaves. If these slaves are found in hardware, the states of all slaves are ok. If there is a mismatch between hardware and configuration the view shows at which position that mismatch was detected.

The *“Slave diagnosis”* shows the following information for each configured slave:

Topology Position		Position of the configured slave device.
Configured Station Address		Address that is defined by configuration. This address is not topology dependent.
Slave Name		Configured name of the slave device.
Slave State		The state of the slave. Possible slave states are:
	`NOT CONNECTED` [1])	
	`INIT`	
	`PREOP`	
	`SAFEOP`	
	`OP`	
	`INIT ERR`	
	`PREOP ERR`	
	`SAFEOP ERR`	
Port State [2])		The state of all ports (0-3) of the given slave.
		Shows how many connections this slave has to other slaves and if the connections are working fine:
	Connected	=> Cable is plugged in
	+ Link	=> Physically connected to another slave
	+ Communication	=> Communication works fine
Last Error		The last error that occurred in this slave. As text, if available, and error number. If this is any topology error, the editor view will show a hint to perform a bus scan.
Emergency [CAN application protocol over EtherCAT (CoE)]		This column contains up to 5 CoE emergency entries. Each entry has
	Error code	
	Address of the error register	
	Error data (1 byte)	
		If there are more than five emergencies reported by the slave, the columns show a hint that some emergency entries have been lost. The column is empty, if no CoE emergencies exist.
Frame Error Counters [2])		Counts transmission errors on frame layer, detected by CRC check of frames. Fast growing values show a serious problem. Possible root causes include damaged cables, high electromagnetic noise or misbehavior of EtherCAT slave devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.
Physical Layer Error Counters [2])		Counts transmission errors on physical layer. Possible root causes include electromagnetic disturbance or faulty devices. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.

Link Lost Counters [2])	Optional feature of EtherCAT slave devices, not supported by every device.
	Counts loss of physical connection (no link, LED off). Even short interruptions can be detected. Possible root causes include power dips, device reset, poor cables or connectors, loose contact. Four counter values are shown, one for each port 0-3. Column has red background in case of any value other than 0.

[1]) Note that columns *"Port State"*, *"Frame Error Counters"*, *"Physical Layer Error Counters"* and *"Link Lost Counters"* show *"LLD: Timeout"*, if this state is `NOT CONNECTED`, because this information is not accessible.

[2]) Note that this column contains *"LLD: Timeout"*, if slave state is `NOT CONNECTED`.

General note on the counters

Please note that this kind of errors will be detected by devices when power state changes, e.g. when the device itself or a neighboring device is powered on, caused by switching artifacts on the cable. This does not signal an issue, only counters increasing during normal operation should trigger deeper analysis. Counters can be reset by the PLC program using corresponding function blocks.

PROFIBUS

The fieldbus PROFIBUS is supported in AC500 PLC as master and slave. The communication modules *"CM592-DP PROFIBUS DP V0/V1 master module"* and *"CM582-DP PROFIBUS DP slave module"* are provided for these purposes.

Parameterization of the CM592-DP/CM582-DP communication modules

Configuration is valid as of CPU FW 3.5.0.

To append a communication module, add the communication module to the *"Extension_Bus"* node.

- Right-click the desired slot and select *"Add object"*.
- Select the communication module from the list and click *[Replace object]*.

- Double-click the new node to open the CM592-DP/CM582-DP PROFIBUS DP configuration in the editor window. Click on tab *"CM592-DP/CM582-DP Parameters"* if not already opened.

The following parameters are available:

Parameter	Default value	Value	Description
Run on config fault	No	No	In case of a configuration error, the user program is not started.
		Yes	The user program is started independent of a faulty configuration of the PROFIBUS communication module.

Click on tab *"CM592-DP/CM582-DP I/O Mapping"* to open the *"Bus Cycle Options"* in the editor window.

The following parameter is available:

Parameter	Default value	Value	Description
Bus cycle task	Use parent bus cycle settings	Use parent bus cycle settings	Settings from PLC settings tab are used.
		Task	Name of the task that triggers the bus cycle

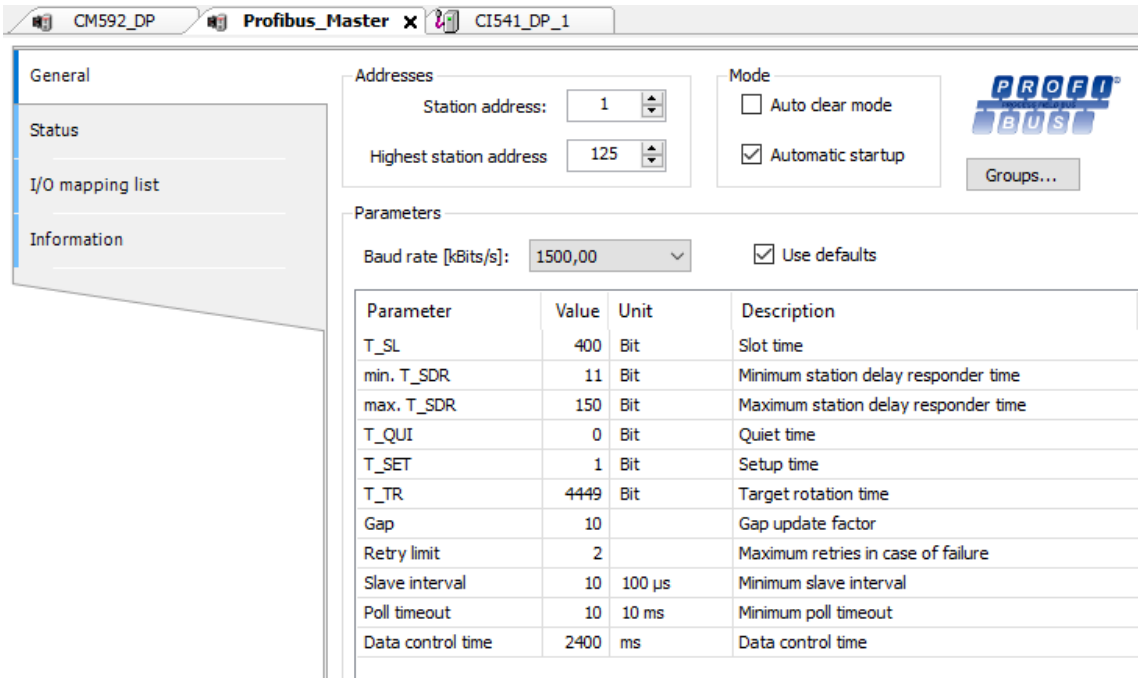
Click on tab CM592-DP/CM582-DP IEC-Objects to open the list of used IEC Objects. For information instantiated I/O driver function block class is shown.

CM592-DP PROFIBUS DP master communication module

Configuration of a PROFIBUS DP master

Double-click on *"Profibus_Master_x (Profibus_Master)"* to open the *"Profibus_Master"* configuration in the editor window:

Click on tab *"General"* if not already opend.



Most of the parameters are calculated automatically. Uncheck *[Use defaults]* to enable values to be edited individually. Checking *[Use defaults]* again will revert all parameters to default values.

All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:

tBit = 1 / transmission rate in [bit/s]

The conversion from milliseconds into a bit time is shown in following formula:

*tBit = Time in [ms] * transmission rate in [bit/s]*

The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1)
Adresses				
Station address	1	0...125	The individual device address of the master device on the bus.	DpParameter -> Station address
Highest station address	126	0...126	The highest bus address up to which a master searches for another master at the bus in order to pass on the token. This station address must on no account be smaller than the master station address.	DpParameter -> Highest station address
Mode				
Auto-Clear mode	Enabled	Disabled	The master operation mode will stay in the mode 'Operate' and the communication to all available slaves is kept up.	AutoClear-Supported
		Enabled	The masters operation mode will change from 'Operate' to 'Clear' and it shuts down the communication to all assigned slaves, if at least 1 slave is not responding within the data control time.	
Automatic startup	Enable	Disable	Do not perform automatic startup	AutoStart
		Enable	Perform automatic startup	
Parameters				
Baud rate	1500	9.6 19.2 45.45 93.75 187.5 500 1500 3000 6000 12000	Data transfer speed in [kBits/s]. The baud rate must be set to the same value for all devices on the bus. The result of changing the baud rate is that all other parameters must be recalculated.	DpParameter -> Baudrate
T_SL Slot time	300	37.. 65535	Monitoring time of the sender (requester) of a telegram for the acknowledgement of the recipient (responder). After expiration, a retry occurs in accordance with the value of maximum telegram retries.	DpParameter -> TSL

Parameter	Default	Value	Description	Parameter (Remark 1)
min. T_SDR Minimum station delay responder time	11	1...65535	Shortest time period that must elapsed before a remote recipient (responder) may send an acknowledgement of a received query telegram. The shortest time period between reception of the last bit of a telegram to the sending of the first bit of a following telegram.	DpParameter -> min. TSDR
max. T_SDR Maximum station delay responder time	150	1...65535	Longest time period that must elapse before a sender (requestor) may send a further query telegram. Greatest time period between reception of the last bit of a telegram to the sending of the first bit of a following telegram. The sender (requestor, master) must wait at least for this time period after the sending of an unacknowledged telegram (e.g. broadcast only) before a new telegram is sent.	DpParameter -> max. TSDR
T_QUI Quiet time	0	0...127	Time delay that occurs for modulators (modulator-trip time) and repeaters (repeater-switch time) for the change over from sending to receiving.	DpParameter -> TQUI
T_SET Setup time	1	0...255	Minimum period reaction time between the receipt of an acknowledgement to the sending of a new query telegram (reaction) by the sender (requestor).	DpParameter -> TSET
T_TR Target rotation time	11894	1.. 2 -1 (=16777215)	Pre-set nominal token cycle time within the sender authorization (token). The available time for the master to send data telegrams to the slaves depends on the difference between the nominal and the actual token cycle time. The Target rotation time (TTR) is shown in Bit times [tBit] like the other bus parameters. Below the displayed bit time, the Target rotation time is also displayed in [ms]. The default value depends on the number of slaves attached to the master and their module configuration.	DpParameter -> TTR

Parameter	Default	Value	Description	Parameter (Remark 1)
Gap Gap update factor	10	0...255	Factor for determining after how many token cycles an added participant is accepted into the token ring. After expiry of the time period G*TTR, the station searches to see whether a further participant wishes to be accepted into the logical ring.	DpParameter -> Gap update factor
Retry limit Maximum retries	1	1...15	Maximum number of repeats in order to reach a station.	DpParameter -> max. retry limit
Data control time	120	1..2^{24}-1	Defines the time in [ms] within the Data_Transfer_List is updated at least once. After the expiration of this period, the master (class 1) reports its operating condition automatically via the Global_Control command. The default value depends on the transmission rate.	DpParameter -> Data control time
Slave interval Minimum slave interval	2000	1...65535	Defines the minimum time period between two slave list cycles in [µs]. The maximum value the active stations require is always given. The default value depends on the slave types.	DpParameter -> min. slave interval
Poll timeout Minimum poll timeout	10		Sets the maximum period of time in [ms] during which the response has to be received.	DpParameter -> Poll timeout

Remark 1:

To display the parameters of this column, enable the option *“Show generic device configuration views”* under *“Tools ➔ Options ➔ Device editor”*.

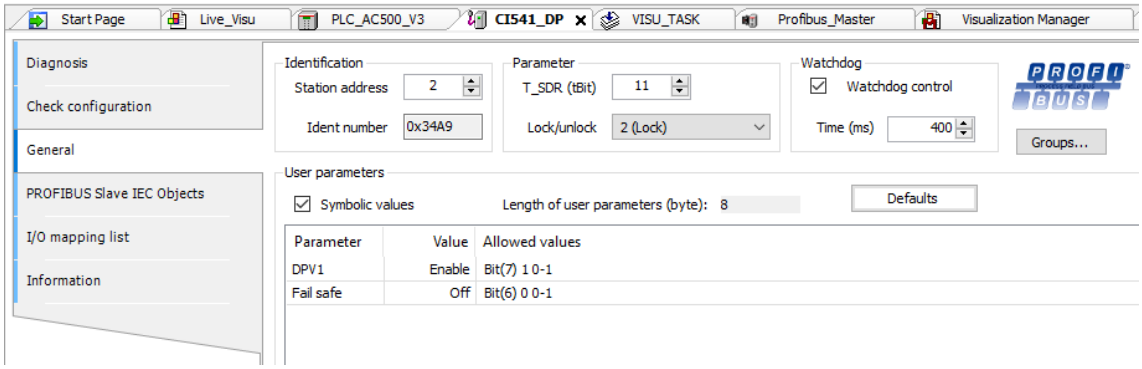
Configuration of a PROFIBUS DP slave

A PROFIBUS DP slave can be added by right-clicking on *“Profibus_Master_x (Profibus_Master)”* and selecting *“Add object”*.

If the desired device is not listed it can be installed via the *“Device Repository”* (menu item *“Tools” -> “Device Repository”*).

The slave configuration parameters can be edited in slave related editor window. To open this editor window, double-click the corresponding slave in the device tree.

Click on tab *“General”* if not already opened.



All times for the PROFIBUS parameters are given in bit time [tBit]. The bit time is the result of the reciprocal of the transmission rate:

tBit = 1 / transmission rate in [bit/s]

The conversion from milliseconds into a bit time is shown in following formula:

*tBit = Time in [ms] * transmission rate in [bit/s]*

The following parameters are available:

Parameter	Default	Value	Description	Parameter (Remark 1)
Identification				
Station address	1	0...126	Station address of the PROFIBUS DP slave device.	StationAddress
Ident number	GSD file specific	----	Ident number of the PROFIBUS DP slave device.	SlavePrmData -> identNumber
Parameter				
T_SDR (tBit)	11	11...255	The parameter T_SDR (tBit) represents the minimum station delay of a responder (time a responder waits before generating the reply frame).	SlavePrmData -> minTsdr
Lock/unlock	2 (Lock)	0 (T_SDR unlock)	The TSDR and slave-specific parameter may be overwritten.	Bit 6 = 0 and bit 7 = 0 of bitmask SlavePrmData -> stationStatus
		1 (Will be unlocked)	The slave is released to other masters.	Bit 6 = 1 and bit 7 = 0 of bitmask SlavePrmData -> stationStatus
		2 (Lock)	The slave is locked to other masters, all parameters are accepted.	Bit 6 = 0 and bit 7 = 1 of bitmask SlavePrmData -> stationStatus

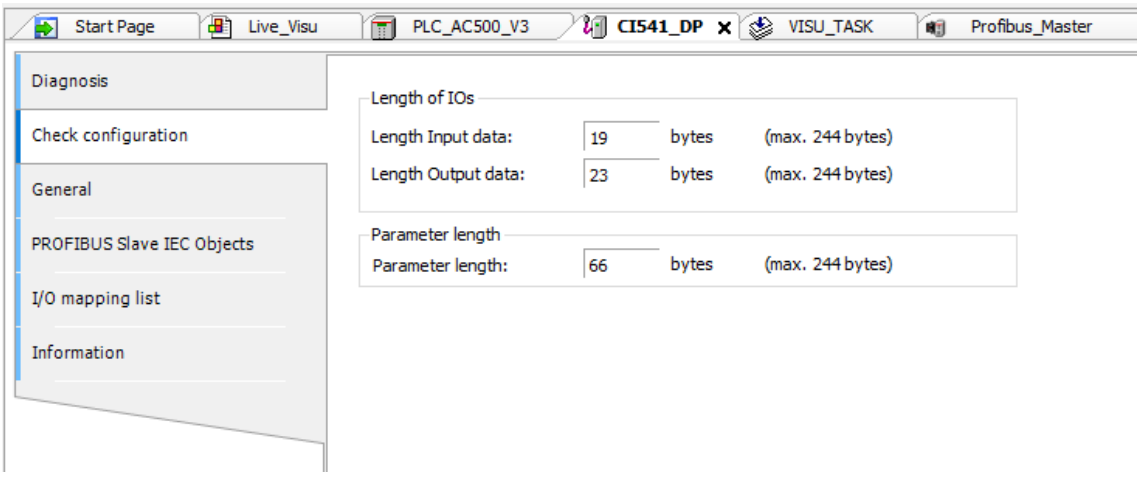
Parameter	Default	Value	Description	Parameter (Remark 1)
		3 (Unlock)	The slave is released to other masters.	Bit 6 = 1 and bit 7 = 1 of bit-mask Slave-PrmData -> stationStatus
Watchdog				
Watchdog control	Enabled	Disabled	The PROFIBUS Slave does not utilize the Watchdog Control Time setting.	SlavePrmData -> wdFact1
		Enabled	The PROFIBUS slave utilizes the Watchdog Control Time setting in order to detect communication errors to the assigned Master. When the Slave finds an interruption of an already operational communication, defined by a Watchdog time, then the Slave carries out an independent Reset and places the outputs into the secure condition.	
Time (ms)	400	0...2540	Watchdog time in [ms]. The default value depends on the number of slaves attached to the master and their configuration.	SlavePrmData -> wdFact2
User parameter				
Symbolic values	Enabled	Disabled	No symbolic names for the user parameters.	-
		Enabled	The values for the parameters are shown with symbolic names.	-
Length of user parameter (Byte)	3	Device-specific	The length of the user parameters in [bytes]. By default this value is 3 due to the existing reserved values.	-
Defaults	-	-	The button restores the default values of the user parameters.	-

Remark 1:

To display the parameters of this column, enable the option *“Show generic device configuration views”* under *“Tools ➔ Options ➔ Device editor”*.

Click on tab *“Check configuration”*.

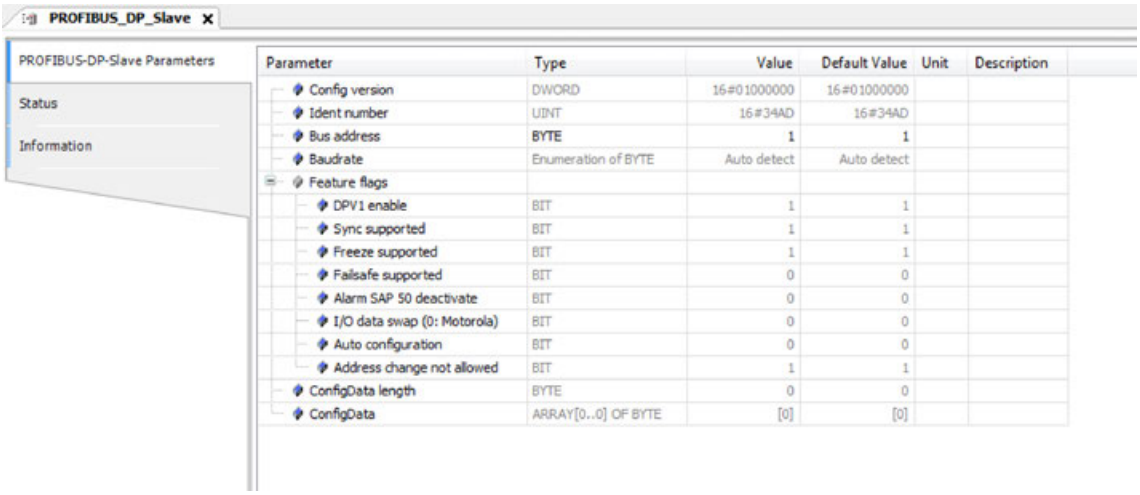
Following dialog shows values for input/output/parameter data occupied by your configuration. Here it can be checked how much data is left for further configuration.



CM582-DP PROFIBUS DP slave communication module

Configuration of PROFIBUS DP slave

Double-click on *"PROFIBUS_DP_Slave"* to open the PROFIBUS slave configuration in the editor window:



The following parameters can be modified:

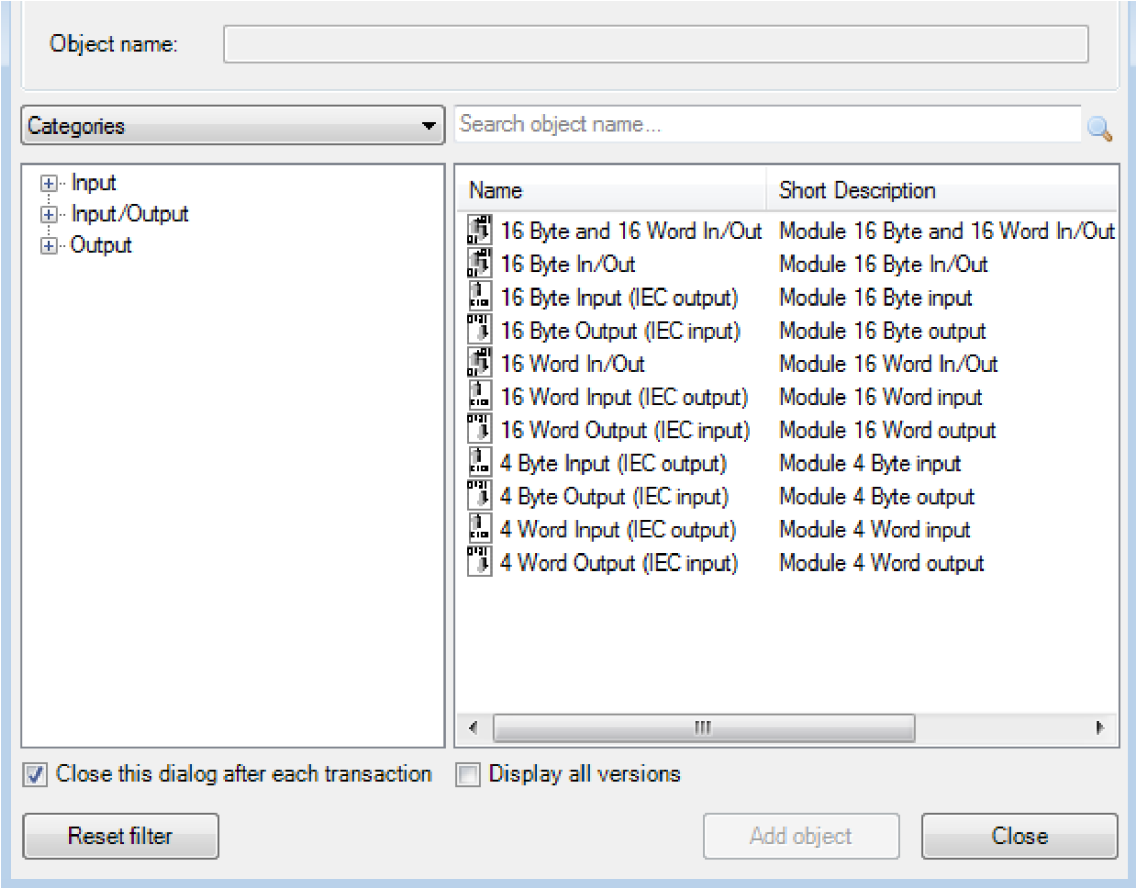
Parameter	Default value	Value	Description
Bus address	1	0...126	The bus address is the individual device address of the slave device on the bus.

Configuration of I/O data objects

To append I/O data, add the desired input / output objects to the Communication Module node.

Right-click the Communication Module node and select *"Add object"*.

Different types of data objects group I/O variables by size and direction. The I/O driver of the PLC firmware copies the amount of data bytes configured by these data objects cyclically.



Select the desired I/O objects from the list and click *[Add object]*.

> *To keep basic load of PLC low, only configure as much I/O data objects as actually required. If further I/O variables need to be added later, additional data objects can be inserted.*

Technical details on the device such as the maximum amount of bytes used for I/O data is described in the device specification for .

Double-click an added I/O object node to open the preset configuration. As the I/O objects do not need user configuration all parameters in the *"Parameters"* tab are read-only.

Open the *"I/O Mapping"* tab to configure the mapping configuration for the I/O object.

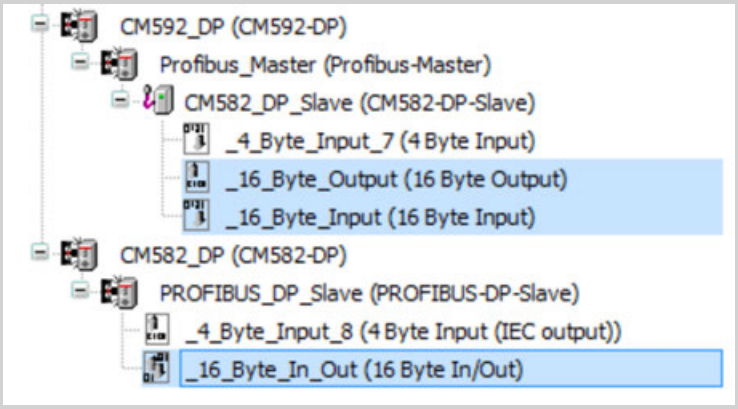
Possible inconsistency

On using CM582-DP slave device configured with modules types combining input and output data the following situation may happen:

Example

CM582-DP Communication Module configuration uses module type 16 Byte In/Out.

The device representation assigned to CM592-DP master uses module types 16 Byte Output and 16 Byte Input at the same place instead.



This mismatch will not be detected; neither by Automation Builder nor by PROFIBUS master and slave.

However, the communication will run stable and I/O data exchange is executed successfully.

Reason:

AC500 defines modules combining input and output directions to be split to two separated module configurations internally with output direction first.

Thus in AC500 the PROFIBUS configuration data for one module of type 16 Byte In/Out looks the same as for the combination of module types 16 Byte Output and 16 Byte Input.

Mapping of the I/Os

Double-click on the desired I/O data object in the device tree to show current I/O mapping connected to this data object.

See chapter Symbolic Names for Variables, Inputs and Outputs for further details on mapping inputs and outputs ↳ *Chapter 1.6.6.2.13.7 “Symbolic names for variables, inputs and outputs” on page 3776*.

1.6.6.2.12 Communication interface modules

Configuration of communication interface modules

Automation Builder can be used to configure the parameters of CI5xx devices.

> *Configuration of S500 I/O modules can be performed without CI5xx devices connected.*

Adding CI5xx device to the device tree

1. Right click in the device tree on the node *“Slot1”* or *“Slot2”* of the *“Extension_Bus”* and click *“Add object”*.

   ⇨ The window *Replace object : Slot* <...> opens.

2. Select your *CM5xx master module* and click *[Add object]*.
   ⇨ The *CM5xx master* appears in the Slot.
3. Right click on the *CM5xx master module* and click *“Add object”*.
   ⇨ The window *Add object below : <...>_Master* opens.
4. Select your *“CI5xx”* device and click *[Add object]*.
   ⇨ The *“CI5xx”* device appears in your device tree.

Adding S500 I/O modules

1. Right click on your *“CI5xx”* device and click *[Add object]*.
   ⇨ The window *Add object below:* opens.
2. Select your I/O module and click *[Add object]*.
   ⇨ The I/O module is added.

Configure parameters

▷ Double-click the *“CI5xx”* device to open editors and select the *“CI5xx_IO Parameters”* tab.

This editor shows the parameters that can be set for each device. For more information see ↳ *Chapter 1.6.3.7 “Communication interface modules (S500)” on page 3043*, and ↳ *Chapter 1.6.3.6 “I/O modules” on page 2569*.

CI521-MODTCP/CI522-MODTCP

Unbundled CI52x-MODTCP configuration

Automation Builder can be used to configure the parameters of CI52x-MODTCP devices.

A direct Ethernet connection is required between the PC running Automation Builder and the CI52x-MODTCP module.

Configuration of S500 I/O modules can be performed without CI52x-MODTCPs modules connected.

Start a project from template

1. Select *“New Project”* in menue item *“File”*.
   ⇨ The window *“New Project”* appears.
2. Select the *“CI52x-MODTCP Configuration Project”* and click *“OK”*.
   ⇨ The window *“Select PLC”* opens.
3. Select a *“CI52x-MODTCP”* device and click *“Add device”*.
   ⇨ A project is created. More modules can be added.

Add CI52x-MODTCP to a project

1. Right click in the device tree on the root of the *"Project"* and click *"Add object"*.
   ⇨ The window *"Add object below"* opens.
2. Select *"Modbus devices"* and click *"Add object"*.
   ⇨ The node*"Modbus_devices"* appears in your device tree.
3. Right click on the node *"Modbus_devices"* and click *"Add object"*.
   ⇨ The window *"Select PLC"* opens.
4. Select your *"CI52x-MODTCP"* device and click *"Add device"*.
   ⇨ The *"CI52x-MODTCP"* device appears in your device tree.

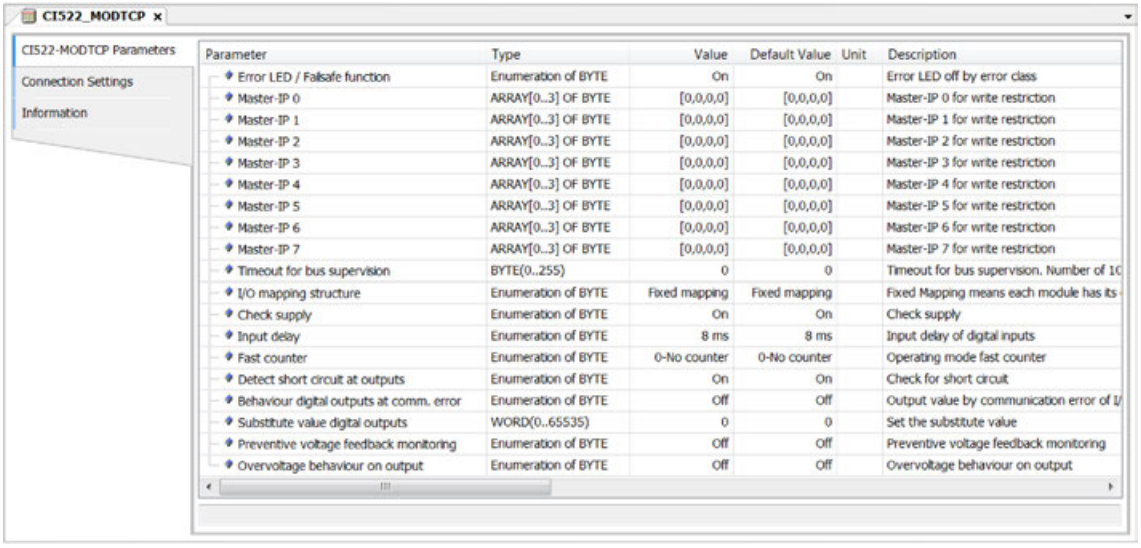
Add S500 I/O modules

1. *"Add object"* to your *"CI52x-MODTCP"* device.
   ⇨ The window *"Add object below: CI52x-MODTCP"* opens.
2. Select your I/O module and click *"Add object"*.
   ⇨ The I/O module is added.

Configure parameters

▷ Double-click the device to open editors and select the *"CI52x-MODTCP Parameters"* tab.

This editor shows the parameters that can be set for each device. For more information see ↳ *Chapter 1.6.3.7.4.1.7.1 "Parameters of the module" on page 3176* CI521, ↳ *Chapter 1.6.3.7.4.2.7.1 "Parameters of the module" on page 3206* CI522 and ↳ *Chapter 1.6.3.6 "I/O modules" on page 2569*.



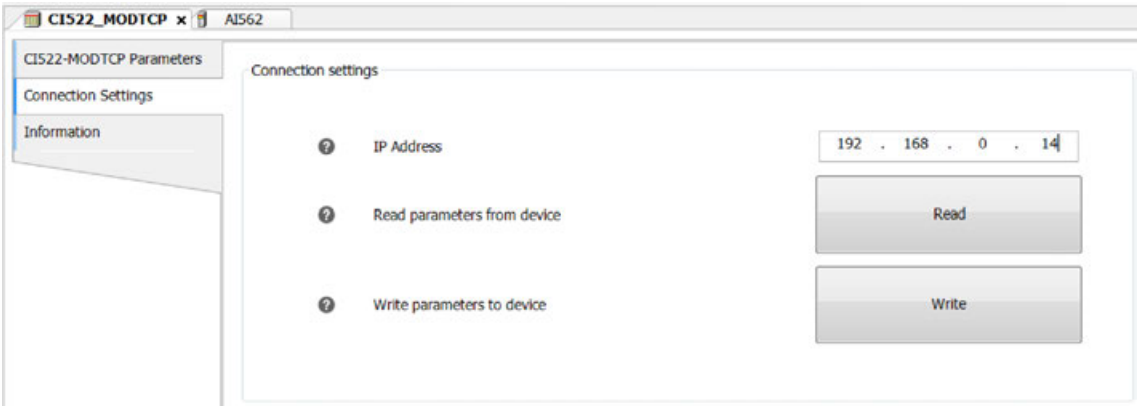
Parameter	Type	Value	Default Value	Unit	Description
Error LED / Failsafe function	Enumeration of BYTE	On	On		Error LED off by error class
Master-IP 0	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 0 for write restriction
Master-IP 1	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 1 for write restriction
Master-IP 2	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 2 for write restriction
Master-IP 3	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 3 for write restriction
Master-IP 4	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 4 for write restriction
Master-IP 5	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 5 for write restriction
Master-IP 6	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 6 for write restriction
Master-IP 7	ARRAY[0..3] OF BYTE	[0,0,0,0]	[0,0,0,0]		Master-IP 7 for write restriction
Timeout for bus supervision	BYTE(0..255)	0	0		Timeout for bus supervision. Number of 10
I/O mapping structure	Enumeration of BYTE	Fixed mapping	Fixed mapping		Fixed Mapping means each module has its
Check supply	Enumeration of BYTE	On	On		Check supply
Input delay	Enumeration of BYTE	8 ms	8 ms		Input delay of digital inputs
Fast counter	Enumeration of BYTE	0-No counter	0-No counter		Operating mode fast counter
Detect short circuit at outputs	Enumeration of BYTE	On	On		Check for short circuit
Behaviour digital outputs at comm. error	Enumeration of BYTE	Off	Off		Output value by communication error of I/
Substitute value digital outputs	WORD(0..65535)	0	0		Set the substitute value
Preventive voltage feedback monitoring	Enumeration of BYTE	Off	Off		Preventive voltage feedback monitoring
Overvoltage behaviour on output	Enumeration of BYTE	Off	Off		Overvoltage behaviour on output

Connect to device

To read or write parameters, the CI52x-MODTCP module must be connected to the PC with an Ethernet connection.

See ↳ *Chapter 1.6.3.7.4.1.5 "Addressing" on page 3175* CI521 and ↳ *Chapter 1.6.3.7.4.2.5 "Addressing" on page 3206* CI522 of the CI52x-MODTCP hardware documentation for information on configuring the IP address of the device.

On the CI52x-MODTCP device editor, the *"Connection Settings"* tab allows the IP address of the device to be entered.



Read Reads the parameters from the CI52x-MODTCP and also for the attached S500 I/O modules.

Write Sends the parameters from the editors to the CI52x-MODTCP and also the S500 I/O modules.

Device checking

The CI52x-MODTCP module knows which I/O modules are attached.

While reading and writing parameters, the project must match the physical hardware. Otherwise an error will be given.

Communication errors will also result in error messages.

When the parameters have been read or written correctly, a message is seen in the *"All messages"* window:

Attached S500 modules

It is possible to read and write parameters when the S500 I/O modules are not attached to the CI52x-MODTCP module.

> *To perform a read, the project structure must still match the configuration of CI52x-MODTCP.*

A warning will be shown if an I/O module is not detected:

When writing parameters, the CI52x-MODTCP configuration is overwritten so the current configuration of missing (unplugged) modules does not matter.

If the I/O modules are attached, then the project must match the hardware, otherwise an error will be given.

Firmware update

As of Automation Builder 2.2.1, the IP Configuration Tool can be used to perform firmware updates for CI52x-MODTCP devices.

1.6.6.2.13 I/O bus and I/O modules

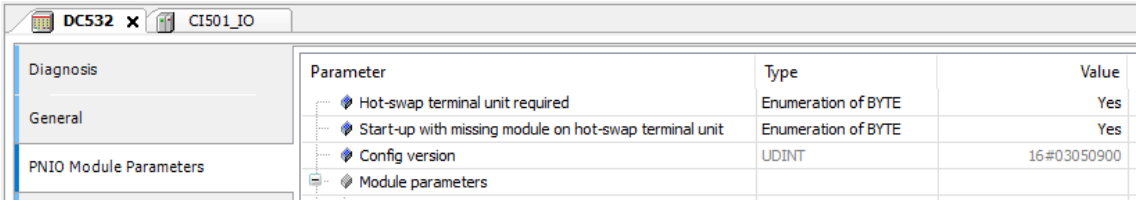
Hot swap configuration

Parameter configuration

I/O extension modules include the below parameters for hot swap configuration

Parameter	Purpose	Value
Hot-swap terminal unit required	To include diagnosis for missing hot-swap terminal unit	Yes: Communication Interface provides extended diagnosis for missing hot-swap terminal unit
		No (default): Extended diagnosis not available
Start-up with missing module on hot-swap terminal unit	Ignore missing module during start-up on hot-swap terminal unit. Incomplete I/O configurations must not prevent the system from starting.	Yes: Module is optional, start-up if there is no module available on hot-swap terminal unit
		No (default): Module is mandatory, start-up only if correct module is available

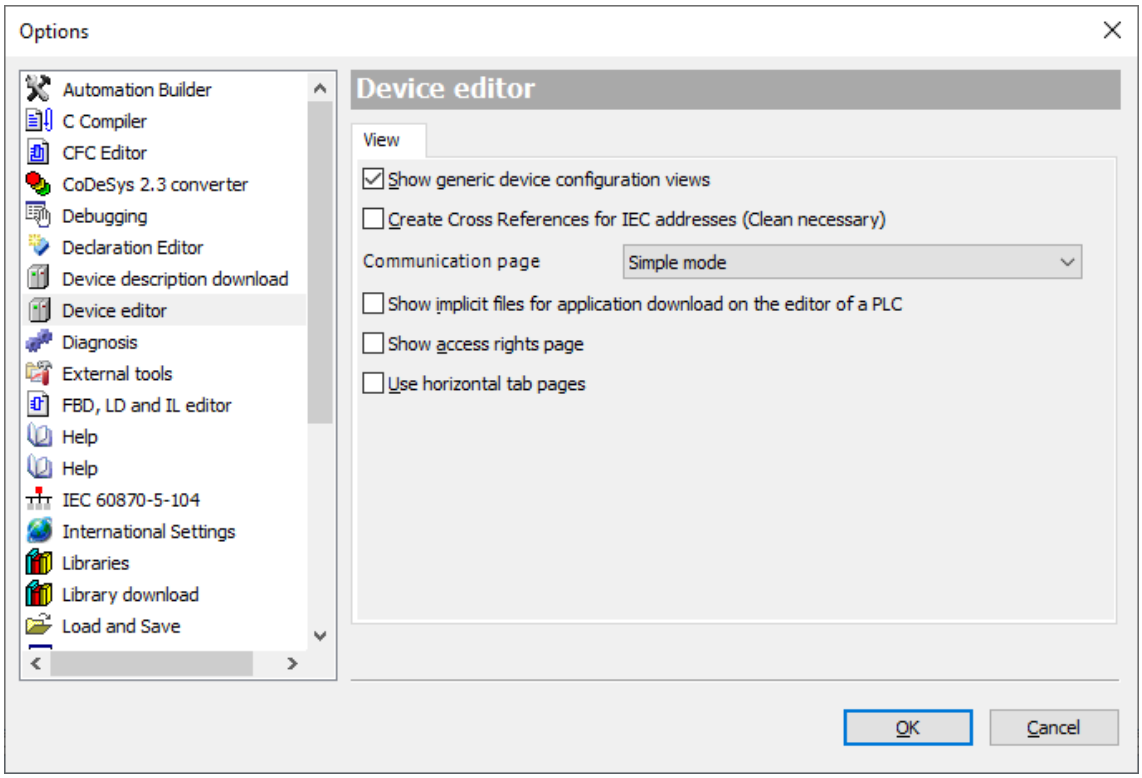
In the Automation Builder projects for V3 PLCs, hot-swap parameters can be configured from Module Parameters tab of respective I/O module.



By default, the Module Parameters tab is not visible for parameter configuration.

Follow the below steps to enable this tab

1. In the Automation Builder menu select *“Tools ➔ Options”*
2. Select *“Device editor”* option from *“Options”* dialog.
3. Enable the option *“Show generic device configuration views”* (if not already done)
4. To save the settings and close the dialog select *“OK”*



Parameterization of the I/O bus

Double-click the *"IO_Bus"* node in the device tree to open the I/O bus configuration.

The following parameters are available:

Parameter	Default	Value	Description
Run on config fault	No	No	In case of configuration fault the user program will not be launched.
		Yes	The user program will be also launched in case of configuration error on the I/O Bus.
Max wait run	3000	0...120000	Maximum waiting time for valid inputs.

In case of a digital I/O Module, the channels are provided as WORD, BYTE and BOOL. Because the analog inputs can also be configured as digital inputs, bit 0 of each channel is also available as BOOL.

The symbolic name of a channel can be entered in front of the string "AT" in the channel declaration.

All channels should have a symbolic name and only symbolic names should be used in the program code. If the hardware configuration has changed or if you want to download the project to a PLC with another hardware configuration and thus the PLC configuration has to be changed, the addresses of the inputs and outputs can change. In case of symbolic programming (i.e., symbolic names are used), the program code does not have to be changed.

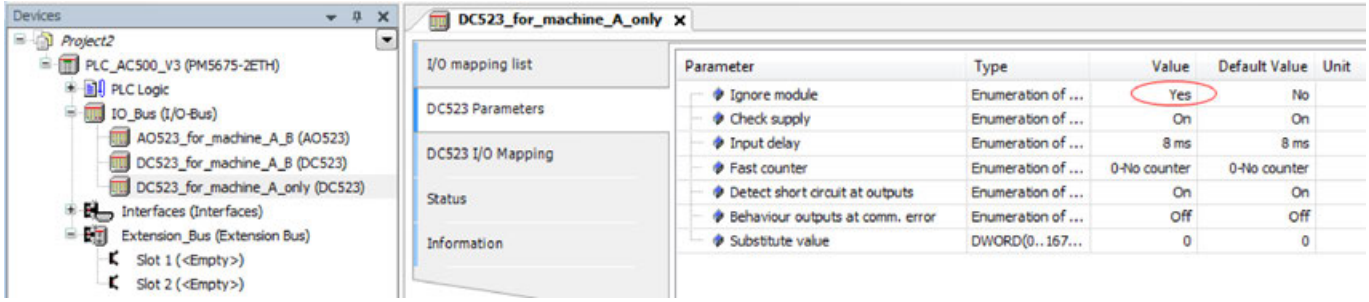
Parameter 'Ignore module'

All I/O devices provide the parameter "Ignore module". This parameter can be used for simulation purposes and determines whether an I/O device is considered or ignored during a PLC configuration check.

This allows to use an existing Automation Builder project/PLC configuration though some hardware devices are not physically available in a hardware installation.

Example

The Automation Builder project for machine A shall be used for machine B. However, the second DC523 device is missing in the hardware installation of machine B. Hence, for machine B the value for 'Ignore module' is set to 'YES'.



I/O bus - Bus cycle task

General information

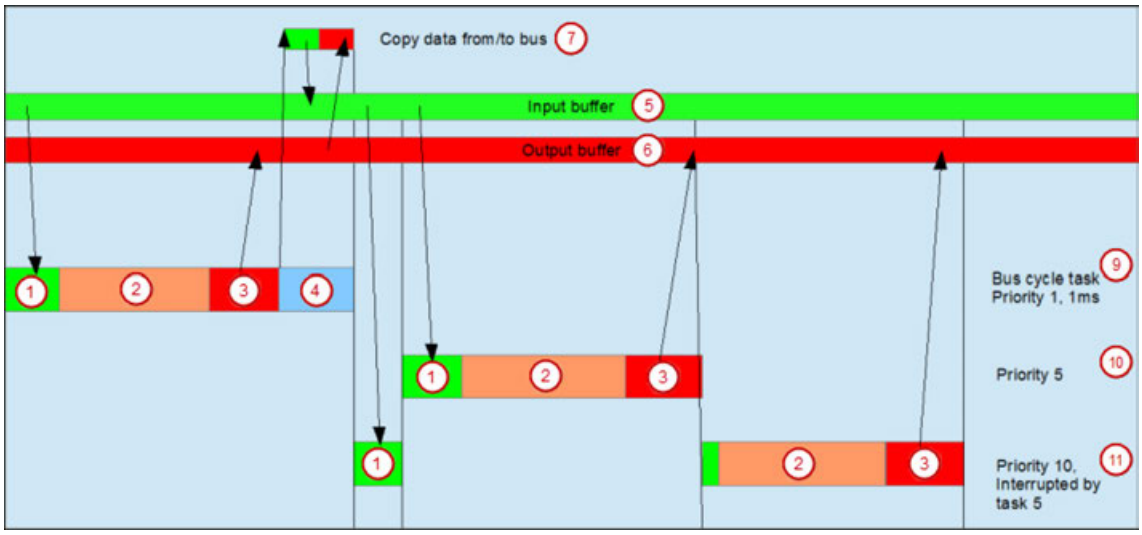
By "bus" it means all fieldbuses including I/O bus. There is no bus cycle task for Modbus because it is controlled by POUs. Modbus does not provide IO mapping.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "*"PLC Settings"*" to avoid unexpected behavior. The task defined in *"PLC Settings"* determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If *[unspecified]* is set in *"PLC Settings"*, the EtherCAT task might be automatically used by other fieldbuses, potentially causing EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in *"PLC Settings"*.

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task . The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.



(1) Read inputs from input buffer
(2) IEC task
(3) Write outputs to output buffer
(4) Bus cycle
(5) Input buffer
(6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks

The *"Task Deployment"* provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

Insertion of S500 I/O devices

1. Right-click *"IO_Bus"* in device tree and select *[Add object]*.

   -> The Add Device dialog window where all available S500 I/O Devices are listed will open.

2. Append the S500 I/O Devices in the same order as they are mounted on the hardware.

   Input and output modules connected to the I/O bus occupy the I/O following area: %IB0 .. %IB999 or %QB0 .. %QB999.

AC500 (Standard): PM56xx support up to 10 S500 I/O Devices.

Configuring the input and output modules and channels

The I/O channel configuration depends on the corresponding S500 I/O Device. See hardware documentation of the I/O Device for more information.

The individual configuration parameters can be opened in the editor window via double-click on the corresponding module and are listed in tab [S500 I/O device name] Configuration.

Symbolic names for variables, inputs and outputs

The IEC naming rules are not checked during input in Automation Builder.

Input and output mapping

Devices with I/Os provide an I/O Mapping tab in their configuration editor where the available I/O channels can directly be mapped to a global variable.

The corresponding variable declarations are automatically available in the project.

All available I/O channels can easily be assigned to a variable.

Variable	Mapping	Channel	Address	Type	Default Value	Unit	Description
b_Input_IB0		Digital inputs I0 - I7	%IB0	BYTE			
x_Input_IB0_IX0		Digital input I0	%IX0.0	BOOL			
x_Input_IB0_IX1		Digital input I1	%IX0.1	BOOL			
x_Input_IB0_IX2		Digital input I2	%IX0.2	BOOL			
x_Input_IB0_IX3		Digital input I3	%IX0.3	BOOL			
x_Input_IB0_IX4		Digital input I4	%IX0.4	BOOL			
x_Input_IB0_IX5		Digital input I5	%IX0.5	BOOL			
x_Input_IB0_IX6		Digital input I6	%IX0.6	BOOL			
x_Input_IB0_IX7		Digital input I7	%IX0.7	BOOL			
		Digital inputs I8 - I15	%IB1	BYTE			
		Digital inputs I16 - I23	%IB2	BYTE			
		Digital inputs I24 - I31	%IB3	BYTE			
Fast counter							

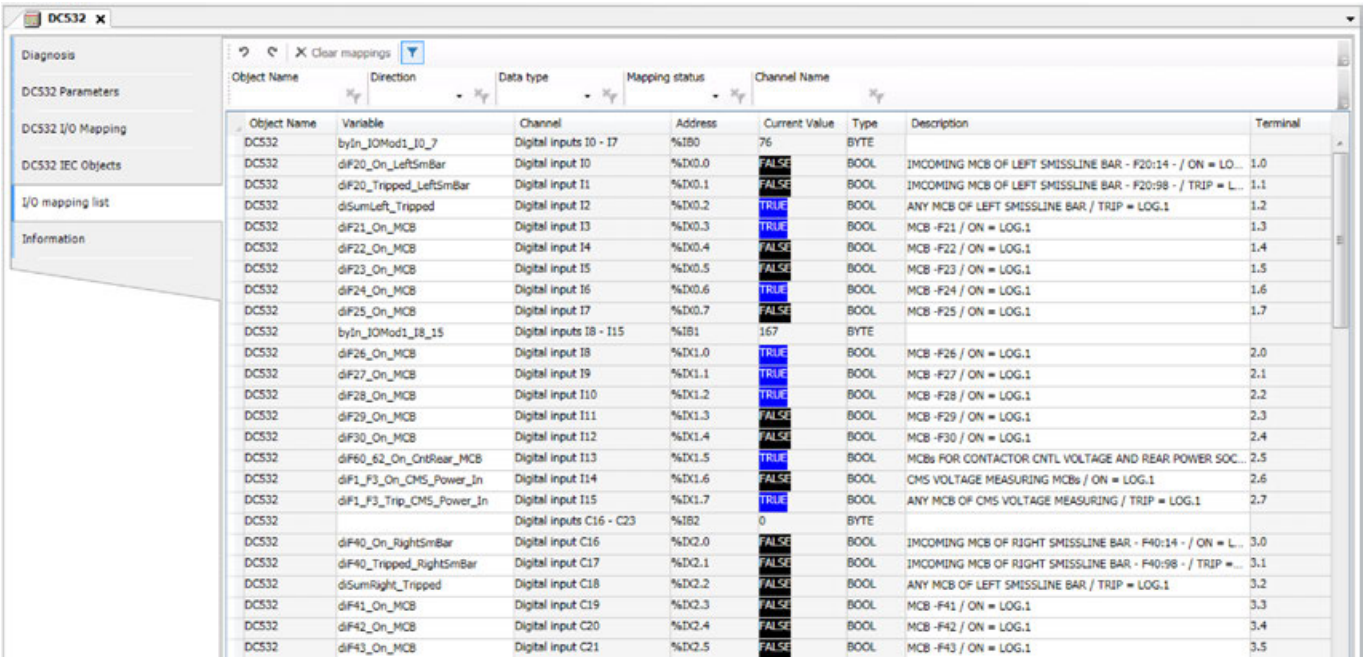
AC500 uses Intel Byte Order (Little Endian).

Only entries with a data type set in column "Type" can be mapped. These entries can be expanded to show the available I/O channels.

If the project has been imported from a previous Automation Builder version, all variables should be checked to avoid inconsistencies concerning the I/O mapping.

I/O mapping list

Automation Builder contains an I/O mapping list feature for creating mapping variables with better usability support compared to the tree structured view. Details on the tree structured view is provided in the CODESYS Development System *Chapter 1.4.1.7.1 “Configuring Devices and I/O Mapping” on page 213*.



Functionalities of the I/O mapping list:

- Displays I/O mappings for current node and all valid subsequent child nodes.
- Displays channel information with additional columns.
- Supports keyboard functions such as *cut*, *copy*, *paste*, *delete*, and *select all* within the editor and within Excel spreadsheet (for bulk editing).
- Contains a toolbar for various actions, e.g. filtering, undo/redo and clear mappings.
- Supports single click edit and easy navigation using arrow keys.
- Improvised error handling:
  - Allows to enter invalid mapping variables. This provides flexibility in bulk editing. Only when saving the project, the errors - according to IEC 61131 standard - are displayed.
  - In the message window, the error log is visible. The user can track the errors to their corresponding channel in the editor.
- Allows multi-selection of rows and columns. (Random selection is not allowed.)

Configuring I/O mapping list

Automation Builder supports tree and list based editors for creating I/O mapping variables.

1. From the **Tools** menu, select **Options**.
2. Under **Automation Builder**, select the **Editors** tab.
3. Choose your desired mapping dialog and click **OK**.
   - Choose **tree based** to display the I/O mapping in tree structure.
   - Choose **list based** to display the I/O mapping as list with the functionalities of the ToolBar.
   - Choose **both** to display both the tree structure (**I/O Mapping** tab) and the list view (**I/O mapping list** tab).

Available channel information

The I/O mapping list displays the channel information in offline and online mode. In online mode, all columns are read-only. In offline mode, some columns are editable.

The order of the devices in I/O mapping list is synchronized with the order in the device tree.

The channels of a device are ordered by the device description file. If channels have a section, the channel information is represented in a specific format.

Example: Fast counter: Actual value 1. These channels are listed at last position of a device.

Editing I/O mapping list

1. In the device tree, double-click **IO_Bus** to configure entire I/O mapping list of different I/O devices.
2. Enter the variables and descriptions to map the I/O devices.

> *Do not start variable names with a number or a special character. When saving the project, this generates an error. Example: 12input3, @input4.*

3. Click **Save Project** to save the I/O mapping changes.

Toolbar

Filtering

Especially in case of long I/O mapping lists, it might be helpful to filter the I/O mappings. For this, click the *"Filter"* icon to display all available criteria for filter options.

> *When reducing the width of the editor, some filters might be hidden.*

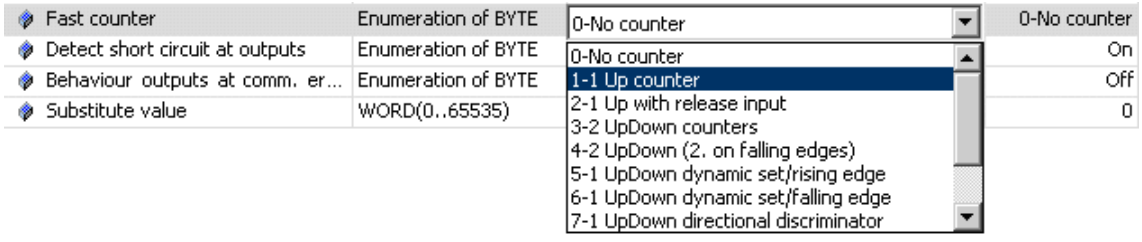
Undo, redo and clear

- **Undo**: Cancels the last change.
- **Redo**: Repeats the last change.
- **Clear mappings**: Deletes all variables and descriptions.

Fast counter

Configuration for S500 I/O modules

1. In the device tree, add a digital I/O module to the *"IO-Bus"* node.
2. Double-click the node for the I/O module, open the *"Parameters"* tab and set the counting mode *Chapter 1.6.6.2.13.9.2.1 "Counting modes" on page 3786* of the *"Fast counter"* parameter.



3. In the *"I/O Mapping"* tab channel configuration is displayed. ↳ *Chapter 1.6.6.2.13.9.3 "Control of the fast counter" on page 3790*

Operands

Table 656: Input information

Description of the input information	Output information of the user program	Description	
Start value 1	Output double word 0	Double word	Set values for the counters 1 and 2: Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (depending on the operating mode either via a terminal or the bit SET within the control byte 1 or 2), the values of the double word variables are loaded into the counter 1 or 2.
Start value 2	Output double word 1	Double word	
End value 1	Output double word 2	Double word	End value for the counters 1 and 2: The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously whether or not their programmed end value is equal to their actual value. When the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.
End value 2	Output double word 3	Double word	

Description of the input information	Output information of the user program	Description	
Control byte 1 see 1)	Output byte 0	Byte: Bit 0 = UP/DWN Bit 1 = EN Bit 2 = SET Bit 3 = CF_HW Bit 4 to Bit 7 free	Control bytes for the counter 1: **UP/DWN**: In some operating modes, the counter can count downwards, too. If counting down is desired, set the bit UP/DWN to TRUE and the bit SET to 1. When doing so, the counter starts counting downwards from the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. **EN**: Processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **SET**: The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. **CF_HW** 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1.
Control byte 2 see 1)	Output byte 0	Byte: Bit 0 = UP/DWN Bit 1 = EN Bit 2 = SET Bit 3 to Bit 7 free	Control bytes for the counter 2: **UP/DWN**: In some operating modes, the counter can count downwards, too. If counting down is desired, set the bit UP/DWN to TRUE and the bit SET to 1. When doing so, the counter starts counting downwards from the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. **EN**: Processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte.

Description of the input information	Output information of the user program	Description	
			SET: The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table.

1) Only for CI581-CN/CI582-CN: Control bytes 1 and 2 are available twice on grounds of data consistency. Hence, a Start and End evaluation is only effected if the signals "Control Byte1_0" and "Control Byte1_1" or "Control Byte2_0" and "Control Byte2_1" (process image) are identical.

Table 657: Output information

Output information	Input information for the user program	Description	
Actual Value 0	Input double word 0	Double word	Actual value of the counter 0
Actual Value 1	Input double word 1	Double word	Actual value of the counter 1
Status Byte 0	Input byte 0	Byte: Bit 0 = CF Bit 1 to Bit 7 free	CF: When the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only when the counter is set again (set value), CF is reset to FALSE.
Status Byte 1	Input byte 1		

Operating modes

Inputs and outputs which are not used by the counters, are available for other tasks.

Legend:

- A refers to input channel A
- B refers to input channel B
- C refers to output channel C

Operating mode	Function	Used inputs and outputs	Notes
0	No counter	none	This operating mode is selected if the integrated fast counter is not necessary.
1	One count up counter	A = Counting input C = End value reached	The counting input and the output "End value reached) are enabled by the bit EN = TRUE within the control byte.

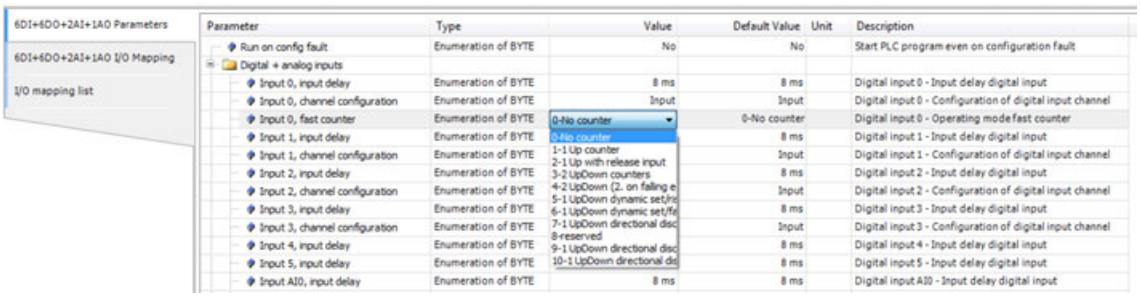
Operating mode	Function	Used inputs and outputs	Notes
2	One count up counter with enable input via terminal	A = Counting input B = Enable input C = End value reached	The enable input enables the counting input and the output "end value reached". The counter is only enabled if the enable input = TRUE (signal 1) AND the bit EN = TRUE within the control byte.
3	Two up/down counters	A = Counting input 0 B = Counting input 1	With this operating mode, two counters exist, which are independent of each other. The state "End value reached" is only readable from the two status bytes. It is not readable from output terminals. The counting direction is defined by the bit UP/DWN within the control byte.
4	Two up/down counters (1 counting input inverted)	A = Counting input 0 B = Counting input 1	This operating mode equals operating mode 3 with one exception: The counting input B (of counter 1) is inverted. It counts the TRUE/FALSE edges at input B.
5	One bidirectional counter with a dynamic set input via terminal	A = Counting input B = Dynamic set input	With this operating mode, one bidirectional counter is available which has a dynamic set input. Dynamic means that the set operation is performed at the FALSE/TRUE signal edge (0/1 edge) of the set input and not while the signal is TRUE. The state "End value reached" is only readable from the status byte, not from an output terminal.
6	One bidirectional counter with a dynamic set input via terminal	A = Counting input B = Dynamic set input	This operating mode equals operating mode 5 with one exception: The dynamic set input operates at the TRUE/FALSE edge (1-0 edge).

Operating mode	Function	Used inputs and outputs	Notes
7	One bidirectional counter for position sensors	A = Trace A of the position sensor B = Trace B of the position sensor	With this operating mode, incremental position sensors can be used which interchange their counting signals on tracks A and B in a 90° phase sequence. Depending on the sequence of the signals at A and B, the counter counts up or down. There is no pulse-multiplier function (e.g. x2 or x4). The position sensor must provide 24 V signals. Signals of 5 V sensors must be converted. Zero traces are not processed. The state "End value reached" is only readable from the state byte 0, not from an output terminal. The bit UP/DWN within the control byte must be FALSE. Otherwise, a parameter error occurrs. In this operating mode, the maximum counting frequency is: I/O modules 35 kHz. Communucation interface modules 50 kHz.
8	Reserved		

Operating mode	Function	Used inputs and outputs	Notes
9	One bidirectional counter for position sensors (pulse multiplier x2)	A = Trace A of the position sensor B = Trace B of the position sensor	This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means, that the counter counts both the positive edges and the negative edges of trace A. This results in the double number of counting pulses. The precision increases correspondingly. In this operating mode, the maximum counting frequency is: I/O modules 30 kHz. Communucation interface modules 35 kHz.
10	One bidirectional counter for position sensors (pulse multiplier x4)	A = Trace A of the position sensor B = Trace B of the position sensor	This operating mode equals operating mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means that the counter counts the positive and negative edges of the traces A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly. In this operating mode, the maximum counting frequency is: I/O modules 15 kHz. Communucation interface modules 20 kHz.

Configuration for onboard I/Os

1. In the device tree, double-click the *"Onboard I/O"* node (OBIO).
2. In the *"Parameters"* tab set the counting mode ↳ *Chapter 1.6.6.2.13.9.2.1 "Counting modes" on page 3786* for the fast counter.



3. In the *"I/O Mapping"* tab channel configuration is displayed. ↳ *Chapter 1.6.6.2.13.9.3 "Control of the fast counter" on page 3790*

Configuring the fast counter

The parameter of the fast counter channels of the Onboard I/O must be configured before they can be used. User should take these steps to configure the fast counter:

Channel	Direction	Width	Description
Actual value X	Input	DWORD	Current value of the fast counter.
State byte X	Input	BYTE	**Bit 0 = CF** If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only, if the counter is set again (set value), CF is reset to FALSE. **Bit 1 to Bit 7 free**
Start value X	Output	DWORD	Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X.
End value X	Output	DWORD	The end values for the two counters are stored as comparison values into the module by the user program. Both counters compare continuously, whether or not their programmed end value is equal to their actual value. If the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.

Channel	Direction	Width	Description
Control byte 1	Output	BYTE	**Bit 0 = UP/DWN** In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. When doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0, the counter jumps to 4,294,967,295. **Bit 1 = EN** The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **Bit 2 = SET** The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table). **Bit 3 = CF_HW** 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1. **Bit 4 to Bit 7 free**
Control byte 2	Output	BYTE	**Bit 0 = UP/DWN** In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. When doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0, the counter jumps to 4,294,967,295. **Bit 1 = EN** The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. **Bit 2 = SET** The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table). **Bit 3 to Bit 7 free**

Counting modes

The fast counter can be configured as one mode out of 10 possible modes. The desired operating mode is selected in the PLC configuration using configuration parameters. Inputs and outputs which are not used by the counter are available for other tasks. In the following table, A means input channel A, B means input channel B and C means output channel C.

CPUs	Integrated fast counter	Assigned inputs		Assigned Outputs	Remarks
		Channel A	Channel B	Channel C	
PM55x, PM56x	Yes	Input channel 0	Input channel 1	Output channel 0	Only 1 fast counter is available on the module. Input channel 0 is the default channel for fast counter. Input channel 1 can be used as another fast counter channel depending on fast counter mode.

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
0	No counter	None	Fast counter is disabled	-
1	1 count up counter	A = Counter input C = End value reached	Counting up A from 0 to 0xFFFFFFFF When the end value is reached, C will be set to high.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
2	1 count up counter with release input	A = Counter input B = Enable input C = End value reached	Counting up A from 0 to 0xFFFFFFFF The counter is enabled if B is high When the end value is reached, C will be set to high.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
3	2 Up/Down counters	A = Counter input 1 B = Counter input 2	2 independent counters. Status "End value reached" is only readable from the 2 status bytes, not from output terminals. The counting direction is defined by the Boolean parameters UD1 and UD2 of function block ONB_IO_CNT (Handle fast counter on Onboard I/O)	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
4	2 Up/Down counters (2nd on falling edges)	A = Counter input 1 B = Counter input 2	Same as operating mode 3, but counting input B is inverted (counts at TRUE/FALSE edges at input B).	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
5	1 Up/Down counter with dynamic set/ rising edge	A = Counter input B = Dynamic set input	1 Up/Down counter is available which counts on the rising edge of A and has a dynamic set input on B. Dynamic set input will set the start value at the rising edge of B.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)
6	1 Up/Down counter with dynamic set/ falling edge	A = Counter input B = Dynamic set input	1 Up/Down counter is available which counts on the rising edge of A and has a dynamic set input on B. Dynamic set input will set the start value at the falling edge of B.	30 kHz (before firmware V2.0.6) 50 kHz (since firmware V2.0.6)

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
7	1 UpDown directional discriminator	A = Phase A B = Phase B	With this mode, incremental encoders can be used which give their counting signals on phase A and B in a 90° phase sequence to each other. Dependent on the sequence of the signals at A and B, the counter counts up or down. There is no pulse multiplier function.	12 kHz (before firmware V2.0.6) 35 kHz (since firmware V2.0.6)
8	Reserved	-	-	-

Operating Mode	Function	Input channels	Description	Counting frequency (max.) for PM5x4-T and PM5x4-R
9	1 UpDown directional discriminator X2	A = Phase A B = Phase B	This mode is the same as mode 7 with one exception: There is a pulse multiplication x2 with the evaluation of the counting inputs. This means that the counter counts both the positive edges and the negative edges of phase A. This results in the double number of counting pulses. The precision increases correspondingly.	11 kHz (before firmware V2.0.6) 30 kHz (since firmware V2.0.6)
10	1 UpDown directional discriminator X4	A = Phase A B = Phase B	This mode is the same as mode 7 with one exception: There is a pulse multiplication x4 with the evaluation of the counting inputs. This means that the counter counts both the positive edges and the negative edges of phase A and B. This results in the fourfold number of counting pulses. The precision increases correspondingly.	10 kHz (before firmware V2.0.6) 15 kHz (since firmware V2.0.6)

If channel 0 is configured as fast counter, the other channels 1,2 and 3 cannot be configured as interrupt inputs. Otherwise, a configuration error will appear and the CPU will be stopped.

Control of the fast counter

To control the fast counter configuration open the *“I/O Mapping”* tab.

The channels can be mapped as described in Symbolic Names for Variables, Inputs and Outputs and have the following meaning ↳ *Chapter 1.6.6.2.13.7 “Symbolic names for variables, inputs and outputs” on page 3776*:

Fast counter						
		Actual value 1	%ID17	DWORD		Actual value 1
		Actual value 2	%ID18	DWORD		Actual value 2
		State byte 1	%IB76	BYTE		State byte 1
		State byte 2	%IB77	BYTE		State byte 2
		Start value 1	%QD11	DWORD		Start value 1
		End value 1	%QD12	DWORD		End value 1
		Start value 2	%QD13	DWORD		Start value 2
		End value 2	%QD14	DWORD		End value 2
		Control byte 1	%QB60	BYTE		Control byte 1
		Control byte 2	%QB61	BYTE		Control byte 2

Channel	Direction	Width	Description
Actual value X	Input	DWORD	Current value of the fast counter
State byte X	Input	BYTE	Bit 0 = CF If the counter reaches the programmed end value, the counter output is stored permanently as CF = TRUE (end value reached). Only if the counter is set again (set value), CF is reset to FALSE. Bit 1 to Bit 7 free
Start value X	Output	DWORD	Each counter can be set to a start value. Start values are loaded into the counter by the user program. Using the set signal (dependent on the operating mode either via a terminal or the bit SET within the control byte X), the values of the double word variables are loaded into the counter X.
End value X	Output	DWORD	The end values for the 2 counters are stored as comparison values into the module by the user program. Both counters compare continuously whether or not their programmed end value is equal to their actual value. When the counter (actual value) reaches its programmed end value, the binary output CF of the status byte is set permanently.

Channel	Direction	Width	Description
Control byte 1	Output	BYTE	Bit 0 = UP/DWN In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. If doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. Bit 1 = EN The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte. Bit 2 = SET The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. CF = 0 Bit 3 = CF_HW 0 = state of CF is set to hardware channel (only for mode 1 and 2) 1 = normal output is set to hardware channel Bit 3 is evaluated only in control byte of counter 1. Bit 4 to Bit 7 free
Control byte 2	Output	BYTE	Bit 0 = UP/DWN In some operating modes, the counter can count downwards, too. If counting down is desired, the bit UP/DWN must be set to TRUE. If doing so, the counter starts counting downwards at the start value (set value) to the end value (max. from 4,294,967,295 to 0 or hexadecimal from FF FF FF FF to 00 00 00 00). After reaching 0 the counter jumps to 4,294,967,295. Bit 1 = EN The processing of the counter signals must be enabled. Depending on the operating mode, enabling is done via a terminal or by the bit EN = TRUE within the control byte.

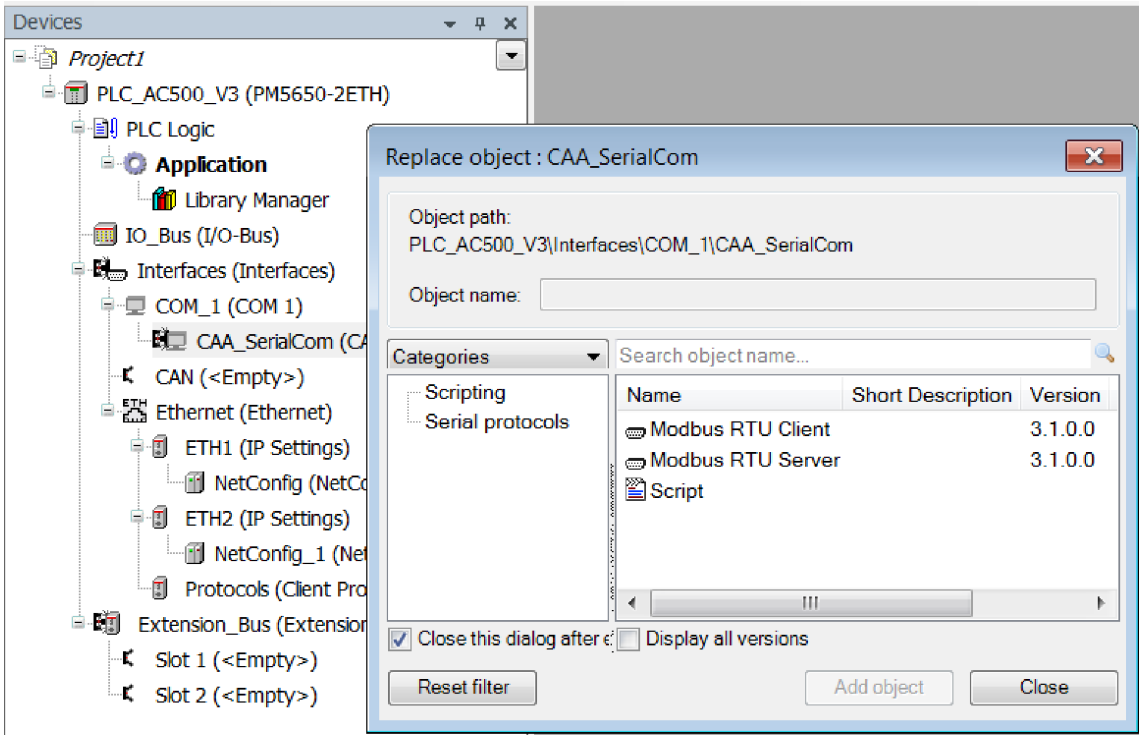
Channel	Direction	Width	Description
			Bit 2 = SET The counter can be set to a start value (see the description of the set values for the counters 1 and 2 at the beginning of this table. Bit 3 to Bit 7 free

1.6.6.2.14 Serial interface

Configuring Modbus RTU on serial interface

To enable Modbus RTU on a serial interface the protocol setup per default has to be replaced by either Modbus RTU Client or Server, depending on required operation mode.

A serial interface supports only one protocol/operation mode at once.



Replace object *"CAA_SerialCom"*

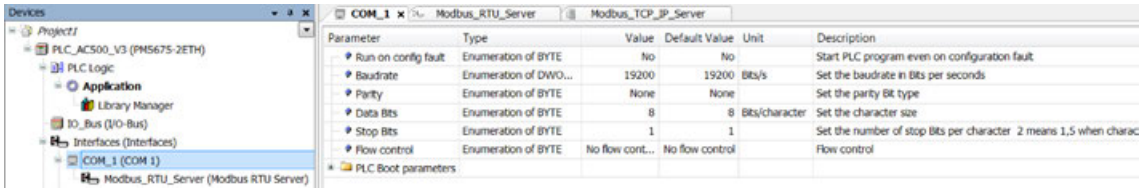
1. Right-click node *"CAA_SerialCom"* and click *"Add object"*.
2. Select *"Modbus RTU Client"* or *"Modbus RTU Server"* and click *"Add object"*.

   ⇨ *"CAA_SerialCom"* is replaced by your selection.

Parameters

Serial

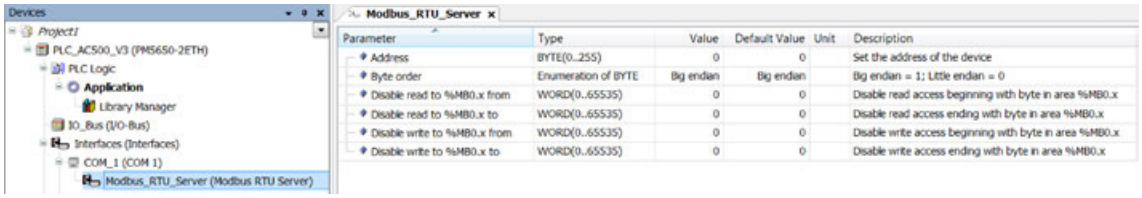
Serial parameters to be set selecting the interfaces node *"COM_1"*. They are common for both operating modes client and server.



> *The parameter "Data bits" always **has to be** set to "8" for Modbus.*

Modbus RTU server

Server specific parameters to be set selecting the protocol's node *"Modbus_RTU_Server"*.



Address

Bus address of the PLC as Modbus RTU Server on that interface

Byte Order

Format/Endianess for the transmission of WORD values (register) within the request/response telegram (default: Big Endian)

Disable

Parameter	Default	Value	Description
Disable write to %MB from	0	0 ... 65535	Disable write access starting at %MBx
Disable write to %MB to	0	0 ... 65535	Disable write access up to %MBx
Disable read from %MB from	0	0 ... 65535	Disable read access starting at %MBx
Disable read from %MBx to	0	0 ... 65535	Disable read access up at %MBx

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

Modbus RTU client

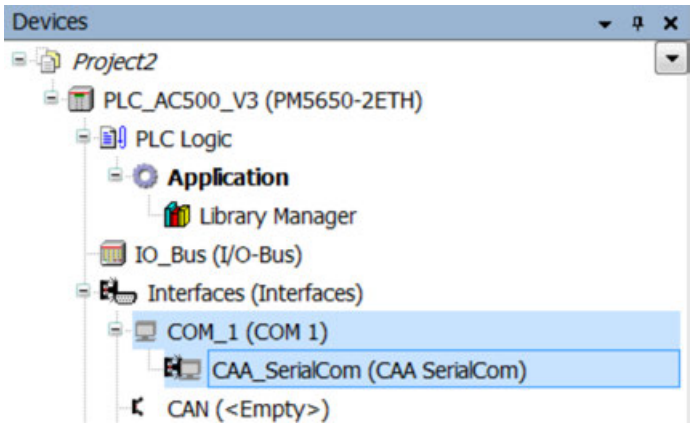
"Modbus RTU Client" does not have any protocol parameters.

Configuring CAA SerialCom on serial interface

The protocol *CAA SerialCom* represents the standard serial protocol provided by 3S and allows the users to implement their own custom protocol.

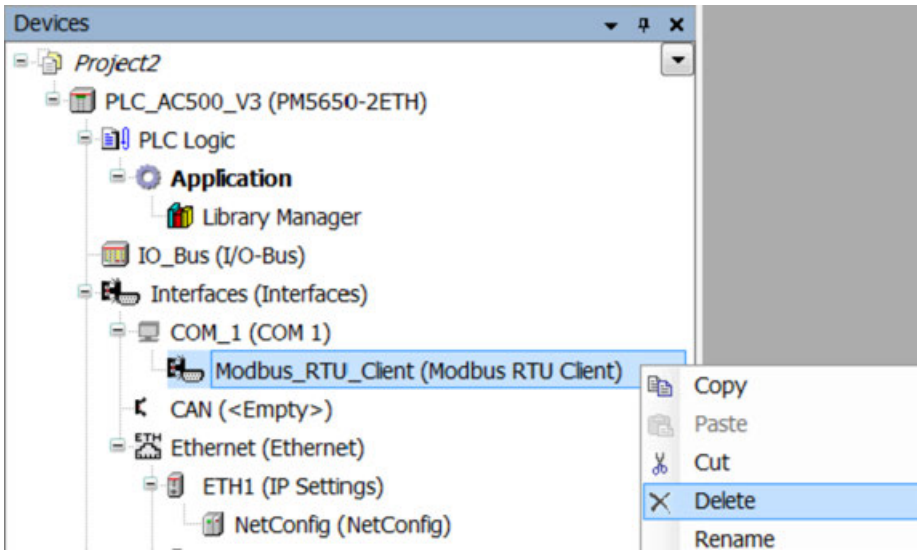
> *For details on CAA SerialCom, refer to standard 3S V3 documentation .*

Default setting



When creating a new project, the protocol *"CAA SerialCom"* is automatically attached to the *"COM_1"* port of a V3 PLC.

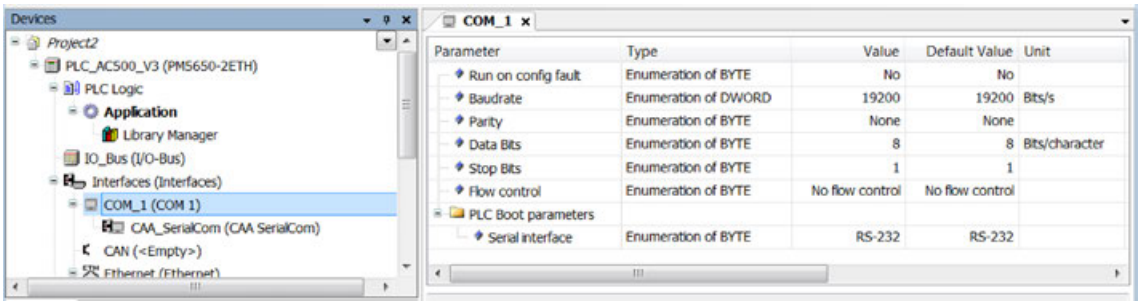
Switch to default setting



▷ Right-click on the node attached to *"COM_1"* node in the device tree and click *"Delete"*.

⇨ The node is switched back to the *"CAA SerialCom"* protocol.

Parameters



Since *CAA SerialCom* doesn't represent a "real" protocol, there are no specific parameters required. All common settings can be found at the Tab *"COM_1"* after double-click on the *"COM_1"* node (see also ↳ *Chapter 1.6.6.2.14.3 "Setting up a serial interface" on page 3798*).

Activate particular configuration parameters

The parameters set up in the Automation Builder device tree are NOT automatically taken over in the PLC.

It is still required to use the *3S IEC POUs* to activate the particular configuration parameters.

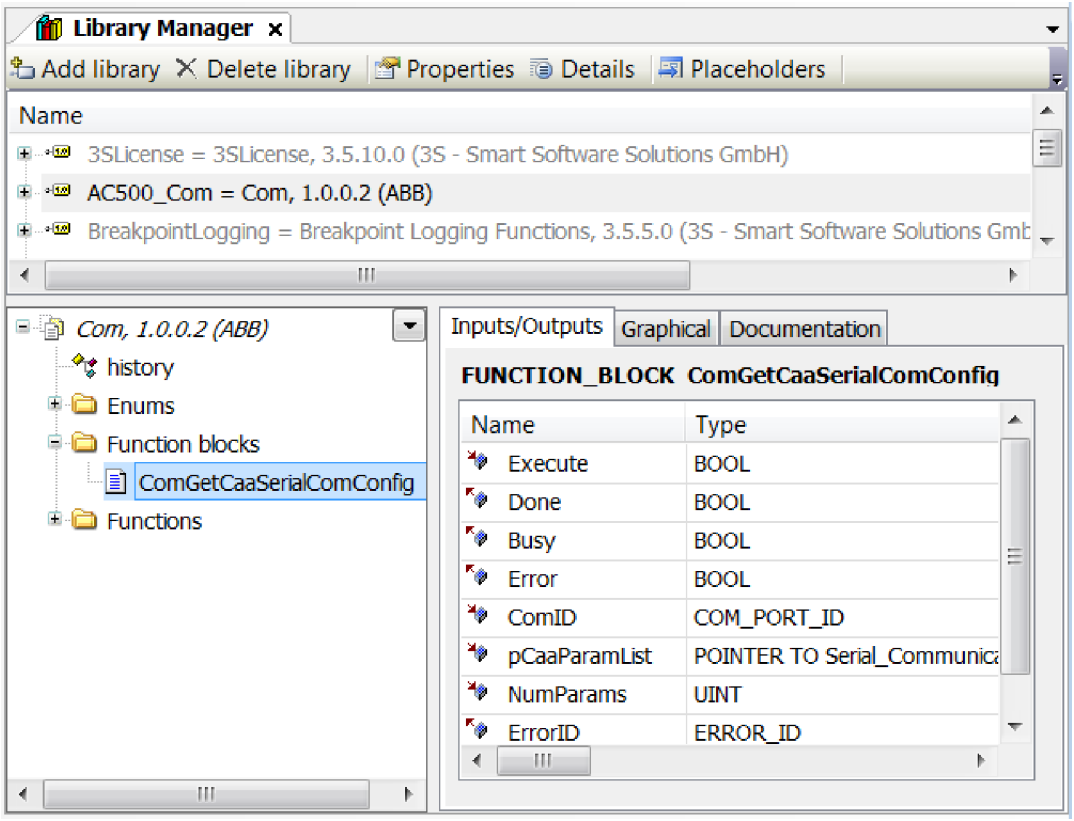


ABB provides the library *AC500_Com* (*"ABB - AC500 / Use Cases / Serial Communication)"* which contains a *POU* called *"ComGetCaaSerialComConfig"*.

The function block can be used to obtain the configuration data which is set up in Automation Builder to directly pass it to *CAA SerialCom-POU Open*. This avoids manual creation of a parameter list.

The following code snippet shows, how the COM port is identified by its node name and how the parameter list for the function block is read from the configuration data of the currently loaded IEC application:

```
FUNCTION_BLOCK GET_CAA_COM_CFG
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR

     ComGetCaaSerialComConfig:    ComGetCaaSerialComConfig;
        bExecGetCfg:              BOOL := FALSE;
        bDoneGetCfg:              BOOL := FALSE;
        bErrorGetCfg:             BOOL := FALSE;

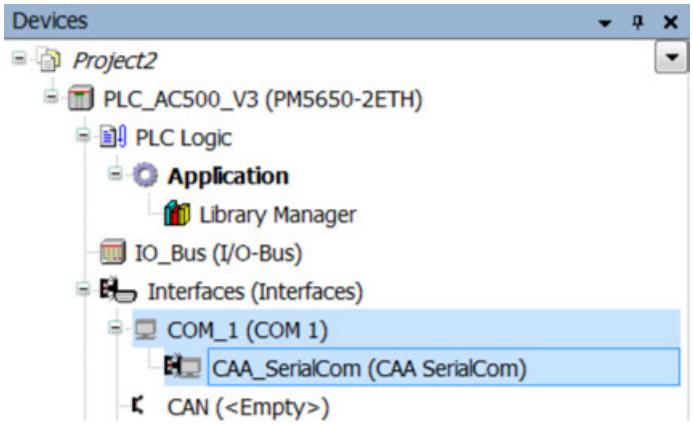
         bError := TRUE;
END_IF

IF uiStep = STEP_FAILED_GET_CFG_CAA THEN
         bError := TRUE;
END_IF
```

Setting up a serial interface

General



The configuration for serial interfaces and their protocols is done via two nodes:

- One node represents the common serial parameters related to the hardware port.
- The node below represents the parameterization for the particularly attached protocol.

Protocols supported by AC500 V3 PLCs

- 3S CAA SerialCom (common serial communication, send/receive data ↳ *Chapter 1.6.6.2.14.2 “Configuring CAA SerialCom on serial interface” on page 3794*)
- Modbus RTU (client & server ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*)

How to switch between the protocols, see ↳ *“Default setting” on page 3795*.

Configuration

The following parameters are available in the configuration view of the COM port node:

Parameter	Value ranges	Description
Run on config fault	No	If this parameter is set to “Yes” the IEC application will not be prevented from switching to RUN state, independent from possibly existing configuration errors of the particular COM port.
	Yes	
Transmission rate	9600 baud/sec	Sets up the transmission rate to use for the COM port.
	19200	
	38400	
	57600	
	115200	
Parity	None	Sets up the parity to use for the COM port.
	Odd	
	Even	
Data bits	5 data bits	Sets up the number of data bits to use for the COM port
	6 data bits	
	7 data bits	
	8 data bits	
Stop bits	1 stop bits	Sets up the number of stop bits to use for the COM port.
	2 stop bits	

Parameter	Value ranges	Description
Flow control	No flow control	Allows to switch between different flow control modes (either RTS/CTS hardware or Xon/Xoff software or none). This setting is only valid for RS-232 serial interface mode. In case RS-485 is used for parameter “Serial interface”, flow control must set to “No flow control”. Otherwise a configuration error is triggered.
	Hardware RTS/CTS	
	Software Xon/Xoff	
Boot parameter Serial interface	RS-232	Allows to switch between RS-232 and RS-485. Due to technical reasons, it’s not possible to dynamically switch between the modes. This means, a reboot (or power cycle) of the PLC is required to activate the particular setting once changed.
	RS-485	

Comparison to V2

The following table shows the differences between V2 and V3 PLCs regarding the parameter set for serial interfaces:

V2 Parameter	Representation in V3	Remark
Run on config fault	Run on config fault	Exactly the same
RTS control	Flow control (partially)	Special modes which allow to use PLC as modem and mode implicitly setting RS-485 will not be taken over. Flow control settings will be limited and only support hardware, software or none.
Transmission rate	Transmission rate	For V3, the transmission rate range will be 9600 to 115200. Low modes will not be supported due to lack of support in Linux. High rates were only realized in V2 to support field bus plug as well as CS31 field bus. Both protocols are not supported anymore in V3, so these transmission rates won’t be available in V3. Approach: Only support most common transmission rates
Parity	Parity (subset)	A500 V3 doesn’t allow to configure parity modes “mark” and “space”. This means, only “none”, “odd” and “even” are configurable.
Data Bits	Data Bits	Exactly the same
Stop Bits	Stop Bits	Exactly the same

1.6.6.2.15 Gateway configuration

1. In the Automation Builder project, right-click the topmost PLC tree node and select *“Communication Settings”*.

   ⇨ The dialog window Communication Settings appears.

2. Click *“Advanced Settings”* to open the ↬ *Chapter 1.4.1.20.2.8.2 “Tab 'Communication Settings'” on page 840* dialog.

   ⇨ This information will be stored in the project file.

3. Click *“Gateway”* and select the desired action from the Gateway menu either to change the local gateway (see *Chapter 1.4.1.20.3.18.2 “Command 'Configure the Local Gateway'” on page 1125*) or to add a new gateway channel (see *Chapter 1.4.1.20.3.18.1 “Command 'Add New Gateway'” on page 1124*).

   Confirm your settings with *“OK”*.

Gateway settings on windows server 2012

Gateway as a service

To allow multiple concurrent users from different user sessions on the server to connect to PLCs, the user has to run CODESYS gateway as a system service. This is managed by a service called "CoDeSys V2.3 Gateway Service Wrapper". The service starts on system start-up and launch the gateway.

If you want to restart the gateway, use "Services management console" to restart "CoDeSys V2.3 Gateway Service Wrapper".

Gateway settings

You can set the communication settings in the Automation Builder project for every PLC. Otherwise, an error message is displayed while trying to open CODESYS.

See the description for *Chapter 1.6.6.2.15 “Gateway configuration” on page 3799* and select "TCP/IP" under *“Connection”*.

1.6.6.2.16 CAN onboard

CANopen

In Automation Builder, a CANopen network consists of one CANopen manager which acts as master device and optional CANopen remote devices which act as slave devices.

CANopen manager (master)

Tab 'CANopen Manager - General'

Table 658: “General”

“Node-ID”	The node number identifies the CANopen Manager as unique (range of values: 1...127).
“Check and Fix Configuration”	Opens the dialog of the same name. See below for details.
“Autostart CANopen Manager”	☑: The CANopen Manager starts automatically (switches to OPERATIONAL mode) after all required slaves are ready. ☐: The CANopen Manager has to be started from the application. The function block `CiA405.NMT` can be used to do this. Hint: As long as the CANopen Manager is not in OPERATIONAL mode, no PDOs are sent (outputs refreshed).
“Polling of optional slaves”	☑: When a slave does not respond during the boot sequence, the CANopen Manager interrogates it every second until it does respond. Constantly polling the slave increases the bus cycle time, which can interfere with the application (especially motion applications). You can deactivate polling to avoid this behavior. If polling is deactivated, then a slave is detected again when it sends a bootup message.
“Start slaves”	☑: The CANopen Manager is responsible for starting the slaves. ☐: You have to start the slaves from the application. Use the CiA405 NMT function block to do this.

"NMT start all (if possible)"	☑: If the *"Start slaves"* option is activated, then the CANopen Manager starts all slaves with an "NMT Start All" command. The "NMT Start All" command is not executed as long as optional slaves are not yet ready to be started. In this case, the CANopen Manager starts each slave individually. The "NMT Start All" command can be guaranteed only in a project without optional slaves.
"NMT error behavior"	• *"Restart slave"*. If an error occurs during slave monitoring (NMT Error Event), then the slave is restarted automatically by the stack (NMT Reset + SDO Configuration + NMT Start). • *"Stop slave"*. If an error occurs during slave monitoring (NMT Error Event), then the slave is stopped. Then you have to reset the slave from the application, using the CiA405 NMT function block.

Table 659: "Guarding"

Working with heartbeat messages is an alternative method of monitoring. It can be executed from both master and slave nodes, as opposed to node guarding. Normally the master sends heartbeat messages to the slaves.	
"Enable heartbeat producing"	The master sends heartbeats. They define the time interval in the *"Producer time"*. When the slaves are provided with the heartbeat function, a heartbeat consuming entry from the slave is created for the master. Then the Node-ID and the 1.5x heartbeat interval of the master are applied. ☐: Node guarding is enabled for the slaves. The settings from the EDS file of the slaves are used for this. If the values there cannot be used, then default values are used. Note that a CANopen Slave device can also be configured as a heartbeat producer.
"Node-ID"	Unique identification (1-127) of the heartbeat producer on the bus
"Producer time (ms)"	Interval length between successive heartbeats (in milliseconds)
"Redundancy Node-ID"	Requirement: A *"Redundancy Configuration"* object is inserted below the application. Unique identification (1-127) of the redundant heartbeat producer on the bus
"Redundancy wait time (µs)"	Requirement: A *"Redundancy Configuration"* object is inserted below the application. Duration of how long the passive controller waits for the heartbeat of the active controller. If this time is exceeded, then the passive controller takes on the active role.

Table 660: "SYNC"

"Enable SYNC producing"	☑: The CANopen manager sends SYNC telegrams (disabled by default) The synchronous PDOs are sent directly after the SYNC telegram.
"COB-ID (Hex)"	CAN-ID of the SYNC telegram. Range of possible values: [1...2047].
"Cycle period (µs)"	Interval length (in microseconds) after which the SYNC telegram is sent
"Window length (µs)"	Length of the time frame for synchronous PDOs (in microseconds)
"Enable SYNC consuming"	☑: (disabled by default). Another device must produce the SYNC telegrams that are received by the CANopen Manager.

NOTICE!
If SYNC producing is enabled for the CANopen manager, then you are not permitted to select the *"Enable SYNC producing"* option for all other bus devices.

Table 661: “TIME”

“Enable TIME producing”	☑: (disabled by default). The CANopen Manager sends TIME messages.
“COB-ID (Hex)”	(Communication Object Identifier): identifies the time stamp of the message. Default values: [0...2047], preset 16#100
“Producer time (ms)”:	Interval (in milliseconds) when the time stamp is sent. This value has to be a multiple of the task cycle time. Possible values [0, 65535]

The run time has to support high resolution timestamps. If not, then an error message is displayed.

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*
- *Chapter 1.6.6.2.16.1.2.1 “Tab 'CANopen Remote Device - General'” on page 3803*

Dialog 'Check and Fix Configuration'

If you insert several devices below the CANopen manager, then error messages may report multiple assigned Node-IDs or invalid COB-IDs. The *“Check and Fix Configuration”* button opens a dialog for solving these conflicts.

For conflicts with Node-IDs or PDO COB-IDs, you can click *“Edit Conflicts”* to open a dialog with detailed information.

Table 662: “Node-ID and COB-ID conflicts”

“Doubled node number”	List of all devices with identical IDs. In the field of the *“Node-ID”* column, you can enter new node numbers for the affected devices.
“Incorrect and double assignment of PDO COB-IDs”	The COB-IDs that are generated automatically from the device description files may not be permitted. All incorrect entries are listed with the respective device names, Node-IDs, and indexes. There are three options for correcting invalid COB-IDs: ● Correct the displayed formula for calculating the COB-IDs so that a valid COB-ID results. You can change the formula in the respective table element. ● Accept the automatic suggestion for the COB-ID by clicking the respective button. ● Accept all automatic suggestions by clicking the *“Use Suggested COB-ID”* button.

Corrected entries are removed from the displayed list automatically.

You can solve timing problems automatically by using the *“Automatic Repair”*. The command modifies all timing values to compatible values. (The time should be a multiple of the task time.)

CANopen remote device (Slave)

In CODESYS, a CANopen Remote Device is a slave device that you insert below a CANopen Manager in the device tree of a project. A distinction is made between modular and non-modular slaves:

- **Modular slaves**: You can insert CANopen modules (submodules) below a modular slave. These modules provide a *“I/O Mapping”* tab to map their inputs and outputs. Modular slaves can also have fixed I/Os. Then these devices also provide the *“I/O Mapping”* tab. Modular devices provide the *“Configure PDO mapping automatically”* option, which we recommend for standard applications. You find this option in the *“CANopen Remote Device”* dialog, on the *“General”* tab.
- **Non-modular slaves**: You cannot insert additional modules below a non-modular device. The inputs and outputs of these devices are mapped in the *“I/O Mapping”* dialog. Automatic mapping is not possible here.

See also

- *Chapter 1.6.6.2.16.1.2.1 “Tab 'CANopen Remote Device - General'” on page 3803*

Tab 'CANopen Remote Device - General'

The general settings of the CANopen Slave are defined in this dialog of a CANopen Remote Device (slave).

Table 663: “General”

“Node-ID”	The node number identifies the CANopen Remote Device uniquely. It corresponds to the number (value between 1 and 127) set on the device (hardware). You have to provide the Node-ID as a decimal.
“Expert settings”	☑: All settings are displayed that are predefined by the device description (EDS file) for the device.
“SDO channels (...)”	Click this button to open a dialog for activating the SDO channels that are predefined in the EDS file. Service data objects (SDOs) allow access to all entries in the CANopen object directory. An SDO creates a peer-to-peer communication channel between two devices (SDO server and client channel).
“Optional device”	☑: The slave is optional and not required for starting the CAN network.
“Sync producing”	Available only when the *“Enable sync producing”* option is cleared in the CANopen Manager. ☑: The I/O transmission is synchronized on the bus. The slave works as a sync producer. The parameters of the sync interval are defined in the settings of the CANopen Manager.
“No initialization”	This option is for non-configurable slave that already start with a valid configuration. ☑: The master does not send configuration SDOs or NMT start commands to the slave. PDO communication and monitoring (heartbeat, node guarding) are performed when this has been configured in the configurator. If the slave does not start automatically, then the user can use the CiA405 NMT function block to send an NMT start command to the slave.
“Default settings”	The availability of this option depends on the contents of the device description file. ☑: Activated by default. The slave nodes are reset to the default parameters before the configuration is loaded to the device or always when the slave is configured. Which parameters can be set is device-specific. The concrete task is performed from the subindex of the list box. ● *“Sub:001”*: All parameters are reset. ● *“Sub:002”*: Communication parameters (index 1000h - 1FFFh manufacturer-specific communication parameters) are reset. ● *“Sub:003”*: Application parameters (index 6000h - 9FFFh manufacturer-specific application parameters) are reset. ● *“Sub:004” - “Sub:127”*: Manufacturer-specific, individual selection of parameters is reset. ● *“ Sub:128” - “Sub254”*: Reserved for future purposes
“Autoconfig PDO mapping”.	This option is available for modular devices only. ☑ PDO mapping is generated automatically from the definitions in the device description and then cannot be changed in the two mapping dialogs. If the automatically generated mapping does not match your application, then you can deactivate the option and configure the mapping manually. We recommend that this option is activated for standard applications.

Table 664: “Node Guarding”

Node guarding is an outdated monitoring method and should not be used anymore because is uses RTR frames. You should always use heartbeats whenever possible. In some exceptions, such as for older slaves, you can use only node guarding.	
“Enable node guarding”	☑: The CANopen Manager sends a message to the slave in the *“Guard time (ms)”* interval. If the slave does not respond with the given *“Guard COB-ID”* (Communication Object Identifier), then the CANopen Manager resends this message as many times as defined in *“Lifetime factor”* or until the slave responds. If the slave does not respond, then it is marked as "unavailable".
“Guard time (ms)”	Interval for sending messages (default: 200 ms)
“Lifetime factor”	When the slave does not respond, a node-guarding error is established according to the *“Lifetime factor”* time multiplied by the *“Guard time”*.
“Enable heartbeat producing”	☑: The module sends heartbeats in the time intervals as given in *“Producer time (ms)”*.
“Producer time (ms)”:	The default setting is 200 as long as there is no special entry or the entry in the device description file is 0.
“Heartbeat consuming (...)”	Opens a *“Heartbeat Consuming Properties”* dialog. There you activate the slaves that you want to watch. The number of possible slaves to be monitored is defined in the EDS file. To do this, you must select the "Enable" check box and enter the Node-ID of the slave and the required values in the *“Heartbeat time”* field (in milliseconds). Then the slave monitors the heartbeats that are sent from the affected slaves (defined by the Node-ID). When no more heartbeats are received, the slave switches off the I/Os. When a slave is monitoring, a green check mark is displayed on the *“Heartbeat Consuming”* button. **Note**: When you insert a device with the heartbeat function, its heartbeat settings are harmonized automatically with the master (CANopen Manager).

Table 665: “Emergency”

“Activate Emergency”	☑: When internal errors occur, the slave sends emergency messages with a unique COB-ID. You can read these messages by using the function blocks from the library `CAA Can Low Level Extern` (`RECV_EMCY_DEF`, `RECV_EMCY`).
“COB-ID”	CAN ID of the EMCY message. Range of possible values: [1...2047].

Table 666: “TIME”

The availability of this function depends on the device description.	
“Enable TIME producing”	☑: The device sends TIME messages.
“COB-ID (Hex)”	(Communication Object Identifier): identifies the time stamp of the message.
“Enable TIME consuming”	☑: The device processes TIME messages.

Table 667: “Checks at Startup”

The respective information is read from the firmware of the CANopen Slave (0x1018 identity object) and compared to the information from the EDS file. In case of disparities, the configuration is stopped and the slaves are not started.	
“Vendor ID”	☑: Check of the vendor ID at startup
“Product number”	☑: Check of the product number at startup
“Revision number”	☑: Check of the revision number at startup

Tab 'CANopen Device - PDOs'

Object: CANopen Remote Device, CANopen Local Device

This dialog is available only in the device editor of a CANopen Slave of version V3.5.6.0 or higher. It shows all PDOs and their default settings. In this dialog, you can add new objects and delete or edit existing objects.

On the left side, there are the PDOs that the slave receives from the master. On the right side, there are the PDOs that the slave sends to the master.

“Add PDO”	Opens the *“Select PDO”* dialog where all available PDOs are displayed. In this dialog, you select the PDOs to be added to *“Receive PDOs”* or *“Transmit PDOs”*.
“Add Mapping”	Opens the *“Select Item from Object Directory”* dialog. Objects are listed there that you can add to the PDO mapping.
“Edit”	When a PDO is selected, the *“PDO Properties”* dialog opens. When a PDO mapping is selected, the *“Select Item from Object Directory”* dialog opens.
“Delete”	Deletes the selected objects from the list
“Move Up”	Moves the selected object upwards by one line.
“Move Down”	Moves the selected object downwards by one line.

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

Dialog 'PDO Properties'

“COB-ID”	Every PDO message must have a COB-ID (Communication Object Identifier). You can input explicit values (example: 16#201) or formulas (example: $NODEID+16#200).
“RTR”	Remote Transmission Request. This option is available for transmit PDOs only. ☑ You can use an RTR frame for interrogating the PDO externally.
“Inhibit time (x 100µs)”	You can edit this field only if the device supports this functionality. The inhibit time is the minimum time between two messages of a specific PDO. You can use this setting for preventing PDOs from being sent too often when their values are edited. Default: "0". Possible values: 0–65535.

"Transmission type"	● *"Acyclic - synchronous"*: When a change is made, the PDO is transmitted synchronously, but not periodically. (default) ● *"Cyclic - synchronous"*: The PDO is transmitted every nth sync. ● *"Synchronous – only RTR"*: Available for transmit PDOs only. After a synchronization message, the PDO is updated, but not transmitted. Transmission is by explicit request only (Remote Transmission Request). ● *"Asynchronous – only RTR"*: Available for transmit PDOs only. The PDO is updated and transmitted by explicit request only (Remote Transmission Request). ● *"Asynchronous – manufacturer specific"*: The PDO is transmitted only after specific events. ● *"Asynchronous – device profile"*: The PDO is transmitted according to the CiA device profile.
"Number of syncs"	For transmission type *"Cyclic - synchronous"* only. Indicate the interval for transmitting the PDOs. The value is a multiple of the *"Cycle period (µs)"* of the CANopen Manager. Default: 1. Possible values: 1–240. Example: Number of syncs = 4, Cycle Period = 1000 µs → transmission interval = 4000 µs
"Event time (x 1ms)"	Only for transmission types *"Asynchronous - manufacturer specific"* and *"Asynchronous - device profile"*. You can edit this field only if the device supports this functionality. Indicate the time span that should be between two PDO transmissions PDOs (in milliseconds). Default: "0". Possible values: 0–65535.
"Processing by CANopen Manager"	☑: Default settings ☐: The CANopen Manager does not process the PDO any longer. It is no longer transmitted or received.

Dialog 'Select Item from Object Directory'

For modular slave, you have to clear the *"Autoconfig PDO mapping"* option to be able to configure the mapping manually.

The table shows all object directory entries from the EDS file of the device. For receive PDOs, CODESYS provides only the objects here with write permission (flag = w); for transmit PDOs, read permission.

"Name"	COB-ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory.
"Index"	Index of the object
"Subindex"	Subindex of the object
"Access type"	● *"RW"*: Read/Write ● *"RO"*: Read Only ● *"WO"*: Write Only ● *"RWW"*: Read/Write per SDO; write permission per PDO (==> RxPDO, output from the master viewpoint, input from point of view of the slave). ● *"RWR"*: Read/Write per SDO; read permission per PDO (==> TxPDO, input from the master viewpoint, output from the point of view of the slave). ● CONST=constant
"Type"	Data type of the object
"Default value"	Default value of the object
"Bit length"	Length of the object

Tab 'CANopen Remote Device - SDOs'

During the initialization of the CAN bus, CODESYS transmits the current configuration settings by using SDOs (service data objects).

On this tab, you configure the necessary SDOs. You configure the necessary SDOs and determine the transmission order of the objects and the actions taken in case of a transmission error.

The object order in this list corresponds to the transmission order of SDOs to the module.

> **NOTICE!**
> If the *"Expert settings"* option is not activated for the current device, then only the user-defined SDOs are shown here.

"Add SDO"	Opens the *"Select Item from Object Directory"* dialog where all available SDOs are displayed. The selected object is inserted after the selected object.
"Modify"	Opens the *"Select Item from Object Directory"* dialog and marks the corresponding object. You can modify the object parameters or replace the object with another one.
"Delete"	Deletes the selected objects from the list
"Move Up"	Moves the selected object upwards by one line.
"Move Down"	Moves the selected object downwards by one line.
"Abort on Error"	☑: If an error is detected for this SDO, then the stack stops the configuration phase of the current slave. The slave remains in PREOPERATIONAL mode.
"Jump to Line on Error"	☑: The transmission is continued with the SDO that you indicated in the *"Next Line"* column.
"Next Line"	Line number where processing continues if there an error is detected
"SDO Timeout (ms)"	Timeout for the SDO transmission. If the slave does not respond to the SDO request within this time, then the transmission is canceled with a timeout.
"Create all SDOs"	☑: Creates an SDO for all writable objects starting at index 16#2000 for which a default value is given in the EDS. Only experts should use this option. It should be deactivated for standard use.
"Write complete PDO configuration"	☑: This option forces the writing of all PDO configuration objects. In this way, you make sure that the settings in the project correspond to those of the slave. ☐: PDOs are not deactivated explicitly. The requirement is that the *"Default settings"* option is activated in the common settings of the slave and the PDOs are also deactivated in the EDS. If the default values in the EDS do not match the default settings of the slave firmware, then this procedure may cause problems. In this case, you should activate this option.

See also

- *Chapter 1.6.6.2.16 "CAN onboard" on page 3800*

Dialog 'Select Item from Object Directory'

The table shows all object directory entries from the device EDS file for each SDO that are writable and not larger than 4 bytes. Before you add an SDO for selection in the SDO dialog, you can modify its parameters in the fields below the table. In this way, you can also created an SDO that is not writable in the EDS file by entering a new index/subindex value.

"Name"	COB-ID of the PDO or the name of the mapped object as it is used in the device description and in the object directory.
"Index"	Index of the object

"Subindex"	Subindex of the object
"Access type"	• *"RW"*: Read/Write • *"WO"*: Write Only • *"RWW"*: Read/Write per SDO; write permission per PDO (==> RxPDO, output from the master viewpoint, input from point of view of the slave). • *"RWR"*: Read/Write per SDO; read permission per PDO (==> TxPDO, input from the master viewpoint, output from the point of view of the slave).
"Type"	Data type of the object
"Default value"	Default value of the object
"Bit length"	Length of the object
"Value"	

CANopen module

CANopen modules are components that you insert below a CANopen remote device.

J1939

J1939 is a CAN-based protocol (CAN stands for "Controller Area Network"). It was developed for serial data transmission between electronic control units (ECU) in heavy goods vehicles. The CODESYS plug-in 'DeviceEditorJ1939' provides dialogs to configure J1939 devices according to SAE J1939 standards.

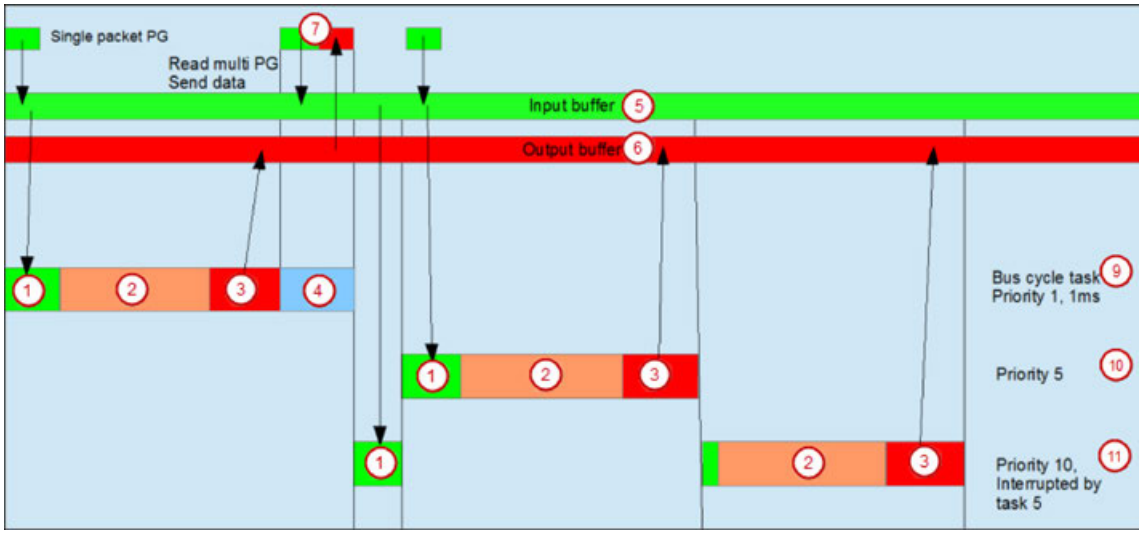
- *Chapter 1.6.6.2.16 "CAN onboard" on page 3800*

Bus Cycle Task

Behavior of the bus cycle for J1939



(1) Receive single package PG (4) Receive multi-package PGs, send PGs

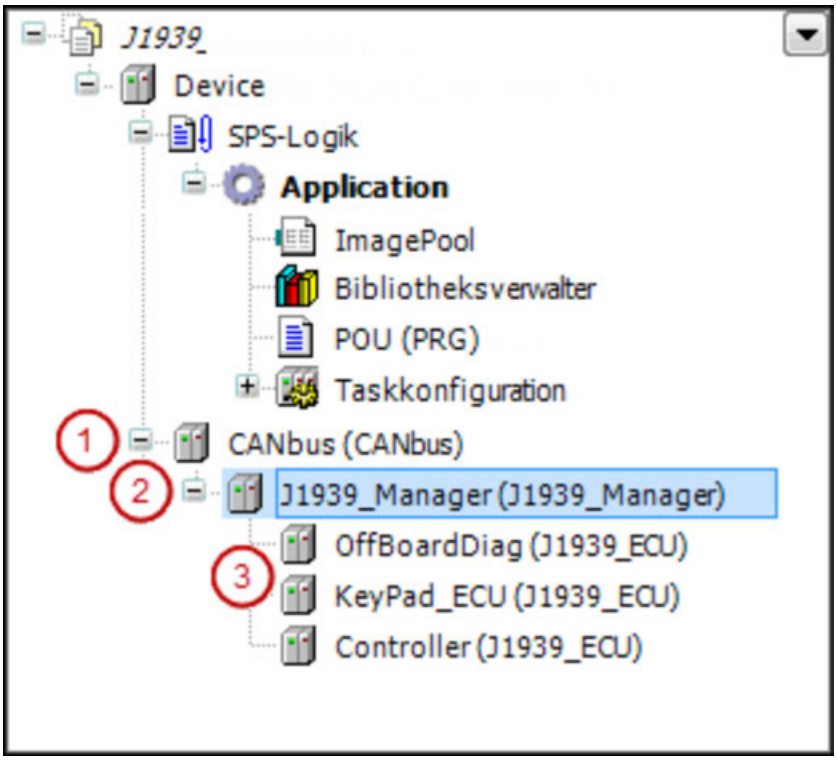
See also

- *Tab '<device name> I/O Mapping'*

J1939 manager

The J1939 Manager is inserted in the device tree below the CAN bus node. It provides the J1939 parameter groups and signal database. The ECUs are inserted below the J1939 Manager.

The *“Scan Devices”* command is not available for J1939.



(1) CANopen Manager (2): J1939 Manager (3) J1939 ECU

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*
- *Chapter 1.6.6.2.16.2.2.1 “Tab 'J1939 Manager - General'” on page 3809*

Tab 'J1939 Manager - General'

In CODESYS version 3.5 SP17 and higher, the J1939 configurator is no longer supplied with a parameter group / signal database. The old database is no longer supported.

However, you can post-install a DBC database in the J1939 Manager.
A database can be purchased, for example from CSS Electronics: https://www.csselectronics.com/screen/product/j1939-dbc-file-pgn-spn

If you do not install a database, then you can also configure parameter groups and signals manually on the “User-Defined” tab.

“Databases”	List with names of installed databases (DBC or DB format)
“Install”	Opens the file manager to select a J1939 file (DBC or DB format). The J1939 files are usually stored in "`C:\ProgramData\CODESYS\J1939 Databases`".

“Uninstall”	Uninstalls the selected database
“Set as default”	Sets a database as the default database. This database is then set as default in the *“Add Parameter Group”* and *“Add Signal”* dialogs.

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

J1939 ECU

Tab 'J1939 ECU - General'

In this dialog of the J1939 ECU editor, the general parameters of a J1939 ECU can be displayed and modified.

Table 668: “General”

“Preferred address”	Address of the ECU. If more than one ECU with the same address exists in the network, then all affected ECUs get a new address. The requirement is that the ECUs allow an address change (*“Arbitrary Address Capable”*).
“Local Device”	☑ You can configure any number of local ECUs. Then every local ECU is its own ECU instance in the J1939 network. For local devices, an additional *“RX Signals (P2P)”* dialog is provided to configure received signals.

Table 669: “ECU NAME”

“NAME (64 bit): 16#”	Hexadecimal 64-bit code that contains complete information about the subsequent parameters. Each time this code is modified, the respective parameter is also modified. The same is true for the other direction.
“Arbitrary address capable”	☑ If the ECU detects an address conflict, then it tries independently to set another address.
“Industry group”	List of industry groups according to the definition from SAE J1939.
“Vehicle system instance”	The parameter depends on the *“Vehicle system”*. The 4-bit value assigns a number to each instance of the *“Vehicle system”*.
“Vehicle system”	The value is defined in the SAE J1939 standard.
“Reserved”	Always deactivated and reserved for future SAE definitions.
“Function”	The parameter is defined and assigned by SAE. The range of values is 0...255, but not all values are assigned. The interpretation of values, which are greater than or equal to 127, depends on the *“Industry”* selection. For example, the value "133" means "Product Flow" in the "Agricultural and Forestry Equipment" industry. If "Construction Equipment" is selected for *“Industry”*, then the same value means "Land Leveling System Display". If the value is less than 128 (0 – 127), then there is no dependency to other parameters.

"Function instance"	The parameter is related to the *"Function"* field. A J1939 network can consist of multiple ECUs with the same *"Function"*. The 5-bit *"Function instance"* assigns a number to each instance of the *"Function"*, where 0 is assigned to the first instance.
"ECU instance"	A J1939 network can include multiple ECUs that have the same task. For example, a vehicle can have two identical ECUs, where one measures vehicle speed and the other measures the trailer speed.
"Manufacturer code"	The 11-bit manufacturer code is assigned by SAE and indicates the company that manufactured the ECU. This code is defined in the SAE J1939 document.
"Identity number"	The 21-bit identity number is assigned by the manufacturer and should be used for assuring unique names in a product line. The manufacturer can also add more information to the identity number, such as serial number and date of manufacture.

Table 670: "Communication Watchdog"

"Enable communication watchdog"	☑ The stack checks whether the ECU transmits data within the given *"Watchdog time"*. If this does not happen, then the device is classified as "not available" and highlighted in red in the device tree.

See also

- *Chapter 1.6.6.2.16 "CAN onboard" on page 3800*

Tab 'J1939 ECU - TX Signals'

This dialog shows the parameter groups that are transmitted to all other ECUs (broadcast) or to a specific ECU (P2P). In this dialog, you can activate and deactivate individual groups and modify their parameters. You can also add new groups or signals to the list.

"Enable"	☑: The parameter group is transmitted. ☐ The parameter group is not transmitted for a local device. For a remote device, the PLC does not process this group.
"Type"	• *"Broadcast"*: The parameter group is transmitted to all ECUs. • *"Peer-to-Peer P2P"*: The parameter group is transmitted to a specific ECU.
"Add PG"	Opens the *"Add Parameter Groups"* dialog.
"Add Signal"	Opens the *"Add Signal"* dialog. The button is enabled only if you have selected a parameter group.

Parameter group properties

Table 671: "General"

"PGN"	The "parameter group number" is a unique number for addressing a parameter group.
"Name"	Name of the parameter group
"Description"	Description of the parameter group
"Length"	The length of the message data (0...1785 bytes). Due to the maximum array length of 8 bytes, messages with over 8 bytes are transmitted as multipackages.

Table 672: “Transmission settings”

These settings are provided only for the TX parameter groups of local devices.	
“Priority”	Priority of the parameter group (0..7). Priority 0 is the highest and 7 is the lowest.
“Target address”	The target address is needed for P2P parameter groups only.
“Transmission mode”	Determines the time when a parameter group is transmitted (for local devices). ● *“Mode change”*: The PG is transmitted when the value of the signal changes. ● *“Cyclic”*: The PG is transmitted after a specified number of PLC cycles (see cycle time factor). ● *“On request”*: The PG is transmitted on request of another device. ● *“Application-controlled”*: The PG is transmitted when triggered by the application.
“Cycle time factor”	Number of PLC cycles after which the parameter group is transmitted. Only applies for cyclic transmission.

Signal parameters

Table 673: “General”

“SPN”	Suspect Parameter Number. One of the numbers assigned by the SAE for a specific parameter in a parameter group.
“Name”	Name of the parameter
“Description”	Description of the parameters
“Length (bits)”	Length of the signal (in bits: 1...14280).
“Byte position (0..1784)”	Start byte in the parameter group (0...1784).
“Bit position (0..7)”	Bit position of the start byte (0..7).

Table 674: “Conversion”

“Conversion”	TRUE: The value is calculated with scaling and offset.
“RAW data type”	Format of the raw data: Unsigned / Signed / Float / Double
“Byte order”	Little endian or big endian of the raw signal
“Scaling”	Factor (for *“Conversion”* =TRUE)
“Offset”	Offset (for *“Conversion”* =TRUE)
“Minimum value”	Expected minimum value of the converted signal (for informational purposes only)
“Maximum value”	Expected maximum value of the converted signal (for informational purposes only)
“Unit”	Unit of the converted signal
“ICE data type”	Resulting data type of the I/O channels

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

Tab 'J1939 ECU - P2P RX Signals'

This dialog is available for local ECUs only. It shows all PGs (parameter groups) that should be received by other ECUs. In this dialog, individual groups can be activated and deactivated as well as their parameters modified. New groups or signals can also be added to the list.

The commands and parameters of this dialog are the same as those on the *“TX Signals”* tab.

See also

- *Chapter 1.6.6.2.16.2.3.2 “Tab 'J1939 ECU - TX Signals'” on page 3811*

Command 'Scan for Devices'

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: *“Project”*; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller und PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the *“Scan Devices”* dialog opens and displays the found devices.

Dialog 'Scan Devices'

Table 675: “Scanned Devices”

“Device name, Device type, Address, Station name, etc.”	Data about the scanned device depending on network type. When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally. Value that indicate differences between the project and the scanned device are shown in orange. If multiple device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. For more detailed information, see the corresponding fieldbus chapters. If a device description cannot be found, then the following message is shown: "Attention! The device was not found in the repository." Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description.
“Show differences to project”	☑: The table in the dialog also shows additional configured devices (in the device tree of the project). ☐: The table shows all scanned devices. The configured devices are not shown.
“Scan for Devices”	Starts a new search.
“Copy All Devices to Project”	The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown.

NOTICE!
If you insert devices, which are available in the device tree, to the device tree with *“Copy All Devices to Project”*, then the following should be noted. The data of the *“Process Data”* and *“<...> I/O Mapping”* tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 676: “Configured Devices”

This part of the dialog is visible only when you select the *“Show differences to project”* option. Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.	
	If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.
	If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.
	If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.
	All scanned devices are copied to the project.
	Deletes the selected configure device.

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

Tab 'CANbus - General'

Table 677: “General”

“Network”	Number of the CAN network that is linked via the CAN bus interface. Permitted values: 0 to 100.
“Baud rate”	Baud rate (in bits per second) for transmitting data on the bus. The default value is used from the device description file (*.devdesc) of the CAN bus device. You can select the baud rate from the list box or type it directly into the input field.

See also

- *Chapter 1.6.6.2.16 “CAN onboard” on page 3800*

1.6.6.2.17 EtherCAT configurator

Refer to the general description for information about the following tabs of the device editor.

- *Chapter 1.4.1.20.2.8.11 “Tab '<device name> I/O Mapping'” on page 854*
- *Chapter 1.4.1.20.2.8.12 “Tab '<device name> IEC Objects'” on page 859*
- *Chapter 1.4.1.20.2.8.3 “Tab 'Parameters'” on page 844*
- *Chapter 1.4.1.20.2.8.18 “Tab 'Status'” on page 870*
- *Chapter 1.4.1.20.2.8.19 “Tab 'Information'” on page 870*

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

The configuration of EtherCAT modules is based on the device description files for the master and slave devices employed and can be adapted in the project in configuration dialogs. In order to ensure the simplest and most error-free use possible, we recommend for standard applications that you activate the option for the *“Automatic Configuration”* of the master, so that the majority of the configuration settings are performed automatically.

Requirements

The requirement for the combination of EtherCAT devices with a CODESYS Control Win V3 is the installation of the program library WinPCap (freely downloadable, e.g. from winpcap.org). Furthermore, add the following entries to the CODESYS configuration file (...\ \GatewayPLC\\CODESYSSP.cfg):

- `component.<subsequent number>=CmpEt100Drv`
  Required only with the RTE. The RTE requires special network drivers. Available for Realtek RTL81x9/RTL8169, Intel Pro 100 / 1000
- `component.<subsequent number>=CmpRTL81x9Mpd`
  Required only with the RTE. Available for RTL8139.
- `component.<subsequent number>=8169Mpd`
  Required only with the RTE. Available for Realtek RTL8169 or RTL8168 (PCIe version))

The bus cycle task is set in the general PLC settings.

Access to the EtherCAT configuration by the application takes place via instances of the EtherCAT master and EtherCAT slave. If the EtherCAT master or EtherCAT slaves are inserted as objects into a project, instances are automatically created for master and slaves that can be addressed in the application program. For example a restart, a stop or a status check of the EtherCAT device can be performed from the application.

Furthermore, the EtherCAT library offers function blocks for the reading and writing of individual parameters, even during bus operation.

- *Chapter 1.4.1.20.4.13.6 “Dialog 'Options' - 'Device Editor'” on page 1190*
- *Chapter 1.4.1.20.2.8.9 “Tab 'PLC Settings'” on page 850*

EtherCAT master

Tab 'EtherCAT Master - General'

Object: EtherCAT Master

The tab is used for the configuration of the basic settings for the EtherCAT Master. The basic settings are preset from the device description file.

Settings of the configuration parameters

NOTICE!

The auto-configuration mode (*“Autoconfig master/slaves”* option) is selected by default and is adequate for standard applications. If the mode is not selected, then all configuration settings for the master and the slave(s) have to be done manually. Expert knowledge is required to do this. The auto-configuration mode option has to be switched off to configure slave-to-slave communication.

“Autoconfig master/slaves”	☑ The main part of the master and slave configuration is done automatically, based on the device description file and implicit calculations. The dialog for the FMMU/Sync settings is not available. Even if this option of the master is selected, an expert mode can be enabled explicitly for each individual slave, which allows for manual editing of the automatically generated process data configuration.

Table 678: "EtherCAT NIC Settings"

"Target address (MAC)"	MAC address of the device in the EtherCAT network that is to receive the telegrams. Options ● *"Broadcast"*: A *"Target address (MAC)"* does not have to be specified. ● *"Redundancy"*: Enabled when the bus is constructed in a ring topology and redundancy is to be supported. With this function, the EtherCAT network remains functional even in the case of a broken cable. When this function is enabled, the parameters have to be defined in the *"Redundancy EtherCAT NIC Settings"* area.
"Source address (MAC)"	MAC address of the controller (target system) or network name (name of the adapter or PLC (target system))
"Network name "	Name or MAC of the network, depending on which of the following options is selected:
"Select network by MAC"	☑: The network is specified by the MAC ID. Then the project cannot be used on another device because each network adapter has a unique MAC ID.
"Select network by name"	☑: Network is identified by the network name and the project is device-independent.
"Scan"	Scans the network for the MAC IDs or names of the target devices that are currently available.

Table 679: "Redundancy EtherCAT NIC Settings"

These settings are displayed only when the *"Redundancy"* option is selected. Here the parameters of the additional device are defined according to the description for *"EtherCAT NIC Settings"*.

Table 680: "Distributed Clock"

"Cycle time (µs)"	Time span after which a new data telegram is dispatched on the bus. When the *"Distributed Clock"* function is enabled in the slave, the master cycle time specified here is transferred to the slave clocks. As a result, a precise synchronization of the data exchange can be achieved. This is particularly important when spatially distributed processes require simultaneous actions. An example of a simultaneous action is applications in which multiple axes have to execute coordinated movements at the same time. A very precise, network-wide time base with a jitter of considerably less than 1 microsecond can be achieved in this way.
"Sync offset"	Parameter for setting the delay time between the DC time base of the EtherCAT Slave and the cycle start of the PLC. With the default value of 20%, the PLC cycle starts 20% of the bus cycle time after the sync interrupt of the slave. This means in the case of ● `FrameAtTaskStart` = `FALSE` when the EtherCAT data is sent at the end of the PLC cycle: The PLC cycle may require 80% of the bus cycle time minus the delay time in the runtime, and this without the master no longer placing the current process data on the bus in time (assuming that the EtherCAT Slave expects the new data exactly with the sync interrupt). ● `FrameAtTaskStart` = `TRUE` (default value when using CODESYS SoftMotion): For the controller program, nearly 100% of the cycle is always available. Here the *"Sync offset"* determines only when the EtherCAT data of the master is exchanged to and from the slaves relative to the time base of the EtherCAT Slave.

“Sync window monitoring”	☑ Synchronization of the slaves can be monitored.
“Sync window”	Time for *“Sync window monitoring”*. When the synchronization of all slaves is within this time window, the variable `xSyncInWindow` (`IoDrvEthercat`) is set to `TRUE`, otherwise to `FALSE`.

Table 681: “Options”

“Use LRW instead of LWR/ LRD”	☑ Direct communication from slave to slave is possible. Combined read/write commands (LRW) are used instead of separate read commands (LRD) and write commands (LWR).
“Messages per task”	☑ Read and write commands (the handling of the input and output messages) can be controlled by means of various tasks.
“Automatically restart slaves”	☑ The master immediately attempts to restart the slaves in the case of a communication breakdown.

Table 682: “Master Settings”

These settings can be edited only when the *“Autoconfig master/slaves”* option is deactivated. Otherwise this is done automatically and they are not visible here.	
“Image In Address”	First logical address of the first slave for input data
“Image Out Address”	First logical address of the first slave for output data

See also

- *Chapter 1.6.6.2.17.2.1 “Tab 'EtherCAT Slave - General' ” on page 3819*
- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*

Tab 'EtherCAT Master - Sync Unit Assignment'

Object: EtherCAT Master

The tab shows all slaves that are inserted below a specific master with an assignment to the sync units.

With the EtherCAT sync units, multiple slaves are configured into groups and subdivided into smaller units. For each group, the working counter can be monitored for an improved and more exact error detection. As soon as a slave is missing in a sync unit group, the other slaves in the group are also shown as missing. Detection occurs immediately in the next bus cycle because the working counter is checked continuously. With the device diagnosis, the missing group can be remedied as quickly as possible.

Unaffected groups remain operable without any interference.

Sync unit support is defined by the device description of the EtherCAT Master and can be disabled for vendor-specific device descriptions. By default, it is provided with a device description of version 3.5.8.0 and higher.

“Device name”	Name of the slave
“Sync unit”	Name of the selected sync unit. You can combine single devices or entire groups (multiple selection) into on sync unit group.
“Add”	When you type a name in the text field, you can create a new sync unit.
“Delete”	Deletes the selected sync unit. When slaves are assigned to the group to be deleted, a warning dialog opens. If you click *“Yes”* to acknowledge the dialog, then these devices are reassigned to the default group.

See also

- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*

Tab 'EtherCAT Master - Parameters'

Object: EtherCAT Master

The tab contains the master parameters which are defined in the device description file.

When the auto-configuration mode is selected in the *“Master”* dialog, the parameters are set here automatically according to the specifications from the device description file and the network topology. Nothing should be changed in the generic editor because an invalid configuration can be set here.

“Value”	Editable: A change is effective only when the auto-configuration mode is disabled. Whether or not the change becomes effective depends on the respective parameter.

- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*
- *Configuration*

EtherCAT slave

Tab 'EtherCAT Slave - General'

Object: EtherCAT Slave

The basic settings for the EtherCAT Slave are configured on this tab. The basic settings are preset from the device description file.

Table 683: “Address ”

Fields can be edited only when the auto-configuration mode of the EtherCAT Master is disabled.	
“AutoInc address”	Self-incrementing address (16-bit) that results from the position of the slave in the network. The address is used only during the system boot when the master assigns the EtherCAT addresses to its slaves. When the first message runs through all the slaves for this purpose, each slave increments its *“AutoInc address”* by 1. The slave with address 0 then gets the data. A possible input here is "-8".
“EtherCAT address”	Final address of the slaves, assigned by the master during bootup. The address is independent of the position of the slave in the network.

Table 684: “Additional”

“Expert settings”	☑: Additional settings are possible for the startup checking and time monitoring (see below). The *“Expert Process Data”* tab is also available in the device editor. However, expert settings are not required for standard applications. The auto-configuration mode is recommended and sufficient for standard applications.
“Optional”	At the start of the stack, the system checks whether optional devices are available. ☑: The slave is defined as optional and no error message is generated if the device is missing from the bus system. If a device is not found, then it is disabled automatically and displayed in gray in the device tree. A corresponding message is displayed in the logger. Note: If you define a slave as "optional", then it has to have a unique identification. You can change this by means of the three possible settings in the *“Identification”* section. Available only when the *“Autoconfig master/slaves”* option is selected in the settings of the EtherCAT Master and the EtherCAT Slave supports this function.

Table 685: “Distributed Clock”

“Select DC”	List box with all settings for the distributed clocks of the device description file
“Enable ”	☑: Cycle time for the data exchange. It is displayed in the *“Sync unit cycle (µs)”* input field and determined by the cycle time of the master. As a result, the master clock can synchronize the data exchange in the network.

The *“Sync0”* and *“Sync1”* settings described below are slave-dependent:

Table 686: “Sync0”

“Enable Sync 0”	☑: Synchronization unit *“Sync0”* is used. A synchronization unit describes a set of process data that is exchanged synchronously.
“Sync unit cycle”	☑: The master cycle time (multiplied by the factor selected from the list box) is used as the synchronization cycle time for the slave. *“Cycle time (µs)”* displays the cycle time currently set.
“User-defined”	☑: A custom cycle time (in microseconds) can be specified in the *“Cycle time (µs)”* field.

Table 687: “Sync1”

“Enable Sync 1”	☑: Synchronization unit *“Sync1”* is used. A synchronization unit describes a set of process data that is exchanged synchronously.
“Sync unit cycle”	☑: The master cycle time (multiplied by the factor selected from the list box) is used as the synchronization cycle time for the slave. The *“Cycle time (µs)”* field displays the cycle time currently set.
“User-defined”	☑: A custom cycle time (in microseconds) can be specified in the *“Cycle time (µs)”* field.

Table 688: “Diagnosis”

This area section appears in online mode only.	
“Current State”	State of the slave Possible states: *“Init”*, *“Preoperational”*, *“Safe Operational”*, and *“Operational”* The state *Operational* indicates that the slave configuration has been correctly completed and that process data (inputs and outputs) are being accepted.

Table 689: “Startup Checking”

“Check vendor ID”	By default the vendor ID and product ID of the device are checked against the current configuration settings when the system boots up. If they do not agree, then the bus is stopped and no further actions are executed. This is done to prevent an incorrect configuration from being loaded onto the bus system. Options for deactivating the corresponding check.
“Check product ID”	
“Check revision number”	☑: The revision number is checked during the system bootup according to your selection in the list box.
“Download expected slot configuration”	☑ For online verification of the configured and actual module configuration. If the configurations do not match, then the device still switches to "Run". In this case, an entry is made in the device logbook.

Table 690: “Timeouts”

By default, watchdog is not defined for the following actions. If necessary, an appropriate timeout can be specified here (in milliseconds):	
“SDO access”	Transmits the SDO list at system start. Specified in milliseconds.
“I -> P”	Switch from *“Init”* mode to *“Preoperational”* mode. Specified in milliseconds.
“P -> S / S -> O”	Switch from *“Preoperational”* mode to *“Safe Operational”* mode, or from *“Safe Operational”* mode to *“Operational”* mode. Specified in milliseconds.

Table 691: “DC Cyclic Unit Control: Assign to Local µC”

One or more options for the *“Distributed Clock”* function can be activated here that should be used on the local microprocessor. The check is performed in the registry at 0x980 in the EtherCAT Slave. Possible settings:	
“Cycle unit”	
“Latch unit 0”	
“Latch unit 1”	

Table 692: “Watchdog”

“Set multiplier”	The PDI watchdog and SM watchdog receive their impulses from the local terminal clock divided by the watchdog multiplier.
“Set PDI watchdog”	This watchdog triggers when there is no PDI communication with the EtherCAT Slave controller for longer than the PDI (Process Data Interface) watchdog time which has been set and activated.
“Set SM watchdog”	This watchdog triggers when there is no EtherCAT process data communication with the terminal for longer than the SM (SyncManager) watchdog time that has been set and activated.

Table 693: “Identification”

In this section, you set the device identification of the slave. As a result, you can make the address of the slave independent of its position in the bus. The following options are visible only when the *“Activate expert settings”* option or *“Optional”* option is selected. If you have identified the slave as *“Optional”*, then you have to assign a unique ID to it.	
“Disabled”	The identification of the slave is not checked.

“Configured station alias (ADO 0x0012)”	Address that is stored in the EEPROM of the device. You can change the value in the *“Scan Devices”* dialog or in online mode. For stock devices, you need to assign this number one time. This means that you have to connect the device one time to an EtherCAT Master and save the number.
“Write to EEPROM”	Visible in online mode only for *“Configured station alias”*. Writes the defined address for *“Value”* to the EEPROM of the slave.
“Explicit device identification (ADO 0x0134)”	The device identification is hard set on the hardware (for example, by DIP switches). It is displayed in *“Actual address”*.
“Data Word (2 Bytes)”	A 2-byte value for the identification is saved in the slave.
“Value”	Expected value for the check. If the actual value does not correspond to this setting, then an error is issued.
“ADO (hex)”	Initial value from the device description. You can change this value in the *“Data word”* option.
“Actual address”	Visible in online mode only. Displays the address of the slave. You can use this display for checking the success of the *“Write to EEPROM”* command.

Tab 'EtherCAT Slave - FMMU/Sync'

Object: EtherCAT Slave

The tab shows the FMMUs and Sync Manager of the EtherCAT Slave as they are defined in the device description file. There is an option to edit the FMMUs and Sync Manager (for example, for the configuration of slave-to-slave communication).

Requirement: The auto-configuration mode in the EtherCAT Master is disabled.

Note that these are expert settings which are not usually required for standard applications.

Table 694: “FMMU ”

The table shows the *Fieldbus Memory Management Units* of the slave, which are used for handling the process data. In each case the allocation of the logical address (*“Global Start Address”*) to a physical address (*“Phys. start address”*) is defined. Bit-by-bit mapping is possible.	
“Modify”	
“Add”	
“Delete”	

Table 695: “Edit FMMU”

“Global Start Address”	
“Length”	
“Start bit”	
“End bit”	
“Phys. start address”	

“Phys. start bit”	
“Access”	*“Read”* *“Write”*
“Flags”	*“Enable”*

Table 696: “Sync Manager ”

Display and editing of the synchronization manager of the slave. The physical start address, the type of access, the buffer, and the physical address to which the interrupts are to be sent (as well as others) are defined for each available Sync Manager type (mailbox in, mailbox out, inputs, outputs).

Table 697: “Edit Syncman”

“Phys. start address”	
“Length”	
“Buffer”	*“1”* *“3”*
“Access”	*“Read”* *“Write”*
“Interrupts”	*“to EtherCAT”* *“to PDI”*
“Flag control”	*“Enable”*
“Watchdog”	*“Trigger”*
“SyncMan type”	*“”*

- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*

Tab 'EtherCAT Slave - Expert Mode Process Data'

Object: EtherCAT Slave

The tab provides another more detailed view of the process data, which is also displayed in the *“Process Data”* dialog. Moreover, the download of the PDO assignment and the PDO configuration is enabled here.

Requirement: The expert settings for the slave are selected.

See also:

- *Chapter 1.6.6.2.17.2.1 “Tab 'EtherCAT Slave - General' ” on page 3819*

Table 698: “Sync Manager ”

List of the Sync Managers with data size and PDO type

Table 699: “PDO assignment (16#1C12)”

List of the PDOs assigned to the selected *“Sync-Manager”*.
When a check box is selected, the PDOs are enabled and I/O channels are created. This is similar to the simple PDO configuration view.

Table 700: “PDO list”

List of the PDOs assigned to the selected *“Sync-Manager”*.
You can add new entries or edit or delete existing entries by executing the respective commands (*“Add”*, *“Delete”*, *“Edit”*) in the command bar or context menu.

Table 701: “Edit PDO list”

“Name”	
“Index”	
“Direction”	• *“TxPDO (input)”*: ☑: The PDO is transmitted from the master to the slave. • *“RxPDO (output)”*: ☑ The PDO is transmitted from the slave to the master.
“Flags”	• *“Required”*: The PDO is required and cannot be disabled in the *“PDO assignment”*. • *“Windows contents”*: The contents of the PDO are fixed and cannot be modified. It is then not possible to add entries in *“PDO contents”*. • *“Virtual PDO”*: Reserved for future use
“Exclude PDOs”	It is possible to define an exclusion list. When a PDO is enabled in the *“PDO assignment”*, others are disabled and cannot be enabled.
“Sync unit”	ID of the Sync Manager to which the PDO is to be assigned

Table 702: “PDO Contents”

Displays the contents of the PDOs selected in the *“PDO list”*. You can add new entries or edit or delete existing entries by executing the respective commands (*“Add”*, *“Delete”*, *“Edit”*) in the command bar or context menu. You can change the PDO order by clicking *“Move Up”* and *“Move Down”*.

Table 703: “Download”

“PDO assignment”	☑: Specific CoE commands for initializing the `0x1cxx` objects are generated and written to the slave.
“PDO configuration”	☑: The CoE commands for `0x16xx` or `0x1axx` are generated, and then the PDO mapping is downloaded to the slave. Normally, the default values originate from the ESI file and the device has to support this functionality. For example, if a device has a fixed configuration, then these commands are regarded as flawed.
“Load PDO info from the device”	The current PDO configuration is read from the slave and entered into the configuration. The lists in the upper and lower right are then deleted and filled with the read data. This is especially useful when the ESI file is incomplete and the configuration is available only on the slave.

Tab 'EtherCAT Slave - Process Data'

Object: EtherCAT Slave

The tab of the EtherCAT configurator displays the process data for the inputs and outputs of the slave. The data is preset from the device description file.

Table 704: "Select the Outputs"

The table shows the outputs of the slave defined by *"Start address"*, *"Type"*, and *"Index"*. If outputs of the device are enabled here (for writing), then these outputs can be assigned to project variables in the *"EtherCAT I/O Mapping"* dialog.

Table 705: "Select the Inputs"

The table shows the inputs of the slave defined by *"Name"*, *"Type"*, and *"Index"*. If inputs of the device are enabled here (for reading), then these inputs can be assigned to project variables in the *"EtherCAT I/O Mapping"* dialog.

- *Chapter 1.6.6.2.17 "EtherCAT configurator" on page 3815*

Tab 'EtherCAT Slave - Startup Parameters'

Object: EtherCAT Slave

On the tab, the SDOs (service data objects) for 'CAN over EtherCAT' (CoE) or the IDNs (identification numbers) for 'Servodrive over EtherCAT' (SoE) are defined for the current slave. These parameters are determined for the device when the system is started.

The object directory with the required data objects is described in the EtherCAT XML description file or in an EDS file that is referenced in the XML file.

Requirement: The device supports 'CAN over EtherCAT' or 'Servodrive over EtherCAT'.

Some modules that are inserted below a slave have their own startup parameters. These parameters are also displayed in this list but cannot be edited here. The parameters are modified in the editor of the corresponding module.

List of SDOs or IDNs The order (from top to bottom) specifies the order in which the objects are transferred to the module.	
"Line"	Line number
"Index:Subindex"	For CoE only
"IDN"	For SoE only Identification number
Name	
"Bit length"	Bit length of the SDO or IDN
"Abort on Error"	☑: In case of error, the transfer is aborted with an error status.
"Jump to Line on Error "	☑: In case of error, the transfer is resumed with the SDO or IDN at the specified *"Line"*.

“Next Line ”	☑: The transfer is resumed with the SDO or IDN at the next line.
“Comment”	Input field for comments
“Move Up”	Moves the selected line upwards by one line
“Move Down”	Moves the selected line downwards by one line
“Add”	Opens the *“Select Item from Object Directory”* dialog adding SDOs or IDNs.
“Delete”	Removes the selected entry.
“Modify”	Opens the *“Select Item from Object Directory”* dialog for changing the parameters of the selected SDO or IDN

Dialog 'Select Item from Object Directory'

The dialog lists all available object directory entries as defined in the XML file. The parameters of the objects can be modified in this dialog. New objects can also be created. This is useful when none or only an incomplete object directory exists.

Table 706: “CAN over EtherCAT ”

List of available object directory entries as defined in the EDS file.	
Column *“Index:Subindex”*	Identifies the entry in the object directory
Column *“Name”*	
Column *“Flags”*	Display of access flags: RW (read/write), RO (read only), WO (write only)
Column *“Base Value”*	Editable (double-click to open)
Input fields	
“Name”	Input field for displaying and changing the name
“Index: 16#”	By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file.
“Subindex: 16#”	
“Bit length”	Range of values of the object
“Value”	Each value may be max. one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad). If the *“Byte array”* option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4).
“Full access”	The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every subindex has to be transferred individually.
“Byte array”	☑ Values can be specified as a comma-separated byte array.

