Function: This command opens the *“Edit Page Size”* dialog box, in which you change the size of the page-oriented CFC editor.

Call: Main menu *“CFC”*

Requirements: A page-oriented CFC editor is active.

Dialog box 'Edit page size' dialog box

“Width”	Width of the page (minimum 24, maximum 1024). Elements outside of the working area are marked red.
“Height”	Height of the page (minimum 24, maximum 1024). Elements outside of the working area are marked red.
“Margin width”	Width of the margin (minimum 6, maximum 25% or page width).
“Set as standard for new CFC objects”	☑: The current settings are selected as standard for new CFC objects.

See also

- *Chapter 1.4.1.19.1.6.5.1 “CFC element 'Page'” on page 522*

Command 'Negate'

Symbol: 

Function: This command negates the selected function block input or function block output.

Call: Main menu *“CFC”*, context menu

Requirements: A CFC editor is active. A function block input or function block output is selected.

Command 'EN/ENO'

Symbol: 

Function: This command adds a boolean input *“EN”* (Enable) and a boolean output *“ENO”* (Enable Out) to the selected function block.

Call: Main menu *“CFC”*, context menu

Requirements: A CFC editor is active. A function block is selected.

The added input *“EN”* activates the function block. The function block is executed only if the input is `TRUE`. The value of this signal is output at the *“ENO”* output.

Command 'None'

Symbol: ; keyboard shortcut : *[Ctrl]+[M]* (to toggle between *“S”*, *“R”*, *“REF”*, and None)

Function: The command removes a Reset (R), Set (S), or REF from the input of the *“Output”* element.

Call: Menu bar: *“CFC ➔ Set/Reset”*; context menu: *“Set/Reset”*

Requirement: A CFC editor is active. The input of an *“Output”* element is selected.

Command 'R (Reset)'

Symbol: ; keyboard shortcut : *[Ctrl]+[M]* (to toggle between *“S”*, *“R”*, *“REF”*, and None)

Function: The command adds a Reset to the input of a Boolean *“Output”* element.

Call: Menu bar: *“CFC ➔ Set/Reset”*; context menu: *“Set/Reset”*

Requirement: A CFC editor is active. The input of an *“Output”* element is selected.

If an *“Output”* element has a Reset input, then the Boolean output value is set to *“FALSE”* as soon as the value of the input is *“TRUE”*. The *“FALSE”* value at the output is retained, even if the input value changes.

See also

- *Chapter 1.4.1.20.3.12.7 “Command 'S (Set)'” on page 1091*

Command 'S (Set)'

Symbol: ; keyboard shortcut : *[Ctrl]+[M]* (to toggle between *“S”*, *“R”*, *“REF”*, and none)

Function: The command adds a Set (S) to the input of a Boolean *“Output”* element.

Call: Menu bar: *“CFC ➔ Set/Reset”*; context menu: *“Set/Reset”*

Requirement: A CFC editor is active. The input of an *“Output”* element is selected.

If an *“Output”* element has a Set input, then the Boolean output value is set to *“TRUE”* as soon as the value of the input is *“TRUE”*. The *“TRUE”* value at the output is retained, even if the input value changes.

See also

- *Chapter 1.4.1.20.3.12.6 “Command 'R (Reset)'” on page 1091*

Command 'REF= (Reference Assignment)'

Symbol: ; keyboard shortcut : *[Ctrl]+[M]* (to toggle between *“S”*, *“R”*, *“REF”*, and None)

Function: The command assigns a reference to an *“Output”* element.

Call: Menu bar: *“CFC ➔ Set/Reset”*; context menu: *“Set/Reset”*

Requirements: A CFC editor is active. The input of an *“Output”* element is selected.

Example:

Declaration:

```
ref_int : REFERENCE TO INT;
a : INT;
```

CFC:

This corresponds to the ST code: `ref_int REF= a;`

For more information, see the description for the data type `REFERENCE TO`.

- *Chapter 1.4.1.19.5.13 “Reference” on page 658*

Command 'Display Execution Order'

Function: The command temporarily shows a numbered tag for all CFC elements of the programming object.

Call

- Menu bar: *“CFC ➔ Execution Order”*
- Context menu in the CFC editor

Requirement: A CFC editor is active and the *“Auto Data Flow Mode”* property is selected.

The numbers represent the automatically determined execution order. The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position in the editor.

The tags are hidden as soon as you click in the CFC editor.

See also

- *Chapter 1.4.1.8.3.2.1 “Automatic Execution Order by Data Flow” on page 242*

- *Chapter 1.4.1.20.4.10.13 “Dialog 'Properties' - 'CFC Execution Order'” on page 1165*

Command 'Set Start of Feedback'

Symbol: 

Function: The command defines the selected element as the starting point within a feedback.

Call:

- Menu bar: *“CFC ➔ Execution Order”*
- Context menu: *“Execution Order”*

Requirement: A CFC editor is active and the *“Auto Data Flow Mode”* property is selected. Moreover, a network of the CFC POU contains a feedback, and an element within the feedback is selected.

In the CFC editor, the starting point within the feedbacks is decorated with the symbol. Then the element has the lowest number in the execution order within the feedbacks. At runtime, the processing of the feedback begins with this element.

- *Chapter 1.4.1.20.4.10.13 “Dialog 'Properties' - 'CFC Execution Order'” on page 1165*

Command 'Send to Front'

Symbol: 

Function: The command numbers the elements so that the selected elements are located at the front of the execution order.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and the *“Explicit Execution Order Mode”* property is selected. At least one element is selected.

The selected elements get the lowest numbers beginning at 0 while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Send to Back'

Symbol: 

Function: The command numbers the elements so that the selected elements are located at the end of the execution order.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and the *“Explicit Execution Order Mode”* property is selected. At least one element is selected.

The selected elements get the highest numbers while keeping the previous order. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Move Up'

Symbol: 

Function: The command numbers the elements so that the selected elements are located one position forward.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and at least one element is selected. The *“Explicit Execution Order Mode”* property is selected.

The selected elements get a numbering decreased by one while keeping the previous order. The selected elements are processed one position earlier. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also

- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Move Down'

Symbol: 

Function: The command numbers the elements so that the selected elements are located one position backward.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and at least one element is selected. The *“Explicit Execution Order Mode”* property is selected.

The selected elements get a numbering increased by one while keeping the previous order. The elements are processed one position later. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

See also

- *Chapter 1.4.1.8.3.2.1 “Automatic Execution Order by Data Flow” on page 242*

- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Set Execution Order'

Function: The command opens a dialog for setting the number of the selected element to any value.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and the *“Explicit Execution Order Mode”* property is selected. Exactly one element is selected.

The selected element gets the number specified in the dialog. The remaining elements are numbered so that their execution order remains the same. The topological positions of the elements are retained anyway.

- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Order by Data Flow'

Function: The command numbers the elements in the program by data flow, or in the case of multiple networks by their topological position in the editor.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and the *“Explicit Execution Order Mode”* property is selected.

The command is also available when no element is selected.

The execution order is determined by data flow. In the case of multiple networks, it is determined by their topological position of the networks. All numbered elements of the POU are set accordingly. Afterwards, the execution order is identical to that in auto data flow mode. The topological positions of the elements are retained anyway.

See also

- *Chapter 1.4.1.8.3.2.1 “Automatic Execution Order by Data Flow” on page 242*

- *Chapter 1.4.1.20.3.12.11 “Command 'Send to Front'” on page 1092*
- *Chapter 1.4.1.20.3.12.12 “Command 'Send to Back'” on page 1093*
- *Chapter 1.4.1.20.3.12.13 “Command 'Move Up'” on page 1093*
- *Chapter 1.4.1.20.3.12.14 “Command 'Move Down'” on page 1094*
- *Chapter 1.4.1.20.3.12.17 “Command 'Order by Topology'” on page 1095*

Command 'Order by Topology'

Function: The command orders the execution order of the elements by their topological position from right to left and from top to bottom.

Call: Menu bar: *“CFC ➔ Execution Order”*; context menu: *“Execution Order”*

Requirements: A CFC editor is active and the *“Explicit Execution Order Mode”* property is selected. At least one element is selected.

The command applies to all elements in the program, even if not all elements are selected when the command is executed. The topological positions of the elements are retained anyway.

See also

- *Chapter 1.4.1.8.3.2.1 “Automatic Execution Order by Data Flow” on page 242*

- *Chapter 1.4.1.20.3.12.16 “Command 'Order by Data Flow'” on page 1095*

Command 'Edit Parameters'

Function: This command opens the *“Edit Parameters”* dialog box, where you change the constant input parameters of a function block.

Call: Main menu *“CFC ➔ Edit Parameters”*, or *“Right-Click ➔ Edit Parameters”*, click the *“Parameter”* function block.

Requirements: A CFC editor is active. An instantiated function block has VAR_INPUT CONSTANT variables in its declaration.

This functionality applies only to blocks that are inserted in a CFC with CODESYS >= V3.5 SP4.

CODESYS displays blocks with VAR_INPUT CONSTANT variables by the word *“Parameter”* in the lower left corner of the block.

Dialog Box 'Edit Parameters'

“Parameters”	Name of the variable
“Type”	Data type of the variables
“Value”	Click into the field to type a value.
“Initial Value”	Initialization Value
“Category”	Additional information about the parameters; these values are defined by attributes and cannot be changed in this dialog box. • `parameterCategory` • `parameterUnit` • `parameterMinValue` • `parameterMaxValue`
“Unit”	
“Min”	
“Max”	
“Delete Prepared Parameters”	This command is active when you write a prepared value (*“Debug ➔ Write Value”*).

When you exit the field and the dialog box by clicking *“OK”*, the value changes are applied to the project.

Example of a block with constant inputs

```
FUNCTION_BLOCK FB1
VAR_INPUT CONSTANT
    {attribute 'parameterCategory':='General'}
    {attribute 'parameterUnit':= 'm/s'}
    {attribute 'parameterMinValue':= '0'}
    {attribute 'parameterMaxValue':= '100'}
    fbin1:INT;
    fbin2:DWORD:=24354333;
    fbin3:STRING:='abc';
END_VAR
```

> *This functionality and the declaration of variables with keyword `VAR_INPUT CONSTANT` applies only to the CFC editor. In the FBD editor, CODESYS always shows all input parameters on the block, regardless of whether or not they are declared as `VAR_INPUT` or `VAR_INPUT CONSTANT`. CODESYS also does not make a distinction about this in text editors.*

See also

- *Chapter 1.4.1.19.1.6.4 “CFC Editor in Online Mode” on page 516*
- *Chapter 1.4.1.20.3.12.19 “Command 'Save Prepared Parameters to Project'” on page 1097*

Command 'Save Prepared Parameters to Project'

Function: This command saves the prepared parameter values to the project.

Call: Main menu *“CFC”*.

Requirements: A CFC editor is active. Parameter values of function block instances are changed in online mode. You are in offline mode.

If the values of constants on the controller are different from the values in the application, then this is indicated by a red asterisk next to the parameter field. Clicking *“Incur Prepared Parameters”* saves the controller values to the application.

See also

- *“Changing of constant input parameters of function block instances” on page 518*
- *Chapter 1.4.1.20.3.12.18 “Command 'Edit Parameters'” on page 1096*

Command 'Connect Selected Pins'

Symbol: 

Function: The command establishes a connection between the selected pins.

Call: Main menu *“CFC”*, context menu

Requirements: A CFC editor is active. Precisely one output and several inputs are selected.

In order to select the pins you must keep the *[CTRL]* key pressed while clicking on the pins. Then you execute the command.

See also

- *Chapter 1.4.1.20.3.12.23 “Command 'Select Connected Pins'” on page 1098*

Command 'Unlock Connection'

Symbol: 

Function: This command unlocks a disabled connection.

Call: Main menu *“CFC ➔ Routing”*, context menu *“Routing”*

Requirements: A CFC editor is active. A connection or a connection mark is selected.

You obtain a disabled connection if you change the connections of the automatic routing. If you wish to carry out automatic routing again, you must first unlock a disabled connection.

With a mouse-click on the icon of a disabled connection you can similarly unlock this connection.

See also

- *Chapter 1.4.1.8.3.2.2 “ Programming in the CFC editor” on page 246*
- *Chapter 1.4.1.19.1.6.5.12 “CFC element 'Connection Mark - Source/Sink'” on page 525*

Command 'Show Next Collision'

Function: This command displays the next collision in the editor and marks the place concerned.

Call: Menu menu *“CFC ➔ Routing”*, context menu *“Routing”*

Requirements: A CFC editor is active and at least one connection with a collision is present.

This function is very useful if you operate with large networks and see only one sub-area. A collision is additionally indicated to you by the red bordered symbol in the top right corner of the editor.

Command 'Select Connected Pins'

Symbol: ; shortcut: *[Ctrl]+[Left Arrow]*, or *[Ctrl]+[Right Arrow]*

Function: The command selects all pins that are connected to the currently selected line, or connected to the currently selected connection mark in page-oriented CFC.

Call: *“CFC”* menu; context menu

Requirements: A CFC editor or a page-oriented CFC editor is active. One line and therefore exactly one connection or exactly one connection mark is selected.

See also

- *Chapter 1.4.1.19.1.6.1 “CFC Editor” on page 511*
- *Chapter 1.4.1.19.1.6.2 “CFC editor, page-oriented” on page 514*
- *Chapter 1.4.1.19.1.6.5.12 “CFC element 'Connection Mark - Source/Sink'” on page 525*

Command 'Reset Pins'

Symbol: , *[Ctrl]+[U]*

Function: The command restores the deleted pins of a box.

Call: *“CFC ➔ Pins”* menu; *“Pins”* in the context menu

Requirements: A CFC editor is active and a box is selected.

The command restores all inputs and outputs of the box as they are defined in their implementation.

See also

- *Chapter 1.4.1.20.3.12.25 “Command 'Remove Unused Pins'” on page 1098*

Command 'Remove Unused Pins'

Symbol:

Function: The command removes all unused pins of the selected element.

Call: Menu *“CFC ➔ Pins”*, context menu *“Pins”*

Requirements: A CFC editor is active. An element is selected.

See also

- *Chapter 1.4.1.20.3.12.24 “Command 'Reset Pins'” on page 1098*

Command 'Add Input Pin'

Symbol: 

Function: The command adds a further input to the selected function block.

Call: Main menu *“CFC ➔ Pins”*, context menu *“Pins”*

Requirements: A CFC editor is active. A function block is selected.

See also

- *Chapter 1.4.1.20.3.12.27 “Command 'Add Output Pin'” on page 1099*

Command 'Add Output Pin'

Symbol: 

Function: The command adds a further output to the selected function block.

Call: Main menu *“CFC ➔ Pins”*, context menu *“Pins”*

Requirements: A CFC editor is active. A suitable function block is selected.

See also

- *Chapter 1.4.1.20.3.12.26 “Command 'Add Input Pin'” on page 1099*

Command 'Route All Connections'

Symbol:

Function: This command cancels all manual changes to the connections in the program and re-establishes the original state.

Call: Main menu *“CFC ➔ Routing”*, context menu *“Routing”*

Requirements: A CFC editor is active.

CODESYS cannot automatically route connections that are fixed by control points. You must remove the control points before executing the command. Use the *“Remove Control Point”* command to do this. Furthermore you must disconnect connections that have been changed manually and are marked by the  icon. Use the *“Disconnect Connection”* command to do this.

See also

- *Chapter 1.4.1.20.3.12.29 “Command 'Remove Control Point'” on page 1099*
- *Chapter 1.4.1.20.3.12.21 “Command 'Unlock Connection'” on page 1097*

Command 'Remove Control Point'

Function: This command removes a control point.

Call: Context menu *“Routing”*

Requirements: A CFC editor is active. You have selected a connecting line.

If you move the mouse pointer over a selected connecting line, the existing control points are displayed with yellow circle symbols. Set the cursor on the control point to be deleted and execute the command from the context menu.

See also

- *Chapter 1.4.1.19.1.6.5.2 “CFC element 'Control Point'” on page 522*
- *Chapter 1.4.1.20.3.12.30 “Command 'Create Control Point'” on page 1100*

Command 'Create Control Point'

Symbol: 

Function: The command creates a control point on a connecting line.

Call: Context menu *“Routing”*

Requirements: A CFC editor is active. The cursor is over a connection.

The control point is created in the position on the connection at which the cursor is located when calling the command. The command corresponds to the *“Control Point”* element in the *“Tools”* window.

See also

- *Chapter 1.4.1.19.1.6.5.2 “CFC element 'Control Point'” on page 522*
- *Chapter 1.4.1.20.3.12.29 “Command 'Remove Control Point'” on page 1099*

Command 'Connection Mark'

Symbol: 

Function: This command switches the display of the connection between two elements back and forth between a connecting line and the use of connection marks.

Call: Main menu *“CFC”*, context menu

Requirements: A CFC editor is active. A connection or a connection mark is selected.

If you have selected a connecting line, the command removes this line and adds a *“Connection Mark - Source”* at the output of one element and a *“Connection Mark - Sink”* at the input of the other. Both are given the same name by default, “C-<n>”, where n is a sequential number.

If you select a pair of connection marks, the command converts these marks into a connecting line.

See also

- *Chapter 1.4.1.19.1.6.5.12 “CFC element 'Connection Mark - Source/Sink'” on page 525*

Command 'Create group'

Symbol: 

Function: This command groups the selected elements.

Call: Main menu *“CFC ➔ Group”*, context menu *“Group”*

Requirements: A CFC editor is active. Several elements are selected.

Grouped elements can only be moved together. The position of the elements is not affected by the grouping.

See also

- *Chapter 1.4.1.20.3.12.33 “Command 'Ungroup'” on page 1101*

Command 'Ungroup'

Symbol: 

Function: The command undoes a previous grouping.

Call: Main menu *“CFC ➔ Group”*, context menu *“Group”*

Requirements: A CFC editor is active. A grouping is selected.

See also

- *Chapter 1.4.1.20.3.12.32 “Command 'Create group'” on page 1100*

Command 'Prepare Box for Forcing'

This command is required when using compiler versions 3.5.11.x and 3.5.12.x.
The command is no longer required for compiler versions >= 3.5.13.0.

Function: The command activates and deactivates the forceability of the inputs for a function block element.

Call:

- CFC
- Context menu

Requirements: The CFC editor is in offline mode and a function block element is selected.

After executing the command, the *“Force Function Block Input”* command is available in online mode to open a dialog for forcing the box input values.

See also

- *Chapter 1.4.1.20.3.12.35 “Command 'Force Function Block Input'” on page 1101*
- *Chapter 1.4.1.19.1.6.1 “CFC Editor” on page 511*
- *Chapter 1.4.1.11.4 “Forcing and Writing of Variables” on page 401*

Command 'Force Function Block Input'

NOTICE!
This kind of forcing uses a data breakpoint internally and is therefore different from forcing with the *“Force Values”* command or *[F7]*.

Values that were forced by the command *“Force FB Input”* do not respond to the commands *“Show All Forces”* or *“Unforce Values”*.

Function: The command opens the *“Force Value”* dialog to force the selected input of a function block. Forcing can be canceled with the same command and dialog.

Call:

- CFC
- Context menu

Requirements:

- The CFC editor is in online mode and the input of the function block is selected.
- For compiler versions 3.5.11.x and 3.5.12.x, the "forceability" of the function block is enabled by the *“Prepare Box for Forcing”* command.

In the *“Force Value”* dialog, you can either specify a value that the input of the function block should be forced, or remove the currently forced value.

After forcing, the input is highlighted in green again. Boolean inputs get a small monitoring view with the forced value. The forced value is displayed in the *“Value”* column of monitoring views (in the declaration part of the POU or in a watch list).

Dialog 'Force Value'

“Expression”	Name of the function block input. Example: `TON_1.IN`.
“Type”	Data type of the input

Table 160: “What do you want to do?”

“Set a new value to force”	: You can specify a new value in the input field. The format has to correspond to the data type.
“Remove value”	: Forcing at the input is canceled.

- *Chapter 1.4.1.11.4 “Forcing and Writing of Variables” on page 401*
- *Chapter 1.4.1.20.3.12.34 “Command 'Prepare Box for Forcing'” on page 1101*

Command 'Use Attributed Member as Input'

Symbol:

Function: This command allows for connecting a structure member to a scalar type input.

Call: Menu bar: *“CFC ➔ Pins”*; context menu: *“Pins”*

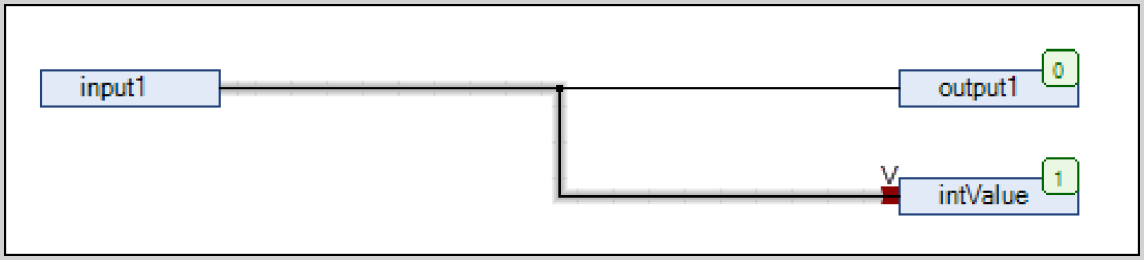
Requirements: A CFC editor is active and a function block input is selected.

The member of the structure that is connected to the input of the subsequent function block must be provided with the pragma `{attribute 'ProcessValue'}`. The data type of the structure member has to be compatible with the data type of the subsequent input. Inputs connected in this way are flagged with the "V" symbol.

Example

```
TYPE QINT :
STRUCT
    Status : STRING;
    {attribute 'ProcessValue'}
    Value1 : INT;
    Value2 : INT;
END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
    input1: QINT;
    output1: QINT;
    intValue: INT;
END_VAR
```



If you do not execute the command *“Use attributed member as input”* for this link, then a compiler error is issued.

See also

- *Chapter 1.4.1.19.6.2.37 “Attribute 'ProcessValue'” on page 726*

Menu 'FBD/LD/IL'

Command 'Insert Network'

Symbol:  , shortcut: *[Ctrl]* + *[I]*

Function: This command inserts a further network in the FBD/LD/IL editor.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The FBD, LD or IL editor is active. No box is selected.

See also

- *Chapter 1.4.1.19.1.5.4.1 “FBD/LD/IL element 'Network'” on page 504*
- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.20.3.13.2 “Command 'Insert Network (Below)'” on page 1105*

Command 'Insert Network (Below)'

Symbol:  , shortcut: *[Ctrl]+ [T]*

Function: This command inserts a further network in the FBD/LD/IL editor below the selected network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected. No box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Toggle Network Comment State'

Symbol:  , shortcut: *[Ctrl] + [O]*

Function: The command comments the selected network in or out.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Assignment'

Symbol  , shortcut: *[Ctrl] + [A]*

Function: This command inserts an assignment in the FBD or LD editor.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

In IL an assignment is programmed via the operators `LD` *and* `ST`*.*

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Box'

Symbol:  , shortcut: *[Ctrl] + [B]*

Function: This command inserts a box that is available in the project at the end of the selected network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

If you select this command the input assistant opens, where you can select the desired box.

See also

- *Chapter 1.4.1.19.1.5.4.2 “FBD/LD/IL element 'Box'” on page 505*
- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.8.5 “Using input assistance” on page 260*

Command 'Insert Box with EN/ENO'

Symbol:  , shortcut: *[Ctrl] + [Shift]+ [E]*

Function: This command inserts a box with a boolean input *“Enable”* and a boolean output *“Enable Out”* at the end of the selected network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: the FBD, LD or IL editor is active. A network is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.8.5 “Using input assistance” on page 260*

Command 'Insert Empty Box'

Symbol:  , shortcut: *[Ctrl] + [Shift] + [B]*

Function: This command inserts an empty function block at the end of the currently selected network.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Empty Box with EN/ENO'

Symbol: 

Function: The command inserts an empty box with a Boolean input *“Enable”* and a Boolean output *“Enable Out”* at the end of the selected network.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD editor, the IL editor or the LD editor is active. A network must be selected. No other box may be selected.

If *“Enable”* has the value `FALSE` at the time of the function block call, then the operations defined in the FB are not executed. Otherwise, if *“Enable”* has the value `TRUE`, these operations are executed. The ENO output acts as a repeater of the EN input.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Box Parallel (Below)'

Function: This command inserts an empty box parallel below the selected function block.

Call: Menu bar: *“FBD/LD/IL”*; context menu.

Requirements: A box is selected in the LD editor.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Jump'

Symbol , shortcut: *[Ctrl]+[L]*

Function: This command inserts a jump element before the selected element.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A connecting line is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.7 “FBD/LD/IL element 'Jump'” on page 506*

Command 'Insert Label'

Symbol:

Function: This command inserts a jump label into the currently selected network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A network is selected. No jump label is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.6 “FBD/LD/IL element 'Label'” on page 506*

Command 'Insert Return'

Symbol: RET

Function: This command inserts an element *“Return”* in the selected place.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD, LD or IL editor is active. A box output is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.8 “FBD/LD/IL element 'Return'” on page 506*

Command 'Insert Input'

Symbol: , shortcut: *[Ctrl]+[Q]*

Function: This command adds a further input to an extendable box (ADD, OR, ADD, MUL, SEL) above the selected input.

Call: *“FBD/LD/IL”* menu

Requirements: The FBD or LD editor is active. An input of a box is selected.

If a box is selected, the command *“Append Input”* is available in the context menu. The input is inserted at the lower end of the box.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Coil'

Symbol: , shortcut: *[Ctrl]* + *[A]*

Function: This command inserts a coil into the network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The LD editor is active. A network, a coil or a connecting line is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.12 “LD element 'Coil'” on page 508*

Command 'Insert Set Coil'

Symbol:

Function: This command inserts a set coil into the network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The LD editor is active. A network, a coil or a line is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Reset Coil'

Symbol:

Function: This command inserts a reset coil into the network.

Call: Main menu *“FBD, LD, IL”*, context menu

Requirements: The LD editor is active. A network, a coil or a line is selected, but no box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.12 “LD element 'Coil'” on page 508*
- *“Ladder diagram (LD)” on page 235*

Command 'Insert Contact'

Symbol , shortcut: *[Ctrl]* + *[K]*

Function: This command inserts a contact to the left of the selected element.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The LD editor is active. A line or a contact is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Insert Contact (Right)'

Symbol: , shortcut: *[Ctrl] + [D]*

Function: This command inserts a contact to the right of the selected element.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The LD editor is active. A line, a contact or a box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Insert Contact in Parallel (Below)'

Symbol: ; keyboard shortcut: *[Ctrl]+[R]*

Function: This command inserts a contact with lines in parallel with and below the selected element.

Call: Menu bar: *“FBD/LD/IL”*; context menu.

Requirements: The LD editor is active. A line or a contact or a box is selected.

> *You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for "Closed branches".*

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

- *Chapter 1.4.1.19.1.5.4.14 “Closed branch” on page 509*

Command 'Insert Contact in Parallel (Above)'

Symbol: ; keyboard shortcut: *[Ctrl]+[P]*

Function: This command inserts a contact with lines in parallel with and above the selected element.

Call: Menu bar: *“FBD/LD/IL”*; context menu.

Requirements: The LD editor is active. A line, a contact or a box is selected.

> *You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for "Closed branches".*

See also

- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

- *Chapter 1.4.1.19.1.5.4.14 “Closed branch” on page 509*

Command 'Toggle Parallel Mode'

Function: This command toggles a parallel branch between an OR construct and the Short Circuit Evaluation (SCE) .

Call: Menu bar: *“FBD/LD/IL”*; context menu.

Requirements: The LD editor is active. A vertical line of a parallel branch is selected.

> *You can program closed parallel branches in a LD network as short circuit evaluation (SCE) or OR constructs. SCE branches are displayed with double vertical lines, and OR branches with single lines. Refer to the help page for "Closed branches".*

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.14 “Closed branch” on page 509*

Command 'Insert Negated Contact'

Symbol: , shortcut: *[Ctrl]* + *[K]*

Function: This command inserts a negated contact to the left of the selected element.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The LD editor is active. A line or a contact is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Insert Negated Contact Parallel (Below)'

Symbol:

Function: The command inserts a negated contact with lines in parallel with and below the selected element.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The LD editor is active. A line, a contact or a box is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.8.3.1.2 “Programming ladder diagrams (LD)” on page 239*

Command 'Paste Contacts: Paste Below'

Shortcut: *[Ctrl] + [F]*

Function: This command inserts a previously copied contact with lines below the selected element.

Call: Main menu *“FBD/LD/IL ➔ Paste”*, context menu

Requirements: the LD editor is active.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Paste Contacts: Paste Above'

Shortcut: *[Ctrl] + [F]*

Function: This command inserts a previously copied contact with lines above the selected element.

Call: Main menu *“FBD/LD/IL ➔ Paste Contacts”*, context menu

Requirements: the LD editor is active. A line or a contact is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Paste Contacts: Paste Right (After)'

Shortcut: *[Ctrl] + [G]*

Function: this command inserts a previously copied contact to the right of the selected element.

Call: Main menu *“FBD/LD/IL ➔ Paste Contacts”*, context menu

Requirements: The LD editor is active. A line or a contact is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.11 “LD element 'Contact'” on page 507*

Command 'Insert IL Line Below'

Symbol: 

Function: The command inserts an instruction line below the selected line.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The IL editor is active. A line is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Delete IL Line'

Symbol:  , shortcut: *[Ctrl]+[Del]*

Function: This command deletes the selected instruction line.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The IL editor is active. A line is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Negation'

Symbol: , shortcut: *[Ctrl]* + *[N]*

Function: This command negates the following elements:

- Input/output of a box
- Jump
- Return
- Coil

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: the FBD or LD editor is active. The corresponding element is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Edge Detection'

Symbol FBD: , symbol LD: , shortcut: *[Ctrl]* + *[N]*

Function: This command inserts an edge detector before the selected box input or box output.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. A box input or box output is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Set/Reset'

Symbol: , shortcut *[Ctrl]* + *[M]*

Function: In the case of an element with a boolean output, this command switches between reset, set and no mark.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. An element with a boolean output is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Set Output Connection'

Symbol: , shortcut *[Ctrl]*+ *[W]*

Function: This command turns the selected box output into the forwarding box output.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. One of several box outputs is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Branch'

Symbol: , shortcut *[Ctrl]* + *[Shift]* + *[V]*

Function: This command creates an open line branch on the selected line.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. An input or an output of a box is selected.

See also

- *Chapter 1.4.1.19.1.5.4.9 “FBD/LD/IL element 'Branch'” on page 506*
- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Insert Branch Above'

Symbol:

Function: This command inserts a line branch above the selected open line branch.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. An open line branch is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.9 “FBD/LD/IL element 'Branch'” on page 506*

Command 'Insert Branch Below'

Symbol:

Function: This command inserts a line branch below the selected open line branch.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The FBD or LD editor is active. An open line branch is selected.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*
- *Chapter 1.4.1.19.1.5.4.9 “FBD/LD/IL element 'Branch'” on page 506*

Command 'Set Branch Start Point'

Symbol

Function: This command sets the starting point of a line branch on the selected line.

Call: Main menu *“FBD/LD/IL”*, context menu

Requirements: The LD editor is active. A line is selected.

See also

- *Chapter 1.4.1.19.1.5.4.14 “Closed branch” on page 509*
- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Set Branch End Point'

Symbol 

Function: This command sets the end point of a line branch on the selected line.

Call: Main menu *"FBD/LD/IL"*, context menu

Requirements: The LD editor is active. A line is selected. A starting point of the line branch has been set.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*
- *Chapter 1.4.1.19.1.5.4.14 "Closed branch" on page 509*

Command 'Update Parameters'

Function: This command enters changes to the declaration of the selected element in the diagram.

Call: Main menu *"FBD/LD/IL"*, context menu

Requirements: The FBD, LD or CFC editor is active. A box is selected. An extending change has been made to the declaration.

The command checks whether a box and its declaration in the declaration editor correspond. The change is accepted for the box only if the declaration was extended. Deletions and overwrites are not updated.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*

Command 'Remove Unused FB Call Parameters'

Symbol: 

Function: This command deletes inputs and outputs of the selected box to which no variable and no value were assigned. However, the default inputs and outputs are always retained.

Call: Main menu *"FBD/LD/IL"*, context menu

Requirements: The FBD or LD editor is active. A box is selected. The box has interfaces to which no value is assigned.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*

Command 'Repair POU'

Symbol: 

Function: This command repairs internal inconsistencies in the selected box.

Call: Main menu *"FBD/LD/IL"*, context menu

Requirements: The FBD or LD editor is active. The defective box is selected. The editor has found internal inconsistencies in the programming module that can possibly be resolved automatically. CODESYS reports the inconsistencies in the Message window.

This situation is conceivable when editing a project that was created with an older programming system version that did not yet handle the inconsistency concerned as an error.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*

Command 'View as Function Block Diagram'

CAUTION!
Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: *[Ctrl] + [1]*

Function: This command converts the active instruction list or the active ladder diagram into the function block diagram.

Call: Menu *"FBD/LD/IL ➔ View"*

Requirements: The LD or IL editor is active.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*

Command 'View as Ladder Logic'

CAUTION!
Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: *[Ctrl] + [2]*

Function: This command converts the current function block code or the active instruction list into a ladder diagram.

Call: Menu *"FBD/LD/IL ➔ View"*

Requirements: The FBD or IL editor is active.

See also

- *Chapter 1.4.1.19.1.5.1 "FBD/LD/IL Editor" on page 495*

Command 'View as Instruction List'

If necessary, IL can be activated in the CODESYS options.

CAUTION!
Loss of data! An error-free conversion requires syntactically correct code. Otherwise parts of the implementation can be lost.

Shortcut: *[Ctrl] + [3]*

Function: This command converts the active function block code or the active ladder diagram into an instruction list.

Call: Menu *"FBD/LD/IL ➔ View"*

Requirements: The LD or FBD editor is active.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Command 'Go to'

Symbol:

Function: This command allows you to jump to any network.

Call: Main menu *“FBD/LD/IL”*

Requirements: The LD, FBD or IL editor is active. A network is selected.

This command opens a dialog box with an input field. Enter the number of the desired network in the input field.

See also

- *Chapter 1.4.1.19.1.5.1 “FBD/LD/IL Editor” on page 495*

Menu 'Library'

Command 'Add Library'

Function: The command opens the *“Add Library”* dialog. In this dialog, you can add libraries to the Library Manager and then integrate them in your application.

Call: Menu bar: *“Libraries”*

Requirement: The Library Manager is open in the editor.

Dialog 'Add Library'

In the line above the library list, you can search for library names or library modules by typing an appropriate string.	
“Library”	Suitable libraries that are installed in the library repository. For example, the selection of libraries is defined in the device description or by the system integrator. By default, the displayed libraries are grouped into categories.
“Company”	Vendor of the library
“Advanced”	Opens the advanced *“Add Library”* dialog
	The displayed libraries are grouped into categories.
	The displayed libraries are listed in alphabetical order.
	All available libraries are displayed.

Specific libraries can be blacklisted in a device description. These libraries cannot be added below this device in the Library Manager.

See also

- *Chapter 1.4.1.20.3.8.5 “Command 'Library Repository'” on page 1061*

Dialog 'Add Library' – 'Advanced'

You should use this dialog only if you have expert knowledge of library referencing. Using this dialog, you can link special versions or change placeholder definitions.

> *We recommend seriously that you follow the guidelines for the creation of libraries when developing and referencing libraries.*

Table 161: Tab 'Library'

“Company”	Filtering the list according to vendor
“Group by category”	☑: Display of the libraries in a tree structure grouped in categories. ☐: Display of the libraries in alphabetical order in a flat structure.
“Display all versions”	☑: Display of all versions of the libraries. Version specification '*' means the latest version available in the repository. ☐: Display of the latest versions of the libraries only. A multiple selection of libraries is possible in this display. To do this, hold down the *[Shift]* key and select the entries.
“Details”	Opens a detailed view with the library modules.
“Library Repository”	Opens the *“Library Repository”* dialog. There you can install more libraries to your local system.

Table 162: Tab 'Placeholder'

“Placeholder name”	The input field provides a combo box for entering the valid placeholder names that are read from the currently accessible device descriptions. You can also enter a new placeholder name in order to define a free placeholder, which is not resolved by the device or by the library profile.
“Default library”	CODESYS uses this library when for any reason no device is available that the resolution defines. In this way it is possible to compile the current project without errors.

> ***Note about placeholder resolution***
> *For compiler version V3.5.8.0 and later, the following statement applies in the case of library placeholders with a resolution in the device description that are located in the Library Manager of the POU pool. This placeholder is always resolved automatically according to the description of the device that compiles the application.*

See also

- *Chapter 1.4.1.16.1 “Information for Library Developers” on page 449*
- *Chapter 1.4.1.20.3.14.4 “Command 'Placeholders'” on page 1120*

Command 'Try to Reload Library'

Function: This command tries to reload the selected library.

Call: Main menu *“Library”*.

Requirement: A library is selected that failed to load.

If for any reason a library is not available in the defined repository location when a project is opened, CODESYS displays a corresponding error message. Once you have rectified the error, i.e. when the library is properly available again, you can reload the library with this command without having to leave the project.

See also

- *Chapter 1.4.1.20.3.8.5 “Command 'Library Repository'” on page 1061*

Command 'Properties'

Function: The command opens the *“Properties”* dialog for the library selected in the Library Manager.

Call

- Menu bar: *“Library”*
- Context menu of the selected library
- Symbol in the toolbar of the Library Manager

Requirement: A library is selected.

NOTICE!
This dialog is intended for library developers. Use this only if you have profound knowledge of library referencing. In addition, follow the guidelines for library developers.

See also

- *Chapter 1.4.1.16.1 “Information for Library Developers” on page 449*

Dialog 'Properties'

Table 163: “General”

“Namespace”	Namespace of the selected library. By default, this is identical to the library name, unless it was defined explicitly in the project information when the library was created. You can change the namespace for the open project. Example: `LA`
“Default”:	Library that triggers the placeholder when no other trigger is defined or is possible. Requirement: The selected library is a library placeholder, and therefore the setting is available. Note: For compiler version 3.5.8.0 and higher, the following statement applies in the case of library placeholders with a resolution in the device description that are located in the Library Manager of the *“POUs”* view. This placeholder is always resolved automatically according to the description of the device that compiles the application.

If the selected library is developed in compliance with the "Guidelines for Developing Libraries", then we do not recommend that you change the following settings.

Table 164: “Version”

Selection of version constraint Requirement: The settings are available only if the selected library is **not** a library placeholder. Note: Container and interface libraries are created automatically with library references with version constraint. As far as possible, do not create libraries that include library references with version constraint. Otherwise, you reference the libraries by placeholders. Edit a placeholder resolution in the *“Placeholders”* dialog.	
“Exact version”	: (selected from list box) Version is integrated into the project. Note: This option is strongly recommended for container libraries, and it is usually preset for this library type.
“Always newest version”	: The library repository is scanned and the latest detected version is integrated. Note: If a newer library version is available, then the library POUs that are actually used can change. This option is strongly recommended for interface libraries, and it is usually preset for this library type.

Table 165: “Visibility”

“Allow only qualified access to all identifiers”	: Library POUs (and variables) are called in the project only with prepended namespace paths.
“When the current project is referenced as a library in another project ”	Note: Changing the following settings makes sense only if you created a library with your project and therefore opened a library project. In this way, the selected library is referenced in the new library.
“Make visible all IEC symbols in the project if is this reference were directly integrated here.”	: As a container library, the selected library makes the contents of the referenced library visible at the top level (later in a project). Requirement: A container project is created with a library project. A container library does not implement its own POUs, but references other libraries exclusively. It bundles libraries. A container library can be employed sensibly to bundle multiple libraries (in a reference) in a project. This option **must** be activated for each library reference. Symbolic access to library POUs: `<namespace of container library>.<POU name>` : The contents of the referenced library is accessed uniquely by means of the namespace. The path name consists of the library name and the unique name (library reference), and it is prepended to the POU name. Requirement: **No** container project is created with a library project.
“Do not show this reference in the dependency tree.”	: The selected library is not displayed in the Library Manager as a library reference (later in a project). The library is a hidden reference. Warning: If there are compile errors resulting from hidden library errors, then detecting the errors may be difficult. : The selected library is displayed as a library reference (later in a project).

“Optional (if the library is missing, no error will be reported).”	: The selected library is treated as optional. When downloading the project that references the library, no error is reported, even if the library is **not** available in the library repository.

See also

- *Chapter 1.4.1.20.3.14.4 “Command 'Placeholders'” on page 1120*

Command 'Placeholders'

Function: This command opens the *"Placeholders"* dialog box. The dialog shows information on the currently selected placeholder library and allows to assign a project-specific resolution.

Call:

- Menu *"Libraries"*
- Symbol in the symbol bar in the upper part of the Library Manager window.

Requirement: A placeholder library is selected in the Library Manager.

A placeholder library, which is included in the *"Devices"* view, will be resolved as follows:

- If you have assigned a specific resolution to the placeholder library via the dialog *"Placeholder"*, this will be applied.
- If no specific resolution is defined, it will be checked, whether there is one specified in the device description of the application..
- Afterwards the library profile will be checked for a resolution definition.
- The result is displayed in the Library Manager below the *"Effective Version"*.

A placeholder library, which is included in the *"POUs"* view, gets resolved as follows:

- A specific resolution defined in the dialog *"Placeholder"* will be **ignored**.
- For the application it will be checked whether there is a resolution defined in the device description.
- Afterwards the library profile will be checked.
- The result is displayed in the tooltip of the symbol .

- *Chapter 1.4.1.16 "Using Libraries" on page 448*
- *Chapter 1.4.1.20.2.14 "Object 'Library Manager'" on page 874*
- *Chapter 1.4.1.16.1 "Information for Library Developers" on page 449*

Dialog box 'Placeholders'

"Name"	Name of the placeholder.
"Library"	Current resolution, valid for the project Double-click on the entry in order to edit the placeholder resolution. A selection list with the available library versions appears. Additionally the command *"Other Library"* is available.
Command *"Other Library"*	The command opens the dialog box *"Bibliothek durchsuchen"* for searching and installing libraries. Choose this command, if you do not want to redirect to another version, but on a specific libray.
"Info"	Type of placeholder resolution: ● Resolved by device description ● Resolved by library profile ● Resolved by <specific library>

Command 'Export Library'

Function: This command is used for saving the library file to the hard disk.

Call: Context menu of the Library Manager

Requirement: A library is selected in the Library Manager.

The command opens the standard dialog for saving a file in the local file system. The library file can have the file type `Library files (*.library)`, `Compiled library files (*.compiled-library)`, or `Compiled library files (*.compiled-library-v3)`.

See also

- *Chapter 1.4.1.20.2.14 “Object 'Library Manager'” on page 874*
- *Chapter 1.4.1.16.4 “Exporting library files” on page 451*

Menu 'Image Pool'

Command 'Insert Image'

Symbol: 

Function: This command inserts a new line into an image pool.

Call: Main menu *“Imagepool”*, or right-click.

Requirements: An image pool is active and a line is selected in the image pool.

See also

- *Chapter 1.4.1.20.2.13 “Object 'Image Pool'” on page 873*

Menu 'Declarations'

Command 'Insert'

Symbol 

Function: This command inserts a new line for a variable declaration in the declaration editor and the input field for the variable name opens.

Call: Context menu in the tabular declaration editor; button in the declaration heading.

To edit the other fields of the declaration lines, double-click the fields and select the data from the drop-down lists or by means of the respective dialogs.

See also

- *Chapter 1.4.1.8.2.1 “Using the declaration editor” on page 226*

Command 'Edit Declaration Header'

Function: The command opens the dialog *“Edit Declaration Header”*, which serves in the declaration editor for the configuration of a POU header.

Call: Context menu of the tabular declaration editor

Requirements: The tabular declaration editor is the active editor.

See also

- *“Declaring in the tabular declaration editor” on page 227*

Dialog 'Edit Declaration Header'

Function: The dialog is for configuring the declaration part of a POU.

Call: Click on the header bar of the tabular declaration editor, or context menu in the tabular declaration editor.

"Declaration"	Selection list for changing the POU type ● *"PROGRAM"* ● *"FUNCTION_BLOCK"* – *"EXTENDS"*: Input field for a basic function block – *"IMPLEMENTS"*: Input field for an interface ● *"FUNCTION"* – *"Return type"* Input field with current POU name: you can change the name of the POU
"Automatically adapt all references on rename"	☑: Dialog box *"Refactoring"* opens. ☐: Renaming is only effective in the declaration header of the POU.
"Attributes"	The dialog box *"Attribute "* opens for the input of attributes and pragmas.

See also

- *Chapter 1.4.1.8.2.1 "Using the declaration editor" on page 226*
- *Chapter 1.4.1.19.6 "Pragmas" on page 683*
- *Chapter 1.4.1.8.15 "Refactoring" on page 289*

Command 'Move Down'

Symbol: 

Function: This command shifts a variable declaration downwards by one row.

Call: Context menu

Requirement: A row with a variable declaration is selected in the tabular declaration editor.

See also

- *Chapter 1.4.1.8.2.1 "Using the declaration editor" on page 226*

Command 'Move Up'

Symbol: 

Function: This command shifts a variable declaration upwards by one row.

Call: Context menu

Requirement: A row with a variable declaration is selected in the tabular declaration editor.

See also

- *Chapter 1.4.1.8.2.1 "Using the declaration editor" on page 226*

Menu 'Declarations' (Persistence)

Command 'Reorder List and Clean Gaps'

Function: This command cleans the gaps that can result when you make changes to the declaration of persistent variables. The memory requirement is reduced by this cleaning. When the command is executed, CODESYS displays a warning informing the user about the possible loss of data.

Call: Main menu *“Declarations”*, context menu

Requirement: The persistence editor (persistent variable list) is active.

Before cleaning you should consider saving the current values of the persistent variables to a recipe (command *“Save Current Values to Recipe”*). Then you can load the values to the controller again after the next download.

See also

- *Chapter 1.4.1.8.19 “Data Persistence” on page 301*
- *Chapter 1.4.1.20.3.17.3 “Command 'Restore Values from Recipe'” on page 1123*
- *Chapter 1.4.1.20.3.17.2 “Command 'Save Current Values to Recipe'” on page 1123*

Command 'Save Current Values to Recipe'

Function: This command creates a new recipe definition in the recipe manager and stores the current values of the persistent variables in it. You should execute this command before the command *“Reorder List and Clear Gaps”* in order to avoid a possible loss of data. You can subsequently restore the data with the command *“Restore Values from Recipe”*.

Call: Main menu *“Deklarationen”*

Requirement: The application is in online mode and the persistence editor (persistent variable list) is active.

If a list already exists in the recipe manager with the corresponding names when saving a persistent variable list, then the current persistent variables are sorted into the list:

- *New persistent variables are added to the list*
- *Variables, that are not in the list, will be deleted*

Therefore, it is possible to add more recipes to the list in the recipe manager and these will be retained . However, if new variables are added to the list, then these are deleted the next time the command “Save Current Values to Recipe” is executed.

See also

- *Chapter 1.4.1.8.19 “Data Persistence” on page 301*
- *Chapter 1.4.1.20.3.17.1 “Command 'Reorder List and Clean Gaps'” on page 1123*
- *Chapter 1.4.1.20.3.17.3 “Command 'Restore Values from Recipe'” on page 1123*
- *Chapter 1.4.1.20.2.12 “Object 'Persistent variable list'” on page 872*

Command 'Restore Values from Recipe'

Function: This command restores the values of the persistent variables that you have stored in a recipe using the command *“Save Current Values to Recipe”*. You would normally select this command after executing the command *“Reorder List and Clear Gaps”*.

Call: Main menu *“Declarations”*

Requirement: The persistence editor (persistent variable list) is active, the application is in online mode

See also

- *Chapter 1.4.1.8.19 “Data Persistence” on page 301*
- *Chapter 1.4.1.20.3.17.2 “Command 'Save Current Values to Recipe'” on page 1123*
- *Chapter 1.4.1.20.3.17.1 “Command 'Reorder List and Clean Gaps'” on page 1123*
- *Chapter 1.4.1.20.2.12 “Object 'Persistent variable list'” on page 872*
- *Chapter 1.4.1.20.3.17.2 “Command 'Save Current Values to Recipe'” on page 1123*

Command 'Add all instance paths'

Function:

- When you execute the command in the persistence editor, the application is searched for declarations of persistent variables with the `PERSISTENT` keyword which are outside of the persistence editor. For each declaration found, an instance path of this variable is added in the persistence editor.
- When you execute the command in a variable configuration, an instance path is added for each variable with an incomplete address. All function blocks of the application are considered in this case.

Call: Menu bar: *“Declarations”*, right-click.

Requirement

- the persistence editor (global persistent variable list) is active or a variable configuration (global variable list with `VAR_CONFIG` declarations) is opened.
- The application was compiled successfully.

See also

- *Chapter 1.4.1.19.2.12 “Persistent Variable - PERSISTENT” on page 535*
- *Chapter 1.4.1.19.2.13 “Retain Variable - RETAIN” on page 537*

Menu 'Device Communication', Gateway

Command 'Add New Gateway'

Function: This command opens the *“Gateway”* dialog where you can define a gateway channel and add it to the current device configuration.

Call: Menu bar: *“Gateway”* in the *“Communication Settings”* dialog of the device editor.

Dialog 'Gateway'

“Name”	Name of the gateway.
“Driver”	Driver type from a drop-down list.
Driver-specific settings, for example: IP address, port	Editable after double-clicking the predefined value. A short description for each parameter is displayed in the lower part of the dialog. Note: You can also specify the address of a DNS domain. This has to begin with `dns:` (example: `dns:MyDynDNSAdress`).

The dialog is also used for later editing of the gateway entries of your project.

See also

- *Chapter 1.4.1.20.2.8.2 “Tab 'Communication Settings'” on page 840*

Command 'Configure the Local Gateway'

Function: The command opens the *“Gateway Configuration”* dialog where you can configure the block drivers for the local gateway. This is an alternative to manually editing the configuration file `Gateway.cfg`.

Call: Context menu when a gateway entry is selected in the device editor in the *“Communication Settings”* dialog.

> **NOTICE!**
> A correct configuration of the gateway requires detailed knowledge. In case you have any doubts, do not change the default configuration settings.

Dialog 'Gateway Configuration'

The configuration tree displayed in the dialog corresponds to the description currently valid configuration file `gateway.cfg`. It displays the parameters with the current settings for the interfaces involved. Changes to the configuration in the dialog, confirmed by clicking *“OK”* result in the direct update of the configuration file.

> *After the gateway configuration file `gateway.cfg` has been changed, the gateway has to be restarted in order for the changes to be applied.*

“Add”	Menu with commands for adding interfaces and settings. The commands are also available in the context menu of the dialog. The selection depends on which entry is selected and which settings have already been added: *“Add Interface”*: Select an interface for communication via the gateway. It is inserted at the top level of the tree. See the table below for the possible block driver interfaces. *“Add Configuration Setting”*: Select a setting for the selected interface. It is inserted below the interface in the tree. To edit the value of the setting, double-click in the *“Setting”* column to open an editing field. See the table below for the possible settings per block driver interface.
“Delete”	Deletes the selected configuration setting
“Up”, *“Down”*	Moves the selected configuration entry one position up or down.

Table 166: Possible block driver interfaces

"COM Port"	Serial port on the device, for example for data exchange according to the RS-232 standard on a COM port intended for this purpose.
	Possible configuration settings: *"Name"*: Symbolic only *"Port"*: Physical serial port which is used for this interface, for example `COM 5` on a Windows computer *"Baudrate"*: `2400`, `4800`, `9600`, `19200`, `38400`, `57600`, `115200` *"Activate auto addressing"*: ☑ (default = ☐) The setting `Local address` is evaluated. Both devices, which communicate via the serial port, will negotiate their addresses independently before they begin exchanging messages. If the addresses of both devices are the same, then they are negotiated again. This setting is useful when the local addresses cannot be set explicitly, for example for physically separated devices. *"Local address"*: Evaluated only when *"Enable auto addressing"* is activated. Default = actual value for port
"Shared Memory":	Shared memory driver
	Possible settings: *"Name"*: Symbolic only *"Forced address"*: Default = -1 (= `no forced address`); example: `42` means that the driver has to use the fixed address defined here and that addresses are assigned freely in the range `0`-`255`. This setting can be useful when more than one shared memory driver is activated in the configuration.
"Ethernet UDP/IP":	Ethernet interface for data exchange according to the "user datagram protocol".
	Possible settings: *"Name"*: Symbolic only *"Port index"*: Port number for the communication. Port indices are in the range `0`–`3`. They are mapped to the following Ethernet port: `1740` to `1743`. *"IP address"*: Default = `127.0.0.1`. This setting can be useful to explicit set an interface when the device has several network interfaces. Example: `127.0.0.1` stands for some local network interface, also known as `localhost`. Every other address (example: `10.27.7.72`) represents a real IP address which has to be available on the device. *"Network mask"*: Default = 255.255.255.0; example: 255.255.252.0. This setting can be useful to explicitly set an interface when there are multiple network interfaces on the device. *"PPP remote address"*: Default = `127.0.0.1`; example: `10.13.42.240`; establishes a logical point-to-point connection between the UDP interface and the node named with the address specified here; has the effect that the UDP interface communicates exclusively with this node and that no broadcasts are sent in the network
"Ethernet TCP/IP":	Ethernet interface for data exchange according to the "Transmission Control Protocol".

	Possible settings: *“Name”*, *“Port”*, *“IP address”*: See Ethernet UDP/IP above. *“Inactivity timeout”*: Default = 0. This setting defines the time span (in seconds) after which the TCP connections are closed when data is no longer exchanged.
“CAN Client”	*“Name”*: Symbolic only A description for the other settings can be found directly in the dialog.
“USB Port”	*“Name”*: Symbolic only A description for the other settings can be found directly in the dialog.

See also:

- *Chapter 1.4.1.20.2.8.2 “Tab 'Communication Settings'” on page 840*

Menu 'Recipes'

Command 'Insert Variable'

Symbol: 

Function: This command inserts a variable into the currently opened recipe definition before the selected position.

Call: Main menu *“Recipes”*.

Requirement: You have opened a recipe definition in the editor and selected the normal view.

CODESYS inserts the default text "NewVariable" in the column *“Variable”*. You must replace this name with the respective variable name. To do this, open the input assistant by clicking  or enter the variable name directly into the table element.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Add a New Recipe'

Symbol: 

Function: This command opens a dialog box for adding a new recipe (new column) to the recipe definition.

Call: Main menu *“Recipes”*.

Requirement: You have opened a recipe definition in the editor.

After choosing the command, a dialog box opens for you to define the name of the new recipe. The dialog box also provides the capability of copying existing recipes into the new recipe.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Remove Recipe'

Symbol: 

Function: This command removes a recipe from the currently opened recipe definition.

Call: Main menu *“Recipes”*.

Requirement: You have selected a field in the recipe column of a recipe definition.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command ‘Load Recipe'

Symbol: 

Function: The command loads a recipe from a file.

Call: Menu bar: *“Recipes”*.

Requirement: You have selected a field in the recipe column of a recipe definition.

This command overwrites the values of the selected recipe of the recipe definition.

If you have selected the option “Recipe Management in the PLC”, please note the following.

If you change recipes in the project by choosing the command “Load Recipe” or “Read Recipe”, then an online change is required when logging in again.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Save Recipe'

Symbol: 

Function: This command saves the variable values of a recipe to a file.

Call: Main menu *“Recipes”*.

Requirement: You have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS saves the values of the selected recipe to a file. You can define the format in the settings for the recipe manager in the tab *“Storage”*.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Read Recipe'

Symbol: 

Function: This command reads the variable values of a recipe from the controller.

Call: Main menu *“Recipes”*.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values of the selected recipe with the read values from the controller.

If you have selected the option “Recipe Management in the PLC”, please note the following.

If you change recipes in the project by choosing the command “Load Recipe” or “Read Recipe”, then an online change is required when logging in again.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3 “Menu Commands” on page 955*

Command 'Write Recipe'

Symbol: 

Function: This command writes the values of a recipe to the variables in the controller.

Call: Main menu *“Recipes”*.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

When you choose this command, CODESYS overwrites the values in the controller with the values of the selected recipe.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Load and Write Recipe'

Symbol: 

Function: This command loads a recipe from a file and writes the values to the variables in the PLC.

Call: Menu bar: *“Recipes”*.

Requirement: The application is in online mode. You have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to write the variable values also to the recipe in the project or only to write them to the PLC. Updating the values in the recipe could require an online change when logging in again.

When you choose this command, CODESYS overwrites the values of the selected recipe of the recipe definition. In addition, these recipe values overwrite the variable values in the PLC.

If you want to overwrite only individual recipe variables with new values, then remove the values for the other variables before loading to the recipe file. Entries without value definitions are not read, and therefore updating leaves these variables unchanged on the PLC and in the project.

For values of the data type REAL/LREAL, the hexadecimal value is also written to the recipe file in some cases. This is necessary so that the exact identical value is restored when converting back. In this case, change the decimal value and delete the hexadecimal value.

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Read and Save Recipe'

Symbol: 

Function: This command reads the variable values of a recipe from the controller and saves them to a file.

Call: Main menu *“Recipes”*.

Requirement: The application is in online mode and you have selected the value of a recipe in the recipe definition.

After choosing the command, you are prompted either to read the variable values to the recipe or only to save them. Updating the values in the recipe could require an online change when logging in again.

The values are saved with the default name for recipe files according to the settings for the recipe manager (tab *“Storage”*).

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Remove Variables'

Symbol 

Function: This command removes the selected variables from a *“Recipe Definition”*.

Call: The command is not in any menu by default. You can add it to a menu by using the dialog box from *“Tools ➔ Customize”* (command category *“Recipe”*).

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- *Chapter 1.4.1.20.3.19 “Menu 'Recipes'” on page 1127*

Command 'Load Recipes from Device'

Symbol: 

Function: This command initiates the synchronization of the recipes from the open recipe definition in the project and the recipes located on the device in the form of recipe files.

Call: Menu bar: *“Recipes”*.

Requirement: The application is in online mode and a recipe definition is open in the editor.

In detail, the synchronization is described as follows:

- The current values for the recipe variables located in the project are overwritten by the values from the recipes on the controller. As a result, there is likely an online change at the next login.
- If recipe variables are defined in the recipe files on the controller, and the recipe variables are missing in the recipe definition of the project, then these variables are ignored when at the time of download. Before that, a message appears for each recipe file regarding the variables in question.
- If recipe variables are missing in the recipe files on the controller, and these recipe variables are included in the recipe definition of the project, then a message appears for each recipe file with the variables in question.
- If more recipes for these variables have been created on the controller, then they are added to the recipe definition in the project.

Command 'Update Structured Variables'

Symbol: 

Function: This command opens the *“Update Structured Variables”* dialog box.

Call: Main menu *“Recipes”*.

In this dialog box, you can update recipe definitions if the declaration of a structured variable or a block has changed. For example, if the dimension of an array is changed, then you can automatically add or remove the entries in the recipe definition.

Table 167: Dialog Box 'Update Structured Variables'

“Remove not existing variables”	☑: Variables are removed from the recipe definition when they no longer exist in the project due to a change to a structured element.
“Update instances of structures and function blocks”	☑: If the declaration of a structure or function block is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.
“Update array dimensions of array instances”	☑: If the dimension of an array is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.
“Update contained global variable lists”	☑: If the declaration of a global variable list is extended and available in the recipe definition with an instance, then the respective variables are added to the recipe definition.
“Update contained programs”	☑: If the declaration of a program is extended and instanced in the recipe definition, then the respective variables are added to the recipe definition.

See also

- *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*

Menu 'Text List'

Command 'Add Language'

Symbol: 

Function: This command adds a further language column to the text list.

Call: Main menu *"Textlist"*, context menu

Requirement: A text list or a global text list is open and active.

In the dialog box *"Enter Language"*, enter a code for the new language, for example *"en-US"*. CODESYS inserts the code as column header.

Command 'Create Global Text List'

Symbol: 

Function: This command creates the global text list in the *"POUs"* view.

Call: *"Visualization"*, context menu.

Requirements: A visualization is open.