Table 707: Servodrive over EtherCAT

List of available object directory entries as defined in the XML file.	
Column *“IDN”*	Identification number
Column *“Base Value”*	Base value of the IDN. Double-click to modify.
Input fields	
“IDN”	Identification number: Composed from the subsequent parameters ● *“S”*: Standard data ● *“P”*: Product-specific data ● *“PSet”*: Parameter set ● *“Offset”*

“Bit length”	List box for selecting the bit length
“Value”	List box for selecting the value
“Channel”	If the object has multiple subobjects, then this list box is displayed automatically.
“As list”	Parameters are loaded as a list. The first four bytes indicate the length. ☑: The length is calculated automatically.

- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*

Tab 'EtherCAT Slave - Parameters'

Object: EtherCAT Slave

The tab contains the slave parameters which are defined in the device description file.

When the auto-configuration mode of the master is selected, the parameters are set here automatically according to the specifications from the description file and the network topology. For standard applications, it is also not normally required to edit them.

“Value”	Only a few parameters are editable. A change is effective only when the auto-configuration mode is disabled. Basically, the user should not modify anything here because doing so could create an invalid configuration, which would prevent the slave from entering into the operational state.

- *Chapter 1.6.6.2.17.2.1 “Tab 'EtherCAT Slave - General' ” on page 3819*
- *Chapter 1.6.6.2.17.1.3 “Tab 'EtherCAT Master - Parameters' ” on page 3819*
- *Chapter 1.6.6.2.17 “EtherCAT configurator” on page 3815*

Tab 'EtherCAT Slave - EoE Settings'

Object: EtherCAT Slave

This tab is used to configure the communication settings for the individual slaves that support Ethernet over EtherCAT (EoE).

Requirement:

- When using CODESYS Control Win V3, the Microsoft Loopback Adapter has to be installed as a virtual Ethernet adapter. Installation instructions can be found online.

Table 708: “Settings”

“Virtual Ethernet Port”	☑: Enables the EOE functionality of the slave. A unique *“Virtual MAC ID”* has to be defined.
“Virtual MAC ID”	Input field for the *“Virtual MAC ID”*
“Switch port”	◉: The device acts as a switch. No additional network settings are required.
“IP port”	◉: The device acts as an IP port. The *“IP Settings”* have to be configured.

Table 709: “IP Settings”

The Ethernet communication parameters have to be set according to the parameters of the virtual Ethernet adapter.	
“IP address”	IP address of the slave in the network (length: 4 bytes) The IP port has to be in the same range as the virtual Ethernet adapter. For example, if the address of the network adapter is 192.168.1.1 and the subnet mask is 255.255.255.0, then the IP port has to be in the range from 192.168.1.2 to 192.168.1.254.
“Subnet mask”	Subnet mask (length: 4 bytes)
“Default gateway”	Default gateway (length: 4 bytes)
“DNS server”	IP address of the DNS server
“DNS name”	Name of the DNS server

EtherCAT module

Tab 'EtherCAT Module - Startup Parameters'

Object: EtherCAT Module

The SDOs (Service Data Objects) or IDNs that transmit specified parameters to the device at the system start are defined on this tab for the current module.

The object directory with the required data objects is described in the EtherCAT XML description file or in an EDS file that is referenced in the XML file.

Requirement: The device supports *CAN over EtherCAT* or *Servodrive over EtherCAT*

Some modules have their own start parameters which are displayed on the tab. The parameters can be modified there. Likewise, the parameters are also displayed in the slave, but they are blocked there.

Table 710: SDO table

List of SDOs or IDNs The order (from top to bottom) in the SDO table specifies the order in which the SDOs are transferred to the module.	
“Line”	Line number
“Idn”	
“Bit length”	Bit length of the SDO
“Abort on Error”	☑: In case of error, the transfer is aborted with an error status.
“Jump to Line on Error ”	☑: The transfer is resumed with the SDO at the specified *“Line”* in case of error.
“Next Line ”	☑: The transfer is resumed with the SDO at the next line.
“Comment”	Input field for comments
“Move Up”	Moves the selected line upwards by one line

"Move Down"	Moves the selected line downwards by one line
"Add"	Opens the *"Select Item from Object Directory"* dialog. In this dialog you can change the parameters of the SDO before the SDO is added to the configuration. By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file. This is useful if only an incomplete object directory or none at all exists.
"Delete"	Removes the selected entry.
"Modify"	Opens the *"Select Item from Object Directory"* dialog for changing the parameters of the selected SDO or IDN in the table

Servodrive over EtherCAT

Table 711: "Select Item from Object Directory"

List of available object directory entries as defined in the XML file.	
Column *"Idn"*	
Column *"Base Value"*	Base value of the IDN. Editable (double-click to open)
Input fields	
"IDN"	• *"S"* • *"P"*
"PSet"	By specifying new *"PSeT"*/*"Offset"* entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all exists.
"Offset"	By specifying new PSet/Offset-entries, a new object can be added to the IDN that is not yet described in the XML file. This is useful if only an incomplete object directory or none at all exists.
"Bit length"	List box for selecting the bit length
"Value"	List box for selecting the value
"Channel"	If the object has multiple subobjects, then this list box is displayed automatically.
"As list"	Parameters are loaded as a list. The first four bytes indicate the length. ☑: The length is calculated automatically.

"CAN over EtherCAT "

Table 712: "Select Item from Object Directory"

List of available object directory entries as defined in the EDS file.	
Column *"Flags"*	Display of access flags: RW (read/write), RO (read only), WO (write only)
Column *"Base Value"*	Editable (double-click to open)
Input fields	
"Name"	Input field for displaying and changing the name
"Index: 16#"	By specifying new index/subindex entries, a new object can be added to the SDO that is not yet described in the EDS file.
"Subindex: 16#"	
"Bit length"	Range of values of the object

"Value"	Each value may be max. one byte (0-255). It can also be a hexadecimal in IEC syntax (for example, 16#ad). If the *"Byte array"* option is enabled, then the values have to be specified as a comma-separated list (for example, 1,2,3,4).
"Full access"	The complete object is written with one access and all subindexes are set at the same time. The time needed for the transfer is reduced because not every subindex has to be transferred individually.
"Byte array"	☑ Values can be specified as a comma-separated byte array.

Bus Cycle Task - EtherCAT

General information

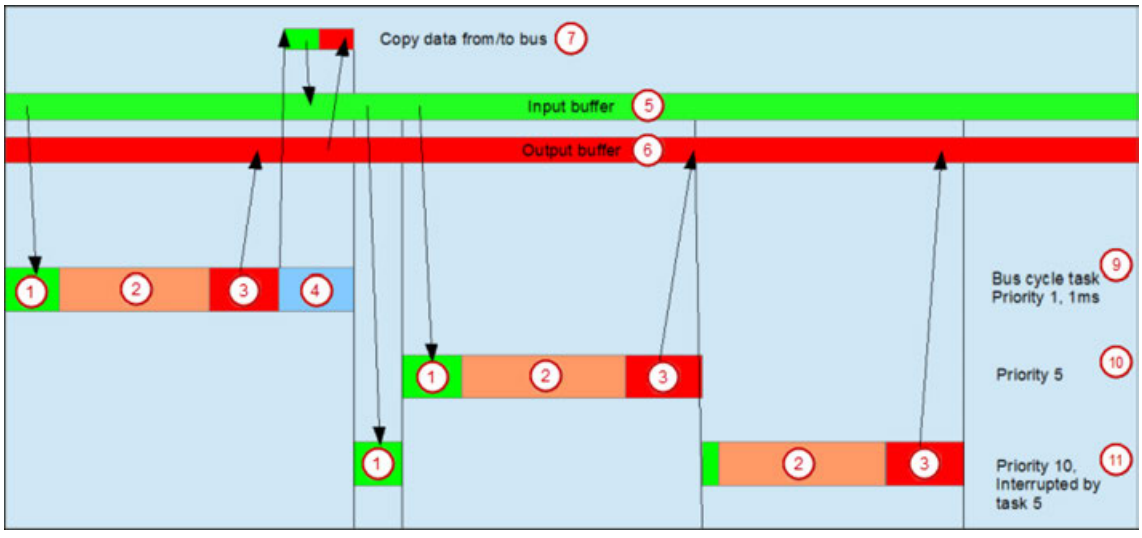
By "bus" it means all fieldbuses including I/O bus. There is no bus cycle task for Modbus because it is controlled by POUs. Modbus does not provide IO mapping.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "*"PLC Settings"*" to avoid unexpected behavior. The task defined in *"PLC Settings"* determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If *[unspecified]* is set in *"PLC Settings"*, the EtherCAT task might be automatically used by other fieldbuses, potentially causing EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in *"PLC Settings"*.

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task . The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.



```
(1) Read inputs from input buffer        (2) IEC task
(3) Write outputs to output buffer       (4) Bus cycle
(5) Input buffer                         (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5
```

Using tasks

The *"Task Deployment"* provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

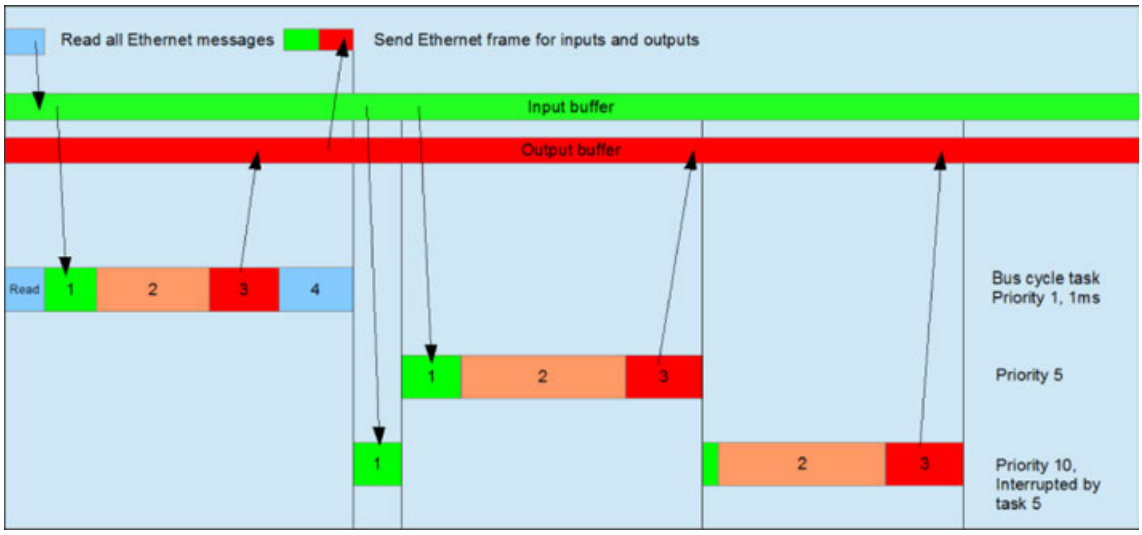
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

Behavior of the bus cycle for EtherCAT

Before the IEC inputs are copied, the pending network messages of the last cycle are read.



When the *"Messages per task"* option is enabled in the settings of the EtherCAT Master, additional telegrams are transmitted to the devices employed per task and input or output employed. Channels that are used in a slow task are also transmitted less frequently. As a result, the bus load can be reduced.

1.6.6.2.18 PROFINET IO Configurator

PROFINET IO (Process Field Network) is an industrial Ethernet standard widely used in the field of manufacturing and process automation. It is managed by the user organization PI (PROFIBUS&PROFINET International) and is considered the successor of PROFIBUS (see *https://www.profibus.com/*).

PROFINET IO controller

Controller – General

Object: PROFINET IO Controller

The PROFINET IO controller, like the slaves, is identified by the station name. For AC500 Communication Modules, you can also configure the IP settings here. Otherwise the settings apply from the superordinate Ethernet node.

“Station name”	The station name of the device. It is used for unique identification of the device in the network.

Table 713: IP Parameters

“IP address”	Note: Available for AC500 Communication Module only. If you insert the controller below an Ethernet adapter, then you have to define the IP parameters in the dialog of the Ethernet adapter.
“Subnet mask”	
“Default gateway”	

Table 714: Default Slave IP Parameter

“First IP address”	Range of IP addresses that CODESYS uses by default when inserting PROFINET IO devices into the device tree. If you use the *“Auto-IP”* function in the scan dialog, then IP addresses are also used from this range. The next free IP address is selected here.
“Last IP address”	
“Subnet mask”	
“Default gateway”	

Table 715: IO Provider / Consumer Status

"Application stop --> Substitute values"	When the user stops the application, the provider state is set to "BAD". Then the slaves set the inputs and outputs to predefined substitute values. For more information, see "CODESYS default values – PROFINET IO substitute values" at the end of this chapter.
"Add to I/O mapping"	☑: The incoming status information is added to the I/O mapping for all modules; provider state for the input data and consumer state for the output data.
"Substitute input data"	● *"Zero"* ● *"Last valid value"*

Table 716: Port Data

"Peer station/port"	Neighboring device with port that is connected to this port. You can accept this setting in the *"PROFINET IO Controller Topology"* tab.
"Check cable length"	Length of the network cable (in meters) ● < 10 ● < 25 ● < 50 ● < 100 When the cable length is specified, it is checked when the controller is powered up. An incorrect cable length causes an error message.
"Check MAU type"	Type of network cable

Table 717: Watchdog

"Activate"	Note: Available for AC500 Communication Module only. ☑: If the AC500 Communication Module firmware is not set within the given time (for example, in the case of an exception error in the application), then it is reset. The connection is terminated and the slaves switch to their substitute values. The defaults for the watchdog originate from the device description.

- *Chapter 1.6.6.2.18 "PROFINET IO Configurator" on page 3832*

CODESYS default values – PROFINET IO substitute values

PROFINET IO devices set their inputs and outputs to predefined substitute values when there is an interruption. These values are defined in the field device in contrast with default values. These values are usually zero, but specific substitute values can also be configured depending on the device.

The substitute values are set in the following cases:

- The connection is interrupted.
- The controller sets the provider state for the incoming data to "BAD".
- Other interruptions occur (for example, exception in host application, incorrect parameterization)

If the *"Application stop --> Substitute values"* option is enabled, then the controller sets the provider states to "BAD" at application stop. In this case, the slaves set their substitute values. All incoming data from the controller is ignored (including default values).

If the default values defined in the application should be set for an application stop, then you have to disabled this option. Moreover, you should select the *"Update IO while stop"* option (in the *"PLC Settings"*). Otherwise, the CODESYS PROFINET IO controller is stopped.

PROFINET IO Controller - Bus Cycle Task

General information

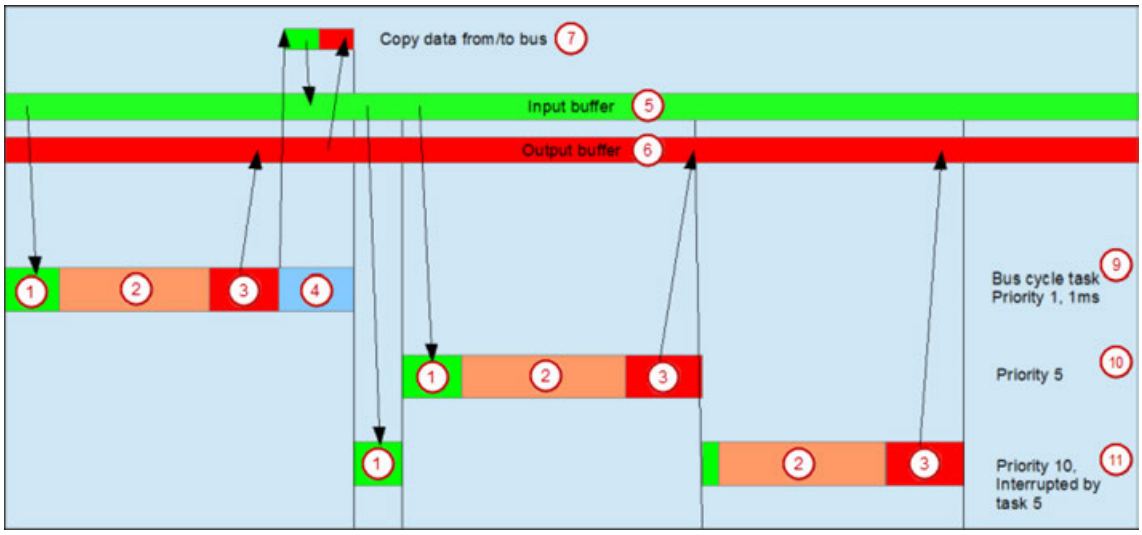
By "bus" it means all fieldbuses including I/O bus. There is no bus cycle task for Modbus because it is controlled by POUs. Modbus does not provide IO mapping.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "*"PLC Settings"*" to avoid unexpected behavior. The task defined in *"PLC Settings"* determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If *[unspecified]* is set in *"PLC Settings"*, the EtherCAT task might be automatically used by other fieldbuses, potentially causing EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in *"PLC Settings"*.

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task . The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.



(1) Read inputs from input buffer
(2) IEC task
(3) Write outputs to output buffer
(4) Bus cycle
(5) Input buffer
(6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5

Using tasks

The *"Task Deployment"* provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

PROFINET IO bus cycle behavior

PROFINET IO does not provide any additional settings. Its functionality corresponds to the general description.

PROFINET IO device

Device – General

Object: PROFINET IO Device

In this dialog, you configure a communication link (PROFINET IO: application relation) to a PROFINET IO Field Device.

For all settings in the present dialog, the device description determines if the values here are editable and the values that are predefined or possible.

“Station name”	The station name of the device. It is used for unique identification of the device in the network.
“Station status”	32-bit error code compliant with the PROFINET IO specification. In case of error, the status is provided here, for example, when establishing a connection fails or a link is interrupted. A description is also displayed.
“IP Parameters”	
“IP address”	The IP settings of the device. Set when establishing the connection to the controller.
“Subnet mask”	
“Default gateway”	
“Communication Settings”	
“Send clock (ms)”	Send clock (in milliseconds).
“Reduction ratio”	Scaling factor The send cycle is defined by *“Send clock”* * *“Reduction ratio”*. Therefore, a *“Send clock”* of 1ms and a *“Reduction ratio”* of 4 means that I/O data is sent every 4ms.
“Phase”	With a *“Reduction ratio”* of `n`, the send cycle is divided into phases 1 to n (where data is sent in one phase only). You can determine in which phase the data is sent for the purpose of load distribution. If *“Send clock”* = 1 and *“Reduction ratio”* = 4 (as in the example above), then you could configure phases 1–4. For four slaves with this send clock and reduction ratio settings, you could assign one of the four phases to each of the four slaves. In this way, only one data packet is sent in each of the four phases of the send cycle and the load is distributed equally.

“Watchdog (ms)”	Monitoring time. A multiple of the send cycle (send cycle = *“Send Clock”* * *“Reduction Ratio”*). Possible values: 3 ms – 1920 ms. A connection is terminated when the controller or the PROFINET IO Device does not receive I/O data from the communication peer within this time period. The device enters failure mode and switches the outputs to substitute values.
“VLAN ID”	VLAN identifier: Number between 0 and 4095 for VLAN type 802.1Q. Note: For newer devices compliant with PROFINET IOspecification V2.3, only "0" is still permitted.
“RT class”	If available, you can select the required RT class from the list (real-time communication).
“User Parameters”	
“Set All Default Values”	CODESYS resets all settings to default values (see default value column) from the GSDML file.
“Read All Values”	CODESYS reads the current values from the device and updates them in the editor.
“Write All Values”	CODESYS writes the current values from the editor to the IO device. Not all IO devices support parameter updates in run mode. If not, then an error message is displayed.

PROFINET IO - Module

Module – General

Object: PROFINET IO Module

Table 718: “Module Information”

“ID number”	Identification of the module (from the device description).
“Slot number”	Position of the I/O module below the I/O device, starting at "1" for the first module and incremented for each additional module. This results automatically from the current structure in the device tree.

Table 719: “User Parameters”

“Set All Default Values”	CODESYS resets all settings to default values (see default value column) from the GSDML file.
“Read All Values”	CODESYS reads the current values from the device and updates them in the editor.
“Write All Values”	CODESYS writes the current values from the editor to the I/O module. Not all I/O modules support parameter updates in run mode. If not, then an error message is displayed.

PROFINET IO - Field Device

The configuration of the PROFINET IO field device consists of the device itself as well as the modules inserted below.

CODESYS provides two different PROFINET IO field devices:

- A variant especially for Communication Module CM579-PNIO
- A variant which is hardware-independent, the CODESYS PROFINET IO field device This variant runs on any number of Ethernet adapters and is also available in a purely programmatically configurable variant.

When inserting the Ethernet-based CODESYS field device, two tasks are created implicitly that are required by the PROFINET IO communication stack.

- *"Profinet_CommunicationTask"*: This task includes the acyclic communication services, such as establishing connections and diagnostics. These services are not time-critical due to very weak real-time demands. Therefore the task is low priority.
- *"Profinet_IOTask"*: This is where the actual PROFINET IO real-time data exchange takes place. Pending I/O data packets are processed in each cycle (see Slave Configurator: *"Send clock"*). Therefore, a cycle time of 1ms is required (for 1ms send clock).

	(6) ↳ *Chapter 1.6.6.2.18.2.2 "Field Device NetX – General" on page 3838* (3) ↳ *Chapter 1.6.6.2.18.1.4.1 "Module – General" on page 3836* (4) Ethernet adapter (7) ↳ *Chapter 1.6.6.2.18.2.1 "Field Device – General" on page 3837*

For maximum IO performance with minimum delay when reading/writing, I/O data can be updated in this task (→ insert own POU that updates IOs in this task). No blocking or persisting operations should be executed in the IO task, such as visualization or file access. If the task is blocked too long, then the watchdog cancels the connection for communicating with the slave (see Slave Configurator: *"Watchdog"*).

NOTICE!
We recommend that you activate the *"Refresh I/Os in Stop"* option in the PLC settings. Otherwise the communication is canceled when the application stops at a breakpoint.

- *Device Editor Options*
- ↳ *Chapter 1.6.6.2.18.2.1 "Field Device – General" on page 3837*
- ↳ *Chapter 1.6.6.2.18.2.2 "Field Device NetX – General" on page 3838*

Field Device – General

Object: PROFINET IO Field Device

The tab displays the basic communication settings.

According to the PROFINET IO standard, the PROFINET IO device is responsible for the IP settings of the used adapter. It has to save remanent IP settings and be able to reset or modify at the request of the controller (IP=0.0.0.0). Initial state (Reset to factory) is with deactivated IP suite (IP=0.0.0.0).

To allow this full reset of the IP configuration, some settings have to be done on most systems (see chapter ↳ *Chapter 1.6.6.2.18 "PROFINET IO Configurator" on page 3832*).

However, if the PROFINET IO device is a programmable logic controller and connected with the (CODESYS) programming environment via one and the same Ethernet adapter, then modifying and resetting the IP address is interruptive (connection termination between IDE and PLC). Therefore, one of the modes is provided that deviates from the standard (*"Use project parameters"*).

Table 720: "IP and Name Assignment"

"Use remanent data"	The IP settings and the station name of the file are used. The file is stored in the file system. The data is set by the controller and saved to a file by the device.
"Use project parameters"	The IP settings and the station name of the project are used (settings of the Ethernet adapter). This option must be selected for Windows, VxWorks, and WinCE, because changing the IP address is not possible for these systems.
"Station name"	Station name of the PROFINET IO Device

Table 721: "IO Provider / Consumer Status"

"Use incoming"	☑: The I/O data for the provider and consumer states is generated which is received by the controller.
"Use outgoing"	☑: The I/O data for the provider and consumer states is generated which is sent to the controller.
"Substitute values"	The substitute values for the output data become active when the corresponding provider status (Output Data PS) is set to `Bad`. The output data is sent by the controller and copied to the %I area of the Profinet modules. The following options are available for the substitute values: ● *"Inactive"*: The outputs are set to "inactive" (example: 0). ● *"Last value"*: The output data retains the last valid value (provider status = `GOOD`). The value is retained even if the connection to the controller has been interrupted.

In online mode, the station name and the IP settings are displayed "Status" tab.

See also

- *Chapter 1.6.6.2.18 "PROFINET IO Configurator" on page 3832*

Field Device NetX – General

Object: PROFINET IO Field Device

The tab displays the basic communication settings.

"Use remanent data"	The IP settings and the station name of the file are used. Initially, the IP address is `0.0.0.0` according to the standard and the station name is blank. When a controller sets these values with the "store remanent" option, then they are stored here.
"Use project parameters"	When starting the device, the values defined in the project for IP configuration and station name are always used initially.

“Station name”	The name of the device in the network. Note: The station name and the IP settings can deviate from the (default) settings configured in the project. They can be set by the controller in runtime mode and in some cases stored persistently (this means when this is specified for the controller in the `Set IP` or `Set station name` commands). After a restart, the device is configured with these values as long as the *“Use remanent data”* option is set.
“IP address”	Initial IP settings Caution: This data can be modified by the PROFINET IO Controller. The remanent data is stored on the file system of the controller. After the controller is restarted, this stored data goes into effect. The settings here are then ignored.
“Subnet mask”	
“Default gateway”	

In online mode, the station name and the IP settings are displayed “Status” tab.

1.6.6.3 Protocols and special servers

1.6.6.3.1 IEC60870-5-104 (Telecontrol)

General information IEC60870

Introduction

The implemented IEC60870-5-104 protocol allows link-ups between AC500 CPUs with onboard Ethernet and external systems. The link-up takes place via the onboard Ethernet interface of the CPU. The telecontrol protocol according to IEC60870-5 is used.

The CPU can work as both control station and substation. In control direction, setpoints and commands can be set; in monitoring direction the control station sends status values, real values and discrete values to the substation. Via general inquiry, the substation requests the control station to send all status values, real values and discrete values. Otherwise, these values are sent by the control station on a change-driven basis, cyclically or when triggered by an application. Status values, real values and discrete values may contain timestamps. These are filled in with the time of the process station when sent. The CPU can time-synchronize the telecontrol link.

A module accepts the configuration of the physical interface (link layer) and the general protocol parts (application layer).

Send and receive blocks are available for data exchange. These blocks exist for the IEC60870-5 data types setpoint value, command value, double command value, status value, double status value, real value and discrete value. The inputs/outputs of the send and receive blocks are combined with the signals to be communicated. See documentation of IEC60870 library for more information.

For a better understanding on how events are processed on a AC500 V3 PLC, refer to the *application example*.

Limits of supported devices

AC500 V3 (Standard):

- PM5630: Support of 5 control stations and/or substations with 1.000 information objects overall on ETH1 and ETH2.
- PM5650: Support of 10 control stations and/or substations with 5.000 information objects overall on ETH1 and ETH2.
- PM5670: Support of 20 control stations and/or substations with 10.000 information objects overall on ETH1 and ETH2.

Limits of supported devices

AC500-eCo V3:

-
- PM5012/ PM5052: no support of IEC60870-5-104 protocol.
- PM5072: Support of 5 substations with up to 1.000 information objects overall on ETH1 and ETH2. IEC60870 control stations are not supported.

Data flow control

Each send or receive block can only process one data message. Ideally, new data are available at each user task run-through or new data can be sent.

If the output OV (send block only) indicates TRUE, the function block computes more quickly than the data can be sent. This can happen if the receive block is not computed quickly enough and has thus not collected all the data.

Alternatively, this block sends either cyclically or if the input value is changed. Ideally, the topical data can be sent via the telecontrol link in connection with every user task run-through.

Data integrity

With IEC60870-5 protocol, a distinction is made between data transmission in the monitoring direction (status values, real values, discrete values) and in the control direction (commands and setpoints).

All data transmissions are acknowledged from the link communication level by the receiver. This acknowledgement is not sent to the sender of the data in every telecontrol link.

For data transmission in control direction, additional acknowledgement (e.g. ACTTERM) is possible. These acknowledgements are not sent by every telecontrol link either. For safe data transmission, it is necessary, in such cases, to configure data readback. The receiver then sends the data received back to the sender via the corresponding send blocks.

Information in the monitoring direction is acknowledged by the receiver on the lowest communication level (link level) when received. This acknowledgement is generated by the telecontrol head itself with some telecontrol heads. In the event of overload/overrun, a data message may be lost. For data in the control direction, so-called ACTTERM acknowledgement can be used. This additional acknowledgement is sent back to the sender when the data have been executed in the process. If data are to be sent in the monitoring direction with guaranteed transmission, it is necessary to read back the sent value via another variable and, after observing a monitoring time, resend in the event of an error.

Data transmission

Send blocks

On the basis of the communication protocol, it is sensible to restrict the data types at one send block to one type. Therefore, there are 5 types of send blocks: send of status values, commands, real values, setpoints and discrete values. These types are mapped to the IEC1131 data types BOOL, REAL and DINT. See documentation of IEC60870 Library for more information.

Operating modes of the send blocks

The send blocks know three operating modes to send their data:

- Caused by request pin (SEND)
- Send in connection with a change of data (AUTO)
- Cyclic send of data (CYCLE)

Send via request pin

The SEND signal is evaluated on the rising edge, the RDY signal remains applied for one computation cycle. If a rising edge is generated again at the SEND signal although no acknowledgement has yet been received from the receiver, the OV pin is set in order to indicate that an overrun has happened. The evaluation of the receive acknowledgement is carried out before the evaluation of whether transmission is to take place. This means, assuming that there is an appropriately fast telecontrol link, that in connection with change-driven and cyclic transmission, a transmission job can be sent in connection with every computation of the block. In connection with send via the request pin it is possible to send only in connection with every second computation (send takes place only with a rising edge).

Change-driven send of data

Data are always sent when the value of the input variables changes. When changes take place, there is an internal simulation that the SEND pin changed from 0 to 1.

In order to prevent unnecessarily frequent send in the event of mild fluctuations in the input value, a threshold value can be configured for real values and setpoints. The input value is not sent until it differs positively or negatively from the value last sent by more than the threshold value.

If the input value changes again although no acknowledgement has yet been received from the receiver, the OV pin is set in exactly the same way as in connection with send via the request pin. If an error occurs during send, the job is automatically retried until the value has been sent without error.

Cyclic send

The data are automatically sent after expiration of a configurable cycle time (SCANDOWN). This cycle time is indicated in multiples of the task cycle time in which the block is computed. In this operating mode, an overrun error can occur if the transmission is faster than the response time of the receiver. For setpoints, it is necessary to ensure that an acknowledgement is generated by the receiver which is not sent until the setpoint is accepted. The send block is not ready for transmission again until after this acknowledgement has been received.

Receive blocks

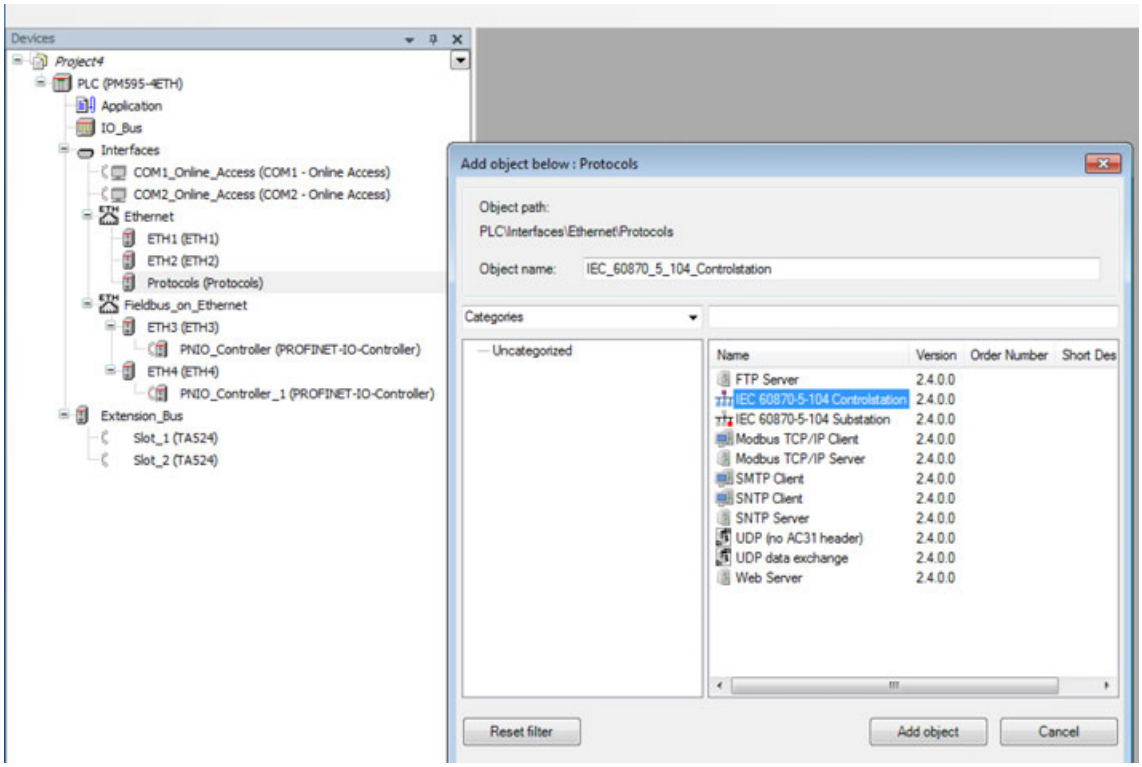
In receive direction, the jobs enter the device module via the interface. The device module selects the correct receive block using the telecontrol address. To this end, during installation the receive blocks pass their parameterized telecontrol addresses to the device module. The device module stores the data received and the receive blocks make the data available at their output pins in connection with the next computation of the user task.

Configuration

Configuration changes >= Automation Builder 1.1/CBP 2.4

The IEC 60870 protocol allows link-ups between AC500 CPUs with onboard Ethernet (e.g. PM595-4ETH and PM591-2ETH) and external systems.

The link-up takes place via the onboard Ethernet interface of the CPU. As of Automation Builder Version 1.1 telecontrol is also supported for CPUs that provide more than one Ethernet interface (e.g. PM595-4ETH and PM591-2ETH). This allows to use different Ethernet interfaces for IEC 60870 connections, hence, telecontrol configuration is changed. Further, as of this version terminology is aligned with IEC 60870 standard and provides additional features that are described in this chapter. For a description on principle telecontrol configuration.



For further information on configuration changes, see the following chapters:

Control and Substations ≥ CBP 2.4 ↬ *Chapter 1.6.6.3.1.2.2 “Control station and substation configuration” on page 3842*

Import Export ≥ CBP 2.4 ↬ *Chapter 1.6.6.3.1.2.1 “Configuration changes >= Automation Builder 1.1/CBP 2.4” on page 3841*

Validity Check of Configuration ≥ CBP 2.4 ↬ *Chapter 1.6.6.3.1.2.4 “Validity check of configuration” on page 3862*

Control station and substation configuration

The CPU can work as both, control station and substation.

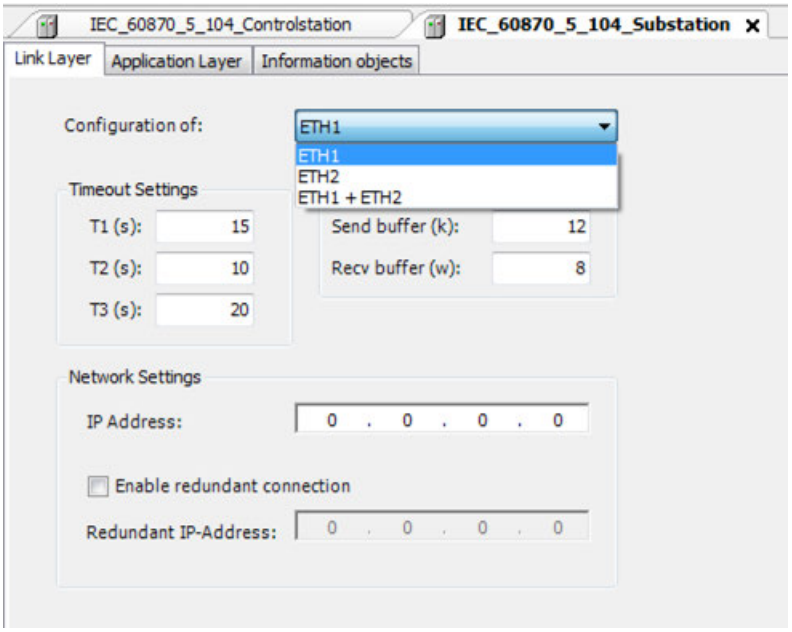
Control station	Client, master, controlling station: Synonyms for a higher-level station (central station, monitors other stations)
Control direction	Data transfer direction from the control station to the substation
Substation	Server, slave, controlled station: synonyms for a subordinate IEC 60870-5-104 telecontrol station (which is monitored)
Monitoring direction	Data transfer direction from the substation to the controlling station

Configure a control station in the device tree *PLC -> Interfaces -> Ethernet -> ETHx*:

1. Right-click *"ETHx ➔ Add objects"*.
2. Select the control station from the list and click *"Add object"*. Configure substations and further control stations in the same way. As of Automation Builder 1.1 any combination of control stations and substations can be configured, in due consideration of a total number of 10 stations.
3. Double-click the new control station node to open parameter configuration. In the Link Layer tab access to the Ethernet interface is configured.

> *As of Automation Builder 2.2.1 the V3 PLC telecontrol station objects from GVL IEC60870_5_104_Connection_GVL can only be used in Structured Text by adding the namespace of the GVL as prefix.*
>
> *Example:*
>
> *byteValue := IEC60870_5_104_Connection_GVL.IEC_60870_5_104_Control-station.Con;*

Tab link layer



In order to provide flexible usage of control stations and substations as of Automation Builder 1.1 configuration of substations has been changed. As several substations can be operated with several Ethernet interfaces, select the Ethernet interface to be used from the pull-down menu. Enter the IP address to the control station and if required to another control station (redundant connection). If no IP address is defined, the substation accepts connection to any control station.

> *This field is not available in the Link Layer tab of control stations. Selection of ETH interface is only possible for substations. The control station is always configured on both interfaces by default.*

Timeout settings

T1, T2, T3: The values for the connection control and message replication; timeout1/2/3.

Buffer settings

This parameter gives the maximum number of outstanding messages and acknowledgement behavior.

Send buffer (k): Maximum difference receive sequence number to send state variable.

Rec buffer (w): Latest acknowledge after receiving w I format APDUs.

Network settings

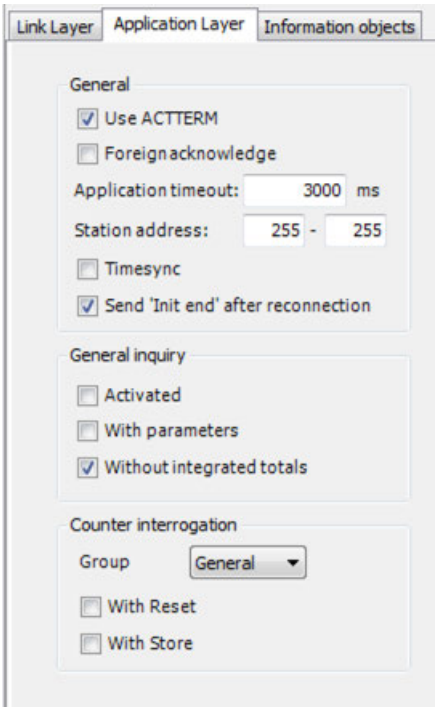
Network settings are available for control stations and for substations. The IP address of the control station and if available the IP address of another control station (redundant IP address) can be selected by the user.

For an overview on the configured Ethernet interfaces for the control stations and substations, double-click the *“Protocols”* node.

Tab application layer

Settings

The application layer is the communication layer with which the send and receive blocks work.



Use ACTTERM

This parameter concerns only setpoints and commands. If this parameter is checked, an acknowledgement with set ‘actterm’ is generated as reason for transmission at the time at which the receive block is computed and outputs its telecontrol data at its output pins. On transmission side, the data block awaits the reception of this ACTTERM acknowledgement and reacts with its corresponding output to the reception of this acknowledgement. For commands with execution time, the acknowledgement is generated when the command is terminated, for commands with continuous execution time and for setpoints, the acknowledgement is generated when the data are output to the output pins.

ForeignAck-nowledge

If this option is not enabled (default), a message that was sent is considered as ok as soon as transmission was successful. If you enable this option, a message that was sent is not considered as ok until a success message (foreign acknowledge) is returned from the receiver.

Application timeout This time indicates how long an acknowledgement will be awaited on the application level. An acknowledgement is generated only for commands and setpoints on the application level.

Station address The station address defines which station will be subject to a count query. The values define the 2 bytes for the common telecontrol address (Common addr.). The values concerned are as follows:

0: The station address is not used.

1...254: The count is queried on the station defined by the station address.

255: The count is queried on all accessible stations.

Timesync After each new establishment of a link and once per hour, a ‘coarse time synchronisation’ message is generated. This time synchronisation is only supported from AC500 to external systems. Time synchronisation from an external system to AC500 is not provided! Incoming time synchronisation messages are confirmed by the process station but not executed. Greenwich Mean Time (GMT) is used as the time for the synchronisation.

Send 'Init end' after reconnection After each establishment of a link or only in connection with the first establishment of a link and after reconfiguration, an init end message is generated. After the init end message, there is a general inquiry, if configured.

General inquiry

Activated This parameter concerns only real values, discrete values and status values. The device module generates a general inquiry message after each new establishment of a link. The other side then generates a message with the reason for transmission ‘general inquiry’ for every data point and subsequently an init end message. This procedure ensures that, in the event of a new establishment of a link, all data are available on the reception side in topical form.

With parameters If general inquiry is activated the parameter values are sent.

Without integrated totals With a general inquiry no integrated total values are sent.

Counter interrogation

Group General, 1 .. 4: The count inquiry is executed for a specific group of counters (1 .. 4). The count inquiry is executed for all groups of counters.

With reset The reset quality bit is sent along with the count inquiry.

With relocate The relocate quality bit is sent along with the count inquiry.

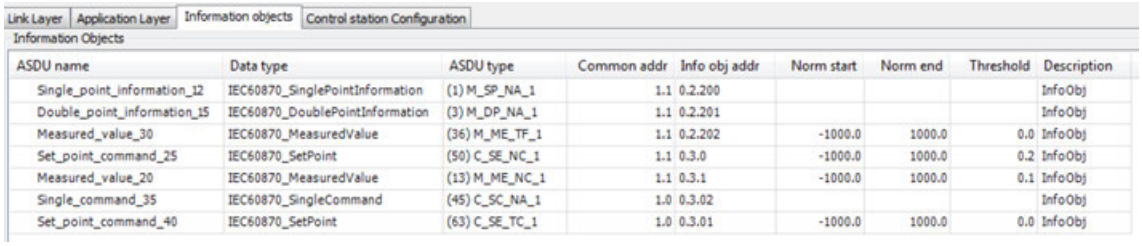
Tab information objects

Open the *“Information object”* tab to configure so called information objects and a common address (known as 'data points' and 'Global address' in former Automation Builder versions). In this tab different information objects and their services for transmission are defined. A data point or information object is identified via a system-wide unambiguous address containing a maximum 5 bytes.

1. Right-click in the empty view and select *“Add Information Object with ASDU”* to add a data group. Select the desired object from the list (e.g. M_SP_NA_1).

   ⇨ An information object with a corresponding ASDU (Application Service Data Unit) is created.

2. Configure the settings in the *“Information Object”* tab to your convenience.



ASDU name	Data type	ASDU type	Common addr	Info obj addr	Norm start	Norm end	Threshold	Description
Single_point_information_12	IEC60870_SinglePointInformation	(1) M_SP_NA_1	1.1	0.2.200				InfoObj
Double_point_information_15	IEC60870_DoublePointInformation	(3) M_DP_NA_1	1.1	0.2.201				InfoObj
Measured_value_30	IEC60870_MeasuredValue	(36) M_ME_TF_1	1.1	0.2.202	-1000.0	1000.0	0.0	InfoObj
Set_point_command_25	IEC60870_SetPoint	(50) C_SE_NC_1	1.1	0.3.0	-1000.0	1000.0	0.2	InfoObj
Measured_value_20	IEC60870_MeasuredValue	(13) M_ME_NC_1	1.1	0.3.1	-1000.0	1000.0	0.1	InfoObj
Single_command_35	IEC60870_SingleCommand	(45) C_SC_NA_1	1.0	0.3.02				InfoObj
Set_point_command_40	IEC60870_SetPoint	(63) C_SE_TC_1	1.0	0.3.01	-1000.0	1000.0	0.0	InfoObj

3. Double-click a table cell to modify pre-set values. For some ASDUs additional sub information objects can be configured. For this, right-click the already existing ASDU and select *“Add Information Object”* to selected ASDU option. This allows configuration of 16 data points at the most (depending on the ASDU type). With *“Remove Information Object”* the selected ASDU is deleted.

Description of the columns

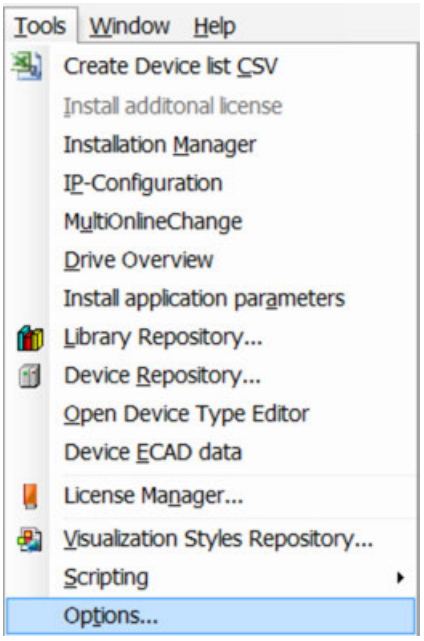
- ASDU name: node name of the information object (name of the ASDU).
- Data type: Data type of the ASDU.
- ASDU type: Type of ASDU.
- Common addr: Common address of the ASDU (known as 'Global Address' in former AB Versions). Byte 1/2 of the common telecontrol address of the block (range: 0...255).
- Info obj addr: Together with common address Info obj addr defines the endpoint (range: 0...255).
- Norm start: Low limit (0 %) of the normalized range for real values and setpoints.
- Norm end: High limit (100 %) of the normalized range for real values and setpoints.
- Threshold: Threshold limit beyond which a change of the input value referred to.
- Description: Table cell for free text. Use this field to describe your configuration settings e.g. differences between configuration variants.

Format of common addr and info obj addr

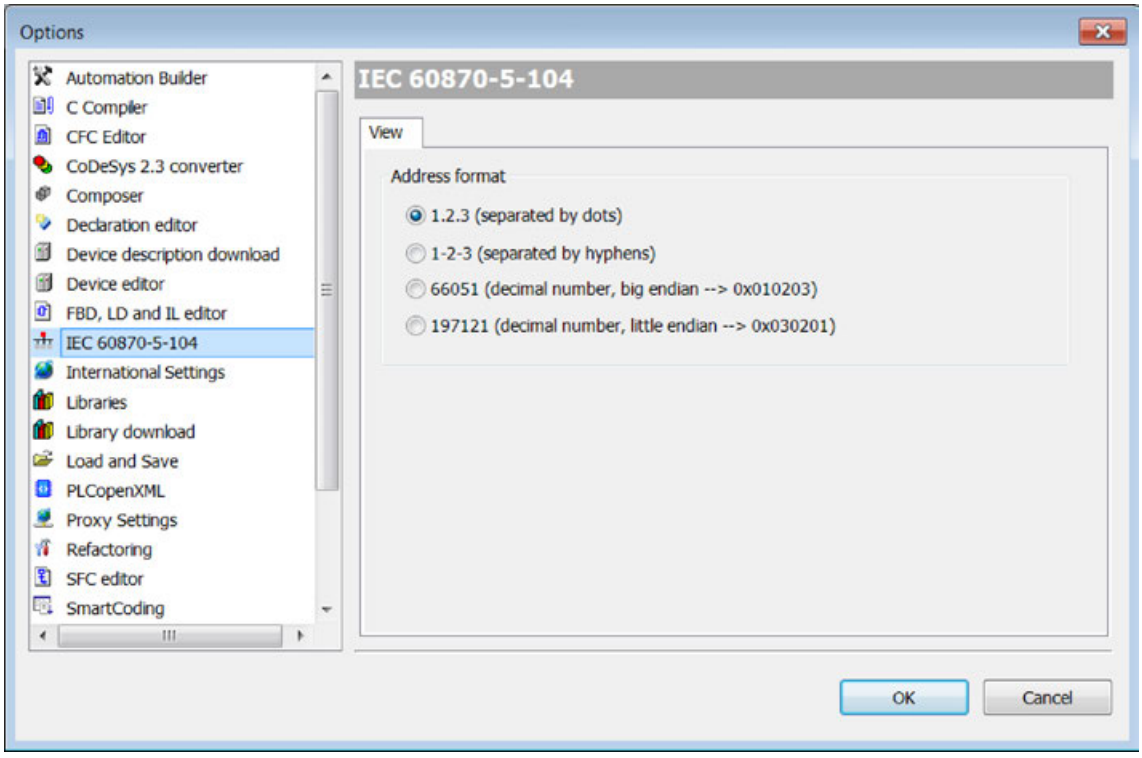
The following adress formats of your entries in the columns *Common addr* and *Info obj addr* of the Tab *Information Objects* are possible:

- 1.2 and 3.4.5 (Default format)
- 1-2 and 3-4-5
- 258 or hex 0x102 and 197637 or hex 0x30405
- 513 or hex 0x201 and 328707 or hex 0x50403

Previously you have to choose your preferred adress format:



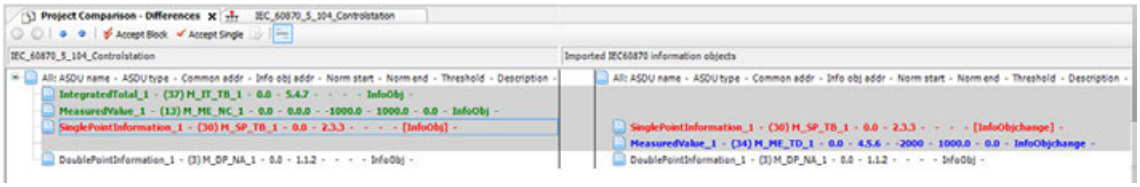
1. Click *"Tools"*and then *"Options..."*
   ⇨ The Window *Options* appears



2. Select *IEC 60870-5-104*, make your choice and click *OK*.

Import options of information objects

The User can accept the imported IEC60870 information objects as single change or change as block.



IEC60870-5-104 Multiple connections

An AC500 with more than one substation connection must be able to identify the corresponding control station clearly. This identification takes place exclusively via the control station's IP address. In order to make it possible for a non-redundant control station to have redundant access to a substation with 2 Ethernet connections. The local substation address is ignored during connection establishment.

In the following descriptions, the term station must not be confused with the individual connection. One station can have several connections. An IEC60870-5-104 communication always takes place between a control station and a substation. A control station can manage several substations and also simultaneously be a substation for one or several control stations. However, these must then be realized using different stations.

A PLC may **not** be configured for another PLC repeatedly as a substation or a control station unless a disjunctive Ethernet infrastructure is used for this.

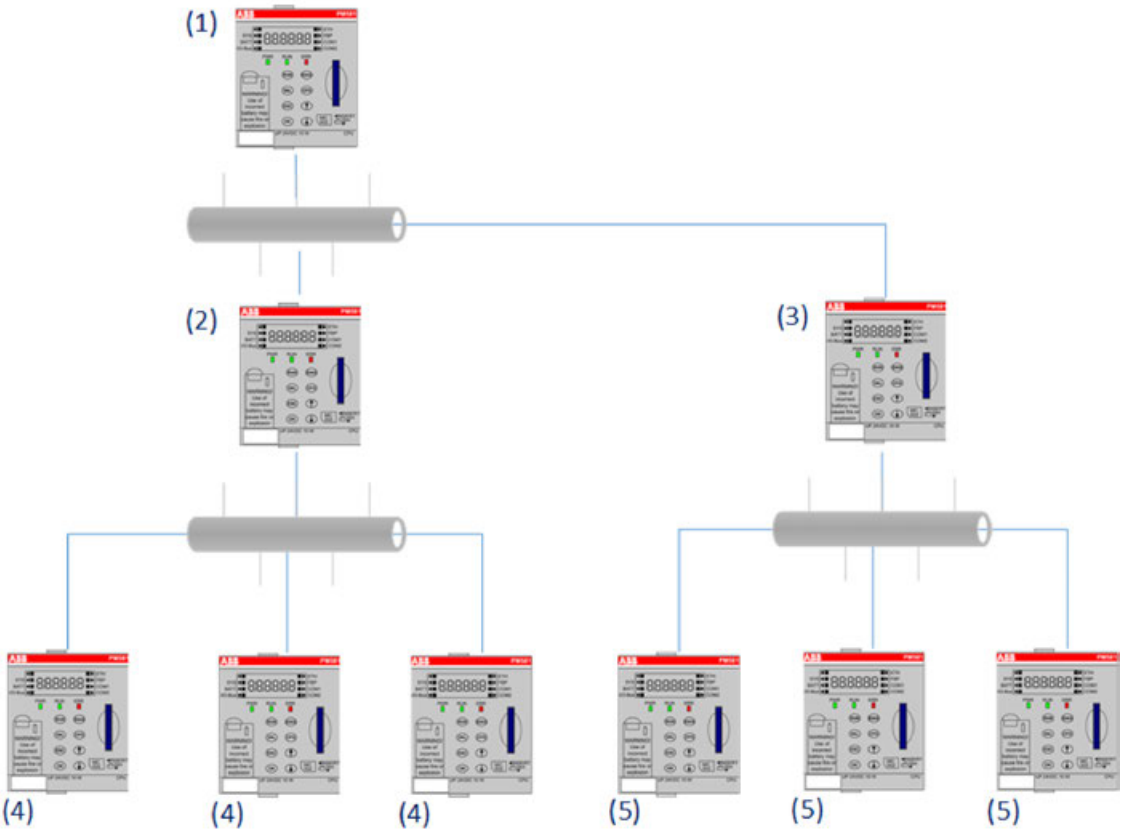
Redundant connections must be specified as such in the configuration.

An AC500 can be used only once as control station for another AC500, it makes no sense to use the same AC500 repeatedly as a control station for the same substation. Such a structure is configured as a redundant control station as long as only one AC500 exists as a control station per substation. However, this control station may have 2 IP addresses. Therefore, this configuration must either have the IP address 0.0.0.0 entered on the substation for the control station, meaning that all IP addresses are accepted and no other control station can access this AC500 or alternatively the possible control station addresses must be specified (ETH1 and ETH2).

Tree constellation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

If you plan to control several substations with the AC500, they can be cascaded. This results in a tree structure.



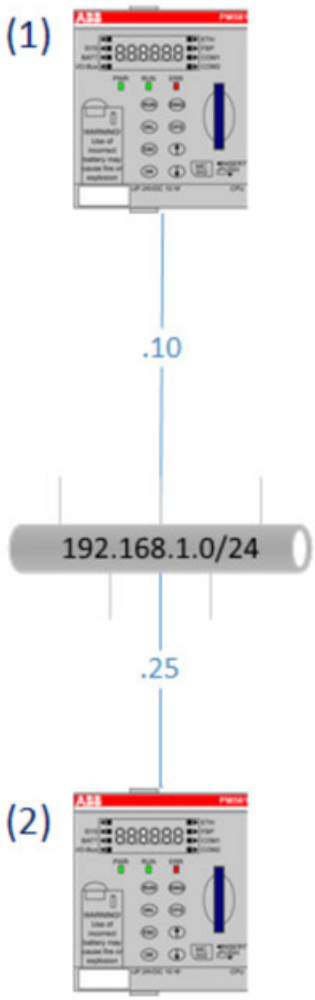
(1) 2 control stations
(2) Substation and 3 control stations
(3) Substation and 3 control stations
(4) Substation
(5) Substation

Structures of connections

In the following, the notation 192.168.1.0/24 is used for TCP/IP networks. Here, the figure /24 specifies the network mask with 255.255.255.0 and 192.168.1.0 describes the network. The valid addresses for this Class C network are 192.168.1.1 to 192.168.1.254! Only the last byte of the address is provided on the respective devices, with e.g. .10. This means that the respective device has the address 192.168.1.10.

Minimal structure

A control station with an Ethernet interface is connected to a substation with an Ethernet interface.



(1) Control station
(2) Substation

Configuration at control station

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The respective substation IP address must be specified at the control station. For this, in the network settings of the control station (1) enter the IP address of the substation (in the example: 192.168.1.25). Option *“Enable redundant connection”* must be disabled.

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

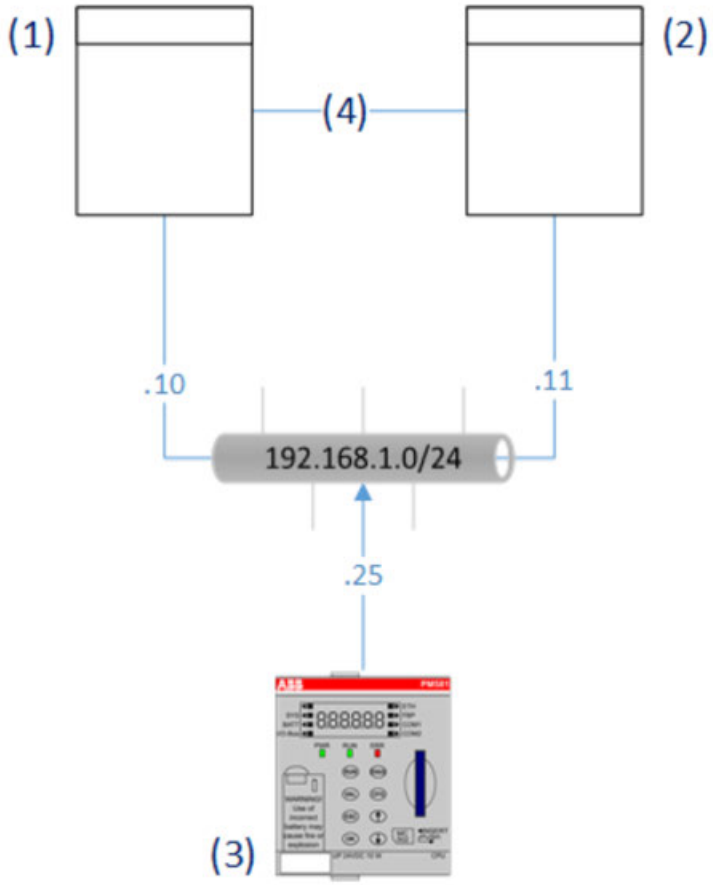
Either the control station IP address or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP address of the control station (in the example: 192.168.1.10). Option *“Enable redundant connection”* must be disabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.*

Minimal redundancy structure

The most simple redundant structure with an AC500 consists of a redundant control station (not AC500) which is connected to the AC500 substation with 2 different IP addresses. These redundant control stations must synchronize which control station is active.

Only one control station can be active at any given time.



(1) Control station 1A (Not AC500)
(2) Control station 1B (Not AC500)
(3) Substation
(4) Redundancy link

Configuration at control stations

The respective substation IP address must be specified at the control stations 1 and 2 (not AC500). For this, in the network settings of both control stations enter the IP address of the substation (in the example: 192.168.1.25).

Configuration at substation

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

Either the control station IP addresses or the general address 0.0.0.0 must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.1.11). Option *“Enable redundant connection”* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station can be configured on this controller for a further substation.*

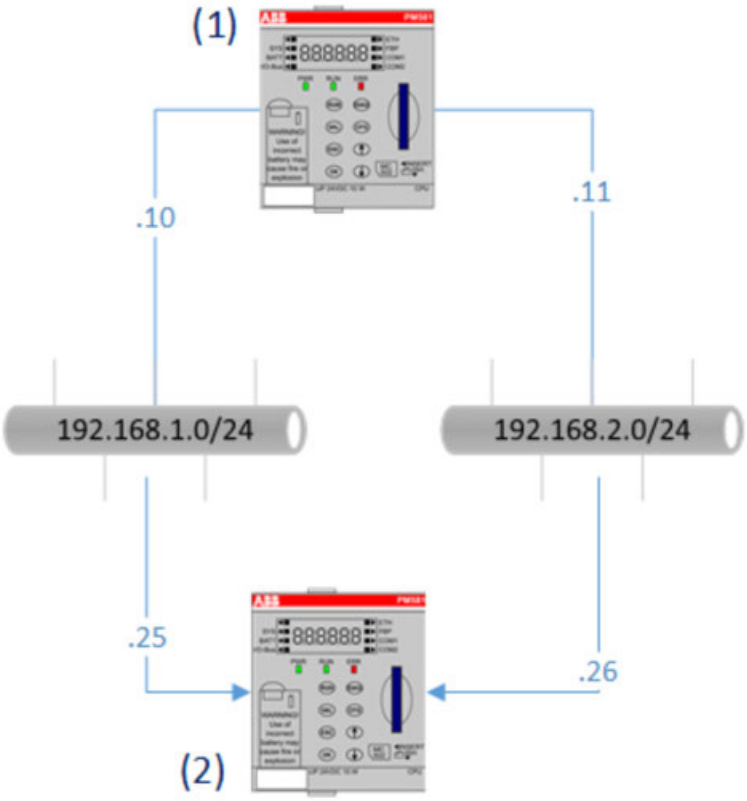
Network redundancy

For network redundancy a control station can reach a substation via 2 paths.

Both the control station and the substation can have 2 different IP addresses. Without special network routing, 2 separate networks should exist, within which both the substation and the control station each have 2 interfaces.

Possible variants of network redundancy are described in the following.

Network redundancy with 2 separate networks



(1) Control station with 2 redundant paths
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option *"Enable redundant connection"* must be enabled.

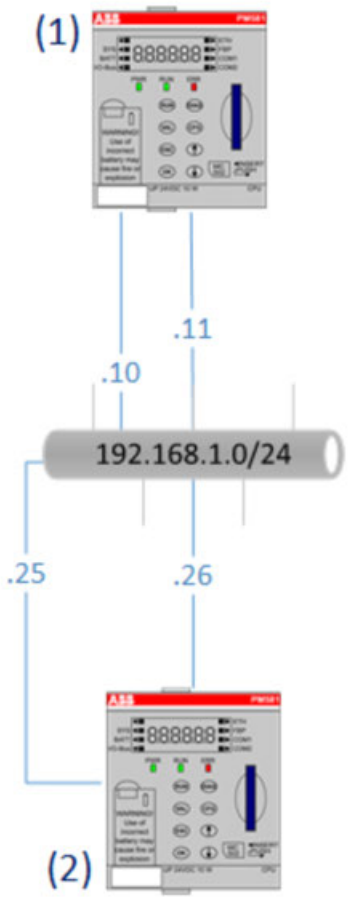
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 1 network and 2 Ethernet ports in substation



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option *"Enable redundant connection"* must be enabled.

Configuration at substation

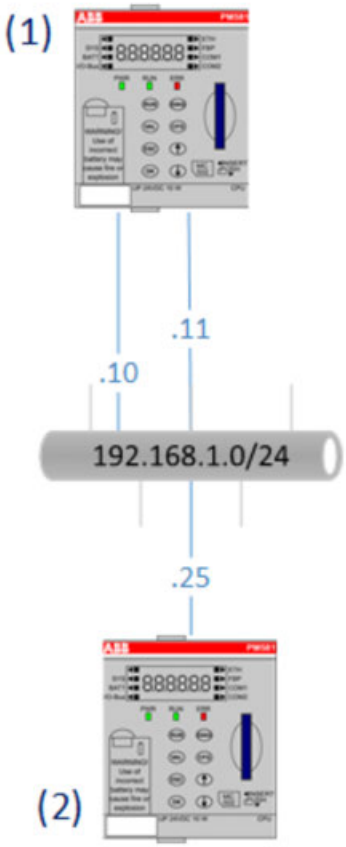
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 1 network and 1 Ethernet port in substation

> *No online redundancy.*
>
> *Only one connection will be established.*



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 1 Ethernet interface

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 0.0.0.0). Option *"Enable redundant connection"* must be disabled.

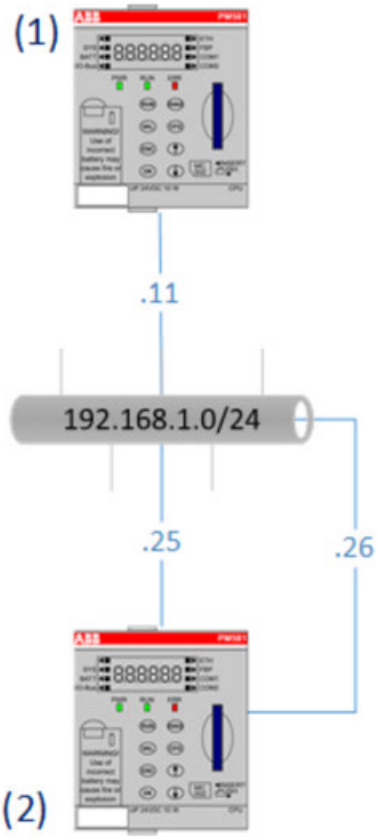
Configuration at substation

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Network redundancy with 2 Ethernet ports in substation



(1) Control station with 2 paths to reach substation
(2) 1 Substation with 2 Ethernet interfaces

Configuration at control stations

PM591-2ETH, PM595-4ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.1.26). Option *"Enable redundant connection"* must be enabled.

Configuration at substation

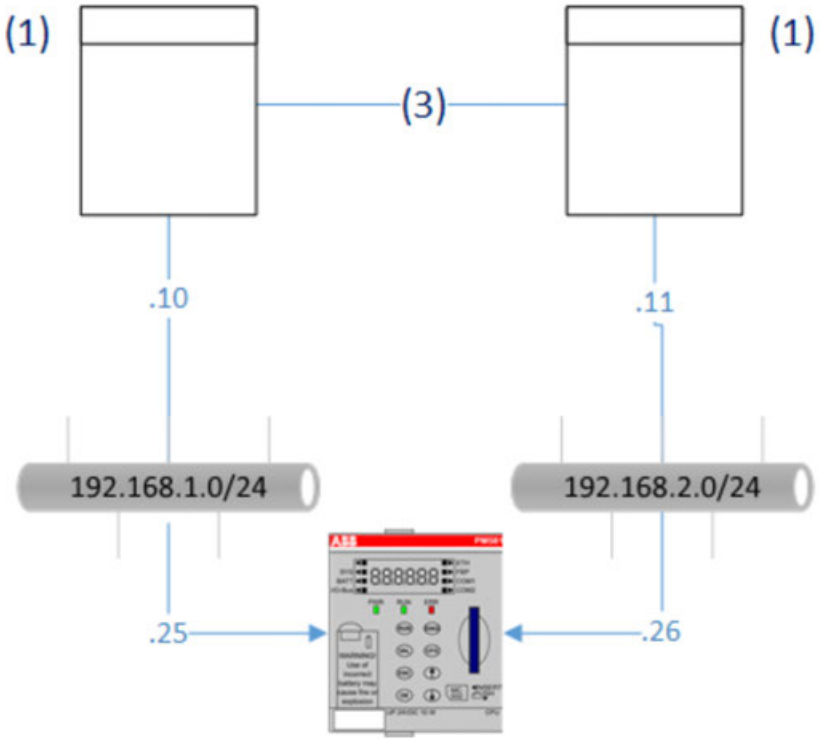
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.11 and 0.0.0.0). Option *"Enable redundant connection"* must be disabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Full control station redundancy

A control stationcan consist of two fully redundant units (not AC500s), which are connected via a redundancy link. These control stations must ensure that only one of them at a time is actively connected to the substation and communicates with it. The inactive control station, however, can establish non-active connection with a substation and monitor it with keep alive packages.



(1) 2 redundant Control stations (Not AC500)
(2) 1 Substation with redundant Control station and 2 Ethernet interfaces (2nd port)
(3) Redundancy link

Configuration at control stations

The substation's IP address must be specified at the control stations (1) (not AC500). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26).

Configuration at substation

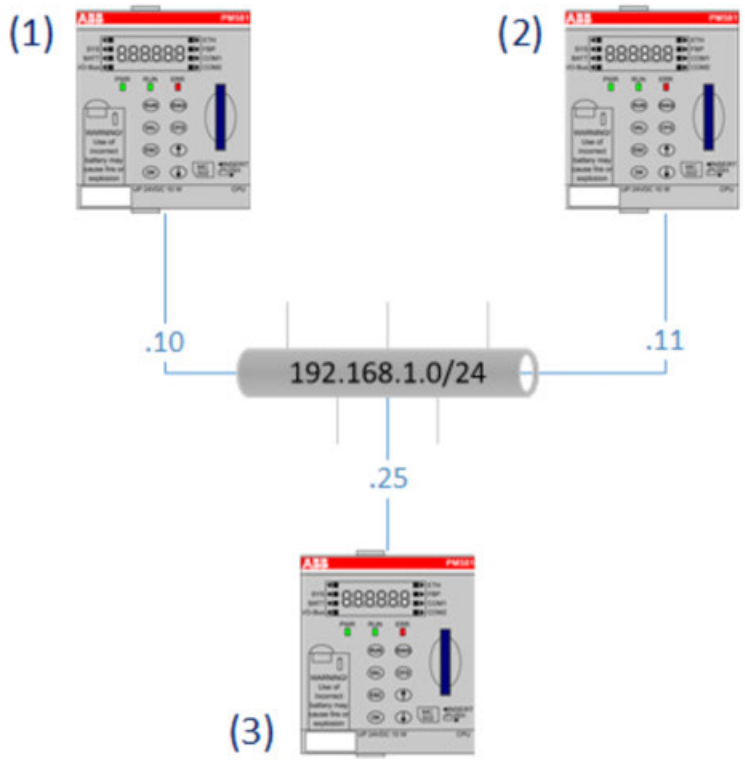
PM591-2ETH, PM595-4ETH, PM5650-2ETH:

Either the control station's IP addresses or the general address 0.0.0.0 must be specified at the substation (2). For this, in the network settings of the substation enter the IP addresses of the control station (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be enabled.

> *If the general address 0.0.0.0 is used at the substation, no further control station on another substation can be configured on this controller. Equally, the substation connection must be activated for both interfaces.*

Multiple control stations on the same network

As of firmware version 2.4, an AC500 can be used as a substation for several control stations. For this, the control stations must be distinguished by their IP addresses. Should a control station have more than one IP address (redundancy), both possible IP addresses should also be entered for the allocated substation connection. As a result, even despite being equipped with several Ethernet interfaces, a device can only be one allocated control station at a time for a determined substation. Thus, several substations can be configured for different control stations on a AC500.



(1) Control station 1
(2) Control station 2
(3) 2 Substations (IEC60870-5-104 2nd Connection)

Configuration at control stations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The substation’s IP address must be specified at the control stations. For this, in the network settings of the control station (1 and 2) enter the IP addresses of the substation (in the example: 192.168.1.25). Option *“Enable redundant connection”* must be disabled.

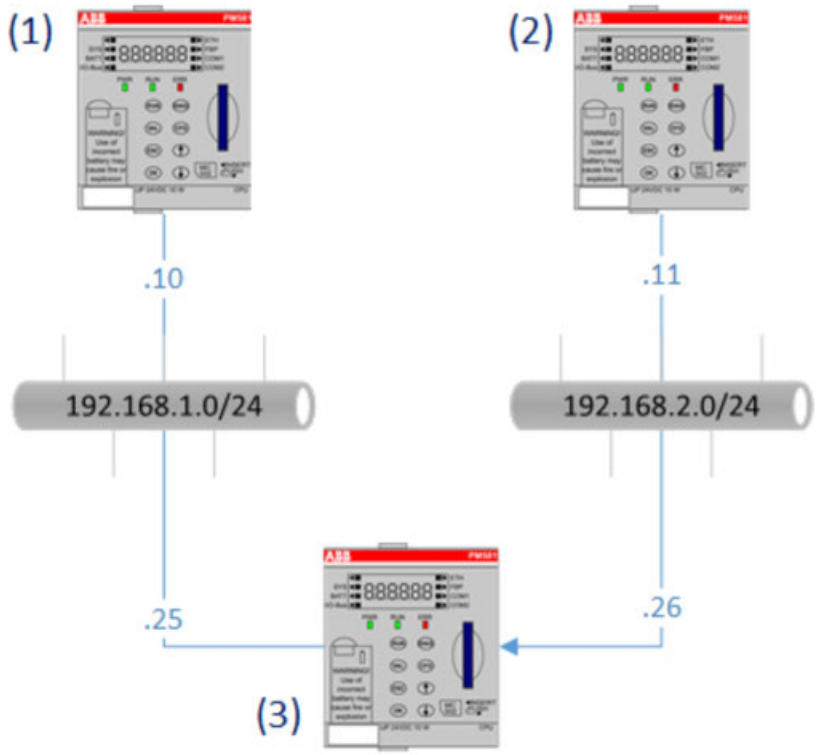
Configuration at substations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3). For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.1.11). Option *“Enable redundant connection”* must be disabled.

Multiple control stations on different networks

As of firmware version 2.4, an AC500 can have several local Ethernet interfaces which can be used for separate control station connections. For this, a control station must be identified via its IP address. The substation address used locally is not used to distinguish a connection in order to enable a network and therefore route redundancy. On AC500, the acception of IEC60870-5-104 connections on an interface can only be prevented.



(1) Control station 1
(2) Control station 2
(3) 2 Substations with 2 Ethernet interfaces (2nd port and 2nd connection)

Configuration at control stations

PM57x-/ PM58x-/ PM59x-ETH, PM5650-2ETH:

The substation's IP addresses must be specified at the control stations (1 and 2). For this, in the network settings of the control station enter the IP addresses of the substation (in the example: 192.168.1.25 and 192.168.2.26). Option *"Enable redundant connection"* must be disabled.

Configuration at substations

PM591-ETH, PM595-ETH, PM5650-2ETH:

Both control station's IP addresses must be specified at the substation (3) under both substation connections. For this, in the network settings of the substation enter the IP addresses of the control stations (in the example: 192.168.1.10 and 192.168.2.11). Option *"Enable redundant connection"* must be disabled.

Double connection

*This configuration **does** work.*

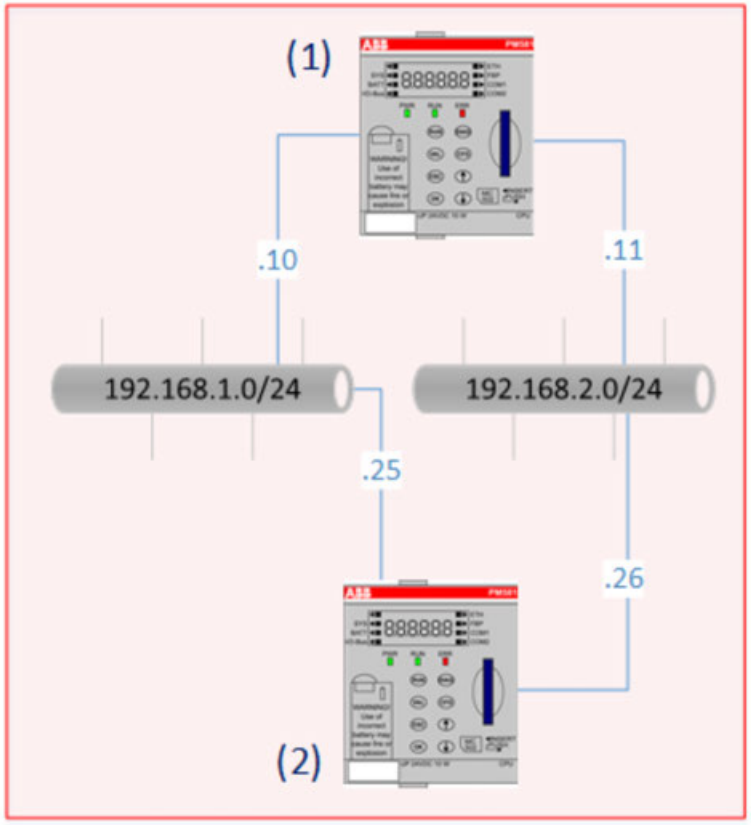
*But it is **senseless!***

It is possible to configure a double connection between 2 stations using 2 separate networks (at least logically separated sub-networks).

However, such a setup has no advantages via-à-vis the minimal structure right at the start ↳ *Chapter 1.6.6.3.1.2.2.6.1.1 “Minimal structure” on page 3850*.

For this setup, connection data must be double configured and double resources are also required at the stations, not providing any advantages whatsoever.

Rather the opposite is true, because such configurations are highly prone to errors.



(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

Faulty configuration

*This configuration **does not** work!*

If an AC500 is configured as a control station, the interface which is used to reach the substation is not defined.

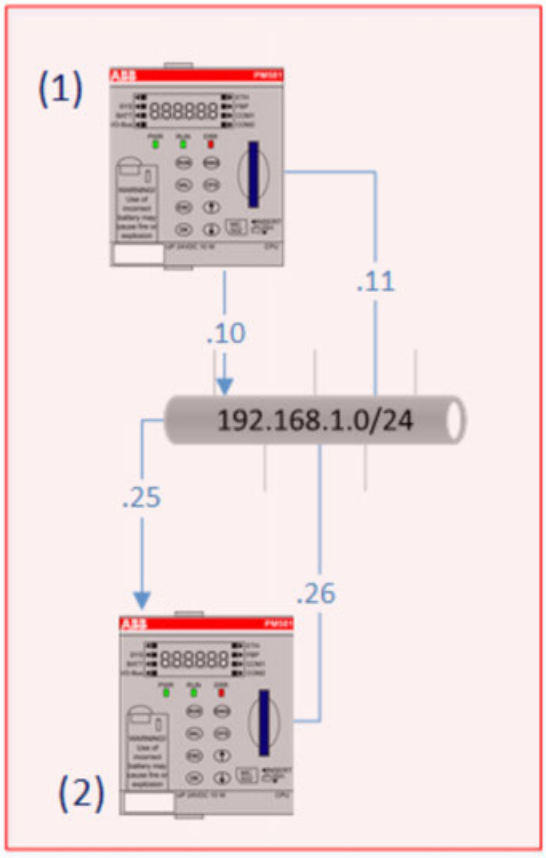
The decision as to which interface is used for this is taken by TCP/IP when running.

It is also dependent on the current network configuration.

Here, the current link status and the order of link recognition may be decisive for the interface to be used.

Such a scenario would not result in stable communication as both substations cannot clearly distinguish the control stations.

Instead, the connection management for a substation will assume that the control station has lost the connection and then establishes a connection.



(1) 2 Control stations with 2 Ethernet interfaces
(2) 2 Substations with 2 Ethernet interfaces

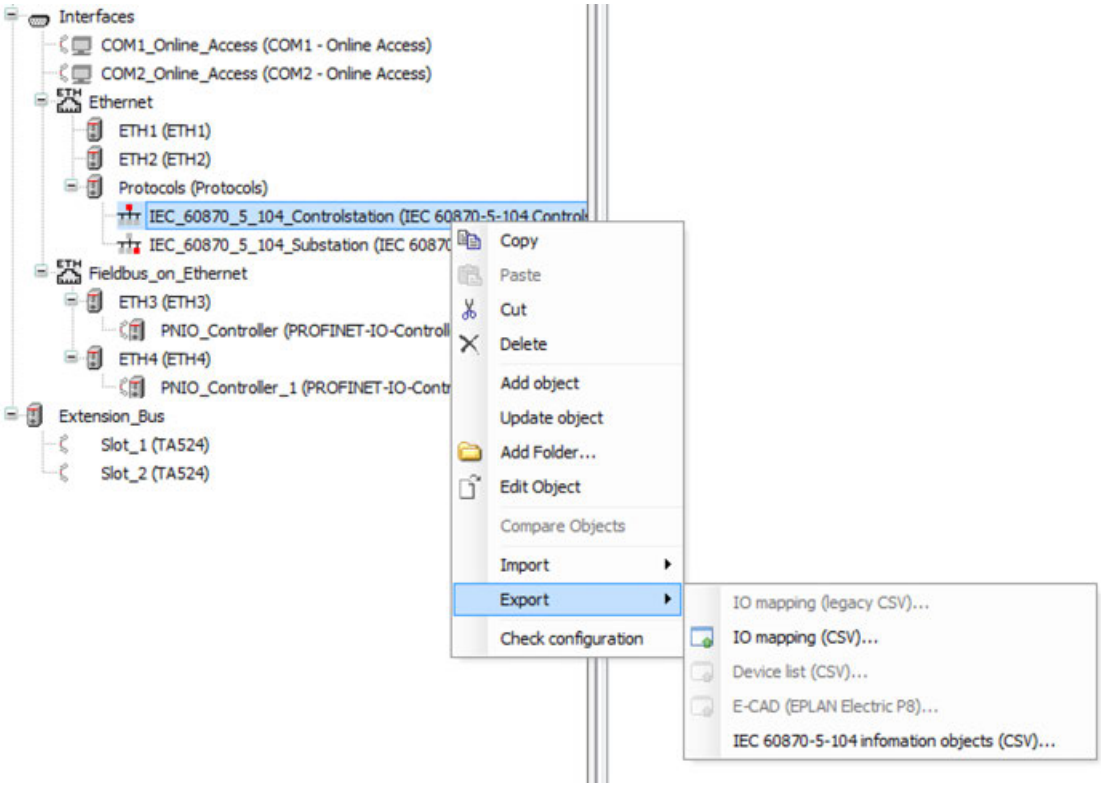
Export a CSV file

As an alternative many values can be modified at a time by exporting the configuration to a CSV file. After modifying the file data, import the CSV file *Chapter 1.6.6.3.1.2.3 “Import/Export functionality ” on page 3861*.

Import/Export functionality

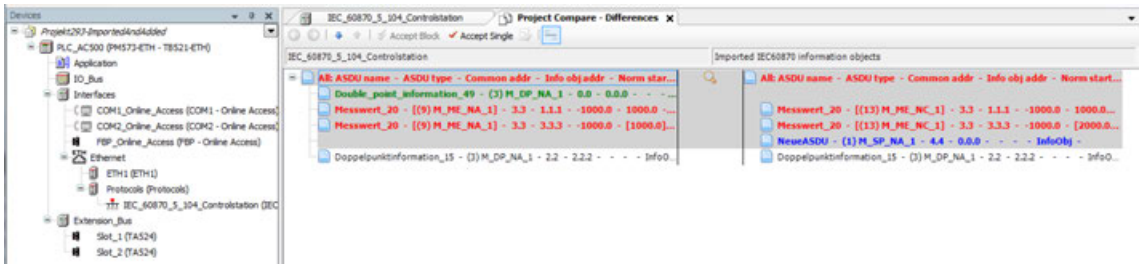
As of Automation Builder 1.1 (CBP >= 2.4) configuration of control stations and substations can be exported/imported via CSV file. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and modify the values within the file to your convenience:

1. Export configuration data: right-click the node of the control station or substation to be exported.



2. Click *“Export ➔ IEC 60870-5-104 information objects (CSV)”* and store the CSV file to a desired directory.
3. Open the CSV file with a spreadsheet software (e.g. Microsoft Excel) and change the values to your convenience. Added table columns are only accepted after the last column.
4. Import configuration data: right-click the node of the control station or substation that has been exported previously.
5. Click *“Import ➔ IEC 60870-5-104 information objects (CSV)”* and select the CSV file from the file system. Configuration data is imported.

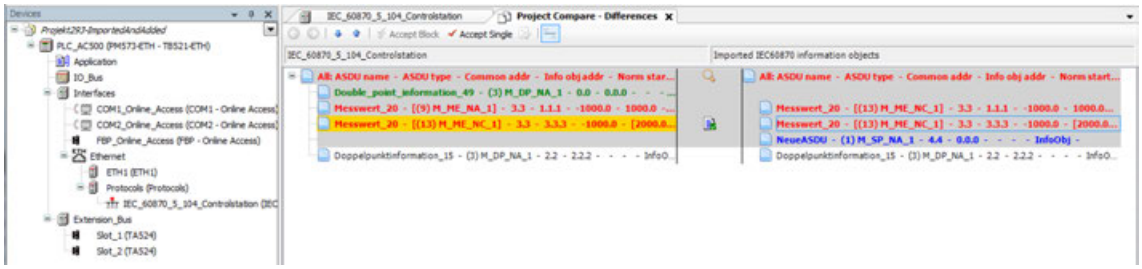
As of Automation Builder 1.1.1 during file import the project data is compared with the project data that is already available. In order to prevent data from being overwritten inadvertently, you can select the data that shall be imported in the *“Project Compare - Differences”* window:



Data on the left side of the window refers to already available project data. This data is displayed under *“Control station ➔ Information objects”* tab. Data on the right side of the window refers to new data that can be imported after your confirmation. Decide whether to import (and overwrite) the data or not.

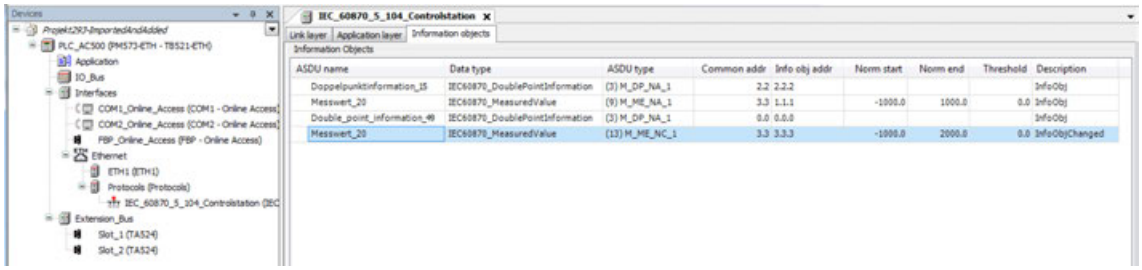
- Data in black color means the existing data and the data to be imported is identical.
- Data in red color means the existing data and the data to be imported differ. Decide whether to import the new data (and to overwrite the existing data) or not.
- Data in blue color means, the data to be imported is new and will be added to the existing data.
- Data that has been confirmed for the import already is displayed in green color (after clicking the *[Accept Single]* button).

In order to move data from one side of the window to another, select the data and click the *[Accept Single]* button. Data is highlighted in yellow.



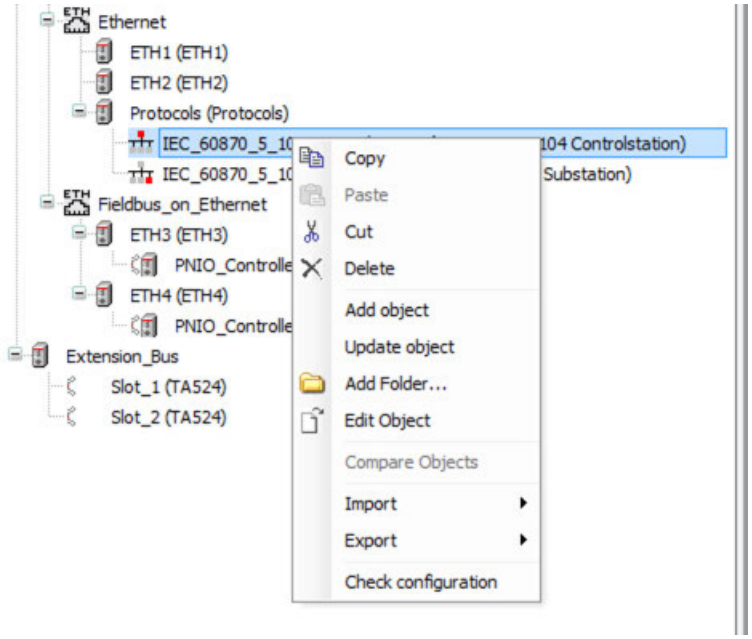
To confirm the import of all new data, click the top entry (here: All: ASDU name - ASDU tpye - Common addr - ...). Then, click the *[Accept Single]* button.

Close the *"Project Compare - Differences"* tab, save your project and confirm the message. The changes are displayed in the *"Information objects"* tab.



Validity check of configuration

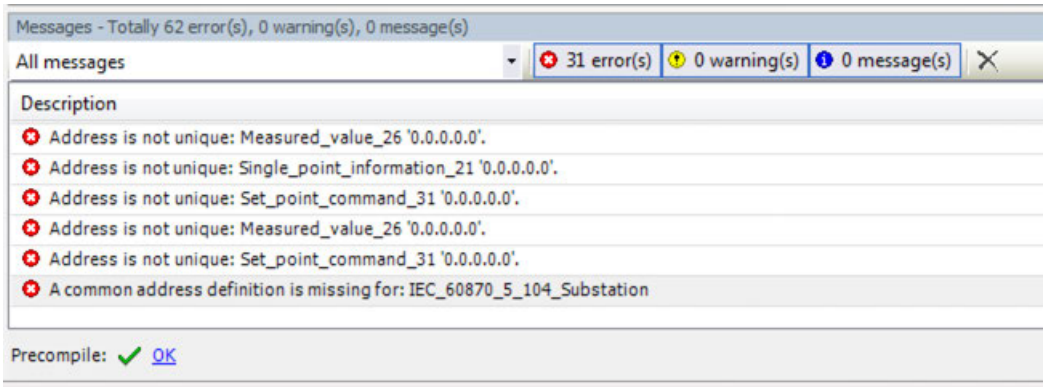
We recommend you to verify the IEC configuration of control stations and substations: Right-click a control station or substation -> Check configuration.



The check will look for the following topics:

- Duplicate addresses.
- Stations without any Information objects.
- ASDU names, which are not unique.

When a check finds errors or incompatibilities this will be reported in a separate messages view at the buttom of the window:



With a double-click on the error line, the part of the configuration with the violation will be opened. Now, you can correct the error.

IEC60870 compatibility list

AC500 V2.4 IEC60870-5-104 Compatibility List

9 Interoperability

This companion standard presents sets of parameters and alternatives from which subsets must be selected to implement particular telecontrol systems. Certain parameter values, such as the choice of "structured" or "unstructured" fields of the INFORMATION OBJECT ADDRESS of ASDUs represent mutually exclusive alternatives. This means that only one value of the defined parameters is admitted per system. Other parameters, such as the listed set of different process information in command and in monitor direction allow the specification of the complete set or subsets, as appropriate for given applications. This clause summarizes the parameters of the previous clauses to facilitate a suitable selection for a specific application. If a system is composed of equipment stemming from different manufacturers, it is necessary that all partners agree on the selected parameters.

The interoperability list is defined as in IEC 60870-5-101 and extended with parameters used in this standard. The text descriptions of parameters which are not applicable to this companion standard are strike-through (corresponding check box is marked black).

NOTE In addition, the full specification of a system may require individual selection of certain parameters for certain parts of the system, such as the individual selection of scaling factors for individually addressable measured values.

The selected parameters should be marked in the white boxes as follows:

☐ Function or ASDU is not used

☒ Function or ASDU is used as standardized (default)

☒ Function or ASDU is used in reverse mode

☒ Function or ASDU is used in standard and reverse mode

The possible selection (blank, X, R, or B) is specified for each specific clause or parameter.

A black check box indicates that the option cannot be selected in this companion standard.

9.1 System or device

(system-specific parameter, indicate definition of a system or a device by marking one of the following with "**X**")

☐ System definition

☐ Controlling station definition (Master)

☐ Controlled station definition (Slave)

9.2 Network configuration

(network-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~Point-to-point~~ ■ ~~Multipoint~~

■ ~~Multiple-point-to-point~~ ■ ~~Multipoint-star~~

9.4 Link layer

(network-specific parameter, all options that are used are to be marked "X". Specify the maximum frame length. If a non-standard assignment of class 2 messages is implemented for unbalanced transmission, indicate the Type ID and COT of all messages assigned to class 2.)

~~Frame format FT 1.2, single character 1 and the fixed time out interval are used exclusively in this companion standard.~~

Link transmission

- ~~Balanced transmission~~
- ~~Unbalanced transmission~~

Frame length

- ~~Maximum length L (number of octets)~~

Address field of the link

- ~~not present (balanced transmission only)~~
- ~~One octet~~
- ~~Two octets~~
- ~~Structured~~
- ~~Unstructured~~

AC500 V2.4 IEC60870-5-104 Compatibility List

When using an unbalanced link layer, the following ASDU types are returned in class 2 messages (low priority) with the indicated causes of transmission:

■ ~~The standard assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission
9, 11, 13, 21	<1>

■ ~~A special assignment of ASDUs to class 2 messages is used as follows:~~

Type identification	Cause of transmission

~~Note: (In response to a class 2 poll, a controlled station may respond with class 1 data when there is no class 2 data available).~~

9.5 Application layer

Transmission mode for application data

Mode 1 (Least significant octet first), as defined in 4.10 of IEC 60870-5-4, is used exclusively in this companion standard.

Common address of ASDU
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~ [X] Two octets

Information object address
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~ [ ] Structured
■ ~~Two octets~~ [ ] Unstructured
[X] Three octets

Cause of transmission
(system-specific parameter, all configurations that are used are to be marked "**X**")

■ ~~One octet~~ [X] Two octets (with originator address). Originator address is set to zero if not used

Length of APDU
(system-specific parameter, specify the maximum length of the APDU per system)

The maximum length of APDU for both directions is 253. It is a fixed system parameter.

■ Maximum length of APDU per system in control direction

AC500 V2.4 IEC60870-5-104 Compatibility List

■ Maximum length of APDU per system in monitor direction

Selection of standard ASDUs

Process information in monitor direction
(station-specific parameter, mark each Type ID "**X**" if it is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

AC500 V2.4 IEC60870-5-104 Compatibility List

9.6 Basic application functions

Station initialization
(station-specific parameter, mark "**X**" if function is used)

[X] Remote initialization

Cyclic data transmission
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Cyclic data transmission

Read procedure
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Read procedure

Spontaneous transmission
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions)

[X] Spontaneous transmission

Double transmission of information objects with cause of transmission spontaneous
(station-specific parameter, mark each information type "**X**" where both a Type ID without time and corresponding Type ID with time are issued in response to a single spontaneous change of a monitored object)

The following type identifications may be transmitted in succession caused by a single status change of an information object. The particular information object addresses for which double transmission is enabled are defined in a project-specific list.

- [ ] Single-point information M_SP_NA_1, M_SP_TA_1, M_SP_TB_1 and M_PS_NA_1
- [ ] Double-point information M_DP_NA_1, M_DP_TA_1 and M_DP_TB_1
- [ ] Step position information M_ST_NA_1, M_ST_TA_1 and M_ST_TB_1
- [ ] Bitstring of 32 bit M_BO_NA_1, M_BO_TA_1 and M_BO_TB_1 (if defined for a specific project)
- [ ] Measured value, normalized value M_ME_NA_1, M_ME_TA_1, M_ME_ND_1 and M_ME_TD_1
- [ ] Measured value, scaled value M_ME_NB_1, M_ME_TB_1 and M_ME_TE_1
- [ ] Measured value, short floating point number M_ME_NC_1, M_ME_TC_1 and M_ME_TF_1

AC500 V2.4 IEC60870-5-104 Compatibility List

Station interrogation
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] global
- [ ] group 1
- [ ] group 2
- [ ] group 3
- [ ] group 4
- [ ] group 5
- [ ] group 6
- [ ] group 7
- [ ] group 8
- [ ] group 9
- [ ] group 10
- [ ] group 11
- [ ] group 12
- [ ] group 13
- [ ] group 14
- [ ] group 15
- [ ] group 16

Information object addresses assigned to each group must be shown in a separate table.

Clock synchronization
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Clock synchronization
- [ ] Day of week used
- [ ] RES1, GEN (time tag substituted/ not substituted) used
- [ ] SU-bit (summertime) used

optional, see 7.6

Command transmission
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Direct command transmission
- [X] Direct set point command transmission
- [ ] Select and execute command
- [ ] Select and execute set point command
- [ ] C_SE ACTTERM used

- [ ] No additional definition
- [X] Short-pulse duration (duration determined by a system parameter in the outstation)
- [X] Long-pulse duration (duration determined by a system parameter in the outstation)
- [X] Persistent output

- [ ] Supervision of maximum delay in command direction of commands and set point commands
- [ ] Maximum allowable delay of commands and set point commands

AC500 V2.4 IEC60870-5-104 Compatibility List

Transmission of integrated totals
(station- or object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [ ] Mode A: Local freeze with spontaneous transmission
- [ ] Mode B: Local freeze with counter interrogation
- [ ] Mode C: Freeze and transmit by counter-interrogation commands
- [ ] Mode D: Freeze by counter-interrogation command, frozen values reported

- [X] Counter read
- [X] Counter freeze without reset
- [X] Counter freeze with reset
- [X] Counter reset

- [X] General request
- [X] Request counter group 1
- [X] Request counter group
- [X] Request counter group 3
- [X] Request counter group 4

Parameter loading
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Threshold value
- [ ] Smoothing factor
- [ ] Low limit for transmission of measured values
- [ ] High limit for transmission of measured values

Parameter activation
(object-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [ ] Act/deact of persistent cyclic or periodic transmission of the addressed object

Test procedure
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

- [X] Test procedure

AC500 V2.4 IEC60870-5-104 Compatibility List

File transfer
(station-specific parameter, mark "**X**" if function is used).

File transfer in monitor direction

☐ Transparent file
☐ Transmission of disturbance data of protection equipment
☐ Transmission of sequences of events
☐ Transmission of sequences of recorded analogue values

File transfer in control direction

☐ Transparent file

Background scan
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

☒ Background scan

Acquisition of transmission delay
(station-specific parameter, mark "**X**" if function is only used in the standard direction, "**R**" if only used in the reverse direction, and "**B**" if used in both directions).

■ ~~Acquisition of transmission delay~~

Definition of time outs

Parameter	Default value	Remarks	Selected value
t_0	30 s	Time-out of connection establishment	
t_1	15 s	Time-out of send or test APDUs	
t_2	10 s	Time-out for acknowledges in case of no data messages $t_2 < t_1$	
t_3	20 s	Time-out for sending test frames in case of a long idle state	

Maximum range for timeouts t_0 to t_2: 1 s to 255 s, accuracy 1 s.
Recommended range for timeout t_3: 1 s to 48 h, resolution 1 s.
Long timeouts for t_3 may be needed in special cases where satellite links or dialup connections are used (for instance to establish connection and collect values only once per day or week).

Maximum number of outstanding I format APDUs *k* and latest acknowledge APDUs (*w*)

Parameter	Default value	Remarks	Selected value
k	12 APDUs	Maximum difference receive sequence number to send state variable	
w	8 APDUs	Latest acknowledge after receiving *w* I format APDUs	

Maximum range of values *k*: 1 to 32767 (2^{15}–1) APDUs, accuracy 1 APDU

AC500 V2.4 IEC60870-5-104 Compatibility List

Maximum range of values *w*: 1 to 32767 APDUs, accuracy 1 APDU (Recommendation: *w* should not exceed two-thirds of *k*).

Portnumber

Parameter	Value	Remarks
Portnumber	2404	In all cases

Redundant connections

2 Number N of redundancy group connections used

RFC 2200 suite

RFC 2200 is an official Internet Standard which describes the state of standardization of protocols used in the Internet as determined by the Internet Architecture Board (IAB). It offers a broad spectrum of actual standards used in the Internet. The suitable selection of documents from RFC 2200 defined in this standard for given projects has to be chosen by the user of this standard.

☐ Ethernet 802.3

☐ Serial X.21 interface

☐ Other selection from RFC 2200:

1.6.6.3.2 IEC 61850 Server

IEC 61850 Server

The package CODESYS IEC 61850 Server is a configurator for creating an IEC 61850 Server according to IEC 61850. The IEC 61850 is the communication standard for switchgear automation of medium and high voltage technology.

The essential features of this package are::

- Configuration of data models for IEDs (Intelligent Electronic Device) with logical devices, logical nodes, data objects and data attributes
- Generation of the corresponding IEC 61131-3 code
- Mapping of data attributes to IEC 61131-3 variables
- Configuration of dynamic data sets
- Buffered and unbuffered Reports
- Protocols implemented: MMS and GOOSE
- Import /Export of different SCL formats

Inserting the IEC 61850 Server into the device tree

The IEC 61850 Server is inserted below an Ethernet Adapter in the device tree. For this select the Ethernet Adapter in the device tree and activate the context menu command *“Add device...”*. In the opened dialog select the IEC 61850 Server in the *“Miscellaneous ”* category and activate the *“Add device ”* button .

The configuration of the IEC 61850 Server takes place in the *Chapter 1.6.6.3.2.3.1 “IEC 61850 Editor” on page 3885*.

Quickstart

Here, a project with an IEC 61850 Server is created as an example. After the configuration of the Server, a data set is created and assigned to a Report. Subsequently the code is generated for the IEC 61850 Server and the project is loaded to the PLC. On the PLC the project can be connected with an d IEC 61850 client.

Step 1: Create a new project and insert the IEC 61850 Server

First create a new project. Select the *“Standard project ”* template.

Subsequently the dialog opens for selecting the PLC and the implementation language. Select the CODESYS Control Win V3 PLC and the *“Structured Text (ST)”* implementation language.

Now the project is created displayed with its objects in the device tree.

In order to add the IEC 61850 Server to the PLC, first add an Ethernet Adapter:

1. Mark the PLC in the device tree and activate the context menu command *“Add Device...”*
2. In the *“Add Device”* dialog select the adapter *“Ethernet ”* of the *“Fieldbusses ➔ Ethernet Adapter”* category and confirm your selection by activating the *“Add Device ”* button.

Subsequently, add the IEC 61850 Server to the Ethernet Adapter as follows:

1. Select the Ethernet Adapter in the device tree and activate the context menu command *“Add Device...”*.
2. In the *“Add Device”* dialog select the *“IEC 61850 Server”* of the *“Miscellaneous ”* category and confirm your selection with the *“Add Device ”* button.

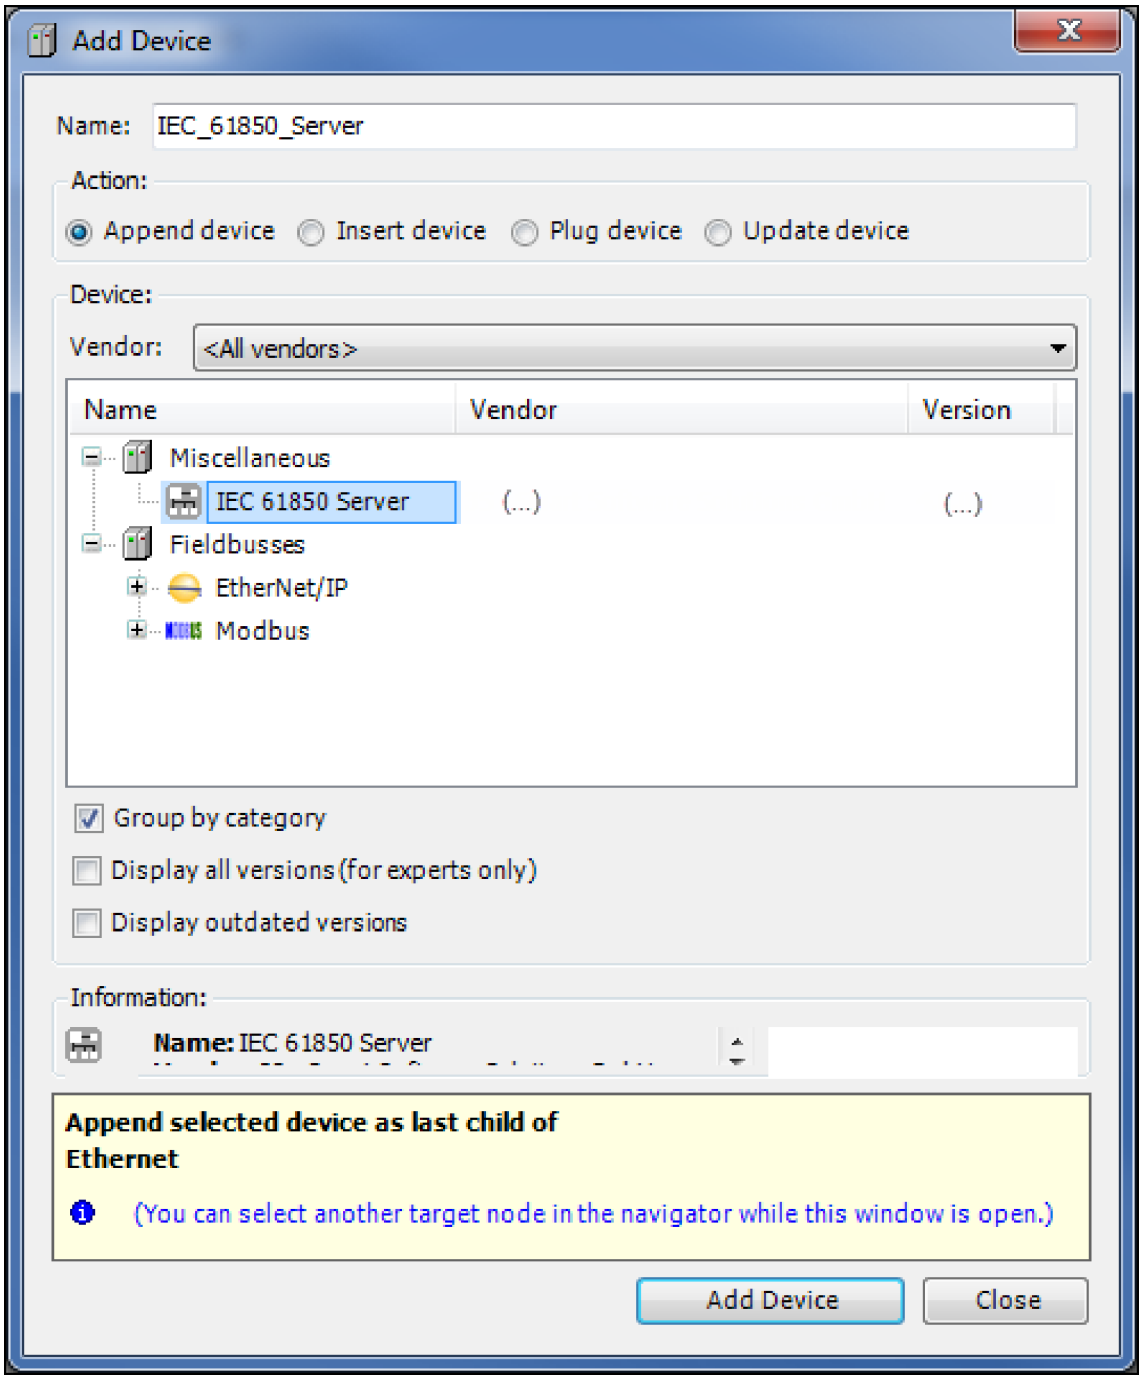

Fig. 311: 'Add Device' dialog

Now the IEC 61850 Server is inserted in the device tree.

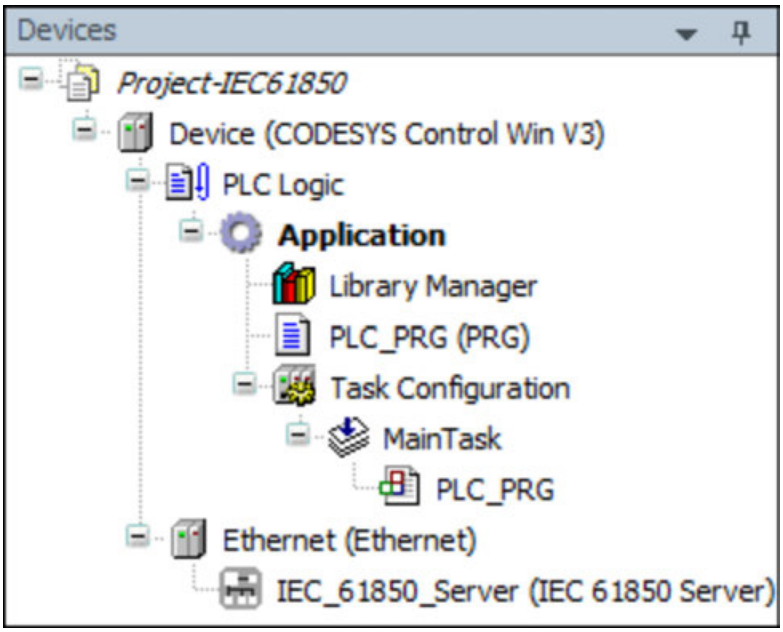

Fig. 312: Device tree with IEC 61850 Server

Step 2: Add the Logical Device to the server

Open the editor for the configuration of the server via a double-click on the IEC 61850 Server in the device tree.

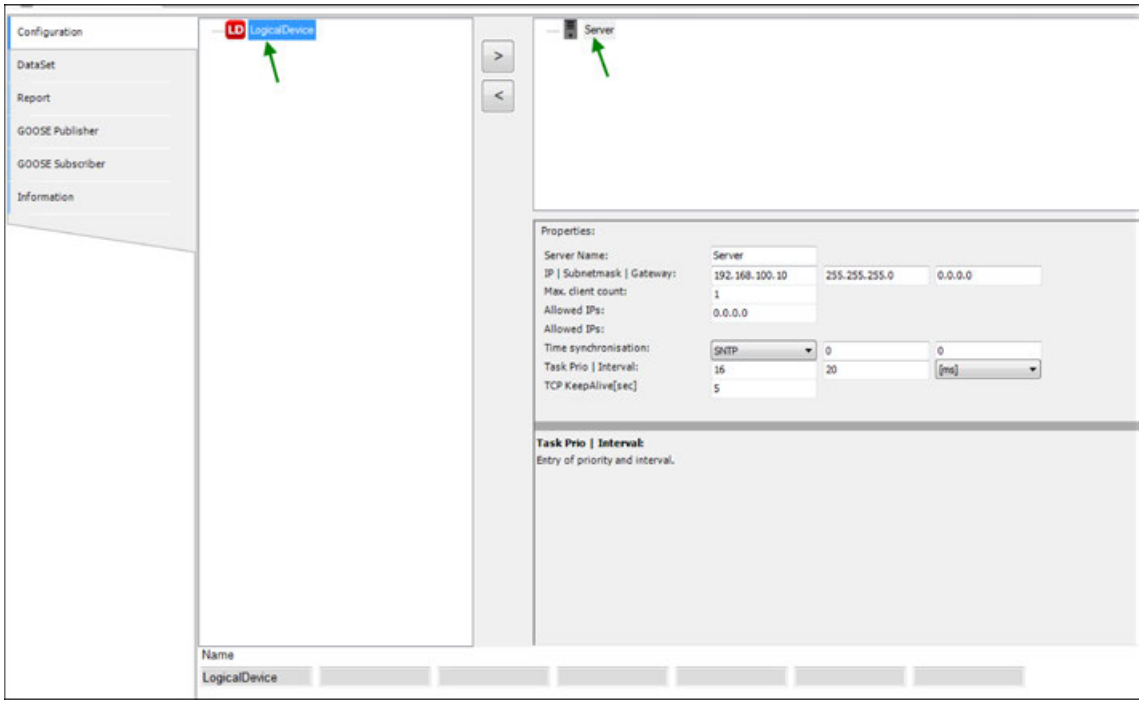

Fig. 313: editor of the IEC 61850 Server

First a *"Logical Device"* is added to the server. The *"Logical Device "* is the instance of an IED.

1. Select the *"Logical Device"*
2. Activate the *">"* button

Together with the *"Logical Device"* the two LNC instances () *"LLN0"* and *"LPHD1"* are added. These two information objects are elements of every IED and can not be removed.

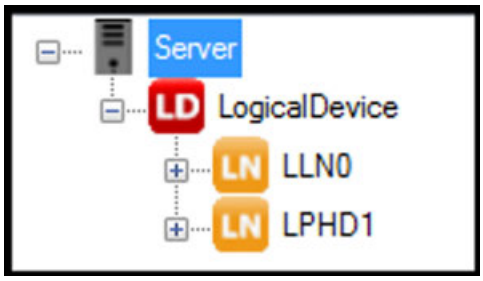

Fig. 314: Server with Logical Device, LLN0 and LPHD1

Step 3: Add another LNC instance to the Logical Device

1. Select the *"Logical Device"* below the server
2. On the left-hand side select the *"XCBR"* LNC instance below *"LN [Xxxx]-Switchgear"*
3. Activate the *">"* button

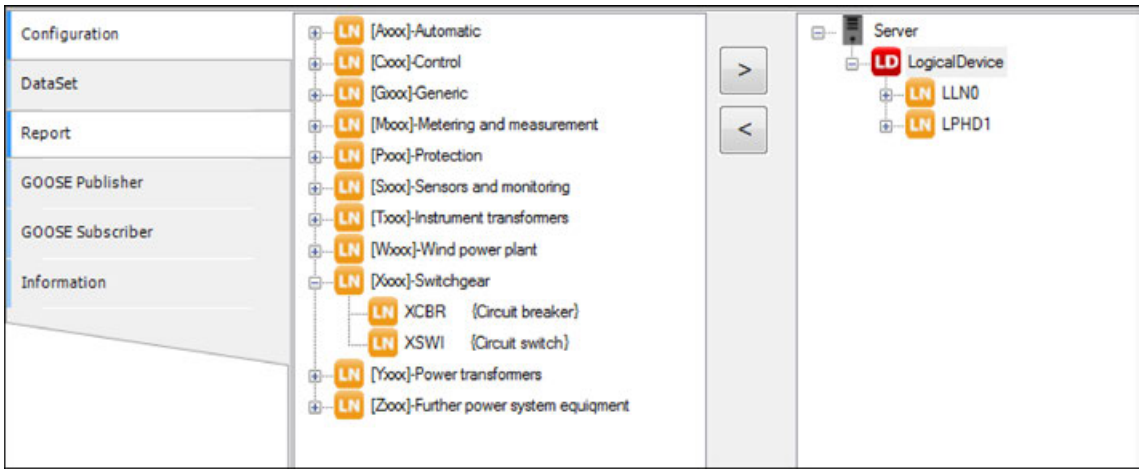

Fig. 315: Adding the LNC instance 'XCBR'

Step 4: Expand the *"XCBR"* LNC instance with the optional *"MaxOpCap"* CDC instance

If you select the LNC instance on the right-hand side, all of the optional and obligatory CDCs (data objects DC) will be displayed on the left-hand side. .

1. Select the *"XCBR"* LNC instance on the right-hand side
2. Select the *"MaxOpCap"* CDC instance on the left-hand side
3. Activate the *">"* button

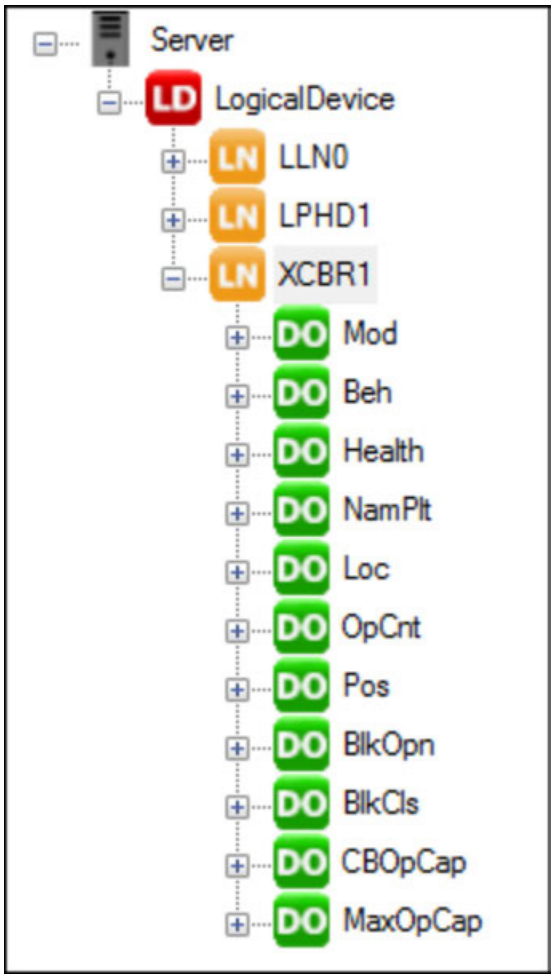

Fig. 316: XCBR1 with 'MaxOpCap' CDC

Step 5: Link an attribute (DA) of the IEC 61850 Server with a CODESYS variable

1. Select the desired attribute (in the example: *"Server ➔ LogicalDevice ➔ XCBR1 ➔ MaxOpCap ➔ DA (ST I INT32) StVal "*)
2. Edit the CODESYS variable name in the input field *"Monitoring Var"* (in the example Var_stVal) in the *"Properties"* section

The *"Autom. declare"* option must be activated, thus the variable is declared automatically as global variable by theIEC 61850 Server. You can edit the initial value in the input field next to the *"Monitoring Var"* field.

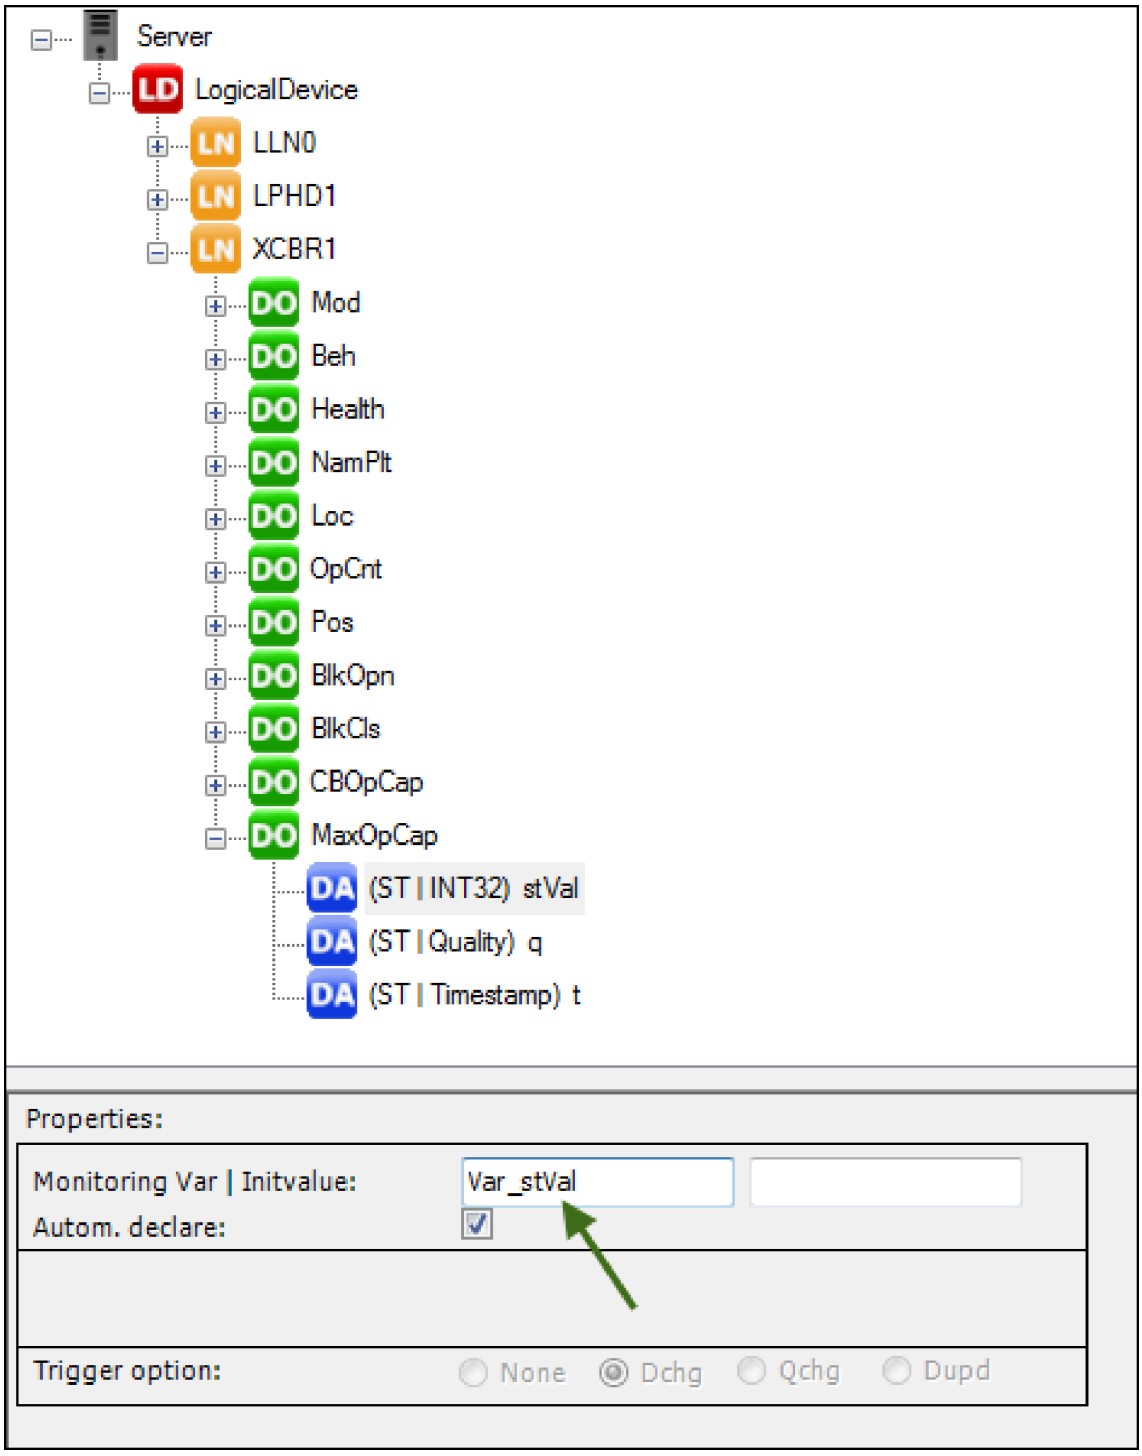

Fig. 317: Link of the attribute 'stVal' to the monitoring variable 'Var_stVal'

Step 6: Create a data set

In this step you create a data set (Compilation of data) for the IEC 61850 configuration created in the previous steps.

1. Open the *"DataSet"* tab
2. Activate the *"New"* button. The created *"LLN0.dataSet_0"* data set is displayed in the *"DataSets"* section.
3. Select the *"LLN0.dataSet_0"* DataSet
4. Select the *"MaxOpCap"* data object on the left-hand side (*"Server ➔ LogicalDevice ➔ LN XCBR1 ➔ FC ST ➔ DO MaxOpCap"*)
5. Activate the *">"* button.

Now the data set contains the data object *“LogicalDevice/XCBR1.ST.MaxOpCap”*

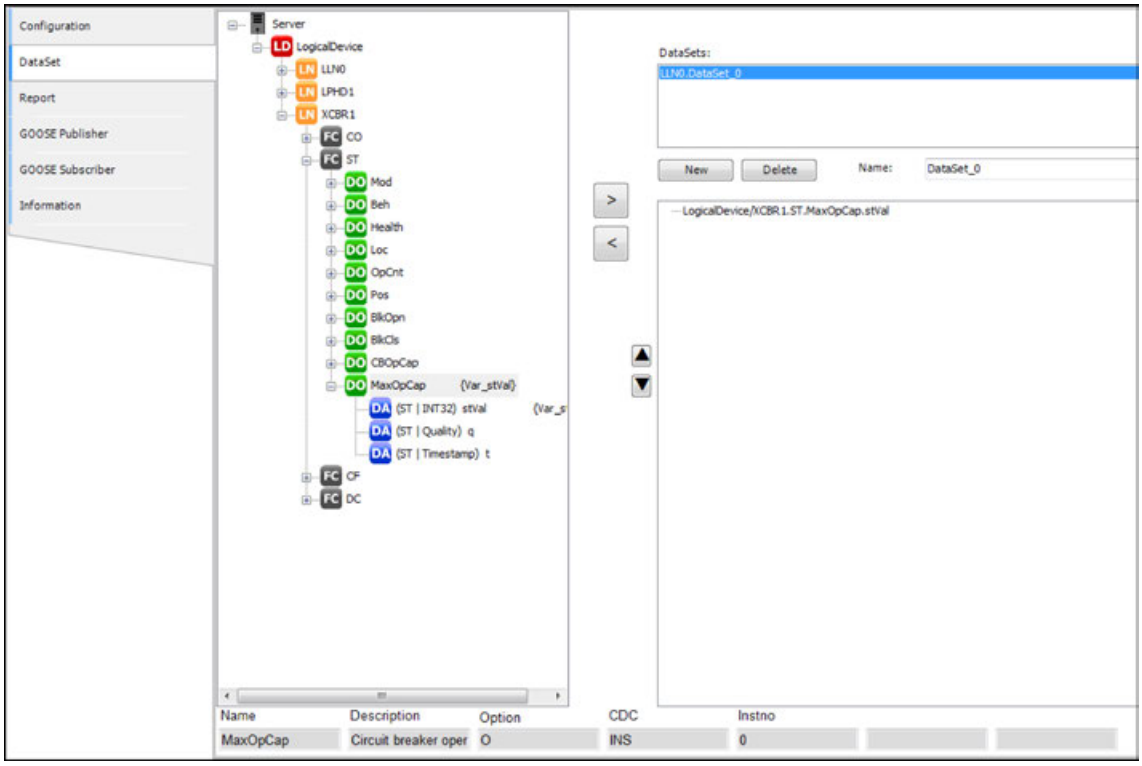

Fig. 318: 'DataSet' tab

Step 7: Create a Report

In this step you assign a report to the defined data set. A report transports the data assigned via a data set to a connected client in the event of a trigger (see *Trigger Options*).

1. Open the *“Report”* tab
2. Activate the *“New ”* button. The *“RCB_1”* is displayed in the *“Reports”* section. In the *“Name:”* field you can change the name of the report.
3. Select the *“LLN0.DataSet_0”* data set in the *“DataSet”* selection list

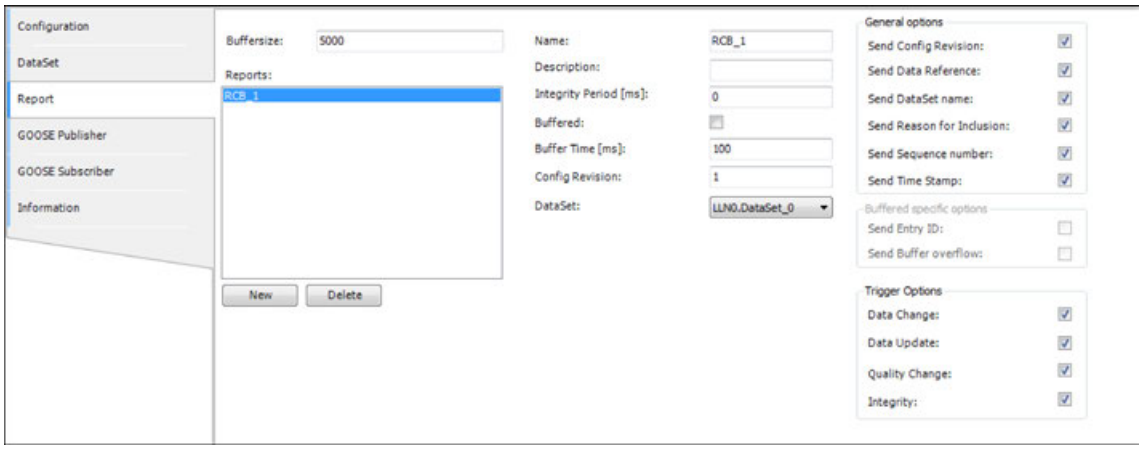

Fig. 319: 'Report' tab with created 'RCB' report

You set options about the reporting behavior in the *“General options”* section, you select the events that trigger a report in the *“Trigger Options”* section (for more information about these options see *Trigger Options*).

Step 8: Generate code and load the application to the PLC

The *"Generate code"* command of the menu *"IEC61850"* generates code from the created configuration and puts it into the *"IEC61850 Generated POUs"* folder of the device tree.

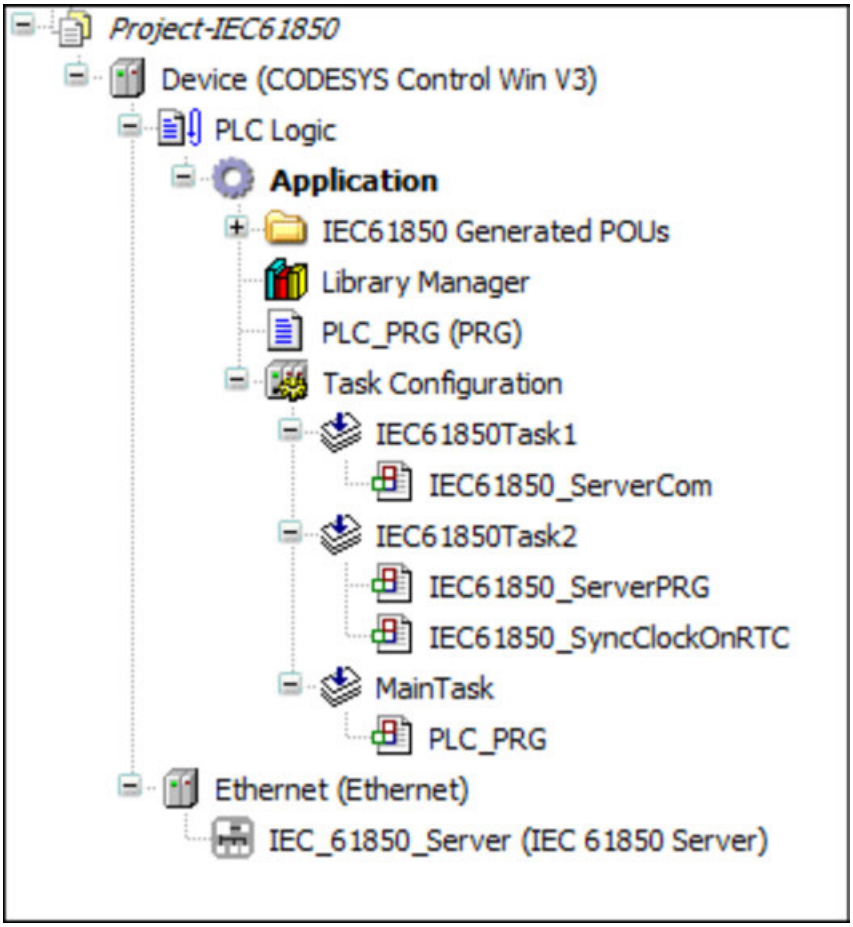

Fig. 320: device tree with 'IEC61850 Generated POUs'

The global variable *"Var_stVal"* created in step 5 is listed in the *"IEC61850_Generated_GVL"* global variables list.

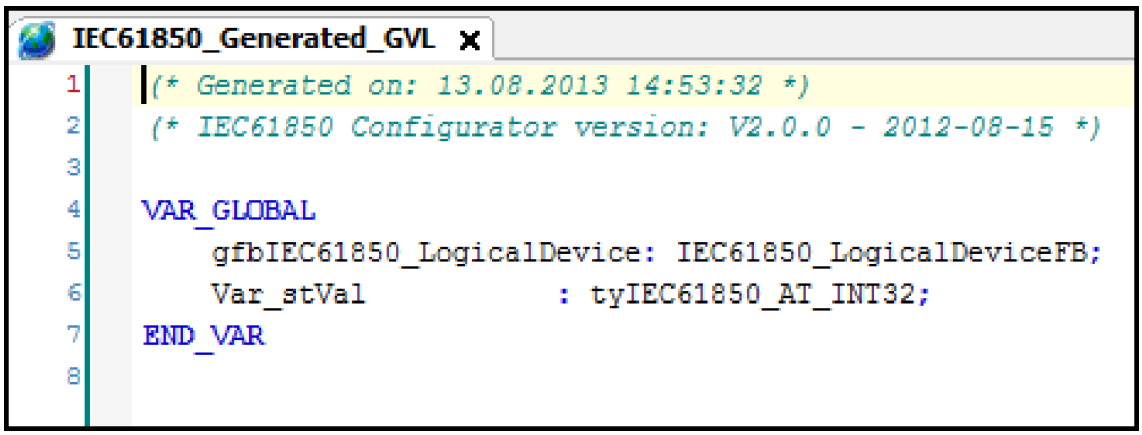

Fig. 321: IEC61850_Generated_GVL with 'Var_stVal'

Subsequent compile the application via the *"Build ➔ Build"* command.

Step 9: Connecting with an IEC 61850 Client

If the application was finished successfully you create a connection to an IEC 61850 client in this step. For this, login to the PLC and start the application via the *"Start"* command of the *"Debug"* menu. Now you connect an IEC 61850 client with the IEC 61850 Server. By the client you can read out your IEC 61850 Server configuration and the configured data sets und reports, as well as you can receive GOOSE messages and send GOOSE messages to the server.

Editor of the IEC 61850 Server

IEC 61850 Editor

You open the editor of the IEC 61850 Server with the *“Edit Object ”* command of the *“File ”* category or with a double-click on the device in the device tree.

> *If you move the mouse pointer over buttons, options or names of input fields in this editor more information about the element is displayed by the tooltip.*

The tabs of the editor::

- *Chapter 1.6.6.3.2.3.2.1 “Configuration” on page 3885*
- *Chapter 1.6.6.3.2.3.3 “DataSet” on page 3895*
- *Chapter 1.6.6.3.2.3.4 “Report” on page 3896*
- *Chapter 1.6.6.3.2.3.5 “GOOSE Publisher” on page 3898*
- *Chapter 1.6.6.3.2.3.6 “GOOSE Subscriber” on page 3900*
- *Chapter 1.6.6.3.2.3.7 “Information” on page 3902*

Configuration

Configuration

In the *“Configuration”* tab of the IEC 61850 editor you create, configure an parametrize the IED from the pool of the existing LNC and CDC types.

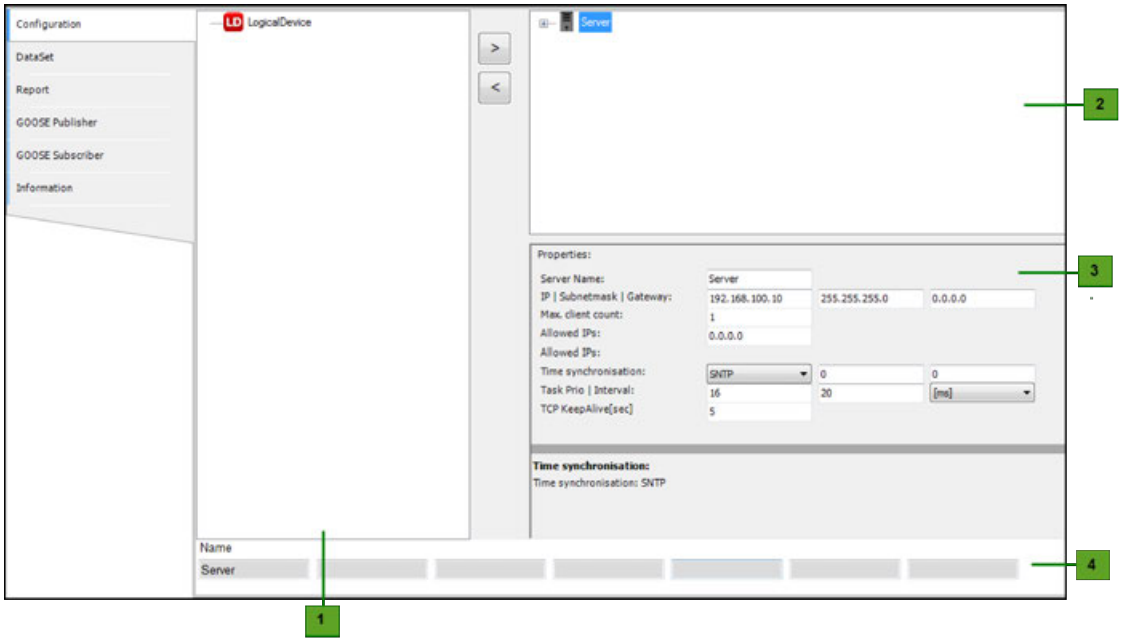

Fig. 322: 'Configuration' tab

“Configuration” is split in 4 sections:

- Section 1 and section 2 are for creating the IEC 61850 Server. In section 1 all of the choices are displayed, which can be added to the instance currently focused or to the object of the sever currently focused in section 2. In the default setting there is the Logical Device (LD) in section 1 and the server ( ) in section 2. For more information see *Chapter 1.6.6.3.2.3.2.2 "Creation of the IEC 61850 Server" on page 3886*
- In the *"Properties"* section 3 the following activities can be performed, depending on the selected objects:
  - *"Parameterization of the IEC 61850 Server" on page 3889*
  - *"Entry of a device name for the Logical Device" on page 3890*
  - *"Connecting an attribute (DA) with a CODESYS variable" on page 3890*
  - *"Entry of a node prefix for LNC instances" on page 3893*
- 4 is the status bar. For a more information see *Chapter 1.6.6.3.2.3.2.4 "Status bar" on page 3893*.

Creation of the IEC 61850 Server

Adding instances

You add an element to the server or to the marked instance below the server by selecting the element in section 1 and activating the *">"* button or by a double-click on the element

Removing instances

To delete instances below the server, mark the instance an activate the*"<"* button..

Configure the server

If you create a new configuration, the default settings in the *Chapter 1.6.6.3.2.3.2.1 "Configuration" on page 3885* tab are: the Logical Device in section 1 and the server in , section 2 .

First the *"Logical Device"* (LD) is added to the server. The Logical Device is an instance of an IED (intelligent field device). Together with the Logical Device the objects having the option 'mandatory' are added automatically. These objects added automatically can not be removed from the Logical Device.

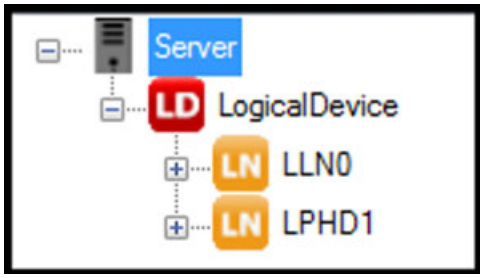

Fig. 323: Server with Logical Device an d objects 'LLN0' und ' LPHD'

Any number of logical nodes (LN) can be added to the Logical Device.

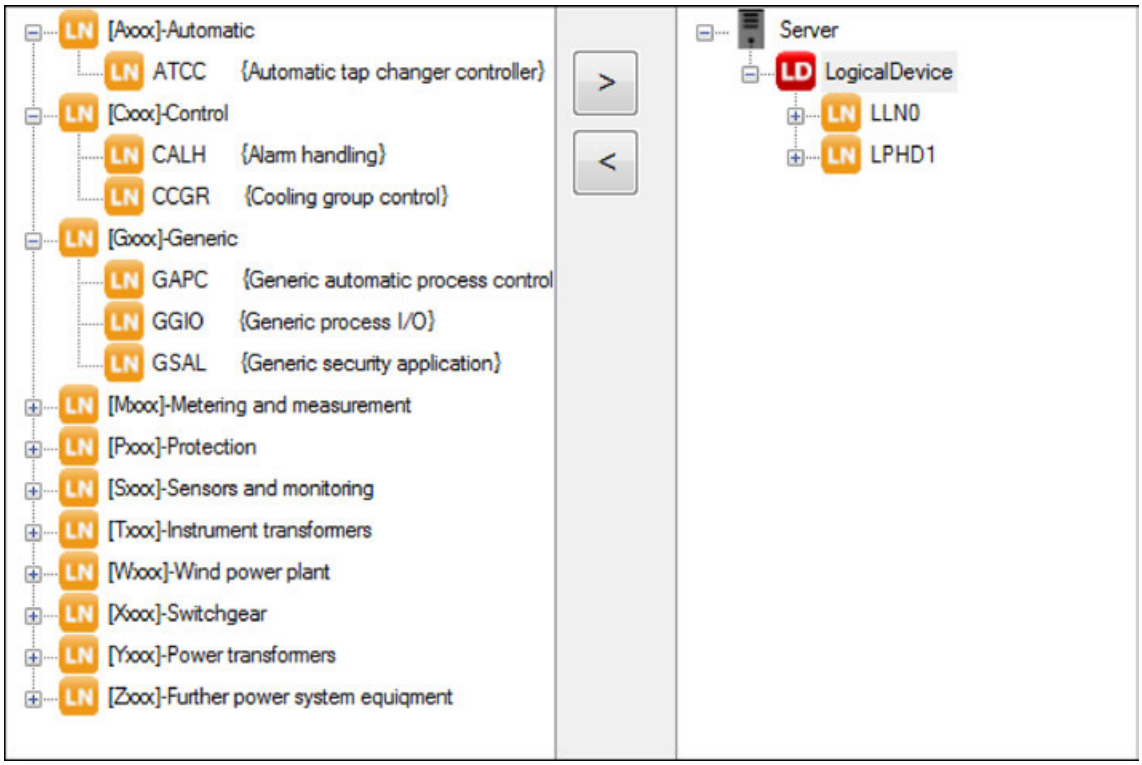

Fig. 324: 'Configuration': List of the available LACS

If you mark a LNC instance in section 2 all mandatory and all optional CDC types (data object DO) will be listed in section 1. The mandatory CDC types (Mod, Beh, Health, NamPlt, in the example) are already contained in the LNC instance (LN GGIO1) and can not be removed.

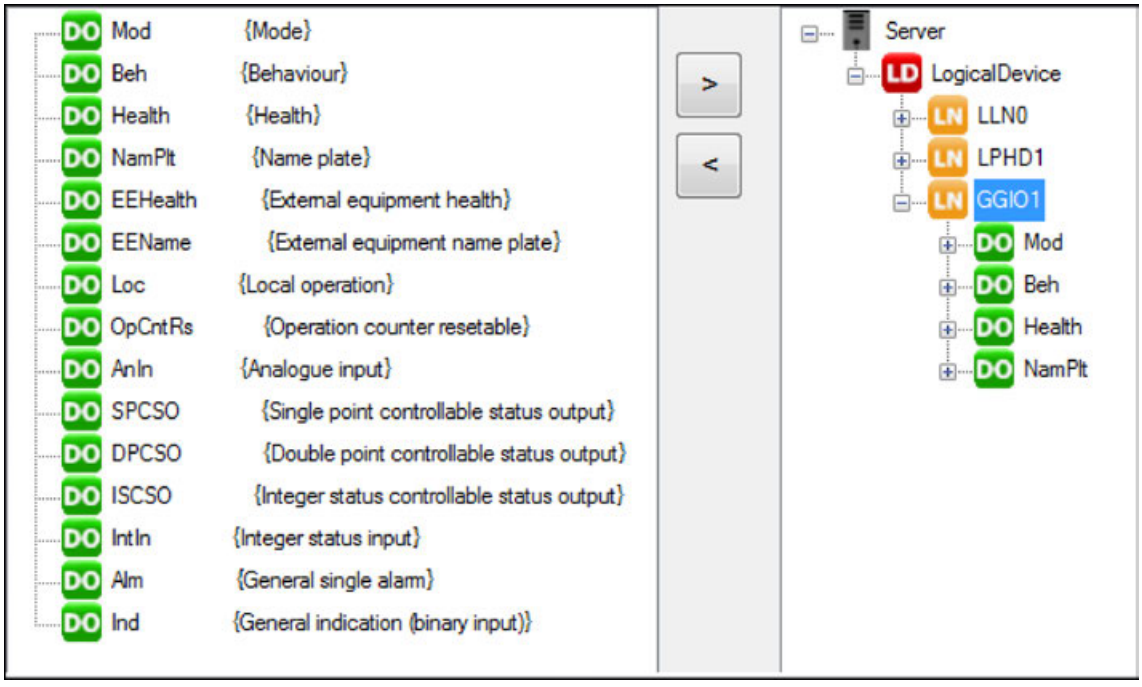

Fig. 325: 'Configuration' list of the CDCs (DO) available for the GGIO1

The DOs include the attributes (DAs)

Fig. 326: 'Configuration': list of attributes (DA) of the added to the CDC 'DO AnIn'

The attributes of the server can be connected with CODESYS variables (see *"Connecting an attribute (DA) with a CODESYS variable" on page 3890*).

Properties

3: In the *"Properties "* section of the *Chapter 1.6.6.3.2.3.2.1 "Configuration" on page 3885* tab the following functions can be performed dependent on the marked object or the marked instance:

- *"Parameterization of the IEC 61850 Server" on page 3889*
- *"Entry of a device name for the Logical Device" on page 3890*
- *"Connecting an attribute (DA) with a CODESYS variable" on page 3890*
- *"Entry of a node prefix for LNC instances" on page 3893*

> *If you move the mouse pointer over an input field or the name of an input field, you get a tooltip with a description in the window below the "Properties " (see the following figure).*

Parameterization of the IEC 61850 Server

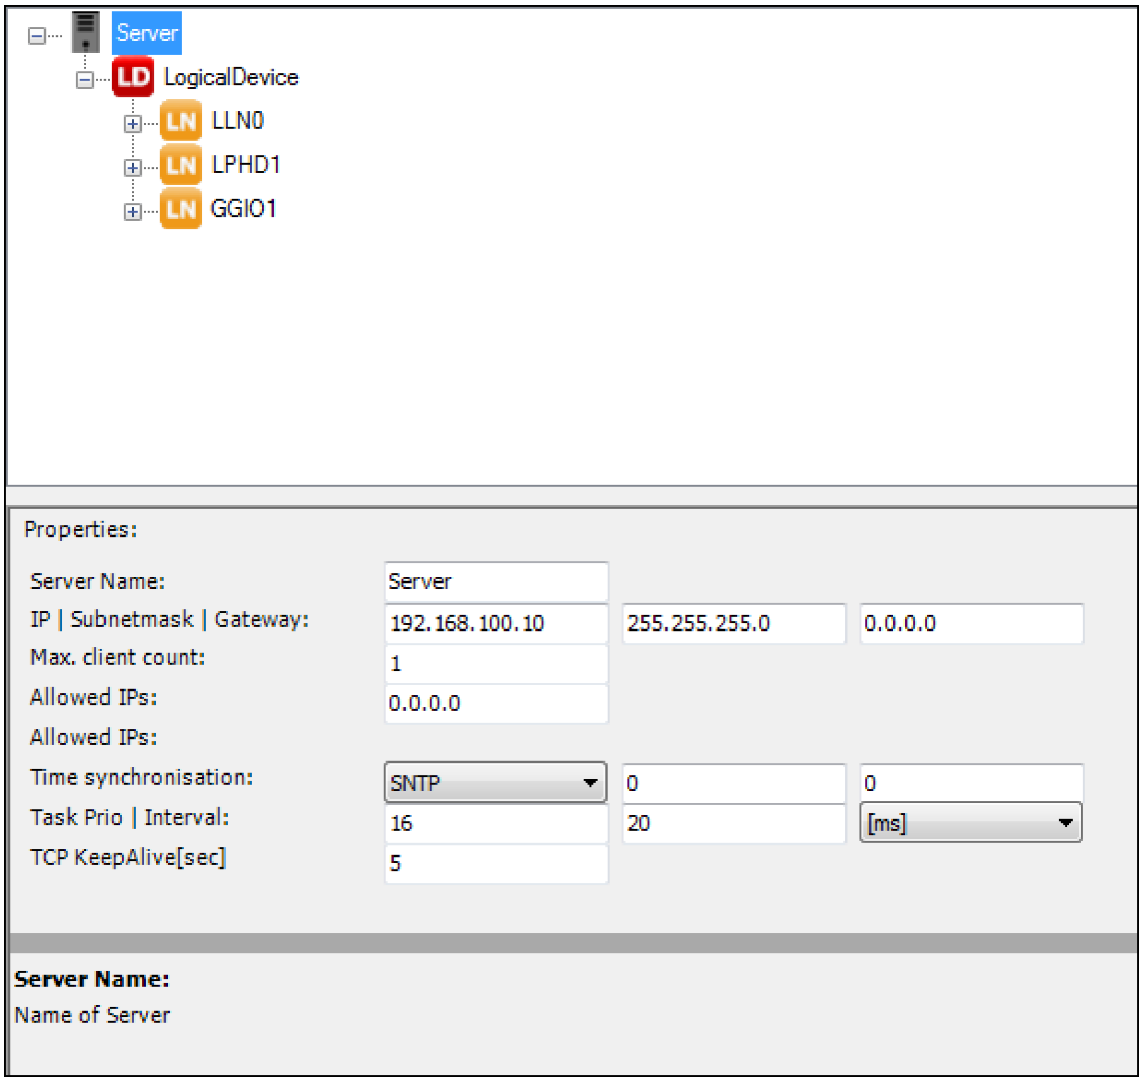

Fig. 327: 'Properties' with tooltip of 'Max. client count'

Property	Description
Server Name	Name of the server,
IP I Subnetmask I Gateway	Own IED IP address, I Subnetmask I own gateway address
Max.client count	The maximum number of clients that can connect to the IED, possible values: 1, 2, 3, 4, 5
Allowed IPs	Allowed IPs for clients 1...5 default is 0.0.0.0, whereby an IP address that equals 0.0.0.0 means that no IP address validity test will take place. If more than one client connection was selected above, additional IPs must be configured for each one. As soon as an IP address is parameterized with 0.0.0.0, testing for all connected clients is deactivated.

Property	Description
Time synchronisation	Selection: SNTP SNTP (default): SNTP time synchronization. In addition to activation, functionality must be parameterized in the device's web-based management. Currently, the SNTP time telegram does not use milliseconds, which means accuracy is measured in 1 second increments. 1. Input field **Time zone**: Offset between Greenwich (GMT)- and the local time (for Germany 1 h, for example). The value is limited between -12 an d+ 14 2. Input field: **DLS Mode**: Ratio for the mode summer/winter time changeover. Possible values: ● 0 = No automatic summertime/wintertime changeover ● 1 = Timeover from wintertime to summertime on last the Sunday in March, changeover from summertime to wintertime on the last Sunday in October
Task Prio I Interval	Task 1.input field: entry of the priority, 2.input field: entry of the interval in ms
TCP KeepAlive[sec]	The KeepAlive is to check the connection to the client.

Entry of a device name for the Logical Device

If the Logical Device LD is focused in the configured server you can entry a device name for the Logical Device in the 'Properties' section.

Connecting an attribute (DA) with a CODESYS variable

1. Select the attribute of a CDC instance below the server.
2. Enter the desired CODESYS variable name into the input field *“Monitoring Var”* in the properties section.

   Entry optionally an initial value into the input field right-side hand of the variable name.

In case of an attribute with RW-access, a *“Control Variable”* (writing access) can be entered in addition to the *“Monitoring Var”* variable (reading access) . For a more detailed description about reading and writing of variables at the IEC 61850 Server see *Chapter 1.6.6.3.2.4 “Reading and Writing from CODESYS Variables ” on page 3902*. The monitoring and control variables declared in the *“Properties”* section are displayed next to the respective attribute and at the superordinated node *“DO”* of the server tree.

By activating the *“Autom. declare ”* checkbox the variable is declared by the IEC 61850 configurator and stored in the *“IEC61850_Generated_GVL”* (of the *“IEC61850 Generated POUs”* folder) after *Chapter 1.6.6.3.2.5.1.1 “Generate code” on page 3903* of the IEC 61850 Server.

If you do not activate the “Autom. declare” checkbox you select the variable via the input assistance ([F2])) or you declare the variable yourself.

“Trigger option:” With the trigger options you set the attributes to select the events which might trigger a report. The selected trigger option is displayed in the status bar. For a description of the options see *status bar*.

The trigger option determines whether the ↳ Chapter 1.6.6.3.2.3.4 “Report” on page 3896, assigned to the ↳ Chapter 1.6.6.3.2.3.3 “DataSet” on page 3895, is sent when the value of this attribute changes.

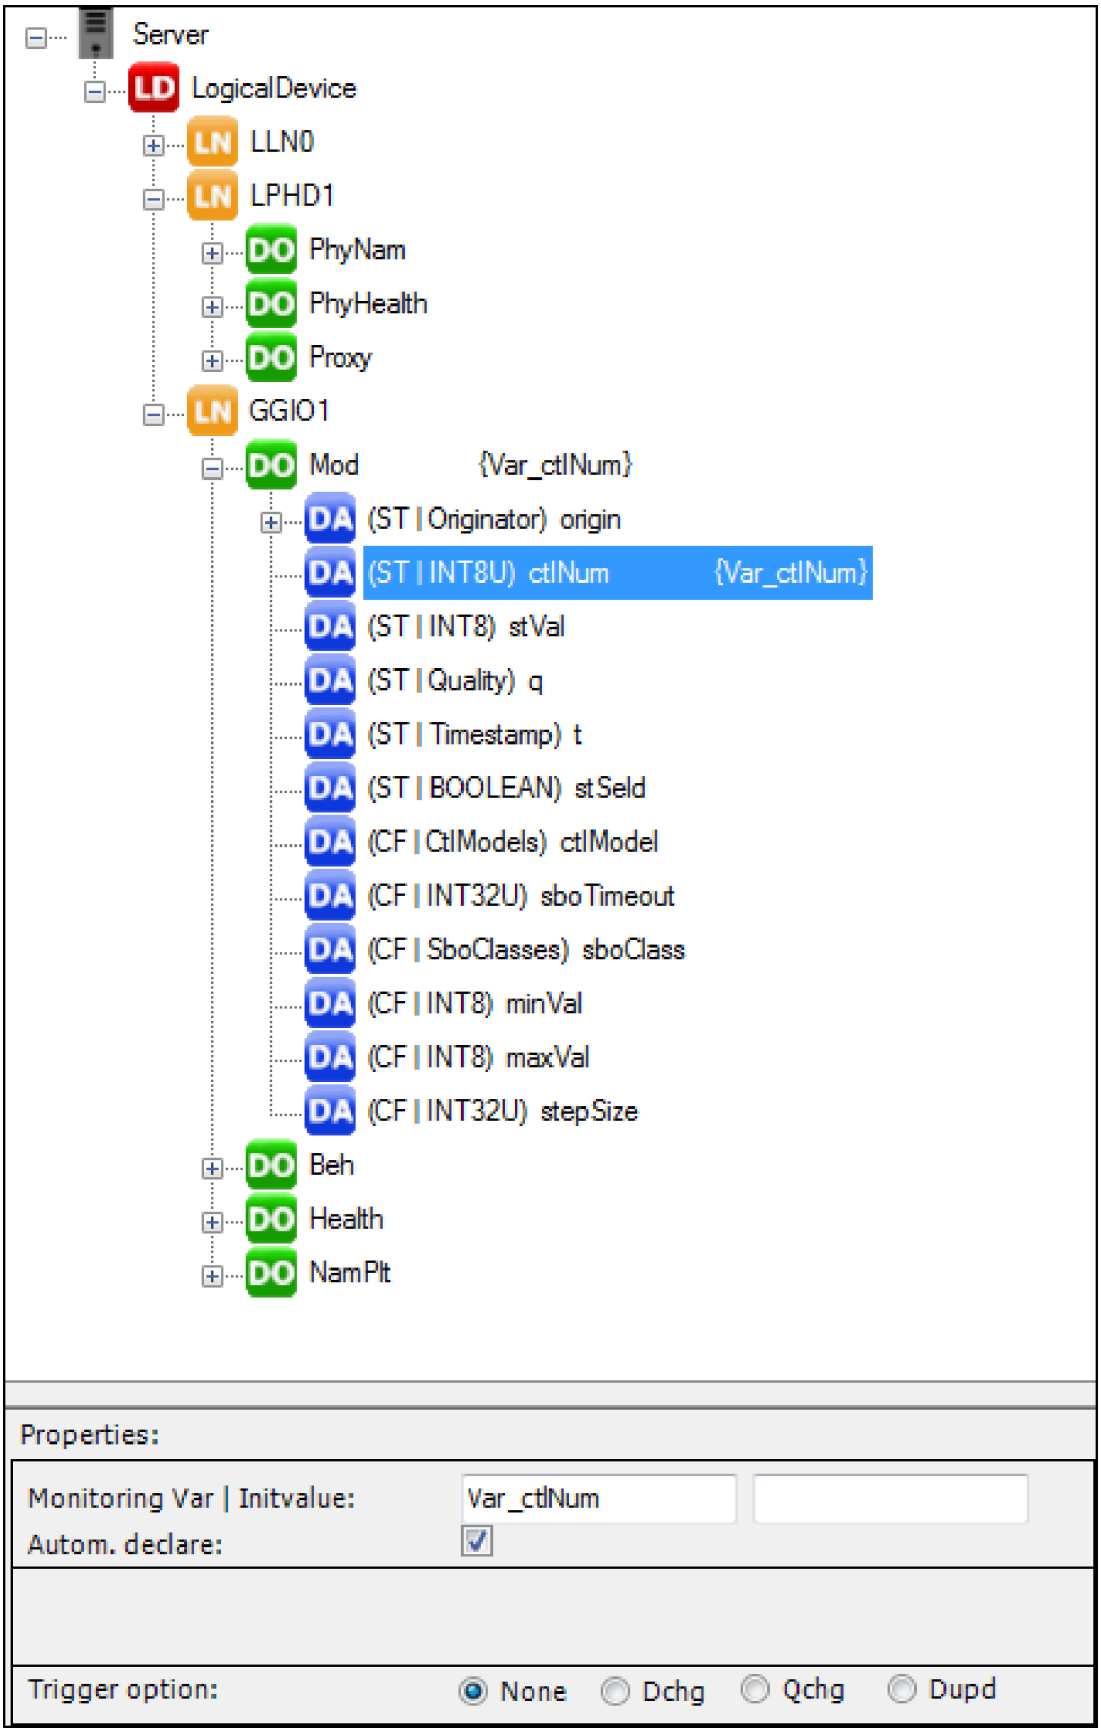

Fig. 328: 'Properties' for the attribute(DA) 'ctlNum', input fields: 'Monitoring Var' with 'Initvalue'

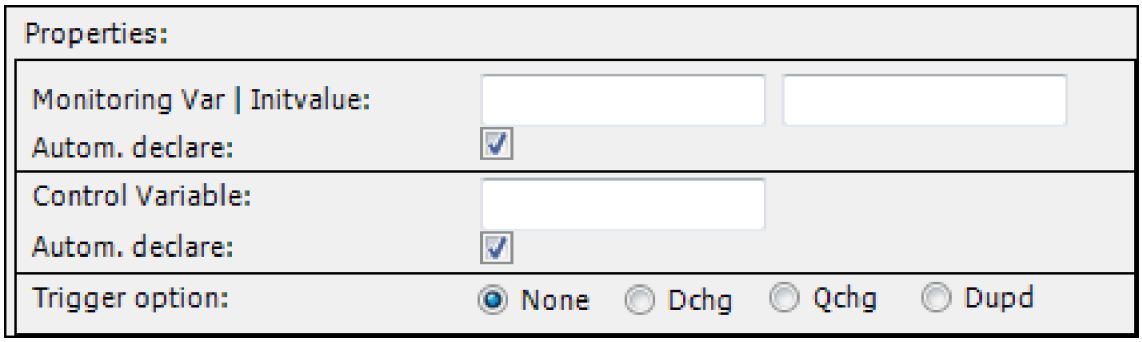

Fig. 329: 'Properties' of an attribute with RW-access: in addition input : 'Control Variable'

Entry of a node prefix for LNC instances

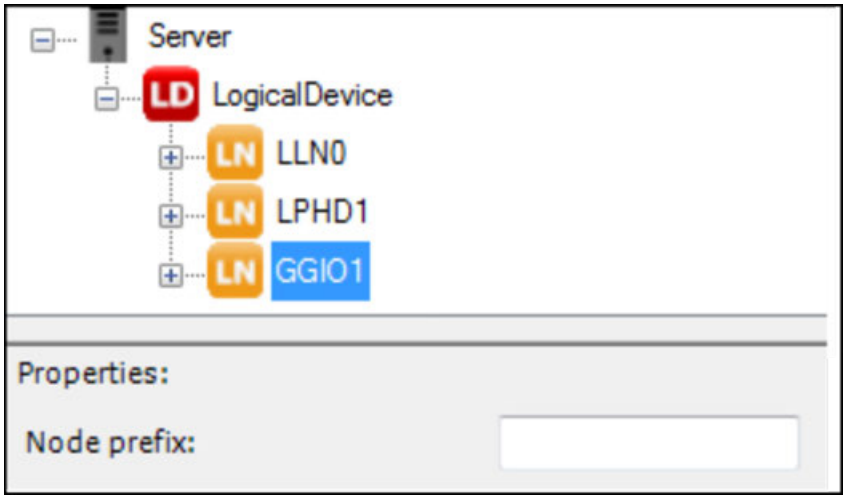

Fig. 330: 'Properties' of the LNC instance 'GGIO1' with 'Node prefix' input field

Here you enter a prefix for the selected LNC instance. The prefix is put in front of the LN name in the server tree. The prefix is displayed in the ↳ *Chapter 1.6.6.3.2.3.2.4 “Status bar” on page 3893*, too.

Status bar

In the status bar (4 of the ↳ *Further information on page 3885*) of the IEC 61850 editor you find object-specific detail information about the selected object.

Object information: Server and Logical Device

Fig. 331: Status bar for the Server

Only the information *“Name”* is displayed for the server and the Logical Device.

Object information: LN

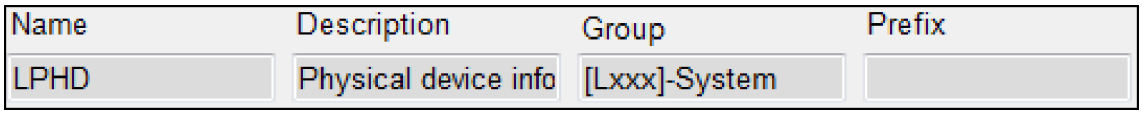

Fig. 332: Status bar for the LN instance 'LPHD'

Status	Description
"Name"	Name of the selected LN instance
"Description"	Description of the selected LN instance
"Group"	Associated group of the LN instance Examples: [Axxx]-Automatic [Cxxx]-Control [Gxxxx]-Generic ...
"Prefix"	Prefix of the LNC instance, entered by the user

Object information: Common Data Class Object (CDC Object)

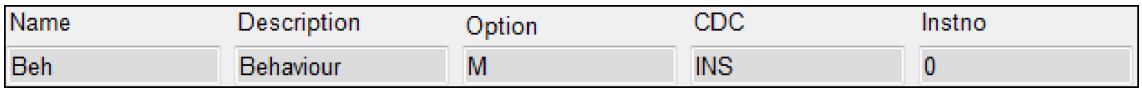

Fig. 333: Status bar of the CDC instance 'Beh'

Status	Description
"Name"	Name of the attribute
"Description"	Description of the selected CDC instance
"Option"	Option of the selected CDC- instance M = mandatory O = optional
"CDC"	Type of the selected CDC instance
"Instno"	Instance number of the CDC instance. Only optional CDCs can have instance numbers. If there is only one optional CDC, it has no instance number. Otherwise 1 to n.

Objects with the 'mandatory' options are inserted automatically when adding the Logical Device.

Object information: Attribute (DA)

Fig. 334: Status bar of the attribute 'q'

Status	Description
"Name"	Name of the attribute
"FC"	Functional Constraint of the selected attribute
"Option"	Option of the selcted attribute: M = mandatory O = optional

Status	Description
"Type"	Data type of the attribute
"Trigger Option"	Trigger option of the attribute dchg = data change dupd = data update qchg = quality change <empty> = no trigger option
"Value"	Associated variable
"Writeable"	Access for the attribute R = Read W = Write RW = Read and Write

DataSet

In this tab of the IEC 61850 editor you create and delete data sets, you assign attributes (DA) and data objects (DO) to a data set and you delete existing assignments.

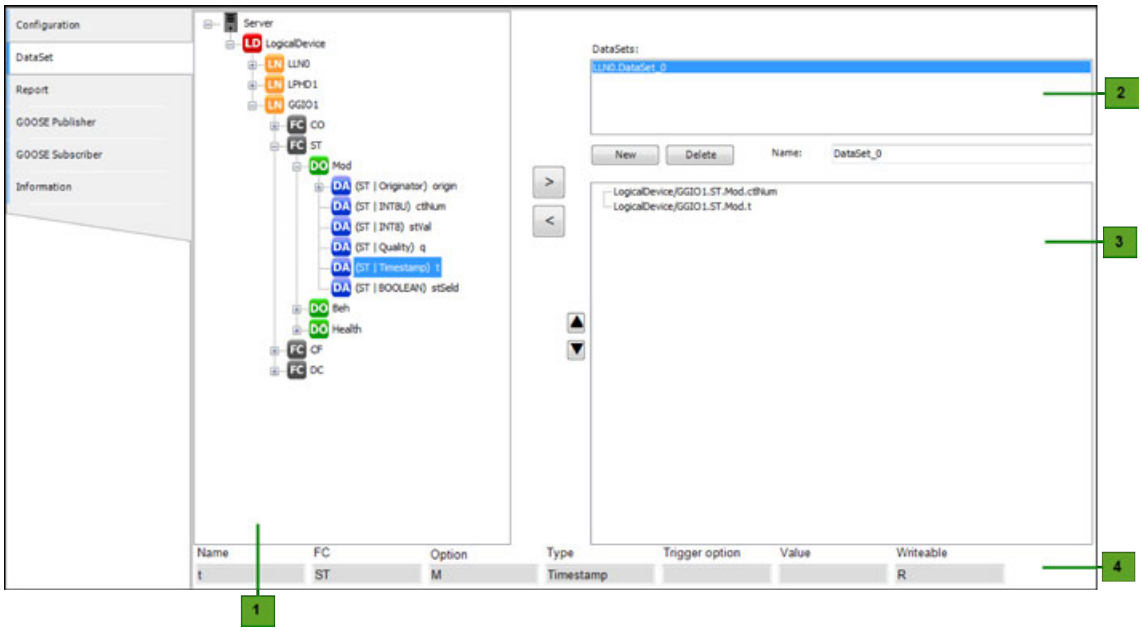

Fig. 335: 'DataSet' tab with 'LLN0.DataSet_0' data set and DAs 't' and 'ctlNum'

Structure of the tab

Section 1 displays the IEC 61850 Server created in the ↳ *Chapter 1.6.6.3.2.3.2.1 "Configuration" on page 3885* tab.

The sections 2 and 3 are for creating, editing and deleting of data sets. In section 2 the data sets are listed. In section 3 the attributes and data objects of the data set are listed, which is marked in section 2.

For more information about section 4 see ↳ *Chapter 1.6.6.3.2.3.2.4 "Status bar" on page 3893*.

> **NOTICE!**
> The order of the attributes of a data set is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication. For more information about GOOSE communication see *Chapter 1.6.6.3.2.3.5 "GOOSE Publisher" on page 3898* and *Chapter 1.6.6.3.2.3.6 "GOOSE Subscriber" on page 3900*.

Buttons:

- *"New"*: Create a new data set. This is displayed in the *"DataSets"* section and is named *"LLN0.DataSet_Suffix"*. The suffix is incremented beginning with 0 (1. DataSet: LLN0.DataSet_0 ...)
- *"Delete"*: Delete a data set: Select the desired data set in the *"DataSets"* section and activate the *"Delete"*.button.
- *">"*: Assign an attribute or a data object to the selected data set. First select the data set in section 2 then select the attribute or the data object in section 1 and activate the *">"* button.
- *"<"*: Deletes an element from a data set. First select the data set in section 2 then select the attribute or the data object in section 1 and activate the *"<"* button.
- ▼: Moves the selected entry one row up
- ▲: Moves the selected entry one row down.

Input fields

- *"Name: "* Name of the data set can be edited. The name gets the prefix *"LLN0."*.

Report

In this tab of the IEC 61850 editor you create and parameterize buffered und unbuffered reports. A report transports the data, that are assigned to it, to the connected client in the event of a trigger. Each report a data set must be assigned to.

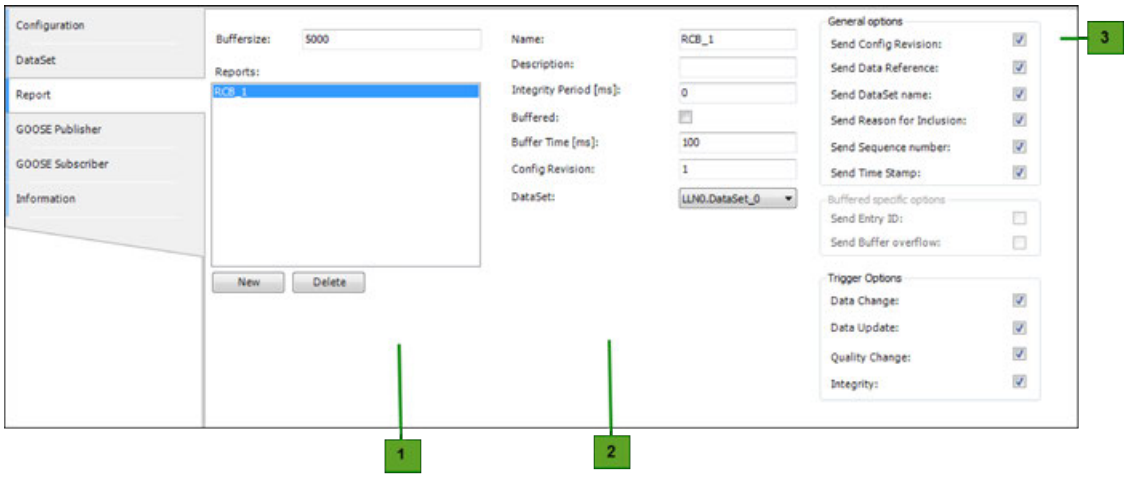

Fig. 336: 'Report' tab

In section 1 the created report control blocks (RCB) are listed. The following buttons are available:

- *"New"*: Create a new report control block.
- *"Delete"*: 'Delete the selected report control block

In section 2 you make general settings for the reporting configuration.

Table 722: General settings

Setting possibility	Description
"Buffersize"	Buffer size of buffered reports (in bytes).
"Name"	Unique Report Block name within the logical node.
"Description"	Description of the report block
"Integrity Period [ms]"	Stealthy general interrogation. After this time the referenced data set will be actuated. Time (ms) between two messages The messages are transferred cyclic, independent from other events.
"Buffered"	Enable / disable the report buffering. A buffered report stores the data, even if there's no connection to the client. In the case of an unbuffered report, the messages will get lost, if there is no connection to the client.
"Buffer Time [ms]"	Buffer time is the amount of time that the server waits to transfer a report after a given event occurs. Events that occur during this time period are collected and then transferred as a batch. If the buffer time is 0, the telegram will be sent immediately. For example, if the buffer time 10s the telegram will be sent after this time period or when the value changes the second time.
"Config Revision"	Versioning is used to identify whether or not a member was deleted from a data set or whether member order has changed. Such changes cause values to not be transferred, or cause values to be in a different location within the report. Such an event is communicated to the client with a new version number. Since all data sets are firmly defined, this identifier does not apply to the solution described here.
"DataSet"	Data set reference

Section 3 is for the setting of the following options:

- *"General options"*: Control of the reporting behavior. An activated checkbox means, that the information is transferred by the message
- *"Buffered specific options"*: can be activated, if the option *"Buffered:"* (in section 2) is activated.
- *"Trigger options"*: Determining of attributes to select the events which may trigger a message.

If the checkbox is activated the information will be transferred by the message.

Table 723: General options

Setting Possibility	Description
"Send Config Revision"	'Config Revision' information
"Send Data Reference"	Enable/disable to transfer the complete reference information, for example: LogicalDevice/GGIO1.ST.Mod.ctlNum
"Send DataSet name"	Enable/disable to transfer the data set name
"Send Reason for Inclusion"	Enable/disable to transfer the reason of transmission for each attribute
"Send Sequence Number"	Enable/disable to transfer a unique sequence number for each message
"Send Time Stamp"	Enable/disable to transfer the timestamp of transmission for each message

Table 724: Buffered specific options

Setting Possibility	Description
" Send Entry ID"	Enable/disable to transfer the 'Entry ID'
"Send Buffer overflow"	Enable/disable to transfer the message if a buffer overflow occurs.

Table 725: Trigger options

Setting Possibility	Description
"Data Change "	Enable/disable to trigger the report if a 'data change' event occured
"Data Update"	Enable/disable to trigger the report if a 'data update' event of an attribute occured.
"Quality Chance"	Enable/disable to trigger the report if a 'quality change' event of an attribute occured
"Integrity"	Enable/disable the cyclic transmission of the report independent of any datachanges (Stealthy general interrogation) . The time period has to be defined in the *"Integrity Period"* general setting.
"General Interrogation"	

Create a report control block and assign it to a data set

1. Activate the *"New"* button
2. Select the desired data set from the *"DataSet"* selection list

GOOSE Publisher

In the *"GOOSE Publisher"* tab of the IEC 61850 editor you create, edit and delete GOOSE messages. If a value changes in the selected data set, a GOOSE message is sent.

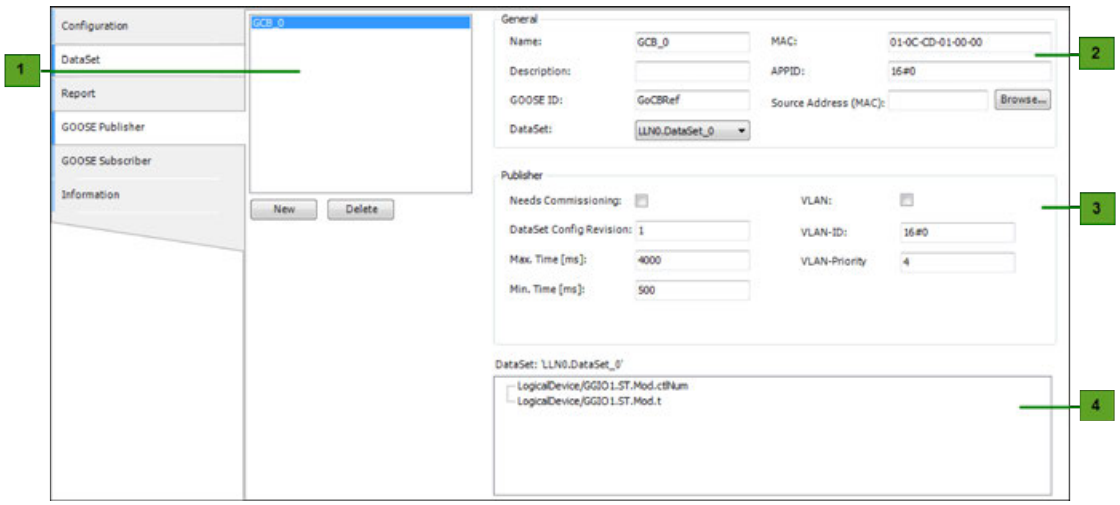

Fig. 337: 'GOOSE Publisher' tab

NOTICE!
The order of the attributes of a DataSet is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.

NOTICE!

To receive a GOOSE message from an IED, sender an recipient must have the identical settings in the following input fields:

- *“APPID”*
- *“GOOSE-ID”*
- *“Dataset structure (with regard to order and data type of the attributes)”*

After the data set is sent, it is sent again after time interval of 500 ms. The repeat time then doubles and the data set is sent again. The data set is sent repeatedly until the value set in the *“Repeat Time”* input field is reached. The data set is then sent again at the Repeat Time interval.

Sections of the tab:

1: List of the GOOSE control blocks (GCB).

A GOOSE control block is a GOOSE message.

Buttons

- *“New”*: Create a new GOOSE cntrol block
- *“Delete”*: Delete the selected GOOSE control block.

2: General settings:

Table 726: General

Setting	Description
“Name”	Name of the GOOSE control block., editable
“Description”	Description of the GOOSE control block
“GOOSE-ID”	Unique character string of the GOOSE control block, editable
“DataSet”	Data set sent as a GOOSE message.
“MAC”	Multicast addressing Multicast addressing is used to send GOOSE messages. Addressing allows a entire group of devices to exchange data with each other. Requirement: unique address allocation of the different device groups. Valid range of values: 01-0C-CD-01-00-00....01-0C-CD-01-01-FF
“APPID”	Application-ID Number for the system-wide unique identification of a GOOSE control block. To exchange GOOSE telegrams, this number must be identical for sender and recipient. Valid range of values: 0 ... 4095
“Source Address (MAC)”	*“Browse...”* button: looks for an Ethernet Port in the network. Requirement: an existing network path to the PLC (see *ms-its:CODESYS.chm::/Communication_Settings.htm*).

3: GOOSE Publisher settings

Table 727: Publisher

Setting	Description
"Needs Commissioning"	Indicates whether the control block must be checked Value is provided from the configurator. Usage of the flag is customer-specific.
"DataSet Config Revision"	Integer value with the version of the GOOSE control block.
"Repeat Time (T0)[ms]"	Time interval during which the GOOSE telegram is valid.
"Max. Time [ms]"	Source supervision time (heartbeat cycle)
"Min. Time [ms]"	Maximum permissible send delay time of a data change
"VLAN"	'Virtual Local Area Network' Logical subnet within a physical network. Multicast messages can be passed through and filtered. The configuration is done in managed ETHERNET switches. If the *"VLAN"* checkbox is activated, values can be entered into the *"VLAN-ID"* and *"VLAN-Priority"* input fields, concerning the passed through of massages via switches.
"VLAN-ID"	A value of 0 is a non-configured VLAN in which the switch performs no filtering. This value is recommended when no logical network should be set up. Valid range of values: 0 ... 4095.
"VLAN-Priority"	Messages within a managed ETHERNET switch can be forwarded depending on the priority Valid range of values: : 0 … 7. Default value for GOOSE: 4.

4: Content of the data set assigned to the GOOSE control block.

Create an GOOSE control block and assign it to a data set

1. Activate the *"New"* button
2. Select the desired data set from the *"DataSet"* selection list.

GOOSE Subscriber

In this tab of the IEC 61850 editor you make settings for the receiving of GOOSE messages.

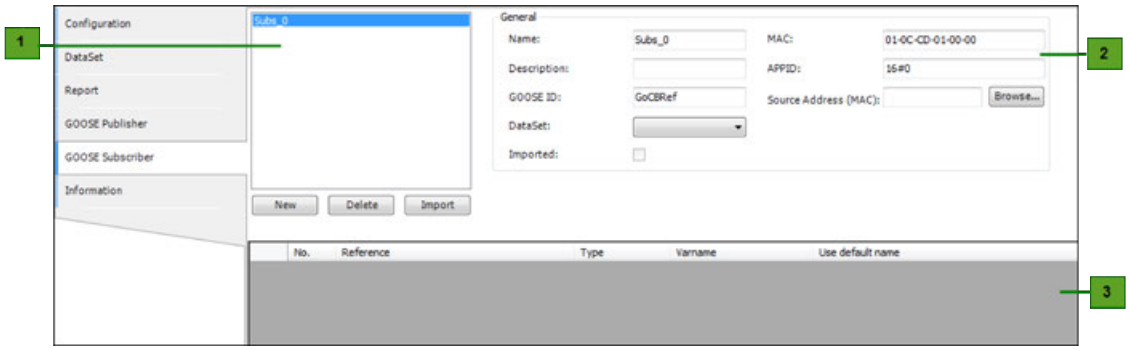

Fig. 338: 'GOOSE Subscriber' tab

NOTICE!
The order of the attributes of a data set is important for the receiving and the sending of GOOSE messages. Type and order of the entries from sender and recipient must be identical for GOOSE communication.

NOTICE!
To receive a GOOSE message from an IED, sender an recipient must have the identical settings in the following input fields:

- *"APPID"*
- *"GOOSE-ID"*
- *"DataSet"* structure (with regard to order and data type of the attributes)

Sections of this tab:

1: List of the GOOSE control blocks (GCB)

Buttons

- *"New"*: Create a new GOOSE control block
- *"Delete"*: Delete the selected GOOSE control block.
- *"Import"*: Import a GOOSE control block in the SCL format

2: General settings:

Table 728: General

Setting	Description
"Name"	Name of the GOOSE control block., editable
"Description"	Description of the GOOSE control block
"GOOSE-ID"	Unique character string of the GOOSE control block, editable
"DataSet"	Data set received as a GOOSE message.
"MAC"	Multicast addressing Multicast addressing is used to send GOOSE messages. Addressing allows a entire group of devices to exchange data with each other. Requirement: unique address allocation of the different device groups Valid range of values: 01-0C-CD-01-00-00....01-0C-CD-01-01-FF
"APPID"	Application-ID Number for the system-wide unique identification of a GOOSE control block. To exchange GOOSE telegrams, this number must be identical for sender and recipient. Valid range of values: 0 ... 4095
"Source Address (MAC)"	*"Browse..."* button: looks for an Ethernet Port in the network. Requirement: an existing network path to the PLC (see *ms-its:CODESYS.chm::/Communication_Settings.htm*).

3: List to assign GOOSE messages to global variables.

All attributes within the selected data set are listed in this list. You can assign incoming GOOSE messages to global CODESYS variables. For this, select the desired attribute in the list and edit the name of a global variable in the *"Varname"* column. If you edit a new variable name a global variable will be created, if you activate the *"Use default name"* checkbox, a variable name is generated automatically. This variable will be written by incoming GOOSE messages.

The variables will be stored *"IEC61850_Generated_GVL"* (of the *"IEC61850 Generated POUs"* folder) after ↳ *generating the code* of the IEC 61850 Server.

No.	Reference	Type	Varname	Use default name
1	LogicalDevice/GGIO1.ST.Mod.ctlNum	INT8U	Var_ctlNum	☐
2	LogicalDevice/GGIO1.ST.Mod.t	Timestamp	Subs_0_Entry1	☑

Fig. 339: Example for the variable list

Create a GOOSE control block and assign it to a data set

1. Activate the *"New"* button
2. Select the desired data set from the *"DataSet"* selection list

Information

This tab of the IEC 61850 editor shows information on the IEC 61850 Server

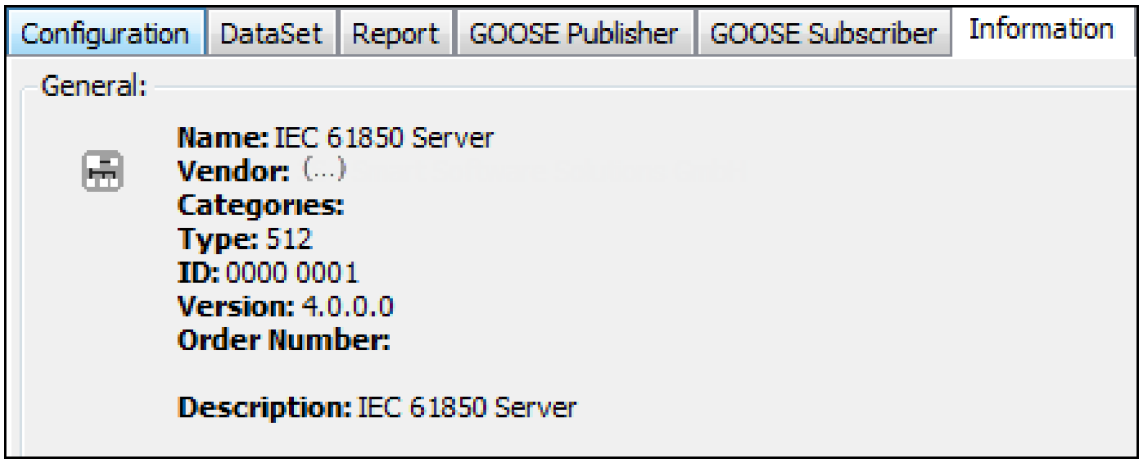

Fig. 340: 'Information' tab'

Reading and Writing from CODESYS Variables

Monitoring direction, reading

For reading in monitoring direction you connect an attribute (DA) with R-access (read) a CODESYS monitoring variable (see *"Parameterization of the IEC 61850 Server" on page 3889*).

The following dataflow variants are possible:

- from the IEC 61850 Server to the connected IEC 61850 Client to read a CODESYS monitoring variable
- from an I/O module to the IEC 61850 Server to the connected IEC 61850 client to read an I/O module pin.

Control direction, writing

For writing in control direction you connect an attribute (DA) with W-access (write) to a CODESYS control variable (see *"Parameterization of the IEC 61850 Server" on page 3889*).

The following dataflow variants are possible:

- from a connected IEC 61850 client to the IEC 61850 Server to write a CODESYS-variable
- form the connected IEC 61850 client to the IEC 61850 Server to an I/O module to write the I/O module pins.

Monitoring direction + control direction, reading an writing

It may be the case that the IEC 61850 client will read the monitoring variable of an attribute and will write the control variable of the same attribute. Monitoring variable and control variable must not be the sameCODESYS variable.

In monitoring direction the data flow takes place from the IEC 61850 Server to the connected IEC 61850 client to read the CODESYS monitoring variable.

In control direction the data flow takes place from the connected IEC 61850 client to the IEC 61850 Server to write the CODESYS control variable.

Menu Command sorted by Categories

IEC61850

Generate code

Symbol: 

On activating the *“Generate code”* command of the *“IEC61850”* category the code generation is started and the generated IEC 61850 code is stored in the folder *“IEC61850 Generated POUs”* in the device tree.

Export Server

This command of the *“IEC61850”* category exports the current configuration. In the *“Safe as ”* dialog select the format filter:

- XML files: for IEC 61850 format with all specific data, variable mapping, for example
- SCL-Files: for IEC 61850 format to export data to other IEC 61850 tools

If you have changed the configuration since the latest code generation, you will be asked whether new code should be generated before export.

Import Server

This command of the *“IEC61850”* category discards the current configuration and imports an new configruation. In the *“Save as ”* dialog select the format filter:

- XML files: for IEC 61850 format with all specific data, variable mapping, for example
- SCL Files: for IEC 61850 format to import data from other IEC 61850 tools

Options

The *“Options”* command of the *“IEC61850”* category opens a dialog for the setting of different display options for the IEC 61850 configurator.

Option	Description
“Show FC besides data attribute”	Display option, shows functional constraint of attribute as a comment.
“Show type besides data attribute”	Display option, shows type of attribute as a comment
“Show trigger option besides data attribute”	Display option, shows trigger option of attribute as a comment
“Show description besides data objects”	Display option, shows description of attribute as a comment
“Enable SCL Private block”	

Option	Description
“Select all Data Objects ”	Debug-Option: Selection of all data objects (DO)
“Select all Data Attributes”	Debug-Option: Selection of all data attributes (DA)

Reset

This command of the *“IEC61850”* category deletes the whole current configuration and all objects of the current application created via the *“Generate code”* command.

Logical Name Classes (LNC)

The following LNCs are available for the configuration of the IEC 61850 Server

Name	Description
	Automatic Control Functions
ATCC	Automatic tap changer controller
	Control
CALH	Alarm handling
CCGR	Cooling group control
	Generic Functions
GAPC	Generic automatic process control
GGIO	Generic process I/O
GSAL	Generic security application
	System
LLN0	Logical Node Zero
LPHD	Physical device information
	Metering and measurement
MMTR	Metering
MMXN	Non phase related Measurement
MMXU	Measurement
MSQI	Sequence and imbalance
MSTA	Metering Statistics
	Protection
PDIF	Differential
PFRC	Rate of change of frequency
PHAR	Harmonic restraint
PHIZ	Ground detector
PIOC	Instantaneous overcurrent
PMRI	Motor restart inhibition
PMSS	Motor starting time supervision
PTOV	Overvoltage
	Sensors and monitoring

Name	Description
SARC	Monitoring and diagnostics for arcs
SIMG	Insulation medium supervision (gas)
SIML	Insulation medium supervision (liquid)
	Instrument transformers
TCTR	Current transformer
TVTR	Voltage transformer
	Wind power plant (IEC61400-25)
WALM	Wind power plant alarm information
WAPC	Wind power plant active power control
WCNV	Wind turbine converter information
WGEN	Wind turbine generator information
WMET	Wind power plant meteorological information
WNAC	Wind turbine nacelle information
WROT	Wind turbine rotor information
WAPC	Wind power plant reactive power control information
WOW	Wind turbine tower information
WTRF	Wind turbine transformer information
WTRM	Wind turbine transmission information
WTUR	Wind turbine general information
WYAY	Wind turbine yawing information
	X-Switchgear Functions
XCBR	Circuit Breaker
XSWI	Circuit Switch
	Y-Power Transformers
YEFN	Ground fault neutralizer (Petersen Coil)
YLTC	Tap Changer
YPSH	Power Shunt
YPTR	Power Transformer
	Further power system equipment
ZAXN	Auxiliary network
ZBAT	Battery
ZCAP	Capacitor Bank
ZCON	Converter
ZGEN	Generator
ZGIL	Gas Insulated Line
ZLIN	Power Overhead Line
ZMOT	Motor
ZREA	Reactor
ZRRC	Rotating reactive component
ZSAR	Surge arrestor

Name	Description
ZTCF	Thyristor controlled frequency converter
ZTCR	Thyristor controlled reactive converter

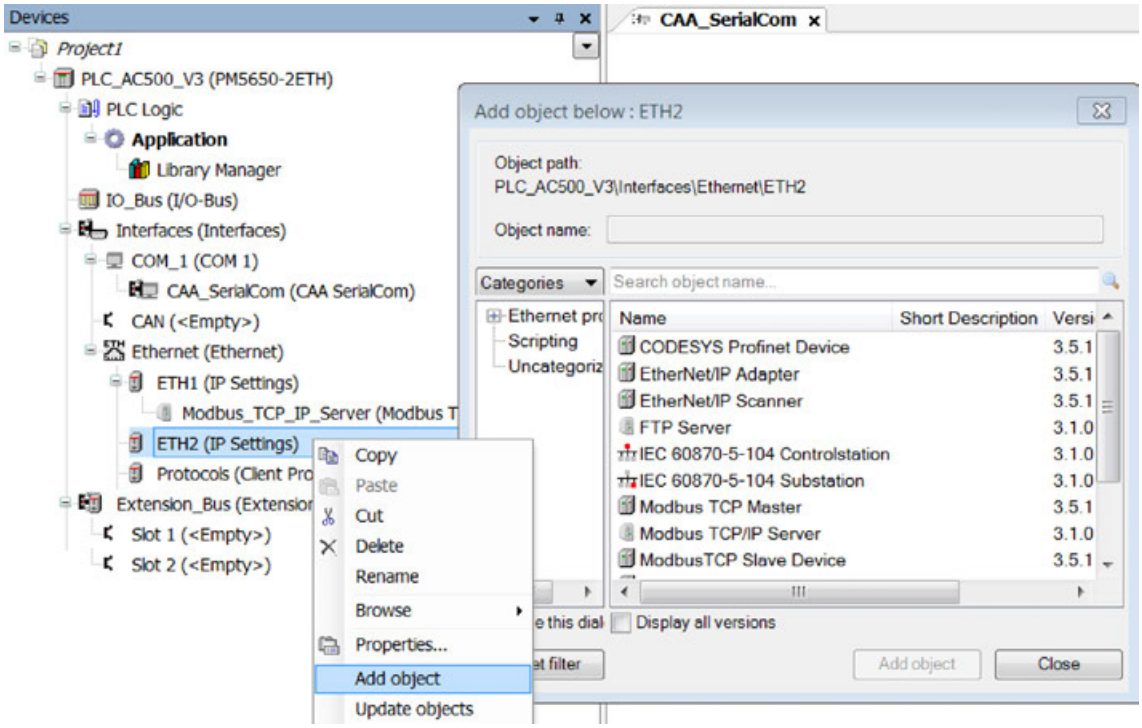
		T0 (ms)	(<= 10 ms)	7 <= T3 < 10
		T1 (µs)	(<= 1ms)	10 <= T3 < 13
		T2 (µs)	(<= 100 µs)	13 <= T3 < 15
		T3 (µs)	(<= 25 µs)	15 <= T3 < 18
		T4 (µs)	(<= 25 µs)	15 <= T3 < 18
		T5 (µs)	(<= 1 µs)	T3 >= 20
Supported TimeStamp resolution	7	nearest power of 10 ms		

1.6.6.3.3 Modbus protocol

Modbus on TCP/IP protocol

Configuration of Modbus TCP/IP server

Adding a Modbus TCP/IP server to device tree



A Modbus TCP/IP Server instance can be added to any specific Ethernet interface / IP address. Each interface supports max. one instance of *“Modbus TCP/IP Server”*. Other protocols can be added in parallel.

1. Right click on ETH interface and click *“Add object”*.
   ⇨ The window *“Add object below: ETH”* appears.
2. Select *“Modbus TCP/IP Server”* and click *“Add object”*.
   ⇨ The node *“Modbus_TCP_IP_Server”* is added.

Setting the parameters of Modbus_TCP_IP_Server

Parameter	Type	Value	Default Value	Unit	Description
Byte order	Enumeration of BYTE	Big endian	Big endian		Big endian = 1; Little endian = 0
Port	WORD(1..65535)	502	502		TCP Port on which the Server listens
Startup behaviour	Enumeration of BYTE	Active	Active		Startup behaviour
Behaviour in state inactive	Enumeration of BYTE	No activity	No activity		Behaviour in state inactive
Disable write to %MB0.x from	WORD(0..65535)	0	0		Disable write access beginning with byte in area %MB0.x
Disable write to %MB0.x to	WORD(0..65535)	0	0		Disable write access ending with byte in area %MB0.x
Disable read to %MB0.x from	WORD(0..65535)	0	0		Disable read access beginning with byte in area %MB0.x
Disable read to %MB0.x to	WORD(0..65535)	0	0		Disable read access ending with byte in area %MB0.x

Byte Order

Format/Endianess for the transmission of WORD values (register) within the request/response telegram (default: *“Big Endian”*).

Port

TCP Port on which the Server listens.

Startup Behaviour

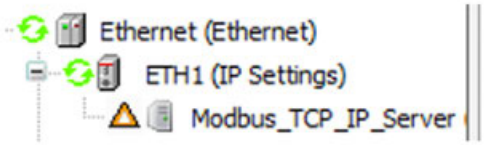
This parameter specifies how the Server behaves when configuration data is loaded (e.g. on download). It's default value is *"Active"*. This means the Server is immediately addressable after configuration has been performed. In case the Server should be activated later on during run time by means of function block *ModTcpServOnOff* this parameter value has to be set to *"No activity"*. Parameter *Behaviour in state inactive* then specifies the Server's behaviour during the inactive phase.

Behaviour in state inactive

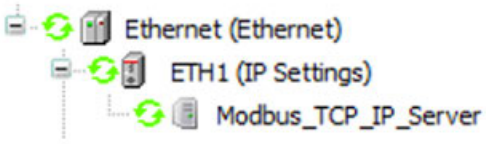
This parameter specifies how the Server behaves in inactive state. This state may be set at the very beginning (parameter *Startup Behaviour* = *"No activity"*) and/or requested during run time calling function block *ModTcpServOnOff*. It's default value is *"No activity"*. This means the Server is not addressable at all (no listening socket on TCP/IP) when it is inactive. Using this setting, any requests by Modbus TCP clients lead to the result *Failed to connect to Server* or *Timeout*. All other parameter values make the Server respond with an exception code to any requests by Modbus TCP clients.

The presentation of the icon next to the Modbus TCP Server in the device tree depends on the state of the Server:

Inactive



Active



Attention:
Exception code 9 is actually not defined by Modbus specification. This may cause problems using a different Modbus TCP client than AC500 V3.

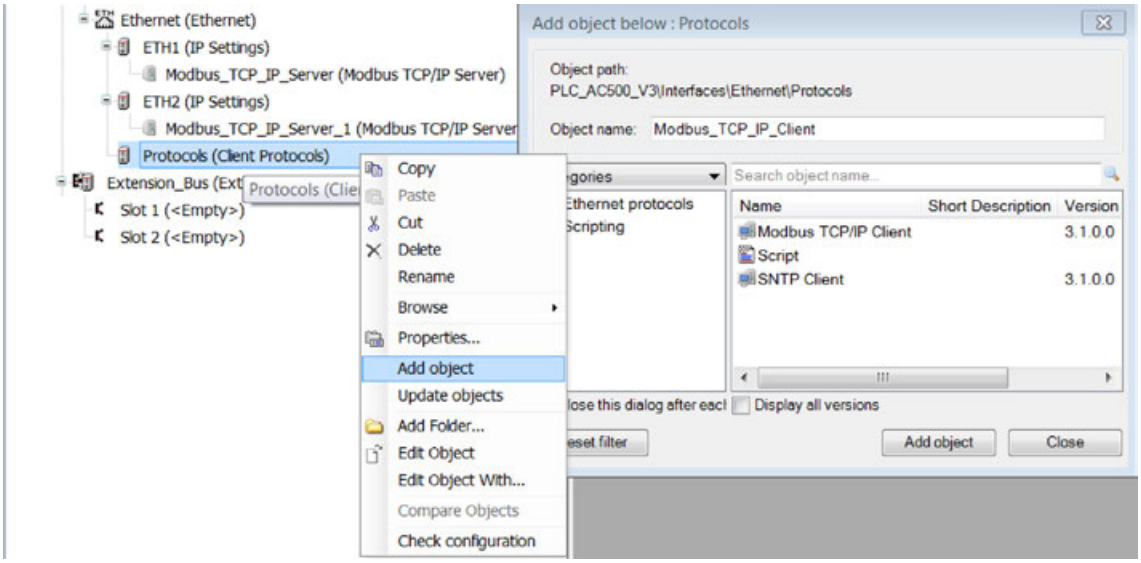
Disable

Parameter	Default	Value	Description
Disable write to %MB from	0	0 ... 65535	Disable write access starting at %MBx
Disable write to %MB to	0	0 ... 65535	Disable write access up to %MBx
Disable read from %MB from	0	0 ... 65535	Disable read access starting at %MBx
Disable read from %MBx to	0	0 ... 65535	Disable read access up at %MBx

It is possible to disable read and/or write access to individual segments. Reading/writing is disabled beginning at the set start address and is valid up to the set end address (inclusive).

Configuration of Modbus TCP/IP client

Adding a Modbus TCP/IP client to the device tree



The *"Modbus_TCP_IP_Client"* instance has to be added to the common Ethernet client protocols' node. This node supports max. one instance of Modbus TCP/IP client. Other protocols can be added in parallel.

1. Right click on the node*"Protocols"* and click *"Add object"*.
   ⇨ The window*"Add object below: Protocols"* appears.
2. Select *"Modbus TCP/IP Client"* and click *"Add object"*.
   ⇨ Node *"Modbus_TCP_IP_Client"* is added.

Depending on a Server's IP-Address the client sends it's requests via the Ethernet interfaces available.

Setting the parameters of Modbus_TCP_IP_Client

Modbus TCP/IP client does not have any parameters.

Modbus on RTU protocol

Protocol description can be found in the chapter for Serial interfaces ↳ *Chapter 1.6.6.2.14.1 "Configuring Modbus RTU on serial interface" on page 3793*.

1.6.6.3.4 NTP/SNTP protocol

Introduction of the NTP/SNTP protocol

AC500 V3 support the NTP and the SNTP protocol ((Simple) Network Time Protocol). Compared to SNTP, the NTP protocol achieves higher accuracy in time synchronization, meeting advanced requirements for accuracy and reliability of a PLC solution. In case a configured NTP protocol cannot be used, SNTP protocol is used as a fallback solution.

The protocols NTP and SNTP provide the functionality to synchronize the clock of a PLC to an external time source. For further information and specification of the protocol please refer to the document *RFC4330*.

The following modes are supported by the implementation of the AC500 V3 PLC:

- (S)NTP client
- (S)NTP server
- (S)NTP client and server

The function block *PmSntpInfo* can be used to read diagnosis information of the protocol.

Refer to the documentation of the library *ABB_Pm_AC500.lib* for further information.

- *If a high precision of system time is wanted, use a fully functional NTP server or at least an SNTP server with a high-precision time-source (e.g. DCF-77 receiver). Avoid cascading several levels of (S)NTP server / (S)NTP clients.*
- *Client requests are normally sent at intervals depending on the frequency tolerance of the client clock and the required accuracy. However, under no conditions requests should be sent at less than one minute intervals (see RFC 4330). Keep that in mind when setting polling-interval of the (S)NTP client, especially if a huge amount of clients use one single server.*
- *Be sure not to use broadcast or multicast addresses as server or backup-server since current (S)NTP implementation does not support manycast mode.*

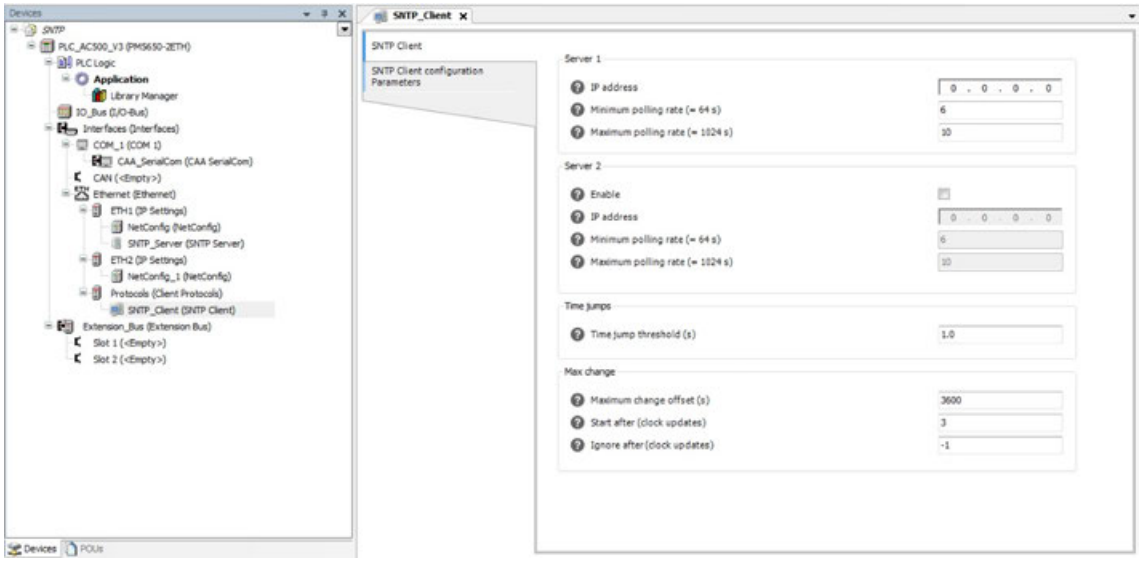
Configuration of the (S)NTP protocol

(S)NTP client configuration

Implementation of (S)NTP client and (S)NTP server is based on protocol version 4.

For (S)NTP client configuration add a new object *“SNTP Client”* under *“Protocols (Client Protocols)”*.

For a PLC only one instance of an (S)NTP client is possible.



The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.

Server 1

Parameter	Default	Value	Description
IP address	0.0.0.0	Valid IP address	IP address of a server which is used as external time source.
Minimum polling rate	6 2^6 = 64 s	-4 ... 24	Specifies the lower limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be lower than this limit.
Maximum polling rate	10 2^10 = 1024 s	0 ... 24	Specifies the upper limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be higher than this limit.

Server 2

Parameter	Default	Value	Description
Enable	FALSE	TRUE or FALSE	Enable server
IP address	0.0.0.0	Valid IP address	IP address of a server which is used as external time source.
Minimum polling rate	6 2^6 = 64 s	-4 ... 24	Specifies the lower limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be lower than this limit.
Maximum polling rate	10 2^10 = 1024 s	0 ... 24	Specifies the upper limit of the polling rate. It is calculated as power of 2 and has the unit [s]. The actual polling rate is determined by the protocol itself but it will not be higher than this limit.

Time jumps

Parameter	Default	Value	Description
Enable	TRUE	TRUE or FALSE	Enables the option 'Time jumps'
Time jump threshold	1.0 s	0 ... 3.403e+38	Specifies the threshold value for time steps in seconds
Limit	-1	-1 … 2147483647	Number of first clock updates after that this option is deactivated, a negative value activates this option permanently.

Max change

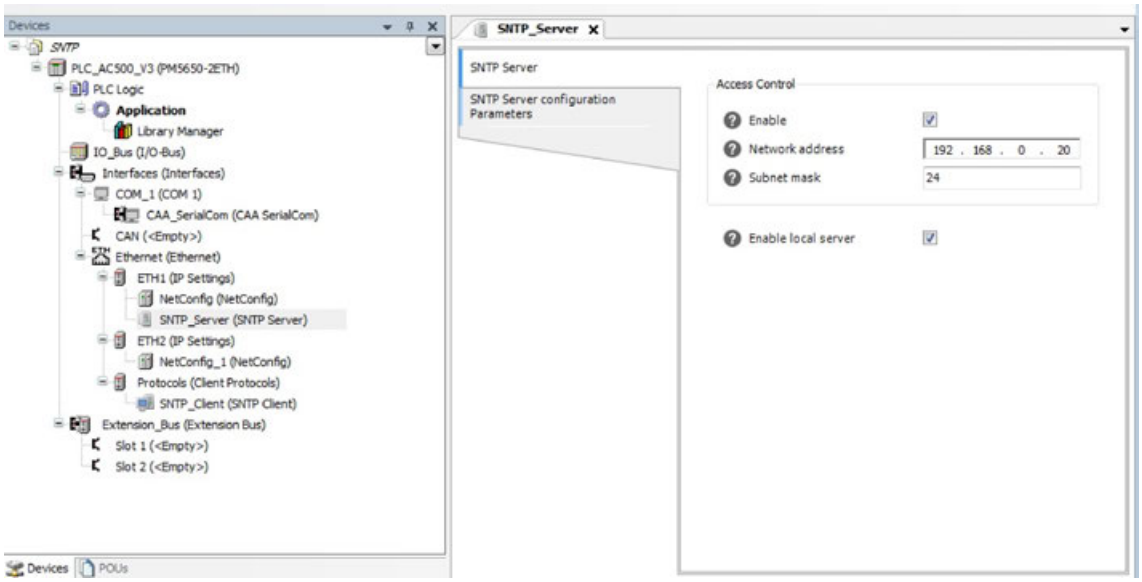
Parameter	Default	Value	Description
Enable	TRUE	TRUE or FALSE	Enables the option 'Max change'
Maximum change offset	3600 s	0 … 4294967295	Maximum allowed clock offset in seconds
Start after	3	0 … 4294967295	Specifies the number of first clock updates after that this option is activated
Ignore after	-1	-1 … 2147483647	Specifies the number of ignored clock updates which exceed the maximum offset. The protocol will be stopped when this value will be exceed. It is never stopped when a negative value is set.

(S)NTP server configuration

Implementation of (S)NTP client and (S)NTP server is based on protocol version 4.

For (S)NTP server configuration add a new object *“SNTP Server”* under of the available *“Ethernet interfaces (ETH1-ETHn)”*.

For a PLC only one instance of an (S)NTP server is possible.



The following parameters are available:

Not all parameters are shown in the user interface.

It should not be necessary to change the default values of the other parameters for the most applications.

But there is the possibility to edit them in the generic parameter editor.

Access control

Parameter	Default	Value	Description
Enable	FALSE	TRUE or FALSE	Enables Access Control
Network address	0.0.0.0	Valid IP address	Network address of allowed clients
Subnet mask	24	8 ... 32	Subnet mask of the network address

Local server

Parameter	Default	Value	Description
Enable	FALSE	TRUE or FALSE	This option enables the protocol to run as local server. That means without synchronization to an external time source.
Stratum	10	1 ... 15	Stratum of the server when it is used as local server
Distance	1 s	0 … 3.403e+38	Distances in seconds of the server when it is used as local server
Orphan	FALSE	TRUE or FALSE	Enables or disables the orphan mode

1.6.6.3.5 FTP server

Configuration of FTP server

As of SystemFW 3.1.0 the FTP server is listening only on the Ethernet interface, which the protocol is configured on. It is not possible to have an FTP server on both Ethernet interfaces.

AC500 V3 PLCs only support explicit authorization. AC500 V3 PLCs do not support implicit authorization.

1. Under *“Ethernet -> ETH [1,2,...]”* add a new object and select *“FTP Server”* from the list.
2. Double-click the *“FTP_Server ”* item to open FTP server configuration and change the default settings of the parameters, if required.

Parameter		Default	Value	Description
FTP Server				
	Port	21	21	Do not change the default setting. The parameter specifies the port which is used to connect to the FTP server on the PLC.
	Sessions	1	1...4	Enter the max. number of allowed simultaneous and parallel connections to the FTP server. Each session uses one socket. Note: Some FTP clients require several connections to work.
Passwords		-	-	Set each user’s passwords for login. No entry = no password.
	system	-	-	System RAM disk
	sdcard	-	-	Inserted memory card.
	userdisk	-	-	User section of the flash disk.
	flashdisk	-	-	Only available with PM5675-2ETH

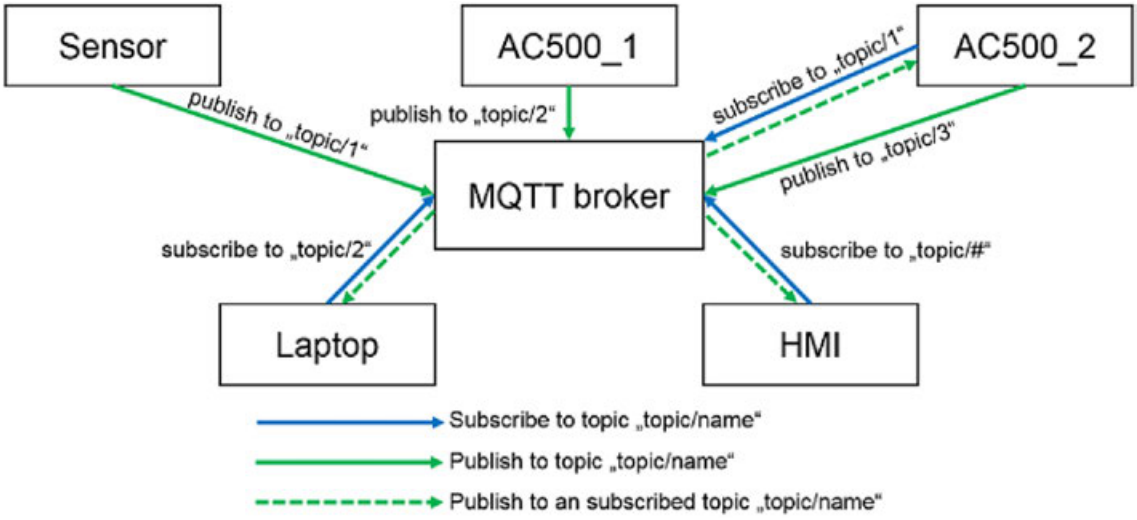
1.6.6.3.6 MQTT client protocol

System technology

The MQTT protocol is a lightweight communication protocol which is widely used on the internet to connect embedded device to the cloud.

The MQTT (Message Queuing Telemetry Transport) client library allows to integrate an AC500 processor module to act as a client in the MQTT protocol. Thus, it is possible to exchange data between the AC500 and other devices connected to the MQTT network.

In the figure below, there is an MQTT network with one broker (MQTT broker in the middle) and five clients. The figure shows the main functions of MQTT to send and receive data: publish and subscribe. The clients can publish messages with a specific topic to send data (e. g. the temperature of a connected sensor with a timestamp) to the MQTT broker. For example, the client “AC500_1” publishes a message to topic “topic/2”. On the other hand side clients can also subscribe to topics to receive data. For example, the client “Laptop” has subscribed topic “topic/2”. So all messages with the topic “topic/2” which has been published to the MQTT broker will be sent immediately to the client “Laptop”. This creates a message flow from the client "AC500_1" to the laptop.

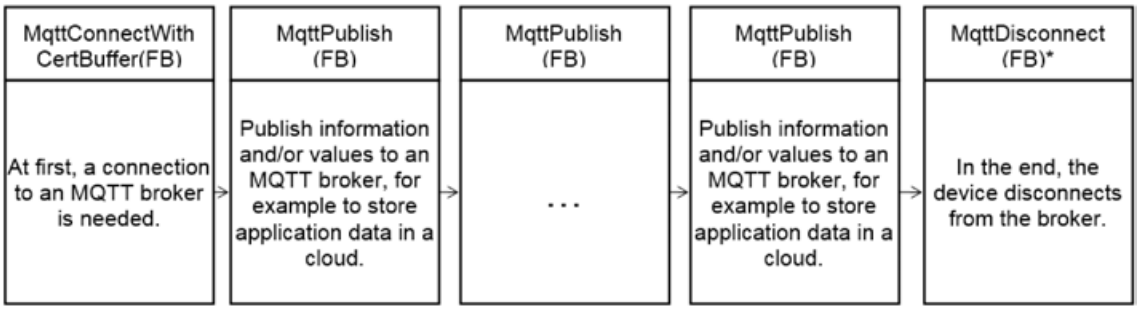


To realize the MQTT behavior, there are several function blocks implemented in the *Chapter 1.5.11 “MQTT client library” on page 2376*.

Table 740: Function blocks overview

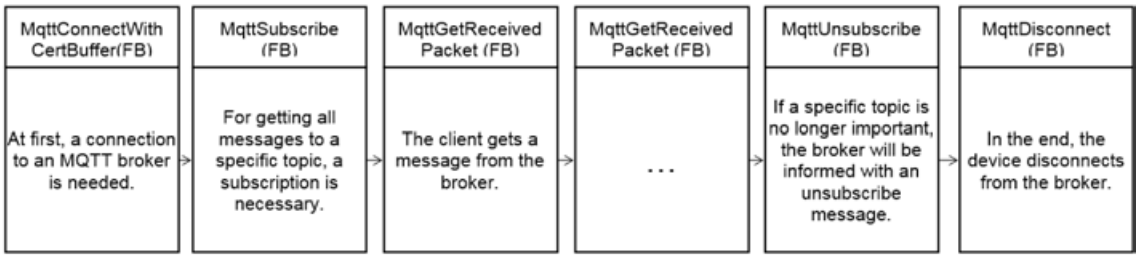
Function Block	Description
MqttConnectWithCertBuffer MqttConnectWithCertFile	Every MQTT use case starts with establishing a connection to an MQTT broker. Therefore, a connection structure needs to be created. The connection structure is used to identify the connection for subsequent operations like publish or subscribe. It is possible to establish an SSL connection. Using an SSL connection, at least a certificate for the server is needed. Certificates can be loaded from a buffer (program variable) or a file which is stored on the PLC.
MqttGetReceivedPacket MqttPing MqttPublish MqttSubscribe MqttUnsubscribe	These function blocks can be used on an established MQTT connection to realize the desired use case.
MqttDisconnect	This function block is the end of each use case.

One MQTT send use case could look like this:



*) It makes sense for several publish messages in a row (e. g. one message per second) not always open a new connection.

One MQTT receive use case could look like this:



TLS version

The MQTT client uses the TLS version 1.2.

Configuration in Automation Builder

For the MQTT client no configuration is needed.

Configuration in CODESYS

All function blocks have to be called in tasks with cyclically processing.

You can use the function blocks with:

- PLC_PRG with automatic task configuration or manual task configuration.
- One single program or different programs.
- One single task or different tasks.

With different programs assigned to different tasks you can define different cycle times and priorities.

Limitations

- No persistent session. After an interrupted connection, the client needs to subscribe on topics again in case of reconnect.
- One connection (MQTT_CONNECTION) cannot be shared between multiple tasks. Different connections can be used by different tasks or even within the same task.
- Only one FB can operate on a single connection at the same time. Always wait for the FB to complete before calling the next FB. To use two different FB's in parallel (like publish and receive) it is necessary to have two different connections, otherwise they must be called one after the other.

Hardware

The MQTT protocol requires AC500 devices with integrated Ethernet.

Examples

Example projects for the libraries can be found in the folder: \Users\Public\Documents\AutomationBuilder\Examples.

MQTT can be used using the MQTT client library or JSON. An introduction to programming with JSON is given in the *application example*.

1.6.6.3.7 AC500 V3 secure protocols

Introduction

The following protocols can be secured using certificates:

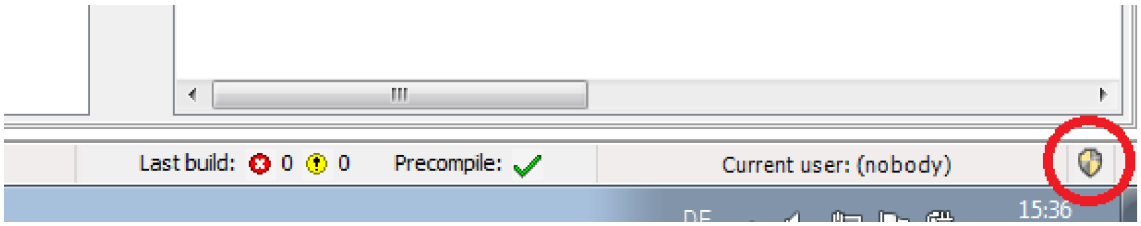
- Communication between Automation Builder and the PLC (e.g. Programming, Monitoring)
- Communication between the PLC's webserver and visualization clients (browsers)
- Communication between the PLC's FTP server and FTP clients
- Communication between the OPC UA server and OPC UA clients

As a prerequisite to enable secure communication on one or more protocols, the required certificates need to be present on the PLC.

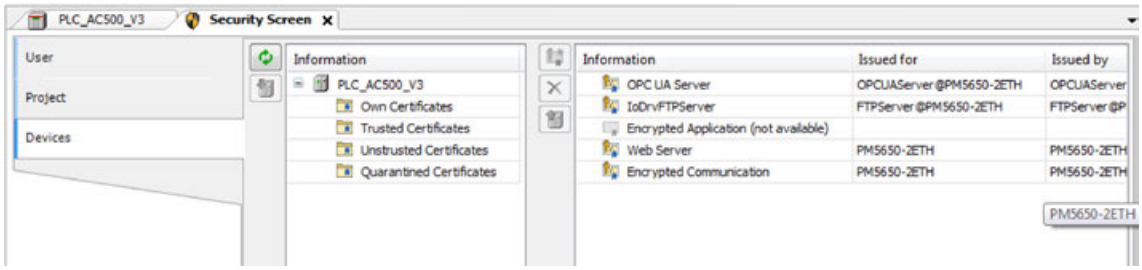
> *For security reasons ABB does not encourage the use of self-signed certificates. ABB shall not be held liable for any damage or loss that arises due to the use of self-signed certificates on AC500 PLCs.*
>
> *Self-signed certificates protect against eavesdropping if used correctly. They do not offer any secure means of authentication.*

Certificate handling

Automation Builder offers a convenient *"Security Screen"* to manage certificates on connected PLCs.



It can be accessed through the *shield icon* on the lower right corner of the main window:



Use the tab *"Devices"* to manage certificates on the PLC.

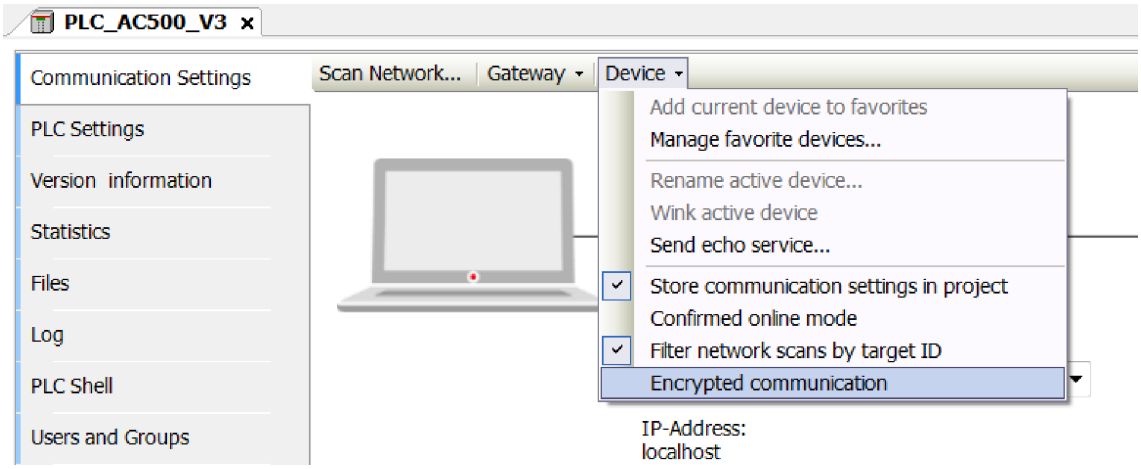
It offers to:

- show certificates available on the PLC
- import and export certificates
- create new (self-signed) certificates
- trust or untrust certificates

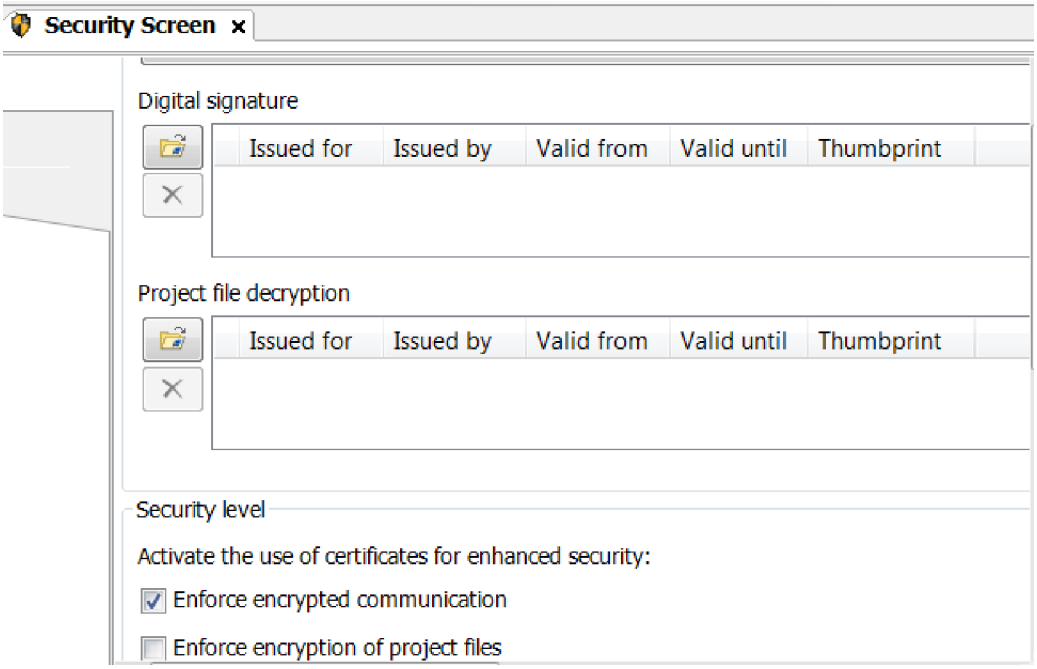
Configuring secure protocols

Encrypted communication between Automation Builder and the PLC

Via tab *"Communication Settings"*



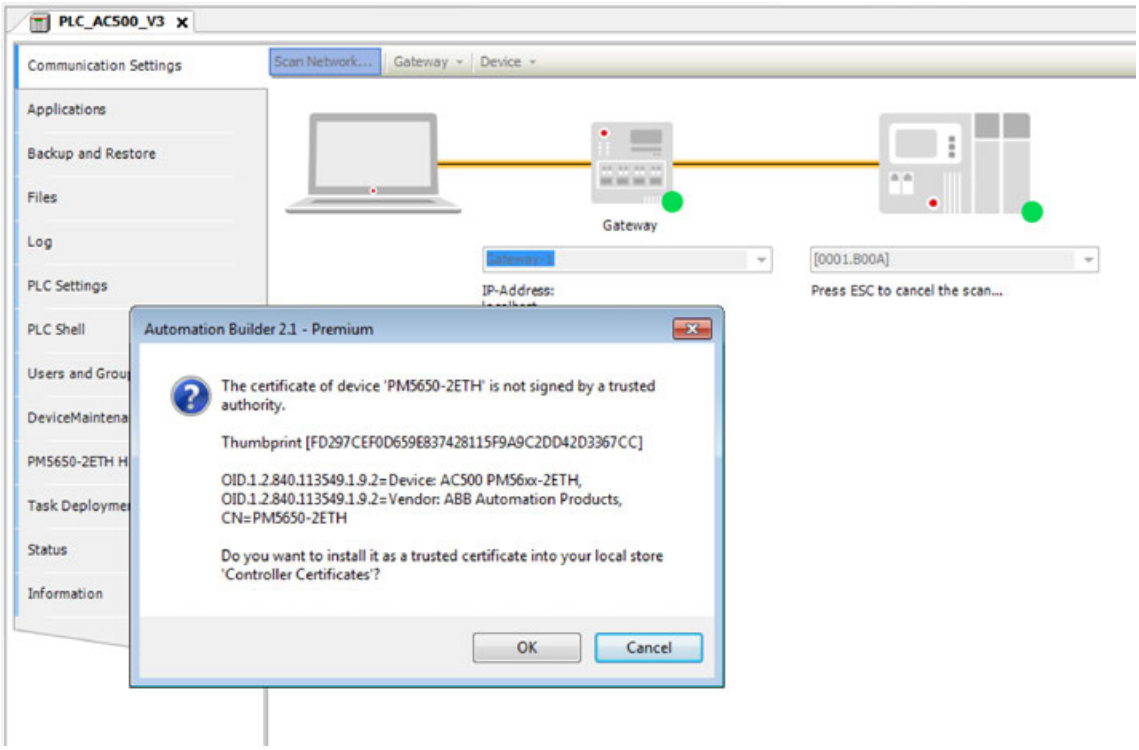
Via *"Security Screen"* in Automation Builder



Install a trusted certificate

> *Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also ↳ Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479 and ↳ Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913).*

When trying to log in or when you set the PLC as active path, there will be a one-time pop-up asking you to add the PLC’s certificate to the trusted certificates:



After trusting the PLC’s certificate, the communication between the Automation Builder and the PLC is now encrypted.

This is shown by additional yellow lines around the communication path on the *“Communication Settings”* page.

Secure web server

1. Generate or import a certificate for the web server

> *Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also ↳ Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479 and ↳ Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913).*

2. Attach a web server node to either ETH1 or ETH2 or both and configure security mode.
   ⇨ This will automatically insert a visualization into the project.

   The available modes of operation are:

   - http only
   - https only
   - Both (http and https)
   - Redirect http to https

3. Download and set the PLC to RUN.

4. Connect to the web server using the configured method: https://<your PLC´s IP address>/webvisu.htm.

> *In case you are using a self-signed certificate, your browser will show some warnings.*
>
> *If you are aware of the risks of self-signed certificates, this can be ignored.*
>
> *Further information on page 3920*

Secure FTP

1. Import a certificate to the PLC for FTP or create a self-signed certificate.

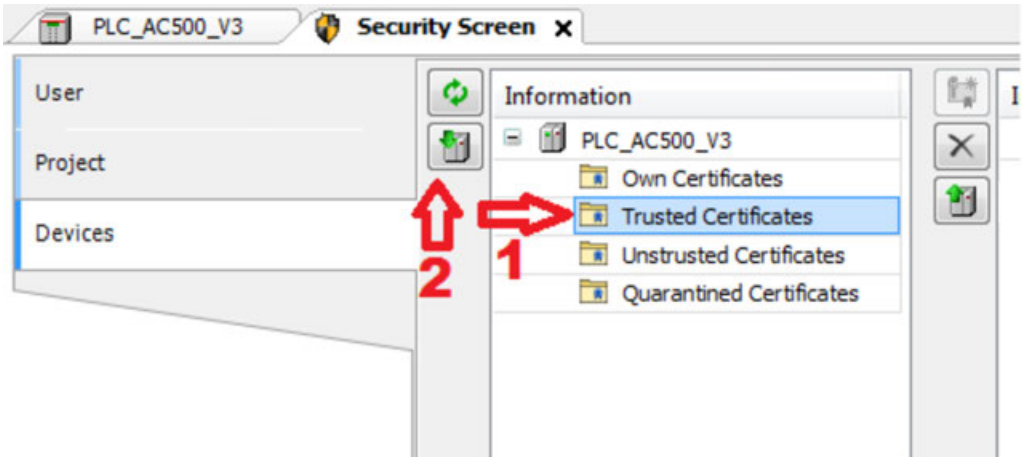
> *Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479 and Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913).*

2. Add an FTP server to either ETH1 or ETH2
3. Set the parameter *“Security Mode”* to either *“BOTH”* or *“FTPS only”*.
   ⇨ You can use any FTP client that supports FTPS explicit mode (FTPES).

> *In case you are using a self-signed certificate, the FTP client will show some warnings or notice that it does not know the certificate and wants you to check it.*
>
> *Further information on page 3920*

OPC UA secure

OPC UA uses mutual authentication, which means that both partners must have their own certificate and know the other’s certificate, before being able to establish a connection!



1. Create a new certificate in your OPC UA client.

   Ensure the PLC clock is set to the current time and date when using certificates on the PLC. Otherwise the certificate cannot be used to secure a protocol (see also ↳ Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479 and ↳ Chapter 1.6.6.3.4.2.1 “(S)NTP client configuration” on page 3913).

2. Import that certificate to the *“Trusted Certificates”* in your PLC using the *“Security Screen”*.
3. Import a certificate for the OPC UA server on the PLC or create a self-signed certificate.
4. Export that cert to the PC and provide it as a trusted certificate to your OPC UA client.
5. Reboot the PLC and check that it is in RUN and both certificates are on the PLC (via the *“Security Screen”*).
6. Add the PLC as OPC UA server in your OPC UA client.
7. Connect to the OPC UA Server.

   ⇨ You can interact normal with the UA server.

In case you are using a self-signed certificate, you will see some warning message (depending on the OPC UA client).

If you are aware of the risks of self-signed certificates, this can be ignored.

↳ Further information on page 3920

The certificate warnings will only go away when using a certificate from a trusted certification authority or a certificate derived from this by an intermediate certification authority (e.g. a company CA).

That process is done via PLCShell command “cert-createcsr”, then getting the file from the PLC via the filebrowser tab in “cert/export” and getting that signing request turned into a real certificate by a certification authority.

Import the certificate generated by your certification authority using the security screen.

1.6.6.3.8 KNX configurator

Refer to the general description for information about the following tabs of the device editor.

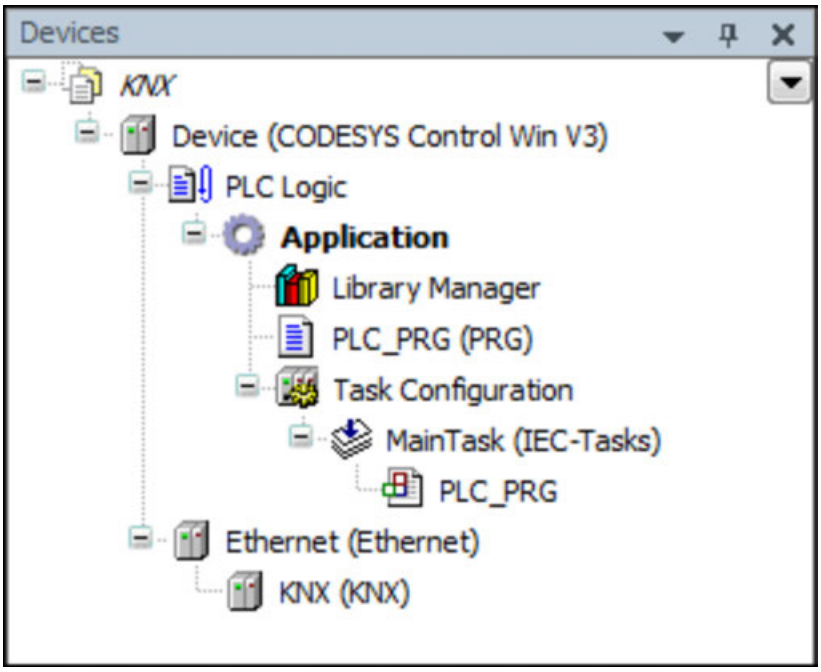
- *↳ Chapter 1.4.1.20.2.8.11 “Tab '<device name> I/O Mapping'” on page 854*
- *↳ Chapter 1.4.1.20.2.8.12 “Tab '<device name> IEC Objects'” on page 859*
- *↳ Chapter 1.4.1.20.2.8.3 “Tab 'Parameters'” on page 844*
- *↳ Chapter 1.4.1.20.2.8.18 “Tab 'Status'” on page 870*
- *↳ Chapter 1.4.1.20.2.8.19 “Tab 'Information'” on page 870*

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

With the KNX editor from CODESYS, you define the communication objects of your building automation. The communication objects are exported and made available to the ETS5 program. Linking the communication objects to the different KNX devices is performed exclusively in the ETS5 program. Therefore, only the objects are generated in CODESYS. The objects are linked to variables from the PLC program by means of *"I/O mapping"*.

You add an Ethernet adapter below the controller. Then you add the KNX device below the adapter. You can insert only one KNX device per controller.



See also

- ↳ *Chapter 1.4.1.20.4.13.6 "Dialog 'Options' - 'Device Editor'" on page 1190*

ETS5 Software - 'DCA' Plug-In

Linking the communication objects of the different KNX devices is performed exclusively in the ETS5 program. To do this, you need the ETS5 software (light or professional version). You also need the KNX product file available from KNX.

Programming steps

1. Create a project in CODESYS.
2. Download the CODESYS project to the controller.
   ⇨ The CRC is also downloaded to the controller.
3. Create an export file in CODESYS.
   ⇨ The CRC is also saved in the export file.
4. Read the export file into the configuration of ETS5.
5. Parameterize the objects in ETS5.
6. Start the program on the controller.
7. Transfer the KNX configuration to the controller.
   ⇨ The CRC is also transferred. The runtime system checks whether or not both CRCs match. When they match, the KNX device is identified as functional by the green arrow. If not, then an error is issued in the logger. In case of error, the process data (inputs/outputs) is not updated.

Tab 'KNX - General'

Object: KNX

The tab in the configurator of the KNX editor shows an overview of all communication objects. The I/Os of the communication objects are applied automatically to the I/O mapping.

Entries can be edited directly in the table or in the *“Communication object”* dialog. Existing entries can be copied via copy&paste. The next free channel number is used automatically in this case.

Table 741: “Address settings”

“Add”	Opens the *“Communication object”* dialog for adding objects
“Edit”	Opens the *“Communication object”* dialog for editing objects
“Delete”	Deletes the selected communication objects
“Export to ETS”	Exports the list of communication objects in an XML file. This file can be imported by ETS5 if ETS5 has the DCA plug-in installed. Note: The command is also available in the context menu when the KNX node is selected.
“Export to ETS”	Exports the communication objects in a CSV file
“Import CSV”	Imports the communication objects from a CSV file
“Identification”	CRC of the communication object. This must be identical to the CRC in ETS5.

Dialog 'Communication object'

“Number of group object”	Unique channel number. Gaps in the numbering is permitted. If the channel number is already assigned, then an error text is displayed and the *“OK”* button is disabled.
“Type”	Determines whether or not the object in CODESYS is used as *“Input”* or *“Output”*.
“Data point type”	The data types (DPT = Data Point Types) are specified in the KNX standard. In CODESYS, a selection of the most common data types is available. Only the basic data type can be selected, without units (for example, DPT9.*).
“Name of group object”	Any object name. Depending on the data type, a predefined text is automatically added.
“Function of group object”	Any function name. Depending on the data type, a predefined text is automatically added.
“Watchdog Timeout”	If no new message has been received after this time has elapsed, then the status bit `Timeout` is set.

Tab 'I/O Mapping'

Object: KNX

The I/O channels are generated for each communication object:

Table 742: General I/Os

Signal	Description
"Program LED Status"	This input is set by the ETS program. The signal can be used for identifying a special controller when several controllers are used (for example, by switching a LED). The status is also set when the *"Program Button"* is set to `TRUE`. Then the device is in programming mode. As soon as ETS5 has successfully set the physical address, this input switches to `FALSE`.
"Program Button"	The *"Program Button"* is needed for assigning the physical address from ETS5. If the output is set to `TRUE`, then the device is in programming mode and then ETS5 can assign the address specified there to the device.

Table 743: I/O channels of the communication object

Signal	Description
"Status byte"	Status byte as defined in the KNX stack. This allows you to determine in the application whether or not data has been received. The status can be reset by means of the `ResetStatusFlags` method.
"Trigger/Disable Cyclic, send on change" *"Trigger Output"*	Depending on the configuration in the ETS program, this output has the following function: ● If at least one of the options *"send on difference"*, *"send on change"*, or *"Cyclic sending"* is enabled, then the output is defined as deactivation. If it is set to TRUE, then cyclic sending or send on change is stopped. ● If none of the options *"send on difference"*, *"send on change"*, or *"Cyclic sending"* is enabled, then sending is triggered by a rising edge.
"Value"	Value for the input or outputs – depending on the corresponding communication object.

ETS5 - Tab 'Parameter'

The parameter page of the ETS5 configuration software is available only after you have imported the CODESYS configuration file. The parameter page is where you define the sending behavior of the values.

Table 744: "General Information"

"Default gateway"	Default gateway for sending
"Telegram rate"	Sending rate of telegrams Note: This restriction should be applied in exceptional cases only, because this causes the reaction times to be extended.
"Project title"	In CODESYS, these parameters can be defined in the project information. They are imported to ETS5 in the XML file and displayed here. *"Identifier"*: CRC of the configuration. The CRC is also displayed in CODESYS and must be identical to the CRC displayed here so that communication can be started.
"Application date"	
"Identifier"	
"Version"	
"Application state"	
"Description"	

The objects are subdivided into groups of ten (1 .. 10, 11 .. 20, 21 .. 30, etc.). A maximum of 1000 communication objects is possible.

Table 745: “Object 1 .. 10”

“<type>”	Type of the object The parameter cannot be changed.
“Communication direction”	*“Output (PLC to KNX)”*: The value is sent from the CODESYS controller to the KNX object. For this communication direction, more settings are possible (*“Send condition”*, etc.). *“Input (KNX to PLC)”*: The value is sent to the CODESYS controller. The parameter cannot be changed.
“Send condition”	*“No automatic sending”*: No send when value is changed *“Send on change”*: Send each time value is changed *“Send on difference”*: Send when the change in value corresponds to at least the value for *“Sending difference”*.
“Sending difference”	Requirement: *“Send condition”* is *“send on difference”*. The value is passed when its change is at least this value.
“Cyclic sending”	*“Disable”*: No cyclic sending *“Enable (seconds)”*, *“Enable (minutes)”*: Cyclic sending – regardless of the *“Send condition”*.
“Cycle time [hh:mm:ss]”	Rate for cyclic sending (in hours/minutes/seconds) Requirement: *“Cyclic sending”* is set to *“Enable (seconds)”*.
“Cycle time [hh:mm]”	Rate for cyclic sending (in hours/minutes) Requirement: *“Cyclic sending”* is set to *“Enable (minutes)”*.

1.6.6.3.9 BACnet-BC

Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include 'Who is', 'I am', 'Who has' and 'I have' for device and object search and identification, *“Read Property”* and *“Write Property”* for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:

http://www.bacnet.org

http://www.bacnet.org/Bibliography

AC500 and BACnet

A BACnet device can be described by its *“BACnet Interoperability Building Blocks”* (BIBB)s, which are needed to establish services. They are grouped in different areas:

- *"Data Sharing"* (DS)
- *"Alarm and Event Management"*(AE)
- *"Scheduling"* (SCHED)
- *"Trending"* (T)
- *"Device and Network Management"* (DM)

"Data Sharing" for example contains two BIBBs which are needed for the *"Service Read Property"*:

- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. *"BACnet Simple Sensor"* (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

		CP600	AC500 V3		AC500 V2		
Interoperability Areas (IA)	**BACnet Device-profiles**						
	B-OWS	**B-OD**	**B-BC**	**B-AAC**	**B-ASC**	**B-SA**	**B-SS**
Data Sharing	DS-RP-A, B	DS-RP-A, B	DS-RP-A, B	DS-RP-B	DS-RP-B	DS-RP-B	DS-RP-B
	DS-RPM-A	DS-RPM-A, B	DS-RPM-A, B	DS-RPM-B			
	DS-WP-A	DS-WP-A, B	DS-WP-A, B	DS-WP-B	DS-WP-B	DS-WP-B	
	DS-WPM-A		DS-WPM-B	DS-WPM-B			
		DS-V-A					
		DS-M-A					
Alarm & Event Management	AE-N-A	AE-N-A	AE-N-I-B	AE-N-I-B

	DM-BR-A		DM-BR-B				

The AC500 V2 supports BIBBs qualifying it as *"BACnet Application Specific Controller"* (B-ASC), by installing the BACnet B-ASC library.

AC500 V3 supports many more BIBBs qualifying it as *"BACnet Building Controller"* (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

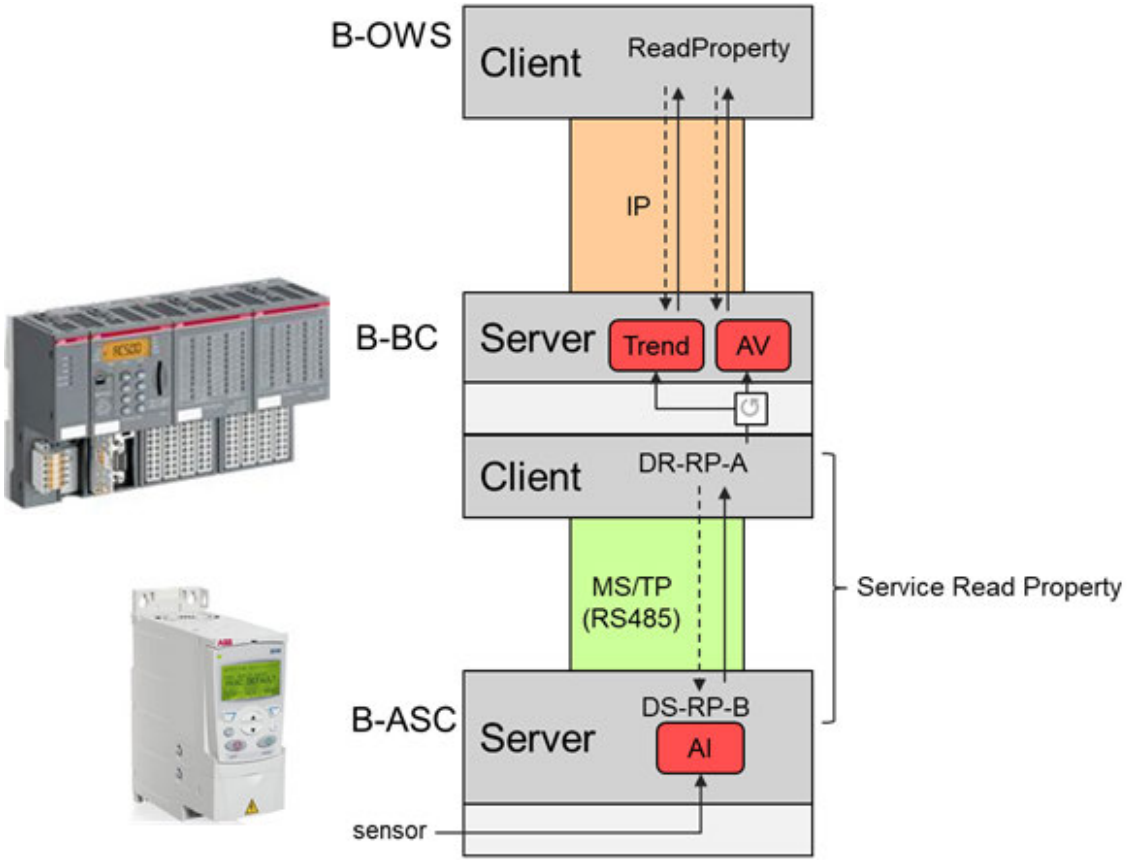
DS-COV-A, -B	(Change of Value-A, -B)
DS-COVP-A, -B	(Change of Value of Properties-A, -B)
AE-N-E-B	(Alarm and Event-Notification External-B)
AE-ASUM-B	(Alarm and Event-Alarm Summary-B)
SCHED-I-B	(Scheduling-Internal-B)
T-VMT-E-B	(Viewing and Modifying Trends External-B)

DM-TS-B	(Time Synchronization-B)
DM-UTC-B	(UTC Time Synchronization-B)
DM-MTS-A	(Manual Time Synchronization-A)
DM-LM-B	(List Manipulation-B)
DM-OCD-B	(Object Creation and Deletion-B)
NM-BBMDC-B	(BBMD Configuration-B)

...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.



A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as *“Analog Input”* (AI) object on the MS/TP network.

Chapter 1.6.6.3.9.3.1 “Supported BACnet networks ” on page 3931

AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as *“Analog Value”* (AV) object and as *“Trend”* object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects *“Analog Value”* and *“Trend”* for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.

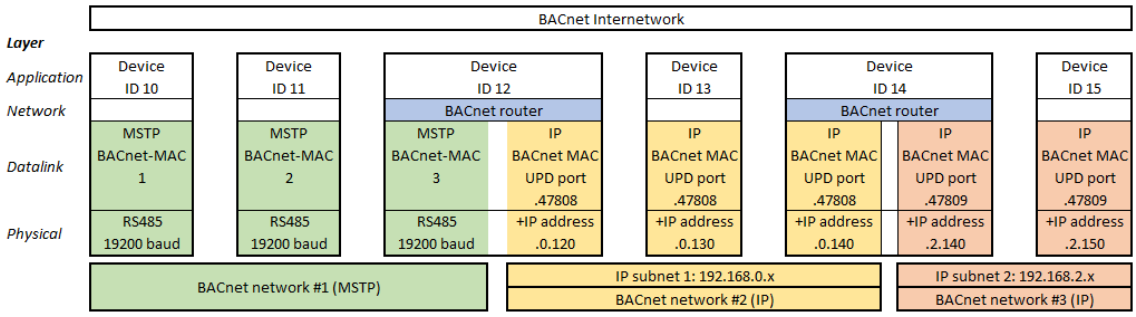
AC500 V3 as BACnet Building Controller (B-BC)

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS-485
- BACnet IP, based on Ethernet / UDP / IP



Different networks can be combined to one common *"BACnet internetwork"*. The figure above shows an example of some BACnet devices in one *"BACnet internetwork"*. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example *"BACnet internetwork"* consists of different BACnet networks:

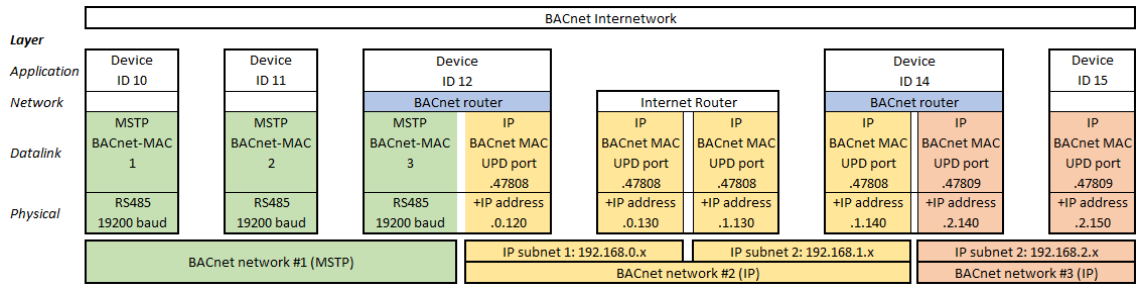
- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
  ↳ *Chapter 1.6.6.3.9.3.4.4 "Configuration of datalinks " on page 3939*
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.
  ↳ *Chapter 1.6.6.3.9.3.4.4 "Configuration of datalinks " on page 3939*

To form a common *"BACnet internetwork"* the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.



The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by *"Broadcast Management Devices"* (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in *Chapter 1.6.6.3.9.3.4.4 "Configuration of datalinks " on page 3939*.

Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with *"ID 12"*. The device contains more objects like the *Analog Input* object, representing the input of a temperature measurement device. An object contains several properties, like *"ID, Description, Present Value, Unit"* etc.

Further possible objects of an AC500 B-BC are:

- *"Binary Input"* for example from connected to a switch
- *"Analog / Binary Output"* for actuators
- *"Analog / Binary Values"* for local variables
- *"Calender"*
- *"Schedule"*
- *"Trend Log"*
- ...
- A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.

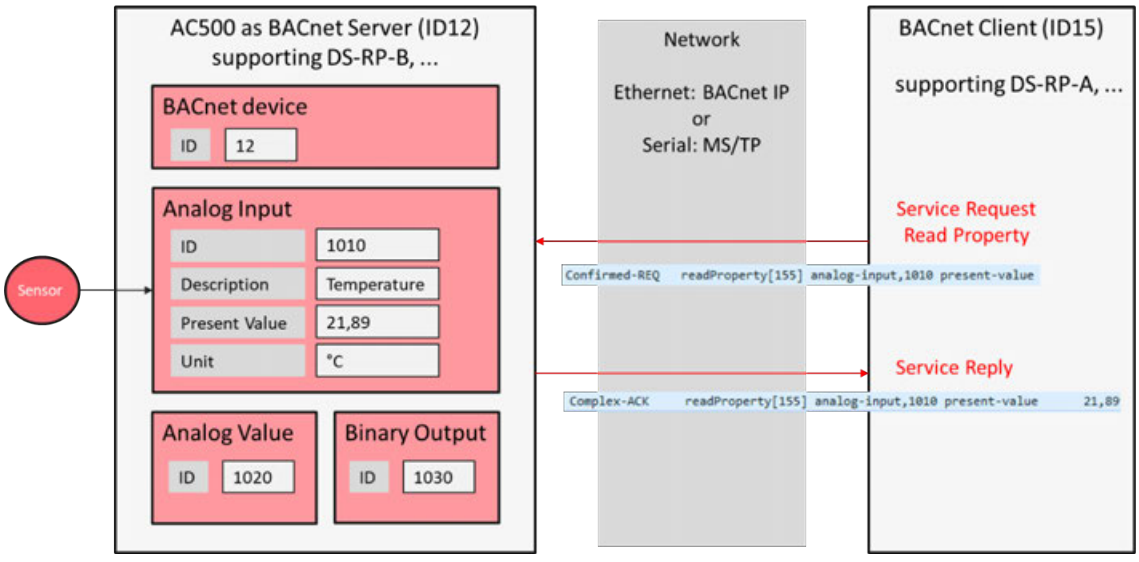


Fig. 341: BACnet objects, properties, services and BIBBs

Supported BIBBs and services

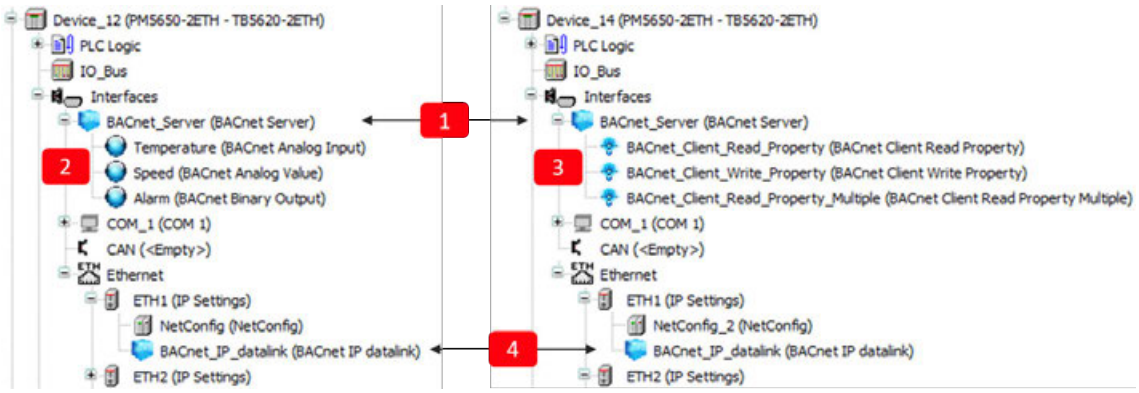
While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 341 *BACnet objects, properties, services and BIBBs* shows a simple *"Service Read Property"* which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request *"Read Property"*, asking for the present value of the *"Analog Input"* of object with *"ID 1010"*.
2. The server answers with an acknowledge, sending the present value which is 21,89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

BACnet configuration in Automation Builder

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.



Following objects need to be created:

1 *"BACnet Server"* root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. ↳ *Chapter 1.6.6.3.9.3.4.1 "Configuration of BACnet server root object " on page 3934*

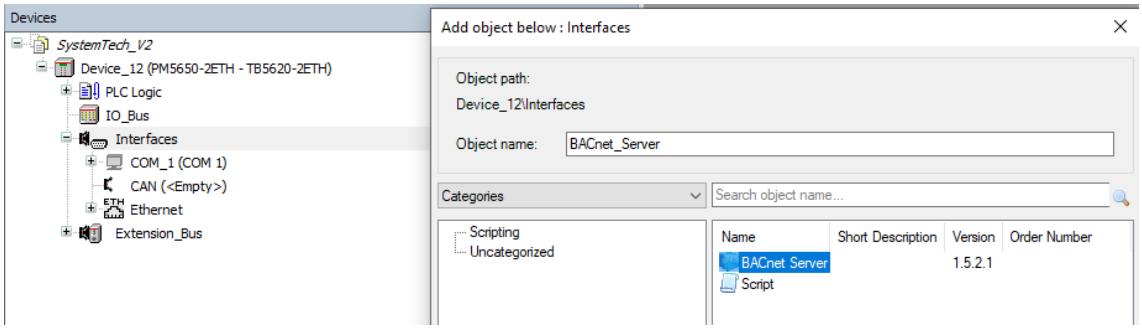
2 BACnet server objects, for example *"BACnet Analog Input"* `Temperature`. The properties of the objects must be controlled (written or read) by the PLC logic. ↳ *Chapter 1.6.6.3.9.3.4.2 "Adding BACnet server objects" on page 3935*

3 BACnet client objects, represented by a different symbol. For example, *"BACnet Client Read Property"*. The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. ↳ *Chapter 1.6.6.3.9.3.4.3 "Adding BACnet client functionality" on page 3936*

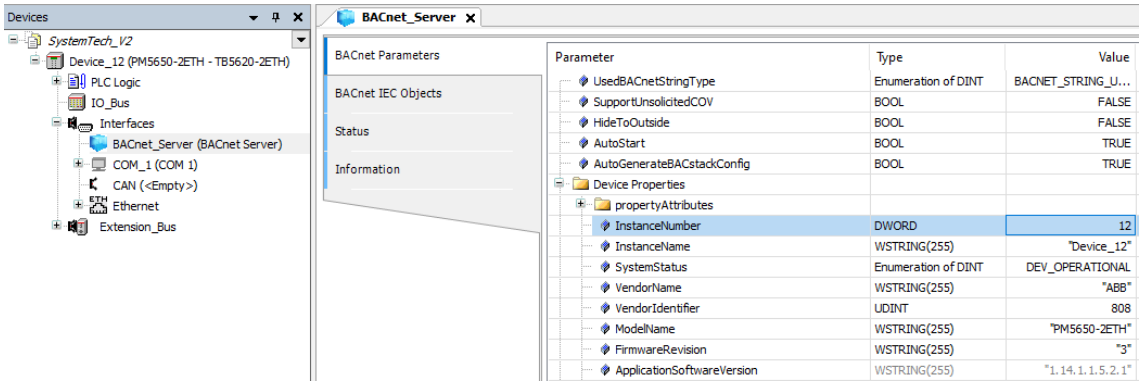
4 Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the *"BACnet Server"* object. In the example above the IP address of `ETH1` is automatically retrieved by inserting the *"BACnet IP datalink"* below the `ETH1` port. ↳ *"Configuration of an IP datalink" on page 3940*. For MS/TP refer to ↳ *"Configuration of an MS/TP datalink" on page 3939*.

Configuration of BACnet server root object

1. Create an empty project with an AC500 V3 CPU type and call it fpr example *“Device_12”*.
2. Insert a *“BACnet Server”* object below the interfaces object in the device tree.

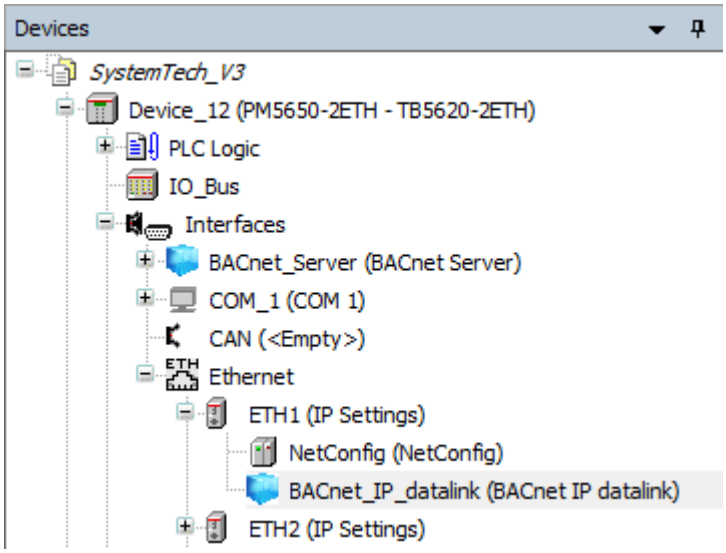


3. Set the device `InstanceNumber` in the *“BACnet Parameters”* of the *“BACnet Server”*, e.g. to `12` and the `InstanceName` to `Device_12` (according to Fig. 341 *BACnet objects, properties, services and BIBBs*).



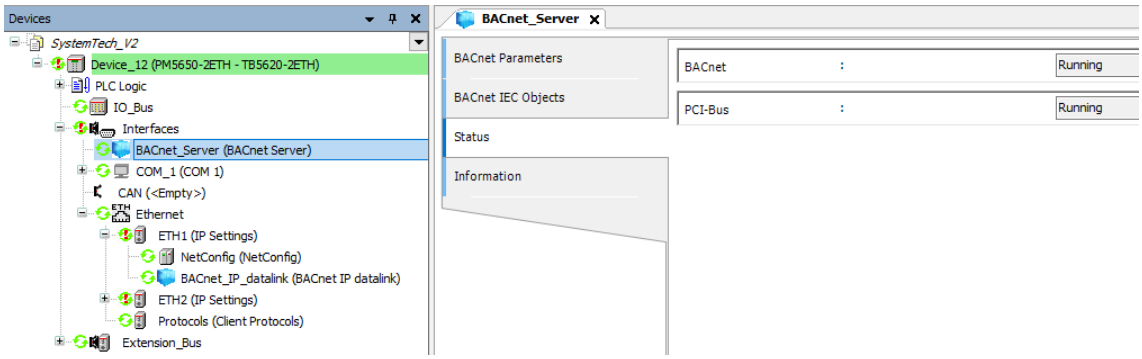
4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below `ETH1`. Default parameters are sufficient if only one datalink is used.

↳ *“Configuration of an IP datalink” on page 3940*

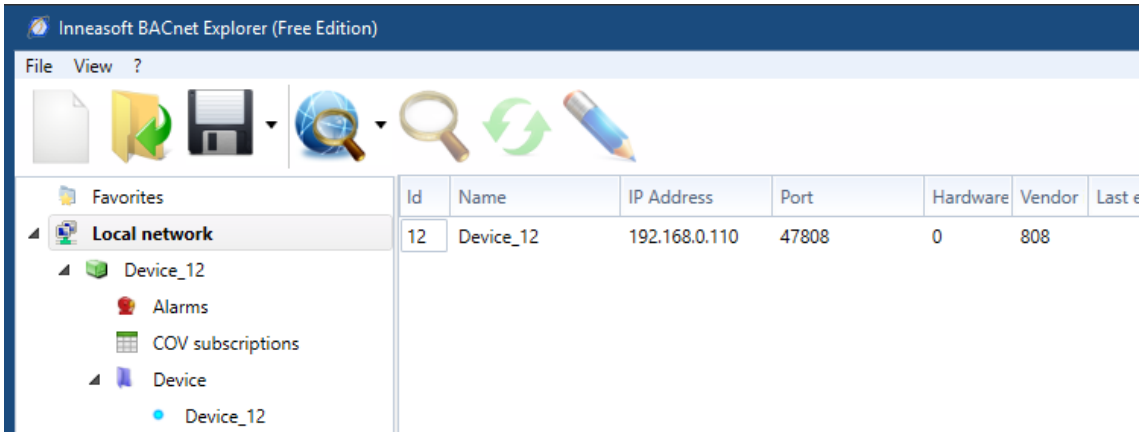


5. Build the project, download to the PLC and set it to *[RUN]*. The status of the *"BACnet Server"* should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select *[Show license information]* from the runtime licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

↳ *Chapter 1.6.6.2.2.2 "PLC runtime licensing" on page 3665*



6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

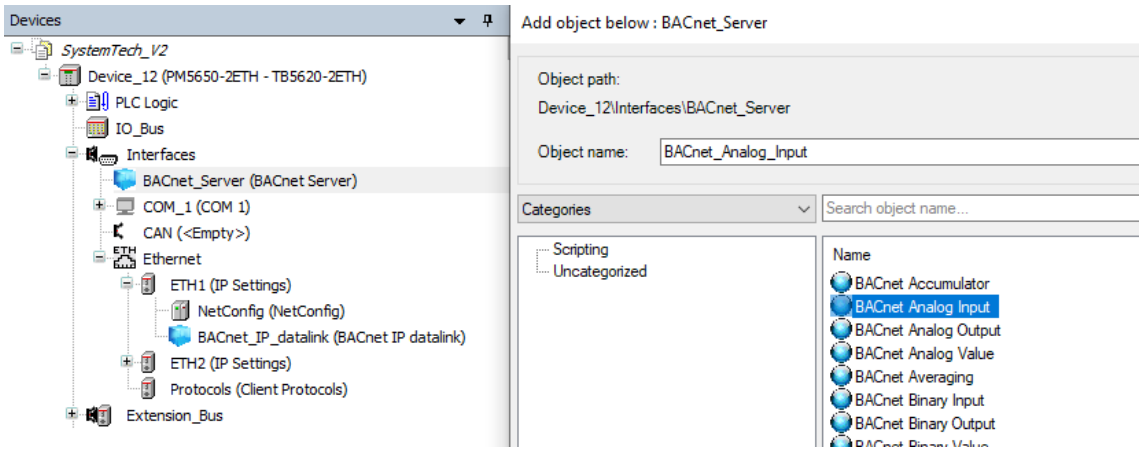


Adding BACnet server objects

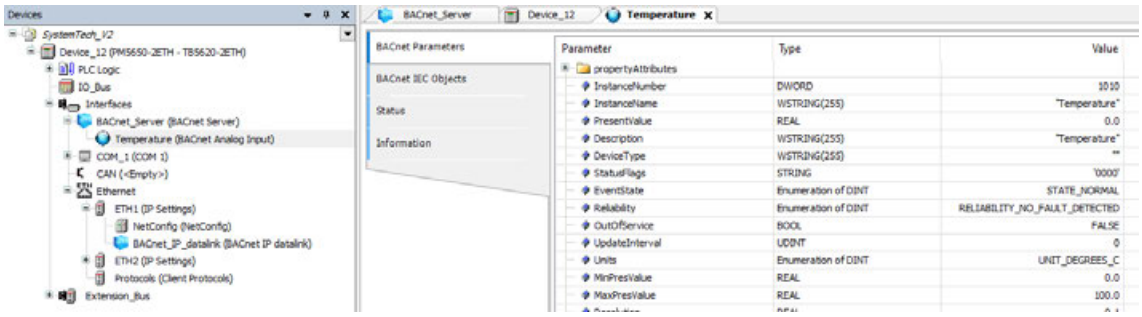
Goal is to publish an analog value as BACnet server object. This example is according to Fig. 341 *BACnet objects, properties, services and BIBBs*, left part containing a temperature value.

1. Configure a *"BACnet Server"* root object according to ↳ *Chapter 1.6.6.3.9.3.4.1 "Configuration of BACnet server root object " on page 3934*.

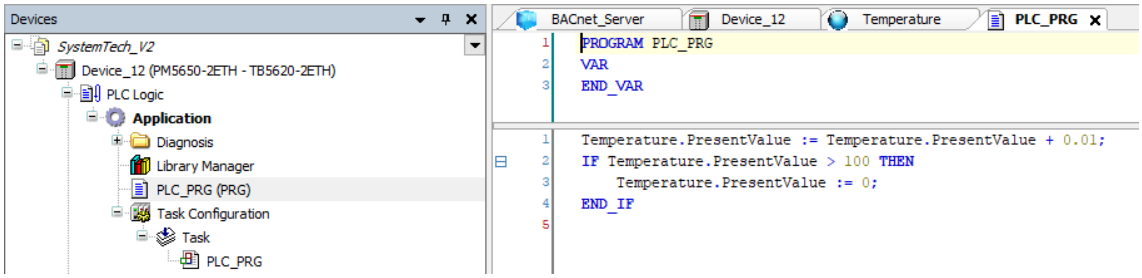
2. Add a *"BACnet Analog Input"* object below the *"BACnet Server"*.



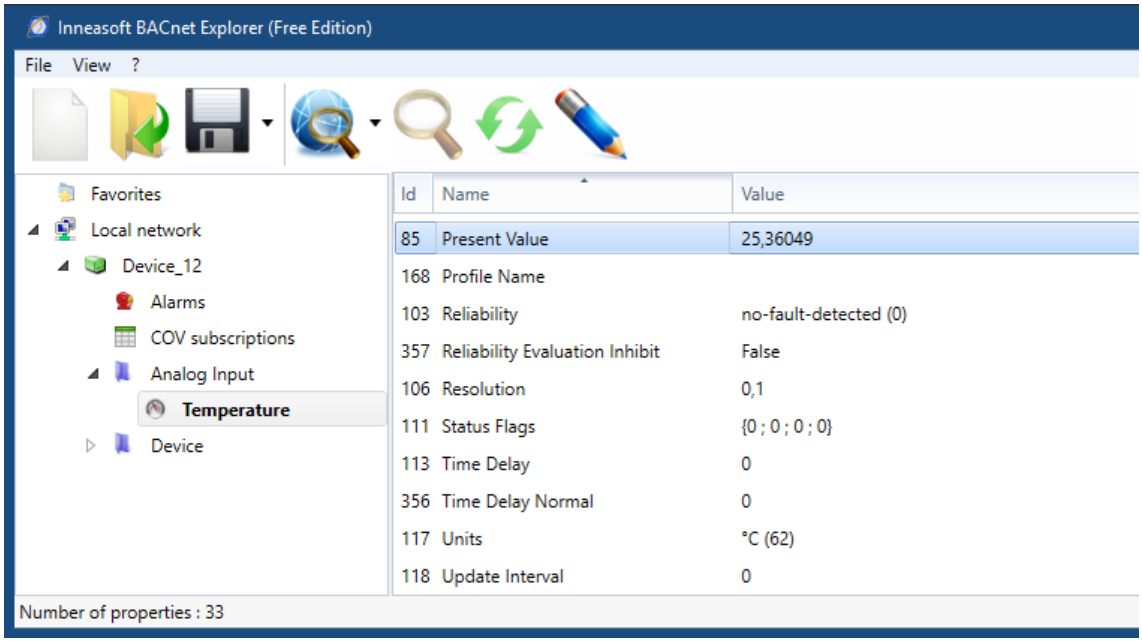
3. Rename it to `Temperature`, adjust the parameters: `InstanceNumber`: `1010`, `Description`: `Temperature`, `Units`: `UNIT_DEGREES_C`.



4. The present value of the objects `Temperature` needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.



5. Download the program and observe the temperature value in the BACnet client.

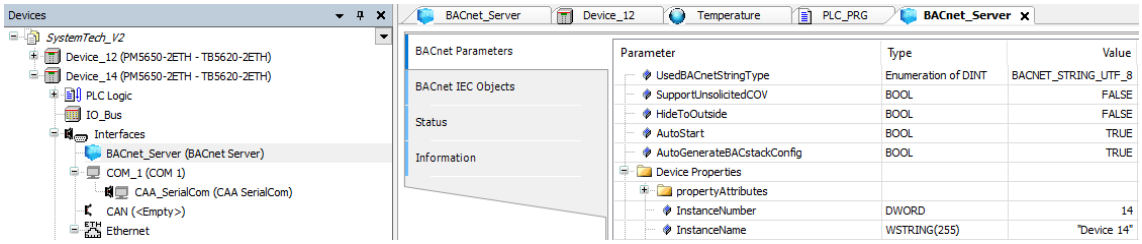


Adding BACnet client functionality

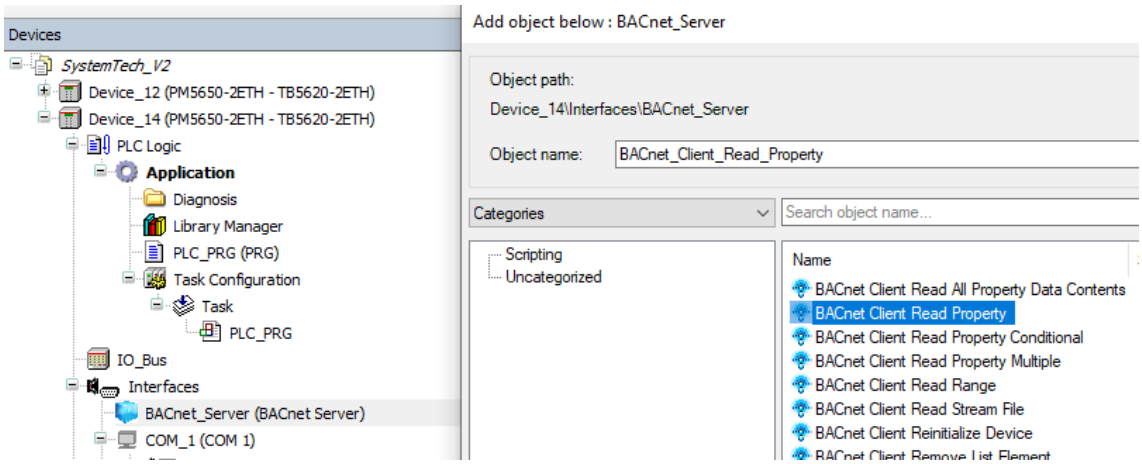
Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 341 *BACnet objects, properties, services and BIBBs*, right part.

1. Add a new controller and configure a *"BACnet Server"* root object according to ↳ *Chapter 1.6.6.3.9.3.4.1 "Configuration of BACnet server root object " on page 3934*.

2. Set `InstanceNumber` to `14` and `InstanceName` to `Device 14`.



3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a *"BACnet Server"*. Add a *"BACnet Client Read Property"* below the *"BACnet Server"* node.

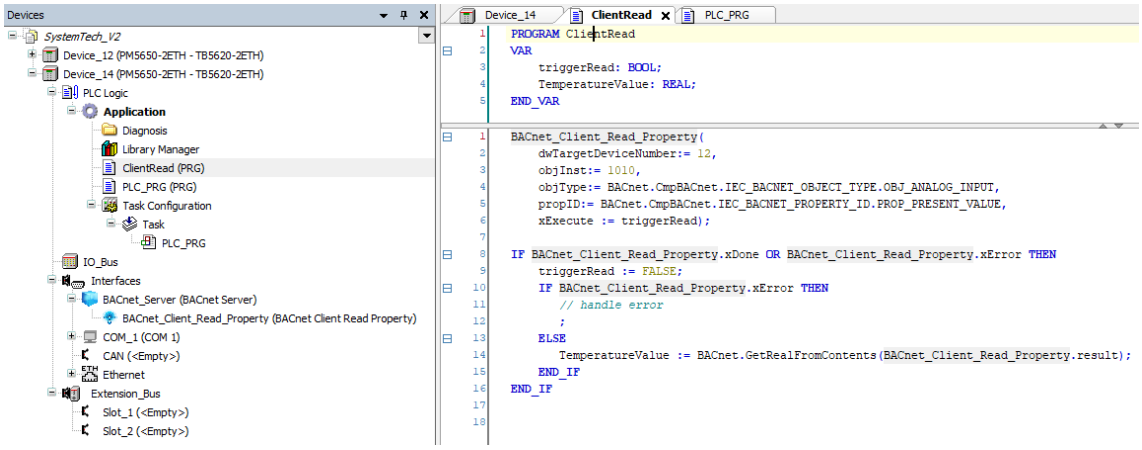


4. The created object *“BACnet Client Read Property”* generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

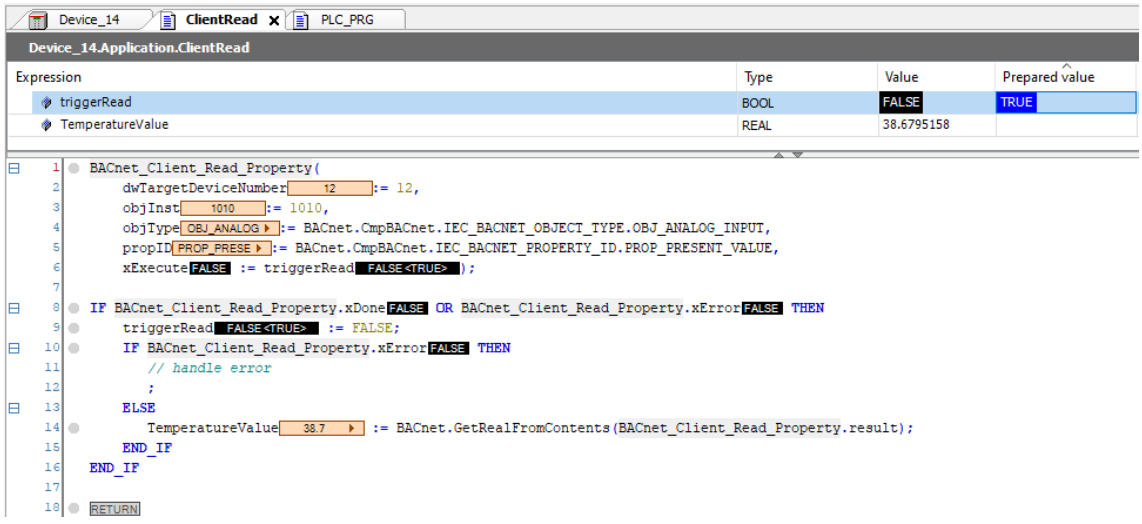
   In line 1-5 of the code part the function block is called with the following parameter:

   - Device ID of the server to read from (`12`) ↳ *Chapter 1.6.6.3.9.3.2 “Supported objects and properties ” on page 3932*
   - Object ID of the object to read from (`1010` for the *“Analog Input”*)
   - Object type (*“Analog Input”*)
   - Property to read (*“present value”*)
   - `triggerRead` to start the read operation

   When the user (or another program part) sets the variable `triggerRead` from `FALSE` to `TRUE` the edge triggered function block `BACnet_Client_Read_Property` starts operation and sends the read request to the server device. After receiving the reply from the Server, the output `.xDone` gets `TRUE` (line 8) and the temperature value can be read from the output `.result` (line 14).

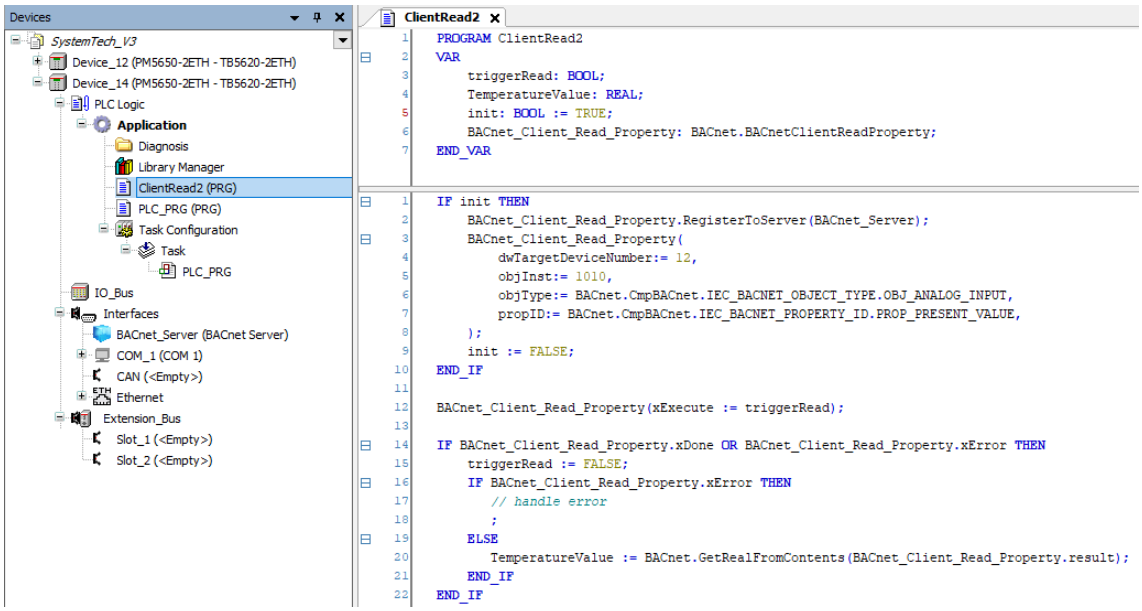


5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting `triggerRead` to `TRUE`. In online mode the read temperature value can be observed in line 14.

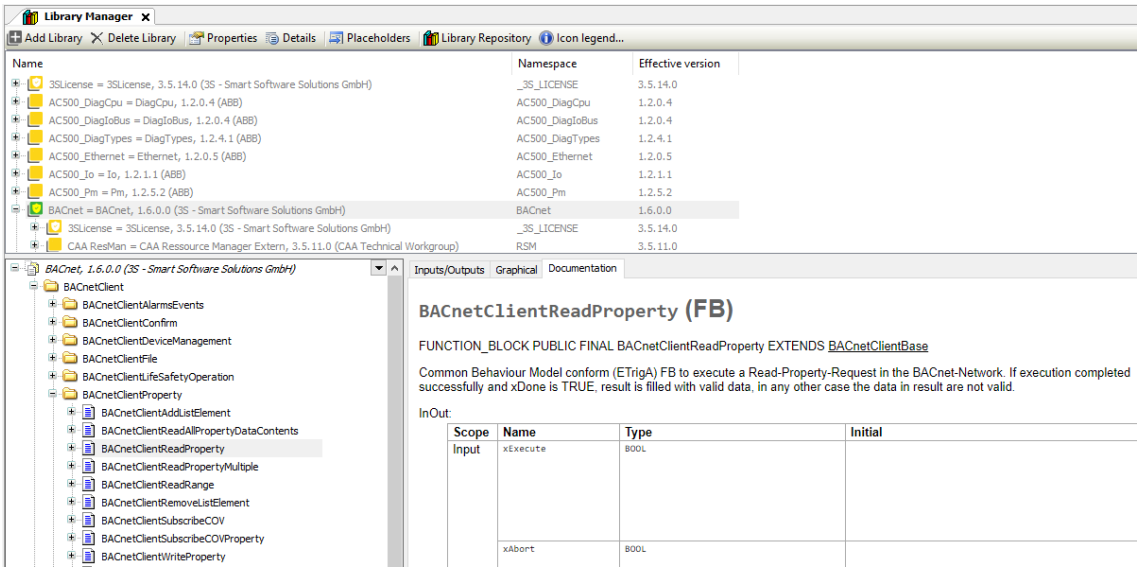


Alternative configuration

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.



There is no `BACnet_Client_Read_Property` object created below the *"BACnet Server"*. Instead a function block `BACnet_Client_Read_Property` must be declared in the PRG (line 6 in the declaration) and initially "connected" to its *"BACnet Server"* in IEC-code via `RegisterToServer()`, and thus get activated (line 2 in the code) ↳ *Chapter 1.10 "Reference, function blocks" on page 4292*.



Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

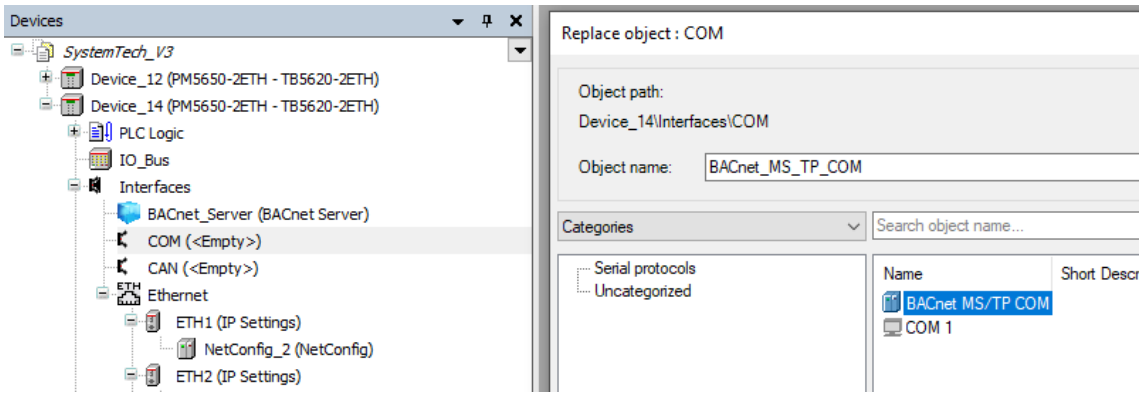
↳ *Chapter 1.6.6.3.9.3.1 "Supported BACnet networks " on page 3931*

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.

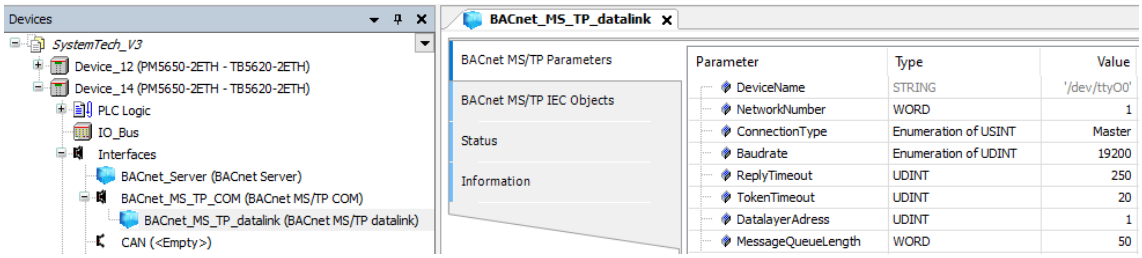
Configuration of an MS/TP datalink

- Add the *"BACnet MS/TP COM"* object below the COM port.



In fact the empty COM port is replaced by the *"BACnet MS/TP COM"*. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

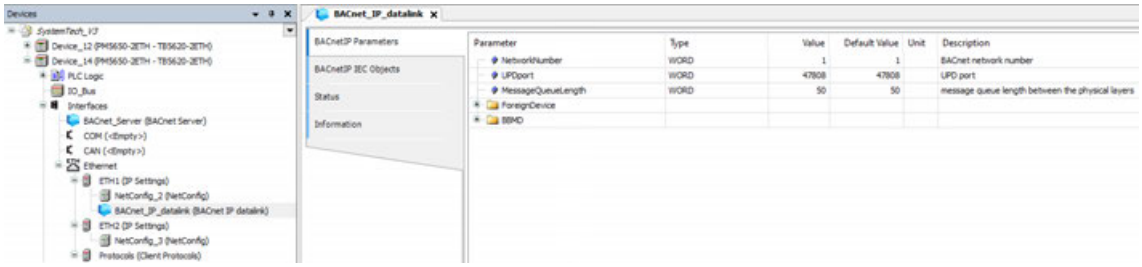
- Below the *"BACnet MS/TP COM"* port object an *"BACnet MS/TP datalink"* is inserted automatically which can be configured according to the requirements.



- `NetworkNumber`: Use the default value `1` if no routing is required. For routing, use a unique network number in one controller.
- `ConnectionType`: Use the default value `Master` if no routing is required. For routing, use *"Master – answering always postponed"*.
- `Baudrate` can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.
- `DatalayerAddress`: This is the MAC address as described in *Chapter 1.6.6.3.9.3.1 "Supported BACnet networks " on page 3931*. The MAC address must be unique in the MS/TP network.
- For all other parameters the default values are recommended for typical applications.

Configuration of an IP datalink

- Add a *"BACnet_IP_datalink"* object below the Ethernet port `ETH1` or `ETH2`.



- `NetworkNumber`: Use the default value if no routing is required. For routing, use a unique network number in one controller.
- `UPDport`: Use the default value (`47808` decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in *Chapter 1.6.6.3.9.3.1 “Supported BACnet networks ” on page 3931*. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (`ETH1` or `ETH2`); its IP address is set in the communication settings of the CPU node, *“Device_14”* in the example.
- `ForeignDevice` and `BBMD`: Special configuration is only needed if an internet router is located between two BACnet devices.
  Chapter 1.6.6.3.9.3.1 “Supported BACnet networks ” on page 3931
  AC500 can be configured as `ForeignDevice` or `BBMD`, but not the combination of both. An example for BBDM can be found in the example folder.

Configuration of Routing

Routing enables the combination of different BACnet networks to one common *“BACnet internetwork”*.

Chapter 1.6.6.3.9.3.1 “Supported BACnet networks ” on page 3931

BACnet devices from different BACnet networks can communicate with each other.