See also

- *Chapter 1.4.1.20.2.9 "Object 'GlobalTextList'" on page 871*
- *Chapter 1.4.1.8.8.1 "Managing static text in global text lists" on page 269*

Command 'Export Everything as Text'

Symbol: 

Function: This command exports all the text lists of the project.

Call: Main menu *"Textlist"*, context menu

Requirement

- A text list or a global text list is open and active.
- The visualization does not code the characters of the texts in Unicode.

CODESYS creates a file as plain text in the format `.txt` for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in *"Project ➔ Project Settings ➔ Visualization"*, category *"General"* in *"Text list files"*.

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

Command 'Export All Unicode .txt Text List Files'

Symbol: 

Function: This command exports all the text lists of the project.

Call: Main menu *"Textlist"*, context menu

Requirement

- A text list or a global text list is open and active.
- The visualization codes the characters of the texts in Unicode.
  - The option *"Use Unicode strings"* in the visualization manager is activated.
  - The compiler instruction `VISU_USEWSTRING` in the application is set. Check this by selecting the command *"Properties"* in the context menu of the application. Then select the *"Compile"* tab. `VISU_USEWSTRING` must be entered in the input field for *"Compiler defines"*.

CODESYS creates a file as plain text in the format `.txt` for each text list. The name of the text list becomes the name of the file. The directory into which the files are exported is set in *"Project ➔ Project Settings ➔ Visualization"*, category *"General"* in *"Text list files"*.

A controller can read and use this format. For example, you can copy the file to a controller and, by means of a configuration in the visualization manager, prevent the text lists from being transmitted again when loading the application.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Insert Text'

Symbol: 

Function: This command inserts a new line into the text list above the selected line. An input field under *"Standard"* opens, in which you input the source text.

Call: Main menu *"Textlist ➔ Insert Text"*, context menu

Requirement: A text list, not a *"GlobalTextList"*, is open and active. A field in the table is selected.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Import/Export Text Lists'

Symbol: 

Function: This command exports an active text list, imports a file, or matches a text list with a file. The file has the CSV format. The *"Import/Export"* dialog provides options for this.

Call: Menu bar: *"Text List ➔ Import/Export Text Lists"*; context menu

Requirement: A text list or global text list is active.

Dialog 'Import/ Export'

"Select File for Import"	File that CODESYS reads. ... opens the dialog *"Select Text List File"* for you to select a file.
"Select export file"	File that CODESYS writes to. ... opens the dialog *"Select Text List File"* for you to select a file and directory.

Table 168: “Import/Export Type”

“Import”	Requirement: A file is selected in *“Select file for compare or import”*. The file can contain text list entries for both the global text list and text lists. Global text list ● CODESYS reads the file, compares the text list entries for the same source text, and accepts differences in the translations. CODESYS overwrites any translations in the project. Text lists ● CODESYS reads the file, compares the text list entries for the same ID, and accepts differences in the source text and translations into the project. CODESYS overwrites any text list entries in the project. ● If the file contains a new ID, then the text list entry is imported into the text list of the project and the text list is added.
“Import replacement file”	Requirement: A replacement file is selected in *“Select file for compare or import”*. The replacement file contains replacements for the global text list. CODESYS processes the replacement file row by row and performs the specified replacements in the global text list. The structure of the replacement file is described in the section "Managing static text in a global text list".
“Export”	Requirement: The file that CODESYS writes to is selected in *“Select export file”*. CODESYS exports all texts from all text lists of the current project. All languages available in the project are inserted as columns in the export file. The file can be used for the external translation of the language-dependent texts.
“Export text differences only”	Requirement: An import file is selected for the comparison in *“Select file for compare or export”*, and an export file that CODESYS writes to is selected in *“Select export file”*. CODESYS reads the import file and then uses that information to compare the rows of the active text list. CODESYS ignores the rows that match. If rows differ, then CODESYS writes the row to the export file and, if necessary, copies translations from the text list. CODESYS accepts the translations from the import file and overwrites them if necessary.

- *Chapter 1.4.1.8.8 “Managing text in text lists” on page 266*
- *“Updating the global text list with a replacement file” on page 271*

Command 'Remove Language'

Symbol: 

Function: Removes the selected language column from the text list.

Call: Main menu *“Textlist”*, context menu

Requirement: A text list or a global text list is open and active. A field is selected in the column of the language that you wish to remove.

See also

- *Chapter 1.4.1.8.8 “Managing text in text lists” on page 266*

Command 'Rename Language'

Symbol: 

Function: Opens a dialog for specifying a new name for a language that is displayed in the text list as a column heading.

Call: Menu bar: *"Text List"*; context menu.

Requirement: A text list or global text list is active. A field in the language column to be renamed is selected.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Remove Unused Text List Entries'

Symbol: 

Function: This command checks whether a text list entry in the project is used as static text. If not, CODESYS removes it from the text list.

Call: Main menu *"Textlist"*, context menu

Requirement: The *"GlobalTextList"* is open and active. A field in the table is selected.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Check Visualization Text IDs'

Symbol: 

Function: This command checks whether the ID of a text list entry in the project is correct and reports the result.

Call: Main menu *"Textlist"*, context menu

Requirement: The *"GlobalTextList"* is open and active. A field in the table is selected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Update Visualization Text IDs'

Symbol 

Function: This command updates all inconsistent IDs in a static text list.

Call: Main menu *"Textlist ➔ Paste Text"*, context menu

Requirement: The *"GlobalTextList"* is open and active. A field in the table is selected. The object is write protected.

If CODESYS finds during checking that the global text list and the static texts of the visualizations do not correspond, this could be because the global text list is or was write protected. The requirement for this is that you have set up a user management system in the project.

See also

- *Chapter 1.4.1.8.8 "Managing text in text lists" on page 266*

Command 'Add Text List Support'

Symbol: 

Function: This command adds text list support to the selected DUT object (type: enumeration).

Call: Context menu of a standard DUT object (type: enumeration ).

Text list support allows the localization of the enumeration component identifier and the display of the symbolic component value in a text output of a visualization.

See also

- *Chapter 1.4.1.20.2.6 “Object 'DUT'” on page 835*
- *Chapter 1.4.1.20.3.20.13 “Command 'Remove Text List Support'” on page 1136*

Command 'Remove Text List Support'

Symbol: 

Function: This command removes text list support from the selected enumeration object.

Call: Context menu of an object of an enumeration with text list support ().

Text list support allows the localization of the enumeration component identifier and the display of the symbolic component value in a text output of a visualization.

47293

Menu 'Trace'

Command 'Add Variable'

Function: This command adds a trace variable to the configuration.

Call: Main menu *“Trace”*.

A new variable is displayed in the tree view of the trace configuration. The associated variables configuration appears to the right in *“Variable Settings”*.

See also

- *Chapter 1.4.1.20.4.15.2 “Dialog 'Trace Configuration'” on page 1209*
- *Chapter 1.4.1.12.3.2 “Creating trace configuration” on page 424*

Command 'AutoFit'

Symbol:

Function: This command scales the y-axis of the trace diagram for optimum display of all graphs, making sure that the y-values fit in the visible region of the diagrams. The command works with both single-channel and multi-channel displays.

Call: Menu bar: *“Trace”*; context menu.

Trace in a single-channel display When all trace variables are displayed in one diagram, the trace is in single-channel display.

Trace in a multi-channel display When the trace variables are displayed in multiple diagrams, the trace is in multi-channel display.

See also

- *Chapter 1.4.1.20.4.15.2 “Dialog 'Trace Configuration'” on page 1209*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Compress'

Symbol: 

Function: This command compresses the trace graph by zooming into the displayed time range by a fixed percentage.

Call: Main menu *“Trace”*, or context menu.

See also

- *Chapter 1.4.1.20.3.21.18 “Command 'Stretch'” on page 1146*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Configuration'

Function: This command opens the *“Trace Configuration”* dialog box for enabling the configuration of the data recording.

Call: Main menu *“Trace”*, or context menu.

See also

- *Chapter 1.4.1.20.4.15.2 “Dialog 'Trace Configuration'” on page 1209*
- *“Subdialog 'Variable Settings'” on page 1211*

Command 'Cursor'

Symbol: 

Function: This function

- inserts a trace cursor into the trace diagram when **no** trace cursor is available
- inserts a second trace cursor into the trace diagram when **1** trace cursor is available
- removes the trace cursors when **2** trace cursors are available

Call: Menu bar: *"Trace"*; context menu.

A trace cursor is a small black triangle with a vertical black line running parallel to the y-axis.

Trace diagram without trace cursors

In this mode, you can process the trace diagram with the mouse pointer. The x-value that focuses on with the cursor is displayed in the status bar with normal style. Example: *"Time: 1m23s456ms; Value: 1 "*

Trace diagram with one trace cursor

In the status bar and y-value, CODESYS prints the time that was marked by the trace cursor. Example: *"Time: 1m23s456ms "*

Trace diagram with two trace cursors

In the status bar, CODESYS prints the two times and the time interval that are marked by the two trace cursors. Example: *"Time: 1m23s456ms - Time: 1m24s456ms (Δ 1s) "*.

User input in the trace diagram

If one or two trace cursors are available, then you can move them along the x-axis.

Mouse Input	Symbol	Effect
Drag the triangle of a trace cursor to another position.		While the mouse button is pressed, the cursor can be moved without restriction. The current y-value is always displayed in the status bar. When the mouse button is released, the cursor jumps to the nearest measuring point

Keyboard Shortcuts	Effect
[Left arrow] *[Right arrow]*	CODESYS moves the black trace cursor to the next measuring point.
[Shift]+[Left Arrow] *[Shift]+[Right Arrow]*	CODESYS moves the gray trace cursor to the next measuring point.

See also

- *Chapter 1.4.1.12.3.5 "Navigating into trace data" on page 429*

Command 'Download Trace'

Symbol: 

Function: This command transfers the trace configuration on the controller to the associated application, and starts the data recording. The recorded data is transferred back to the development system. The trace diagram shows the current samples and continues.

Call: Menu bar: *"Trace"*; context menu.

Requirement: The command is available when the assigned application is in online mode.

See also

- *Chapter 1.4.1.12.3.3 "Operating the data recording" on page 427*

Command 'Export Symbolic Trace Config'

Function: This command exports a trace configuration to a `traceconfig` file.

Call: Main menu *“Trace”*, or context menu.

Requirement: The origin application includes a symbol configuration that defines the configured trace variables as symbols. Access to the IEC variables where data was recorded is therefore symbolic. Then you can use the trace configuration for various similar applications.

Using the configuration file

You can transfer this file to any runtime system. At runtime, its `CmpTraceMgr` runtime system component can access and perform data recording. The configuration file also includes information about the application context in addition to the configuration data.

The configuration file defines the following context:

- Application name
- Trace name
- Task name

The application that is executed at runtime must fulfill the following conditions:

- The application has the same name as the origin application.
- The trace that is configured in the application has the same as the trace that is configured in the origin application
- The task that is running in the data recording has the same name as the task that is configured in the origin application.

NOTICE!
The configuration is not loaded automatically. You must execute the command explicitly.

You can proceed as follows:

– Access the trace manager programmatically via IEC code by using library interfaces.
– Register the configuration file with the trace manager. Then the trace manager loads the configuration file when the application is started.

For more information about the functionality of the trace manager, refer to "Trace Manager Runtime System Component Description".

Sample configuration file

Configuration file `Trace_Trigger.traceconfig`

```

- *Chapter 1.4.1.12.3.6 “Managing trace” on page 430*

Command 'Load Trace'

Function: This command makes it possible to load a file, which contains the configuration and data, and was saved to the file system of the development system. The *“Load Trace”* dialog box opens.

Call: Main menu *“Trace”*, or context menu.

Dialog box *“Load Trace”*

“File name”	Name of the file that is loaded
“File type”	File format ● `*.trace`: *“Trace file”* that includes the trace configuration ● `*.csv`: Text file in CSV format that includes a trace configuration

See also

- *Chapter 1.4.1.20.3.21.15 “Command 'Save Trace'” on page 1145*
- *Chapter 1.4.1.12.3.6 “Managing trace” on page 430*

Command 'Mouse Zooming'

Symbol: (command disabled), (command enabled)

Function: This command enables and disables mouse zooming in the trace diagram.

Call: Menu bar: *“Trace”*; context menu.

User input in the trace diagram

If the command is enabled, then you can stretch a box with the mouse. When you release the mouse button, the display zooms in on the box and the data is enlarged.

See also

- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

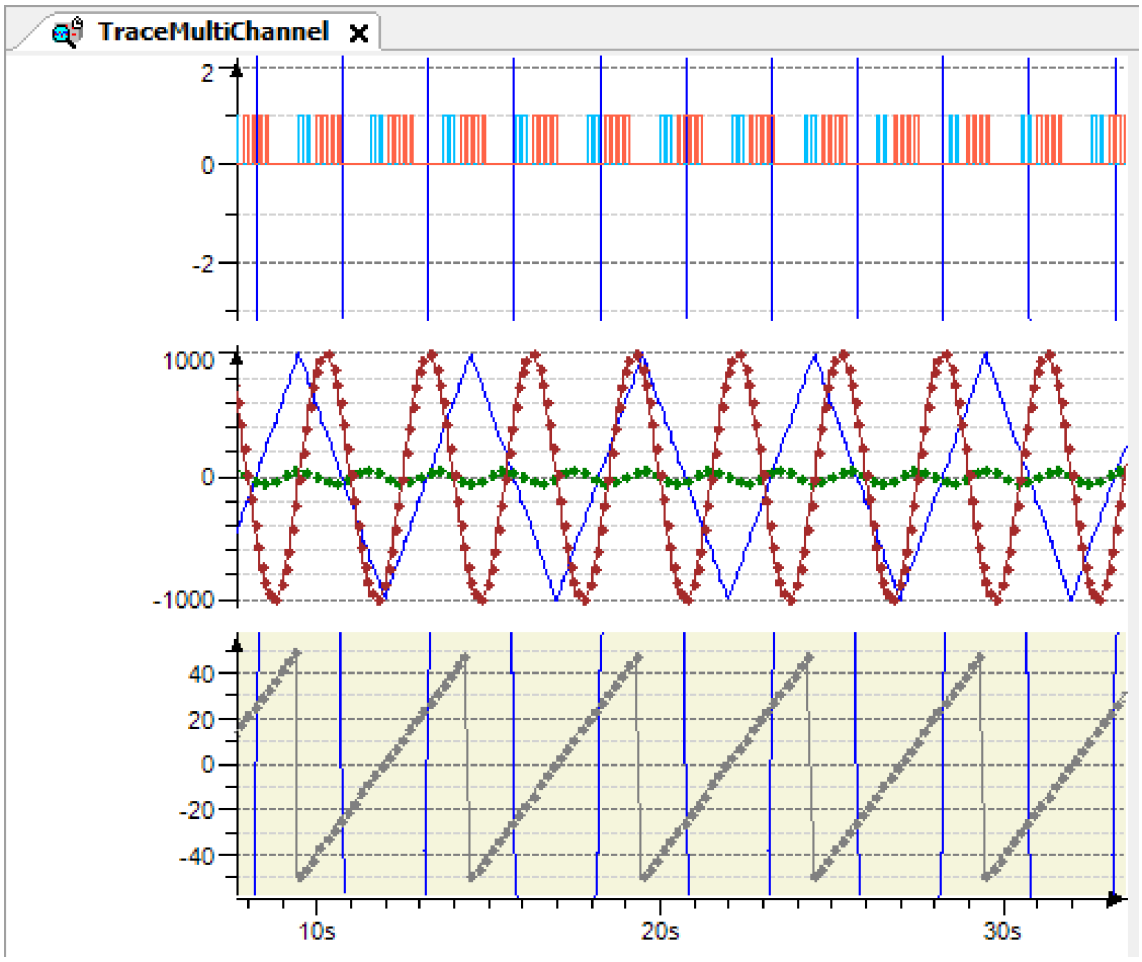
Command 'Convert to Multi-Channel'

Function: This command switches the display in the trace editor from single-channel to multi-channel.

Call: Menu bar: *“Trace”*; context menu.

Multi-channel display

Multi-channel display means that the trace variables are displayed in multiple diagrams.



See also

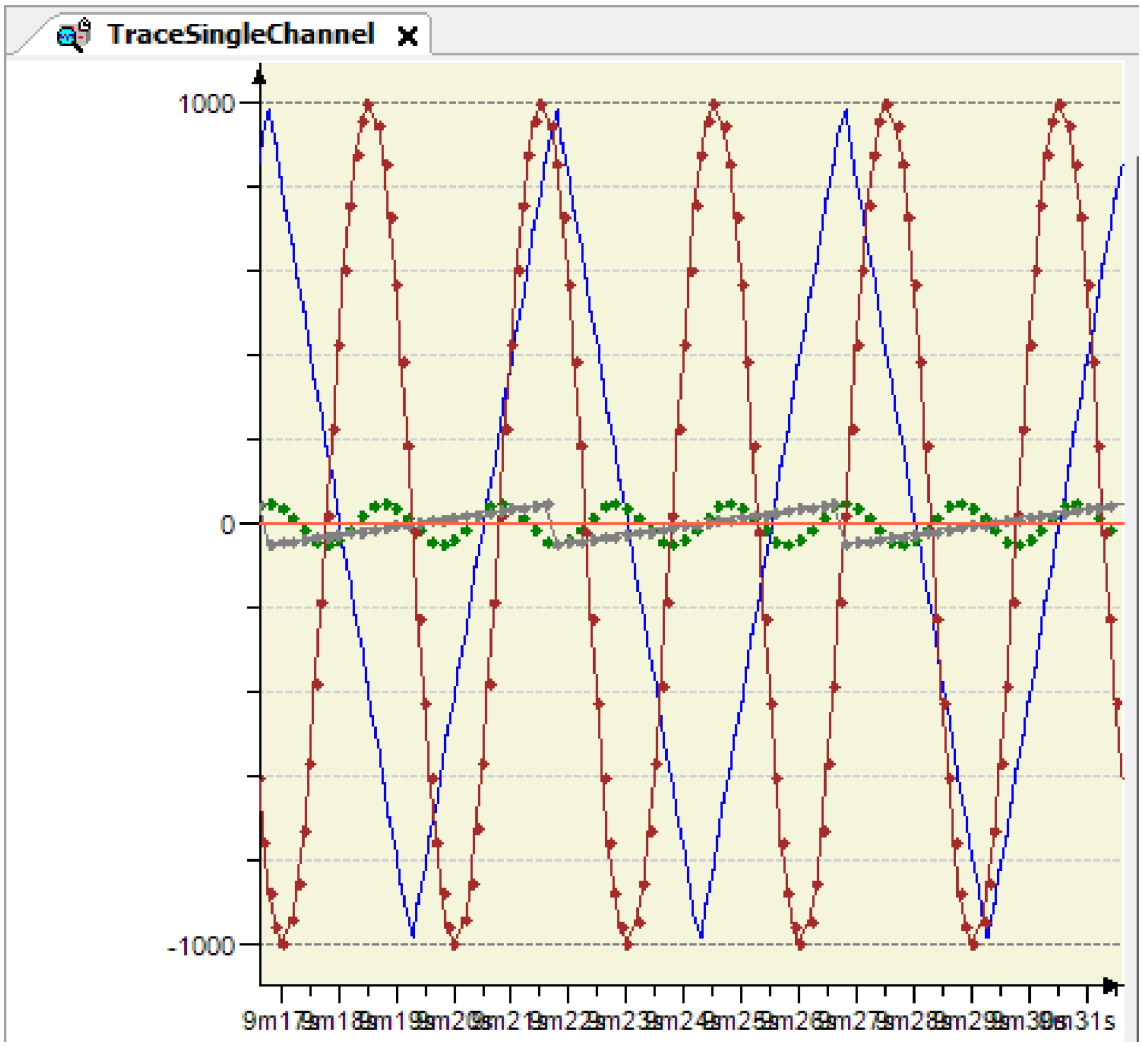
- *Chapter 1.4.1.20.4.15.2 “Dialog 'Trace Configuration'” on page 1209*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Convert to Single-Channel'

Function: This command switches the display in the trace editor from multi-channel to single-channel.

Call: Menu bar: *“Trace”*; context menu.

Single-channel display If a trace is displayed as single-channel, then all trace variables are included in one diagram.



See also

- *Chapter 1.4.1.20.4.15.2 “Dialog 'Trace Configuration'” on page 1209*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Online List'

Function: This command opens the *“Online List”* dialog. If the trace editor of a DeviceTrace object is active, then all traces that are running on the controller are displayed in a tree view. If the trace editor of an application-specific trace object is active, then only this trace is displayed if it is running on the controller.

Call: Menu bar: *“Trace”*; context menu of the trace editor.

Requirement: The runtime system uses the `CmpTraceMgr` components. An application belonging to the device is in online mode.

NOTICE!

Closing the DeviceTrace editor terminates the connection to the controller.

Please note that the connections to the controller is also terminated when the last open *"DeviceTrace"* editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the *"DeviceTrace"* objects.

At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

Dialog 'Online List'

"Delete from runtime"	Stops and removes the selected trace from the running application.
"Upload"	This command is visible when a DeviceTrace is loaded in the trace editor. A DeviceTrace is a trace that runs on the controller: In the device tree, it can be represented with a DeviceTrace object directly below a device. When you execute this command, the trace that is selected in the tree view is loaded from the runtime system into the trace editor. Any existing configuration in the project is overwritten. For example, the device can provide traces for data of the processor load (`cpuload`, `plcload`), which then you can track in the trace editor in CODESYS. An individual *"DeviceTrace"* object is necessary in the device tree for each trace of the device that should be displayed in the project.

See also

- *Chapter 1.4.1.12.3.4 "Accessing All Traces on the Controller" on page 428*

- *Chapter 1.4.1.20.2.28 "Object 'Trace'" on page 945*
- *Chapter 1.4.1.20.3.21.19 " Command 'Upload Trace'" on page 1146*

Command 'Reset Trigger'

Symbol: 

Function: This command resets the trace configuration after a triggered data recording. Then the application can record new data and react to a trigger again.

Call: Main menu *"Trace"*, or context menu.

Requirement: After triggering, the complete data is in the buffer of the development system.

See also

- *Chapter 1.4.1.12.3.3 "Operating the data recording" on page 427*

Command 'Reset View'

Symbol: 

Function: This command resets the trace diagram to the default view.

Call: Main menu *"Trace"*, or context menu.

Requirement: The display in the trace diagram has been changed by zooming, scrolling, or *“AutoFit”*.

See also

- *Chapter 1.4.1.20.3.21.2 “Command 'AutoFit'” on page 1137*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Save Trace'

Function: This command saves the data to a file on the development system. Depending on the file format, the configuration may also be saved. The *“Save Trace”* dialog box opens.

Call: Main menu *“Trace”*, or right-click.

Dialog Box 'Save Trace'

“File name”	Name and location of the trace file
“File type”	File format ● `*.trace`: *“Trace file”* contains the data and configuration. You can run the *“Load Trace”* command to load the file to the trace editor when offline. ● `*.txt`: *“Text file”* contains the recorded data. You can load this file type and edit it with tools that support CSV format. It cannot be loaded to the trace editor when offline because the trace editor cannot read this format. ● `*.trace.csv` *“Trace CSV file (data only)”* contains the recorded data. Address information is provided for each trace variable. The created file can be read in the runtime system. The data is imported but the trace cannot be started because the variable addresses are not saved.

See also

- *Chapter 1.4.1.20.3.21.8 “Command 'Load Trace'” on page 1141*
- *Chapter 1.4.1.12.3.6 “Managing trace” on page 430*

Command 'Start Trace'

Symbol: 

Function: This command starts the data recording on the controller when it is stopped.

Call: Main menu *“Trace”*, or context menu.

Requirement: The assigned application on the runtime system is running and a trace configuration is loaded.

See also

- *Chapter 1.4.1.12.3.3 “Operating the data recording” on page 427*

Command 'Stop Trace'

Symbol: 

Function: This command stops the data recording of a trace.

Call: Main menu *“Trace”*, or context menu.

Requirement: The assigned application on the runtime system is running and executes a trace.

See also

- *Chapter 1.4.1.12.3.3 “Operating the data recording” on page 427*

Command 'Stretch'

Symbol: 

Function: This command stretches the trace graph by zooming out of the displayed time range by a fixed percentage.

Call: Main menu *“Trace”*, or context menu.

See also

- *Chapter 1.4.1.20.3.21.3 “Command 'Compress'” on page 1137*
- *Chapter 1.4.1.12.3.5 “Navigating into trace data” on page 429*

Command 'Upload Trace'

Function: This command establishes the connection to the PLC device, if not already connected. Then it opens the *“Online List”* dialog listing the traces running on the controller. Then the selected trace is loaded to the trace editor by means of the *“Upload”* command in the dialog.

Call: Menu bar: *“Trace”*; context menu of the trace editor.

Requirement: The editor of a *“DeviceTrace”* object is open. The runtime system uses the `CmpTraceMgr` components (trace manager). At least one application in the runtime system in running. The communication settings for the PLC are configured correctly in the CODESYS project.

> **NOTICE!**
>
> **Closing the DeviceTrace editor terminates the connection to the controller.**
>
> Please note that the connections to the controller is also terminated when the last open *“DeviceTrace”* editor is closed. In order for device traces to be displayed again in the project, you have to reload them into the *“DeviceTrace”* objects.
>
> At this time, closing the editor is also the recommended procedure for deliberately terminating the connection to the controller. Logging out is not enough for this.

See also

- *“Dialog 'Online List'” on page 1144*
- *Chapter 1.4.1.20.2.29 “Object 'DeviceTrace'” on page 948*
- *Chapter 1.4.1.12.3.4 “Accessing All Traces on the Controller” on page 428*

Command 'Statistics'

Function: This command opens the *“Trace Statistics”* dialog box, which shows statistics about each trace variable.

Call: Main menu *“Trace”*, or right-click.

Requirement: The trace editor contains samples.

Dialog Box 'Trace Statistics'

The analyzed time range and duration are shown in the caption.

The table contains one line per signal.

“Signal”	Name pf the trace variable (for example, `PLC_PRG.S1`)
“Index”	0-based index of the signal order
“N”	Number of measurements for the calculations
“Min”	Smallest value
“Avg”	Average
“Median”	Middle value when the values are ordered by size
“RMS”	Root mean square
“StdDev”	Standard deviation
“Max”	Largest value
“Integral”	Integral
“Min ⊿t [s]”	Smallest change of time intervals for successive values
“Avg ⊿t [s]”	Average change of time intervals for successive values
“Median ⊿t [s]”	Median change of time intervals for successive values
“StdDev ⊿t [s]”	Standard deviation of change of time intervals for successive values
“Max ⊿t [s]”	Largest change of time intervals for successive values

Click a column head in the table.	CODESYS sorts the table by that column, changing the order from ascending to descending and back. Default: The table is sorted ascending by the *“Index”* column. The signals are then sorted in the same order as in the signal tree.
Click in the line.	The line is selected. You can select or clear other lines by pressing *[Shift]+ [arrow]* up or down.
[Ctrl]+[C]	CODESYS copies the selected lines as text to the clipboard. The values of the individual columns are tab-separated, and the lines are delimited with the control character *[CR]* or *[LF]*. Requirement: At least one line is selected.

See also

- ↳ *Chapter 1.4.1.12.3 “Data Recording with Trace” on page 421*

Other

Command 'Add Watch'

Symbol: 

Function: This command adds the variable of the current location of the cursor to a watchlist for the purpose of online monitoring.

Call: Right-click a variable in an editor when the application is in online mode.

This command adds the variable to the currently opened watchlist. If a watchlist is not open, then the variable is added to the *“Watch 1”* list and that view opens.

See also

- *Chapter 1.4.1.12.1.2 “Using watch lists” on page 416*
- *Chapter 1.4.1.12.1 “Monitoring of Values” on page 409*

Command 'Implement Interfaces'

Function: This command updates the implemented interfaces for a function block.

Call: Context menu of the selected function block (FB) in the device tree.

Requirement: The function block implements an interface that you have modified. For example, an additional method was added to the interface.

In object-oriented programming, if you derive a function block (FB) from a base function block, which implements one or more interfaces, for the purpose of inheritance, then the following applies:

When you execute the “Implement Interfaces” command for the derived FB, all interface methods and interface attributes of the base FB are accepted into the derived FB in the form of stubs (without implementation). Then you are responsible for making sure that an "empty" method/attribute in the derived FB does not conflict with an implemented one in the base FB. The following actions are taken to support you in this case: If there es a base implementation for a method/attribute, then CODESYS adds a pragma attribute {error..} in the first line of the affected derived interface method or interface attribute that will generate the error message. If there is no base implementation for the method/attribute, then there is a pragma attribute entry for a warning. After editing the block, you must remove the error pragma attribute entry explicitly.

See also

- *Chapter 1.4.1.20.2.18.4 “Object 'Interface'” on page 888*
- *Chapter 1.4.1.8.22.2 “Implementing interfaces” on page 312*

Command 'Limit Results to Current Declaration'

Function: When multiple declarations have been found, this command collapses the display in the cross-reference list. It shows only the results for the declaration that you selected explicitly in the list.

Call: Right-click.

Requirement: The cross-reference list is active. Multiple declarations for the searched symbol are listed as cross-references.

See also

- *Chapter 1.4.1.8.13.1 “Using the cross-reference list to find occurrences” on page 285*

1.4.1.20.4 Dialogs

The dialogs of the CODESYS user interface bascally are described on the help pages for the CODESYS menu commands or CODESYS objects. The help book *“Dialogs”* contains only descriptions of dialogs, which

- appear only after multi-step calls after a certain menu command call or within an object editor,
- or which are not placed on a help page for a command or for an object because of their complexity (multiple subdialogs).

Dialog 'Import Assistant'

Function: The dialog allows for the transfer of CODESYS options and package installations from an older CODESYS installation that was found in the local computer.

Call: The dialog opens when a recently installed CODESYS version is started for the first time and an older version is installed on the computer.

“Program settings”	☑: The user-specific CODESYS options are transferred from the older installation to the new installation.
“Packages”	☑: The packages installed with the older CODESYS version are transferred to the Package Manager of the new version. See the list of discovered package installations with the *“Name”*, *“Version”*, and *“Installation date”*.
“Import”	The program settings and/or options are transferred to the current CODESYS version.
“Skip”	The program settings and/or options are not transferred to the current CODESYS version.

See also

- *Chapter 1.4.1.1.1 “Setting CODESYS options” on page 180*

Dialog 'Library Reference Conversion'

Function: The dialog defines how references to libraries that are no longer available are to be handled. Note: The undefined library references can be found in the Global Library Manager located in the *“POUs”* view.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a library which cannot be used anymore in the current CODESYS version.

> *A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.*

Table 169: “What do you want to do?”

“Convert and install the library as well.”	The converter also converts the library file into the new format. It remains referenced in the project. It is installed automatically in the library repository in the "Other" category. If the library does not provide the necessary project information for an installation, then the *“Enter Project Information”* dialog opens for the information to be added.
“Use the following library that has already been installed”	The previously used library is replaced by another library. The *“Browse”* button opens a dialog for selecting from the local library repository.
“Ignore the library. The reference will not appear in the converted project”	The library reference is removed from the project.

“Remember this mapping for all future occurrences of that library reference”	The settings made here in the dialog are also used for future project conversions.

See also

- *Chapter 1.4.1.2.2 “Opening a V2.3 project” on page 187*
- *Chapter 1.4.1.20.3.8.5 “Command 'Library Repository'” on page 1061*

Dialog 'Select Function Block'

Function: The dialog is used for selecting a function block for I/O mapping. The function block should be mapped to the I/O channel selected in the *“<device name> I/O Mapping”* tab or to the object selected in the *“<device name> IEC Objects”* tab.

Call:

- Tab *“<device name> I/O Mapping”*, command button *“Add FB for I/O channel”*
- Tab *“<device name> IEC Objects”*, command button *“Add”*

The dialog provides all function blocks from the active application and the libraries included in the project which fulfill the following:

- The function block has the `{attribute 'io_function_block'}` attribute.
- The function block contains input or output parameters that match the channel type (input, output, data type) and has the `{attribute 'io_function_block_mapping'}` attribute.

When a function block is selected that provides multiple matching parameters, only the first one is mapped automatically to the channel. The others can only be assigned manually in the *“<device name> I/O Mapping”* tab.

After the function block is assigned, the parameter of the function block instance is entered in the *“Variable”* column of the mapping table. Then the path is composed as follows:

`<application name>.<device channel name>_<FB name>_<continuous FB instance number>. <FB parameter name>`

Example: `App1.Out_4_Int_myScale_Output_Int_1.iOutput` for the parameter `iOutput` of the first inserted instance of the function block `myScale_Output`.

“Find”	Input field for searching for function block names
“Type”	Function blocks in the tree structure that match the channel type. Nodes: application, library name(s)
“Documentation”	Shows the available documentation for the library selected in the tree or the library block.

See also

- *Chapter 1.4.1.20.2.8.11 “Tab '<device name> I/O Mapping'” on page 854*
- *Chapter 1.4.1.19.6.2.22 “Attribute 'io_function_block', 'io_function_block_mapping'” on page 707*

Dialog 'Device Conversion'

Function: The dialog defines how references to devices that are no longer available are to be handled.

Call: When opening a CoDeSys V2.3 project in V3, the dialog opens when the converter detects a device reference which cannot be used anymore.

A CoDeSys V2.3 project can be converted into a CODESYS V3 project only if the CODESYS V2.3 Converter package is installed in CODESYS V3. The package is available in the CODESYS Store.

Table 170: “What do you want to do?”

“Use the following device that has already been installed”	CODESYS replaces the previously used device in the device tree with another device. The *“Browse”* button opens a dialog for selecting from the local device repository.
“Ignore the device. All device specific objects will not be available in the new project”	The device entry with all objects inserted below it is removed from the device tree.

“Remember this mapping for all future occurrences of that device”	The settings made here in the dialog are saved in the CODESYS Options, in the *“CODESYS V2.3 Converter”* category. As a result, they are also valid for future project conversions.

See also

- *Chapter 1.4.1.2.2 “Opening a V2.3 project” on page 187*
- *Chapter 1.4.1.20.3.8.8 “Command 'Device Repository'” on page 1067*

Dialog 'Breakpoint Properties'

Function: The dialog is used to display or change the properties of the selected breakpoint in the *“Breakpoints”* view.

Call:

- *"Breakpoints"* view, *"Properties"* button
- *"Breakpoints"* view, *"New"* button, *"New Breakpoint"* command or *"New Data Breakpoint"* command

Requirement: An entry is selected in the list of breakpoints.

The dialog is identical to the *"New Breakpoint"* dialog which is opened in the *"Debug"* menu by means of the respective commands. Therefore, see the description in the help for the *"New Breakpoint"* dialog.

See also

- *Chapter 1.4.1.20.4.8 "Dialog 'New Breakpoint'" on page 1154*

Dialog 'Permissions'

Function: The permissions of user groups are defined here with which they can execute specific actions on specific objects in the project.

Call: Menu bar: *"Project ➔ User Management"*.

Every change made in the dialog is applied immediately.

Actions

All possible actions on objects of the projects are listed in *"Actions"*. The actions are divided into four categories and assignments to all current objects of the project are listed below each action. For each "action->object" assignment, you can define the permission for each existing user group.

Action categories:

"Commands"	Actions regarding the execution of commands
"Users, groups and permissions"	Actions regarding the configuration of user accounts, user groups, and their permissions
"Object types"	Actions regarding the creation of object types
"Project objects"	Actions regarding the viewing, modification, removal, and child-object handling of objects of the project

Actions in detail:

"Execute"	Execute a menu command
"Create"	Create a new object in the project
"Add or remove children"	Add or remove a child object below an existing object
"Modify"	Modify an object in the editor or modification of user, group, and permission settings in the corresponding editor/dialog
"Remove"	Delete or remove an object
"View"	Open the view of an object in the editor

	Possible target of an action. This can be specific objects of the project, or the user, group, and permission configuration.

Permissions

All defined user groups (except the "Owner" group) are listed in *"Permissions"* with a toolbar for configuring the permissions of a group.

Granted	The action, which is selected in the actions view, on the selected target(s) is **granted** for the selected group.
Denied	The action, which is selected in the *"Actions"* view, on the selected target(s) is **denied** for the selected group.
	The permission that executes the actions, which are selected in the *"Actions"* view, on the selected targets has not been defined explicitly. However, the actions are **granted by default**; for example, because the corresponding permissions have been granted to the parent object. Example: The group has the permission for the object "myplc". As a result, it also has the permission by default for the object "myplc.pb_1".
	The action, which is expanded in the actions view, on the selected targets has not been denied explicitly. However, it is denied by default; for example, because it has been denied to the parent object.
No symbol	There are currently multiple actions selected in the Actions view for which the group does not have the same permission.

Toolbar:

"Grant"	The selected action on the selected target object is granted explicitly for the selected group.
"Deny"	The selected action on the selected target object is denied explicitly for the selected group.
"Clear"	The permission for the selected action on the selected target object is reset to the default value for the selected group.

"Export/Import"	Opens a menu with the commands ● *"Export all permissions"* ● *"Export selected permissions"* ● *"Import permissions"*
"Export all permissions"	Exports all actions and their configured access permissions of the current project to a user-specific file of data type `*.perms`. To do this, the *"Export Permissions"* dialog opens for you to specify a file name and to select a location in the file directory. The default file type is `Permissions (*.perms)`.
"Export selected permissions"	Exports all selected actions and their configured access permissions of the current project to a user-specific file of data type `*.perms`. To do this, the *"Export Permissions"* dialog opens for you to specify a file name and to select a location in the file directory. The default file type is `Permissions (*.perms)`.
"Import permissions"	The contents of a `*.perms` file is merged with the actions and permissions of the current project. Groups that are part of the file but not part of the project are ignored. The actions and permissions are aligned by name. To do this, the *"Import Permissions"* opens for you to select the `*.perms` file from the file system.

See also

- *Chapter 1.4.1.5.5 "Protecting Objects in the Project by Access Rights" on page 204*

Dialog Box 'Prepare Value'

Function: This dialog box is used for preparing a value for a forced variable. CODESYS executes the prepared action with the next forcing.

CODESYS opens the dialog box in the following situations:

- When clicking in the field *“Prepared value”* of a forced variable in the declaration section
- When clicking in the inline monitoring field of a forced variable
- When clicking in the field *“Prepared value”* of a forced variable in the monitoring window

“Prepare a new value for the next write or force operation”	Value that CODESYS writes to the variable with the next force operation
“Remove a preparation with a value”	CODESYS deletes the prepared value.
“Release the force, without modifying the value”	CODESYS retains the forced value and ends forcing. CODESYS marks the variable `<Unforce>`.
“Release the force and restore the variable to the value it had before forcing it”	CODESYS resets the forced value and ends forcing. The variable is marked with `<Unforce and restore>`.

See also

- *Chapter 1.4.1.20.3.7.16 “Command 'Force Values'” on page 1053*

Dialog 'New Breakpoint'

Function: In the dialog, you define the settings for a new breakpoint or data breakpoint. It is identical to the *“Breakpoint Properties”* dialog which is used in the *“Breakpoints”* view.

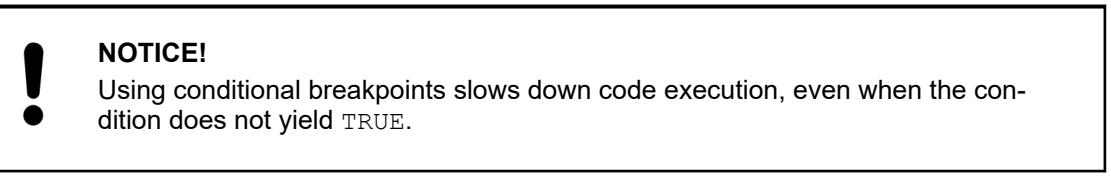
Call:

- *“Debug ➔ New Breakpoint”*
- *“Debug ➔ New Data Breakpoint”*

Requirement: The application is in online mode.

Tab 'Condition'

The dialog defines the requirements for which program processing should halt at a breakpoint.



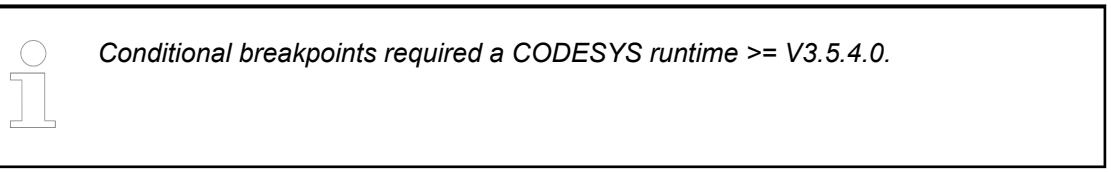


Table 171: “Tasks”

“Break only when the breakpoint is hit in one of the following tasks”	☑: CODESYS evaluates the breakpoint only if it is reached by specific tasks. The required tasks must be activated. For example, you can define a single debug task and also prevent other tasks that use the same block from being affected when debugging.

Table 172: “Hit Count”

“Hit Count”	*“Break always”*: The program always halts at this breakpoint. Alternative: The program halts at the breakpoint when the breakpoint has been hit as often as defined in the following (type in the required hit count or select it from the number list): ● *“Break when the hit count is equal to”* ● *“Break when the hit count is a multiple of ”* ● *“Break when the hit count is greater than or equal to”*

Table 173: “Condition”

“Break, when true”	☑: CODESYS evaluates the specified condition and halts the program at the breakpoint only when the result yields `TRUE`. You can define a condition as a valid Boolean expression. Examples: `x>100`, `x[y]=z`, `a AND b`, `boolVar`.

Tab 'Data' Requirement: This is used for the properties of a data breakpoint.

The function of data breakpoints depends on the target system. Currently, data breakpoints are possible only with the CODESYS Control Win V3.

On the tab, the variable or memory address is specified for which the data breakpoint is set or will be set.	
“Break execution when the value of the variable or address changes”	● Input of a qualified variable name ● …: Selection of a variable in the *“Input Assistant”* dialog, in the *“Watch Variables”* category Examples: variable: `PLC_PRG.fb_DoSth.dwVariable`; address: `16#12A`, `0x12A`, `129`
“Size”	Number of bytes of the specified variable or memory address above which should be monitored for changes. When a new variable or memory address is specified, a value that matches the data type or memory is set automatically at first. Note: The *“Size”* and quantity depend on the target system. For the CODESYS Control Win V3, a maximum of four data breakpoints with a maximum size of 8 bytes can be defined. Example: `4` for data type `DWORD` Example: `2` for data type `DWORD`: Only the two first bytes of the variable are monitored.

Tab 'Execution Point Settings' Here. an existing breakpoint or data breakpoint can be converted into an execution point.

"Execution point (execution does not stop at breakpoint)"	☑: The breakpoint becomes an execution point. Processing does not halt at this point and the given code is executed. ● Execution point of a breakpoint: activated: ●; deactivated: ○ ● Execution point of a data breakpoint: activated: ●; deactivated: ○
"Execute the following code"	Code that is executed when the execution point is reached. Looping structures (For, While) and IF or CASE expressions are not possible.
"Print a message in the device log"	This option is available only when you select the *"Enable logging in breakpoints"* option in *"Project Settings ➔ Compile Options"*. CODESYS can print variables with the placeholder {variable name} in the message text.

Tab 'Location' Requirement: The command *"New breakpoint"* was selected.

"POU"	POU of the active application where the breakpoint is placed.
"Position"	Position of the breakpoint in the POU. Entry as row and column numbers (text editor) or as network or element numbers.
"Instances"	In the case of function blocks, you have to define whether the breakpoint should be set in the implementation or in an instance. ☑ CODESYS sets the breakpoint in the instance. For this option, select *"Instance Path"*. ☐ CODESYS sets the breakpoint in the implementation.

"Enable breakpoint immediately"	☑: The breakpoint is activated. ☐: The breakpoint is not activated. To activate later, click the button in the *"Breakpoints"* view.

- *Chapter 1.4.1.11.2 "Using Breakpoints" on page 395*

Dialog 'Monitoring Range'

Function: This dialog restricts the range of array elements whose values are displayed during monitoring.

Call: Click in the column field *"Data Type"* that belongs to the array variable.

Requirement: A POU is in online mode and is being monitored. In addition, a variable of the POU has the data type *"ARRAY"*.

"Valid range"	The validity range of the array elements that are monitored. Example of a three-dimensional array: `[1..10][-3..3][-10..10]`
"Maximum number of array elements"	Number of elements of the array variables Example: `1470`
When you edit one of the settings *"Start"*, *"End"*, or *"Scroll range of 1000 elements"*, both of the other settings are adapted automatically.	

“Start”	Index of the first array element whose value is displayed.
“End”	Index of the last array element whose value is displayed.
“Scroll range of 1000 elements”	Scrollbar for selecting a range from the set of array elements.

- *Chapter 1.4.1.12.1.1 “Calling of monitoring in programming objects ” on page 410*

Dialog 'Properties'

This dialog box is for the configuration of the properties of an object in CODESYS. In addition, depending on the object, it contains different tabs that each handle a category of properties.

Call: Menu *“View”*, context menu of the object in the *“Devices”*, *“POUs”* or *“Modules”* view.

Dialog Box 'Properties' - 'Common'

Function: This dialog box shows common information about the selected object.

Call: Main menu *“View ➔ Properties”*, or context menu of the object (*“Common”*).

Requirement: An object is selected in the device tree or POUs view.

Table 174

“Name ”	Object name as shown in the device tree or POUs view
“Object type ”	Type of object (for example, POU, application, or interface)
“Open with ”	Type of editor to display or edit the object

Dialog 'Properties' - 'Boot Application'

Function: The settings on this tab define when and how a boot application is created from the application.

Requirement: The device supports the settings.

Call: Select the application object; context menu: *“Properties”*; menu bar: *“View ➔ Properties”*, *“Boot Application”* category

“Create implicit boot application on download”	A boot application is created automatically when downloading the application.
“Create implicit boot application on Online Change”	A boot application is created automatically when for an online change.
“Remind boot application on project close”	Before closing the project, CODESYS prompts to create the boot application.
“Verify boot application after creation”	After the boot application is created, an independent service checks whether or not the boot application has been created correctly.

Regardless of the presets defined here, you are always able to create a boot application explicitly when you login.

See also

- *Chapter 1.4.1.10.6 “Generating boot applications” on page 391*
- *Chapter 1.4.1.20.3.6.6 “Command 'Online Change'” on page 1033*

Dialog 'Properties' - 'Encryption'

Function: The dialog contains the properties of the application for encryption. If the CODESYS Security Agent is installed, then you can start a wizard for the encryption of downloads, online changes, and boot applications.

Call:

- Menu bar: *“View ➔ Properties”*
- Context menu of an application object

Table 175: “Encryption Technology”

If the *“Enforce encryption of downloads, online changes and boot applications”* option is selected in the *“Security Screen”* view in the *“Security level”* group, then the encryption technology is set to *“Encryption with certificates”* and cannot be changed in this dialog.	
“No Encryption”	
“Simple Encryption”	You can download the boot application to the controller only when the defined dongle (license key) is connected to the computer. The dongle is provided by ABB AG or by the respective hardware manufacturer. The firmcode is displayed. Type in the delivered product code.

"Encryption with license management"	You can download the boot application to the controller only after you have specified the product code and firmcode, and the respective dongle is connected to both the development computer and the controller. You receive the codes from the vendor that manages the licenses.
"Encryption with certificates"	You can download the boot application to the controller only when a valid certificate exists for it. The *"Certificates"* group is enabled. See the description below. The option is already selected if the *"Enforce signing of downloads, online changes and boot applications"* option is selected on the *"User"* tab of the *"Security Screen"* view.

Table 176: "Certificates"

Note: If the *"Enforce encryption of downloads, online changes and boot applications"* option is selected in the *"Security Screen"* view in the *"Security level"* group, then the encryption technology is set to *"Encryption with certificates"* and cannot be changed in the *"Properties"* dialog.	
	The *"Certificate Selection"* dialog opens. Here you can select previously installed certificates of devices for which the encryption of download, online change, and boot application is enabled. The list can contain several entries if several devices are authorized to run this application.
"Digitally sign application code"	The application is signed with a digital signature. The certificate for the digital signature is specified in the *"Security Screen"* view on the *"User"* tab.
Area for the display of the selected certificates with corresponding information	Information per certificate: ● *"Issued for"* ● *"Issued by"* ● *"Valid from"* ● *"Valid until"* ● *"Thumbprint"*
"Encryption Wizard"	This button is available only if the CODESYS Security Agent is installed. It starts the wizard with the same name. See the help for CODESYS Security Agent in this case.

Dialog 'Properties' - 'Build'

Symbol: 

Function: The dialog contains options for building (build operation) the object.

Call: Menu bar: *"View* ➔ *Properties"*; context menu of the object in the device tree

Name	Description
"Exclude from build"	☑: This object and recursively its child objects are not considered for the next compile process. The object entry is displayed in green fonts in the *"Devices"* or *"POUs"* view.
"External implementation" *"(Late link in the runtime system) "*	☑: CODESYS does not generate any code for this object when compiling the project. The object is linked as soon as the project is running on the target system, provided it is available there (for example, in a library). The object name is postfixed with `(EXT)` in *"Devices"* or *"POUs"* view.

Name	Description
“Enable system call”	☑: A system call (runtime system) for functions is possible. Background: As opposed to CoDeSys V2.3, the ADR operator in V3 can be used with function names, program names, function block names, and method names. It replaces the INSTANCE_OF operator. BUT: It is not possible to call function pointers from within CODESYS.
“Link always”	☑: The object is marked by the compiler and therefore always included in the compile information. This means that it is always compiled and downloaded to the PLC. Note: The pragma `{attribute 'linkalways'}` can also be used to instruct the compiler to always include an object.
“Compiler defines”	Here you can specify defines or conditions for compiling the object (conditional compile). You can also type in the expression `expr`, which is used in these kinds of pragmas. Multiple entries are possible as a comma-separated list (see `{define}` statements). Example: `hello, test:='1'`
“Additional compiler definitions from the device description”	
“Defined in device”	List of compiler definitions that originate from the device description. These compiler definitions are used in the build if they are not listed in the *“Ignored definitions”* field.
“Ignored definitions”	List of compiler definitions from the device description that are not used in the build.
>	Copies the selected compiler definition from the *“Defined in device”* field to the *“Ignored definitions”* field.
<	Moves the selected compiler definition from the *“Ignored definitions”* field to the *“Defined in device”* field. The compiler definition is used in the build.

See also

- *Chapter 1.4.1.19.6.3 “Conditional Pragmas” on page 732*
- *Chapter 1.4.1.19.6.2.24 “Attribute 'linkalways'” on page 708*

Dialog 'Properties' – 'Build' (C-integration)

Function: In this dialog, you configure the build environment and the necessary data for the integration of the C development environment.

Call: Main menu *“View”*, context menu of the object *“C Code Module”*

Requirement: The object *“C Code Module”* is selected in the device tree.

> **NOTICE!**
> The dialog in this form is valid only for CODESYS Control Win V3 and Visual Studio. For other environments, the dialog can look different or may not even be available at all.

“Visual Studio location”	Installation path of Visual Studio on the hard disk You can also select the path with the input assistant or search for it with the magnifying glass.
“Windows SDK location”	Installation path of Windows SDK on the hard disk You can also select the path with the input assistant or search for it with the magnifying glass.
“Temporary build folder Location”	Path on the hard disk for the temporary build files

See also

- *Chapter 1.4.1.8.10 “Integrating C Modules” on page 275*

Dialog 'Properties' - 'Access Control'

Function: The dialog defines the access rights of user groups for objects.

Call: Main menu *“View ➔ Properties”*, context menu of an object in the view *“Device”* or *“POUs”*.

Requirement: An object is selected in the view *“Device”* or in the view *“POUs”*.

“Groups, actions and permissions”	A table which displays the following user groups access rights on objects: ● *“View”* ● *“Modify”* ● *“Remove”* ● *“Add/remove children”* Perform a double click on the access right symbol to open the drop down list with the available rights.

See also

- *Chapter 1.4.1.5.5 “Protecting Objects in the Project by Access Rights” on page 204*
- *Chapter 1.4.1.20.4.6 “Dialog 'Permissions'” on page 1152*

Dialog 'Properties' - 'External file'

Function: The dialog is used to view and edit the properties of the external file. The properties were defined when the object was created. Changed properties are saved by pressing the *“OK”* button.

Call: Menu bar: *“View ➔ Properties”*; context menu of the object

Requirement: The object of the external file is selected in the *“Devices”* view or the *“POUs”* view.

Table 177

“What do you want to do with the external file?”	
“Remember the link”	The file is available in the project only as long as it exists in the defined file path.

“Remember the link and embed into project”	CODESYS saves an internal copy of the file in the project, as well as the link to the defined file path. The update option selected below applies as long as the external file exists there. Otherwise CODESYS uses the version saved in the project.
“Embed into project”	CODESYS saves only one copy of the file in the project. There is no longer a link to the external file.

Table 178: “When the external file changes, then”

“Reload the file automatically”	If the external file changes, then CODESYS updates the file in the project.
“Prompt whether to reload the file”	If the external file changes, then a dialog prompt opens whether CODESYS should also update the file in the project.
“Do nothing”	The file remains unchanged in the project, even if the external file changes.

Table 179: “Linked File”

Requirement: Either the *“Remember the link”* option or the *“Remember the link and embed into project”* option is selected.	
The following information about the linked file is displayed: *“Name”*, *“Location”*, *“Size”*, *“Changed”*.	
“Display File Properties”	Clicking this button opens the default *“Properties of <file name>”* dialog, which you can also open in the Windows file system by right-clicking the file.

Table 180: “Embedded file”

Requirement: Either the *“Remember the link and embed into project”* option or the *“Embed into project”* option is selected.	
Display of the following information about the embedded file: *“Size”* and *“Changed”*	
“Update the embedded file”	☑: If the external file that was added to the project is changed in the specified file path, then CODESYS updates the embedded file in the project.

See also

- *Chapter 1.4.1.20.2.7 “Object 'External File'” on page 838*

Dialog Box 'Properties' - 'Bitmap'

Function: The dialog is for assigning a bitmap file to the object. The image will be used in the graphic view of the Library Manager and in the Toolbox view of the FBD/LD/IL editor.

Call: Main menu *“View ➔ Properties”*, context menu of the object

Requirement: The object is selected in the view *“Devices”* or in the view *“POUs”*

“Render pixels of this color translparently: ”	The selected color will be displayed transparently.

Dialog 'Properties - Application Build Options'

Function: The dialog includes settings that CODESYS uses for creating a boot application for the controller.

Call: Menu bar: *“View ➔ Properties”*; context menu of an application object

“Download application info”	This feature requires compiler version >=3.5.0.0, runtime version >= 3.5.0.0. The information about the application contents is also downloaded to the PLC. We recommend that you keep this option enabled because it allows for a difference check between the current application and the application on the PLC. This compares the number of blocks, data, and memory locations. To get the information about the differences, click *“Details”* in the *“Applications”* tab of the device editor. This is also in the message view that opens when you are downloading an application to the PLC when it is different from the one already on the PLC.
“Stop parent application in case of exception”	Available for applications with a parent application.
“Dynamic memory settings”	Memory is allocated dynamically for the application, for example when using the operator `__NEW`. In this case, define the *“Maximum size of memory (bytes)”*. Caution: The entire memory is not available for creating objects dynamically. Instead, the system always uses part of it for management information.

- *Chapter 1.4.1.10.6 “Generating boot applications” on page 391*
- *Chapter 1.4.1.20.2.1 “Object 'Application'” on page 819*

Dialog 'Properties' - 'Target memory settings'

Function: The dialog allows for changing the memory settings of the target device.

Call: Menu bar: *“View ➔ Properties”*; context menu of the application

Requirement: The application is selected in the *“Devices”* view.

“Override target memory settings”	☑: The memory settings stored in the device description are overridden by the values specified in *“Input size”*, *“Output size”*, and *“Memory size”*. Note: If the memory settings of the target device are changed, then it is no longer possible to log in to an existing application on the target device, nor is it possible to perform an online change.
“Input size” *“Output size”* *“Memory size”*	Input fields for the memory sizes used to override the values `"memory-layout\\input-size"`, `"memory-layout\\output-size"`, and `"memory-layout\\memory-size"` stored in the device description. Requirement: The *“Override target memory settings”* option is selected.

See also

- *Chapter 1.4.1.20.2.1 “Object 'Application'” on page 819*

Dialog 'Properties' - 'Network Variables'

Symbol:

Function: In this dialog, you define network properties for the variable list that is selected in the device tree. Furthermore, any variables in it that are declared as network variables are also available.

Call: *“Context menu of variable list in device tree ➔ Properties”*, *“Network Variables”* tab

“Network type”	UDP
“Task”	Task of the current application that controls the variables to be sent. CODESYS always sends the variables at the end of a task cycle.
“List identifier”	Used to identify the network variable list. Must be unique
“Pack variables”	The size of the packages (telegrams) that are transmitted depends on the network type. In the case of *“UDP”*, a package is 256 bytes. ☑: CODESYS bundles the variables for sending in packages in order to reduce as much as possible the number of packages to send. In the case of variables of type array or structured data types, this can lead to the splitting of the variables into multiple telegrams. As a result, data inconsistencies are possible within these variables, even if the variable size is smaller than the package size. ☐: CODESYS generates one package per variable.
“Transmit checksum”	☑: A checksum is provided for each variable package. The receiver checks the checksum to make sure that the variable definitions match from the sender and receiver. A package with non-matching checksums is not accepted.
“Acknowledgement”	☑: CODESYS sends an acknowledgement message for each received data package. If the sender does not receive a confirmation before it sends again, then an error is written to the diagnostic structure. Note: For the `NetVarUdp` library version 3.5.7.0 and later, a receiver channel is no longer assigned when confirmed transfer is not selected. In this way, network variable exchange is also possible between two controllers on one hardware device .
“Cyclic transmission”, *“Interval”*	CODESYS sends the variables within the defined interval. Example for time definition: "T#70ms".
“Transmit on change”, *“Minimum gap”*	☑: CODESYS sends the variables only if their values have changed. You can use "minimum gap" to define the least amount of time between two transmissions.
“Transmit on event”, *“Variable”*	☑: CODESYS sends the variables as soon as the defined variable yields `TRUE`.
“Settings”	Protocol-specific settings; possible entries depend on the network library. *“Port”*: Number of the port that CODESYS uses for data exchange with other network units. The *“Default value”* is "1202". You can change the current value in the *“Value”* field at any time. Select the field, press the *[Space Bar]*, and type the value. **Caution**: The other nodes in the network must define the same port. If more than one UDP connection is defined in the project, then the port numbers in all configurations are adapted to this value. *“Broadcast Adr.”*: The *“Default value”* is 255.255.255.255, which means that data exchange will take place with all network units. You can change the current value in the *“Value”*: select the field, press the *[space bar]*, and type the address or address range of a subnetwork (for example, `197.200.100.255` when communication should be with all nodes that have an IP address in the range 197.200.100.x.

Dialog 'Properties' - 'Network Settings'

If the device supports the network functionality, then the current network settings for a GNVL (global network variable list) can be displayed and changed in the *"Properties"* dialog of the object. These are the settings that were used when adding the GNVL in the *"Add Network Variable List (Receiver)"* dialog.

See also

- *"Dialog Box 'Add Network Variable List (Receiver)'" on page 880*

Dialog 'Properties' - 'CFC Execution Order'

Function: The tab switches the mode of the execution order for CFC objects.

Call: Context menu: *"Properties"* of a CFC object in the *"Devices"* view or *"POUs"* view

Tab 'CFC Execution Order'

"Execution order"	In the CFC editor, you position the elements and therefore also the networks freely. Two modes are available to prevent the execution order in the CFC POU from being undefined.
"Auto Data Flow Mode"	In this mode, the execution order is determined automatically by data flow, or in case of ambiguity, by network topology. The POUs and the outputs are numbered internally. The networks are executed from top to bottom and left to right. Advantage: The automatically defined execution order is optimized by time and by cycle. You do not need any information about the internally managed execution order during the development process. The following commands are provided afterwards in the *"CFC ➔ Execution Order"* menu: ● *"Display Execution Order"* ● *"Set Start of Feedback"* The elements in the CFC editor are displayed without markers and without numbering. It is not possible to change the execution order manually. For networks with feedback, you can also set a starting point.
"Explicit Execution Order Mode"	In this mode, you can define the execution order explicitly. To do this, the elements are displayed in the CFC editor with markers and numbering, and menu commands are provided for defining the order. The following commands are provided in the *"CFC ➔ Execution Order"* menu: ● *"Send to Front"* ● *"Send to Back"* ● *"Move Up"* ● *"Move Down"* ● *"Set Execution Order"* ● *"Order by Data Flow"* ● *"Order by Topology"* Note: Up to CODESYS V3.5 SP1, this was the usual behavior of CFC POUs. Pay attention that it is your responsibility to adapt the execution order and assess the consequences and impacts. This is another reason why the execution order is always displayed.
"Apply to All CFCs"	Changes the mode for all other CFC objects in the project to the mode selected in the list

Dialog 'Properties' - 'SFC Settings'

Function: The dialog defines the default settings for all POUs used in the project, which are programmed in SFC.

Call: Main menu *“View ➔ Properties”*, context menu of a SFC POU in the view *“Device”* or *“POUs”*.

Flag

List of all possible SFC flags	*“Use”* ☑: The SFC flag is activated and will be considered in the program execution. *“Declare”* ☑: The SFC flag is declared automatically. If *“Declare”* is activated, but *“Use”* is not activated, the variable will be declared but the flag has no effect in the program execution. Hint: If you have manually declared a SFC variable you have to disable the declaration of this flag in the *“SFC Settings”*. Otherwise the automatically generated flag will overwrite the manually declared flag. Hint: A automatically declared flag variable is only visible in the online mode in the declaration part of the SFC editor.
“Use defaults”	☑: The settings of this dialog overwrites the *“SFC settings”* of the single POUs.

See also

- *Chapter 1.4.1.19.1.4.6 “SFC Flags” on page 481*

Build

Table 181: “Code generation”

“Calculate active transitions only”	☑: CODESYS generates code for the currently active transition only.

Dialog 'Properties' – 'Link to File'

Function: The dialog defines the link of an external file with the contents of the global variable list (GVL). You can either export the GVL to an external file or import it from an external file.

Call: Menu bar: *“View ➔ Properties”*; context menu of an object of type *“Global Variable List”*

“File name”	Input field of the file path
“Export before compile ”	☑: Before each compile of the project (for example with *[F11]*), CODESYS saves a file with the extension `gvl` in the path, which is specified in the *“File name”* field.
“Import before compile ”	☑: The export file which is specified in the *“File name”* field is read automatically before each project compile. Therefore you can import a GVL which was exported from another project, for example to set up a communication by means of network variables.

See also

- *Chapter 1.4.1.20.2.10 “Object 'GVL' - Global Variable List” on page 871*
- *Chapter 1.4.1.9.3.1 “Configuring a Network Variable Exchange” on page 361*

Dialog 'Properties' - 'Cam'

Function: Use this dialog to define the global variables of the cam.

Table 182: “Dimensions”

“Master start/end position”	The start and end positions of the master define the range of the master values and therefore the scale of the horizontal axis of the cam. The default settings are given in angular degrees with 0 and 360 as limiting values.
“Slave start/end position”	The associated slave positions are determined by the graph type that is defined for the cam. However, the segment depicted by the curves (this is also the scale of the vertical axis) can be defined by the slave start and end positions given here.

Table 183: “Period”

These settings affect the work in the cam editor and cam table. Depending on these parameters, the slave start point is adjusted automatically when the end point is changed, as well as the other way around. This adjustment optimizes the period transition to be as smooth and jerk-free as possible.	
“Smooth transition”	☑: The values for position, velocity, and acceleration are adjusted automatically.
“Slave period”	Indicates when the slave period is repeated mechanically. The slave position at the start and end of the master period may then be in an interval of a whole number multiple of this value. This value is effective only if the *“Smooth transition”* check box is selected.

Table 184: “Continuity Requirements”

Activation of these options for the continuity of the curve does not have any effect when editing the cam. It does, however, prompt a continuity check, which reports any violations to the message view (CAM). It is not possible to edit jumps in the position curve. The default setting also requires the continuity of velocity and acceleration. You can clear these options, for example in the special case of a curve that consists of only linear segments. However, this will lead to kinks in the position curve. By default, the jerk (3rd derivative) is not tested for jumps.	
“Position”	☑: The entire curve is tested for jumps.
“Velocity”	
“Acceleration”	
“Jerk”	

Table 185: “Compile Format”

When compiling, `MC_CAM_REF` structure variables are generated. A cam is described according to the following options:	
“polynomial (XYVA)”	Polynomial description of the individual points consisting of the master position, slave position, slave velocity, and slave acceleration.
“one dimensional point array”	1D table of slave positions
“two dimensional point array”	2D table of composite master/slave positions
“Elements”	Number of elements in the arrays. This array has already been created in SM3_Basic for the default cases *“128”* and *“256”*. If you type in another value, you must create the structure in your application (see the following example).

Example of an array with 720 elements