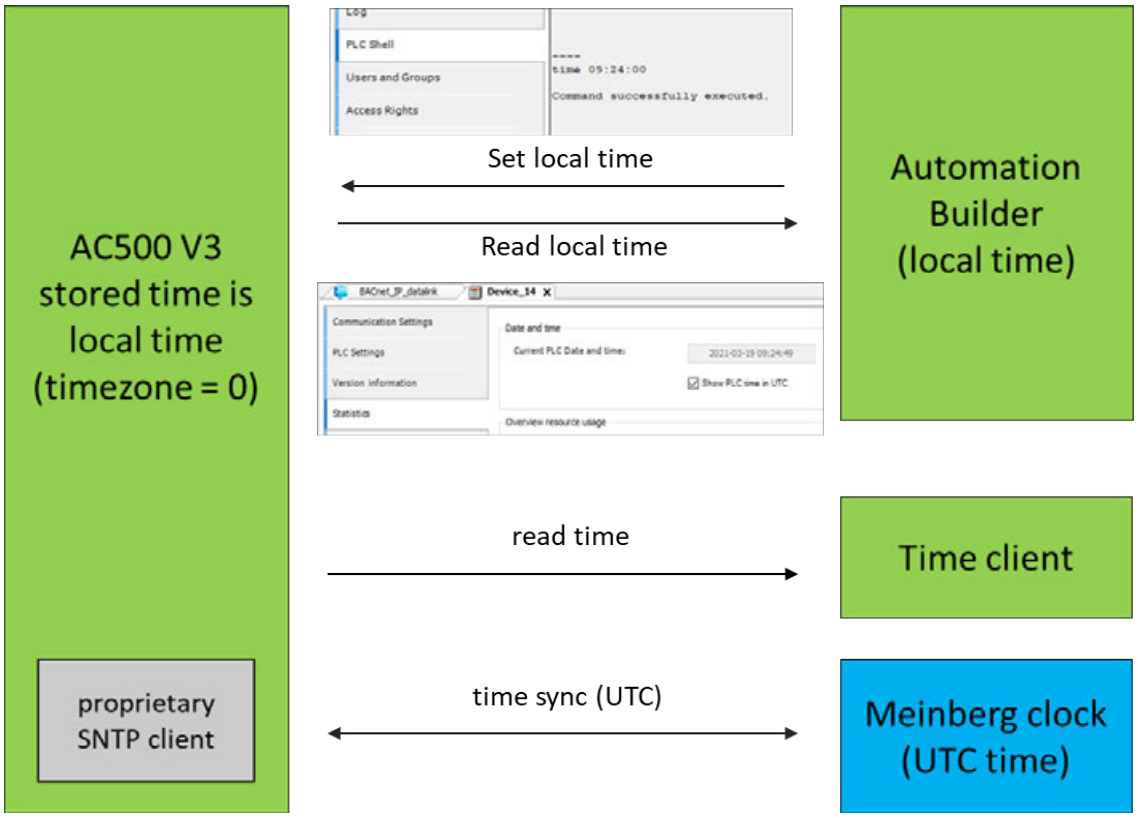
If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

Chapter 1.6.6.3.9.3.1 “Supported BACnet networks ” on page 3931

For MS/TP the `ConnectionType` must be set to *“Master – answering always postponed”*. An example for routing can be found in the example folder.

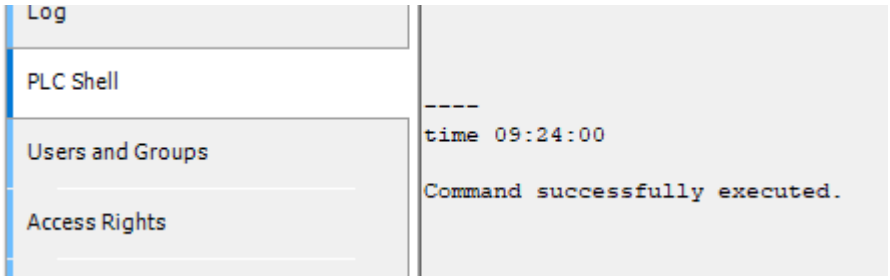
Time syncronisation

The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.

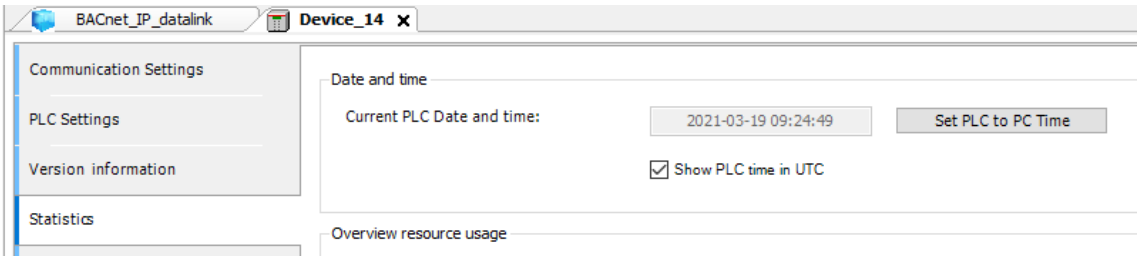


Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab *"PLC Shell"*:
  Set the time by the command "time hh:mm:ss"



- Read the local time from the Automation Builder Tab *"Statistics"*:
  "Current PLC Date and time" shows the PLC time as local time without conversion, if the tab *"Show PLC time in UTC"* is enabled.



For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab "Statistics"), since this is always converting from local time to UTC time.

- BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.
- If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.
  Please contact the PLC support for more information.

Package content

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
  - BACnet plug-in component
  - Device descriptions for *"BACnet Server"*, BACnet objects, BACnet client and datalinks
  - Libraries: `BACnet`, `BACnetDefaultImpl` and `CmpBACnet`.
    Chapter 1.6.6.3.9.3.5.1 "BACnet libraries" on page 3943

Example folder

- Example folder
  - Examples and example documentation
    Chapter 1.6.6.3.9.3.5.2 "Application examples" on page 3944
  - Datasheet and FAQ
    BACnet Protocol Implementation Conformance Statement (PICS), acting as a datasheet, describing all BACnet objects, services and communication capabilities.
    BACnet Conformance Certificate
    FAQ – Frequently Asked Questions, including AC500 specific information, performance and limit

BACnet libraries

The IEC library `CmpBACnet` represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the `BACstack` methods. The sole use of the IEC library `CmpBACnet` (without the `BACnet` and `BACnetDefaultImpl` libraries) would result in complex and lengthy IEC application code.

The `BACnet` library simplifies BACnet application development considerably as compared to the sole use of `CmpBACnet`, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see `IBACnetEventConsumer`) and distributing the callbacks to multiple receivers in the application

Furthermore, the `BACnet` library provides a plug-in mechanism (`BACnetServerPlugin`) for extending certain aspects of the `BACnet` library. `BACnetServerPlugin` is the basis for the `BACnetDefaultImpl` library.

The `BACnetDefaultImpl` library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of `Trend Log`, `Trend Log Multiple`, and `Event Log` entries
- Update of the date/time information of the device object

The IEC library `BACnet` is intended as a layer over the IEC library `CmpBACnet`. However, the layer does not hide the library because this would require the `BACnet` library to have "facade" functions for `CmpBACnet` functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the `BACnet` library or `CmpBACnet` library are to be used.

General rules:

- Starting and stopping the BACnet stack
  Always use `BACnetServer.StartBACnetStack` and `BACnetServer.StopBACnetStack` or `AutoStart`. Never directly use the corresponding functions of the `CmpBACnet` library, such as `CmpBACnet.BACnetServerInit`.
- Using BACnet server objects and their properties
  Always use the specified function blocks in IEC-lib-BACnet, such as `BACnetAnalogValue`. Never directly use the corresponding functions of the `BACnet` library, such as `CmpBACnet.BACnetStorePropertyInstance`.
- Triggering of asynchronous requests
  Always use the specified client function blocks of the `BACnet` library, such as `BACnetClientReadProperty`. Never directly use the corresponding functions of the `CmpBACnet` library, such as `CmpBACnet.BACnetReadProperty`. All functions of the `CmpBACnet` library that require a `BACnetAsyncTransactionToken` belong to this category and should never be used directly.
- Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application
  Always use `IBACnetEventConsumer` and `BACnetServer.RegisterHook`/`UnregisterHook/RegisterCallback`/`UnregisterCallback`. Never directly use the corresponding functions of the `CmpBACnet` library, such as `CmpBACnet.BACnetSetHook` or `CmpBACnet.BACnetSetCallback`.

When is it appropriate and safe to directly call the functions of the `CmpBACnet` library?

Basically, it is only necessary to call functions of `CmpBACnet` directly when a corresponding functionality is not provided in the `BACnet` library. Check the `BACnet` library first before trying to use `CmpBACnet` directly. It is possible to use blocking functions in `CmpBACnet`, such as `BACnet*CbCompletion`, `BACnetIam(Ex)`, or `BACnetIHave(Ex)`, `BACnetUnconf*`.

Most often, you will use `BACnet*CbCompletion` to implement your specific `IBACnetEventConsumer.BACnetEventCallback`s. But first check whether or not the `BACnetDefaultImpl` library already contains an appropriate standard implementation.

Application examples

- `AC500_V3_BACnet_B-BC_Example_ABxxx.project` including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as *“BACnet Server”*, publish the analog value
- `AC500_V3_BACnet_B-BC_Example_Routing_ABxxx.project`
- Examples from 3S, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing

1.6.6.3.10 OPC UA

AC500 V3 controllers support the OPC UA protocol - a machine to machine communication protocol for industrial automation. Further information on OPC UA:

- How to connect robot controllers to OPC UA: *https://new.abb.com/products/robotics/home/irc5/irc5-options/opc-ua*
- Installation and configuration of an OPC UA server: *Chapter 1.6.6.5.2 “OPC UA server for AC500 V3 products” on page 3981*
- Configuration and handling of OPC UA in Automation Builder: *https://library.e.abb.com/public/1d1cbdc36f2d417cb455c946835d12ea/Application%20Note%203ADR*

1.6.6.4 Data transfer and programming

1.6.6.4.1 Source download/upload

Source download

Prerequisites

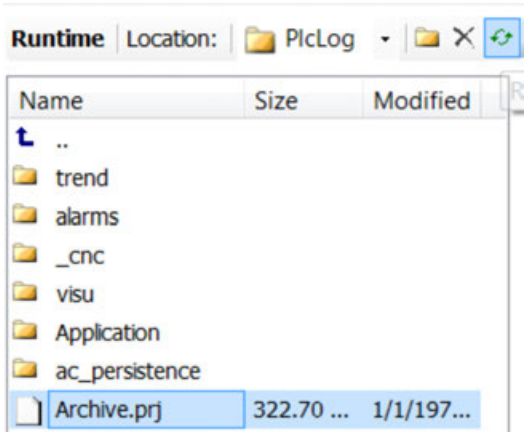
- Communication settings are correct
- Project is saved on PC
- PLC is connected

1. Click *“Online* ➔ *Source download to connected device”*.

   ⇨ Project archive will be downloaded to PLC.

2. To verify download double-click node *“PLC_AC500_V3”*, select view *“Files”* and double-click folder *“PlcLogic”* of the *Runtime* view (if necessary click refresh button of *Runtime* view).

   ⇨ File *Archive.prj* will appear if download was successful.



Source upload

Prerequisite

- Project archive on PLC available (from previous source download)
- PLC is connected

1. Open Automation Builder.
2. Click *“File ➔ Source upload...”*.
   ⇨ Window *Pick the device from where you want to upload the source archive...* appears.

   If you get an error click *[Scan for other devices]*.
3. Select your PLC with the archive and click *[OK]*.
   ⇨ Dialog *Extract Project Archive* appears.
4. Select your preferred folder and click *[Extract]*.
   ⇨ Then you are prompted to open the project archive.
5. Click *[Yes]*.
   ⇨ The project opens.

   Upload was successful.

1.6.6.4.2 Programming and testing

For information on programming see

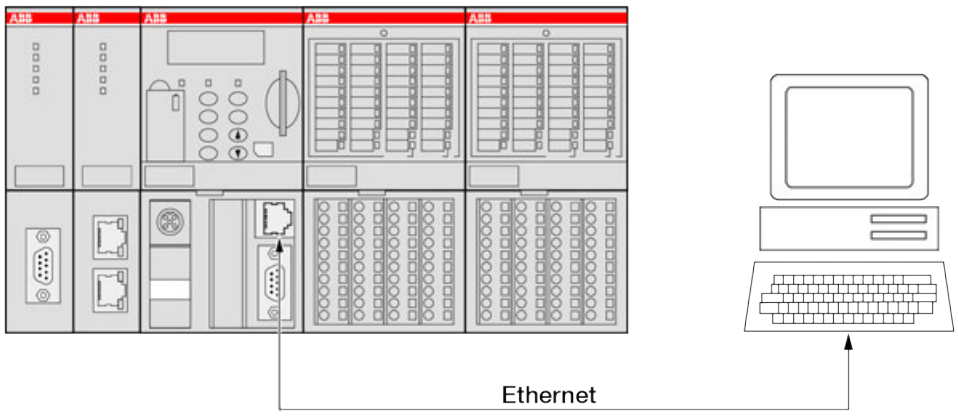
- *Chapter 1.4.1.8 “Programming of Applications” on page 222*
- *Chapter 1.4.1.10.1 “Configuring the Connection to the PLC” on page 380*
- *Chapter 1.6.6.4.3.1 “Enter a known PLC IP address” on page 3947*
- *Chapter 1.4.1.10 “Downloading an Application to the PLC” on page 379*

For Information on testing/debugging see *Chapter 1.4.1.11 “Testing and Debugging” on page 394*

1.6.6.4.3 Configuration of communication via Ethernet (TCP/IP)

Programming via Ethernet is only possible on a PC with Ethernet board and installed network. Programming can be done via the internal (onboard) Ethernet communication module.

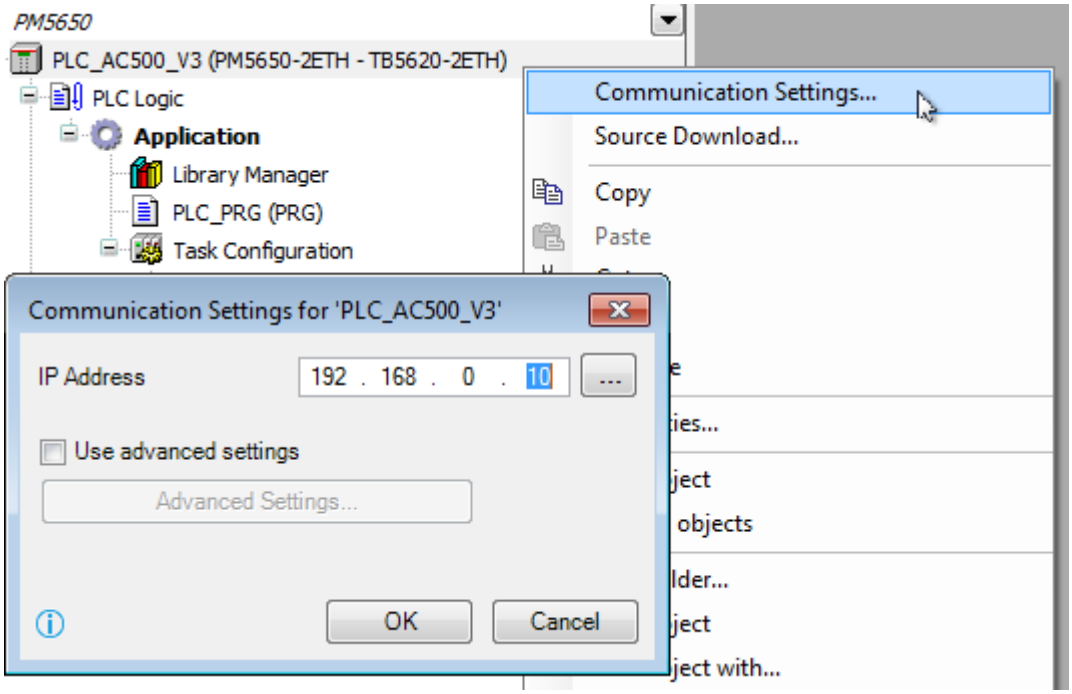
An application note describes the configuration of an AC500 V3 PLC for *EtherNet/IP communication* ↳ *Chapter 1.4.2.4 "EtherNet/IP Configurator" on page 1220*.



Enter a known PLC IP address

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.

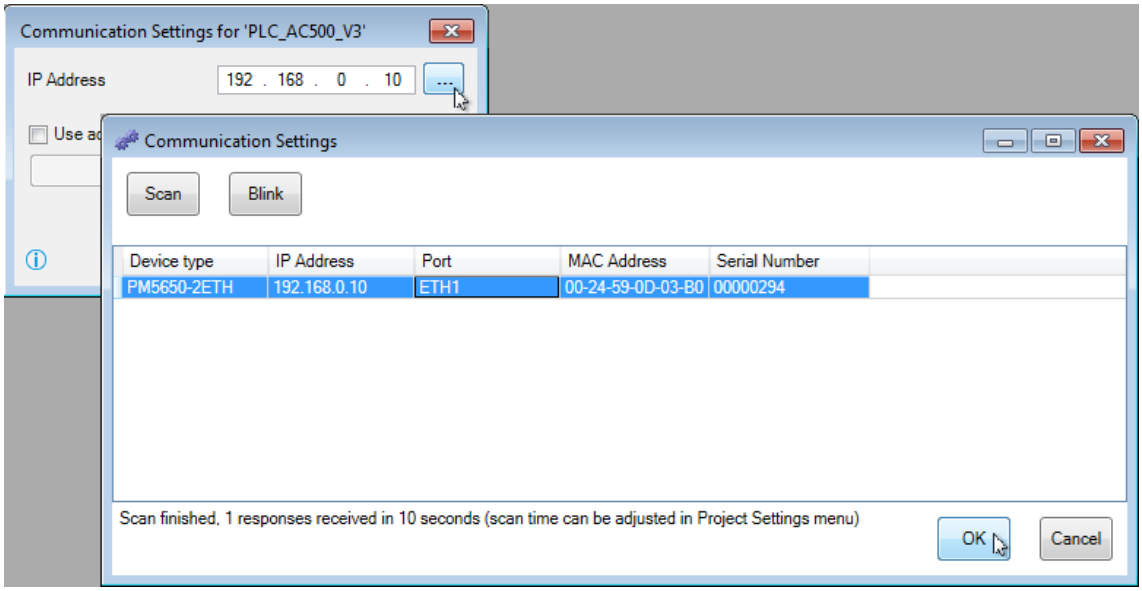


2. Enter your PLC *IP Address* and click *[OK]*.

Enter PLC IP address by scanning devices

1. Right-click the top node *"PLC_AC500 <...>"* and select *"Communication Settings"* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.



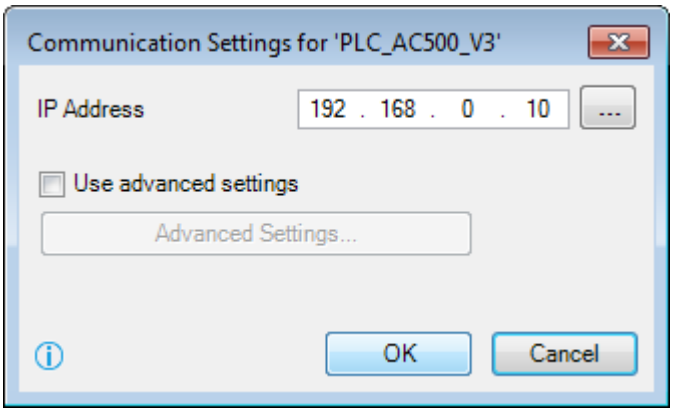
2. Click *[...]*.

   ⇨ Dialog box *Communication Settings <...>* appears.

3. Click *[Scan]*, select your desired PLC and click *[OK]*.

   ⇨ Entry is transferred to the dialog box *Communication Settings <...>*.

   Click *[OK]*.



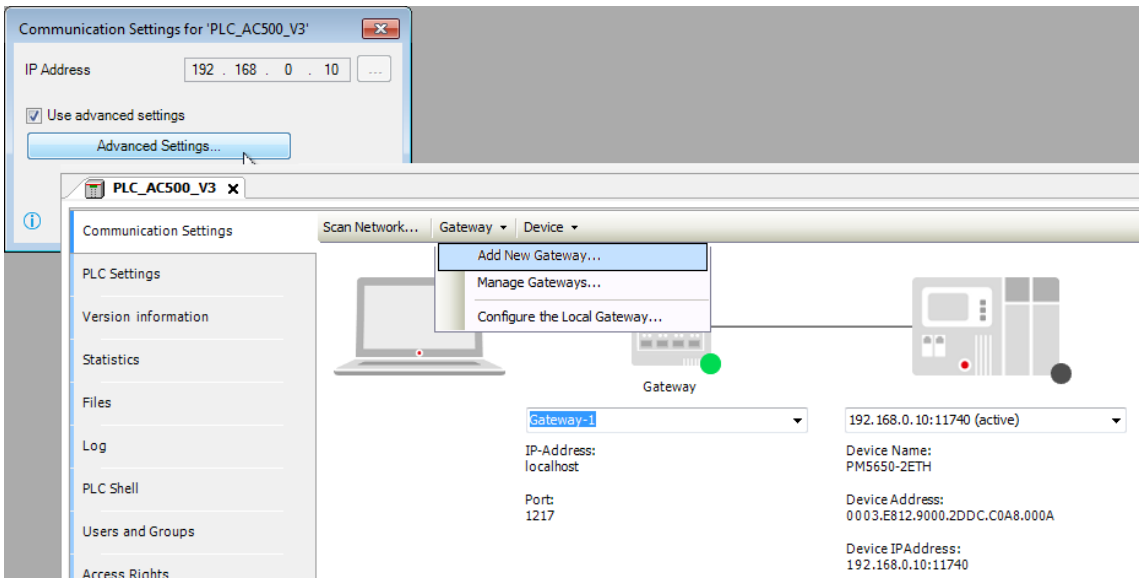
4. Click to log in the *"PLC_AC500_V3"* project.

Enter PLC IP address by *[Advanced Settings...]*

If a remote gateway instead of a local one has to be used it can be configured in the *[Advanced Settings...]*.

1. Right-click the top node *“PLC_AC500 <...>”* and select *“Communication Settings”* from the context menu.

   ⇨ Dialog box *Communication Settings <...>* appears.



2. Enable checkbox*Use advanced settings* and click *[Advanced Settings...]*.

   ⇨ Tab *“Communication Settings”* opens.

3. Check gateway or change if required.

   ⇨ Successful connection is indicated by green dot on the gateway icon.

4. *Manual entry of the IP address.*

   Check IP adress or change if required.

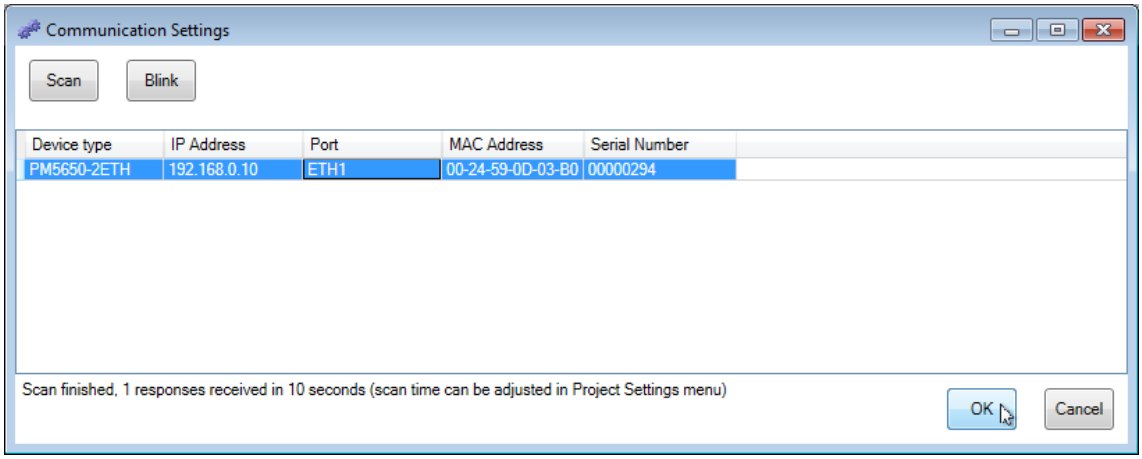
5. Press ENTER to confirm changed IP address.

   ⇨ Successful communication is indicated by green dot on the PLC icon.

6. Or instead of the last two steps:

> *Set the IP address via a scan.*

Click *[Scan Network]*, select your desired PLC and click *[OK]*.



⇨ Successful connection is indicated by green dot on the gateway icon.

7. Click to log in the *"PLC_AC500_V3"* project.

1.6.6.4.4 PLC shell commands

The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab *"PLC Shell"*.
3. Enter "?" in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

> *The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.*
>
> *See:*
>
> *Chapter 1.2.6 "Further information" on page 49*
>
> *Chapter 1.6.6.1.4 "Firmware identification and update" on page 3652.*

1.6.6.4.5 Watchlists

Chapter 1.4.1.12.1.2 "Using watch lists" on page 416

Chapter 1.4.1.12.2 "Changing Values with Recipes" on page 417

1.6.6.4.6 Reference to libraries

Library configuration is described in the chapter ↳ *Chapter 1.5 “Libraries and solutions” on page 2146*.

1.6.6.4.7 Reference to application libraries

Application libraries can be used in AC500 V3 PLCs. The requirements for the use of the function blocks of the application libraries and information and prerequisites for the general handling of application libraries are described in the application examples:

- HTTP library
  In order to be able to use the PLC as a client for web services, the HTTP function block library can be used. Setup and use are described in the *application example*.
- MySQL library
  With the help of the MySQL function block library, MySQL databases can be used to store and access AC500 V3 data. Setup and use are described in the *application example*.
- MSSQL library
  With the help of the MSSQL function block library, MSSQL databases can be used to store and access AC500 V3 data. Setup and use are described in the *application example*

1.6.6.4.8 Programming in C code

With the C code integration plugin from CODESYS, externally implemented C code files can be included in Automation Builder projects. For further information see CODESYS description ↳ *Chapter 1.4.1.8.10 “Integrating C Modules” on page 275*.

1.6.6.5 Server installation

1.6.6.5.1 OPC server for AC500 V3 products

Introduction

Architecture of the CODESYS OPC server

*If folder **C:\ProgramData** is missing, select "Show hidden files, folders and drives" at "Control Panel ➔ All Control Panel Items ➔ Folder Options ➔ View ➔ Hidden files and folders".*

Installation of OPC server

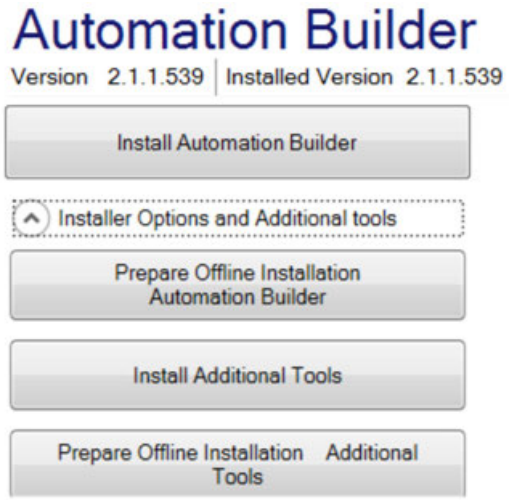
Prerequisites

The following applications are closed:
- *All OPC clients*
- *ABB OPC tunnel*
- *CODESYS gateway server*

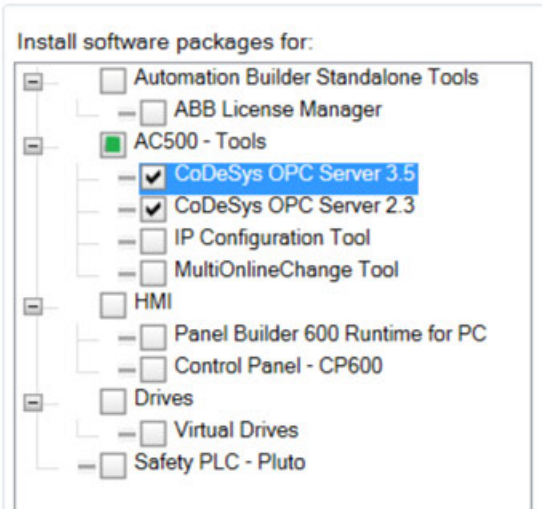
Ensure termination of the following processes:
- *Gateway.exe*
- *CoDeSysOPC.exe*
- *WinCoDeSysOPC.exe*
- *OCTsvc.exe*

Installing with Automation Builder

1. Go to homepage *http://new.abb.com/plc/automationbuilder/platform/software* .
2. Click button of *Latest Automation Builder version (recommended)* and run the installer.



3. Open *"Installer Options and Additional Tools"* and click *[Install Additional Tools]*.
4. Agree to the *"License Terms"*.



5. Select *“Version 2 and/or 3”* and install.

   ⇨ All required files are installed for OPC and the OPC server is registered automatically as user application.

Manual registration and unregistration

It is possible to register or to uninstall the OPC server manually either as COM server (user application) or as a service.

Register the OPC server as interactive software in the Windows registry:

Command for OPC 3: ***`WinCoDeSysOPC/RegServer`***

Register the OPC server as system service:

Command for OPC 3: ***`WinCoDeSysOPC/Service`***

Unregister the OPC server from the Windows registry and from the service entry:

Command for OPC 3: ***`WinCoDeSysOPC/UnRegServer`***

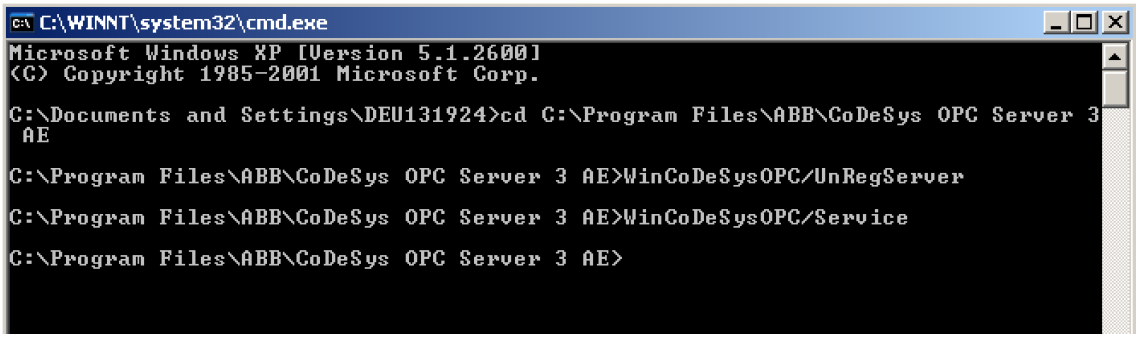
Please see REF1 chapter 3 (OPC 3) ↳ Table on page 3953 for details.

Register OPC server V3 as a system service

Prerequisites

- All programs, processes and services which connect to the OPC server are closed.

1. Start the *"Command Prompt"* with command *"cmd"* in the *"Start ➔ Run... "* window.



2. Go to the *CoDeSysOPC V2* installation folder.
3. Unregister the OPC server with `WinCoDeSysOPC/UnRegServer`.
4. Register the OPC server as system service with `WinCoDeSysOPC/Service`.

OPC clients for tests

Free of charge test clients can be found in the web:

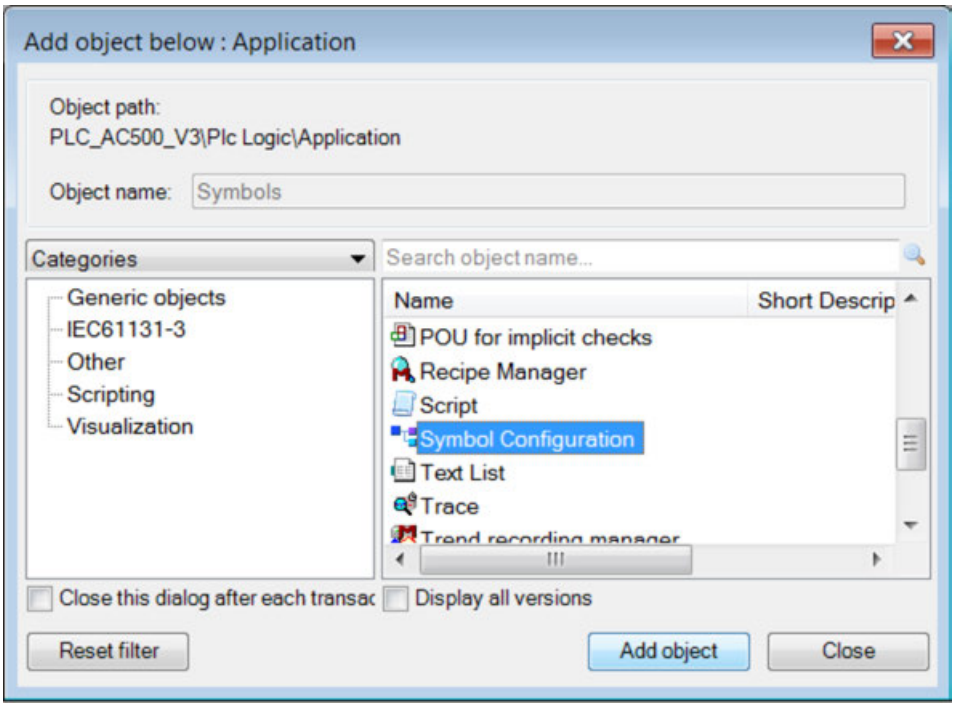
https://industrial.softing.com/us/downloads.html

http://www.matrikonopc.com/products/opc-desktop-tools/index.aspx

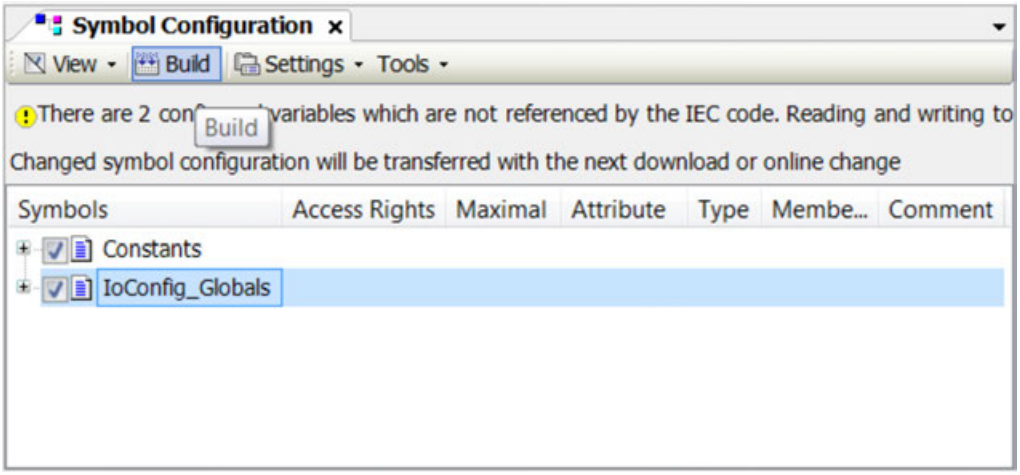
Symbol file

Define symbols

1. Right-click on *"Application"* in CODESYS V3 project and click *"Add Object"*.



2. Choose *"Symbol Configuration"* and click *[Add object]*.



3. Select your programs and/or single symbols and click *[Build]*.
   ⇨ A symbol file will be automatically downloaded to the PLC with Project Download.

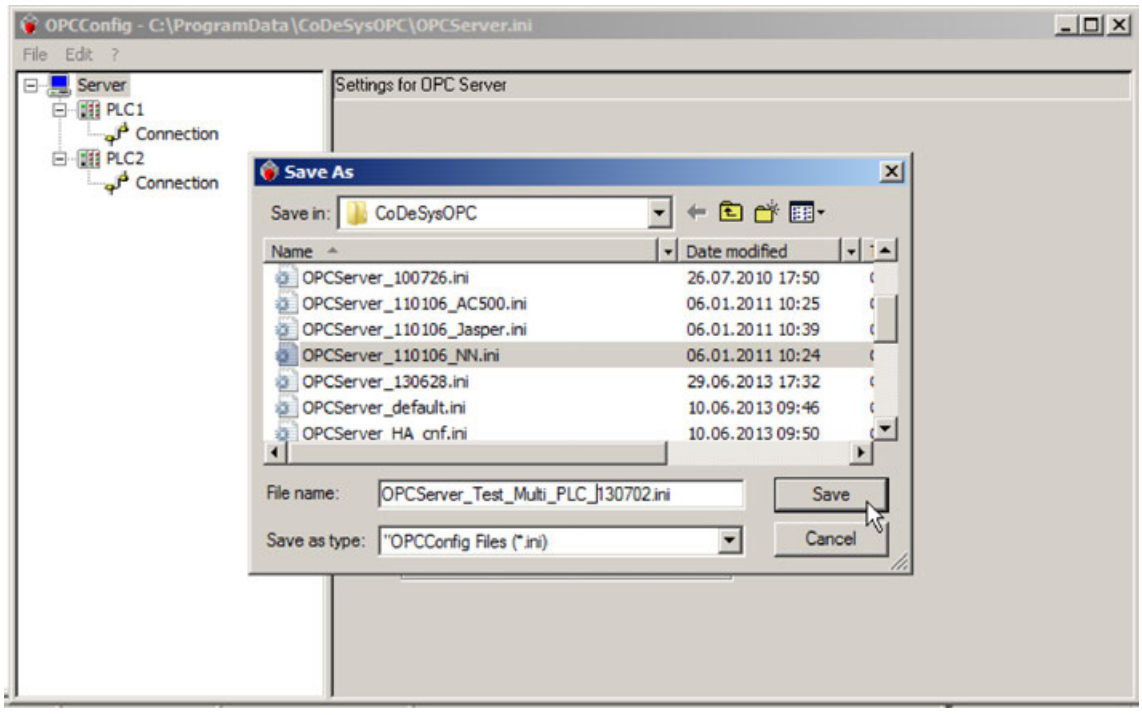
With double-click in the device tree to *"Symbol Configuration"* you can change the *"Symbol Configuration"* settings.

> *To restrict traffic and load, choose only symbols you need.*

Configure OPC server

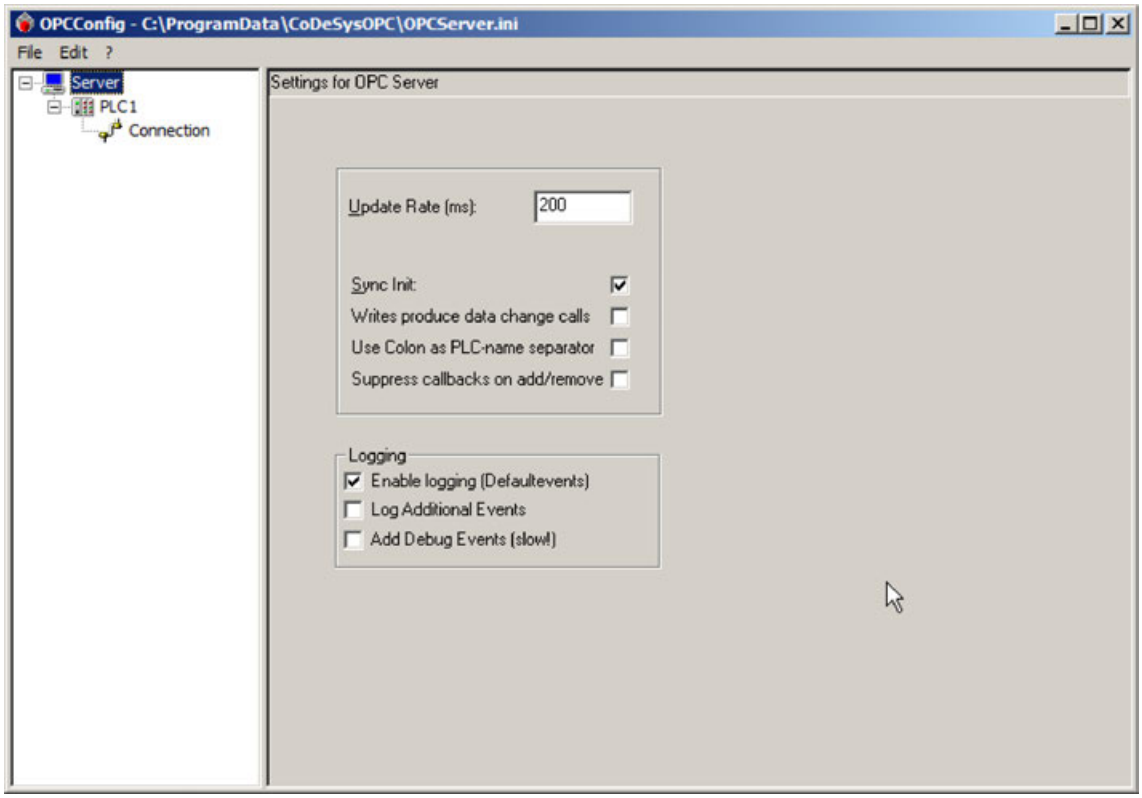
Configure OPC Server V3

1. Start CODESYS/ CoDeSysOPC Server V3/OPC Configurator.



2. If the configuration is needed furthermore, save the configuration.

   The actual configuration at start of OPC server will always be read from *OPCServer.ini*.



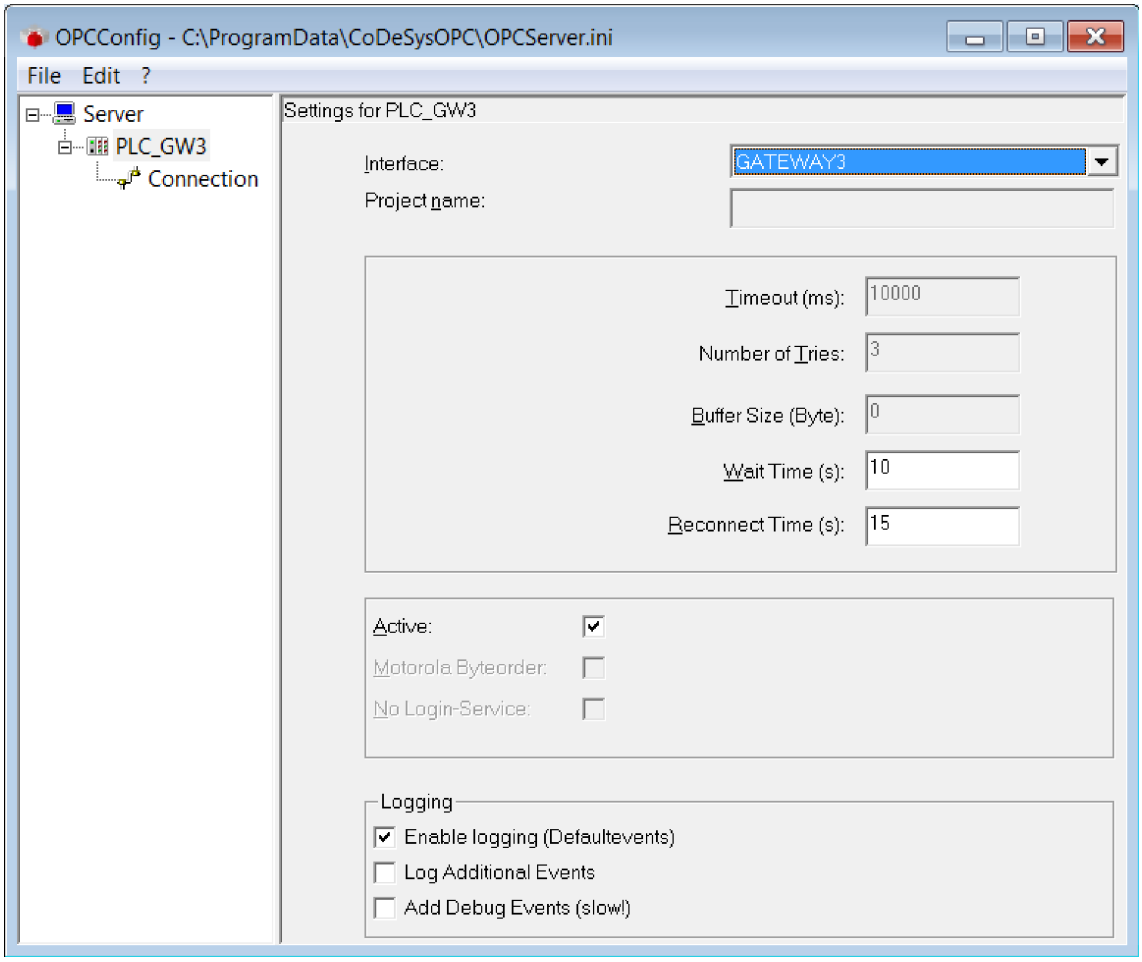
⇨

Update rate

- *The Update Rate may not be 0 (ms)!*
- *The default value of 200 ms is a suitable value of many applications.*
- *The adjustment for the Update Rate depends on the number of symbols (variables).*
- *For a big number of symbols it can be better to increase the Update Rate.*

The checkboxes Sync Init and Enable logging (Defaultevents) must be enabled.

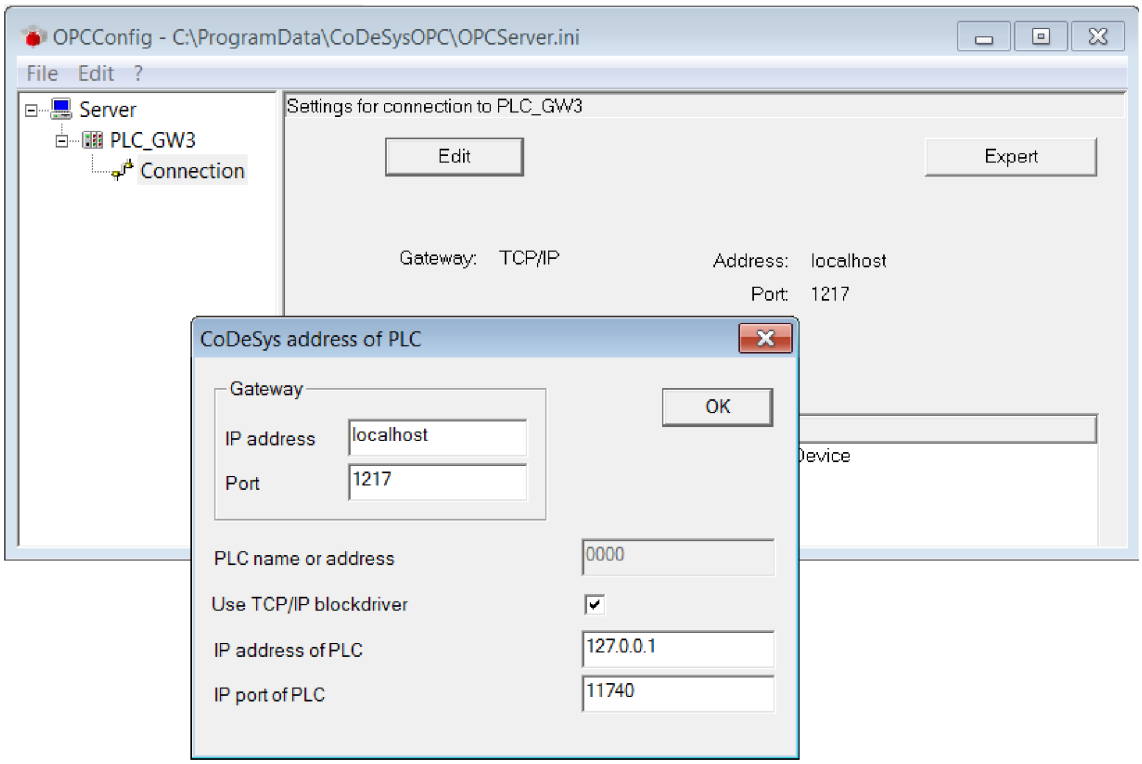
3. Select *“PLC_FW3”*.



⇨

- *If the *.sdb files should be loaded from the “Gateway Files” directory on PC, the project name must be identical with project name in CODESYS. The extension is not necessary.*
- *If the symbol information should be loaded from AC500 V2.x, the project name is not required and can also be empty.*
- *The parameters displayed in the screenshot above are recommended default settings.*
- *The checkbox Active must be enabled.*
- *Enabled checkbox “Enable logging” allows a later diagnosis.*

4. Select *"Connection"* and click *[Edit]*.



5. Enter the TCP/IP address of the target PLC at *PLC name or address* and enable *Use Tcp/Ip blockdriver*.
6. Enter the TCP/IP address of the target PLC at *IP Address of PLC* and click *[OK]*.
7. Click *"File ➔ Save" OPCserver.ini* and *"File ➔ Exit" OPCConfig*.

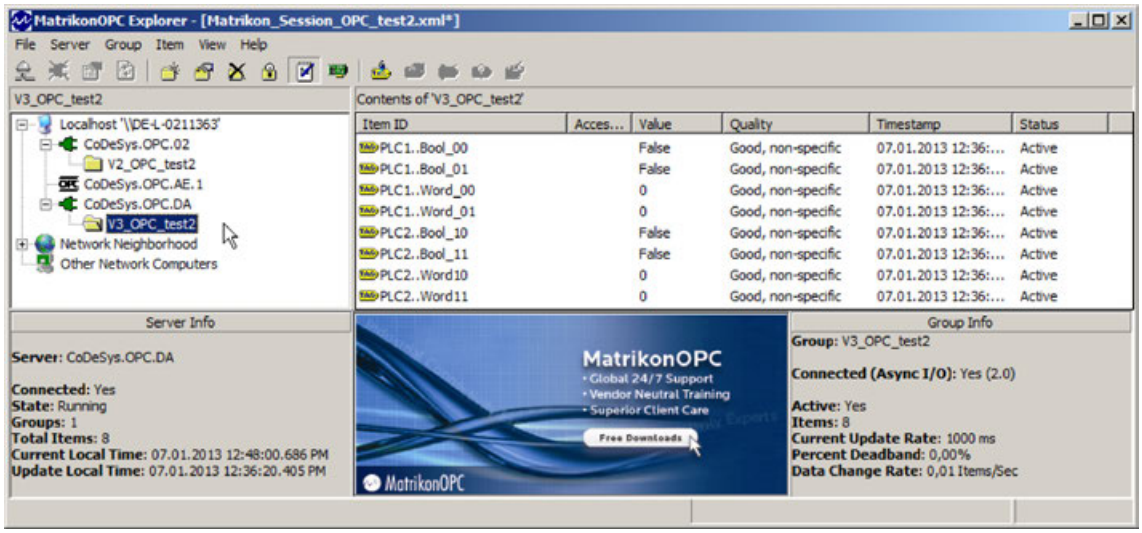
Check OPC function with AC500

It is urgently recommended to check the function of the previous configuration steps.

In order to check the OPC function without AC500, see ↳ Chapter 1.6.6.5.1.4.1 "Test OPC function without AC500" on page 3974.

Check OPC server V3

1. Start *OPCExplorer.exe* and connect *“CoDeSys.OPC.DA”*.

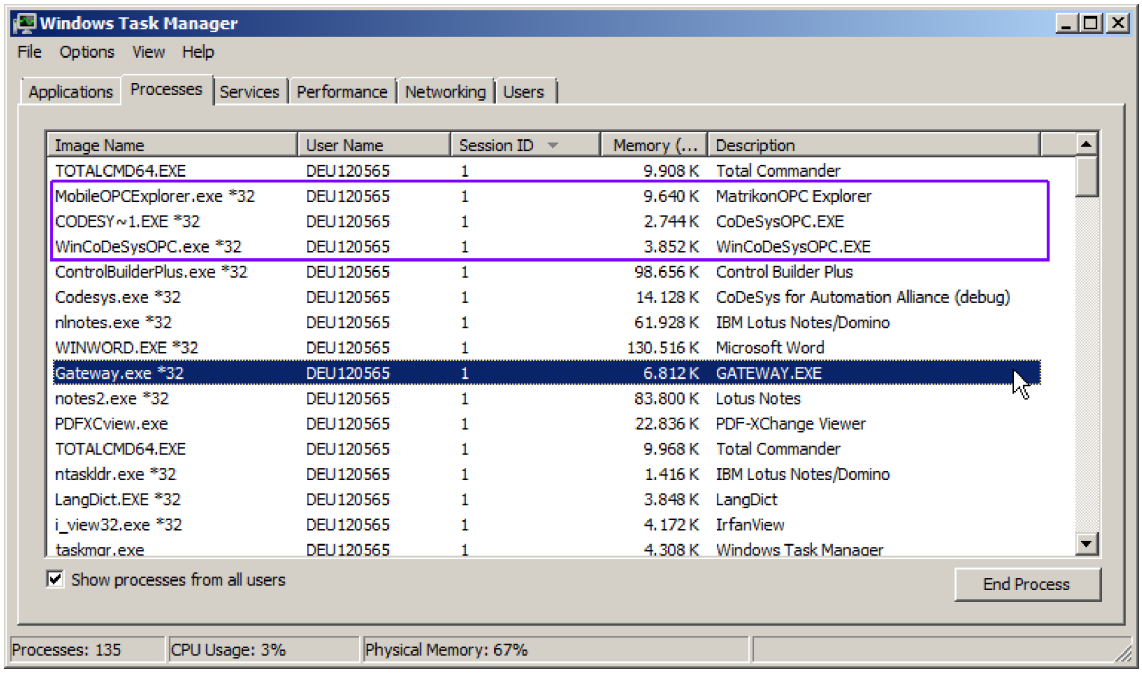


2. Add Group, add Items, select availabe Items in Server *“CoDeSys.OPC.DA”*.

   Add to Tag List, close the Item browser.

   ⇨ If anything is right, then *“CoDeSys.OPC.DA”* is connected, is running and the *“Quality”* of the items is good.

Check processes with windows task manager



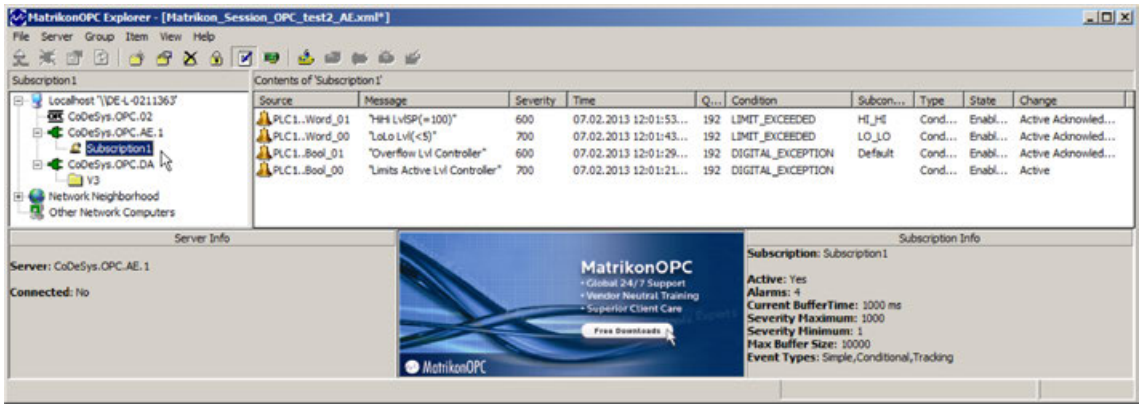
Correct configuration: All processes run with the same *“User Name”* and with the same *“Session ID”*.

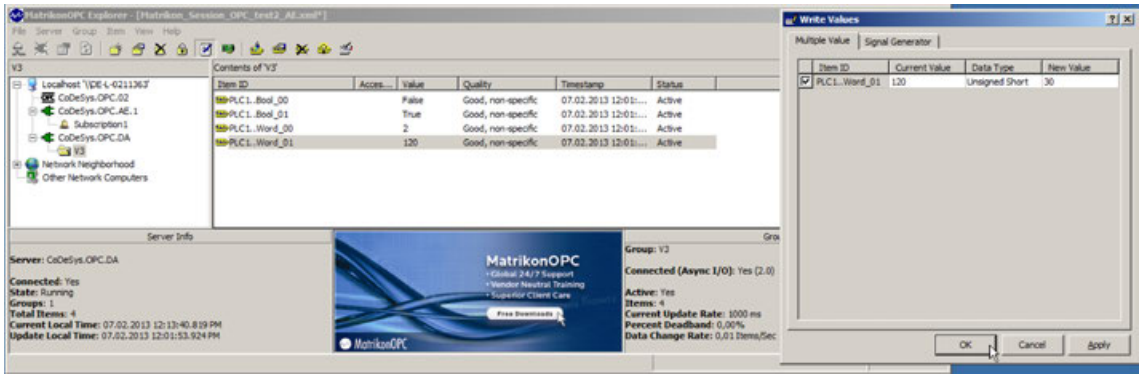
Configure AlarmEvents

> *Refer to REF2 AeConfigurator_UserGuide.pdf for details* ↳ *Table on page 3953.*

Check AlarmEvents

The function of the *“AlarmEvents”* can be checked with *“MatrikonOPC Explorer”*.





The *“AlarmEvents”* can be simulated by writing the value of the Items.

Configure user account for OPC server

> *Please refer to REF3 ReadMe.rtf and REF4 ReleaseNotes OPCV3 AE for HA* ↳ *Table on page 3953.*

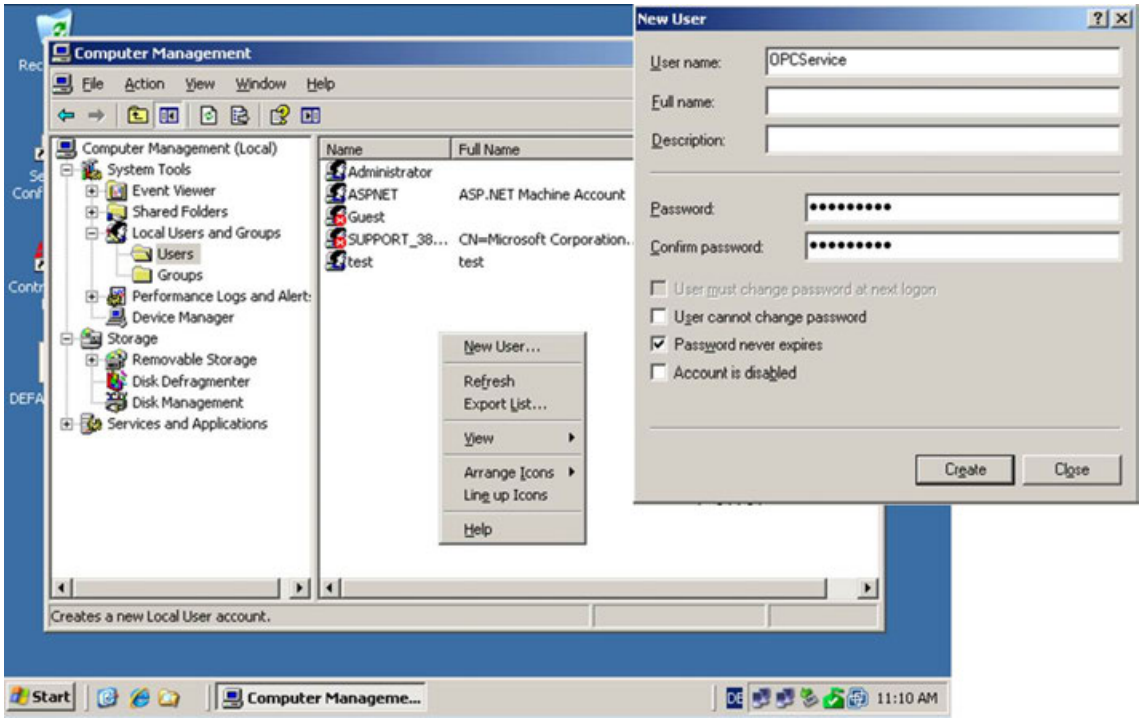
OPC server V3 on Windows Server 2003/ 2008/ 2012/ 2016

When running the OPC server V3 on Windows Server 2003/ 2008/ 2012 /2016 multiple sessions need to be supported. Therefore the installation of the OPC server as service running with a dedicated user account is recommended.

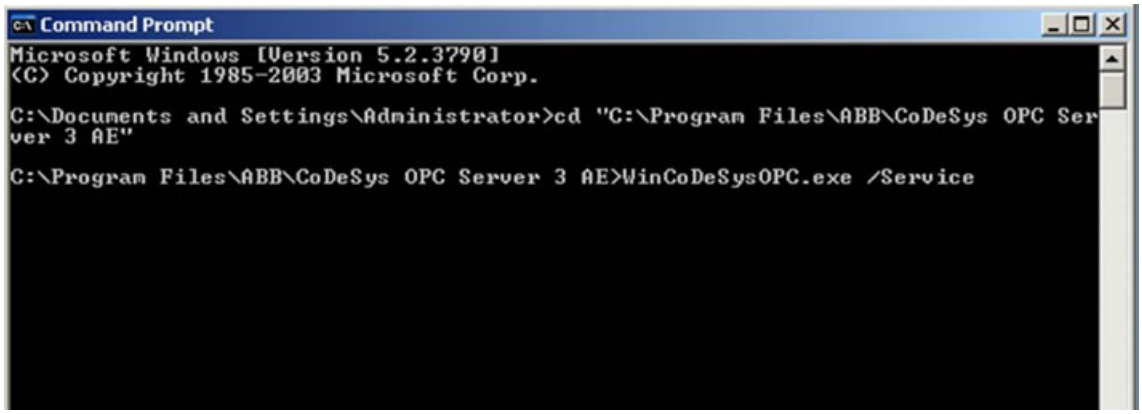
Configuration steps

- Create specific user, no administrator account is required
- Register V3 OPC server as service
- Configure V3 OPC server as service

Create specific user



Registration



Register the OPC Server executable as service from the command line.

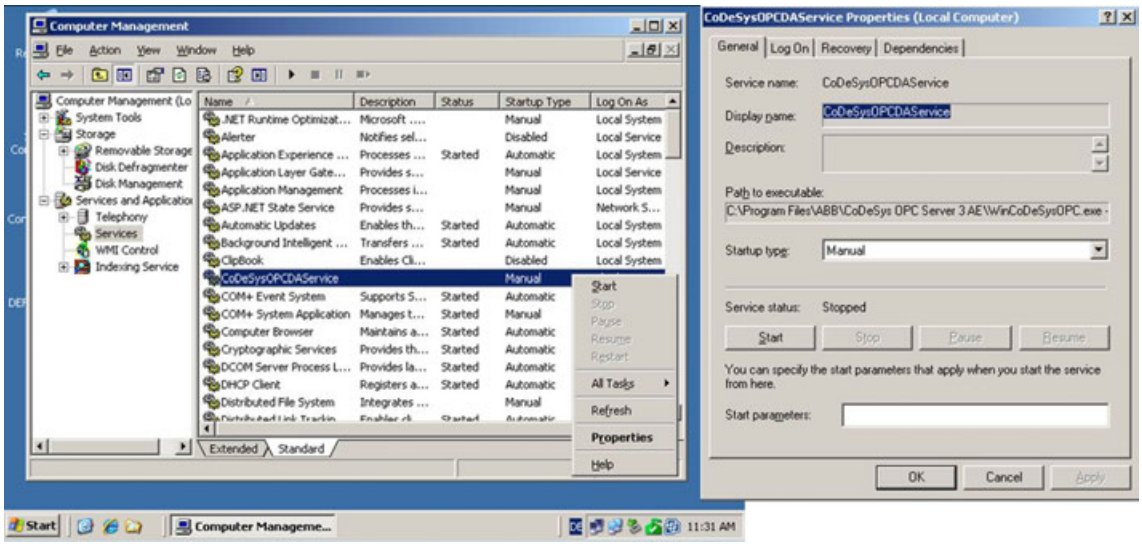
With command “WinCoDeSysOPC /Service” WinCoDeSysOPC.exe gets installed as system service.

Started once, the service will stay “started” until the system gets terminated.

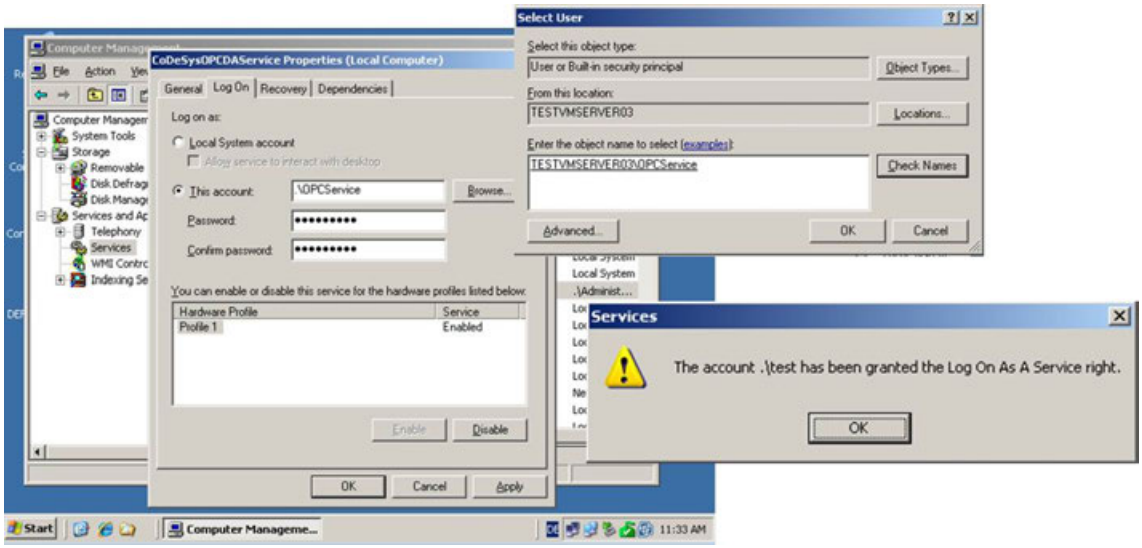
The communication to the configured PLCs survives.

Also here the service gets installed in the current position of WinCoDeSysOPC.exe.

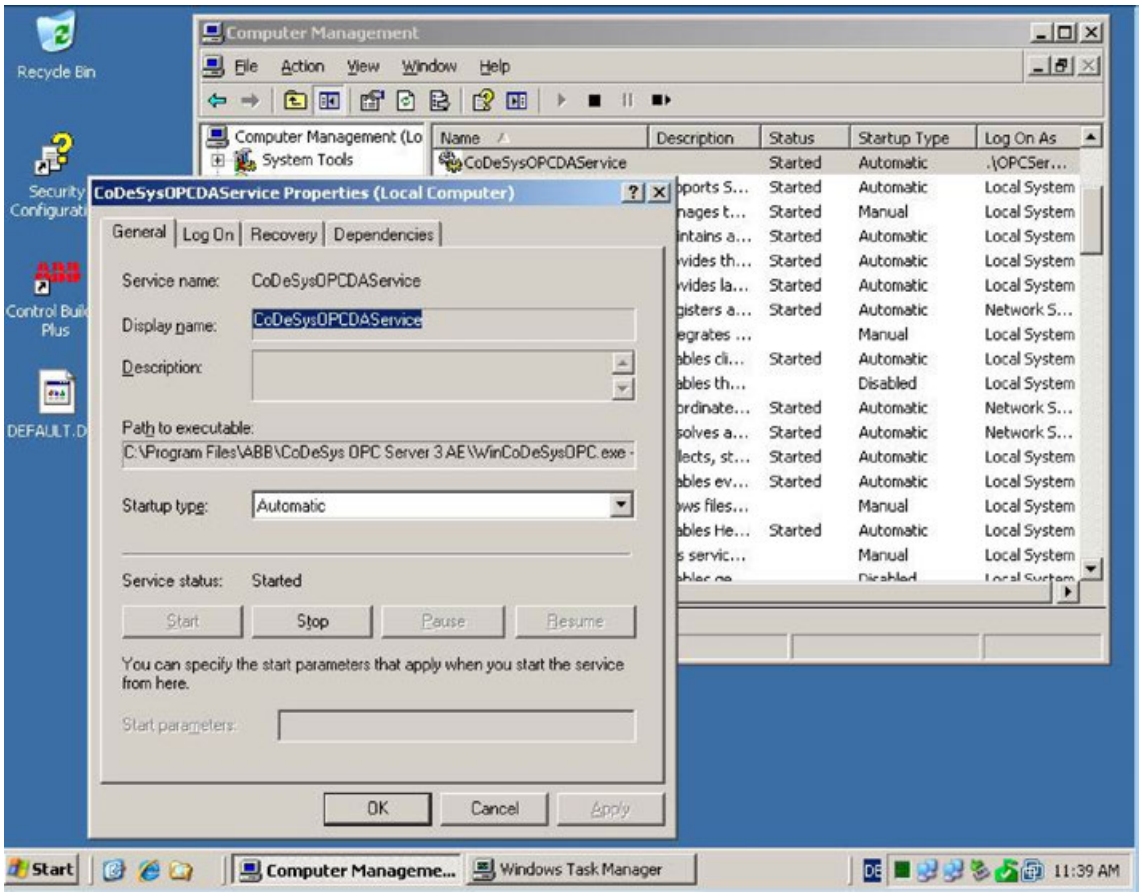
Configuration



At *“Computer Management* ➔ *Services and Applications* ➔ *Services”* open the *“Properties”* of the *“CoDeSysOPCDAService”*.

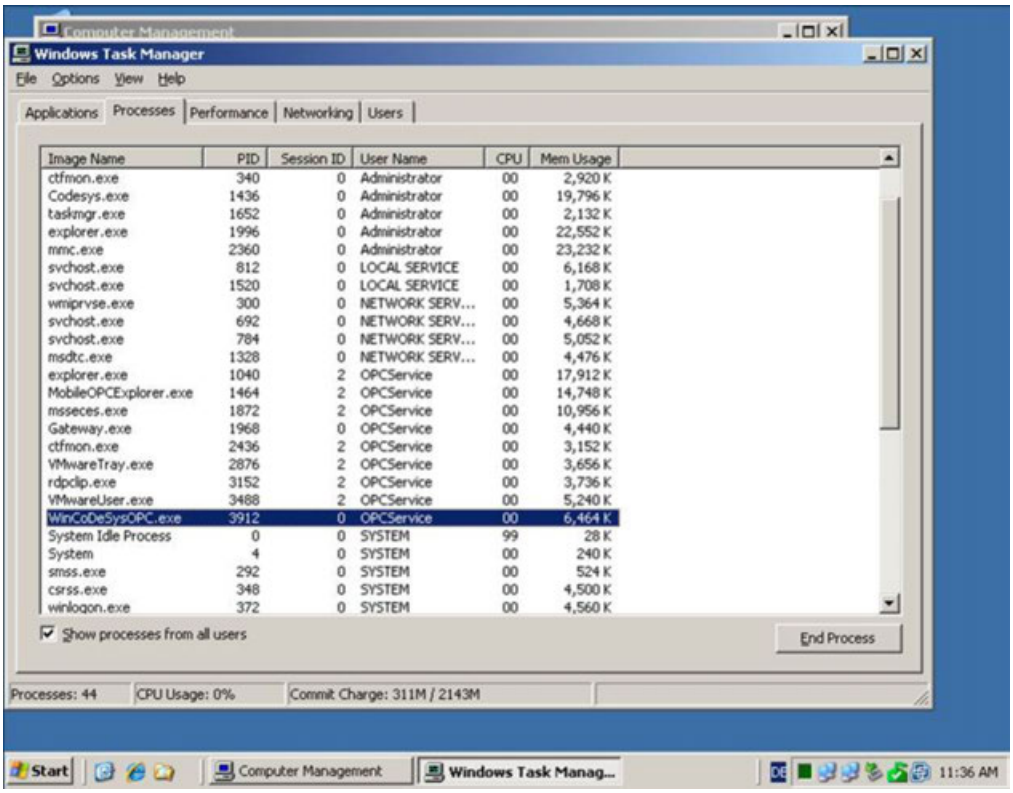


Complete the Service Configuration



Testing

Check Users and Session during Test Cases



Check the *“Session ID”* and *“User Name”* of

- *Gateway.exe*,
- *WinCoDeSysOPC.exe* and
- OPC Client

on different test cases like multi session with terminal service sessions.

Potential issues

Session isolation

Situation

With Windows Server 2003, Windows Server 2008, Windows Server 2016 the Windows 7 services are alone in session 0. User applications run in session 1 (2 and so on).

Services:

A Windows service is a computer program that operates in the background.

Windows services can be configured to start when the operating system is started or can be started manually and run in the background as long as Windows is running. They can operate when a user is not logged on.

Services are:

Windows operating systems include numerous services. OPC client like S+ OPC scanner PGIM, Aspen CIM-IO Manager, ICONICS, .. can also installed as a service.

User applications are:

Microsoft Word, Notepad, MatrikonExplorer, *ControlBuilderPlus.exe* and *Codesys.exe*

Problem

Service and user application are isolated in their session. They can not communicate with each other directly.

OPC Server uses, like the CBP and CODESYS, the gateway server from CODESYS (*gateway.exe*) for the communication with the AC500 and starts the gateway in their session. That creates undefined behavior, if the OPC Server runs as a service. The gateway server is not able to run in multi sessions.

Resolutions

- Install all OPC clients and OPC Server, which use the gateway server, in the same session.
- The OPC Server as a service (session 0) may not be connected at the same time (in parallel) with an OPC server as a user application or CBP or CODESYS (all in session 1) with the AC500. If this function is necessary, different PC or virtual machines must be used.
- Use tools like OPC tunnel. In a DigiVis 500 setup context the OPC server must not be registered as service. The OPC tunnel itself starts the OPC server within its service.

See also http://msdn.microsoft.com/en-us/windows7trainingcourse_sessionisolation_unit .

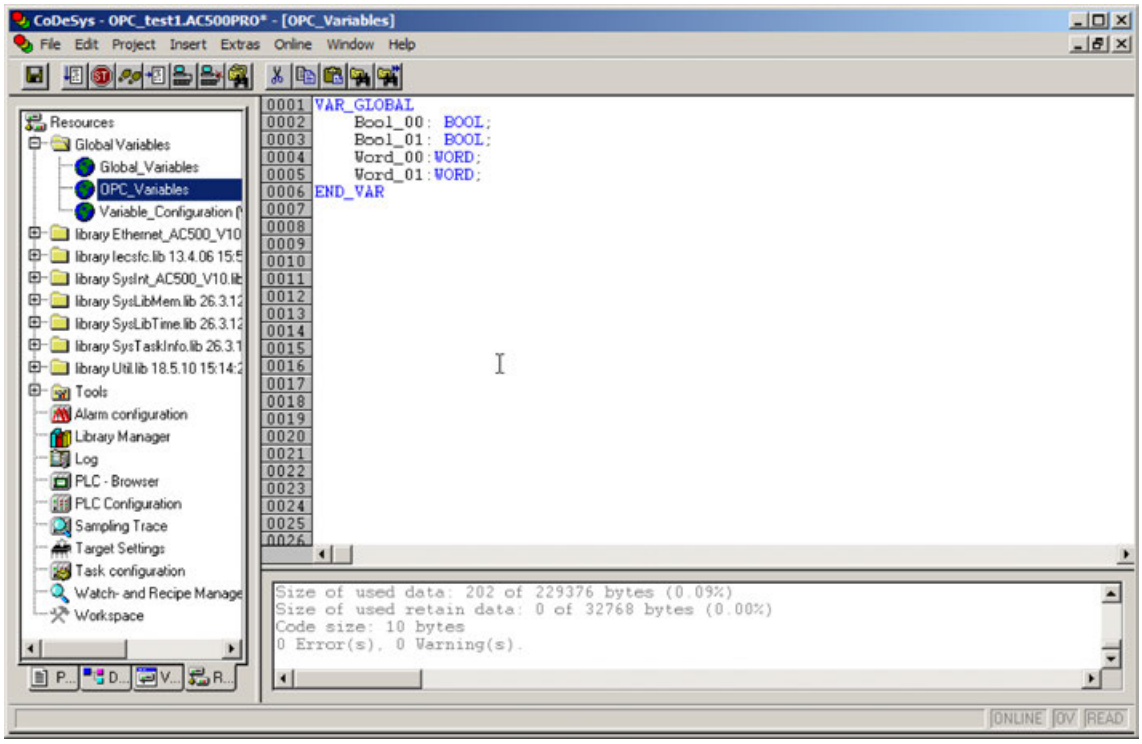
Examples

Test OPC function without AC500

The example shows, how the OPC server V2/V3 can be tested/simulated without available AC500.

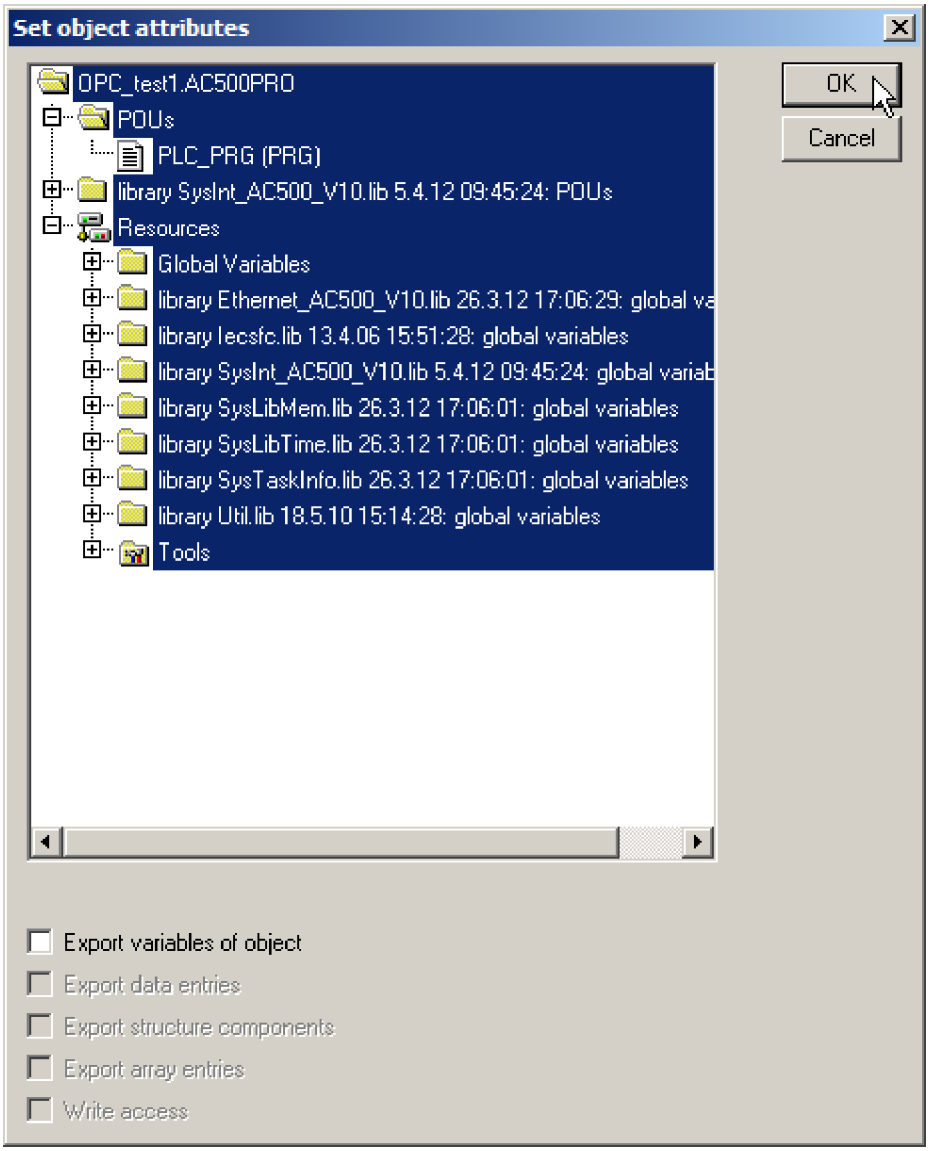
AC500 project

1. Open *CoDeSys Application*.



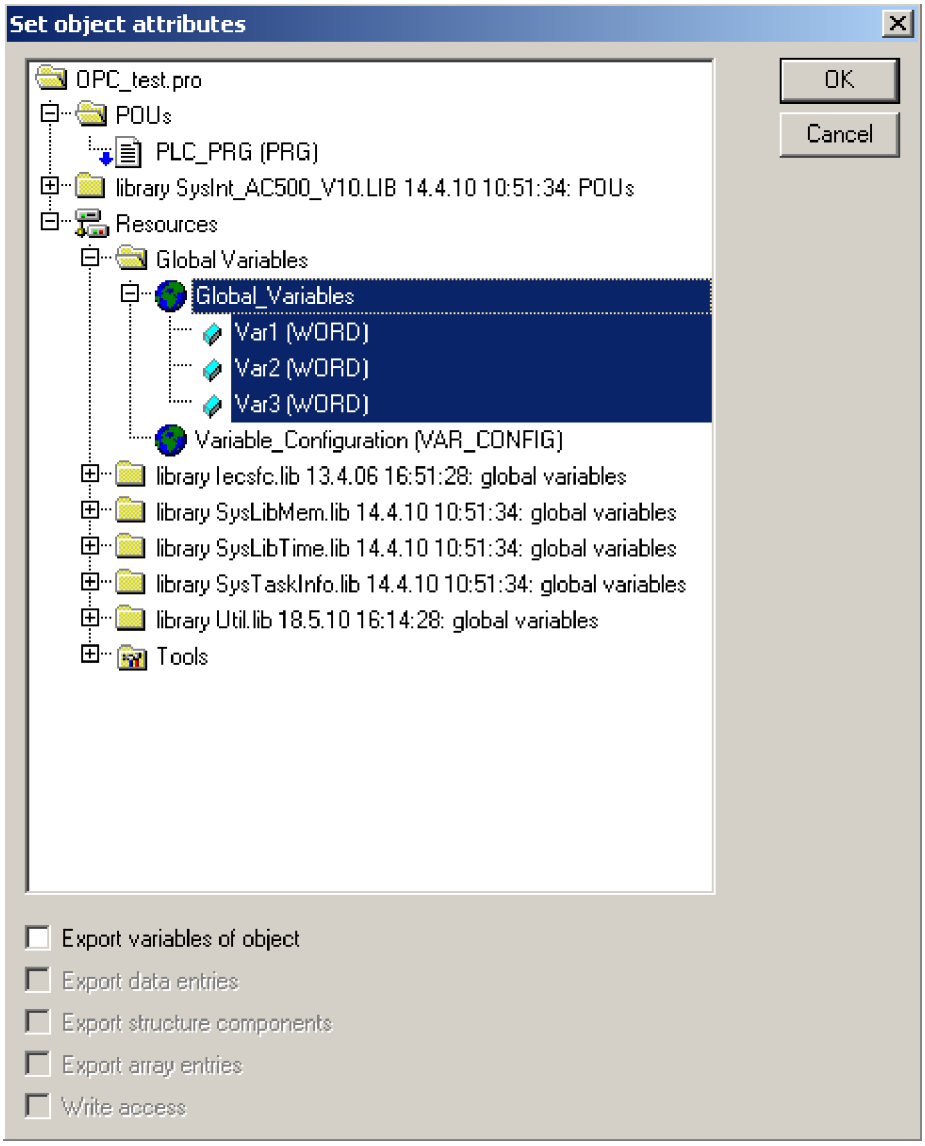
2. Collect all OPC variables in a separate *“Global Variables”* list.

3. Under *"Project ➔ Options "* select the *"Symbol configuration"*.
   Enable checkbox *"Dump symbol entries"* and click *[Configure symbol file]*.



4. Disable all the checkboxes and confirm twice with *[OK]*.

5. Under *"Project ➔ Options " "Symbol configuration"* click *[Configure symbol file]* again.

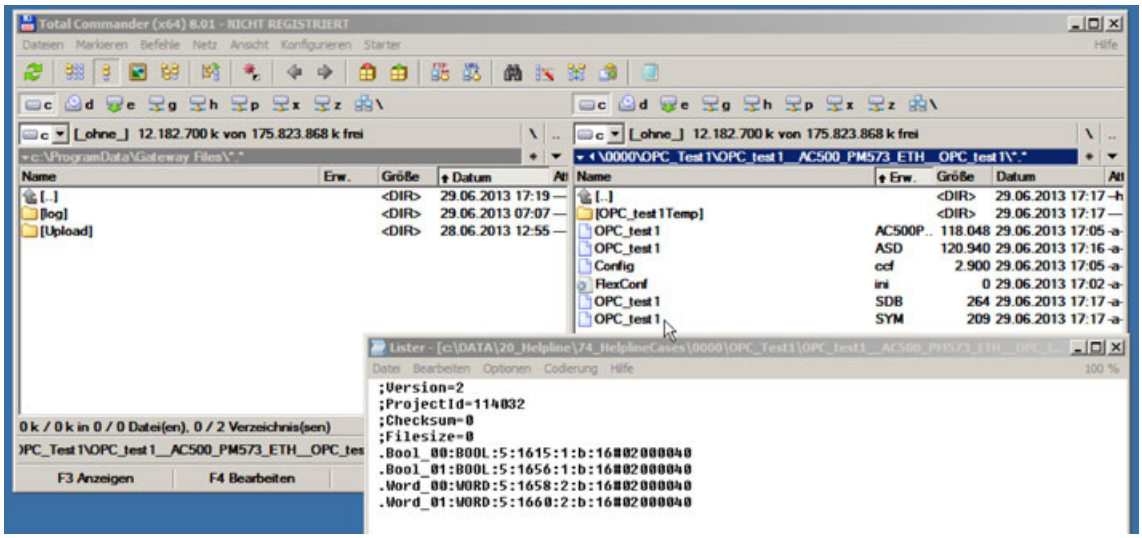


6. Select the variables which should be communicated as symbol.

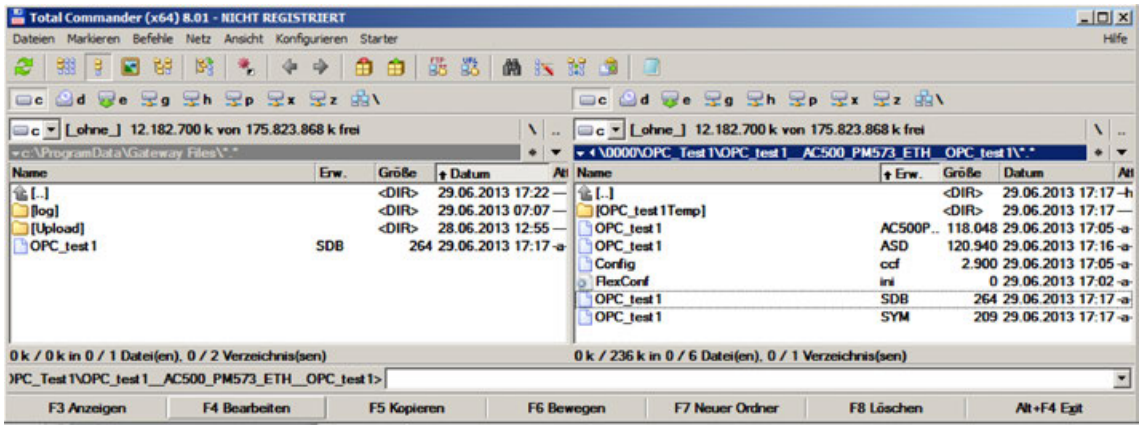
   Enable the following checkboxes:

   - *Export variables of object*
   - *Export structure components*
   - *Export array entries*
   - *Write access*

7. Confirm twice with *[OK]*.
8. Under *"Project ➔ Rebuild all"* rebuild the project.

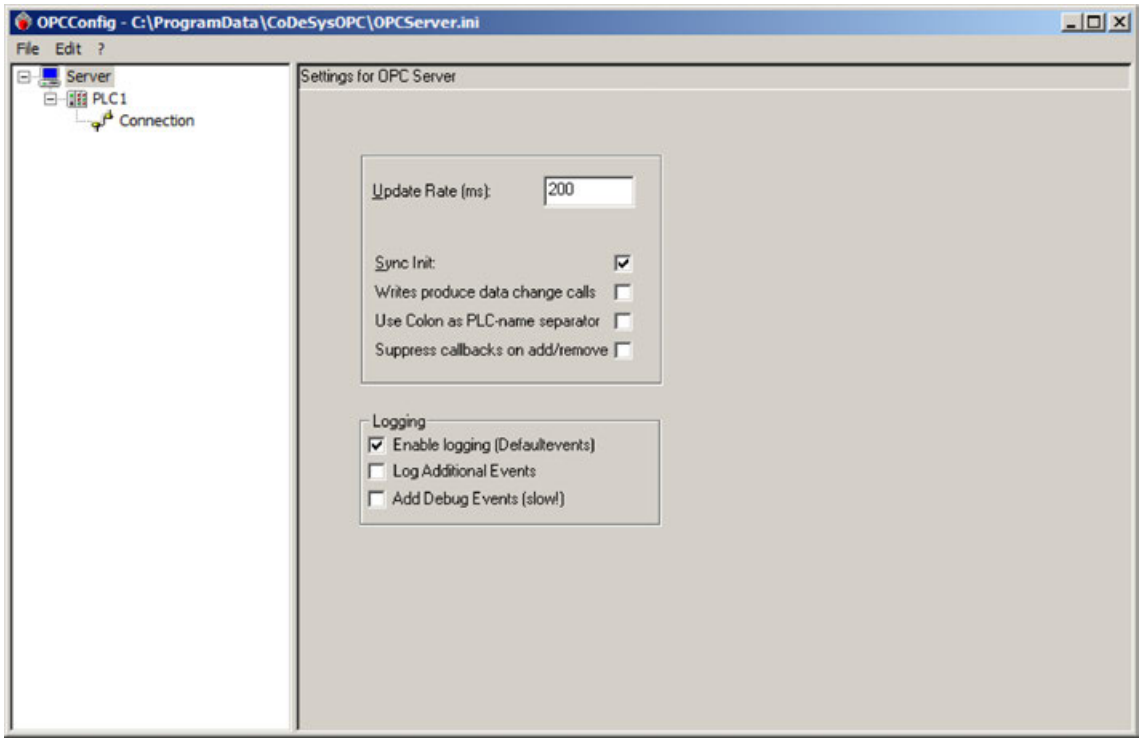


9. In the project folder is the subfolder *"OPC_test1__AC500_PM573_ETH__OPC_test1"*. It contains symbol files **.SYM* and **.SDB* with the time of the *"Rebuild all"*. The items in the file **.SYM* can be checked with Notepad. The binary file **.SDB* contains the items for the OPC server. With *<Online> <Login>* it will copied in the gateway files directory and optionally on the AC500.

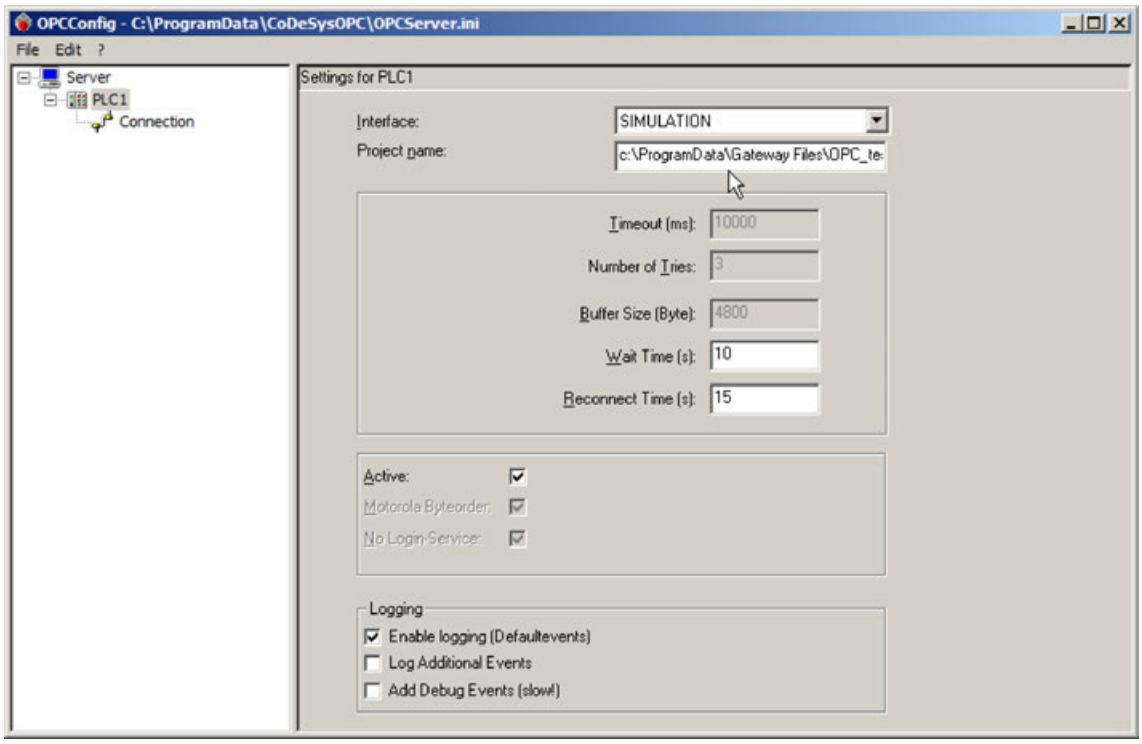


10. The folder *"OPC_test1__AC500_PM573_ETH__OPC_test1"* is a temporary folder, if the CBP project is opened. For the simulation of the server OPC it is copied **.SDB* by hand.

Configure OPC server V3

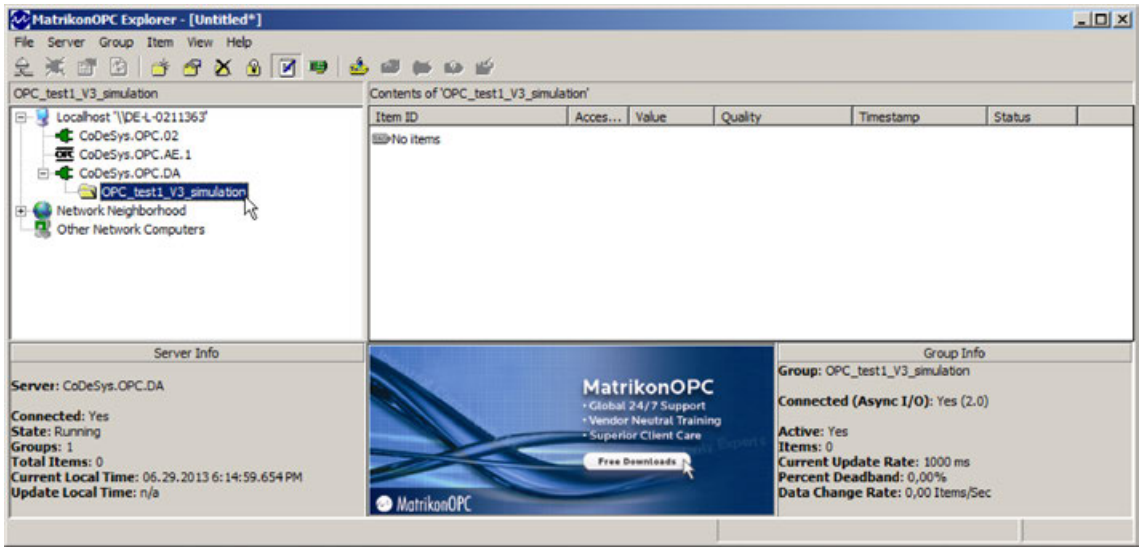


1. Select **Edit**, append **PLC** and keep the default values.

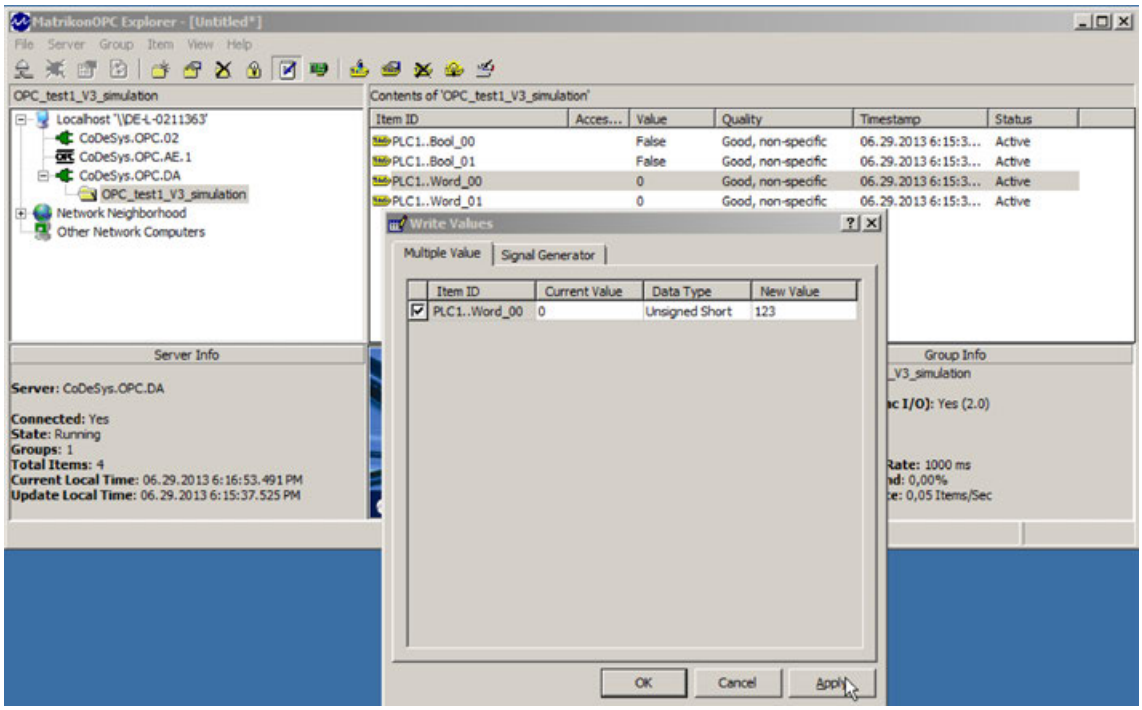


2. You must specify *“Project name”* with the *“directory name”*.
   Connection settings are not required for the simulation.

Check OPC server with MatrikonOPCExplorer

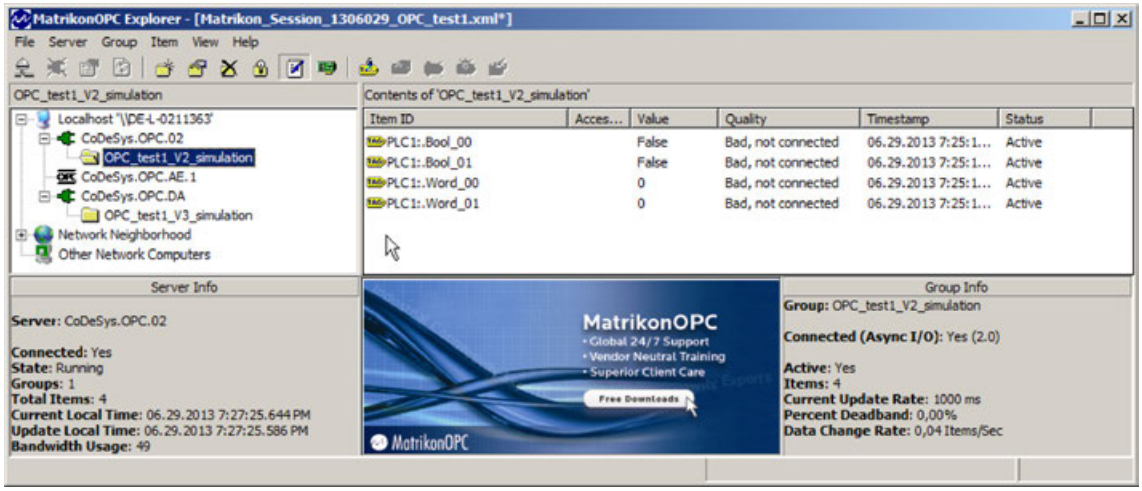


1. OPC Server V3: *"Connect CoDeSys.OPC.DA"*. Add *"Group"*, add *"Items"*, select *"Availabe Tags"* and add to *"Tag List"*.



2. The OPC Server V3 (*"CoDeSys.OPC.DA"*) is connected, running and the *"Quality"* is good.

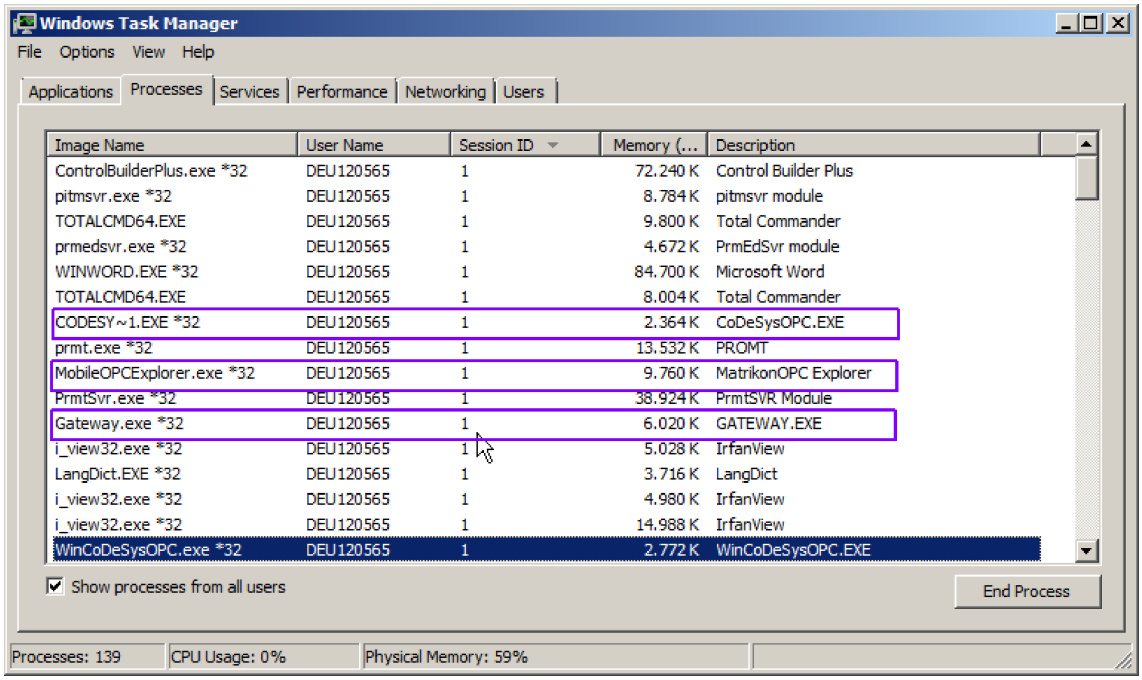
   One OPC client can read / write the values of the items.



3. Similar configuration as above.

   The OPC Server V2 (*"CoDeSys.OPC.02"*) is connected, running and the configured items are found. But the *"Quality"* is bad. One OPC client can not read / write the values of the items.

Check processes with windows task manager



Correct configuration: All *"Processes"* run with the same *"User Name"* and with the same *"Session ID"*.

Summary

The correct function of OPC Server V2 and V3 can be checked without AC500.

With OPC Server V3 with the configuration "SIMULATION" the Project name with the directory name has to be specified. The values of the items can be read and write by one OPC client.

With OPC Server V2, as well as with OPC Server V3 in configuration "GATEWAY", only the project name may be specified. The configured items are found, but the quality is bad. The values of the items can not be read and not write by one OPC client.

Refer to REF5 Online Help of PS501 chapter OPC for details ↪ Table on page 3953.

1.6.6.5.2 OPC UA server for AC500 V3 products

General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2.

The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.

The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of events according to the OPC UA standard.

Application example

The application example How to use OPC server V3 - for DA and UA is available to gain a deeper understanding of the OPC UA protocol and to configure AC500 V3 accordingly.

Creating a project for OPC UA access

1. Click *"File ➔ New Project ➔ AC500 project"* in Automation Builder 2.1 or newer.
2. Choose a *PLC - AC500 V3* and click *[Add object]*.
3. Right-click on node *ETH1 or ETH2* and *"Add object"*.
4. Choose *OPC UA Server* in the dialog and click *[Add object]*.
5. Declare some variables of different types in the program.
6. Right-click *"Application ➔ Add object"*. Choose *Symbol configuration* and click *[Add object]*.
7. Enable checkbox *Support OPC UA Features* in the dialog *Add symbol configuration*.
8. Double-click *"Symbol configuration"* in the *Devices* tree to open the editor *Symbol configuration*.

9. Click *[Build]*.

   ⇨ The variables are displayed in a tree structure.

10. Activate the variables that you want to publish to an *OPC UA client*. Specify the access rights.
11. Download the project to the PLC.

Use node name

1. Double-click node *“OPC_UA_Server”*.
2. Set parameter *Use node name* to TRUE.
3. Double-click node *“PLC_AC500_V3 <...>”*.
4. Click *“Device”* and *“Rename active device...”*
5. Enter new device name in the following dialog and click *[OK]*.

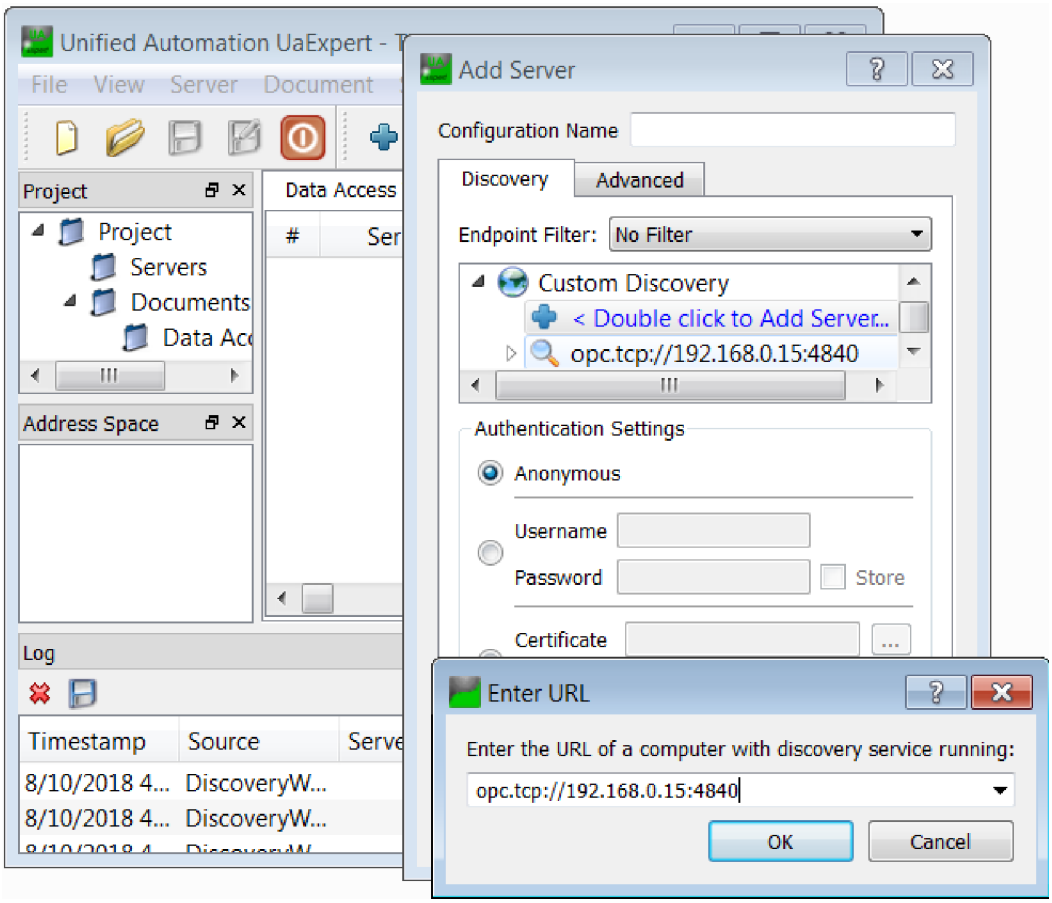
Use UaExpert client

The OPC UA client *UaExpert* is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.

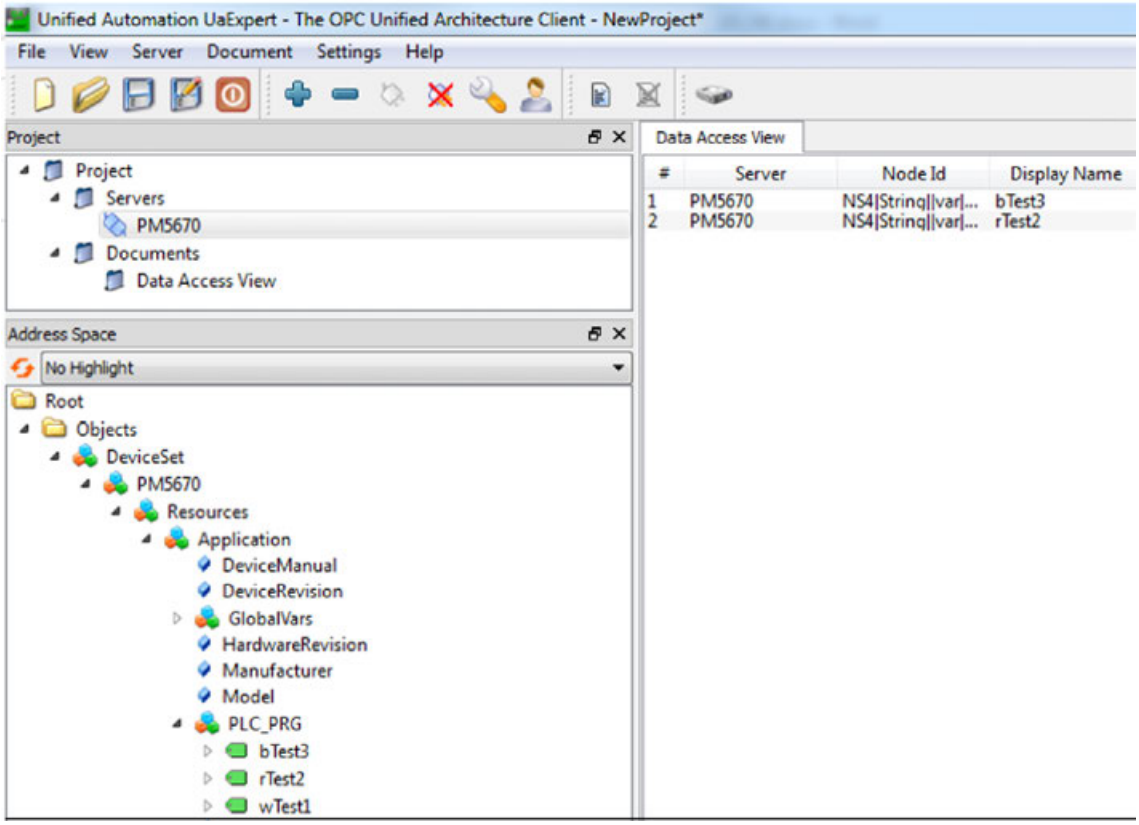
1. Start the *UaExpert* program.



2. Click on the *“blue cross symbol”*.
3. Double-click on the *“blue cross symbol”* in the *Add Server* dialog.

4. Enter URL and click *[OK]*.
   ⇨ The URL appears in the *Add Server* dialog.
5. Select *"Advanced"* tab and click *[OK]*.
6. Click *[Connect]* button.

7. Expand the project tree in the *Address Space* window.



8. Drag and drop the needed symbols to *Data Access View*.

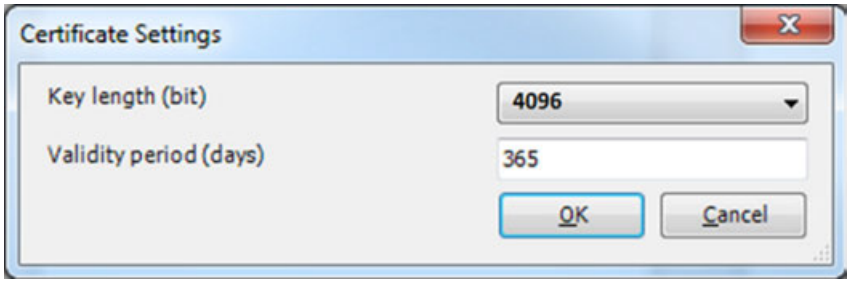
Working with encryption

Creating a certificate for the OPC UA server

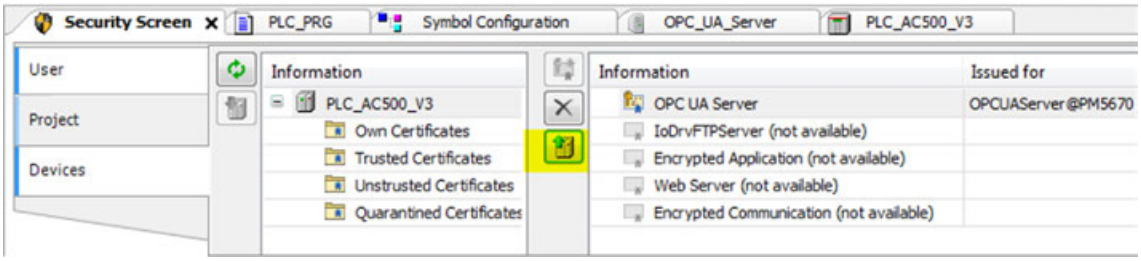
☑ Prerequisite: A battery is inserted and the clock is set to actual time.

1. Double-click the Security symbol in the lower right corner of Automation Builder.
2. Select the *"Devices"* tab.
   ⇨ The certificate information opens.
3. Select the PLC in the left *Information* view.
   ⇨ All services of the PLC that require a certificate are displayed in the right *Information* view.
4. Select the service *"OPC UA Server"*.

5. Click the icon to create a new certificate for the device.
   ⇨ *Certificate Settings* dialog appears.



6. Define the certificate parameters according the figure above and click "*[OK]*.
   ⇨ The certificate is created on the PLC.

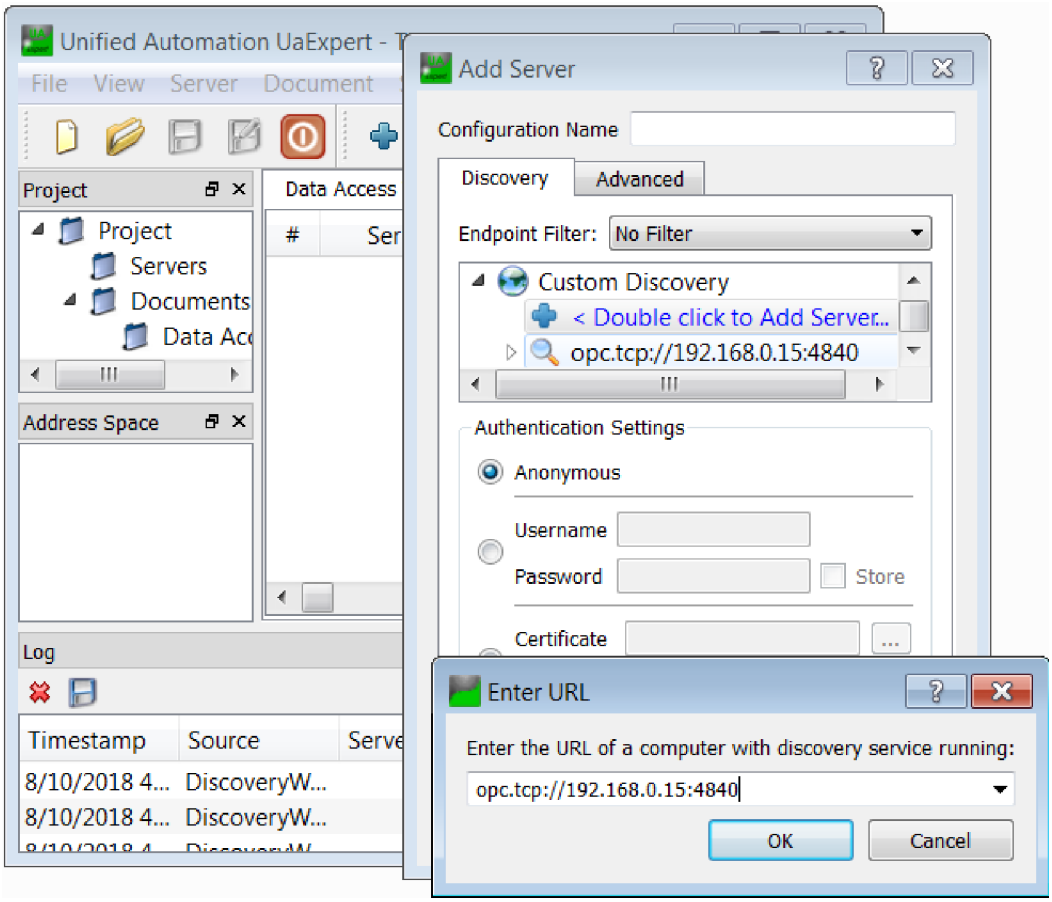


7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see ↳ *Chapter 1.6.6.3.7.3.4 "OPC UA secure" on page 3923*.

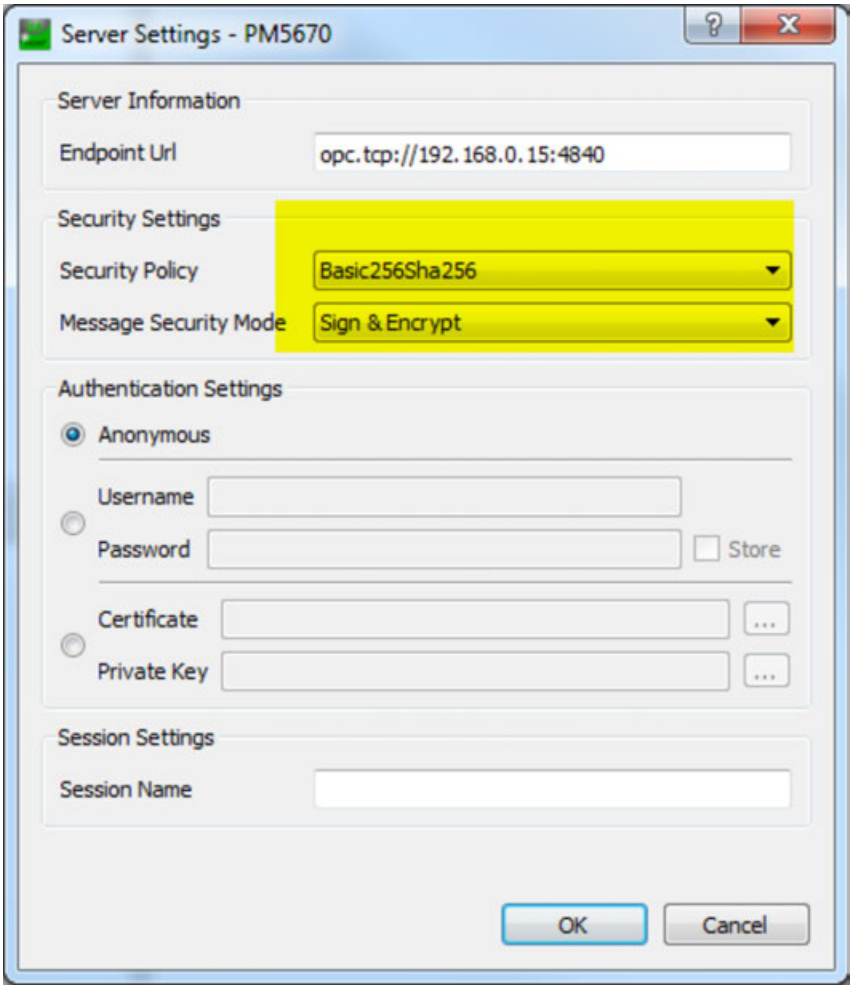
Encrypted connection with UaExpert client

1. Start the *UaExpert* program.

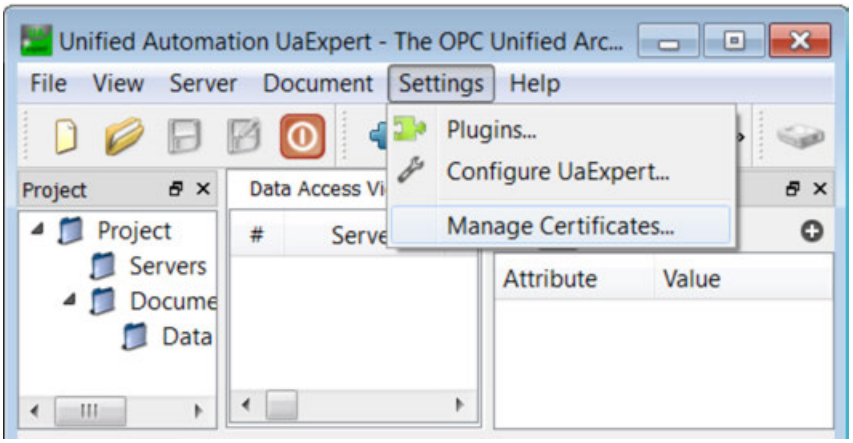


2. Click on the *“blue cross symbol”*.
3. Double-click on the *“blue cross symbol”* in the *Add Server* dialog.
4. Enter URL and click *[OK]*.
   ⇨ The URL appears in the *Add Server* dialog.

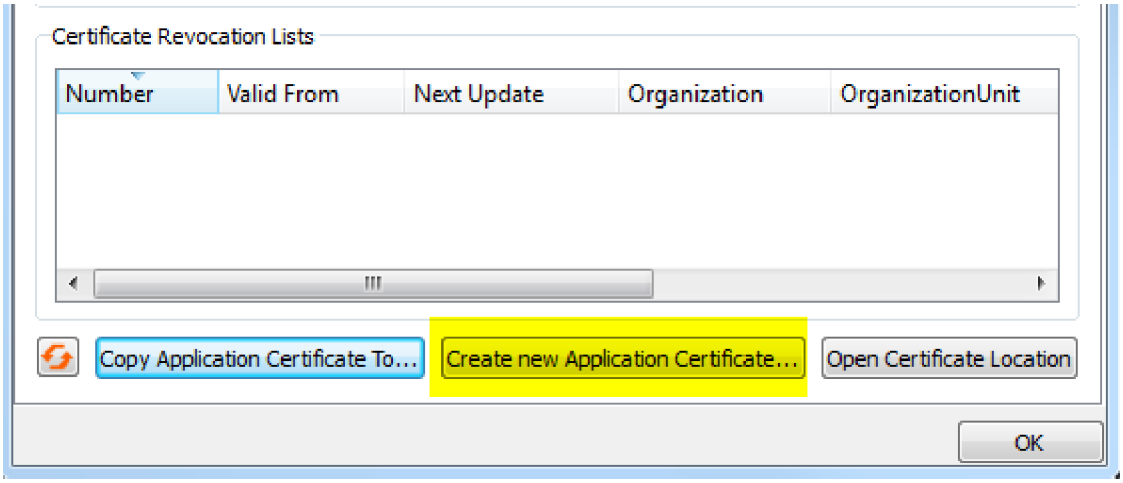
5. Select *"Advanced"* tab.



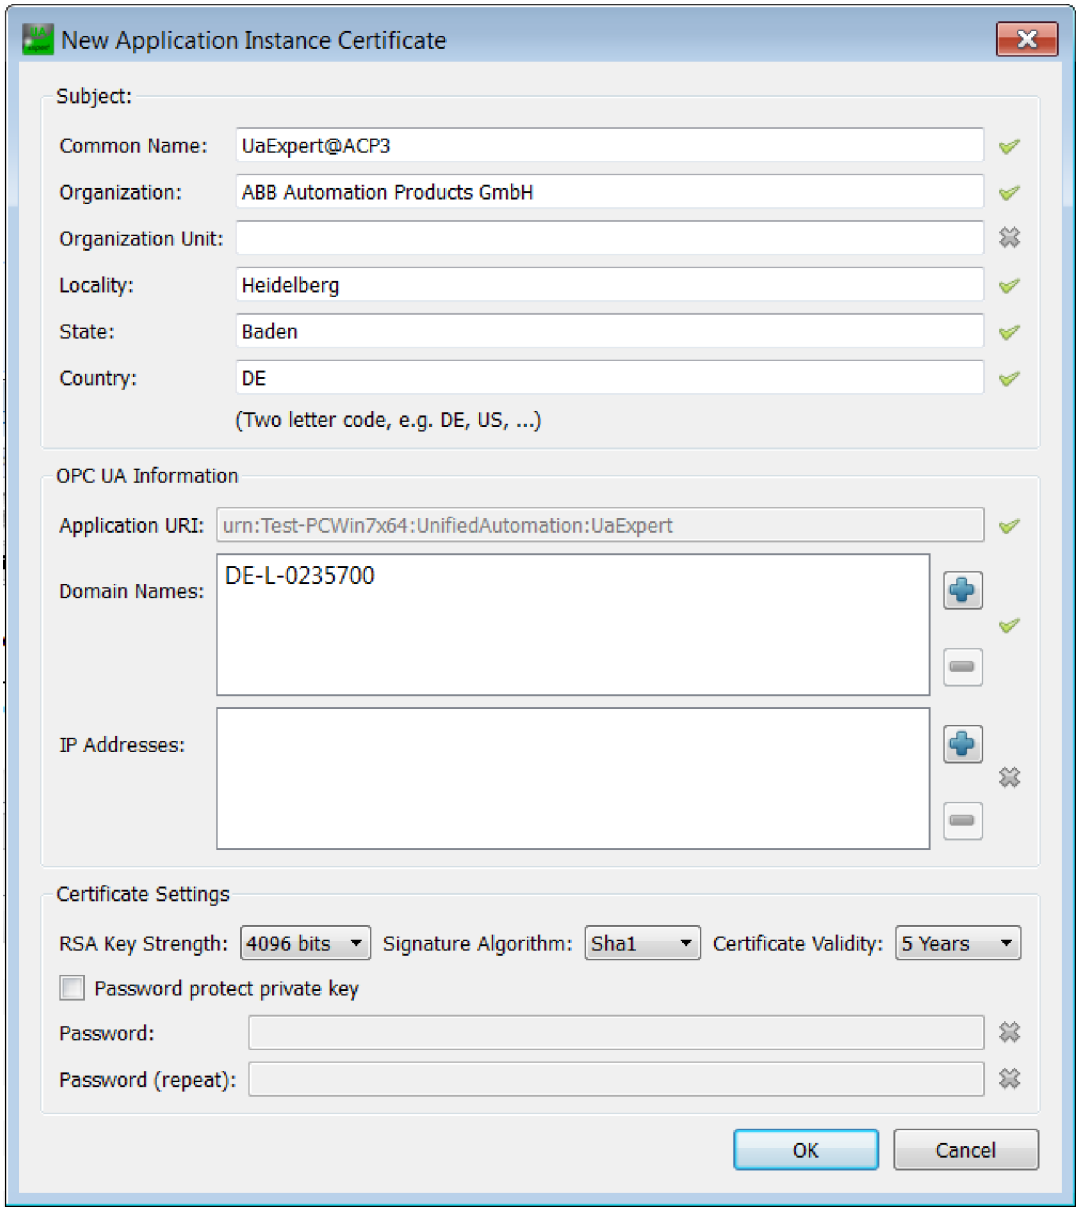
6. Choose option *"Basic256ha256"* of drop-down list *Security Policy* and *"Sign & Encrypt"* of drop-down list *Message Security Mode* and click *[OK]*.



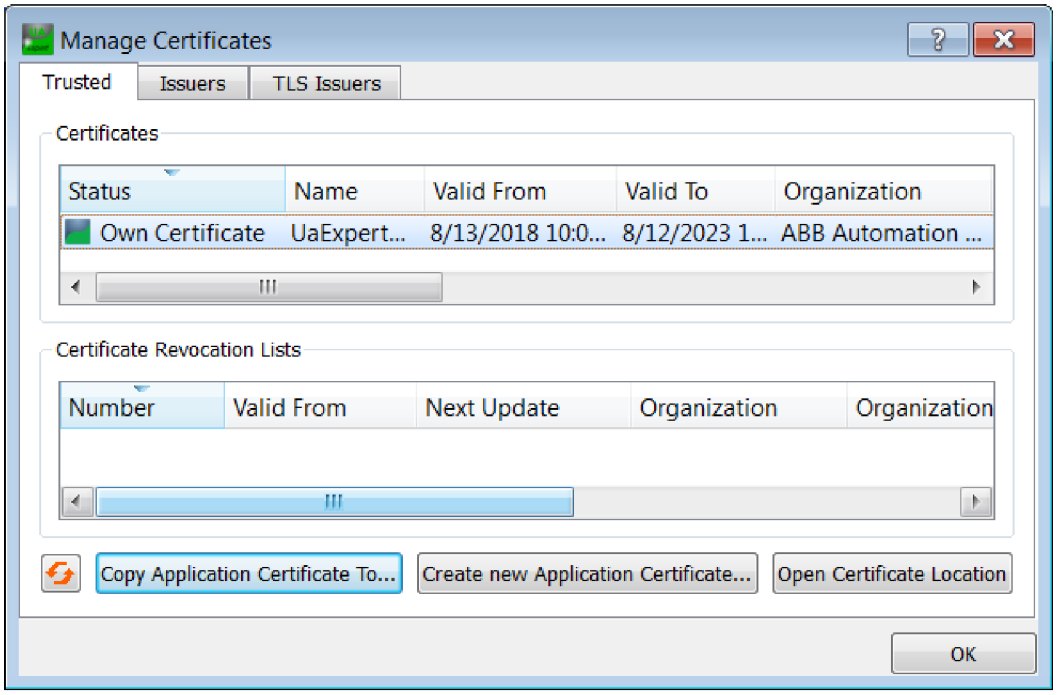
7. Click menu *“Settings”* and *“Manage Certificates”*



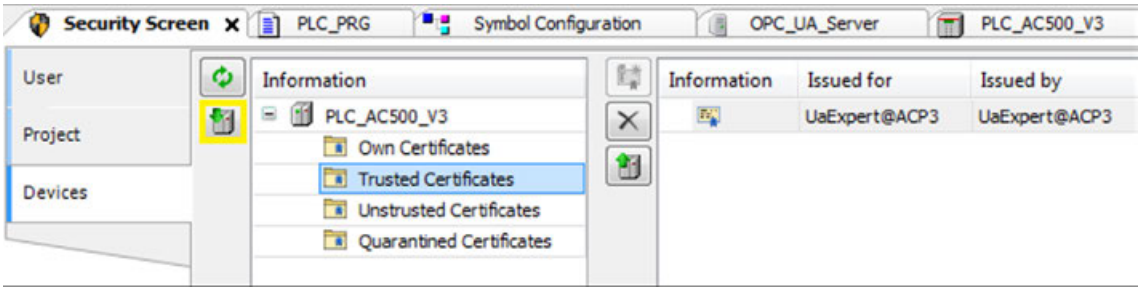
8. Click *[Create new Application Certificate...]*.
   ⇨ Dialog *New Application Instance Certificate* opens.



9. Enter the required informations and click *[OK]*.
   ⇨ Dialog *"Manage Certificates"* opens

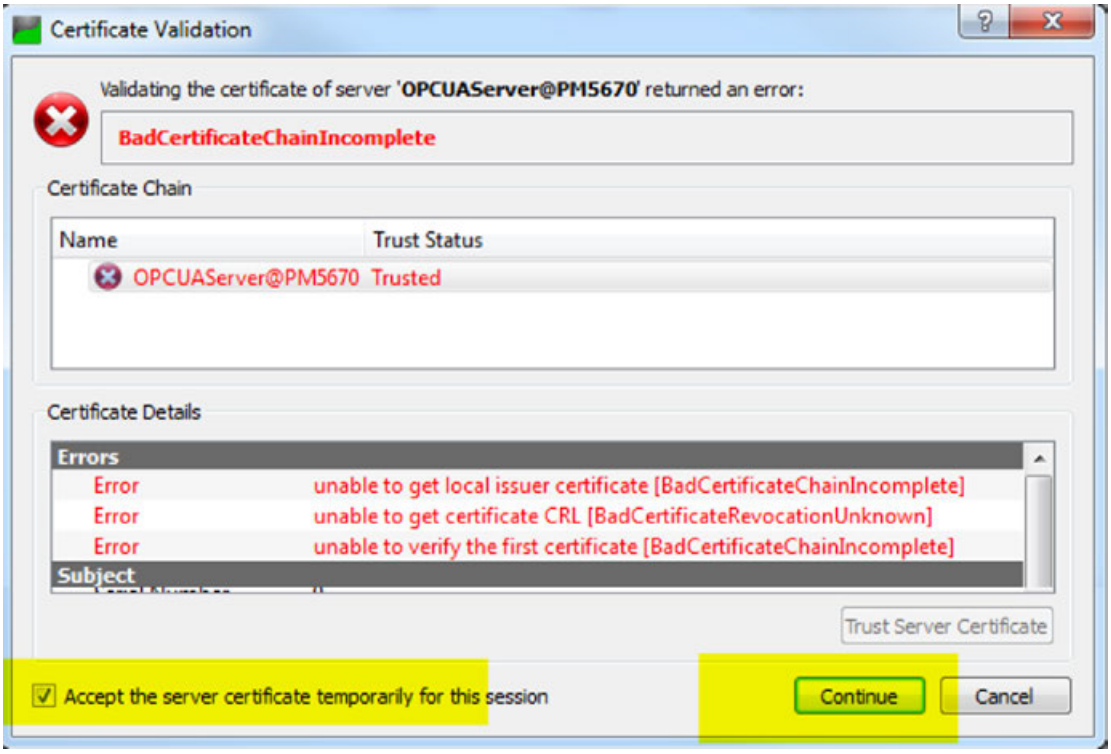


10. Click *[Copy Application Certificate To...]* your PC.



11. Download the certificate to AC500 via the *Security Screen* view.
12. Click *[Connect]* button in the UaExpert client.

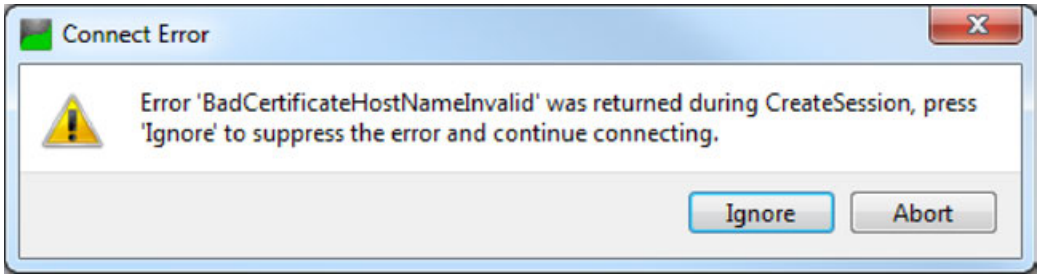
⇨ Dialog *Certificate Validation* opens.



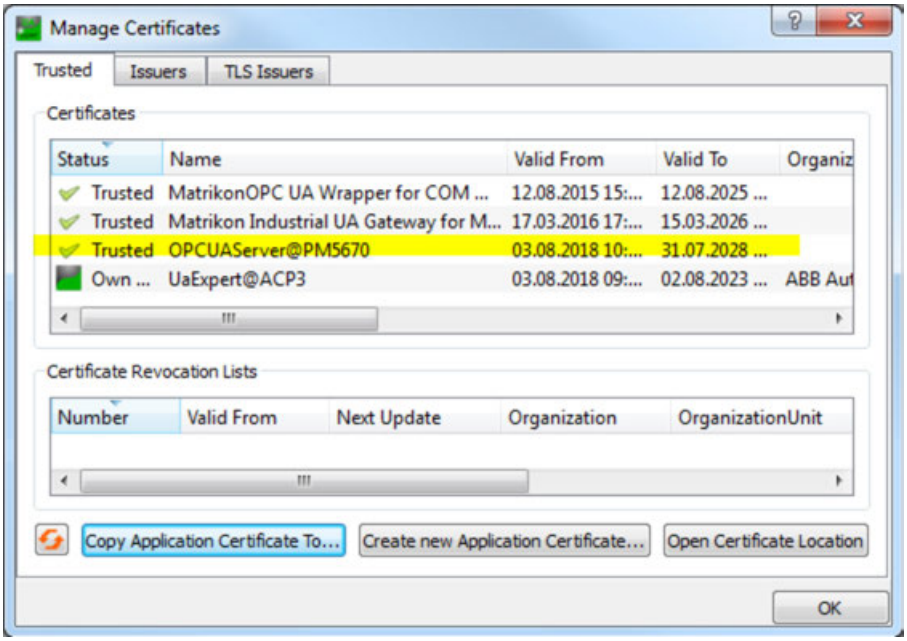
Working with a trusted certificate will avoid this error message.

14. Enable checkbox *Accept the server certificate temporarily for this session* and click *[Continue]*.

⇨ Dialog *Connect Error* opens



15. Click *[Ignore]*

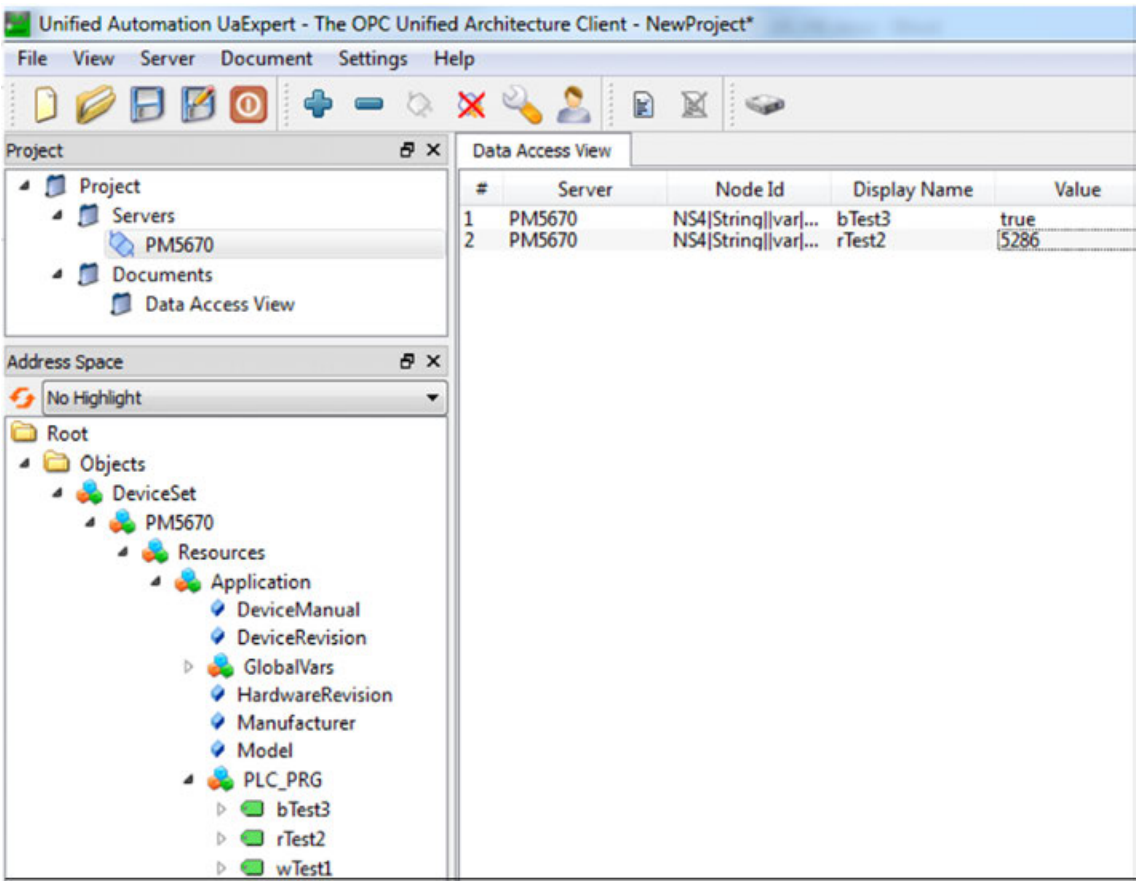


16. Check settings in dialog *Manage Certificates*.

Changing variables via UaExpert client

1. Expand in view *Address Space "Objects ➔ DeviceSet ➔ PM5670 ➔ Resources ➔ Application ➔ PLC_PRG"*.

   ⇨ The variables of the global variable list are visible.



2. Drag and drop the variables to the Data Access View.
3. Change values in the column *Value*.

Configuring OPC UA client

Operating modes

Polling

- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

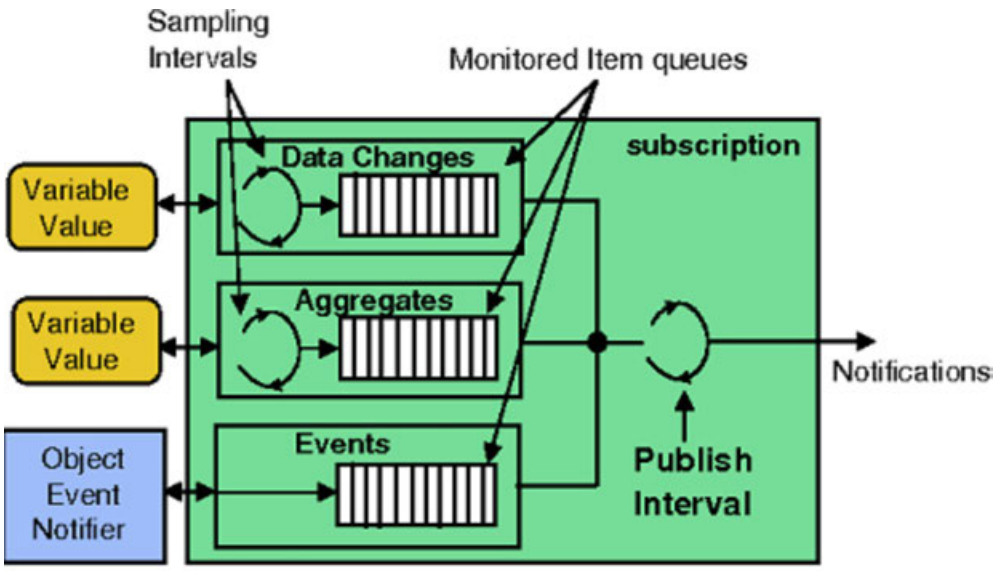
Pub/Sub

Not yet supported

Subscription (recommended mode)

- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

Client defines a group of symbols with	Description
Publishing interval	Interval, in which server publish data to client
Sampling interval	Interval for sampling and storing data at server and send in each publishing interval
Queue size	Array of data to save data if sampling Interval is faster than publishing Interval (At AC500 in the moment only 1)
Data change filter	Can be used to reduce traffic from server to client. Criteria: ● Change of data, ● Change of status ● Change of time stamp AC500 is fix configured for change of data and change of status.

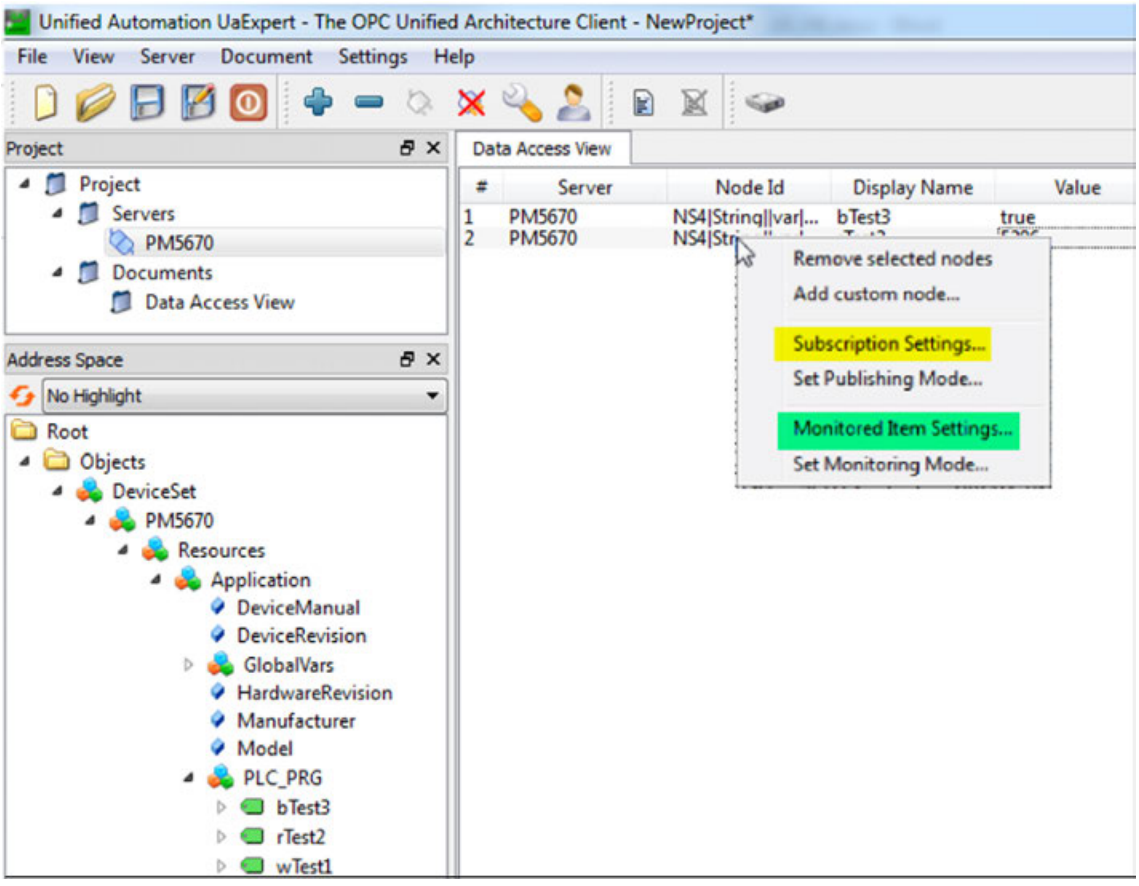


Using OPC UA with subscription mode

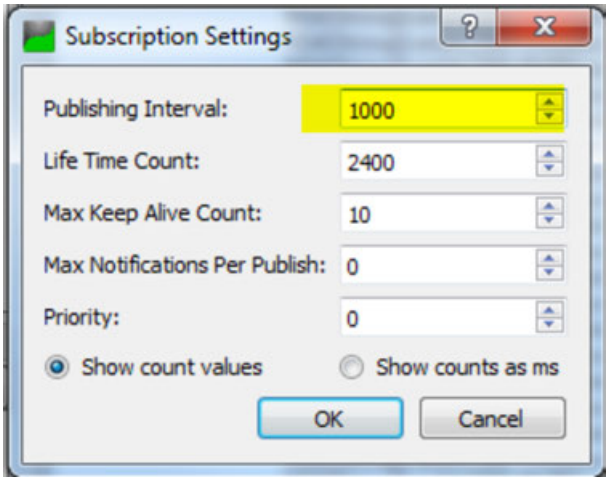
Recommendations:

- *Define only variables you need as symbols*
- *Do not configure publishing Intervals to short (increase load)*
- *Use different subscriptions with different publishing intervals in order to decrease load*
- *Do not use sampling intervals faster then publishing intervals as long as AC500 OPC UA server don‘t support Queue Size different from 1*
- *Be careful: Setting „0“ at sampling Interval at client will be interpreted in server as „as fast as possible“, which is 100ms at AC500 and create a high load.*

Publishing and sampling intervals in UaExpert



1. Right-Click on an Item in *Data Access View* and click *"Subscription Settings"*.



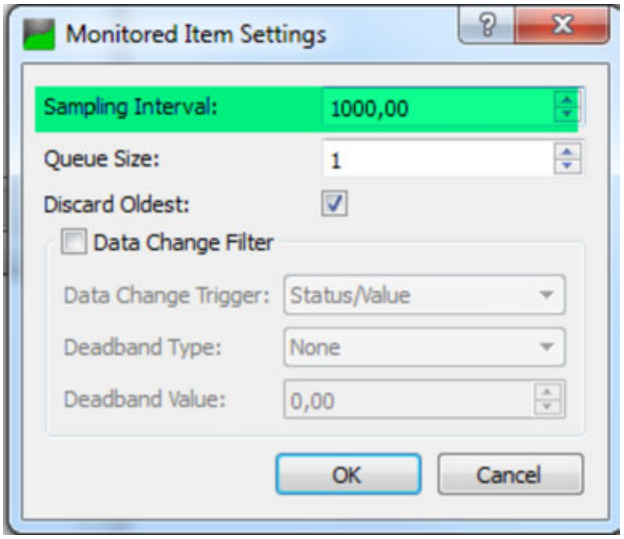
2. Set the recommended values.

   Life Time Count: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deletet.

   Max Keep Alive Count: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

   Click *[OK]*.

3. Right-Click on an Item in *Data Access View* and click *"Monitored Item Settings"*.



4. Set the recommended values.

1.6.6.5.3 Web server

In order to be able to use the PLC as a client for web services, the HTTP function block library can be used. Setup and use are described in an *application example*.

1.6.6.6 Converting an AC500 V2 project to an AC500 V3 project

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example

Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.

1.6.7 Storage devices for AC500 V3 products

1.6.7.1 Introduction of AC500 storage devices for AC500 Products

1.6.7.1.1 Overview

AC500 PLCs offer a variety of storage devices. The following table gives a short overview and a description on these storage devices:

IEC access means that the storage device can be accessed by function blocks of an IEC program.

FTP access means that the device can be accessed via FTP server on the PLC (if available).

Component	Description	IEC access	FTP access	CPUs AC500 V3
userdisk home/userdisk (customer data)	User disk for custom data (flash) Internal persistent mass storage placed in the internal flash device Can be used for any application purpose	Yes	Yes	All
PLCLogic home/PLCLogic (customer data)	Internal persistent mass storage placed in the internal flash device Used for configuration data, user application (boot project), WebVisu files, etc.	Yes	Yes	All
SRAM	Battery-buffered device, non-volatile RAM Used for retain/ persistent and ProzM variables	Yes	No	All
system	System RAM disk (Temp directory) for storing the firmware For internal firmware use only!	Yes	No	All

Component	Description	IEC access	FTP access	CPUs AC500 V3
flashdisk	Internal persistent mass storage device Can be used for any application purpose	Yes	Yes	PM5675-2ETH
memory card	memory card (removable) Removable persistent mass storage device Can be used for any application purpose	Yes	Yes	All

1.6.7.1.2 Functionalities

Filesystem Name	As of CPU firmware	Description
userdisk	V3.0.0	Boot project (size deends on PLC type) WebVisu files for web server Symbol file for OPC server and CP600 panels User data via CAA_File_xxx.lib *) Files via Automation Builder file download Files via FTP server
	V3.1.0	Save persistent data
SRAM	V3.1.0	Save retain and persistent data
system	V3.0.0	Load / save boot project
		Firmware update
		Internal system files
flashdisk	V3.1.0	User data via CAA_File_xxx.lib *) Files via Automation Builder file download Files via FTP server
sdcard	V3.0.0	Firmware update, User data via CAA_File_xxx.lib *) Files via Automation Builder file download Files via FTP server
	V3.1.0	Save persistent data Boot project (size depends on PLC type)

*) Examples for the filename with path (sFileName for FILE.Open) specified by the user ('mydir' is optional, but must be an existing directory):

- 'userdisk/myfile.txt'
- 'sdcard/mydir/myfile.txt'
- 'flashdisk/myfile.txt'

The maximum number of files opened at the same time is limited to 1007.

The max. length of the user string (path and filename) is 241 characters.

Unlike the PLC's memory areas like %M or Retain, where 1 byte actually consumes 1 byte, all storage device utilize a file system.

That means there is a difference between a files size and its size on the disk.

On disks the files are stored in so-called clusters which are a group of disk sectors. "Size on disk" refers to the amount of cluster(s) a file is taking up, while "file size" is an actual byte count of the file data. So you will usually find that the size on disk is larger than the file size. This is not an error, but a result of the disk organization via a file system. Since sector and cluster sizes vary depending on a disk's size and the used file system, the ratios between the size on disk and the file size also vary between the various storage devices.

1.6.7.1.3 Memory sizes

AC500-eCo V3 processor modules

PLC type	system RAM disk	userdisk PlcLogic ...	Retain, ProzM area	flash disk	memory card
PM5012-x-ETH	Dynamically /max. 7.6 MB	30 MB	8 kB Retain and persistent 4 kB (of which 88 byte are reserved for allocation table) ProzM 4 kB	None	see *Chapter 1.6.4.6.5.2 “MC5102 - Micro memory card with micro memory card adapter” on page 3432*
PM5032-x-ETH			32 kB Retain and persistent 16 kB (of which 88 byte are reserved for allocation table) ProzM 16 kB		
PM5052-x-ETH					
PM5072-T-2ETH(W)			100 kB Retain and persistent 36 kB (of which 88 byte are reserved for allocation table) ProzM 64 kB		

AC500 V3 processor modules

PLC type	system RAM disk	userdisk PlcLogic ...	SRAM Retain, ProzM area	flash disk	memory card
PM5630-2ETH	Dynamically /max. 7.6 MB	40 MB 30 MB (as of V3.4.0)	256 kB Retain and persistent 128 kB (of which 24 byte are reserved for allocation table) ProzM 128 kB	None	see *Chapter 1.6.4.6.5.1 "MC502 - Memory card" on page 3428* *Chapter 1.6.4.6.5.3 "MC5141 - Memory card" on page 3437* *Chapter 1.6.4.6.5.2 "MC5102 - Micro memory card with micro memory card adapter" on page 3432*
PM5650-2ETH	Dynamically /max. 16 MB	246 MB (as of V3.0.x) 381 MB (as of V3.1) 285.75 (as of V3.4.0)			
PM5670-2ETH	Dynamically /max. 69 MB	858 MB 643.50 MB (as of V3.4.0)	1536 MB 1 MB retain and persistent (of which 24 byte are reserved for allocation table) 512 kB ProzM		
PM5675-2ETH				8 GB	

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

1.6.7.1.4 Storage device details

This section contains some details on each storage device. For further details on specific topics please also refer to the following chapters:

Storage device sizes	*Chapter 1.6.7.1.3 "Memory sizes" on page 3996*
FTP access	*Chapter 1.6.6.3.5 "FTP server" on page 3917*
PLC shell commands	*Chapter 1.6.6.4.4 "PLC shell commands" on page 3950*

SRAM

The SRAM is a battery-buffered, nonvolatile RAM and is used for the retain/persistent and the ProzM variables. If a battery is inserted into the processor module, the data stored in the SRAM will not get lost during a power-down cycle.

During PLC startup, the SRAM will be deleted automatically if no or an empty battery is inserted into the processor module. In this case the information

```
ABBInitSram_SetupMemory : SRAM cleared
```

and the warning

```
Retain size in config changed, or retain area got corrupted
```

are written into the log file.

Further information see *Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3456*.

Memory card

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card *Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3999*.

Size	Product specific, see table Memory Sizes *Chapter 1.6.7.1.3 “Memory sizes” on page 3996*

Flash disk

The flash disk is an internal persistent mass storage device and can be used for any application purpose.

It has a memory capacity of 8 GB (preformatted).

The flash disk is capable of high data throughput, however, the actual values to be achieved depend on the use cases. If the performance seems to get insufficient, check the following:

- If the PLCs CPU load is high, reduce overall CPU load of the PLC to have more performance for file operations.
- If the device has low free space, cleanup the disk.
  Please consider the cluster size of 4 kB in your application design to achieve optimal usage of the flash disks space and access performance. For example, 10 files with 10 byte each require 10*4 kB disk space, while 1 file with 100 byte requires only 4 kB.

Number of max. write cycles

Technically, the flash chip used in V3 flash disk has 20000 Erase-Cycles (Write cycles).

Due to the produced write overhead, the optimum achievable number of write cycles is 10000 (for typical payload sizes of 256 kB).

Example

The write overhead is indicated by the *write amplification factor* (WAF).

$$\mathrm{WAF} = \frac{\text{Flash Write (in Bytes)}}{\text{Host Write (in Bytes)}}$$

Table 746: Rule of thumb for assessing the flash lifetime for an application:

Typical payload sizes	WAF	Max. write cycles
256 kB	2	10000
128 kB	4	5000
64 kB	8	2500
...	...	...

Typical payload sizes	WAF	Max. write cycles
1024 Byte	512	< 40
512 Byte	1024	< 20

For monitoring the status

It is recommended to use the respective function blocks to monitor the status of the flash disk (see Chapter 1.6.7.4 “Health monitoring” on page 4010).

Since FW version 3.3.0, there is also a diagnosis event supported when the user flash memory reaches the end of its life cycle.

Lifetime of flash disk will also depend on the operating environment.

E.g. high ambient temperatures will impose stress on the user flash memory and reduce the total overwrites achievable.

- Max. write speed is 20 MB/s (continuous write of sequential data)
- Read cycles are unlimited.

1.6.7.2 Memory card in AC500 V3

The memory card is a removable persistent mass storage device and can be used for any application purpose. Both firmware updates and boot project updates can be run from the memory card.

NOTICE!

Removal of the memory card

Do not remove the memory card when it is working. For memory card activity the black square (■) is shown on PLC display as long as a file is open on the memory card. Remove the memory card only when no black square (■) is shown next to memory card in the display. Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

1.6.7.2.1 Firmware and/or application update with memory card

ABB recommends that users carry out the firmware update via Automation Builder. Chapter 1.6.6.1.4 “Firmware identification and update” on page 3652

Not every user has an Automation Builder at his disposal with which a firmware or boot project update can be easily realized. In this case, the user must be provided with a prepared memory card from his client.

It is not possible to update the communication interface modules with a memory card. The firmware of the communication interface modules can only be updated with the IP configuration tool. Chapter 1.6.6.2.9.1.2.3 “Firmware update” on page 3728

Preparation of memory card

Memory cards contain firmware and application. Visualizations and all related objects (like text lists) are also added to the memory card.

The command to create boot project and/or firmware files is available in the context menu of AC500 application nodes *"Export"* in the device tree. In both cases a folder location can be chosen by the user to which the content shall be exported (any location is fine: file system, memory card, etc.). The created folders can also later be copied to a memory card.

For more information, see also

- MC502 - memory card *Chapter 1.6.4.6.5.1 "MC502 - Memory card" on page 3428*
- MC5141 - memory card *Chapter 1.6.4.6.5.3 "MC5141 - Memory card" on page 3437*
- MC5102 - micro memory card with micro memory card adapter *Chapter 1.6.4.6.5.2 "MC5102 - Micro memory card with micro memory card adapter" on page 3432*

Export boot project and firmware

When selecting *"Boot project and firmware (SD card)"* the boot project is additionally exported to the given file location. If not yet existing it is created automatically for V3. On V2 it has to be created before executing the export command. A corresponding error message is then shown with instructions.

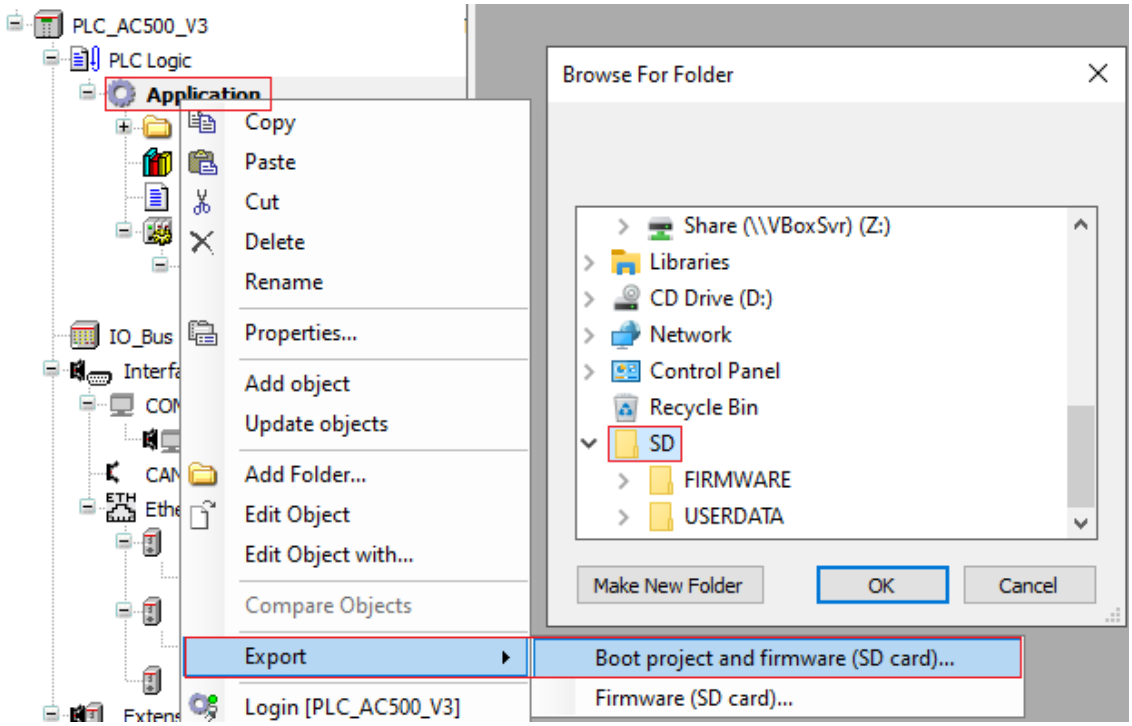


Fig. 342: Example for AC500 V3

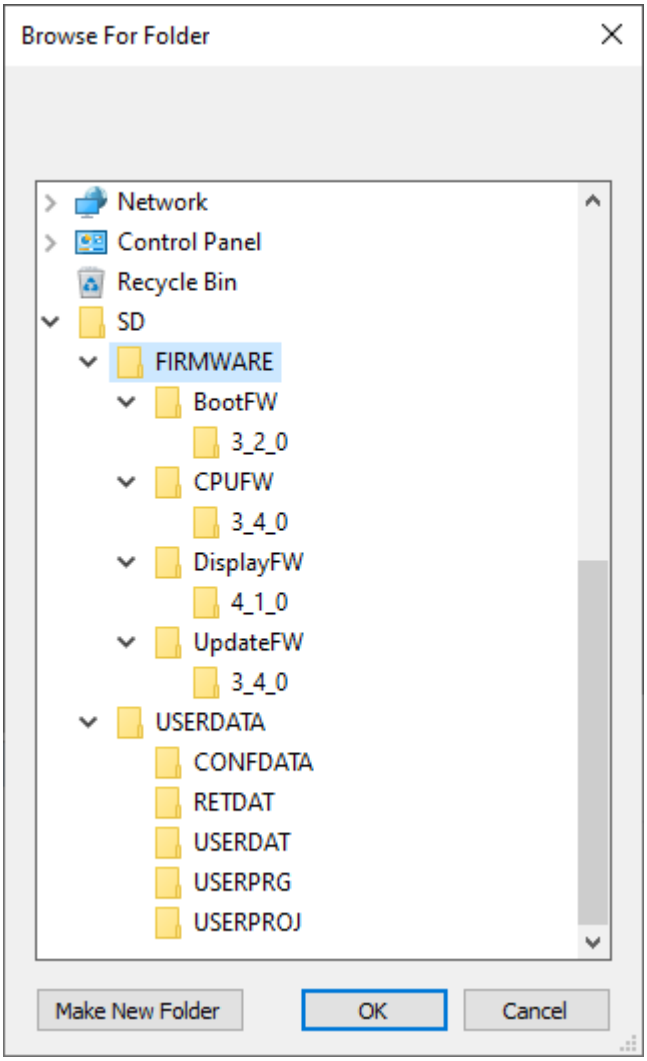
1. Right-click *"Application"* in the device tree.
2. Select *"Export ➔ Boot project and firmware (SD card)..."* .
3. Click *[Make New Folder]* and type in "SD".
4. Select *[OK]* to add the folder.

5. Select folder *"SD"*



⇨ The SD structure has been created and the firmware and application have been exported.

Mark all subfolders and files of the SD folder and copy them to a memory card. Do not copy the SD folder, only the subfolders and files!

> *The created SD folder does not contain user data, remanent data, config data, safety PLC power dip data and safety PLC password!*
>
> *Please add this data if required by the used application.*

Export firmware (only)

When selecting *"Firmware (SD card)"* the firmware of the PLC as well as the communication module is exported.

A confirmation message shows additional information on the export including the exported firmware.

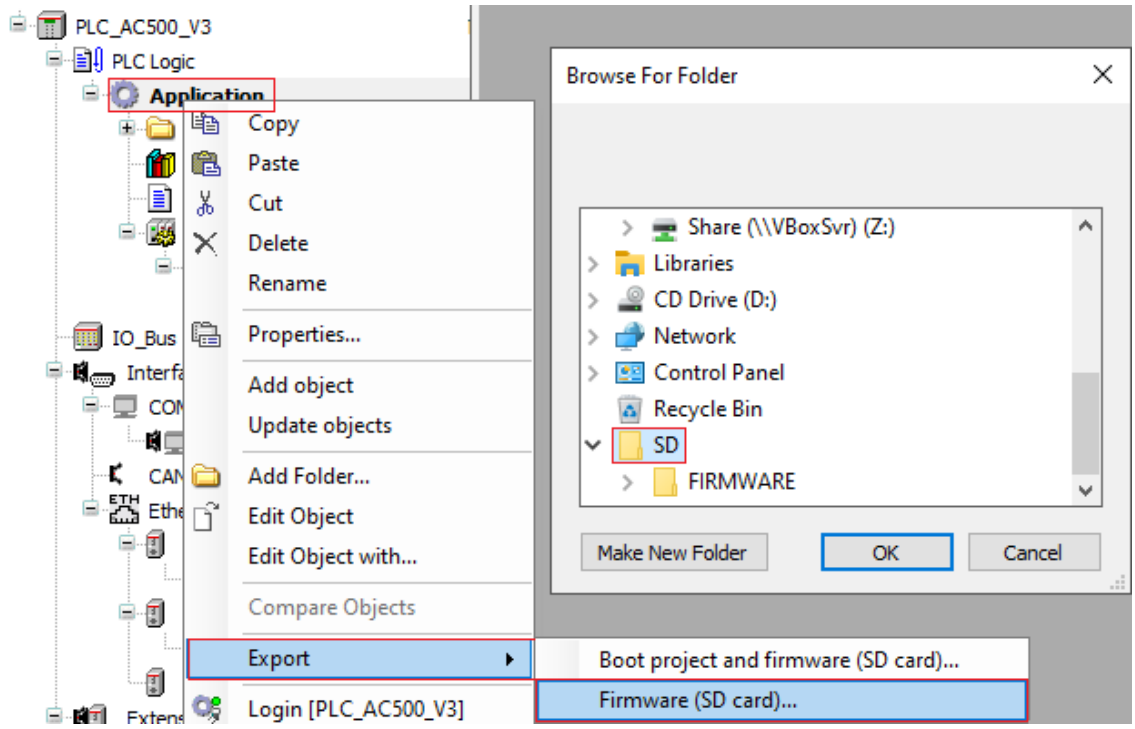


Fig. 343: Example for AC500 V3

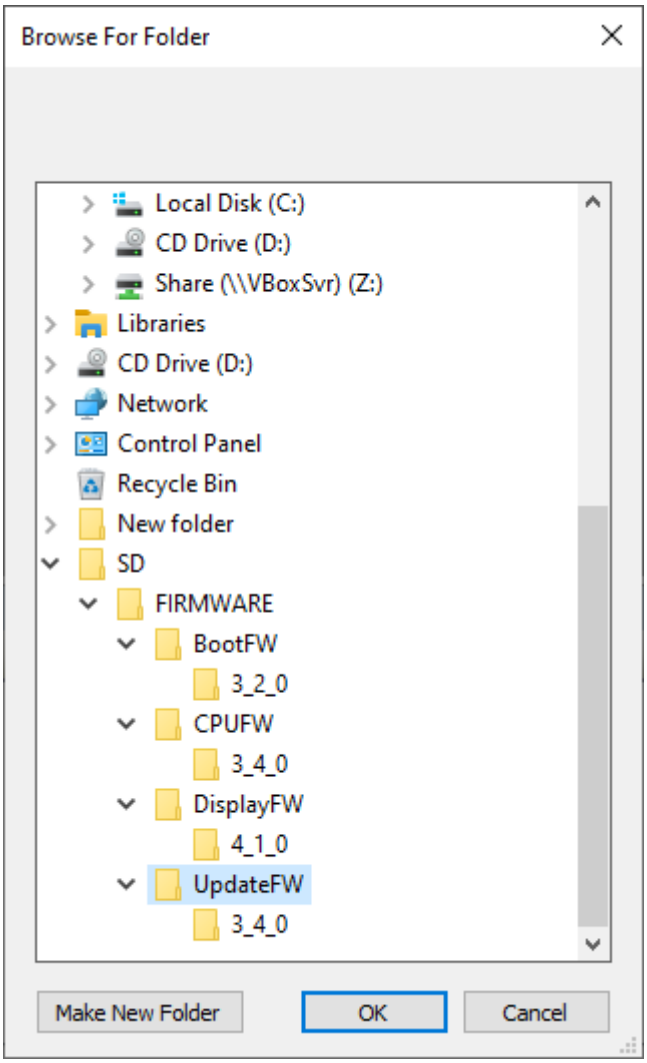
1. Right-click *"Application"* in the device tree.
2. Select *"Export ➔ Firmware (SD card)..."* .
3. Click *[Make New Folder]* and type in "SD".
4. Select *[OK]* to add the folder.
5. Select folder *"SD"*



⇨ The SD structure has been created and the firmware has been exported.

Mark all subfolders and files of the SD folder and copy them to a memory card. Do not copy the SD folder, only the subfolders and files!

Execution of update via memory card

The following steps describe the procedure for updating the firmware or the boot project using a memory card. Prerequisite is the previous download of the current firmware to the memory card either as export from the Automation Builder as described in the previous chapter or as online download from ABB.

Direct from *https://share.library.abb.com/api/v4?cid=9AAC177288&dk=Software*.

Click this link and on the next web page find the relevant firmware package and download it.

- Unpack this .zip archive file at any location of your hard disc
- Insert empty formatted (FAT16 / FAT32) memory card in the PC card reader
- Execute the unpacked *.exe file
- Select PC card reader as the final destination and confirm.

All directories, files and SDCARD.INI file will be automatically created on memory card and properly configured. After the process is complete, one has the prepared memory card with relevant updates.

Boot project and firmware update

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   ⇨ The alternate flashing of the RUN and the ERR LED indicates the running update process.

   At the end of the update process a reboot is executed and the boot project and system firmware is started for the finishing of the update process.

   If RUN LED blinks (ERR LED is off), the update was successful and the display shows *“done”*.

   If ERR LED blinks (RUN LED is off), the update failed and the display shows *“FAIL”*.

   The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   ⇨ The system starts with the new boot project and firmware on the CPU.

Firmware update

1. Switch off the device.
2. Insert the memory card.
3. Switch on the device.
   ⇨ The alternate flashing of the RUN and the ERR LED indicates the running update process.

   At the end of the update process a reboot is executed and the system firmware is started for the finishing of the update process.

   If RUN LED blinks (ERR LED is off), the update was successful and the display shows *done*.

   If ERR LED blinks (RUN LED is off), the update failed and the display shows *FAIL*.

   The text file “SDCARD.RDY” includes the results of the different updates. If the update fails, the file contains the reasons for the abort. Based on this, further steps can be taken to fix the problem.
4. Switch off the device.
5. Remove the memory card.
6. Switch on the device.
   ⇨ The system starts with the new firmware on the CPU.

Description of LEDs

The LEDs below the display indicate the status of the processor module:

LED	State	Color	LED = ON	LED = OFF	LED flashes
Power LED (PWR)	Denotes the power supply state of the processor module	Green	Voltage is present (24 V DC)	Voltage is missing	-
Run LED (RUN)	Denotes the activity state of the processor module	Green	Processor module is in RUN mode	Processor module is in STOP mode	If the LED flashes fast (4 Hz) a firmware update is finished with no errors. If the Run LED flashes fast (4 Hz), alternating with a flashing Run LED the firmware is updated. To enforce boot mode 1, keep the RUN function key pressed during the boot procedure. In this case, the Run LED flashes slowly (1 Hz). A subsequent project download (from within Automation Builder) cancels the blinking.
Error LED (ERR)	Denotes an error	Red	An error has occured.	No errors or only warnings have occurred.	If the Error LED flashes slowly (1 Hz) a firmware update from the memory card is finished with errors. If the Error LED flashes fast with AC500 on display a fatal system error has occurred. If the Error LED flashes fast (4 Hz) alternating with a flashing Run LED the firmware is updated.

A running processor module is indicated with the state RUN on the display, a deactivated processor module is indicated with the state STOP. In both cases the display's backlight is off.

1.6.7.2.2 Content of the memory card for firmware/application update

Only advanced users should apply the instructions in this chapter.

Memory card file content: Firmware version V3.x

Only advanced users should apply the instructions in this chapter.

General update process

Information on the firmware: *Chapter 1.6.6.1.4.2 “ AC500 V3 firmware installation and update” on page 3653*

The main components of the V3 CPU firmware are:

- BootFW (boot firmware): responsible for the starting of the UpdateFW or the SystemFW
- UpdateFW (update firmware): responsible for the update of BootFW, UpdateFW, SystemFW, UpdateHook and boot project
- SystemFW (system firmware, CPUFW): Runtime system of the PLC, additionally responsible for the update of the DisplayFW (display firmware) and the firmware of the communication module
- DisplayFW (display firmware): Firmware of the display

Additionally the update process includes the following parts:

- Communication module (communication module firmware): Firmware of the different communication module
- UpdateHook: Specific patches for the PLC
- UserProgram: Boot project of the application
- License features: Import and export of license files. The license file for the "ImportLicense" is a Wbb or a WibuCmRaU file. The license file of the "ExportLicense" is a WibuCmRaC file.

The firmware updates are triggered by the command file *SDCARD.INI*. In addition a result file of the firmware update is generated (*SDCARD.RDY*, identical path as *SDCARD.INI*). For the group [FirmwareUpdate] the parameters 0, 11, 12 and 13 are defined. For each firmware update two files are necessary. The firmware file and the corresponding signature file.

For example:

AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2

AC500_V3_SystemFirmware_V3.0.1.73.tar.bz2.sig

AC500_V3_DisplayFirmware_V3.0.0.0.app

AC500_V3_DisplayFirmware_V3.0.0.0.app.sig

For the user program the application file and the application *CRC* are necessary. For example:

Application.app

Application.crc

If the signature file and the firmware file do not match, no update is performed and the correspondent error result is written to the file *SDCARD.RDY*.

If the update firmware is running the display shows the text *update*. The blinking of the *RUN* and the *ERR* LED’s indicates the update process.

The file “SDCARD.RDY” includes the results of the different updates. After an update of a communication module *CODESYS Control* is started in safe mode (no download or starting of the application is possible) and the PLC needs a reboot (power down/up; the display shows *please* and *reboot* alternately).

As of system firmware 3.2 the compatibility file "Version.txt" (with the corresponding signature file "Version.txt.sig", identical path as "SDCARD.INI") is necessary for the update process. The update firmware checked the compatibility of the following parts:

- CPUFW (system firmware)
- BootFW (boot firmware

- UpdateFW (update firmware)
- DisplayFW (display firmware)

A missing "Version.txt" or a missing/corrupt "Version.txt.sig" file is signalled at the component "CPUFW" (file "SDCARD.RDY").

If the update process would result in incompatible parts of firmware no update is performed in the update firmware. After starting of the system firmware the compatibility of the communication module firmware is checked additionally. The check of the compatibility of the firmware is executed always (independent of the parameter for the component). Incompatibility is signalled at the corresponding component (file SDCARD.RDY").

Command file *SDCARD.INI* for AC500 V3 Products

Only advanced users should apply the instructions in this chapter.

[FirmwareUpdate]	0 = No update
CPUFW=x x= 0, 11, 12, 13	11 = Update system firmware always with the file specified in module's section [CPU] and component's path key “CPUFW”. 12 = Update with different version, the update is only performed if the version of the file specified by the component path key “CPUFW” in module’s section [CPU] differs from the current version of the CPU. 13 = Update with newer version, the update is only performed if the version of the file specified by the component path key “CPUFW” in module’s section [CPU] is newer than the current version of the CPU.
BootFW=x x= 0, 11, 12, 13	See description CPUFW. The component's path key for the boot firmware in module’s section [CPU] is “BootFW”.

1.6.7.3 Flash memory for AC500 V3 products

AC500 processor modules for V3 products (PM56xx) are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications. The user flash memory can be accessed from the user program using the CAA_File library.

NOTICE!
The user flash memory has a finite number of write cycles.

Important: Programmers should keep the amount of cyclic written data low to ensure long availability.

1.6.7.4 Health monitoring

AC500 V3 products are equipped with non-removable and non-volatile onboard user flash memory for program and data storage. The integrated flash management, including a wear levelling algorithm and a power-fail protected file system, is designed for robustness and operation in industrial environments and applications.

Keep the amount of cyclic written data low to assure long availability of the user flash memory. The spent/remaining lifetime information of the user flash memory can be acquired with the function block PmDiskStatus and PmDiskLifetimeUsed.

Further information is provided in the documentation of the *AC500_Pm* library. *Chapter 1.10 “Reference, function blocks” on page 4292*

Since FW version 3.3.0, there is also a diagnosis message issued when the user flash memory reaches the end of its lifecycle. Please refer to the diagnosis documentation for more info.

1.7 Diagnosis and debugging for AC500 V3 products

1.7.1 The diagnosis system

The diagnosis system enables uniform diagnosis of the CPU and its local interfaces, of the local I/O bus with the connected S500 I/O devices and of the fieldbuses connected via communication modules, considering the special features of the various fieldbuses. The safety CPU is also integrated into the diagnosis system.

Diagnosis data of the devices can be accessed by

- CPU display
- Automation Builder
- IEC application

To forward the information to notify them by, e.g., webserver or OPC UA server, the data retrieved in IEC application can be stored in variables.

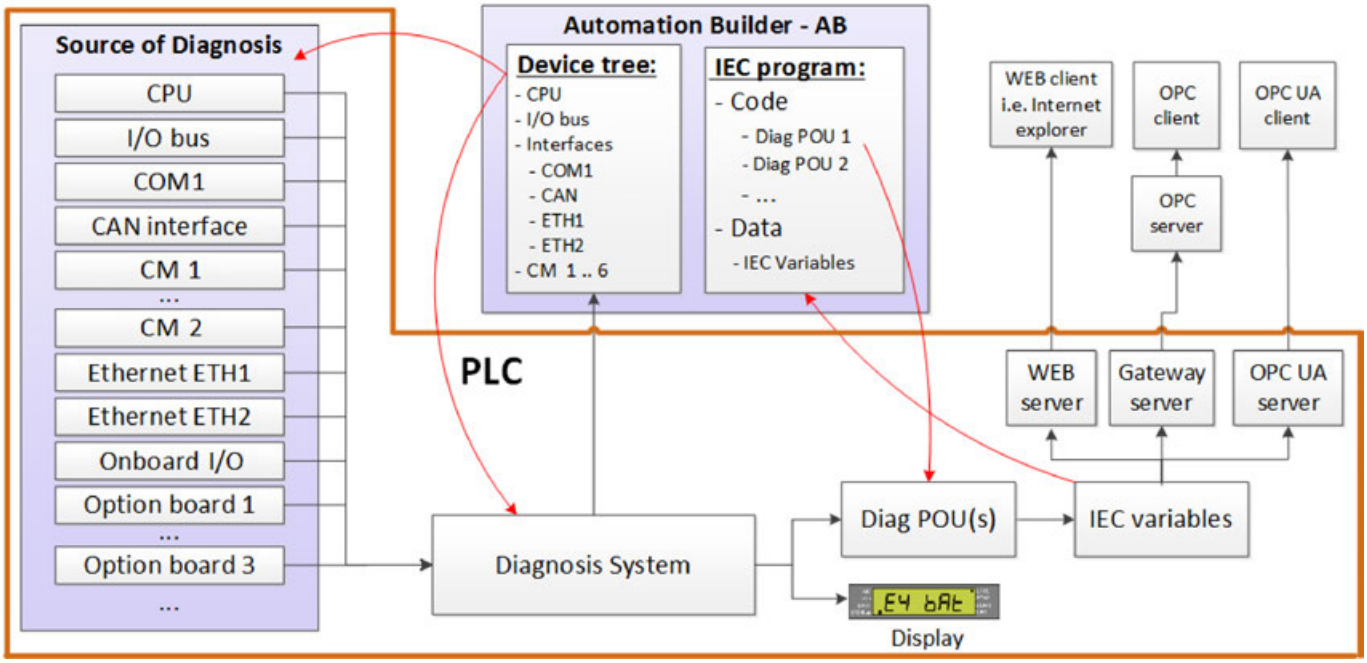

Fig. 344: Overview of the diagnosis system

All diagnosis data is assigned to a device. System diagnosis (e.g., battery low) is coming from the CPU device or one of the child objects (e.g., watchdog diagnosis of a task object).

Diagnosis is available for devices with representation in the Automation Builder device tree.

Diagnosis messages include the severity of an error. Error severity can be used for defining system behavior, e.g., activating the error LED or stop the PLC ↳ *Chapter 1.7.1.5.1 “Error severity” on page 4044*.

Types of diagnosis messages

- An **event** describes the current state of the device. It does not have to be acknowledged.
- An **alarm** describes that at a certain point of time, there was a diagnosis message. It does not say anything about the current state of the device.
  Alarms must be acknowledged by the user. After acknowledging, the alarm disappears for all consumers.

Every diagnosis message has a come time.

Device state

With reference to diagnosis, there are different device states:

- Device without events and without unacknowledged alarms.
- Device with events or unacknowledged alarms.
- Device does not respond and is not available for online connection.

Diagnosis descriptions

Diagnosis messages are always available for all consumers.

- ABB AC500 V3 devices:
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location, error number and text.
- 3rd party devices:
  - Events and unacknowledged alarms.
  - Every diagnosis message with come time, location and error number.
  - Clear text information if available either from a standard or from the device description.
  - If available: Extended diagnosis: Additional data coming from the device for manual analysis.

Extended diagnosis

Some devices are able to provide extended diagnosis. This additional device-dependant diagnosis will only be collected on request and will be device type specific (e.g. bus scan request on PROFINET I/O controller). Main intention is to cover commissioning use cases, when very specific information is required that typically cannot be stored in error numbers in a reasonable way.

1.7.1.1 Access to diagnosis data

Access to device state

- Error LED on CPU *Chapter 1.7.1.2 “Diagnosis in CPU display” on page 4013*
- Automation Builder device tree *Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 4017*
- IEC application via device name *Chapter 1.7.1.4.3 “Device diagnosis” on page 4034*
- IEC application via list of all available diagnosis *Chapter 1.7.1.4.2 “System diagnosis” on page 4025*
- External access via global IEC variables Fig. 344

Access to diagnosis descriptions

- CPU display *Chapter 1.7.1.2.2 “Diagnosis descriptions” on page 4013*
  (for CPU, local I/O bus and connected S500 I/O modules, not for communication modules and field buses)
- Automation Builder via *“All messages”* window *Chapter 1.7.1.3.2 “Diagnosis descriptions” on page 4017*:
  - Support for (bulk) acknowledgement of alarm
  - Access to extended diagnosis data of 3rd party devices devices (if available), without any interpretation
- IEC application via a list of all current diagnosis either of a device (device object from the Automation Builder tree) *Chapter 1.7.1.4.3 “Device diagnosis” on page 4034* or of the complete PLC *Chapter 1.7.1.4.2 “System diagnosis” on page 4025*:
  - Navigation chronologically in both directions (starting either from the oldest or newest diagnosis)
  - Access to the diagnosis numerically (evaluation by IEC application), textual (use on HMI) or to extended diagnosis data of 3rd party devices (if available)
  - Acknowledgement of alarms
- External access via global IEC variables by using the IEC application features for getting all relevant information

Access to extended diagnosis

Extended diagnosis data will be displayed in Automation Builder via *“All messages”* window. The data is displayed as it is provided from the device without any interpretation. Refer to, e.g., the manual of the device to get information about the extended diagnosis data.

1.7.1.2 Diagnosis in CPU display

1.7.1.2.1 Device state

If there is at least one active diagnosis message, the error LED ERR is on.

The behavior of the error LED depends on the setting of CPU parameter *“Error LED” ↳ Table on page 3693*.

> *Diagnosis of AC500-eCo CPUs can only be shown by LED ERR at CPU. No display is available.*

General information on the LEDs, the display and the function keys can be found in chapter *↳ Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486*.

1.7.1.2.2 Diagnosis descriptions

↳ Chapter 1.7.1.2.3 “Reading out diagnosis messages on the CPU” on page 4015.

Entry	Length [byte]	Values	Description	Display
Error severity	1	0 .. 255	Used values: 1, 2, 3, 4, 11 *↳ Chapter 1.7.1.5.1 “Error severity” on page 4044*	**Ex** abc
Hardware ID (HwId)	1	0 .. 255	Location of diagnosis, e.g., subdevice, as three-letter word *↳ Further information on page 4013*	Ex **abc**
Error code	2	1 .. 65535	Error number (low word)	12345
SubSysteminfo byte 1	1	0 .. 255	Depends on hardware ID	d1 123
SubSysteminfo byte 2	1	0 .. 255	Depends on hardware ID	d2 123
SubSysteminfo byte 3	1	0 .. 255	Depends on hardware ID	d3 123
SubSysteminfo byte 4	1	0 .. 255	Depends on hardware ID	d4 123

> *CPU display does not show any communication modules or fieldbus diagnosis. To view these diagnosis messages use Automation Builder ↳ Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 4017 or IEC application ↳ Chapter 1.7.1.4 “Diagnosis in IEC application” on page 4020.*
>
> *This is valid for:*
>
> – *all external communication modules incl. safety CPUs, CM574-RS, FM502-CMS*
> – *CANopen on onboard CAN interface*
> – *fieldbuses on Ethernet interfaces ETH1/ETH2 like PROFINET IO controller, EtherCAT master, etc.*

For identification of the location of a diagnosis the hardware ID and in addition for CPU diagnosis the SubSysteminfo byte 1 is used.

The location is displayed with 3 characters.

Hardware ID	Value	SubSysteminfo byte 1	Value	Display
CPU	0	CPU itself	0	
CPU	0	RAM	17	
CPU	0	Flash	18	
CPU	0	Flashdisk	19	
CPU	0	SD memory card	20	
CPU	0	Display	21	
CPU	0	Battery	22	
CPU	0	RTC (real-time clock)	23	
CPU	0	FPU (floating point unit)	24	
CPU	0	Power supply	25	
Communication module 1	1			
Communication module 2	2			
Communication module 3	3			
Communication module 4	4			
Communication module 5	5			
Communication module 6	6			
COM1 serial interface 1	7			
COM2 reserved for serial interface 2	8			
CAN interface	9			
Onboard I/O (eCo)	10			No display
Option board 1 (eCo)	11			No display
Option board 2 (eCo)	12			No display
Option board 3 (eCo)	13			No display

Hardware ID	Value	SubSysteminfo byte 1	Value	Display
I/O bus	14			
Ethernet ETH1	15			
Ethernet ETH2	16			

1.7.1.2.3 Reading out diagnosis messages on the CPU

Table 747: Example: no diagnosis message in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1			No action	No action	Return into RUN/STOP mode.	

Table 748: Example: diagnosis messages in status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	The processor module is in RUN/STOP mode.	State 1 is displayed	-	-	-	-
1	 Number of diagnosis messages; here 4		Go to first/ next diagnosis message in status list (e.g., state 2)	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Return into RUN/STOP mode.
2	 Diagnosis message example: *Error battery empty or missing* Toggling between state 2 and 3	Selects displayed diagnosis message and shows details *Table 749 "Example: error battery empty or missing" on page 4016*	Go to first/ next diagnosis message in status list	Go to last/ previous diagnosis message in status list	Return into RUN/STOP mode.	Acknowledge and return into RUN/STOP mode.

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
3	 Error ID example Toggling between state 2 and 3					

Table 749: Example: error battery empty or missing

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
0	 E4 = error severity 4 bAt = subdevice battery Toggling between state 0 and 1	State 2 is displayed	State 2 is displayed	State 6 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
1	 Error ID example Toggling between state 0 and 1					
2	 Error number 8 Battery is missing or empty		State 3 is displayed	State 0 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Displays state 0 Return to diagnosis status list
3	 Detail 1 Subdevice 22: battery		State 4 is displayed	State 2 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
4	 Detail 2 Error type 0: device		State 5 is displayed	State 3 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list

State	Display	Result on pressing one of the function keys				
		DIAG	↓	↑	ESC	OK
5	 Detail 3 Error type number 0: device itself		State 6 is displayed	State 4 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list
6	 Detail 4 Additional information 0: none		State 1 is displayed	State 5 is displayed	State 0 is displayed Return to diagnosis status list	State 0 is displayed Return to diagnosis status list

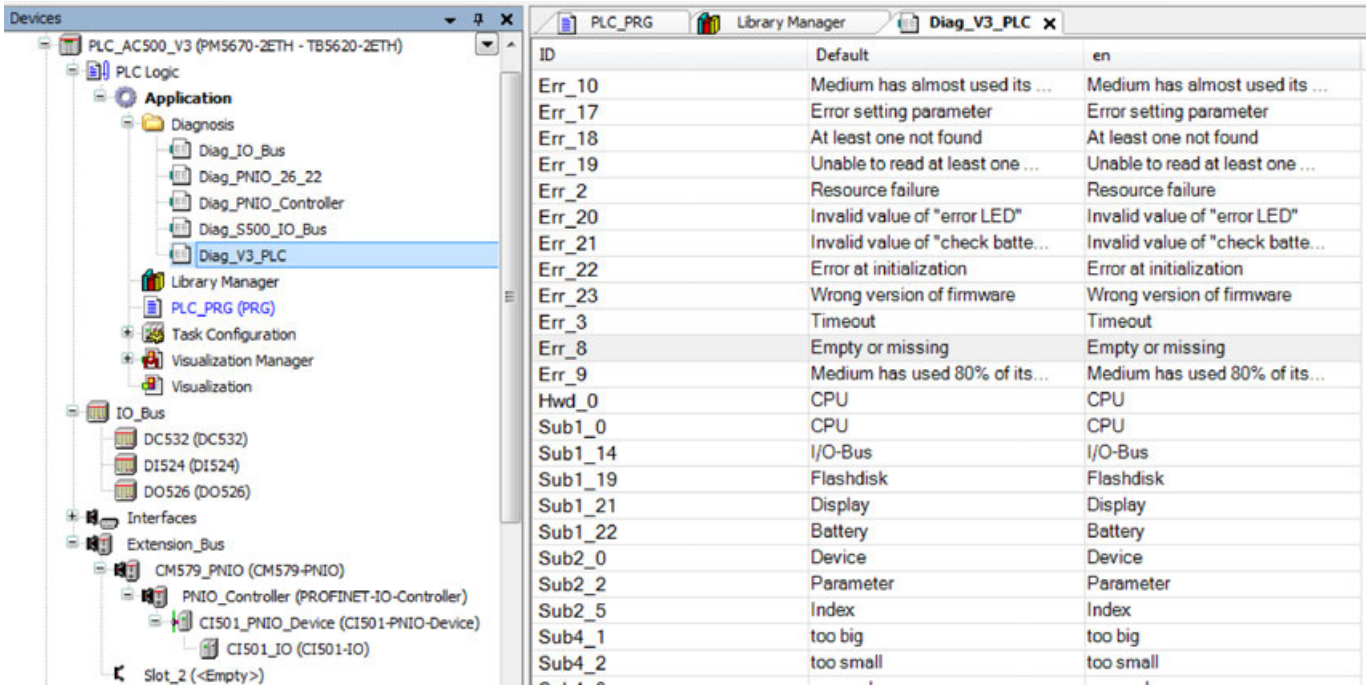
1.7.1.3 Diagnosis in Automation Builder

1.7.1.3.1 Device state

In Automation Builder, colored icons next to the devices' nodes in the device tree indicate the device state of each single device ↳ *Chapter 1.7.2.3 "Project tree in online mode" on page 4047*.

1.7.1.3.2 Diagnosis descriptions

Displayed text For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.



It is necessary to include a visualization, even if visualization will not be used.
Chapter 1.4.5 “CODESYS Visualization” on page 1249

Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

Displayed text for 3rd party devices

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22

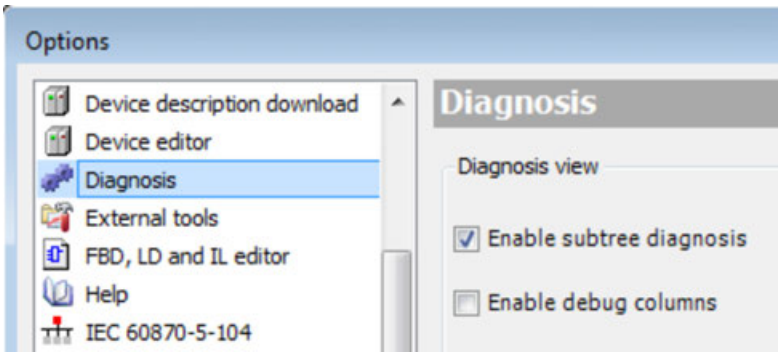
26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.

Which texts are used, depends on parameter *“Selection of diagnosis method”*: Double-click on a PROFINET I/O module and open tab *“General”*.

1.7.1.3.3 System diagnosis

In Automation Builder the system diagnosis is activated by default and can be deactivated in: *“Tools ➔ Options ➔ Diagnosis ➔ Enable subtree diagnosis”*



1.7.1.3.4 Device diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.

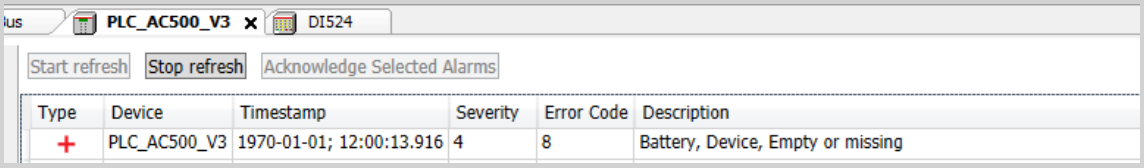
The message consists of:

- Type *Chapter 1.7.1.3.5 “Diagnosis history” on page 4019*
- Timestamp in date and time YYYY-MM-DD hh:mm:ss.ms
- Error severity
- Error code
- Diagnosis description
- Additional data

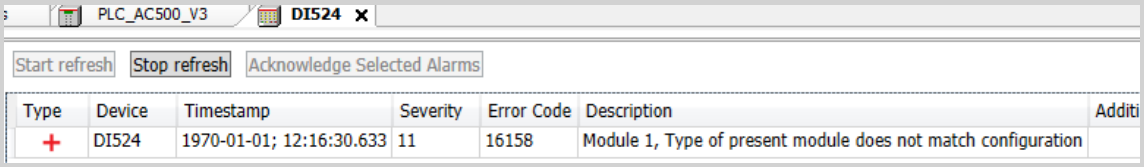
To view the diagnosis message:

1. Double-click on a device.
2. Select the tab *"Diagnosis"*.

Example Battery empty or missing.



Example Wrong module configured on I/O bus.



Device diagnosis is disabled by default.

To enable/disable device diagnosis:

1. Double-click on the PLC.
2. Select the tab *"PLC Settings"*.
3. Under *"Additional Settings"* enable/disable *"Diagnosis for devices"*.
   ⇨ When the device diganosis is disabled, this symbol will be displayed in the device tree and no diagnosis messages will be shown.

1.7.1.3.5 Diagnosis history

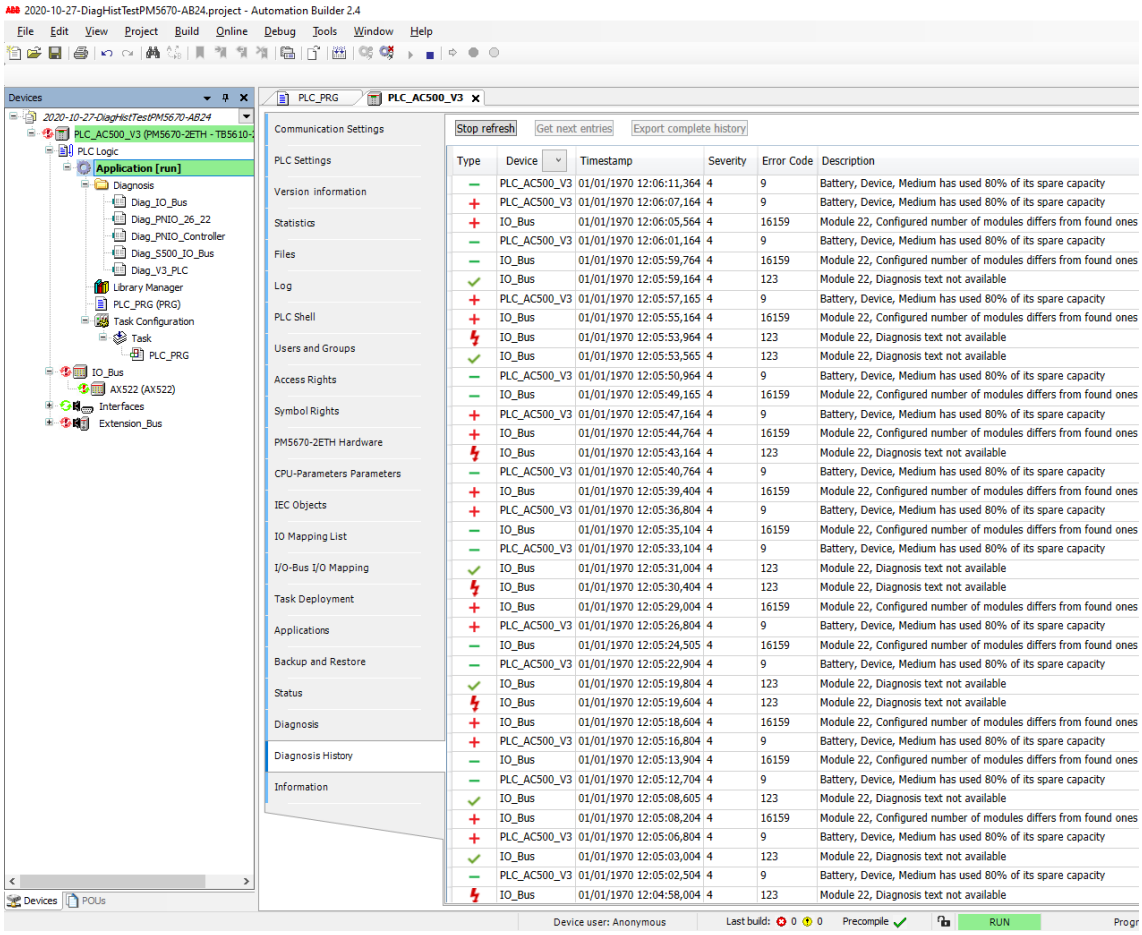
Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

The 'Diagnosis History' view provides an overview of the current and past system events that resulted in a diagnosis event.

- Incoming diagnosis events are indicated with +.
  After the problem that causes a diagnosis event has been resolved, this diagnosis event is indicated automatically with −.
- Alarm events, e.g. PROFINET alarms are indicated with .
  In the 'Diagnosis' view the user can acknowledge an alarm. Note that an alarm event can be acknowledged though the problem that causes the alarm still persists.
  The acknowledge action is indicated with on the concerning event entry. If the icon changes to , the acknowledge action has been completed by the PLC.

The following buttons are available in the 'Diagnosis History' view:

- Start/Stop refresh:
  Enables or disables the automatic refresh mode. In refresh mode new diagnosis events will be displayed automatically. Only the last 100 entries are shown in this view, the latest events on top of the list.
- Get next entries:
  Adds the previous (older) 100 diagnosis events at the bottom of the list.
- Export complete history:
  Creates a csv file with all events from the diagnosis history (not only the visible ones).



1.7.1.4 Diagnosis in IEC application

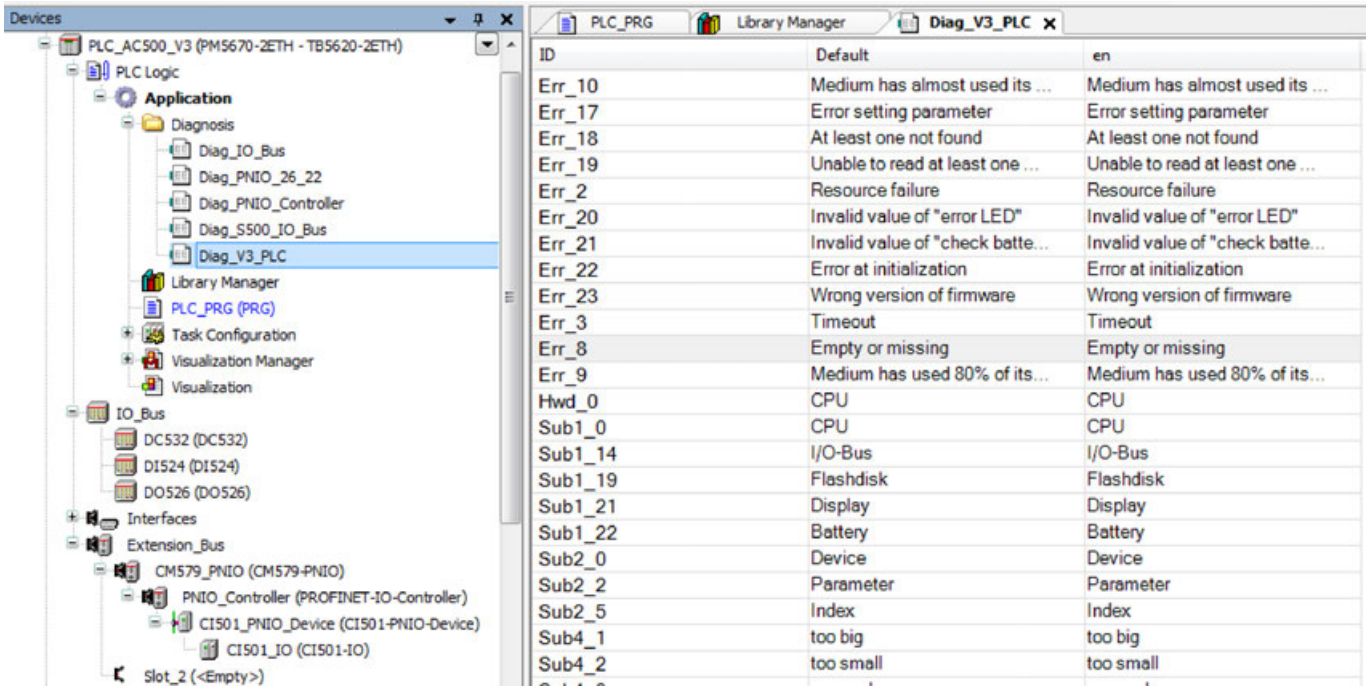
There are two possibilities for accessing the diagnosis messages in the IEC application:

- System diagnosis: Access to diagnosis messages of the whole PLC
- Device diagnosis: Access to the diagnosis messages of a device

For both possibilities common data types (structures and enumerations) are defined in the library AC500_DiagTypes ↬ *Chapter 1.7.1.4.1 “Data types in library AC500_DiagTypes” on page 4021*. The library is automatically included in PLC project.

Displayed text

For output of diagnosis messages in textual format Automation Builder and IEC application use text lists. Both application use the same text lists. The text lists are part of the device description. When inserting a new device in device tree of project, the corresponding text list is loaded. This text lists are part of PLC program and will be downloaded into the PLC.



It is necessary to include a visualization, even if visualization will not be used.
↳ Chapter 1.4.5 “CODESYS Visualization” on page 1249

Without visualization the text lists will not be included.

The text lists are generated automatically. We recommend that you do not change them manually because the changes can be overwritten automatically and without prompting.

Displayed text for 3rd party devices

The text lists for 3rd party devices are created during reading of the device description sheets, e.g., GSDML files for PROFINET I/O devices.

The name of a text list for a PROFINET I/O device is: Diag_PNIO_Vendor ID_Device ID

Example

CI501-PNIO: Diag_PNIO_26_22

26 = vendor ID ABB, 22 = device ID CI501-PNIO

The text list for the AC500 PROFINET I/O modules contains all text needed for PROFINET standard diagnosis and AC500 process alarm handling.

Which texts are used, depends on parameter *“Selection of diagnosis method”*: Double-click on a PROFINET I/O module and open tab *“General”*.

1.7.1.4.1 Data types in library AC500_DiagTypes

All data types regarding diagnosis are defined in the library AC500_DiagTypes.

Structure DIAG_VAL_TYPE

This data type specifies the format of all kinds of diagnosis messages in numeric format. It consists of one element for each detail of a diagnosis message.

Name	Type	Initial	Comment
diTimestamp	DT	DATE_AND_TIME#1970-1-1-0:0	RTC time of eDiagEvent_Occured
uiMs	UINT	0	Milliseconds of event
eClass	teClass	teClass.eDiagClass_4_Warning	Error severity of diagnosis message
szDevice	STRING(80)	""	Name of device, max. 80 characters
eHwInterfaceId	teHwId	teHwId_CPU	Identifier of hardware interface
dwSubSysteminfo	DWORD	0	Any number describing details or location within device, device-specific
dwAdditional	DWORD	0	Additional number describing details or location within device, optional, device-specific
dwErrorCode	DWORD	0	Error code
wSizeExtDiag	DWORD	0	Number of bytes of extended diagnosis data

Structure DIAG_TXT_TYPE

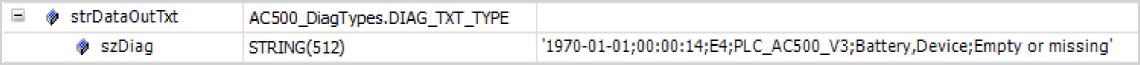
This data type specifies the format of all kinds of diagnosis messages in textual format. It consists of a single string containing all details of a diagnosis message.

Name	Type	Initial	Comment
szDiag	STRING(512)	""	Diagnosis message as text, max. 512 characters

The text consists of the following data, separated by semicolon:

- Timestamp in Date_And_Time (DT) format of eDiagEvent_Occured and added milliseconds
- Error severity
- Device name (max. 80 characters) as defined in Automation Builder device tree
- The error text itself, composed of the interpretation of dwSubSysteminfo and dwAdditional and the error text plus remedy (if available) from Automation Builder text list according dwErrorCode. Displayed as: error text -> remedy.

Example Battery empty or missing.



Enumeration ERROR_ID

Type of the return values of all methods and functions to request information on diagnosis.

Name	Type	Comment	Remedy
NO_ERROR	16#0	Execution successfully completed	
ERR_PARAMETER	16#1	Invalid parameter value in function call	Correct parameter
ERR_NO_SINK	16#2	Failed to register as sink	
ERR_NO_TEXT_LIST	16#3	Failed to get a device text list	Check text lists

Name	Type	Comment	Remedy
ERR_NO_TEXT_ CONTENT	16#4	Failed to get at least one content from text list	
ERR_COMPETING	16#5	Failed due to competing access of other method	Try again
ERR_ASYNC	16#6	Failed to create async process	
ERR_INTERNAL	16#7	Any internal error during execution	
BUSY	16#FFF	Busy	Call again to get final result
NO_ERROR_NO_DATA	16#FFFF	Execution successfully completed, no more diagnosis messages	

All values except "BUSY" are final results. In case "NO_ERROR" is returned, the requested action has been successfully performed. "NO_ERROR_NO_DATA" also indicates a successful completion. The only difference to "NO_ERROR" is the fact, that there is one (more) data to be provided. All other return values (except "BUSY") are final error states. In case a method or function returns "BUSY", it has to be called again in the following cycles until it returns a final result.

Enumeration teClass

Specifies the error severity of diagnosis messages ↳ *Chapter 1.7.1.5.1 “Error severity” on page 4044*.

Name	Error severity
eDiagClass_2_SeriousError	2
eDiagClass_3_Error	3
eDiagClass_4_Warning	4
eDiagClass_Parameter	11

Enumeration teEvent

The enumeration teEvent specifies the severity of diagnosis messages.

Name	Type	Initial	Comment
eDiagEvent_Occured	DINT	1	Error occurred, remains "active" until eDiagEvent_Disappeared
eDiagEvent_Disappeared	DINT	2	Error disappeared, became "active" due to eDiagEvent_Occured earlier on
eDiagEvent_Received	DINT	4	Received a diagnosis message which cannot be analyzed in detail, cannot disappear, needs to be acknowledged
eDiagEvent_Acknowledged	DINT	8	Acknowledge a diagnosis message which has been received by eDiagEvent_Received, removes diagnosis message from diagnosis system although error may still be present

Enumeration teHwId

The enumeration teHwId specifies the hardware component as location of a diagnosis message.

Name	Initial	Comment
eDiagHwId_CPU	0	Any diagnosis message regarding CPU itself, like "battery", "sd card", etc.
eDiagHwId_Coupler1	1	Any diagnosis message regarding communication module at slot 1. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_Coupler2	2	Any diagnosis message regarding communication module at slot 2. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_Coupler3	3	Any diagnosis message regarding communication module at slot 3. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_Coupler4	4	Any diagnosis message regarding communication module at slot 4. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_Coupler5	5	Any diagnosis message regarding communication module at slot 5. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_Coupler6	6	Any diagnosis message regarding communication module at slot 6. May be indicated by any corresponding communication module driver (instance) or a protocol driver (instance)
eDiagHwId_COM1	7	Any diagnosis message regarding COM1. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)
eDiagHwId_COM2	8	Any diagnosis message regarding COM2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)
eDiagHwId_CAN	9	Any diagnosis message regarding CAN interface. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)
eDiagHwId_OnboardIO	10	Onboard I/O, AC500-eCo only
eDiagHwId_OptionBoard1	11	Option board 1, AC500-eCo only
eDiagHwId_OptionBoard2	12	Option board 2, AC500-eCo only
eDiagHwId_OptionBoard3	13	Option board 3, AC500-eCo only
eDiagHwId_IOBus	14	I/O bus
eDiagHwId_ETH1	15	Any diagnosis message regarding ETH1. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)
eDiagHwId_ETH2	16	Any diagnosis message regarding ETH2. May be indicated by any corresponding interface driver (instance) or a protocol driver (instance)

The hardware ID HwId is only used for diagnosis output in CPU display to identify the location of a diagnosis message ↳ *Chapter 1.7.1.2 “Diagnosis in CPU display” on page 4013*.

1.7.1.4.2 System diagnosis

Library AC500_Diag provides several methods and functions to access the diagnosis messages on all devices in the PLC application. It contains also a function to convert numeric diagnosis into a textual format.

The variables and their assigned values can be referred to within the IEC application as well as they can be used to transfer diagnosis messages to any visualization client.

Device state

The library contains a single function block named "Diag", providing several methods to process the device state.

Method	Description
NumTotal	Provides the total number of currently active diagnosis messages
NumClass	Provides the number of currently active diagnosis messages related to the error severity

Method NumTotal

This method provides the total number of currently active diagnosis messages (including parameter errors, etc.).

Scope	Name	Type	Comment
Return	NumTotal	DWORD	Number of diagnosis messages

Example

```
VAR
        fbDiag : AC500_Diag.Diag;   (* instance of FB Diag *)
        dwNumTotal : DWORD;
END_VAR
_____________________________________________________________________________
dwNumTotal := fbDiag.NumTotal();
```

Method NumClass

This method provides the number of currently active diagnosis messages related to the error severity.

Scope	Name	Type	Initial	Comment
Return	NumClass	DWORD		
Input	DataInVal	AC500_DiagTypes.teClass	eClass.eDiagClass_2_SeriousError	Error severity of diagnosis message

Example

```
VAR
        fbDiag : AC500_Diag.Diag;
        eDiagClass_4: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_4_Warning; (* 4 *)
        eDiagClass_3: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_3_Error; (* 3 *)
        eDiagClass_11: AC500_DiagTypes.teClass := AC500_DiagTypes.teClass.eDiagClass_Parameter; (* 11 *)
        dwNumClass_4 : DWORD;
        dwNumClass_3 : DWORD;
        dwNumClass_11 : DWORD;
END_VAR
```

```
dwNumClass_4 := fbDiag.NumClass(eDiagClass := eDiagClass_4);
dwNumClass_3 := fbDiag.NumClass(eDiagClass := eDiagClass_3);
dwNumClass_11 := fbDiag.NumClass(eDiagClass := eDiagClass_11);
```

Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

Table 750: Methods for handling diagnosis entries

Method for system diagnosis	Method for device diagnosis	Description
Ack	DiagAck	Acknowledge a diagnosis alarm previously requested by using any `Get...` / `DiagGet...` method ↳ *Chapter 1.7.1.4.2.2.1 "Method Ack / DiagAck: acknowledgement" on page 4029*
GetFirstVal	DiagGetFirstVal	Get the first (oldest) diagnosis message, numeric values ↳ *Chapter 1.7.1.4.2.2.2 "Methods Get... / DiagGet...: get and sort diagnosis messages" on page 4029*
GetNextVal	DiagGetNextVal	Get the next diagnosis message, numeric values ↳ *Chapter 1.7.1.4.2.2.3 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4030*
GetLastVal	DiagGetLastVal	Get the last (newest) diagnosis message, numeric values ↳ *Chapter 1.7.1.4.2.2.3 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4030*
GetPrevVal	DiagGetPrevVal	Get the previous diagnosis message, numeric values ↳ *Chapter 1.7.1.4.2.2.3 "Method Get-xxx-Val / DiagGet-xxx-Val: numeric values" on page 4030*
GetFirstValExt	DiagGetFirstValExt	Get the first (oldest) diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.2.2.4 "Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4030*
GetNextValExt	DiagGetNextValExt	Get the next diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.2.2.4 "Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4030*
GetLastValExt	Diag GetLastValExt	Get the last (newest) diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.2.2.4 "Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4030*
GetPrevValExt	DiagGetPrevValExt	Get the previous diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.2.2.4 "Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values" on page 4030*
GetFirstValAndTxt	DiagGetFirstValAndTxt	Get the first (oldest) diagnosis message, numeric values and text ↳ *Chapter 1.7.1.4.2.2.5 "Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text" on page 4031*

Method for system diagnosis	Method for device diagnosis	Description
GetNextValAndTxt	DiagGetNextValAndTxt	Get the next diagnosis message, numeric values and text *Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4031*
GetLastValAndTxt	DiagGetLastValAndTxt	Get the last (newest) diagnosis message, numeric values and text *Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4031*
GetPrevValAndTxt	DiagGetPrevValAndTxt	Get the previous diagnosis message, numeric values and text *Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4031*
GetFirstValAndTxtExt	DiagGetFirstValAndTxtExt	Get the first (oldest) diagnosis message, numeric, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetNextValAndTxtExt	DiagGetNextValAndTxtExt	Get the next diagnosis message, numeric, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetLastValAndTxtExt	DiagGetLastValAndTxtExt	Get the last (newest) diagnosis message, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetPrevValAndTxtExt	DiagGetPrevValAndTxtExt	Get the previous diagnosis message, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*

Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any `Get...` / `DiagGet...` method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Ack	DiagAck	AC500_DiagTypes.ERROR_ID	
Input	Data	Data	AC500_DiagTypes.DIAG_VAL_TYPE	Variable containing details of diagnosis alarm to be acknowledged

Example

System diagnosis: acknowledge first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                   (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;  (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;  (* structure of returned values *)
END_VAR
```

```
eErrorID_First := fbDiag.Ack(Data := sFirstVal);
```

Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., `Get-xxx-Val` just provides the basic information in numeric format, `Get-xxx-ValExt` additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required ↳ *Chapter 1.7.1.4.2.2.7 “Function DiagValToTxt” on page 4033*. Alternatively, the methods `Get-xxx-ValAndTxt` and `Get-xxx-ValAndTxtExt` can be used for numeric and textual format in parallel ↳ *Chapter 1.7.1.4.2.2.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4031* ↳ *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result ↳ *Chapter 1.7.1.4.1.3 “Enumeration ERROR_ID” on page 4022*.

All diagnosis messages sorted by time, ascending

1. Call any `GetFirst...` method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any `GetNext...` method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, descending

1. Call any `GetLast...` method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any `GetPrev...` method as long as its final result is "NO_ERROR".

Method Get-xxx-Val / DiagGet-xxx-Val: numeric values

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Get-xxx-Val	DiagGet-xxx-Val	AC500_DiagTypes.ERROR_ID	
Inout	Data	Data	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to write data to

Example System diagnosis: get values for first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                   (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;  (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;  (* structure of returned values *)
END_VAR

eErrorID_First := fbDiag.GetFirstVal(Data := sFirstVal);
```

Example Online mode: battery empty or missing

PLC_PRG

PLC_AC500_V3.Application.PLC_PRG

Expression	Type	Value	Prepared value	Address	Comment
fbDiag	AC500_Diag.Diag				instance of FB Diag

Example

System diagnosis: get numeric values, extended numeric values and text of first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                       (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;      (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;      (* structure of returned values *)
        sFirstTxt : AC500_DiagTypes.DIAG_TXT_TYPE;      (* structure of returned text *)
        abyExtData : ARRAY[0..1023] OF BYTE;            (* byte array for extended diagnosis data *)
        wSize : WORD := 1024;                           (* Size of buffer to copy extended data to *)
        wLength : WORD;                                 (* Size of extended data copied to buffer *)
END_VAR
-------------------------------------------------------------------------------------------------------
eErrorID_First := fbDiag.GetFirstValExt(DataVal := sFirstVal, DataTxt := sFirstTxt,
                                        pExt := ADR(abyExtData), Size := wSize, Length := wLength);
```

Function DiagValToTxt

Call this function to convert a numeric diagnosis message into a textual one at any time, in case this has not yet been done using a method providing both types when requesting this information.

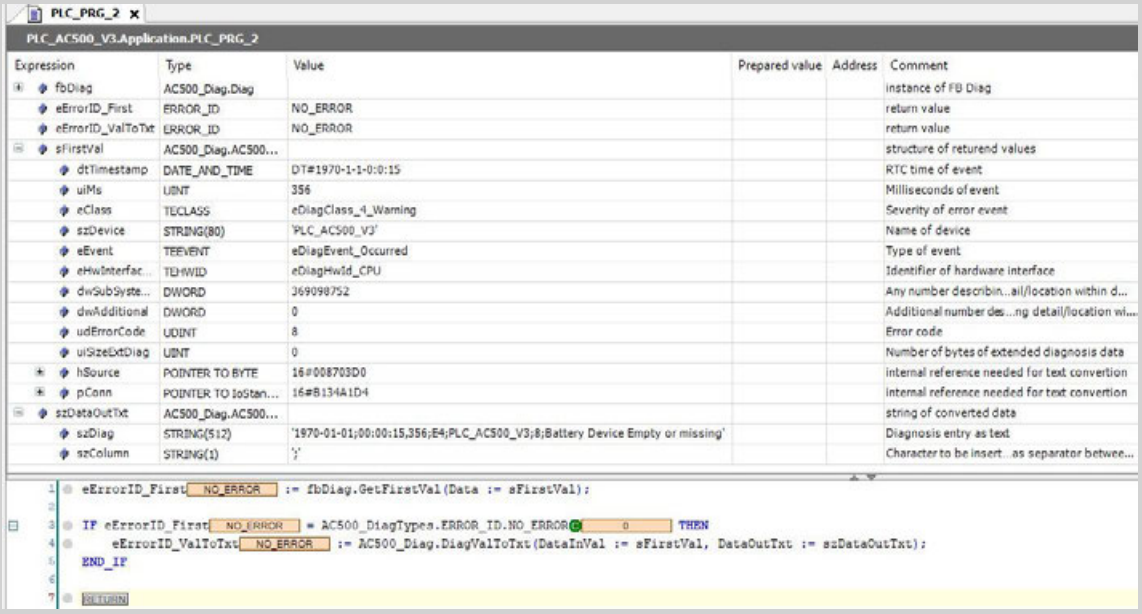
Scope	Name	Type	Comment
Return	DiagValToTxt	AC500_DiagTypes.ERROR_ID	
Inout	DataInVal	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to convert
Inout	DataOutTxt	AC500_DiagTypes.DIAG_TXT_TYPE	Variable to write text to

Example System diagnosis: convert first diagnosis message from numeric value to text

```
VAR
        eErrorID_ValToTxt : AC500_DiagTypes.ERROR_ID;        (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;           (* structure of returned values *)
        szDataOutTxt : AC500_DiagTypes.DIAG_TXT_TYPE;        (* string of converted data *)
END_VAR
```

```
eErrorID_ValToTx := DiagValToTxt(DataInVal := sFirstVal, DataOutTxt := szDataOutTxt);
```

Example Battery empty or missing



1.7.1.4.3 Device diagnosis

Activate device diagnosis

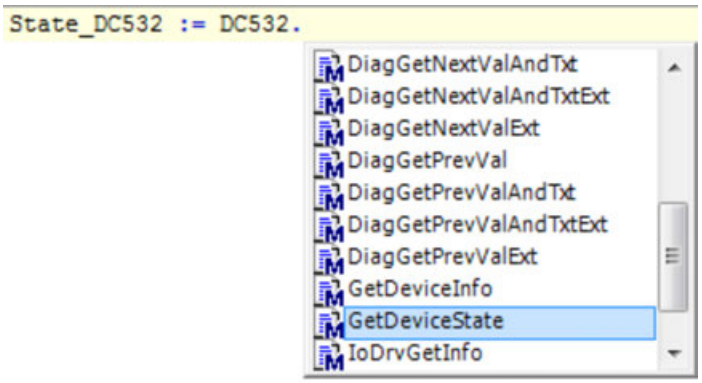
While the notification of diagnosis messages at the display and the Automation Builder is enabled by default, the functionality to access diagnosis messages from within the IEC application needs to be explicitly enabled.

1. Double-click on the CPU in the device tree.
2. Select tab *“PLC Settings”*.
3. Under *“Additional Settings”* select *“Enable Diagnosis for devices”*.
   ⇨ Library CAA Device Diagnosis (namespace DED) is automatically included in the project. This library is needed for displaying and processing the device state.

In case the functionality of diagnosis is no longer needed in IEC application, we recommend to disable this setting.

Device state

1. Open one of the IEC application code editors.
2. Type the device's name as it is written in the device tree, followed by a dot (".").
3. Select the method `GetDeviceState` from the context menu or type the name of the method on yourself.



4. Assign the function's parameters.

```
eError : DED.ERROR;                          (* return value of call *)
bDiagAvailable : BOOL;                       (* at least one diagnosis avilable for this device *)
DeviceState_DC532 : DED.DEVICE_STATE;        (* general device state *)

DeviceState_DC532 := DC532.GetDeviceState(xDiagnosisInfoAvailable => bDiagAvailable, eError => eError);
```

Scope	Name	Type	Comment
Return	GetDeviceState	DEVICE_STATE ↳ *Further information on page 4035*	Current device state
Output	xDiagnosisInfoAvailable	BOOL	If TRUE, diagnosis messages are available regarding the concerning device (= node).
Output	eError	ERROR ↳ *Further information on page 4036*	Type of the return values of all methods and functions of library CAA Device Diagnosis

Table 751: Enumeration DEVICE_STATE (part of the library CAA Device Diagnosis (DED))

Name	Type	Initial	Icon in AB	Comment
UNKNOWN	INT	0		The device is in state unknown. Example: No supervision mechanism active
STOPPED	INT	1		The device is stopped.
RUNNING	INT	2		The device is running.
ERROR	INT	3		The device is in error state.
DISABLED	INT	4		The device is disabled in device tree.

Name	Type	Initial	Icon in AB	Comment
NOT_CONFIG-URED	INT	5		The device has not been yet configured by the stack. Example: Configuration phase not yet started
CONFIGURED	INT	6		The device has been configured by the stack. Example: Configuration phase finished but the device is not in running state
NOT_FOUND	INT	7		The device was not found on bus.

Table 752: Enumeration ERROR (part of the library CAA Device Diagnosis (DED))

Name	Type	Initial	Comment
NO_ERROR	INT	0	No error
FIRST_ERROR	INT	1300	First library-specific error
TIME_OUT	INT	1301	Timeout occured.
ABORT	INT	1302	Operation was aborted.
REF_INVALID	INT	1303	The interface reference was invalid.
NOT_SUPPORTED	INT	1304	The function is not supported.
ERROR_IO	INT	1305	A general I/O configuration error occured.
PARAM_INVALID	INT	1306	Invalid parameter
NODE_NOT_EXISTING	INT	1307	The specified node does not exist.
NO_MEMORY	INT	1308	Dynamic memory allocation is disabled, or system is out of memory.
ADR_NOT_FOUND	INT	1309	The specified I/O address is not valid.
INST_NOT_FOUND	INT	1310	There is no associated [Device] instance for the specific I/O address.
NO_DATA	INT	1311	There is no data available.
OPERATION_INVALID	INT	1312	Operation not possible due to the current state
FIRST_MF	INT	1350	First manufacturer-specific error
LAST_ERROR	INT	1399	Last error

Diagnosis descriptions

The library contains a single function block "Diag", providing several methods to process diagnosis descriptions.

All methods for system diagnosis start with "Get...". For device diagnosis the prefix "Diag" is added: "DiagGet...". For better readability, only the method names for system diagnosis is used in the descriptions of the methods.

Table 753: Methods for handling diagnosis entries

Method for system diagnosis	Method for device diagnosis	Description
Ack	DiagAck	Acknowledge a diagnosis alarm previously requested by using any `Get...` / `DiagGet...` method ↳ *Chapter 1.7.1.4.3.3.1 “Method Ack / DiagAck: acknowledgement” on page 4039*
GetFirstVal	DiagGetFirstVal	Get the first (oldest) diagnosis message, numeric values ↳ *Chapter 1.7.1.4.3.3.2 “Methods Get... / DiagGet...: get and sort diagnosis messages” on page 4039*
GetNextVal	DiagGetNextVal	Get the next diagnosis message, numeric values ↳ *Chapter 1.7.1.4.3.3.3 “Method Get-xxx-Val / DiagGet-xxx-Val: numeric values” on page 4040*
GetLastVal	DiagGetLastVal	Get the last (newest) diagnosis message, numeric values ↳ *Chapter 1.7.1.4.3.3.3 “Method Get-xxx-Val / DiagGet-xxx-Val: numeric values” on page 4040*
GetPrevVal	DiagGetPrevVal	Get the previous diagnosis message, numeric values ↳ *Chapter 1.7.1.4.3.3.3 “Method Get-xxx-Val / DiagGet-xxx-Val: numeric values” on page 4040*
GetFirstValExt	DiagGetFirstValExt	Get the first (oldest) diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.3.3.4 “Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values” on page 4040*
GetNextValExt	DiagGetNextValExt	Get the next diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.3.3.4 “Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values” on page 4040*
GetLastValExt	Diag GetLastValExt	Get the last (newest) diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.3.3.4 “Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values” on page 4040*
GetPrevValExt	DiagGetPrevValExt	Get the previous diagnosis message, numeric and extended numeric values ↳ *Chapter 1.7.1.4.3.3.4 “Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values” on page 4040*
GetFirstValAndTxt	DiagGetFirstValAndTxt	Get the first (oldest) diagnosis message, numeric values and text ↳ *Chapter 1.7.1.4.3.3.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4041*

Method for system diagnosis	Method for device diagnosis	Description
GetNextValAndTxt	DiagGetNextValAndTxt	Get the next diagnosis message, numeric values and text *Chapter 1.7.1.4.3.3.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4041*
GetLastValAndTxt	DiagGetLastValAndTxt	Get the last (newest) diagnosis message, numeric values and text *Chapter 1.7.1.4.3.3.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4041*
GetPrevValAndTxt	DiagGetPrevValAndTxt	Get the previous diagnosis message, numeric values and text *Chapter 1.7.1.4.3.3.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4041*
GetFirstValAndTxtExt	DiagGetFirstValAndTxtExt	Get the first (oldest) diagnosis message, numeric, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetNextValAndTxtExt	DiagGetNextValAndTxtExt	Get the next diagnosis message, numeric, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetLastValAndTxtExt	DiagGetLastValAndTxtExt	Get the last (newest) diagnosis message, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*
GetPrevValAndTxtExt	DiagGetPrevValAndTxtExt	Get the previous diagnosis message, extended numeric values and text *Chapter 1.7.1.4.2.2.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4032*

Method Ack / DiagAck: acknowledgement

This method can be used to acknowledge a diagnosis alarm previously requested by using any `Get...` / `DiagGet...` method. Alternatively, you can acknowledge an alarm in Automation Builder.

After acknowledgement, the alarm is deleted from the diagnosis system.

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Ack	DiagAck	AC500_DiagTypes.ERROR_ID	
Input	Data	Data	AC500_DiagTypes.DIAG_VAL_TYPE	Variable containing details of diagnosis alarm to be acknowledged

Example

System diagnosis: acknowledge first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                   (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;  (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;  (* structure of returned values *)
END_VAR
```

```
eErrorID_First := fbDiag.Ack(Data := sFirstVal);
```

Methods Get... / DiagGet...: get and sort diagnosis messages

All these methods can be used to get the first (oldest), next, last (newest) or previous diagnosis message stored in diagnosis system. The only difference are the details the methods provide. While, e.g., `Get-xxx-Val` just provides the basic information in numeric format, `Get-xxx-ValExt` additionally provides this information by the extended diagnosis data of the entry.

The numeric format provided by these methods can be converted into textual format later on if required ↳ *Chapter 1.7.1.4.2.2.7 “Function DiagValToTxt” on page 4033*. Alternatively, the methods `Get-xxx-ValAndTxt` and `Get-xxx-ValAndTxtExt` can be used for numeric and textual format in parallel ↳ *Chapter 1.7.1.4.3.3.5 “Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text” on page 4041* ↳ *Chapter 1.7.1.4.3.3.6 “Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text” on page 4042*.

All methods may need multiple cycles to process the request. Therefore, they must be called in successive cycles until they return a final result ↳ *Chapter 1.7.1.4.1.3 “Enumeration ERROR_ID” on page 4022*.

All diagnosis messages sorted by time, ascending

1. Call any `GetFirst...` method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any `GetNext...` method as long as its final result is "NO_ERROR".

All diagnosis messages sorted by time, descending

1. Call any `GetLast...` method until it indicates a final result.
2. If the result is not "NO_ERROR_NO_DATA": Call any `GetPrev...` method as long as its final result is "NO_ERROR".

Method Get-xxx-Val / DiagGet-xxx-Val: numeric values

-xxx- = First, Next, Last, Prev. Example: GetFirstVal, DiagGetLastVal.

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Get-xxx-Val	DiagGet-xxx-Val	AC500_DiagTypes.ERROR_ID	
Inout	Data	Data	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to write data to

Example System diagnosis: get values for first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                   (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;  (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;  (* structure of returned values *)
END_VAR

eErrorID_First := fbDiag.GetFirstVal(Data := sFirstVal);
```

Example Online mode: battery empty or missing

PLC_PRG

PLC_AC500_V3.Application.PLC_PRG

Expression	Type	Value	Prepared value	Address	Comment
fbDiag	AC500_Diag.Diag				instance of FB Diag
eErrorID_First	ERROR_ID	NO_ERROR			return value
sFirstVal	AC500_Diag.AC500...				structure of returend values

```
1  eErrorID_First  NO_ERROR  := fbDiag.GetFirstVal(Data := sFirstVal);
```

Method Get-xxx-ValExt / DiagGet-xxx-ValExt: numeric values and extended numeric values

-xxx- = First, Next, Last, Prev. Example: GetNextValExt, DiagGetPrevValExt.

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Get-xxx-ValExt	DiagGet-xxx-ValExt	AC500_DiagTypes.ERROR_ID	
Inout	Data	Data	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to write data to
Input	pExt	pExt	POINTER TO BYTE	Address of buffer to copy extended data to
Input	Size	Size	WORD	Size of buffer to copy extended data to
Inout	Length	Length	WORD	Size of extended data copied to buffer

Example

System diagnosis: get numeric values and extended numeric values for first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                       (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;      (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;      (* structure of returned values *)
        abyExtData : ARRAY[0..1023] OF BYTE;            (* byte array for extended diagnosis data *)
        wSize : WORD := 1024;                           (* Size of buffer to copy extended data to *)
        wLength : WORD;                                 (* Size of extended data copied to buffer *)
END_VAR
-------------------------------------------------------------------------------------------------------
eErrorID_First := fbDiag.GetFirstValExt(Data := sFirstVal, pExt := ADR(abyExtData), Size := wSize, Length := wLength);
```

Method Get-xxx-ValAndTxt / DiagGet-xxx-ValAndTxt: numeric values and text

-xxx- = First, Next, Last, Prev. Example: GetFirstValAndTxt, DiagGetPrevValAndTxt

Scope	Name for device diagnosis	Name for device diagnosis	Type	Comment
Return	Get-xxx-ValAndTxt	DiagGet-xxx-ValAndTxt	AC500_DiagTypes.ERROR_ID	
Inout	DataVal	DataVal	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to write data to
Inout	DataTxt	DataTxt	AC500_DiagTypes.DIAG_TXT_TYPE	Variable to write text to

Example System diagnosis: get numeric values and text for first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                   (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;  (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;  (* structure of returned values *)
        sFirstTxt : AC500_DiagTypes.DIAG_TXT_TYPE;  (* structure of returned text *)
END_VAR
```

```
eErrorID_First := fbDiag.GetFirstValAndTxt(DataVal := sFirstVal, DataTxt := sFirstTxt);
```

Example Online mode: battery empty or missing

PLC_PRG_1

PLC_AC500_V3.Application.PLC_PRG_1

Expression	Type	Value
fbDiag	AC500_Diag.Diag	
eErrorID_First	ERROR_ID	NO_ERROR
sFirstVal	AC500_Diag.AC500...	
dtTimestamp	DATE_AND_TIME	DT#1970-1-1-0:0:15
uiMs	UINT	356
eClass	TECLASS	eDiagClass_4_Warning
szDevice	STRING(80)	'PLC_AC500_V3'
eEvent	TEEVENT	eDiagEvent_Occurred
eHwInterfac...	TEHWID	eDiagHwId_CPU
dwSubSyste...	DWORD	369098752
dwAdditional	DWORD	0
udErrorCode	UDINT	8
uiSizeExtDiag	UINT	0
hSource	POINTER TO BYTE	16#008703D0
pConn	POINTER TO IoStan...	16#B134A1D4
sFirstTxt	AC500_Diag.AC500...	
szDiag	STRING(512)	'1970-01-01;00:00:15,356;E4;PLC_AC500_V3;8;Battery Device Empty or missing'
szColumn	STRING(1)	';'

```
1  eErrorID_First NO_ERROR := fbDiag.GetFirstValAndTxt(DataVal := sFirstVal, DataTxt := sFirstTxt);
```

Method Get-xxx-ValAndTxtExt / DiagGet-xxx-ValAndTxtExt: numeric values, extended numeric values and text

-xxx- = First, Next, Last, Prev. Example: GetLastValAndTxtExt, DiagGetFirstValAndTxtExt

Scope	Name for device diagnosis	Name for device diagnosis	Type	Initial	Comment
Return	Get-xxx-Val-AndTxtExt	DiagGet-xxx-Val-AndTxtExt	AC500_DiagTypes.ERROR_ID		
Inout	DataVal	DataVal	AC500_DiagTypes.DIAG_VAL_TYPE		Variable to write data to

Scope	Name for device diagnosis	Name for device diagnosis	Type	Initial	Comment
Inout	DataTxt	DataTxt	AC500_Dia-gTypes.DIAG_TXT_TYPE		Variable to write text to
Input	pExt	pExt	POINTER TO BYTE	0	Address of buffer to copy extended data to
Input	Size	Size	WORD	0	Size of buffer to copy extended data to
Inout	Length	Length	WORD	0	Size of extended data copied to buffer

Example

System diagnosis: get numeric values, extended numeric values and text of first diagnosis message

```
VAR
        fbDiag : AC500_Diag.Diag;                       (* instance of FB Diag *)
        eErrorID_First : AC500_DiagTypes.ERROR_ID;      (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;      (* structure of returned values *)
        sFirstTxt : AC500_DiagTypes.DIAG_TXT_TYPE;      (* structure of returned text *)
        abyExtData : ARRAY[0..1023] OF BYTE;            (* byte array for extended diagnosis data *)
        wSize : WORD := 1024;                           (* Size of buffer to copy extended data to *)
        wLength : WORD;                                 (* Size of extended data copied to buffer *)
END_VAR
-------------------------------------------------------------------------------------------------------
eErrorID_First := fbDiag.GetFirstValExt(DataVal := sFirstVal, DataTxt := sFirstTxt,
                                        pExt := ADR(abyExtData), Size := wSize, Length := wLength);
```

Function DiagValToTxt

Call this function to convert a numeric diagnosis message into a textual one at any time, in case this has not yet been done using a method providing both types when requesting this information.

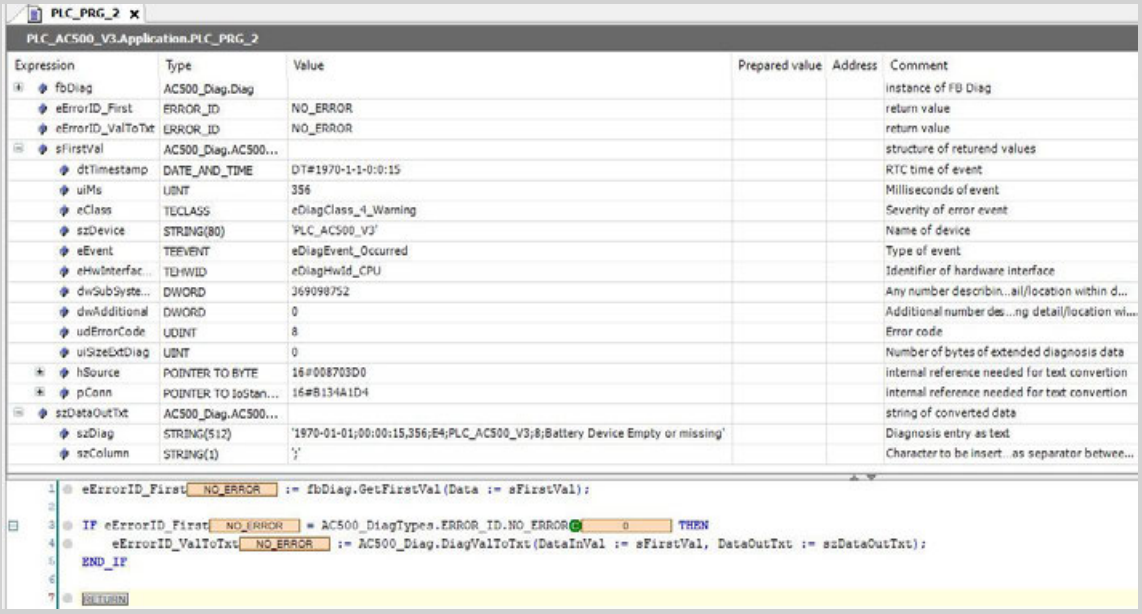
Scope	Name	Type	Comment
Return	DiagValToTxt	AC500_DiagTypes.ERROR_ID	
Inout	DataInVal	AC500_DiagTypes.DIAG_VAL_TYPE	Variable to convert
Inout	DataOutTxt	AC500_DiagTypes.DIAG_TXT_TYPE	Variable to write text to

Example System diagnosis: convert first diagnosis message from numeric value to text

```
VAR
        eErrorID_ValToTxt : AC500_DiagTypes.ERROR_ID;        (* return value *)
        sFirstVal : AC500_DiagTypes.DIAG_VAL_TYPE;           (* structure of returned values *)
        szDataOutTxt : AC500_DiagTypes.DIAG_TXT_TYPE;        (* string of converted data *)
END_VAR
```