```
TYPE SMC_CAMTable_LREAL_720_2 :
STRUCT
    Table: ARRAY[0..719] OF ARRAY[0..1] OF LREAL;
    fEditorMasterMin, fEditorMasterMax: REAL;
    fEditorSlaveMin, fEditorSlaveMax: REAL;
    fTableMasterMin, fTableMasterMax: REAL;
    fTableSlaveMin, fTableSlaveMax: REAL;
END_STRUCT
END_TYPE
```

Dialog 'Properties' - 'Image Pool'

Function: The dialog allows for setting the basic properties of the selected image pool.

Call: *“View* ➔ *Properties”* of an *“Image Pool”* object type; context menu of an *“Image Pool”* object type.

“Download only used images”	☑: Instead of loading all images from the image pool, CODESYS loads only the images that are actually used in the application on the PLC.
“Download by visualization”	☑: The image pool is downloaded with the visualization to the controller.
“Internal”	☑: CODESYS does not provide the image pool in the *“ToolBox”* view. You cannot drag these images to the visualization.

Table 186: “Symbol library settings”

“Mark library as symbol library”	Marks the image pool as a symbol library for use in a visualization. The symbol library receives the key `VisuSymbolLibrary = TRUE` as file property in the project information. The `VisuElements` library is inserted automatically as a placeholder library in the *“POUs”* pool of the Library Manager. Requirement: A library project is open. CODESYS displays symbol libraries that are installed in the repository in the *“Project Settings”* (*“Visualization”* category, *“Symbol Libraries”* tab).
“Textlist for symbol translation”	Select the text list from the drop-down list that contains the translated texts for the image pool.

See also

- *Chapter 1.4.1.20.2.13 “Object 'Image Pool'” on page 873*
- *Chapter 1.4.1.8.9 “Using image pools” on page 274*
- *Chapter 1.4.1.20.4.11.9 “Dialog 'Project Settings' - 'Visualization'” on page 1180*

Dialog 'Properties' - 'TextList'

Function: The dialog allows for setting the basic properties of the selected text list.

Call: *“View ➔ Properties”* of an *“Text List”* object type; context menu of an *“Image List”* object type.

“Download by visualization”	☑: The text list is downloaded with the visualization to the controller.
“Internal”	☑: The text list can be used only in a library. It is not available in an ordinary CODESYS project.

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Dialog 'Properties' - 'Options'

Options (Controller)

Function: This dialog provides the settings for monitoring an login for objects of type device. The availability of the options depends on the device description.

Call: Context menu of the device, or main menu *“View ➔ Properties”*, if the device is selected.

“Monitoring interval (ms)”	Interval of the monitoring (10 ms - 1000 ms)

Table 187: “Interactive Login Mode”

This mode is used to prevent an accidentally login to a different controller.	
“None”	No interaction with the user during login. Corresponds to the behavior of previous versions.
“Enter ID”	During login CODESYS asks to enter an ID. The ID is stored in the controller. Without a valid ID no login is possible. When login a second time, CODESYS does not ask again for the ID if the computer name, the user name, the device name and the device address have not changed. The information is saved in the project options.
“Press key”	During login a dialog prompts and requests the user to press a key on the controller. The timeout for this action is saved in the device description.
“Wink (= blink an LED)”	During login a led blinks on the connected controller.

Table 188: “Symbol Configuration”

“Access variables in sync with IEC tasks”	☐: Default setting, consistent access is not permitted ☑: Consistent access is permitted The setting only will take effect when all applications and boot applications are re-downloaded to the controller. Note: If the option is activated, then the jitter for all IEC applications may increase on this device! The consistent access can disturb the real-time capability.

- *Chapter 1.4.1.20.2.8 “Object 'Device' and Generic Device Editor” on page 839*
- *Chapter 1.4.1.20.2.25 “Object 'Symbol Configuration'” on page 927*

Dialog 'Properties' - 'Monitoring'

Function: The tab contains options for the monitoring of transitions in SFC.

Call: Select transition object, click *“Properties”*; menu bar: *“View ➔ Properties”*.

“Enable monitoring”	☑: An implicit variable is created for the transition, which is then always given the current property value when the application calls the Transition method. The value stored last in this variable is displayed in the monitoring.
“Monitoring using call”	☑: The transition to be monitored is read by directly calling the transition. Note: When you activate this option, you have to consider possible side effects. These kinds of side effects can occur if additional operations are implemented in the transition.

See also

- *Chapter 1.4.1.20.2.18.10 “Object 'Transition'” on page 903*
- *Chapter 1.4.1.19.6.2.25 “Attribute 'monitoring'” on page 709*

Dialog 'Project Settings'

Symbol: 

Function: The object contains the basic configuration of the project. In the *“Project Settings”* dialogs the configuration can be adjusted.

Call: Double click on the *“Project Settings”* object in the device tree, or main menu *“Project ➔ Project Settings”*.

CODESYS saves the project settings directly in the project. If a project is transferred to another system for example the *“Project Settings”* object is transferred as well without the need of a project archive.

The project settings are valid project wide. Dependent on the installed packages the dialogs provide settings for several categories, as for example *“SFC”* or *“User and Groups”*.

See also

- *Chapter 1.4.1.20.3.8.4 “Command 'Package Manager'” on page 1059*

Dialog 'Project Settings' - 'SFC'

Symbol: 

Function: This dialog is used for configuring the settings of SFC objects. The properties of each new SFC object automatically have the configured settings.

Call: Menu bar: *“Project ➔ Project Settings”* (*“SFC”*).

Requirement: A project is open.

Tab 'Flags'

Implicitly generated variables for checking and monitoring the processing in an SFC diagram	
“Active”	☑: The corresponding variable is used.
“Declare”	☑: The corresponding variable is created automatically. Otherwise, you have to declare the variable explicitly if you intend to use it (*“Use”* is selected).

“Apply to all”	In this dialog, CODESYS applies changes to existing SFC objects. CODESYS selects the *“Use defaults”* check box in the properties of the SFC POUs.

NOTICE!
Automatically declared variables are visible in the declaration part of the SFC editor only in online mode.

Tab 'Build'

Table 189: “Code Generation”

“Calculate active transitions only”	☑: CODESYS generates code only for currently active transitions.

Table 190: “SFC Library”

This part of the dialog is available only for compiler versions < 3.4.1.0.	
“Company ” *“Title”* *“Version”*	Defines the SFC library that CODESYS uses by default.
“Namespace”	Enables unique references to libraries. Required when various versions of the library are available on the system. Please make sure that there are no discrepancies between the namespace defined in the library manager and the namespace defined for the individual object. The `SfcIec.library` data is used for the default settings that CODESYS provides with the default profile.

Each SFC block stores the information via the library version that applied when you added the block. This can cause you to use multiple library versions within the same project. In order to prevent this, you are prevented from defining specific versions of `IecSfc.library` (as of compiler version 3.4.1.0). The library version, which you use for all SFC blocks in the project, is defined with a placeholder. CODESYS resolves the placeholder depending on the compiler version in use. The allocation of the library version to the compiler version is defined in the library profile.

See also

- *Chapter 1.4.1.19.1.4.6 “SFC Flags” on page 481*
- *Chapter 1.4.1.16.1 “Information for Library Developers” on page 449*

Dialog 'Project Settings' - 'Users and Groups'

Symbol: 

Function: This dialog is for the configuration of the user management for the current project.

Call: Menu *“Project ➔ Project Settings”*, category *“Users and Groups”*

Tab 'User'

Displays the users and their memberships in groups	
“Add”	Opens the *“Add User”* dialog.
“Edit”	Opens the *“Edit User”* dialog.
“Delete”	An error message appears if you attempt to delete the last user of a group, since a group must have at least one member.

Table 191: “Add User / Edit User”

Input fields for setting up a new user account or changing an existing one	
“Active”	☑ : You may use the user account, default ☐: The user cannot log in. If he attempts to login again with incorrect login data, this can result in automatic deactivation of the account; see below: Settings.
“Memberships”	List of all user groups that you have defined in addition to the group *“Everyone”* (to which each new user automatically belongs). ☑<group name> : the new user belongs to the group.

Table 192: “Export/Import”

“Export Users and Groups”	The command opens the standard dialog for saving a file in the local file system. You can store the users and groups definitions of the project in a file `*.users` in xml format.
“Import Users and Groups”	Export users and groups opens the standard dialog for browsing the local file system for a file. Search for a file with extension `*.users` in order to import the users and groups definiitions, stored in this file, into the project.

Tab 'Groups'

Display of the groups and their members. A group can also be a member of a group.	
“Add”	Opens the *“Add Group”* dialog.
“Edit”	Opens the *“Edit Group”* dialog.
“Delete”	If you delete a group, the user accounts of the members remain unchanged. You cannot delete the groups *“Everyone”* and *“Owner”*.

On button *“Export/Import”* please see above the *“User”* paragraph.

Tab 'Settings'

Display of the groups and their members in a tree structure. A group can also be a member of a group.	
"Maximum number of authentication trials"	☑ (standard) : If the user has attempted to login with an incorrect password the number of times specified here, the user account is deactivated. ☐: The number of the unsuccessful attempts is unlimited
"Automatic logoff after time of inactivity"	☑: The user is automatically logged out if CODESYS does not register any user actions by mouse or keyboard during the time period (minutes) specified here.

See also

- *Chapter 1.4.1.5 "Protecting and Saving Projects" on page 197*
- *Chapter 1.4.1.20.3.4.28 "Command 'User management' – 'Log in User'" on page 1016*

Dialog Box 'Project Settings' - 'Compileoptions'

Symbol:

Function: This dialog box is for configuring the compiler options.

Call: Main menu *"Project ➔ Project Settings"* (*"Compileoptions"* category).

Requirement: A project is open.

Table 193: "Compilerversion"

"Fix Version"	Defines the compiler version that CODESYS uses when compiling and downloading for compile (for example, *"3.5.6.0"* for version 3.5 SP6).

Table 194: "Settings"

"Allow unicode characters for identifiers"	Cleared by default because using Unicode characters in identifier names is not permitted in the IEC standard. May be required for some foreign languages (for example, Asian languages).
"Replace constants"	☑ (default): CODESYS loads the value directly for every scalar constant (not for strings, arrays, and structures). In online mode, CODESYS marks the constants with a symbol that is prepended to the value in the declaration editor or monitoring view. In this case, access is not possible, for example by means of an `ADR` operator, forcing, and writing. ☐: Access to constants is possible, but it prolongs the computation time.
"Enable logging in breakpoints"	For breakpoints that are defined as execution points, you can create a message text in the *"Execution point settings"* dialog box. CODESYS prints this text to the device log when the application halts at the execution point.

Table 195: "Compiler Warnings"

"Maximum number of warnings"	Refers to the warnings that CODESYS prints to the messages view. You define the selection of displayed compiler warnings in the *"Project Settings"* dialog box in the *"Compiler Warnings"* category.

See also

- *Chapter 1.4.1.20.4.11.4 "Dialog Box 'Project Settings' - 'Compiler Warnings'" on page 1173*
- *Chapter 1.4.1.20.2.8.8 "Tab 'Log'" on page 848*

Dialog Box 'Project Settings' - 'Compiler Warnings'

Symbol:

Function: This dialog box is used for selecting the compiler warnings that CODESYS displays in the messages view during a compile process.

Call: Call: Main menu *“Project ➔ Project Settings”* (*“Compiler Warnings”* category).

Requirement: A project is open.

> *You define the maximum number of listed warnings in the “Compileoptions” dialog box.*

See also

- *Chapter 1.4.1.20.4.11.3 “Dialog Box 'Project Settings' - 'Compileoptions'” on page 1173*
- *Chapter 1.4.1.20.3.5.4 “Command 'Build'” on page 1022*

Dialog 'Project Settings' – 'Source Download'

Symbol: 

Function: This dialog defines the compilation and the storage of the source code as a source-code download archive on one or more controllers.

Call: *“Project ➔ Project settings”* menu, *“Download source code”* category

A source-code download archive is a project archive with the name `Archiv.prj`.

> *The settings affect the command “Online ➔ Load source code to connected controller”. These settings do not affect the command “File ➔ Load source code to controller”.*

Table 196: “Destination device”

Defines the location of the project archive.	
“<name of controller>”	Selected controller. CODESYS loads the project archive to this controller. Requirement: the project contains several controllers.
“<all devices in project>”	CODESYS loads the project archive to all controllers in the project.

Table 197: “Content”

Defines the contents of the project archive.	
“Use compact download”	☑: The project archive contains only that device in the project that contains the active application. ☐: The project archive contains all the devices in the project

“Additional Files”	Opens the *“Additional files”* dialog where you can select additional files for downloading.
	Not all types of additional files are available for each project. *“Download information files”* - Project information files *“Library profile”* - Includes the applied profile *“Project information”* - Includes the project information *“Referenced devices”* - Includes all device descriptions of third party devices into the archive *“Referenced libraries”* - Includes all referenced libraries into the archive *“Referenced visualisation styles”* - Includes the used styles *“Visualisation profile”* - Includes the used profile The most important types *“Referenced devices”* and *“Referenced libraries”* should always be included, if the archive shall be usable by Automation Builder installations without availability of the required devices or libraries.

Table 198: “Timing”

Defines the time at which CODESYS creates a project archive.	
“Implicitly at program download and online change”	Each time an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.
“Implicitly at creating boot project”	Each time a boot application is created, CODESYS additionally loads the project archive to the target device(s) with no further prompt.
“Implicitly at creating boot project, download and online change”	Each time a boot application is created, an application is loaded or an online change is made, CODESYS additionally loads the project archive to the target device(s) with no further prompt.
“Prompt at program download and online change”	Each time an application is loaded or an online change is made, CODESYS opens a prompt, where you can select whether CODESYS should load the project archive to the controller.
“Only on demand”	A prompt opens only if the command *“Online ➔ Load source code to connected controller”* is called. There you can select whether CODESYS should load the project archive to the controller.

Dialog 'Project Settings' - 'Page Setup'

Symbol: 

Function: This dialog defines the layout for the print version of the project contents. This layout is used for the printout of the project information by clicking *“File ➔ Print”* and the printout of the project documentation by clicking *“Project ➔ Document”*.

Call: Main menu *“Project ➔ Project Settings”* (*“Page Setup”*)

You can change settings the following:

- *“Paper”*
- *“Margins”*

- *“Header and Footer”*
- *“Document”*
- *“Title Page”*

Table 199: “Edit Header, Edit Footer”

The headers and footers are structured in table style. You can configure rows and columns, and add text and images to the resulting cells.	
“Row spanning”	Number of rows that CODESYS should merge into a single column.
“Column spanning”	Number of columns that CODESYS should merge into a single row.
	Opens the list of available placeholders for the *“Text”* field. When printing the page, CODESYS provides the placeholders with the current values.

Dialog 'Project Settings' - 'Security'

Symbol: 

Function: this dialog is for the configuration of the project protection by a password, a dongle, or a certificate.

Call: Menu bar: *“Project ➔ Project Settings”* (category *“Security”*).

> **NOTICE!**
> If the encryption password is lost you can no longer open the project. You can also no longer restore it.

“No protection”	: The project file is not protected from unauthorized access and data manipulation. Note: We strongly recommend that you use security functionality. : The *“Password”*, *“Dongle”*, and *“Certificates”* options cannot be selected.
“Integrity check”	When you create a new project, this option is enabled by default. : The project file is stored in a proprietary format and its integrity is checked each time the project is loaded. The file may be incompatible with older versions of the development system. Please note that the project file is not encrypted. To better protect your data, activate one of the encryption functions.
“Encryption”	: The *“Password”*, *“Dongle”*, and *“Certificates”* encryption functions can be selected.
“Password”	Entering, changing and confirming the encryption password. If you save the project with these settings you must enter the password later in order to open the project again, even if it is to be loaded as a library reference.
“Dongle”	Requirement: you have connected the CODESYS security key (dongle) to the computer. *“Add”*: The dialog *“Add Registered Dongle”* opens.

“Registered dongles”	Drop-down list of the registered dongles.
“Certificates”	Certificates are used for the encryption of contents of the open project file. Requirement: The certificates for all users who share the project must be installed in the local memory. : The *“Certificate selection”* dialog opens.

Table 200: Adding a registered dongle

“Dongle”	Drop-down list of all connected dongles.
“Update”	CODESYS refreshes the drop-down list.
“Flash”	The LEDs of the currently selected dongle flash for two seconds (if it supports this function).

The dongle must be connected to the computer when CODESYS loads the project, even if it is loaded as a library reference.

Dialog 'Project Settings' - 'Static Analysis Light'

Symbol: §

Function: This dialog activates the tests that the light version of CODESYS Static Analysis performs each time code is generated.

Call: Menu bar: *“Project ➔ Project Settings”* (*“Static Analysis Light”* category).

You can exclude lines of code from the static code analysis by marking the code with the pragma `{analysis ...}` or the pragma `{attribute 'analysis' := '...'}`.

Additional compile tests

“SA0033: Unused variables”	Finds variables that are declared, but not used within the compiled program code. For GVL variables: If there are multiple applications in one project, then only the objects under the currently active application are affected. If there is only one application, then the objects in the `POUs` view are also affected.
“SA0028: Overlapping memory areas”	Detects the locations where two or more variables reserve the same storage space. For example, this occurs for the following declarations: `var1 AT %QB21: INT` and `var2 AT %QD5: DWORD`. In this case, both variables use byte 21, which means that the memory range of the variables overlap.
“SA0006: Write access from multiple tasks”	Detects variables that are written by more than one task.

SA0004 *“Multiple write access on output”*	Detects outputs that are written to more than one location. Note: No error is reported when an output variable (`VAR_IN_OUT`) is written in different branches of `IF` and `CASE` statements. Note: A pragma cannot deactivate this rule.
“SA0027: Multiple use of identifiers”	Detects multiple uses of a name/identifier for a variable or an object (POU) within the scope of a project. The following cases are detected: ● The name of an enumeration constant is the same as in another enumeration in the application or used in an included library. ● The name of a variable is the same as an object in the application or an included library. ● The name of a variable is the same as for an enumeration constant in and enumeration in the application or an included library. ● The name of an object is the same as another object in the application. ● The name of a variable is the same as the name of a method. ● The name of an object is the same as the name of a superordinate object ("parent object").
“SA0167: Temporary function block instances”	The test detects function block instances that are declared as temporary variables. This concerns instances that are declared in a method or in a function or as `VAR_TEMP`, and therefore are reinitialized in each processing cycle and for each POU call.

Examples

SA0003: Empty statements

```
;
(* Comment *);
iVar;
```

SA0006: Concurrent access

```
FUNCTION_BLOCK ADD_FB
g_iTemp1 := g_iTemp1 + INT#1;

PROGRAM PLC_PRG  //controlled by MainTask
g_iTemp1 := g_iTemp1 + INT#2;
g_xTemp2 := g_iTemp1 > INT#10;

PROGRAM PLC_PRG_1  //controlled by SubTask
g_iTemp1 := g_iTemp1 - INT#3;
g_xTemp2 := g_iTemp1 < INT#-10;
```

SA0004 **Multiple write access on output**

```
VAR_GLOBAL
    g_xVar AT %QX0.0 : BOOL ;
    g_iTest AT %QW0 : INT ;
END_VAR

PROGRAM PLC_PRG
IF iCondition < INT#0 THEN
    g_xVar := TRUE;
    g_iTest := INT#12;
END_IF

CASE iCondition OF
    INT#1:
        g_xVar := FALSE;
    INT#2:
        g_iTest := INT#11;
    ELSE
        g_xVar := TRUE;
        g_iTest := INT#9;
END_CASE
```

SA0006: Write access from multiple tasks

```
FUNCTION_BLOCK ADD_FB
g_iTemp1 := g_iTemp1 + INT#1;

PROGRAM PLC_PRG  // Controlled by MainTask
g_iTemp1 := g_iTemp1 + INT#2;
g_xTemp2 := g_iTemp1 > INT#10;

PROGRAM PLC_PRG_1  //Controlled by SubTask
g_iTemp1 := g_iTemp1 - INT#3;
g_xTemp2 := g_iTemp1 < INT#-10;
```

SA0027: Multiple use of name

```
PROGRAM PLC_PRG
VAR
ton : INT;     // error SA0027
END_VAR
```

SA0029: Different notation in implementation and declaration

The `PLC_PRG` POU and a `fnc` function POU are in the device tree.

```
PROGRAM PLC_PRG
VAR
    iVar:INT;
    _123test_var_: INT;
END_VAR
    ivar := iVar + 1; // notation different to that in the
declaration part ->   SA0029
    _123TEST_var_ :=     _123test_var_INT; // notation different to
that in the declaration part ->   SA0029
 Fnc(); // notation different to that in the devices tree ->
SA0029
END_VAR
```

SA0167: Temporary function block instances

```
PROGRAM PLC_PRG
VAR
END_VAR
VAR_TEMP
    yafb: AFB;
END_VAR

FUNCTION Fun : INT
VAR_INPUT
END_VAR
VAR
    funafb: AFB;
END_VAR

METHOD METH: INT
VAR_INPUT
END_VAR
VAR
    methafb: AFB;
END_VAR
```

Dialog 'Project Settings' - 'Visualization'

Symbol: 

Function: The dialog is used to configure the project-wide settings for objects of type *“Visualization”*.

Call: Menu bar: *“Project* ➔ *Project Settings”*, *“Visualization”* category

Requirement: A project is open.

Tab 'General'

Table 201: "Visualization Directories"

"Text list files"	Directory which contains text lists that are available in the project to configure texts for different languages. CODESYS uses the directory, for example to import or export text lists. After clicking ..., the *"Select Directory"* dialog opens which allows for the selection of a directory in the file system.
"Image files"	Directory which contains image files that are available in the project. Multiple folders are separated with a semicolon. CODESYS uses the directory, for example to import or export image files. After clicking ..., the *"Select Directory"* dialog opens which allows for the selection of a directory in the file system.

Table 202: "Advanced"

"Activate property handling in all element properties"	☑: You can also configure a visualization element with a property in those of its properties in which you select an IEC variable. Then CODESYS creates additional code for the property handling when a visualization is compiled. Requirement: Its IEC code contains at least an object of type *"Interface property"* (a property).  Requirement: *"Visible"* is selected.
"Enable implicit checks for visualization POUs"	☑: The implicit check is also performed for visualization POUs. As a result, additional code is generated, which increases memory usage. When memory is limited, this option should be disabled.

See also

- *Object 'Property'*

Tab 'Symbol Libraries'

Table 203: "Visualization Symbol Libraries"

"Symbol libraries"	List of all installed symbol libraries (example: `VisuSymbols`)
"Assigned"	☑: Symbol library is selected in the project and CODESYS makes it available in the *"Visualization ToolBox"* view of a visualization. ☐: Symbol library is installed in the library repository, but CODESYS does **not** make it available in the *"Visualization ToolBox"* view of a visualization.

- *CODESYS Visualization*
- *Dialog 'Add Visualization'*

Dialog 'Project Settings' - 'Visualization Profile'

Symbol:

Function: The dialog enables the setting of the visualization profile.

Call: Menu *“Project ➔ Project Settings”*, category *“Visualization Profile”*

Requirement: A project is open.

Table 204: “Visualization Profile”

“Certain profile”	Profile that CODESYS uses in the project and that determines the visualization elements that are available in the project. The selection list contains all the profiles installed so far.

Dialog 'Project Environment'

Function: You use this dialog for checking the actuality of the software and of the files, which are included in the project. CODESYS checks for example the selected compiler and finds out if there is a newer version. In such a case you can update the affected components.

Call: Main menu*“Project”*

Dialog 'Project Environment' – 'Library Versions'

Function: This dialog displays the libraries of the opened project for which newer versions are available.

Call: Main menu *“Project ➔ Project Environment”*, tab *“Library Version ”*

This dialog opens automatically when you open a project containing outdated libraries.

Table 205

The list shows the name of the outdated library with version, the currently available version and the planned action.	
“Action”	Double-click inside the field to select the desired actions.
“Check for updates when loading this project”	☑: Checking takes place each time the project is opened. ☐: Checking takes place once only.
“Set all to newest”	CODESYS uses the newest available version of the library.
“OK”	CODESYS performs the selected action(s).

Dialog 'Project Environment' - 'Compiler Version'

Function: This dialog shows the current compiler version of the project and provides the capability of updating.

Call: Main menu *“Project ➔ Project Environment”* (*“Compiler Version”* tab).

Table 206

"Current compiler version in project"	Shows the set compiler version for the open project.
"Recommended, newest version"	Shows the latest version.
"Action"	● *"Do not update"*: The compiler version of the project remains the same. ● *"Update to x.x.x.x"*: The selected compiler version is set for the project.
"Check for updates when loading this project"	☑: CODESYS checks for new versions each time the project is opened. If there is a new version, then the respective update dialog opens automatically. ☐: The compiler version is not checked. The update dialogs do not open automatically.
"Set all to newest"	The compiler version is set to the latest version.

Dialog 'Project Environment' - 'Device Versions'

Function: This dialog shows the devices of the open project in which there are new versions available.

Call: Main menu *"Project ➔ Project Environment"* (*"Device Versions"* tab)

This dialog opens automatically when you open a project that contains an outdated device.

Table 207

Names of the outdated devices and their versions, as well as the current version and the planned action.	
"Action"	Double-click in the field to select the required actions.
"Check for updates when loading this project"	☑: The check is performed when the project is opened. ☐: The check is performed one time only.
"Set all to newest"	CODESYS uses the latest library version.
"OK"	CODESYS executes the selected actions.

Dialog 'Project Environment' – 'Visualization Profile'

Function: This dialog shows the current visualization profile of the project. The profile can be updated here.

Call: Menu bar: *"Project ➔ Project Environment"* (*"Visualization Profile"* tab).

"Current visualization profile in the project"	The set visualization profile of the open project.
"Recommended, newest profile"	The newest version.
"Action"	● *"Do not update"*: The visualization profile of the project remains unchanged. ● *"Update to x.x.x.x"*: CODESYS updates the project to the selected visualization profile.
"Check for updates when loading this project"	☑: CODESYS checks for new profiles each time the project is opened. If there is a new version, then the respective update dialog opens automatically. ☐: Not test of the profile when opening the project. The update dialogs do not open automatically.
"Set all to newest"	CODESYS updates the .

- Help about visualization

Dialog 'Project Environment' – 'Visualization Styles'

Function: This dialog shows the current visualization style of the project and provides the capability of updating it.

Call: Menu bar: *"Project ➔ Project Environment"* (*"Visualization Styles"* tab).

Table 208: "Newer versions are available for the following visualization styles currently in use"

"Visualization style"	Version of the set visualization style in the open project
"Current"	Current version of the visualization style (example: `3.5.6.0`)
"Recommended"	Recommended version of the visualization style (example: `3.5.7.0`)
"Action"	● *"Do not update"*: The visualization style of the project remains unchanged. ● *"Update to x.x.x.x"*: CODESYS updates the project to the version of the selected visualization style.
"Check for updates when loading this project"	☑: CODESYS checks for new versions each time the project is opened. If there is a new version, then the respective update dialog opens automatically. ☐: The version is not checked. The update dialogs do not open automatically.
"Set all to newest"	CODESYS updates the version.

- Help for visualization, section "Visualization style"

Dialog 'Project Environment' – 'C Code Modules'

Function: This dialog lists all C-code modules and their C-code files that have changed in the source directory on the disk. You can update individual C-code modules here.

Call: Menu *"Project ➔ Project Environment"*, tab *"C Code modules"*

Table 209: "The sources of the following projects changed"

"Project"	Display of the C-code module with its changed C-code files in the project.
"Action"	Selection option for the C-code module of the *"Project"* field A double-click on the field displays all selection options: ● *"Update"* ● *"Do not update"* For each C-code file this indicates what action is executed if you select the action *"Update"* for the corresponding C-code module (*"Project"*).
"Delete IEC interfaces"	Deletes the created IEC interface if the headers in the project have changed. In this case you must create the IEC interface again.
"Check for updates when loading this project"	☑: checking takes place each time the project is opened.
"Set all to 'newest'"	CODESYS refreshes all C-code modules.
"OK"	CODESYS executes the selected actions in the project.

Dialog 'Project Environment' – 'Visualization Symbols'

Function: The dialog lists installed symbol libraries and allows for you to assign symbol libraries to a project.

Call: Menu bar: *“Project ➔ Project Environment”*, *“Visualization Symbols”* tab

Requirement: The open project contains a visualization and has been saved with a compiler version < `3.5.7.0`. CODESYS recognizes symbol libraries in compiler version `3.5.7.0` and higher.

“Symbol library”	List of all installed symbol libraries
“Active”	☑: Symbol library is selected for the project. CODESYS provides its symbols in the *“Visualization Toolbox”* view. ☐: Symbol library has been previously installed only in the library repository.

See also

- Help for visualization, "Using the symbol library in the visualization" chapter

Dialog 'Options'

Function: You use the dialog box for selecting the CODESYS options. With these options you configure the appearance and the behavior of the user interface. CODESYS saves the current configuration as standard settings in the local system.

Call: Main menu *“Tools ➔ Options”*

Dialog 'Options' - 'Automation Builder'

Symbol:

Function: This dialog is for the configuration of the settings for the Automation Builder.

Call: menu *“Tools ➔ Options”*, category *“Automation Builder”*

Tab 'DeviceTree'

“Show warning message on delete objects”	☑: A warning appears whether the selected object should really be deleted from the project.
“Show device type”	☑: In the project tree the device type is displayed in brackets
“Show device tag”	☑: Show device tag
“Close Add / Update object dialog after single transaction”	☑: The "Add/Update Object" dialog is closed after a single transaction.
“Display all versions”	☐: Some devices are present in several versions. If the check mark is set, then all devices in all versions are displayed. If the checkbox is not set (default), then only the latest version is displayed.

Tab 'Project'

"Check integrity on open project"	☑: The integrity of an open project is automatically checked in the background. *Chapter 1.4.1.20.3.4.10 "Command 'Check integrity'" on page 1006*
"Check configuration on the fly directly on modify"	☑: The configuration can be checked directly when changing.
"Incremental update of configuration data"	☑: Performs an incremental update of configuration data.
"Activate legacy version of CSV signal export / import"	☐: If this checkbox is set, the old version of the CSV signal export/import is activated.

Tab 'Editors' Max parallel opened editors allowed 25 (max. 99).

"I/O-mapping"	
"Use tree based I/O mapping dialog"	☐: The view of the I/O mapping dialog is defined, here use tree based I/O mapping dialog.
"Use list based I/O mapping dialog"	☐: The view of the I/O mapping dialog is defined, here use list based I/O mapping dialog.
"Use both I/O mapping dialog"	☑: The view of the I/O mapping dialog is defined, here use both based I/O mapping dialog.

Tab 'General' ☐: *"Participate in ABB usability improvement program"* (Function not yet active.)

Dialog 'Options' - 'C Compiler'

Symbol:

Function: This dialog is for the configuration of the settings for the *"C Compiler"*.

Call: menu *"Tools* ➔ *Options"*, category *"C Compiler"*

Tab 'GCC 4.7.3'

"Path to Compiler executable"	Path to the file location.	
	"...": Opens the file manager to search for the file location.	
	"Reset": Resets the input.	
"Environment Variables"	*"New.."*: A new input window opens.	*"Variable name:"* Enter new variables.
		"Variable value:" Enter new variables.
	"Edit...": A new input window opens.	*"Variable name:"* Edit new variables.
		"Variable value:" Edit new variables.
	"Delete": Deletes the entries.	
	"Reset": Deletes the entries.	
"Include path"	*"New.."*: A new input window opens.	*"Path:"* Enter a new path.
	"Edit...": A new input window opens.	*"Path:"* Edit include path.
	C:\Program Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11	

	“Delete”: Deletes the entries.
	“Reset”: Deletes the entries.

Tab 'GCC 4.7.3 PM595-4ETH'

“Path to Compiler executable”	Path to the file location.	
	“...”: Opens the file manager to search for the file location.	
	“Reset”: Resets the input.	
“Environment Variables”	*“New..”*: A new input window opens.	*“Variable name:”* Enter new variables.
		“Variable value:” Enter new variables.
	“Edit...”: A new input window opens.	*“Variable name:”* Edit new variables.
		“Variable value:” Edit new variables.
	“Delete”: Deletes the entries.	
	“Reset”: Deletes the entries.	
“Include path”	*“New..”*: A new input window opens.	*“Path:”* Enter a new path.
	“Edit...”: A new input window opens.	*“Path:”* Edit include path.
	C:\Program Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11	
	“Delete”: Deletes the entries.	
	“Reset”: Deletes the entries.	

Tab 'GCC ++ 4.7.3 PM595-4ETH'

“Path to Compiler executable”	Path to the file location.	
	“...”: Opens the file manager to search for the file location.	
	“Reset”: Resets the input.	
“Environment Variables”	*“New..”*: A new input window opens.	*“Variable name:”* Enter new variables.
		“Variable value:” Enter new variables.
	“Edit...”: A new input window opens.	*“Variable name:”* Edit new variables.
		“Variable value:” Edit new variables.
	“Delete”: Deletes the entries.	
	“Reset”: Deletes the entries.	
“Include path”	*“New..”*: A new input window opens.	*“Path:”* Enter a new path.
	“Edit...”: A new input window opens.	*“Path:”* Edit include path.
	C:\Program Files (x86)\ABB\AutomationBuilder\CCodeToolchain\FWAPI\2.11	
	“Delete”: Deletes the entries.	
	“Reset”: Deletes the entries.	

Tab 'External diff tool'

"Path to external diff tool"	*"..."*: Opens the file manager to search for the file location.

Dialog 'Options' - 'CFC Editor'

Symbol: 

Function: This dialog is for the configuration of the settings for editing and printing in the CFC editor.

Call: menu *"Tools ➔ Options"*, category *"CFC Editor"*

Tab 'General'

"Enable AutoConnect"	☑: If you drag a CFC element onto the work area of the editor and insert it, CODESYS automatically connects together unconnected pins that 'touch' one another. Make sure that you do not create unwanted connections when shifting elements!
"Prepare values in implementation part"	☑: In online mode you can also prepare variable values for writing and forcing in the implementation part of the CFC module. In addition, CODESYS displays the values you have just prepared in the inline monitoring box of the variable in angle brackets.

Tab 'View'

"Display grid points"	☑: Grid points at which you can position the elements are visible in the editor.
"Show box icon"	☑: Existing function blocks that are linked with a bitmap are displayed by CODESYS in the CFC editor as symbols. Requirement: You have either created the link for a function block or a function in the object properties or loaded it via a library.
"Edit Line Colors"	Opens the *"Edit Line Colors"* dialog for the definition of the colors of the connecting lines, depending on the data type applied. The lines appear in offline and online mode in these colors, unless CODESYS paints over them with the thick black and blue lines used to display the boolean data flow. ● *"Add Type:"* Adds a data type to the list. ● *"Delete Type"*
"Font"	Display of the font and button for changing the font.

See also

- ↳ *Chapter 1.4.1.20.4.10.8 "Dialog Box 'Properties' - 'Bitmap'" on page 1162*

Tab 'Print'

Setting the *"Layout Options"*	
"Fit method"	*"Page"* or *"Poster"*
"Scale"	Possible values: 20 % - 200 %

See also

- ↳ *Chapter 1.4.1.8.3.2.2 " Programming in the CFC editor" on page 246*
- ↳ *Chapter 1.4.1.19.1 "Programming Languages and Editors" on page 460*

Dialog 'Options' – 'Declaration Editor'

Symbol:

Function: This dialog is for the configuration of the display settings for the declaration editor.

Call: Main menu *“Tools ➔ Options”*, category *“Declaration Editor”*

“Textual only”	Textual view of the declaration editor
“Tabular only”	Tabular view of the declaration editor
“Switchable between textual and tabular”	The declaration editor offers two buttons for switching between the textual and tabular views: : textual view : tabular view The following option defines the view that appears by default when opening a programming object: ● *“Always textual”* ● *“Always tabular”* ● *“Remember recent setting (per object)”* ● *“'Remember recent setting (global)”*

See also

- *Chapter 1.4.1.8.2.1 “Using the declaration editor” on page 226*

Dialog 'Options' – 'Device Description Download'

Symbol:

Function: This dialog is for the configuration of addresses of download servers for device descriptions.

Call: Menu *“Tools ➔ Options”*, category *“Download the Device Descriptions”*.

See also

- *Chapter 1.4.1.17 “Managing devices” on page 452*

Table 210: “Download server”

List of download servers containing device descriptions. By default `'https://store.codesys.com/CODESYSDevs'` is entered as the download server. If you select the button *“Download Missing Device Descriptions”* in the *“Device Repository”* dialog, CODESYS uses the servers entered here and uses the set login data for the proxy server.	
Double-click on *“(Enter new download server here...)”*	An input field opens in which you can enter the URL address of a server.
[Del]	Deletes the selected download server.

See also

- *Chapter 1.4.1.20.3.8.8 “Command 'Device Repository'” on page 1067*
- *Chapter 1.4.1.20.4.13.20 “Dialog 'Options' - 'Proxy Settings'” on page 1198*

Dialog 'Options' - 'Device Editor'

Symbol:

Function: This dialog includes settings for displaying the device editor.

Call: Menu bar: *“Tools ➔ Options”*; category: *“Device Editor”*.

Tab 'View'

“Show generic device configuration views”	☑: This tab with the list of device parameters is available in the device editors of parameterizable devices.
“Create cross references for IEC addresses (clean necessary) ”	☑: CODESYS creates the cross-references for unmapped I/Os.
“Communication page”	• *“Classic mode”*: The *“Communication”* tab of the device editors appears as a split window with the left side showing the current configured gateway channels in a tree structure and the right side showing the associated data and information. • *“Simple mode”*: The *“Communication”* tab appears as described in the corresponding section in the help. Additional modes may also be available from customer-specific extensions.
“Show implicit files for application download on the editor of a PLC”	☑: The tab for synchronized files is available in the device editors. Synchronized files are downloaded to the PLC at the time of application download. These can be external files that were added to the application, or implicit files such as a source code archive.
“Show access rights page”	☑: The *“Access Rights”* tab is available in the device editors. Note: Depending on the device, the device description may overwrite this setting.

See also

- *Chapter 1.4.1.20.2.8.2 “Tab 'Communication Settings'” on page 840*
- *Chapter 1.4.1.20.2.8.6 “Tab 'Synchronized Files'” on page 847*

Dialog 'Options' - 'Diagnosis'

Symbol: 

Function: This dialog is for the *“Diagnosis”* setting and views.

Call: menu *“Tools ➔ Options”*, category *“Diagnosis”*

Table 211: 'Diagnosis view'

“Enable subtree diagnosis”	☑: The subtree diagnosis is switched on.
“Enable debug columns”	☐: Debug columns are enabled.

Dialog 'Options' - 'External tools'

Symbol: 

Function: This dialog is for setting of *“External tools”*.

Call: menu *“Tools ➔ Options”*, category *“External tools”*

Tool	Version
“Panel builder”	*“Default”*

	“Custom”: Opens the file manager to search for the file location. Sometimes it is required to used dedicated versions of these tools (qualified versions, versions supporting more legacy types, …)
“Drive composer pro”	*“Default”*
	“Custom”: Opens the file manager to search for the file location. Sometimes it is required to used dedicated versions of these tools (qualified versions, versions supporting more legacy types, …)

“Restore defaults”	Resets the custom settings to default.

The modified settings will be valid after restart of Automation Builder.

Dialog 'Options' - 'FBD, LD, and IL'

Symbol: 

Function: This dialog is used for configuring the display options for the FBD/LD/IL editor.

Call: *“Tools ➔ Options”* (category *“FBD, LD, and IL”*.

Tab 'General'

Table 212: “View”

“Show network title”	The network title is displayed in the upper left corner of the network.
“Show network comment”	The network comment is displayed in the upper left corner of the network. When the network title is also shown in CODESYS, the comment is shown in the line below.
“Show box icon”	The block symbol is displayed in the block element in the FBD and LD editor. The standard operators also have symbols.
“Show operand comment”	CODESYS shows the comment that you indicated for a variable in the implementation part. The operand comment refers to the local occurrence of the variable only, as opposed to the symbol comment. This comment is truncated automatically depending on available space. You can limit the comment to a defined width by activating the option *“Fixed size for operand fields”*.
“Show symbol comment”	The comment that you indicated for a variable or symbol in the declaration is displayed in CODESYS above the variable name. You can also assign a local operand comment in addition to or instead of the symbol comment.
“Show symbol address”	If an address is assigned to a symbol (variable), then this address is displayed above the variable name.
“Show network separators”	A separator is displayed between the individual networks.

Table 213: “Behavior”

“Placeholder for new operands”	The operand field of pins for the new function block is left blank (instead of "???").
“Empty operands for function block pins”	Adds blank operands instead of `???`.

Table 214: “Font”

Click the input field to open the *“Font”* dialog.

“Fixed size for operand fields”	☑: *“Edit operand sizes”* can be enabled.
“Edit operand sizes”	The *“Operand Sizes”* dialog opens for setting the number of characters and lines.

Tab 'FBD'

Table 215: “View”

“Networks with line breaks”	☑: Display of the network with line breaks so that so that CODESYS can show as many blocks as possible in the current width of the window.
“Connect boxes with straight line”	☑: The length of the lines between the elements are fixed and short.

Table 216: “Behavior”

“Default network content”	Drop-down list: Contents of a new network
“After insertion select”	Drop-down list: Element that CODESYS selects after inserting a new network

Tab 'LD'

Table 217: “View”

“Networks with line breaks”	☑: Display of the network with line breaks so that so that CODESYS can show as many blocks as possible in the current width of the window.

Table 218: “Behavior”

“Default network content”	Drop-down list: Contents of a new network
“After insertion select”	Drop-down list: Element that CODESYS selects after inserting a new network

Tab 'IL'

Table 219: “View”

“Enable IL”	The IL implementation language is available in the development system.

Table 220: “Behavior”

“Default network content”	Drop-down list: Contents of a new network
“After insertion select”	Drop-down list: Element that CODESYS selects after inserting a new network

Tab 'Print'

Table 221: “Layout Options”

“Fit method”	Drop-down list for resizing.
“Avoid cutting of elements”	Elements that do not fit on the page are printed on the next page.
“Mark connections on adjacent pages”	Enabled for selection when *“Avoid cutting of elements”* is selected.

Dialog 'Options' - 'Help'

Symbol:

Function: This dialog defines whether CODESYS Online Help or CODESYS Offline Help opens when help is called.

Call: Menu bar: *“Tools ➔ Options”*; category: *“Help”*.

“Use CODESYS Online Help, if available”	• ☑ CODESYS Online Help opens when CODESYS Help is called. This is the default setting. • ☐ CODESYS Offline Help opens when CODESYS Help is called.

See also

- *“Using CODESYS help” on page 176*

Dialog 'Options' - 'Help'

Symbol:

Function: This dialog activates the online help if available.

Call: menu *“Tools ➔ Options”*, category *“Help”*

☐: *“Use Online Help if available”*.

Dialog 'Options' - 'IEC 60870-5-104'

Symbol:

Function: In this dialog you can set this notation of the *“Address format”*.

Call: menu *“Tools ➔ Options”*, category *“IEC 60870-5-104”*

Tab 'Adress format'

☑ 1.2.3 (separated by dots)
☐ 1-2-3 (separated by hyphens)
☐ 66051 (decimal number, big endian --> 0x10203)
☐ 197121 (decimal number, little endian --> 0x30201)

Dialog 'Options' – 'International Settings'

Symbol:

Function: This dialog is for the setting of the language in the user interface and in the help.

Call: Menu bar: *“Tools ➔ Options”*, category *“International Settings”*.

Dialog 'Options' – 'Libraries'

Symbol:

Function: This dialog helps you to manage the mappings of library references that CODESYS uses during the conversion of an old project. If you have not yet stored any mapping for a certain library, you must redefine the mapping each time when opening an old project in which this library is integrated.

Call: Menu bar: *“Tools ➔ Options”*; category: *“Libraries”*.

A mapping defines what a library reference looks like following the conversion of the project to the current format. There are three possibilities:

- You retain the reference. This means that CODESYS similarly converts the library into the current format (*.library) and installs it in the local library repository.
- You replace a reference with another reference. This means that one of the installed libraries replaces the library that was integrated until now.
- You delete the reference. This means that the converted project no longer integrates the library.

CODESYS applies all the listed mappings to the library references of an old project the next time it is converted. Hence, you must repeat the mapping definition if the same library is integrated again in a project that is to be converted. You can enter a new mapping in the last line.	
“Source Library”	Path of the library that is integrated in the project before the conversion. A double-click an entry makes the field editable and the button for the input assistance appears.
“Target Library”	Name and location of the library that is to be integrated in the project after the conversion. A double-click an entry opens the dialog *“Set target system library”*.

Table 222: “Set target system library”

“Scan”	The *“Select Library”* dialog opens. You can select a library from the library repository here. The dialog corresponds to the dialog in the library repository.
“Ignore”	When CODESYS converts the project, CODESYS always removes the existing source library from the project.

Dialog 'Options' – 'Library Download'

Symbol

Function: This dialog is for the setting of download servers.

Call: menu *“Tools ➔ Options”*, *“Library Download”* category

If you click on the button *“Download Missing Libraries”* in the library manager, CODESYS browses these download servers for libraries marked as missing in the library manager and uses the set login details for the proxy server.	
“Download servers”	URL of a server containing library files
Double-click on *“(Enter new download server here)”*	An input field opens in which you can enter the URL address of a server.

See also

- *Chapter 1.4.1.20.2.14 “Object 'Library Manager'” on page 874*
- *Chapter 1.4.1.20.4.13.20 “Dialog 'Options' - 'Proxy Settings'” on page 1198*

Dialog 'Options' – 'Load and Save'

Symbol: 

Function: The dialog contains settings for the behavior of CODESYS when loading and saving a project.

Call: Menu bar: *“Tools* ➔ *Options”*, *“Load and Save”* category

“Create backup files”	☑: Each time the project is saved, CODESYS also saves the project as the file `<project name>.project` in addition to the file `<project name>.backup`. You can rename the backup file and open it in the programming system.
“Automatically save every … minutes”	☑: CODESYS automatically saves the project at the specified time intervals in a file `<project name>.autosave`, which you can reload following non-regular closing of the programming system. CODESYS deletes the `.autosave` file whenever the project is closed or saved regularly. CODESYS retains the `.autosave` file in the case of an irregular termination. When you open a project for which there is an associated autosave file, the *“Auto Save Backup”* dialog opens. In this dialog you select whether the `.autosave` file or the version of the project last saved by the user should be opened.
“Save before build”	CODESYS saves the project automatically before each build operation.
“Create project recovery information”	Requirement: The *“No protection”* option is selected in the project settings in the *“Security”* category. This means that the project is not protected against unauthorized access and data manipulation, and there is no integrity check when the project is loaded. ☑: If a project crashes during editing, then the next time the project is opened, a prompt is displayed asking whether or not you want to restore the unsaved data and create a new project file. If you click *“Yes”*, then another dialog opens. In this dialog, you can select whether you want to open the restored project or open the project comparison. This project comparison displays the differences between the last saved project and the restored project. Note: The project restore records every change on the hard disk when the change is made. If a power failure or hard disk error occurs on the hard disk during this operation, then the last change may be lost.
“Advanced Settings”	The *“Advanced Settings”* dialog opens.

"At startup"	List box for the startup screen of CODESYS: ● *"Show start page"*: The start page of CODESYS is shown. ● *"Load last loaded project"* ● *"Show "Open Project" dialog"* ● *"Show "New Project" dialog"* ● *"Show empty environment"*
"News page"	URL that is opened by means of the command *"Help ➔ CODESYS CODESYS Homepage"*. By default, this page is `http://www.codesys.com/startpage`.

Table 223: Dialog "Advanced Settings"

"Project compression"	
"Level"	Requirement: The *"No protection"* option is selected in the project settings in the *"Security"* category. This means that the project is not protected against unauthorized access and data manipulation, and there is no integrity check when the project is loaded. List box for the compression level that is used when saving the project. ● *"Least compression - best speed (recommended)"* ● *"Medium compression - medium speed"* ● *"Most compression - worst speed"*
"Load Behavior"	
☑	Libraries and compilation information are loaded in the background while you edit the project.

- *Chapter 1.4.1.5 "Protecting and Saving Projects" on page 197*

Dialog 'Options' - 'Message View'

Symbol:

Function: In this dialog the number of messages can be determined.

Call: menu *"Tools ➔ Options"*, category *"Message View"*

"Maximum numer of messages" xxx

Default, 500, max. 9999, min. 20

Dialog 'Options' - 'Monitoring'

Symbol:

Function: This dialog includes settings for displaying the variable values in monitoring.

Call: Menu bar: *"Tools ➔ Options"*; category: *"Monitoring"*.

Table 224: “Display Mode for Integer Variables”

“Binary”	The value of the variable is displayed in the corresponding format in online mode. This option corresponds to the setting of the command *“Debug ➔ Display Mode”*.
“Decimal”	
“Hexadecimal”	

Table 225: “Floating Point Variables”

“Number of displayed digits”	Decimal places that are represented in online mode when REAL values are displayed. Note: The settings apply to the watch list, the monitoring of the declaration editor and the trace editor. The configuration for inline monitoring of the editor is set in the text editor options.

See also

- *“Tab 'Monitoring'” on page 1205*

Dialog 'Options' - 'PLCopenXML'

Symbol: 

Function:This dialog contains settings for the behavior of CODESYS when exporting or importing PLCopenXM.

Call: Main menu *“Tools ➔ Options”*, category *“PLCopenXML”*

Table 226: “PLCopenXML Export Settings”

“Additionally export declarations as plain text”	By default, CODESYS splits the declaration parts in accordance with the PLCopenXML scheme into individual variables and thus loses the formatting and some comment information. ☑: Formatting and comments are retained. CODESYS additionally writes the plain text of the exported declaration part into the PLCopenXML file and thus extends the PLCopenXML scheme.
“Export Folder Structure”	☑: CODESYS also exports the folders if they contain one of the selected objects. That is a CODESYS-specific extension to the PLCopenXML scheme.

Table 227: “PLCopenXML Import Settings”

“Import folder structure”	☑: If the import file contains information about the folder structure of the objects, CODESYS also imports this structure. ☐: CODESYS imports objects without structure.

- *Chapter 1.4.1.20.3.4.27 “Command 'Import PLCopenXML'” on page 1015*

Dialog 'Options' - 'Proxy Settings'

Symbol: 

Function: You use this dialog for storing the authentication data for the proxy server which is currently used for accessing the internet from CODESYS.

Call: Main menu *“Tools ➔ Options”*, category *“Proxy Settings”*

Requirement: Internet access of the network via proxy server

“Enter proxy credentials”	A double click opens the input request for the user name and the password for the proxy server. CODESYS uses the access data for the establishment of the connection to the download server for libraries and the device description, for the establishment of the connection to the CODESYS Store and for the command *“View ➔ Start Page”*. Requirement: If the internet access of your computer or of the network takes place via a proxy server, then the button is available.

- *Chapter 1.4.1.20.2.14 “Object 'Library Manager'” on page 874*
- *Chapter 1.4.1.20.3.3.20 “Command 'Start Page'” on page 999*

Dialog 'Options' - 'Refactoring'

Symbol: 

Function: The dialog is used for defining the operations in the project for which the automatic refactoring is suggested. The refactoring functionality helps you in your improvement endeavors.

Call: Menu bar: *“Tools ➔ Options”*, *“Refactoring”* category

'Suggest Refactoring for the Following Operations'

“Auto-declare”	When you change the name of a variable in a declaration by calling AutoDeclare (*[Shift]+[F2]*), the activated option *“Apply changes by means of refactoring”* appears. Then the *“Refactoring”* dialog opens and you can change the variable throughout the project. ● *“On adding or removing variables, or on changing the scope”* ☑: You delete the names in the *“Declare Variable”* dialog and click *“OK”* to close the dialog. Then the *“Refactoring”* dialog opens for removing the variable throughout the project. ● *“On renaming variables”* ☑: You specify the names in the *“Declare Variable”* dialog and click *“OK”* to close the dialog. Then the *“Refactoring”* dialog opens for renaming the variable throughout the project. See the chapter: "Refactoring", "Changing a variable declaration and applying refactoring automatically".
“Unit conversion editor”	*“ On renaming of unit conversions”* ● ☑: When you change the name of a conversion in the unit conversion editor, you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.
“Mapping editor”	*“On renaming variables”* ● ☑: When you change a variable name in the device editor (*“I/O Mapping”* tab), you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.

“Navigator”	*“On renaming objects”* ● ☑: When you change the name of an object in the device tree or in the POUs view, you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.
“Tabular declaration editor”	*“On renaming variables”* ● ☑: When you change the name of a variable in the tabular declaration editor, you are prompted whether CODESYS should perform "Automatic Refactoring" when renaming.

Dialog 'Options' - 'SFC Editor'

Symbol: 

Function: This dialog is used for configuring the settings for the SFC editor.

Call: Menu bar: *“Tools ➔ Options”* (*“SFC Editor”* category).

See also

- *Chapter 1.4.1.8.3.4.1 “Programming in SFC” on page 255*
- *Chapter 1.4.1.20.3.11 “Menu 'SFC'” on page 1079*
- *Chapter 1.4.1.19.1.4.1 “SFC editor” on page 476*

Tab 'Layout'

Table 228: “Elements”

This defines the dimensions of the SFC elements: step, action, qualifier, property. The values are given in matrix units, where one matrix unit equals the font size that you set in the text editor options (text area / font). The settings are always active immediately in all open SFC editor views.	
“Step height”	Possible values: 1-100
“Step width”	Possible values: 2-100
“Action width”	Possible values: 2-100
“Qualifier width”	Possible values: 2-100
“Property width”	Possible values: 2-100

Table 229: “Font”

The example text shows the current font. Click it to change the font.

Table 230: “Step Actions”

“Default insertion method”	• *“Copy reference”*: The reference to the action objects that call the step are also copied when the step is copied. The copied step and new step call the same action. • *“Duplicate implementation”*: The reference to the action objects that call the step are linked to this step. When copying the step element, new action objects are created for the new step, and the implementation is duplicated. • *“Always ask”*: When inserting a step action, you are always prompted whether the actions of a step element should be duplicated when it is copied, or whether the reference to the existing action should be applied. Note: If a step already contains an embedded action, then new inserted actions of this step are also embedded. Likewise, new inserted actions are not embedded when the step already contains a non-embedded action. In these cases, you are no longer prompted for a duplication mode.

Table 231: “Embedded Objects”

“Show action and transition objects in the navigator”	☑: Action and transition objects that are embedded in the SFC box by a step are displayed in the *“Devices”* or *“POUs”* tree view.

Tab 'View'

Table 232: “Property Visibility”

List of element properties for the categories *“Common”* and *“Specific”* with definitions of the display options.	
“Property”	Defines the element properties displayed next to the element in the SFC diagram.
“Value”	☑: Display of the property value.
“With Name”	☑: Display of the property value including name.

Table 233: “Online”

“Show step time”	☑: In online mode, CODESYS displays the step time to the right of the steps.

Dialog 'Options' - 'SmartCoding'

Symbol: 

Function: This dialog is for configuring the settings for easier coding.

Call: Menu bar: *“Tools* ➔ *Options”*, *“SmartCoding”* category

“Declare unknown variables automatically (AutoDeclare)”	☑: The *“Declare Variable”* dialog opens when you type an undeclared identifier into an implementation language editor and then click away from the input line. In order for the AutoDeclare function to be available in the ST editor as well, the *“Enable for ST editor”* option also has to be selected.
“Enable for ST editor”	Requirement: The *“Declare unknown variables automatically (AutoDeclare)”* option is selected. ☑: The AutoDeclare function is also available in the ST editor. ☐: The AutoDeclare function is not available in the ST editor.

“Show all instance variables in Input Assistant”	☑: The "List components" function also lets you select the local variables of a function block instance. ☐: The "List components" function lets select only the input variables and output variables of a function block instance.
“Show symbols from system libraries in Input Assistant”	System libraries are inserted in the library manager automatically and displayed in light gray. ☑: Symbols, such as global variables, data types, and function blocks, are offered in the Input Assistant. ☐: The symbols of the system libraries are not available in the Input Assistant.
“List components after typing a dot (.)”	☑: Activates the "List components" function. When you type a dot (.) at a location where CODESYS expects an identifier, a list box appears with possible code.
“List components immediately when typing”	Requirement: The *“List components after typing a dot (.)”* check box is selected. ☑: While you type code, a list box appears with possible identifiers and operators.
“Insert with namespace”	☑: CODESYS adds the namespace before the identifier.
“Convert keywords to uppercase automatically (AutoFormat)”	☑: CODESYS displays all keywords in uppercase.
“Automatically list selection in cross-reference view”	☑: The cross-reference list automatically shows the references of variables, POUs, and DUTs that are currently selected or where the cursor is waiting.
“Underline errors in the editor”	☑: Incorrect or unknown program code is underlined.
“Highlight symbols”	☑: All occurrences of a symbol where the cursor is positioned are highlighted in color within the editor. In this way, cross-references within the editor are quickly detected.
“Max. degree of parallelism”	List box for the number of parallel threads that can be used for the precompile processing. CODESYS detects the displayed number of threads from the number of CPU cores. This default number should be changed only in exceptional cases.

Dialog 'Options' - 'Startup settings'

Symbol:

Function: In this dialog the *“Version profile”* and the *“License”* are set.

Call: menu *“Tools* ➔ *Options”*, category *“Startup settings”*

“Version profil:”	Automation Builder 2.5
	☐ *“Display selected dialog at each start”*: Refers to the version of the AB to be displayed

“License:”	☑ *“Default: take any available license”*
	☐ *“Use only local license”*
	☐ *“Display license selection dialog if shared licenses are available”*

The modified settings will be valid after restart of the Automation Builder.

Dialog 'Options' - 'Text Editor'

Symbol: 

Function: The dialog contains settings for displaying and working in a text editor.

Call: Menu bar: *“Tools* ➔ *Options”*, *“Text Editor”* category

Tab 'Theme' On this tab, you set the desired theme in the interface design of the ST editor.

“Theme”	Color theme for the text editor. The selected theme is shown in the *“Preview”* window. The available color schemes are stored in the installation directory in the `Themes` folder.

Tab 'Editing'

"Number of undos"	Maximum number of editing steps that you can apply the *"Edit ➔ Undo"* command to.
"Folding"	Defines the structuring of the code by indentation. When you select an indentation, you can expand or collapse the indentation section by means of a plus and minus sign in front of the first line of each section. ● *"Indent"*: CODESYS combines all lines that are indented in relation to the preceding line into one indentation unit. ● *"Explicit"*: You mark the code segment explicitly with comments that should be combined in one indentation unit: a comment with three opening braces "{{{" has to be before the segment, and a comment with three closing braces "}}}" has to be after the segment. The comments can contain additional text. Example:  "Word wrap"	● *"Soft"*: The line break occurs at the edge of the editor window when 0 is specified for *"Wrap margin"*. ● *"Hard"*: The line break occurs after the number of characters specified for *"Wrap margin"*.
" Tab width"	Number of characters
"Keep tabs"	☑: CODESYS does not break up the space you have inserted with the *[Tab]* key into individual spaces afterwards.
"Indent width"	If you have selected *"Smart"* or *"Smart with code completion"* for the *"AutoIndent"* option, then CODESYS inserts the number of spaces at the beginning of the line.
"AutoIndent"	● *"None"* ● *"Block"*: A new line automatically applies the indentation of the previous line. ● *"Smart"*: Lines that follow a line which contains a keyword (for example, `VAR`) indent automatically by the specified `Indent width`. ● *"Smart with code completion"*: Indentation as in the case of the *"Intelligent "* option, but CODESYS also inserts the closing keyword (for example, `END_VAR`).

Tab 'Text Area'

"Highlight current line"	☑: The line where the cursor is located is highlighted.
"Matching brackets"	☑: When the cursor is positioned before or after a bracket within a line of code, the corresponding closing or opening bracket is marked by a frame.

"End of line markers"	☑: The end of each editor line is marked by a small dash after the last character (including spaces) of the line.
"Wrap guide"	☑: When a soft or hard line break is activated, the defined line break position is displayed with a vertical line.
"Font"	Clicking the field opens the default dialog for configuring the font.

Tab 'Margin'

Settings for the left margin of the text editor window, which is separated from the input area by a vertical line:	
"Line numbering"	☑: The declaration and implementation parts of the editor are numbered on the left, each beginning with 1.
"Highlight current line"	☑: The line number of the line where the cursor is located is highlighted.
"Show bracket scope"	☑: Brackets include the lines between the keywords that open and close a construct (for example, `IF` and `END_IF`). When the option is enabled and the cursor is positioned before, after, or in one of the keywords of a construct, the bracket area is displayed with a square bracket in the margin.
"Mouse Actions"	You can assign one of the following actions to each of the specified mouse actions or mouse-keyboard combinations. CODESYS performs the selected action when you move the mouse to the plus or minus sign in front of the header of a bracketed area: ● *"None"*: The mouse action does not trigger an action. ● *"Select fold"*: CODESYS selects all lines of the bracketed area. ● *"Toggle fold"*: CODESYS opens or closes the bracketed area, or if there are nested brackets, the first level of the bracketed area. ● *"Toggle fold fully"*: CODESYS opens or closes all levels of a nested bracketed area.

Tab 'Monitoring'

Settings for displaying the monitoring fields	
"Enable inline monitoring"	☑: Display of the monitoring fields behind the variables in online mode
"Number of displayed digits"	Number of comma places in the monitoring field
"String length"	Maximum length of string variable values in the monitoring field

- *Chapter 1.4.1.8.3.3.1 "Programming structured text (ST)" on page 254*

Dialog 'Customize'

The dialog contains the tabs to configure the user interface.

You can reset the CODESYS settings to default by use of the *"Reset"* button.

Dialog 'Customize' - 'Menu'

Function: With this dialog, you define the structure and contents of the user interface.

Call: Main menu *"Tools ➔ Customize"* (*"Menu"*).

When you click *"OK"* to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 234: "Menu"

Display of currently defined menus, submenus, and included commands. In CODESYS, a menu or submenu caption is identified by the caption symbol ( ). The layout from top to bottom corresponds to the layout displayed later in the CODESYS menu.	
"Add Command"	Enabled when a command is selected. Adds a command above the selected command. Opens the *"Add Command"* dialog. Use the *"Add Command"* dialog for selecting one or more commands. Left part: List of categories. Right part: List of commands in the selected category.
"Add Separator"	Adds a separator above the selected command.
"Add Popup Menu"	Adds a popup menu above the selected menu, submenu, or command. Opens the *"Add Popup Menu"* dialog.
"Edit Popup Menu"	Opens the *"Edit Popup Menu"* dialog.
"Reset"	Resets the default settings of the entire menu.
"Load"	Loads the settings from a stored file (<file name>.opt.menu).

Table 235: "Add Popup Menu"

In CODESYS, a new menu is shown in the menu bar only when the menu contains at least one command.	
"Default text"	Select this check box when localization is available.
"Localized Texts"	List: Languages and localized texts.
"Add Language"	Opens a drop-down list of available languages. In CODESYS, the selected language is displayed in the area *"Localized Texts"*. Use the *"Text"* column for typing the localized texts.

- *Chapter 1.4.1.20.4.14.3 "Dialog 'Customize' - 'Toolbars'" on page 1207*

Dialog 'Customize' - 'Command Icons'

Function: This dialog defines the icons of the menu commands.

Call: Menu bar: *"Tools ➔ Customize"* (*"Command Icons"*).

Table 236: "Command icon"

"Assign"	Opens a dialog for selecting the new icon (*.ico).
"Remove"	Removes the user-defined icon. The default icon is active again.
"Reset"	Resets all default settings of the command icons.
"Load"	Loads the settings from a stored file (<file name>.opt.keyb).
"Save"	Saves the current settings to a file (<file name>.opt.keyb).

See also

- *Chapter 1.4.1.1.2.3 “Customize command icon” on page 183*

Dialog 'Customize' - 'Toolbars'

Function: Use this dialog for generating new toolbars or customizing existing toolbars.

Call: Main menu *“Tools ➔ Customize”* (*“Toolbars”*).

When you click *“OK”* to close the dialog, the changes are visible in the menu bar of the CODESYS user interface.

Table 237: “Toolbars”

Display of currently defined toolbars. In CODESYS, the associated commands are listed below each toolbar in the order they will appear in the toolbar. Double-clicking a toolbar in the list switches to editing mode.	
“Add Toolbar”	Enabled when a toolbar is selected. In CODESYS, this adds a toolbar above the selected toolbar and places the cursor in the name field of the new toolbar.
“Add Command”	Enabled when you select a command or blank command entry below a toolbar. Adds a command above the selected command. Opens the *“Add Command”* dialog. Use the *“Add Command”* dialog to select one or more commands. Left part: List of categories. Right part: List of commands in the selected category.
“Add Separator”	Adds a separator above the selected command.
“Hide”	Hide the selected toolbar from the user interface.
“Show”	Shows the selected hidden toolbar in the CODESYS user interface.
“Reset”	Resets the default settings of the toolbars.
“Load”	Loads the settings from a stored file (<file name>.opt.tbar).

See also

- *Chapter 1.4.1.1.2.2 “Customizing toolbars” on page 182*
- *Chapter 1.4.1.20.4.14.1 “Dialog 'Customize' - 'Menu'” on page 1206*

Dialog Box 'Customize' - 'Keyboard'

Function: This dialog box is used for defining keyboard shortcuts (quick access keys or keyboard combinations) for commands.

Call: Main menu *“Tools ➔ Customize”* (*“Keyboard”*).

Table 238: “Keyboard”

“Shortcuts for selected command”	Keyboard shortcuts for the selected command The drop-down list can include more than one keyboard shortcut for the command.
“Press shortcut keys”	Input field for the keyboard shortcut of the selected field. Permitted combinations include *[Ctrl]*, *[Alt]*, *[Shift]*, and other keys. You clicking *“Assign”* to assign a recorded keyboard shortcut to a selected command.
“Shortcut keys currently used by”	Command assigned to the currently defined keyboard shortcut

“Reset”	Resets the default settings of the keyboard shortcuts.
“Load”	Loads the settings from a stored file (<file name>.opt.keyb).

Dialog 'Trace Configuration'

Dialog 'Advanced Trace Settings'

Function: This dialog provides extended settings for recording data.

Call: *“Advanced”* button in *“Trace Configuration ”* dialog, *“Record Settings”* subdialog

Requirement: The trace editor is open and active. The dialog *“Trace configuration”* is open and the top node of the trace record tree is selected so that the subdialog *“Record settings”* is available.

For the calculation of the values, you have to select a task in the “Trace Configuration” dialog.

The buffer size is defined as "number of samples". CODESYS calculates the time intervals that corresponds to this number and displays the result in normal fonts on the right outside the table (for example, *“1h1m1s1ms”*). The calculation is possible only with the help of the task configuration settings and when the task cycle time is known.		
“Measurement in every nth cycle”	Data recording in every n task cycle Preset: `1`; then the application performs the data recording in each task cycle.	Scanning interval of the data recording Example: `100ms`
“Recommended runtime buffer size (samples)”	Requirement: *“Override runtime buffer size”* is deactivated. The maximum number of samples that CODESYS calculates and recommends, which the application stores at runtime per trace variable. CODESYS calculates the number in the task cycle time from the value in *“Measure in every n-th cycle”* and the value in Measure in every n-th cycle.	Maximum length of the time interval during which the application collects data on the runtime system. Example: `2s`
“Override runtime buffer size”	Maximum number of samples per trace variable that saves the application per trace variable in runtime mode. Example: `100` Value range: starting at `10` ☑: The application uses this value, not the value calculated by CODESYS from *“Recommended runtime buffer size (samples)”*.	Maximum length of the time interval during which the application collects data on the runtime system. Example: `6s`
“Trace editor buffer size per variable (samples)”	Number of values that can be stored per variable in the trace editor. Example: `10000`	The maximum time period for the display in the trace editor results from the maximum number and the scanning interval of the data recording. You can scroll back a maximum of this time in the trace editor.

- *Chapter 1.4.1.12.3.2 “Creating trace configuration” on page 424*

Dialog 'Trace Configuration'

Symbol:

Function: The dialog includes the trace configuration for the data recording.

Call

- *“Trace ➔ Configuration”*; context menu
- Link *“Configuration”* in the trace editor
- Link *“Add Variable”* in the trace editor

Requirement: The editor of a trace object is open and active.

See also

- *Chapter 1.4.1.12.3.2 “Creating trace configuration” on page 424*
- *Chapter 1.4.1.12.3 “Data Recording with Trace” on page 421*
- *Chapter 1.4.1.19.6.2.25 “Attribute 'monitoring'” on page 709*

Tree view 'Trace Record' The tree view lists the variables that are traced and allows for access to the variable settings.

Selected trace name	The *“Record Settings”* subdialog is displayed on the right.
Selected trace variable	The *“Variable Settings”* subdialog is displayed on the right.

Table 239: Context menu commands

+ *“Add Variable”*	Adds a new trace variable. The *“Variable Settings”* subdialog opens on the right and it is partially configured. Select a variable in the input field of the *“Variable”* setting to trace its value curve.
“Assign to Diagram”	Lists the diagrams (in the submenu on the right) where the selected variable is not currently displayed. Select a diagram to display the variable there. The command is available when a variable is selected in the tree view. Hint: When the command is deactivated, the variable is already displayed in all diagrams.
“Enabled”	Selected by default Disabled variables are displayed as disabled. They are neither displayed nor recorded.

Tree view 'Presentation (Diagrams)' The tree view lists the diagrams that are displayed in the trace editor and allows for access to their display mode.

Selected node *“Time axis”*	The *“Display Mode”* subdialog for the time axis is displayed on the right. You can specify the time axis display. See below.
Selected diagram name	The settings for the coordinate system of the diagram and a preview are displayed on the right. See below.
Selected node *“Y-axis”*	The *“Display Mode”* subdialog is displayed on the right. You can specify the axis display. See below.

“Show variables”	
Selected trace variable	The *“Variable Settings”* subdialog is displayed on the right. You can configure the trace variable. See below. Note: These are the same settings that can be accessed in the *“Trace Record”* tree view.

Table 240: Context menu commands

+ *“Add Diagram”*	Adds a new diagram below and displays it in the tree view *“Presentation (Diagrams)”*.
+ *“Add New Variable”*	Adds a new trace variable. The *“Variable Settings”* subdialog opens on the right and it is partially configured. Select a variable in the input field of the *“Variable”* setting to trace its value curve. Specify its display. In addition, the variable is assigned to the selected diagram.
“Add Existing Variable”	Lists all trace variables (in the submenu on the right) where the selected diagram is not currently displayed. Select a variable in order to display it in the selected diagram. Hint: When the command is deactivated, all trace variables are already displayed in the selected diagram.

Subdialog 'Record Settings' Requirement: The top node is selected in the *“Trace Record”* tree view.

“Enable trigger”	☑: Triggering is enabled. The trace data is buffered at runtime only when a trigger signal has been sent. You determine how the trigger signal is sent in the *“Trigger variable”*, *“Trigger parameter”*, *“Trigger edge”*, *“Post-trigger (Samples)”*, and *“Trigger level”* settings. ☐: Continuous display of current records
“Trigger variable”	Signal that is used as a trigger. A complete instance path is required. A valid trigger signal is an IEC variable, a property, a reference, a pointer, an array element of the application, or an expression. Allowed types are all IEC-based types **except** `STRING`, `WSTRING`, and `ARRAY`. Enumerations are allowed when the base type is not `STRING`, `WSTRING`, or `ARRAY` The contents of a pointer are not a valid signal. When the runtime system uses the `CmpTraceMgr` component, a property that is linked to the `'monitoring'` attribute can then be recorded as a variable.
“Trigger parameter”	System parameter that is used as a trigger The *“Input Assistant”* dialog lists all valid system parameters in the *“Parameters”* category of the *“Categories”* tab.
▾	Allows the selection of *“Trigger variable”* or *“Trigger parameter”*

"Trigger edge"	Defined the edge detection for triggering: ● *"positive"* – For Boolean trigger variables, triggering occurs when the values changes from `FALSE` to `TRUE`. – For analog trigger variables, triggering occurs when the value as defined in *"Trigger level"* is reached from below. ● *"negative"* – For Boolean trigger variables, triggering occurs when the values changes from `TRUE` to `FALSE`. – For analog trigger variables, triggering occurs when the value as defined in *"Trigger level"* is reached from above. ● *"both"* – For Boolean trigger variables, triggering occurs when the values changes. – For analog trigger variables, triggering occurs when the value as defined in *"Trigger level"* is reached.
"Post trigger (samples)"	Number of records per trace variable that are buffered after triggering. Default: `50`; value range: `0` to (2^{32} `- 1`)
"Trigger level"	Value that is reached to start the triggering
"Task"	Task in which the data is recorded.
"Recording condition"	At runtime, the application checks the recording condition. If it is fulfilled, then the trace data is buffered. Record condition for data recording with `CmpTraceMgr` runtime system component: ● As an expression that includes only permitted operators and operands. Allowed operators that can also be nested: (logical) `AND`, `NOT`,`OR`, comparison operators `<`, `<=`, `>`, `>=`, `=`, `<>`. Allowed operands: Variables that are valid for trace. ● As a variable. Allowed type: `BOOL`, bit access, property. The condition is fulfilled for `TRUE` or `1`. The contents of a pointer are not permitted. Recording condition for a data recording with IEC code. ● As an expression that returns a Boolean value.
"Comment"	Comment (for example, from the recording condition)
"Resolution"	Unit of measure for the time stamp that is recorded per data set ● *"ms"*: Time stamp (in milliseconds). ● *"µs"*: Time stamp (in microseconds) for a task cycle time of 1 ms or less
"Automatic restart"	☑: Persistently saves the trace configuration and the last contents of the RTS buffer to the target device. After the device has been restarted, the trace is started automatically if the trigger has not occurred yet.
"Advanced"	Opens the *"Advanced Trace Settings"* dialog.

See also

- *Chapter 1.4.1.20.4.15.1 "Dialog 'Advanced Trace Settings'" on page 1208*

Subdialog 'Variable Settings'

Requirement: A trace variable is selected in the *"Trace Record"* or *"Display (Diagrams)"* tree view.

"Variable"	Valid variable Variable; value recorded with full instance path. Valid: ● IEC variable ● Property ● Reference ● Contents of the pointer ● Array element Allowed data type ● IEC-based type **except** `STRING`, `WSTRING`, or `ARRAY` ● Enumeration when the base type is not `STRING`, `WSTRING`, or `ARRAY` When the runtime system uses the `CmpTraceMgr` component, a property that is linked to the `'monitoring'` attribute can then be recorded as a variable.
"Parameter"	Parameter whose data is recorded. Requirement: Runtime system with `CmpTraceMgr` component The *"Input Assistant"* dialog lists all valid system parameters in the *"Parameters"* category of the *"Categories"* tab.
	Allows toggling between *"Variable"* and *"Parameter"*
"Color"	Color of the variable in the trace diagram
"Line type"	Display as line chart ● *"Line"*: Values are linked to form a line. ● *"Step"*: Values are linked in the form of steps ● *"None"*: Values are not linked
"Point type"	Display as scatter chart ● *"Dot"*: Value is displayed as a dot ● *"Cross"*: Value is displayed as a cross. ● *"None"*: value is not displayed
"Activate minimum warning"	☑: Warning when less than the lower limit
"Critical lower limit"	If the value of the trace variable falls below the limit, the variable is displayed in the warning color.
"Color"	Warning color on falling below the limit
"Activate maximum warning"	☑: Warning when exceeding the upper limit
"Critical upper limit"	If the value of the trace variable exceeds the upper limit, the variable is displayed in the warning color.
"Color"	Warning color on exceeding the limit

Subdialog 'Display Mode' Requirement: An axis is selected in the tree view *"Presentation (Diagrams)"*

"Display Mode"	Scaling ● *"Auto"*: Automatically scaled time axis ● *"Fixed length"*: Time axis segment with a constant *"Length"* ● *"Fixed"* Time axis segment from *"Minimum"* to *"Maximum"*
"Minimum"	Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*. Examples: `20,PLC_PRG.iLimit_Min, GVL.c_iLimit_Min` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Min : INT := 20`
"Maximum"	Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*. Examples: `80,PLC_PRG.iLimit_Max, GVL.c_iLimit_Max` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Max : INT := 80`
"Length"	Constant segment length; the initial value is adapted automatically.
"Grid"	☑: Diagram with grid line in the X-direction. Select the grid line color from the list box of colors.

Table 241: "Tick marks"

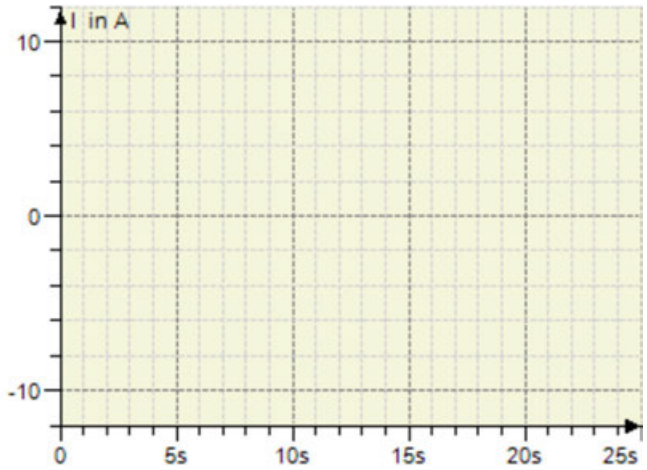
"Fixed spacing"	☑: Display of tick marks with *"Distance"* and *"Subdivisions"*.
"Distance"	Distance between tick marks
"Subdivisions"	Number of subdivisions between two tick marks

"Font"	Font for the time axis.

Link *"Preview"*	Displays the preview of the diagram.

Diagram preview

Requirement: A diagram is selected in the tree view *"Presentation (Diagrams)"*



“Background color”	Background color of the diagram. ▾ opens the list box of colors.
“Background color on selection”	Background color of the selected diagram.

Link *“Add Variable”*	Adds a new trace variable (in the *“Trace Record”* tree view).
Link *“Delete Variable”*	Deletes the selected trace variable (in the *“Trace Record”* tree view).
Link *“Add Diagram”*	Adds a new diagram (in the *“Display”* tree view).
Link *“Delete Diagram”*	Deletes the selected diagram (in the *“Display”* tree view).
Link *“Reset Display Settings”*	Resets the display settings of either the selected diagram or Y-axis to the default values.

“OK”	Accepts the configuration changes and saves the trace configuration.

Dialog Box 'Trend storage'

Function: This dialog box includes the configuration for buffering the trend data of a trend recording.

Call: *“Trend Storage”* button in the editor of a trend recording.

“Maximum number of variables”	Maximum number of trend variables that can be managed in the database. If you increase this value afterwards, then will CODESYS perform a download and reconfigure the database.
“Store every N milliseconds”	Time interval (in ms) when the `CmpTraceMgr` runtime system component buffers the recorded data before storing it persistently in the database. The application calculates internally the number of task cycles from the time interval. The duration of a task cycle is defined in the task configuration. A high value results in better runtime performance. The disadvantage is the increased risk of losing data if the controller crashes or shuts down. A low value reduces this risk. The disadvantage is the slower control over a trend visualization with large amounts of data.
“Limit”	: Limit the recording ● *“No Limit”*: Unlimited number of data records (not recommended) ● *“Maximum number of records”*: Maximum number of data records that are stored in the database. A data record consists of time stamp and the values of the trend variables at this time. ● *“Maximum storage size”*: Maximum size of the trend storage. The application calculates internally the number of data records. Clicking the "down" symbol (▾) of the drop-down list will set the units to kilobytes (KB), megabytes (MB), or gigabytes (GB).

See also

- *Chapter 1.4.1.20.2.31 “Object 'Trend Recording'” on page 949*
- *Chapter 1.4.1.12.4.1 “Getting started with trend recording” on page 431*

Dialog Box 'Advanced Trend Settings'

Function: This dialog box provides more settings for configuring trend recording.

Call: Click *“Advanced”* in the editor of a *“TrendRecording”* object.

“Measure in every n-th cycle”	Frequency that the runtime system records data, depending on the number of processed task cycles. Select a value from the drop-down list or type a value into the input field. Using the settings from the task configuration, CODESYS calculates the time interval according to the frequency. Therefore, the calculation is possible only if at least the task cycle time is set. The result is shown on the right of the input field in normal syntax (for example, *“1h1m1s1ms”*). Default: `1` means that data is recorded in each task cycle.
“Additional Runtime Buffer for”	Length of the time interval when the runtime system can record more data (for example, `1000 ms`). If a delay occurs when writing data in the runtime system component, then there is a risk of data loss due to overwriting. In this case, the runtime system uses the addition buffer.

Dialog 'Certificate Selection'

Symbol:

Function: This dialog is used for selecting the certificates for encryption, decryption, and digital signatures.

Call:

- *“Security Screen”* view, *“User”* tab
- Main menu: *“View ➔ Properties”*, *“Encryption”* tab when the *“Application”* is selected in the device tree.
- Main menu: *“Project ➔ Project Settings”*, category *“Security”*

Dialog 'Certificate selection'

The purpose of the certificate that is selected in the dialog depends on the call location: ● Call location: *"Security screen"* view, *"User"* tab – Certificate for digital signatures – Certificate for the decryption of project files – Certificate for encrypted communication ● Call: *"View ➔ Properties"* of the application – *"Certificates of devices that share the encrypted download and the boot application"* ● Call location: *"Project ➔ Project settings"*, category *"Security"* – *"Certificate for project encryption"*	
Listing of the selected certificates in a table	The following properties are displayed for each selected X.509 certificate: ● *"Created for"* ● *"Created by "* ● *"Valid as of"* ● *"Valid until"* ● *"Thumbprint"*: SHA1 fingerprint Double-clicking an entry opens the *"Certificate"* dialog with the *"General"* tab, *"Details"* tab, and *"Certification Path"* tab. In that tab, you will find a reference to Windows help with more information about the dialog.
	Adds the selected available certificate to the list of selected certificates.
	Deletes the certificate selected in the list.
"Available certificates in the local Windows Certificate Store"	Double-clicking an entry opens the *"Certificate"* dialog with the *"General"* tab, *"Details"* tab, and *"Certification Path"* tab. In that tab, you will find a reference to Windows help with more information about the dialog.
Certificate icons	●  ●  : Certificate with private key ●  : Untrusted certificate

1.4.2 Fieldbus Support

1.4.2.1 Device Diagnosis

CODESYS provides general and fieldbus-specific function blocks for performing a diagnosis on the connected devices.

General diagnosis

You can perform a diagnosis on devices regardless of the fieldbus. The function blocks from the `CAA Device Diagnosis` library are provided for this purpose.

Before you can work with these function blocks, you have to select the *"Enable diagnosis for devices"* option in the PLC settings. This causes CODESYS to create instances of the diagnosis functions blocks automatically. These function blocks can be used for your diagnosis.

Work exclusively with the automatically generated instances of the diagnosis function blocks. Do not create your own instances.

See also

- *Chapter 1.4.1.20.2.8.9 “Tab 'PLC Settings'” on page 850*
- *Library CAA DeviceDiagnosis*

Bus-specific diagnosis

For bus-specific diagnosis options, see the diagnosis chapters of the individual fieldbuses.

1.4.2.2 Fieldbus Devices and I/O Drivers

The technical basis for each fieldbus device, which is configured in the device tree, is the CODESYS I/O driver.

The I/O driver is the link between the fieldbus stack, the IEC application, and the CODESYS IDE. The driver configures the fieldbus stack from the data of the device configuration. It shows the diagnosis, provides an API for the IEC application, and is responsible for the I/O mapping (see chapter "I/O Mapping").

This chapter provides a brief overview of the basic functionality of CODESYS I/O driver devices, without discussing the details of specific bus systems. In addition, some recommendations for the configuration are provided.

Bus cycle task

The bus cycle task is the IEC task in whose context the I/O driver is executed. Some I/O drivers use multiple tasks: usually one real-time critical task (with high priority), which is used for the transfer of I/O data, and another task with low priority for tasks such as evaluating diagnostics and executing acyclic services of the bus system.

With real-time critical bus systems, it has to be ensured that no operations are executed in the context of this bus task that would interrupt the bus clock due to the execution time.

The bus task can be configured in the I/O mapping dialog of the I/O driver device. Note that the settings of the parent device are inherited by default. If this device is the PLC, then its PLC setting applies in the bus cycle task.

NOTICE!

If this above setting is not set, then the task with the shortest cycle time is used. In this way, a non-real-time I/O driver can be executed unintentionally in the task context of a real-time critical driver, thus interrupting its communication. To diagnose these communication problems, it is recommended to check the task monitoring.

See also

- *Table 64 ““Bus Cycle Options”” on page 851*

I/O mapping

An essential function of an CODESYS I/O driver is to update the I/O mapping. This means the mapping of the I/O data of the bus system to variables of the IEC application (and vice versa).

The input/output data is mapped cyclically by copy and conversion operations in both directions from the internal memory image of the bus system to IEC variables assigned to %I and %Q addresses.

For the I/O driver, there is no internal difference whether symbolic names or "direct" access to the %I and %Q addresses are used for this I/O mapping. For the maintainability of the application, it is recommended to always use descriptive variable names (example: variable "TemperatureReactor" instead of "%IW117" access).

The updating of the I/O mapping can be set with *“Always update variables”* (globally in the *“PLC Settings”* or individually for each device in the I/O mapping dialog):

- Disabled:
  Only I/O data used in the application is mapped.
  This may improve performance by avoiding the copy operations, but may cause confusion if the I/O data in the I/O mapping dialog is not updated (the values are then grayed out). This setting is recommended for an application whose development has been completed.
- Enabled 1:
  All data is updated.
- Enabled 2:
  Caution: For productive use in special cases only.
  As a result, inconsistent I/O data may occur, because the bus cycle task reads/writes this data while the application code uses it in other tasks.
  See „Consistency of I/O data“.

See also

- *Chapter 1.4.1.20.2.8.11 “Tab '<device name> I/O Mapping'” on page 854*

Consistency of I/O data

The CODESYS programming system allows the IEC application to use multiple tasks executed in parallel (for visualization, field buses, or other POUs). The application code can access I/O data from the context of these tasks via the mapped IEC variables. By accessing the same data from different tasks, inconsistent or corrupt data could occur (for example, due to interrupted write access).

The I/O driver ensures data consistency by providing each task executing a task cycle with a consistent mapping – a snapshot, so to speak – of all I/O data used.

So a code like in the following example cannot cause problems: (Note "DIV by ZERO")

```
IF(inputData <> 0) THEN                 // inputData is mapped to %I
    x := y / inputData;                 // This will never result in
DIV_BY_ZERO Exception
END_IF                                  // inputData is not updated by
bus cycle during execution of POU
```

NOTICE!
With the *“Always update variables”* option set to *“Enabled 2 – always in bus cycle task”*, this mechanism is overridden. Accordingly, the application code has to take this into account.

Services

In addition to the basic functionality, some I/O drivers provide services that can be called from the CODESYS IDE, such as the device scan function or the setting of device addresses.

General recommendations

Settings:

- *“PLC Settings”*: ☑ I/O updates in stop:
  The bus cycle continues even when the application is stopped, for example when the application is on a debug breakpoint. In this way, communication with the field devices is maintained and can be continued immediately without interruption.
- *“PLC Settings”*: *“Always update variables”* is set to *“Enabled 1 – use bus cycle task if not used in any task”*:
  During the development of the application, it is useful to see the values of all I/O data.

Task configuration:

- Especially for real-time critical fieldbus systems such as Profinet, EtherCAT, or CAN, which depend on maintaining an exact send/receive clock, it is recommended to use a separate bus cycle task with high priority. For less real-time-critical tasks (for example, visualization) a significantly lower priority should be selected than for the bus cycle task.
- In order to achieve maximum I/O throughput with as little offset as possible, separate POUs can be executed in the bus task of the fieldbus system. However, these then have to meet the real-time requirements: for example, no file access or blocking socket functions may be executed, but for example only the calculation of the output data.

Multiple I/O drivers and tasks (trouble-shooting)

If consistent access to I/O data from multiple tasks and possibly across multiple I/O driver instances has to be synchronized, then undesired reciprocal interference between the bus and application task may occur under certain circumstances.

This is the case, for example, when the general system load is high or when the I/O data of the real-time critical fieldbus system is used together with I/O data of a slow and blocking local bus system in the same task.

In case of unexpected interference of the communication, with the particularly real-time-critical fieldbuses (EtherCAT, Profinet, CAN), the task monitoring should therefore first be examined for very large jitter or outliers in the cycle time (maximum value compared to average value). The task list provides detailed information about the use of I/O data in different tasks.

It may be possible to avoid using I/O data from different bus systems in one and the same task or to reduce the number of I/O tasks.

See also

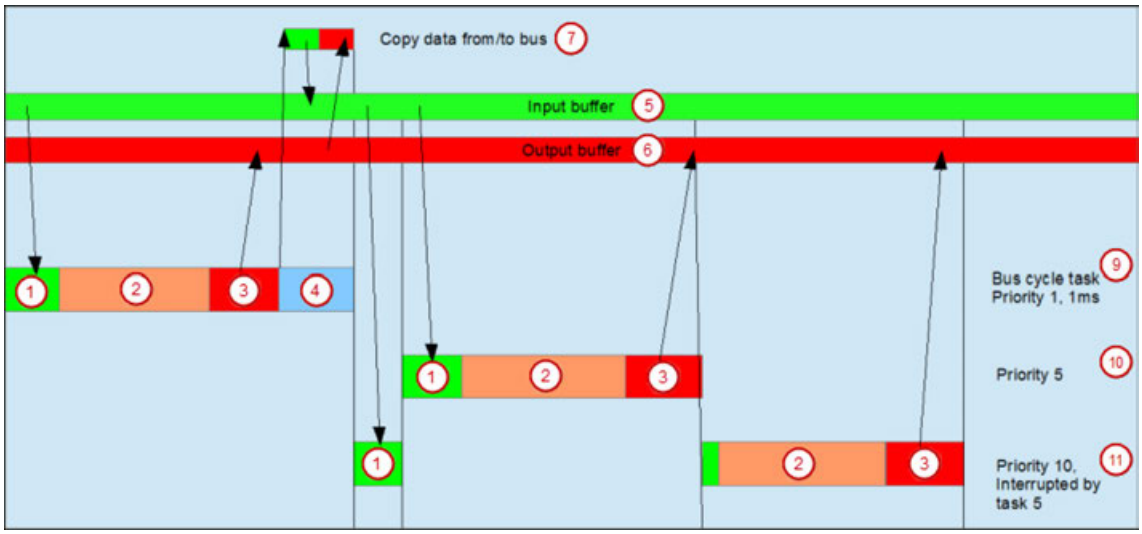
- *Chapter 1.4.1.20.2.8.17 “Tab 'Task deployment'” on page 869*

1.4.2.3 Bus Cycle Task

Generally, for each IEC task, the used input data is read at the start of each task (1) and the written output data is transferred to the I/O driver at the end of the task (3). The implementation in the I/O driver is decisive for additional transfer of the I/O data. It is responsible for the time frame and time point that the actual transfer to the corresponding bus system occurs.

The bus cycle task of the PLC can be defined globally for all fieldbuses in the PLC settings. For some fieldbuses, however, you can change this independent of the global setting. The task with the shortest cycle time is used as the bus cycle task (setting: *“unspecified”* in the PLC settings). The messages are normally sent on the bus in this task.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.



```
(1) Read inputs from input buffer              (2) IEC task
(3) Write outputs to output buffer      (4) Bus cycle
(5) Input buffer                                    (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5
```

Task usage

The *“Task Deployment”* tab provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!
If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

If the same inputs are used in various tasks, then it is possible for the input to change during the processing of a task. This happens when the task is interrupted by a task with a higher priority and causes the process image to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

1.4.2.4 EtherNet/IP Configurator

Refer to the general description for information about the following tabs of the device editor.

- *Chapter 1.4.1.20.2.8.11 “Tab '<device name> I/O Mapping'” on page 854*
- *Chapter 1.4.1.20.2.8.12 “Tab '<device name> IEC Objects'” on page 859*
- *Chapter 1.4.1.20.2.8.3 “Tab 'Parameters'” on page 844*
- *Chapter 1.4.1.20.2.8.18 “Tab 'Status'” on page 870*
- *Chapter 1.4.1.20.2.8.19 “Tab 'Information'” on page 870*

Only in the case of special features is there an additional help page for the specific device editor.

If the "<device name> Parameters" tab is not shown, then select the “Show generic device configuration editors” option in the CODESYS options (“Device Editor” category).

An EtherNet/IP network consists of an EtherNet/IP scanner and one or more EtherNet/IP adapters. In this case, the scanner is the master in the network and the adapters are the slaves.

The CODESYS runtime can act as either a scanner or an adapter.

CODESYS continues to differentiate between a remote adapter and a local adapter.

- **EtherNet/IP Remote Adapter**: In CODESYS, a remote adapter is a device that you insert in the device tree of a project below an EtherNet/IP scanner.
- **EtherNet/IP Local Adapter**: In CODESYS, a local adapter is a device that you insert in the device tree of a project directly below an Ethernet adapter (TCP) or Modbus port (COM). As a result, you can use the CODESYS runtime as a EtherNet/IP adapter.

See also

- *Device Editor Options*

1.4.2.4.1 EtherNet/IP Bus Cycle Task

General information

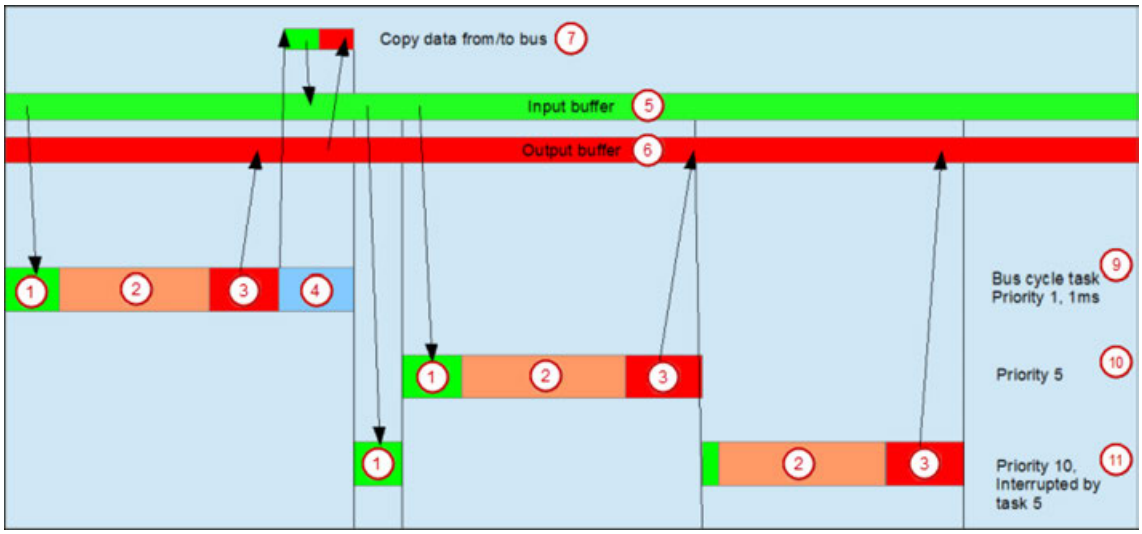
By "bus" it means all fieldbuses including I/O bus. There is no bus cycle task for Modbus because it is controlled by POUs. Modbus does not provide IO mapping.

It's recommended to define a dedicated bus cycle task for each fieldbus configured in the project. It's strongly recommended not to use "unspecified" in the "*"PLC Settings"*" to avoid unexpected behavior. The task defined in *"PLC Settings"* determines the bus cycle task of I/O bus and, depending on the configuration, of the additional fieldbuses (the setting is by default inherited).

Especially in case of EtherCAT, a dedicated bus cycle task should be used which is not shared with other fieldbuses. If *[unspecified]* is set in *"PLC Settings"*, the EtherCAT task might be automatically used by other fieldbuses, potentially causing EtherCAT task processing to fail. This should be avoided by specifying a task different to the EtherCAT task in *"PLC Settings"*.

As a rule, for each IEC task the used input data is read at the start of each task and the written output data is transferred to the I/O driver at the end of the task . The implementation in the I/O driver is decisive for further transfer of the I/O data. The implementation is therefore responsible for the timeframe and the specific time when the actual transmission occurs on the respective bus system.

Other tasks copy only the I/O data from an internal buffer that is exchanged only with the physical hardware in the bus cycle task.