```
eErrorID_ValToTx := DiagValToTxt(DataInVal := sFirstVal, DataOutTxt := szDataOutTxt);
```

Example Battery empty or missing



1.7.1.5 Structure of error numbers

1.7.1.5.1 Error severity

Error severity	Type	Description	Example
1	Fatal errors	Safe operation of the operating system is no longer ensured.	Checksum error in system flash, RAM error
2	Severe error	The operating system works correctly, but the error-free execution of the user program is not ensured.	Checksum error in user flash, task cycle times exceeded
3	Minor errors	It depends on the application whether the user program has to be stopped by the operating system or not. The user decides which reaction is to be done.	Flash memory cannot be programmed, I/O module failed

Error severity	Type	Description	Example
4	Warnings	Errors that occur on peripheral devices or that will have an effect only in the future. The user decides which reactions are to be done.	Short circuit in an I/O module, battery empty/not installed
11	Parameter error	Error occurred during parameter setting	Different I/O devices in PLC configuration and hardware installation

Errors with error severitiy 1 - fatal errors

Errors with error severity 1 are not entered in the diagnosis system. These errors do not allow normal operation of the PLC. These errors are detected during PLC start-up and stop the PLC immediately.

Examples are RAM errors or checksum errors when starting the firmware.

Such errors are indicated by rapid flashing of the ERR LED.

1.7.1.6 Diagnosis history file

Diagnosis history is available as of Automation Builder 2.4.0 / System FW 3.4.0 the diagnosis system has been extended with diagnosis history.

Diagnosis history is the entry of all diagnoses into a file according to their time of occurrence.

The diagnosis history file is in the root directory of the user disk and has the name *“DiagHistory.csv”*. The max. number of entries is 2000. When 2000 entries are reached, the oldest entry is overwritten. The max. size of the extended data is 32 bytes.

An entry consists of following data:

Name	Type	Comment	Example
timestamp	ARRAYDT OF BYTE	RTC time of event in milliseconds consists of diTimestamp in DT format and uiMs milliseconds. See *Chapter 1.7.1.4.1.1 “Structure DIAG_VAL_TYPE” on page 4021* STRUCT.	1603371910177
event	BYTE	Event type (1=comes, 2=gone). See *Chapter 1.7.1.4.1.5 “Enumeration teEvent” on page 4023*.	1
class	BYTE	Severity of error event. See *Chapter 1.7.1.4.1.4 “Enumeration teClass” on page 4023*.	4
compID	UDINT	Component ID	270540802
conn	UDINT	Connector	0xb17777ac
connIdx	UDINT	Connector index	0

Name	Type	Comment	Example
sub	DWORD	SubsystemID: Any number describing detail/location within device, device specific	369098752
addl	DWORD	AdditionalID: Additional number describing detail/location within device, optional, device specific	0
error	DWORD	Error code	9
extended data	ARRAYDT OF BYTE	Extended diagnosis data, max. 32 bytes	

As shown in the example data of the diagnosis history file is not easily readable. The entries must be interpreted according to device and/or fieldbus. Therefor the Automation Builder consists a special view for diagnosis history ↬ *Chapter 1.7.1.3.5 “Diagnosis history” on page 4019*.

With the entries CompID, conn and connID, the device generating the event is clearly identified in the device tree.

If the PLC configuration is changed, the values of this entries may be changed also.

Therefore, the diagnosis history will be deleted during each download.

1.7.2 Online diagnosis in Automation Builder

1.7.2.1 Short description and overview

To use the diagnosis system in Automation Builder, login to the online mode is required ↬ *Chapter 1.7.2.2 “Entering/leaving the online mode” on page 4046*. The online diagnosis in Automation Builder consists of a set of partly animated, mostly read only views. They can be invoked by a double-click on a project tree element which shows a circle indicating that this element is able to show diagnosis messages ↬ *Chapter 1.7.2.3 “Project tree in online mode” on page 4047*.

Available online diagnosis and statistics:

- **Diagnosis messages**
  When the Automation Builder is switched to online mode, incoming diagnosis messages are displayed as plain-text ↬ *Chapter 1.7.1.3 “Diagnosis in Automation Builder” on page 4017*.
- **CPU/PLC diagnosis**
  ↬ *Chapter 1.7.2.4 “CPU diagnosis views” on page 4051*.
- **I/O module diagnosis**
  ↬ *Chapter 1.7.2.5 “Live values in views with I/O components” on page 4056*.
- **Communication module and fieldbus diagnosis**
  ↬ *Chapter 1.7.2.6 “Communication module and fieldbus diagnosis” on page 4056*
- **Diagnosis in IEC application**
  ↬ *Chapter 1.7.1.4 “Diagnosis in IEC application” on page 4020*
  For information on the disk status, diagnosis information can be read out with the function blocks PmDiskStatus and PmDiskLifetimeUsed. ↬ *Chapter 1.6.7.4 “Health monitoring” on page 4010*

1.7.2.2 Entering/leaving the online mode

Prerequisite: Set the gateway before entering the online mode. ↬ *Chapter 1.6.6.2.15 “Gateway configuration” on page 3799*

Enter the online mode

Right-click the *“Application”* node and select *“Login”*.

The Automation Builder project login to online mode updates the latest changes of the project.

The online mode can be entered or left for each PLC in the project separately.

Leave the online mode

Right-click the *“Application”* node and select *Logout*.

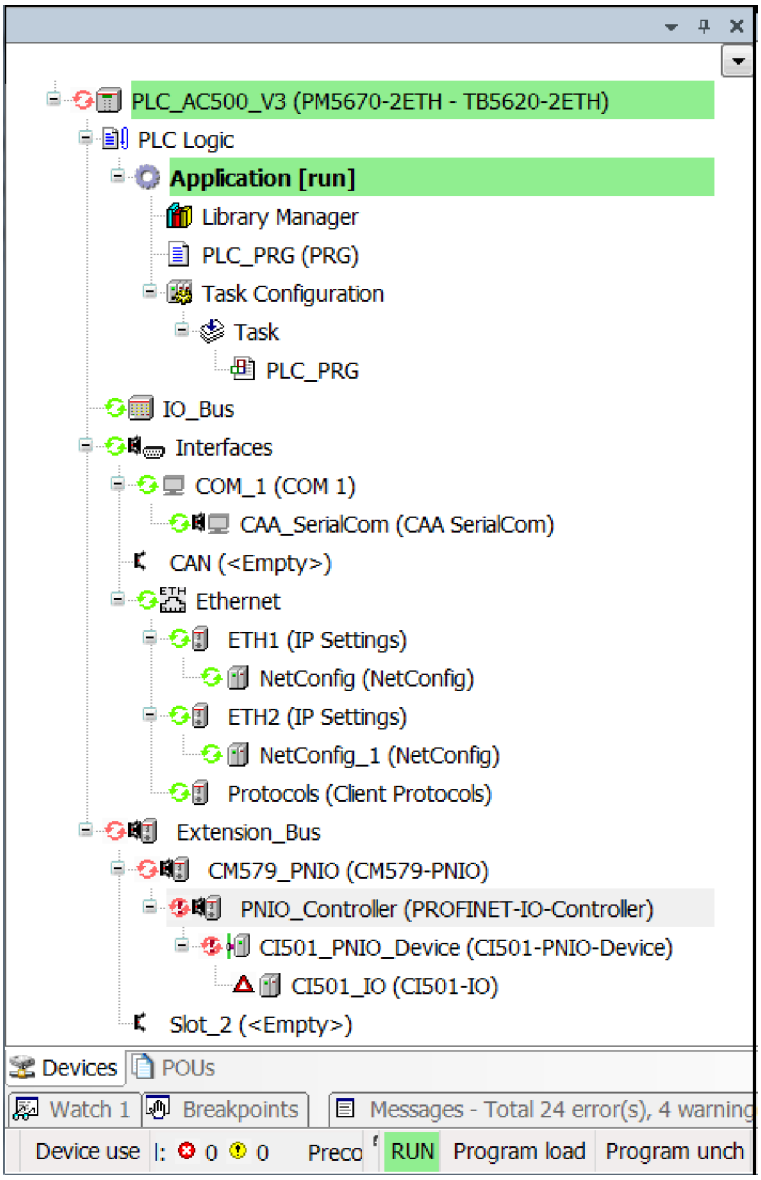
When online mode is active, a thread is running on Automation Builder project which sends cyclically a message to the PLC and expects a response. If the PLC does not respond, the online mode is left programmatically.

1.7.2.3 Project tree in online mode

When Automation Builder enters the online mode internally, it shows the state of all configured communication modules.

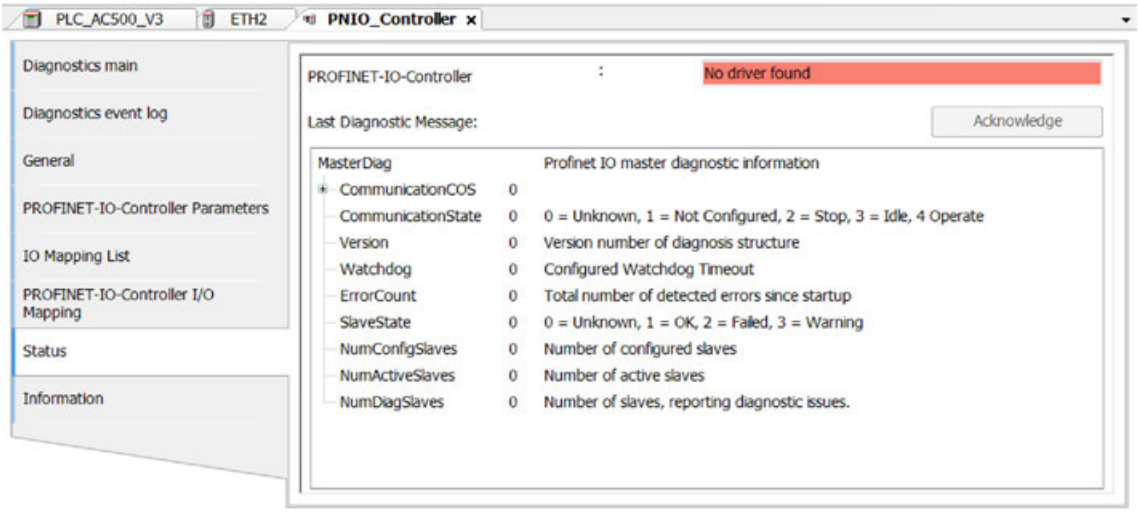
The connection status can be recognized by a symbol in the device tree:

- Device without diagnosis messages
- Device with diagnosis messages or device diagnosis is disabled *Chapter 1.7.2.4.6 “Device diagnosis” on page 4055*
- Device without diagnosis messages, but with diagnosis messages on at least one device in the branch below
- Device with diagnosis messages and with diagnosis messages on at least one device in the branch below
- Device does not respond to identification message and is not available for online connection

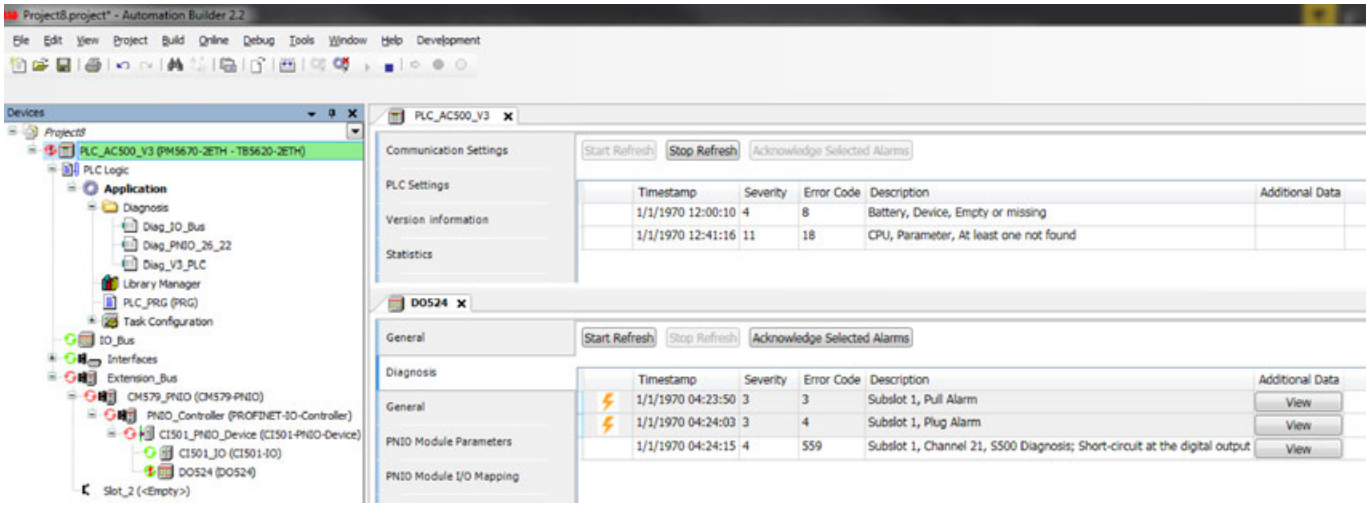


The identification is done in online mode.

- Double-click an element of the device-tree and select *"Status"* tab.
  Diagnosis information will be available.



Diagnosis descriptions

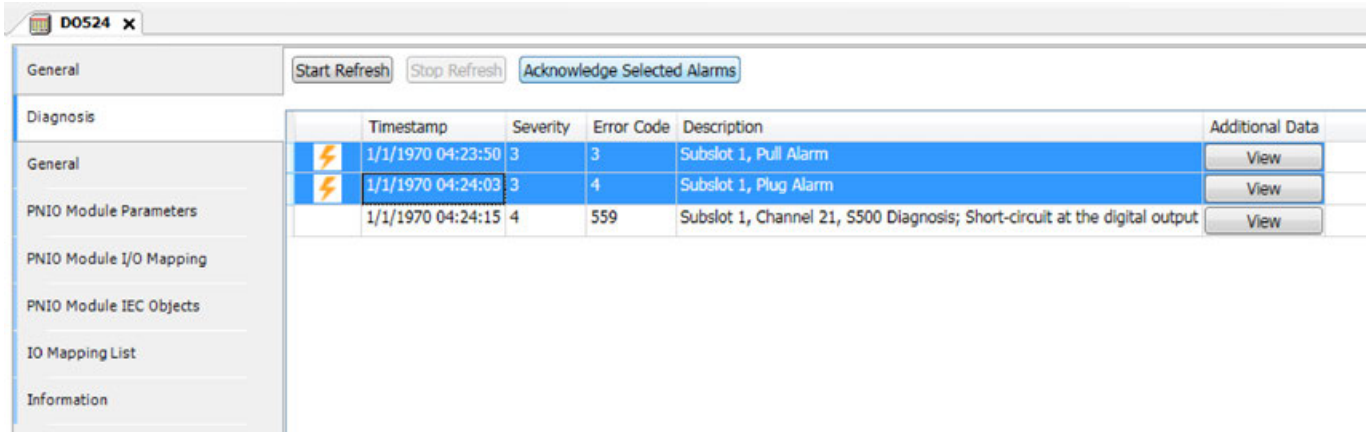


The user will be notified in the device tree with an exclamation mark beside the device having diagnosis messages. The diagnosis messages are provided in the *"Diagnosis"* tab.

Alarms will be presented with a thunderbolt in the first column of the diagnosis grid.

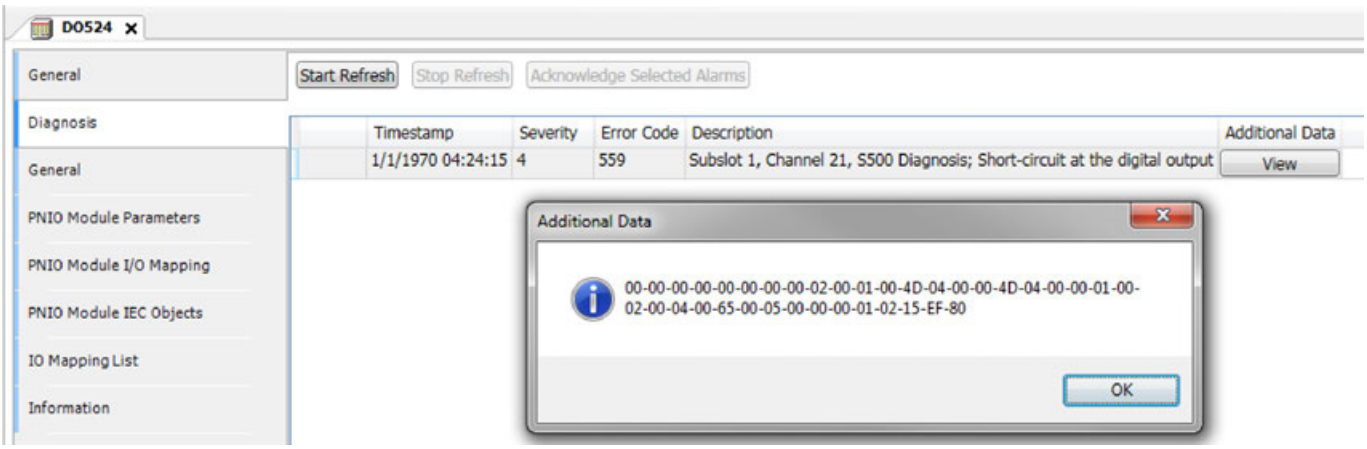
Acknowledging an alarm

1. Stop diagnosis refreshment by clicking *[Stop refresh]*.
2. Select one or more alarms and click *[Acknowledge selected alarms]*.

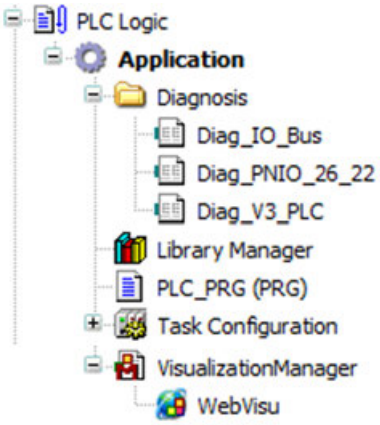


Some diagnosis messages contain additional data. Click *[View]* button to see the additional diagnosis (in hex) for further analysis. If *[View]* button is not available, no additional data is available for this diagnosis message.

You can copy the additional data to the clipboard with *[CTRL] + [C]*.



When building an IEC application in Automation Builder, diagnosis text lists will be generated and added to the device tree below the diagnosis folder. These text lists contain the device type specific diagnosis texts which are used by the diagnosis functions in the PLC application to show corresponding texts for error numbers.

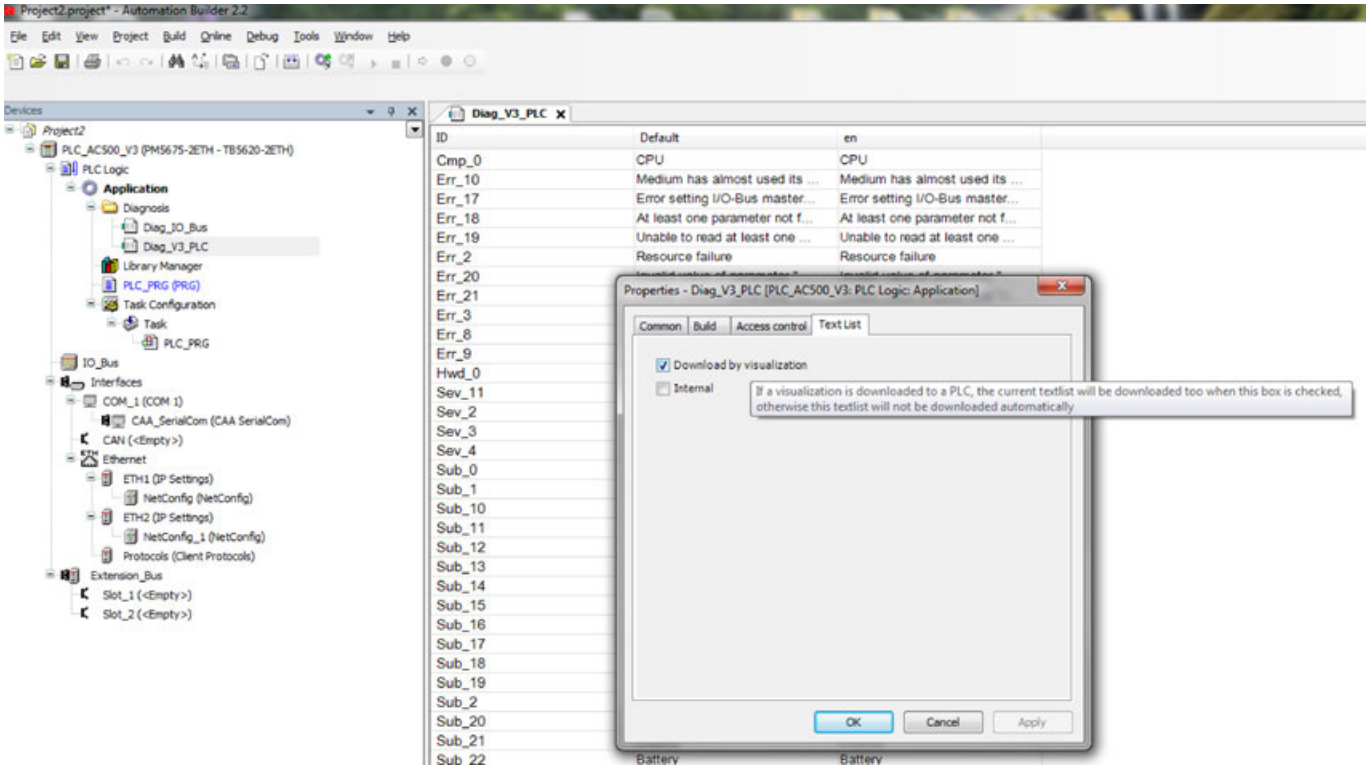


The diagnosis text lists will only be downloaded to the PLC when a visualization is present in the project.

The text lists will be downloaded automatically to the PLC with the visualization.

If there is a problem with downloading the text lists, make sure that the settings are correct:

1. Right-click on a text list and select *“Properties”*.
2. Open the *“Text List”* tab. The check box *“Download by visualization”* has to be selected.



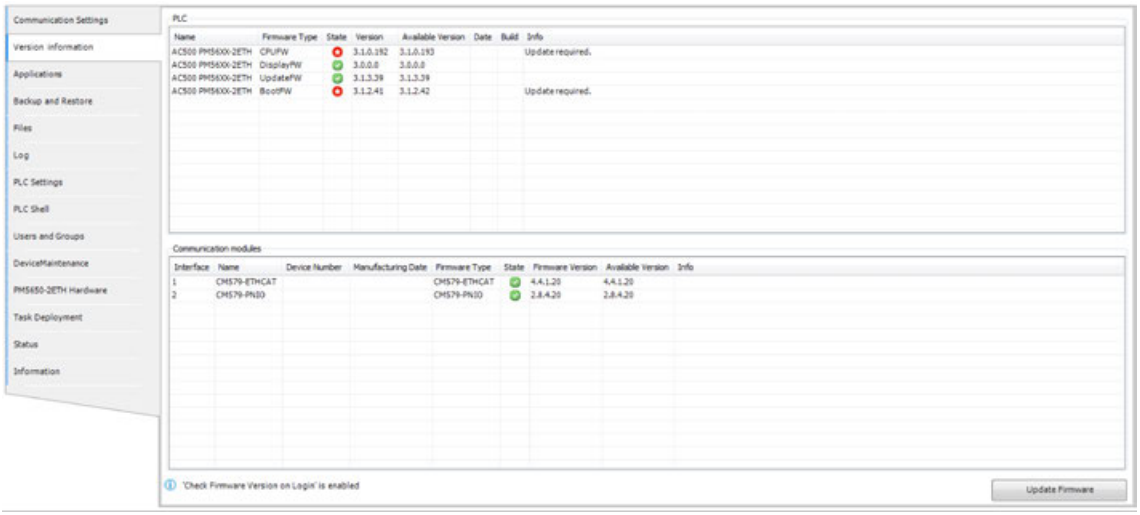
1.7.2.4 CPU diagnosis views

1.7.2.4.1 Version information

Information on the firmware versions of the processor modules or communication modules, is provided on the *“Version information”* tab.

Remarks:

- The *“Version information”* tab displays the version identified on the device and the version provided with Automation Builder.
- The firmware on the devices must match to the Automation Builder version. Upgrade or downgrade to version supplied with Automation Builder is recommended (especially for CPUs) to ensure correct functionality.
- The firmware type can be changed to the type required by the hardware configuration for devices that support changing the firmware type. E.g., the onboard field bus communication modules of PM595 that may be used as PROFINET, Ethernet or EtherCAT communication module.

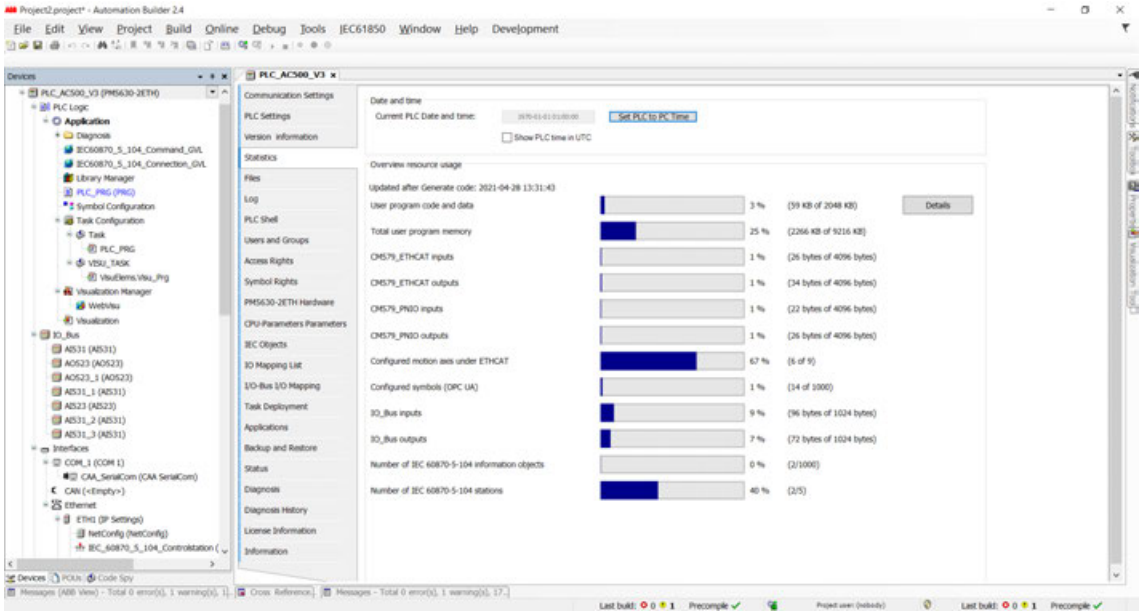


State icons

	Firmware version on device matches version supplied with Automation Builder.
	Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Only for communication modules if CPU firmware must be updated first. This happens when CPU firmware has version below 2.5.0.0. Firmware version (or type) on device is different from version supplied with Automation Builder. Upgrade/downgrade to version supplied with Automation Builder is recommended.
	Identified device is different from configured device, thus no firmware update is possible. Happens only for Communication Modules.
No icon	Firmware of device is not updateable or no newer firmware than the initial version is available.

The [Update Firmware] button to download the new firmware is only enabled if there is updateable firmware.

1.7.2.4.2 Statistics



The *“Statistics”* tab shows the following information:

- *Date and time:* The actual date and time of the PLC is shown. It can be set or synchronized with the date/time of the PC via *“Set PLC Date & Time”* button.
- *Overview resource usage:* This tab shows all the required information (it is collected at latest when the command *“Generate Code”* is executed, some of the information is not available before then.)

  For the limitation *“User program code and data”* a *[Details]* button will be available. Clicking this button will open a modal window showing a more detailed view of the memory usage.

1.7.2.4.3 Log

You can view the PLC log in this tab. It lists the events that were recorded on the target system. This concerns:

- Events during the startup and shutdown of the system (components loaded, with version)
- Application download and loading of the boot application
- Custom entries
- Log entries from I/O drivers
- Log entries from data sources

Offline logging	☐: Default settings ☑: The PLC also records actions that are not related to the connection with the controller.
UTC time	☐: Standard setting; the time stamp is converted to the local time on the computer as indicated by the time zone of the operating system. ☑: The time stamp of the runtime system is displayed.

Severity	There are four categories for the severity of the event: ● : Message ● : Warning ● : Error ● : Debugging You can show or hide each category with the help of the corresponding button in the bar above the list. Each button shows the number of log entries of the category concerned.
Time stamp	Date and time (example: `12-01-2007 09:48`)
Description	Description of the event, for example `Import function failed of`
Component	Name of the runtime system component concerned, e.g. `CmpApp`
Drop-down list with component names	The log list displays only events that concern the selected component
Logger	Drop-down list with all available recordings. The standard setting is the <Default Logger> specified by the target system, at present identical to 'PlcLog' for the CODESYS runtime system
	Refreshes the log list
	Exports the list contents to an XML file. You can select the file name and storage directory.
	Imports a log list from an XML file. The list is then displayed in a separate window.
	The displayed log list is emptied, i.e. all entries are deleted.

1.7.2.4.4 PLC shell commands

The PLC shell is used for requesting specific information from the controller. By entering a device-specific command the response is returned in a result window. The PLC shell can be issued without login.

Proceed as follows:

1. Ensure the gateway is configured properly and a connection to the controller can be established.
2. In Automation Builder double-click the PLC node and open the tab *"PLC Shell"*.
3. Enter `"?"` in the command line of the tab window. All available PLC commands are listed.

If the gateway is able to establish a connection to the controller, an online connection to the PLC is opened automatically.

The commands listed in online mode can differ from the commands shown when pressing the button [...] as Automation Builder version and firmware version can differ.

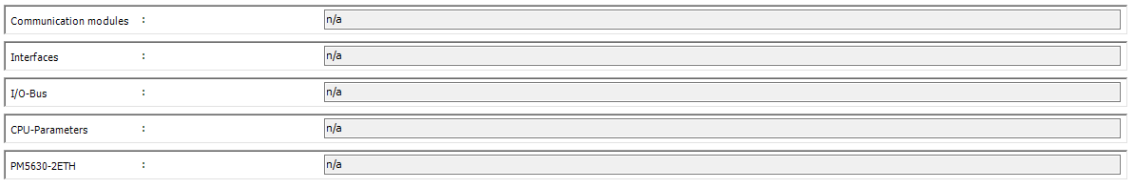
See:

Chapter 1.2.6 "Further information" on page 49

Chapter 1.6.6.1.4 "Firmware identification and update" on page 3652.

1.7.2.4.5 Status

This tab displays status information, for example 'Running' or 'Stopped', and specific diagnosis messages from the respective device, also information about the card used and the internal bus system.



1.7.2.4.6 Device diagnosis

Each node in the device tree has a diagnosis view, which displays the diagnosis messages for this device only.

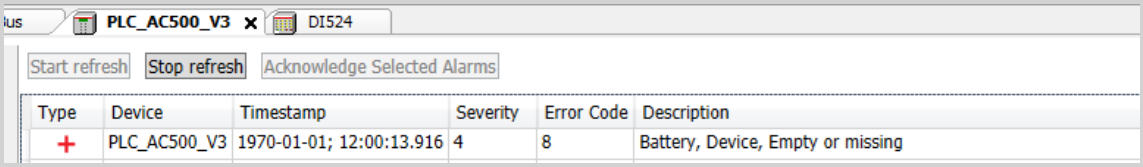
The message consists of:

- Type *Chapter 1.7.1.3.5 “Diagnosis history” on page 4019*
- Timestamp in date and time YYYY-MM-DD hh:mm:ss.ms
- Error severity
- Error code
- Diagnosis description
- Additional data

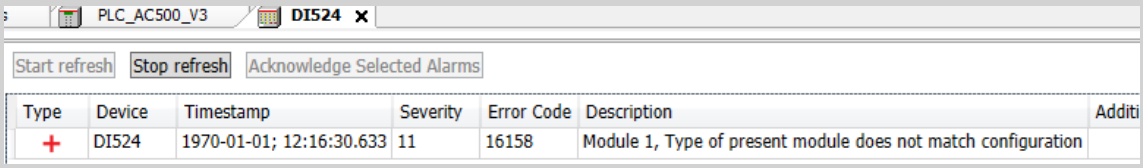
To view the diagnosis message:

1. Double-click on a device.
2. Select the tab *“Diagnosis”*.

Example Battery empty or missing.



Example Wrong module configured on I/O bus.



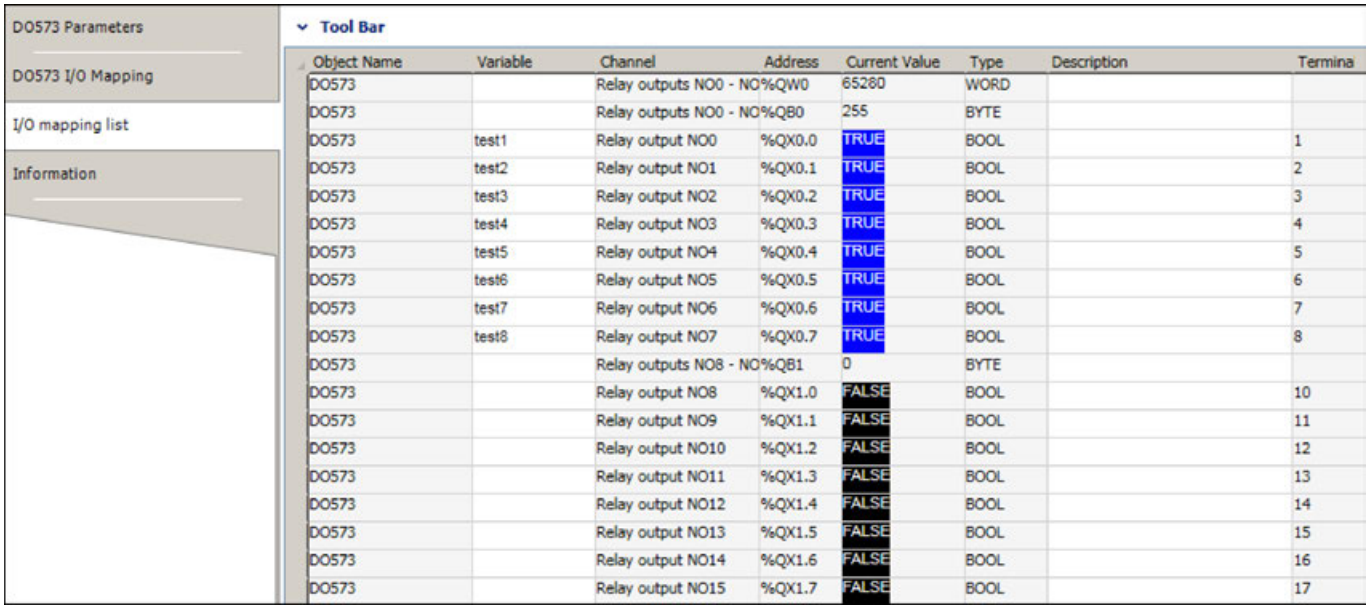
Device diagnosis is disabled by default.

To enable/disable device diagnosis:

1. Double-click on the PLC.
2. Select the tab *“PLC Settings”*.
3. Under *“Additional Settings”* enable/disable *“Diagnosis for devices”*.
   ⇨ When the device diganosis is disabled, this symbol will be displayed in the device tree and no diagnosis messages will be shown.

1.7.2.5 Live values in views with I/O components

"I/O mapping list" tab: In online mode, all Automation Builder views, which contain I/O component mapping tables, show animated live values which are updated every second.



Object Name	Variable	Channel	Address	Current Value	Type	Description	Termina
DO573		Relay outputs NO0 - NO	%QW0	65280	WORD		
DO573		Relay outputs NO0 - NO	%QB0	255	BYTE		
DO573	test1	Relay output NO0	%QX0.0	TRUE	BOOL		1
DO573	test2	Relay output NO1	%QX0.1	TRUE	BOOL		2
DO573	test3	Relay output NO2	%QX0.2	TRUE	BOOL		3
DO573	test4	Relay output NO3	%QX0.3	TRUE	BOOL		4
DO573	test5	Relay output NO4	%QX0.4	TRUE	BOOL		5
DO573	test6	Relay output NO5	%QX0.5	TRUE	BOOL		6
DO573	test7	Relay output NO6	%QX0.6	TRUE	BOOL		7
DO573	test8	Relay output NO7	%QX0.7	TRUE	BOOL		8
DO573		Relay outputs NO8 - NO	%QB1	0	BYTE		
DO573		Relay output NO8	%QX1.0	FALSE	BOOL		10
DO573		Relay output NO9	%QX1.1	FALSE	BOOL		11
DO573		Relay output NO10	%QX1.2	FALSE	BOOL		12
DO573		Relay output NO11	%QX1.3	FALSE	BOOL		13
DO573		Relay output NO12	%QX1.4	FALSE	BOOL		14
DO573		Relay output NO13	%QX1.5	FALSE	BOOL		15
DO573		Relay output NO14	%QX1.6	FALSE	BOOL		16
DO573		Relay output NO15	%QX1.7	FALSE	BOOL		17

1.7.2.6 Communication module and fieldbus diagnosis

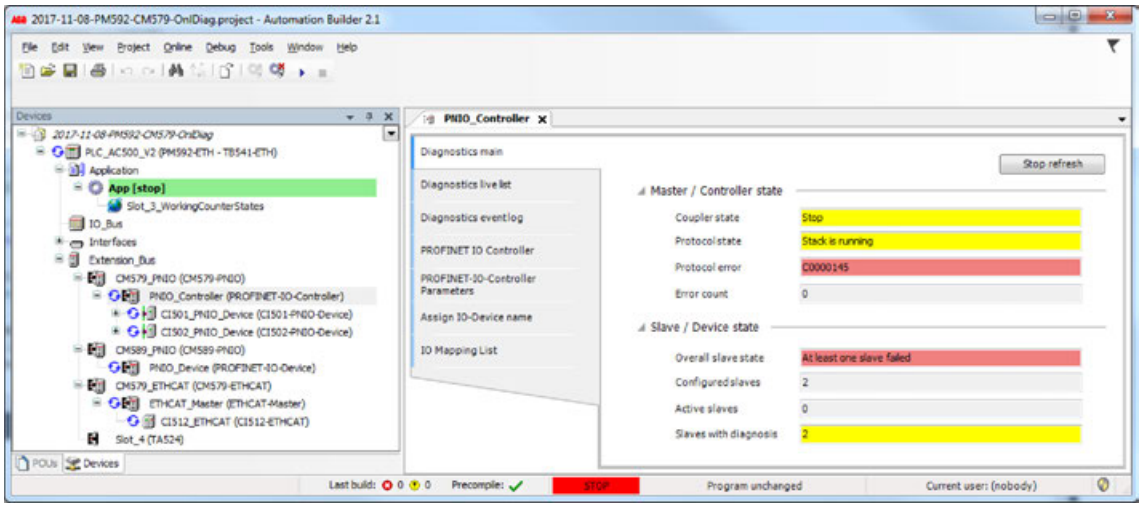
1.7.2.6.1 Fieldbus commissioning

Common online diagnosis views for all netX-based communication modules (e. g. CM579-ETHCAT, CM579-PNIO) can be accessed whenever the related PLC is in online mode
↳ *Chapter 1.7.2.2 "Entering/leaving the online mode" on page 4046*.

Master/controller modules

Master/controller modules like CM579-ETHCAT or CM579-PNIO, provide the following diagnosis views:

- *"Diagnostics main"*: provides diagnosis messages which are common for all protocols (e.g., protocol state and error)
- *"Diagnostics live list"*: provides a list of connected slaves/devices and their state ↳ *Chapter 1.7.2.6.1.1.1 " PROFINET scan and comparison view" on page 4057*
- *"Diagnostics eventlog"*: provides diagnosis messages from the master/controller and its connected slaves/devices



PROFINET scan and comparison view

PNIO_Controller

1. After going online, double-click on *"PNIO_Controller (PROFINET-IO-Controller)"* in the device tree.

   ⇨ The editor *"PNIO_Controller"* is displayed.

2. Select tab *"Diagnostics live list"* and click *[Scan]* to find all hardware devices that exist.

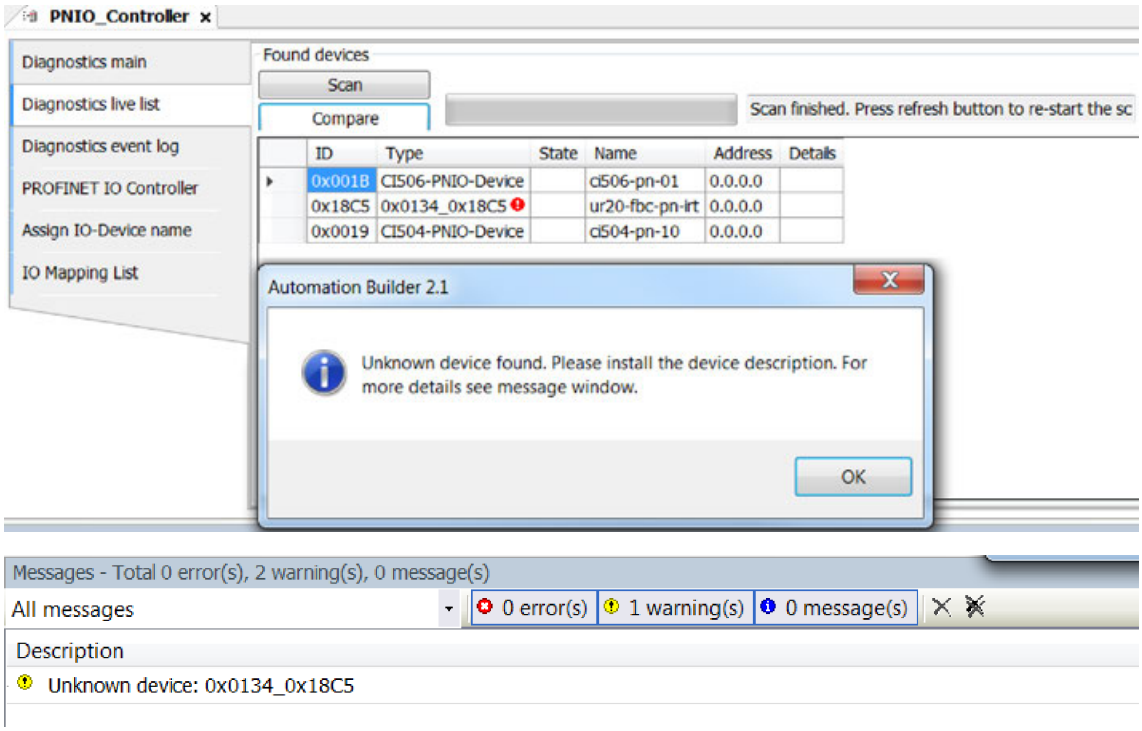
   ⇨ The found devices are listed in a table.

3. Click *[Compare]* to compare the found hardware I/O devices with the current project configuration.

Unknown hardware

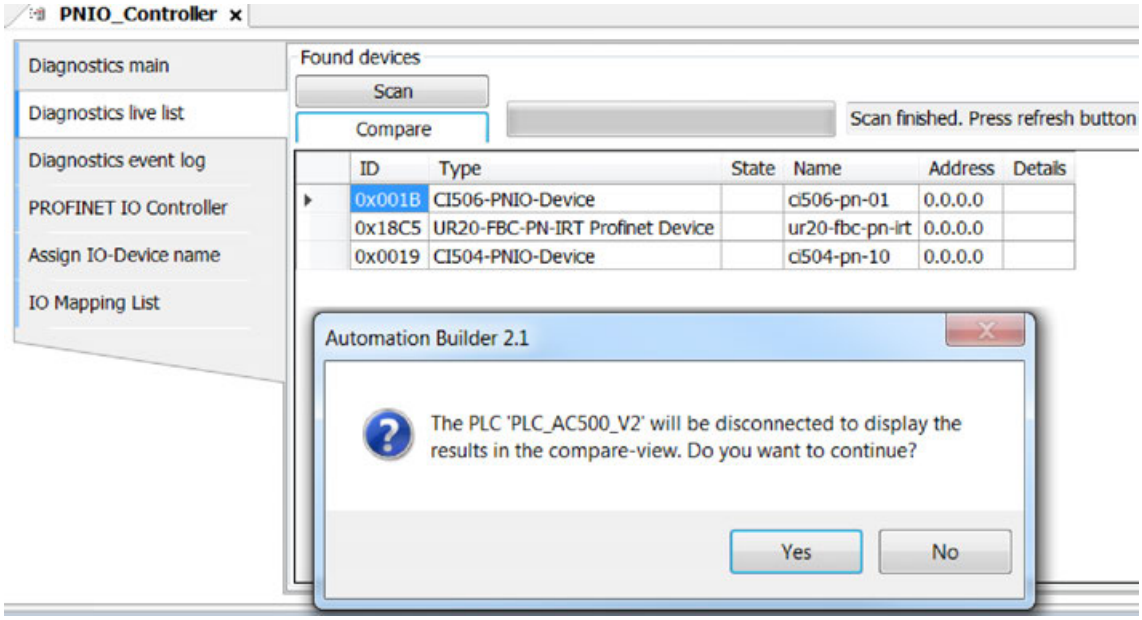
If any I/O hardware device is unknown:

- The devices will be marked with a red exclamation mark.
- A message box will be appear for each unknown device.
- Automation Builder generates a message with information about its vendor ID and device ID.



Comparison view

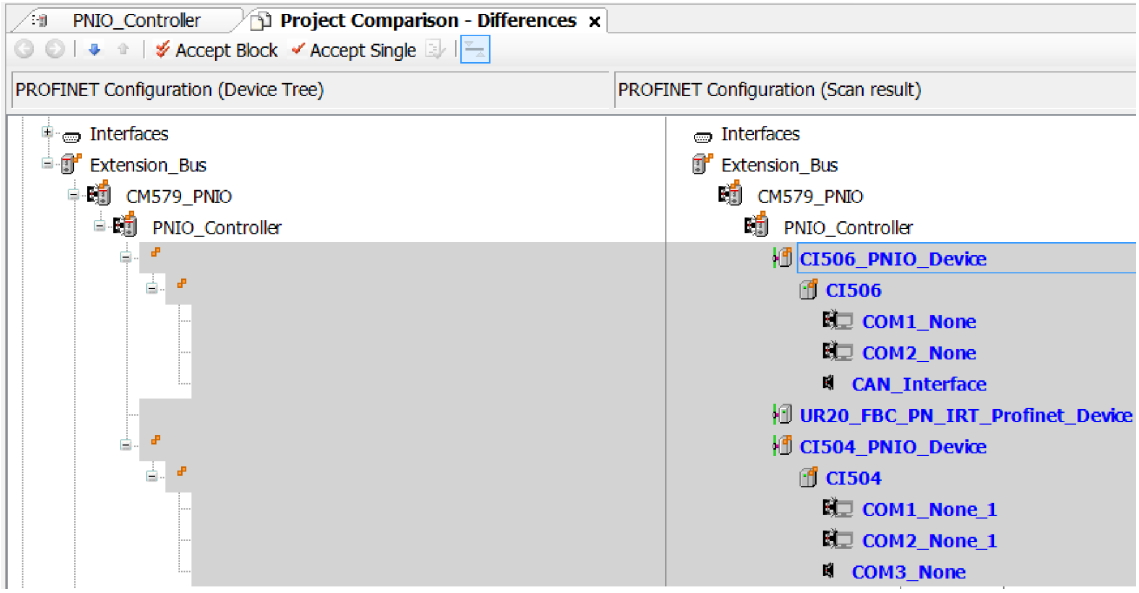
1. To display the comparison view, install the device description for the unknown device.
2. After installing the device description, click *[Scan]* and click *[Compare]*.



⇨ The message box informs you, that the application will go offline to display the comparison view.

3. Click *[Yes]*.

   ⇨ The *"Project Comparison - Differences"* tab displays the difference between the PROFINET configuration in Automation Builder (left side) and the real hardware configuration (right side).

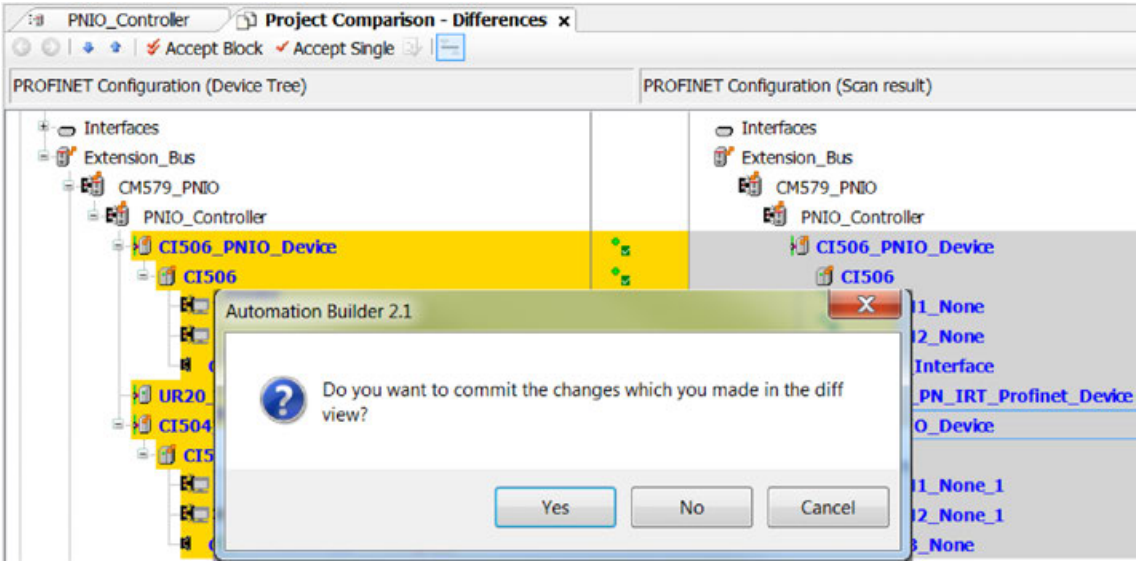


4. Click *[Accept Single]* to accept only a part of the differences or *[Accept Block]* to accept all differences.

   ⇨ After clicking on the Button *[Accept Single]* or *[Accept Block]* the found devices will be moved from the right side to the left side.

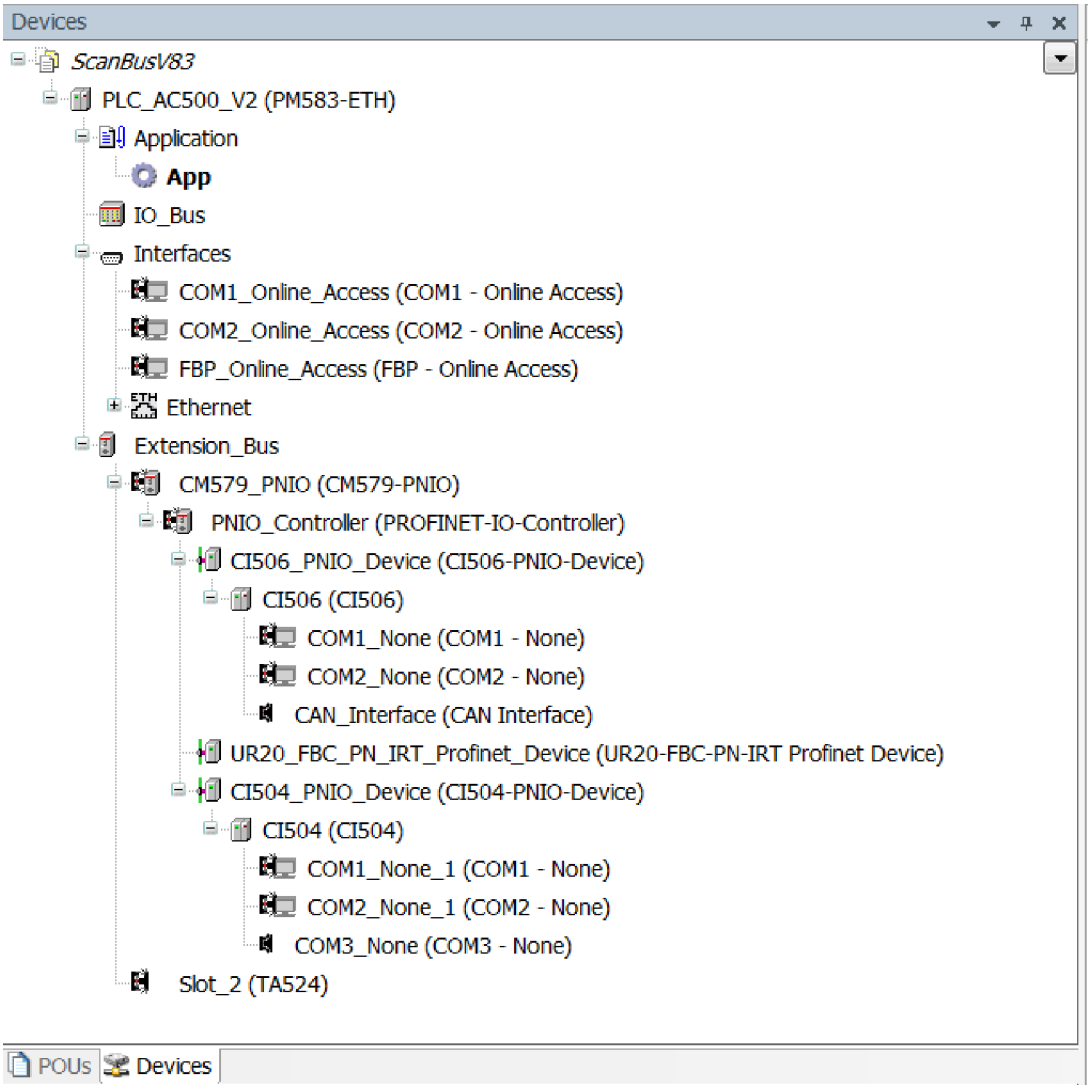
5. Close tab *"Project Comparison - Differences"*.

   ⇨ A message will be displayed to ask if you want to commit the new changes into project.



6. Click *[Yes]*.

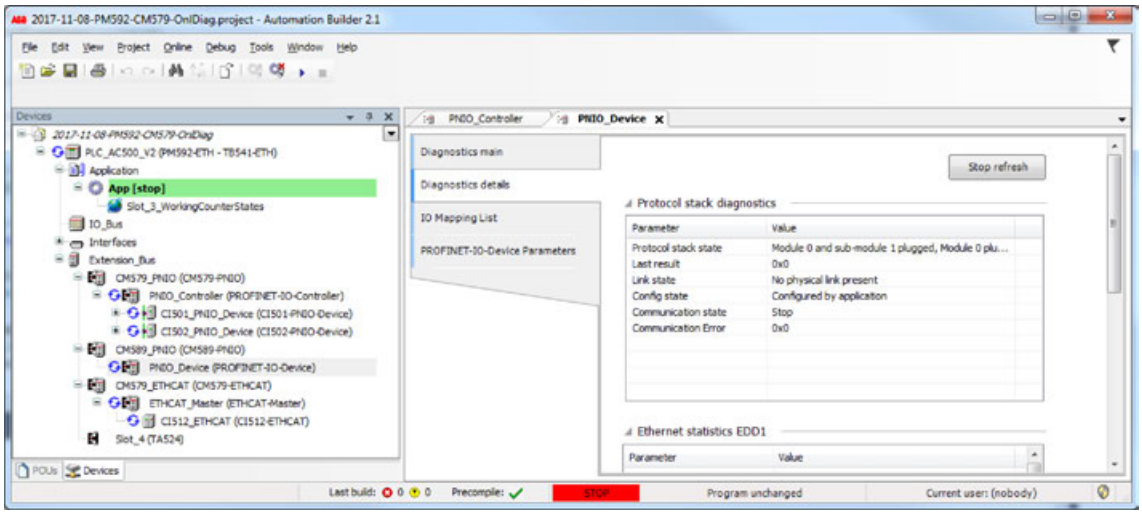
   ⇨ The changes will be saved and the devices will be added to the project.



Slave/device communication modules

Diagnosis views for slave/device communication modules like CM589-PNIO:

- *"Diagnostics main"*: provides diagnosis messages which are common for all protocols
- *"Diagnostics details"*: provides protocol specific diagnosis messages

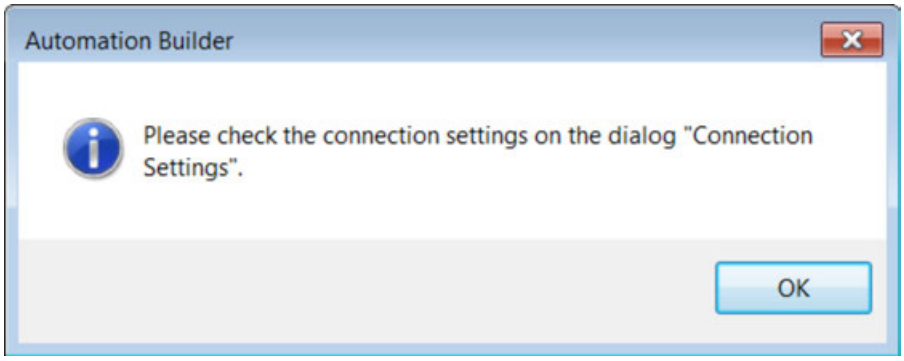


1.7.2.6.2 CI52x Modbus diagnosis

1. Double-click node *"CI52x_MODTCP"* in the device tree.
2. Select *"CI52x Diagnosis"* tab.
   ⇨ The button *[Get Diagnosis]* appears in the tab view.
3. Click on the button *[Get Diagnosis]*.
   ⇨ One of the following use cases will be displayed:
   - Device not connected ↳ *"Device not connected" on page 4061*
   - No Errors on the device ↳ *"No errors on the device" on page 4062*
   - Diagnosis list ↳ *"Diagnosis list" on page 4062*

Device not connected

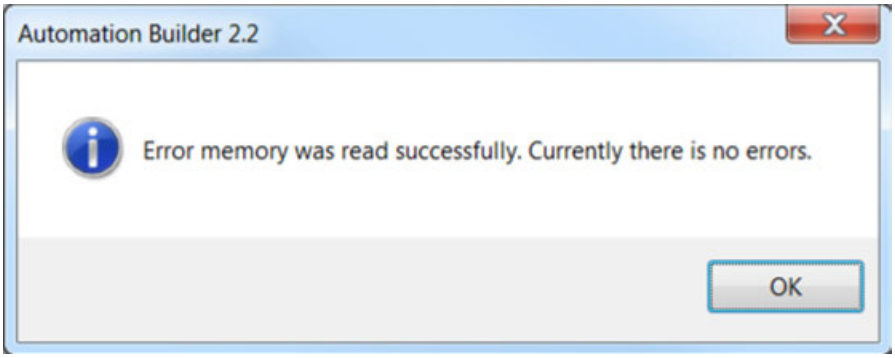
If there is no device connected to the project, the following dialog will be displayed:



1. Select tab *"Connection Settings"* and enter the IP address for the device.
2. Click again button *[Get Diagnosis]*.

No errors on the device

If there are no errors on the device the following dialog will be displayed:



Diagnosis list

If the device is not correctly configured the errors will be displayed with *"Error Code"* and *"Code Description"*.

	Error Code	Code Description
▸	234946507	Process voltage too low
	234946541	Process voltage switched off
	234881072	Module number: 1: Measurement overflow or cut wire at the analog input
*		

1.7.3 Diagnosis messages

1.7.3.1 CPU diagnosis

Diagnosis messages are included in diagnosis text list *"Diag_V3_PLC"*.

Error severity	SubSysteminfo								Additional	Error code Err_x	Meaning	Remedy
	Byte0		Byte1		Byte2		Byte3					
	Sub 1_x	Meaning	Sub 2_x	Meaning	Sub 3_x	Meaning	Sub 4_x	Meaning				
2	0	CPU	2	Parameter	0	-	0	-	0	27	Failed to set parameter "Reboot at powerfail"	
2	14	I/O bus	0	-	0	-	0	-	0	2	Resource failure	
2	14	I/O bus	0	-	0	-	0	-	0	3	Timeout	
2	14	I/O bus	0	-	0	-	0	-	0	17	Error setting I/O bus master parameter	
2	21	Display	0	-	0	-	0	-	0	23	Wrong version of display firmware	
3	21	Display	0	-	0	-	0	-	0	22	Error at initialization of display	
4	22	Battery	0	-	0	-	0	-	0	8	Empty or missing	
4	19	Flash disk	5	Index	0...n	0...n	0	-	0	9	Medium has used 80 % of its spare capacity	

Error severity	SubSysteminfo								Additional	Error code Err_x	Meaning	Remedy
	Byte0		Byte1		Byte2		Byte3					
	Sub 1_x	Meaning	Sub 2_x	Meaning	Sub 3_x	Meaning	Sub 4_x	Meaning				
4	19	Flash disk	5	Index	0...n	0...n	0	-	0	10	Medium has almost used its complete spare capacity or is already dead, action required	
11	0	CPU	2	Parameter	0	-	0	-	0	18	At least one parameter not found	
11	0	CPU	2	Parameter	0	-	0	-	0	19	Unable to read at least one parameter value	
11	0	CPU	2	Parameter	0	-	1 or 2	'too big' or 'too small'	0	20	Invalid value of parameter "LED"	
11	0	CPU	2	Parameter	0	-	1 or 2	'too big' or 'too small'	0	21	Invalid value of parameter "Battery"	
11	0	CPU	2	Parameter	0	-	1 or 2	'too big' or 'too small'	0	26	Invalid value of parameter "Reboot at powerfail"	

1.7.3.2 I/O bus diagnosis

Diagnosis messages are included in diagnosis text lists *“Diag_IO_Bus”* and *“Diag_S500_IO_Bus”*.

Error severity	SubSysteminfo								Additional	Error code Err_x	Meaning	Remedy
	Byte0		Byte1		Byte2		Byte3					
	Sub 1_x	Meaning	Sub 2_x	Meaning	Value	Meaning	Value	Meaning				
2	0	Master	0	-	0	-	0	-	0	16129	Severe error, see log	
2	0	Master	0	-	0	-	0	-	0	16130	Fatal error, see log	
2	0	Master	0	-	0	-	0	-	0	16194	Fatal error, not running any more	
3	0	Master	0	-	0	-	0	-	0	16128	Failed Max Wait Run	
4	1...20	Module n	0	-	0	-	0	-	0	9480	Module <n>, removed from hot swap terminal unit	

Error severity	SubSysteminfo								Additional	Error code Err_x	Meaning	Remedy

4	1...20	Module n	0	-	-	-	0	-	0	9770	No communication with hot swap terminal unit	Restart, if error persists replace terminal unit
4	1...20	Module n	0	-	-	-	0	-	0	16172	Has not passed factory test	
4	1...20	Module n	0	-	-	-	0	-	0	16173	No process voltage UP or UP3	Check process voltage
11	0	-	0	-	-	-	0	-	0	16159	Configured number of modules differs from found ones	
11	0	-	0	-	-	-	0	-	0	16160	At least one module failed during configuration	

1.7.3.4 Communication modules diagnosis

1.7.3.4.1 CM579-ETHCAT

Status codes

Hexadecimal Value	Definition	Description
0x00000000	TLR_S_OK	Status ok
0xC0650005	TLR_E_ETHERCAT_MASTER_ERROR_BUSSCAN_FAILED	Existing bus does not match configured bus.
0xC0650006	TLR_E_ETHERCAT_MASTER_NOT_ALL_SLAVES_AVAIL	Not all slaves are available.
0xC065000B	TLR_E_ETHERCAT_MASTER_INVALID_BUSCYCLETIME	The requested bus cycle time is invalid.
0xC065000C	TLR_E_ETHERCAT_MASTER_INVALID_BROKEN_SLAVE_BEHAVIOUR_PARA	Invalid parameter for broken slave behavior.
0xC065000F	TLR_E_ETHERCAT_MASTER_COE_INVALID_SLAVEID	Invalid SlaveId was used for CoE.
0xC0650012	TLR_E_ETHERCAT_MASTER_COE_INVALID_INDEX	Invalid Index on slave requested.
0xC0650013	TLR_E_ETHERCAT_MASTER_COE_INVALID_COMMUNICATION_STATE	Invalid bus communication state for CoE-Usage.
0xC0650014	TLR_E_ETHERCAT_MASTER_COE_FRAME_LOST	Frame with CoE data is lost.
0xC0650015	TLR_E_ETHERCAT_MASTER_COE_TIMEOUT	Timeout during CoE service.
0xC0650016	TLR_E_ETHERCAT_MASTER_COE_SLAVE_NOT_ADDRESSABLE	Slave is not addressable (not on bus or power down?).
0xC0650017	TLR_E_ETHERCAT_MASTER_COE_INVALID_LIST_TYPE	Invalid list type requested (during GetOdList).
0xC0650018	TLR_E_ETHERCAT_MASTER_COE_SLAVE_RESPONSE_TOO_BIG	Data in slave response is too big for confirmation packet.
0xC0650019	TLR_E_ETHERCAT_MASTER_COE_INVALID_ACCESSBITMASK	Invalid access mask selected (during GetEntryDesc).
0xC065001A	TLR_E_ETHERCAT_MASTER_COE_WKC_ERROR	Slave Working Counter Error during CoE service.
0xC065001C	TLR_E_ETHERCAT_MASTER_INVALID_COMMUNICATION_STATE	Command is not usable in the communication state.
0xC065001E	TLR_E_ETHERCAT_MASTER_BUS_SCAN_CURRENTLY_RUNNING	The scan is already running. It cannot be started twice at the same time.
0xC065001F	TLR_E_ETHERCAT_MASTER_BUS_SCAN_TIMEOUT	Timeout during bus scan. But at least a link is established.
0xC0650020	TLR_E_ETHERCAT_MASTER_BUS_SCAN_NOT_READY_YET	The bus scan was not started before or is not finish yet.
0xC0650021	TLR_E_ETHERCAT_MASTER_BUS_SCAN_INVALID_SLAVE	The requested slave is invalid.
0xC0650022	TLR_E_ETHERCAT_MASTER_COE_INVALIDACCESS	Slave does not allow reading or writing (CoE-Access).
0xC0650023	TLR_E_ETHERCAT_MASTER_COE_NO_MBX_SUPPORT	Slave does not support a mailbox.

Hexadecimal Value	Definition	Description
0xC0650024	TLR_E_ETHERCAT_MASTER_COE_NO_COE_SUPPORT	Slave does not support CoE.
0xC0650025	TLR_E_ETHERCAT_MASTER_TASK_CREATION_FAILED	Task could not be created during run time.
0xC0650026	TLR_E_ETHERCAT_MASTER_INVALID_SLAVE_SM_CONFIGURATION	The Sync Manager configuration of a slave is invalid.
0xC0650027	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TOGGLE	SDO abort code: Toggle bit not alternated.
0xC0650028	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TIMEOUT	SDO abort code: SDO protocol timed out.
0xC0650029	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_CCS_SCS	SDO abort code: Client/server command specifier not valid or unknown.
0xC065002A	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_BLK_SIZE	SDO abort code: Invalid block size (block mode only).
0xC065002B	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_SEQNO	SDO abort code: Invalid sequence number (block mode only).
0xC065002C	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_CRC	SDO abort code: CRC error (block mode only).
0xC065002D	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_MEMORY	SDO abort code: Out of memory.
0xC065002E	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_ACCESS	SDO abort code: Unsupported access to an object.
0xC065002F	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_WRITEONLY	SDO abort code: Attempt to read a write only object.
0xC0650030	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_READONLY	SDO abort code: Attempt to write a read only object.
0xC0650031	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_INDEX	SDO abort code: Object does not exist in the object dictionary.
0xC0650032	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_PDO_MAP	SDO abort code: Object cannot be mapped to the PDO.
0xC0650033	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_PDO_LEN	SDO abort code: The number and length of the objects to be mapped would exceed PDO length.
0xC0650034	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_P_INCOMP	SDO abort code: General parameter incompatibility reason.
0xC0650035	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_I_INCOMP	SDO abort code: General internal incompatibility in the device.
0xC0650036	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_HARDWARE	SDO abort code: Access failed due to an hardware error.
0xC0650037	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE	SDO abort code: Data type does not match, length of service parameter does not match.
0xC0650038	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE1	SDO abort code: Data type does not match, length of service parameter too high.
0xC0650039	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_SIZE2	SDO abort code: Data type does not match, length of service parameter too low.

Hexadecimal Value	Definition	Description
0xC065003A	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_OFFSET	SDO abort code: Sub-index does not exist.
0xC065003B	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE	SDO abort code: Range of values of parameter exceeded (only for write access).
0xC065003C	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE1	SDO abort code: Value of parameter written too high.
0xC065003D	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DATA_RANGE2	SDO abort code: Value of parameter written too low.
0xC065003E	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_MINMAX	SDO abort code: Maximum value is less than minimum value.
0xC065003F	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_GENERAL	SDO abort code: general error.
0xC0650040	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER	SDO abort code: Data cannot be transferred or stored to the application.
0xC0650041	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER1	SDO abort code: Data cannot be transferred or stored to the application because of local control.
0xC0650042	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_TRANSFER2	SDO abort code: Data cannot be transferred or stored to the application because of the present device state.
0xC0650043	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_DICTIONARY	SDO abort code: Object dictionary dynamic generation fails or no object dictionary is present (e.g. object dictionary is generated from file and generation fails because of an file error).
0xC0650044	TLR_E_ETHERCAT_MASTER_SDO_ABORTCODE_UNKNOWN	SDO abort code: unknown code.
0xC0CC0001	ECM_ERROR_LLD_TIMEOUT	LLD: Timeout
0xC0CC0003	ECM_ERROR_LLD_UNSUPPORTED_COMMAND	LLD: Unsupported command
0xC0CC0004	ECM_ERROR_LLD_DUPLICATE_FIXED_STATION_ADDRESS	LLD: Duplicate fixed station address
0xC0CC0005	ECM_ERROR_LLD_SII_CHECKSUM_ERROR	LLD: SII Checksum Error
0xC0CC0006	ECM_ERROR_LLD_SII_EEPROM_LOADING_ERROR	LLD: SII EEPROM Loading Error
0xC0CC0007	ECM_ERROR_LLD_SII_MISSING_ERROR_ACK	LLD: SII Missing Error Ack
0xC0CC0008	ECM_ERROR_LLD_STATE_CHANGE_FAILED	LLD: State Change Failed
0xC0CC0009	ECM_ERROR_LLD_UNEXPECTED_AL_STATUS	LLD: Unexpected AL Status
0xC0CC000A	ECM_ERROR_LLD_UNEXPECTED_WKC	LLD: Unexpected WKC
0xC0CC000B	ECM_ERROR_LLD_MAILBOX_NOT_AVAILABLE	LLD: Mailbox not available

Hexadecimal Value	Definition	Description
0xC0CC000C	ECM_ERROR_LLD_MAILBOX_MESSAGE_TOO_LARGE	LLD: Mailbox message too large
0xC0CC000D	ECM_ERROR_LLD_CONFIGURATION_IN_PROGRESS	LLD: Configuration in progress
0xC0CC000E	ECM_ERROR_LLD_TOO_MANY_CYCLIC_FRAMES	LLD: Too many cyclic frames
0xC0CC000F	ECM_ERROR_LLD_CYCLIC_FRAME_EXCEEDS_MTU	LLD: Cyclic frame exceeds MTU
0xC0CC0010	ECM_ERROR_LLD_INVALID_CYCLIC_TELEGRAM_CONFIG	LLD: Invalid cyclic telegram config
0xC0CC0011	ECM_ERROR_LLD_BUILDING_COPY_ROUTINES_FAILED	LLD: Building copy routines failed
0xC0CC0012	ECM_ERROR_LLD_UNSUPPORTED_SLAVE_STATION_ADDRESS	LLD: Unsupported slave station address
0xC0CC0013	ECM_ERROR_LLD_STATION_ADDRESS_NOT_ALLOWED	LLD: Station Address not allowed
0xC0CC0014	ECM_ERROR_LLD_INVALID_STD_TX_MBX_PHYS_OFFSET	LLD: Invalid Std TxMbx PhysOffset
0xC0CC0015	ECM_ERROR_LLD_INVALID_STD_RX_MBX_PHYS_OFFSET	LLD: Invalid Std Rx Mbx PhysOffset
0xC0CC0016	ECM_ERROR_LLD_INVALID_BOOT_TX_MBX_PHYS_OFFSET	LLD: Invalid BOOT Rx Mbx PhysOffset
0xC0CC0017	ECM_ERROR_LLD_INVALID_BOOT_RX_MBX_PHYS_OFFSET	LLD: Invalid BOOT Tx Mbx PhysOffset
0xC0CC0018	ECM_ERROR_LLD_INVALID_STD_TX_MBX_SM_NO	LLD: Invalid Std Tx Mbx SmNo
0xC0CC0019	ECM_ERROR_LLD_INVALID_STD_RX_MBX_SM_NO	LLD: Invalid Std Rx Mbx SmNo
0xC0CC001A	ECM_ERROR_LLD_INVALID_BOOT_TX_MBX_SM_NO	LLD: Invalid BOOT Tx Mbx SmNo
0xC0CC001B	ECM_ERROR_LLD_INVALID_BOOT_RX_MBX_SM_NO	LLD: Invalid BOOT Rx Mbx SmNo
0xC0CC001C	ECM_ERROR_LLD_UNCONFIGURED_SLAVE_STATION_ADDRESS	LLD: Unconfigured slave station address
0xC0CC001D	ECM_ERROR_LLD_WRONG_SLAVE_STATE	LLD: Wrong slave state
0xC0CC001E	ECM_ERROR_LLD_CYCLE_TIME_TOO_SMALL	LLD: Cycle time too small
0xC0CC001F	ECM_ERROR_LLD_REPETITION_COUNT_NOT_SUPPORTED	LLD: Repetition count not supported
0xC0CC0020	ECM_ERROR_LLD_INVALID_CALLBACK_TYPE	LLD: Invalid callback type
0xC0CC0021	ECM_ERROR_LLD_INVALID_CYCLE_MULTIPLIER	LLD: Invalid cycle multiplier
0xC0CC0022	ECM_ERROR_LLD_UNKNOWN_ERROR	LLD: Unknown Error
0xC0CC0023	ECM_ERROR_LLD_INVALID_REG_LENGTH	LLD: Invalid reg length

Hexadecimal Value	Definition	Description
0xC0CC0024	ECM_ERROR_LLD_INVALID_PARAMETER	LLD: Invalid parameter
0xC0CC0025	ECM_ERROR_LLD_IRQ_NOT_AVAILABLE	LLD: IRQ not available
0xC0CC0026	ECM_ERROR_LLD_IOMEM_IRQ_NOT_AVAILABLE	LLD: IOMem Irq not available
0xC0CC0027	ECM_ERROR_LLD_HW_INIT_FAILED	LLD: Hardware init failed
0xC0CC0028	ECM_ERROR_LLD_MUTEX_CREATION_FAILED	LLD: Mutex creation failed
0xC0CC0029	ECM_ERROR_LLD_DC_RX_LATCH_COMMAND_REQUIRED_FOR_DC	LLD: DC Rx Latch command is not configured within cyclic frames
0xC0CC002A	ECM_ERROR_LLD_TX_PROCESS_IMAGE_EXCEEDED	LLD: Transmit process image is exceeded
0xC0CC002B	ECM_ERROR_LLD_RX_PROCESS_IMAGE_EXCEEDED	LLD: Receive process image is exceeded
0xC0CC002C	ECM_ERROR_LLD_MBX_STATE_IMAGE_EXCEEDED	LLD: Mailbox State image is exceeded
0xC0CC002D	ECM_ERROR_LLD_RESULT_DUPLICATE_BWR_RX_LATCH_CMD	LLD: Duplicate BWR Rx DC Latch command detected in cyclic frames
0xC0CC002E	ECM_ERROR_LLD_RESULT_DUPLICATE_EXT_SYSTIME_CONTROL_CMD	LLD: Duplicate External Sync SysTime Control command detected in cyclic frames
0xC0CC002F	ECM_ERROR_LLD_CC_PROCESS_IMAGE_EXCEEDED	LLD: Cross Communication Process image exceeded
0x40CD0017	ECM_INFO_EMC_BUS_IS_OFF	Bus is off
0xC0CD0001	ECM_ERROR_EMC_REQUEST_DESTINATION_PROBLEM	Request Destination Problem
0xC0CD0002	ECM_ERROR_EMC_INVALID_SLAVE_STATION_ADDRESS	Invalid slave station address
0xC0CD0003	ECM_ERROR_EMC_CONFIGURATION_BUFFER_IS_OPEN	Configuration buffer is open
0xC0CD0004	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION	Wrong state for reconfiguration
0xC0CD0005	ECM_ERROR_EMC_CONFIGURATION_BUFFER_IS_NOT_OPEN	Configuration buffer is not open
0xC0CD0006	ECM_ERROR_EMC_SLAVE_STATION_ADDRESS_ALREADY_IN_CONFIG	Slave station address already in config
0xC0CD0007	ECM_ERROR_EMC_INVALID_STD_MBX_PARAMETERS	Invalid Std Mbx parameters
0xC0CD0008	ECM_ERROR_EMC_INVALID_BOOT_MBX_PARAMETERS	Invalid BOOT Mbx parameters
0xC0CD0009	ECM_ERROR_EMC_STD_MBX_SM_ARE_OVERLAPPING	Std Mbx SMs are overlapping
0xC0CD000A	ECM_ERROR_EMC_BOOT_MBX_SM_ARE_OVERLAPPING	BOOT Mbx SMs are overlapping
0xC0CD000B	ECM_ERROR_EMC_SM_PARAMS_ALREADY_ADDED	SM Params already added

Hexadecimal Value	Definition	Description
0xC0CD000C	ECM_ERROR_EMC_INVALID_SM_NUMBER	Nvalid SM number
0xC0CD000D	ECM_ERROR_EMC_FMMU_PARAMS_ALREADY_ADDED	FMMU params already added
0xC0CD000E	ECM_ERROR_EMC_INVALID_FMMU_NUMBER	Invalid FMMU number
0xC0CD000F	ECM_ERROR_EMC_INVALID_MIN_STATE	Invalid min state
0xC0CD0010	ECM_ERROR_EMC_CYCLE_FRAME_AMOUNT_EXCEEDED	Cycle frame amount exceeded
0xC0CD0011	ECM_ERROR_EMC_INVALID_CYCLIC_FRAME_IN_CONFIGURATION	Invalid cycle frame in configuration
0xC0CD0012	ECM_ERROR_EMC_CYCLE_FRAME_INDEX_NOT_VALID	Cycle frame index not valid
0xC0CD0013	ECM_ERROR_EMC_INVALID_TELEGRAM_LENGTH	Invalid telegram length
0xC0CD0014	ECM_ERROR_EMC_CYCLE_FRAME_LENGTH_EXCEEDED	Cycle frame length exceeded
0xC0CD0015	ECM_ERROR_EMC_AMOUNT_OF_TELE-GRAMS_IN_CYCLIC_FRAME_EXCEEDED	Amount of telegrams in cyclic frame exceeded
0xC0CD0016	ECM_ERROR_EMC_STATE_CHANGE_IN_PROGRESS	State change in progress
0xC0CD0018	ECM_ERROR_EMC_TOO_MANY_SLAVES_GIVEN	Too many slaves given
0xC0CD0019	ECM_ERROR_EMC_DUPLI-CATE_STA-TION_ADDRESS_IN_LIST	Duplicate station address in list
0xC0CD001A	ECM_ERROR_EMC_COM-MAND_TYPE_NOT_ALLOWED_FOR_SLAVE_FSM	Command type not allowed for slave FSM
0xC0CD001B	ECM_ERROR_EMC_CONFIGURA-TION_DATA_INCORRECT	Configuration data incorrect
0xC0CD001C	ECM_ERROR_EMC_VEN-DORID_MISMATCH	VendorID mismatch
0xC0CD001D	ECM_ERROR_EMC_PRODUCT-CODE_MISMATCH	ProductCode mismatch
0xC0CD001E	ECM_ERROR_EMC_REVI-SIONNO_MISMATCH	Revision number mismatch
0xC0CD001F	ECM_ERROR_EMC_SERI-ALNO_MISMATCH	Serial number mismatch
0xC0CD0020	ECM_ERROR_EMC_LOST_CON-NECTION	Lost connection
0xC0CD0021	ECM_ERROR_EMC_UNKNOWN_STATE_CHANGE_HAPPENED	Unknown state change happened
0xC0CD0022	ECM_ERROR_EMC_UNEX-PECTED_STATE_CHANGE_HAP-PENED	Unexpected state change happened

Hexadecimal Value	Definition	Description
0xC0CD0023	ECM_ERROR_EMC_SLAVE_CHANGED_STATE	Slave changed state
0xC0CD0026	ECM_ERROR_EMC_DC_RX_TIMESTAMP_ERROR	DC Rx Timestamp error
0xC0CD0027	ECM_ERROR_EMC_DC_MASTER_PORT_TIMESTAMP_ERROR	DC master port timestamp error
0xC0CD0028	ECM_ERROR_EMC_INVALID_SLAVE_INDEX	Invalid slave index
0xC0CD0029	ECM_ERROR_EMC_WRONG_MASTER_STATE	
0xC0CD002A	ECM_ERROR_EMC_INVALID_TRANSFER_ID	Invalid Transfer Id
0xC0CD002B	ECM_ERROR_EMC_INVALID_SEGMENTATION	Invalid Segmentation
0xC0CD002C	ECM_ERROR_EMC_IP_PARAMS_ALREADY_ADDED	EoE IP Params already added
0xC0CD002D	ECM_ERROR_EMC_EOE_SUPPORT_NOT_AVAILABLE	EoE support not available
0xC0CD002E	ECM_ERROR_EMC_END_CONFIGURATION_IN_PROGRESS	End configuration in progress
0xC0CD002F	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_BUS_IS_ON	Wrong state for reconfiguration (Bus Is On)
0xC0CD0030	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_BUS_SCAN_ACTIVE	Wrong state for reconfiguration (Bus Scan Active)
0xC0CD0031	ECM_ERROR_EMC_WRONG_STATE_FOR_RECONFIGURATION_IN_PROGRESS_TO_BUSOFF	Wrong state for reconfiguration (In Progress to Bus off)
0xC0CD0032	ECM_EROR_EMC_NO_DIAG_ENTRY_AVAILABLE	No Diag Entry available
0xC0CD0033	ECM_ERROR_EMC_SLAVE_SYNC_PARAMS_NOT_POSSIBLE_WITHOUT_WORKING_DC	A slave has been configured to have SYNC0 and/or SYNC1 but does not support DC at all.
0xC0CD0034	ECM_ERROR_EMC_MANDATORY_SLAVE_MISSING	At least one required slave for boot up is missing.
0xC0CD0035	ECM_ERROR_EMC_WRONG_SLAVE_AT_POSITION	A wrong slave at a specific position has been detected.
0xC0CD0036	ECM_ERROR_EMC_NO_DC_REF_CLOCK	No DC reference clock
0xC0CD0037	ECM_ERROR_EMC_DC_REF_CLOCK_DOES_NOT_PROVIDE_64BIT	DC Reference clock does not provide 64 Bit
0xC0CD0038	ECM_ERROR_EMC_INVALID_DC_REF_CLOCK	Invalid DC Reference clock
0xC0CD0039	ECM_ERROR_EMC_COE_SUPPORT_NOT_AVAILABLE	CoE support not available
0xC0CD003A	ECM_ERROR_EMC_SOE_SUPPORT_NOT_AVAILABLE	SoE support not available

Hexadecimal Value	Definition	Description
0xC0CD003B	ECM_ERROR_EMC_FOE_SUPPORT_NOT_AVAILABLE	FoE support not available
0xC0CD003C	ECM_ERROR_EMC_AOE_SUPPORT_NOT_AVAILABLE	AoE support not available
0x40CD003E	ECM_INFO_EMC_RECONNECTED	Reconnected
0x80CD003F	ECM_WARN_EMC_DC_STOPPED	DC stopped
0xC0CD0040	ECM_ERROR_EMC_STOPPED_DUE_SYNC_ERROR	Stopped due Sync Error
0xC0CD0041	ECM_ERROR_EMC_MANDATORY_SLAVE_NOT_IN_OP	At least one mandatory slave is not in OP
0xC0CD0042	ECM_ERROR_EMC_BUS_CYCLE_TIME_NOT_POSSIBLE	Bus Cycle Time not possible
0xC0CD0043	ECM_ERROR_EMC_TOPOLOGY_ERROR_DETECTED	Topology error detected
0xC0CD0044	ECM_ERROR_EMC_TOPOLOGY_MISMATCH_DETECTED	Topology mismatch detected
0xC0CD0045	ECM_ERROR_EMC_NO_VALID_TOPOLOGY_CONFIGURATION_DATA	No valid topology configuration data
0xC0CD0046	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0	Unexpected slave at port 0 of slave.
0xC0CD0047	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT1	Unexpected slave at port 1 of slave.
0xC0CD0048	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT2	Unexpected slave at port 2 of slave.
0xC0CD0049	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT3	Unexpected slave at port 3 of slave.
0xC0CD004A	ECM_ERROR_EMC_UNEXPECTED_SLAVE_RECONNECTED	-
0xC0CD004B	ECM_ERROR_EMC_UNEXPECTED_MISSING_SLAVE_AT_PORT0	Missing slave at port 0 of slave.
0xC0CD004C	ECM_ERROR_EMC_UNEXPECTED_MISSING_SLAVE_AT_PORT1	Missing slave at port 1 of slave.
0xC0CD004D	ECM_ERROR_EMC_UNEXPECTED_MISSING_SLAVE_AT_PORT2	Missing slave at port 2 of slave.
0xC0CD004E	ECM_ERROR_EMC_UNEXPECTED_MISSING_SLAVE_AT_PORT3	Missing slave at port 3 of slave.
0xC0CD004F	ECM_ERROR_EMC_SLAVE_NOT_CHECKED	Slave is not checked.
0xC0CD0050	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_1	Unexpected slave at port 0 and 1 of slave.
0xC0CD0051	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_2	Unexpected slave at port 0 and 2 of slave.
0xC0CD0052	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_3	Unexpected slave at port 0 and 3 of slave.

Hexadecimal Value	Definition	Description
0xC0CD0053	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT1_2	Unexpected slave at port 1 and 2 of slave.
0xC0CD0054	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT1_3	Unexpected slave at port 1 and 3 of slave.
0xC0CD0055	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT2_3	Unexpected slave at port 2 and 3 of slave.
0xC0CD0056	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_1_2	Unexpected slave at port 0, 1 and 2 of slave.
0xC0CD0057	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_1_3	Unexpected slave at port 0, 1 and 3 of slave.
0xC0CD0058	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT0_2_3	Unexpected slave at port 0, 2 and 3 of slave.
0xC0CD0059	ECM_ERROR_EMC_UNEXPECTED_SLAVE_AT_PORT1_2_3	Unexpected slave at port 1, 2 and 3 of slave.
0xC0CD005A	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1	Missing slave at port 0 and 1 of slave.
0xC0CD005B	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_2	Missing slave at port 0 and 2 of slave.
0xC0CD005C	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_3	Missing slave at port 0 and 3 of slave.
0xC0CD005D	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_2	Missing slave at port 1 and 2 of slave.
0xC0CD005E	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_3	Missing slave at port 1 and 3 of slave.
0xC0CD005F	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT2_3	Missing slave at port 2 and 3 of slave.
0xC0CD0060	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1_2	Missing slave at port 0, 1 and 2 of slave.
0xC0CD0061	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_1_3	Missing slave at port 0, 1 and 3 of slave.
0xC0CD0062	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT0_2_3	Missing slave at port 0, 2 and 3 of slave.
0xC0CD0063	ECM_ERROR_EMC_MISSING_SLAVE_AT_PORT1_2_3	Missing slave at port 1, 2 and 3 of slave.
0xC0CD0065	ECM_ERROR_EMC_HC_PARTICIPANT_NOT_ALLOWED_IN_MANDATORY_SLAVE_LIST	A Hot Connect group participant is not allowed to be configured a mandatory slave
0xC0CD0066	ECM_ERROR_EMC_HC_PARTICIPANT_NOT_ALLOWED_IN_MULTIPLE_HC_GROUPS	A Hot Connect group participant is not allowed to be configured in multiple Hot Connect groups
0xC0CD0067	ECM_ERROR_EMC_GC_GROUP_HEAD_IS_NOT_LISTED_FOR_HC_DETECTION	Hot Connect group head is not listed for Hot Connect detection
0xC0CD0068	ECM_ERROR_EMC_DC_SETUP_CALCULATION_ERROR	DC Setup calculation has encountered an error
0xC0CD0069	ECM_ERROR_EMC_NON_DC_SLAVE_MORE_THAN_2_PORTS_IN_DC_SETUP	A slave, which does not support DC, has more than 2 ports in a DC setup

Hexadecimal Value	Definition	Description
0xC0CD006A	ECM_ERROR_EMC_HC_GROUP_CONTAINS_NOT_CONFIG-URED_SLAVE	A Hot Connect group has been defined to include a slave address that has no configuration
0xC0CD006B	ECM_ERROR_EMC_ALCON-TROL_TIMEOUT	AL Control Timeout happened i.e. a slave ESM state change was not completed in time
0xC0CD006C	ECM_ERROR_EMC_DC_MEAS-UREMENT_ERROR	DC measurement encountered an error
0xC0CD006D	ECM_ERROR_EMC_RX_DESTINA-TION_EXCEEDS_RX_IMAGE_SIZE	Receive destination exceeds receive image size
0xC0CD006E	ECM_ERROR_EMC_TX_SOURCE_EXCEEDS_TX_IMAGE_SIZE	Transmit source exceeds transmit image size
0xC0CD006F	ECM_ERROR_EMC_WCSTA-TEBIT_EXCEEDS_RX_IMAGE_SIZE	WcState bit placement exceeds receive image size
0xC0CD0070	ECM_ERROR_EMC_WKC_MAP-PING_EXCEEDS_RX_IMAGE_SIZE	Wkc value placement exceeds receive image size
0xC0CD0071	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0	DC Latch Error detected at port 0 of slave
0xC0CD0072	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1	DC Latch Error detected at port 1 of slave
0xC0CD0073	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT2	DC Latch Error detected at port 2 of slave
0xC0CD0074	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT3	DC Latch Error detected at port 3 of slave
0xC0CD0075	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1	DC Latch Error detected at ports 0 and 1 of slave
0xC0CD0076	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_2	DC Latch Error detected at ports 0 and 2 of slave
0xC0CD0077	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_3	DC Latch Error detected at ports 0 and 3 of slave
0xC0CD0078	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1_2	DC Latch Error detected at ports 1 and 2 of slave
0xC0CD0079	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT1_3	DC Latch Error detected at ports 1 and 3 of slave
0xC0CD007A	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT2_3	DC Latch Error detected at ports 2 and 3 of slave
0xC0CD007B	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1_2	DC Latch Error detected at ports 0, 1 and 2 of slave
0xC0CD007C	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORT0_1_3	DC Latch Error detected at ports 0, 1 and 3 of slave
0xC0CD007D	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS0_2_3	DC Latch Error detected at ports 0, 2 and 3 of slave
0xC0CD007E	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS1_2_3	DC Latch Error detected at ports 1, 2 and 3 of slave
0xC0CD007F	ECM_ERROR_EMC_DC_RX_LATCH_ERROR_AT_PORTS0_1_2_3	DC Latch Error detected at ports 0, 1, 2 and 3 of slave
0xC0CD0080	ECM_ERROR_EMC_ASSIGN_PDO_IS_MISSING_PDO_MAPPING	AssignPDO data is missing related PDO mapping data

Hexadecimal Value	Definition	Description
0xC0CD0081	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_TO_SAME_SM	Parts of Ext Sync object are not mapped to the same SyncManager
0xC0CD0082	ECM_ERROR_EMC_DUPLICATE_EXT_SYNC_OBJ	Duplicate Ext Sync object mapping
0xC0CD0083	ECM_ERROR_EMC_UNSUPPORTED_EXT_SYNC_OBJ_RECORD	Unsupported Ext Sync object record detected
0xC0CD0084	ECM_ERROR_EMC_UNSUPPORTED_MAPPING_OF_EXT_SYNC_OBJ_RECORD	Unsupported mapping of Ext Sync object record detected
0xC0CD0085	ECM_ERROR_EMC_MISSING_MAPPING_OF_EXT_SYNC_OBJ_RECORD	Missing mapping of Ext Sync object record detected
0xC0CD0086	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_TO_SAME_FMMU	Parts of Ext Sync object are not mapped to the same FMMU
0xC0CD0087	ECM_ERROR_EMC_EXT_SYNC_OBJ_INTERNAL_ERROR	Internal error detected regarding Ext Sync object
0xC0CD0088	ECM_ERROR_EMC_EXT_SYNC_OBJ_IS_NOT_MAPPED_IN_ONE_CYCLIC_CMD	Parts of Ext Sync object are not mapped within the same cyclic command
0xC0CD0089	ECM_ERROR_EMC_UNSUPPORTED_FMMU_MAPPING_OF_EXT_SYNC_OBJ_RECORD	Unsupported FMMU mapping of Ext Sync object detected
0xC0CD008A	ECM_ERROR_EMC_EXT_SYNC_REQUIRES_ADJUST_EXT_SYNC_CMD	Unicast Ext Sync control (APWR/FPWR 0x910) is required
0xC0CD008B	ECM_ERROR_EMC_EXT_SYNC_CMD_DOES_NOT_MATCH_XRMW_CMD	Unicast Ext Sync control does not match xRMW command
0xC0CD008C	ECM_ERROR_EMC_EXT_SYNC_REQUIRES_XRMW_CMD	Ext Sync requires DC configuration (xRMW command to 0x910)
0xC0CD008D	ECM_ERROR_EMC_EXPLICIT_DEV_IDENT_FAILED_ALSTATUS	Explicit Device identification via ALSTATUS failed
0xC0CD008E	ECM_ERROR_EMC_EXPLICIT_DEV_IDENT_FAILED_REG	Explicit Device identification via register failed
0xC0CD008F	ECM_ERROR_EMC_COPY_INFOS_FOUND_AT_UNMAPPED_RECEIVE_DATA	CopyInfos found at unmapped receive data
0xC0CD0090	ECM_ERROR_EMC_COPY_INFO_RECEIVE_DATA_AREA_NOT_MATCHING	CopyInfo receive data area is not matching
0xC0CD0091	ECM_ERROR_EMC_SDO_UPLOAD_TOO_LONG	SDO Upload data too long
0xC0CD0092	ECM_ERROR_EMC_SDO_UPLOAD_TOO_SHORT	SDO Upload data too short

Hexadecimal Value	Definition	Description
0xC0CD0093	ECM_ERROR_EMC_SDO_UPLOAD_COMPARE_DOES_NOT_MATCH_EXPECTATION	SDO Upload compare does not match expectation
0xC0CD0094	ECM_ERROR_EMC_SOE_READ_TOO_LONG	SoE Read IDN data too long
0xC0CD0095	ECM_ERROR_EMC_SOE_READ_TOO_SHORT	SoE Read IDN data too short
0xC0CD0096	ECM_ERROR_EMC_SOE_READ_COMPARE_DOES_NOT_MATCH_EXPECTATION	SoE Read compare does not match expectation
0xC0CD0097	ECM_ERROR_EMC_REG_INITCMD_COMPARE_DOES_NOT_MATCH_EXPECTATION	Register read compare does not match expectation
0xC0CD0098	ECM_ERROR_EMC_REDUNDANCY_PORT_ONLY_POSSIBLE_ONCE	Redundancy port can only be placed once into configuration
0xC0CD0099	ECM_ERROR_EMC_STARTUP_SCAN_SII_FAILED	Startup scan of SII failed
0xC0CD009A	ECM_ERROR_EMC_STARTUP_VERIFY_SII_FAILED	Startup verification of SII failed
0xC0CD009B	ECM_ERROR_EMC_MAIN_PORT_NOT_CONNECTED	Main port not connected during topology scan
0xC0CD009C	ECM_ERROR_EMC_BUS_SCAN_TOO_MANY_SLAVES	Bus scan detects too many slaves
0xC0CD009D	ECM_ERROR_EMC_BUS_SCAN_SPLIT_RING_NOT_SUPPORTED	Bus Scan detects unsupported split ring topology
0xC0CD009E	ECM_ERROR_EMC_BUS_SHUTDOWN	Bus is shutting down
0xC0CD009F	ECM_ERROR_EMC_MASTER_ADDRESS_NOT_ALLOWED_AS_STATION_ADDRESS	Master address (0) is not allowed as station address
0xC0CD00A0	ECM_ERROR_EMC_FIRST_STATION_HAS_INVALID_PORT_0	First station has invalid port 0
0xC0CD00A1	ECM_ERROR_EMC_STATION_HAS_INVALID_PORT	Station has invalid port
0xC0CD00A2	ECM_ERROR_EMC_STATION_HAS_NOT_LISTED_STATION_ADDRESS_IN_PORT	Station has not listed station address in port
0xC0CD00A3	ECM_ERROR_EMC_PORT_CONNECTION_BETWEEN_STATIONS_DOES_NOT_MATCH	Port connection between stations does not match
0xC0CD00A4	ECM_ERROR_EMC_STATION_HAS_ALREADY_USED_STATION_ADDRESS_IN_PORT	Station has already used station address in port
0xC0CD00A5	ECM_ERROR_EMC_INVALID_SM_PHYS_START_ADDRESS	Invalid Sm physical start address

Hexadecimal Value	Definition	Description
0xC0CD00A6	ECM_ERROR_EMC_DC_TOPOLOGY_ON_REDUNDANCY_PORT_NOT_SUPPORTED	DC topology on redundancy port connection not supported. DC slaves having AutoIncrement positions behind redundancy port
0xC0CD00A7	ECM_ERROR_EMC_SM_ASSIGN_PDO_ALREADY_ADDED	Sm AssignPdo already added
0xC0CD00A8	ECM_ERROR_EMC_BASE_SYNC_OFFSET_PERCENTAGE_OUT_OF_RANGE	Base Sync Offset percentage out of range
0xC0CF0001	ECM_ERROR_COE_INITIALIZATION_ERROR	CoE: Initialization Error
0xC0CF0002	ECM_ERROR_COE_INVALID_TRANSFER_HANDLE	CoE: Invalid transfer handle used
0xC0CF0003	ECM_ERROR_COE_NO_MAILBOX_AVAILABLE	CoE. No mailbox available
0xC0CF0004	ECM_ERROR_COE_INVALID_TRANSFER_STATE	CoE: Invalid transfer state
0xC0CF0005	ECM_ERROR_COE_TRANSFER_SEGMENT_TOO_LONG	CoE: Transfer segment is too long
0xC0CF0006	ECM_ERROR_COE_SHUTTING_DOWN	CoE is shutting down.
0xC0CF0007	ECM_ERROR_COE_MAX_TOTAL_BYTES_SMALLER_THAN_ACTUAL_TOTAL_BYTES	CoE: Maximum total bytes is smaller than actual total bytes.
0xC0CF0008	ECM_ERROR_COE_MAILBOX_TRANSMIT_FAILED	CoE: Mailbox transmit failed
0xC0CF0009	ECM_ERROR_COE_TRANSFER_ABORTED	CoE: Transfer has been aborted.
0xC0CF000A	ECM_ERROR_COE_SDOINFO_INITIALIZATION_ERROR	0xC0CF000B
0xC0CF000C	ECM_ERROR_COE_PROTOCOL_ERROR	CoE Protocol Error
0xC0CF000D	ECM_ERROR_COE_NO_AOE_AVAILABLE	CoE: No AoE available
0xC0CF000F	ECM_ERROR_COE_INVALID_SLAVE_STATION_ADDRESS	CoE: Invalid slave station address
0xC0CF8000	ECM_ERROR_COE_ABORTCODE_TOGGLE_BIT_NOT_ALTERNATED	SDO Abort Code: Toggle Bit not alternated
0xC0CF8001	ECM_ERROR_COE_ABORTCODE_COMMAND_SPECIFIER_NOT_VALID	SDO Abort Code: Command specifier not valid
0xC0CF8002	ECM_ERROR_COE_ABORTCODE_PROTOCOL_TIMEOUT	SDO Abort Code: Protocol Timeout
0xC0CF8003	ECM_ERROR_COE_ABORTCODE_OUT_OF_MEMORY	SDO Abort Code: Out Of Memory
0xC0CF8004	ECM_ERROR_COE_ABORTCODE_UNSUPPORTED_ACCESS	SDO Abort Code: Unsupported access
0xC0CF8005	ECM_ERROR_COE_ABORTCODE_OBJECT_IS_WRITE_ONLY	SDO Abort Code: Object is write only

Hexadecimal Value	Definition	Description
0xC0CF8006	ECM_ERROR_COE_ABORT-CODE_OBJECT_IS_READ_ONLY	SDO Abort Code: Object is read only
0xC0CF8007	ECM_ERROR_COE_ABORT-CODE_SUB-INDEX_CANNOT_BE_WRITTEN_SI 0_NZ	SDO Abort Code: Subindex cannot be written if subindex 0 is not zero
0xC0CF8008	ECM_ERROR_COE_ABORT-CODE_COM-PLETE_ACCESS_NOT_SUP-PORTED	SDO Abort Code: Complete access not supported
0xC0CF8009	ECM_ERROR_COE_ABORT-CODE_OBJECT_LENGTH_EXCEE DS_MAILBOX_SIZE	SDO Abort Code: Object length exceeds mailbox size
0xC0CF800A	ECM_ERROR_COE_ABORT-CODE_OBJECT_MAPPED_TO_RX PDO_NO_WRITE	SDO Abort Code: Object mapped to RxPDO, SDO Download blocked
0xC0CF800B	ECM_ERROR_COE_ABORT-CODE_OBJECT_DOES_NOT_EXIS T	SDO Abort Code: Object does not exist
0xC0CF800C	ECM_ERROR_COE_ABORT-CODE_OBJECT_CANNOT_BE_PD O_MAPPED	SDO Abort Code: Object cannot be mapped to PDO
0xC0CF800D	ECM_ERROR_COE_ABORT-CODE_PDO_LENGTH_WOULD_E XCEED	SDO Abort Code: PDO Length would exceed maximum size
0xC0CF800E	ECM_ERROR_COE_ABORT-CODE_GEN_PARAM_INCOMPATI-BILITY	SDO Abort Code: General param-eter incompatibility
0xC0CF800F	ECM_ERROR_COE_ABORT-CODE_ACCESS_FAILED_DUE_TO _HW_ERROR	SDO Abort Code: Access failed due to hardware error
0xC0CF8010	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_DOES_NOT_MATCH	SDO Abort Code: Data type does not match
0xC0CF8011	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_LENGTH_TOO_LONG	SDO Abort Code: Data type length too long
0xC0CF8012	ECM_ERROR_COE_ABORT-CODE_DATA-TYPE_LENGTH_TOO_SHORT	SDO Abort Code: Data type length too short
0xC0CF8013	ECM_ERROR_COE_ABORT-CODE_SUB-INDEX_DOES_NOT_EXIST	SDO Abort Code: Subindex does not exist
0xC0CF8014	ECM_ERROR_COE_ABORT-CODE_RANGE_OF_PARAM-ETER_EXCEEDED	SDO Abort Code: Range of param-eter exceeded
0xC0CF8015	ECM_ERROR_COE_ABORT-CODE_VALUE_OF_PARAM_WRITT EN_TOO_HIGH	SDO Abort Code: Value of param-eter written too high
0xC0CF8016	ECM_ERROR_COE_ABORT-CODE_VALUE_OF_PARAM_WRITT EN_TOO_LOW	SDO Abort Code: Value of param-eter written too low

Hexadecimal Value	Definition	Description
0xC0CF8017	ECM_ERROR_COE_ABORT-CODE_MIN_VALUE_IS_LESS_THAN_MAX_VALUE	SDO Abort Code: Minimum value is less than maximum value
0xC0CF8018	ECM_ERROR_COE_ABORT-CODE_GENERAL_ERROR	SDO Abort Code: General Error
0xC0CF8019	ECM_ERROR_COE_ABORT-CODE_NO_TRANSFER_TO_APP	SDO Abort Code: Data cannot be transferred or stored to the application
0xC0CF801A	ECM_ERROR_COE_ABORT-CODE_LOCAL_CONTROL	SDO Abort Code: Data cannot be transferred or stored to the application because of local control
0xC0CF801B	ECM_ERROR_COE_ABORT-CODE_NO_TRANSFER_DUE_TO_CURRENT_STATE	SDO Abort Code: Data cannot be transferred or stored to the applcation because of the present device state
0xC0CF801C	ECM_ERROR_COE_ABORT-CODE_NO_OBJECT_DICTIONARY_PRESENT	SDO Abort Code: Object dictionary dynamic generation fails or no object dictionary is present
0xC0CF801D	ECM_ERROR_COE_ABORT-CODE_UNKNOWN_ABORT_CODE	SDO Abort Code: Unknown abort code
0xC0CF801E	ECM_ERROR_COE_ABORT-CODE_GEN_INTERNAL_COMPAT	SDO Abort Code: General internal incompatibility in the device
0xC0D00001	ECM_ERROR_EOE_INVALID_MAC_ADDRESS	Invalid MAC address
0xC0D00002	ECM_ERROR_EOE_INVALID_CALLBACK_TYPE	Invalid callback type
0xC0D00003	ECM_ERROR_EOE_DESTINATION_UNREACHABLE	Destination unreachable
0xC0D00004	ECM_ERROR_EOE_INVALID_EOE_RESPONSE	Invalid EoE Response
0xC0D00005	ECM_ERROR_EOE_UNKNOWN_ERROR	SetIPParam/SetFilterParam: Unknown error
0xC0D00006	ECM_ERROR_EOE_UNSPECIFIED_ERROR	SetIPParam/SetFilterParam: Unspecified Error
0xC0D00007	ECM_ERROR_EOE_UNSUPPORTED_FRAME_TYPE	SetIPParam/SetFilterParam: Unsupported frame type
0xC0D00008	ECM_ERROR_EOE_NO_IP_SUPPORT	SetIPParam/SetFilterParam: No IP support
0xC0D00009	ECM_ERROR_EOE_DHCP_NOT_SUPPORTED	SetIPParam/SetFilterParam: DHCP not supported
0xC0D0000A	ECM_ERROR_EOE_NO_FILTER_SUPPORT	SetIPParam/SetFilterParam: No filter supported
0xC0D0000B	ECM_ERROR_EOE_TIMEOUT	EoE Timeout
0xC0D0000C	ECM_ERROR_EOE_SHUTTING_DOWN	EoE is shutting down
0xC0D0000D	ECM_ERROR_EOE_MASTER_ADDRESS_NOT_ALLOWED	EoE: Master address is not allowed to use here
0xC0D0000E	ECM_ERROR_EOE_CONFIGURATION_IS_NOT_OPEN	EoE: Configuration is not open

Hexadecimal Value	Definition	Description
0xC0D0000F	ECM_ERROR_EOE_CONFIGURATION_IS_ALREADY_OPEN	EoE: Configuration is already open
0xC0D00010	ECM_ERROR_EOE_DUPLICATE_IP_ADDRESS	EoE: Duplicate IP address
0xC0D00011	ECM_ERROR_EOE_DUPLICATE_MAC_ADDRESS_ON_MULTIPLE_PORTS	EoE: Duplicate MAC address on multiple ports
0xC0D00012	ECM_ERROR_EOE_FRAME_TOO_LARGE	EoE: Frame too large
0xC0D00013	ECM_ERROR_EOE_IF_INITIALIZATION_ERROR	EoE: Interface initialization error
0xC0D00014	ECM_ERROR_EOE_IF_NO_FRAME_AVAILABLE	EoE: No Frame available
0xC0D00015	ECM_ERROR_EOE_LINK_DOWN	EoE: Link down
0xC0D10002	ECM_ERROR_FOE_ERROR_UNKNOWN_ERROR	-
0xC0D10003	ECM_ERROR_FOE_INVALID_TRANSFER_HANDLE	FoE: Invalid transfer handle
0xC0D10004	ECM_ERROR_FOE_INVALID_TRANSFER_STATE	FoE: Invalid transfer state
0xC0D10005	ECM_ERROR_FOE_INVALID_SLAVE_STATION_ADDRESS	FoE: Invalid slave station address
0xC0D10006	ECM_ERROR_FOE_WRONG_SLAVE_STATE	FoE: Wrong slave state
0xC0D10007	ECM_ERROR_FOE_NO_MAILBOX_AVAILABLE	FoE: No mailbox available
0xC0D10008	ECM_ERROR_FOE_TRANSFER_ABORTED	FoE: Transfer has been aborted
0xC0D10009	ECM_ERROR_FOE_PROTOCOL_TIMEOUT	FoE: Protocol Timeout
0xC0D1000A	ECM_ERROR_FOE_TRANSFER_SEGMENT_TOO_LONG	FoE: Transfer segment is too long
0xC0D1000B	ECM_ERROR_FOE_MAILBOX_TRANSMIT_FAILED	FoE: Mailbox transmit failed
0xC0D1000C	ECM_ERROR_FOE_FILENAME_TOO_LONG	FoE: Filename is too long
0xC0D1000D	ECM_ERROR_FOE_BUFFER_EXCEEDED	FoE: Buffer is exceeded
0xC0D1000E	ECM_ERROR_FOE_FIRST_SEGMENT_SHOULD_NOT_BE_EMPTY	FoE: First segment should not be empty
0xC0D1000F	ECM_ERROR_FOE_SEGMENT_SHOULD_BE_EMPTY	FoE: Segment should be empty
0xC0D18000	ECM_ERROR_FOE_ERROR_NOT_DEFINED	FoE: Error Response: not defined
0xC0D18001	ECM_ERROR_FOE_ERROR_NOT_FOUND	FoE: Error Response: Not Found
0xC0D18002	ECM_ERROR_FOE_ACCESS_DENIED	FoE: Error Response: Access Denied

Hexadecimal Value	Definition	Description
0xC0D18003	ECM_ERROR_FOE_ERROR_DISK_FULL	FoE: Error Response: Disk full
0xC0D18004	ECM_ERROR_FOE_ERROR_ILLEGAL	FoE: Error Response: Illegal
0xC0D18005	ECM_ERROR_FOE_ERROR_PACKET_NUMBER_WRONG	FoE: Error Response: Packet number is wrong
0xC0D18006	ECM_ERROR_FOE_ERROR_ALREADY_EXISTS	FoE: Error Response: Already exists
0xC0D18007	ECM_ERROR_FOE_ERROR_NO_USER	FoE: Error Response: No User
0xC0D18008	ECM_ERROR_FOE_ERROR_BOOTSTRAP_ONLY	FoE: Acces to specified file is only allowed in BOOT state
0xC0D18009	ECM_ERROR_FOE_ERROR_NOT_BOOTSTRAP	FoE: Access to specified file is only allowed when in PREOP, SAFEOP or OP
0xC0D1800A	ECM_ERROR_FOE_ERROR_NO_RIGHTS	FoE: No Rights
0xC0D1800B	ECM_ERROR_FOE_ERROR_PROGRAM_ERROR	FoE: Program Error
0xC0D20001	ECM_ERROR_SOE_UNKNOWN_SOE_ERROR	SoE: Unknown SoE Error
0xC0D20002	ECM_ERROR_SOE_INITIALIZATION_ERROR	SoE: Initialization error
0xC0D20003	ECM_ERROR_SOE_INVALID_TRANSFER_HANDLE	SoE: Invalid transfer handle
0xC0D20004	ECM_ERROR_SOE_NO_MAILBOX_AVAILABLE	SoE: No Mailbox available
0xC0D20005	ECM_ERROR_SOE_INVALID_TRANSFER_STATE	SoE: Invalid transfer state
0xC0D20006	ECM_ERROR_SOE_TRANSFER_SEGMENT_TOO_LONG	SoE: Transfer segment is too long
0xC0D20007	ECM_ERROR_SOE_SHUTTING_DOWN	SoE is shutting down
0xC0D20008	ECM_ERROR_SOE_MAX_TOTAL_BYTES_SMALLER_THAN_ACTUAL_TOTAL_BYTES	SoE: Maximum total bytes is smaller than actual total bytes
0xC0D20009	ECM_ERROR_SOE_MAILBOX_TRANSMIT_FAILED	SoE: Mailbox transmit failed
0xC0D2000A	ECM_ERROR_SOE_INVALID_SOE_HEADER	SoE: Invalid SoE header
0xC0D2000B	ECM_ERROR_SOE_PROTOCOL_TIMEOUT	SoE: Protocol Timeout
0xC0D2000C	ECM_ERROR_SOE_PROTOCOL_ERROR	SoE: Protocol Error
0xC0D2000D	ECM_ERROR_SOE_TRANSFER_ABORTED	SoE: Transfer has been aborted
0xC0D2000E	ECM_ERROR_SOE_WRONG_SLAVE_STATE	SoE: Wrong slave state
0xC0D2000F	ECM_ERROR_SOE_NO_AOE_AVAILABLE	SoE: No AoE available

Hexadecimal Value	Definition	Description
0xC0D20010	ECM_ERROR_SOE_INVALID_SLAVE_STATION_ADDRESS	SoE: Invalid slave station address
0xC0D21001	ECM_ERROR_SOE_SSC_NO_IDN	SoE: No IDN
0xC0D21009	ECM_ERROR_SOE_SSC_INVALID_ACCESS_TO_ELEMENT_1	SoE: Invalid access to element 1
0xC0D22001	ECM_ERROR_SOE_SCC_NO_NAME	SoE: IDN has no name
0xC0D22002	ECM_ERROR_SOE_SSC_NAME_TRANSMISSION_IS_TOO_SHORT	SoE: Name transmission is too short
0xC0D22003	ECM_ERROR_SOE_SSC_NAME_TRANSMISSION_IS_TOO_LONG	SoE: Name transmission is too long
0xC0D22004	ECM_ERROR_SOE_SSC_NAME_CANNOT_BE_CHANGED	SoE: Name cannot be changed
0xC0D22005	ECM_ERROR_SOE_SSC_NAME_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Name is write protected at this time
0xC0D23002	ECM_ERROR_SOE_SSC_ATTRIBUTE_TRANSMISSION_IS_TOO_SHORT	SoE: Attribute transmission is too short
0xC0D23003	ECM_ERROR_SOE_SSC_ATTRIBUTE_TRANSMISSION_IS_TOO_LONG	SoE: Attribute transmission is too long
0xC0D23004	ECM_ERROR_SOE_SSC_ATTRIBUTE_CANNOT_BE_CHANGED	SoE: Attribute cannot be changed
0xC0D23005	ECM_ERROR_SOE_SSC_ATTRIBUTE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Attribute is write protected at this time
0xC0D24001	ECM_ERROR_SOE_SSC_NO_UNIT	SoE: IDN has no unit
0xC0D24002	ECM_ERROR_SOE_SSC_UNIT_TRANSMISSION_IS_TOO_SHORT	SoE: Unit transmission is too short
0xC0D24003	ECM_ERROR_SOE_SSC_UNIT_TRANSMISSION_IS_TOO_LONG	SoE: Unit transmission is too long
0xC0D24004	ECM_ERROR_SOE_SSC_UNIT_CANNOT_BE_CHANGED	SoE: Unit cannot be changed
0xC0D24005	ECM_ERROR_SOE_SSC_UNIT_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Unit is write protected at this time
0xC0D25001	ECM_ERROR_SOE_SSC_NO_MAXIMUM_VALUE	SoE: IDN has no maximum value
0xC0D25002	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_TRANSMISSION_IS_TOO_SHORT	SoE: Minimum value transmission is too short
0xC0D25003	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_TRANSMISSION_IS_TOO_LONG	SoE: Minimum value transmission is too long
0xC0D25004	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_CANNOT_BE_CHANGED	SoE: Minimum value cannot be changed

Hexadecimal Value	Definition	Description
0xC0D25005	ECM_ERROR_SOE_SSC_MINIMUM_VALUE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Mimum value is write protected at this time
0xC0D26001	ECM_ERROR_SOE_SSC_NO_MAXIMUM_VALUE	SoE: IDN has no maximum value
0xC0D26002	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_TRANSMISSION_IS_TOO_SHORT	SoE: Maximum value transmission is too short
0xC0D26003	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_TRANSMISSION_IS_TOO_LONG	SoE: Maximum value transmission is too long
0xC0D26004	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_CANNOT_BE_CHANGED	SoE: Maximum value cannot be changed
0xC0D26005	ECM_ERROR_SOE_SSC_MAXIMUM_VALUE_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: Maximum value is write protected at this time
0xC0D27002	ECM_ERROR_SOE_SSC_OPDATA_TRANSMISSION_IS_TOO_SHORT	SoE: OpData transmission is too short
0xC0D27003	ECM_ERROR_SOE_SSC_OPDATA_TRANSMISSION_IS_TOO_LONG	SoE: OpData transmission is too long
0xC0D27004	ECM_ERROR_SOE_SSC_OPDATA_CANNOT_BE_CHANGED	SoE: OpData cannot be changed
0xC0D27005	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_THIS_TIME	SoE: OpData is write protected at this time
0xC0D27006	ECM_ERROR_SOE_SSC_OPDATA_IS_LOWER_THAN_MINIMUM_VALUE	SoE: OpData is lower than minimum value
0xC0D27007	ECM_ERROR_SOE_SSC_OPDATA_IS_HIGHER_THAN_MAXIMUM_VALUE	SoE: OpData is higher than maximum value
0xC0D27008	ECM_ERROR_SOE_SSC_OPDATA_IS_INVALID	SoE: OpData is invalid
0xC0D27009	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_BY_PASSWORD	SoE: OpData is write protected by password
0xC0D2700A	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_DUE_CYCLICALLY_CONFIGURED	SoE: OpData is write protected due to being cyclically configured
0xC0D2700B	ECM_ERROR_SOE_SSC_OPDATA_INVALID_DIRECT_ADDRESSING	SoE: Invalid direct addressing
0xC0D2700C	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_DUE_OTHER_SETTINGS	SoE: OpData is write protected due to other settings.
0xC0D2700D	ECM_ERROR_SOE_SSC_OPDATA_INVALID_FLOATING_POINT_NUMBER	SoE: Invalid floating point number

Hexadecimal Value	Definition	Description
0xC0D2700E	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_PARAMETERIZATION_LEVEL	SoE: OpData is write protected at parameterization level
0xC0D2700F	ECM_ERROR_SOE_SSC_OPDATA_IS_WRITE_PROTECTED_AT_OPERATION_LEVEL	SoE: OpData is write protected at operation level
0xC0D27010	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_ALREADY_ACTIVE	SoE: Procedure command already active
0xC0D27011	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_INTERRUPTIBLE	SoE: Procedure command not interruptible
0xC0D27012	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_EXECUTABLE_AT_THIS_TIME	SoE: Procedure command is not executable at this time
0xC0D27013	ECM_ERROR_SOE_SSC_OPDATA_PROCEDURE_COMMAND_NOT_EXECUTABLE_INVALID_PARAM	SoE: Procedure command is not executable due to invalid parameter
0xC0D4005C	ECM_ERROR_ENI_NO_SLAVES_IN_ENI	ENI does not contain any slaves
0xC0D50001	ECM_ERROR_ALSTATCODE_UNSPECIFIED_ERROR	ALStatusCode: Unspecified error
0xC0D50002	ECM_ERROR_ALSTATCODE_NO_MEMORY	ALStatusCode: No memory
0xC0D50003	ECM_ERROR_ALSTATCODE_INVALID_DEVICE_SETUP	ALStatusCode: Invalid Device Setup
0xC0D50011	ECM_ERROR_ALSTATCODE_INVALID_REQUESTED_STATE_CHANGE	ALStatusCode: Invalid requested state change
0xC0D50012	ECM_ERROR_ALSTATCODE_UNKNOWN_REQUESTED_STATE	ALStatusCode: Unknown requested state
0xC0D50013	ECM_ERROR_ALSTATCODE_BOOTSTRAP_NOT_SUPPORTED	ALStatusCode: Bootstrap not supported
0xC0D50014	ECM_ERROR_ALSTATCODE_NO_VALID_FIRMWARE	ALStatusCode: No valid firmware
0xC0D50015	ECM_ERROR_ALSTATCODE_INVALID_BOOT_MAILBOX_CONFIGURATION	ALStatusCode: Invalid BOOT mailbox configuration
0xC0D50016	ECM_ERROR_ALSTATCODE_INVALID_PREOP_MAILBOX_CONFIGURATION	ALStatusCode: Invalid PREOP mailbox configuration
0xC0D50017	ECM_ERROR_ALSTATCODE_INVALID_SYNC_MANAGER_CONFIGURATION	ALStatusCode: Invalid sync manager configuration
0xC0D50018	ECM_ERROR_ALSTATCODE_NO_VALID_INPUTS_AVAILABLE	ALStatusCode: No valid inputs available

Hexadecimal Value	Definition	Description
0xC0D50019	ECM_ERROR_ALSTAT-CODE_NO_VALID_OUTPUTS	ALStatusCode: No valid outputs
0xC0D5001A	ECM_ERROR_ALSTAT-CODE_SYNCHRONIZA-TION_ERROR	ALStatusCode: Synchronization error
0xC0D5001B	ECM_ERROR_ALSTAT-CODE_SYNC_MAN-AGER_WATCHDOG	ALStatusCode: Sync Manager watchdog
0xC0D5001C	ECM_ERROR_ALSTAT-CODE_INVALID_SYNC_MAN-AGER_TYPES	ALStatusCode: Invalid Sync Manager Types
0xC0D5001D	ECM_ERROR_ALSTAT-CODE_INVALID_OUTPUT_CON-FIGURATION	ALStatusCode: Invalid output configuration
0xC0D5001E	ECM_ERROR_ALSTAT-CODE_INVALID_INPUT_CONFIGU-RATION	ALStatusCode: Invalid input configuration
0xC0D5001F	ECM_ERROR_ALSTAT-CODE_INVALID_WATCHDOG_CO NFIGURATION	ALStatusCode: Invalid Watchdog configuration
0xC0D50020	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_COLD_STA RT	ALStatusCode: Slave needs cold start
0xC0D50021	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_INIT	ALStatusCode: Slave needs INIT
0xC0D50022	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_PREOP	ALStatusCode: slave needs PREOP
0xC0D50023	ECM_ERROR_ALSTAT-CODE_SLAVE_NEEDS_SAFEOp	ALStatusCode: slave needs SAFEOP
0xC0D50024	ECM_ERROR_ALSTAT-CODE_INVALID_INPUT_MAPPING	ALStatusCode: Invalid Input Mapping
0xC0D50025	ECM_ERROR_ALSTAT-CODE_INVALID_OUTPUT_MAP-PING	ALStatusCode: Invalid Output Mapping
0xC0D50026	ECM_ERROR_ALSTAT-CODE_INCONSISTENT_SET-TINGS	ALStatusCode: Inconsistent settings
0xC0D50027	ECM_ERROR_ALSTAT-CODE_FREERUN_NOT_SUP-PORTED	ALStatusCode: FreeRun not supported
0xC0D50028	ECM_ERROR_ALSTAT-CODE_SYNCMODE_NOT_SUP-PORTED	ALStatusCode: SyncMode not supported
0xC0D50029	ECM_ERROR_ALSTAT-CODE_FREERUN_NEEDS_3BUFF ER_MODE	ALStatusCode: FreeRun needs 3Buffer mode
0xC0D5002A	ECM_ERROR_ALSTAT-CODE_BACK-GROUND_WATCHDOG	ALStatusCode: Background Watchdog
0xC0D5002B	ECM_ERROR_ALSTAT-CODE_NO_VALID_INPUTS_AND_ OUTPUTS	ALStatusCode: No valid Inputs and Outputs

Hexadecimal Value	Definition	Description
0xC0D5002C	ECM_ERROR_ALSTAT-CODE_FATAL_SYNC_ERROR	ALStatusCode: Fatal Sync error
0xC0D5002D	ECM_ERROR_ALSTAT-CODE_NO_SYNC_ERROR	ALStatusCode: No Sync error
0xC0D50030	ECM_ERROR_ALSTAT-CODE_INVALID_DC_SYNC_CON-FIGURATION	ALStatusCode: Invalid DC SYNC configuration
0xC0D50031	ECM_ERROR_ALSTAT-CODE_INVALID_DC_LATCH_CON-FIGURATION	ALStatusCode: Invalid DC Latch configuration
0xC0D50032	ECM_ERROR_ALSTAT-CODE_PLL_ERROR	ALStatusCode: PLL error
0xC0D50033	ECM_ERROR_ALSTAT-CODE_DC_SYNC_IO_ERROR	ALStatusCode: DC Sync IO error
0xC0D50034	ECM_ERROR_ALSTAT-CODE_DC_SYNC_TIMEOUT_ERR OR	ALStatusCode: DC Sync Timeout Error
0xC0D50035	ECM_ERROR_ALSTAT-CODE_DC_INVALID_SYNC_CYCL E_TIME	ALStatusCode: DC Invalid Sync Cycle Time
0xC0D50036	ECM_ERROR_ALSTAT-CODE_DC_SYNC0_CYCLE_TIME	ALStatusCode: DC Sync0 Cycle Time
0xC0D50037	ECM_ERROR_ALSTAT-CODE_DC_SYNC1_CYCLE_TIME	ALStatusCode: DC Sync1 Cycle Time
0xC0D50041	ECM_ERROR_ALSTAT-CODE_MBX_AOE	ALStatusCode: MBX_AOE
0xC0D50042	ECM_ERROR_ALSTAT-CODE_MBX_EOE	ALStatusCode: MBX_EOE
0xC0D50043	ECM_ERROR_ALSTAT-CODE_MBX_COE	ALStatusCode: MBX_COE
0xC0D50044	ECM_ERROR_ALSTAT-CODE_MBX_FOE	ALStatusCode: MBX_FOE
0xC0D50045	ECM_ERROR_ALSTAT-CODE_MBX_SOE	ALStatusCode: MBX_SOE
0xC0D5004F	ECM_ERROR_ALSTAT-CODE_MBX_VOE	ALStatusCode: MBX_VOE
0xC0D50050	ECM_ERROR_ALSTAT-CODE_EEPROM_NO_ACCESS	ALStatusCode: EEPROM no access
0xC0D50051	ECM_ERROR_ALSTAT-CODE_EEPROM_ERROR	ALStatusCode: EEPROM error
0xC0D50060	ECM_ERROR_ALSTAT-CODE_SLAVE_RESTARTED_LOC ALLY	ALStatusCode: Slave restarted locally
0xC0D50061	ECM_ERROR_ALSTAT-CODE_DEVICE_IDENTIFICA-TION_VALUE_UPDATED	ALStatusCode: Device identificatin value updated
0xC0D500F0	ECM_ERROR_ALSTAT-CODE_APPLICATION_CON-TROLLER_AVAILABLE	ALStatusCode: Application controller available

Hexadecimal Value	Definition	Description
0xC0D58000	ECM_ERROR_ALSTAT-CODE_VENDOR_SPE-CIFIC_CODE_START	Begin of vendor-specific ALStatus-Code mapping
0xC0D5FFFF	ECM_ERROR_ALSTAT-CODE_VENDOR_SPE-CIFIC_CODE_END	End of vendor-specific ALStatus-Code mapping
0xC0D60001	ECM_ERROR_IF_COE_SUP-PORT_NOT_AVAILABLE	CoE support is not configured
0xC0D60002	ECM_ERROR_IF_SOE_SUP-PORT_NOT_AVAILABLE	SoE support is not configured
0xC0D60003	ECM_ERROR_IF_FOE_SUP-PORT_NOT_AVAILABLE	FoE support is not configured
0xC0D60004	ECM_ERROR_IF_AOE_SUP-PORT_NOT_AVAILABLE	AoE support is not configured
0xC0D60005	ECM_ERROR_IF_INVALID_TRANS PORT_TYPE	Invalid transfer type
0xC0D60006	ECM_ERROR_IF_SOE_INVALID_D RIVE_NO	SoE: Invalid drive number
0xC0D60007	ECM_ERROR_IF_SOE_INVALID_E LEMENT_FLAGS	SoE: invalid element flags
0xC0D60008	ECM_ERROR_IF_INVALID_SOE_T RANSFER_ID	SoE: Invalid transfer ID
0xC0D60009	ECM_ERROR_IF_TRANSFER_AB ORTED	Transfer aborted
0xC0D6000A	ECM_ERROR_IF_OUT_OF_PACKE TS	Out of packets
0xC0D6000B	ECM_ERROR_IF_OUT_OF_TRAN SFER_CONTEXTS	Out of transfer contexts
0xC0D6000C	ECM_ERROR_IF_INVALID_SUB-INDEX_FOR_COMPLETE_ACCESs	CoE: Invalid subindex for Complete Access
0xC0D6000D	ECM_ERROR_IF_INVALID_COE_T RANSFER_ID	CoE: Invalid transfer ID
0xC0D6000E	ECM_ERROR_IF_INVALID_COE_S DOINFO_LISTTYPE	CoE: Invalid SDOINFO ListType
0xC0D6000F	ECM_ERROR_IF_FILE_READ_ER ROR	File Read Error
0xC0D60010	ECM_ERROR_IF_COULD_NOT_O PEN_FILE	Could not open file
0xC0D60011	ECM_ERROR_IF_INVALID_CONFI G_NXD	Invalid config.nxd detected
0xC0D60012	ECM_ERROR_IF_CONFIG_NXD_ WITHOUT_SLAVES	Config.nxd does not contain any slaves
0xC0D60013	ECM_ERROR_IF_INVALID_FILE_N AME	Invalid file name
0xC0D60014	ECM_ERROR_IF_INVALID_FOE_T RANSFER_ID	Invalid FoE transfer id
0xC0D60015	ECM_ERROR_IF_INVALID_GET_T OPOLOGY_TRANSFER_ID	Invalid GetTopology transfer id

1.7.3.4.2 CM592-DP PROFIBUS DP master diagnosis

In Automation Builder, diagnosis messages of communication module CM592-DP are displayed at device tree node *“CM592-DP”* and all nodes below, slave devices and I/O modules.

Click tab *“Diagnosis”*.

Within PLC application, diagnosis messages can be read by diagnosis related methods of function block type *“Diag”*, provided in library *“Diag”*. Furthermore, at CM592-DP specific I/O driver function block and slave and I/O module specific function blocks. *Chapter 1.7.1.4 “Diagnosis in IEC application” on page 4020*

In PLC display, diagnosis messages of CM592-DP are not shown.

Following diagnosis messages are signaled by CM592-DP.

CM592 communication module specific diagnosis messages:

Severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	655360	Watchdog error communication module	
3	0	0	655361	Firmware version of CM592-DP not supported	Update firmware
3	0	0	655362	Configuration error	Check configuration and correct errors
3	0	0	655363	CM592-DP not found	Plug correct communication module
3	0	0	655364	CM592-DP has wrong type	Plug correct communication module
4	0	0	655365	No PROFIBUS slave device configured	Check configuration
4	0	0	655366	No PROFIBUS slave IO channel configured	Check configuration
3	0	0	655367	Configuration version mismatch	Use matching CPU firmware version
3	0	0	655368	Diagnosis lost, could not save additional diagnosis data	Check configuration - too many active diagnosis messages received
3	0	0	655369	CM592-DP is not communicating	Check bus connection and configuration
3	0	0	655370	CM592-DP signals communication error	Check bus connection and configuration
3	0	0	655371	Starting CM592-DP's protocol stack failed	Check bus connection and configuration

Severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	655372	Stopping CM592-DP's protocol stack failed	
3	0	0	655373	PLC cannot be set to RUN due to error at CM592-DP	Check error log and correct errors
3	0	0	655374	CI54x communication interface module is sending not supported diagnosis format	Check configuration and FW revision of communication interface module

PROFIBUS standard diagnosis messages:

Severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	65536	Standard diagnosis message received	Check additional data for details
3	0	0	65537	Slave device offline	Check if slave device is connected physically and up and running
3	0	0	65538	Slave device reports error in configuration data	Check if slave device description data (GSD) is up-to-date
3	0	0	65539	Slave device reports error in parameter data	Check if slave device description data (GSD) is up-to-date
3	0	0	65540	Slave device cannot provide valid data	Check slave device status
3	0	0	65541	Slave device reports extended diagnosis overflow	Start with resolving root causes of available diagnosis messages
3	0	0	196608	Identifier diagnosis message received	Check additional data for details
3	0	0	262144	Device diagnosis DPV0 format received	Check additional data for details
3	0	0	327680	Device diagnosis DPV1 alarm received	Check additional data for details
3	0	0	393216	Device diagnosis DPV1 status received	Check additional data for details

PROFIBUS channel diagnosis messages:

Severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0 - 63	0	131072	Channel diagnosis, channel x, Reserved error code y	
3	0 - 63	0	131073	Channel diagnosis, channel x, Short circuit	
3	0 - 63	0	131074	Channel diagnosis, channel x, Undervoltage	
3	0 - 63	0	131075	Channel diagnosis, channel x, Overvoltage	
3	0 - 63	0	131076	Channel diagnosis, channel x, Overload	
3	0 - 63	0	131077	Channel diagnosis, channel x, Overtemperature	
3	0 - 63	0	131078	Channel diagnosis, channel x, Line break	
3	0 - 63	0	131079	Channel diagnosis, channel x, Upper limit value exceeded	
3	0 - 63	0	131080	Channel diagnosis, channel x, Lower limit value exceeded	
3	0 - 63	0	131081	Channel diagnosis, channel x, Error	
3	0 - 63	0	131082 - 131087	Channel diagnosis, channel x, Reserved error code y	
3	0 - 63	0	131088 - 131103	Channel diagnosis, channel x, Manufacturer specific error y	

ABB Communication Interface Module (CI54x) specific diagnosis messages:

Severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	255	0	8722	Internal error	
3	255	0	8732	Internal error	

4	255	0	9480	I/O module removed from hot swap terminal unit or defective module on hot swap terminal unit	Plug I/O module, replace I/O module
4	255	0	9500	Wrong I/O module plugged on hot swap terminal unit	Remove wrong I/O module and plug projected I/O module
4	255	0	9514	No communication with I/O module on hot swap terminal unit	Replace I/O module
4	255	0	9526	I/O module does not support hot swap	Power off system and replace I/O module
4	255	0	9736	Hot swap terminal unit required but not found	Plug hot swap terminal unit
4	255	0	9764	Defective hot swap terminal unit	
4	255	0	9770	No communication with hot swap terminal unit	Restart, if error persists replace terminal unit
3	255	0	16131	Timeout	Replace I/O module
3	255	0	16137	Overflow diagnosis buffer	Restart
4	255	0	16138	Voltage overflow at outputs (above UP3 level)	Check terminals / check process supply voltage
3/4	255	0	16139	Process voltage UP or UP3 too low	Check process supply voltage
3	255	0	16145	No communication with I/O module	Replace I/O module
3	255	0	16147	Checksum error	Replace I/O module
3	255	0	16154	Parameter error	Check configuration
4	255	0	16159	At least one module does not support failsafe function	Check modules and parameterization

3	255	0	16160	Wrong I/O module type on socket	Replace I/O module / check configuration
4	255	0	16162	No response during initialization of the I/O module	Replace I/O module
3	255	0	16164	Internal data exchange failure	Replace I/O module
3	255	0	16168	Different hard-/firmware versions in the module	Replace I/O module
3	255	0	16171	Internal error	Replace I/O module
3/4	255	0	16173	No process voltage UP or UP3	Check process voltage
4	255	0	16174	Voltage feedback on activated digital outputs DO0...DO7 on UP3	Check terminals
4	255	0	16175	Sensor voltage too low	
3	0 - 31	0	18	Test error	
4	0 - 31	0	257	Wrong measurement, false temperature at the compensation channel	
4	0 - 31	0	258	AI531: Wrong measurement; potential difference is too high; CD522: PWM duty cycle out of duty area	
4	0 - 31	0	260	Measurement overflow	Check channel wiring and sensor power supply
4	0 - 31	0	263	Measurement underflow at analog input	Check channel wiring and sensor power supply
4	0 - 31	0	266	Short circuit and cut wire or "out of range"	
4	0 - 31	0	267	Output/process voltage to small/low	
3	0 - 31	0	273	Test error	
4	0 - 31	0	303	Short circuit at an analog input	Check channel wiring

4	0 - 31	0	304	Analog value overflow or broken wire at an analog input	Check value or check terminals
4	0 - 31	0	530	Internal fuse at 0V is defect. 0V not connected with GND	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module
3	0 - 31	0	540	Test error	
3	0 - 31	0	555	Internal error	
4	0 - 31	0	558	Externally voltage detected on digital output DO0...DO7	Check terminals
4	0 - 31	0	559	Short circuit at digital output	Check channel wiring
4	0 - 31	0	772	Analog value overflow at an analog output	Check output value
4	0 - 31	0	775	Analog value underflow at an analog output	Check output value
4	0 - 31	0	796	Different configuration	
3	0 - 31	0	1037	Test error	
4	0 - 31	0	1070	Externally voltage detected on digital output DC0...DC7	Check terminals
4	0 - 31	0	1071	Short circuit at digital output	Check terminals

1.7.3.4.3 CM582-DP PROFIBUS DP slave diagnosis

The diagnosis messages of the communication module CM582-DP are displayed in the tab *“Diagnosis ”* of node *“CM582-DP”* in the device tree of the Automation Builder. Within PLC application they can be read with the diagnosis methods of IO driver or function block *“Diag”*.

In the PLC display the diagnosis messages of CM582-DP are not shown.

The following diagnosis messages are signaled by CM582-DP:

Error severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	1000x	No communication module or wrong type found	Plug the correct communication module
3	0	0	1001	Type of CM582-DP not supported	Exchange the communication module
3	0	0	1002	Firmware version of CM582-DP not supported	Update firmware of CM582-DP

Error severity	SubSysteminfo	Additional	Error code	Meaning	Remedy
3	0	0	1003	Identification of communication module failed	Exchange the communication module or plug the correct communication module
3	0	0	2000	Watchdog error	-
3	0	0	2001	CM582-DP is not communicating	Check bus connection and configuration
3	0	0	2002	CM582-DP signals communication error	Check bus connection and configuration
3	0	0	2003	Starting of CM582-DP's protocol stack failed	Check bus connection and configuration
3	0	0	2004	Stopping of CM582-DP's protocol stack failed	-
3	0	0	2005	PLC cannot be set to run due to an error of CM582-DP	Check error log and correct errors
3	0	0	3000	Configuration error	Check configuration and correct errors
3	0	0	3001	Configuration version mismatch	Use matching CPU firmware version
3	0	0	3002	Writing parameters to CM582-DP failed	Check configuration and correct errors
3	0	0	3003	Configuration of IM0 data failed	Check configuration and correct errors
3	0	0	3004	Reading of a parameter failed	Check configuration and correct errors
3	0	0	3005	Parameter value not supported or out of limits	Check configuration and correct errors

1.7.3.4.4 AC500-S: errors from safety CPU and safety I/O modules

Table 754: Error messages for safety CPU

Severity	Error code	Description	Remedy
2	8235	Internal error	Replace module
2	8448	Operation finished	Change Safety PLC switch address setting or remove memory card from non-safety PLC. Restart Safety PLC. If this error persists, replace Safety PLC.
2	8449	Wrong user data	Delete user data from Safety PLC. Restart Safety PLC and write user data again.
2	8450	Internal PROFIsafe initialization error	Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support.
2	8460	Flash read error	Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support.

Severity	Error code	Description	Remedy
2	8466	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8476	Boot project download error	Reload boot project. If this error persists, replace Safety PLC.
2	8488	Wrong firmware version	Update Safety PLC firmware. Restart Safety PLC. If this error persists, replace Safety PLC.
2	8491	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8496	Overvoltage or under-voltage detected	Restart Safety PLC. Check Safety PLC setting for power supply error. If this error persists, replace Safety PLC.
2	8500	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8704	User program triggered safe stop	Check user program
2	8705	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8706	Internal PROFIsafe error	Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support.
2	8707	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8714	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8717	Flash write error	Restart Safety PLC. If this error persists, replace Safety PLC. Contact ABB technical support.
2	8721	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8722	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8723	Checksum error has occured in Safety PLC	Restart Safety PLC. If this error persists, replace Safety PLC.
2	8729	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8741	Cycle time error in Safety PLC	Check Safety PLC watchdog time.
2	8742	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8746	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8747	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8756	Internal error	Contact ABB technical support. Replace Safety PLC.
2	8758	Internal error	Contact ABB technical support. Replace Safety PLC.

Severity	Error code	Description	Remedy
2	8990	PROFIsafe configuration error	Check F-Parameter configuration of I/O module and reload boot project
3	12561	Safety source addresses cannot be checked	Check PROFIsafe F-Host library version (2.0.0 or above). If this error persists, contact ABB technical support.
3	12570	Error in configuration data, safety PLC has not accepted configuration data, e.g., mismatch between safety and non-safety PLC configuration.	Create new configuration data for both safety and non-safety PLC again, re-create and download boot projects to both safety and non-safety PLC again.
3	12571	Error in configuration data, Safety PLC cannot read configuration data	Create boot project
3	12598	PROFIsafe F_Dest_Add rules are violated	Check Safety PLC configuration or switch address setting against PROFIsafe F_Dest_Add configuration rules. Restart Safety PLC. If this error persists, contact ABB technical support.
3	32770	Watchdog error communication module	
3	32771	Wrong firmware version of communication module	Update firmware
3	32772	Initialisation of safety module on slot failed. More than one safety module plugged	Remove this module or Only that one safety module plugged -> defective, replace this module
3	32774	Invalid configuration data	Check configuration
3	32775	Safety module not found	Check configuration. At Safety PLC: Check Safety PLC switch address setting. Restart Safety PLC. If this error persists, replace Safety PLC.
3	32776	Safety module has wrong type	Check configuration
4	16640	Reserved switch address setting.	Warning
4	16644	Boot project not loaded, maximum power dip reached	Restart Safety PLC
4	16648	Power dip data missed or corrupted. Default power dip data was flashed by Safety PLC	Warning
4	16659	CRC error boot project	Create new boot project and restart Safety PLC
4	16909	Flash write error (production data)	Warning

Severity	Error code	Description	Remedy
4	16935	More than one instance of SF_WDOG_TIME_SET or SF_MAX_POWER_DIP_SET	Warning
4	16922	No or wrong configuration data from PM5x, run state not possible	Create correct boot project at PM5x
4	17421	Flash write error (boot project)	Warning
4	17677	Flash write error (boot code)	Warning
4	17933	Flash write error (firmware)	Warning
4	18189	Flash write error (password)	Warning
4	18445	Flash write error (user data)	Warning
4	18701	Flash write error (user data)	Warning
4	18957	Flash write error (internal)	Warning
4	19213	Flash write error (internal)	Warning
4	19469	Flash write error (internal)	Warning
4	32777	Program not started because of configuration error	Check configuration
4	32778	Program not started, no application running in safety module	Check configuration, download safety application to safety module

Table 755: Error messages for safety I/O modules (channel or module reintegration is possible)

Severity	Error code	Description	Remedy
3	3	Discrepancy time expired	Check discrepancy time value, channel wiring and sensor.
3	12	Test pulse error	Check wiring and sensor.
3	13	Channel test pulse cross-talk error	Check wiring and sensor. If this error persists, replace I/O module. Contact ABB technical support.
3	25	Channel stuck-at error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
3	28	Channel cross-talk error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
3	260	Measurement overflow at the I/O module	Check channel wiring and sensor power supply.
3	263	Measurement underflow at the I/O module	Check channel wiring and sensor power supply.

Severity	Error code	Description	Remedy
3	311	Channel value difference too high	Adjust tolerance window for channels. Check channel wiring and sensor configuration.
3	525	Channel readback error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
3	530	Channel cross-talk error	Check I/O module wiring. Restart I/O module, if needed. If this error persists, replace I/O module.
3	16138	Process voltage too high	Check process voltage
3	16139	Process voltage too low	Check process voltage
3	16148	PROFIsafe communication error	Restart I/O module. If this error persists, contact ABB technical support.
3	16153	PROFIsafe watchdog timed out.	Restart I/O module. If this error persists, increase PROFIsafe watchdog time.
3	16171	Internal error in the device	Replace I/O module

Table 756: Error messages for safety I/O modules (channel or module reintegration ist not possible)

Severity	Error code	Description	Remedy
3	16146	Plausibility check failed (iParameter)	Check configuration
3	16147	Checksum error in the I/O module	Check safety configuration and CRCs for I- and F-Parameters.
3	16154	Parameter value	Check master or configuration
3	16156	F-Parameter configuration and address switch value do not match.	Check I/O module F-Parameter configuration and module address switch value.

1.7.3.4.5 CM579-PNIO – PROFINET I/O controller diagnosis

Diagnosis data for CM579-PNIO is not displayed in PLC display. In Automation Builder, we recommend to use methods with text output to get diagnosis messages in clear text format. E.g., `DiagGetFirstValAndTxt`.

Output string:

<timestamp>; <error severity>; <device name>; <error location>; error ID <id>: <error text>

For experts: manual interpretation

If you need to access the diagnosis data directly, you have to interpret them manually. Refer to the example to learn how to interpret them correctly ↯ *Chapter 1.7.3.4.5.1 “Manual interpretation of CM579-PNIO diagnosis” on page 4111*.

Diagnosis messages are included in diagnosis text lists *“Diag_PNIO_Controller”* and *“Diag_PNIO_Vendor ID_Device ID”*.

Error severity	SubSysteminfo		Additional		Error code		Meaning	Remedy
	Word 2 (bit 16..31)	Word 1 (bit 0..15)	Word 2 (bit 16..31) ADD_SUB_TYPE	Word 1 (bit 0..15) ADD_TYPE	Word 2 (bit16...31)	Word 1 (bit0...15)		
	Sub1_	Sub2_	Add_Word 1_Word 2		Err_x or Err_Word 1_Word 2 (Word1/2 in hex format)

Manual interpretation of CM579-PNIO diagnosis

For better understanding, we show the manual interpretation of CM579-PNIO diagnosis with an example.

System: AC500 CM579-PNIO + CI501-PNIO + optional S500 I/O inserted as PROFINET standard device

Error: discrepancy time expired (class 3, error ID 3) at channel 4 of first attached S500 I/O device on CI501-PNIO

For comparison: If a method with text output is used, e.g. DiagGetFirstValAndTxt the text output will be the string: `Timestamp; E3; device name; subslot 1, channel 4, extended channel diagnosis; error ID 3: discrepancy time expired (class 3, error ID 3)`

In Automation Builder the following error entry data is displayed:

Diag_Val[1]	AC500_DiagTypes.D...		
dtTimestamp	DATE_AND_TIME	DT#2019-10-15-14:48:34	RTC time of event
eClass	TECLASS	eDiagClass_3_Error	Severity of error event
szDevice	STRING(80)	'M0_PN03_M2'	Name of device
eHwInterfaceId	TEHWID	eDiagHwId_Coupler2	Identifier of hardware interface
dwSubSystemInfo	DWORD	65540	Any number describin...ail/location within d...
dwAdditional	DWORD	131076	Additional number des...ng detail/location wi...
dwErrorCode	DWORD	196867	Actual error code
wSizeExtDiag	WORD	44	Number of bytes of extended diagnosis data
pExtDiagData	POINTER TO BYTE	16#0079EA40	internal reference ne... for acknowledgement
hSource	POINTER TO BYTE	16#0077ABE8	internal reference needed for text convertion
pConn	POINTER TO IoStan...	16#B573DDD8	internal reference needed for text convertion

Analyze the data in the following order: Element *"dwAdditional"* for the type of diagnosis, element *"Error Code"*, element *"SubSysteminfo"*.

Type of diagnosis

1. Analyze element *"dwAdditional"*, column "Additional" in error lists.

   Convert the given value from decimal to hexadecimal format.

   "dwAdditional" = 131076 = 16#20004
2. Interpretation:

   Word 2 = 2

   Word 1 = 4
3. Generate error text Add_Word 1_Word 2 = Add_4_2
4. Look up which error type it is.

   Add_4_2 = extended channel diagnosis

Data analysis

1. Analyze element *"Error Code"*:

   "dwErrorCode" = 196867 = 16#30103 →

   Word 2 (extended error type) = 16#0003

   Word 1 (error type) = 16#0103

   ➔ Error text: Err_Word 1 (hex)_Word 2 (hex)

   ➔ Err_0103_0003 →

   Error ID 3 – discrepancy time expired (class 3, error ID 3)
2. Analyze *"SubSysteminfo"*

   "dwSubSysteminfo" = 65540 = 16#10004 →

   Word 2 (subslot index) = 1

   Word 1 (channel index) = 4

Error severity	SubSysteminfo		Additional		Error code		Meaning	Remedy
	Word 2 (bit 16..31)	Word 1 (bit 0..15)	Word 2 (bit 16..31) ADD_SUB_TYPE	Word 1 (bit 0..15) ADD_TYPE	Word 2 (bit16...31)	Word 1 (bit0...15)		
3	Subslot index (0 – 16#9FFF)	Channel index (0 – 16#7FFF)	2 (USI: 16#8002) extended channel diagnosis	4 (diagnosis alarm)	Extended error type	Error type	Subslot <subslot idx>, channel <channel idx>, extended channel diagnosis; <error text>	
3	1	4	2	4	16#0003	16#0103	Subslot 1, channel 4, extended channel diagnosis; <error text>	
	dwSubSysteminfo		Add_Word 1_Word 2		dwErrorCode		Entries in Diag values	
3	Sub2_ = Subslot	Sub1_ = Channel	Add_4_2 = extended channel diagnosis		Err_Word 1_Word 2 Err_0103_0003 = error ID 3: Discrepancy time expired (class 3, error ID 3)		Text search criteria (ID) in text list Diag_PNIO_26_22 Text from Automation Builder error list (default) in text list Diag_PNIO_26_22	

1.8 Engineering interfaces and tools

1.8.1 Export and import interfaces

1.8.1.1 Exporting and importing ECAD data (PBF)

Automation Builder provides an ECAD interface for exchanging the PLC configuration data with EPLAN Electric P8 and Zuken E3. This feature removes double data entry between electrical engineering in the ECAD tool and the control logic programming in Automation Builder by synchronizing the PLC hardware including topology and I/O signals between these tools.

Automation Builder - ECAD interface supports various flexible workflows:

- Enables PLC hardware planning and configuration in the ECAD tool and allows importing the exported data from the ECAD tool through the *PBF* file (process integration bus interchange format) into the Automation Builder project with diff and merge functionality, providing full control on selective import/merge.
- Enables PLC hardware configuration in Automation Builder and allows exporting the configuration to the ECAD tool through a *PBF* file.
- Supports bi-directional roundtrip engineering with loss less data exchange between Automation Builder and the ECAD tool.

Automation Builder uses the rack information to identify the relations between:

- PLC and devices plugged to I/O bus or extension bus.
- Fieldbus slave and attached IO devices.

It is recommended to assign the PLC, IO devices, communication modules and fieldbus slaves properly to the rack in the ECAD project. If the rack information is missing, devices will be imported to the device pool and must be arranged manually in the Automation Builder project or mapped to already existing devices.

1.8.1.1.1 Requirements on EPLAN electric P8

- EPLAN Electric P8 with PLC and Bus Extension. It is recommended to use version 2.3 or later.
- Use of appropriate part data and macros for ABB devices. This can be achieved by getting the part data and macros from the EPLAN data portal.

1.8.1.1.2 Importing PLC data from the ECAD tool

You can create a new Automation Builder PLC project from the existing PLC hardware configuration in your ECAD tool, by importing the exported *PBF* file to Automation Builder.

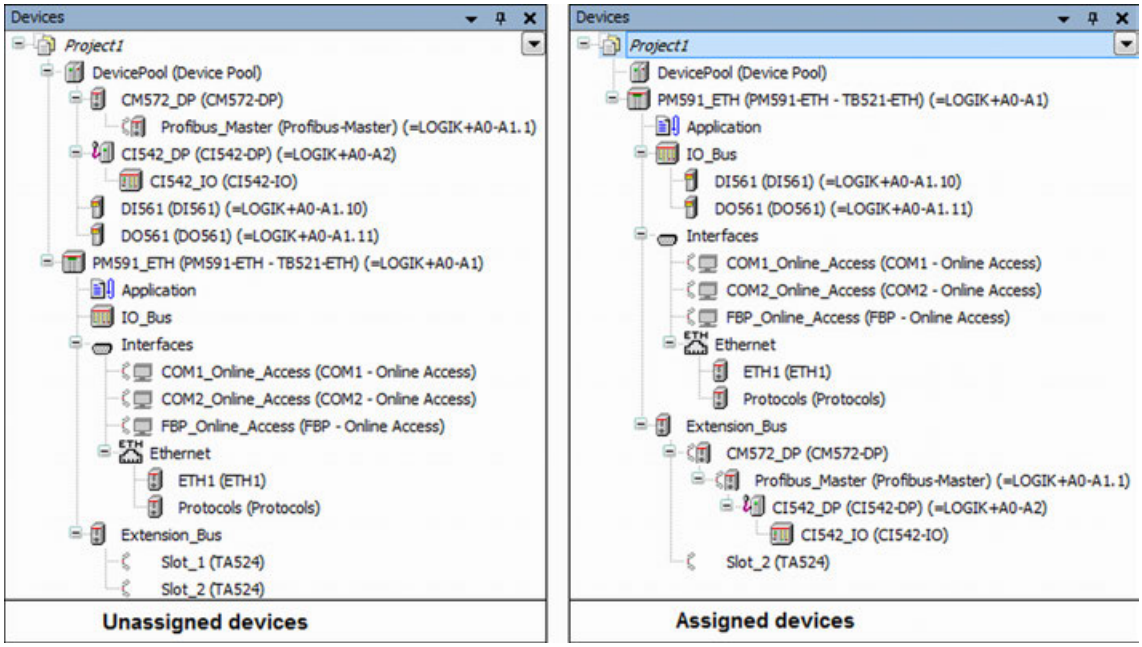
Import *PBF* file to Automation Builder

1. From the main menu, select *"Project ➔ Import ➔ ECAD (PBF)"*.
2. From the file system, select the *PBF* file.

   Automation Builder starts importing the devices and its associated signals from the *PBF* file. After a successful import, the result is displayed in the **Project Compare –Differences** view. You can now decide and selectively merge the differences.

   ↬ *Chapter 1.4.1.20.3.4.21 "Command 'Compare'" on page 1010*
3. Select the DevicePool node and click *"Accept Block"* to accept the complete PLC structure in the ECAD tool.
4. Select the PLC node and click *"Accept Block"* to accept all child device nodes.

   > *The DevicePool node holds all devices coming from the ECAD tool without any hierarchy information. The missing hierarchy information can be defined after closing the editor.*
5. Close the **Project Compare – Differences** view to accept the changes.
6. Arrange unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.



⇨ The I/O signals assigned to I/O devices in the *PBF* file are imported and allocated to IO devices. IO signals can be viewed in I/O mapping editor of the I/O devices.

1.8.1.1.3 Importing third party devices

Prerequisite: To import third party devices from ECAD to Automation Builder, install third party fieldbus devices (for example, GSD, GSDML and EDS files) using *“Tools ➔ Device repository”* in Automation Builder.

1. From the main menu, select *“Project ➔ Import ➔ ECAD (PBF)”*.
2. From the file system, select the ECAD *pbf* file which consists of third party devices.

   ⇨ When the device identifier of the third party device installed in Automation Builder does not match with the device identifier of the device imported from ECAD, an error window is shown with the devices which are failed to import with error identifier 14.

   To import third party devices, it is required to assign ECAD identifier (PLC type designation/order number) in Automation Builder in *“Tools ➔ Device ECAD data”*. Click the link in the *Import* window to see the error messages in a text file.
3. Click *“Continue”* in the Import window to import valid devices to the project that are imported successfully or click *“Cancel”* to cancel the import process.
4. In Automation Builder, click *“Tools ➔ Device ECAD data”*.
5. In the Device ECAD data editor, add the ECAD identifier for the devices shown in the import errors window with error identifier 14, to enable these devices for export and import.

   ⇨ Also, add the ECAD identifiers for all devices which need to support export/import in ECAD.
6. Reimport the *pbf* file to import the third party devices.

1.8.1.1.4 Exporting PLC data to ECAD tool

1. Open the existing PLC project.
2. In the device tree, right-click *“PLC ➔ Export ➔ ECAD (PBF)”*.
3. Select the desired location in the file system to save the *PBF* file.

   The ECAD user can import the exported *PBF* file from Automation Builder and can use the imported PLC data for electrical engineering purpose. If the user modifies imported PLC data in the ECAD project, the data can be imported back to the Automation Builder project which supports the round trip engineering efficiently with loss less synchronization of the data.

1.8.1.1.5 Exporting third party devices

1. Right-click on a PLC device, click *“Export”* and select *“ECAD (PBF)”*.
2. Save the file to the desired location in the file system.

   If the third party devices does not contain assigned ECAD identifiers, a message is displayed showing which devices cannot be exported.

   ⇨ To add ECAD identifiers to the devices, see *Importing third party devices* *Chapter 1.8.1.1.3 “Importing third party devices” on page 4114*.

   After adding ECAD identifiers to the third party devices, execute *“Export”* to export the devices including third party devices.

1.8.1.1.6 Importing ECAD PLC data to existing AB project

Automation Builder ECAD interface supports concurrent engineering by importing the ECAD data to the existing Automation Builder PLC project.

1. From the main menu, select *“Project ➔ Import ➔ ECAD (PBF)”*.
2. Select the PBF file which has been created during the export from the ECAD tool.
3. Select the PLC from the list and click *“OK”*.

   ⇨ A dialog window is displayed if the Automation Builder project provides PLCs of the identical type as defined in the PBF file.

   By selecting *“None”* in the dialog window a new PLC is defined in the ECAD tool.
4. In the **Project Compare – Differences** view, click  to merge device signals.

   ⇨ The differences between the current PLC hardware configuration in Automation Builder and the ECAD PLC data are displayed.
5. Select the differences as desired and click *“Accept Single”* to accept the selected difference block.
6. Close the **Project Compare – Differences** view to accept the changes.

1.8.1.1.7 Arrange or map devices imported to the device pool

Devices that are imported to the device pool because of missing hierarchy information (mainly rack information) must be arranged manually in the Automation Builder project or mapped to already existing devices.

Arrange devices imported to the device pool

Arrange the unassigned devices in the DevicePool to the PLC hardware structure by drag-and-drop.

Map devices imported to the device pool

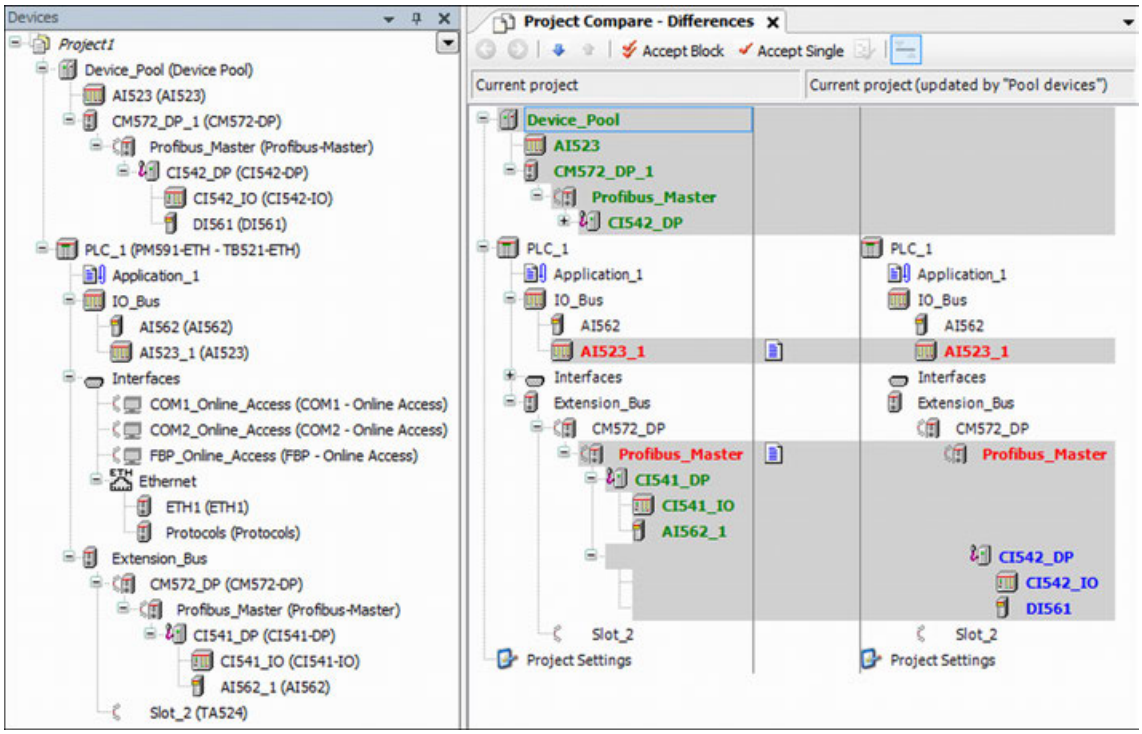
If the devices are already added to the Automation Builder project prior to the import, you have to map the instances of the same type manually (one instance in the Automation Builder project tree and one instance in the DevicePool).

After mapping the devices, you can selectively merge the device parameter or signal in the difference view.

To map pool devices, proceed as follows:

1. In the device tree, select the Device Pool node, click *“Project”* and select *“Map pool devices”*.
2. Map the device pool instances of identical types in the project from the drop-down list and click *“OK”*.

   ⇨ Pool devices which are mapped are removed from the device pool and mapped to the corresponding Automation Builder device. Differences between the signals of the mapped I/O devices are displayed. e.g. AI523_1 device:



1.8.1.1.8 Limitations

The following limitations are considered when working with the Automation Builder ECAD interface:

- The scope of a PBF file is limited to one single PLC including all connected devices.
- There is no representation of XC variants of devices in Automation Builder. Therefore, always use the standard variant for export. This might lead to part data mismatch when importing into the ECAD tool.
- In reimport or round trip import cases, if any changes are made in ECAD by adding a new communication module with connecting to one of the PLC slot or replacing existing communication module, then those device changes to the communication modules are not displayed as connected to PLC slots during the import in Automation Builder diff and import, instead those CM modules are added under the device pool. After merging and importing is completed, to work with device pool devices ↳ *Chapter 1.8.1.1.7 “Arrange or map devices imported to the device pool” on page 4115*.
- IO mapping data cannot be imported for IO devices plugged to an EtherCAT slave when they are imported individually to the device pool because of missing hierarchy information. After arranging the devices properly in the device tree, the import can be done again to import also the IO mapping data.

1.8.1.2 Exporting and importing I/O mapping (CSV)

The I/O module mappings of an Automation Builder project can be exported to CSV for bulk editing in MS Excel or other documentation purposes. I/O mappings can be exported at single I/O module level or at PLC level.

Further, the I/O module mappings can be imported with the option of displaying differences and merging each single changed or import all signals at once by overwriting existing I/O module signals.

1.8.1.2.1 Exporting IO mapping data to CSV

To export I/O mappings to a CSV signal list, proceed as follows:

1. In the device tree, right-click *"PLC ➔ Export ➔ IO mapping (CSV)"*.
2. Save the **IO mappings CSV** to the desired location in the file system.

   If the CSV signal list has been exported successfully, a success message is displayed. The status of the export is shown in the dialog.
3. In the export dialog, click the link to open the exported **IO mapping CSV** file in MS Excel.

> *The template can only be opened if MS Excel is installed and configured to open .csv files.*

4. In the IO mapping (CSV) file, change **Variable** and **Description** fields to edit I/O mappings.

	A	B	C	D	E	F
1	//Automation Builder IO Mappings Export V1.0					
2	//Important: change only first and fourth column in Excel					
3	*Variable	Channel name	Data type	*Description	Terminal	Device name
4	//AI562 (PLC\IO_Bus)					
5	Drive act speed	Analog input I0+	INT	Actual drive speed	11	AI562
6		Analog input I1+	INT		14	AI562
7	//AI523_1 (PLC\IO_Bus)					
8	ai0	Analog input I0+	INT	ai0 desc	2	AI523_1
9		Digital input I0+	BOOL		2	AI523_1
10		Analog input I1+	INT		2.1	AI523_1
11		Digital input I1+	BOOL		2.1	AI523_1
12		Analog input I2+	INT		2.2	AI523_1
13		Digital input I2+	BOOL		2.2	AI523_1
14		Analog input I3+	INT		2.3	AI523_1
15		Digital input I3+	BOOL		2.3	AI523_1
16		Analog input I4+	INT		2.4	AI523_1

⇨

> *Do not modify other field's data in IO mapping (CSV) file.*

1.8.1.2.2 Importing I/O mapping data from CSV

To import an edited I/O mapping (CSV) file, proceed as follows:

1. From the main menu, select *“Project ➔ Import ➔ IO mapping (CSV) ➔ Open”*.
2. A CSV signal list import dialog is displayed.
   ⇨ With *“YES”*, all I/O mappings will be imported without difference view. With *“NO”*, the difference view is displayed with the I/O mapping differences.
3. In the **Project Compare – Differences** view, click  to merge I/O mappings.
4. Select the signal row for which the difference is to be accepted. Select the **Variable** field and click *“Accept Single”* to merge the I/O mappings.
5. Close the **Project compare – Differences** view to accept the changes and merge the I/O mappings with the Automation Builder project.

1.8.1.3 Exporting and importing device list (CSV)

The Automation Builder project devices can be exported to CSV for bulk device renaming or adding device tag labels to devices in MS Excel or other documentation purposes. A devices export is only possible at PLC level.

Automation Builder provides importing devices in bulk based on device type, instance and hierarchy information provided in the CSV file.

1.8.1.3.1 Exporting device list to CSV

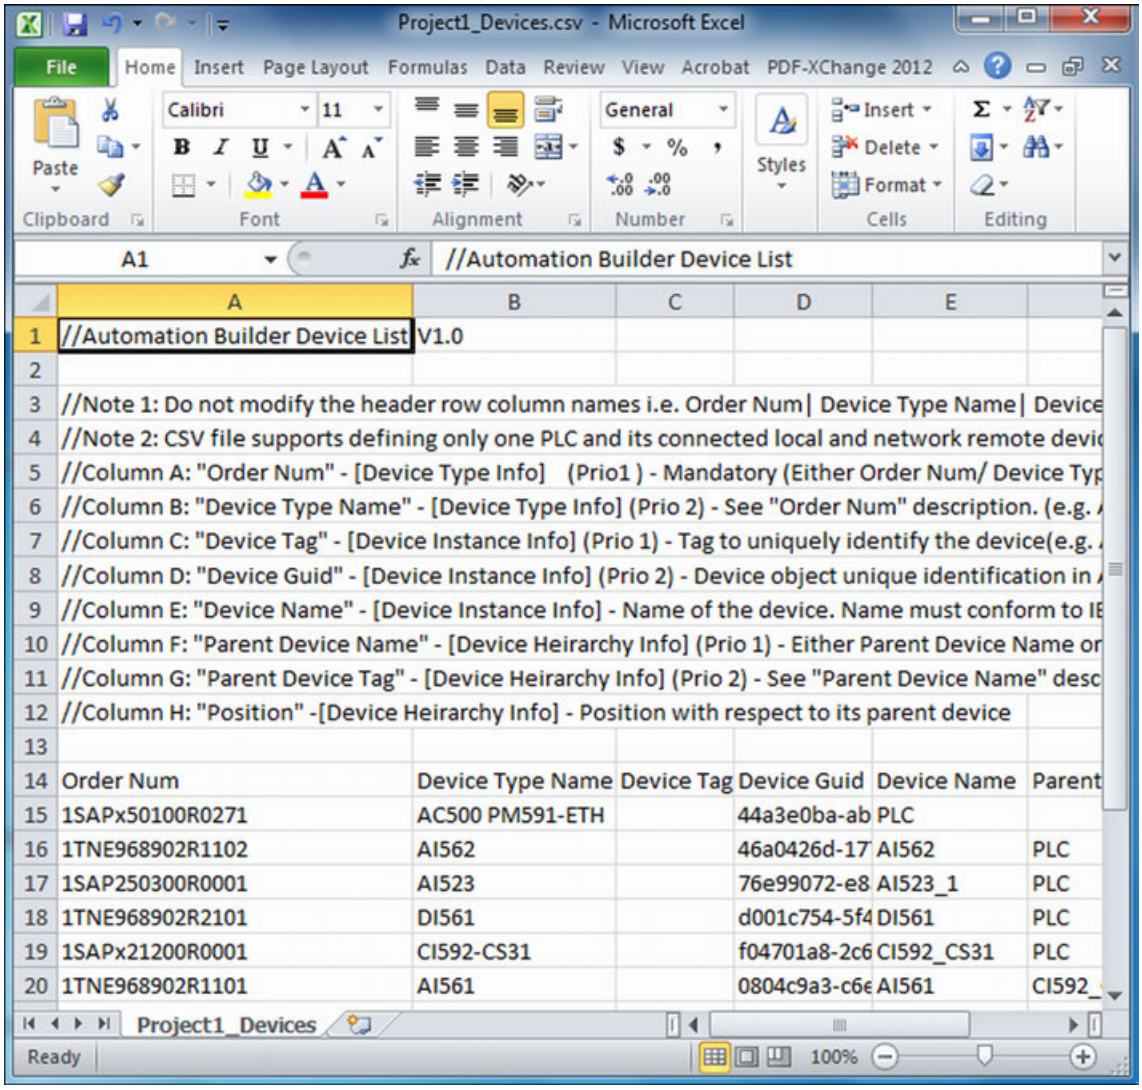
To export a CSV device list, proceed as follows:

1. In the device tree, right-click *“PLC ➔ Export ➔ Device list (CSV)”*.
2. Select the desired location in the file system to save the **Device list (CSV)**.

   If the CSV device list is exported successfully, a success message is displayed.

3. In the Export dialog, click the link to open the exported CSV device list.

   The exported CSV device list consists of all devices connected to the PLC that is exported. Each row represents a device with its device type and hierarchy information.



1.8.1.3.2 Creating CSV device list

To create the devices in CSV, use the device list template provided in Automation Builder.

▷ In the main menu, click *"Tools ➔ Create CSV Device list"*.

⇨ The device list template is opened in the MS Excel.

> *The template can only be opened if MS Excel is installed and configured to open .csv files.*

In this file, add each device in a separate row with device information like Device Type (Order Num or Device Type Name) and instance details (name, tag) and hierarchy information (parent Device name, parent Device Tag, position). The mandatory information required to import CSV is only Device Type. All other fields are optional. After editing the device list CSV file, save it in the file system and close.

1.8.1.3.3 Importing a device list from CSV

To import devices from CSV in bulk, proceed as follows:

1. From the main menu, click *“Project ➔ Import ➔ Device list (CSV)”*.
2. Select the device list CSV file from the file system and click *“Open”* in the Import dialog.

   All devices that are defined in the CSV are imported. The **Project Compare – Differences** view displays the current project and the project that has been updated by the import file.
3. Select the desired devices and click *“Accept Block”* to accept all the devices and its child device nodes or *“Accept Single”* to accept only a single device.
4. After closing the **Project Compare – Differences** view, the devices are imported to the Automation Builder project.

   ⇨ The devices (except PLC) are placed under the device pool if the valid device hierarchy information is not provided in the CSV device list file. By drag-and-drop devices can be assigned to the desired PLC hardware structure ↳ *Chapter 1.8.1.1.7 “Arrange or map devices imported to the device pool” on page 4115*.

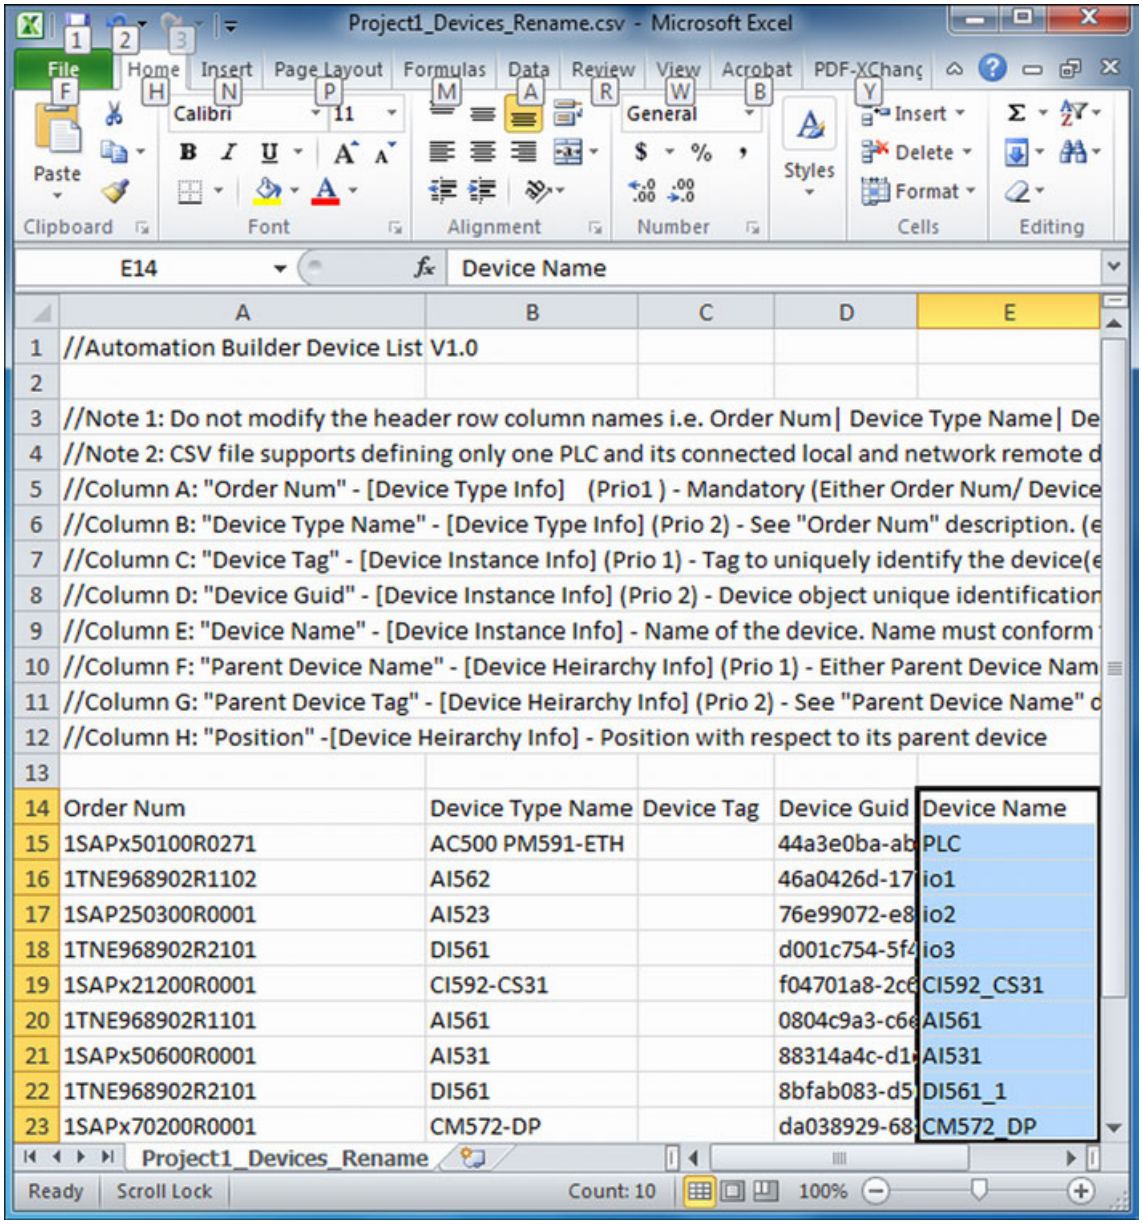
   If a device tag is provided for a device in CSV, it appears next to each device node in the device tree.

1.8.1.3.4 Renaming devices

To rename the devices, proceed as follows:

1. In the device tree, right-click *“PLC ➔ Export ➔ Device list (CSV)”*.
2. Select the desired location from the file system to save the CSV device list.

3. Rename the device names in the column **Device Name**:



4. Click *“Project ➔ Import ➔ Device list (CSV)”*.

5. Select the updated CSV file from the file system.

   Open the **Project Compare – Differences** view. If only the device names have been changed in the CSV file, the difference view does not show the changes.

> *Device Name changes are not displayed as changes in the difference view.*

6. Close the **Project Compare – Differences** view. The Renamed Devices dialog is displayed with the current name and the new name provided in the CSV file.

7. In the Rename Devices window, select the desired devices and click *“OK”*.

   The device names are updated in the Automation Builder project.

1.8.2 CODESYS Security Agent

1.8.2.1 Integration in CODESYS Development System

At this time, you can configure and create certificates of the controller with the CODESYS Security Agent. You can then configure encrypted communication with the controller, as well as encrypt the boot application, download, and online change.

See also

- *Chapter 1.8.2.2 “Encrypted Communication with Devices via Controller Certificates” on page 4122*
- *Chapter 1.8.2.3 “Encryption of the Boot Application, Download, and Online Change” on page 4123*

1.8.2.2 Encrypted Communication with Devices via Controller Certificates

Details on how to encrypt and to sign the application on the controller is described in an application note:*AC500 V3 - Encrypt and Sign your Application*

Requirement: A digital signature for certificate exchange is configured.
Chapter 1.4.1.8.17 “Encrypting an application” on page 294

> ***No certificate use in live system***
> *Self-signed certificates should **never** be used on production or public websites. The certificates that are created in the following steps are self signed.*

We assume that there is still no certificate on the controller that is intended for encrypted communication. In the following steps, you generate this kind of certificate and encrypt communication:

1. Configure the active path to the controller.
2. Open the *“Security Screen”* view by double-clicking the symbol in the status bar or by clicking *“View ➔ Security Screen”*. Select the *“Devices”* tab.
3. Click the button to refresh the list of available devices and their certificate stores.
4. Select the corresponding device on the left side.
   ⇨ On the right side, there is still no license listed for the *“Encrypted communication”* use case.
5. On the right side, select *“Encrypted Communication”* and click the button to create a new certificate on the device.

   Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.

   ⇨ The certificate is generated and listed in the table with its properties. The symbol before *“Encrypted communication”* now appears as such: . The field in the "Valid until" column is highlighted in green because the remaining time is still at least two-thirds of the entire validity period.

6. In this step, you activate encrypted communication with the controller.

   Open the *“Security Screen”* view of CODESYS (*“Users”* tab). In the *“Security Level”* group, select the *“Enforce encrypted communication”* option.

   ⇨ As of this point, communication with all controllers is possible only as long as the certificate is valid on the controller and you have a key for it.

   The connecting line between the development system, the gateway, and the controller is displayed in yellow on the *“Communication Settings”* tab of the device editor of the controller.

   As an alternative to the *“Enforce encrypted communication”* option that was just described and which applies to all controllers, you can also encrypt communication with a specific controller only. To do this, open the *“Communication”* tab in the device editor of the controller. Click *“Encrypted Communication”* in the *“Device”* list box.

7. Now log back in again to the controller.

   ⇨ A dialog opens with the notification that the certificate of the controller is not signed by a trusted source. In addition, the dialog displays information about the certificate and prompts for you to install it as a trustworthy certificate in the local store in the "Controller Certificates" folder.

8. Confirm the dialog.

   ⇨ The certificate is installed in the local store and you are logged in to the controller.

   In the future, communication with the controller will be encrypted automatically with this control certificate.

   Note: When logging in to the controller, the expiration date of the certificate currently in use is checked. You get a warning if the remaining time is just one-third of the entire time or less. Then you can renew the certificate in time in the security screen.

See also

- *Chapter 1.8.2.4.1 “View 'Security Screen' - 'Devices'” on page 4125*
- *Chapter 1.8.2.1 “Integration in CODESYS Development System” on page 4122*

1.8.2.3 Encryption of the Boot Application, Download, and Online Change

Details on how to encrypt and to sign the application on the controller is described in an application note:*AC500 V3 - Encrypt and Sign your Application*

Aim: You want to encrypt boot applications, downloads, and online changes with a certificate to make sure that the application on the controller cannot be exchanged at will. To do this, you need to download a corresponding certificate of the type "Encrypted Application" from the controller and install it to the "Windows Certificate Store" of your computer. This certificate is required for all development environments that need to make changes to the application on the controller. For example, if this application has to be downloaded from another computer, then the certificate also has to exist on this computer.

See also

- *Chapter 1.8.2.1 “Integration in CODESYS Development System” on page 4122*
- CODESYS Help: "Security", "Encryption", "Certificate"

Encrypting the boot application, download, and online change with the encryption wizard

Requirement: The active path to the controller is configured.

1. Open the *“Properties”* dialog of the application.
2. Click the *“Encryption”* tab. Set *“ Encryption Technology”* to *“Encryption with certificates”*.
   ⇨ The *“Encryption Wizard”* button is available in the *“Certificates”* field.
3. Click the *“Encryption Wizard”* button.
   ⇨ The *“Encryption Wizard”* dialog opens. The status is `Not connected` and under *“Details”* is `Ready`.
4. Click the *“Start”* button.
   ⇨ The wizard searches for suitable certificates on the controller. If necessary, the controller creates a new certificate which is registered in the Certificate Store of your computer.

   NOTE: A certificate obtained this way is automatically accepted as trusted.

   If a certificate for application encryption already exists on the controller, then it is used.

   If a new certificate has to be created on the controller for your CODESYS, then the *“Certificate Settings”* dialog opens for configuring the key length for the private key and the validity period.
5. In the *“Certificate Settings”* dialog, click *“OK”* to confirm the default or edited values for key length and validity period.
   ⇨ CODESYS saves the values in the CODESYS options as the default for the next certificate configuration of this kind.

   In the *“Details”* of the wizard, you see a description of the performed actions and the thumbprint of the recently created certificate.
6. When the status reaches *“Wizard finished”*, close the wizard.
   ⇨ The new certificate is listed in the *“Certificates”* field of the properties dialog. In the *“Certificate Store”*, it is listed under *“Controller Certificates”*. In the *“Security Screen”* view, on the *“Devices”* tab, the certificate is displayed in the right window with the *“Encrypted Application”* information.
7. Confirm the *“Properties”* dialog of the application.
8. Open the *“Security Screen”* view.
   ⇨ On the *“Project”* tab, in the *“Encryption of boot application, download and online change”* group, the certificate is displayed with the *“Encrypted Application”* information.

   Boot application, download, and online change are therefore encrypted and only possible as long as the configured certificate and signature are valid.

- *Chapter 1.8.2.4.2 “Dialog 'Encryption Wizard'” on page 4128*
- CODESYS Help: Dialog "Properties" "Encryption"
- CODESYS Help: "Security", "Encryption", "Certificate"

Encrypting the boot application, download, and online change without the encryption wizard

Requirement: The active path to the controller is configured. There is still no certificate on the controller that is suitable and valid for encryption.

1. Open the *“Security Screen”* view by double-clicking the symbol in the status bar or by clicking *“View ➔ Security Screen”*. Open the *“Devices”* tab.
2. Click the *“Refresh the list of available devices and their certificate stores”* button.
3. Select the device listed on the left side.

4. Select *"Encrypted Application"* on the right side and click the *"Create a new certificate on the device"* button.

   Change the default key length to 4096. Otherwise an error occurs that is only visible in the log of the PLC.

   ⇨ The certificate is created and listed in the table with the symbol.

5. Double-click the certificate entry.

   ⇨ The Windows *"Certificate"* default dialog opens.

6. Click the *"Install certificate"* button on the *"General"* tab.

   ⇨ The *"Certificate Import Wizard"* opens.

7. In the *"Certificate Store"* dialog, select the *"Place all certificates in the following store"* option and select the *"Controller Certificates"* folder for *"Certificate Store"*.

   ⇨ The controller certificate is imported to the *"Controller Certificates"* directory and it is immediately available for the encryption of downloads, online changes, and boot applications.

8. Open the *"Project"* tab and double-click the application entry in the *"Encryption of boot application, download and online change"* group.

   ⇨ The *"Properties"* dialog of the application opens.

9. Click the *"Encryption"* tab and set *"Encryption Technology"* to *"Encryption with certificates"*. Then click . Note: If the *"Enforce encryption of downloads, online changes and boot applications"* option is selected in the *"Security Screen"*, then *"Encryption with certificates"* is already preset.

10. In the *"Certificate Selection"* dialog, select the corresponding certificate from the *"Controller Certificates"* folder and click .

11. Click *"OK"* to confirm the dialog.

    ⇨ The certificate is displayed in the properties dialog.

12. As above when using the wizard, steps 7 and 8.

Enforcing the encryption of boot applications, downloads, and online changes

▷ Open the *"Users"* tab in the *"Security Screen"*. In the *"Security level"* group, select the *"Enforce encryption of downloads, online changes and boot applications"* option.

⇨ Only with a valid certificate is it possible to change the application on the controller.

1.8.2.4 Reference, User Interface

1.8.2.4.1 View 'Security Screen' - 'Devices'

Symbol:

Function: The tab allows for the configuration and the transfer of controller certificates for encrypted communication with the controller.

Call: Menu bar: *“View”*

The *“Devices”* tab shows all PLC devices configured in the project and their certificate store. If the communication path to the controller is configured, then you see the certificates that are stored in memory. Here you can create and configure new certificates on the controller. If a certificate currently in use is about to expire, then you get a warning when you log in to the device. From there you can also switch directly to the *“Security Screen”* to renew the certificate.

Left side: *“Information”*	Devices and certificate store Shows the individual devices as expandable nodes, each with the controller-specific certificate store below it.
Toolbar (left side)	: Refresh the display : Download: Transfer the selected certificate to the PLC

Right side: *“Information”*	If the active path to the controller is set and a device node is selected, then every use case for controller certificates is displayed on the right side. ● *“OPC UA Server”*: Encrypted communication over an OPC UA server ● *“Encrypted Communication”*: Encrypted communication between the development system and the controller ● *“Encrypted Communication”*: Encryption of the boot application ● *“Web server”*: Encrypted communication with the web server As long as a certificate is not available for one of these use cases, it is displayed with the  symbol as *“(not available)”*. When a certificate store is selected on the left side, all certificates in it are displayed on the right side with the following information: *“Information”*: Use case (currently the controller component in question is displayed: for example *“CmpSecureChannel”*.) *“Created for”*: Name of the computer for which the certificate was created (for example, *“MyLocalPC”*) *“Created by”*: Name of the computer on which the certificate was created (for example, *“MyLocalPC”*) *“Valid as of”*: Date (for example, *“07/20/2017 15:09:29”*) *“Valid until”*: Date (example: *“07/20/2022 00:00:00”*. Depending on the remaining time of the certificate, the highlight color of the field changes: green -> yellow (two-thirds expired) -> orange (nine-tenths expired) -> red (expired). Note: When logging in to the controller, you get a warning when two-thirds or more of the validity period have expired. Then you can renew the certificate here in the *“Security Screen”*. *“Thumbprint”*: Hash value from specific properties of the certificate for purposes of identification (for example, *“279e1a46b86bd636c8e6f19fd51c222469ec49a8”*) This thumbprint can be used together with the Mqtt library. Refer to the Mqtt library documentation in the Library Manager. Double-clicking a certificate entry opens the default Windows *“Certificate”* dialog. As a result, you can import a controller certificate into the Windows Certificate Store in the *“Controller Certificates”* folder, so that it is available for the encryption of boot applications, downloads, and online changes. If multiple certificates are available for one use case, then the system follows the steps below to determine the certificate that is used: ● Certificate that was created directly by the user (currently not supported) ● Filtering of existing certificates by: – 1. Subject (user of the certificate) – 2. Key usage – 3. Extended key usage – 4. Valid time stamp ● Dividing of detected, valid certificates as "signed" and "self-signed" ● Filtering of signed certificates, and the self-signed certificates by the following criteria: – 1. Longest validity period – 2. Strongest key

	Drag&Drop: Moving of the certificate to another certificate store of the same device Double-clicking a certificate entry opens the default Windows dialog for displaying all certificate information.
Toolbar (right side)	: Creates a new certificate for a specific use case The *“Certificate Settings”* dialog opens for configuring the *“Validity period”* of the certificate and the *“Key length”* for the private key. Clicking *“OK”* saves the specified values in the CODESYS options. The values are reset at the next operation. As long as the certificate is being created, "*“(computing)”*" is shown after the use case. You cannot cancel the creation operation, but you can close and continue working with the *“Security Screen”*. : Delete the selected certificate. : Upload and save the selected certificate to the local file system. : Details about the selected certificate: Opens the *“Certificate”* dialog with the *“General”* tab, *“Details”* tab, and *“Certification Path”* tab. : Renew the selected certificate. Opens the *“Certificate Settings”* dialog to create an additional new certificate for a certificate that will expire soon, with the same purpose and specified key length. The predefined values in the dialog are adapted, if necessary, depending on the selected certificate.

1.8.2.4.2 Dialog 'Encryption Wizard'

Function: The wizard makes sure that a certificate for the encryption of downloads, online changes, and boot applications is downloaded from the controller. If a valid certificate does not exist on the controller for this purpose, then the wizard makes sure that a certificate is created. Changes to the application on the controller (download, online change, boot application) are possible only when this certificate exists.

Call: *“Properties”* dialog of an application, *“Encryption”* tab, *“Encryption with certificates”* setting, *“Encryption Wizard”* button

Requirement: *“Encryption Technology”* is set to *“Encryption with certificates”*.

“Status”	Statuses while the wizard:is in action: ● *“Not connected”*: The connection to the controller has not been established yet or the device cannot be reached. ● *“Error connecting to the device”*: The network path to the controller has not been set correctly. ● *“Connecting...”*: A connection to the controller is being established. ● *“Processing request...”*: The wizard is checking for available certificates and if necessary makes sure that the controller creates a new certificate. The certificate downloaded from the controller is automatically classified as "trusted" and registered in the Certificate Store of the computer. ● *“Wizard finished”*
“Details”	Description of the individual actions of the wizard with corresponding notices in the case of failures
“Start”	If the connection path to the controller is set correctly in the device editor, then the wizard starts the necessary actions for encrypting downloads, online changes, and boot applications with a certificate. If an expired certificate exists, then a corresponding warning is displayed with a dialog prompt whether or not a new certificate should be created by the controller. When this is confirmed, the new certificate is created and loaded to the local Certificate Store. In this case, the existing boot application may not start anymore and must be created again with the new certificate. The *“Certificate Settings”* dialog opens when a new certificate is to be created on the device. Here you configure the *“Key length (bit)”* and the *“Validity period (days)”* for the certificate.

1.8.3 CODESYS Static Analysis

Already when programming in CODESYS, CODESYS Static Analysis helps to write more readable code and to detect contradictory or unsupported settings. In particular, potential sources of error can be identified, such as test code or pointers that have not been checked for 0 before dereferencing. With specific checks, you can make sure that the code is portable. Example: The analysis should report the use of language resources for object orientation because the code is to run on platforms that do not support object orientation.

The analysis checks the source code of the CODESYS project and reports any deviations from certain coding rules, naming conventions, or permitted keywords and identifiers. CODESYS Static Analysis is based on the rule set defined in the PLCopen Coding Guidelines and extends it with additional test options.

You can display the detected deviations as errors or warnings in the message view before the project is downloaded to the target system. For errors that are reported by Static Analysis based on precompile information, there is support for an immediate error handling ("Quickfix").

You activate Static Analysis either explicitly by clicking *“Build ➔ Run Static Analysis”*, or you let it execute automatically at each code generation. You activate the automatic execution in the *“Static Analysis”* dialog of the projects settings. In this dialog, you also configure what is to be checked in detail. You can use pragma statements to exclude individual parts of the code from the check.

To evaluate the code quality, you can also display selected metrics that CODESYS Static Analysis detects in your code in a separate view. An example of this is the McCabe metric, which measures the cyclomatic complexity and indicates the number of execution paths that can be processed during code execution.

NOTICE!
The analysis is performed only for the code of the applications in the current project. Libraries are not taken into consideration.

The CODESYS development system contains a light version of Static Analysis that is extended by CODESYS Static Analysis.

- Usage and benefits of code optimizations are described in the *application example*.

1.8.3.1 Configuring and Running Static Analysis

Using a basic sample project below, you will find the most important steps and options for configuring and running a static analysis.

Requirements: CODESYS Static Analysis is installed.

Sample project If you want to reproduce the example project, create a standard project and insert the POUs below the application in the device tree. Then configure the communication settings for the connection to your local CODESYS Control Win V3.