```
(1) Read inputs from input buffer        (2) IEC task
(3) Write outputs to output buffer       (4) Bus cycle
(5) Input buffer                         (6) Output buffer
(7) Copy data to/from bus
(9) Bus cycle task, priority 1, 1 ms
(10) Bus cycle task, priority 5
(11) Bus cycle task, priority 10, interrupted by task 5
```

Using tasks

The *"Task Deployment"* provides an overview of used I/O channels, the set bus cycle task, and the usage of channels.

WARNING!

If an output is written in various tasks, then the status is undefined, as this can be overwritten in each case.

When the same inputs are used in various tasks, the input could change when a task is processed. This happens if the task is interrupted by a task with a higher priority and causes the process map to be read again. Solution: At the beginning of the IEC task, copy the input variables to variables and then work only with the local variables in the rest of the code.

Conclusion: Using the same inputs and outputs in several tasks does not make any sense and can lead to unexpected reactions in some cases.

1.4.2.4.2 EtherNet/IP Scanner

CODESYS runtime as EtherNet/IP scanner

CODESYS provides two different EtherNet/IP scanners:

- (1): A device that you insert directly below each network adapter A CODESYS Ethernet/IP scanner (IEC) can also be an adapter at the same time – functionally an originator and an adapter in one.
- (2): A device that needs a special cifX adapter

You insert one or more EtherNet/IP adapters below a scanner.

- *Chapter 1.4.2.4.2.1 “Tab 'EtherNet/IP Scanner - General'” on page 1223*
- *Chapter 1.4.2.4.2.2 “Tab 'EtherNet/IP Scanner NetX - General'” on page 1224*

Tab 'EtherNet/IP Scanner - General'

Object: EtherNet/IP Scanner

This tab in the configurator of the EtherNet/IP scanner includes the basic settings. The network interface used by the scanner is configured in the settings of the Ethernet adapter.

Table 242: “Options”

“Automatic restoring of connections ”	☑: The scanner always attempts to automatically re-establish an interrupted connection. For example, if a timeout is detected for UDP I/O messages or the TCP connection to the adapter is interrupted. If the option is activated, then the scanner reconnects to the adapters with the lost connection.

Tab 'EtherNet/IP Scanner NetX - General'

Object: EtherNet/IP Scanner NetX

This tab in the configurator of the EtherNet/IP scanner contains the basic settings for communication in the network.

Table 243: "Address Settings"

"Use static IP address"	
"IP address" *"Subnet mask"* *"Gateway address"*	These entries each occupy four bytes and serve to identify the scanner within the network environment
"Optain IP address automatically"	This option is available only for the NetX scanner
"BOOTP"	Assignment of the IP address by a server by means of Bootstrap Protocol (BOOTP)
"DHCP"	Automatic configuration of the network settings by the host by means of Dynamic Host Configuration Protocol (DHCP)

Table 244: "Ethernet Settings"

"Speed and duplex:"	Bit rate of the transmission. In case of *"Auto-negotiation"*, the highest of the available bit rates is selected automatically.

Table 245: "Options"

"Auto-reestablish connections"	☑: The scanner always attempts to automatically re-establish an interrupted connection. For example, if a timeout is detected for UDP I/O messages or the TCP connection to the adapter is interrupted. If the option is activated, then the scanner reconnects to the adapters with the lost connection.

Tab 'NetX Configuration'

Object: EtherNet/IP Scanner

As an alternative to the general EtherNet/IP node in case of a NetX field bus the EtherNet/IP node (NetX) can be added to the device tree. This node provides the additional NetX configuration dialog to select the NetX chip (slot for the card) and the communication channel of this chip. The name of the setting used in the dialog and the possible settings provided by the selection lists are defined by the device description.

Table 246: "NetX Settings"

"Slot"	Slot to be used. In case of PCI cards with NetX chip, the slot numbers usually correspond to the PCI card numbers.
"NetX Com channel"	Channel on the card to be used for the communication. A NetX board may have up to four communication channels for different fieldbusses.
"Auto-initialize bus"	☑ The user is asked to determine if the bus should be reinitialized when downloading or when resetting the application. A new initialization will interrupt the bus and may lead to unwanted behavior of the machine.

Tab 'EtherNet/IP Scanner - I/O Mapping'

Object: EtherNet/IP Scanner

Note: No project variables can be mapped to the outputs and inputs with the EtherNet/IP scanner.

See also

- *Tab '<device name> I/O Mapping'*

EtherNet/IP Remote Adapter

Tab 'EtherNet/IP-Adapter - General'

Object: EtherNet/IP Adapter

The tab in the device editor of the EtherNet/IP adapter contains the basic settings for network communication.

Table 247: “Address settings”

“IP address ”	Address for the identification of the EtherNet/IP adapter device.

Table 248: “BOOTP”

Bootstrap Protocol This option is available only for adapters under the NetX scanner.	
“MAC address”	Device-specific MAC address of the slave
“Save IP address”	☑: The address of the slave is saved. The requirement, however, is that the slave supports this function. This option is only available for the CIFX scanner.

Table 249: “Electronic keying”

“Compatibility check”	☑: The adapter uses its own keying values to perform a compatibility check of the keying values from the EDS file. All keying values are sent to the device. Then the device decides whether it is compatible with the received values. ☐: The adapter uses its own keying values to perform an exact check of the keying values from the EDS file. The user decides which keying information should be checked. ● Vendor ID ● Device type ● Product code ● Major revision ● Minor revision If the check fails, then an I/O connection is not established to the device and an error message is issued to the status page.
“Restore default values”	For generic devices only.

- *Chapter 1.4.2.4 “EtherNet/IP Configurator” on page 1220*

Tab 'EtherNet/IP Adapter - Connections'

Object: EtherNet/IP Adapter

The upper part of this tab displays a list of all configured connections. When there is an "Exclusive owner" connection in the EDS file, it is inserted automatically when adding the adapter. The configuration data for these connections can be changed in the lower part of the dialog.

The configuration data is defined in the EDS file. The data is transmitted when the connection to the adapter is established.

“RPI (ms)”	Requested Packet Interval: Exchange interval of the input/output data
“O -> T size (bytes)”	Size of the producer data from the scanner to the adapter (**O**riginator --> **T**arget)
“T -> O size (bytes)”	Size of the consumer data from the adapter to the scanner (T --> O)
“Proxy Config Size (Bytes)”	Size of proxy configuration data
“Target Config Size (Bytes)”	Size of adapter configuration data
“Connection Path”	Address of the - configuration objects - input objects - output objects
“Add Connection”	Opens the *“New Connection”* dialog. The parameters for the new connection are determined here.
“Delete Connection”	Deletes the selected connection from the list
“Edit Connection”	Opens the *“Edit Connection”* dialog. The parameters for the existing connection are modified here.

Table 250: “Configuration Data”

The table shows the connections with the configuration parameters from the EDS file. The connections are divided into configuration groups.	
“Raw data values”	If the scaling parameters are defined in the EDS file for the data, then you can show the values as raw data or converted data. ☑: The data is displayed without conversion. In the case of Enum data types, the index of the enumeration value is shown. ☐: The data is displayed with conversion. In the case of Enum data types, the enumeration value is shown.
“Display parameter groups”	☑: If groups are defined in the EDS file, then the parameters that are defined in these groups are displayed in a sorted list.
“Defaults”	Resets to the default values
“Value”	Double-click to change the value. Depending of the data type, you can specify the value directly in the input field or select from a list box. In the case of bit field data types and deactivated raw data values, a dialog opens for you to choose the individual bits. Only those bits can be selected which fall within defined minimum and maximum values. If bit field data types contain enumerations in the associated EDS file, then only these enumerations are shown with the associated bit positions. If a connection contains a parameterizable connection path in the EDS file, then here you can modify the different parameters of the respective connection.

- *Chapter 1.4.2.4 “EtherNet/IP Configurator” on page 1220*

Dialog 'New Connection'

Object: EtherNet/IP Adapter

Generic connection (freely configurable)

The dialog contains the parameters for the new connection.

Table 251: “Connection Path Settings”

“Automatically generated path”	The *“Connection Path”* is generated automatically from the values for *“Configuration assembly”*, *“Consuming assembly”*, and *“Producing assembly”*.
“User-defined path”	The *“Connection Path”* is specified manually in the corresponding input field.
“Path defined by symbolic name”	The path is specified by a symbolic name. Requirement: The device must support symbolic connection paths.

Table 252: “General Parameters”

“Connection Path”	The connection path is used to address one or more objects in the adapter that provide the input data and receive the output and configuration data. Requirement: The connection path is set to *“User-defined path”*.
“Symbolic name”	An ANSI string is used instead of the normal connection path. See the manual of the respective EtherNet/IP adapter for permitted ANSI strings. Requirement: The connection path is set to *“Path defined by symbolic name”*.
“Trigger type”	● *“Cyclic”*: Data exchange takes place cyclically at intervals set by the RPI. ● *“Change of State”*: Data is exchanged automatically after a change to the scanner outputs or adapter inputs. ● *“Application”*: Not implemented
“Transport Type”	Details for this can be taken from the specifications CIP Volume 1 and Volume 2.
“RPI (ms)”	(Requested Packet Interval) Length of the time interval (in milliseconds) in which the transmitting application requests the transmission of data to the target application. This value must be a multiple of the bus cycle task.
“Timeout multiplier”	In case of device failure, there is a time delay (RPI * Timeout multiplier) before the device state switches to "Error".

Predefined connection (EDS file)

Use this option to employ existing connections from an EDS file. The data that can be changed are defined in the EDS file.

Table 253: “Scanner to Adapter (Output)”

“O--> T size (bytes)”	Amount of data from scanner to adapter
“Proxy Config Size (Bytes)”	Size of proxy configuration data
“Adapter Config Size (Bytes)”	Size of adapter configuration data

“Connection type”	● *“Null”*: A network connection is not established. ● *“Multicast”*: A network connection is established. The connection data can be received by multiple consumers. ● *“Point to Point”*: A network connection is established. The connection data can be received by exactly one consumer.
“Connection Priority”	Two scanners using different priorities to one adapter can cause conflicts. Adapting the connection priority solves this problem.
“Fixed/Variable”	See the specifications CIP Volume 1 and Volume 2 for details of the parameters.
“Transfer format”	
“Inhibit time”	
“Heartbeat multiplier”	Requirement: The *“Transfer format”* is *“Heartbeat”*. Extends the interval at which the scanner sends heartbeat messages to the adapter. This value is multiplied by the *“RPI”* value. Example: *“RPI”* = 10ms and *“Heartbeat multiplier”* = 10 causes a message to be sent every 100ms.

Table 254: “Adapter to Scanner (Input)”

“T--> O size (bytes)”	See description for *“Scanner to Adapter”*.
“Connection type”	
“Connection Priority”	
“Fixed/Variable”	
“Transfer format”	
“Inhibit time”	

See also

- *Chapter 1.4.2.4.2.5.2 “Tab 'EtherNet/IP Adapter - Connections'” on page 1226*

Tab 'EtherNet/IP Adapter - Assemblies'

Object: EtherNet/IP Adapter

The upper part of this tab displays a list of all configured connections. When a connection is selected, the associated assemblies in the lower area of the tab are displayed.

Table 255: Connections

A description of the columns is found on the "Connections" tab.

Table 256: “Output Assembly”, “Input Assembly”

“Add”	Opens the *“Select Parameters”* dialog.
“Delete”	Deletes all selected parameters.
“Move Up” *“Move Down”*	Moves the selected parameter within the list. The order in the list determines the order in the I/O mapping.

“Name” *“Bit length”* *“Help string”*	You can double-click in the text field to edit the values.
“Show filling bytes of assemblies”	☑: The filling bytes of the assemblies are shown in the I/O mapping. This can be helpful in case the parameter layout of the assemblies is not mapped correctly in the EDS file.

See also

- *Chapter 1.4.2.4.2.5.2 “Tab 'EtherNet/IP Adapter - Connections'” on page 1226*

Dialog 'Select Parameters'

“Display parameter groups”	☑ The dialog displays all parameters from the EDS file by group. ☐ The dialog displays all parameters from the EDS file in a flat structure. Individual parameters from this list can be selected and added to the list of assemblies by clicking *“OK”*.
“Generic parameters”	☑ You can add generic parameters. Individual values of the parameter can be edited.

Tab 'EtherNet/IP Adapter - User Parameters'

Object: EtherNet/IP Adapter

The tab displays all additional parameters that are transmitted once only into the bus system during the phase of the starting procedure allotted to this.

> **NOTICE!**
> The user parameters are also transmitted again when a connection is reestablished, for example after the failure of a remote adapter.

“New”	Opens the *“Select Parameters”* dialog for adding a new parameter. The new parameter is inserted before the selected line.
“Modify”	Opens the *“Select Parameters”* dialog for changing an existing parameter.
“Move Up”, *“Move Down”*	Changes the order of the user parameters. The order of the parameters in the list corresponds to the order at the initialization.
“Value”	The value of the respective parameter can be changed directly by double-clicking the value. If applicable, a list box opens containing possible values.
“Abort If Error”	☑: In case of error, the entire transmission of the parameters is aborted.
“Jump to Line If Error”	☑: In case of error, the program resumes with the line specified in the *“Next Line”* column. In this way, an entire block can be skipped during the initialization, or a return can be defined. Note: A return can lead to an infinite loop if it is never possible to write a certain parameter.

See also

- *Chapter 1.4.2.4.2.5.6 “Dialog 'Select Parameters'” on page 1230*

Dialog 'Select Parameters'

Object: EtherNet/IP Adapter

The dialog contains a list of the parameters that are defined in the EDS file. You can define your own generic parameters in addition to the specified parameters.

The values of the selected parameter are displayed in the lower section of the dialog. They can be changed there.

“Display parameter groups”	☑: Display of the parameters sorted by parameter groups
“Generic parameters”	☑: Enables the creation of generic parameters
“Name”	Name of the generic parameter
“Class”	Each object class that can be addressed by the network is identified by an integer value.  A class can also be addressed from the class by specifying a special object instance (see *“Instance”*).
“Instance”	Integer value for the unique identification of an object instance within a class. Example of an object instance:  If the value 0 is assigned to the instance, then the class itself is referenced by this special instance. Example – object instance 0: 
“Attribute”	Integer value that can belong to a certain class or instance. Example attribute: 
The values for “Class”, “Instance”, and “Attribute” are defined in the "CIP Networks Library" (Vol. 1 and 2) or in the manual of the device manufacturer.

CAUTION!
When individual values are entered, a plausibility check is not performed. Any errors are identified only when the bus is started and they are reported with a message in the log file.

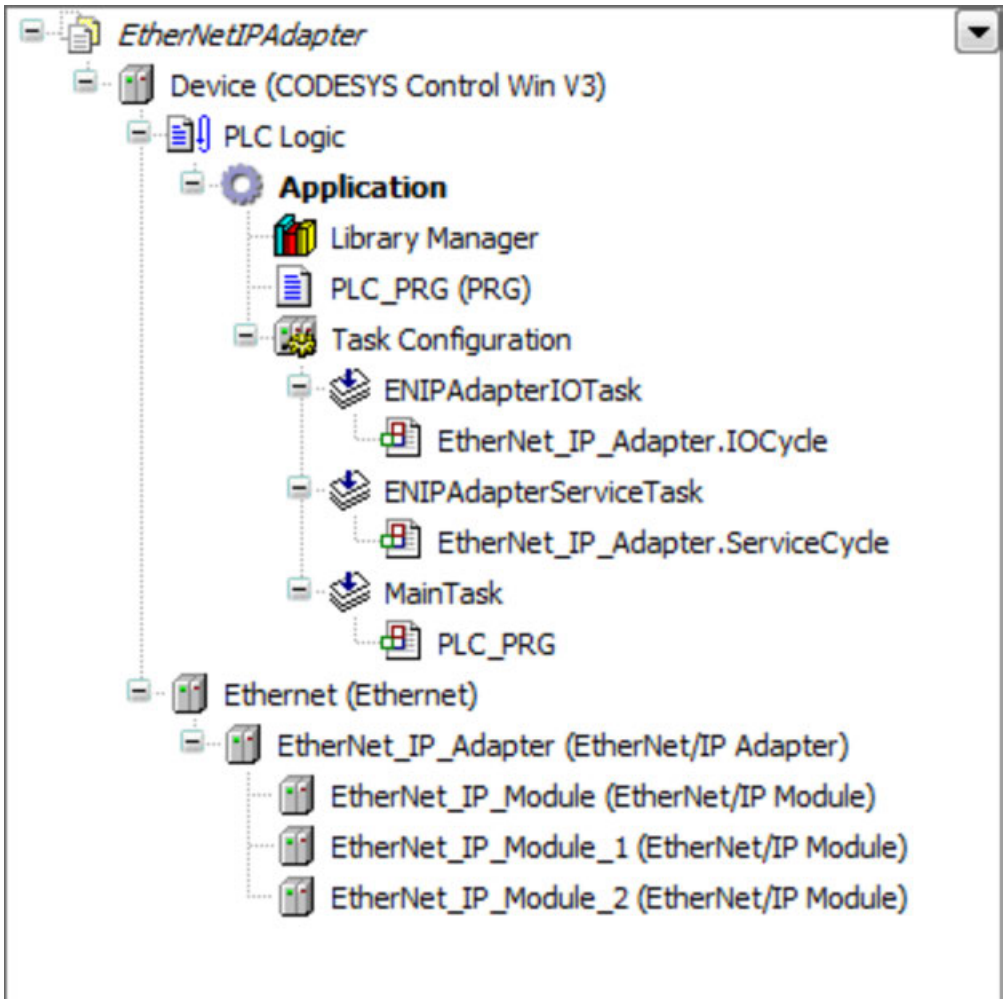
- *Chapter 1.4.2.4.2.5.5 “Tab 'EtherNet/IP Adapter - User Parameters'” on page 1229*

1.4.2.4.3 EtherNet/IP Local Adapter

CODESYS runtime as EtherNet/IP adapter

First, you insert the EtherNet/IP adapter below an Ethernet adapter. Then, you insert the modules below the EtherNet/IP adapter.

The sum of the input and output data of the modules determines the connection size of the adapter.



See also

- *Chapter 1.4.2.4.3.1 “Tab 'EtherNet/IP-Adapter - General'” on page 1232*
- *Chapter 1.4.2.4.3.3.1 “Tab 'EtherNet/IP Module - General'” on page 1233*

Tab 'EtherNet/IP-Adapter - General'

Object: EtherNet/IP Adapter

The device editor tab shows general information from the device description file. You can modify these values.

Table 257: “EDS File”

“Vendor name”	
“Vendor ID”	Provided by the ODVA (Open DeviceNet Vendors Association)
“Product name”	Values from the EDS file
“Product code”	
“Major revision”	
“Minor revision”	

“Enable ACD”	☑ Enables the ACD functionality (Address Conflict Detection) for the EtherNet/IP adapter. Note: The ACD functionality is normally applied by the operating system. Therefore, the user should only use this function very conscientiously. By enabling ACD, complications can result between the controller and the operating system. ACD is a mechanism that EtherNet/IP devices can use to detect and respond to IPv4 address conflicts. The ACD mechanism used in EtherNet/IP complies with the IETF RFC 5227 standard.
“Install to Device Repository”	If a device with the same device identification has already been installed, then you are asked whether the device should be overwritten. If the device is inserted as a remote adapter below an EtherNet/IP scanner, then you will be asked to automatically update the device.
“Export EDS File”	The EDS file is created and stored on the local computer. In this way, the EDS file can be used in an external configuration file.

Tab 'EtherNet/IP Adapter - Tags'

Object: EtherNet/IP Adapter

The tab of the device configurator is used for communication between an EtherNet/IP scanner and an EtherNet/IP adapter. The tab shows all device connections from the device description. The user can define a connection tag for each of these device connections.

No additional connections can be added on this tab.

Requirement: This tab is displayed only if the device description contains the parameter `ShowTagsPage` and the value of the parameter is set to `TRUE`.

Table with the device connections defined in the device description.	
“Connection Name”	Information originates from the device description Not editable
“ Transport Type”:	Information originates from the device description Not editable
“Connection Path”	Information originates from the device description Not editable
“Symbolic Connection Tag”	Connection tag for the connection predefined in the device description. Specified by the user.

EtherNet/IP Module

Tab 'EtherNet/IP Module - General'

Object: EtherNet/IP Adapter

This device editor tab displays general information from the device description file: You can adjust these values.

Table 258: “Module Information”

“Module”	Provides a selection of all module EDS files stored in the device description. The I/O data is then read from the selected module EDS to create corresponding I/O channels.
“Vendor”	
“Vendor ID”	Provided by the ODVA (Open DeviceNet Vendors Association)
“Product name”	Values from the EDS file
“Product code”	
“Major revision”	
“Minor revision”	

1.4.2.4.4 Command 'EtherNet/IP - Scan Devices'

Function: The command establishes a brief connection to the hardware and determines the devices in the network. Then you can apply the devices found into the device tree of your project.

Call: Menu bar: *“Project”*; context menu of a device object in the device tree

Requirement: The communication settings to the controller are correct. The gateway and the PLC are started. The device supports the scan function.

The following devices provide the scan function: EtherCAT master, EtherNet/IP Scanner (IEC), Sercos master, CANopen Manager, CANopen Manager SIL2, PROFINET controller und PROFIBUS DP master.

You can perform the device scan immediately if the scan function is permanently implemented in the PLC. When scan function is implemented in a library, you have to log in only one time to download the library to the controller.

The command refers to the master controller selected in the device tree. For example, an already inserted PROFINET IO controller can be selected and the command used to determine the I/O devices and I/O modules assigned to it.

After performing the scan operation, the *“Scan Devices”* dialog opens and displays the found devices.

Dialog 'Scan Devices'

Table 259: “Scanned Devices”

“Device name, Device type, Address, Station name, etc.”	Data about the scanned device depending on network type. When you change a value in the list of scanned devices, the value is shown in italics. This indicates that the new value has been changed in the editor in CODESYS, but not in the device. When you download the value to the device, it is shown normally. Value that indicate differences between the project and the scanned device are shown in orange. If multiple device descriptions are available for the scanned device, then the name is displayed in bold. The selection of the matching device description is resolved differently for different fieldbuses. For more detailed information, see the corresponding fieldbus chapters. If a device description cannot be found, then the following message is shown: "Attention! The device was not found in the repository." Depending on the bus system, additional information is displayed, such as manufacturer number and product number. The device cannot be inserted into the project without the installed device description.
“Show differences to project”	☑: The table in the dialog also shows additional configured devices (in the device tree of the project). ☐: The table shows all scanned devices. The configured devices are not shown.
“Scan for Devices”	Starts a new search.
“Copy All Devices to Project”	The device that is selected in the table is inserted into the device tree in the project. If nothing is selected, then all scanned devices are shown.

NOTICE!
If you insert devices, which are available in the device tree, to the device tree with *“Copy All Devices to Project”*, then the following should be noted. The data of the *“Process Data”* and *“<...> I/O Mapping”* tabs of the existing devices can be overwritten with the data of the recently inserted devices.

Table 260: “Configured Devices”

This part of the dialog is visible only when you select the *“Show differences to project”* option. Differences between the scanned and configured devices are color-coded. Devices displayed in green are identical on both sides. Devices displayed in red are available only in the view of the scanned or configured devices.	
	If you have selected a device in both views, then the scanned devices are inserted above the selected configured device.
	If you have selected a device in both views, then the scanned devices are inserted below the selected configured device.
	If you have selected a device in both views, then the configured devices are replaced by the selected scanned device.
	All scanned devices are copied to the project.
	Deletes the selected configure device.

Scanning an adapter can fail if the PLC is in RUN mode and a connection already exists from the scanning controller to the adapter. Then the scanning causes another connection to be established to the adapter, which interrupts the existing connection in some adapters. Then the scanner restarts the connection to the adapter, which causes the adapter to interrupt the connection to the scanning controller.

For this reason, it makes sense to perform a network scan in STOP mode after a "Reset". If RUN mode cannot be interrupted, then scanning is possible without an projected remote adapter (EtherNet/IP scanners in the device tree only).

For experts

When accepting the remote adapter by means of the *"Copy to Project"* command, the I/O dimensions with which the adapter responded are set for the first "exclusive owner" connection. In order to log all of the detected assembly instances after scanning, the definition `IODRVETHERNETIP_PRINT_SCAN_RESULT` must be set. By default, it is scanned by the instance ID 100–199. This can be adapted by means of the library parameters `ParamScanStartOfInstanceAssem` and `ParamScanLastOfInstanceAssem` from the library `IoDrvEtherNetIP Library`. This might be necessary, for example to scan in another manufacturer-specific range (assembly instance ID ranges).

1.4.3 OPC UA server for AC500 V3 products

1.4.3.1 General

OPC UA server can be added as an object below the Ethernet interfaces ETH1 or ETH2.

The user can access the variable interface of the PLC via a client. At the same time, communication can be protected by means of encryption.

The CODESYS OPC UA server supports the following features:

- Browsing of data types and variables
- Standard read/write services
- Notification for value changes: subscription and monitored item services
- Encrypted communication according to "OPC UA standard (profile: Basic256SHA256)"
- Imaging of the IEC application according to "OPC UA Information Model for IEC 61131-3"
- Supported profile: Micro Embedded Device server Profile
- By default, there is no restriction in the number of sessions, monitored items, and subscriptions. The number depends on the performance of the respective platform.
- Sending of events according to the OPC UA standard.

Application example

The application example How to use OPC server V3 - for DA and UA is available to gain a deeper understanding of the OPC UA protocol and to configure AC500 V3 accordingly.

1.4.3.2 Creating a project for OPC UA access

1. Click *"File ➔ New Project ➔ AC500 project"* in Automation Builder 2.1 or newer.
2. Choose a *PLC - AC500 V3* and click *[Add object]*.
3. Right-click on node *ETH1 or ETH2* and *"Add object"*.
4. Choose *OPC UA Server* in the dialog and click *[Add object]*.
5. Declare some variables of different types in the program.

6. Right-click *“Application ➔ Add object”*. Choose *Symbol configuration* and click *[Add object]*.
7. Enable checkbox *Support OPC UA Features* in the dialog *Add symbol configuration*.
8. Double-click *“Symbol configuration”* in the *Devices* tree to open the editor *Symbol configuration*.
9. Click *[Build]*.
   ⇨ The variables are displayed in a tree structure.
10. Activate the variables that you want to publish to an *OPC UA client*. Specify the access rights.
11. Download the project to the PLC.

1.4.3.3 Use node name

1. Double-click node *“OPC_UA_Server”*.
2. Set parameter *Use node name* to TRUE.
3. Double-click node *“PLC_AC500_V3 <...>”*.
4. Click *“Device”* and *“Rename active device...”*
5. Enter new device name in the following dialog and click *[OK]*.

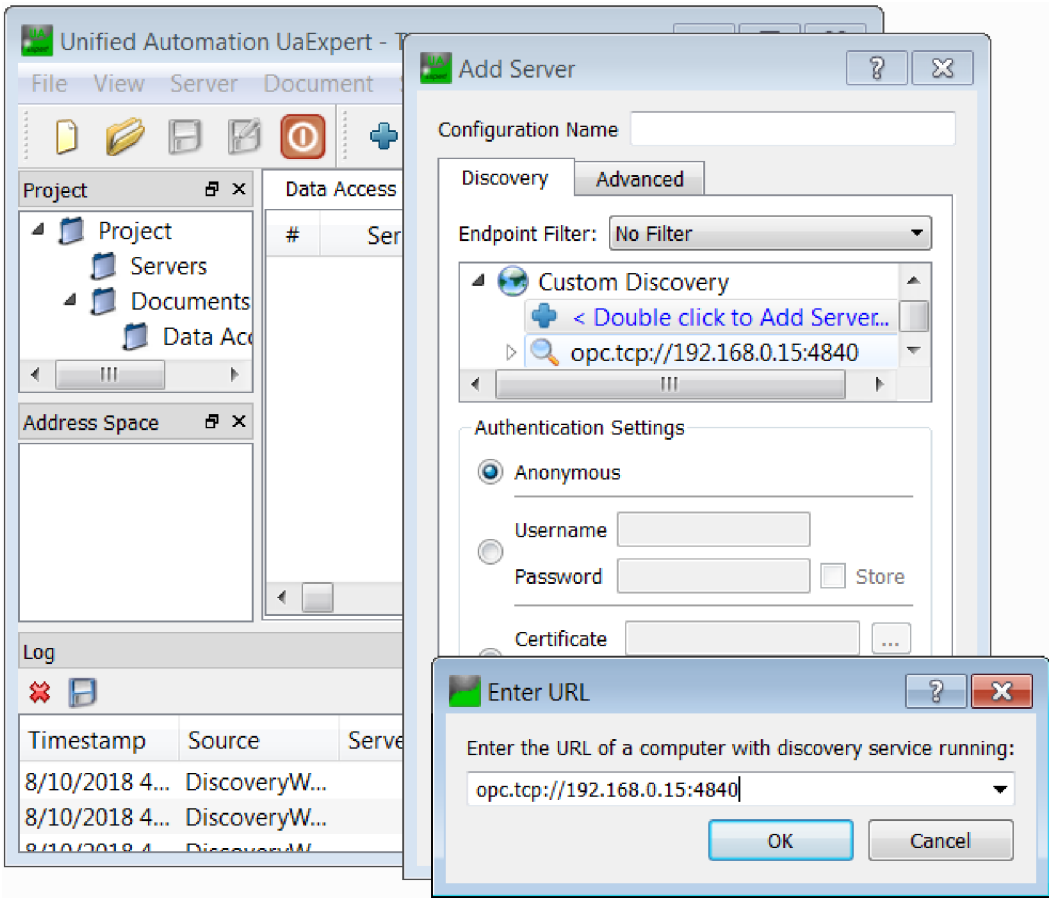
1.4.3.4 Use UaExpert client

The OPC UA client *UaExpert* is available for download from the Unified Automation website and can be used free of charge (freeware license).

Using this client, you can connect to the AC500 OPC UA server.

The following description refers to this program. Other OPC UA clients work in a similar way.

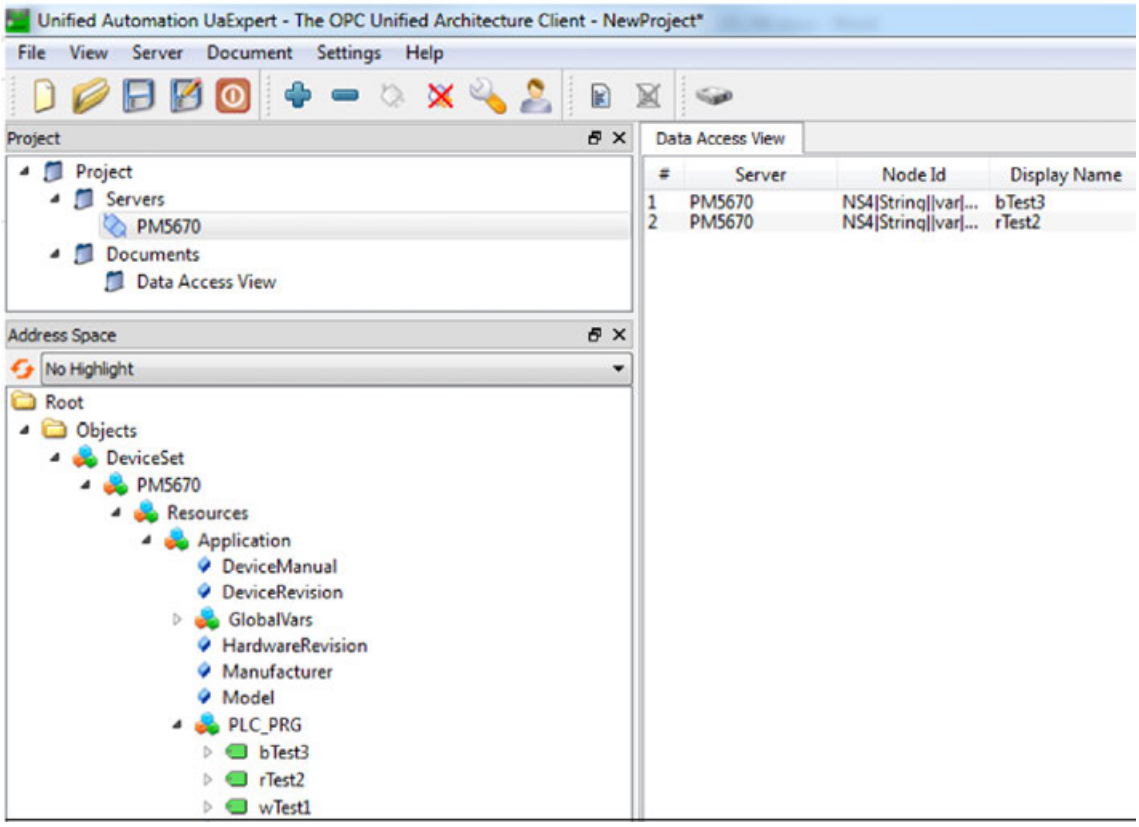
1. Start the *UaExpert* program.



2. Click on the *"blue cross symbol"*.
3. Double-click on the *"blue cross symbol"* in the *Add Server* dialog.
4. Enter URL and click *[OK]*.

   ⇨ The URL appears in the *Add Server* dialog.
5. Select *"Advanced"* tab and click *[OK]*.
6. Click *[Connect]* button.

7. Expand the project tree in the *Address Space* window.



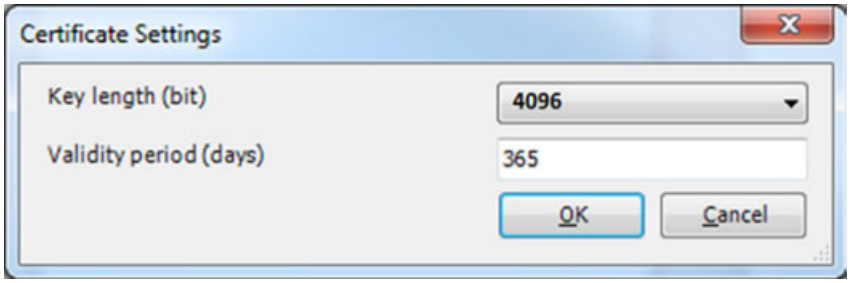
8. Drag and drop the needed symbols to *Data Access View*.

1.4.3.5 Working with encryption

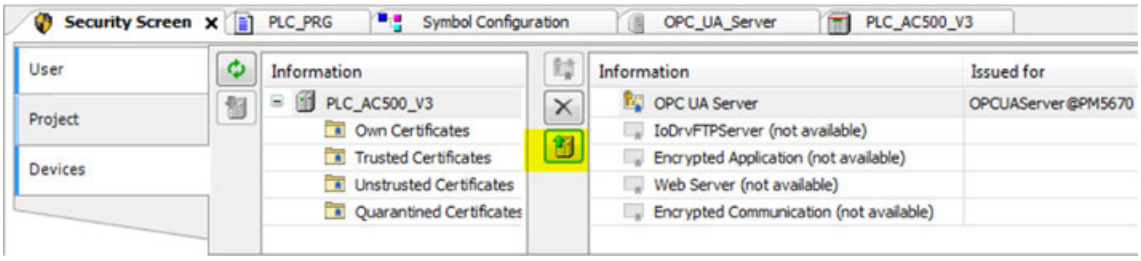
1.4.3.5.1 Creating a certificate for the OPC UA server

☑ Prerequisite: A battery is inserted and the clock is set to actual time.

1. Double-click the Security symbol in the lower right corner of Automation Builder.
2. Select the *"Devices"* tab.
   ⇨ The certificate information opens.
3. Select the PLC in the left *Information* view.
   ⇨ All services of the PLC that require a certificate are displayed in the right *Information* view.
4. Select the service *"OPC UA Server"*.
5. Click the icon to create a new certificate for the device.
   ⇨ *Certificate Settings* dialog appears.



6. Define the certificate parameters according the figure above and click “*[OK]*.
   ⇨ The certificate is created on the PLC.

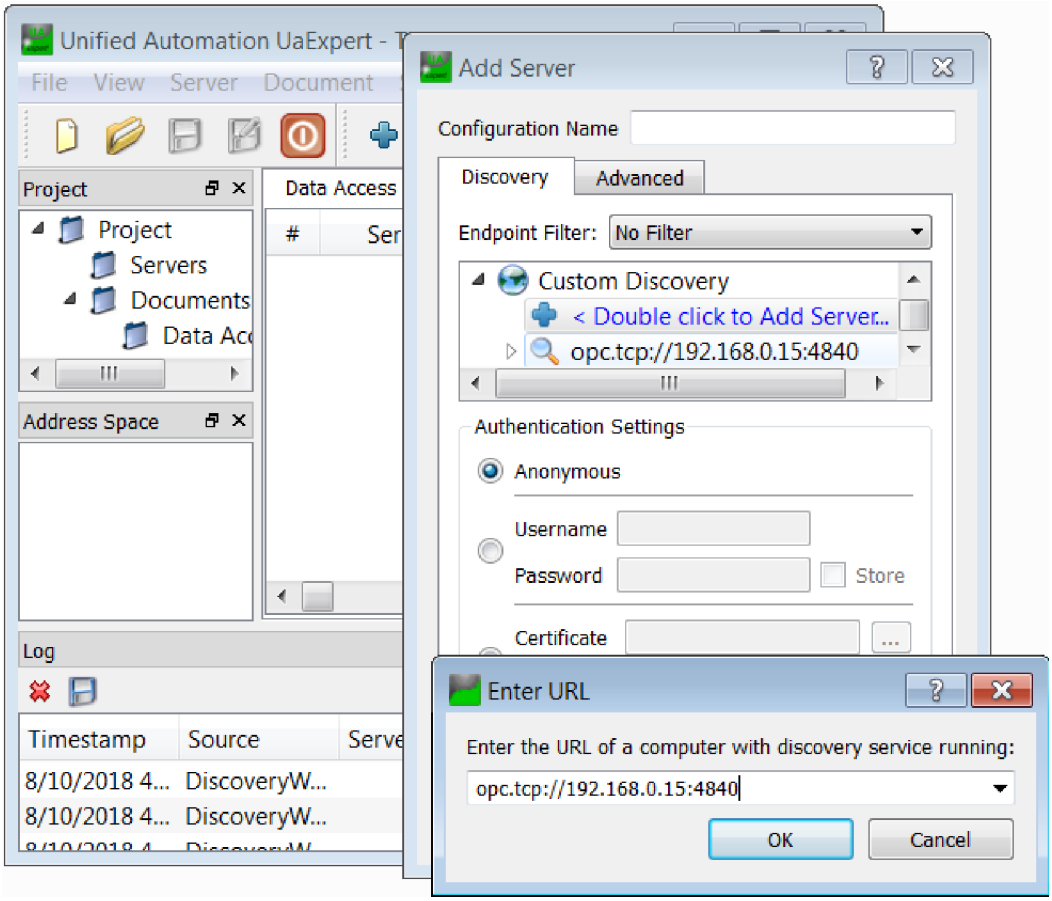


7. Upload the certificate to your PC.
8. Restart the runtime system.

For further information see ↳ *Chapter 1.6.6.3.7.3.4 “OPC UA secure” on page 3923*.

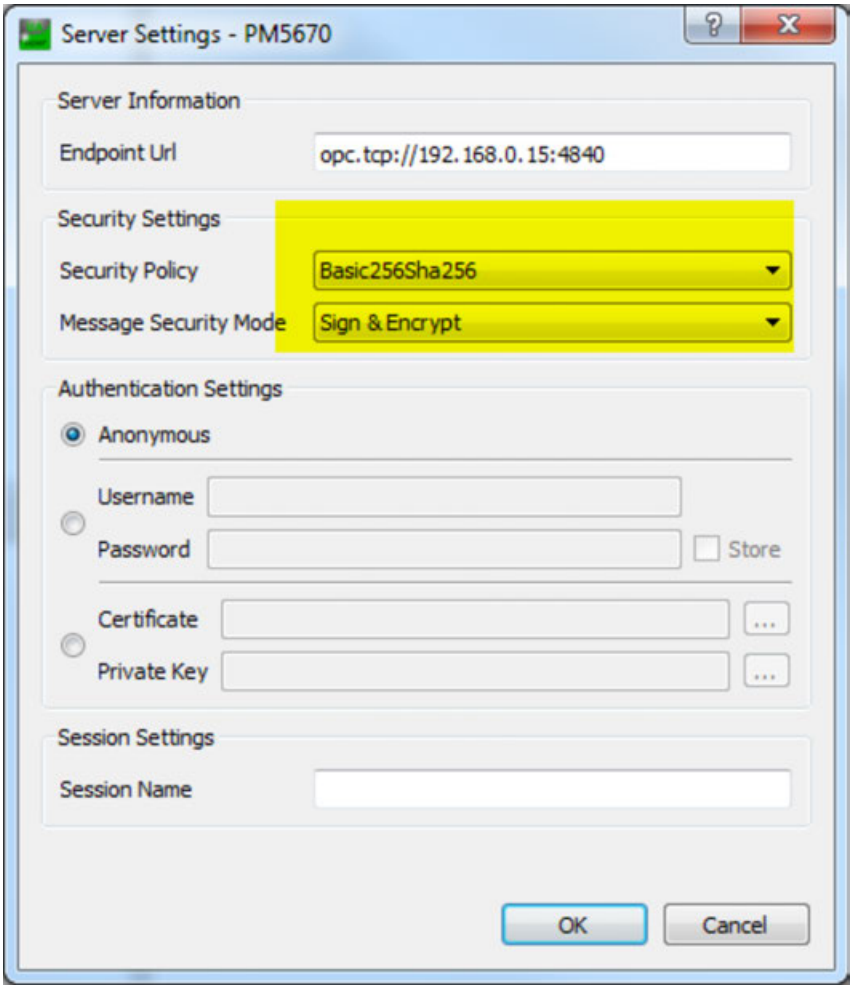
1.4.3.5.2 Encrypted connection with UaExpert client

1. Start the *UaExpert* program.

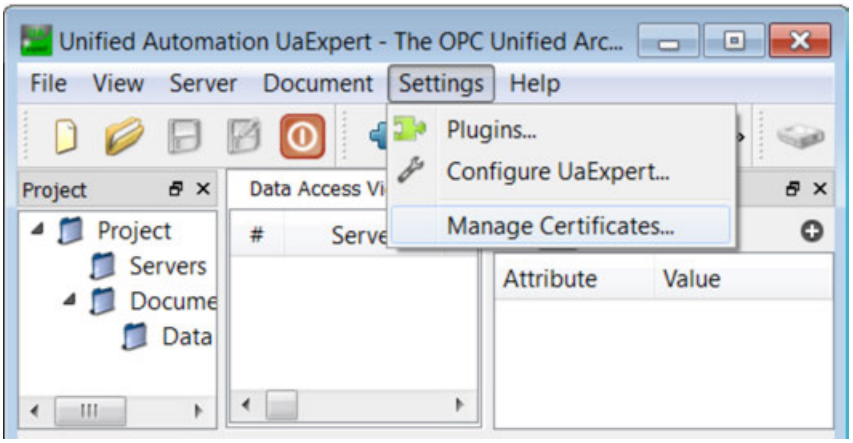


2. Click on the *“blue cross symbol”*.
3. Double-click on the *“blue cross symbol”* in the *Add Server* dialog.
4. Enter URL and click *[OK]*.
   ⇨ The URL appears in the *Add Server* dialog.

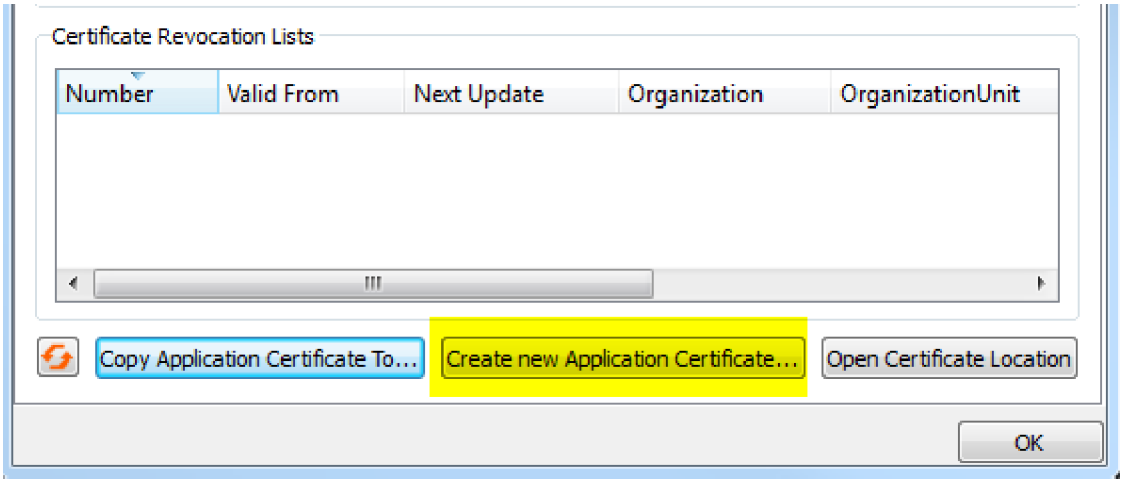
5. Select *"Advanced"* tab.



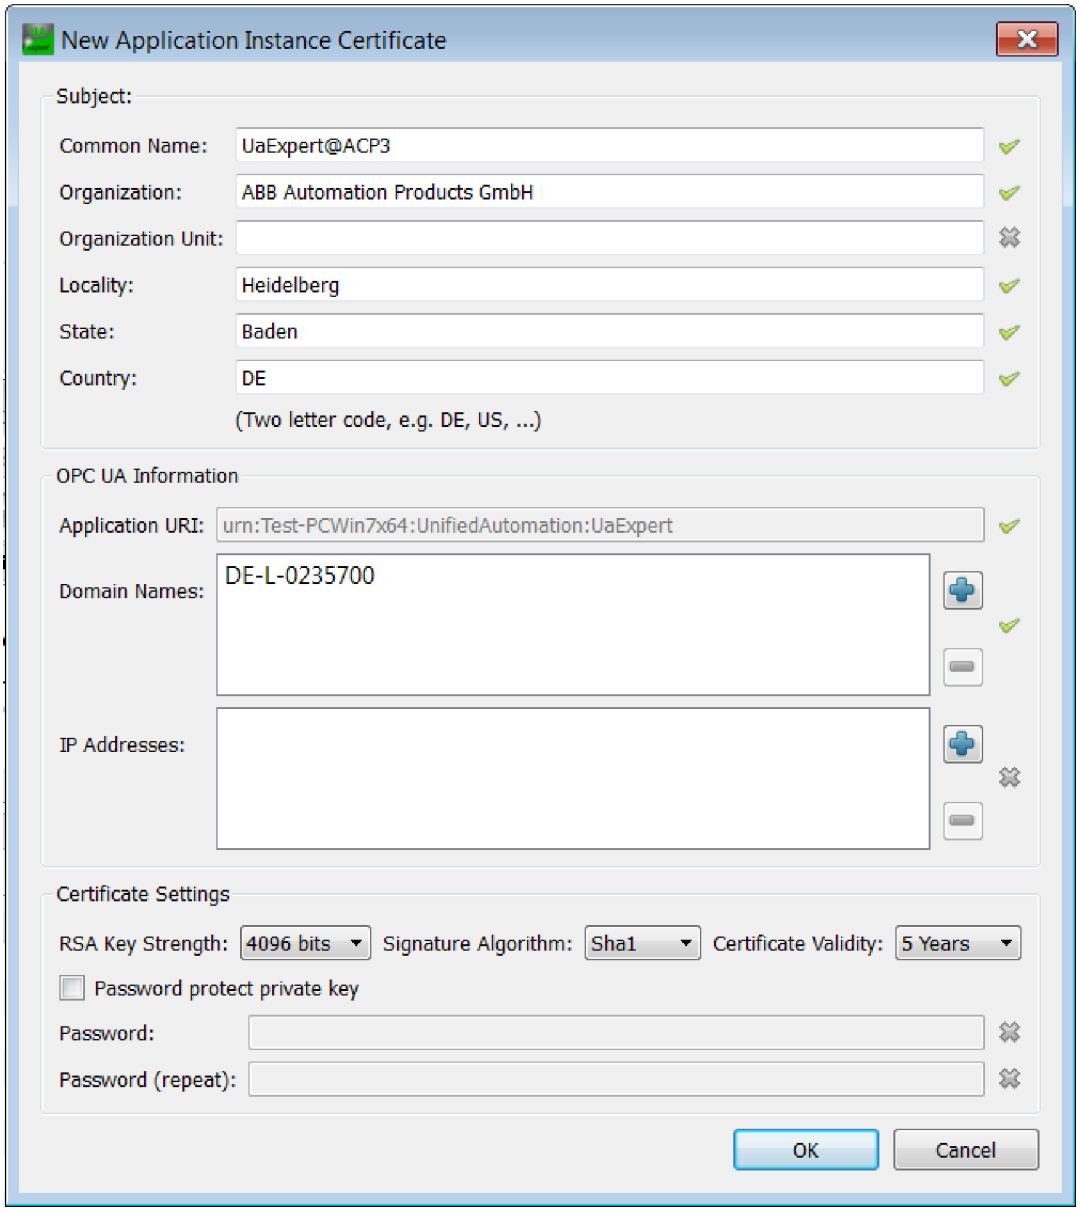
6. Choose option *"Basic256ha256"* of drop-down list *Security Policy* and *"Sign & Encrypt"* of drop-down list *Message Security Mode* and click *[OK]*.



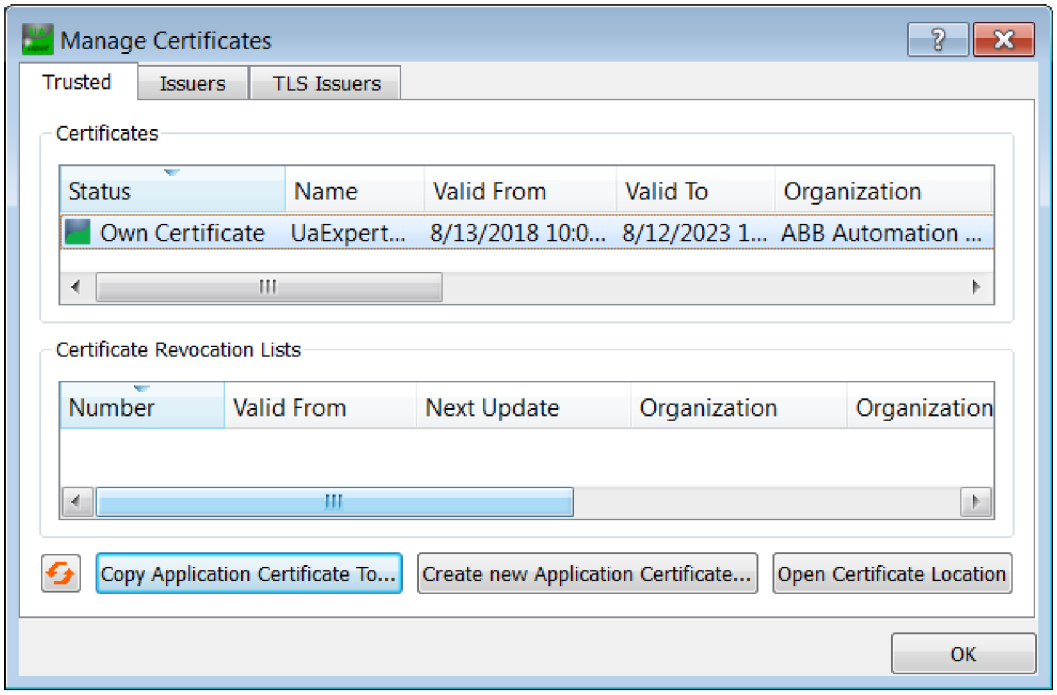
7. Click menu *“Settings”* and *“Manage Certificates”*



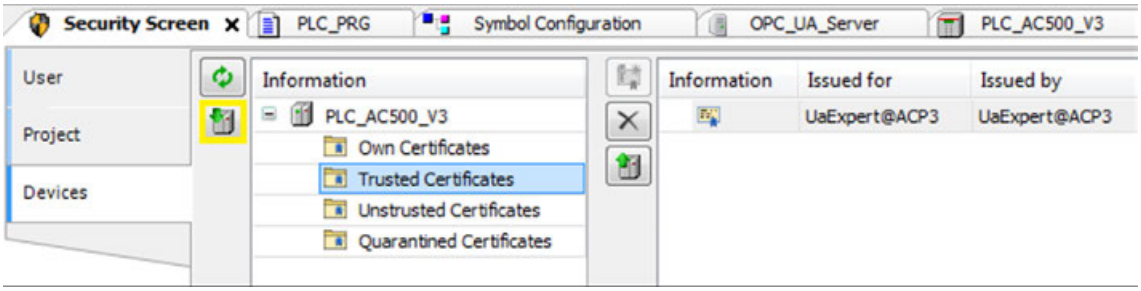
8. Click *[Create new Application Certificate...]*.
   ⇨ Dialog *New Application Instance Certificate* opens.



9. Enter the required informations and click *[OK]*.
   ⇨ Dialog *"Manage Certificates"* opens

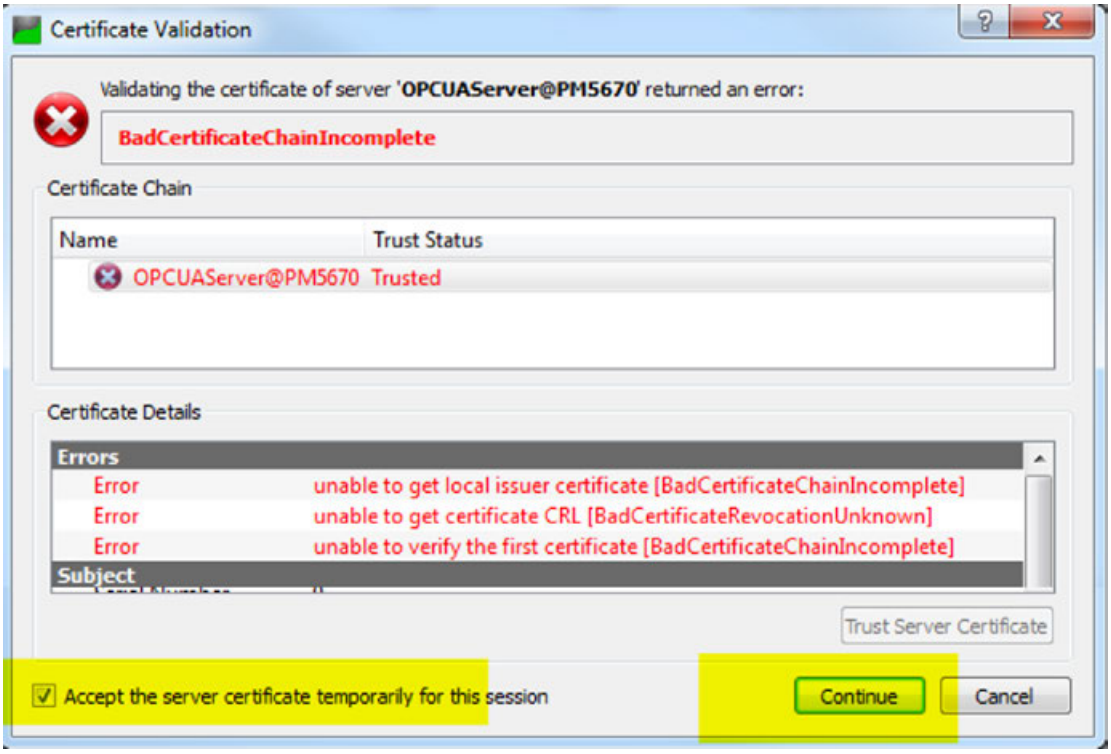


10. Click *[Copy Application Certificate To...]* your PC.



11. Download the certificate to AC500 via the *Security Screen* view.
12. Click *[Connect]* button in the UaExpert client.

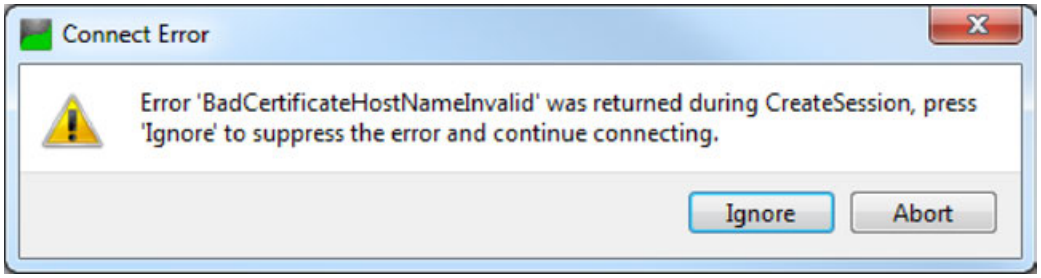
⇨ Dialog *Certificate Validation* opens.



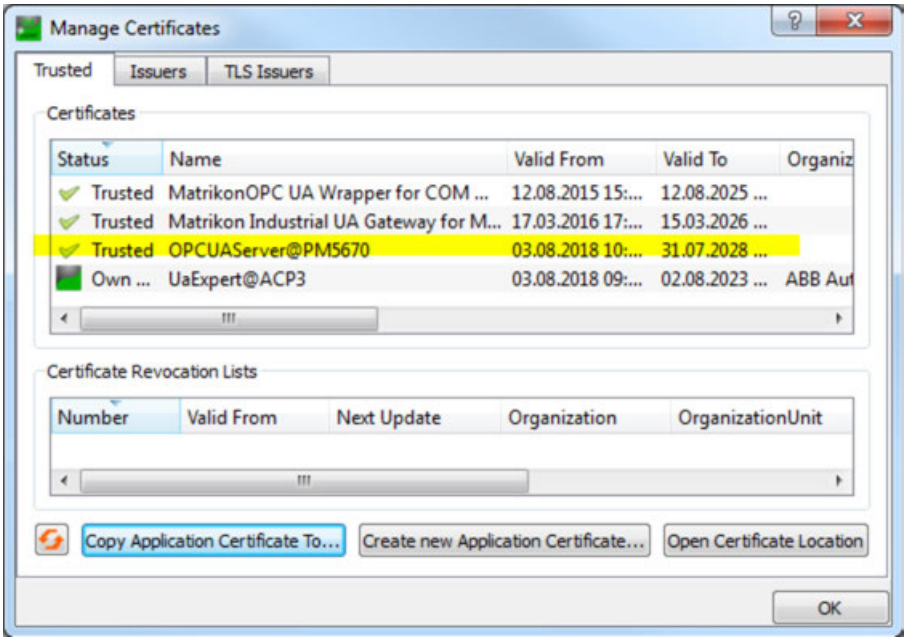
Working with a trusted certificate will avoid this error message.

14. Enable checkbox *Accept the server certificate temporarily for this session* and click *[Continue]*.

⇨ Dialog *Connect Error* opens



15. Click *[Ignore]*

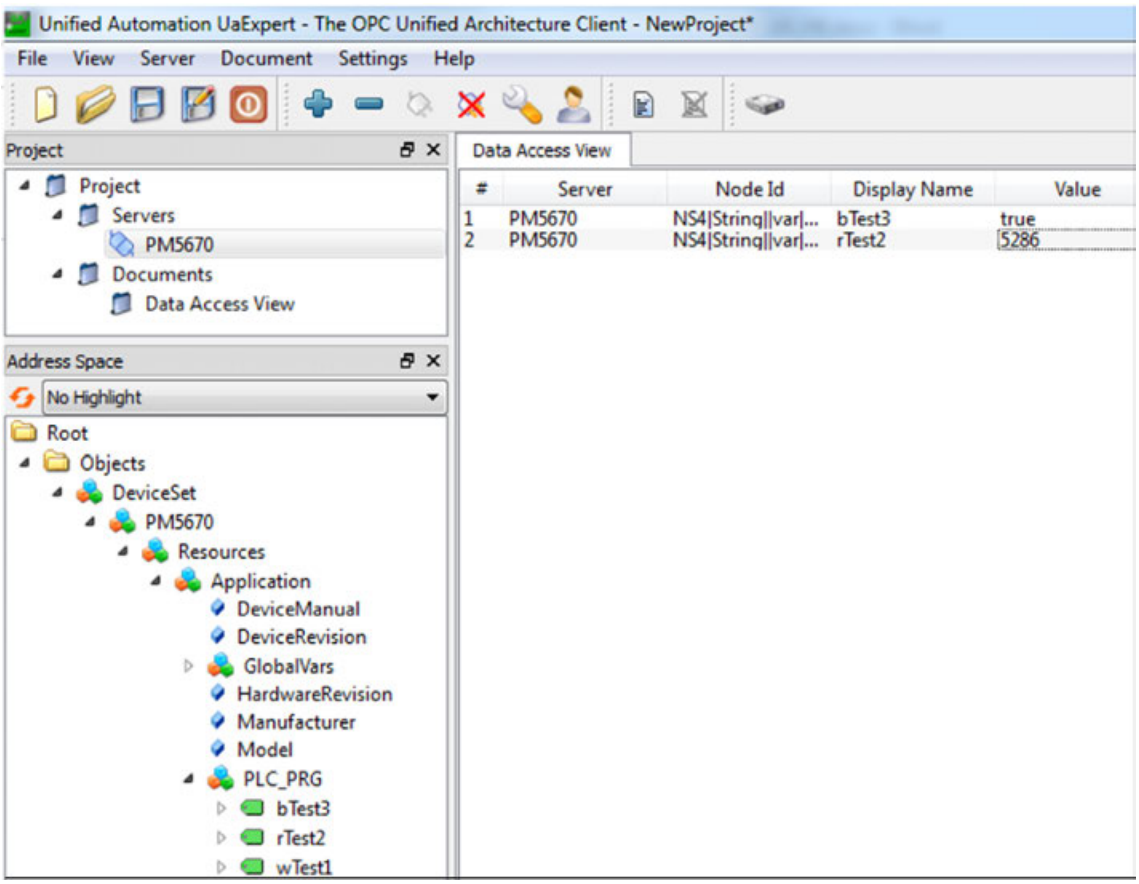


16. Check settings in dialog *Manage Certificates*.

1.4.3.6 Changing variables via UaExpert client

1. Expand in view *Address Space "Objects ➔ DeviceSet ➔ PM5670 ➔ Resources ➔ Application ➔ PLC_PRG"*.

   ⇨ The variables of the global variable list are visible.



2. Drag and drop the variables to the Data Access View.
3. Change values in the column *Value*.

1.4.3.7 Configuring OPC UA client

1.4.3.7.1 Operating modes

Polling

- Objects will be continuously updated in a defined interval
- Create higher load then Subscription
- Is recommended only for a few Symbols

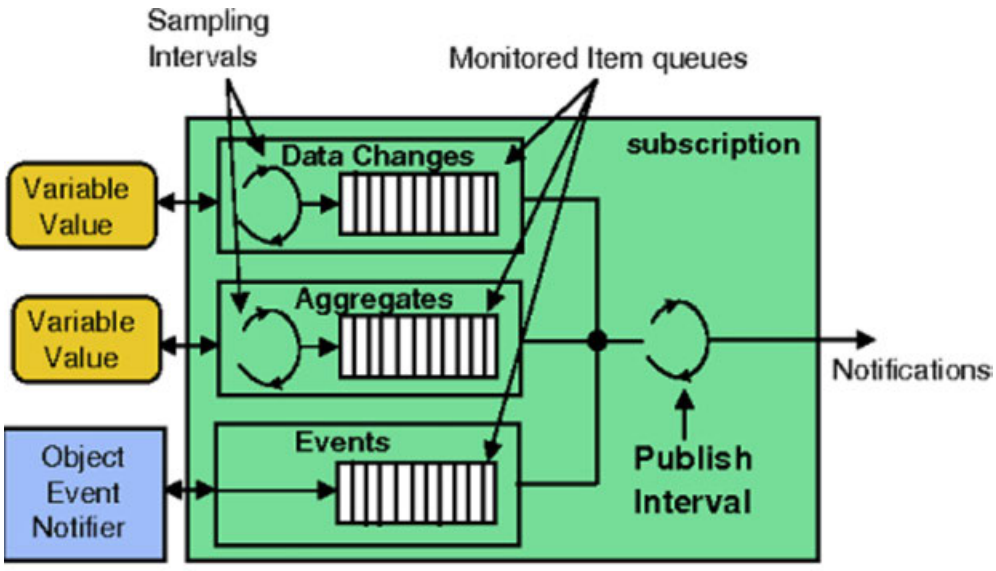
Pub/Sub

Not yet supported

Subscription (recommended mode)

- Updated objects depending on the publishing interval and filters
- Method to reduce load
- Different intervals
- Filter possible (coming in AC500)

Client defines a group of symbols with	Description
Publishing interval	Interval, in which server publish data to client
Sampling interval	Interval for sampling and storing data at server and send in each publishing interval
Queue size	Array of data to save data if sampling Interval is faster than publishing Interval (At AC500 in the moment only 1)
Data change filter	Can be used to reduce traffic from server to client. Criteria: ● Change of data, ● Change of status ● Change of time stamp AC500 is fix configured for change of data and change of status.

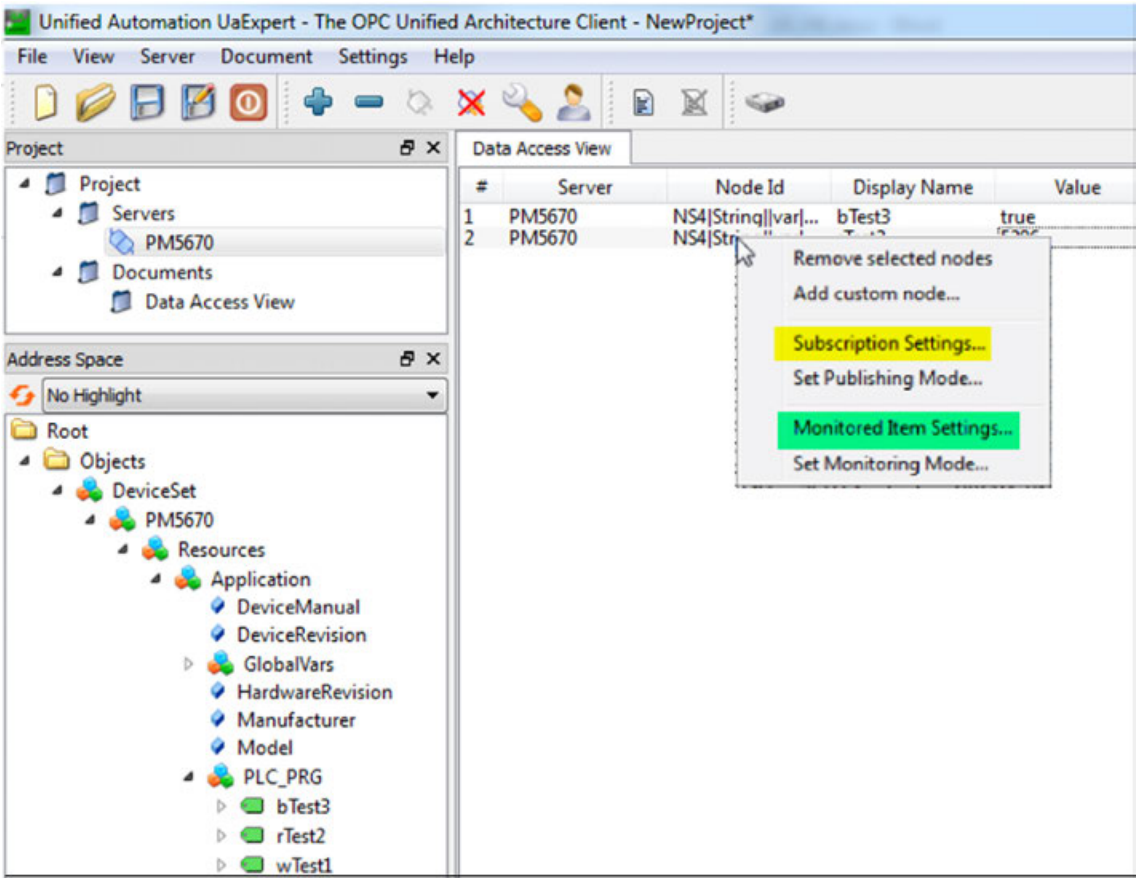


1.4.3.7.2 Using OPC UA with subscription mode

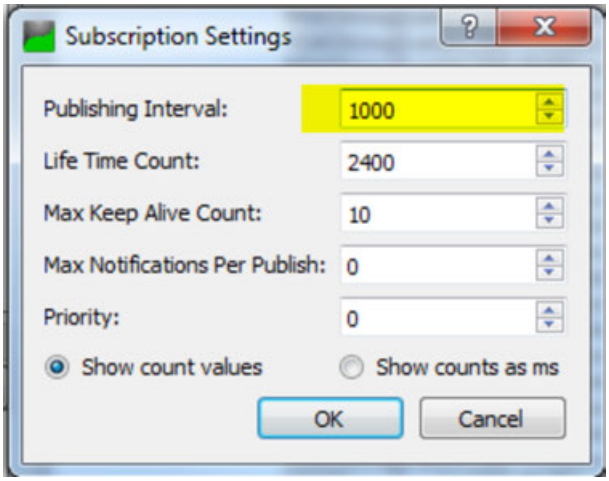
Recommendations:

- *Define only variables you need as symbols*
- *Do not configure publishing Intervals to short (increase load)*
- *Use different subscriptions with different publishing intervals in order to decrease load*
- *Do not use sampling intervals faster then publishing intervals as long as AC500 OPC UA server don‘t support Queue Size different from 1*
- *Be careful: Setting „0“ at sampling Interval at client will be interpreted in server as „as fast as possible“, which is 100ms at AC500 and create a high load.*

Publishing and sampling intervals in UaExpert



1. Right-Click on an Item in *Data Access View* and click *“Subscription Settings”*.



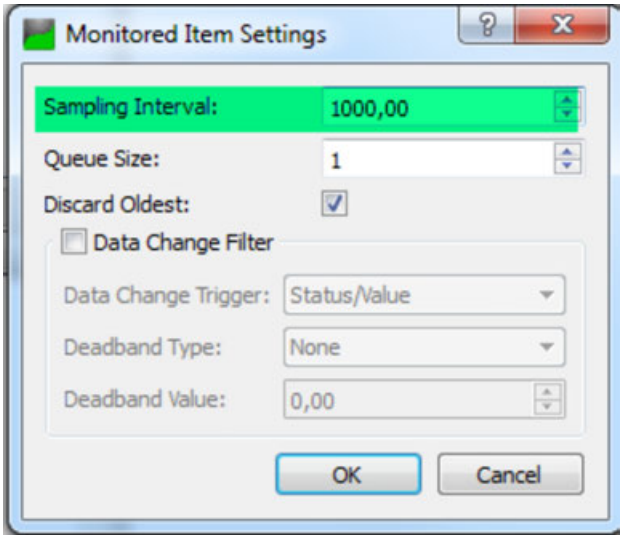
2. Set the recommended values.

   Life Time Count: Number of publishing intervals in which client has to send publish requests to the server. After this period without request from client, subscription in server will be deletet.

   Max Keep Alive Count: If there are no new data to send, server can skip a publishing interval. After the alive count, server has to send, even if there are no new data.

   Click *[OK]*.

3. Right-Click on an Item in *Data Access View* and click *“Monitored Item Settings”*.



4. Set the recommended values.

1.4.4 Libraries

Libraries are used for preparing POUs and functions for use in CODESYS applications. In addition to the descriptions presented here in the help, always see the documentation included in the library as well.

For using libraries in your CODESYS project, see the "Managing Libraries" chapter.

To create your own CODESYS libraries, follow the guidelines for library developers.

See also

- *Chapter 1.4.1.16 “Using Libraries” on page 448*

1.4.4.1 Guidelines for creating libraries

Libraries must be created according to specific rules to avoid compatibility issues.

The main items include the following:

- Select a meaningful library name (required)
- Use templates to ensure consistency (optional)
- Use a familiar and uniform project structure, when possible (optional)
- Register a unique library namespace (required)
- Enter all project information (required)
- Apply the correct method for referencing other libraries correctly (required)
- Design smart external and internal interfaces (required)
- Implement a user-friendly error handling (required)
- Apply the correct method (protection) for deployment (required)
- Apply a consistent naming convention to get clean code (optional)
- When revising an existing library, consider the interface compatibility with previous versions.

Please follow these guidelines when developing libraries in CODESYS: "Library Development Summary". You will find this document as a CHM file (LibDevSummary.chm) in the installation directory of CODESYS, or in the online help.

1.4.5 CODESYS Visualization

Everything in one project

In the same CODESYS project, you use CODESYS Visualization to create the suitable user interface for your application. You link the visualization to the application variables and in this way they can animate and display data. When creating a visualization and an application, you use common functions, for example, as library and source code management or find/replace throughout the project.

Overview of functionality

- **Display variant depending on the target platform**
  You can execute the same visualization on various target platforms. Possible display variants are CODESYS WebVisu, CODESYS TargetVisu. In addition, there is a display integrated in the development system.
- **Visualization editor**
  In the graphic editor you design the desired user interface from visualization elements. The visualization elements are provided via libraries in a "ToolBox". You drag them into the editor area and adapt them with the help of a property configurator.
- **Referenceable visualizations**
  A visualization can be referenced in other visualizations. This enables the creation of user interfaces with a complex structure. For this purpose CODESYS Visualization also provides predefined visualizations, e.g. for dialogs.
- **Simple design change**
  The simple change of the look & feel of a visualization is possible in one place by creating a different visualization style.
- **Multilingualism**
  You can conveniently prepare visualization texts in several languages with the help of text lists. You can configure a user input element for switching to a different language in online mode.

- **User management**
  You can set up the visualization's own user management for access control up to individual element level.
- **Other useful features**
  Function block instances of visualizations, array accesses to the visualization, real-time data logging, extendability of the pool of visualization elements, provision of graphic objects via symbol libraries, calls of PLC functions from the visualization, reusability of visualizations by depositing them in libraries.

Table 261: Overview of the objects, editors, repositories, etc. relevant for the visualization in the CODESYS Development System

Visualization	Object below an application in the device tree or in the POUs pool that contains a visualization image. A visualization can reference other visualizations.
Visualization editor and additional views	In this IEC 61131-3-compliant editor you can create the desired graphical user interfaces, panels, dialogs, etc. from visualization elements. The editor is made up of the following components: ● Graphic editor area for arranging the elements ● *"Interface Editor"*: for the parameterization of the visualization ● *"Hotkey Configuration"*: editor for defining keys for online operation ● *"Elementlist"*: overview of all visualization elements used, editor for the position of the elements on the z-axis The following views are also available: ● *"ToolBox"*: view for the provision of visualization elements ● *"Properties"*: view with editor for the configuration of the element that currently has the focus in the graphic editor
Visualization element	Ready-to-use elements from the visualization libraries are available in the Tools view of the visualization editor for insertion.
Visualization profile	The profile defines which visualization elements are available. Each project that contains a visualization is based on such a profile (project settings).
Visualization Styles	The selected style determines the "look & feel" of the elements. It is set application-wide in the visualization manager. Ready-to-use styles are provided and you can also create your own.
Visualization Manager	Each application has a visualization manager of its own for its visualizations with various settings such as user management, style, language, input type, etc. The *"Visualization Manager"* object is suspended in the device tree below the application.
Display variant	A visualization can be displayed in online mode in the following variants, which are created as objects under the visualization manager: ● CODESYS TargetVisu (target visualization and remote target visualization on PLC devices) ● CODESYS WebVisu (web visualization via a web browser) ● Visualization integrated in the development system

Visualization library	Collection of visualization elements that are provided in the toolbox.
Symbol library	Collection of images and graphics that you can use in visualizations. When inserting a visualization object you can choose whether the installed system libraries should be available in the project.
Visualization Element Repository	Repository for the management of the visualization profiles and the visualization element libraries.
Visualization Styles Repository	Repository for the management of visualization styles.
VISU_TASK	This task is automatically present as an object in the task configuration of an application as long as an object for a display variant of the type WebVisu or TargetVisu is also inserted under the Visualization Manager.

System overview and mechanism, display variants

The user interfaces created in CODESYS can be used in different display variants, depending on which ones the controller employed supports.

The display variants

- Visualization ("diagnostic visualization") integrated in the CODESYS Development System:
  The integrated visualization in the development system is ideal for application tests, for service or diagnostic purposes and for the commissioning of a system. As soon as a connection to the controller has been established, the visualization editor switches over and animates the elements displayed. This variant is part of the free CODESYS Development System and can always be used, irrespective of the controller employed.
- CODESYS WebVisu:
  This variant means web-based display of the user interface in a standard browser (PCs, tablets, smartphones), enabling remote access, remote monitoring and service and diagnosis of a system via the Internet. A standard web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.
- CODESYS TargetVisu:
  This variant runs independent of the platform on control systems with an integrated display. Logic application and user interface run on the same device; the user interface is displayed directly on the controller. This variant is suitable for the operation and monitoring of machines and plants. An optional extension of the runtime system is required for the use of CODESYS TargetVisu.

1.4.5.1 Preparing CODESYS and projects

The following provides details of the presets that exist for visualizations and the steps that are necessary for creating a visualization in a project.

Presets

When you create a visualization in a project, you should know that the following presets apply:

Scope	Location	Setting
Throughout CODESYS	*“Tools ➔ Options”* Categories *“Visualization”* and *“Visualization styles”*	● Visualization editor: display, handling ● Paths of the basic text and image files ● Visualization styles
Throughout the project	*“Project ➔ Project settings”* Categories *“Visualization”* and *“Visualization profiles”*	● "Properties handling" for the visualization elements ● Paths of the basic text and image files ● Symbol libraries with ready content ● Visualization profile
Throughout the application	*“Visualization Manager”*:	● Unicode, CurrentVisu variable, multitouch, semi-transparency, memory size, data transmission, number of clients ● Visualization styles ● Language setting, language-specific font ● Default keyboard configuration ● Visualizations and visualization references ● Font for each language ● User management
Single visualization	*“Properties”* of the visualization object Category *“Visualization”*	● Purpose and scope of use ● Size definition
Display variant of a single visualization	Editor of the WebVisu or TargetVisu object	● Start visualization, refresh rate, buffer size, html file name ● Scaling options ● Display options ● Default text input

Project-specific updates of the visualization profile, the visualization styles, and the visualization symbol libraries are possible in *“Project ➔ Project environment”* of the respective tabs.

Customization of the visualization menu is performed in *“Tools ➔ Customize”*.

- *Chapter 1.4.5.19.3.7 “Dialog 'Options' - 'Visualization Styles'” on page 1761*
- *Chapter 1.4.5.19.3.13 “Dialog 'Project Settings' - 'Visualization'” on page 1766*
- *Chapter 1.4.5.19.3.14 “Dialog ‘Project Settings’ - ‘Visualization Profile’” on page 1767*
- *Chapter 1.4.5.19.3.10 “Dialog 'Project Environment' - 'Visualization Profile'” on page 1764*
- *Chapter 1.4.5.19.3.11 “Dialog 'Project Environment' - 'Visualization Styles'” on page 1765*
- *Chapter 1.4.5.19.3.12 “Dialog 'Project Environment' – 'Visualization Symbols'” on page 1765*
- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Creating visualization objects in the project

For each visualization, you insert a *“Visualization”* object into your project like any other object. This also applies to visualizations that should be used later only within other visualizations. You can insert the new visualization object directly below an application, or below the root node of the *“Devices”* view (for availability throughout the entire project).

The required base libraries and other objects, such as the Visualization Manager, are inserted automatically. When you insert the visualization object below an application, the subordinate objects for the display variants supported by the device are also displayed.

Every visualization object can be edited separately in the visualization editor.

The following steps describe a simply example for creating an object for an application-specific visualization.

Requirement: A project is open. An application is created in the device tree.

1. Select the application in the device tree. Click *"Add object ➔ Visualization"* in the context menu.

   ⇨ The *"Add visualization"* dialog box opens. In the *"Symbol libraries"* table, there is at least the standard entry *"VisuSymbols Vx.x.x. (System)"*, and possibly other installed symbol libraries.

2. Accept the default name `Visualization`. Activate the *"VisuSymbols"* option. Then the visualization symbols (graphical objects) are contained in the library in the visualization project. Click *"Add"* to close the dialog box.

   ⇨ In the device tree, the *"Visualization manager"* and *"Visualization"* objects are inserted below the application. Depending on the device in use, the *"TargetVisu"* and/or *"WebVisu"* objects are also created below the visualization manager.

   If a *"TargetVisu"* object or *"WebVisu"* object is created, then a *"VISU_TASK"* object is also created below the task configuration with an implicit program call.

   The required visualization libraries are added automatically in the *"Library Manager"* of the application.

   The visualization editor opens with the *"Visualization"* editor window and the *"ToolBox"* and *"Properties"* views.

   In the *"ToolBox"* view, there is a *"Symbols"* button for viewing the symbols from the library `VisuSymbols.library`.

3. Now you can create the required visualization in the visualization editor.

4. Note: You can create structured visualizations by using a frame element to reference one visualization in another visualization. Dialog visualizations are a special option for this. In this case, the input configuration of a visualization element is used for referencing.

For creating an application-dependent visualization, insert the visualization object directly below the root node of the device tree. This corresponds to insertion in the "POUs" view. In this case, the visualization manager is not created with objects for the display variants.

See also

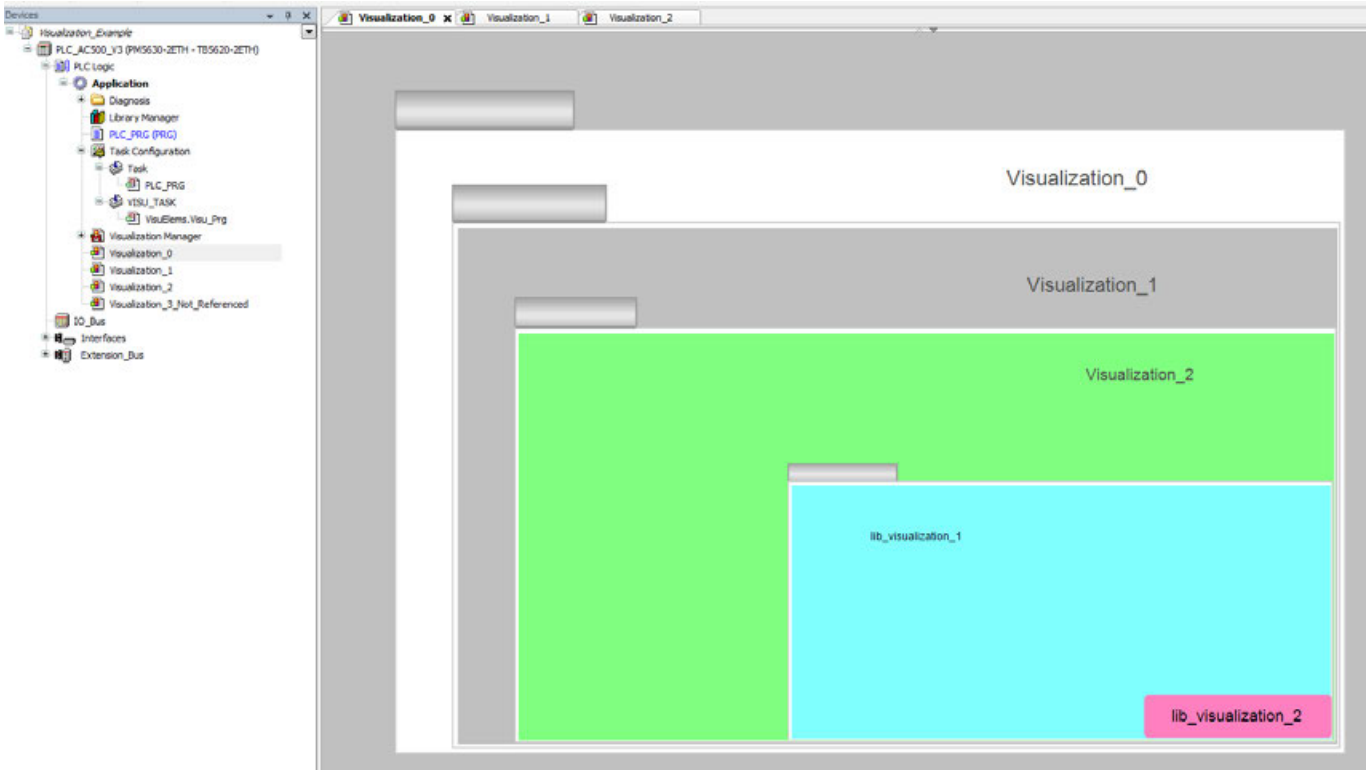
- *Chapter 1.4.5.19.3.7 "Dialog 'Options' - 'Visualization Styles'" on page 1761*
- *Chapter 1.4.5.19.3.13 "Dialog 'Project Settings' - 'Visualization'" on page 1766*
- *Chapter 1.4.5.19.3.15 "Dialog 'Properties' of Visualization Objects" on page 1767*

1.4.5.2 Limitation of the number of usable web pages on AC500 V3 PLCs

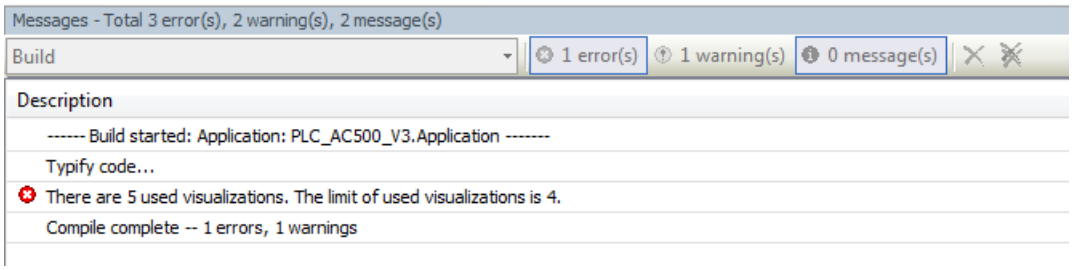
Automation Builder will get all the available visualizations in the project and count those reachable from the visualization client objects (WebVisu and RemoteTargetVisualization).

In case the predefined number of visualizations is exceeded an error is shown in the message window, preventing the user from compiling the project.

The error will be shown under *"Build"* category when the user executes the build command. The PLC program won't download to the PLC until this error is solved (like with any other build errors). In the image below, there are 5 visualizations being used (3 of them added directly into the Automation Builder project and the other 2 referenced from a library that was added to the project).



The error will look like this when build command is executed:



If the visualizations are in the project but not being referenced (e.g. not reachable from the *“Start Visualization”* in the WebVisu) they are not taken into account for this limitation. If the error condition is solved, the error will disappear when the user executes the build command again.

1.4.5.3 Designing a visualization with elements

The visualization editor provides the visualization elements for designing a user interface in the *“Visualization Toolbox”* view.

Drag the desired element into the editor view and adapt it in the *“Properties”* view: purely visual design, labeling, display of data, reaction to user inputs, possibility to input values, etc.

Static or dynamic configuration of the properties is possible. This means the assignment of fixed values or the assignment of application variables. A dynamic configuration allows for an animation which is executed at runtime.

See also

- *Chapter 1.4.5.19.4.1.1 “Visualization Editor” on page 1772*
- *Chapter 1.4.5.8 “Animating visualization elements” on page 1293*

1.4.5.3.1 Select Element

The *“Visualization Toolbox”* view provides the following elements for selection:

- All visualization elements which the set visualization profile defines.
- Image elements for all images of the project from the integrated libraries or symbol libraries.
- Frame elements for all visualizations of the project or from the libraries.

> *See the “Project Settings” for the currently set visualization profile and the currently used symbol libraries.*

The elements are combined into specific categories, each of which has its own button in the *“Visualization Toolbox”* view. You can create new categories and assign its elements.

The elements of the categories are displayed in the *“Visualization Toolbox”* view as preview images. It is also possible to search for an element name.

Simply drag the preview image of the element to the desired position in the editor window. Then the configurable properties of the element are displayed automatically in the *“Properties”* view of the visualization editor.

See also

- *Chapter 1.4.5.19.4.1.1 “Visualization Editor” on page 1772*
- *Chapter 1.4.5.19.4.1.2 “View 'Visualization Toolbox'” on page 1773*
- *Chapter 1.4.5.18.1.5 “Visualization Element 'Image'” on page 1418*
- *Chapter 1.4.5.18.1.6 “Visualization Element 'Frame'” on page 1432*

Create or remove new element category

Requirement: The visualization editor is open.

1. In the *“Visualization Toolbox”* view, click the button.
   ⇨ the *“Configure Categories and Items”* dialog opens.
2. In the dialog, click the + symbol to open the *“Add Category”* dialog. Note: Click the − symbol or press the *[Del]* key to delete the definition of a category.
3. In the *“Name”* field, specify a name (example: `tagA`) and click *“OK”* to close the dialog.
   ⇨ In the *“Configure Categories and Items”* dialog, the new custom category `tagA` is inserted below in the tree view. It is provided with the symbol.
4. Click the *“Enable”* option for the new category, and click *“OK”* to close the dialog.
   ⇨ CODESYS adds a *“tagA”* button in the *“Visualization Toolbox”* view. When you click the button, all elements that are assigned to this category are displayed.

See also

- *Chapter 1.4.5.19.3.4 “Dialog 'Configure Categories and Items'” on page 1747*

Assigning a visualization element of an element category

Requirement: The visualization editor is open. You have already created a custom category `tagA`. A button labeled `tagA` is visible in the *“Visualization Toolbox”* view.

1. In the *“Visualization Toolbox”* view, right-click an element to open its context menu.
   ⇨ A context menu opens. It contains the *“Add Item to Category 'tagA'”* and *“Add to Categories”* commands.
2. Click *“Add to Category 'tagA'”* and click *“OK”* to close the dialog.

3. Click the *"tagA"* button.
   ⇨ All elements are displayed which are assigned to this category, below it also the currently assigned element.

See also

- *Chapter 1.4.5.19.4.1.2 "View 'Visualization Toolbox'" on page 1773*

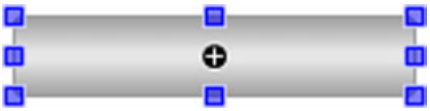
1.4.5.3.2 Positioning the Element, Adapting Size and Layer

A visualization is a raster image in pixels. The pixel position is specified in X/Y-coordinates. The origin (0,0) is located at the upper left corner of the window. The positive X-values run to the right, and the positive Y-values run downwards. The position of an element on the Z-axis of the visualization is controlled by the position in the element list (see below).

Configuring the size and position in the editor

The size and position of an element are specified as pixel coordinates in the *"Properties"* view. These settings are displayed graphically in the editor view at the same time.

When you drag a visualization element from the *"Visualization Toolbox"* view to the editor view, it is shown as selected, as in the following example of a rectangle element:



The possible positions depend on the set grid. You can change its settings CODESYS options. Commands in the context menu are available for alignment and grouping.

Now you can move or resize the element directly in the editor. As an alternative, you configure the *"Position"* property in the properties editor, which opens automatically for the selected element. See the description for this, for example in the help page for the *"Button"* element. The changes are also updated in the other editor.

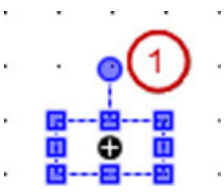
Changing the element size and position in the editor

1. Focus the element so that the shape of the mouse pointer indicates movement (example:).
2. Drag the element to any position.
   ⇨ The position of the element is also updated in the properties *"Position ➔ X"* and *"Position ➔ Y "*.
3. Focus on a blue box.
   ⇨ The shape of the mouse pointer is a double arrow that indicates the direction you can drag the box in order to resize the box: .
4. Drag the blue box to resize the element.
   ⇨ The position of the element is also updated in the properties *"Position ➔ X"* and *"Position ➔ Y "*.

Moreover, you can rotate the *"Rectangle"*, *"Line"*, *"Polygon"*, and *"Pie"* elements.

Static rotation of rectangle, line, polygon, pie, or image

1. Select the element for static rotation. Example: Rectangle
   ⇨ The rectangle is displayed with a handle next to the movable position boxes.



(1) Handle

2. Drag the mouse pointer over the handle.
   ⇨ The cursor is displayed as a rotating arrow .
3. Rotate the element to any position.

   ⇨ In the property *"Position ➔ Angle"*, the set angle is displayed in degrees.

See also

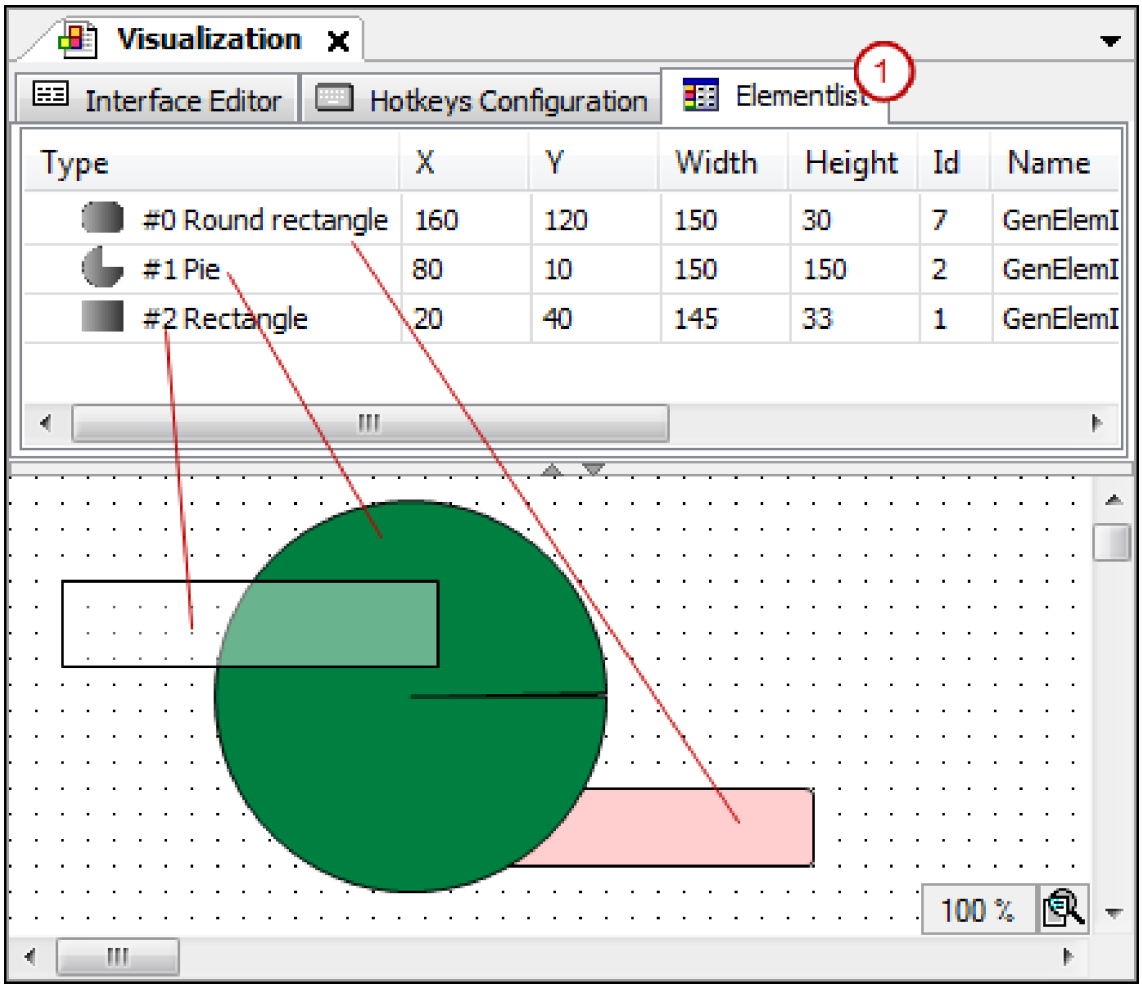
- *Chapter 1.4.5.8.1 "Configuring rotations and offsets" on page 1293*

Moving the visualization element forward and back

Each visualization element is in its own layer of the visualization (Z-axis). It can be hidden by other elements in the foreground and hide other elements in the background. The order of layers is visible on the *"Element List"* tab above the editor view. The order of elements from front to back specifies the order of visualization layers from back to front.

Use the commands from the *"Order"* context menu to move a selected element.

Example of an element list (1):



See also

- *Chapter 1.4.5.19.2.3 “Command 'Visualization Element List'” on page 1721*
- *Chapter 1.4.5.19.2.5 “Command 'Order'” on page 1723*
- *Chapter 1.4.5.19.2.6 “Command 'Alignment'” on page 1723*
- *Chapter 1.4.5.19.2.7 “Command 'Group'” on page 1726*

1.4.5.3.3 Assigning a color

You configure the color of a visualization element either statically by means of the *“Color”* property, or dynamically by assigning an application variable by means of the *“Color variables”* property. Depending on the element, color assignments are also available in other properties. For example, for the font color, this is provided in the *“Text”* property of a labeled element.

For the static assignment of a color value, you can always use the color dialog in the properties editor, which provides color palettes to choose from.

You can specify the color as a style color. Style colors are color names for color definitions from the actively applied style. When configuring an corresponding property, you are provided with a list of available style colors. **We recommend that you use style colors** because then you can change colors centrally by means of a style selection or a style customization. You can also open the *“Color”* dialog to select a value from color palettes.

In addition, you can define the fill color of an element as a *“Gradient”*. Then the color changes linearly, radially, or axially from the initial color to the final color. You configure the *“Gradient setting”* in the *“Gradient Editor”* dialog.

See also

- *“Element property 'Colors'” on page 1369*

Designing a visualization element with a style color or a fixed color value

> **NOTICE!**
> A color assignment with style color allows for easy global color changes.

☑ Requirement: The visualization editor is open.

1. Insert some `Rectangle` elements.
2. Select an element.
   ⇨ The *“Properties”* view is active.
3. Click in the *“Colors ➔ Normal state ➔ Fill color”* property.
   ⇨ A list box and the [...] button appear.
4. Assign a **style color** to the rectangle. For example, select *“Elementfillcolor”* from the list box.
5. Define the degree of transparency in the *“Colors ➔ Normal state ➔ Fill color ➔ Transparency”* property. Use the slider to select the value *“136”*.
6. Select another rectangle. Click in the *“Colors ➔ Normal state ➔ Fill color”* property.
   ⇨ A list box and the [...] button appear.
7. Assign a **fixed color value** to the rectangle. Click [...] to do this.
   ⇨ The *“Color”* dialog opens.

8. Select a standard color or *“Define Custom Colors”* to fine-tune your selection. Then click *“OK”*.
   ⇨ The color is set as a fixed value. The color is displayed as a small rectangle. The RGB values are also indicated next to it.
9. Click in the *“Colors ➔ Normal state ➔ Fill color ➔ Transparency”* property.
10. Use the slider to select the value *“136”*.
    ⇨ The color is semitransparent.

See also

- ↳ *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*

Designing a visualization element with a color gradient

☑ Requirement: The visualization editor is open.

1. Drag a *“Rectangle”* element to the visualization.
2. Select the *“Colors ➔ Use gradient color”* property.
3. Click in the *“Colors ➔ Gradient setting”* property.
   ⇨ The *“Gradient Editor”* dialog opens.
4. Define the color gradient for the element:
   - *“Gradient type”*: *“Radial”*
   - *“Standard radial”*: *“Center”*
   ⇨ The fill color of the element changes radially from white to black.

See also

- ↳ *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*

Configuring a visualization element for color animation

The *“Color variables”* property, which certain elements may have, is used for the color animation of the element. If you assign a variable there, then you can program color changes in the application code or configure a user input that results in a color change.

You can see an example in the "Animating Visualization Elements" chapter.

- ↳ *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*
- ↳ *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*
- ↳ *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

1.4.5.3.4 Using texts

You can get displayed text in an element by assigning a string in the element property *"Texts ➔ Text"*. For example all base elements have this property. Also, you can get displayed a text as a tooltip (element property *"Texts ➔ Tooltip"*). Texts assigned in this way are static. They are managed in the object *"GlobalTextList"* in view *"POUs"* and they cannot be modified during runtime, neither programmatically nor via an user input.

However, you can extend a static text by (exactly) 1 placeholder containing a formatting specification, in order to output the content of a variable at this place. At runtime the current value of the variable, which you have assigned to the element via property *"Textvariable"*, will be output.

> *On the possible formatting specifications please see: Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

By dynamic configuration you can animate the optical representation of the text.

You can localize the static texts, if you have set up multilingualism in your project.

See some examples for the text configuration of visualization elements in the following chapters.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

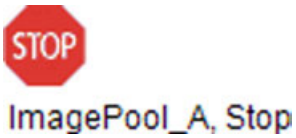
Labeling an image element with a static text

☑ Precondition: A project containing a visualization is opened. You have an image file representing a stop symbol.

1. Below the Application object insert an object *"Image Pool"* named `ImagePool_A`.
2. In the image pool `ImagePool_A` add your stop symbol image file with ID `Stop`.

   ⇨ 
3. Open the visualization and from the ToolBox draw an element *"Image"* into the editor.

   ⇨ The input assistant opens. In tab `Category` you see the image pool`ImagePool_A`.
4. Select the image `Stop` and close the dialog with *"OK"*.
5. Configure the property *"Text"* of the image: `ImagePool_A, Stop`
6. Configure the property *"Text properties ➔ Horizontal alignment"*: `Left`.
7. Configure the property *"Text properties ➔ Vertical alignment"*: `Bottom`.



Text output: Element outputs the result of ST code which is executed on a mouse-click

☑ Precondition: A project containing a visualization is opened.

1. Open the visualization and insert a *"Button"* element.
   ⇨ The *"Properties"* view opens for the new element.
2. Configure property *"Text"*: `Number of clicks: %I`
   ⇨ The string contains the placeholder `%I`.
3. In POU `PLC_PRG` of the application declare a type-conform variable: `iClicks : INT;`
4. Configure the property *"Text variable"* of the button element with `PLC_PRG.iClicks`.
   ⇨ At runtime the variable value will be output instead of the placeholder.
5. Below property *"Inputconfiguration"*, in the cell containing the input event `OnMouseClick`, click on *"Configure"*.
6. From the list of possible actions choose `Execute ST-Code`.
7. Enter the code for the action in the editor *"Execute ST-Code"*:
   ```
   PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
   ```
8. Close the dialog with *"OK"*.
   ⇨ The user input is configured.
9. Build, download and start the application.
   ⇨ The application is running. The visualization opens. The element is labeled and the number of clicks will be output. If you as user click on the button, the number will be increased.

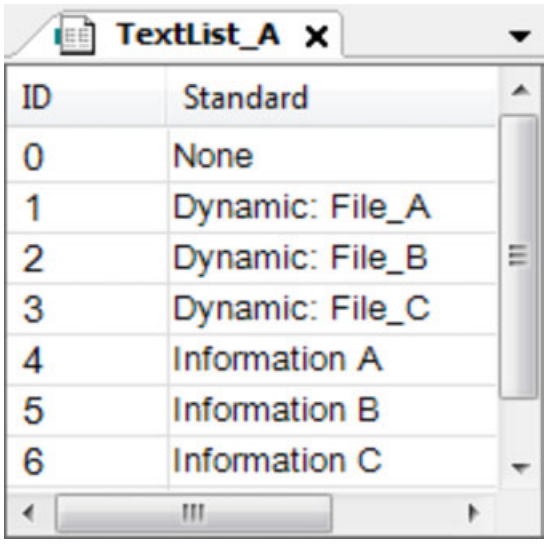
Text output: Dynamic output using a textlist

Using the *"Text field"* element you can produce a dynamic text output. The text output can be effected via an user input or via the application program.

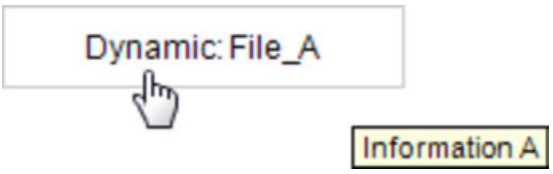
☑ Precondition: A project containing a visualization is opened.

1. Open the visualization and insert a *"Text field"* element.
   ⇨ The *"Properties"* view shows the configuration of the element.

2. Below the application add a Text List with the following entries: `Textlist_A`.



3. In POU `PLC_PRG` of the application declare the text variable:`strTextID : STRING := '0';`
4. Also declare the variable `strTooltipID : STRING := '0';`
5. Also declare the variable `iText : INT;`
6. Configure the property *"Dynamic texts ➔ Text List"* with `'Textlist_A'`.
7. Configure the property *"Dynamic texts ➔ Text index"* with `PLC_PRG.strTextID`.
8. Configure the property *"Dynamic texts ➔ Tooltip index"* with `PLC_PRG.strTooltipID`.
9. In POU `PLC_PRG` implement the CASE instruction as shown below.
   ⇨ The variables in property *"Dynamic Texts"* are programmed.
10. Configure the property *"Inputconfiguration ➔ OnMouseclick"* for `Execute ST-Code` with `PLC_PRG.iText := (PLC_PRG.iText + 1) MOD 4;`
    ⇨ For element *"Text field"* an user input is configured.
11. Build, download and start the application.
    ⇨ The application is running. The visualization opens. In the text field the text `None` is output. When you as user click on the element, the text changes to `Dynamic_File_A`. And the matching tooltip is available: `Information A`. With each click the text changes according to the CASE instruction.



CASE instruction

```
CASE iText OF
0:    strTextID := '0';
    strToolTipID := '0';

1:    strTextID := '1';
    strToolTipID := '4';

2:    strTextID := '2';
    strToolTipID := '5';

3:    strTextID := '3';
```

```
    strToolTipID := '6';
ELSE
    strTextID := '0';
    strToolTipID := '0';
END_CASE;
```

Text output: Configuring a static + dynamic text output

In property *"Texts ➔ Text"* you can define a text in order to get a static text output. A text in *"Texts ➔ Tooltip"* will be displayed as tooltip. You can configure the text in a way, that the content of a variable is additionally output.

You can extend a static text by (exactly) 1 placeholder including a formatting definition, in order to output the content of a variable at this place at runtime. The variable must be assigned in property *"Text variable"*. When the variable value changes in the application code, then at the same time the output in the visualization changes.

☑ Precondition: A project containing a visualization is opened.

1. Open the visualization and insert an element *"Text field"*.
   ⇨ The *"Properties"* view shows the element configuration.
2. Configure the property *"Texte ➔ Text"*: `File name: %s`
   ⇨ The text contains the placeholder `%s`.
3. In POU `PLC_PRG` of the application declare a type-conform variable `strFileName : STRING := 'File_A';`
4. Configure the property *"Text variable"* of the text field with `PLC_PRG.strFileName`.
   ⇨ At runtime the variable value will be output instead of the placeholder.
5. Build, download and start the application.
   ⇨ The application is running. The visualization opens. The text field element displays the text: `File name: File_A`

See also

- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Configuring text input in a text field

You can use the *"Text field"* element in order to output the text given by a variable, or to provide a place, where the user can give input on the variable.

Additionally you can configure a text input. In this case on an user input an input field in the element *"Text field"* will appear. As a precondition you must have configured an user input action in the property *"Inputconfiguration"*.

See also

- ↳ *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

Showing text as a tooltip

☑ Precondition: A project containing a visualization is opened.

1. Open the visualization and insert an element *"Text field"*.
   ⇨ The *"Properties"* view shows the element configuration.
2. Configure the property *"Texts ➔ Text"*: `File name: %s`
   ⇨ The text contains the placeholder `%s`
3. Configure the property *"Texts ➔ Tooltip"*: `Storage location: %s`
4. In POU `PLC_PRG` of the application declare a type-conform variable `strFileName : STRING := 'File_A';`

5. In POU `PLC_PRG` of the application declare also the variable `strFileDir : STRING := 'D:/Data';`
6. Configure the property *"Text variable"* of the text field with `PLC_PRG.strFileName`.
   ⇨ At runtime the variable value will be output instead of the placeholder.
7. Configure the property *"Tooltip"* of the text field with `PLC_PRG.strFileDir`.
8. Build, download and start the application.
   ⇨ The application is running. The visualization opens. The text field element shows the text `File name: File_A`. When the mouse cursor is moved above the text field, the tooltip will be displayed: `Storage location : D/Data`.

See also

- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Configuring element *"Text field"* for text input

The user should be able to enter text in a text field. For this configure an input of type *"Write variable"* on a text output variable. This text output variable will store the text input of the user and will display this text instead of the placeholder (this is `%s` in the example below). You specify the text output variable in the property *"Text variables ➔ Text variable"*.

☑ Precondition: A project containing a visualization is opened.

1. In POU `PLC_PRG` of the application declare a string variable: `strInput : STRING;`
2. Open the visualization and insert an element *"Text field"*.
   ⇨ The *"Properties"* view shows the configuration of the element.
3. In property *"Texts ➔ Text"* enter `Input: %s`.
4. In property *"Inputconfiguration"* for mouse action *"OnMouseClick"* click on *"Configure"* to open the *"Input Configuration"* dialog box. There choose action *"Write a Variable"* and activate option *"Use text output variable"*. Close with *"OK"*.
5. In the element property *"Text variables ➔ Text variable"* assign the text output variable `PLC_PRG.strInput`.
6. Build, download and start the application.
   ⇨ The application is running. The visualization opens. The element outputs the text: `Input:`. Click in the element to open an input field, where you can enter a string. After having terminated the input by *[Enter]*, the text will be adopted.

Animating the text display

Configure the property *"Font variables"* in order to animate the display of a text. All base elements have this property, additionally the table, scrollbar and text field element.

See also

- ↳ *Chapter 1.4.5.8.2 "Animating a text display" on page 1295*

Configuring the 'Label' element

☑ Precondition: A project containing a visualization is opened.

1. Open a visualization and insert an element *"Label"*.

   ⇨ The *"Properties"* view with the pre-set property configuration opens.

2. Configure the property *"Texts ➔ Text"*: `Visualization A`.

Making an element invisible

You can configure the property *"State variables ➔ Invisible"* in order to hide an element in the visualization.

☑ Precondition: In the visualization you have configured a text field, which gets visible only, if a certain application variable gets TRUE. For example in order to show certain instructions or descriptions only in a certain state of the machine.

1. For the text field element configure the property *"Texts ➔ Text"* with `Error detected: Do the following....`

   Configure the property *"Text properties ➔ Font color"* with *"dark red"*.

2. In `PLC_PRG` declare the variable `bIsInvisible : BOOL : TRUE;` (this is the initialization for the current example; normally the variable should be set to TRUE by the application program under certain conditions.

3. Configure the property *"State variables ➔ Invisible"* with `PLC_PRG.bIsInvisible`.

4. Build, download and start the application.

   ⇨ The application is running. The visualization opens and the text field is not visible. When you set `bIsInvisible` to `TRUE`, the textfield will be displayed.

1.4.5.3.5 How to display variable values in the visualization

There are simple to very specialized visualization elements for displaying data from a running application.

Examples:

- Simple output of variable values: For example, you can configure a purely formatting specification for a *"Rectangle"* element in the *"Text"* property and the variable whose value is to be displayed in the element in the *"Text variable"* property.
- Display of structured variable values (structure, array, function block): You use the *"Table"* element and specify an array variable in its configuration in the *"Data array"* property whose values are to be displayed in the table. One-dimensional arrays can also be displayed in a *"Histogram"*.
- Display of values by image switching. Example: A specific screen is displayed depending on the error message that occurs. You do this by configuring an *"Image"* element with a variable for the *"Bitmap ID variable"* property.
- Display a variable value as a bar or with a pointer on a scale: You specify a variable in the *"Value"* property of the *"Bar Display"* element or *"Meter"* element to display its value as a bar on a horizontal or circular scale.
- Display of alarms: The alarms configured in the alarm management of the application can be made visible by means of the *"Alarm Table"* and *"Alarm Banner"* elements in the user interface.
- *"Trace"* and *"Trend"*: For graphical recording of variable values over a period of time.

For details, see the descriptions of the element properties.

See also

- *Chapter 1.4.5.18.1 "Visualization Elements" on page 1367*
- *Chapter 1.4.5.3.4 "Using texts" on page 1260*
- *Chapter 1.4.5.21.4 "Displaying Array Data in a Histogram" on page 2138*

1.4.5.3.6 How to Change Variable Values via the Visualization

In addition to displaying values from the controller, a user interface is also used to enter and change values.

In general, you can configure user input for each element in its *“Input configuration”* properties. Moreover, elements have been developed especially for specific input.

Examples:

- A *“Button”* element (or *“Rectangle”* element, and so on) that is clicked to open a predefined dialog visualization for easily specifying a value.
- A *“Slider”* element for changing the value of a variable by moving visual element parts, for example with the mouse. In the case of the slider: The element adjusts the value of a variable, depending on the position of the slider within the slider. You define the value range of the slider bar by means of the scale start and scale end.
- A switch element (example; *“Power Switch”*) for setting a Boolean value.
- A *“Spin Box”* element for incrementing or decrementing the value of a variable in defined intervals.
- A *“Button”* element for writing a recipe, executing a specific ST code, writing a specific variable, and so on (definition in the input configuration).

See also

- *Chapter 1.4.5.19.5 “Visualization Elements” on page 1791*
- *Chapter 1.4.5.4 “Configuring user inputs” on page 1267*

1.4.5.3.7 Designing a background

You can design the background of your visualization in color or with an image. To do this, use the command *“Visualization ➔ Background”*.

See also

- *Chapter 1.4.5.19.2.10 “Command 'Background'” on page 1728*
- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Configuring an image as a background

In addition, you can use the property “Integrate background” in the dialog “Properties” of a visualization object to specify whether the background image should always be displayed in its entirety or whether it should be truncated.

☑ Requirement: A project with a visualization is open.

1. Open the visualization and select the command *“Visualization ➔ Background”*.
2. Activate the option *“Image”* and open the input assistant.
3. Select an image in the dialog *“Input Assistant”*.

   ⇨ The image serves as a background image.

See also

- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Configuring a colored background

☑ Requirement: A project with a visualization is open.

1. Open the visualization and select the command *“Visualization ➔ Background”*.
2. Activate the option *“Color”*.
3. Select a style color such as *“Element background color”* from the selection list.
   ⇨ The background of the visualization is colored.

1.4.5.4 Configuring user inputs

User inputs for a visualization are configured in order to operate the visualization.

For this purpose, you configure input events on visualization elements where follow-up actions are triggered. The combination of user inputs and follow-up actions are defined in the *“Input configuration”* of an element. For example, you can select a mouse click on an element as the input event and opening a dialog box as the input action.

Keyboard events can also be configured that trigger actions in a specific visualization window when the events occur. You program this kind of input configuration for a visualization in its *“Keyboard configuration”* editor.

In addition, keyboard events can be configured that occur in all visualizations programmed in the application. You configure this kind of input configuration per application below the visualization manager in the *“Standard keyboard shortcuts”* tab.

Input is usually performed with the mouse and keyboard as controlling device. You can also configure a user operation by means of gestures.

If a visualization device is not equipped with a mouse, then you can activate default keyboard usage. Then a user can operate the visualization with the keyboard only by navigating with the arrow keys and triggering events by pressing the *[Enter]* key.

If a visualization device is not equipped with a keyboard, then you can call a virtual keyboard or a virtual numeric keypad.

> **NOTICE!**
> Configure keyboard events only for keys that the visualization device supports.

See also

- *Chapter 1.4.5.19.2.2 “Command 'Keyboard Configuration'” on page 1720*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*
- *Chapter 1.4.5.19.4.3 “Tab 'Visualization Manager' - 'Default Hotkeys'” on page 1781*

Processing order of keyboard events

1. Event handler of the application. Requirement: The event handler is activated.
2. Events of the default keyboard usage
3. Events of the keyboard usage are configured in the tab *“Visualization manager” - “Default hotkeys”*.
4. Events of keyboard usage are configured in the tab *“Keyboard configuration”* for the currently visible visualization.

See also

- *Chapter 1.4.5.4.5 “Capturing user input events” on page 1277* *Chapter 1.4.5.19.1 “Keyboard Shortcuts for Default Keyboard Action” on page 1717*

- *Chapter 1.4.5.19.4.3 “Tab 'Visualization Manager' - 'Default Hotkeys'” on page 1781*
- *Chapter 1.4.5.19.4.3 “Tab 'Visualization Manager' - 'Default Hotkeys'” on page 1781*

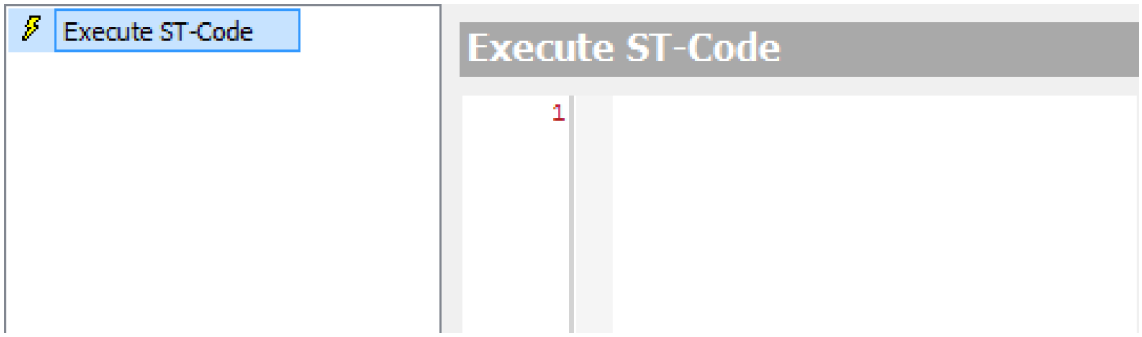
1.4.5.4.1 Configuring user inputs for visualization elements

All base elements and some common control elements have the *“Input configuration”* property. This is where you can configure a user input for an element. For this purpose, you select an input event and an input action.

Configuring user inputs

☑ Requirement: A project is open with a visualization.

1. Open the visualization and added a *“Button”* element.
   ⇨ The *“Properties”* view opens for the new button.
2. Configure the property *“Text”* with `Number of clicks: %i`.
3. Declare a variable `iClicks : INT;` in the application in the `PLC_PRG` POU.
4. Configure the *“Text variable”* property of the button as `PLC_PRG.iClicks`.
   ⇨ At runtime, its variable value will replace the placeholder in the *“Text”* property.
5. In the *“Input configuration”* property, click the *“Configure”* button in the `OnMouseClick` line.
6. Select the `Execute ST code` action from the list of possible actions and click the > symbol.
   ⇨ The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.



7. Program the action in the editor at *“Execute ST code”*:
   ```
   PLC_PRG.iClicks := PLC_PRG.iClicks + 1;
   ```
8. Click *“OK”* to close the dialog box.
   ⇨ The user input is configured.

9. Compile, download, and start the application.

   ⇨ The application runs. The visualization opens. If the user clicks the button, then the action is executed, the variable `PLC_PRG.iClicks` is incremented, and the number of clicks is printed.

See also

- ↳ *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

1.4.5.4.2 Configuring gesture recognition

You can execute a visualization on a device that is operated by means of gestures. The visualization retains its user input configuration for mouse and keyboard operation and also recognizes gestures and multi-touch events. Gesture events are recognized and interpreted as mouse events.

For this purpose, activate the *“Activate multi-touch”* setting in the visualization manager.

Elements of the type *“Frame”* or *“Tab control element”* display contents that a user should be able to move. Therefore, configure their *“Scaling type”* property with *“Fixed and scrollable”*.

Gesture recognition for:

- Tapping
  A quick tap on the element is interpreted as a mouse click.
- Panning
  Pressing, moving, and releasing with one finger in a frame or with a tab control element (in the window area of the element) will move the contents.
- Multi-finger touch detection
  Touching several elements at the same time will input for all elements. These touch events are interpreted as the respective mouse events.
  Example:
  Two-hand operation in order to trigger an action with two simultaneous inputs on two different elements.
  Virtual mixing console where multiple sliders can be operated at the same time.

In addition, the `IGestureEventHandler` interface is available in the `VisuElems.VisuElemBase` library. You can use this to implement application code that recognizes gestures and executes follow-up actions.

The following display variants can execute a visualization on a multi-touch device

- CODESYS WebVisu

See also

- ↳ *“Implementing event handling with multi-touch” on page 1270*

Using gestures to control visualizations

☑ Requirement: A project is open with a visualization and a user input configuration. It contains one button. The visualization device is a display with multi-touch support.

1. Double-click the *"Visualization manager"* object.
   ⇨ The editor opens.
2. Click the *"Settings"* tab.
3. In the *"Additional settings"* group, activate the *"Activate multi-touch"* option.
4. Compile, download, and start the application.
   ⇨ The application runs. The visualization opens. When a user touches the display of the visualization device, the visualization responds. Elements that respond to mouse events also respond to touch events Several buttons can be pressed at the same time. Scrollable frames or tab control elements are displayed without scrollbars and can be moved by panning.

   Note: The *"Scaling type"* property of elements type *"Frame"* or *"Tab control element"* must be set to *"Fixed and scrollable"*.

See also

- *Chapter 1.4.5.18.1.6 "Visualization Element 'Frame'" on page 1432*
- *Chapter 1.4.5.18.1.10 "Visualization Element 'Tabs'" on page 1463*

Implementing event handling with multi-touch

☑ Requirement: The device is multi-touch capable

1. Implement and register a function block that receives the gesture events.
   ⇨
```
FUNCTION_BLOCK GesturesHandler IMPLEMENTS
VisuElems.VisuElemBase.IGestureEventHandler2

VisuElems.g_VisuEventManager.SetGestureEventHandler(THIS^);
```
2. Implement and register a function block that sets the touch areas.
   ⇨
```
FUNCTION_BLOCK RectProvider IMPLEMENTS
VisuElems.VisuElemBase.IApplicationRectangleProvider

VisuElems.g_VisuRectangleProvider := THIS^;
```
3. Implement actions as application code that are executed when a gesture event occurs

1.4.5.4.3 Configuring text input with the virtual keyboard

A visualization is usually configured so that it calls a virtual keyboard for a text input event when an input device is not available. For this purpose, the follow-up action *"Write variable"* is preset accordingly in the user input: The value *"Standard"* is selected for the *"Input type"* setting.

However, you can also configure especially how text is input. For this purpose, more input types are available in the user input, such as `Text input` or the listed visualizations. These visualizations have the visualization type *"Numpad/Keypad"* and display virtual keyboards or numeric keypads.

In the *"Settings for default text input"* setting of the visualization manager you can preset a keyboard visualization that is called from all visualizations in the application when required. This is possible without having to customize the user inputs of the visualizations.

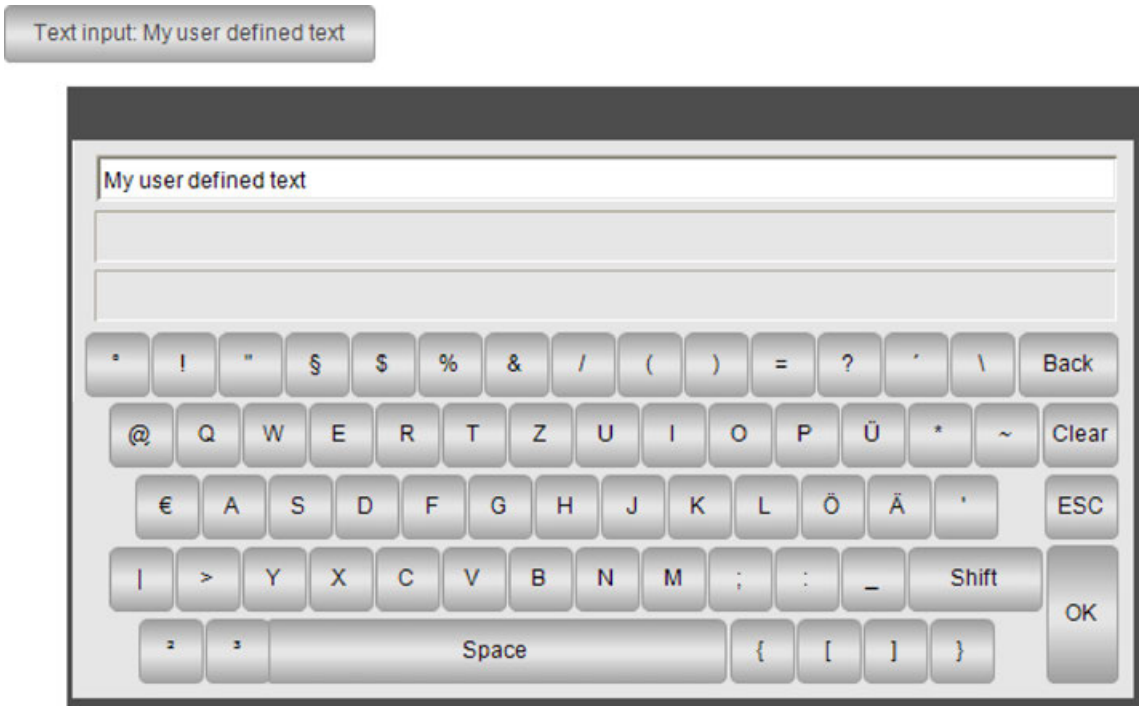
See also

- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Configuring text input especially for virtual keyboards

☑ Requirement: A project is open with a visualization.

1. Declare an input variable in the `PLC_PRG` program.
   ⇨ `VAR_INPUT stInput : STRING; VAR_END`
2. Add a button to the visualization and select the element.
3. Configure the property *“Texts ➔ Text”* with `Text input: %s`.
4. Configure the property *“Text variables ➔ Text variable”* with `PLC_PRG.stInput`.
5. Click auf *“Configure”* in the property *“Input configuration ➔ OnMouseClick”*.
   ⇨ The *“Input Configuration”* dialog box opens. The selected input event is printed below the caption.
6. Select the *“Write variable”* action.
7. Select the visualization `Visudialogs.Keypad` in *“Input type”* of the implementation of the action.
   ⇨ The virtual keyboard `Visudialogs.Keypad` is selected as the input device.
8. Compile, download, and start the application.
   ⇨ The visualization opens.
9. Click the button as a visualization user.
   ⇨ The virtual keyboard appears and allows text input by means of the mouse.



Configuring numeric input especially for virtual numeric keypads

☑ Requirement: A project is open with a visualization.

1. Declare an input variable in the `PLC_PRG` program.

   ⇨ `VAR_INPUT iInput : INT; VAR_END`

2. Open the visualization and added a *“Rectangle”* element.
3. Select the element in the editor.

   ⇨ The properties are visible in the *“Properties”* view.

4. Configure the property *“Texts ➔ Text”* with `Number input: %i`.
5. Configure the property *“Text variables ➔ Text variable”* with `PLC_PRG.iInput`.
6. In the *“Input configuration”* property, click the *“Configure”* button in the `OnMouseClick` line.

   ⇨ The *“Input Configuration”* dialog box opens. The selected input event is printed below the caption.

7. Select the `Write variable` action from the list of possible actions and click the > symbol.

   ⇨ The action appears in the list of actions to be executed. The blank implementation of the action appears in the window area to the right of the list.

8. Select the following settings:

   “Input type” set to `VisuDialogs.Numpad`.

   “Choose variable to edit” set to *“Use text output variable”*.

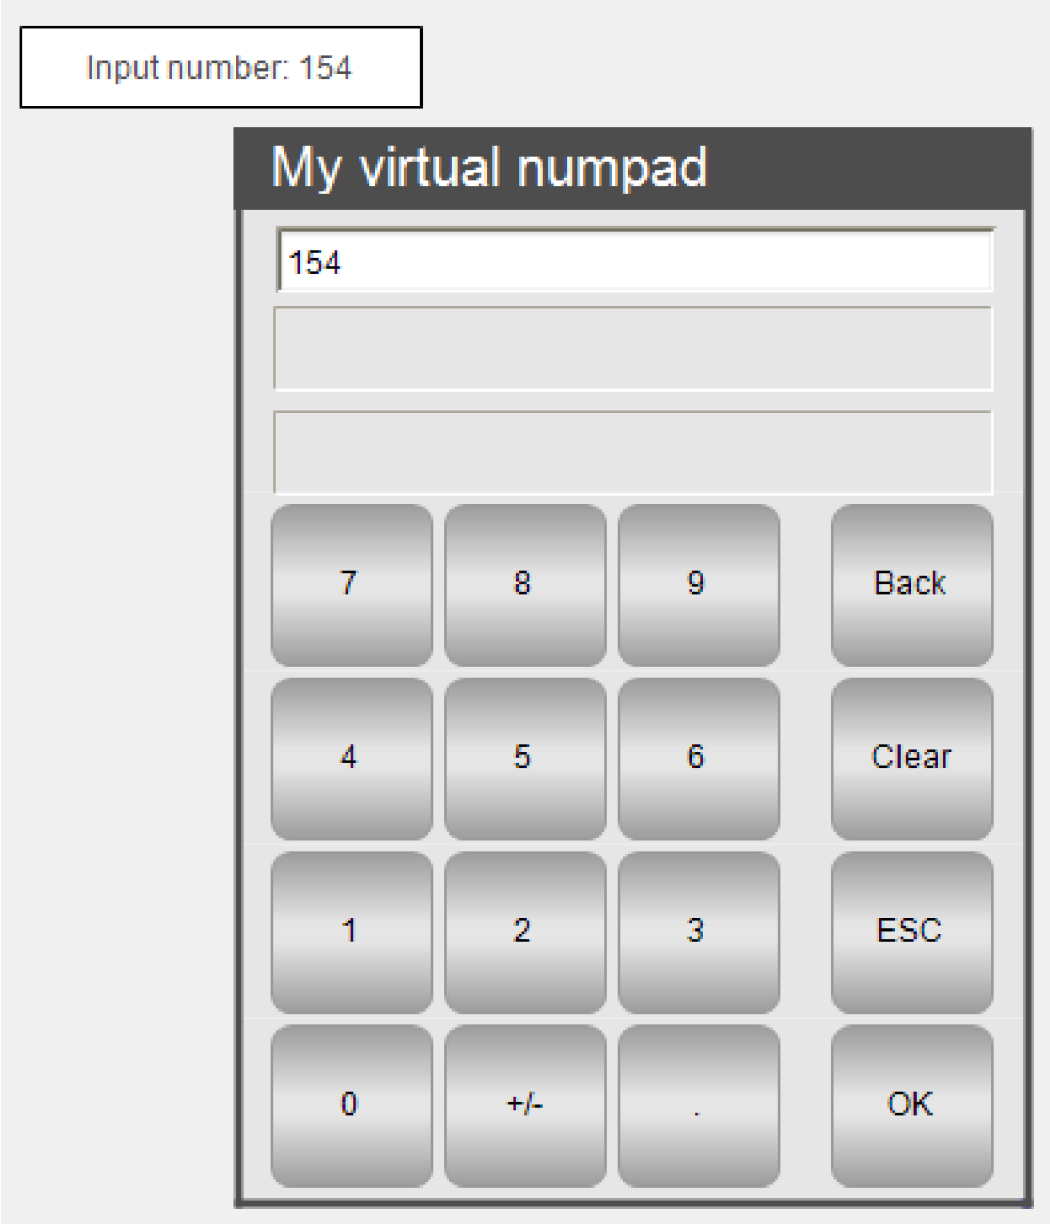
   “Dialog title” set to `'My virtual numpad'`.

9. Click *“OK”* to close the dialog box.

   ⇨ The user input is configured.

10. Compile, download, and start the application.

    ⇨ The application runs. The visualization opens. When a user clicks the rectangle, the numeric keypad opens.



Defining standard text input

☑ Requirement: A project is open with a visualization and a user input configuration. For all *"Write variable"* follow-up actions, the value *"Default"* is selected for the *"Input type"* setting.

1. Double-click the visualization manager.
2. Click in the default text input in the *"Settings"* tab (*"Default text input"* group) and assign visualizations.

    ⇨ These visualizations are defined as default text input. If a display variant does not have a keyboard, then these visualizations are called without you having to adapt the user input.

1.4.5.4.4 Configuring Keyboard Shortcuts

You can define keyboard shortcuts and assign specific actions to them. At runtime, a visualization detects the keyboard input event and executes the action.

There are different locations where you can configure a keyboard input event.

The options include the following:

- Configure keyboard input for a specific element.
- Configure keyboard input for a specific visualization.
- Configure keyboard input that is valid for all visualizations.
- Select the default hotkeys.

If the visualization integrated in CODESYS is executed, then you can deactivate the keyboard input of the visualization in order to use the keyboard shortcut from CODESYS in this state.

Configuring keyboard shortcuts for elements

You can define a keyboard shortcut that triggers an action for an element. The element has to be visible and operable. For this purpose, the property *"Input configuration ➔ Keyboard shortcuts"* is available in the *"Properties"* view of the visualization editor.

☑ Requirement: A CODESYS project is open with the existing visualizations `visEllipse` and `visRectangle`.

1. Select the application in the device tree and add a visualization named `visMain`.

   ⇨ The visualization editor opens.

2. In the *"Visualization Toolbox"* view, select and drag the *"Frame"* element to the editor.

   ⇨ The *"Configuration of Frame Visualizations"* dialog opens.

3. Double-click in succession the `visEllipse` and `visRectangle` visualizations in *"Available Visualizations"*.

   ⇨ The visualizations appear in *"Selected Visualizations"*.

4. Click *"OK"* to exit the dialog.

   ⇨ The visualization contains a new element type *"Frame"*. The 2 selected visualizations appear under its property *"References"*.

   In the editor, the frame shows the visualization with the index `0`.

5. Add a button and configure its properties:

   Select `Rectangle` in the property *"Texts ➔ Text"*.

   In the *"Input configuration ➔ OnMouseDown"* property, select *"Toggle frame visualization"* for the visualization `visRectangle`.

   Specify the value `R` in the property *"Input configuration ➔ Keyboard shortcuts ➔ Key"*.

   ⇨ The button has a user input and a keyboard shortcut.

6. Add a button and configure its properties:

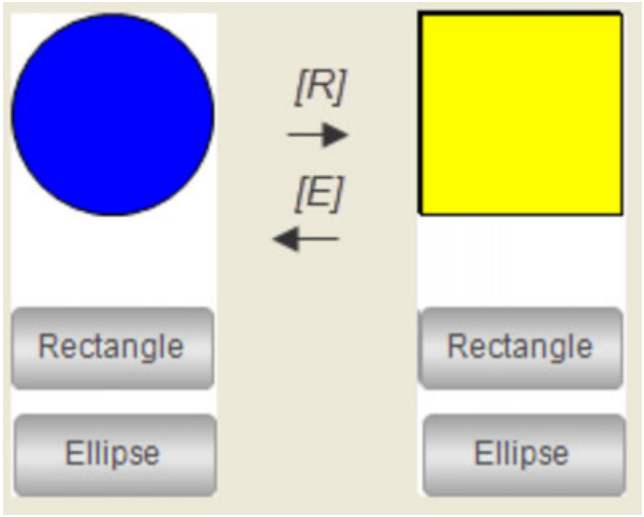
   Select `Ellipse` in the property *"Texts ➔ Text"*.

   In the *"Input configuration ➔ OnMouseDown"* property, select *"Toggle frame visualization"* for the visualization `visEllipse`.

   Specify the value `E` in the property *"Input configuration ➔ Keyboard shortcuts ➔ Key"*.

   ⇨ The button has a user input and a keyboard shortcut.

7. Click *"Online ➔ Login"* for the device and start the application.
   ⇨ The visualization starts. It has a frame where one of the referenced visualizations runs. Focus on the `visEllipse` visualization and press *[E]*. The visualization switches the contents in the frame to the `visEllipse` visualization. When you press *[R]*, the visualization switches the contents in the frame to the `visRectangle` visualization.



See also

- *Chapter 1.4.5.18.1.6 "Visualization Element 'Frame'" on page 1432*
- *"Input action 'Switch Frame Visualization'" on page 1756*

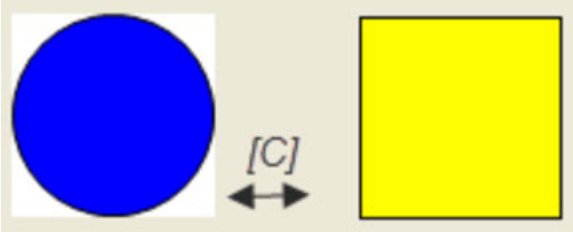
Configuring keyboard shortcuts for a specific visualization

You can define keyboard shortcuts that trigger an input action on a specific visualization. The *"Keyboard Configuration"* tab in the editor of the visualization is used for this purpose.

☑ Requirement: A CODESYS project is open with the visualizations `visEllipse` and `visRectangle`.

1. Open the CODESYS TargetVisu object and select `visEllipse` as the start visualization.
2. Open the `visEllipse` visualization and click the *"Keyboard Configuration"* tab.
3. Click *"Visualizations ➔ Keyboard Configuration"*.
   ⇨ The *"Keyboard Configuration"* tab opens.
4. Select the value `C` in the *"Key"* column.
5. Activate the *"Press key"* option.
6. Select the *"Change shown visualization"* value in the *"Action Type"* column.
7. Select `visRectangle` in the *"Action"* column.
   ⇨ The user input is configured for *[C]*.
8. Open the `visRectangle` visualization and click the *"Keyboard Configuration"* tab.
9. Select the value `C` in the *"Key"* column.
10. Activate the *"Press key"* option.
11. Select the *"Change shown visualization"* value in the *"Action Type"* column.
12. Select `visEllipse` in the *"Action"* column.
    ⇨ The user input for *[C]* is also configured for this visualization.

13. Build the application.
14. Click *"Online ➔ Login"* for the device and start the application.
    ⇨ The visualization starts and displays an ellipse. Focus on the `visEllipse` visualization and press *[C]*. The `visRectangle` visualization is displayed. Focus on the visualization and press *[C]* again. Now the visualization is switched again to `visRectangle`.



See also

- *"Tab 'Keyboard configuration'" on page 1720*
- *"Input action 'Change Shown Visualization'" on page 1752*

Configuring keyboard shortcuts for all visualizations in the application

You can define keyboard shortcuts that trigger the same input action for all visualizations of the application. The *"Default Hotkeys"* tab in the Visualization Manager is available for this purpose.

☑ Requirement: A project is open with a visualization.

1. Open the visualization.
2. Add a rectangle.
3. Configure the property *"Texts ➔ Text"* with `Keyboard shortcut`.
4. Double-click the *"GlobalTextList"* object.
5. Click in the table, *"Add Language"*, and then specify `de`.
   ⇨ The language `de` is configured.
6. Click in the table, *"Add Language"*, and then specify `en`.
   ⇨ The language `en` is configured.
7. Configure translations for `de` and `en` for the text `Keyboard shortcut`.
   ⇨ `Hotkey Keyboard Shortcut Hotkey`
8. Open the Visualization Manager and select the *"Default Hotkeys"* tab.
9. Specify `D` in the *"Key"* column.
10. Activate the *"Press key"* option.
11. Select the *"Change language"* value in the *"Action Type"* column.
12. Select the language `de` in the *"Action"* column.
    ⇨ The keyboard event for *[D]* is configured.
13. Specify `D` in the *"Key"* column.
14. Activate the *"Press key"* option.
15. Select the *"Alt"* option.
16. Select the *"Change language"* value in the *"Action Type"* column.

17. Select the language `en` in the *"Action"* column.
    ⇨ The keyboard event for *[Alt]+[D]* is configured.
18. Compile, download, and start the application.
    ⇨ The visualization opens.
19. As the visualization user, press *[D]*.
    ⇨ The text is displayed in the language `de`.

See also

- *Chapter 1.4.5.19.4.3 "Tab 'Visualization Manager' - 'Default Hotkeys'" on page 1781*
- *"Input action 'Change Language'" on page 1751*

Activating standard keyboard handling

When you activate the universal keyboard shortcuts for standard keyboard handling, the user can operate the visualization without a mouse. Elements that respond to user input can process a keyboard event instead of a mouse event without adapting its input configuration.

☑ Requirement: A project with a visualization is open.

1. Click the *"Visualization Manager"* object.
2. Activate the *"Activate standard keyboard handling"* option.
   ⇨ The universal keyboard shortcuts are activated.
3. Download the application to a device and start the application.
   ⇨ The visualization starts. Now operation can proceed without the mouse. You can navigate in the window by means of the *[Arrow]* and *[Tab]* keys and press *[Enter]* instead of the mouse button.

See also

- *Chapter 1.4.5.19.1 "Keyboard Shortcuts for Default Keyboard Action" on page 1717*

Activating and deactivating keyboard shortcuts for integrated visualizations

If you execute the visualization as an integrated visualization, then the *"Visualization ➔ Activate Keyboard Usage"* command is available in order to deactivate the capturing of keyboard events. It is actually possible for the same keyboard shortcuts to be defined in the visualization and in CODESYS

When you activate the command, the **visualization** executes the configured keyboard events.

When you deactivate the command, CODESYS executes the keyboard events. Capturing keyboard events is then deactivated for the visualization.

See also

- *Chapter 1.4.5.19.2.4 "Command 'Activate Keyboard Usage'" on page 1722*

1.4.5.4.5 Capturing user input events

You can capture user input events in the application. For this purpose, you can implement a function block that is executed when user events occur.

Capturing the writing of variables

When the user completes the input of a value (in an input field), an edit control event is closed. You can capture this event in the application as follows.

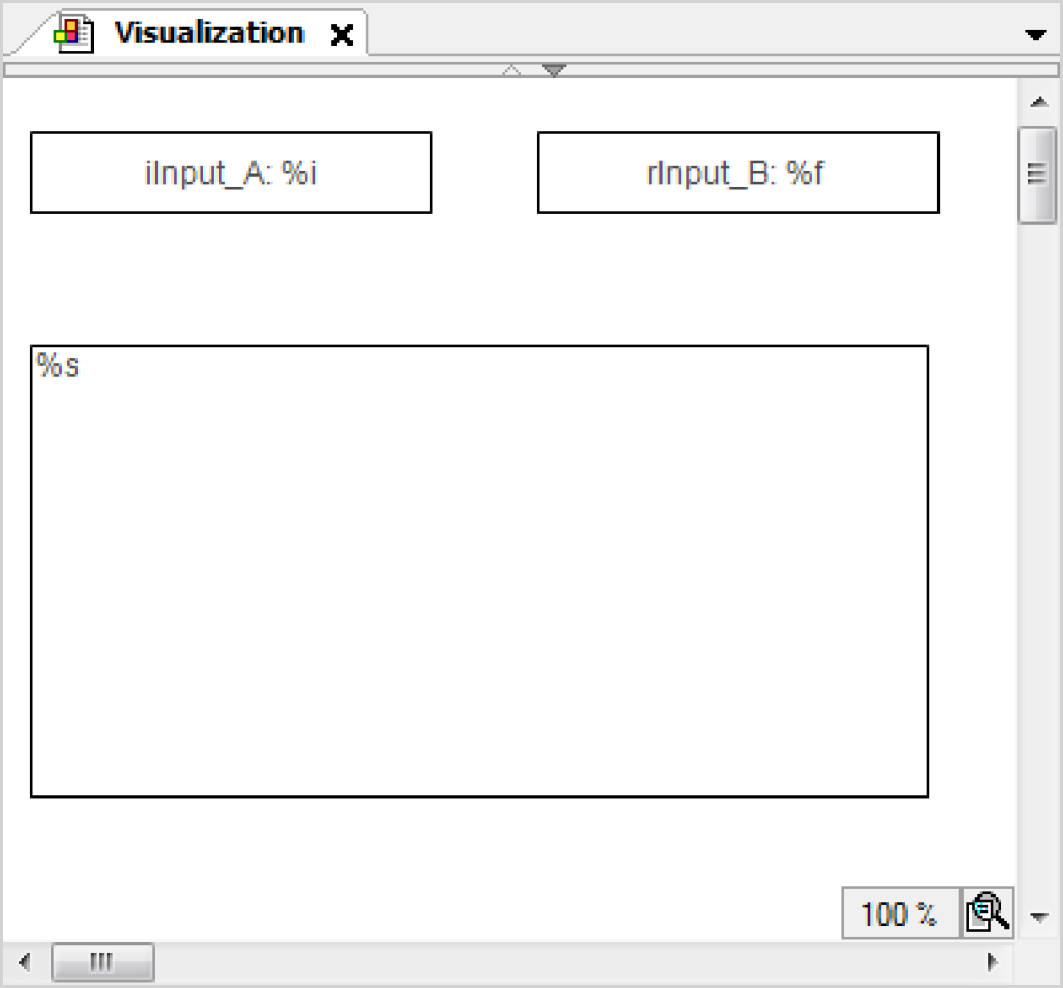
1. Create a function block that implements the `VisuElems.IEditBoxInputHandler` interface from the `VisuElemBase` library.
2. Pass the instance to the global event manager `VisuElems.Visu_Globals.g_VisuEventManager` by calling the `SetEditBoxEventHandler` method.

Example

A visualization has two input fields for `iInput_A` and `rInput_B` and one text output element.

The input fields are rectangles that the user is prompted to click in order to input text.

The text output element is a rectangle where the contents of the text variable `PLC_PRG.stInfo` are printed. The text variable contains the last input by a user in one of the input fields and the additional information that was added.



Properties of the rectangle `iInput_A`	
"Texts ➔ Text"	`iInput_A: %i`
"Text variables ➔ Text variable"	PLC_PRG.iInput_A
Properties of the rectangle `rInput_B`	
"Texts ➔ Text"	`iInput_B: %i`
"Text variables ➔ Text variable"	PLC_PRG.rInput_B
Properties of the rectangle for the text output	
"Texts ➔ Text"	`%s`
"Text variables ➔ Text variable"	PLC_PRG.stInfo

PLC_PRG implementation