```
FUNCTION_BLOCK fb1
VAR_INPUT
       iVar_fb1in1 : INT;
       ivar_fb1in2 : INT;
       rVar_fb1in3 : REAL;
END_VAR
VAR_OUTPUT
       iVar_fb1out:INT;
END_VAR
VAR
       P_fSampleProperty : INT;
    rVar : REAL;
       PRO : BOOL;
END_VAR
iVar_fb1out:=iVar_fb1in1 + 1;

FUNCTION_BLOCK fb2
VAR_INPUT
       iVar_fb2in:INT;
END_VAR
VAR_OUTPUT
       iVar_fb2out:INT;
END_VAR
VAR
END_VAR
```

```
PROGRAM PLC_PRG
VAR
    fb1_inst: fb1;
    fb2_inst: fb2;
END_VAR
fb1_inst(iVar_fb1in1 := 99);
fb2_inst(iVar_fb2in := 22);
fb2_inst(iVar_fb2in := 1);
```

Checking for compliance to rules

1. Click *"Build ➔ Static Analysis ➔ Settings"*. Switch to the *"Rules"* tab.

   ⇨ A list is displayed containing all possible rule checks. They are organized in a tree structure by topical category. The rule number is added in parentheses (for example, *"Unused variables (33)"* in category *"Unused objects"*).

2. Click the check box of the first line a few times (*"Rules"* node).

   ⇨ Clicking toggles the activation status. The check boxes in the entire tree have a red or orange check mark, or no check mark at all.

3. In this way, activate all entries with a red check mark. This means that CODESYS Static Analysis should report any detected rule violations as errors.

4. Click *"Build ➔ Static Analysis ➔ Run Static Analysis"*.

   ⇨ Errors are reported in the message view. The message texts are tagged with a § and begin with the error number "SA<rule number>".

5. Double-click the first message `SA0033: Unused variables 'iVar_fb2out'.`

   ⇨ The focus moves to the declaration part of function block `fb2` and the relevant variable is selected. The variable is declared, but not used. This is checked in Rule 33 (*"Unused variables"*). In the code, the relevant locations are underlined with a wavy line.

6. To test the automatic execution of the analysis, click *"Build ➔ Static Analysis ➔ Settings"*. On the *"Settings"* tab, select the *"Perform static analysis automatically"* option. Click *"OK"* to exit the dialog.

7. Click *"Online ➔ Login"*.

   ⇨ A dialog prompt indicates that compile errors exist. The errors reported by the code analysis are displayed again in the message view.

8. Click *"Build ➔ Static Analysis ➔ Settings"*. Switch to the *"Rules"* tab.Now clear all of the rules in the dialog. In the *"Unused Objects"* category, explicitly activate Rule SA0035 (*"Unused input variables (35)"*) with an orange-colored check mark to report a warning. See the tooltip for the rule text: *"This rule corresponds to the following PLCopen rules: CP24"*). Click *"OK"* to exit the dialog.

   In the project settings, click *"OK"*.

9. Click *"Build ➔ Generate Code"*.

   ⇨ The analysis is performed automatically. Two errors are reported in the message view: `§ SA0035: Unused input variable 'iVar_fb1in2` and `§ SA0035: Unused input variable 'iVar_fb1in3`.

10. Double-click the message and comment or remove the declaration. Perform the code analysis again.

    ⇨ No error messages are displayed.

See also

- *Chapter 1.8.3.2.2.1 “Dialog 'Static Analysis Settings' - 'Settings'” on page 4138*
- *Chapter 1.8.3.2.2.2 “Dialog 'Static Analysis Settings' - 'Rules'” on page 4139*

Checking for compliance to defined naming conventions

1. Click *“Build ➔ Static Analysis ➔ Settings”*. Click the *“Naming Conventions”* tab.
   ⇨ You see a table in a tree structure that is divided into expandable categories of variables and program blocks.
2. Expand the *“Prefixes for Variables” - “Prefixes for Types”* category, and in the *“Prefix”* column, specify `I` for *“INT (14)”*.

   Expand the *“Prefixes for POUs” - “Prefixes for POU Type”* category: In the *“Prefix”*column, specify the `prog` for *“PROGRAM (122)”* and `fb` for *“FUNCTIONBLOCK (103)”*.
3. Select the *“First character after prefix should be an upper case letter”* option. Clear all other options.
4. Click *“Build ➔ Static Analysis ➔ Run Static Analysis”*.
   ⇨ Error messages:
   - `NC0102: Invalid name 'PLC_PRG': Expect prefix 'prog'` because PLC_PRG does not have the required prefix
   - `First character after prefix should be uppercase: 'ivar_fb1in2'` because `ivar_fb1in2 : INT;` in `fb1`
   - `NC0014: Invalid variable name P_fSampleProperty: Expect prefix 'i'` because this integer variable does not have the required prefix

See also

- *Chapter 1.8.3.2.2.3 “Dialog 'Static Analysis Settings' - 'Naming Conventions'” on page 4140*

Checking for forbidden symbols

1. Click *“Build ➔ Static Analysis ➔ Settings”*. Click the *“Forbidden Symbols”* tab.
   ⇨ A line editor allows for specifying character strings that should not to be used in the code.
2. As an example, double-click the blank line and type in the invalid character string `PRO` directly. Double-click the next blank line and click … to open the input assistance. From *“Standard Types”*, select *“REAL”*. Click *“OK”* to exit the dialog.
3. Click *“Build ➔ Static Analysis ➔ Run Static Analysis”*.
   ⇨ The error messages `Forbidden symbol 'REAL'` and `Forbidden symbol 'PRO'` are displayed in the message view. Double-click the message text to jump to the relevant line of code.

See also

- *Chapter 1.8.3.2.2.5 “Dialog 'Static Analysis Settings' - 'Forbidden Symbols'” on page 4148*

Displaying of metrics

CODESYS Static Analysis performs selected tests on the code, and you can display the results in a view.

1. Click *"Build ➔ Static Analysis ➔ Settings"*. Click the *"Metrics"* tab.
   ⇨ The metrics that CODESYS Static Analysis applies to the code are listed in a table.
2. For this example, activate the *"Number of inputs variables"* metric and specify the permitted range of values: lower limit `1` and upper limit `2`. Activate some more metrics, for example *"Code size"* and *"Number of calls"*.
3. Click *"Build ➔ Static Analysis ➔ View Standard Metrics"*.
   ⇨ The view includes a table with a line for each *"Program unit"* of the sample program. For each activated metric, there is a column showing the measured values. Values that are outside of the range of values defined in the settings are highlighted in red. In the case of this specific example, this is at least the *"PLC_PRG/Inputs"* field because the number of input variables in this POU is greater than the defined upper limit of `2`.

See also

- ↳ *Chapter 1.8.3.2.1 "Commands" on page 4133*

1.8.3.2 Reference, User Interface

1.8.3.2.1 Commands

Command 'Settings'

Function: The command opens the *"Static Analysis Settings"* dialog.

Call: Menu bar: *"Build ➔ Static Analysis"*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

See also

- ↳ *Chapter 1.8.3.2.2.1 "Dialog 'Static Analysis Settings' - 'Settings'" on page 4138*

Command 'Run Static Analysis'

Symbol: §

Function: The command starts the static analysis for the active application and displays the results in the message view.

Call: Menu bar: *"Build ➔ Static Analysis"*

During the code analysis, CODESYS generates code just like the *"Build ➔ Generate Code"* command. The results of the analysis are displayed as errors § and warnings § in the message view (*"Build"* category). The numbers refer to the corresponding rules as they are defined in the project settings. The syntax for the displayed messages is *"SA<rule number:<rule text>"*.

See also

- *Chapter 1.8.3.3.2 "Rules" on page 4154*

Command 'View Standard-Metrics'

Symbol: 

Function: The command starts the static analysis for the active application and displays the metrics for all POUs in a table.

Call: Menu bar: *"Build ➔ View Standard Metrics"*

The metrics (code numbers) to be displayed are activated in the project settings. You can access the configuration by clicking *"Configure"* in the context menu of the displayed table. If a value is outside of the configured upper and lower limits, then the field in the table is highlighted in red.

See also

- *Chapter 1.8.3.2.2.4 "Dialog 'Static Analysis Settings' - 'Metrics'" on page 4147*

Standard Metrics

Metric	Description
"Code size"	Number of bytes
"Variable size"	Number of bytes
"Stack size"	Number of bytes
"Calls"	Number of calls
"Tasks"	Number of calls from tasks
"Global"	Number of different global variables
"I/Os"	Number of direct object accesses
"Local"	Number of local variables
"Inputs"	Number of input variables
"Outputs"	Number of output variables
"NOS"	Number of statements
"Comments"	Percentage of comments
"McGabe"	McGabe complexity
"Prather"	Prather complexity of nesting
"DIT"	Depth of inheritance tree
"NOC"	Number of children
"RFC"	Response for class
"Elshof"	Elshof complexity of reference
"CBO"	Coupling between objects
"LCOM"	Lack of cohesion in methods
"n1 (Halstead)"	Number of different used Halstead (n1) operators

Metric	Description
“N1 (Halstead)”	Number of Halstead (N1) operators
“n2 (Halstead)”	Number of different used Halstead (n2) operands
“N2 (Halstead)”	Number of operands (N2)
“HL (Halstead)”	Halstead length (HL)
“HV (Halstead)”	Halstead volume (HV)
“D (Halstead)”	Halstead difficulty (D)
“ SFC branches”	Number of SFC branches
“SFC steps”	Number of SFC steps

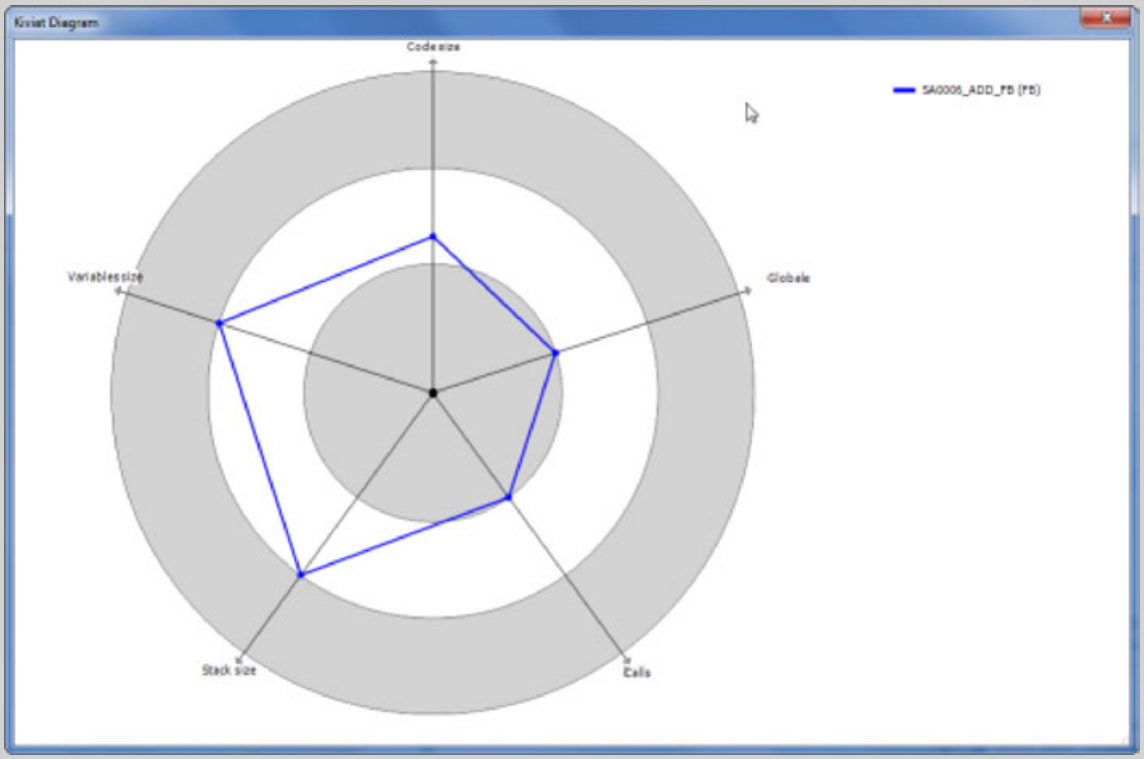
Commands in the context menu

The following commands are provided in the context menu of the table:

- *“Calculate”*: The values are refreshed.
- *“Copy Table”*: The table is copied to the clipboard. The separators are tabs.
- *“Print Table”*: The default dialog for setting up a print job opens.
- *“Export Table”*: The table is exported as a CSV file. The separators are semicolons.
- *“Kiviat Diagram”*: Requirement: At least three metrics have defined upper and lower limits.
  A radar chart is created for the selected POU. This visualizes the quality of POU code with respect to a given standard.
  Each metric is depicted as an axis with its origin at the center (value 0) which radiates outward into three concentric ring zones. The inner ring zone represents the range of values below the lower limit defined for the metric. The outer ring represents the range of values above the upper limit. The axes of the metrics are distributed uniformly around the circle.
  The current values of the individual metrics on the axes are connected by a line. In the ideal case, the complete line is located in the middle zone.
- *“Configure”*: The table for selecting the desired metrics opens. This corresponds to the table in the project settings.
- *“Open POU”*: The POU opens in the editor.

Example of a Kiviat diagram for five metrics

The name of the metric is displayed at the end of the respective axis and the name of the POU is displayed in the upper right corner of the diagram.



See also

- ↳ *Chapter 1.8.3.2.2.4 “Dialog 'Static Analysis Settings' - 'Metrics'” on page 4147*

Command 'Extract function'

Function: The command opens the *“Extract Function Configuration”* dialog.

The command extracts selected code from the ST editor and creates a new method or function containing this code. The affected code in the ST editor is replaced by a correct call. When code is extracted from a function block or the child of a function block, a new method is created from the code. When code is extracted from a program or a function, a new function is created from the code.

Call: Context menu: *“Refactoring”*

Requirements: When the selected code consists of one or more statements:

- The selected code does not contain any compile errors.
- The selected code is located in the implementation part of an ST POU.
- The selected code does not contain any exiting jumps
  Examples of exiting jumps include the following:
  – Using `RETURN` to exit the enclosing function
  – Using `CONTINUE` or `EXIT` to exit a loop enclosing the code

You can undo the changes that the “Extract function” command made in your project by positioning the cursor in the device tree and clicking “Edit ➔ Undo”.

Table 757: Dialog “Extract Function Configuration”

“Name”	Name of the recently created function or method The default name can be changed.
“Return value”	Determines the return value of a function if there are multiple output and/or input/output parameters
“Parameter”	Display of the available POUs Configuration whether the parameters are used as input, output, or input/output variables : Input variables : Output variables : Input/Output variables
	The changes made for *“Name”*, *“Return value”*, or *“Parameter”* are undone.
Upper code window	Recently created code of the call location
Lower code window	Recently created code of the function or method
“OK”	The displayed code changes are accepted in the ST POUs and the dialog is closed.
“Cancel”	The displayed code changes are rejected and the dialog is closed.

Command 'Detect clones'

Function: The command scans the program code of the open CODESYS project for copied code, and opens the *“Clone detection results”* view to display the detected cloned code blocks. In the process, only code blocks larger than a specific size are considered to be clones. Very small chunks of code are not displayed as clones.

Call:

- Menu bar: *“Build ➔ Static Analysis”*
- Context menu: *“Static Analysis”*

Requirement: The CODESYS project is open.

Two code positions are considered clones if they have the following properties:

- Same structural composition
- Variables have the same data type.
- Variable names may be different (exception: component access). However, an identifier that is contained multiple times in the code has to be in the same place in both code positions.
- Literals have the same data type.
- Literals may be different. A literal that occurs multiple times in the code has to occur at the same place in both code positions.

Table 758: View “Clone detection results”

“Summary”	Tab to display the search results ● *“Number of found cloned code sequences”* ● *“Number of statements compared”* ● *“Number of statements in cloned code”* ● *“Clone ratio”*: Specified as a percentage: *“Number of statements in cloned code”* / *“Number of statements compared”*

"Results"	The tab displays the code clones in a tree view and provides commands and filter options. The first occurrence of a duplicate from the set of duplicates is taken as the root node. The background color of the child nodes indicates whether the code is different or completely identical. Same colors mean the "same code". The contents of the tree view are sorted in descending order by the number of statements of the duplicated code.
Commands and filters on the *"Results"* tab	
"Subnodes/Clone"	Number of subnodes (statements) in the code block If the number of subnodes is less than 20, then the code clone is not considered.
"Filter on Object"	Input field for an *"Object"*, by which the clone list is filtered
"Show selected clones"	Requirement: Two child nodes of the same parent node are selected. Both programming objects are displayed in the upper part of the view for comparison. In the process, the code duplicates are highlighted and differences (for example, different variable names) are highlighted in a different color.
List of code clones	Columns ● *"Description"* ● *"Subnodes/Clone"* ● *"Object"* ● *"Position"* Double-clicking a child node opens the corresponding programming object, and the duplicated code block is selected there.

1.8.3.2.2 Dialogs

For the dialogs for the configuration of static code analysis, click *"Build ➔ Static Analysis ➔ Settings"*. Requirement: A CODESYS project is open.

Dialog 'Static Analysis Settings' - 'Settings'

Function: In the dialog, you select automatic static analysis, and save or load the project settings for static analysis as a CSA file.

Call:

- Menu bar: *"Project ➔ Project Settings"*, *"Static Analysis"* category, *"Open configuration dialog"* link
- Menu bar: *"Build ➔ Static analysis ➔ Settings"*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

"Perform static analysis automatically"	☑: CODESYS performs the code check automatically at each code generation (for example, when the *"Build ➔ Generate Code"* command is executed or before a download. ☐: The code check is not performed automatically, but it can be performed explicitly by means of the *"Build ➔ Static Analysis ➔ Run Static Analysis"* command.
"Load"	Opens the *"Load Static Analysis Configuration"* dialog for selecting the project settings for the static analysis as a CSA file in the file system. When you click the *"Open"* button, the selected CSA file is loaded.
"Save"	Opens the *"Save Static Analysis Configuration"* dialog for saving all project settings in the *"Static Analysis"* category as a CSA file in the file system.

See also

- *Chapter 1.8.3.1 "Configuring and Running Static Analysis" on page 4130*

Dialog 'Static Analysis Settings' - 'Rules'

Function: In the dialog, you select the rules that are checked during the static analysis of the source code of a project.

Call:

- Menu bar: *"Project ➔ Project Settings"*, *"Static Analysis"* category, *"Open configuration dialog"* link
- Menu bar: *"Build ➔ Static analysis ➔ Settings"*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

This tab shows a tree structure of all rules that can be checked during static analysis. By default, every rule is activated, with the exception of SA0016, SA0024, SA0073, SA0101, SA0105, SA0106, SA0133, SA0134, SA0150, SA0162, and all strict IEC rules.

Each rule has a unique number. When the rule is checked and a violation is detected, the rule number and an error description are shown in the message view in the *"Build"* category in the following format: **SA<rule number>**, where SA stands for "Static Analysis" (example: "SA003" for rule 3).

The list of available rules can be extended by specific plug-ins.

Some rules that are activated in the dialog can be deactivated temporarily in the application by applying a pragma.	
When you click the check box, the setting toggles between ☐, ☑, and ☑. When you activate or deactivate a parent node, all child rules are also activated or deactivated, respectively.	
"Filter":	• Input field for the strings to be searched for • : Rules are grouped by category. – *"Structured by Importance"*: Sorting by *"Importance High"*, *"Importance Medium"*, and *"Importance Low"* – *"Default"*: Default structuring of the rules in CODESYS Static Analysis • : Rules are displayed as a flat list. By clicking on the corresponding column header, the list can be sorted by rule number, activation/deactivation, rule-specific configuration, or importance.

Columns	
"Rules"	List of rules with rule number
Rule check	● ☐: The rule is not checked. ● ☑: If the result of the check is positive, then an error (§) for the static analysis is displayed in the message view. ● ☑: If the result of the check is positive, then a warning (§) for the static analysis is displayed in the message view.
"Precompile"	Rules which can be checked during precompile are identified by a check mark ✓ in this column. An immediate bugfix (Quickfix) is possible for these rules. You can execute an automatic, immediate error handling directly at the affected code positions.
"Rule specific configuration"	For some rules, you can double-click the field to open a rule-specific dialog to configure the rule.
"Importance":	Importance of the rule: ● 3 red stars: High ● 2 orange stars: Medium ● 1 gray star: Low

See also

- *Chapter 1.8.3.3.2 "Rules" on page 4154*
- *Chapter 1.8.3.3.1 "Pragmas and Attributes" on page 4149*
- *"Checking for compliance to rules" on page 4131*

Dialog 'Static Analysis Settings' - 'Naming Conventions'

Function: In the dialog, you define the prefixes for the data types and scopes of variables, as well as prefixes for POUs and user-defined data types (DUTs). Static analysis checks compliance with the naming conventions. When a convention is not observed, the static analysis reports an error message in the *"Messages"* view.

Call:

- Menu bar: *"Project* ➔ *Project Settings"*, *"Static Analysis"* category, *"Open configuration dialog"* link
- Menu bar: *"Build* ➔ *Static analysis* ➔ *Settings"*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

The error messages are displayed in the following format: § **`NC <prefix convention number> :`** `<message text>`. NC stands for "Naming Convention". For example, the error message "§*"NC0102: Invalid name..."*" means a violation of naming convention 102 for POUs of type `PROGRAM`.

> *You can use the pragma `'naming'` to deactivate naming conventions for individual identifiers. The identifiers can begin with anything, not necessarily with the prefix.*

"Filter"	Input field for strings to be searched for

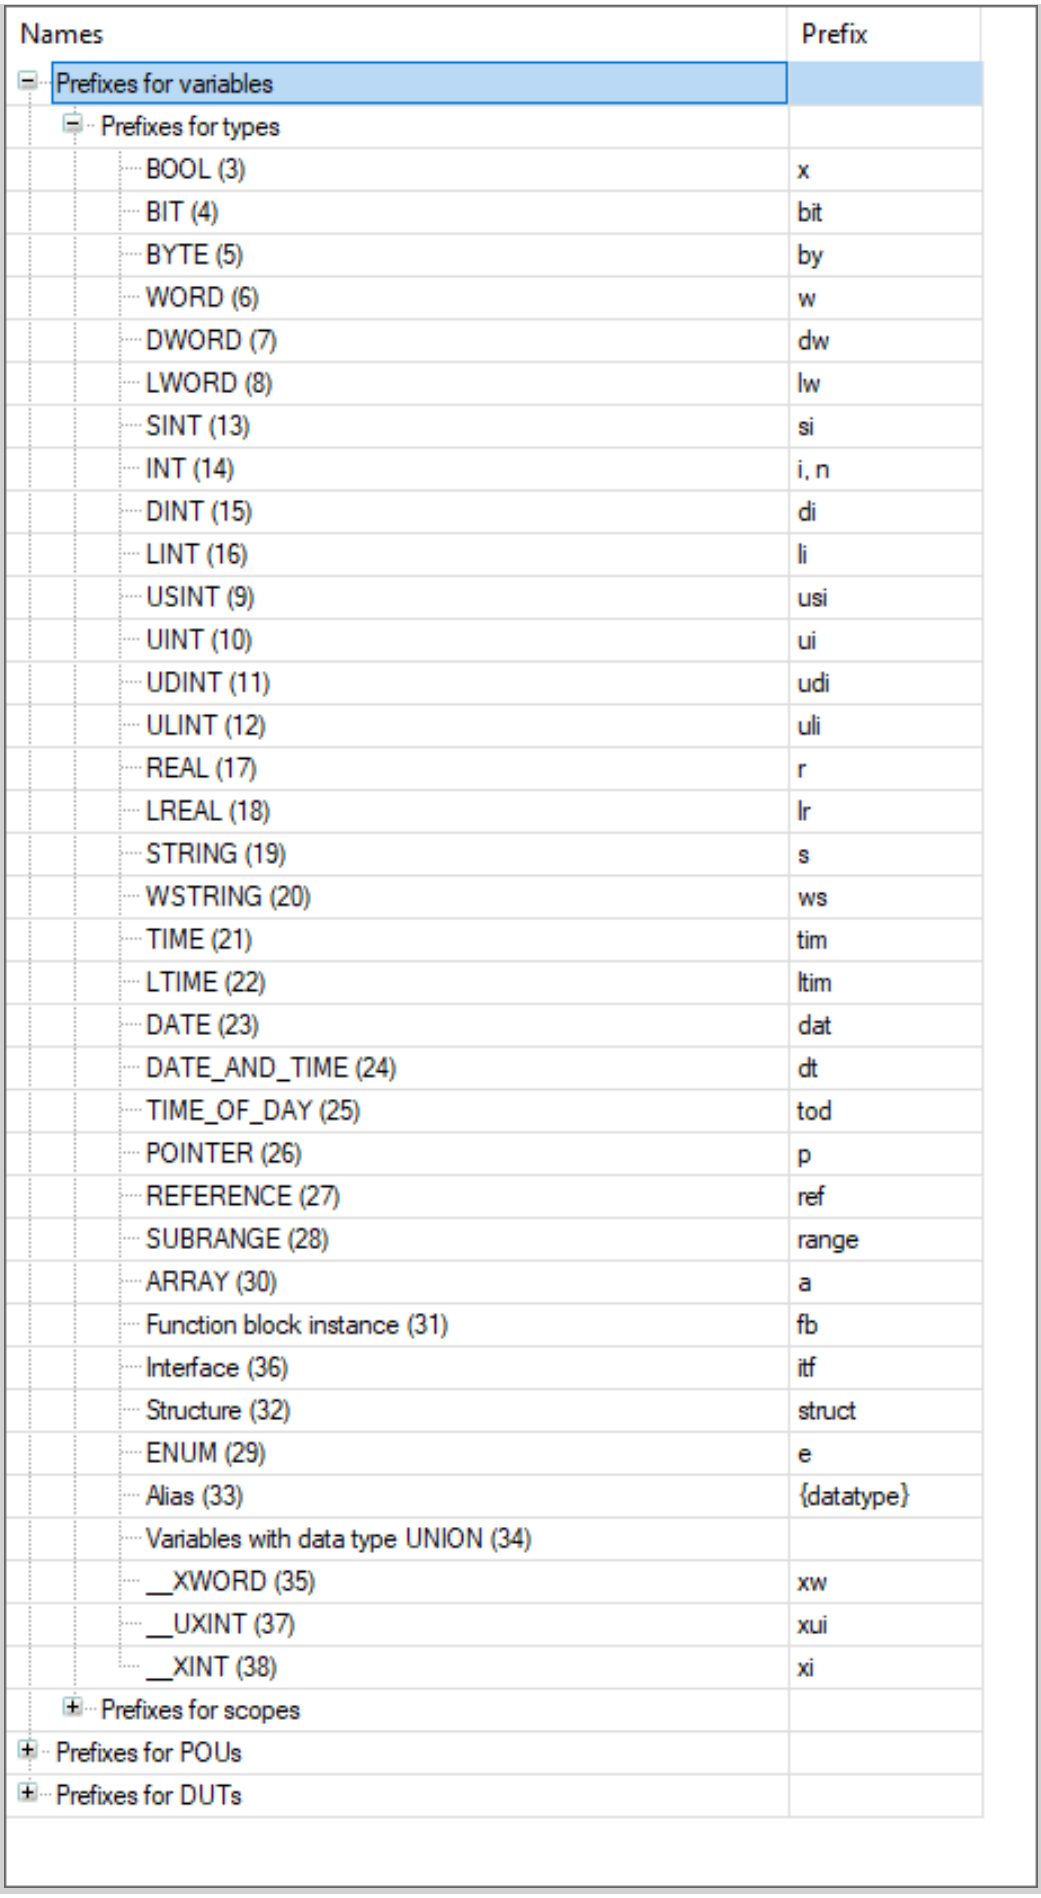
Table with the naming conventions	
“Names”	Nodes and elements for which a prefix can be defined. The number in parentheses after each element (for example, *“PROGRAM (102)”*) is the prefix convention number that is reported in the case of noncompliance with a naming convention.
“Prefix”	Input field of the prefix ● Multiple prefixes can be specified by means of comma separation. Example: *“Prefix for POUs”*, `PROGRAM (102):prog, PRG_` *“Prefix for POUs”*, `FUNCTION (103):fun, FUN_` ● Regular expressions (RegEx) are also possible for prefixes. To do this, an `@` has to be prepended. Example: The name has to begin with `x` and may contain one character from the scope `a-dA-D`: `@x[a-dA-D]`. ● For variables of type *“Alias”* and POUs of type *“Property”*, the prefix can be defined with the placeholder `{datatype}`.
“Prefixes for variables”	Organizational node for all variables for which a prefix can be defined dependent on data type or scope.
“Prefixes for POUs”	Organizational node for all POU types and method scopes for which a prefix can be defined
“Prefixes for DUTs”	Organizational node for the DUT data types (structure, enumeration, alias, or union) for which a prefix can be defined
“Prefixes for custom types”	Organizational node for special custom types (particularly those from libraries) You can extend the list with conventions: Click the blank space below it. In the *“Input Assistant”* dialog, specify the name of a custom type or select a custom type. To delete a convention, select it and press the *[Del]* key. Note: These conventions have priority over the prefixes which are defined with the attribute `{attribute 'nameprefix' := '<prefix>'}`.

Options	
“First character after prefix should be an upper case letter”	☑: Static analysis reports an error for a variable when the first character of the variable name after the defined prefix is not an uppercase letter.

“Combine scope prefix with data type prefix”	☑: As its namespace, a variable must have the defined prefix followed by the defined prefix for its data type. Example: The following prefixes are defined: `g_` for *“VAR_GLOBAL”*, and `r` for the data type *“REAL”*. The code analysis reports errors for global REAL variables that do not have the prefix `g_r`. ☐: If conventions for the namespace are specified for a variable, then these conventions are taken into account. As a result, any data type conventions are ignored. Example: The following prefixes are defined: `g_` for *“VAR_GLOBAL”*, and `r` for the data type *“REAL”*. The code analysis reports exclusively errors for global `REAL` variables that do not have the prefix `g_`.

“Recursive prefixes for combinable data types”	☑: Variables of combined data types have to have compound prefixes that follow the defined naming conventions.
	Example:
	`ppiVariable : POINTER TO POINTER TO INT;`
	The prefix `p` was defined for variables of data type `POINTER`, and the prefix `I` was defined for the data type `INT`. Static analysis reports errors for all variables of type `POINTER TO POINTER TO INT` which do not have the prefix `ppi`.
	`refaiVar : REFERENCE TO ARRAY[1..3] OF INT;`
	The prefix `ref` was defined for the data type `REFERENCE TO`, the prefix `a` for an array, and the prefix `I` for the data type `INT`. Static analysis reports errors for all variables of type `REFERENCE TO ARRAY[1..3] OF INT` which do not have the prefix `refai`.

Example	The following naming convention corresponds for the most part to the recommendations described in the "Identifiers" chapter.



Names	Prefix
Prefixes for variables	
Prefixes for types	
BOOL (3)	x
BIT (4)	bit
BYTE (5)	by
WORD (6)	w
DWORD (7)	dw
LWORD (8)	lw
SINT (13)	si
INT (14)	i, n
DINT (15)	di
LINT (16)	li
USINT (9)	usi
UINT (10)	ui
UDINT (11)	udi
ULINT (12)	uli
REAL (17)	r
LREAL (18)	lr
STRING (19)	s
WSTRING (20)	ws
TIME (21)	tim
LTIME (22)	ltim
DATE (23)	dat
DATE_AND_TIME (24)	dt
TIME_OF_DAY (25)	tod
POINTER (26)	p
REFERENCE (27)	ref
SUBRANGE (28)	range
ARRAY (30)	a
Function block instance (31)	fb
Interface (36)	itf
Structure (32)	struct
ENUM (29)	e
Alias (33)	{datatype}
Variables with data type UNION (34)	
__XWORD (35)	xw
__UXINT (37)	xui
__XINT (38)	xi

- *Identifiers*
- *Data Type Alias*
- *PROPERTY*

Dialog 'Static Analysis Settings' - 'Metrics'

Function: In the dialog, you select the metrics to be displayed for each POU in the *“Standard Metrics”* view by means of the *“Build ➔ Static Analysis ➔ View Standard Metrics”* command.

Call:

- *“Open configuration dialog”* button in the menu *“Project ➔ Project Settings”*, *“Static Analysis”* category
- Menu bar: *“Build ➔ Static analysis ➔ Settings”*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

The “Code size”, “Variable size”, “Stack size”, and “Calls” metrics are reported only for POUs from libraries which are integrated in the project.

Violations of the upper and lower limits of the activated metrics can be reported as build errors by means of static analysis rule `SA0150`.

“Metrics”	All selectable metrics are displayed in the column.
“Active”	☑: The metric is displayed for each POU in the *“Standard Metrics”* view following the *“Build ➔ Static Analysis ➔ View Standard Metrics”* command. ☐: The metric is not displayed in the *“Standard Metrics”* view following the *“Build ➔ Static Analysis ➔ View Standard Metrics”* command.
“ Lower limit”	Lower value from which the *“Metric”* is displayed
“Upper Limit”	Upper value to which the *“Metric”* is displayed

See also

- *“Displaying of metrics” on page 4133*
- *Chapter 1.8.3.3.2.52 “SA0150: Violations of lower or upper limits or the metrics” on page 4220*

Dialog 'Static Analysis Settings' - 'Forbidden Symbols'

Function: In the dialog, you define the keywords and symbols that must not be used in the project code.

Call:

- *“Open configuration dialog”* button in the menu *“Project ➔ Project Settings”*, *“Static Analysis”* category
- Menu bar: *“Build ➔ Static analysis ➔ Settings”*

Requirement:

- The CODESYS Static Analysis package is installed.
- A project is open.

Input line	Double-clicking the line opens the line editor for specifying a keyword or symbol. …: The Input Assistant opens for selecting the keyword or symbol.

See also

- *“Checking for forbidden symbols” on page 4132*

1.8.3.3 Reference, Programming

1.8.3.3.1 Pragmas and Attributes

CODESYS Static Analysis provides pragmas and attributes for activating or deactivating individual rules or naming conventions for static code analysis.

Requirement: The rules or conventions are activated or defined in the project settings.

Attributes are inserted in the declaration part of a POU to deactivate specific rules for an entire programming object.

Pragmas are used in the implementation part of a POU to deactivate specific rules for individual lines of code. One exception is Rule 164, which can also be switched off in the declaration part.

Rules that are deactivated in the project settings cannot be activated by means of pragmas or attributes.

Rule SA0004 cannot be deactivated by means of a pragma or an attribute.

See also

- *Chapter 1.8.3.3 “Reference, Programming” on page 4148*

Pragma 'analysis'

This pragma is used to deactivate the code rules for individual code lines of a POU. You deactivate code rules by specifying the rule numbers with a prepended minus sign ("-"). A prepended plus sign ("+") activates the rule. You can specify any number of rules in the pragma.

Insert location: Deactivation: In the implementation part, with `{analysis - ...}` before the first code line where the code analysis is deactivated. Activation: With `{analysis + ...}` after the last line of the deactivation. For Rule 164, the pragma can also be inserted in the declaration part before a comment.

Syntax:

```
Deactivation of rules:

{analysis -<rule number> ( , -<additional rule number> )* }
* : optional none, one or more additional rule numbers

Activation of rules:

{analysis +<rule number> ( , +<additional rule number> )* }
* : none, one or more additional rule numbers
```

Example

Rule 24 is deactivated for two lines and then reactivated. As a result, rule 24 is not checked in these lines so that `nTest:=DINT#99` is allowed for example.

```
  {analysis -24}
 nTest := 99;
 iVar := INT#2;
 {analysis +24}
```

Deactivating multiple rules:

```
 {analysis -10, -24, -18}
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Attribute 'analysis'

The attribute deactivates specific rules for an entire programming object. You deactivate the code rules by specifying the rule numbers with a prepended minus sign ("-"). You can specify any number of rules in the attribute.

Insert location: In the declaration part of a POU, in the first line.

Syntax:

```
{attribute 'analysis' := '-<rule number> ( , -<additional rule
number> )* '}
* : none, one or more additional rule numbers
```

Example

Rules 33 and 31 are deactivated for the entire structure:

```
{attribute 'analysis' := '-33, -31'}
TYPE My_Structure :
STRUCT
    iLocal : INT;
    uiLocal : UINT;
    udiLocal : UDINT;
END_STRUCT
END_TYPE
```

Rule 100 is deactivated for the array:

```
{attribute 'analysis' := '-100'}
PROGRAM PLC_PRG
VAR
    aBigData: ARRAY[1..10000] OF DWORD;
    aBigDATA_2: ARRAY[1..10000] OF DWORD;
END_VAR
;
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Attribute 'naming'

The attribute marks the code lines that are excluded from the analysis of naming convention. An `off` is assigned to the pragma attribute before the first code line where the code analysis is deactivated. An `on` is assigned after the last line. When an `omit` is assigned, only the next code line is ignored.

Insert location: Deactivation: In the declaration part of POUs and DUTs, above the affected lines. Activation: Below the affected lines.

Syntax:

```
{attribute 'naming' := '<switch state>'}
<switch state> : on | off | omit
on : naming is switched on
off : naming is switched off
omit : only next code line is switched off
```

Example

Defined naming conventions: 1) INT variable names must be prepended with "int" as the identifier prefix, for example "intVar1". 2) Program names must begin with "prog".

For the code presented below, the static analysis issues messages only for the following variables: `cccVar`, `aVariable`, and `bVariable`.

```
VAR
{attribute 'naming' := 'off'}
    iVarA : INT;
    iVarB : INT;
{attribute 'naming' := 'on'}
    iVarC : INT;
END_VAR

VAR
    ...
{attribute 'naming' := 'omit'}
    iVarC : INT;
...
END_VAR

{attribute 'naming' := 'omit'}
PROGRAM PLC_PRG
VAR
...
END_VAR

{attribute 'naming' := 'off'}
PROGRAM DoSomethingA
VAR
{attribute 'naming' := 'on'}
    iVarA : INT;
    iVarB : INT;
        …
VAR_END
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Attribute 'nameprefix'

The attribute defines a prefix for variables of a structured data type. The prefix must be prepended to the identifier of variables that are declared by this type.

Insert location: In the line before the declaration of a structured data type

Syntax:

```
{attribute 'nameprefix' := '<prefix>'}
```

Example

In the following example, Static Analysis issues a message for pB because the variable name does not begin with "point".

```
{attribute 'nameprefix' := 'point'}
TYPE DATAPOINT :
STRUCT
    iX: INT;
    iY: INT;
END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
    pointA : DATAPOINT;
    pB : DATAPOINT;
END_VAR
pointA.iX := 1;
pointA.iY := 10;
pB.iX := 2;
pB.iY := 20;
```

Error message after static analysis: *“Invalid variable name 'pB'. Expect prefix 'point'”*

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Attribute 'analysis:report-multiple-instance-calls'

The attribute marks a function block for checking for rule 105: Only function blocks with this attribute are checked whether the function block instances are called more than one time. If rule 105 is deactivated in the project settings, then the attribute does not have any effect.

Insert location: Top line in the declaration part of a function block.

Syntax:

```
{attribute 'analysis:report-multiple-instance-calls'}
```

Example

```
// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DoA
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iA : INT;
END_VAR
iA := iA + 1;

{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iB : INT;
END_VAR
iB := iB +1;

PROGRAM PLC_PRG
VAR
    fbA : FB_DoA;
    fbB : FB_DoB;
ND_VAR

fbA();
fbB();    // SA0105
fbA();
fbB();    // SA0105

--> SA0105: Instance 'fbB' called more than once
```

See also

- *Chapter 1.8.3.3.2.46 “SA0105: Multiple instance calls” on page 4206*
- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

1.8.3.3.2 Rules

SA0001: Unreachable code

Detects lines of code that are not executed, for example due to a RETURN or CONTINUE statement

Justification: Unreachable code should always be avoided. The test often indicates that test code still exists which should be removed.

Importance: High

PLCopen rule: CP2

Example

```
PROGRAM PLC_PRG
VAR
    xReturn_Before_End: BOOL;
    xContinue_In_Loop_FUN: BOOL;
    iCounter: INT;
END_VAR

xContinue_In_Loop_FUN := FALSE;
FOR iCounter := INT#0 TO INT#5 BY INT#1 DO
  CONTINUE;
  xContinue_In_Loop_FUN := FALSE;
END_FOR

--> SA0001: Unreachable code detected in 'PLC_PRG'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0002: Empty objects

Detects POUs, GVLs, data type declarations, or interfaces that do not contain any code

Justification: Empty objects should be avoided. They are often a sign that an object has not been implemented completely. Exception: In some cases, no code is specified in the body of a function block when it should be used by interfaces only. In other cases, a method is created only because it is required by an interface without a sensible implementation being possible for the method. No matter the case, this kind of situation should be commented.

Importance: Medium

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0003: Empty statements

Detects lines of code that have a semicolon (`;`) but not a statement

Justification: An empty statement can be a sign for missing code.

Note: There are good reasons for using empty statements. For example, in a CASE statement it can make sense to explicitly program out all cases, even those where there is nothing to do. When this kind of empty CASE statement contains a comment, Static Analysis does not generate an error message.

Importance: Low

Examples

```
CASE value OF
1:DoSomething();
2:;
3:DoSomethingElse();
END_CASE

--> SA0003: Empty statements
```

```
CASE value OF
1:DoSomething();
2:;              //nothing to do
3:DoSomethingElse();
END_CASE

--> No SA error
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0004: Multiple write access on output

Detects outputs that are written to more than one location

Justification: The maintainability is degraded when an output is written in different locations in the code. Then it is uncertain which write access is the one that actually has an effect in the process. Good practice is to calculate the output variables in auxiliary variables and assign the calculated value at one location at the end of the cycle.

Importance: High

PLCopen rule: CP12

An error is not issued when an output variable (`VAR_IN_OUT`) is written in different branches of `IF` and `CASE` statements.

A pragma cannot deactivate this rule.

Example

```
VAR_GLOBAL
    g_xVar AT %QX0.0 : BOOL ;
    g_iTest AT %QW0 : INT ;
END_VAR

PROGRAM PLC_PRG
IF g_iCondition < INT#0 THEN
    g_xVar := TRUE;
    g_iTest := INT#12;
END_IF

CASE g_iCondition OF
    INT#1:
        g_xVar := FALSE;
    INT#2:
        g_iTest := INT#11;
    ELSE
        g_xVar := TRUE;
        g_iTest := INT#9;
END_CASE

--> SA0004: Multiple write access on output '%QX0.0'
--> SA0004: Multiple write access on output '%QW0'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0006: Write access from several tasks

Detects variables that are written by more than one task

Justification: A variable that is written in multiple tasks may change its value unexpectedly. This can lead to confusing situations. String variables (and on some 32-bit systems also 64-bit integer variables) can even reach an inconsistent state if the variable is written to two tasks simultaneously.

Exception: In specific cases, it may be necessary for several tasks to write a variable. For example, use semaphores to make sure that access does not lead to an inconsistent state.

Importance: High

PLCopen rule: CP10

Example

```
VAR_GLOBAL
    g_iTemp1: INT;
END_VAR

PROGRAM PLC_PRG    // Controlled by MainTask
g_iTemp1 := g_iTemp1 + INT#2;

PROGRAM PLC_PRG_1  //Controlled by SubTask
g_iTemp1 := g_iTemp1 - INT#3;

--> SA0006: Concurrent write access to 'g_iTemp1' in Tasks
MainTask, SubTask
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0007: Address operator on constants

Detects lines of code where the operator `ADR` is applied for a constant

Justification: Using a pointer to a constant variables overrides the `CONSTANT` property of the variable. The variable can be changed by means of the pointer without any notification from the compiler.

Exception: In rare cases, it might be useful to pass a pointer to a constant to a function. However, you have to make sure that this function does not change the transferred value. Whenever possible, use `VAR_IN_OUT CONSTANT`.

Importance: High

When the “replace constants” option is selected in the “Compiler options” of the project settings, the address operator is not permitted for scalar constants (integer, BOOL, REAL) and a complie error is issued. (Constant strings, structures, and arrays always have an address.)

Example

```
PROGRAM PLC_PRG
VAR CONSTANT
    c_iValue : INT := INT#15;
END_VAR
VAR
    poiValue : POINTER TO INT;
END_VAR
poiValue := ADR(c_iValue); // SA0007

--> SA0007: Address to constant variable 'c_iValue'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0008: Check subrange types

Detects out-of-range violations of subrange types. Assigned literals are already checked by the compiler. When constants are assigned, then the values must be within the defined range. When variables are assigned, then the data types must be identical.

Justification: If subrange types are used, then make sure that this subrange is not exited. The compiler checks for these kinds of subrange violations only for assignments of constants.

Importance: Low

The check is not performed for CFC objects because the code structure does not allow for it.

Example

```
VAR_GLOBAL
      iVarGlob:INT;
END_VAR

PROGRAM PLC_PRG
VAR
   iSubr1: INT (INT#1..INT#10);
   iSubr2: INT (INT#1..INT#1000);
   iCount: INT;
   by_SubType : BYTE (BYTE#0..BYTE#11);
   iVar : INT (-4095..4095);
END_VAR
   iSubr1 := nCount;              // SA0008
   iSubr1 := subr2;               // SA0008
   iSubr1 := gvl.iVarGlob;        // SA0008
   //byBYTE_SubType := BYTE#123;  //already detected by compiler,
error "Cannot convert type..."

--> SA0008: Subrange variable 'iSubr1' maybe out of allowed range
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0009: Unused return values

Detects function, method and property calls in which the return value is not used

Justification: When a function or method returns a return value, it should also be evaluated. The return value often indicates whether or not the function was executed successfully. If not, then you will not be able to identify later whether the return value was forgotten or if it is actually not needed.

Exception: If a return value is irrelevant to the call, then you can document this and omit the assignment. Error returns should never be ignored.

Importance: Medium

PLCopen rule: CP7 / CP17

Example

```
FUNCTION Return_BOOL : BOOL
VAR_INPUT
END_VAR
VAR
    xTest : BOOL;
END_VAR
xTest := FALSE;
Return_BOOL := xTest;

PROGRAM PLC_PRG

Return_BOOL ();  // SA0009

--> SA0009: Ignoring return value of 'Return_Bool'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0010: Arrays with only one component

Detects arrays with only one element

Justification: An array with one element can be replaced by a base-type variable. Access to this variable is considerably faster than access by index to the variable.

Exception: The length of an array is often determined by a constant and is a parameter for a program. Then the program can work with arrays of different lengths and does not have to be changed if the length is only 1. This kind of situation should be documented accordingly.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    aoiEmpty : ARRAY [22..22] OF INT;
    aorEmpty : ARRAY [1..1] OF REAL;
END_VAR

aoiEmpty;
aorEmpty;

--> SA0010: Vacuous array element in variable 'aoiEmpty'
--> SA0010: Vacuous array element in variable 'aorEmpty'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0011: Useless declarations

Detects structures or enumerations with only one component

Justification: This kind of declaration can be confusing for the reader. A structure with only one element can be replaced by an alias type. An enumeration with only one element can be replaced by a constant.

PLCopen rule: CP22 / CP24

Importance: Low

Example

```
TYPE SingleStruct :
STRUCT
    iPart : INT;
END_STRUCT
END_TYPE

TYPE myUnion :
UNION
    lrValue : LREAL;
END_UNION
END_TYPE

TYPE SingleEnum :
(
    OnlyOne := 1
);
END_TYPE

--> Useless declaration 'SingleStruct'
--> Useless declaration 'myUnion'
--> Useless declaration 'SingleEnum'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0012: Variable which could be declared as constants

Detects variables that are not accessed with write permission and therefore could be declared as constants

Justification: If a variable is written only at the declaration point and is otherwise used only for reading, then the static analysis assumes that the variable should also not to be changed. Firstly, a declaration as a constant results in checking that the variable is not changed when the program is changed. Secondly, the declaration as a constant may result in faster code.

> **NOTICE!**
> If multiple applications exist in one project, then only the objects below the currently active application are affected. If there is only one application, then the objects in the common POU pool are also affected.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    iVar : INT := INT#17;
    iTest : INT;
END_VAR
iTest := iTest + iVar;   // SA0012: iVar could be declared as
constant

--> SA0012: Variable 'iVar' could be declared as constant
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0013: Declarations with the same variable name

Detects variables with names that are already used by other variables (for example, global and local variables with the same name). Also detects variables with names of functions, actions, methods, or properties which are used in the same access scope. Variables are also detected that are declared in a GVL in the *“Devices”* view or in the POUs pool. For this, however, the GVL of the *“POUs”* view have to be used in the application program.

Justification: The same names can be confusing when reading the code, and they can cause errors if the wrong object is accessed unintentionally. We recommend that you use naming conventions to avoid these situations.

PLCopen rule: N5 / N9

Importance: Medium

Example

```
VAR_GLOBAL
    xVar1 : BOOL;
    iVar3 : INT;
END_VAR

PROGRAM PLC_PRG
VAR
    xVar1 : BOOL;  // SA0013
    iVar3 : INT;   // SA0013
END_VAR

xVar1 := NOT GVL.xVar1;
iVar3 := iVar3 + INT#2;
iVar3 := GVL.iVar3;

--> SA0013: Declaration of 'iVar1' hides symbol 'GVL.iVar1
--> SA0013: Declaration of 'xVar3' hides symbol 'GVL.xVar3
```

Example The function block `POU` has the action `ACT` and the method `METH`.

```
FUNCTION_BLOCK POU
VAR
    ACT : UINT;  // SA0013
    METH : BYTE; // SA0013
END_VAR

--> SA0013: Declaration of 'ACT' hides symbol 'POT.ACT'
--> SA0013: Declaration of 'METH' hides symbol 'POT.METH'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0014: Assignment of instances

Detects assignments to function block instances. In the case of instances with pointer or reference variables, these assignments are potentially risky.

Justification: This is a performance warning. When an instance is assigned to another instance, all elements and subelements are copied from the one instance to the other instance. Pointers to data are also copied, but not their referenced data, so that the target instance and the source instance contain the same data after the assignment. Depending on the size of the instances, this kind of assignment could last a long time. For example, if an instance should be passed to a function for processing, then it is much more efficient to pass a pointer to the instance. If you want to selectively copy values from one instance to another, then a copy method is useful: `inst_First.Copy_From(inst_Second)`.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    inst_First : My_FB;
    inst_Second : My_FB;
END_VAR
inst_First();
inst_Second := inst_First;  // SA0014

--> SA0014: Assignment of instances
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0015: Access to global data via FB_Init

Detects the access of a function block to global variables by means of the method `FB_Init`. The value of this variable depends on the order of initializations.

Justification: Depending on the declaration location of the POU instance, an uninitialized variable could be accessed if the rule is violated.

Importance: High

Example

```
VAR_GLOBAL
    g_xTest1 : BOOL;
    g_iTest3 : INT;
END_VAR

METHOD PUBLIC fb_init : BOOL
VAR_INPUT
  bInitRetains : BOOL; // If TRUE, the retain variables are
initialized (warm start / cold start)
  bInCopyCode : BOOL;  // If TRUE, the instance afterwards gets
moved into the copy code (online change)
END_VAR
g_xTest1 := NOT g_xTest1;       // SA0015
g_iTest3 := g_iTest3 + INT#1;   // SA0015

--> SA0015: FB_Init method of function block 'POU' accesses global
data
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0016: Gaps in structures

Detects gaps in structures or function blocks that are caused by the alignment requirements of the currently set target system. If possible, you should remove the gaps by resorting the structure elements or filling them with a dummy element. If this is not possible, then you can deactivate the rule for the affected structures by means of the `analysis` pragma.

Justification: Due to different alignment requirements on different platforms, there may be a different layout in the memory for these kinds of structures. Then the code can perform differently, depending on the platform.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    myStruct : Unpadded_Structure;
END_VAR
myStruct.iTest := 0;

TYPE Unpadded_Structure :
STRUCT
    xTest : BOOL;
    iTest : INT;    // SA0016
    byTest : BYTE;
    wTest : WORD;
END_STRUCT
END_TYPE

--> SA0016: Structure 'Unpadded_Structure' must be padded (pack-
mode=8)
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0017: Non-regular assignments

Detects assignments to pointers that are neither addresses (`ADR` operator, pointer variables) nor constants `0`

Justification: If a pointer contains a value that is not a valid address, then an access violation exception occurs when dereferencing the pointer.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    pInt : POINTER TO INT;
    dwAddress : DWORD;
END_VAR
dwAddress := dwAddress + DWORD#1;
pInt := dwAddress; // SA0017

--> SA0017: Non-regular assignment
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0018: Unusual bit access

Detects bit access to signed variables. However, the IEC 61131-3 standard permits only bit access and bit shift operations on bitfields. See also the strict rules SA0147 and SA0148.

Justification: Signed data types should not be used as bitfields and the other way around. The IEC 61131-3 standard does not provide for this kind of access, and therefore you should comply with this rule when you write portable code.

Importance: Medium

Exception for flag enumerations: When an enumeration is declared as a flag by means of the `{attribute 'flags'}` pragma attribute, the `SA0018` error is not issued for bit access with the `OR`, `AND` or `NOT` operators.

Example

```
PROGRAM PLC_PRG
VAR
    iTemp1 : INT;
    diTemp3 : DINT;
    uliTemp4 : ULINT;
    siTemp5 : SINT;
    usiTemp6 : USINT;
    byTemp2 : BYTE;
END_VAR
iTemp1.3 := TRUE;     // SA0018
diTemp3.4 := TRUE;    // SA0018
uliTemp4.18 := FALSE; // no error because this is an unsigned data
type
siTemp5.2 := FALSE;   // SA0018
usiTemp6.3 := TRUE;   // no error because this is an unsigned data
type
byTemp2.5 := FALSE;   // no error because the byte is a bitfield

--> SA0018: Unusual bit access
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*
- *Chapter 1.8.3.3.2.49.12 “SA0147: Unusual shift operation - strict” on page 4214*
- *Chapter 1.8.3.3.2.49.13 “SA0148: Unusual bit access - strict” on page 4215*

SA0020: Possibly assignment of truncated value to REAL variable

Detects operations on integer variables for which a truncated value could be assigned to a `REAL` data type variable

Justification: Static analysis issues an error when the result of an integer calculation is assigned to a `REAL` or `LREAL` variable. The programmer should be alerted to a possible incorrect interpretation of this kind of assignment: `lrealvar := dintvar1 * dintvar2`. Because the range of values of `LREAL` is greater than that of `DINT`, one could assume that the result of the calculation could always be represented in `LREAL`. But that is not the case. The processor calculates the result of the multiplication as an integer and then casts the result to `LREAL`. An overflow in the integer calculation would be lost. To work around the problem, the calculation has to be done as a `REAL` operation: `lreal_var := TO_LREAL(dintvar1) * TO_LREAL(dintvar2)`.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
 rx : LREAL;
 di : DINT;
END_VAR
rx := di * di                                  // SA0020
rx := TO_LREAL(di) * TO_LREAL(di) // No message

--> SA0020: Possibly assignment of truncated value to REAL variable
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0021: Transporting the address of a temporary variable

Detects address assignments of temporary variables (on the stack) to non-temporary variables

Justification: Local variables of a function or method are created on the stack and they exist only while the function or method is being processed. If a pointer points to this kind of variable after processing the method or function, then you can use this pointer to access undefined memory, or to access an incorrect variable in another function. This situation should be avoided at all costs.

Importance: High

Example

```
FUNCTION TempVarInFUNC : DWORD
VAR
    uiTemp : UINT;
END_VAR
TempVarInFUNC := ADR(uiTemp);    // SA0021

PROGRAM PLC_PRG
VAR
    dwTest : DWORD;
END_VAR
dwTest := TempVarInFUNC();

--> SA0021: Transporting address of temporary variable to outer
scope symbol
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0022: (Possibly) unassigned return value

Detects all functions and methods that include an execution thread without an assignment to the return value

Justification: An unassigned return value in a function or method is an indication of missing code. Even if the return value always has a default value, it is always useful to assign it again explicitly to avoid confusion.

Importance: Medium

Example

```
FUNCTION FUN : DINT
VAR_INPUT
    bTest : BOOL;
END_VAR

IF bTest THEN
    RETURN;
END_IF
FUN := 99;

--> SA0022: (Possibly) unassigned return value
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0023: Complex return values

Determines complex return values that cannot be returned with a simple registry copy of the processor. This includes structures, arrays, and return values of type `STRING` (regardless of the size of the used memory).

Justification: This is a performance warning. If large values are returned as the result of a function, method, or property, then the processor copies them multiple times when executing the code. This can lead to runtime problems and should be avoided whenever possible. Performance can be improved by passing a structured value as `VAR_IN_OUT` to a function or method and filling it in the function or method.

Importance: Medium

Example

```
TYPE LargeStructure :
STRUCT
    a : LINT;
    b : BOOL;
END_STRUCT
END_TYPE

FUNCTION Large_Return_Value_FUNC : LargeStructure   // SA0023

--> SA0023: Complex return values
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0024: Untyped literals / constants

Detects untyped literals and constants

Justification: CODESYS assigns types for literals depending on their use. In some cases, this can cause unexpected problems, which should be resolved better with a typed literal. For example: `dw := ROL(DWORD#1, i)`

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    iTemp1 : INT = 10;     // SA0024
    diTemp2 : DINT;
    liTemp3 : LINT;
    rTemp4 : REAL;
    lrTemp5 : LREAL;
END_VAR
iTemp1 := iTemp1 + INT#34;
diTemp2 := diTemp2 + 23;   // SA0024
liTemp3 := liTemp3 + 124;  // SA0024
rTemp4 := rTemp4 + 1.1;    // SA0024
lrTemp5 := lrTemp5 + 3.4;  // SA0024

--> SA0024: Untyped literal found
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0025: Unqualified enumeration constants

Detects enumeration constants for which a qualified name does not prepend the enumeration

Justification: Qualified access makes the code more readable and easier to maintain. Without forcing qualified variable names, an additional enumeration could be inserted when the program is extended. This enumeration contains a constant with the same name as an existing enumeration (see the example below: "red"). This would result in ambiguous access to this piece of code. We recommend to always use only enumerations with the {attribute 'qualified-only'}.

Importance: Medium

Example

```
TYPE COLOR
(red,green,blue);
END_TYPE

PROGRAM PLC_PRG
enumVar : COLOR;

enumVar := COLOR.red; // SA0025
enumVar := red;       // SA0025

--> SA0025: Enumeration constant 'red' not qualified
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0026: Possible truncated strings

Detects string assignments and string initializations that do not use sufficient string length

Justification: When strings of different lengths are assigned, a string could be truncated. This can have unexpected results.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    strVar1 : STRING[10];
    strVar2 : STRING[6];
    strVar3 : STRING[6] := 'abcdefghi';  // SA0026
END_VAR

strVar2 := strVar1;                      // SA0026

--> SA0026: Truncation of string 'abcdefghi'
--> SA0026: Possible truncation of string 'strVar1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0027: Multiple uses of identifiers

Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project

Justification: Same names can be confusing when reading the code. They can cause errors if the wrong object is accessed accidentally. Define and follow naming conventions to avoid any situation like this.

The following cases are detected:

- The name of an enumeration is identical to the name of another enumeration in the application or in an integrated library.
- The name of a variable is identical to the name of another object in the application or in an integrated library.
- The name of a variable is identical to the name of an enumeration constant in an enumeration in the application or in an integrated library.
- The name of an object is identical to the name of another object in the application or in an integrated library.

Importance: Medium

Example

The `Standard` library is integrated in the project and provides the `TON` function.

```
PROGRAM PLC_PRG
VAR
ton : INT;
END_VAR

--> Variable name 'ton' in 'PLC_PRG' already used for an object in
library 'standard, ...'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0028: Overlapping memory areas

Detects the lines of code where two or more variables reserve the same memory

Justification: When two variables reserve the same memory, the code may behave with unexpected results. This situation should be avoided at all costs. If you cannot avoid using a value in different interpretations (for example, one time as `DINT` and another time as `REAL`), then you should define a `UNION`. You can also use a pointer to access a value with a different type without the value being converted.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
iVvar1 AT %QB21: INT;
dwVar2 AT %QD5: DWORD;
END_VAR

--> The following variables access the same memory:
--> SA0028: iVar1 AT %QB21
--> SA0028: dwVar2 AT %QD5
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0029: Notation in code different to declaration

Detects the code locations where the notation of an identifier is different from the notation in its declaration

Justification: The IEC 61131-3 standard defines identifiers as not case-sensitive. This means that a variable declared as "varx" can also be used as "VaRx" in the code. However, this is confusing and misleading and should be avoided.

Importance: Medium

Example A POU `PLC_PRG` and a POU `fnc` (function) exist in the device tree.

```
PROGRAM PLC_PRG
VAR
    iVar: INT;
    _123test_var_: INT;
END_VAR

ivar := iVar + 1;                   // SA0029
_123TEST_var_ := _123test_var_;        // SA0029
Fnc();                              // SA0029

--> SA0029: Notation in code (ivar) must equal declaration (iVar)
--> SA0029: Notation in code (_123TEST_var_) must equal declaration
(_123test_var_)
--> SA0029: Notation in code (Fnc) must equal declaration (fnc)
```

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Unused Objects

SA0031: Unused signatures

Detects programs, function blocks, functions, data types, interfaces, methods, properties, and actions that are not called within the compiled program code

Justification: Unused objects unnecessarily increase the size of the project and can be confusing when reading the code.

Importance: Low

PLCopen rule: CP2

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the POU pool are also affected.

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0032: Unused enumeration constants

Detects enumeration constants that are not used in the compiled program code

Justification: Unused enumeration constants unnecessarily increase the size of the enumeration definition and can be confusing when reading the program.

PLCopen rule: CP24

Importance: Low

If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example

```
TYPE My_Enum :
(
    one := 1, two := 2
);
END_TYPEE

--> SA0032: Unused enumeration constant 'one'
--> SA0032: Unused enumeration constant 'two'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0033: Unused variables

Detects variables that are declared but not used within the compiled program code

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP22 / CP24

For GVL variables:If multiple applications exist in a project, then only the objects below the currently active applications are affected. If there is only one application, then the objects in the common POU pool are also affected.

Example

```
PROGRAM PLC_PRG
VAR
    iCounter1 : INT;
    iCounter2 : INT;        // SA0035
END_VAR

ICounter1 := 100;

--> SA0035: Unused Variable 'iCounter2'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0035: Unused input variables

Detects input variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP24

Example

```
FUNCTION_BLOCK AFB
VAR_INPUT
    iIn1: INT;
    iIn2: INT;
END_VAR
VAR_OUTPUT
    iOut1: INT;
END_VAR

PROGRAM PLC_PRG
VAR
    Fb1: AFB;
END_VAR

Fb1(iIn1 := 99)

--> SA0035: Unused input 'iIn2'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0036: Unused output variables

Detects output variables that are not used by any function block instance

Justification: Unused variables make a program less readable and maintainable. Unused variables unnecessarily fill memory and unnecessarily waste runtime during initialization.

Importance: Medium

PLCopen rule: CP24

Example

```
FUNCTION_BLOCK AFB
VAR_INPUT
    iIn1: INT;
    iIn2: INT;
END_VAR
VAR_OUTPUT
    iOut1: INT;
END_VAR

PROGRAM PLC_PRG
VAR
    Fb1: AFB;
END_VAR
Fb1(iIn1 := 99)

--> SA0036: Unused output 'iOut1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0034: Enumerations with incorrect assignment

Detects values that are assigned to an enumeration variable. Only defined enumeration constants of an enumeration variable are permitted to be assigned.

Justification: A variable of the enumeration type should have only the intended values, otherwise the code that uses this variable may not work correctly. We recommend to always use enumerations with the `{attribute 'strict'}`. Then the compiler already checks the correct use of the enumeration components.

Importance: High

Example

```
TYPE COLOR :
(
    Red := 0,
    Green,
    Yellow
);
END_TYPE

PROGRAM PLC_PRG
VAR
    eColor1: COLOR;
END_VAR

eColor1 := COLOR.Red;
eColor1 := 1;         // SA0034

--> SA0034: Use enumeration value instead of 'INT#1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0037: Write access to input variable

Detects input variables (VAR_INPUT) that are accessed with write permission within the POU

Justification: According to the IEC 61131-3 standard, an input variable must not be changed within a POU. This kind of access is also a cause for errors and makes the code poorly maintainable. This is an indication that a variable is used as both an input variable and an auxiliary variable. This kind of dual use should be avoided.

Importance: Medium

Example

```
VAR_GLOBAL
    g_xGlob AT %QX0.0 : BOOL;
END_VAR

PROGRAM PLC_PRG
VAR_INPUT
    xVarIn1:BOOL;
    xVarIn2:BOOL;
END_VAR
VAR
    iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
    INT#1:
    g_xGlob := xVarIn1;
    INT#2:
    g_xGlob := xVarIn2;
ELSE
    g_xGlob := FALSE;
        xVarIn1 := FALSE;     // SA0037
END_CASE

--> SA0037: Write access to input variable 'xVarIn1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0038: Read access to output variable

Detects output variables (VAR_OUTPUT) that are accessed with read permission within the POU

Justification: According to the IEC 61131-3 standard, it is prohibited to read an output within a POU. This is an indication that the output is not only used as an output but also as a temporary variable for intermediate results. This kind of dual use should be avoided.

Importance: Low

Example

```
VAR_GLOBAL
    g_xGlob AT %QX0.0 : BOOL ;
    g_iGlob AT %QW1 : INT ;
END_VAR

PROGRAM PLC_PRG
VAR_OUTPUT
    xVarOut1:BOOL;
    xVarOut2:INT;
    xVarOut3:INT;
END_VAR
VAR
    iCondition : INT;
END_VAR

iCondition := iCondition + INT#1;
CASE iCondition OF
    INT#1:
        xVarOut1 := g_xGlob;
        xVarOut2 := g_iGlob;
    INT#2:
        xVarOut3 := xVarOut2;  // SA0038
    ELSE
        xVarOut1 := FALSE;
        g_xGlob := xVarOut1;     // SA0038
        xVarOut2 := INT#0;
        xVarOut3 := INT#-1;
END_CASE

--> SA0038: Read access to output variable 'xVarOUT2'
--> SA0038: Read access to output variable 'xVarOUT1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0040: Possible division by zero

Detects code locations where there is possible division by zero

Justification: Division by zero should never occur, and a variable denominator should always be checked for 0 first.

Importance: High

Example

```
VAR_GLOBAL
    g_iVar AT %QW1 : INT ;
END_VAR

PROGRAM PLC_PRG
VAR
    iCounter : INT;
    iSumme:INT;
    iMid:INT;
    iVal1:INT := INT#2;
    iVal2:INT;
    iVal3:INT := INT#3;
    iVal4:INT := INT#4;
    iVal5:INT;
END_VAR

IF iVal2 <> 0 THEN
iVal1 := iVal1/iVal2;   // no error
END_IF;
iMid := iSumme / iCounter; //  SA0040
iCounter := iCounter + INT#1;
iSumme := g_iVar + iSumme;
IF iMid < INT#100 THEN
    iVal1 := iVal1 / iVal2;       //  SA0040
END_IF

--> SA0040: Possible division by zero
--> SA0040: Possible division by zero
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0041: Detect possible loop invariant code

Detects assignments in loops that calculate the same value for each loop cycle. These lines of code could possibly be inserted outside of the loop.

Justification: This is a performance warning. Code that is executed in a loop, but does the same thing in each loop cycle, can be executed outside of the loop.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    iCounter, iVar1, iVar2: INT;
END_VAR

FOR iCounter := 0 TO 10 DO
    iVar1 := 100;        // SA0041
    iVar2 := iVar2 + iVar1;
END_FOR

--> SAN0041: Possible loop invariant code 'iVar1 := 100'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0042: Usage of different access paths

Detects the usage of different access paths for the same variable

Justification: Different access to the same element decreases the readability and maintainability of a program. We recommend the consistent usage of `{attribute 'qualified-only'}` for libraries, global variable lists, and enumerations. This forces a fully qualified access.

Importance: Low

Example

```
VAR_GLOBAL
        iTemp:INT;
        instPOU:POU;
END_VAR

FUNCTION_BLOCK POU
VAR
    a:INT;
END_VAR
a := INT#1;

PROGRAM SA0042
VAR
    ptiTemp:POINTER TO INT;
    sTemp:STRING;
END_VAR

ptiTemp := ADR(iTemp);

ptiTemp^:= INT#1;
iTemp:= INT#2;                          //  SA0042 - direct access
on variable
GVL.iTemp := INT#3;                     //  SA0042 - access on
variable via GVL

sTemp := CONCAT( 'ab', 'cd');           // SA0042 - direct access on
function
sTemp := Standard.CONCAT( 'ab', 'cd'); // SA0042 - access on
function via Standard

instPOU();                              //  SA0042 - direct access
on POU instance
GVL.instPOU();                          //  SA0042 - access via GVL

--> SA0042: Different access paths for 'CONCAT'
--> SA0042: Different access paths for 'Standard.CONCAT'
--> SA0042: Different access paths for 'instPOU'
--> SA0042: Different access paths for 'GVL.instPOU'
--> SA0042: Different access paths for 'iTemp'
--> SA0042: Different access paths for 'GVL.iTemp'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0043: Use of a global variable in only one POU

Detects the use of a global variable in only a single POU

Justification: A global variable that is used in only one location should also only be declared at this location.

Importance: Medium

PLCopen rule: CP26

Example

```
VAR_GLOBAL
 g_xVar AT %QX0.0 : BOOL ;
    g_iTest AT %QW1 : INT ;
    g_wTest AT %QW2 : WORD;
END_VAR

PROGRAM prog1
VAR
    iCondition : INT;
    bTemp :BOOL;
END_VAR
iCondition := iCondition + INT#1;
IF iCondition < INT#0 THEN
    bTemp := g_xVar;   // SA0043 - g_xVar only read in this POU
ELSIF iCondition = INT#0 THEN
    bTemp := g_xVar;   // SA0043 - g_xVar only read in this POU
ELSE
       bTemp := g_xVar;   // SA0043 - g_xVar only read in this POU
       g_wTest := WORD#4; // g_WTest used also in prog2 -> OK
END_IF

PROGRAM prog2
VAR
    iCondition : INT;
END_VAR
iCondition := iCondition + INT#1;

CASE iCondition OF
    INT#1:
        g_iTest := WORD_TO_INT(g_wTest); // SA0043 - g_iTest only
written in this POU
    INT#2:
        g_iTest := INT#2;               // SA0043 - g_iTest only
written in this POU
    ELSE
        g_iTest := INT#3;               // SA0043 - g_iTest only
written in this POU
END_CASE

--> SA0043: Global variable 'g_xVar' only used in 'prog1'
--> SA0043: Global variable 'g_iTest' only used in 'prog2'
```

SA0044: Declarations with reference to interface

Detects declarations with `REFERENCE TO` interfaces and declarations of `VAR_IN_OUT` variables with interfaces (implicitly implemented by means of `REFERENCE TO`)

Justification: An interface type is always implicitly a reference to an instance of a function block that implements this interface. A reference to an interface is therefore a reference to a reference and can result in unwanted behavior.

Importance: High

Example `ITF` is an interface that is defined in the project.

```
PROGRAM PLC_PRG
VAR
    inst:POU;
    itf_inst1 : ITF;
    itf_ref : REFERENCE TO ITF; // SA0044
END_VAR FUNCTION_BLOCK POU
VAR_INPUT
    inst_itf2 : ITF;
END_VAR
VAR_OUTPUT
    inst_itf3 : ITF;
END_VAR
VAR_IN_OUT
    inst_itf4 : ITF;           // SA0044
END_VAR

--> SA0044: Reference to interface 'itf_ref'
--> SA0044: Reference to interface 'itf4_ref'
```

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Conversions

SA0019: Implicit pointer conversions

Detects implicitly generated pointer conversions

Justification: In CODESYS, pointers are not strictly typed and they can be assigned to each other in any way. This is often used and therefore not reported by the compiler. However, it can also accidentally cause unexpected access. If you assign a `POINTER TO BYTE` to a `POINTER TO DWORD`, then you can unintentionally overwrite memory using the latter pointer. Therefore, always check this rule and block the message for cases in which you intentionally want to access a value with a different type.

Implicit data type conversions are reported with a different message.

Importance: High

PLCopen rule: CP25

Exception: `BOOL` <-> `BIT`

Example

```
PROGRAM PLC_PRG
VAR
    pINT : POINTER TO INT;
    byteVar : BYTE;
END_VAR

pINT := ADR(byteVar);

--> SA0019: Implicit conversion from pointer to 'POINTER TO BYTE'
to pointer to 'POINTER TO INT'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0130: Implicit expanding conversions

Detects implicit conversions from smaller data types to larger data types

Justification: The compiler permits any assignments of different types when the value range of the source type is completely contained within the value range of the target type. However, the compiler will build a conversion into the code as late as possible. For an assignment of type `lint := dint * dint`, the compiler performs the implicit conversion only after multiplication: `lint := TO_LINT(dint * dint)`. An overflow is therefore truncated. To prevent this, you can already convert the elements: `lint := TO_LINT(dint) * TO_LINT(dint)`. Therefore, it may be useful to report locations where the compiler implements implicit conversions in order to check whether these are exactly what is intended. Furthermore, explicit conversions can be used to improve portability to other systems when those systems have more restrictive type checks.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
 byTemp : BYTE;
 usiTemp : USINT;
    uiTemp: UINT;
    iTemp : INT;
    udiTemp: UDINT;
 diTemp : DINT;
 uliTemp : ULINT;
    liTemp : LINT;
    lwTemp : LWORD;
    lrTemp : LREAL;
END_VAR

liTemp := iTemp;       // SA0130
uliTemp := usiTemp;    // SA0130
lwTemp := udiTemp;     // SA0130
lrTemp := byTemp;      // SA0130
diTemp := uiTemp;      // SA0130

byTemp.5 := FALSE;     // OK (BIT_BOOL conversion)

--> SA0130: Implicit widening conversion from type 'INT' to type
'LINT'
--> SA0130: Implicit widening conversion from type 'USINT' to type
'ULINT'
--> SA0130: Implicit widening conversion from type 'UDINT' to type
'LWORD'
--> SA0130: Implicit widening conversion from type 'BYTE' to type
'LREAL'
--> SA0130: Implicit widening conversion from type 'UINT' to type
'DINT'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0131: Implicit narrowing conversions

Detects implicit conversions from larger data types to smaller data types

Justification: This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    rTemp : REAL;
    lrTemp : LREAL;
END_VAR
rTemp := lrTemp;    // SA0131

--> SA0131: Implicit narrowing conversion from type 'LREAL' to type
'REAL'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0132: Implicit signed/unsigned conversions

Detects implicit conversions from signed data types to unsigned data types or the other way around.

This message is obsolete now because it is already reported as a warning by the compiler.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    byTest :BYTE;
    udiTest: UDINT;
    ulktest: ULINT;
    wTest    : WORD;
    lwTest : LWORD;
    siTest    : SINT;
    iTest    : INT;
    diTest : DINT;
    liTest    :LINT;
END_VAR
liTest := ulktest;    // SA0132
udiTest:= diTest;     // SA0132
siTest := byTest;     // SA0132
wTest := iTest;       // SA0132
lwTest := siTest;     // SA0132

--> SA0132: Implicit signed/unsigned conversion from type 'ULINT'
to type 'LINT'
--> SA0132: Implicit signed/unsigned conversion from type 'DINT' to
type 'UDINT'
--> SA0132: Implicit signed/unsigned conversion from type 'BYTE' to
type 'SINT'
--> SA0132: Implicit signed/unsigned conversion from type 'INT' to
type 'WORD'
--> SA0132: Implicit signed/unsigned conversion from type 'SINT' to
type 'LWORD'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0133: Explicit narrowing conversions

Detects explicit conversions from a larger data type to a smaller data type

Justification: A large number of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low

Example

```
PROGRAM SA0133
VAR
    siVar:SINT;
    diVar:DINT;
    liVar:LINT;
    byVar:BYTE;
    uiVar:UINT;
    dwVar:DWORD;
    lwVar:LWORD;
    rVar:REAL;
    lrVar:LREAL;
END_VAR
siVar := LINT_TO_SINT(liVar);     // SA0133
byVar := DINT_TO_BYTE(diVar);     // SA0133
siVar := DWORD_TO_SINT(dwVar);    // SA0133
uiVar := LREAL_TO_UINT(lrVar);    // SA0133
rVar := LWORD_TO_REAL(lwVar);     // SA0133

--> SA0133: Explicit narrowing conversion from type 'LINT' to type
'SINT'
--> SA0133: Explicit narrowing conversion from type 'DINT' to type
'BYTE'
--> SA0133: Explicit narrowing conversion from type 'DWORD' to type
'SINT'
--> SA0133: Explicit narrowing conversion from type 'LREAL' to type
'UINT'
--> SA0133: Explicit narrowing conversion from type 'LWORD' to type
'REAL'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0134: Explicit signed/unsigned conversions

Detects explicit conversions from signed data types to unsigned data types and the other way around

Justification: Excessive use of type conversions may indicate that you have chosen the wrong data types for variables. For this reason, there are programming guidelines that require an explicit justification for data type conversions.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    byVar :BYTE;
    udiVar : UDINT;
    uliVar : ULINT;
    lwVar : LWORD;
    wVar : WORD;
    siVar    : SINT;
    iVar    : INT;
    diVar : DINT;
    liVar    : LINT;
END_VAR
liVar := ULINT_TO_LINT(uliVar);
udiVar := DINT_TO_UDINT(diVar);
siVar := BYTE_TO_SINT(byVar);
wVar := INT_TO_WORD(iVar);
lwVar := SINT_TO_LWORD(siVar);

--> SA0134: Explicit signed/unsigned conversion from type 'ULINT'
to type 'LINT'
--> SA0134: Explicit signed/unsigned conversion from type 'DINT' to
type 'UDINT'
--> SA0134: Explicit signed/unsigned conversion from type 'BYTE' to
type 'SINT'
--> SA0134: Explicit signed/unsigned conversion from type 'INT' to
type 'WORD'
--> SA0134: Explicit signed/unsigned conversion from type 'SINT' to
type 'LWORD'
```

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Use of Direct Addresses

SA0005: Invalid addresses and data types

Detects invalid addresses and data type specifications. Valid size prefixes in addresses: X for `BOOL` B for 1-byte data types, W for 2-byte data types, and D for 4-byte data types.

Justification: Variables located on direct addresses should preferably be associated with an address that corresponds to their data type width. It can be confusing for the reader of the code, for example, if a `DWORD` is assigned to a `BYTE` address.

Importance: Low

Example

```
PROGRAM Check_Address_Type_PRG
VAR
    iVar AT %QB0 : INT ;   // OK e. g.: %QW0
    xTest AT %QW1 : BOOL ; // OK e. g.: %QX1.0
END_VAR

iVar := iVar + INT#1;
xTest := NOT xTest;

--> SA0005: Invalid address for data type 'iVar'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0047: Accesses to direct address

Detects direct address access in the implementation code

Justification: Symbolic programming is always preferable. A variable has a name that can also have a meaning. An address cannot indicate what it is used for.

Importance: High

PLCopen rule: N1 / CP1

Example

```
PROGRAM PLC_PRG
VAR
    xVar : BOOL;
    byVar : BYTE;
END_VAR

xVar := %IX0.0;
%QX0.0 := xVar;
%MX0.1    := xVar;
%MB1    := byVar;

--> Access to direct address '%IX0.0'
--> Access to direct address '%QX0.0'
--> Access to direct address '%MX0.1'
--> Access to direct address '%MB1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0048: AT-declarations on direct addresses

Detects `AT` declarations on direct addresses

Justification: The use of direct addresses in the code is problematic because the address then appears in multiple locations: first in the controller configuration where the assignment of a physical object to an address is defined, and second in the program where variables are assigned to these addresses. If the addresses are relocated because the configuration is changed, then you have to reassign variables to addresses at a completely different location in the program. This is a cause of error and results in poorer readability and maintainability of the code. Therefore, it is best to perform all assignments in the I/O mapping of the device editor.

Importance: High

PLCopen rule: N1 / CP1

Note: We recommend that you use direct addresses ONLY in the *"I/O Mapping"* tab of the device editor.

Example

```
PROGRAM PLC_PRG
VAR
    xVar1    AT    %IX0.0    : BOOL;
    byVar1    AT    %IB1    : BYTE;
    xVar2    AT    %QX0.0    : BOOL;
END_VAR

--> SA0048: Declaration uses direct address '%IX0.0'
--> SA0048: Declaration uses direct address '%IB1
--> SA0048: Declaration uses direct address '%QX0.0'
```

- *Chapter 1.8.3.1 "Configuring and Running Static Analysis" on page 4130*

Rules for Operators

SA0051: Comparison operations on BOOL variables

Detects comparison operations on variables of type `BOOL`

Justification: CODESYS permits these kinds of comparison, but they are very unusual and can be confusing. The IEC 61131-3 standard does not provide for these comparisons. By avoiding them, you increase the portability of the code to other development systems.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    xBool1, xBool2 : BOOL;
    xResult : BOOL;
END_VAR
xResult := xBool1 > xBool2;  // SA0051
xBool1 := NOT xBool1;           // OK!
xBool2 := xBool2 XOR xBool1;    // OK!

--> SA0051: Comparison operations on BOOL varables
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0052: Unusual shift operation

Detects shift operations (bit shift) on signed variables. In the case of shift operations on bitfield data types (`Byte`, `DWORD`, `LWORD`, `WORD`), an error is not reported.

Justification: CODESYS permits shift operations on signed data types. However, these operations are unusual and can be confusing. The IEC 61131-3 standard does not provide for these kinds of operations. Therefore, they should be avoided in order to increase the portability of the code to other development systems.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    iTemp : INT;
    dwTemp1 : DWORD;
    byTemp2 : BYTE;
    diTemp3 : DINT;
    siTemp4 : SINT;
    liTemp5 : LINT;
END_VAR

//the following lines each will cause an  SA0052:
iTemp := SHL(iTemp, BYTE#2);
diTemp3 := SHR(diTemp3, BYTE#4);
siTemp4 := ROL(siTemp4, BYTE#2);
liTemp5 := ROR(liTemp5, BYTE#2);

//no error SA0052 because DWORD and BYTE are bit field data types:
dwTemp1 := SHL(dwTemp1, BYTE#3);
byTemp2 := SHR(byTemp2, BYTE#1);

---> SA0052: Unusual shift operation
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0053: Too big bitwise shift

Detects whether or not the data type width of the operand has been exceeded in the case of a bitwise shift (bit shift) of operands

Justification: If a shift operation exceeds the data type width, then a constant `0` is generated. If a rotation shift exceeds the data type width, then it is difficult to read. Therefore, the rotation value should be shortened.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    byTemp1 : BYTE;
    wTemp2 : WORD;
    dwTemp3 : DWORD;
    lwTemp4 : LWORD;
END_VAR
byTemp1 := SHR(byTemp1, BYTE#25);
wTemp2 := SHL(wTemp2, BYTE#45);
dwTemp3 := ROR(dwTemp3, BYTE#78);
lwTemp4 := ROL(lwTemp4, BYTE#111);

--> SA0053: Too big bitwise shift
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0054: Comparisons of REAL/LREAL for equality / inequality

Detects whether or not the comparison operators = (equality) and <> (inequality) compare the operands of type `REAL` or `LREAL`

Justification: `REAL`/`LREAL` values are implemented as floating-point numbers according to the IEEE 754 standard. This standard implies that specific, apparently simple decimal numbers cannot be represented with precision. As a result, there may be different representations as `LREAL` for the same decimal number.

Consider the following lines of code:

```
lr11 := 1.1;
lr33 := 3.3;
lrVar1 := lr11 + lr11;
lrVar2 := lr33 - lr11;
botest := lrVar1 = lrVar2;
```

In this case, `botest` returns `FALSE`, even if the variables `lrVar1` and `lrVar2` both return the monitoring value of 2.2. This is not an error of the compiler, but a property of the floating point units of all conventional processors. You can avoid this by specifying a minimum value by which the values may differ: `botest := ABS(lrVar1 - lrVar2) < 0.1;`

Exception: A comparison with `0.0` is not reported by this analysis. For the 0, there is an exact representation in the IEEE 754 standard, and therefore the comparison functions normally as expected. Therefore, for better performance, it makes sense to permit a direct comparison here.

Importance: High

PLCopen rule: CP54

Example

```
PROGRAM PLC_PRG
VAR
    rTest1 : REAL;
    rTest2 : REAL;
    lrTest3 : LREAL;
    lrTest4 : LREAL;
    xResult : BOOL;
END_VAR

//the following lines each will cause an  SA0054:
xResult := rTest1 = rTest1;
xResult := rTest1 = rTest2;
xResult := rTest1 <> rTest2;
xResult := lrTest3 = lrTest3;
xResult := lrTest3 = lrTest4;
xResult := lrTest3 <> lrTest4;
//the following lines each will not cause an  SA0054:
xResult := rTest1 > rTest2;
xResult := lrTest3 < lrTest4;

--> SA0054: Comparisons of REAL/LREAL for equality / inequality
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0055: Unnecessary comparisons of unsigned operands

Detects unnecessary comparisons with unsigned operands. An unsigned data type is never less than zero. This can be used as a sign check.

Justification: A comparison detected with this check yields a constant result and is an indication of an error in the code.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
 byTest: BYTE;
END_VAR

WHILE byTest >= 0 DO
    byTest := byTest - 1;
END_WHILE;

--> SA0055: Unnecessary comparisons of unsigned operands
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0056: Constant out of valid range

Detects literals (constants) outside of the valid range of the operator

Justification: The message is issued in cases when a value is compared with a constant that is outside of the range of this value. Then the comparison constantly returns `TRUE` or `FALSE`. This is an indication of a programming error.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    byTestVar: BYTE;
END_VAR

WHILE byTestVar >= 260 DO
 byTestVar := byTestVar + 1;
END_WHILE

--> SA0056: Constant out of valid range
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0057: Possible loss of decimal places

Detects statements with possible loss of decimal places

Justification: A piece of code of the following type (`diTemp2 := 1 rTemp1 := TO_REAL(diTemp2 / DINT#2)`) can cause a misinterpretation. The author or reader of this line of code can assume that the division would be performed as a `REAL` operation, and in this case the result would be `REAL#0.5`. However, this is not true. It is an integer operation. The result is cast to `REAL` and `rTemp1` gets the value `REAL#0`. To avoid this, use a cast to make sure that the operation is performed as a `REAL` operation: `rTemp1 := TO_REAL(diTemp2) / REAL#2`.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    rTemp1 : REAL;
    diTemp2 : DINT;
    liTemp3 : LINT;
END_VAR

diTemp2 := diTemp2 + DINT#11;
rTemp1 := DINT_TO_REAL(diTemp2 / DINT#3);    // SA0057
rTemp1 := DINT_TO_REAL(diTemp2) / REAL#3.0;
liTemp3 := liTemp3 + LINT#13;
rTemp1 := LINT_TO_REAL(liTemp3 / LINT#7);    // SA0057
rTemp1 := LINT_TO_REAL(liTemp3) / REAL#7.0;

--> SA0057: Possible loss of decimal places
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0058: Operations on enumeration variables

Detects operations on variables of the enumeration data type Assignments are permitted.

Justification: Enumerations should not be used as ordinary integer values. You can also define an alias data type or use a subrange type.

Importance: Medium

Exception: If an enumeration is tagged with the pragma `{attribute 'strict'}`, then the compiler already reports this kind of operation.

If an enumeration is declared as a flag by the pragma `{attribute 'flags'}`, then an error is not issued for `AND`, `OR`, `NOT`, or oder `XOR` operations.

Example

```
TYPE My_Enum :
(
    red := 1, blue := 2, green := 3, black := 4
);
END_TYPE

PROGRAM PLC_PRG
VAR
    iTemp1 : INT;
    abc : My_Enum;
END_VAR
iTemp1 := iTemp1 + INT#1;
abc := My_Enum.red;                         // OK
iTemp1 := My_Enum.black / My_Enum.blue;  //  SA0058
iTemp1 := My_Enum.green / My_Enum.red;   //  SA0058

--> SA0058: Operations on enumeration variables
```

Example with a pragma {attribute 'flags'}

```
{attribute 'flags'}  // declaring the enumeration as a "flag"
TYPE Flags :
(
    Unknown := 16#00000001,
    Stopped := 16#00000002,
    Running := 16#00000004
) DWORD;
END_TYPE

PROGRAM PLC_PRG
VAR
 iTemp1 : INT;
 abc : Flags;
    batate : BYTE;
    dwFlags : DWORD;
    dwState : DWORD;
END_VAR

// OK for the following
IF (dwFlags AND Flags.Unknown) <> DWORD#0 THEN
    dwState := dwState AND Flags.Unknown;
ELSIF (dwFlags OR Flags.Stopped) <>DWORD#0 THEN
    dwState := dwState OR Flags.Running;
END_IF
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0059: Comparison operations always returning TRUE or FALSE

Detects comparisons with literals that always have the result `TRUE` or `FALSE`, and can already be processed during at the compile.

Justification: An operation that consistently yields `TRUE` or `FALSE` is an indication of a programming error.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    byTemp1 : BYTE;
END_VAR

WHILE byTemp1 <= 255 DO
    byTemp1 := byTemp1 + 1;
END_WHILE;

--> SA0059: Relational operator '<=' always evaluates 'TRUE'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0060: Zero used as invalid operand

Detects operations where an operand with the value "0" causes an invalid or a nonsense operation

Justification: This kind of expression could be an indication of a programming error. In any case, it unnecessarily wastes runtime.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    byTemp1 : BYTE;
    wTemp2 : WORD;
    dwTemp3 : DWORD;
END_VAR

byTemp1 := byTemp1 + 0;
wTemp2 := wTemp2 - WORD#0;
dwTemp3 := dwTemp3 * DWORD#0;

--> SA0060: Zero used as invalid operand
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0061: Unusual operation on pointer

Detects operations one variables of type `POINTER TO` which are not = (equality), <> (inequality), + (addition), or `ADR`.

In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. Therefore, the addition of a pointer with an integer value is considered a common operation on pointers. This makes it possible to use a pointer to process an array of variable length. All other (unusual) operations with pointers are reported with SA0061.

Importance: High

PLCopen rule: E2 / E3

Example

```
PROGRAM PLC_PRG
VAR
    piTemp : POINTER TO INT;
    iTemp : INT;
END_VAR

iTemp := iTemp + INT#1;
piTemp := ADR(iTemp);
piTemp := piTemp * DWORD#5;   // SA0061
piTemp := piTemp / DWORD#2;   // SA0061
piTemp := piTemp MOD DWORD#3; // SA0061
piTemp := piTemp + DWORD#1;
piTemp := piTemp - DWORD#1;   // SA0061

--> SA0061: Unusual operation on pointer
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0062: Uses of TRUE or FALSE in expressions

Detects the use of the literals `TRUE` or `FALSE` in expressions

Justification: This kind of expression is obviously unnecessary and may indicate an error. In any case, the expression unnecessarily affects the runtime.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    xTemp1, xTemp2 : BOOL;
END_VAR
xTemp1 := xTemp1 AND NOT TRUE;
xTemp2 := xTemp1 OR TRUE;
xTemp2 := xTemp1 OR NOT FALSE;
xTemp2 := xTemp1 AND FALSE;

--> Uses of TRUE or FALSE in expressions
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0063: Possibly not 16-bit-compatible operations

Detects 16-bit operations with temporary results. Background: On 16-bit systems, 32-bit temporary results can be truncated. Example: `(int+10)` can exceed 16 bits.

Justification: In the very rare case that you have to write code which should run on a 16-bit processor as well as on a 32-bit processor, this message should help to prevent any problems.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    iVar : INT;
END_VAR
iVar := (iVar + 10) / 2;

--> SA0063: Compatibility for 16 Bit - Possible truncated
intermediate result
```

SA0064: Addition of pointer

Detects the addition of pointers

Justification: In CODESYS, pointer arithmetic is generally permitted and can also be used appropriately. However, it is also a source of errors. Therefore, programming rules exist that generally prohibit pointer arithmetic. This test can check such a requirement.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    iTest:INT;
    ariTest:ARRAY[0..10] OF INT;
    {attribute 'analysis':='-111'}
    piTest:POINTER TO INT;
    i:INT;
END_VAR

piTest := ADR(ariTest[0]);            // OK
piTest^:= 0;
piTest := ADR(ariTest) + SIZEOF(INT); // SA0064
piTest^:= 1;
piTest := ADR(ariTest) + 6;           // SA0064
piTest^:= 3;
piTest := ADR(ariTest[10]);
FOR i:=0 TO 10 DO
    piTest^ := i;
    piTest := piTest + 2;                // SA0064
END_FOR

--> SA0064: Addition of pointer
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0065: Incorrect pointer addition to base size

Detects pointer additions for which the value to be added does not match the base size of the pointer. Only literals of the base size can be added. Also multiplication products of the base size cannot be added.

Justification: In CODESYS (in contrast to C and C++), when adding a pointer with an integer value, only this integer value is added as the number of bytes, and not the integer value multiplied by the base size. Example in ST:

```
pINT := ADR(array_of_int[0])
pINT := pINT + 2 ;   // In CODESYS, pINT then points to
array_of_int[1]
```

This code would function differently in C:

```
short* pShort
pShort = &(array_of_short[0])
pShort = pShort + 2;  // In C, pShort then points to array_of_short[2]
```

Therefore, in CODESYS, you should always add a multiple of the base size of the pointer to a pointer. Otherwise, the pointer may point to non-aligned memory which (depending on the processor) can lead to an alignment exception when accessing it.

Importance: High

Example

```
VAR
 pudiTest:POINTER TO UDINT;
    udiTest:UDINT;
    prTest:POINTER TO REAL;
    rTest:REAL;
END_VAR

pudiTest := ADR(udiTest) + 4;                  // OK
pudiTest := ADR(udiTest) + ( 2 + 2 );          // OK
pudiTest := ADR(udiTest) + SIZEOF(UDINT);      // OK
pudiTest := ADR(udiTest) + 3;                // SA0065
pudiTest := ADR(udiTest) + 2*SIZEOF(UDINT);    // SA0065
pudiTest := ADR(udiTest) + ( 3 + 2 );          // SA0065
prTest := ADR(rTest);
prTest := prTest + 4;                          // OK
prTest := prTest + ( 2 + 2 );                  // OK
prTest := prTest + SIZEOF(REAL);               // OK
prTest := prTest + 1;                          // SA0065
prTest := prTest + 2;                          // SA0065
prTest := prTest + 3;                          // SA0065
prTest := prTest + ( SIZEOF(REAL) - 1 );       // SA0065
prTest := prTest + ( 1 + 4 );                  // SA0065

--> SA0065: Incorrect pointer addition to base size
```

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0066: Uses of temporary results

Detects the use of temporary results in statements with a data type that is less than the registry size. The implicit cast in this case may lead to unwanted results.

Justification: For performance reasons, CODESYS performs operations on the register width of the processor. Intermediate results are not truncated. This can lead to misinterpretations as in the following case: `usintTest := 0; xError := usintTest - 1 <> 255;`. In CODESYS, `xError` is `TRUE` in this case because the operation `usintTest - 1` is typically executed as a 32-bit operation and the result is not cast to the byte size. Then the value `16#ffffffff` (not equal to 255) is located in the registry. To avoid this, you have to cast the intermediate result explicitly: `xError := TO_USINT(usintTest - 1) <> 255;`

NOTICE!

If this message is activated, then many less problematic locations in the code will be reported. Although a problem can only occur when the operation produces an overflow or underflow in the data type, the static analysis cannot differentiate between the individual locations.

If you include an explicit typecast in all reported locations, then the code will be much slower and less readable.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    byTest:BYTE;
    liTest:LINT;
    xError:BOOL;
END_VAR

//type size smaller than register size;
byTest := 0;
IF (byTest - 1) <> 255 THEN //use of temporary result + implicit
casting ->  SA0066
    xError := TRUE;
ELSE
    xError := FALSE;
END_IF

//type size equal to or bigger than register size;
liTest := 0;
IF (liTest - 1)  <> -1 THEN // use of temporary result and no
implicit casting -> OK
    xError := TRUE;
ELSE
    xError := FALSE;
END_IF

--> SA0066: Use of temporary result: (byTest - USINT #1)
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

Rules for Statements

SA0072: Invalid uses of counter variable

Detects the use of a counter variable in a `FOR` loop

Justification: Manipulation of the counter variable in a `FOR` loop can easily result in an infinite loop. To prevent the execution of the loop for specific values of the counter variable, use `CONTINUE` or simply an `IF`.

Importance: High

PLCopen rule: L12

Example

```
PROGRAM PLC_PRG
VAR_TEMP
    iIndex : INT;
END_VAR
FOR iIndex := INT#0 TO INT#20 BY INT#1 DO
    iIndex := iIndex - INT#1;
END_FOR

--> SA0072: Invalid use of counter variable 'iIndex'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0073: Uses of inadequate counter variable

Detects the use of non-temporary variables in `FOR` loops.

Justification: This is a performance warning. A counter variable is always initialized each time a POU is called. You can create this variable as a temporary variable (`VAR_TEMP`). Access to it may be faster and the variable does not take up any permanent memory.

Importance: Medium

PLCopen rule: CP21 / L13

Example

```
PROGRAM PLC_PRG
VAR
    nIndex : INT;
    iVar : INT;
END_VAR
FOR nIndex := INT#0 TO INT#20 BY INT#1 DO
    iVar := iVar + nIndex;
END_FOR

--> SA0073: Inadequate counter variable
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0080: Loop index variable for array index exeeds array range

Detects the FOR statements where the index variable is used to access an array index and exceeds the range of the array index

Justification: Arrays are typically processed in `FOR` loops. The start and end value of the counter variable should typically match (or at least not exceed) the upper and lower bounds of the array. A typical cause of error is detected here when array bounds are changed and constants are not carefully used; or when a different value is used accidentally in the `FOR` loop than in the array declaration.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
 iIndex1,iIndex2,iIndex3 : INT;
 arWord : ARRAY[1..100] OF WORD;
 arararINT : ARRAY[1..9,1..9,1..9] OF INT;
 arUSINT : ARRAY[0..99] OF USINT;
END_VAR

//1 violation of the rule(lower range is exeeded): SA0080
FOR iIndex1 := INT#0 TO INT#100 DO
    arWord[iIndex1] := INT_TO_WORD(iIndex1);
END_FOR

//6 violations (lower and upper range is exceeded for each array
dimension): 3SA0080
FOR iIndex2 := INT#0 TO INT#10 DO
    arararINT[iIndex2, iIndex2, iIndex2] := iIndex2;
END_FOR

//1 violation (upper range is exceeded by the end result of the
index), previous expressions on index are not evaluated -> OK
FOR iIndex3 := INT#0 TO INT#50 DO
    arUSINT[iIndex3 * INT#2] := INT_TO_USINT(iIndex3);
END_FOR

--> SA0080: Loop index range of 'Index1' exceeds array range
--> SA0080: Loop index range of 'Index2' exceeds array range
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0081: Upper border is not a constant

Detects the FOR statements where the upper bound is not defined with a constant value

Justification: If the upper bound of a loop is a variable value, then it is no longer possible to see how often a loop is executed. This can result in serious problems at runtime. The worst case is an infinite loop.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    i:INT;
    iBorder1: INT := 10;
    iBorder2: INT := 10;
    iCounter: INT;
END_VAR
VAR CONSTANT
    ciBorder:INT := 10;
END_VAR

FOR i:=0 TO 10 DO    //OK
    iCounter := i;
END_FOR

FOR i:=0 TO ciBorder DO // OK
    iCounter := i;
END_FOR

FOR i:=0 TO iBorder1 DO    // SA0081
    iCounter := i;
END_FOR

FOR i:=0 TO iBorder2 DO    // SA0081
    iCounter := i;
    IF iCounter = 10 THEN
        iBorder2 := 50;
    END_IF
END_FOR

--> SA0081: Upper border of a for loop must be a constant value
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0075: Missing ELSE

Detects `CASE` statements without an `ELSE` branch

Justification: Defensive programming requires the inclusion of an `ELSE` branch in every `CASE` statement. If there is nothing to do in the `ELSE` branch, then include a comment to indicate this. It is then clear to the reader of the code that the case was not simply forgotten.

Importance: Low

PLCopen rule: L17

Example

```
PROGRAM PLC_PRG
VAR
    iVar : INT;
    xTemp : BOOL;
END_VAR

iVar := iVar + INT#1;
CASE iVar OF
    INT#1:
        xTemp := FALSE;
    INT#2:
        xTemp := TRUE;
END_CASE

--> SA0075: Missing ELSE in CASE statement
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0076: Missing enumeration constant

Detects whether or not an enumeration variable is used as a condition and not all enumeration values are treated as `CASE` branches

Justification: Defensive programming requires the processing of all possible values of an enumeration. If an action is not required for a particular enumeration value, then you should add a comment to indicate this explicitly. It is then clear to the reader of the code that the value was not simply forgotten.

Importance: Low

Example

```
TYPE My_Enum :
(
    red := 1, blue := 2, green := 3, black := 4
);
END_TYPE

PROGRAM PLC_PRG
VAR
    iVar : My_Enum;
    xTemp : BOOL;
END_VAR
iVar := My_Enum.black;

CASE iVar OF
    My_Enum.red:
        xTemp := FALSE;
    My_Enum.blue, My_Enum.green:
        xTemp := TRUE;
    ELSE
        xTemp := NOT xTemp;
END_CASE

--> SA0076: Missing enumeration constant 'black' in CASE statement
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0077: Type mismatches with CASE expression

Detects code locations where the data type of a condition does not match that of the `CASE` branch

Justification: If the data types between the `CASE` variable and the `CASE` itself do not match, then this could indicate an error.

Importance: Low

Example

```
TYPE My_Enum :
(
    eins := 1, zwei := 2, drei := 3, vier := 4
);
END_TYPE

PROGRAM PLC_PRG
VAR
    diVar : DINT;
    xTemp : BOOL;
END_VAR
diVar := diVar + DINT#1;
CASE diVar OF
    DINT#1:
        xTemp := FALSE;
    My_Enum.zwei, DINT#3:    //SA0077
        xTemp := TRUE;
    ELSE
        xTemp := NOT xTemp;
END_CASE

--> SA0077: Type mismatches with CASE expression
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0078: Missing CASE branches

Detects `CASE` statements without `CASE` branches and only one `ELSE` statement

Justification: A `CASE` statement without cases wastes execution time and it is difficult to read.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    iVar : INT;
    xTemp : BOOL;
END_VAR

iVar := iVar + INT#1;
//in the following the case descriptions are missing:
CASE iVar OF
    ELSE
        xTemp := NOT xTemp;
END_CASE

--> SA0078: CASE-Missing CASE branches
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0090: Return statement before end of function

Detects whether or not the `RETURN` statement is not the last statement in a function, method, property, or program.

Justification: A `RETURN` in the code results in worse maintainability, testability, and readability of the code. A `RETURN` in the code is easily overlooked. Before each `RETURN`, it is often forgotten to insert code that should always be executed when exiting a function.

Importance: Medium

PLCopen rule: CP14

Example

```
FUNCTION FUN : DINT
VAR_INPUT
    bTest : BOOL;
END_VAR

IF bTest THEN
    RETURN;
END_IF
FUN := 99;

--> SA0090: Return statement before end of function
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0095: Assignments in conditions

Detects assignments in conditions of `IF`, `CASE`, or `REPEAT` constructs

Justification: An assignment (:=) and a comparison (=) can easily be mistaken. As a result, an assignment in a condition can easily be unintentional, and it is therefore reported. This can also confuse the reader of the code.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    iCond1:INT := INT#1;
    iCond2:INT := INT#2;
    xCond:BOOL := FALSE;
    iVar : INT;
END_VAR

IF INT_TO_BOOL(iCond1 := iCond2) THEN                       // SA0095
    iCond1 := INT#1;
    iCond2 := INT#2;
ELSIF (iCond1 := 11) = 11 THEN                              // SA0095
    iCond1 := INT#1;
    iCond2 := INT#2;
END_IF

IF xCond := TRUE THEN                                       // SA0095
    xCond := FALSE;
END_IF

IF (xCond := FALSE) OR (iCond1 := iCond2) = 12 THEN         // SA0095
    xCond := FALSE;
    iCond1 := INT#1;
    iCond2 := INT#2;
END_IF

IF (iVar := iVar + 1) = 120 THEN                            //
SA0095 (can be valid, but is not reparable very well
iVar := 0;
END_IF

WHILE (xCond = TRUE) OR (iCond1 := iCond2) = 12 DO          // SA0095
    xCond := FALSE;
END_WHILE

//Error: assignment in repeat loop
REPEAT
    xCond := FALSE;
UNTIL
    (xCond = TRUE) OR (iCond1 := iCond2) = 12               //
SA0095
END_REPEAT

--> SA0095: Assignment in condition: '...'
```

See also

- ↳ *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0100: Variables greater than <n> bytes...

Detects variables that use more than n bytes, where n is defined by the current configuration. Default value: 1024 bytes. The value can be changed by double-clicking the line.

Justification: Some programming guidelines specify a maximum size for a single variable. This can be checked with this.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    aobyTest : ARRAY [0..1024] OF BYTE;
END_VAR

aobyTest[INT#0] := aobyTest[INT#0] + BYTE#1;

--> SA0100: Variable 'aobyTest' greater 1024 bytes
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0101: Names with invalid length

Detects names with invalid lengths. In the *“Project Settings”*, double-click the rule entry to open a dialog where you can define the length of the name and define any exception.

Justification: Some programming guidelines specify a minimum length for variable names. This analysis can be used to check compliance.

Importance: Low

PLCopen rule: N6

Example

```
PROGRAM PLC1                    // SA0101
VAR
    iVar1: INT;                 // SA0101
END_VAR

--> SA0101: Incorrect length of name 'PLC1'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0102: Access to program/fb variables from the outside

Detects external access to local variables of programs or function blocks

Justification: CODESYS permits external read access to local variables of programs or function blocks. This contradicts the principle of data encapsulation (hiding data) and does not comply with the IEC 61131-3 standard.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    iCounter : INT;
    afb_Instance : AFB;
    bfb_Instance : BFB;
END_VAR
iCounter := A_PRG.iLocal;               //  SA0102
iCounter := bfb_Instance.iLocal;        //  SA0102
A_PRG();

FUNCTION_BLOCK AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iLocal: INT;
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;

FUNCTION_BLOCK BFB EXTENDS AFB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
END_VAR
METHOD METH : INT
VAR_INPUT
END_VAR
iLocal := iLocal + 1;

PROGRAM A_PRG
VAR
    iLocal: INT;
END_VAR
iLocal := iLocal + 1;

--> SA0102: Access to program/fb variable 'iLocal' from the outside
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0103: Concurrent access on not atomic data

Detects whether or not non-atomic variables (for example, with data type `STRING`, `WSTRING`, `ARRAY`, `STRUCT`, FB instances, 64-bit data types) are used in more than one task

Justification: When there is no synchronization during access, inconsistent values can be read when reading in one task and writing in another task at the same time.

Importance: Medium

> *For some data types, especially 64-bit integers, it depends on the platform whether or not access is atomic. Static analysis reports a problem only when the controller does not support atomic access to 64-bit integer data types.*

This rule does not apply in the following cases:

- If the target system has a floating point unit (FPU), then access of multiple tasks to `LREAL` variables is not detected
- If the target system is a 64-bit processor or the corresponding target setting is set for the target device, then the rule does not apply to 64-bit data types

Example

The project contains both programs, `PRG1` and `PRG2`: The program `PRG1` is called by the task `MainTask_1`. The program `PRG2` is called by the task `MainTask_2`.

```
GVL
VAR_GLOBAL
    lrTest : LREAL;   // Since the target system has an FPU, SA0103
does apply.
    lint1 : LINT;
    sTest : STRING;   // SA0103
    wsTest : WSTRING; // SA0103
END_VAR

PROGRAM PRG1
GVL.lrTest := 5.0;
GVL.sTest := 'welt';
GVL.wsTest := "welt";
GVL.lint1 := 99;

PROGRAM PRG2
GVL.lrTest := 5.0;
GVL.sTest := 'hallo';
GVL.wsTest := "hallo";
GVL.lint1 := 88;

--> SA0103: Concurrent access on not atomic data 'sTest'
--> SA0103: Concurrent access on not atomic data 'wsTest'
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0105: Multiple instance calls

Detects the instances of function blocks that are called multiple times. To do this, the function blocks haves to be marked with the pragma `{attribute 'analysis:report-multiple-instance-calls'}`.

Justification: Some function blocks are designed in such as way that they can be called only one time in the cycle. This test checks whether or not a call is made in multiple locations.

Importance: Low

PLCopen rule: CP16 / CP20

Example

```
// {attribute 'analysis:report-multiple-instance-calls'} Deactivated
FUNCTION_BLOCK FB_DoA
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iA : INT;
END_VAR
iA := iA + 1;

{attribute 'analysis:report-multiple-instance-calls'}
FUNCTION_BLOCK FB_DoB
VAR_INPUT
END_VAR
VAR_OUTPUT
END_VAR
VAR
    iB : INT;
END_VAR
iB := iB +1;

PROGRAM PLC_PRG
VAR
    fbA : FB_DoA;
    fbB : FB_DoB;
ND_VAR

fbA();
fbB();    // SA0105
fbA();
fbB();    // SA0105

--> SA0105: Instance 'fbB' called more than once
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0106: Virtual method calls in FB_INIT

Detects method calls in the `FB_Init` method of a base function block, which are overwritten by a function block derived from a base function block

Justification: In these cases, it could be that the variables in the overwritten methods are not initialized in the base FB.

Importance: High

Example

The function block `FB_A` includes the methods `FB_Init` and `Meth_MyInit`. `FB_Init` calls `Meth_MyInit` for initialization. The function block `FB_B` is derived from `FB_A`. `PLC_PRG` calls `FB_B` and therefore uses its `mbMyDintB` variable before it has been initialized. `FB_B.Meth_MyInit` overwrites `FB_A.Meth_MyInit`.

```
FUNCTION_BLOCK FB_A
VAR
    mbMyDintA : DINT;
END_VAR FUNCTION_BLOCK FB_B EXTENDS FB_A
VAR
    mbMyDintB : DINT;
END_VAR METHOD FB_Init : BOOL
VAR_INPUT
    bInitRetains:BOOL;
    bInCopyCode:BOOL;
END_VAR
VAR
    diDummy:DINT;            // SA0106
END_VAR
mbMyDintA := 123;
diDummy := Meth_MyInit(); METHOD Meth_MyInit : DINT
VAR_INPUT
END_VAR
mbMyDintB := 123; // access to member of FB_B PROGRAM PLC_PRG
VAR
    g_BInst : FB_B;
 xVar : BOOL;
END_VAR
xVar := g_BInst.fb_init(TRUE, TRUE);
//this instruction causes the following order of initializations:
//FB_A.fb_init
//FB_B.Meth_MyInit // SA0106
//FB_B.fb_init
//FB_B.Meth_MyInit

--> SA0106: Virtual method call 'Meth_MyInit' in FB_INIT
```

See also

- ↳ *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0107: Missing formal parameters

Detects whether or not formal parameters are missing

Justification: Code becomes more readable when formal parameters are specified in the call.

Importance: Low

Example

```
FUNCTION FUNA : BOOL
VAR_INPUT
    bDo: BOOL;
    bInit: BOOL;
    bManual : BOOL;
END_VAR
VAR
    iInit: INT;
    iLocal: INT;
    iManual: INT;
END_VAR

IF bInit = TRUE THEN
    iInit := iInit + 1;
END_IF
IF bDo = TRUE THEN
    iLocal := iLocal + 1;
END_IF
IF bManual = TRUE THEN
    iManual:= iManual + 1;
END_IF
FUNA := TRUE;

PROGRAM PLC_PRG
VAR
END_VAR

FUNA(bInit := TRUE, bDo := TRUE, bManual := FALSE);     // OK
FUNA(TRUE, TRUE, bManual:= FALSE);                      // SA0107

--> SA0107: Missing formal parameter for input 'TRUE'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

Checking Strict IEC Rules

SA0111: Pointer variables

Detects variables of type `POINTER TO`

Justification: The IEC 61131-3 standard does not permit pointers.

Importance: Low

Example

```
VAR
    piTemp : POINTER TO INT;
    pbyTemp : POINTER TO BYTE;
END_VAR

--> SA0111: Data type POINTER not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0112: Reference variables

Detects variables of type `REFERENCE TO`

Justification: The IEC 61131-3 standard does not permit references.

Importance: Low

Example

```
VAR
 ref_int : REFERENCE TO INT;
 ref_dw : REFERENCE TO DWORD;
END_VAR

--> Data type REFERENCE not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0113: Variables with data type WSTRING

Detects variables of type `WSTRING`

Justification: Not all systems support `WSTRING`. The code is more easily portable without `WSTRING`.

Example

```
VAR
    wstrTemp : WSTRING;
END_VAR

--> SA0113: Data type WSTRING not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0114: Variables with data type LTIME

Detects variables of type `LTIME`.

Justification: Not all systems support `LTIME` The code is more easily portable without `LTIME`.

Importance: Low

Example

```
VAR
    ltVar : LTIME; // SA0114
END_VAR

--> SA0114: Data type LTIME not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0115: Variables with data type UNION

Detects declarations of a `UNION` data type and variable declarations of the `UNION` type

Justification: The IEC 61131-3 standard does not include unions. The code is more easily portable without unions.

Importance: Low

Example

```
TYPE u1: UNION
 lrTemp : LREAL;
 liTemp : LINT;
END_UNION
END_TYPE

PROGRAM PLC_PRG
VAR
    uVar: u1;
END_VAR

--> SA0115: Unions not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0117: Variables with data type BIT

Detects variable declarations of data type BIT (possible within structure definitions)

Justification: The IEC 61131-3 standard does not include the data type `BIT`. The code is more easily portable without `BIT`.

Importance: Low

Example

```
TYPE Struct1 :
STRUCT
    bitVar : BIT;
    iVar : INT;
    bVar : BOOL;
END_STRUCT
END_TYPE

--> SA0117: Variables with data type BIT
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0119:Object-oriented features

Detects the use of object-oriented features, such as function block declarations with `EXTENDS` and `IMPLEMENTS`, or property and interface declarations. This rule is useful when you write code that is intended to be ported to other IEC 61131-3-compliant systems.

Justification: Not all systems support object-oriented programming. The code is more easily portable without object-orientation.

Importance: Low

Example

```
//Function block extended by another and implementing an interface:
FUNCTION_BLOCK POU EXTENDS CTD IMPLEMENTS ITF        //SA0119
...

// Declaration parts of property methods assigned to a function
block:
POU.Prop.Get        //SA0119
POU.Prop.Set        //SA0119

--> SA0119: Object-oriented features not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0120: Program calls

Detects program calls

Justification: According to the IEC 61131-3 standard, programs can be called in the task configuration only. The code is more easily portable when you do not call programs from other locations.

Importance: Low

Example

```
PROGRAM prog_control
VAR
END_VAR

PROGRAM PLC_PRG
VAR
END_VAR

prog_control();

--> SA0120: Program call to 'prg_control' not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0121: Missing VAR_EXTERNAL declarations

Detects the use of a global variable in function blocks without them being declared there as *“VAR_EXTERNAL”*

Justification: According to the IEC 61131-3 standard, access to global variables is permitted only by an explicit import by means of a `VAR_EXTERNAL` declaration.

Importance: Low

PLCopen rule: CP18

Example

```
VAR_GLOBAL
    iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
 ivar:INT;
END_VAR

ivar:=iGlob1;        // SA0121

--> SA0121: EXTERNAL declaration required for variable ''iGlob1'
```

Example:
Avoid error

```
VAR_GLOBAL
    iGlob1:INT;
END_VAR

PROGRAM PLC_PRG
VAR
 ivar:INT;
END_VAR
VAR_EXTERNAL
 iGlob1:INT;
END_VAR

ivar:=iGlob1;        // OK
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0122: Array index defined as expression

Detects the use of expressions in the declaration of array indexes

Justification: Not all systems permit expressions as array limits.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR CONSTANT
 c_iValue : INT := INT#15;
END_VAR
VAR
 arr: ARRAY[0..c_iValue + 1] OF INT;
END_VAR

--> SA0122: Only constants allowed for array definition 'arr'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0123: Usages of INI, ADR or BITADR

Detects the use of the CODESYS-specific operators `INI`, `ADR`, and `BITADR`

Justification: CODESYS-specific operators prevent the portability of code.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    uiTemp: UINT;
    TempVarInFUNC: DWORD;
END_VAR

TempVarInFUNC := ADR(uiTemp);        //SA0123

--> SA0123: Operator 'ADR' not allowed
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0147: Unusual shift operation - strict

Detects bit shift operations that are not made to bitfield data types (`BYTE`, `WORD`, `DWORD`, `LWORD`)

Justification: The IEC 61131-3 standard permits bit access only to bitfield data types. However, the CODESYS compiler also permits bit shift operations with unsigned data types.

Importance: Low

See also the strict rule SA0018.

Example

```
PROGRAM PLC_PRG
VAR
  in_byte : BYTE := 16#45;   // 2#01000101
  in_word : WORD := 16#0045; // 2#0000000001000101
  in_uint : UINT;
  in_dint : DINT;
  erg_byte : BYTE;
  erg_word : WORD;
  erg_uint : UINT;
  erg_dint : DINT;
  n: BYTE := 2;
END_VAR

erg_byte := SHL(in_byte,n);  // no error because BYTE is a bit field
erg_word := SHL(in_word,n);  // no error because WORD is a bit field
erg_uint := SHL(in_uint,n);  // SA0147
erg_dint := SHL(in_dint,n);  // SA0147

--> SA0147: Unusual shift operation - strict
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*
- *Chapter 1.8.3.3.2.17 “SA0018: Unusual bit access” on page 4164*

SA0148: Unusual bit access - strict

Detects bit access that is not made to bitfield data types (`BYTE`, `WORD`, `DWORD`, and `LWORD`). The IEC 61131-3 standard permits only bit access to bitfield data types. However, the CODESYS compiler also permits bit access to unsigned data types.

Example

```
PROGRAM PLC_PRG
VAR
    iTemp1 : INT;
    diTemp3 : DINT;
    uliTemp4 : ULINT;
    siTemp5 : SINT;
    usiTemp6 : USINT;
    byTemp2 : BYTE;
END_VAR

iTemp1.3 := TRUE;     // SA0148
diTemp3.4 := TRUE;    // SA0148
uliTemp4.18 := FALSE; // SA0148
siTemp5.2 := FALSE;   // SA0148
usiTemp6.3 := TRUE;   // SA0148
byTemp2.5 := FALSE;   // no error because BYTE is a bit field

--> SA0148: Unusual bit access - strict
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0118: Initialisations not using constants

Detects initializations that do not assign constants

Justification: Initializations should be constant if possible and should not refer to other variables. In particular, you should avoid function calls during initialization because this can allow access to uninitialized data.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    dwTemp : DWORD := 22;
    dwTest : DWORD := dwTemp;          //  SA0118
    dwVar : DWORD := TempVarInFUNC(); //  SA0118
END_VAR

--> SA0118: Initialisations not using constants
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0124: Pointer dereferences in declarations

Detects pointer dereferences that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium

Example

```
FUNCTION_BLOCK FB_Test
VAR_INPUT
    refStruct: REFERENCE TO ST_Test;
END_VAR
VAR
    xPointer : BOOL := refStruct.a; // SA0124
    iCount : INT;
END_VAR

--> SA0124: Dereference access in initialisation
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0125: References in initializations

Detects reference variables that are used for initialization in the declaration part

Justification: Pointers and references should not be used for initializations because this can lead to access violations if the pointer has not been initialized.

Importance: Medium

Example

```
PROGRAM PLC_PRG
VAR
    xRef: REFERENCE TO INT;
    iCount: INT := xRef;
END_VAR

--> SA0125: Reference used in initializations
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0140: Statements commented out

Detects commented-out statements

Justification: Code is often commented out for debugging purposes. When this kind of comment is released, it is not always clear at a later time whether the code should be deleted, or whether it has been commented out for debugging purposes and unintentionally not uncommented.

Importance: High

PLCopen rule: C4

Example

```
PROGRAM PLC_PRG
VAR
    iValue1: INT;
    iValue2: INT;
END_VAR

iValue1 := 100;
iValue2 := 200;
// iValue2 := 300;

--> SA0140: Statement commented out:: iValue2 := 300
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

Possible Use of Uninitialized Variables

SA0039: Possible null-pointer deferences

Detects code locations where a null pointer is possibly dereferenced

Justification: A pointer should be checked before each dereferencing to make sure it is not equal to zero. Otherwise an access violation may occur at runtime.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR
    ptiVar1:POINTER TO INT;
    ptiVar2:POINTER TO INT;
    ptiVar3:POINTER TO INT;
    iVar:INT;
    iCount :INT;
    iCondition: INT;
END_VAR

iCount := iCount + INT#1;
ptiVar1 := ADR(iVar);
ptiVar1^ := iCondition; // OK - valid reference
ptiVar2^ := iCondition; // SA0039 - null pointer dereferenciation
iVar := ptiVar3^;       // SA0039 - null pointer dereferenciation

--> SA0039: Possible null pointer dereference 'ptiVar2^'
--> SA0039: Possible null pointer dereference 'ptiVar3^'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0046: Possible use of not initialised interface

Detects the use of interfaces that were not initialized before being used

Justification: An interface reference should be checked for <> 0 before it is used. Otherwise an access violation may occur during access.

Importance: High

Example

```
//declaration of INTERFACE ITF and assigned METH2:
METHOD METH2 : BOOL
VAR_INPUT
    iInput2:INT;
END_VAR
//declaration of INTERFACE Master_ITF1 and assigned METH:
METHOD METH : BOOL
VAR_INPUT
    iInput:INT;
END_VAR

PROGRAM PLC_PRG
VAR
    instPOU:POU;
    instITF:ITF;
    instMasterITF1:Master_ITF1;
    instMasterITF2:Master_ITF2;
    iDummy:INT;
    xDummy:BOOL;
    instNoInitITF:ITF;
    instNoInitITF2:ITF;
    instNoInitMasterITF1:Master_ITF1;
    instNoInitMasterITF2:Master_ITF2;
END_VAR

instITF := instPOU;
xDummy := instITF.METH(iInput := iDummy);             // OK
instMasterITF1 := instPOU;
xDummy := instMasterITF1.METH(iInput := iDummy);      // OK

xDummy := instNoInitITF.METH(iInput := INT#1);        // SA0046
xDummy := instNoInitITF.METH2(iInput2 := INT#2);      // SA0046
xDummy := instNoInitMasterITF1.METH(iInput := INT#3); // SA0046
iDummy := instNoInitMasterITF2.Prop;                  // SA0046

IF instNoInitITF <> 0 THEN
    instNoInitITF.Prop;          // OK, weil das Interface nicht 0
sein kann
END_IF

--> SA0046: Possible use of not initialised interface
'instNoInitITF'
--> SA0046: Possible use of not initialised interface
'instNoInitITF'
--> SA0046: Possible use of not initialised interface
'instNoInitMasterITF1'
--> SA0046: Possible use of not initialised interface
'instNoInitMasterITF2
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0145: Possible use of not initialised reference

Detects any reference variables that may not be initialized before use and are not checked by the operator `__ISVALIDREF`. This rule is applied in the implementation part of POUs. Rule SA0124 applies to the declaration.

Justification: A reference should be checked for its validity before access because an access violation may occur during access.

Importance: High

Example

```
PROGRAM PLC_PRG
VAR_INPUT
    ref_iTest : REFERENCE TO INT;
END_VAR

ref_iTest := 99;            // SA0145
IF __ISVALIDREF(ref_iTest) THEN
    ref_iTest := 88;
END_IF

--> SA0145: Possible use of not initialised reference 'ref_iTest'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*
- *Chapter 1.8.3.3.2.49.15 “SA0124: Pointer dereferences in declarations” on page 4216*

SA0150: Violations of lower or upper limits or the metrics

Detects the POUs that violate the activated metrics at the lower or upper limits

Justification: Code that complies with certain metrics is easier to read, easier to maintain, and easier to test.

Importance: High

PLCopen rule: CP9

Example

Initial situation: The *“Number of calls”* metric is selected in *“Project Settings ➔ Static Analysis ➔ Metrics”*. Lower limit: `0`; upper limit: `3`. `Prog_1` is called five times.

When running the static analysis, the *“SA0150: Metric violation for Prog_1. Report for metric calls (5) > 2”* error is issued in the message view, in the *“Build”* category.

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0160: Recursive calls

Detects recursive calls in actions, methods, and properties of function blocks. Also detects possible recursions from virtual function calls and interface calls.

Justification: Recursions lead to non-deterministic behavior and are therefore a source of errors.

Importance: Medium

PLCopen rule: CP13

Example

The following method `Call` is assigned to the function block `FB_Test`:

```
FUNCTION_BLOCK FB_Test
VAR
    bParameter: BOOL;
END_VAR

METHOD Call : BOOL
VAR_INPUT
END_VAR
Call := THIS^.Call();        //SA0160
```

The program `PLC_PRG` calls `FB_Test`:

```
PROGRAM PLC_PRG
VAR
    fbTest : FB_Test;
    bValue : BOOL;
END_VAR
bValue := fbTest.bParameter;
fbTest.Call();

--> SA0160: Recursive call detected: 'PLC_PRG -> FB_Test.Call ->
FB_Test.Call
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0161: Unpacked structure in packed structure

Detects unpacked structures that are used in packed structures

Justification: The compiler typically sets an unpacked structure to an address that allows aligned access to all elements within the structure. If you create this structure in a packed structure, then aligned access is no longer possible. Furthermore, access to an element in the unpacked structure can lead to a misalignment exception.

Importance: High

Example

The structure `structSingleDataRecord` is packed, but it contains the unpacked structures `struct4Byte` and `struct9Byte`.

```
{attribute 'pack_mode' := '1'}
TYPE structSingleDataRecord :
STRUCT
    str9ByteData: struct9Byte;    (* 9 BYTE *)
    str4ByteData: struct4Byte;    (* 4 BYTE *)
    udi1: UDINT;
    udi2: UDINT;
    udi3: UDINT;
    usi4: USINT;
END_STRUCT
END_TYPE (* 9 BYTE *)
TYPE struct9Byte :
STRUCT
    usiRotorSlots: USINT;        (* 1 BYTE *)
    uiMaxCurrent: UINT;           (* 2 BYTE  *)
    usiVelocity: USINT;           (* 1 BYTE  *)
    uiAcceleration: UINT;        (* 2 BYTE  *)
    uiDeceleration: UINT;        (* 2 BYTE *)
    usiDirectionChange: USINT;    (* 1 BYTE *)
END_STRUCT
END_TYPE TYPE struct4Byte :
STRUCT
    //udiDummy : UDINT;
    rRealDummy : REAL;
END_STRUCT
END_TYPE

--> SA0161: Declaration of an unpacked struct 'struct9ByteData'
inside a packed struct 'structSingleDataRecord'
--> SA0161: Declaration of an unpacked struct 'struct4ByteData'
inside a packed struct 'structSingleDataRecord'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0162: Missing comments

Detects uncommented locations in the program

Justification: Complete commenting is required by many programming guidelines, and it increases the readability and maintainability of the code.

Importance: Low

PLCopen rule: C2

Comments are required in the following cases:

- Declaration of variables (Comments are located either above the declaration or to the right of the declaration.)
- Declaration of programs, function blocks, or methods (Comments are located above the declaration in the first line.)

Example

```
PROGRAM PLC_PRG
VAR
    iMaxValue:  INT;
END_VAR

--> SA0162: Missing comment for 'PLC_PRG'
--> SA0162: Missing comment for 'iMaxValue'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0163: Nested comments

Detects nested comments

Justification: Nested comments should be avoided because they are difficult to read.

Importance: Low

PLCopen rule: C3

Example

```
{attribute 'do-analysis'}
(* That is
(* nested comment 1 *)
*)
PROGRAM PLC_PRG
VAR
(* That is
// nested comment 2
comment *)
    iVal1: INT;
    iVal2: INT;

(* That is
(* nested comment 3 *) *)
    pVal3: POINTER TO DWORD;
    hugo: INT;
END_VAR

(* That is
// nested comment 4
comment *)

iVal1 := iVal1 + 1;

(* That is
(* nested comment 5 *)
*)

(* Not that one *)

--> SA0163: Nested comment 'nested comment 1'
--> SA0163: Nested comment 'nested comment 2'
--> SA0163: Nested comment 'nested comment 3'
--> SA0163: Nested comment 'nested comment 4'
--> SA0163: Nested comment 'nested comment 5'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0164: Multiline comments

Detects multiline comments that are coded as `(* comment *)`. Only single-line comments that are coded as `// comment` are permitted.

Justification: Some programming guidelines prohibit multiline comments in code because the beginning and end of a comment could get lost and the closing comment bracket could be deleted by accident.

You can deactivate this check by means of the pragma `analysis`, also for comments in the declaration part.

Importance: Low

PLCopen rule: C5

Example

```
{attribute 'do-analysis'}
(*
    This is a multi-line comment                // SA0164
*)
PROGRAM PLC_PRG
VAR
// This is a single line comment
    a: DINT;
END_VAR

(* This is not a single line comment *)         // SA0164
a := a + 1;
```

See also

- *Chapter 1.8.3.3.1.2 “Attribute 'analysis'” on page 4150*

SA0165: Tasks calling other POUs than programs

Detects tasks that call function blocks or functions instead of a program

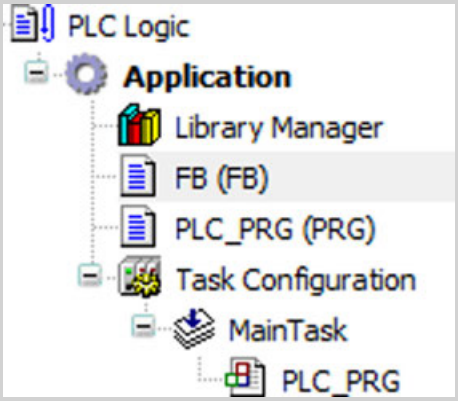
Justification: This rule is part of the PLCopen Coding Guidelines. Therefore, compliance is also checked in CODESYS. We do not see any problems with data consistency in CODESYS if tasks would call POUs other than programs. However, problems can occur if the code is to be ported to other platforms.

Importance: Low

PLCopen rule: CP16

Tasks are inserted below the task configuration. The POUs to be called are configured in the tasks. The POUs must be the *“Program”* type. The *“Function block”* and *“Function”* types are not permitted.

Example



See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0166: Max. number of input/output/in-out variables...

Detects whether or not a defined number of input variables (`VAR_INPUT`), output variables (`VAR_OUTPUT`) or `VAR_IN_OUT` variables is exceeded in a POU. In the *“Project Settings”*, double-click the rule entry to open a dialog where you define the maximum number.

Justification: This is about checking individual programming guidelines. Many programming guidelines provide for a maximum number of POU parameters. Too many parameters make the code unreadable and the POUs difficult to test.

Importance: Medium

PLCopen rule: CP23

Example

In the project settings, for Rule 166, you have defined a maximum number of `1` for `VAR_IN_OUT` variables.

```
FUNCTION_BLOCK FB1
VAR_INPUT
 xIn    : BOOL;
END_VAR
VAR_IN_OUT
 xInOut1 : BOOL;
    xInOut2 : BOOL;
END_VAR

--> SA0166: Too many VAR_IN_OUT variables in POU 'FB1'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0167: Temporary function block instances

Detects function block instances that are declared as temporary variables. This affects instances that are declared in a method or function or as `VAR_TEMP`, and therefore are reinitialized in each processing cycle or for each POU call.

Justification: Function blocks have a state that is usually maintained over multiple PLC cycles. An instance on the stack exists only for the duration of the function call. Therefore, it rarely makes sense to create an instance as a temporary variable. Secondly, function block instances are often large and need a lot of space on the stack (which is usually restricted to controllers). Thirdly, the initialization and often also the scheduling of a function block can take a long time.

Importance: Medium

Examples

```
PROGRAM PLC_PRG
VAR
END_VAR
VAR_TEMP
    yafb: AFB;
END_VAR

FUNCTION Fun : INT
VAR_INPUT
END_VAR
VAR
    funafb: AFB;
END_VAR

METHOD METH : INT
VAR_INPUT
END_VAR
VAR
    methafb: AFB;        // SA0167
END_VAR

--> SA0167: Temporary function block instance: 'methafb'
```

See also

- *Chapter 1.8.3.3.1.5 “Attribute 'analysis:report-multiple-instance-calls'” on page 4152*

SA0168: Unnecessary Assignments

Detects assignments to variables which do not have any effect in the code.

Justification: When values are assigned to a variable multiple times without the variable being evaluated between assignments, the first assignments do not have any effect on the program.

Importance: Low

Example

```
PROGRAM PLC_PRG
VAR
    dwVal1 : DWORD;
    dwVal2 : DWORD;
END_VAR

dwVal1 := 1;                // unnecessary assignment
IF  dwVal2 > 100 THEN
    dwVal2 := 0;
    dwVal2 := dwVal2 + 1;
END_IF
dwVal1 := 2;

--> SA0168: The variable 'dwVal1' is assigned but its value is
never used.
```

See also

- *Chapter 1.8.3.1 “Configuring and Running Static Analysis” on page 4130*

SA0169: Ignored outputs

Detects the outputs of methods and functions that are not specified when calling the method or function.

Justification: Ignored outputs can be a notice about an unhandled error or meaningless function calls because results are not used.

Importance: Medium

Example

```
FUNCTION Fun1
VAR_INPUT
    bIn : BOOL;
VAR_END
VAR_OUTPUT
 bOut : BOOL;
END_VAR

PROGRAM PLC_PRG
VAR
        bValue :BOOl;
END_VAR

Fun1(bIn : TRUE);

 --//SA0169: The output 'bOut' is ignored when called.
```

1.8.4 Drive composer pro integration

Drive Composer Pro is a start-up and maintenance tool for ABB's common architecture drives. The tool is used to view and set drive parameters, and to monitor and tune process performance.

Drive Composer Pro provides:

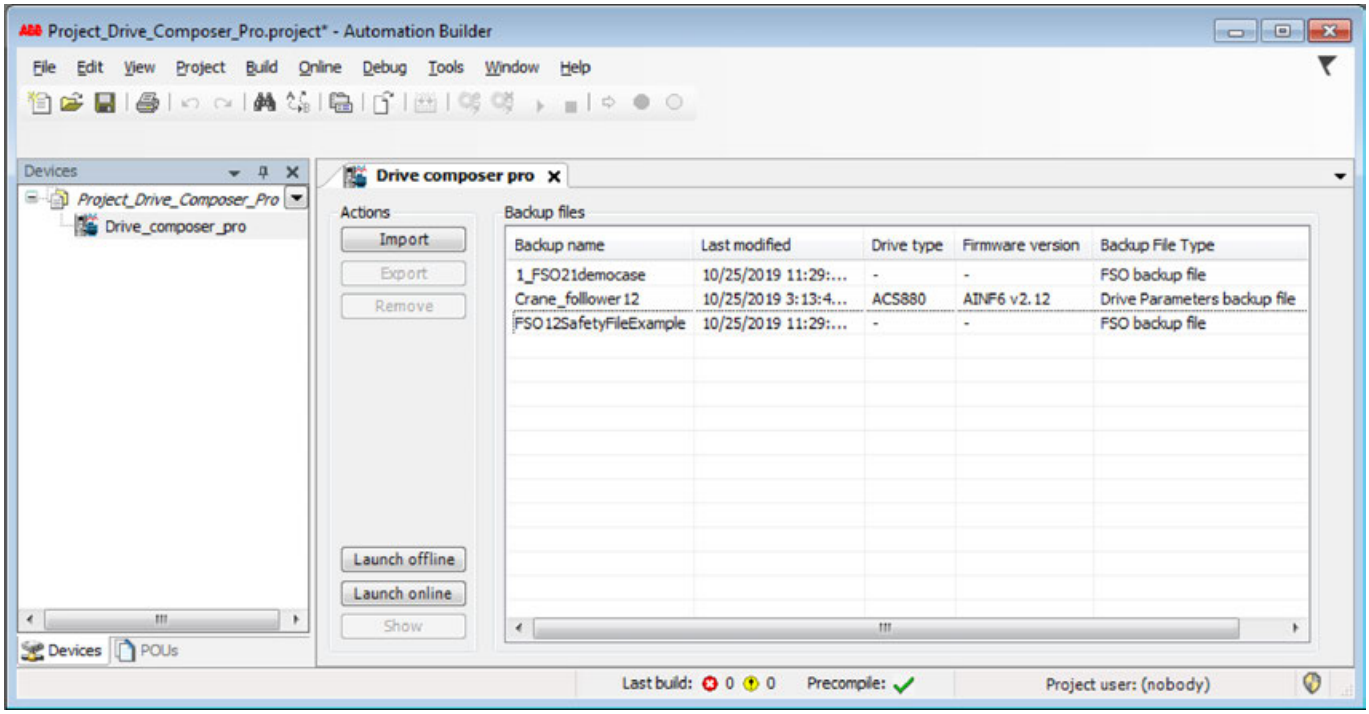
- Setting parameters,
- taking local control of the drive from the PC,
- event logger handling
- control diagrams,
- fast monitoring,
- working with multiple drives on the PC tool network,
- macro script editing for parameters and much more.

1. Add *“Drive Composer Pro”* object into the tree via add object dialog.
2. Open the *“Drive Composer Pro”* with double-click on the object.

In the following section important functions are described.