```
PROGRAM PLC_PRG
VAR_INPUT
    iInput_A:INT;   (* Used in the visualization as user input
variable*)
    rInput_B:REAL; (* Used in the visualization as user input
variable*)
    stInfo : STRING;   (* Informs about the user input via the edit
```

```
control field;
        String gets composed by method 'VariableWritten;
        Result is displayed in the lower rectangle of the
visualization *)
END_VAR
VAR
    inst : POU;
    bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
    bFirst := FALSE;

VisuElems.Visu_Globals.g_VisuEventManager.SetEditBoxEventHandler(ins
t);
    (* Call of method VariableWritten *)
END_IF
```

POU implementation

```
FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IEditBoxInputHandler
(* no further declarations, no implementation code *)
```

Method VariableWritten assigned to POU

```
METHOD VariableWritten : BOOL
(* provides some information always when an edit control field is
closed in the visualization, that is a variable gets written by
user input in one of the upper rectangles *)
VAR_INPUT
    pVar : POINTER TO BYTE;
    varType : VisuElems.Visu_Types;
    iMaxSize : INT;
    pClient : POINTER TO VisuElems.VisuStructClientData;
END_VAR

// String stInfo, which will be displayed in the lower rectangle,
is composed here
PLC_PRG.stInfo := 'Variable written; type: ';
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, INT_TO_STRING(varType));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', adr: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(pVar));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
SEL(pClient^.globaldata.clienttype =
VisuElems.Visu_ClientType.Targetvisualization,'other visu',
'targetvisu'));
```

Capturing keyboard events

When the user presses and releases the key, a keyboard event is triggered in the visualization. You can capture this event in the application as follows.

1. Create a function block that implements `VisuElems.IVisuUserEventManager` from the `VisuElemBase` library.
2. Pass the instance to the global event manager `VisuElems.Visu_Globals.g_VisuEventManager` by calling the `SetKeyEventHandler` method.

Example

A visualization has one text output element. The text output element is a rectangle where the contents of the text variable `PLC_PRG.stInfo` are printed. The text variable contains information about the last key pressed by the user.

Properties of the rectangle for the text output	
"Texts ➔ Text"	`%s`
"Text variables ➔ Text variable"	PLC_PRG.stInfo

Implementation of the `PLC_PRG` program

```
PROGRAM PLC_PRG
VAR_INPUT
    stInfo : STRING;
END_VAR
VAR
    inst : POU;
    bFirst : BOOL := TRUE;
END_VAR

IF bFirst THEN
    bFirst := FALSE;

VisuElems.Visu_Globals.g_VisuEventManager.SetKeyEventHandler(inst);
END_IF
```

Implementation of the `POU` function block

```
FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IKeyEventHandler
(* no further declarations, no implementation code *)
```

Implementation of the `VariableWritten` method of the `POU` function block

```
/// This method will be called after a key event is released.
/// RETURN:
/// TRUE - When the handler has handled this event and it should
not be handled by someone else
/// FALSE - When the event is not handled by this handler
METHOD HandleKeyEvent : BOOL
VAR_INPUT
    /// Event type. The value is true if a key-up event was
released.
    bKeyUpEvent : BOOL;
    /// Key code
    dwKey : DWORD;
    /// Modifier. Possible values:
    /// VISU_KEYMOD_SHIFT : DWORD := 1;
    /// VISU_KEYMOD_ALT : DWORD := 2;
    /// VISU_KEYMOD_CTRL : DWORD := 4;
    dwModifiers : DWORD;
    /// Pointer to the client structure were the event was released
    pClient : POINTER TO VisuStructClientData;
END_VAR
VAR
END_VAR

PLC_PRG.stInfo := 'KeyEvent up: ';
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
BOOL_TO_STRING(bKeyUpEvent));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', key: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, DWORD_TO_STRING(dwKey));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', modifier: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
DWORD_TO_STRING(dwModifiers));
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo, ', by: ');
PLC_PRG.stInfo := CONCAT(PLC_PRG.stInfo,
```

```
SEL(pClient^.globaldata.clienttype =

VisuElems.Visu_ClientType.Targetvisualization,

                                                'other visu',
'targetvisu'));
```

Recording variable value changes triggered by input events

All visualization elements that change the value of a variable by user input call the `IValueChangedListener` interface. With this interface, the value changes can be recorded and then processed programmatically.

1. Implement a function block (example: `POU`) that implements the `IValueChangedListener` interface.

   ```
   FUNCTION_BLOCK POU IMPLEMENTS VisuElems.IValueChangedListener
   ```

   ⇨ In the device tree, the *"ValueChanged"* method is inserted below the function block.

2. In a program (example: *"PLC_PRG"*), implement the IEC code that registers the interface.

   ```
   VisuElems.g_itfValueChangedListenerManager.AddValueChangedListene
   r(itfValueChangedListener)
   ```

   ⇨ *"PLC_PRG"* receives all value changes by means of the *"ValueChanged"* method.

   Now you can record and process the value changes.

1.4.5.5 Setting Up User Management

In the visualization user management, you define users and user groups and assign access rights to user groups for individual visualization elements. In the user management dialogs, users can be registered and unregistered in runtime mode and passwords and user management can be changed.

In a project with several applications, you can configure user management for each application.

NOTICE!
When a visualization user management exists, an unregistered user automatically receives the access rights from the `None` group.

1.4.5.5.1 Setting up user management for visualizations

When you set up user management for your visualization, the following variants are possible:

- Empty user management
  An empty user management contains the `None` user group. You configure all users and groups yourself.
- User management with default users and groups
  This user management contains the `Admin`, `Service`, `Operator`, and `None` groups. The first three groups each contain one user with the same name as the group.

Create new user management

☑ Requirement: A user management does not exist yet for your visualization.

1. Click the *“Visualization Manager”* object in the device tree.
2. Select the *“User Management”* tab.
3. Click *“Create Empty User Management”* or *“Create User Management with Default Groups and Users”* depending on which variant you need.

   ⇨ The *“Groups”*, *“Users”*, and *“Settings”* tabs are displayed.

   The *“Group”* tab opens.
4. If you have created an empty user management, then you configure the new groups and users.

   If you have created a user management with default groups and users, then you can grant permissions for elements in your visualization. You can also select the user management dialogs and assign them to the buttons of the visualization.

See also

- *Chapter 1.4.5.19.4.5 “Tab 'Visualization manager' - 'User management'” on page 1782*
- *Chapter 1.4.5.5.2 “Configuring users and groups” on page 1283*
- *Chapter 1.4.5.5.4 “Configuring permissions for groups” on page 1285*
- *Chapter 1.4.5.5.3 “Editing and Selecting User Management Dialogs” on page 1284*

1.4.5.5.2 Configuring users and groups

Groups and their users for the basis for user management. A group has one or more users; a user can belong to multiple groups. The permissions of the visualization elements are always assigned to a group.

Adding groups

☑ Requirement: You have already created a user management by clicking *“Create Empty User Management”* or *“Create User Management with Default Groups and Users”* in the *“Visualization Manager”* (*“User Management”* tab).

1. Click the *“Visualization Manager”* object in the device tree.
2. Select the *“User Management”* tab.
3. Click in the last line of the list.

   In this line, the field of the *“Group Name”* column is still empty.
4. Click in the field of the *“Group Game”* column and specify the name for the new group.
5. If necessary, activate the options *“Automatic Logout”* and *“Permission to Change User Data”*.

Adding users and assigning groups

☑ Requirement: A user management exists with at least on group. The *“Visualization Manager”* is open.

1. Select the tab *“User Management ➔ User”*.
2. Click in the last empty line of the list.

3. Specify the *“Login Name”*.
   ⇨ CODESYS applies the *“Login Name”* as *“Password”*.
4. If you want to change the password, click in the *“Password”* field of the user.
   ⇨ The *“Change Password”* dialog box opens.
5. Click the *“User Group”* field.
   ⇨ The *“User Groups the User Belongs to”* dialog box opens.
6. Activate the *“Assigned”* option for the groups that the user should be long to and click *“OK ”* to confirm.
   ⇨ In the *“User Group”* field, all groups are listed that the new user belongs to.

See also

- *Chapter 1.4.5.5.1 “Setting up user management for visualizations” on page 1282*
- *Chapter 1.4.5.19.4.5 “Tab 'Visualization manager' - 'User management'” on page 1782*

1.4.5.5.3 Editing and Selecting User Management Dialogs

In the user management dialogs, you define the login, logout, changing of the user password, and editing of the user management in the visualization at runtime.

> **NOTICE!**
> If you create your own dialog as a user management dialog, then you should use the visualizations from the included library project `VisuUserMgmtDialogs.library` as the basis, because it uses the required interfaces. Your own user management dialog is listed then in *“Visualization Manager ➔ Settings”*, *“Settings for User Management Dialogs”*.

Editing user management dialogs

Requirement: The library project `VisuUserMgmtDialogs.library` exists in the installation directory.

1. Click *“File ➔ Open Project”*.
2. Select the project `VisuUserMgmtDialogs.library` from the `Projects` folder of the installation directory.
3. Click *“View ➔ POUs”*.
   ⇨ In the *“POUs”* view, the project is displayed with the visualizations *“UserMgmtChangePassword”*, *“UserMgmtConfig”*, and *“UserMgmtChangePassword”*.
4. Double-click a visualization (example: *“UserMgmtLogin”*).
5. Change the visualization as you like and save the project.
6. Then, reinstall the library and add it to the *“Library Manager”* of your application.

Selecting user management dialogs

☑ A user management already exists in your application in the *“Visualization Manager”* object (*“User Management”* tab).

☑ The *“VisuUserManagement”* library is in the Library Manager.

1. In the device tree, click the *“Visualization Manager”* object.
2. Select the *“Dialog Settings”* tab.
3. In *“Settings for User Management Dialogs”*, select the dialogs for *“Login dialog”*, *“Change password dialog”*, and *“Change configuration dialog”*.

> *If no entries can be seen in “Settings for User Management Dialogs” in the dialog lists, then close the “Visualization Manager” and reopen it.*

Configuring visualization buttons for the login, logout, change password, and user management dialogs

☑ Requirement: A visualization is open.

1. Drag a *“Button”* element from the *“Visualization Toolbox”* view (*“Common Controls”* category) to the visualization.
2. In the *“Properties”* view, click the *“Input configuration”* node.
3. In the *“Input configuration ➔ OnMouseClick”* property, click *“Configure”*.
4. In the *“Input configuration”* dialog, click *“User Management”* and >.
   ⇨ The following *“Dialogs and actions”* are listed on the right: *“Login”*, *“Logout”*, *“Change User Password”*, and *“Open User Configuration”*.
5. Select the dialog or action to assign to the button and click *“OK”*.
   ⇨ When the button is clicked at runtime, the selected dialog opens or the selected action is executed.

> *If you want to open and edit the user management in the visualization at runtime, you have to be a member of a group that has “Permission to Change User Data”.*

See also

- *Chapter 1.4.5.4.1 “Configuring user inputs for visualization elements” on page 1268*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

1.4.5.5.4 Configuring permissions for groups

Configuring permissions for an element of the visualization

Permissions for visualization-elements are not granted to individual users, but to groups with assigned users.

☑ Requirement: A *“Visualization”* object is open with at least one inserted visualization element.

1. Click a visualization element in the editor.
2. Click the *“Value”* field of the *“Permissions”* element property in the *“Properties”* view.

   ⇨ The *“Permissions”* dialog box opens.
3. Select the permissions that the respective user group should have for the visualization element.

   Note: If the option *“Group hierarchy is used”* is activated, the groups lower in the hierarchy cannot be granted more permissions than groups higher in the hierarchy.

In the “Element List” of the visualization, the “Permissions” column shows the element permissions granted to groups.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*
- *Chapter 1.4.5.19.4.5 “Tab 'Visualization manager' - 'User management'” on page 1782*
- *Chapter 1.4.5.19.4.1.1 “Visualization Editor” on page 1772*

1.4.5.6 Setting Up Multiple Languages

Texts and tooltip texts for visualizations are managed in text lists and can be displayed in different languages. To switch a visualization between the available languages, configure a visualization element with the corresponding input configuration for changing the language.

There are static texts that are managed in *“GlobalTextList”* (generated automatically) and dynamic texts from created text lists. A dynamic text can be changed at runtime with a variable that defines the index of the text list entry. Static texts are fixed labels within a visualization; dynamic texts are often used for displaying variable values or error messages.

For creating and using text lists, see: *Chapter 1.4.1.8.8 “Managing text in text lists” on page 266*.

You can modify the appearance and formatting of texts and tooltips with the element properties “Text properties” and “Font variables”.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Configuring language switching for texts from text lists

Requirement: An empty visualization object is inserted into the project and it is open for editing in the visualization editor. There is also a *“Visualization Manager”* object. User management is not created for the visualization.

The following instructions provide a simplified example:

- By means of two buttons, the user should be able to toggle the visualization texts between English and German.
- Static texts in the visualization include the labels "State, Machine 01", "State, Machine 02", "English", and "German". These texts are located in the *"GlobalTextList"* in English and German.
  Dynamic texts will describe the state of both machines. The texts are provided in the text list *"Status_Texts"* in English (`en`) and German (`de`).

1. Drag a *"Text Field"* from the *"Visualization Toolbox"* view (*"Common Controls"* category) to the editor view. Specify the value `State, Machine M01` in the properties editor for the element property *"Texts ➔ Text"*.
2. Copy the element and change the copy label to `State, Machine M02`.
3. See also the figure in step 14 for the following steps.

   Insert two elements of type *"Button"* from the *"Visualization Toolbox"* view (*"Common Controls"* category) in the visualization editor. With these elements, the user should be able to toggle the language of the visualization. Specify the text `German` or `English` in the properties editor for element property *"Texts ➔ Text"* (4).
4. Double-click and open *"GlobalTextList"* in the *"POUs"* view.

   ⇨ The texts are entered in the *"Standard"* (1) column, and the *"ID"*s `0` and `1` are assigned automatically as additional information.
5. Add the languages *"de"* and *"en"* with the texts shown in the following figure.

GlobalTextList

ID	Default (1)	de	en
3	English	Englisch	English
2	German	Deutsch	German
0	State, Machine M01:	Zustand Maschine M01:	State, Machine M01:
1	State, Machine M02:	Zustand Maschine M02:	State, Machine M02:

6. Close the *"GlobalTextList"*.
7. Add two elements of type *"Rectangle"* from the *"Visualization Toolbox"* view (*"Basic"* category) in the visualization editor. The current state of each machine should be displayed.
8. For managing the texts for describing the states, add an object of type *"Text List"* below the application. Name the list `Status_Texts`.
9. Specify the texts shown in the figure for the standard language (1) and the target languages *"en"* and *"de"* in the editor of *"Status_Texts"*.

Status_Texts

ID	Default (1)	de	en
0	running	läuft	running
1	stopped	läuft nicht	not running
2	starting	läuft gerade hoch	starting
3	error	Fehlermeldung!	error message!

10. Close the text list *"Status_Texts"*.
11. Select the rectangle element for displaying the state of machine M01. Select the text list `Status_Texts` from the combo box in the properties editor (2) for the *"Dynamic texts"* element property (5). Specify an application variable for *"Text index"* that shows the appropriate text index for the state of the machine at runtime. Example: `PLC_PRG.ivar_status_m01`.

12. Now configure the user input for both buttons for toggling the language in the visualization.

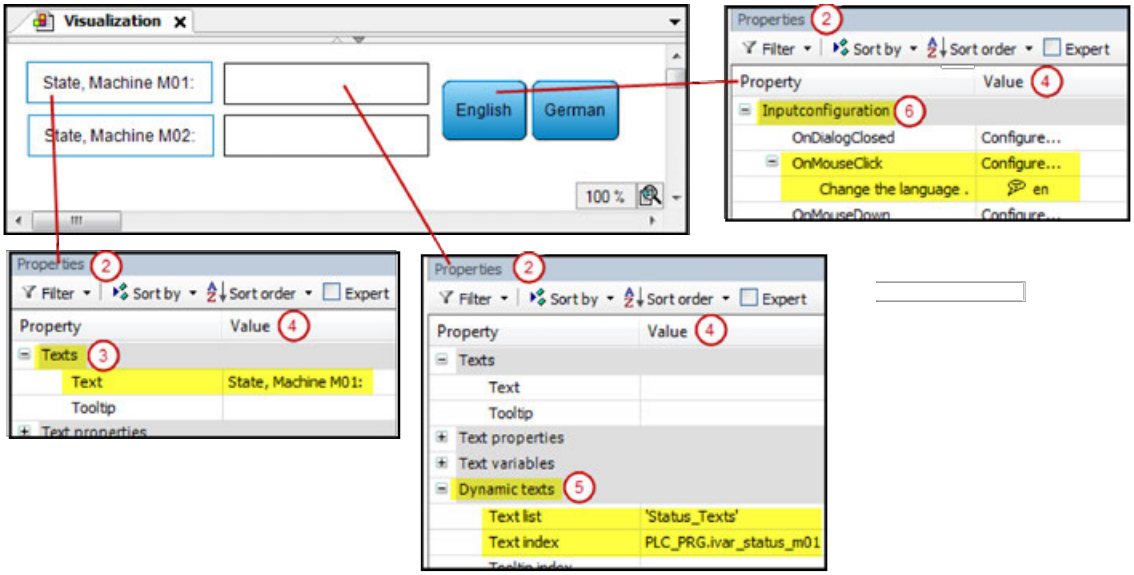
    Select the "German" button. Double-click *“Configure”* of the property *“Input configuration”* (6), *“OnMouseClick”*.

    ⇨ The *“Input configuration / OnMouseClick”* dialog opens.

13. Select *“Change the language”* on the left. Click the arrows to accept the setting to the right. Select *“de”* in *“Language”* to the right of the dialog in the ... input assistance. Click *“OK”* to confirm.

14. In the same way, configure the entry for the second button: `English`: *“Text list”*: `Status_Texts`, *“Text index”*: `3`, *“Change the language”*: English).

    ⇨ The following figure shows the performed properties configurations for the four visualization elements.

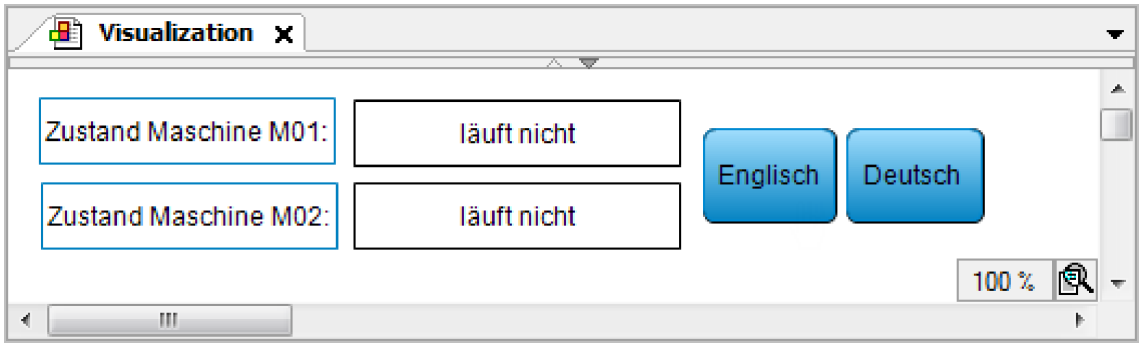


15. When the application is compiled without errors, you can test the visualization in simulation mode. Activate the option *“Online ➔ Simulation”*. Click *“Online ➔ Login”*.

    ⇨ The visualization appears in the visualization editor view in online mode:

16. Click the *"German"* button.

    ⇨ The language changes to German:



See also

- *"Input action 'Change Language'" on page 1751*

Setting up fonts for a language

The font for a visualization element is defined in the properties editor. If a language switch is provided, you can overwrite this basic font with another font for each language in the visualization manager.

Requirement: A visualization is set up with at least one language in addition to the default language. For an example, see *"Configuring language switching for texts from text lists" on page 1286*

1. Double-click and open the *"Visualization Manager"* object and select the *"Font"* tab.
2. Double-click the field in the *"Font"* line for a particular language. Select a font from the combo box.
3. In the *"Font size"* line, replace the value `1` with a value greater than 1 (example: `2`) in order to increase the size of the font as defined by the visualization style; or replace it with a value less than 1 in order to decrease is (example: 0.5).

   ⇨ In online mode, the font changes depending on the set language.

See also

- *Chapter 1.4.5.19.4.6 "Tab 'Visualization Manager' - 'Font'" on page 1786*

1.4.5.7 Visualizing alarm management

In CODESYS, the alarm management is a powerful object for creating and managing alarms. You can group alarms and set the acknowledgement behavior individually. The alarm display in the visualization can also be customized.

The *"Alarm Table"* and *"Alarm Banner"* visualization elements are available for displaying and processing alarms. The alarm table lists the alarm texts. The alarm banner is a simplified version of the alarm table. It visualizes a single alarm only. However, by adding scroll elements you can allow for switching the display from one active alarm to another active alarm.

See also

- *Chapter 1.4.1.8.20 "Alarm Management" on page 309*

Creating an alarm table

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following instructions are based on the example that is described in the "Configuring alarm management" chapter.

1. Open the visualization editor.
2. Drag the *“Alarm Table”* element from the *“Alarm Manager”* group to the visualization editor.
   ⇨ The *“Alarm Table”* visualization element is visible in the editor.
3. In the *“Alarm configuration”* / *“Alarm groups”* property, define the alarm groups that you want to visualize. Click into the value field.
   ⇨ The *“Select Alarm Group”* dialog opens.
4. Clear the *“All”* check box and select the *“PartsDeficit”* alarm group. Add the group to the selected alarm groups by clicking the > button.
5. In the *“Alarm configuration”* / *“Alarm classes”* property, define the alarm classes that you want to visualize. Click into the value field.
   ⇨ The *“Select Alarm Class”* dialog opens.
6. Clear the *“All”* check box and select the *“PartsDeficit”* alarm class. Add the alarm class to the selected alarm classes by clicking the > button.
7. Add an additional column. Click the *“Columns”* / *“Create New”* button.
   ⇨ CODESYS adds the column *“[2]”* to the properties. The *“Symbol”* column is added to the table.
8. Select data type *“State”* for column [2].
   ⇨ The default column heading *“State”* is shown in the table.
9. Name the *“Column heading”* column "Status".
10. Specify the appearance of the selected table cell. Set the *“Selection”* / *“Selection color”* to *“Green”*.
11. In the *“Control variables”* / *“Confirm selection”* property, specify the variable `bQuitAlarm` for confirming messages.
12. Adjust the other properties to your requirements. See the "Alarm table" visualization element for a complete description of the properties.

See also

- *Chapter 1.4.5.18.1.22 “Visualization Element 'Alarm Table'” on page 1545*

Inserting elements for acknowledging alarms

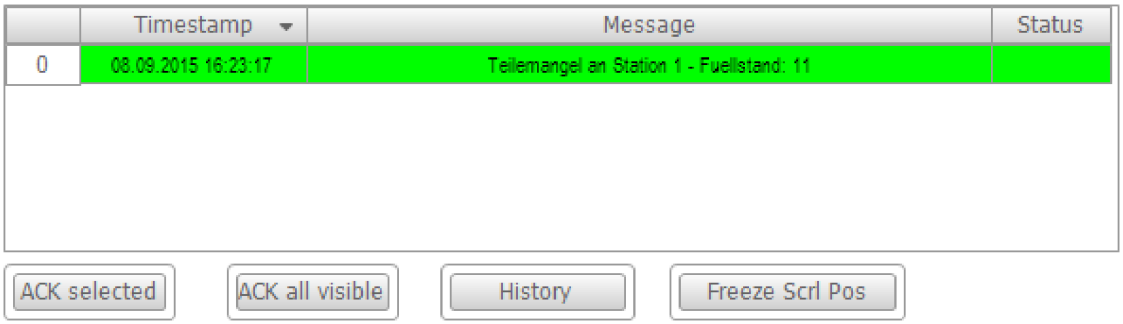
In CODESYS, predefined buttons are available for controlling the alarms in an alarm table.

Requirement: An *“Alarm table”* element exists in the visualization.

1. Select the visualization element in the editor.
2. Click *“Visualization ➔ Insert elements for acknowledging alarms”*.
   ⇨ The *“Alarm Table Wizard”* dialog opens.

3. Click *“OK”* to accept all settings.

   ⇨ Four buttons are added for controlling the alarm table.



See also

- ↳ *Chapter 1.4.5.18.1.22 “Visualization Element 'Alarm Table'” on page 1545*

Creating an alarm banner

Requirement: In your project, alarms are defined in alarm groups and they are assigned to an alarm class. The following statement is based on the example that is described in the "Configuring alarm management" chapter.

The alarm banner displays an active alarm in online mode. If there are multiple active alarms, filtering takes place by means of the filter criteria set in the alarm banner (newest for filter criterion "Priority" and most important for filter criterion "Newest"). See the instructions below for adding scroll elements in order to switch the display between multiple alarms.

1. Open the visualization editor.
2. Drag the *“Alarm banner”* element from the *“Alarm manager”* group to the visualization editor.

   ⇨ The *“Alarm banner”* visualization element is visible in the editor.
3. In the *“Alarm configuration”* / *“Alarm groups”* property, define the alarm groups that you want to visualize. Click into the value field.

   ⇨ The *“Select Alarm Group”* dialog opens.
4. Clear the *“All”* check box and select the *“PartsDeficit”* alarm group. Add the group to the selected alarm groups by clicking the > button.
5. In the *“Alarm configuration”* / *“Alarm classes”* property, define the alarm classes that you want to visualize. Click into the value field.

   ⇨ The *“Select Alarm Class”* dialog opens.
6. Clear the *“All”* check box and select the *“PartsDeficit”* alarm class. Add the alarm class to the selected alarm classes by clicking the > button.
7. Set the *“Alarm configuration”* / *“Filter criterion”* property to *“Newest”*.

   ⇨ In online mode, the newest alarm message is always shown.
8. Add an additional column. Click the *“Columns”* / *“Create new”* button.

   ⇨ CODESYS adds the column *“[2]”* to the properties. The *“Symbol”* column is added to the table.
9. Select data type *“State”* for column [2].

   ⇨ The default column heading *“State”* is shown in the table.
10. In the *“Confirmation variable”* property, specify the variable `bQuitAlarm` for confirming messages.

See also

- ↳ *Chapter 1.4.5.18.1.23 “Visualization Element 'Alarm Banner'” on page 1554*

Adding elements for scrolling the active alarms

Elements can be added to an alarm banner for switching the display between the individual active alarms. You can control the scrolling with visu-local variables or application variables.

1. Select the added "Alarm banner" visualization element. Click *“Insert Elements for Scrolling Alarms”* in the context menu.
   ⇨ The *“Alarm Banner Wizard”* opens.
2. Select the element type for the scroll elements: *“Button”* or *“Rectangle”*.
3. Activate the action(s) for which a control should be inserted: *“Scroll to next alarm”*, *“Scroll to previous alarm”*.
4. Specify a Boolean variable that gets the value `TRUE` when multiple active alarms are present. If you have already configured a project variable in the element properties, then it is also specified here in the wizard. Otherwise CODESYS automatically creates the visu-local variable *“xMultipleAlarmsActive”*.
5. In the next step, check the configuration of the element properties of the extended alarm banner.
6. Select the alarm banner element and look at the section *“Handling of multiple active alarms”* in the *“Properties”* view. You have two options:
7. Option 1: The display should switch automatically. Activate the *“Switch automatically”* property.
   ⇨ Now, in *“Every N seconds”* you define the time interval after which the display in the alarm banner in online mode should switch to the next alarm.
8. Option 2: The display should be controlled by means of the application. Deactivate the *“Switch automatically”* property.
   ⇨ Switching between the active alarms can be controlled by two variables. By default, `xNext` and `xPrev` are created for scrolling to the next or previous alarm. You can replace these variables with custom your own defined application variables.

Filter alarm events by the contents of the latch variable

Filtering by the contents of a latch variable can be useful when there are a lot of alarm events displayed. If the latch variable assigned to an alarm in the alarm group definition contains, for example, the error number or the name of a device instance, then you can filter the alarms in the visualization by it.

For this purpose, you configure an input option in the alarm visualization for the contents of the latch variable to be filtered by. For example, insert an input field which writes to the variable that is specified in the *“Alarm configuration”* - *“Filter by latch 1”* - *“Filter variable”* property of the configuration of the *“Alarm table”* element or *“Alarm banner”* element.

In addition, you configure an input option for the type of filtering. The type determines whether a numeric value (typed literal, LINT literal) or the string value of the latch variable is used for filtering. Filtering can also be switched off by means of type setting `0`. For example, in the visualization, insert another input field which writes to the variable that is specified in the *“Filter type”* property of the configuration of the alarm table or alarm banner.

For more information, see the "Alarm Filter Latch Example" sample project in the CODESYS *Store*.

1.4.5.8 Animating visualization elements

The animation of a visualization element at runtime can serve to visualize value curves in addition to serving purely visual purposes. Animation is possible through a dynamic configuration of certain element properties, i.e. by controlling these properties with a variable. See the following examples of possible animations.

1.4.5.8.1 Configuring rotations and offsets

You can animate a visualization element and have it shifted or rotated at runtime. To do this you assign variables in its property *"Absolute movement"* and then program the animation in the application code.

Configuring an offset

You can configure an offset of the element by programming the variables in *"Absolute movement ➔ Movement"*.

☑ Requirement: A project with a visualization is open.

1. Open the visualization and add an element *"Rectangle"*.
   ⇨ The view *"Properties"* displays the configuration of the element.
2. In the application in the POU `PLC_PRG`, declare type-compliant variables: `diOffsetX : DINT;` and `diOffsetY : DINT;`
3. Configure the property *"Absolute movement ➔ Movement ➔ X"* with `PLC_PRG.diOffsetX` and *"Y"* with `PLC_PRG.diOffsetY`.
4. Implement a shift of the element, for example by means of a modulo division of the value:

   ```
   diOffsetX := diOffsetX MOD 100;
   diOffsetY := diOffsetY MOD 100;
   ```

5. Compile, load and start the application.
   ⇨ The application runs. The visualization opens. The rectangle moves.

Configuring a rotating element

When an element rotates, then the center point of the element rotates precisely around its center. The center is defined in the property *"Center"*. The center point of an element is calculated internally. If the center point and center coincide, then there is no rotation.

You can configure a clockwise rotation of the element by increasing the value of the variable *"Absolute movement ➔ Rotation"*.

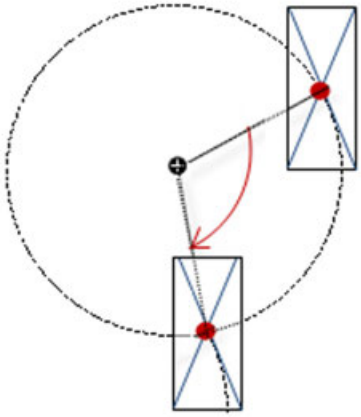
☑ Requirement: A project with a visualization is open.

1. Open the visualization and add an element *"Rectangle"*.
   ⇨ The view *"Properties"* displays the configuration of the element.
2. In the application in the POU `PLC_PRG`, declare a type-compliant variable:`rValue : REAL;`
3. Configure the property *"Absolute movement ➔ Rotation"* with `PLC_PRG.rValue`.
4. Implement the clockwise rotation of the element by increasing the value of the variable:

   ```
   rValue := rValue + 0.1;
   ```

5. Compile, load and start the application.

   ⇨ The application runs. The visualization opens. The rectangle rotates about the center. The alignment of the element with respect to the coordinate system is fixed.



Configuring a rotating element

When an element performs an inner rotation and rotates, then the center point of the element rotates precisely around its center. This is the point defined in the property *"Center"*. The alignment of the element also rotates relative to the coordinate system. If the center point of the element and the center coincide, this produces a rotation on the spot.

You can configure a clockwise rotation of the element by increasing the value of the variable *"Absolute movement ➔ Inner rotation"*.

If the visualization is In runtime, you can see that the element rotates (also relative to the coordinate system of the visualization).

☑ Requirement: A project with a visualization is open.

1. Open the visualization and add an element *"Polygon"*, which you form into a pointer.

   ⇨ The view *"Properties"* displays the configuration of the element.

2. Drag the center point of the element to the base of the pointer.
3. In the application in the POU `PLC_PRG`, declare a type-compliant variable:

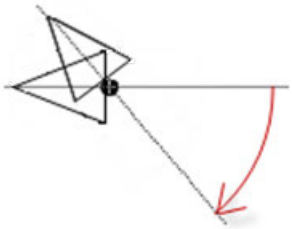
   ```
   rValue : REAL;
   ```

4. Configure the property *"Absolute movement ➔ Inner rotation"* with `PLC_PRG.rValue`.
5. Implement the clockwise rotation of the element by increasing the value of the variable:

   rValue := rValue + 0.1;

6. Compile, load and start the application.

   ⇨ The application runs. The visualization opens. The pointer rotates about its base.



See also

1.4.5.8.2 Animating a text display

An animation of the text display can be configured in the property *“Font variables”*. All basic elements have this property as well as tables, scrollbars and text fields.

Example: animating the font size

☑ Requirement: A project with a visualization is open.

1. Open the visualization and add an element *“Rectangle”*.
   ⇨ The view *“Properties”* displays the configuration of the element.
2. Configure the property *“Texts ➔ Text”* with `Important`:
3. In the application in the POU `PLC_PRG`, declare a type-compliant variable:
   ⇨ `iFontHeight : INT;`
4. Configure the property *“Font variables ➔ Size”* with `PLC_PRG.iFontHeight`.
5. Implement a change of the font size.
   ⇨ iFontHeight := iFontHeight + 1) MOD 20;
6. Compile, load and start the application.
   ⇨ The application runs. The visualization opens. The rectangle is labelled with `Important`. The font size grows from 1 to 20.

See also

- ↳ *Chapter 1.4.5.18.1.1 “Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'” on page 1368*

1.4.5.8.3 Animating a color display

The colors of an element are specified in the *“Colors”* properties of the element properties. There you can select either a predefined style color from the selection list or a color in the color dialog.

The *“Color variables”* element property is used for the color animation of the element. If you pass variables to the properties, then you can program color changes in the application code or configure a user input that results in a color change. A color constant or color variable in the code has the data type `DWORD` and is encoded according to the RGB color space or RGBA extension.

Color definition in RGBA color space

> **NOTICE!**
> The *“Activate semi-transparent drawing”* option is provided in the Visualization Manager. This option is enabled by default so that the *“Transparency”* property is available for all color definitions. With programmatic color definition, the leading byte is interpreted as an alpha channel and therefore used as the transparency value of the color. When the option is cleared, the *“Transparency”* property is not available and the leading byte is ignored in color literals.

Color information in the code is specified as `DWORD` literals. The value is in the RGBA color space and is usually shown as a hexadecimal number. The value is coded with additive portions of red, green, and blue. It is appended with the alpha channel which determines the transparency of the color.

Byte order of a color literal

```
16#<TT><RR><GG><BB>

<TT> : 00 - FF     // Transparency in 256 levels
<RR> : 00 - FF     // Red in 256 levels
<GG> : 00 - FF     // Green in 256 levels
<BB> : 00 - FF     // Blue in 256 levels
```

The graduation value for transparency is `16#FF` for opaque and `16#00` for transparent. For each color portion, one byte is reserved for 256 color graduations `16#FF` to `16#00`. `16#FF` means 100% color portion and `16#00` means 0% color portion.

<TT>	Byte for the transparent graduation of 00-FF
<RR>	Byte for the red portion of 00-FF
<GG>	Byte for the green portion of 00-FF
<BB>	Byte for the blue portion of 00-FF

Example

Table 262: Color literal

16#FF0000FF	Blue, opaque
16#FF00FF00	Green, opaque
16#FFFFFF00	Yellow. opaque
16#88888888	Gray, semitransparent
16#88000000	Black, semitransparent
16#FFFF0000	Red, opaque

Example

Global declaration of color constants

```
VAR_GLOBAL CONSTANT
    c_dwBLUE : DWORD := 16#FF0000FF;          // Highly opaque
    c_dwGREEN : DWORD := 16#FF00FF00;          // Highly opaque
    c_dwYELLOW : DWORD := 16#FFFFFF00;          // Highly opaque
    c_dwGREY : DWORD :=16#88888888;          // Semitransparent
    c_dwBLACK : DWORD := 16#88000000;          // Semitransparent
    c_dwRED: DWORD := 16#FFFF0000;          // Highly opaque
END_VAR
```

Animating a visualization element in color

1. Create a standard project in CODESYS.
2. Declare global color constants in the POU tree.

   ⇨

```
{attribute 'qualified_only'}
VAR_GLOBAL CONSTANT
    gc_dwRed : DWORD := 16#FFFF0000;
    gc_dwGreen: DWORD := 16#FF00FF00;
    gc_dwYellow: DWORD := 16#FFFFFF00;
    gc_dwBlue: DWORD := 16#FF0000FF;     // Highly opaque
    gc_dwBlack : DWORD := 16#88000000;     // Semitransparent
END_VAR
```

3. In the device tree, declare local color variables in `PLC_PRG`.

   ⇨
   ```
   VAR
       dwFillColor: DWORD := GVL.gc_dwGreen;
       dwFrameColor : DWORD := GVL.gc_dwBlack;
       dwAlarmColor : DWORD := GVL.gc_dwRed;
   END_VAR
   ```

4. Declare a control variable.

   ⇨ `bChangeColor : BOOL;`

5. Declare an input variable in `PLC_PRG`.

   ⇨ `bInput : BOOL;`

6. Enable the visualization editor.
7. Drag a *"Rectangle"* element to the visualization editor.

   ⇨ The *"Properties"* view of the element opens.

8. Configure the properties of the rectangle as follows:
   - Property *"Color variables"*, *"Normal state"*, *"Filling color"*: `PLC_PRG.dwFillColor`
   - Property *"Color variables"*, *"Normal state"*, *"Frame color"*: `PLC_PRG.dwFrameColor`
   - Property *"Color variables"*, *"Alarm state"*, *"Filling color"*: `PLC_PRG.dwAlarmColor`
   - Property *"Color variables"*, *"Toggle color"*: `<toggle/tap variable>`
   - Property *"Input configuration"*, *"Toggle"*, *"Variable"*: `PLC_PRG.bInput`
9. Program the variables as follows:

   ```
   PROGRAM PLC_PRG
   VAR
       dwFillColor: DWORD := GVL.gc_dwGreen;
       dwFrameColor : DWORD := GVL.gc_dwBlack;
       dwAlarmColor : DWORD := GVL.gc_dwRed;

       bChangeColor : BOOL;
       bInput : BOOL;
   END_VAR

   IF bChangeColor = TRUE THEN
       dwFillColor := GVL.gc_dwYellow;
       dwFrameColor := GVL.gc_dwBlue;
   ELSE
       dwFillColor:= GVL.gc_dwGreen;
       dwFrameColor := GVL.gc_dwBlack;
   END_IF
   ```

   ⇨ The colors are initialized at runtime. If the variable `bChangeColor` is then forced to `TRUE`, the color display of the rectangle changes. When the rectangle is clicked in the visualization, the rectangle is displayed in alarm colors.

1.4.5.9 Displaying data arrays in tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element *“Table”* for this.

In the configuration of the element *“Table”*, enter an array variable in the property *“Data array”*. The array components are displayed in the rows and columns of the table.

A table for displaying data arrays can also be created in the following way. You duplicate a single element having at least one property that is described by a structured variable. The single element is configured as a "template" for this and duplicated with a command.

1.4.5.9.1 Displaying Array Variables in Tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element *“Table”* for this.

In the configuration of the element *“Table”*, enter an array variable in the property *“Data array”*. The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the `MYSTRUCT` DUT and the declarations in the `PLC_PRG` program.

```
TYPE MYSTRUCT :
    STRUCT
        iNo : INT;
        bOnStock : BOOL;
        strPartNumber : STRING;
    END_STRUCT
END_TYPE
```

```
PROGRAM PLC_PRG
VAR
    arrStruct : ARRAY[0..6] OF MYSTRUCT;
    iSelectedColumn : INT;
END_VAR
```

1. Drag the *“Table”* visualization element to the visualization editor.
2. Assign the array variable `arrStruct` to the *“Data array”* property.
   ⇨ The structure members are displayed as column headings and the array index as row headings.
3. Change the *“Columns ➔ Column ➔ [0] ➔ Column header”* property to an informative heading (example: `Number`).
4. Change the heading of column [1] to `in stock` and column [2] to `Part number`. Adjust the column width.
5. Assign a color to the *“Selection ➔ Selection color”* property.
6. Define the *“Selection ➔ Selection type”* property as `Row selection`.

7. In the *“Selection ➔ Variable for selected row”* property, define the `PLC_PRG.iSelectedColumn` variable.

   ⇨ The following display results in online mode:

	Number	in Stock	Part Number
0	0	FALSE	
1	0	FALSE	
2	0	FALSE	
3	0	FALSE	

See also

- *Chapter 1.4.5.18.1.13 “Visualization Element 'Table'” on page 1485*

1.4.5.9.2 Configuring and Multiplying Visualization Elements as Templates

A table can also be created to display data arrays in the following way. You multiply a single element that has at least one property which is described by a structured variable. To do this, the single element is configured as a "template" and multiplied by means of a command.

You can use the *“Visualization ➔ Multiply Visu Element”* command to display array data in a visualization. The command multiplies a template element to create an element of the same type for each array component. The layout of the new elements in the visualization is one-dimensional as a row or column, or two-dimensional as a table.

To do this, drag an applicable element into the visualization editor. Then configure the properties of the element with array variables and specify the index access placeholder `$FIRSTDIM$` as component access. If you have declared a multidimensional array, then you can use the second index access placeholder `$SECONDDDIM$` for the additional dimension. Configure the remaining properties as usual with the typical values. The purpose is to create a valid template element. Then execute the *“Multiply Visu Element”* command on the template element. Now the dialog with the same name opens. There you define in detail how many elements should be created and where they should be located.

After multiplying, the visualization contains as many of the same elements as are indexed using placeholders. In doing so, the settings in the *“Multiply Visu Element”* dialog are taken into consideration. All new elements in the properties that were preset with placeholders have these replaced with precise indexes. The remaining properties have been applied and copied without changes.

For example, you can have a layout of nine buttons as 3x3 tables, which are all the same size or the same color, but vary in the labeling. The labels are declared as a string array (nine components) and are passed as a value to the *“Texts”->“Text”* property.

Valid template element:

- Declaration of array variables
  Example: `asText: ARRAY[1..3, 1..3] OF STRING;`
- Element with applicable element type

- Configuration of at least one property of the applicable element with array variables with index access placeholders
  Example: Property *“Texts”*, *“Text”* = `PLC_PRG.asText[$FIRSTDIM$, $SECONDDIM$]`
  This is possible for all properties that permit a variable as a value (for example, also properties from the "Animation" or "Input" categories. To configure multiple properties for an element with arrays and index access placeholders, all arrays must have the same structure with the same dimension. The declarations have to be compatible.
- Configuration of properties that do not vary (and are therefore the same for all generated elements) with the usual values without index access placeholders
  Example:
  `sButtonTip : STRING := 'This element is created by multiplication'`
  Property *“Texts”*, *“Tooltip”* = `%s`
  Property *“Text variables”*, *“Tooltip variable”* = `sButtonTip`

You can still use the placeholder `%` as usual for the text display of variable values in the properties in “Texts”.

Applicable visualization elements

Visualization elements that can be multiplied:

- *“Rectangle”*
- *“Rounded Rectangle”*
- *“Ellipse”*
- *“Line”*
- *“Polygon”*
- *“Polyline”*
- *“Bézier Curve”*
- *“Image”*
- *“Frame”*
- *“Button”*
- *“Pie”*
- *“Spin Box”*
- *“Text Field”*
- *“Check Box”*
- *“Image Switcher”*
- *“Lamp”*
- *“Dip Switch”*
- *“Power Switch”*
- *“Push Switch”*
- *“Push Switch LED”*
- *“Rocker Switch”*
- *“Rotary Switch”*

Configuring and multiplying lamps and buttons as templates

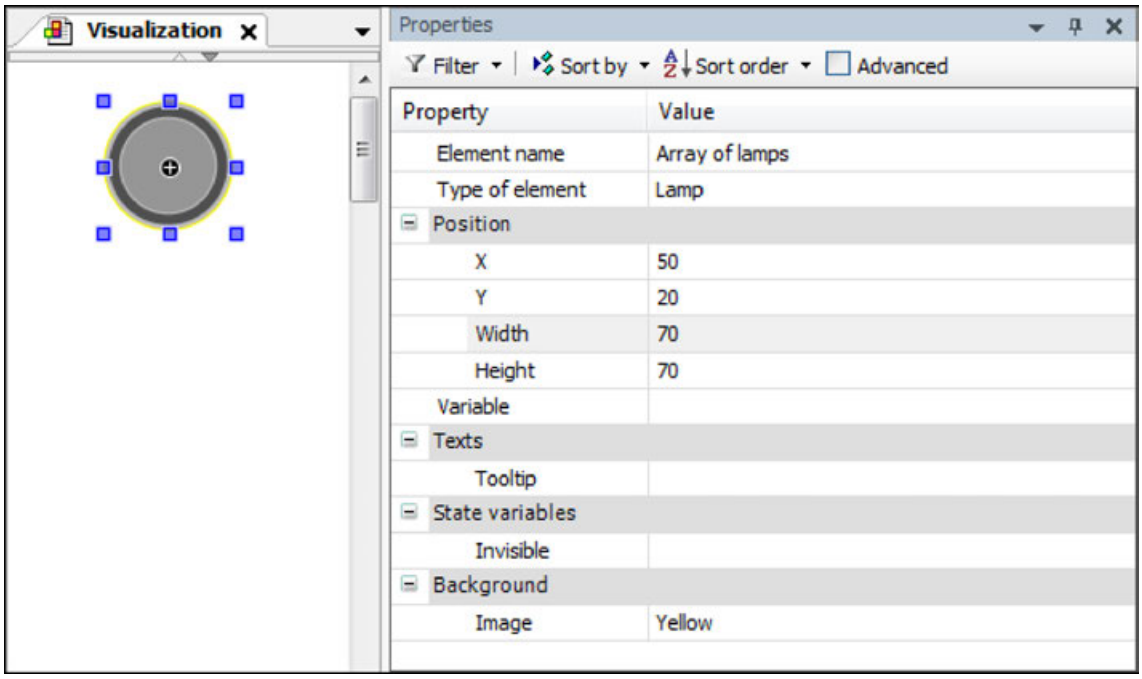
1. Create a new standard project.
   ⇨ A CODESYS Control Win V3 is configured as the device. The `MainTask` calls `PLC_PRG`. The implementation language is ST.

2. In `PLC_PRG` in the program code, declare array variables with basic data type `STRING`.

   ⇨