Import of backup files

1. Import of FSO backup files (*.dcsafety) and Drive Parameters backup files (*.dcparamsbak) into Automation Builder project via the Drive Composer Pro object in the device tree.
2. View of integrated FSO backup files and Drive Parameters backup files in Automation Builder project - refer to figure below.

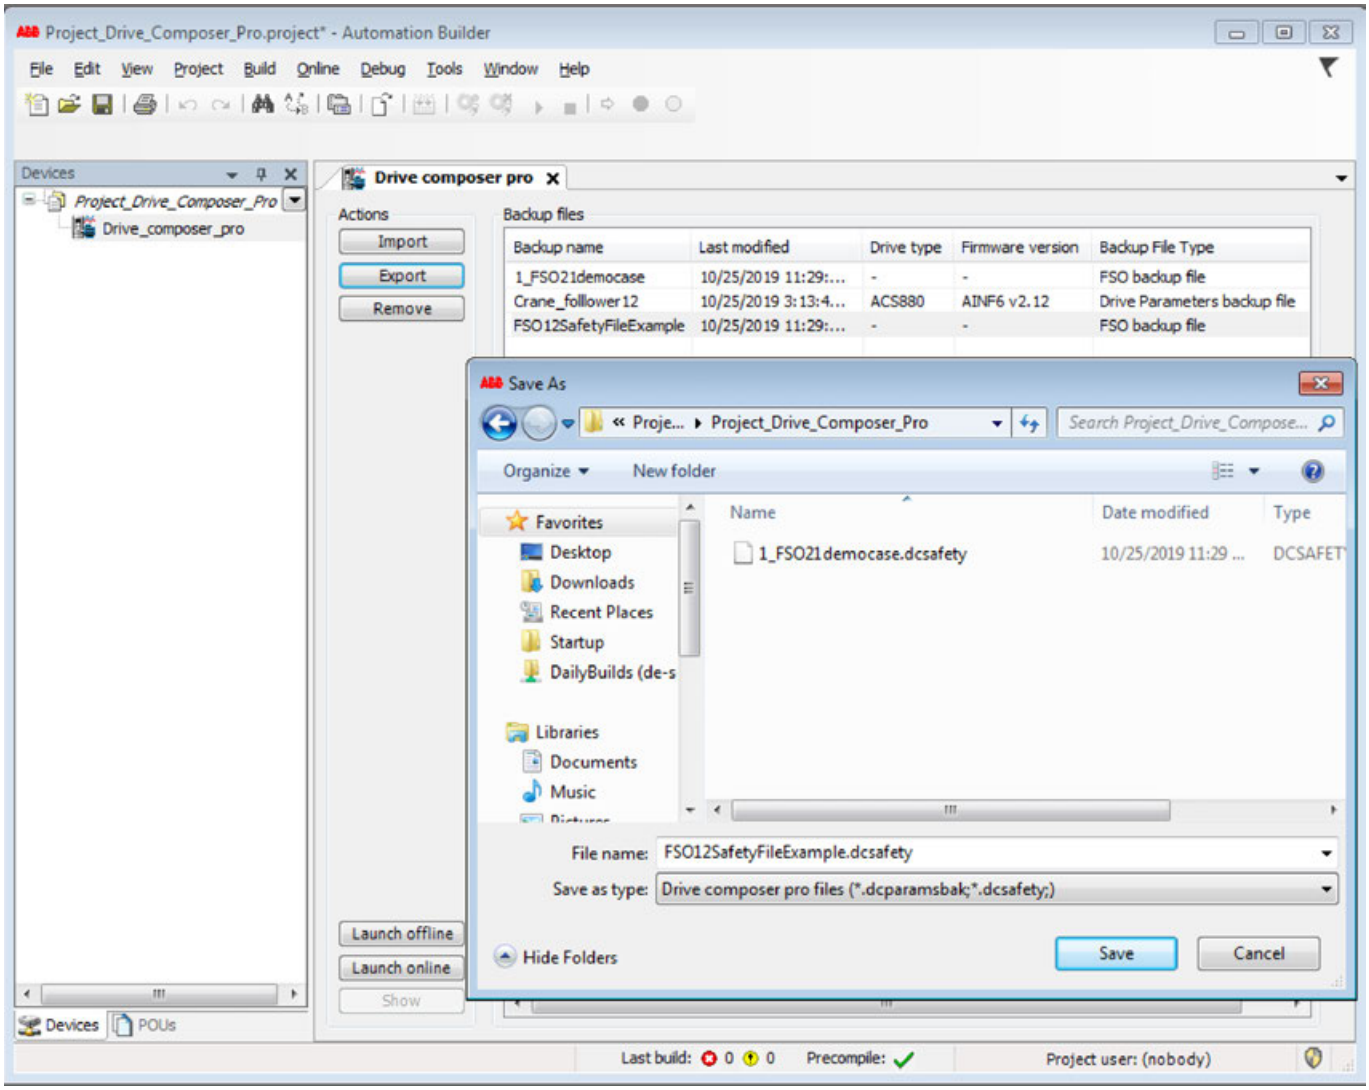


⇨

Drive Composer Pro can't be launched directly with integrated “FSO backup files” but they have to be loaded manually via context menu on the drive in Drive Composer Pro → “Safety Settings”.

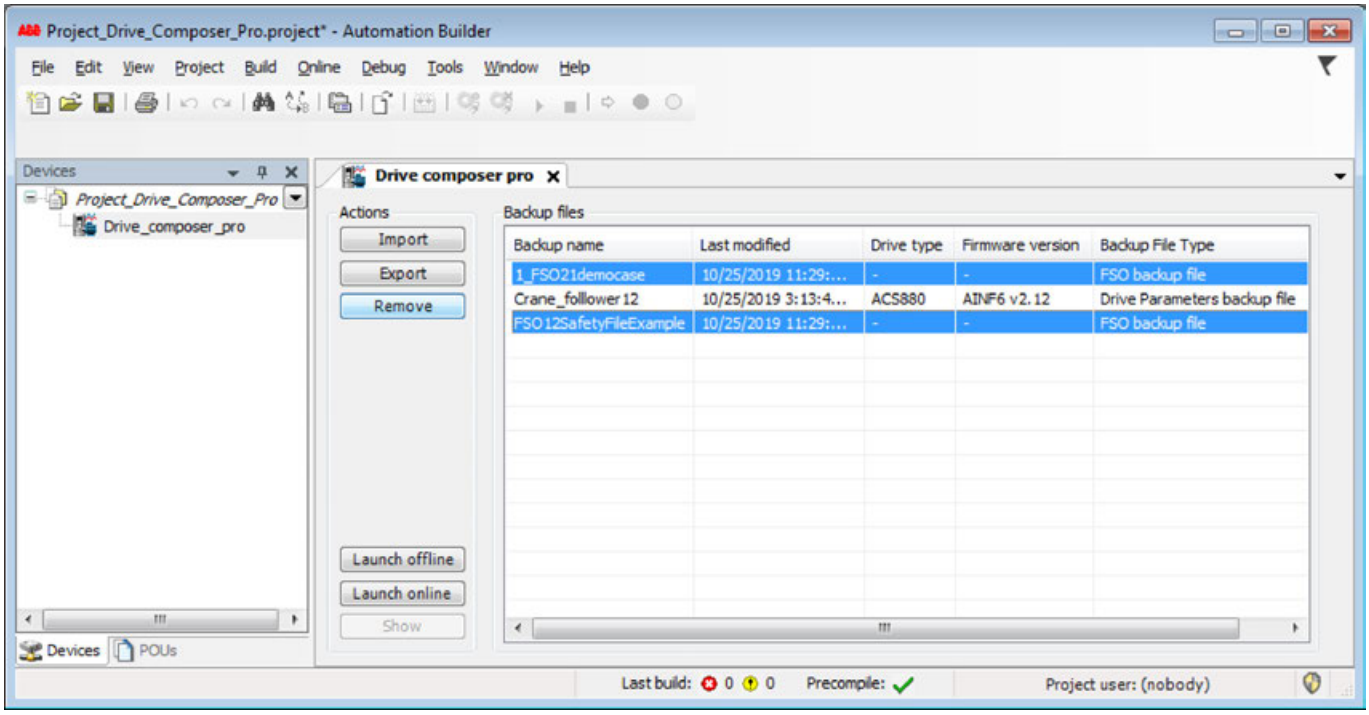
Export of backup files

1. Select the FSO and Drive Parameters backup files.
2. Export the selected file by clicking *[Export]*.
   ⇨ Select the desired storage path.



Remove of backup files

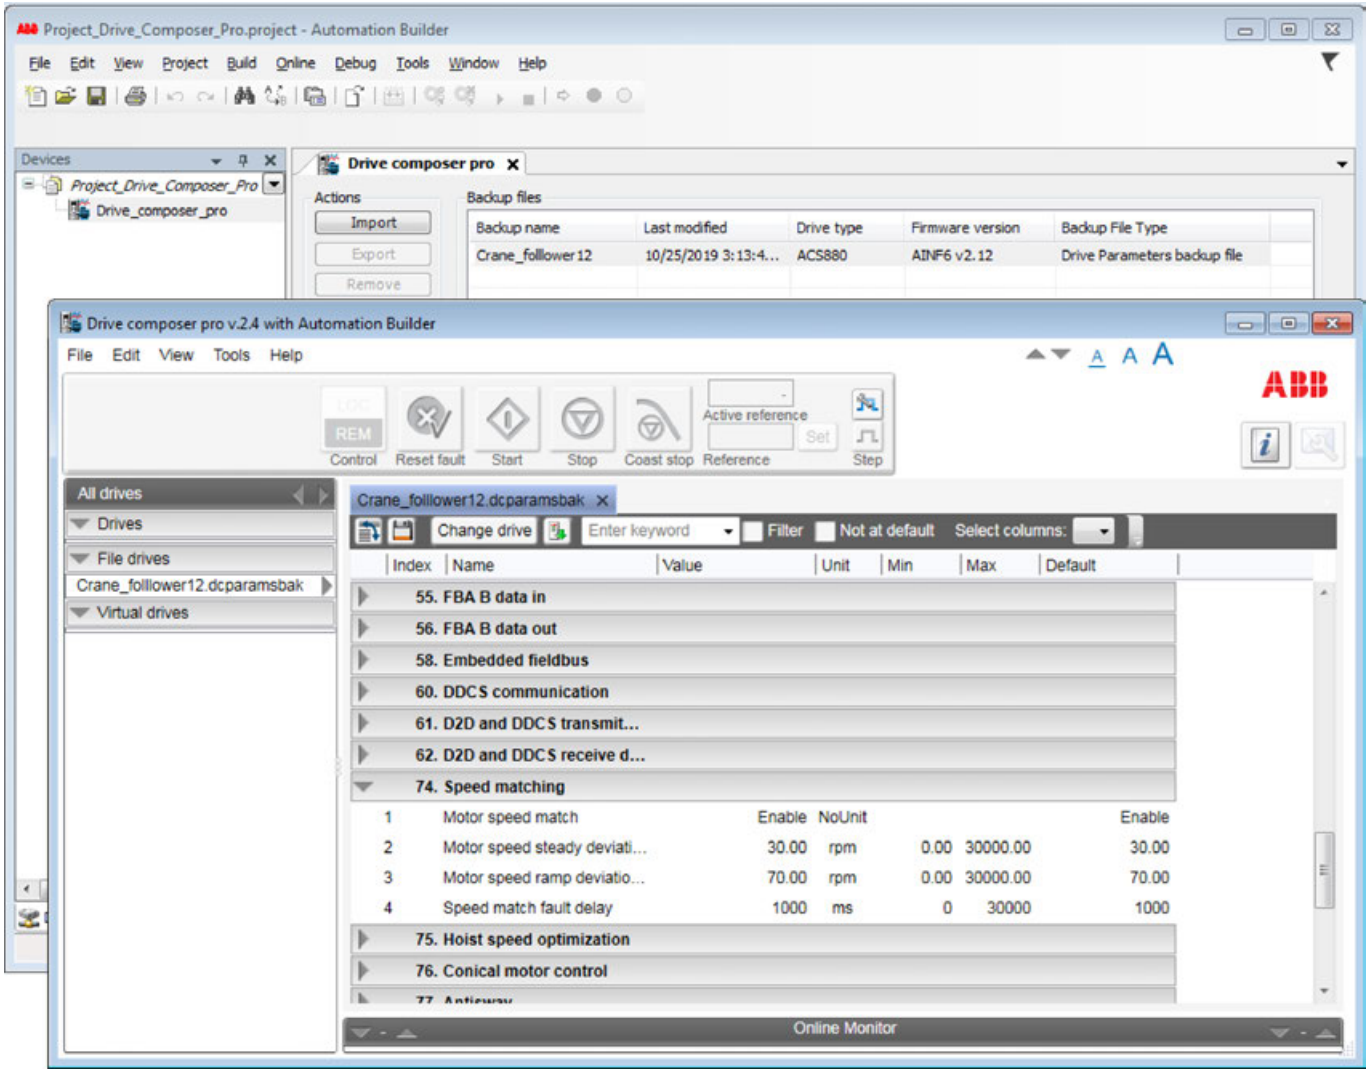
1. Select the FSO and Drive Parameter backup files from Automation Builder project.
2. Remove the selected files by clicking *[Remove]*.



View standard drive parameter backup files

1. Open the *“Crane_follower12.dcparamsbak”* with double-click.
2. The *“Drive Composer Pro”* starts automatically.

> *Standard Drive Parameter backup files (*.dcparamsbak) are automatically displayed under “File Drives”.*



3. Saved changes in the standard drive parameter backup file are automatically updated in the Automation Builder project.

1.8.5 Professional Version Control

SVN integration in CODESYS

Professional Version Control allows for the development of CODESYS projects under version control by Apache™ Subversion®. Professional Version Control provides an SVN client integrated in CODESYS. The objects of your project are versioned in a central *SVN repository*.

As a rule, the SVN repository should be created in a server configuration and located on a server. For testing purposes, you can create a local SVN repository where you can access via `file://`.

Professional Version Control requires a valid license and can be installed using the Automation Builder Installer or the Automation Builder Installation Manager.

1.8.5.1 Getting Started

The following steps are required in order to develop your CODESYS project with Professional Version Control with version control by Apache™ Subversion®:

1. Install the Professional Version Control package in CODESYS.
2. Install an SVN server.
3. Create an SVN repository.
4. Open your CODESYS project in CODESYS.
5. Import the CODESYS project into the SVN project archive.
   ⇨ The CODESYS project is saved in the SVN repository.
6. To edit and further develop the project with SVN version control, the project is edited in CODESYS and then committed to the SVN repository.

A detailed description of these individual steps is located in the following sections.

See also

- *Chapter 1.8.5.3 “Using an SVN Repository” on page 4232*
- *Chapter 1.8.5.4 “Using Working Copies” on page 4234*

1.8.5.2 Version control

What is version control?

Apache™ Subversion® (SVN) is a tool for version and revision management of current and previous versions of files, such as source code, websites, and documentation. Apache™ Subversion® is a registered trademark of the Apache Software Foundation.

Revision management (also known as version control, version management, and source code management) is the management of changes to documents, programs, and other information that is stored as computer files. Version control is employed frequently in software development when a team of employees works on the same files.

Tasks

- Co-writing of changes in revisions: At any time, you can show who made which changes at which time.
- Restoring of old revisions of individual files: At any time, you can reverse accidental changes to files.
- Archiving of special revisions of a project: At any time, you can revert to older versions.
- Coordination of common access of developers to data
- Development of a project simultaneously in multiple branches

Script Engine SVN Add-on API

Professional Version Control provides a scripting-interface for SVN.

1.8.5.3 Using an SVN Repository

An *SVN repository* usually saves information as a file system tree, a hierarchy of files, and directories. Any number of clients connects to the SVN repository and reads or writes changes to the files in revisions.

Creating an SVN repository

NOTICE!

Consult with your IT specialists for more information, for example how to create an SVN repository. For production purposes, we recommend a strictly dedicated administrative SVN server.

We recommend that you create the suggested default directory structure in the SVN repository.

See also

– *http://svnbook.red-bean.com/en/1.8/svn.tour.importing.html#svn.tour.importing.layout*

Creating an SVN repository for testing purposes

NOTICE!

Use the `file://` access method for testing purposes only.

You can reach SVN repositories that were created in format 1.8 or 1.9 via the `file://` protocol.

For testing purposes, you can create a local SVN repository without installing your own server. The SVN repository is accessed via `file://` and provides the same functionality as a server.

Creating a test repository with TortoiseSVN

☑ Requirement: The SVN client TortoiseSVN 1.9 is installed on the development system.

1. Create a new, empty folder on your local file system. The test repository will be created there.
   ⇨ Example: `D:\SVN repository`
2. Click *"TortoiseSVN ➔ Create repository here"*.
   ⇨ The dialog *"Create repository"* opens.
3. Click *"Create directory tree"*.
   ⇨ The `SVN repository` is created.

See also

- Documentation TortoiseSVN *Documentation TortoiseSVN*

Accessing the SVN repository

Table 759: SVN repository URLs

`file:///`	Direct access to an SVN repository (on local hard drive)
`http://`	Access via WebDAV protocol to Apache server that is supported by SVN
`https://`	As `http://`, but with SSL encryption
`svn://`	Access via own protocol to an `svnserve` server
`svn+ssh://`	As `svn://`, but tunneled via SSH

Import the project into the SVN repository.

1. Open the CODESYS project that you want to save in the SVN repository.
   ⇨ Example: `A.project` is open.
2. Click *"Project ➔ SVN ➔ Import project to SVN"*.
   ⇨ The *"Browse SVN repository"* dialog opens.
3. Select the directory `file:///D:/SVN repository/trunk` in the directory tree.
4. Select the command.
   ⇨ The *"Create remote directory"* dialog opens.
5. Specify the URL for the new directory.
   Note: Because the new directory should contain the CODESYS project, specify the project name with extension here.
   ⇨ `file:///D:/SVN%20repository/trunk/A.project`
6. Click *"OK"* to close the dialog.
7. Select the new project and click *"OK"* to exit the *"Browse SVN repository"* dialog.
   ⇨ The *"Import Project to SVN"* dialog opens. The directory `file:///D:/SVN repository/trunk/A.project` is specified in *"URL of SVN repository"*.

See also

- *Chapter 1.8.5.5.1 "Overlay Icons" on page 4235*

1.8.5.4 Using Working Copies

Checking out a project

You can copy CODESYS projects to your development system that are saved in the SVN repository.

Creating a working copy

1. Open CODESYS.
2. Click *"Project ➔ SVN ➔ Checkout"*.
   ⇨ The *"Checkout"* dialog opens.
3. Specify the URL of the SVN repository and select a project in the SVN repository tree.
   If a CODESYS project has the extension `.project` or `_project`, then it is recognized automatically as a project at checkout. If it has the extension `.library` or `_library`, then it is recognized as a library project.
4. In *"Checkout to"*, specify the name and location of the working copy on your development system.
5. Click *"OK"* to close the dialog.
   ⇨ The project opens in CODESYS. In the object tree of the project, the SVN link is shown with overlaid icons. Now the project is saved as a working copy on your development system.

See also

- *Chapter 1.8.5.5.1 "Overlay Icons" on page 4235*

Editing the working copy

Update the working copy before you start editing, especially if the project is revised by a team. This is how you avoid conflicts.

1. Open the working copy.
2. Click *“Project ➔ SVN ➔ Update project”* (symbol:).
   ⇨ You working copy is current.
3. Revise your project.
4. Click *“Project ➔ SVN ➔ Edit SVN working copy”*.
   ⇨ The dialog opens. There you can browse your changes.
5. Close the dialog.
6. If necessary, you can click *“SVN ➔ Revert”* in the context menu.
   ⇨ The file is reverted back to the base revision and your changes are discarded.
7. If necessary, you can click *“Compare”* in the context menu of an edited object.
   ⇨ The compare dialog opens. You can resolve any conflicts here.
8. Close the compare dialog.
9. Click *“Project ➔ SVN ➔ Commit project”* (symbol:).
   ⇨ The *“Commit”* dialog opens.
10. In *“Message”*, specify a log entry that describes your changes. Example: `Changes for customer ABC, request 1234.`
    ⇨ Your changes are saved in the SVN repository as a revision with a revision number.

See also

- *Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 4238*

Changed working copy format in Professional Version Control `V4.1.0.0` and later

For projects in version Professional Version Control `V4.1.0.0` and later, the working directory (working copy) has a new format.

If you open a project that was created with `V4.0.4.0` or earlier, then the project is updated automatically to the new format when it is opened.

If you open a project that was created with `V4.0.4.0` or earlier and the project is based on an older SVN version of `1.7.x` or earlier, then you are prompted whether or not CODESYS should update the format. If you decline the update, then the SVN link of the project is deactivated. You can still load and edit the project.

The update does not have an effect on saving to the SVN server. You can also checkout projects with earlier versions of the client. The new format affects only the local working directory.

1.8.5.5 Reference, User Interface

1.8.5.5.1 Overlay Icons

Every object in CODESYS has a status value in the SVN repository. This status value is displayed in the object tree (in the *“POUs”*, *“Devices”*, or *“Modules”* views) for each object by overlay icons.

Table 760: Overlay icons

	Object is planned to be added to the SVN repository.
	Object conflicted
	Object deleted
	Object modified
	Object with modification in the metadata
	Object with modifications in the memory format
	Object normal
	Object write-protected (read-only)
	Object locked
	Object with deleted subobjects
	Object ignored on commit
	External object
	Ignored object
	Unversioned object
	Object with modified subobjects
	The object is not saved in the SVN repository. It will be created again when loaded from SVN.
	`SVN_VERSION_INFO` temporarily unavailable, for example as with interface libraries
	The status of the object is not updated.
	The object was modified on the server (**U**pdate available).
	The object was locked on the server by another user (or in another working directory).
	Tree conflict by changes to the structure of the project

1.8.5.5.2 Commands

Not all commands are available in the logged in state because some SVN commands of the project could be changed.

Table 761: Availability of commands

Command	Not Logged In	Logged In
Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 4238	X	X
Chapter 1.8.5.5.2.2 “Command 'Edit SVN working copy'” on page 4239	X

Command 'SVN Repository Browser'

Symbol: 

Function: This command opens the SVN repository browser. The contents of an SVN repository is shown in a tree structure here. You can search through the repository in the browser.

Call: Menu bar: *“Project ➔ SVN”*.

Depending on the selected object, the following commands are available in the context menu:

- *“Show log”*
- *“Checkout”*
- *“Create folder”*
- *“Copy to”*
- *“Rename”*
- *“Delete”*

Double-clicking the object with the right mouse button opens the log dialog.

Dialog 'SVN Repository Browser'

"URL"	URL in SVN repository Example: `https://svnserver/repository/trunk/ControlABC.project` Tip: As soon as a valid SVN repository is specified, you can browse and select a specific project by means of the adjacent button.
15	Opens the dialog *"Select revision"*. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"3"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
	Updates the browser view by rescanning the SVN repository.
	Navigates the URL address up by one folder.
Left area	Directory tree in the SVN repository. Project nodes are shown in bold.  Note: In this view, you can directly edit the project name and the name of the superordinate folder.
Right area	List of objects of the selected directory
"Close"	Closes the dialog

See also

- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 4267*

Command 'Edit SVN working copy'

Symbol:

Function: This command opens the dialog *"Edit SVN working copy"* and displays the working copy in a browser from the SVN view.

Call: Menu bar: *"Project ➔ SVN"*.

The functionality of the browser allows for:

- Access to and actions on objects that are not displayed in the *"Devices"* view.
- Actions on objects that can lead to exceptions in the *"Devices"* view.
- Editing of global objects that are modified, in conflict, or blocked.

Dialog ‘Edit SVN working copy'

Table 762: “Edit SVN working copy: <project name> - <project URL>”

“Path in SVN repository”	Display of working copy from SVN view. The file and folder structure of the objects in the project are presented in a tree view. In this way, the recursion depth of an object is clear. : Object selected for the following menu command
“Name of object”	File name of the object Example: `Application`
“ Node type”	The top node is the project root directory.
“Text status”	Object status: ● *“modified”* ● *“added”* ● *“deleted”* ● *“non-versioned”* ● *“Conflicted”*
“Property status”	Status in SVN repository: ● *“modified”* ● *“added”* ● *“deleted”* ● *“Conflicted”* ● *“normal”*
“Revision”	Revision number
“Conflict information”	File conflict, property conflict, or tree conflict
“Lock”	For locked objects, the user who applied the lock is displayed. Example: `b.mayer`
“Lock comment”	Lock message. Implicit, normal, or stolen lock.
“URL”	URL of the object

Table 763: Menu commands

“Select ➔ All”	Selects all files.
“Select ➔ None”	Deselects all files.
“Select ➔ Modified”	Selects the modified files.
“Select ➔ Conflicted”	Selects the conflicted files.
“Select ➔ Locked”	Selects the locked files.
	Updates the working copy. Changes made by others are added from the SVN repository to your working copy.
“Update ➔ Project”	Updates all files of the project.
“Update ➔ Selected nodes”	Updates only the selected files.
“Update ➔ Selected nodes and children”	Updates the selected files and subordinate files.
“Reset”	Discards your changes to the working copy. Then the object corresponds to the revision in the repository.

"Delete ➔ Selected nodes"	Deletes the selected objects from the working copy.

"Commit"	Commits your changes to the SVN repository. Any locked objects will be unlocked.
"Commit ➔ Project"	Commits all files in the project.
"Commit ➔ Selected nodes"	Commits only the selected files.
"Commit ➔ Selected nodes and children"	Commits the selected files and subordinate files.

	Commands for managing locks.
"Locks ➔ Revalidate all"	Checks the validity of locks in the working copy. Any invalid locks will be unlocked.
"Locks ➔ Release locks"	Releases the lock.
"Locks ➔ Acquire locks"	Locks the object from editing by others.
"Locks ➔ Steal locks"	Locks the file for you and removes the lock of another user. Tip: Avoid stealing a lock because the changes made by another user can be lost.

	Commands to resolve conflicts.
"Conflicts ➔ Mark as resolved"	Indicates a displayed conflict in the SVN repository as marked and resolved. Note: Select the command if you edited and resolved the displayed conflict. Then you can commit changes again.
"Conflicts ➔ Resolve using theirs"	Resolves the conflict: In the SVN repository, the changes are accepted that were committed by other users. Your changes are discarded.
"Conflicts ➔ Resolve using mine"	Resolves the conflict: In the SVN repository, the changes to your working copy are accepted and the changes by other users are discarded.

"Show log"	Opens the dialog *"Log - Application"*. The history of the selected node is shown here. The previous revisions are displayed with the respective actions.

"Change location"	Changes the storage location of the selected object within the working copy. Example: You can resolve a tree conflict by saving the local object to another location. Then update the parent object to apply it to the locked children.

"Update"	Updates the browser view by rescanning the working copy.

"Cleanup"	Executes an SVN cleanup operation on the working copy.

Command 'Import project to SVN'

Symbol: 

Function: This command opens the *"Import Project to SVN"* dialog for importing a CODESYS project to the SVN repository.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement

- You have access to an SVN repository and you know its URL.
- You have read access to the entire project.

> **NOTICE!**
> Projects are always saved unencrypted on the server. Therefore, take appropriate security measures (for example, respective access rights to the SVN server) for protecting your projects.

See also

- User and access management in *Protect and save project*

Dialog 'Import Project to SVN'

"URL of SVN repository"	URL of the SVN repository with the new project folder where the files are imported Example: `https://svnserver/repository/trunk/ControlABC.project` Hint: When importing libraries, specify the extension `.library` or `_library`. For projects, specify the extension `.project` or `_project`. Then the project type is recognized automatically at checkout and the options are set accordingly in the *"Checkout"* dialog.
	Opens the *"SVN Repository Browser"* dialog The previous project structure is displayed and you can edit them here.
"Import message"	Text for use as log message Example: `Control project for customer A`
"Recent messages"	Opens the *"Recent Messages"* dialog. There you can reuse the last log messages.
"Generate SVN_VERSION_INFO"	☐: The object `SVN_VERSION_INFO` is not created automatically during the import operation. Therefore, the project does not get any global constants or variables for the project metadata.
"OK"	Creates the current project in the SVN repository and imports the project objects. The local project in CODESYS Development System is linked to the SVN repository. Overlay icons show this in the object trees.

See also

- *Chapter 1.8.5.5.2.4 "Command 'Checkout'" on page 4242*
- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*
- *Chapter 1.8.5.5.1 "Overlay Icons" on page 4235*

Command 'Checkout'

Symbol: 

Function: This command opens the *"Checkout"* dialog. Here you can checkout a project stored in the SVN repository as a working copy.

Call: Menu bar: *"Project ➔ SVN"*.

Dialog 'Check-out'

Table 764: "URL of SVN repository"

	URL of the project in the SVN repository Example: `https://svnserver/repository/trunk/ControlABC.project` Tip: As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in *"Revision"* and select a specific project.
	Opens the dialog *"Select revision"*. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
	Opens the *"SVN repository browser"* dialog Here you can browse the SVN repository.

Table 765: "Checkout to"

"Name"	Name of the working copy Example: `ControlABC.project`
"Location"	Storage location of the working copy Example: `/D:/svn/repository/trunk/ControlABC.project`

Table 766: "Checkout as"

"Project"	The project is saved as a CODESYS project "`<project name>.project`".
"Library"	The project is saved as a CODESYS library file "`<project name>.library`".
"Auto-detect"	CODESYS attempts to recognize the project type by means of the extension. The current implementation checks whether the URL of the project ends with "`_library`" or "`.library`". In this case, the project is recognized as a library or a project.

Table 767: "Checkout options"

"Omit externals":	☑: Externals (external objects) are not copied to the working directory.

Table 768: "Revision"

For a description, refer to the section "Dialog 'Select revision'". Note: The group provides the same options as the *"Revision"* dialog.

"OK"	Checks out the project from the SVN repository, saves it locally to the specified location, and opens it in CODESYS as the primary project.

If files were encrypted when imported to the SVN repository, or if they have been committed, then note the following:

When committing to the SVN repository, the information about an encrypted project file is included. However, the type of encryption is not included (password, Wibu security key, X509 certificate). Therefore, it may be necessary to encrypt the working copy again in the project settings. In this case, a dialog opens when exiting the command to notify you of this. Then you are able to switch directly to the project settings.

See also

- *Chapter 1.8.5.5.3.3 “Dialog 'Select revision'” on page 4267*
- *Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 4238*
- *"Version control with Subversion", Section "Revision identifier"*

Command 'Commit', Command 'Commit Project'

Symbol:

Function: The command commits changes that were made in CODESYS to the SVN repository. The *“Commit”* dialog opens for this purpose.

Call:

- Context menu: *“SVN”* to commit exactly this object
- *“Project ➔ SVN ➔ Commit Project”* to commit all changes in the project at the same time

Requirement: At least one object was modified. An object whose contents have been modified is overlaid in the object tree with the , , or symbol.

When you execute the command, the lock on the objects to be committed is lifted automatically.

See also

- *Chapter 1.8.5.5.1 “Overlay Icons” on page 4235*

Dialog 'Commit'

Table 769: “Commit to: <URL project/object>”

	URL in SVN repository Example: `file:///D:/SVN repository/trunk/ControlABC.project`
“Log message”	Type in a log message that comments your change. Example: `Bug fix error 123`
“Recent Messages”	Opens the *“Recent Messages”* dialog for displaying the last log messages. You can click a log message to accept it.

Table 770: "Changes made (double-click on object for compare, right-click on object for more operations)"

	List of objects that were changed and can therefore be committed. The SVN URLs mirror the hierarchy of the object in the SVN repository. The objects are highlighted in color according to the object status: ● Blue: Modified ● Green: Added ● Dark red: Deleted ● Red: Conflicted ● Black: Non-versioned (not in SVN repository) Note: These objects are displayed when the *"Show non-versioned objects"* option is selected. ● Gray: Excluded from commit Note: This is the case when the *"Ignore during commit"* option is selected. The list also contains objects which have not been modified but have a lock. This helps to prevent locking from going unnoticed in the repository. Double-click an object in order to open the compare dialog. The revision of the working copy is compared with the base revision. The compare dialog also opens when you click *"Compare"* in the context menu. Right-click an object in order to open the context menu. Note: When the *"Commit Project"* command has been executed, a list of objects is shown here. When the *"Commit"* command is applied to a specific object, only this object is shown (if modified or locked) and its modified or locked child objects.
"Object"	☑: The object is selected for the commit. Example: ☑ Device\Plc Logic\Application\PLC_PRG
"Text status"	Object status in CODESYS ● *"Modified"* ● *"Added"* ● *"Deleted"* ● *"Non-versioned"* ● *"Conflicted"*
"Property status"	Status of the metadata of the object ● *"Modified"* ● *"Added"* ● *"Deleted"* ● *"Conflicted"* ● *"Normal"*
"Lock"	If the object has a lock, then it is shown here the user who applied the lock. Example: `b.mayer`
"Description"	Display of the log message
"Select/Deselect All"	☑: All objects in the list are selected.

"Keep Locks"	☑: Your locked object remains in locked after the commit.
"Keep Change Lists":	☑: The change list also remains after the commit. ☐: The change list is not deleted after the commit.
"Update After Commit (recommended)"	☑: The object/project is updated after the commit. Select this check box to ensure that the project is up-to-date and to prevent conflicts resulting from mixed revisions of working copies.

Button *“Update Project”*	Updates the project Hint: Prevent conflicts by committing a previously updated project/object.
“OK” Keyboard shortcut *[Ctrl]+[Enter]* Keyboard shortcut *[Ctrl]+[Enter]*	Checks the working copy first. Starts the commit of changes when the working copy is current. Opens a dialog when the working copy is outdated. You can then select from the following: ● *“Abort the commit, I want to investigate the issue.”* ● *“Yes, I want to update this project now.”* ● *“Continue with the commit, I know what I do.”* Note: The history of the commit is displayed in the *“Messages”* view. The messages are highlighted in color. ● Blue: Commit a change ● Green: Add an object ● Dark red: Delete/replace an object ● Black: Other messages (summary)

Handling external objects

If the external object is in the same SVN repository, then changes in this external object are listed in the commit dialog and committed together with the internal project. If an external object is in another SVN repository, then you are notified about changes in the external project and you have to commit these separately.

An external object has the “externals” property.

- *Chapter 1.8.5.5.2.6 “Command 'Compare'” on page 4247*
- SVN help: *http://svnbook.red-bean.com/en/1.7/svn.basic.in-action.html#svn.basic.in-action.mixedrevs)*

Context menu (right-click on object)

“Compare”	Opens the compare dialog to compare the working copy with the top-level revision.
“Compare with HEAD version”	Opens the compare dialog to compare the working copy with the HEAD revision.
“Compare with Revision”	The list entries are highlighted in color according to the object status: ● Blue: Modified ● Green: Added ● Dark red: Deleted ● Red: Conflicted ● Black: Non-versioned (not in SVN repository) Note: These objects are displayed when the *“Show non-versioned objects”* option is selected. ● Gray: Excluded from commit Note: This is the case when the *“Ignore during commit”* option is selected for the object.
“Revert”	Discards your changes to the working copy. Then the object corresponds to the revision in the SVN repository.
“Show log”	Shows the version history of the selected object.

"Properties"	Opens the *"SVN Properties"* dialog. The properties are displayed there and you can edit them.
Move to change list	Note: This command has not been implemented yet.

Command 'Compare'

Symbol: 🔍

Function: This command opens a tab that shows the result of the comparison of your working copy and the BASE revision. The base revision is the top-level revision in the SVN repository.

Call:

- Menu bar: *"Project ➔ SVN"*.
- Context menu

Requirement: The object is versioned, it was modified locally, and it does not contain any conflicts.

Multiple tabs can be open at the same time with the comparison of different objects.

> ***Comparison by object type***
> *The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.*

See also

- *Chapter 1.6.6.1.1.6 "Comparing projects" on page 3640*

Command 'Compare with HEAD revision'

Symbol: 🔍

Function: This command opens a tab that shows the result of the comparison of your working copy and the HEAD revision. The HEAD revision is the top-level revision in the branch. You can revert specific changes that were committed to the HEAD revision.

Call: Context menu: *"SVN"*

Requirement: The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

> ***Comparison by object type***
> *The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.*

See also

- *Chapter 1.4.1.20.3.4.21 "Command 'Compare'" on page 1010*

Command 'Compare with revision'

Symbol: 🔍

Function: This command opens the *"Project log"* dialog or *"Log - <object> "* where the version history is displayed from the project or an object of the CODESYS project. Here you can select a revision. A tab opens and shows the result of the comparison of your working copy and the revision.

Call: Context menu: *"SVN"*

Requirement: The object is versioned and not conflicted.

Multiple tabs can be open at the same time with the comparison of different objects.

> ***Comparison by object type***
> *The comparison dialog makes use of the functionality of the CODESYS command "Project ➔ Compare". In this way, objects are compared according to their object type.*

See also

- *"Tab 'Project log', Dialog 'Log - <object>'" on page 4254*
- *Chapter 1.4.1.20.3.4.21 "Command 'Compare'" on page 1010*

Command 'Compare to remote project...'

Symbol:

Function: This command opens the dialog *"Select Remote Project for Comparison"*.

Call: Menu bar: *"Project ➔ SVN"*.

See also

- *Chapter 1.4.1.20.3.4.21 "Command 'Compare'" on page 1010*

Dialog 'Select Remote Project for Comparison'

Table 771: "URL of SVN repository"

https://svnserver/repository/trunk/ControlABC.project	URL of the project in the SVN repository that is compared. Example: `file:///D:/SVN repository/trunk/ControlDEF.project` As soon as a valid SVN repository is specified, you can click the adjacent button or use the options to browse in *"Revision"* and select a project.
15	The label on the button corresponds to the selected revision: ● *"HEAD"*: Top revision (latest). ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) After clicking the button, the dialog *"Select revision"* opens. Note: The dialog provides the same options as the *"Revision"* group.
...	Opens the dialog *"Browse SVN repository"* to search the SVN repository.

Table 772: "Checkout options"

"Omit externals":	☑: External objects are not compared.

Table 773: “Revision”

Options for selecting a specific revision Note: the current valid selection is also displayed next to the SVN repository URL.	
“HEAD”	: The HEAD revision is selected. This is the latest revision (top revision) within a branch.
“Revision”	: A specific revision is selected by the revision number. Example: `3`
“Date”	: The specific revision is selected by the modification date. Example: `12/23/2016 11:59:59`
“Use UTC Time”:	: Modification date in universal time.

Table 774: “compare options”

“Ignore Whitespace”	: No comparison of whitespace characters. Semantically relevant whitespaces, such as in strings, are compared anyway.
“Ignore Comments”	: No comparison of comments.
“Ignore Properties”	: No comparison of properties. Folders, the property *“Exclude from build”*, and POU images are not compared. See: Dialog 'Properties'

“OK”	Compares the SVN project with the working copy.

See also

- *Chapter 1.8.5.5.2.1 “Command 'SVN Repository Browser'” on page 4238*
- *Chapter 1.4.1.20.4.10 “Dialog 'Properties'” on page 1157*

Command 'Include externals to project', Command 'Include externals'

Symbol:

Function: These commands open the dialog *“Include externals”*.

Call:

- Menu bar: *“Project ➔ SVN”*.
- Context menu: *“SVN”*

Requirement: An object is selected in the object tree. The external objects are linked below that. If you have selected nothing or the project root directory, then the command *“Include externals to project”* is available. If you have selected an object, then the command *“Include externals”* is available.

The same external objects cannot be linked multiple times at different locations in the same project. This leads to problems in CODESYS because of conflicts with the internal identification of the object.

Dialog 'Include externals'

Table 775: "URL of SVN repository"

file:///D:/SVN repo A/trunk/DSTest.project/Source	URL of the external object that is linked. The object to be linked is versioned and can have sub-objects. External objects are located at another location in the SVN repository than the project. It can even be in another SVN repository. Example: `file:///D:/SVN repo A/trunk/DSTest.project/GlobalTextList` Note: The objects that should be linked below the selected object must have a matching object type. For example, only a task can be linked below the *"Task configuration"* object.
15	Opens the dialog *"Select revision"*. Here you can select a revision. The button is labeled with the currently selected revision: ● *"HEAD"*: Top revision (latest). Preset ● *"15"*: Revision number of the selected revision ● *"23.12.2016 11:59:59 (UTC)"*: Change date of the selected revision (UTC) Note: The dialog provides the same options as the *"Revision"* group.
...	Opens the *"SVN repository browser"* dialog Here you can browse the SVN repository.

Table 776: "Revision"

Options for selecting a revision Note: the current valid selection is also displayed in the buttons next to the SVN repository URL.	
"HEAD"	: Latest revision (top revision) selected in a branch.
"Revision"	: A specific revision by the revision number. Example: `3`
"Date"	: A specific revision by the modification date. Example: `12/23/2016 11:59:59`
"Use UTC Time":	: Modification date in universal time.

"OK"	Adds the external object and its sub-objects with the property `svn:externals` to your project (below the selected object). The working copy is updated and the external object is overlaid with the ↗ symbol. Example: Source (external device `Source`) Note: If the linking fails (for example when adding a device below a task configuration), then the complete operation fails and reverts back. Note: Renaming or moving individual external objects is permitted inly within an external tree, whereby it is not permitted to move the top object. To move a complete tree, you have to remove it and link it to another location.

> *"... You should seriously consider using explicit revision numbers in all of your externals definitions. Doing so means that you get to decide when to pull down a different snapshot of external information, and exactly which snapshot to pull. Besides avoiding the surprise of getting changes to third-party repositories that you might not have any control over, using explicit revision numbers also means that as you backdate your working copy to a previous revision, your externals definitions will also revert to the way they looked in that previous revision, which in turn means that the external working copies will be updated to match the way they looked back when your repository was at that previous revision. For software projects, this could be the difference between a successful and a failed build of an older snapshot of your complex codebase. ..."*
>
> *This is a quote from:*
>
> *http://svnbook.red-bean.com/nightly/en/svn.advanced.externals.html).*

Command 'Ignore on commit'

Function: This command identifies an object and adds it to the "ignore-on-commit" list. Then it is deactivated in the commit dialog by default.

Call: Menu bar: *"SVN"*

Requirement: At least one object is available that is not in the change list `ignore-on-comment`.

Objects of the "ignore-on-commit" list are overlaid with the symbol in the object tree. By default, they are not selected in the commit dialog, unless a dependency of a selected object requires it. These objects can always be selected manually in the dialog.

See also

- *Chapter 1.8.5.5.2.26 "Command 'Un-Ignore on commit'" on page 4259*

Command 'SVN Info'

Function: This command provides information about the selected object in the SVN repository. The *"SVN Information"* dialog opens for this purpose.

Call: Context menu: *"SVN"*

Requirement: A versioned object (with SVN link) is selected in the object tree.

Dialog 'SVN Information'

Example

```
Name: Device_4\Plc Logic\Application\PLC_PRG
URL: file:///D:/SVN repository/trunk/ControlABC.project/Device/Plc
Logic/Application/PLC_PRG/svnobj
Repository Root: file:///D:/SVN repository/
Repository UUID: 185325d7-73eb-e54b-ab50-206aa23c8b42
Revision: 29
Node Kind: File
Schedule: Normal
Last Changed Author: a.mayer
Last Changed Rev: 8
Last Changed Date: 17.01.2017 12:33:51
Text Last Updated: 17.01.2017 12:33:51
Checksum: d5fb4d91ebaea06f26bcdb15942724d57932b6a3
```

Command 'Show properties'

Symbol: 

Function: This command opens the *"SVN Properties"* dialog. Here you can edit the properties of the versioned object.

Call: Context menu: *"SVN"*

Requirement: A versioned, unlocked object is selected.

Dialog 'SVN Properties'

Table 777: "properties for: <object name>"

"Name"	Name of the property Example: `myprop:customer-number` Note: SVN has some reserved properties. Example: `svn:mime-type`
"Value"	Example: `1234` Double-click in the field to edit the value.
"Add"	Opens a dialog to define another property with its value.
"Remove"	Deletes the selected property.
"Show binary properties"	☑: The binary properties are also displayed.
"Reset"	Resets the changes displayed in green.
"OK"	Accepts the changes.

See also

- *http://svnbook.red-bean.com*.

Command 'Get lock'

Symbol: 

Function: This command locks the object explicitly for you. The *"Lock Message"* dialog opens for this purpose.

Call: Context menu: *"SVN"*

Requirement: The versioned object is not locked (not overlaid with the symbol).

Dialog 'Lock Message'

"Enter the reason why you lock the object:"	Lock message Example: `Locked for processing task 123`
Button *"Recent Message"*	Shows message in the dialog that have already been used. There you select one in order to use the lock message.
"Recursive"	☑: The object is locked with all subordinate child objects.
"OK"	Locks the object When the lock is successful, the object (in the object tree) is overlaid with the  symbol.

Command 'Steal locks'

Symbol: 

Function: This command steal the lock of the object. The *"Lock Message"* dialog opens for this purpose.

Call: Context menu: *"SVN"*

Requirement: The versioned object is locked by someone else (overlaid with the  symbol).

Dialog 'Lock Message'

"Enter the reason why you lock the object:"	Lock message Example: `a.mayer had to steal the lock because the changes need to be implemented so urgently.`
"Recent Message"	Shows message in the dialog that have already been used. There you select one in order to use the lock message.
"Recursive"	 : The lock is stolen by the object and all subordinate child objects.
"OK"	Steals the lock. When the stolen lock is successful, the object (in the object tree) is overlaid with the  symbol.

Command 'Release lock'

Symbol: 

Function: This command releases the lock of an object.

Call: *"Context menu ➔ SVN"*

Requirement: The object is locked.

Command 'Release locks recursively'

Symbol: 

Function: This command releases the lock of an object explicitly with all of its subordinate objects.

Call: *"Context menu ➔ SVN"*

Requirement: The object is locked.

Command 'Show log', Command 'Show project log'

Symbol: 

Function: These commands open the tab *"Project log"* or *"Log - <object>"*. The version history of the project or an object of the CODESYS project is displayed in the tab.

Call:

- Menu bar: *"Project ➔ SVN"*.
- *"Context menu ➔ SVN"*

If you select nothing or the base node in the object tree, then the history of the entire project is displayed (*"Show project log"*). If you select one or more objects, then the history of these elements is displayed (*"Show log"*).

Multiple tabs can be open at the same time with the version history of different objects.

Tab 'Project log', Dialog 'Log - <object>'

Upper area ● *"Revision"*: Revision number ● *"Author"* ● *"Date"* ● *"Message"*: Message entered at commit	List of all revisions of the project or the selected objects in the information. The first 100 revisions are displayed by default. The *"Next 100"* and *"All"* buttons are provided for displaying more or all revisions. Several commands are available in the context menu of each revision. These context menu commands are described below.
Middle area	Display of the *"Message"* of the revision that is selected in the upper area.
Lower area ● *"Action"* ● *"Path"*: Object path in SVN ● *"Copy from path"* ● *"Copy from revision"*	List of actions that were performed on the objects of the project in the selected revision:
"Hide unrelated changed paths"	☑: All changes of this revision are hidden that do not have any relevance to the object.
"Stop on copy/rename"	☑: If the object was copied from another location in the SVN repository, then no more log messages are retrieved. This is especially beneficial when branches or tags are monitored and only changes within the branch are relevant.
"Filter/Range"	Opens the *"Filter"* dialog
"All"	All revisions are listed.
"Next 100"	The next 100 revisions are listed.

Table 778: Dialog "Filter"

"Revision range"	The displayed revisions can be filtered by *"Head"*, *"Revision"*, or *"Date"*. ☑: The option fields for *"Start revision"* and *"End revision"* are editable. *"Use UTC time"*: Date display in universal time. For more detailed information, refer to the description "Dialog 'Select revision'".
"Message contains"	Display of revision logs that contain a special text in the *"Message"*
" Author contains"	Display of revision logs of the specified author
"Path contains"	Display of revision logs of the specified path

Table 779: Context menu commands of the revisions

"Compare with base working copy"	Compares the selected revision of the object with the base working copy (without local changes).
"Com with working copy"	Compares the selected revision of the object with the working copy.
"Compare with HEAD revision"	Compares the selected revision of the object with the HEAD revision.
"Compare with previous revision"	Compares the selected revision of the object with the previous revision.
"Update item to revision"	Updates the object to the selected revision. Note: Changes of the project by this command cannot be committed. For VSS users: This is comparable to loading an older version without checkout. To revert a previous commit, the command *"Revert to this revision"* has to be used.

"Revert to this revision"	Reverts the object to the selected revision. This command does not have an effect on the SVN repository as long as the changes are not committed. Internally, SVN reverts the merges for all changes that were made after the selected revision in order to revert the changes of the preceding commits.
"Edit author"	Opens a dialog for changing the author of the revision.
"Edit log message"	Opens a dialog for changing the log message of the revision.
"Revision properties"	Opens the dialog *"Revision properties"* where the properties are displayed. In the dialog, you can activate the *"Add"* and *"Remove"* properties and the option *"Show binary properties"*.
"Create branch/tag from this revision"	Creates a branch or tag from the selected revision.
"Browse SVN repository"	Opens the *"SVN repository browser"* dialog
"Copy to clipboard"	Copies log details of the selected revision to the clipboard This is the revision number, author, date of revision, log message, and the list of changes objects for each revision.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*
- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 4267*

Command 'Revert', Command 'Revert project'

Symbol: 

Function: This command opens the *"Revert"* dialog. In the dialog, select the objects whose local changes should be reverted, and those that are reverted to the state of the base revision of the working copy.

Call:

- Menu bar: *"Project ➔ SVN"*.
- *"Context menu ➔ SVN"*

If you select nothing or the main node in the device tree, then all modified objects are listed in this dialog (*"Revert project"*). If you selected one or more objects, then only the changes to this object are listed and recursively their sub-objects (*"Revert"*).

Dialog 'Revert'

"Group externals"	☑: The external definitions are grouped by their external storage locations.
"Keep locks"	☑: The lock is retained for all files that are modified by the revert command.
"Select/deselect all"	

When external objects are deleted, Professional Version Control cannot restore this data in SVN offline mode. The user is prompted how to proceed:

- Switch back to SVN online mode and call the external objects.
- Connect now to the SVN server one time in order to complete the current operation, but afterwards switch back to SVN offline mode.
- Skip the retrieval of the external objects. They can be fetched later by updating the project.

See also

- *Chapter 1.8.5.5.2.20 “Command 'Revert to revision', Command 'Revert project to revision'” on page 4256*

Command 'Revert to revision', Command 'Revert project to revision'

Symbol:

Function: This command opens the *“Select revision”* dialog. In this dialog, you select the revision to which the project or the selected objects revert.

Call:

- *“Project ➔ SVN”*
- *“Context menu ➔ SVN”*

If nothing or the base node is marked in the object tree, then the entire project is reverted to a specific revision (*“Revert project to revision”*). If one or more objects are selected, then these objects and their sub-objects are reverted (*“Revert to revision”*).

Dialog 'Select revision'

For a description of the dialog, refer to the section "Select revision".

See also

- *Chapter 1.8.5.5.3.3 “Dialog 'Select revision'” on page 4267*
- *Chapter 1.8.5.5.2.19 “Command 'Revert', Command 'Revert project'” on page 4255*
- *Chapter 1.8.5.5.2.18 “Command 'Show log', Command 'Show project log'” on page 4253*

Command 'Update', Command 'Update project'

Symbol:

Function: This command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.

Call:

- Menu bar: *“Project ➔ SVN”*.
- *“Context menu ➔ SVN”*

If nothing or the main node is selected, then the entire project is updated (*“Update project”*). If one or more objects are selected, then these objects and their sub-objects are updated (*“Update SVN”*).

The following cases are possible:

- Projects are added to the project that are present in the SVN repository, but not in the project. In this case, the message "Added <object>" is issued to the message view.
- Objects that no longer exist in the SVN repository, but are present in the project locally (and not marked as "added"), are treated according to the Subversion standard procedure: If local changes are present, then the object remains in the project as unversioned. If there are no local changes, then the object is also deleted locally because the user can retrieve the object from an older version at any time. In this case, "Deleted object" is issued to the message view.
- Versioned objects that exist in both the SVN repository and the project are updated if they are different. Three cases to observe:
  - No local changes have been made since the last update: In this case, the local object is overwritten by the contents from the SVN repository. The message *"Object updated"* is issued to the message view.
  - Local changes have been made since the last update and the corresponding object type can be merged. When versions have been merged successfully, the message *"Objects merged"* is issued to the message view. If the command is not executed successfully, then the object is marked as "Conflicted object" in the object tree and the message *"Conflicted object"* is issued.
  - Local changes have been made since the last update and the corresponding object type cannot be merged. In this case, the object is marked as "Conflicted object" in the object tree and the message *"Conflicted object"* is issued.

If only some of the objects are updated, it may be that objects with the same name already exist. For example, this situation can come from moving objects to a folder.

For this conflict, you can react in the following ways:

- Do nothing and leave the conflict-causing objects as they are.
- Update (and remove) the conflicting objects in order to correct the conflict.
- Update the entire project in order to remove all conflicting objects and correct the conflict.

See also

- *Chapter 1.8.5.5.2.22 "Command 'Update to revision'" on page 4257*

Command 'Update to revision'

Symbol:

S**Function**: This command opens the *"Update"* dialog. In the dialog, the revision is defined for updating the project.

Call:

- *"Project ➔ SVN"*
- *"Context menu ➔ SVN"*

If you select nothing or the base node in the object tree, then the entire project is updated to a revision (*"Update project to revision"*). If you select one or more objects, then these objects are updated and their sub-objects are updated recursively (*"Update to revision"*). As an option, you can define that the sub-objects are not updated.

The behavior of the updating process (for example merging of conflicts) is similar to the *"Update project"* and *"Update"* commands.

Dialog 'Update'

"HEAD"	: This command behaves the same as the *"Update"* and *"Update project"* commands.
"Revision"	: The revision to which was last updated is selected by the revision number. ...: Opens the dialog *"Log"* for selecting the revision.

"Date"	: The revision to which was last updated is selected by the modification date. *"Use UTC time"*: : The date is displayed in universal time.
"Recursive"	: Default setting. The selected part is updated recursively. This means that all elements below the selected object are also updated.
"Omit external objects"	: External objects are not updated.

See also

- *Chapter 1.8.5.5.2.21 "Command 'Update', Command 'Update project' " on page 4256*
- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 4267*

Command 'Update only this'

Symbol:

Function: The command updates the selected objects. In contrast to the *"Update"* and *"Update to Revision"* commands, the child objects are not updated.

Call: *"Context menu ➔ SVN"*

See also

- *Chapter 1.8.5.5.2.21 "Command 'Update', Command 'Update project' " on page 4256*
- *Chapter 1.8.5.5.2.22 "Command 'Update to revision'" on page 4257*

Command 'Disconnect project from SVN'

Symbol:

Function: This command deletes all connections of the current project to SVN by converting the project into a non-versioned project.

Call: Menu bar: *"Project ➔ SVN"*.

Because this operation cannot be reversed, the operation must be confirmed before the command is executed.

Use the command "Connect to existing project" to connect to the SVN repository again at a later time.

See also

- *Chapter 1.8.5.5.2.30 "Command 'Connect to existing project'" on page 4261*

Command 'Switch'

Symbol:

Function: This command opens the *"SVN switch"* dialog. In this dialog, you specify a URL in the SVN repository to which the current working copy of the project is updated. The command switches a project from a branch or tag to another.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement: The project is versioned.

Dialog 'SVN switch'

"From"	Current SVN URL of the project
"To"	Input field for the target URL in SVN ● *"HEAD"*: The *"Select revision"* dialog opens. ● ...: The *"SVN Repository Browser"* dialog opens. There you select the target URL in the SVN repository.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*

Command 'Un-Ignore on commit'

Function: This command removes an unversioned object from the ignore list so that the object is checked by default on commit.

Call: Context menu: *"SVN"*

Requirement: The command *"Ignore on commit"* was executed for the object. The object is marked with the symbol.

See also

- *Chapter 1.8.5.5.2.11 "Command 'Ignore on commit'" on page 4251*

Command 'SVN Cleanup'

Function: This command opens the *"SVN Cleanup"* dialog. In the dialog, you define actions that are performed when cleaning up the SVN working copy.

Call: Menu bar: *"Project ➔ SVN"*.

Dialog 'SVN Cleanup'

Table 780

"Internal SVN working copy"	
"Update time stamps (speeds up SVN status display)"	☑: Corrects recorded time stamps for unchanged files in the working directory. This leads to a reduction in the compare time for future checks. It is not necessary to execute this in regular intervals in the normal workflow.
"Vacuum cached pristine copies (may reduce the size of your project file)"	☑: Cleans the buffer for the original copies by deleting older versions that are no longer referenced by the current project. Advantage: The size of the project file is reduced. Disadvantage: If you downgrade to older revisions, or if you switch between different branches, then the retrieved data size will become larger.
"Clear work queue and force unlock of SVN internal data structures (emergency only!)"	☑: Cleans up the internal SVN task queues and unlocks internal SVN data structures. This should never be necessary during normal work by Professional Version Control. Note: Use this option only if errors occur for SVN commands due to locked working copies. When this is the case, it refers to an error in Professional Version Control. Then please send us an error report (if possible with steps to repeat) to the CODESYS support. Info: These are administrative locks that are internal locks in the SVN working copy. These locks are not set up by context menu commands. For more information, refer to the section "The three meanings of locks" in: *http://svnbook.red-bean.com/en/1.8/svn.advanced.locking.html*
"Project contents"	

“Revert all local changes (use with care!)”	Reverts all local changes to the original status in the SVN repository.
“Release all locks”	Releases all advisory locks in the project (locks visible to the user). These locks are activated by *“Acquire lock”* and *“Steal lock”*.
“Revalidate all locks against the repository (they could have been stolen)”	Checks whether the locally available advisory locks are still valid or have been stolen by someone else for example. All invalid locks are removed.
“Status caches”	
“Clear all caches and refresh status icons”	Deletes all internal caches that Professional Version Control has and updates the status icons. Required only if it issues an error in Professional Version Control through which the caches or the status display are inconsistent.

Command 'Clear authentication data'

Function: This command opens the *“CODESYS”* dialog. In this dialog, define the caches that will be deleted.

Call: Menu bar: *“Project ➔ SVN”*.

Dialog 'CODE-SYS'

The authentication memory contains the authentication data of all SVN repositories for which the user has selected for saving the authorization data. This memory is deleted completely by this command.	
“Clear the shared on-disk cache.”	☑: The data saved on the computer is deleted.
“Clear the RAM cache of this instance.”	☑: The data saved in the RAM is deleted.

The authentication data saved on the computer is stored in `%APPDATA%\Subversion\auth`. This memory path is also used for most other Subversion client applications (for example, TortoiseSVN and AnkhSVN). Therefore, deleting the authentication data affects these applications as well.

Command 'Merge changes'

Symbol: 

Function: This command opens the *“Merge”* dialog. In this dialog, you determine the revisions with the changes to be merged with the working copy of the project.

Call: Menu bar: *“Project ➔ SVN”*.

Requirement: The project is linked to SVN.

Dialog 'Merge'“”

"Kind of merge"	• *"Sync/Reintegrate/Symmetric merge"*: Synchronizes all missing changes from trunk (or a different branch) into this branch. • *"Cherry pick"*: Integrates specifically selected revisions from one branch to another branch. This is necessary, for example, if any error trapping has to be ported back to an older version.
"Merge source"	SVN URL of the SVN repository • Input field • *"HEAD"*: HEAD revision • ...: Dialog *"SVN Repository Browser"* opens for selecting the SVN repository.
"Define start and end revision"	Select this option to merge a cohesive range of revisions with the working copy.
"Start revision"	Defines the range of revisions that are merged with the working copy: • *"HEAD"*: HEAD revision • *"Revision"*: Start and end revision of the range • *"Date"*: Date of the start and end revisions
"End revision"	
"Define revision range"	Select this option to merge individual revisions with the working copy. You can also highlight the individual revisions in the *"Log"* dialog. Note: When defining ranges, CODESYS SVN behaves like other graphical clients, such as Tortoise SVN), and not like the command-line client. Example: For a range of `4-7`, revisions 4, 5, 6, and 7 are merged. See also: *Merging a Range of Revisions*
"Dry run (simulation)"	☑: This command is executed without changing the working copy. Files that are changed during an actual merge are displayed, as well as ranges where conflicts occur.
"Record only"	☑: The revision is marked as "merged" without actually performing the merge.
"Ignore ancestry "	☑: SVN uses path-based differences only, not history-based differences.

- *Chapter 1.8.5.5.3.3 "Dialog 'Select revision'" on page 4267*
- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*

Command 'Connect to existing project'

Symbol:

Function: This command opens the *"Connect to SVN repository"* dialog. In the dialog, you define the URL and the revision of the SVN repository with which the unversioned project is connected.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement: The project is disconnected from SVN.

NOTICE!
Only users who have read access to the entire project (see the CODESYS user and access management) can import the project into the SVN repository or can link to an existing database project.

NOTICE!
This command functions reliably only when the project has already been imported into SVN and then disconnected with the command *"Disconnect project from SVN"*.

Dialog 'Connect to SVN repository'

"URL of existing project"	URL of the SVN repository *"HEAD"*: Selection of the revision in the *"Select revision"* dialog ...: Selection of the SVN repository in the *"SVN Repository Browser"*
"Checkout options"	*"Omit externals"*: External objects are not checked out.
"Revision"	● *"HEAD"*: HEAD revision ● *"Revision"*: Number of the revision ● *"Date"*: Date of the revision *"Use UTC time"*: ☑: Date display in universal time.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*

Command 'Resolve conflict'

Symbol: 🔍

Function: This command opens the *"<object>"* dialog. In the dialog, the conflicts are displayed and functions for resolving conflicts are prepared in order to merge changes.

Call: Context menu of the object.

Requirement: The object has a conflict that has occurred by updating the object with local changes.

Dialog '<object>'

"Compare"	The local objects are displayed on the left side, and the version from the SVN repository is displayed on the right side.
"Use mine"	A local change is used.
"Use yours"	A change of the version from the SVN repository is changed.
"Apply"	All changes are accepted that you made in this dialog. The status of the object is changed.
"Cancel"	Cancels all changes that you made in this dialog. But the object keeps the conflicted status.

Command 'Work in offline mode'

Function: This command switches to SVN offline mode. In SVN offline mode, the implicit locking and all commands that access the SVN repository are not possible.

Call:

- Menu bar: *"Project ➔ SVN"*.
- Context menu: *"SVN"*

Requirement: The project is linked to SVN.

When switching back to SVN online mode, all present locks on the working copy are checked against the server. If this locking is invalid, then it is released.

Uses case

The user on a machine wants to make changes to the project without disconnecting the connection. At the moment, there is not connection to the server. Despite this, when automatic locking is activated, work is possible because the SVN offline mode deactivates the automatic lock temporarily.

Command 'Copy (Branch/Tag)'

Symbol: 

Function: This command opens the *"SVN Copy Branch/Tag"* dialog. There you can *"Branch"* or *"Tag"* a revision of your project. A specific revision of your project is saved there at this position. A branch is normally used in order to save changes isolated in one version. A tag is used for marking a specific state, for example a shipping version. Internally, it is copied not in the actual sense, but more refers to the revision.

Call: Menu bar: *"Project ➔ SVN"*.

Requirement: The project is versioned.

Dialog 'SVN Copy (Branch/Tag)'

Table 781: "SVN repository"

"From"	SVN path of the current project Example: `https://svnserver/repository/trunk/ControlABC.project`
"To"	Target path in the SVN repository for the copy operation Example of tag: `https://svnserver/repository/tags/V4.4.4.4/ControlABC.project` ...: Dialog *"SVN Repository Browser"* opens for selecting the target path.

Table 782: "Log message"

Input field	Comment the change in a log message. Example: `Tag for version 4.4.4.4 created.`
" Recent Messages"	Opens the dialog *"Recent Messages"* to display the last log messages. You can click a log message to accept it.

Table 783: "Create copy from"

"Working copy (including local changes)"	The new branch/tag refers to the working copy including all local changes. The local changes are committed to the SVN repository for this purpose.
"Base revision of working copy (<revision number>)"	The new branch/tag refers to the base revision of your working copy whose revision number is displayed in the parentheses. If the working copy already contains local changes, then these are not committed to the SVN repository.
"HEAD revision of the repository"	The new branch/tag refers to the HEAD revision of your project.
"Specific revision in SVN repository" 	The new branch/tag refers to a revision that is displayed on the adjacent button. Click the button to change the revision. The *" dialog opens."*.

"Switch to new location "	☑: After the dialog is confirmed, the working copy switches to the new branch/ tag.

"OK"	The target path is created (as a new tag `../repository/tags/V4.4.4.4` or as a new branch `../repository/branches/new_feature`). Then the revision specified in *"Create copy from"* is copied there.

See also

- *Chapter 1.8.5.5.2.1 "Command 'SVN Repository Browser'" on page 4238*

Command 'Pending Changes'

Symbol:

Function: The command opens the *"Pending Changes"* view. All objects are listed there which have changed from the base revision or which are locked.

Call: *"View ➔ Pending Changes"*

View 'Pending Changes'

The modified or locked objects are shown in the lower half of the view. You can use the *"Commit"*, *"Revert"*, and *"Update"* commands on single or multiple objects. You will find commands for comparing and displaying the version history in the context menu of a selected object.

Double-clicking the object opens the project comparison.

"Select"	Selection or clearing of all objects
"Commit"	Commits local changes to the SVN repository
"Revert"	Reverts the local changes to the state of the base revision of the working copy
"Update"	The command commits changes in the SVN repository to the project. The update is performed with the HEAD revision.
"Keep Locks"	☑ Lock is not released automatically after commit
"Recent Messages"	Shows the last used log messages. You can click a log message to accept it.
"Messages"	Type in a log message that comments your change. Example: `Bug fix error 123`

1.8.5.5.3 Dialogs

Dialog 'Options' - 'SVN Settings'

Tab 'General' Symbol: 

Function: This tab includes the basic settings for Professional Version Control.

Call: Menu bar: *"Tools ➔ Options"*.

Table 784: "Automatic locking and merging"

"Merge"	Behavior for the commands *"Update"*, *"Merge"*, or *"Switch"*, when both sides (working copy and SVN repository) have changed from the base version. ● *"Mark all colliding changes as conflicts"*: The objects are not merged automatically. All changes with a conflict are marked as "With conflict", even if some of them can be merged automatically. ● *"Merge mergeable changes, mark the others as conflicts"*: Changes that can be merged are merged automatically. All others are marked as "With conflict". ● *"Merge mergeable changes, ask the user for the others"*: Changes that can be merged are merged automatically. The user is prompted for all others. ● *"Always ask the user, even for mergeable changes"*: For all changed objects, the user is prompted, even if some of them can be merged automatically.
"Locks"	Behavior such as Professional Version Control objects when they are changed locally. ● *"Always try to lock before modification"*: All objects are locked before they are changed, even if they can be merged. ● *"Only lock the objects which don't support merging"*: Only those objects are locked that cannot be merged automatically. ● *"Never acquire a lock automatically"*: No objects are locked, not even if they can be merged automatically.
"Marker"	● *"Use conflict markers when merging objects"*: If objects with conflicts exist that cannot be merged, then these conflicts are marked in the source code with conflict markers. In addition, the object itself is marked as being merged successfully (no conflict). ● *"Leave non-mergeable objects as conflicted"*: No conflict marker is set. Objects that cannot be merged remain in the status "With conflict".
"Prompt the user when automatic locking fails."	☑: If it is not possible, to lock the object, then the dialog *"Automatic locking failed"* opens (see dialog description).

Example of conflict markers

```
Foo();
>>>>>>>>>>>>>>>
I := I + 1;
===============
I := I + 2;
<<<<<<<<<<<<<<<
```

Table 785: "Server check"

"Check server for updates and locks"	☑: Professional Version Control checks in the specified time interval that objects have been updated on the server. In addition, it checks whether objects are locked or locks have been stolen.
"Check interval (minutes)"	Example: 10

Table 786: “Ignore for comparison”

Ignore whitespace	☑: Whitespace differences between the current project and the reference project are ignored.
Ignore comments	☑: Comments in the programming code are excluded from the comparison.
Ignore Properties	☑: Object properties are excluded from the comparison.

> *Some of the SVN options can be overwritten by the project-specific settings.*
>
> *Project-specific settings are defined in the menu “Project ➔ Project settings”, category “SVN Settings”.*

- *Chapter 1.8.5.5.3.5 “Dialog 'Automatic locking failed'” on page 4270*
- *Chapter 1.8.5.5.3.2 “Dialog 'Project Settings' - 'SVN Settings'” on page 4266*

Tab 'SSH'

Symbol:

Function: This tab contains the settings for the SSH protocol.

Call: Menu bar: *“Tools ➔ Options”*.

Table 787: “SSH client implementation”

“libssh2 (recommended)”	Professional Version Control uses Libssh2 for establishing a connection via SSH protocol. This is the recommended setting.
“SharpPlink (backwards compatibility)”	Professional Version Control uses plink.exe for establishing a connection with SSH servers. This option is required only for communication with outdated servers that support the deprecated SSH-1 protocol.

> *The SSH configuration can be overwritten by means of the environment variable `SVN_SSH` or server-specific by means of the SVN configuration file.*

See also

- *Tunneling via SSH*

Dialog 'Project Settings' - 'SVN Settings'

Symbol:

Function: The behavior of the integrated SVN version control system is configured in this dialog.

Call: Menu bar: *“Project ➔ Project Settings”* (*“SVN Settings”*).

Requirement: A project is open.

Table 788: “Automatic locking and merging”

With these settings, you can overwrite the default settings that were made in the dialog *“Tools ➔ Options”*, category *“SVN Settings”*.	
“Merge”	Behavior for the commands *“Update”*, *“Merge”*, or *“Switch”*, when both sides (working copy and SVN repository) have changed from the base version.

“Locks”	Behavior such as Professional Version Control objects when they are changed locally.
“Marker”	Behavior for conflicts

Table 789: “Settings SVN version info”

“Create SVN_VERSION_INFO constants for IEC access”	☑: The object `SVN_VERSION_INFO` is created and includes global constants or variables for the project metadata. ☐: The object `SVN_VERSION_INFO` is not available. When you activate the option, the object is created automatically. When you deactivate the option, the object is removed from the project automatically.

See also

- *Chapter 1.8.5.5.3.1 “Dialog 'Options' - 'SVN Settings'” on page 4265*

Dialog 'Select revision'

Function: This dialog shows the currently selected revision. You can edit the selection there.

“Revision”	
“HEAD”	◉: The latest revision (top revision) within a branch is displayed.
“Revision”	◉: A specific revision is displayed by the revision number. Example: `3` Tip: Click [...] to show the revisions. Then the *“Log”* dialog opens to display the revisions and the associated actions. The revision that you select there is applied.
“Date”	◉: A specific revision is checked out by the modification date. This is the highest revision at the given time (the last revision before that time). Example: `12/23/2016 11:59:59` Tip: See section "Revision identifiers" in "Version control with Subversion"
“Use UTC Time”:	☑: Modification date in universal time is used.
“Reset recursively”	☑: All objects below the selected object are also reset. The action fails if ● Objects have been moved in or out of the hierarchy below ● Objects outside of the hierarchy would be changed by implicit dependencies

Dialog 'Subversion Authentication'

The dialogs are used for authenticating the server/client connection. A server or client authentication is performed depending on the initial situation and protocol.

Overview of possible protocols and dialogs

- `svn://`: The SVN protocol; either unencrypted or SSL/TLS encrypted
  - Can prompt for user name and password (even for an unencrypted connection)
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid (for TLS/SSL encryption)
  - As an alternative or in addition to the user name and password prompt, the client can also be authenticated with client certificates (for TLS/SSL encryption). The dialogs for authentication open with the client certificate.
- `http://`: SVN via http, unencrypted
  - Can prompt for user name and password
- `https://`: SVN via http, SSL/TLS encrypted.
  - Can prompt for user name and password
  - Can prompt for a server certificate from the dialog for authentication in order to confirm the server if a certificate is unknown, defective, or invalid.
  - As an alternative or in addition to the user name and password, the client can also be authenticated with client certificates. The dialogs for authentication open with the client certificate.
- `svn+ssh://`: The SVN protocol, encrypted through an SSH tunnel. SSH (Secure Shell) is the usual networking tool in Linux/Unix for accessing other computers.
  - Can prompt for user name and password
  - Prompts for server certificate in the dialog for authentication if the server is still unknown in order to be sure that it is the correct server.

Dialog for authentication with a server certificate

Initial situation: CODESYS (as a client) receives an unknown or defective server certificate.

This dialog shows information about the certificate. There you can confirm the identity of the server.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 790: “Certificate information” (for SSL/TLS connections)

“Host name”	Example: `svn repository`
“Thumbprint”	
“Valid from”	
“Valid to”	
“Issuer”	Example: `ABB AG`
“Certificate”	

Table 791: “SSH server key information” (for SSH connections)

“Key type”	
“Key size (bits)”	
“Key thumbprint”	

“Save information to RAM”	☑: The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates and established the connection.

The certificate memory is secured cryptographically and distributed with other SVN clients.

See also

- *Version Control with Subversion*

Dialog for authentication with a client certificate

Initial situation: The SVN server requires a client certificate for authentication.

In this dialog, you select the client certificate in order to confirm the identity.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 792: “The SSL server requires a client certificate file.”

“File”	Client certificate file

“Save information to RAM”	☑: The certificate is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The certificate is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates and established the connection.

Dialog for authentication with a pass phrase

Initial situation: The SVN server is configured so that it demands a client certificate for authentication. The applied certificate is protected by a pass phrase.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

Table 793: “A pass phrase is needed to unlock the certificate.”

“Pass phrase”	Example: `***`

“Save information to RAM”	☑: The pass phrase is saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: The pass phrase is saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Authenticates with client certificates by means of a pass phrase and establishes the connection.

Dialog for authentication with a user name and password

Initial situation: The SVN server is configured so that it demands a user name and password for authentication.

“Authentication area”	Connection that is secured Example: `https://svn repository:443`

“User name”	Example: `a.mayr`
“Password”	Example: `***`

“Save information to RAM”	☑: Saved to the working memory. Then the client recognizes in the current CODESYS session for future connections. If you restart CODESYS, then you have to accept the certificate again.
“Save to disk”	☑: Saved on the computer and it is available for future connections. If you restart CODESYS, then the saved certificate is used.

“OK”	Establishes the connection and authenticates it.

Dialog 'Automatic locking failed'

The dialog shows a list of all objects for which an automatic locking was not possible. In the optoins you define how Professional Version Control will resolve the confilict.

Table 794: “Automatic Locking and Merging”

• *“Try to steal the lock for the affected objects”* • *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if another user has locked the object.
• *“Update the affected objects to the newest revision”* • *“Update the whole project to the newest revision”* • *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if there exists a more current version of the object on the server.
• *“Activate the "Offline Mode" to temporarily suppress locking”*	These options are displayed if no connection can be established to the server.
“SVN Project Settings”	Opens the SVN project settings dialog (menu *“Project ➔ Project Settings”*). There you can change the settings for the automatic locking.
“SVN Settings”	Opens the general SVN project settings dialog (menu *“Tools ➔ Options”*).

See also

- *Chapter 1.8.5.5.3.1 “Dialog 'Options' - 'SVN Settings'” on page 4265*
- *Chapter 1.8.5.5.3.2 “Dialog 'Project Settings' - 'SVN Settings'” on page 4266*

1.8.5.5.4 Objects

Object 'SVN_VERSION_INFO'

Symbol: 

The object contains the SVN metadata of the project as global constants or variables in a variable list. It is located in the *“POUs”* view. You can specifically retrieve the data of the global constants or variables by the application. By calling specific data, you can also reduce the memory usage on the controller.

The SVN metadata is provided for this purpose, subdivided over multiple global variable lists (GVLs):

- *“SVN_VERSION_INFO”*
- *“SVN_Info_Summary”*
- *“SVN_Info_SummaryW”*
- *“SVN_Info_URI”*
- *“SVN_Info_Revisions”*
- *“SVN_Info_Flags”*
- *“SVN_info_LastChange”*

The SVN_VERSION_INFO object is created automatically when a project is imported to a SVN repository. To do so the option *“Create SVN_VERSION_INFO”* in the dialog *“Import project to SVN”* must be activated.

Furthermore you can create the object or remove it from the project with the option *“Generate SVN_VERSION_INFO constants for IEC Access”* (Dialog *“Project ➔ Project Settings”*, category *“SVN Settings”*).

Table 795: Global Constants

Name	Data type	Description
MINREVISION	LINT	Lowest revision number of the working copy
MAXREVISION	LINT	Highest revision number of the working copy
PARTIAL	BOOL	TRUE: The working copy is incomplete. Example: Cancellation during the last update due to a network error or a checkout.
MODIFIED	BOOL	TRUE: Local changes were made.
SWITCHED	BOOL	TRUE: Parts of the project were branched (with the *"Switch"* command).
VERSION	STRING	Version identification, similar to Apache™ Subversion® (subversion.exe) Example: 12:34M, means MINREVISION = 12, MAXREVISION = 34, MODIFIED = TRUE For more information, refer to the documentation for Apache™ Subversion®.
CLEAN	BOOL	TRUE: The version is clean. This is the case when MINREVISION is equal to MAXREVISION, the working copy is complete, and non-versioned, and is was not switched.
URL	WSTRING	SVN-URL of the project Example: https://svnserver/repository/trunk/ControlABC.project

If a controller does not support the data type WSTRING, then a compiler error is issued when accessing the object SVN_VERSION_INFO.

1.8.6 Subversion

1.8.6.1 Project Version Control with Subversion

Introduction

Automation Builder projects can be stored in Subversion (SVN) repositories by using the Project Version Control. The Project Version Control can be used to track changes on a project and to have access to historic versions of the whole project or objects in the project. It is possible to hold different versions of a project in branches and to compare these versions. The Project Version Control enables multiple engineers to work collaboratively on the same project.

Basic knowledge

Make yourself familiar with the concepts of SVN.

This manual about Project Version Control is additionally to the following information and describes mainly the specific behavior of Subversion in Automation Builder.

- Homepage of Subversion: *http://subversion.apache.org/*
- Online user manual for Subversion: *http://svnbook.red-bean.com/*
- Documentation on SVN integration in Automation Builder: Refer to subfolder .

1.8.6.1.1 Preconditions

Automation Builder

- In Automation Builder, the Project Version Control must be installed.
- A valid license for the Project Version Control must be activated.
- All collaborating users working on the same project need:
  - Automation Builder installed in the same version with the same features.
  - License for same edition.
  - Same set of optional third party device descriptions.
  - Same set of optional customer specific packages.

SVN server

The Project Version Control can be used in combination with an SVN server in version 1.6 or newer, the repository format should be 1.5, 1.6 or 1.7. Newer repository formats are not yet supported.

The usage of local repositories in the local file system or even on a network share is strongly discouraged.

1.8.6.1.2 Working with Project Version Control

- All objects in the device tree or POU tree are represented by an object in the SVN repository, there might be hidden objects that are not visible in the tree but that exist in SVN.
- The smallest unit in the SVN repository is one object including all its data like name, parameters, device identification.
- Objects are identified in the SVN repository by their name. Renaming one object in Automation Builder means to delete it from the SVN repository and add a new one to the SVN repository. Renaming an object causes a break in the history of that object.
- By default objects are locked before they are changed to prevent other users from changing the object. The locking strategy can be changed in the user options.
- Objects can be compared to other versions of the same object, many differences/changes between the current object in the Automation Builder project and the compared object can be merged into the object in the Automation Builder project. Merging changes could be used to resolve conflicts in case concurrent changed can not be avoided.

- To ensure consistency it is required and also enforced that some changes can be committed or reverted only together.
  - All changes to device objects in the hardware tree that are sub-nodes to the same top level device. Note: Objects that are not devices are excluded, e.g. the application node.
  - All changes below the AC500 PLC application node.
- Most SVN operations can not be performed while other external applications like CODESYS or Panel Builder work on files that are embedded in Automation Builder project.
- Some operations like changing the target or updating the project to the latest device (description) versions do a recursive lock of the whole AC500 PLC. If the lock can’t be obtained the operation is aborted.
- Some objects contain internal data that has no meaning to the end user but is also important. Changes on such data are not shown in the compare dialog or are summarized by a placeholder like "There are hidden changes".
- Including externals is not supported.

1.8.6.1.3 Recommendations on Working with Project Version Control

Be collaborative

- Multiple users that work collaboratively on the same project should agree on their responsibility for certain parts of the project where they do changes to avoid conflicts and tree conflicts.
- Agree on locking strategy used by all users working on the same project.
- Distribute the work between multiple users meaningful.
  - It is suggested to setup the hardware structure at first before other users checkout a project to work on it and limit structure changes in the hardware tree to the minimum.
  - Before adding objects, especially top level objects, users should agree that only one user adds objects at top level or below the same parent, or agree on unique names for the objects to add. The default naming scheme for new objects bears the risk of name conflicts. These conflicts could be resolved only by reverting the changes of the user who later tried to commit the changes.

Be careful

- The SVN integration (and also project compare) gives lot of power to the user, users should be sure to do only things they fully understand. Especially by merging changes incomplete it is possible to create inconsistent data.
- Adding devices, removing devices or even changing parameters can have side effects to other devices, do not change objects/parameters to their original state by merging that were not done explicitly.
- Commit changes frequently to SVN.
  - To release locks that you don’t longer need.
  - To reduce the risk of conflict with co-workers.
  - To keep the sets of changes to commit small.
- Do frequent updates when collaborating in a team.
  - To be up-to date.
  - To keep the sets of changes to get from SVN small.
  - To reduce the risk of losing work results in case of conflicts.
- To avoid conflicts, it is suggested to stay with the default setting to automatically lock objects before doing changes. Consider explicit recursive locks of sub-trees where you plan bigger changes.
- Prefer a clean checkout over using the switch command to change between different branches.
- Do not use the switch command to change between unrelated projects, this could corrupt the Automation Builder project (local copy, not in SVN) easily.
- Commit local changes to the SVN repository before creating a branch.

Be effective

- Give objects good/correct names after adding them and use renaming of objects already committed to SVN sparely to maintain a continuous history in the SVN repository.
- The goal to revert only single changes of all changes done that must be committed/reverted together, could be achieved by using project compare or the object compare dialog.
- If changes can’t be committed to the SVN repository because of locks hold by other users, it is possible to create a branch, use the switch command to change to this branch and commit the changes there. The branch and base line could be merged together later.

1.8.6.1.4 Known Issues and Troubleshooting

Not all changes are shown for all objects, but hidden changes are also important.

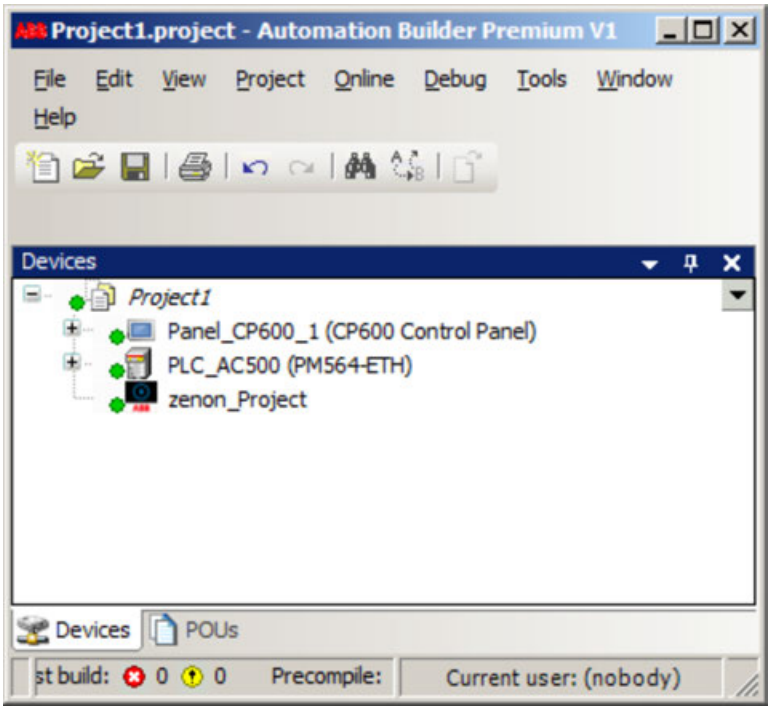
The device pool may be changed as side effect of several operations, including opening the project.

When a project was corrupted (by performing an update that tried to add an AC500 Communication Module) it is possible to save this project and merge changes to a project that has been cleanly checked out by project compare.

1.8.6.2 SVN Support Examples

1.8.6.2.1 Importing Automation Builder Project to SVN Repository

1. In the Automation Builder main menu, go to *"Project ➔ SVN ➔ Import Project to Subversion"*.
2. Enter user credentials and click *"OK"*.
3. Select SVN server repository to import Automation Builder project and click *"OK"*.
   ⇨ The Automation Builder project is imported into the selected repository and connected automatically to the repository. The imported project nodes are identified with green indicators.



1.8.6.2.2 Logging in User2

1. In the Automation Builder main menu, go to *"Project ➔ SVN ➔ Checkout"*.
2. Enter user credentials and click **OK**.
3. Select the repository location, project folder and revision if any and click *"OK"*.
   ⇨ The project will checked out of the repository, saved in the selected location and opened as a primary project.

The tables below provide the descriptions of the options availlable in the check-out dialog.

Checkout options	
Omit externals	Do not checkout external objects.
As library project	Saves the project as a CODESYS library file.

Revisions	
HEAD	Checks out the Head revision.
Revision	Allows to select the required revision of the project.
Date	Allows to select a revision date of the project.

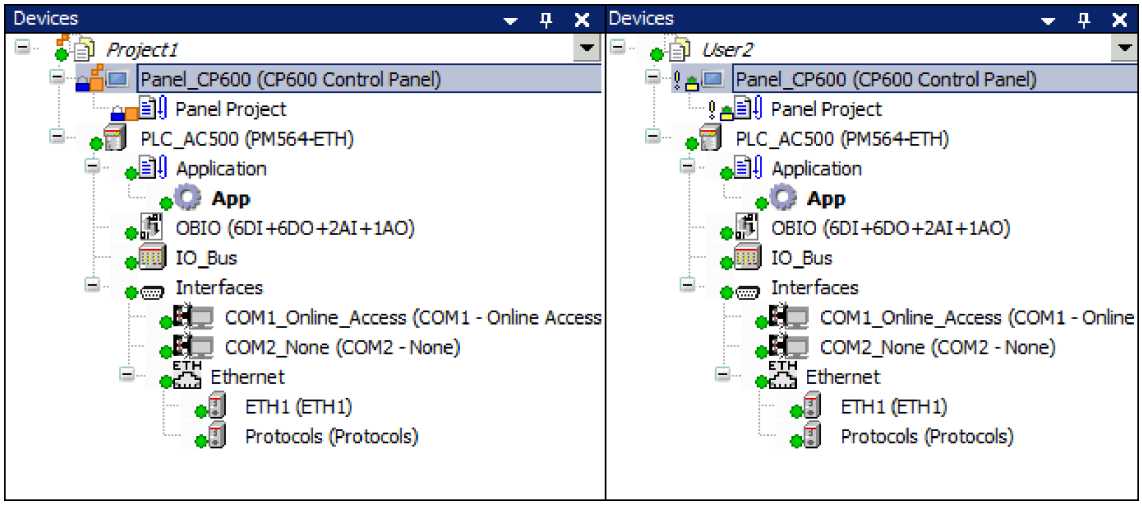
The following instances can occur in the workflow.

- If the project contains any updates, the specific project level node is indicated with .
- If a new object is added to the project, the newly added node is indicated with .
- If the project node is deleted, the specific node is indicated with .

1.8.6.2.3 Examples

Example 1

If User1 modifies Panel_CP600 project, then the node indicator turns to orange with lock symbols. If User2 need to modify the same Panel_CP600 project, the Panel_CP600 project appears with a lock symbol.

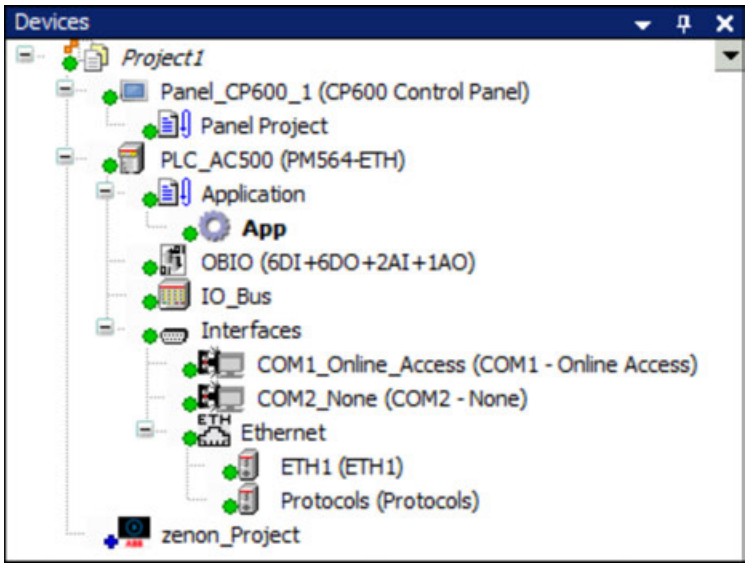


To steal the lock of an affected object, proceed as follows:

1. Double-click *"Panel_CP600"* project.
   ⇨ Automatic lock failed dialog is displayed.
2. Enable *"Try to steal the lock for the affected objects"* and click *"OK"* to steal the lock.
3. In the Lock Message window, enter the reason to steal the lock and click *"OK"*.
4. User2 can modify and commit the project.

Example 2

If User1 adds a new object to the project and commit the changes, then User2 can update the project to see the latest modifications.



Example 3

The user can revert to any of the available project revisions.

1. Right-click on object node and select *"SVN ➔ Revert to Revision"*.
2. Select or enter the revision number and click *"OK"*.
   ⇨ The revision command reverts local changes of this object back to the specific revision of the working copy.
3. Right-click on the object node and select *"SVN ➔ Commit"*.
4. In the commit window, enter the reason to change the project and click *"OK"* to make the changes.
   ⇨ The project node is updated with the latest changes.

Example 4

SVN server allows to select the required revisions of Automation Builder project. You can checkout the project using *"Project ➔ SVN ➔ Checkout"* and then enter the credentials and click *"OK"*.

In the check-out dialog, do the following:

1. Select the project repository.
2. Activate *"Revision"* and select or enter the revision number and click *"OK"*.

The user can work on the selected revision. To commit the changes to the project, right-click on project and select *"SVN ➔ Commit Project"*.

1.8.7 Python

1.8.7.1 Python script support

Using scripts

Scripting allows python scripts to be used to automate project configuration in Automation Builder. Parameters can be added to scripts, so that a generic script can be customized before execution. The user can add a script to most parts of the device tree. A script can be started either from the user interface (by a command or with the python scripting editor) or from the Windows command line and is saved with the project.

With the scripting feature commands or complex program operations can be automated.

Examples of use cases:

- Integration of Automation Builder in automatic build server environments:
  - continuous integration (CI)
  - continuous delivery (CD)
  - continuous testing
- Integration with third-party software, for example:
  - code generators
  - creation of projects that are custom tailored to a specific machine configuration
- Creation of documentation
- Updating of libraries: Setting of project information during the release process
- Automatic testing: Mostly in connection with the Professional Test Manager
- Outputting variables via monitoring APIs

Licensing

A valid license is required to use the scripting. If you open a project with the existing script object without a valid license, you are not allowed to add or edit the scripts. However, the scripts are not removed from the project.

Scripting language

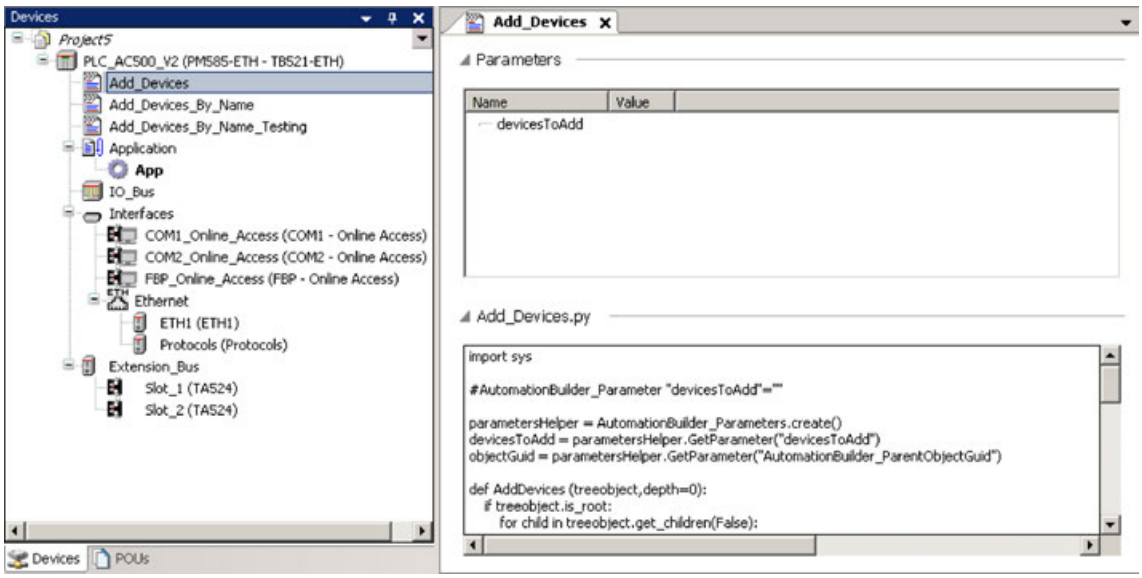
The Automation Builder scripting language is modular and based on IronPython. For this purpose, the Automation Builder “ScriptEngine” component combines the IronPython interpreter with the Automation Builder development environment which makes the extensive python framework libraries available including file access in networks and much more.

1.8.7.2 Working with script objects

Scripts to execute can be added to and stored in the Automation Builder project. Additionally, parameters can be added to scripts, so that generic scripts can be customized before execution.

Adding a script object to the project

1. In the device tree, right-click on a node (e.g. a PLC node) and click *“Add object”*.
2. Under *“Scripting category”* select *“Script ➔ Add object”*.
   ⇨ The 'Add Script' dialog is displayed.
3. Browse and select a script from the file system or create a new script by clicking *[Add]*.
   ⇨ A script is added below the selected node and the editor is opened.



4. The default parameter values are read from the script. The user can edit the default values as required.

> *Editing scripts within Automation Builder is not supported. You can use an external editor to edit the script and then import it to Automation Builder.*

> *The script objects can be reused within the project via copy-and-paste around the device tree.*

Execution

The user can execute the script with the parameter values via the execute button in the editor or via right-click on the script object in the device tree by selecting *"Script ➔ Execute"*.

Import

The user can import the script from the file system. This will replace the contents of the current script object with the contents of the imported file. Optionally, parameter values will be preserved if the imported script has a matching named parameter. In the device tree, right-click on a script object and select *"Script ➔ Import"*.

Export

The user can export the selected script and saved it as a new file in the file system. The exported file does not include any edited parameter values. In the device tree, right-click on a script object and select *"Script ➔ Export"*.

Parameters

The following instructions help the user to create parameters in the python script:

- Parameters must be defined in the script.
- Parameters and values are optional.
- The `ParameterName` and the `ParameterValue` must be delimited with symbols. The format must be as follows:
  "#AutomationBuilder_Parameter {"ParameterName"} {= "ParameterValue"}
- {ParameterName} is the name given to the parameter. This allows the values to be referenced in the python script.
- {ParameterValue} is the default value given to the parameter. This value can be modified in the editor.

The example below shows the format of the `ParameterName` and `ParameterValue` in the script.

- #AutomationBuilder_Parameter "numWidgets": creates a new parameter called `numWidgets`.
- #AutomationBuilder_Parameter "numWidgets" = "4": creates a new parameter called `numWidgets` and initializes to the value 4.

Using parameters within the python script:

- Parameters can be used in the script by creating an instance of the parameter helper: parameterHelper = AutomationBuilder_Parameters.create()
- Individual parameters are retrieved by calling: GetParameter(parameterName). devicename = parameterHelper.GetParameter("Name")

Python script examples

A set of python script examples are available in the path %Public%\Documents\Automation-Builder\Examples\Python scripts.

1.8.7.3 Python script editor

In Automation Builder a browser-based python script editor is integrated. This allows the user to modify the existing python script, to create a python script from the scratch and to finally execute the script. Moreover, it assists the user in writing the script with the following features:

- Auto suggest
  - IntelliSense suggestions for the python syntax during typing.
  - IntelliSense for CODESYS script engine and Automation Builder injected script objects.
  - Built-in language service that provides complete code intelligence for objects, properties and methods.
  - Details of the object with *[CTRL]* + *[spacebar]*.
- Auto completion
  Press the Enter key on a function suggested by IntelliSense in order to insert it.
- Python syntax highlighting (basic syntax colorization)
  The function and its respective namespace is automatically colored in order to match colors.
- Matching brackets
  Matching brackets are highlighted as soon as the cursor is near to one of them using the command palette.
- Zoom
  Changes the font size of the editor's content.
- Find and replace
  Support of 'Find' (search for a keyword) and 'Find and replace' (search and replace a keyword). This feature is supported in the editor, however not integrated in Automation Builder platform.
- Minimap
  High level overview of the script for a quick navigation and code understanding.
- Copy/paste
  Support of 'copy and paste' of the script text within and into the editor.
- Undo/redo
  Support of 'undo/redo' for editing actions. This feature is supported in the editor, however not integrated in Automation Builder platform.
- Keyboard shortcuts
  Keyboard shortcuts allow to perform most tasks directly from the keyboard (e.g. *[CTRL]* + *[Z]*, *[CTRL]* + *[Y]*) including copy and paste. For further keyboard shortcuts refer to the command palette (*[F1]*).
- Folding
  Support of folding and expanding script regions.
- Comment/uncomment the code
  Support of commenting (*[CTRL]* + *[K]*) and uncommenting (*[CTRL]* + *[C]*) code through shortcuts.
- 'Execution' button
  Executes the script directly in the editor window.
- In order to start a new script from the scratch the user can start with an empty editor. This can be done via the 'Add script' dialog without script file selection.

For further features that can be used in the python script editor refer to the command palette (*[F1]*).

Limitations with CODESYS script engine IntelliSense

- No IntelliSense available for return type of a property.
- No support of IntelliSense for keyword “None”.
- No IntelliSense support for method overloading.
- No IntelliSense support for methods that return an object.
- Private methods are also part of IntelliSense. Refer to the CODESYS script engine document to verify the access modifier.

1.9 Human machine interface

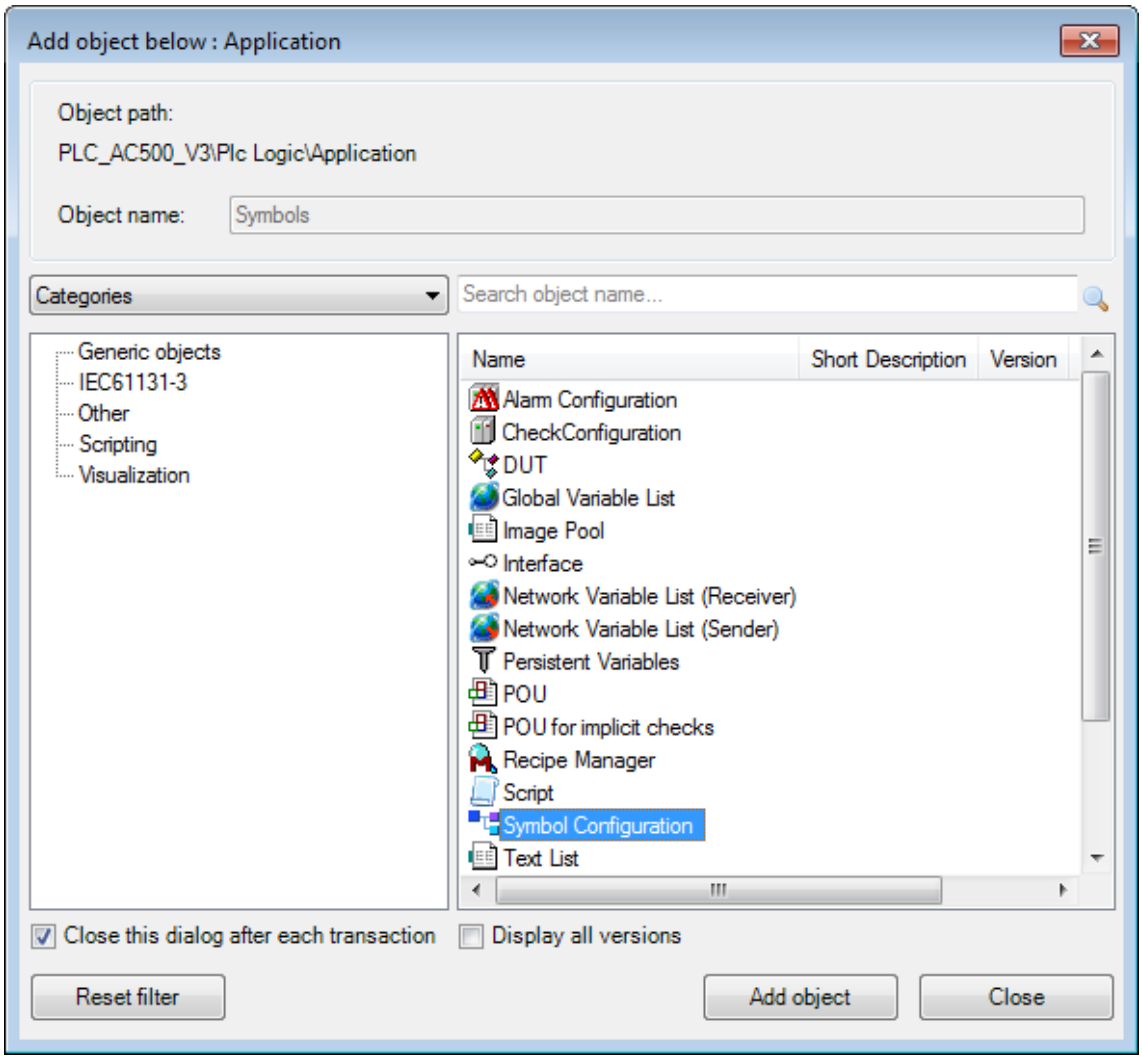
1.9.1 Panel Builder interface

This document describes HMI CP600 Control Panel configuration in Automation Builder and starting HMI configuration and programming software Panel Builder 600 from Automation Builder. The Panel Builder project created for the HMI CP600 is stored within the Automation Builder project.

1.9.1.1 Adding desired AC500 PLC to the project

Configuring the Symbol File

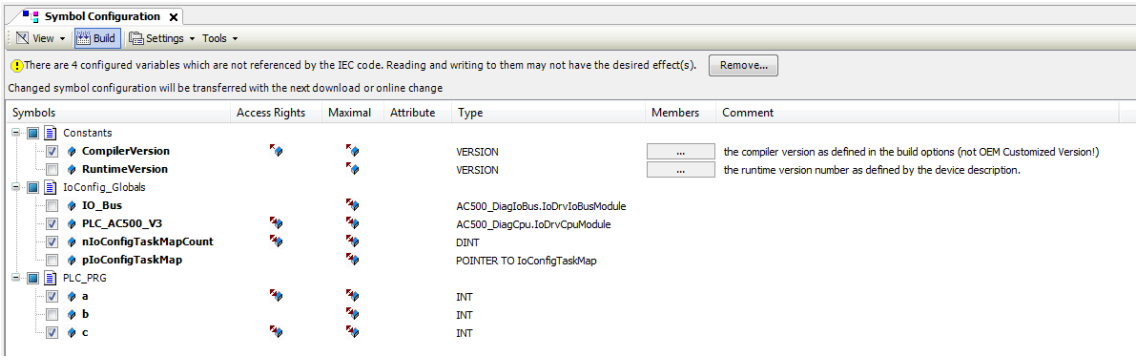
1. In the Automation Builder device tree, right-click the *"Application"* node and click *"Add object"*



2. Click on *"Symbol Configuration"* and click *"Add object"*

   ⇨ A *"Symbol Configuration"* object is added to the *"Application"* node.

3. Double-click on the *"Symbol Configuration"* object , then click on *"Build"*



⇨ A list of all variables in the project is generated. Single variables or groups of variables can be selected by checking the corresponding item in the list.

4. After the symbols have been configured, download the project or click *"Build ➔ Generate code"* in the Automation Builder to create an .xml file containing all the variables read to be imported in the Tag Editor.

1.9.1.2 Creating a Panel Builder project

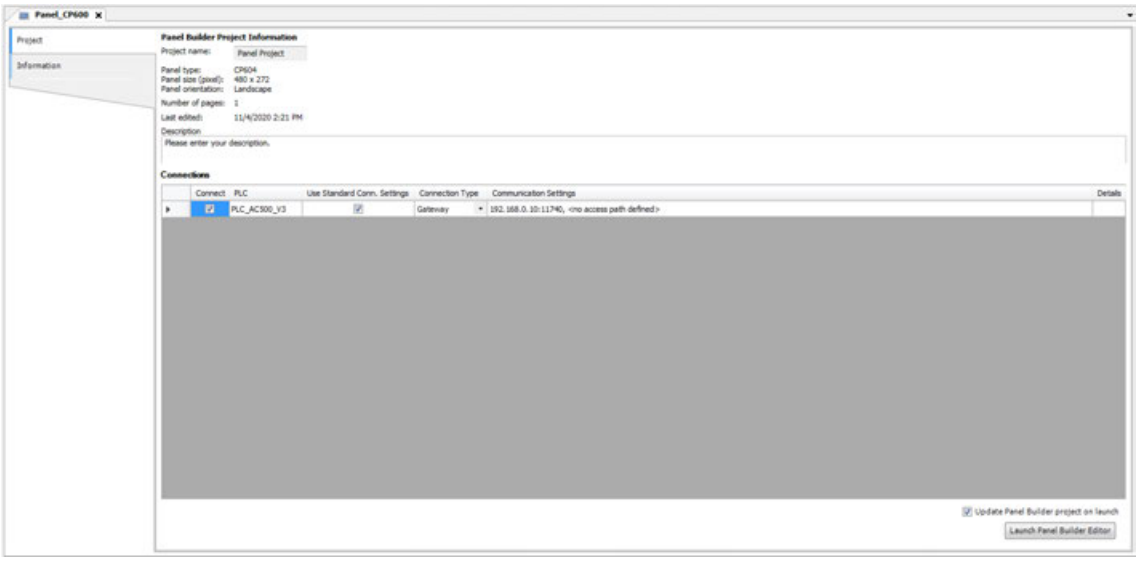
Adding a panel object

1. Right-click in the Automation Builder device tree and click *"Add object ➔ Panel-CP600"*
2. Click on *"CP600 Control Panel"* and click *"Add object"*

⇨ A Control Panel object is added to the Automation Builder device tree.

Starting a Panel Builder project

1. In the device tree, double-click *"Panel CP600"* object to start Panel CP600 screen.



2. Select the required PLC and enable the checkbox in the 'Use Standard Connection Settings' column to use it as a standard gateway connection.

   You can set communication settings using the application program or by creating custom communication settings. Custom communication settings can be configured by clicking the button in the 'Details' column.

3. Enable the *"Update Panel Builder project on launch"* checkbox and click *[Launch Panel Builder Editor]*.

> *If you update Automation Builder project with new variables and data types or if there are changes in existing Automation Builder project variables and data types (new, modified, deleted), recompile CODESYS application to refresh the symbol file, then launch Panel Builder editor.*

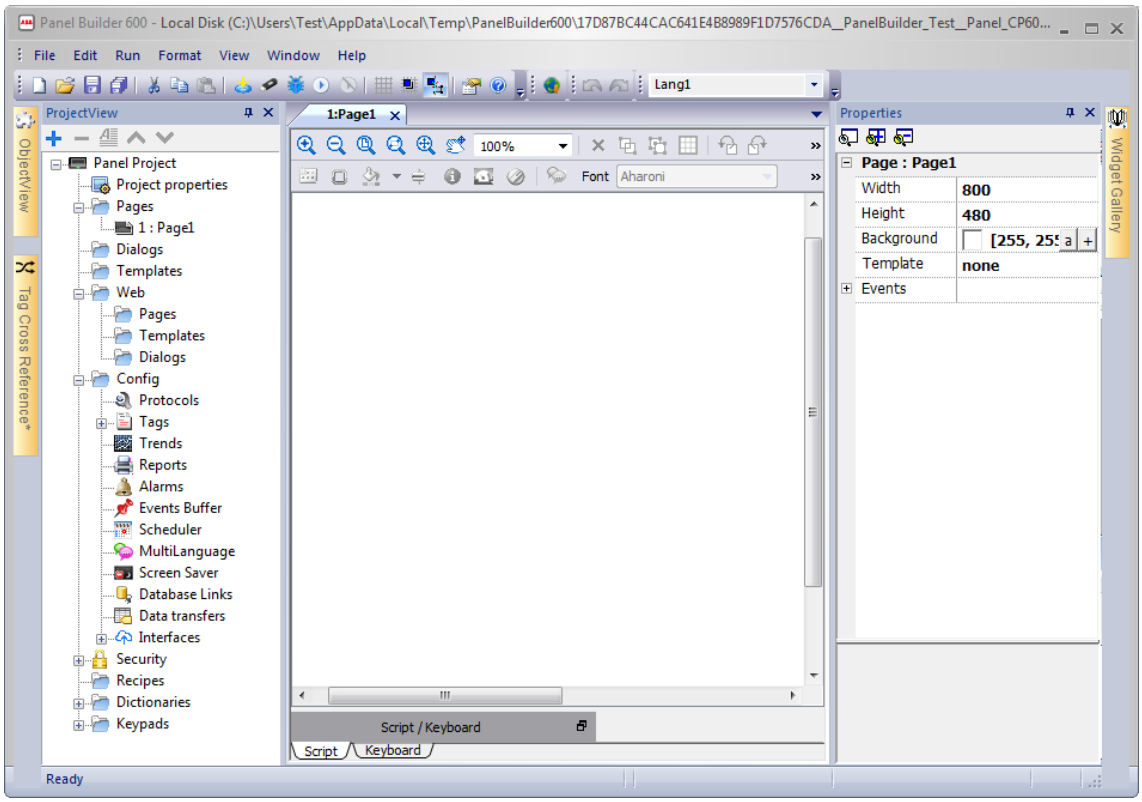
4. Select *"New"* and click *"Open"* to create a new HMI project.

   ⇨ A project wizard is displayed.

> *If you want to import an already existing Panel Builder project file from the file system, select "Import existing project file" and proceed.*

5. Select the required panel type and orientation and click *"Finish"*.

   ⇨ A new project wizard starts only if the Panel project is empty.

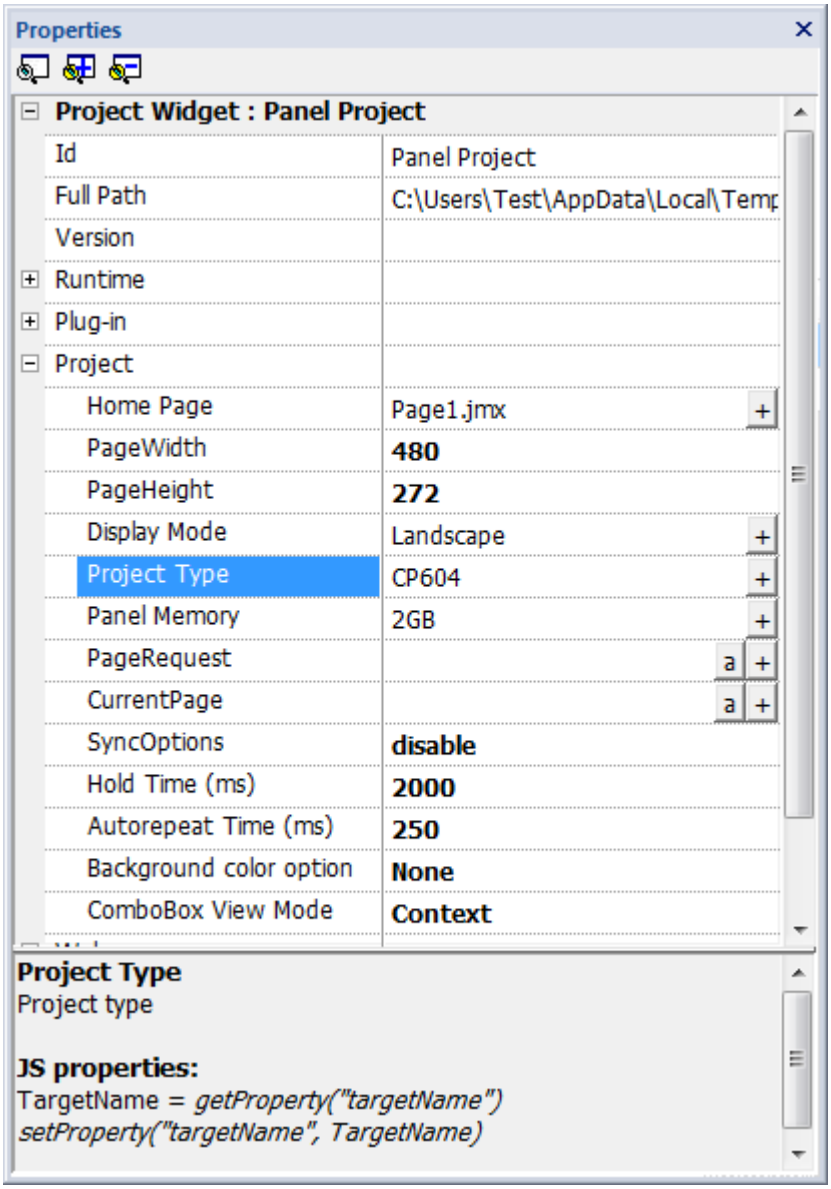


> *The panel projects can be compared in Automation Builder using the "Compare Objects" option.*

Changing panel type

1. In the Panel project, double-click *"Project properties"* to change the panel type to the panel which is used.

   ⇨ The Properties dialog is displayed.



2. In the Properties dialog, expand *"Project"* and click *"Project Type "*.

   ⇨ A project wizard dialog is displayed.

3. Select the desired panel type and click *"Finish"*.

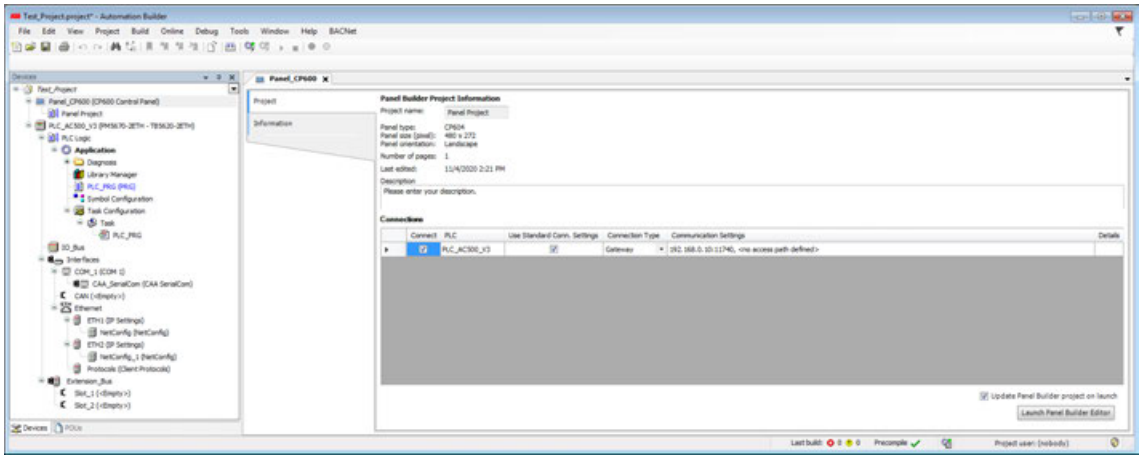
Project information

The project information view provides an overview of the Panel Builder project without opening the project. To open the project information, double-click the *"Panel_CP600"* object.

The project information is updated every time the Panel Builder project is edited. You can rename the Panel Builder project via context menu.

> *The project name is internally used as a base for the Panel Builder project file name. Therefore, the project name has to comply with general file name restrictions.*

The Panel Builder project information shows the list of PLCs added to the project.

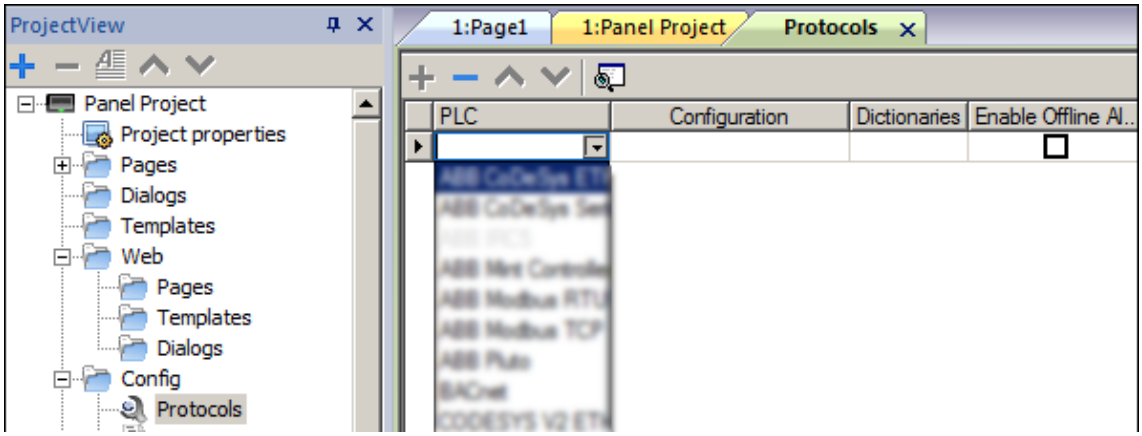


1.9.1.3 Configuring Panel Builder

Configuring communication protocols

> *The user can configure a panel project manually in Panel Builder editor when there is a need to create individual panel projects. Otherwise, the configuration is updated in the panel project while launching Panel Builder editor in Automation Builder.*

1. In the Panel Builder project structure, double-click *"Config ➔ Protocols"*.
2. Click + to add a protocol.



3. Select *"OPC UA Client"* to ensure an encrypted communication between AC500 V3 devices and the control panels. This is necessary to protect passwords and other data in terms of cyber security.

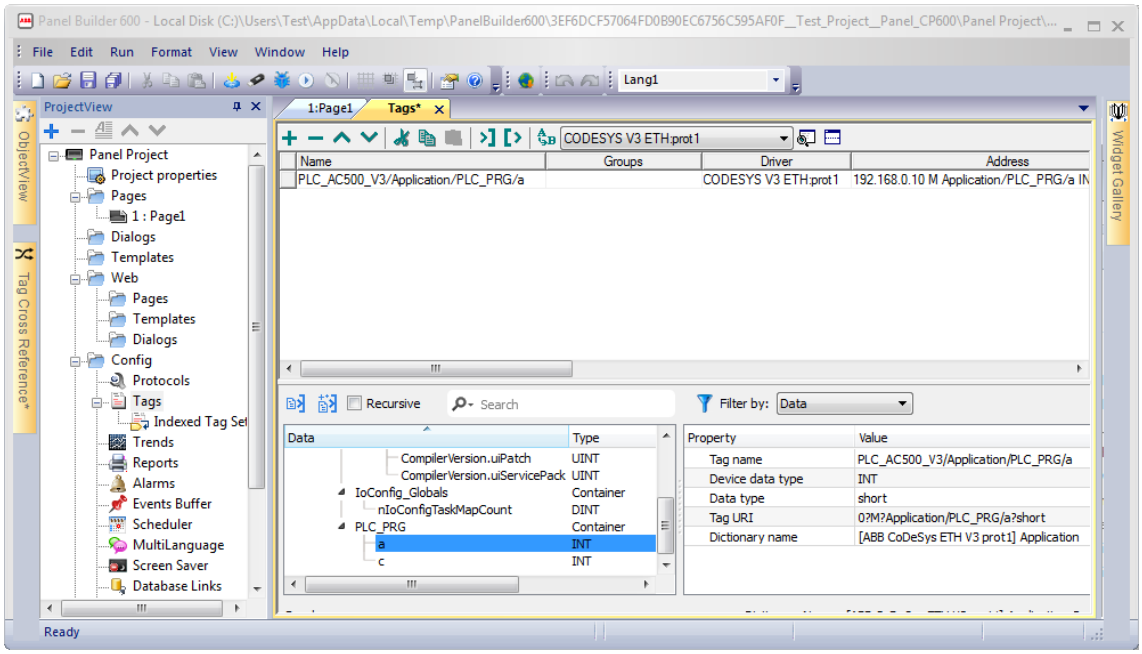
   Set the IP address, port, protocol type and PLC models. Click *[OK]*.

Importing tags

1. In the Panel project view, click *"Config ➔ Tags"*.
2. Select the protocol from the drop-down list and click ›] to import tags.

> *If the Panel Builder contains multiple tag importers, a dialog is displayed to select the required importer type.*

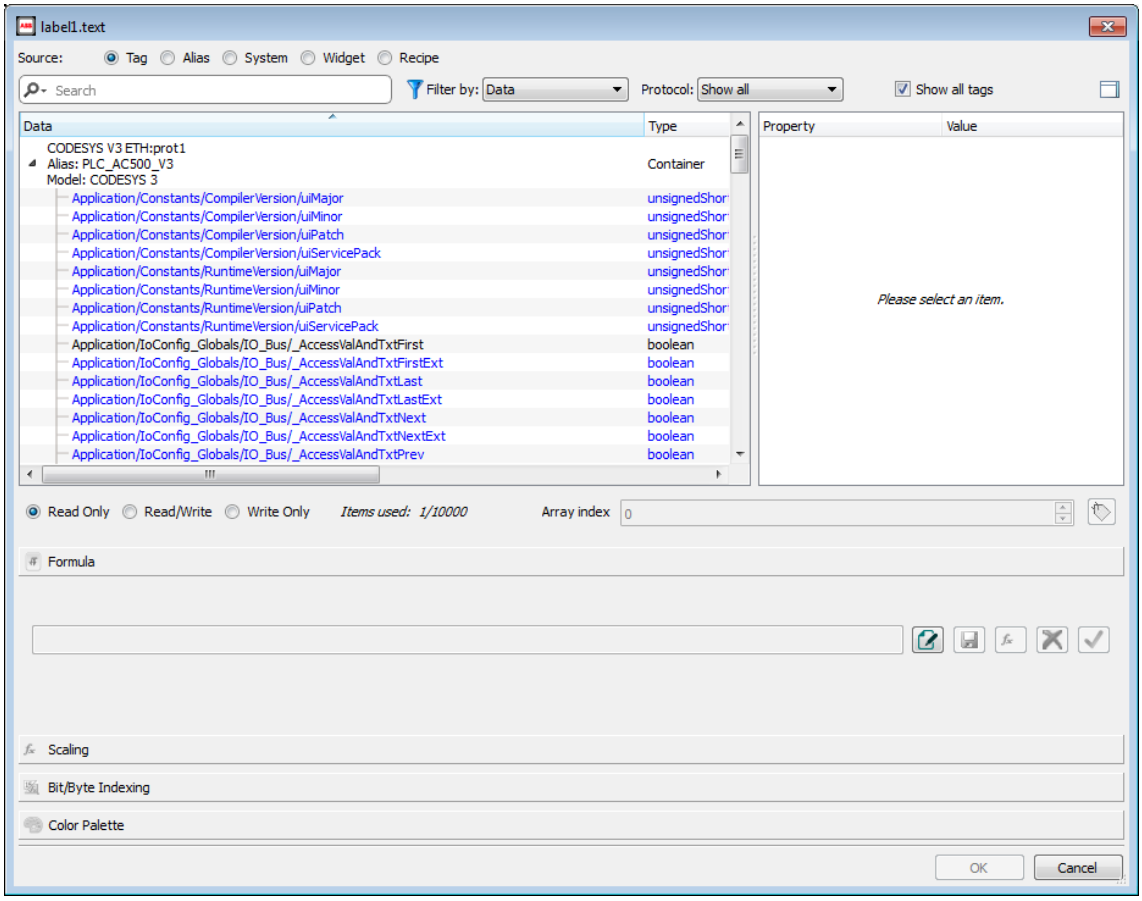
3. Select the symbol file which was exported to the file system.
4. In the lower part of the tag editor, mark the desired tags and click *“Import Tag (s)”* to import the tags to the Panel Builder project.



Attaching tags to widgets

1. In the project view, expand *“Pages”* and double-click **Page1**.
2. In the Panel Builder 600 main menu, select *“View ➔ Toolbars and Docking Windows ➔ Widget Gallery”*.
3. Drag-and-drop the desired widget to the page editor.

4. Right-click on the widget value and select *"Attach To"* to attach a tag to the widget.



5. Select the desired tag and select the desired option for the authorization *"Read Only"* or *"Read/ Write"* or *"Write Only"*. Then, click *[OK]*.

Downloading a project to panel

1. In the Panel Builder main menu, click *"Run ➔ Download To Target"*.
2. Select the CP600 project from the drop-down list and click *"Download"*.

Importing an existing Panel Builder project

1. In the Automation Builder device tree, right-click the Panel project and click *"Import ➔ Panel Builder Project"*.

   System prompts to overwrite the exiting project object data.
2. Click *"Yes"* to confirm.
3. Select the existing Panel Builder 600 project from the file system and click *"Open"*.

   ⇨ The imported project is displayed.

Exporting Panel Builder project

1. In the Automation Builder device tree, right-click the Panel Builder 600 project and click *"Export ➔ Panel Builder Project"*.
2. Click *"Browse"* and select the desired location in the file system and save the project file.
   ⇨ A success message is displayed, if the project file exports successfully.

> *When you double-click the Panel Builder project node, the compressed information of the node is extracted into a temporary folder and then the external Panel Builder program is started. After the external Panel Builder program is closed, the corresponding Panel Builder files can be compressed back into the node and saved in the Automation Builder project.*

> *We recommend to edit the Panel Builder project by starting Panel Builder through the Automation Builder. You can also export a Panel Builder project to the file system to edit the project by using the external Panel Builder. Then, reimport it to Automation Builder.*

1.9.2 SCADA Integration

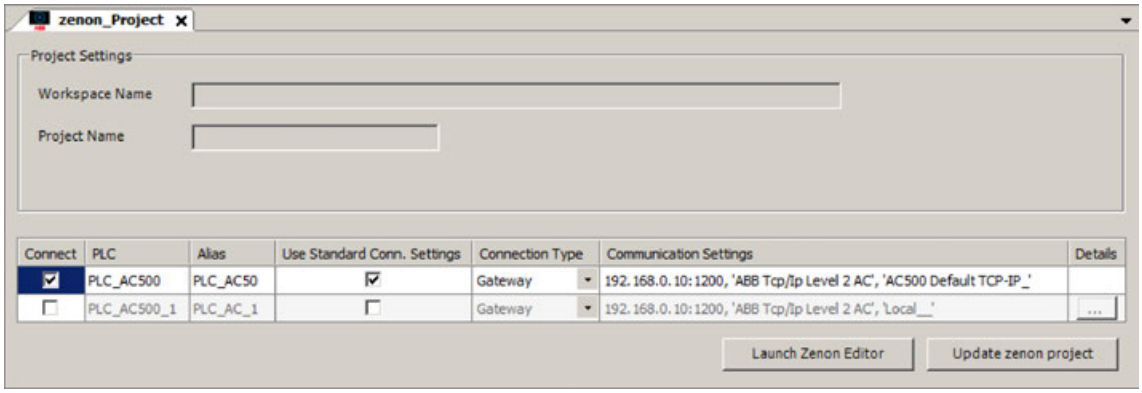
Overview

This document describes SCADA integration configuration in Automation Builder using zenon editor. The configured device network address information and variables are synchronized with zenon editor to avoid double entry.

The Automation Builder supports both standard and multi-user functionality.

1.9.2.1 Creating Workspace and Project

1. In the device tree, double-click *"zenon_Project"*.



⇨ To launch the zenon editor, click *[Launch Zenon Editor]*.

To update the zenon project with latest changes of application program, click *[Update zenon project]*.

2. Select the required PLC and select the *“Use Standard Conn. Settings”* option to use as a standard gateway connection.

   This enables the user to use the same communication settings that Automation Builder uses to communicate to the PLC.

   > *The configured gateway communication settings made in Automation Builder are displayed in the column 'Connection Type'.*

   As an alternative you can create custom communication settings: Deselect the *“Use Standard Conn. Settings”* option and click the button in the 'Details' column.

3. Click *[Launch Zenon Editor]* to create a new workspace and project.

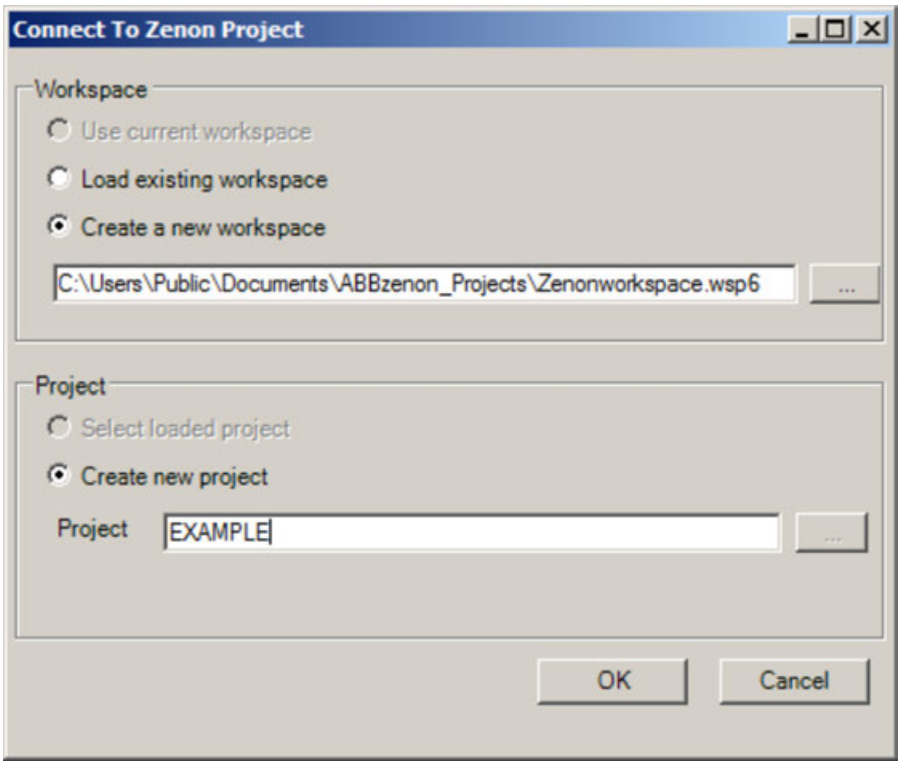


Fig. 345: Connect to zenon project

⇨

> *If Zenon Editor is already running, then select the “Use current workspace” option.*

4. Select the *“Create a new workspace”* option and select the file location to create a new workspace.
5. Select the *“Create new project”* option to create a project.

   ⇨ ABB zenon editor is displayed.

> *If you update or change an Automation Builder project with new variables or data types (new, modified, deleted), recompile the application to refresh the symbol file and click [Update zenon project].*

After creating the project and workspace in Automation Builder, it is not required to set it again for the zenon object. A double-clicking on the zenon project shows the previously configured zenon project and the workspace.

1.9.2.2 Loading existing Workspace and Project

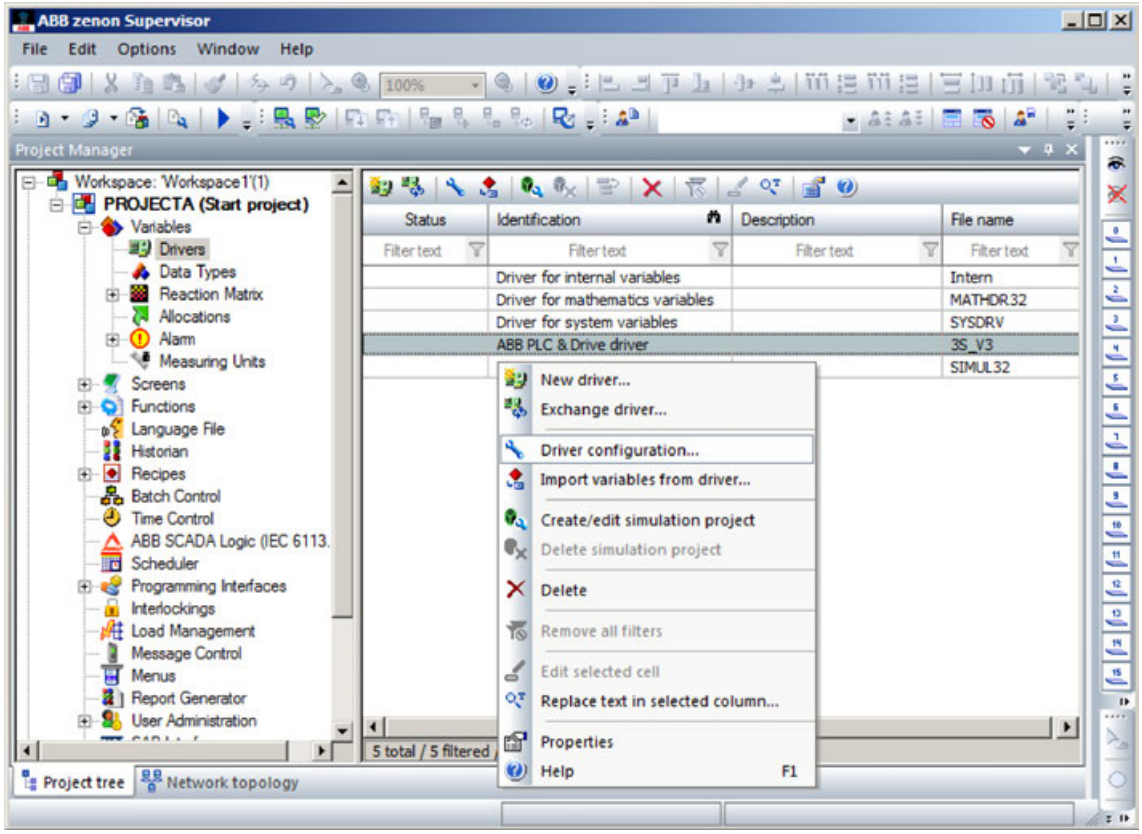
You can load an existing workspace and project to ABB zenon supervisor.

1. In the zenon_Project screen, click *[Update zenon project]*.
   ⇨ Connection to the zenon project dialog is displayed.
2. In the workspace area, enable *"Load existing workspace"* and select the location.
3. In the project area, enable *"Select loaded project"* and click *[OK]*.
   ⇨ Zenon editor loads the selected existing workspace and the project.

1.9.2.3 Checking the Gateway Settings in a Zenon Project

The gateway settings configured in Automation Builder can be checked in a zenon project. The IP address configured in Automation Builder are displayed in the zenon driver configuration.

In the Project Manager structure of the zenon editor, click *"Variables ➔ Drivers"* to configure the driver configuration.



The *"Settings"* tab shows all gateway settings based on the number of configured PLCs in Automation Builder. The IP address should be similar to the project gateway settings in Automation Builder.

> *In the zenon project window, the **Connect** column should be checked to transfer the desired number of PLC connection settings to the zenon editor.*

1.9.2.4 Generating a Symbol File

Before generating the symbol file, define the variables in theCODESYS application.

1. In the CODESYS application main menu, click *“Project ➔ Options”*.
2. In the *“Options”* dialog, click *“Symbol configuration”*. Enable *“Dump symbol entries”* and *“Dump XML symbol table”* and click *“Configure symbol file”*.

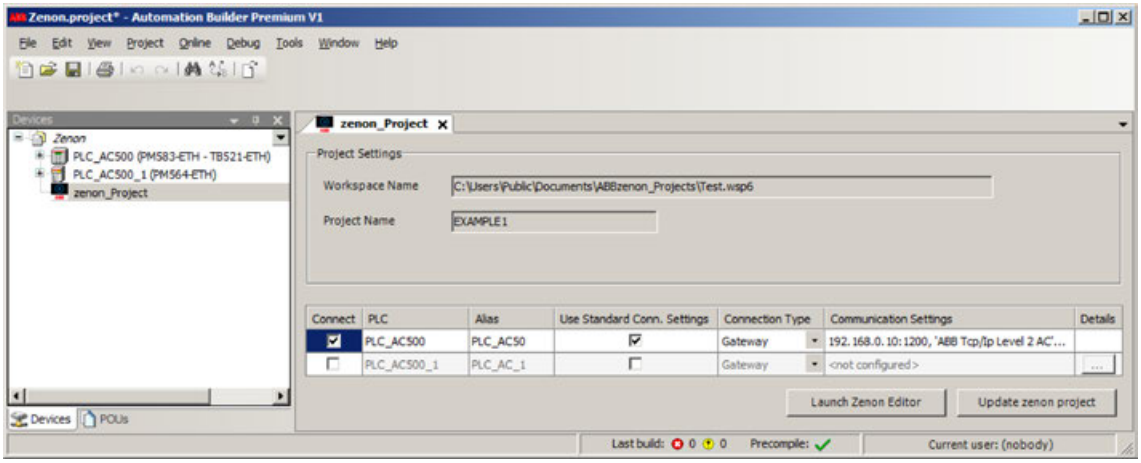
   ⇨ Set object attributes dialog is displayed.
3. Enable *“Export variables of object”*. If this option has a gray background, double-click on it to activate.
4. In the CODESYS application window, click at the bottom of the window and click *“Resources ➔ Tools ➔ Target settings”*.
5. In the target settings dialog, open the *“General”* tab and enable *“Download symbol file”*.
6. From the CODESYS application main menu, select *“Project ➔ Build”* to compile the project.

> *Precondition to generate a symbol file is to create the application and perform a PLC program build in CODESYS application.*

The symbol file is generated after the build. The data exchange can be transferred to the zenon project by clicking *[Update zenon project]* in Automation Builder.

1.9.2.5 Updating Standard Data Types

The standard data types created in CODESYS application can be updated to the zenon project by clicking on *“Update zenon project”*.



> *Data types and variables can be updated from the desired number of PLCs configured in the zenon project of Automation Builder.*

In the zenon project, double-click *“Variables”* and check the updated standard data type.

1.9.2.6 Creating Data Types

1. In the CODESYS application open the *“Data types”* tab. Right-click *“Data types* ➔ *Add object”* to create a new data type.
2. Enter the user defined data type name.
3. In *“POUs”* tab, add the user defined variable data type and compile.
   ⇨ The user defined data type is created and can be imported in the zenon editor.

> *If you modify or delete the data types in CODESYS application, compile with “Rebuild all option”.*

1.9.2.7 Importing Data Types in zenon Editor

1. In the zenon project, click *[Update zenon project]* to update the data types.
2. Click *“Update”* to update the variables and data types to the zenon project.
   ⇨ The user defined variables and data types are imported to the zenon project.

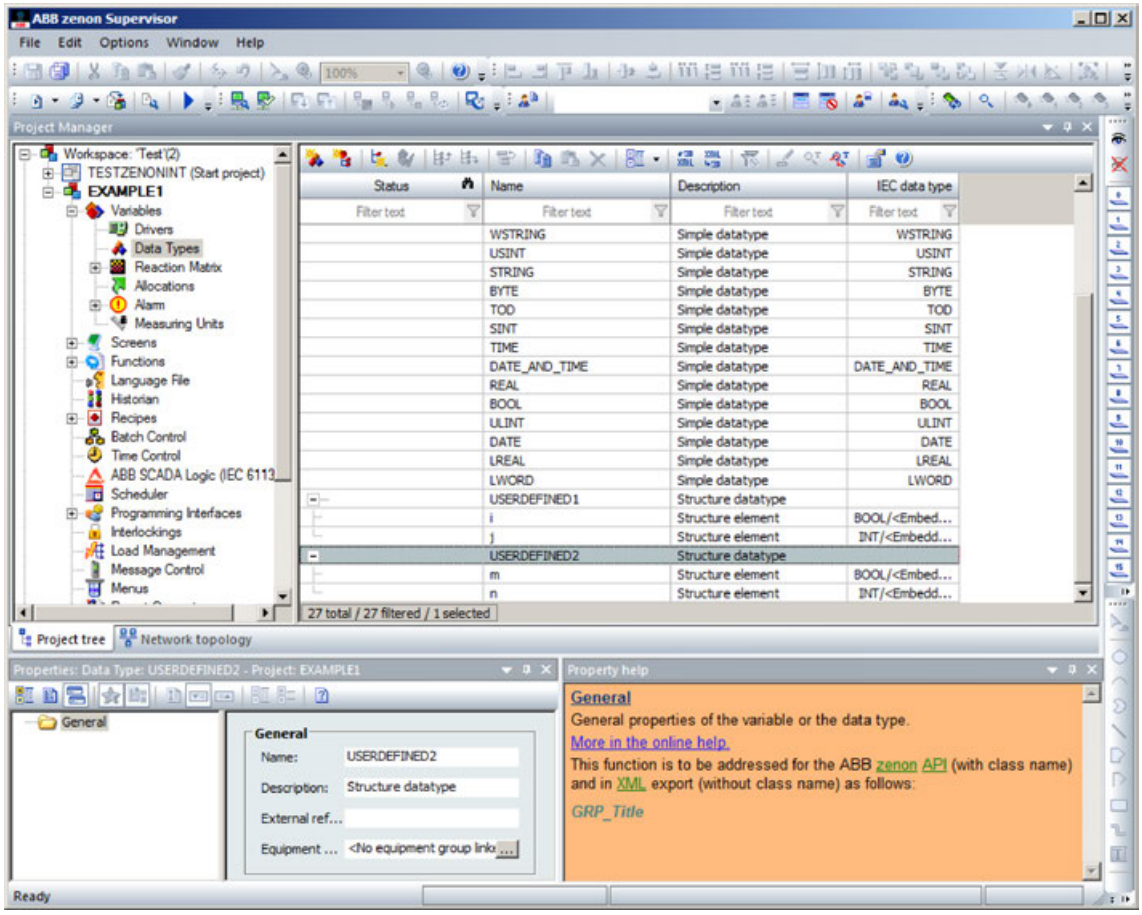


Fig. 346: User defined variables