```
PROGRAM PLC_PRG
VAR
    axLampIsOn: ARRAY[1..2,1..3] OF BOOL;  // For lamp,
property 'variable' and button, user input
    asButtonText: ARRAY[1..2,1..3] OF STRING := // Output text
for button, property 'text variables''text variable'
    [
        '1A Lamp', '2A Lamp',
        '1B Lamp', '2B Lamp',
        '1C Lamp', '2C Lamp'
    ];
END_VAR
```

3. Select the application in the device tree and click *"Add Object ➔ Visualization"*.
4. In the *"Add Visualization"* dialog, specify the name `VisuMain` and click *"Add"* to close the dialog.
5. Drag a *"Lamp"* element from the *"Visualization Toolbox"* view to the visualization.
6. Configure the fixed property values.



7. Double-click the value field of the *"Variable"* property.

   ⇨ The line editor opens.

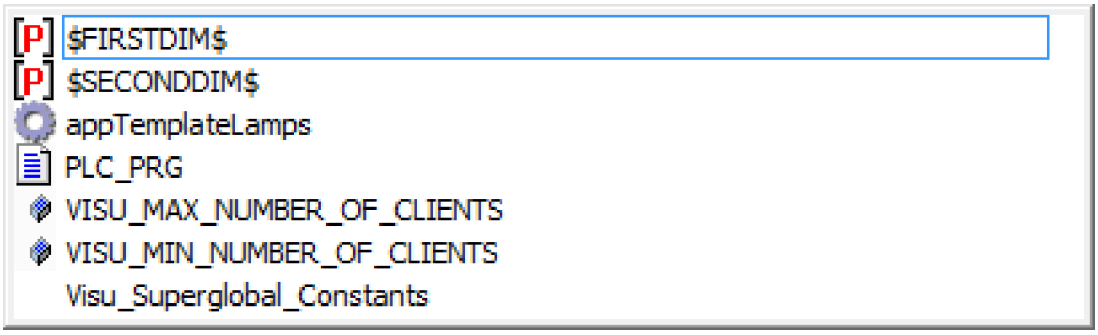
8. Click ...

   ⇨ The Input Assistant opens.

9. Select the array variable `PLC_PRG.axLampIsOn` from the variable tree.

10. Extend the string at the end, for example with "`[f`".

    ⇨ If you have activated SmartCoding (*"Options"* dialog, *"SmartCoding"* category, *"List components immediately when typing"* option), then the current variable list appears with the placeholders:



11. Select the placeholder `$FIRSTDIM$` for the first dimension and confirm the selection.
12. Extend the string at the end, for example with "`,s`".

    ⇨ The variable list appears again.
13. Select the placeholder `$SECONDDIM$` for the second dimension and confirm the selection.
14. Complete the string with a closing bracket.

    ⇨ `PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]`

    The lamp is configured as a template.
15. Click *"Visualization ➔ Multiply Visu Element"*.

    ⇨ The *"Multiply Visu Element"* dialog opens. The default values are derived from the array declarations.

    "Total number of elements", *"Horizontal"* = `2`

    "Total number of elements", *"Vertical"* = `3`
16. Declare the distance between the new elements.

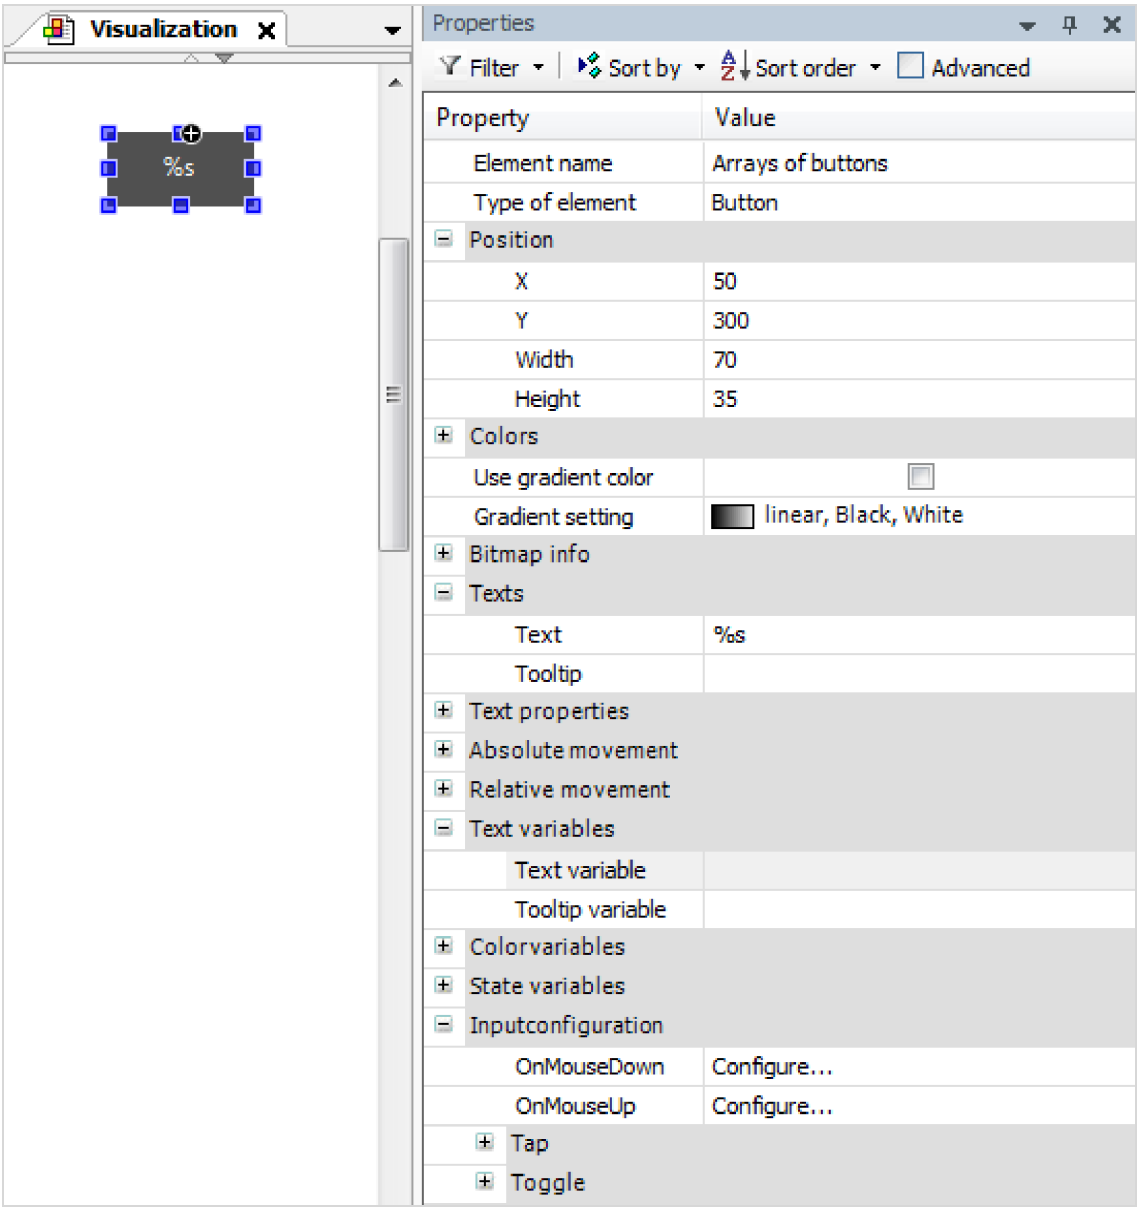
    ⇨ *"Offset between elements"*, *"Horizontal"* = `3`

    "Offset between elements", *"Vertical"* = `3`
17. Check the advanced settings.
18. Click *"OK"* to confirm the selection.

    ⇨ The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.
19. In the *"Visualization Toolbox"*, in the *"Common Controls"* category, drag the *"Button"* element to the visualization editor.

    ⇨ The *"Properties"* view of the element opens.

20. Configure the fixed property values.



21. Configure the value for the *“Text variables”->“Text variable”* property.

    ⇨ `PLC_PRG.asButtonText[$FIRSTDIM$, $SECONDDIM$]`

22. Configure the value for the *“Input configuration”->“Toggle”->“Variable”* property.

    ⇨ `PLC_PRG.axLampIsOn[$FIRSTDIM$, $SECONDDIM$]`

    The button is configured as a template.

23. Click *“Visualization ➔ Multiply Visu Element”*.

    ⇨ The *“Multiply Visu Element”* dialog opens. The default values are derived from the array declarations.

    “Total number of elements”, *“Horizontal”* = `2`

    “Total number of elements”, *“Vertical”* = `3`

24. Declare the distance between the new elements.

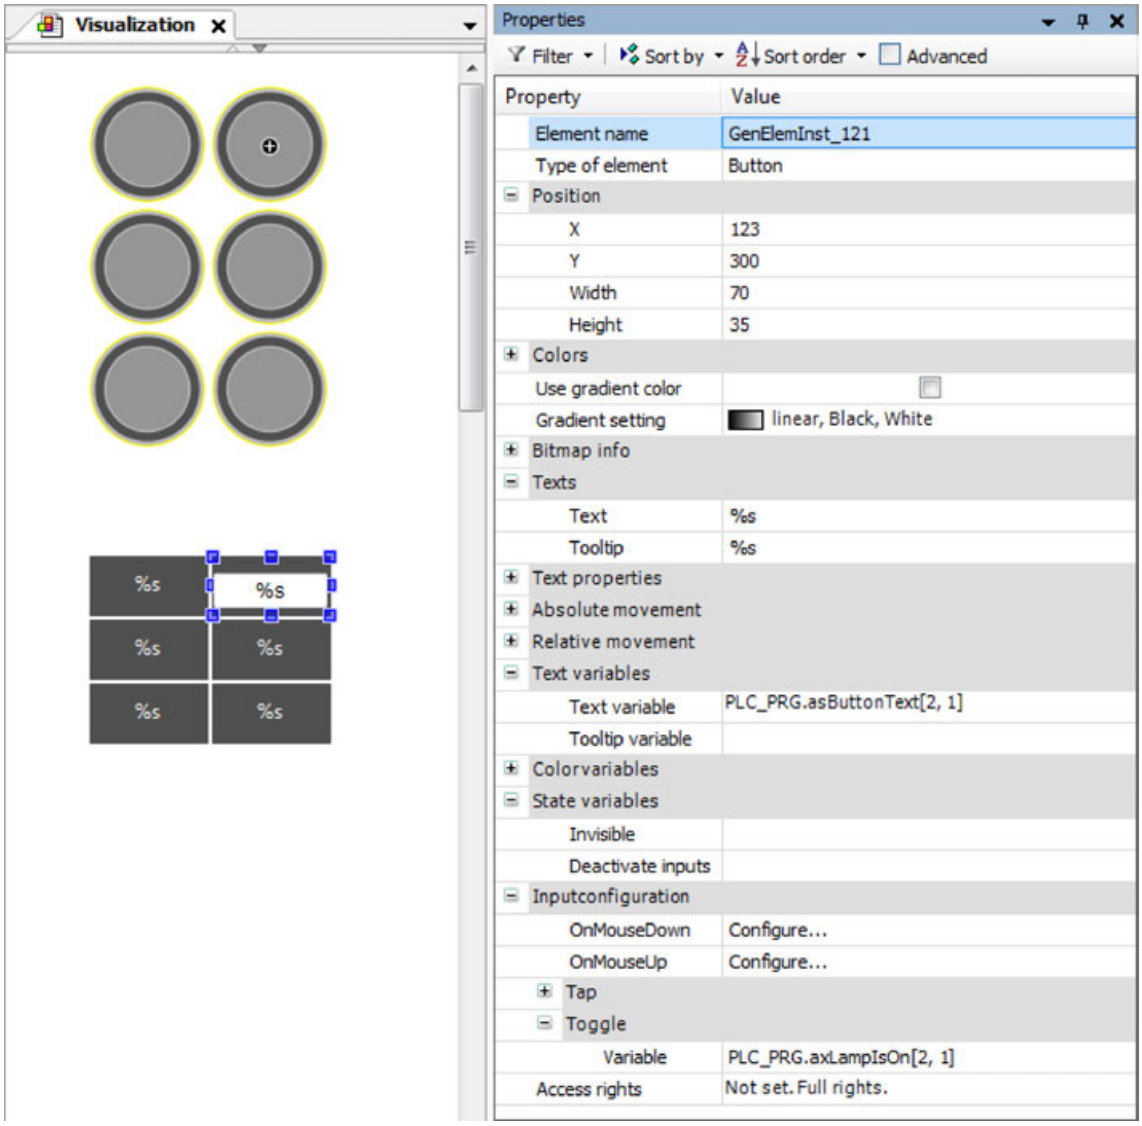
    ⇨ *“Offset between elements”*, *“Horizontal”* = `3`

    “Offset between elements”, *“Vertical”* = `3`

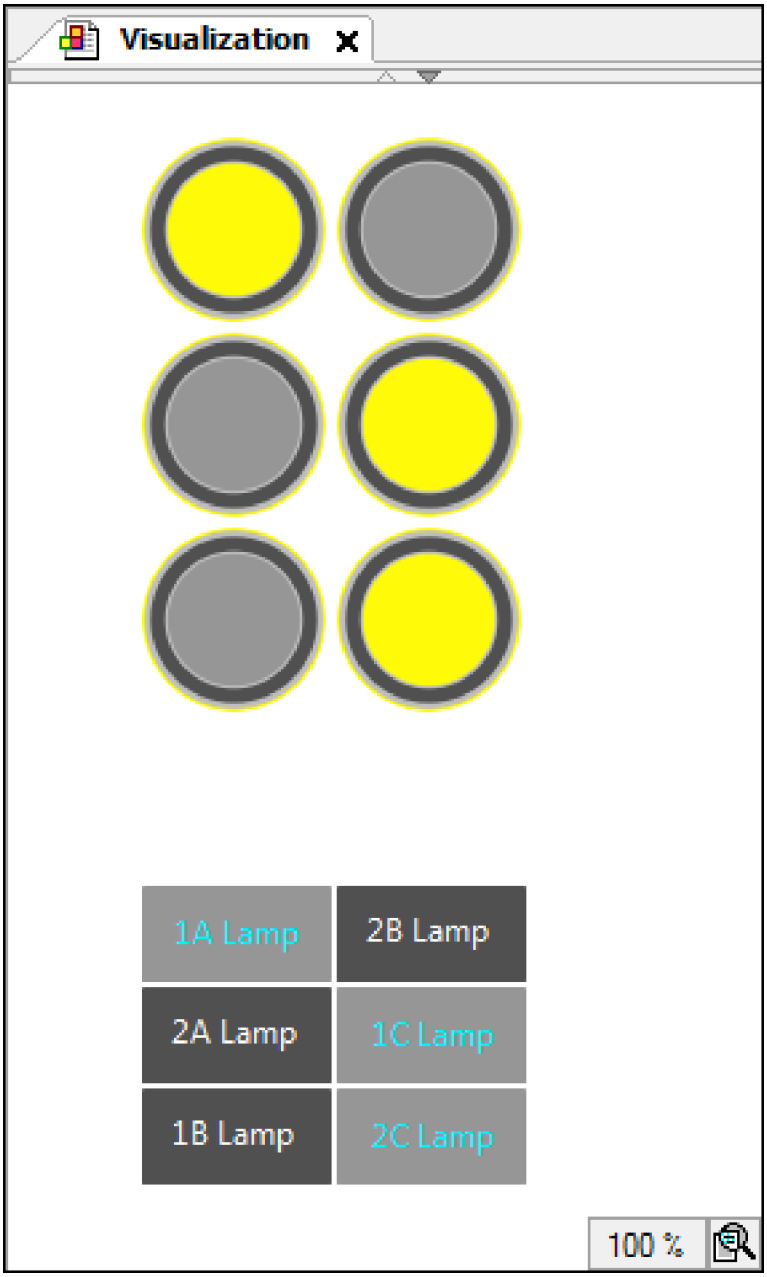
25. Check the advanced settings.

26. Click *“OK”* to confirm the selection.

    ⇨ The new elements appear in the visualization editor. All properties are configured with a precise index and the array variables are indexed.



27. Build, start, and download the application.
    ⇨ Visualization at runtime:



Array variable with more than two dimensions

You can also configure the template element with array variables that have more than two dimensions, but you can only assign placeholders to a maximum of two of the dimensions. In the additional dimensions, the indexes are fixed.

Example

Declaration

```
PROGRAM PLC_PRG
VAR
 asText: ARRAY[1..2, 1..3, 1..6, 1..2] OF STRING;
END_VAR
```

Configure the *“Text variables”*, *“Tooltip variable”* property for the template element:

```
PLC_PRG.asText[2, $FIRSTDIM$, $SECONDDIM$, 2]
```

Layout of a one-dimensional array in a table

You can configure the template element with a one-dimensional array by means of the index access placeholder `$FIRSTDIM$`. If the number of new elements to be created is greater than five, then a tabular layout is preset in the *"Multiply Visu Element"* dialog. The layout of the new elements is as quadratic as possible.

Example

```
PROGRAM PLC_PRG
VAR
 asText: ARRAY[1..100] OF STRING;
END_VAR
```

The default setting in the *"Multiply Visu Element"* dialog allows for a layout of 100 new elements in a 10x10 field.

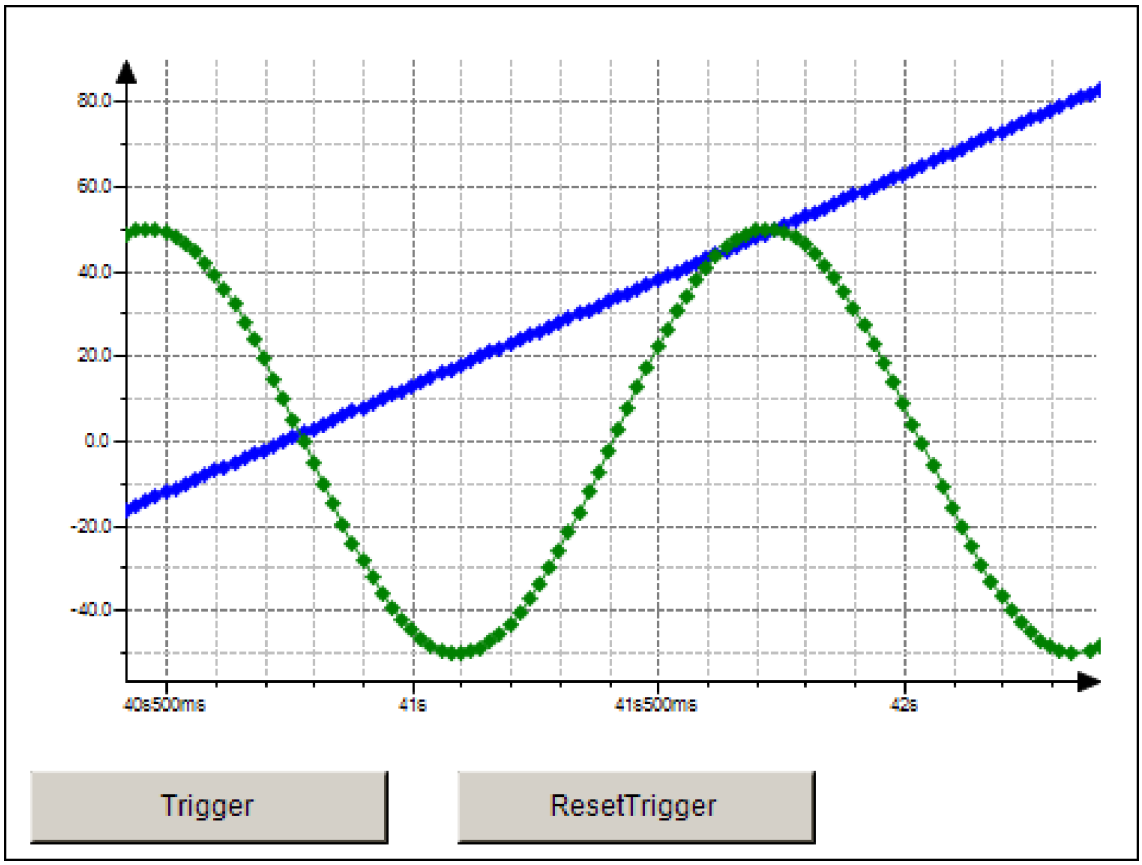
- *Options for SmartCoding*

1.4.5.10 Displaying data curve with trace

With this element, you can integrate a trace graph in the visualization that monitors and displays variable values permanently. You configure the displayed trace graph in the element properties. In addition, you can add control elements that control the trace functionality. This is done manually or by using the *"Insert Elements for Controlling Trace"* command.

Configurations for the 'Trace' visualization element can be taken from the 'Trace' object.



See also

- *Chapter 1.4.5.10.1 “Getting started with trace” on page 1307*
- *Chapter 1.4.5.19.2.15 “Command 'Insert Elements for Controlling Trace'” on page 1737*
- *Chapter 1.4.1.12.3 “Data Recording with Trace” on page 421*

1.4.5.10.1 Getting started with trace

Create a project with the following program PLC_PRG:

```
PROGRAM PLC_PRG
VAR
    iVar : INT;
    rSin : REAL;
    rVar : REAL;
END_VAR

iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

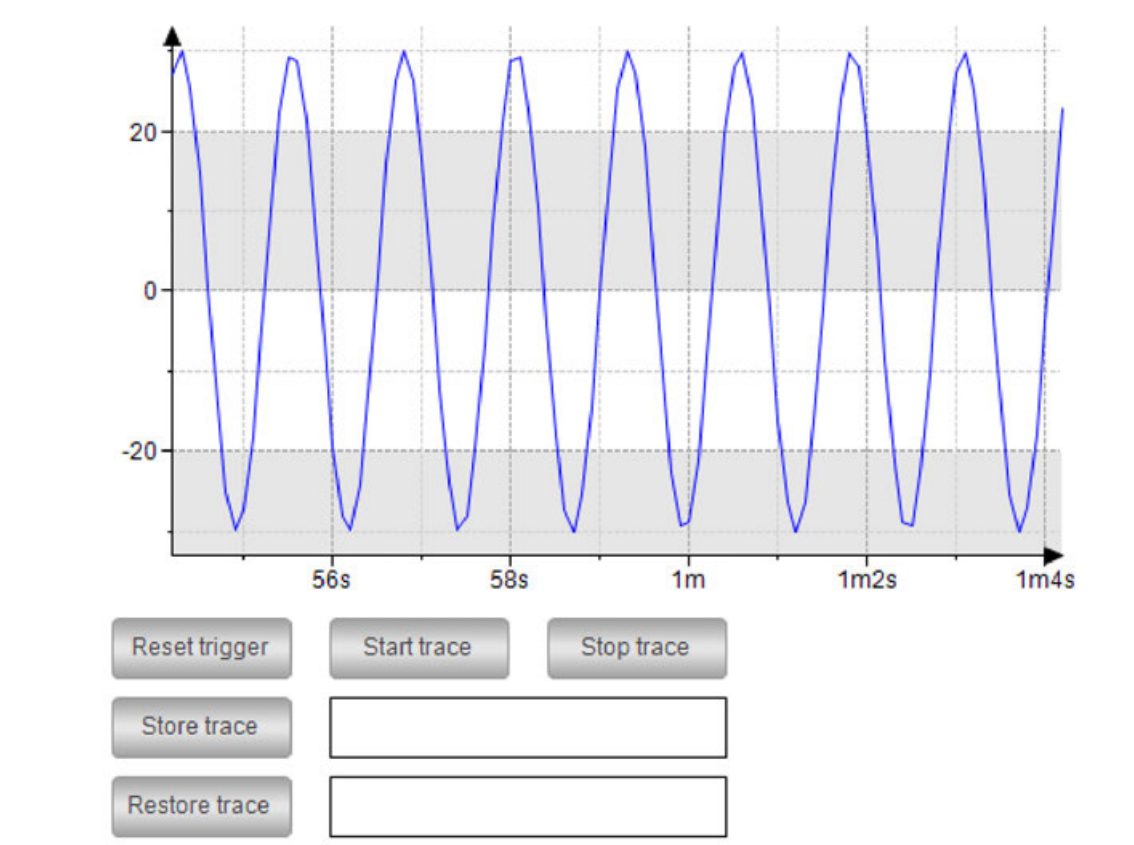
1. In the device tree, select the application and add a new visualization by clicking *“Project ➔ Add Object ➔ Visualization”*.
   ⇨ The respective visualization editor opens.
2. Add the *“Visualization”* object to the device tree below *“Application”*.
   ⇨ An empty visualization appears.
3. Open *“Toolbox ➔ Special Controls”*.
4. Drag the *“Trace”* element to the visualization editor.
   ⇨ The element properties are displayed on the right side.

5. Click the symbol in the *"Trace"* property.
   ⇨ The *"Trace Configuration"* dialog opens.
6. Click *"Add Variable"* to add an entry to the tree view of the trace configuration and select a project variable (for example, `PLC_PRG.rSin`).
7. Click the top node of the trace configuration.
   ⇨ The group *"Record Settings"* is shown on the right.
8. Select the `MainTask` option for the *"Task"* setting.
   Tip: The trace recording and the corresponding program should be executed in the same task.
9. Click *"OK"*.
   ⇨ The task configuration is applied.
10. Select the trace element and click *"Visualization ➔ Add Elements for Trace Control"*
    ⇨ The *"Trace Wizard"* dialog opens. By default, all control elements are activated there.
11. Click *"OK"* to close the dialog.
    ⇨ The control elements are added to the visualization and the control variables are declared. Then the control elements and the trace element are configured with the control variables.
12. Download the application to the controller and start it.

Example

Record the sine-shaped data of the IEC variable `PLC_PRG.rSin`

The `PLC_PRG` program is running on the PLC. When you follow the "Getting Started" instructions, the following interface is displayed:



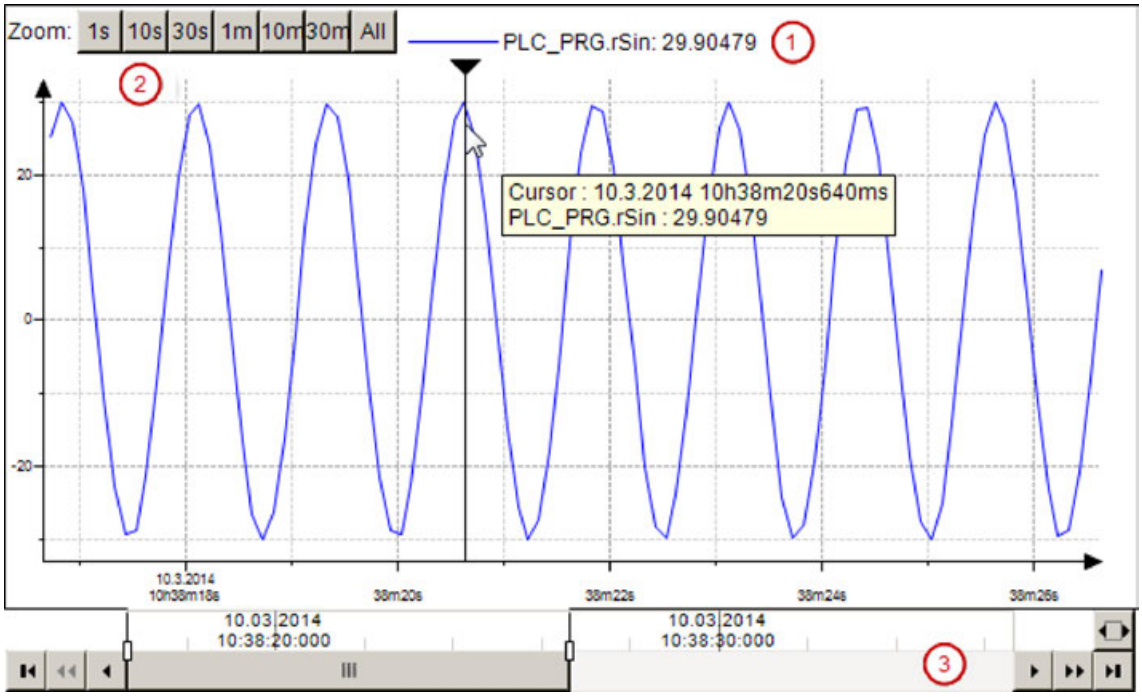
You can control the trace recording by clicking the buttons.

See also

- *Chapter 1.4.5.19.2.13 “Command 'Configure Trace'” on page 1734*
- *Chapter 1.4.5.19.3.19 “Dialog 'Display Settings'” on page 1770*
- *Chapter 1.4.5.18.1.34 “Visualization Element 'Trace'” on page 1619*

1.4.5.11 Displaying data curve with trend

A trend visualizes data that is used in the database of a trend recording. In contrast to the trace element, the trend element is particularly appropriate for long-term data recording.



The visualization of a trend encompasses the Trend element and the control elements. The three possible control elements can be seen in the illustration.

- Legend ①: Outputs the trend variables with values.
- Time range picker ②: Provides buttons for selecting predefined time ranges.
- Date range picker ③: encompasses control elements for navigation and zooming in the historical and current data on basis of the set date range.

A cursor is optionally available that enables the reading of a value at a certain time.

You can execute a trend visualization in the following clients:

- Target visualization
- Integrated visualization

See also

- *Chapter 1.4.5.11.1 “Getting Started with Trend Visualization” on page 1309*
- *Chapter 1.4.5.18.1.35 “Visualization Element 'Trend'” on page 1625*
- *Chapter 1.4.5.18.1.45 “Visualization Element 'Date Range Picker'” on page 1680*
- *Chapter 1.4.5.18.1.46 “Visualization Element 'Time Range Picker'” on page 1685*

1.4.5.11.1 Getting Started with Trend Visualization

When you execute a Trend, it is best to proceed with user guidance and the help of the trend wizard.

Development of a visualization with trend

1. Create an empty standard project and program at least one variable into `PLC_PRG`.
   ⇨ `PLC_PRG` is declared and implemented
2. Add the *"Visualization"* object to the device tree below *"Application"*.
   ⇨ An empty visualization appears.
3. Open *"Toolbox ➔ Special Control"*.
4. Drag the *"Trend"* element to the visualization
   ⇨ The *"Trend Recording"* dialog opens with the *"Recording Settings"*.
5. Select the task in which the trend recording will be executed.

   > *In general the trend recording runs in the same task as the main program, i.e. PLC_PRG.*

   Therefore, select `MainTask`.
6. Add a trend variable with *"Add Variable"* and assign an IEC variable from PLC_PRG to the trend variable.
7. Click *"OK"* to close *"Trend Configuration"*.
   ⇨ There is a newly created object of the type Trend recording under *"Trend Recording Manager"*. The active visualization contains a *"Trend"* element that is selected.
8. Click *"Visualization ➔ Insert Elements for Controlling Trend Elements"*.
   ⇨ The *"Trend Wizard"* dialog box opens.
9. By default, all three control elements are activated in the dialog. Click *"OK"* to close the dialog box.
   ⇨ The active visualization contains a *"Trend"* with control elements.
10. Set the application containing the trend objects to active.
11. Compile the application with *[F11]*.
12. Click *"Online ➔ Login"*.
13. Start the application with *[F5]*.
    ⇨ The target visualization appears. The visualization contains the trend diagram with the value curve of the variable. The control elements enable user inputs.

See also

- *Trend recording*
- *Chapter 1.4.5.11.2 "Programming a Trend Visualization" on page 1312*
- *Chapter 1.4.5.19.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 1739*

Example: Visualization of the sinusoidal trend of an IEC variable.

The following objects are implemented in the project:

- `PLC_PRG`
- `Visualization_Trend1`
- `VisuWithTrend`

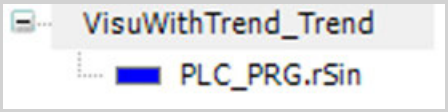
PLC_PRG `PLC_PRG` runs as part of the application on the controller.

```
PROGRAM PLC_PRG
VAR
    iVar : INT;
    rSin : REAL;
    rVar : REAL;
END_VAR

iVar := iVar + 1;
iVar := iVar MOD 33;

rVar := rVar + 0.1;
rSin := 30 * SIN(rVar);
```

Visualization_Trend1 `Visualization_Trend1` is the object that contains the configuration of the trend recording.



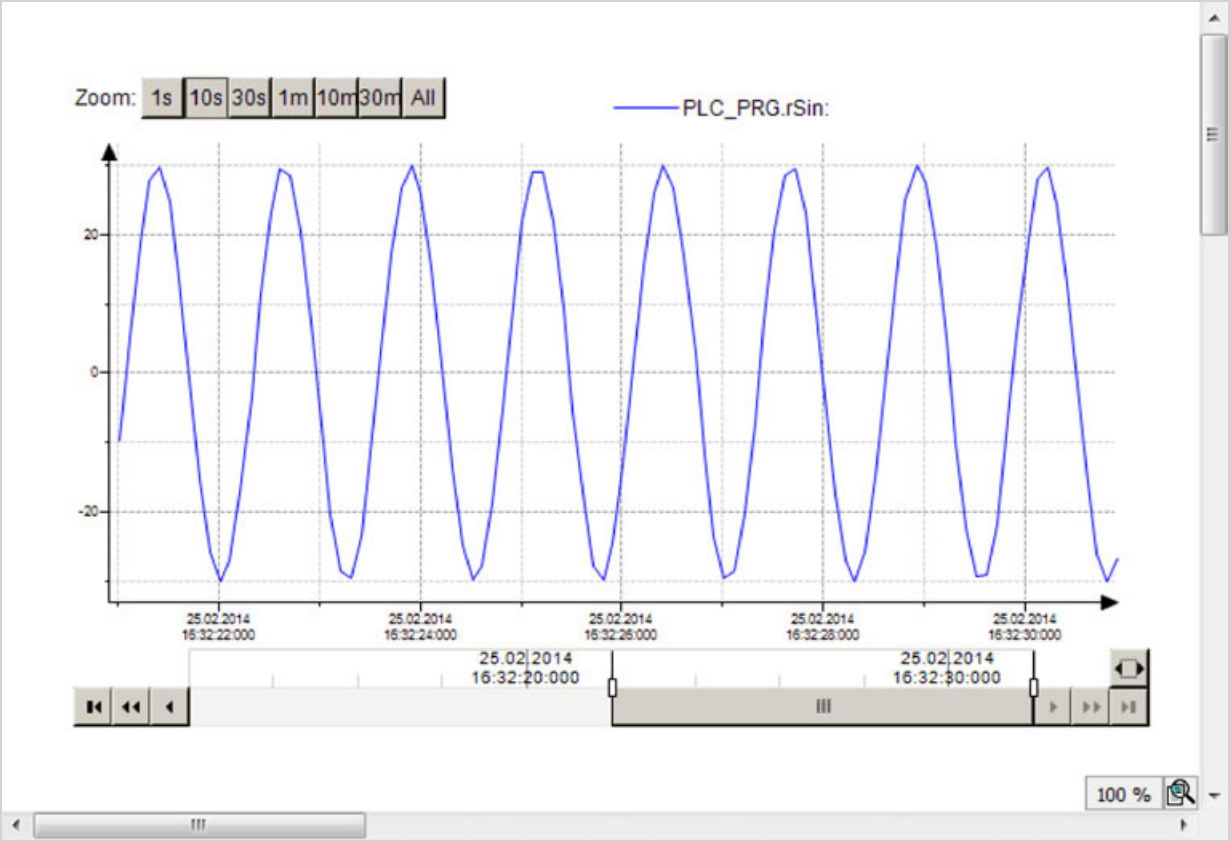
VisuWithTrend

`VisuWithTrend` is the object that visualizes the trend.

The visualization contains four elements: one *"Trend"* and three control elements. The properties of the trend are defined as follows.

Properties	Value
"Trend recording"	Visualization_Trend1
"Display cursor"	☑
"Display tool tip"	☑
"Show frame"	☑
"Date Range Picker"	Trend1DateRangeSelector
"Time Picker"	Trend1TimeSelector
"Legend"	Trend1Legend

`VisuWithTrend` at runtime



1.4.5.11.2 Programming a Trend Visualization

To display a trend recording in the visualization, you define which application provides which trend recording. You define the display by means of the *"Properties"* of the trend element and the controls used.

Defining the application and data source

The visualization task and the trend recording task generally run under the same application. If this is not the case, then the application containing the visualization task requires a data source manager.

1. Select a trend element in the active visualization editor.
   ⇨ The properties of the trend element are displayed on the right side.
2. Double-click the value field *“Properties ➔ Application”*.
3. Use the Input Assistant (...) to select the application. You can also specify the name of the application directly.

See also

- *Trend Recording*
- *Data Source Manager*

Adding a control

1. Select a trend element in the active visualization editor.
2. Click *“Visualization ➔ Insert Elements for Trend Controlling”*.
   ⇨ The *“Trend Wizard”* dialog opens.
3. Select the desired control. Examples: *“Date Range Picker”*, *“Time range Range Picker”*, *“Legend”*. Click *“OK”* to confirm.
   ⇨ The selected controls are inserted for the trend element. You can move them to any position you like. In the *“Properties”* of the trend element, the controls are shown below *“Assigned controls”*.

See also

- *Chapter 1.4.5.19.2.18 “Command 'Insert Elements for Controlling the Trend'” on page 1739*

Defining the trend recording to visualize

1. Select a trend element in the active visualization editor.
   ⇨ The properties of the trend element are displayed on the right side.
2. Click the value field of *“Properties ➔ Trend recording”*
   ⇨ *“Select trend recording”* is displayed. The trend recordings available application-wide are listed under *“Available trend recordings”*.
3. Select a trend record below *“Available trend recordings”*.
4. Click .
   ⇨ The trend recording is located under *“Selected trend recording”*.
5. Click *“OK”* to confirm the entry.
   ⇨ The selected trend recording is listed in *“Values”* in *“Properties ➔ Trend recording”*.

See also

- *Trend Recording*

Removing a control

A control that was added with the help of the "Trend Wizard" cannot be deleted via the Trend wizard dialog.

1. Select a control of a trend in the active visualization editor.
2. Press *[Del]* or *"Delete"* to delete the element.
3. Select the trend in the active visualization editor.
4. Delete the assigned value in *"Properties ➔ Assigned controls ➔ <control>"*.

NOTICE!
It is absolutely necessary to delete this reference manually. The property is not deleted automatically by deleting the control.

Configuring the coordinate system of the trend diagram

1. Select a trend in the active visualization editor.
2. Use the *"Visualization ➔ Configure Trend Display Settings"* command.
   ⇨ The *"Display Settings"* dialog opens.
3. Adapt the settings as needed.

See also

- *Chapter 1.4.5.19.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 1739*

Reading a trend value at runtime

1. Open *"View ➔ Element Properties"*.
2. Select a trend element in your visualization.
   ⇨ The properties of the trend element are displayed on the right side.
3. Select the *"Properties ➔ Show cursor"* option and *"Show tooltip"*.
   ⇨ A cursor is drawn in the coordinate system.
4. Select the *"Properties ➔ Show tooltip"* option.
5. Download the application to the controller and start the application.
6. *If the diagram "runs", then the date range has been placed in such a way that its end time is the current time.*

   Select the date range so that the diagram does **not** run. If necessary, drag the scroll bar to an earlier date range.
   ⇨ A cursor is available. The tooltip of the cursor informs you of the trend values. For each trend variable, the legend displays the value at the point in time at which the cursor is positioned.

Deleting the trend recording history

You can insert an input element in the visualization which the operator can use to delete the previous value recording in the trend visualization at runtime. The curve displayed until then is removed and the display starts over.

1. In the application (example: in the program `PLC_PRG`), implement the following code:

```
itfTrendRecording : ITrendRecording;
itfTrendStorageWriter : ITrendStorageWriter;
itfTrendStorageWriter3 : ITrendStorageWriter3;
sTrendRecordingName : STRING := 'TrendRecording';
itfTrendRecording :=
GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTr
endRecordingName));
xClearHistoryTrend: BOOL;

IF xClearHistoryTrend THEN
itfTrendRecording :=
GlobalInstances.g_TrendRecordingManager.FindTrendRecording(ADR(sTr
endRecordingName));
IF itfTrendRecording <> 0 THEN
    itfTrendStorageWriter :=
itfTrendRecording.GetTrendStorageWriter();
    IF __QUERYINTERFACE(itfTrendStorageWriter,
itfTrendStorageWriter3) THEN
itfTrendStorageWriter3.ClearHistory();
    END_IF
END_IF
```

2. In the visualization of the trend recording, add a button for deleting the previous curve. Configure its *"Toggle"* property with the variable `PLC_PRG.xClearHistoryTrend`.

   ⇨ When `xClearHistoryTrend` is set to `TRUE`, the previously recorded curve is deleted. The recording immediately starts again.

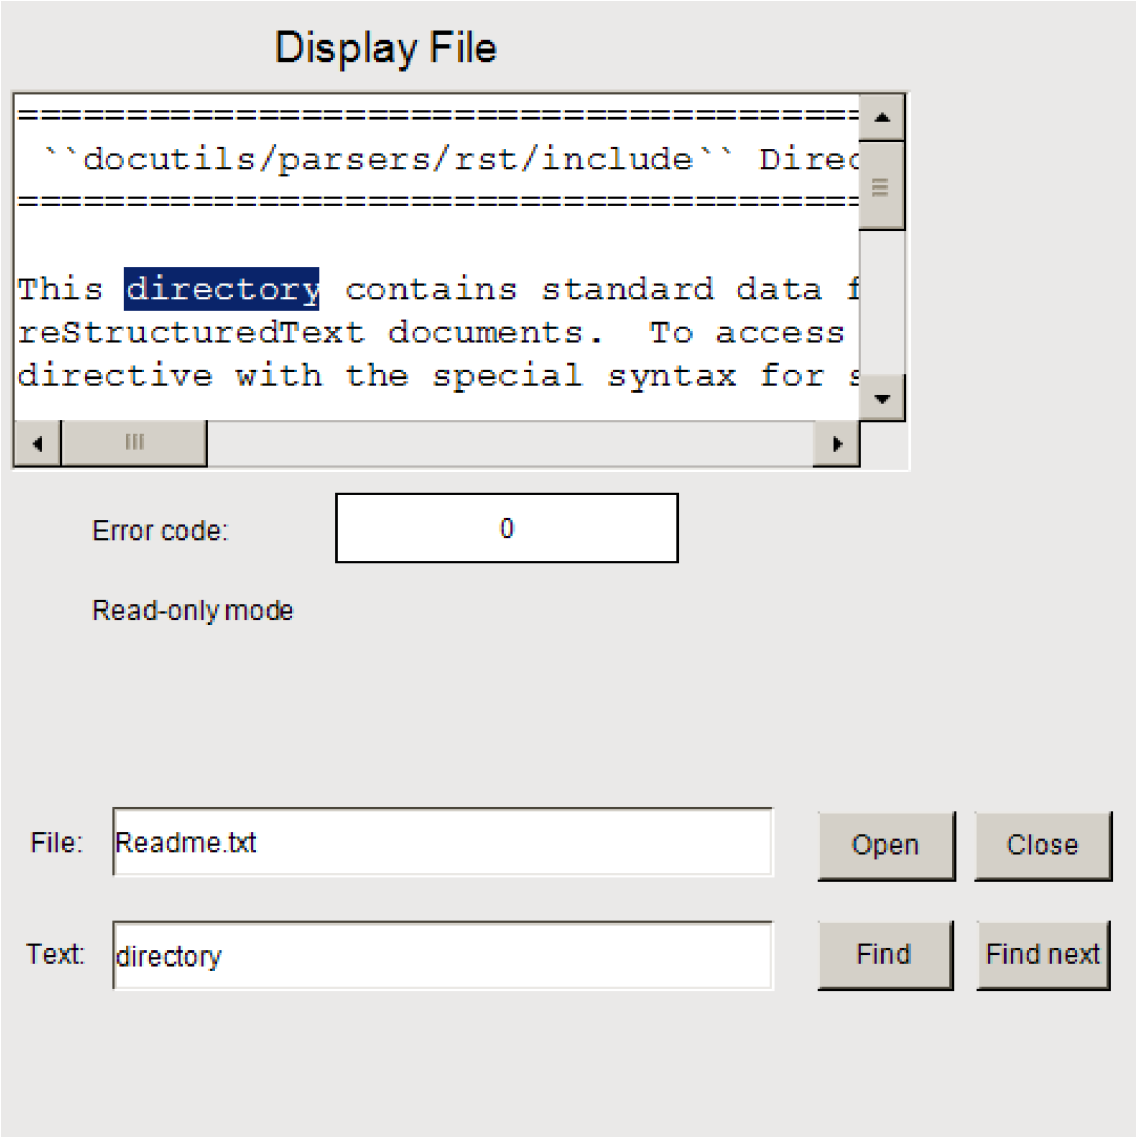
1.4.5.12 Displaying and Editing Text Files

With the help of the element *"Text Editor"* you can display a text file in the user interface and optionally also enable the user to edit the file.

1.4.5.12.1 Configuring the Display of a Text File

In order to display a text file that is located on the controller, you need not only the element *"Text Editor"*, but also control elements for selecting, opening and closing the file. Optionally a text search function can be set up in the file with further control elements.

Example:



Configuring the element *"Text Editor"*, example

1. Drag an element *"Text Editor"* into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the `GVL` object.

   ⇨ Refer to the declaration of the control variables for this.
3. For the *"Text Editor"*, configure the property *"Editing mode"* with *"Read only"*.
4. Also configure the property *"Control variables"*.

   Assign the following variables there:

   - *"Control variables ➔ File ➔ Variable"* with `g_sFileName`
   - *"Control variables ➔ File ➔ Open"* with `g_bFileOpen`
   - *"Control variables ➔ File ➔ Close"* with `g_bFileClose`
   - *"Control variables ➔ File ➔ New ➔ Variable"* with `g_bFileNew`
   - *"Control variables ➔ File ➔ Save ➔ Variable"* with `g_bFileSave`
   - *"Control variables ➔ Edit ➔ Variable"* with `g_sEditSearchFor`
   - *"Control variables ➔ Edit ➔ Find"* with `g_bEditFind`
   - *"Control variables ➔ Edit ➔ Find next occurrence"* with `g_bEditFindNext`

Declaring the control variables

```
VAR_GLOBAL
                    g_sFileName: STRING := 'Readme.txt';
                    g_bFileOpen : BOOL;
                    g_bFileClose: BOOL;
                    g_bFileNew: BOOL;
                    g_bFileSave: BOOL;
                    g_sEditSearchFor : STRING;
                    g_bEditFind : BOOL;
                    g_bEditFindNext : BOOL;

                    g_usiErrorHandlingVarForErrorCode: USINT;
                    g_bVarForContentChanged : BOOL;
                    g_bVarForReadWriteMode: BOOL;
                    END_VAR
```

Configuring control elements for the file selection

1. Add an element *“Label”*.
2. Configure the property *“Texts ➔ Text”* with `File:`.
3. Add an element *“Rectangle”* next to it, in which the user can then enter the file name:
4. Configure the property *“Texts ➔ Text”* with `%s`:
5. Configure the property *“Texts ➔ Text variable”* with `g_sFileName`.
6. Configure the property *“Input configuration ➔ OnMouseclick”* with *“Write a variable”*.
   In the dialog *“Input Configuration”*, select *“Text input”* as the *“Input type”*.
   Activate the option *“Use text output variable”*.
   ⇨ The rectangle for the input of the file name is configured.
7. Add an element *“Button”* for opening the file.
8. Configure the property *“Texts ➔ Text”* with `Open`:
9. Configure the property *“Input configuration ➔ OnMouseclick”* with *“Toggle a variable”*.
   Assign `g_bFileOpen` as a variable.
   ⇨ The button `Open` is configured.
10. Add a further element *“Button”* for closing the file.
11. Configure the property *“Texts ➔ Text”* with `Close`:
12. Configure the property *“Input configuration ➔ OnMouseclick”* with *“Toggle a variable”*.
    Assign `g_bEditFile` as a variable.
    ⇨ The button `Close` is configured.

Control elements for searching for a text.

1. Add an element *“Label”*.
2. Configure the property *“Texts ➔ Text”* with `Text:`.
3. Alongside it, add an element *“Rectangle”* for the input of the text to be found.
4. Configure the property *“Texts ➔ Text”* with `%s`:
5. Configure the property *“Texts ➔ Text variable”* with `g_sEditSearchFor`.
6. Configure the property *“Input configuration ➔ OnMouseclick”* with *“Write a variable”*.
   In the dialog *“Input Configuration”*, select *“Text input”* as the *“Input type”*.
   Activate the option *“Use text output variable”*.
   ⇨ The rectangle is configured.
7. Add an element *“Button”* for starting the search.
8. Configure its property *“Texts ➔ Text”* with `Find`.

9. Configure the property *"Input configuration ➔ OnMouseclick"* with *"Toggle a variable"*.

   Assign `g_bEditFind` as a variable.

10. Also add the action *"Execute ST-Code"*.

    Program the action with: `g_bEditFindNext := FALSE;`

    ⇨ The button is configured.

11. Add a further element *"Button"*.
12. Configure the property *"Texts ➔ Text"* with `Find next`.
13. Configure the property *"Input Configuration ➔ OnMouseclick"* with *"Toggle a variable"*.

    Assign `g_bEditFind` as a variable.

14. Also add the action *"Execute ST code"*.

    Program: `g_bEditFindNext := TRUE;`

    ⇨ The button is configured.

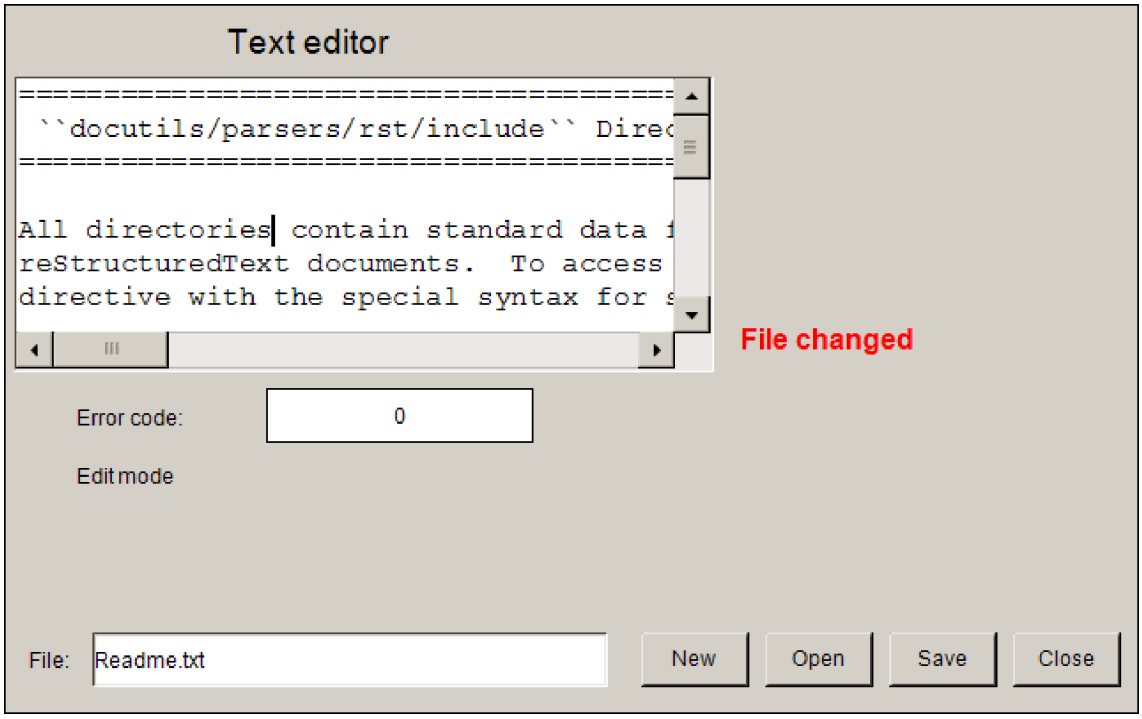
See also

- *Chapter 1.4.5.18.1.41 "Visualization Element 'Text Editor'" on page 1653*

1.4.5.12.2 Configuring the Editing of a Text File

In order to be able to create a new text file or edit an existing one on the controller with the *"Text Editor"* in the user interface, you need not only the element *"Text Editor"*, but also control elements for selecting, opening, closing, saving and creating a file.

Example:



Configuring the element *"Text Editor"*, example:

1. Drag an element *"Text Editor"* into the visualization editor.
2. Declare the control variables for the element, for example as global variables in the `GVL` object.

   ⇨ Refer below to the declaration of the control variables for this.

3. For the *"Text Editor"*, configure the property *"Editing mode"* with *"Read/Write"*.

4. Also configure the property *"Control variables"*.

   Assign the following variables there:

   - *"Control variables ➔ File ➔ Variable"* with `g_sFileName`
   - *"Control variables ➔ File ➔ Open"* with `g_bFileOpen`
   - *"Control variables ➔ File ➔ Close"* with `g_bFileClose`
   - *"Control variables ➔ File ➔ Save"* with `g_bFileSave`
   - *"Control variables ➔ File ➔ New"* with `g_FileNew`

Declaring the control variables

```
VAR_GLOBAL
                g_sFileName: STRING := 'Readme.txt';
                g_bFileOpen : BOOL;
                g_bFileClose: BOOL;
                g_bFileSave: BOOL;
                g_FileNew: BOOL;
                g_usiErrorHandlingVarForErrorCode: USINT;
                g_bVarForContentChanged : BOOL;
                g_bVarForReadWriteMode: BOOL;
                END_VAR
```

Configuring control elements for file selection

1. Add an element *"Label"*.
2. Configure it in the property *"Texts ➔ Text"* with `File:`.
3. Add an element *"Rectangle"* next to it.
4. Configure its property *"Texts ➔ Text"* with `%s`.
5. Configure its property *"Texts ➔ Text variable"* with `g_sFileName`.
6. Configure the property *"Input configuration ➔ OnMouseclick"* with *"Write a variable"*.

   In the dialog *"Input Configuration"*, select *"Text input"* as the *"Input type"*.

   Activate the option *"Use text output variable"*.

   ⇨ The rectangle for the input of the file name is configured.
7. Add an element *"Button"*.
8. Configure its property *"Texts ➔ Text"* with `New`.
9. Configure the property *"Input configuration ➔ OnMouseclick"* with *"Toggle a variable"*.

   Assign `g_bFileNew` as a variable.

   ⇨ The button `New` is configured.
10. Add a further element *"Button"*.
11. Configure the property *"Texts ➔ Text"* with `Open`:
12. Configure the property *"Input configuration ➔ OnMouseclick"* with *"Toggle a variable"*.

    Assign `g_bFileOpen` as a variable.

    ⇨ The button `Open` is configured.
13. Add a further element *"Button"*.
14. Configure its property *"Texts ➔ Text"* with `Save`.
15. Configure the property *"Input configuration ➔ OnMouseclick"* with *"Toggle a variable"*.

    Assign `g_bFileSave` as a variable.

    ⇨ The button `Save` is configured.
16. Add a further element *"Button"*.
17. Configure its property *"Texts ➔ Text"* with `Close`.

18. Configure the property *“Input configuration ➔ OnMouseclick”* with *“Toggle a variable”*.

    Assign `g_bEditFile` as a variable.

    ⇨ The button `Close` is configured.

See also

- ↳ *Chapter 1.4.5.18.1.41 “Visualization Element 'Text Editor'” on page 1653*

1.4.5.13 Configuring a variable assignment with unit conversion

A variable that was assigned in a visualization can be linked with a unit conversion. This causes the variable value to be converted according to a predefined rule and the result is edited in the visualization.

You have already configured the conversion rules in the editor of an object of the type *“Unit Conversion”*.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Linking a variable with unit conversion

☑ Requirement: A project with a visualization is open. In addition, the application contains the object `UnitConversion` with the rule `convert_A`.

1. Select an element.

   ⇨ The view *“Properties”* opens.

2. When assigning a variable, link the variable `iVar_A` with a rule of the unit conversion:

   ```
   convert_A.convert(iVar_A)
   ```

3. Compile, load and start the application.

   ⇨ The application runs. The visualization opens. The unit conversion is applied.

1.4.5.14 Using recipes in visualization elements

You can manage and use the recipes created in CODESYS by means of a visualization. For this purpose, the input configuration of a visualization element provides the following commands:

- *“Read Recipe”*
- *“Write Recipe”*
- *“Load Recipe from File”*
- *“Save Recipe to File”*
- *“Create Recipe”*
- *“Delete Recipe”*

See also

- ↳ *Chapter 1.4.1.12.2 “Changing Values with Recipes” on page 417*
- ↳ *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Example: Loading recipes by means of visualization elements

Requirement: The *“Visualization”* object is added to the project.

1. Create a recipe according to the instructions in the section "Changing Values with Recipes - Creating Recipes".

   Assign the following names:

   - Recipe definition: "Recipes"
   - Recipes: "Recipe1" and "Recipe2"
   - Variables: `iValue1` and `iValue2`

   Type in different variable values of both recipes.
2. Open the *“Visualization”* object in the editor.
3. Drag a *“Button”* element to the visualization. Label it "Load Recipe 1". You can specify the text by double-clicking the element or in the *“Texts ➔ Text”* property.
4. Click the value field of the *“Input configuration”*: *“OnMouseDown”* property.

   ⇨ The *“Input Configuration”* dialog box opens.
5. Select *“Execute command”* in the left of the left side and click the button

   ⇨ The configuration of the *“Internal command”* opens on the right side of the dialog.
6. Select the *“Write Recipe”* command from the drop-down list.
7. Click the button.

   ⇨ The *“WriteRecipe”* command is added to the list.
8. Specify the first parameter as `Recipes` and the second parameter as `Recipe1`.
9. Click *“OK”* to close the dialog box.
10. Drag a second button to the visualization, name it "Load Recipe 2", and repeat steps 4 to 8. For step 7, specify `Recipe2` as the second parameter.
11. Load the program to the controller and start it Click the *“Load Recipe 1”* and *“Load Recipe 2”*, and monitor the variables `iValue1` and `iValue2`.

The other recipe commands are assigned to visualization elements as described in this example. Refer to the help page of the input configuration for a description of the internal commands.

1.4.5.15 Creating a structured user interface

You can reference visualizations that are available or exist in the project in another visualization and thus reuse them. You obtain a structured user interface that consists of several visualizations. In principle you have the following possibilities to reference visualizations.

On the one hand you can display visualizations within a main visualization and toggle between them. The element *“Frame”* or *“Tabs”* serves here as a window area element that defines the display area for the referenced visualizations.

On the other hand you can configure a user input for a visualization that causes another visualization to open as a dialog. The requirements for this is that it has the visualization type *“Dialog”*. A dialog is used to collect inputs from the user.

In addition, you can declare an interface for a visualization that is to be referenced in order to vary the display of the visualization at runtime. A visualization is thereby instanced with different data and executed.

See also

- *Chapter 1.4.5.18.1.6 “Visualization Element 'Frame'” on page 1432*
- *Chapter 1.4.5.18.1.10 “Visualization Element 'Tabs'” on page 1463*

1.4.5.15.1 Displaying Multiple Visualizations in One Visualization

You can reference other visualizations within a main visualization either in a *“Frame”* or a *“Tabs”* element, and then display them in the window pane of the element.

In the case of the *“Frame”* element, you can freely program which of the visualizations is displayed at which time. One option is to use the switch frame variable of the *“Frame”* element, which automatically triggers a switch according to its value. You can also program additional controls which, after user input, trigger input actions that result in switching a visualization.

NOTICE!

Visualizations can be nested at any depth by means of *“Frame”* elements. In order to use the *“Switch to any visualization”* frame selection type without any problems, a *“Frame”* must not contain more than 21 referenced visualizations.

For more information, see also the description for the *“Input configuration”* of an element: Action *“Switch frame visualization”*.

Moreover, you can use the *“Tabs”* to reference visualizations. It is easy and advantageous that the *“Tabs”* element provides preconfigured control of the visualization switch.

In CODESYS Forge, you will find the sample project "Visualization Switching". There you will see a visualization that displays other visualizations in a frame area one after another at runtime. The visualization switch is controlled either by the user, programmatically, or via the FrameManager.

See also

- *Sample project in CODESYS Forge*

Switching frame visualizations by means of a variable

In the main visualization, the *“Frame”* element displays one of the referenced frame visualizations at runtime. The user can select the *“Radio Buttons”* element which is displayed in the frame.

Connecting frame visualizations with a radio buttons element

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
3. In the *“Add Visualization”* dialog, specify the name `VisuMain` and click *“Add”* to close the dialog.
4. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
5. In the *“Add Visualization”* dialog, specify the name `Visu1` and click *“Add”* to close the dialog.
6. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
7. In the *“Add Visualization”* dialog, specify the name `Visu2` and click *“Add”* to close the dialog.
8. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
9. In the *“Add Visualization”* dialog, specify the name `Visu3` and click *“Add”* to close the dialog.

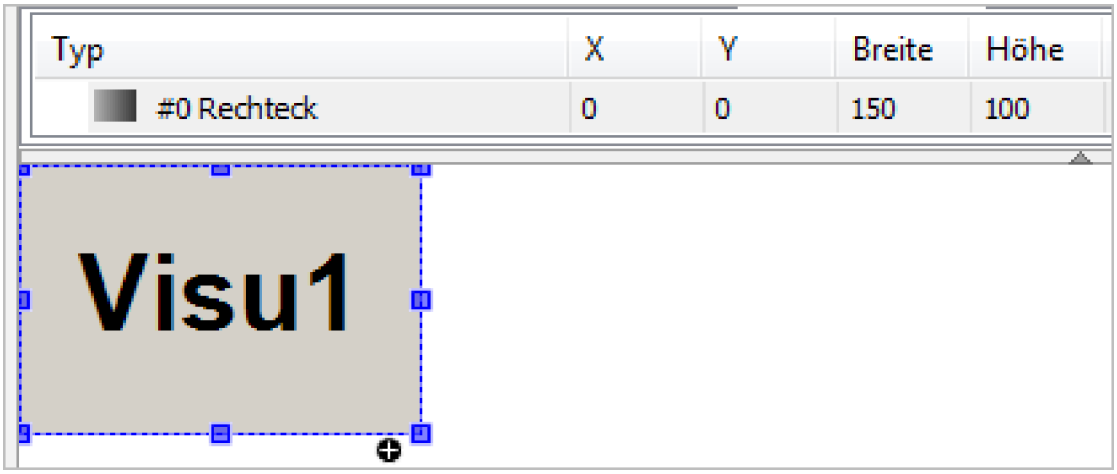
   ⇨ In addition to the main visualization, there are three more visualization objects.
10. Open the `Visu1` object.

11. In the *“Visualization Toolbox”*, in the *“Basic”* category, select and drag the *“Radio Buttons”* element to the visualization editor.

    ⇨ The *“Properties”* view of the element opens.

12. Configure the properties of the rectangle as follows:

    - Property *“Texts”*, *“Text”* = `Visu1`
    - Property *“Text properties”*, *“Font”* = *“Title”*
    - Property *“Colors”*, *“Normal state”*, *“Fill color”* = *“Light gray”*



13. Program the object `Visu2` accordingly.

    Properties of the rectangle:

    - Property *“Texts”*, *“Text”* = `Visu2`
    - Property *“Text properties”*, *“Font”* = *“Title”*
    - Property *“Colors”*, *“Normal state”*, *“Fill color”* = *“Gray”*

14. Program the object `Visu3` accordingly.

    Properties of the rectangle:

    - Property *“Texts”*, *“Text”* = `Visu3`
    - Property *“Text properties”*, *“Font”* = *“Title”*
    - Property *“Colors”*, *“Normal state”*, *“Fill color”* = *“Dark gray”*

15. Open the `VisuMain` object.

16. In the *“Visualization Toolbox”*, in the *“Basic”* category, select and drag the *“Frame”* element to the visualization editor.

    ⇨ The *“Frame Configuration”* dialog opens.

17. In the *“Available Visualizations”* window area, on the *“By Visualization Name”* tab, select the object `Visu1`. In *“Selected Visualizations”*, click *“Add”*.

18. Then select the object `Visu2` and click *“Add”* in *“Selected Visualizations”*.

19. Then select the object `Visu3` and click *“Add”* in *“Selected Visualizations”*.

20. Click *“OK”* to exit the dialog.

    ⇨ Now the *“Frame”* element references the three selected visualizations. The references (1) are listed in the *“References”* property in the element properties of the *“Frame”* element. In addition to the visualization name, the corresponding index value (2) is also displayed.

    Note: You can open the dialog when you click the *“Configure”* button in the value field of the *“References”* property. See (3). You can influence the index by means of the visualization order in the *“Selected Visualizations”* list.

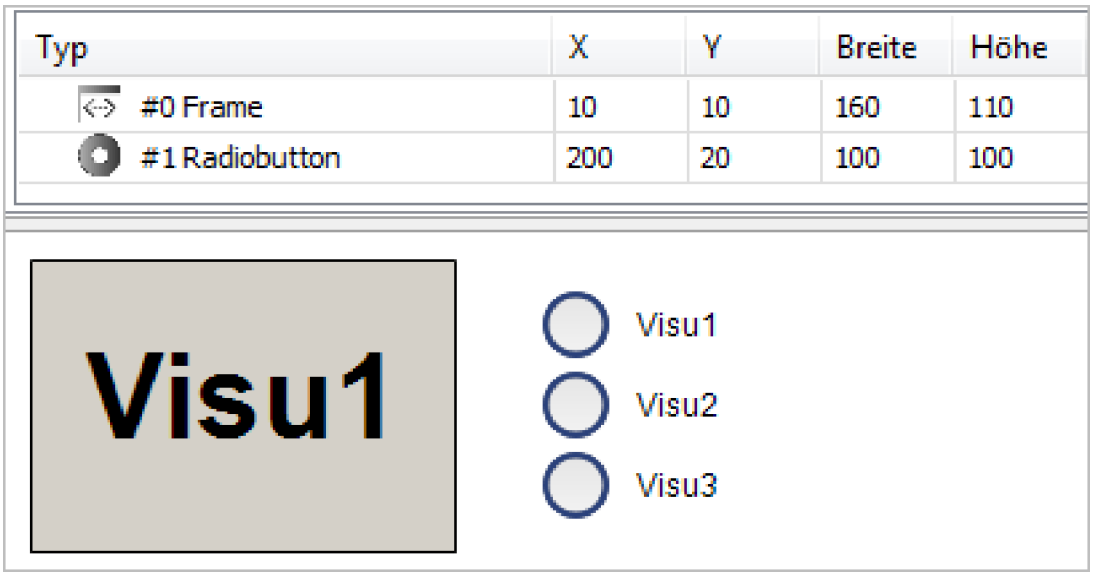
21. In the *“Visualization Toolbox”*, in the *“Common Controls”* category, drag the *“Radio Buttons”* element to the visualization editor.

    ⇨ The *“Properties”* view of the element opens.

22. In the *“Radio button settings”*, *“Radio button”*, click the *“Create new”* button.

    ⇨ This element has three switches to select from.

23. Configure the properties of the radio button as follows:
    - Property *“Radio button settings”*, *“Areas”*, *“[0]”*, *“Text”* = `Visu1`
    - Property *“Radio button settings”*, *“Areas”*, *“[1]”*, *“Text”* = `Visu2`
    - Property *“Radio button settings”*, *“Areas”*, *“[2]”*, *“Text”* = `Visu3`



24. In the `PLC_PRG` program, declare a local variable for the number of the visualization that is active.

    ⇨
    ```
    VAR
        iActiveVisu : INT; // Index of visu activated by the user
    END_VAR
    ```

25. Select the *“Radio Buttons”* element. In the value field of the *“Variable”* property, click ....

26. In the *“Input Assistant”* dialog, select the recently declared variable. Then exit the dialog.

    ⇨ Property of the *“Radio Buttons”* element:
    - Property *“Variable”* = `PLC_PRG.iActiveVisu`

27. Select the *“Frame”* element. Click in the value field of the *“Switch frame variable”*, *“Variable”* property. Specify the recently declared variable here as well.

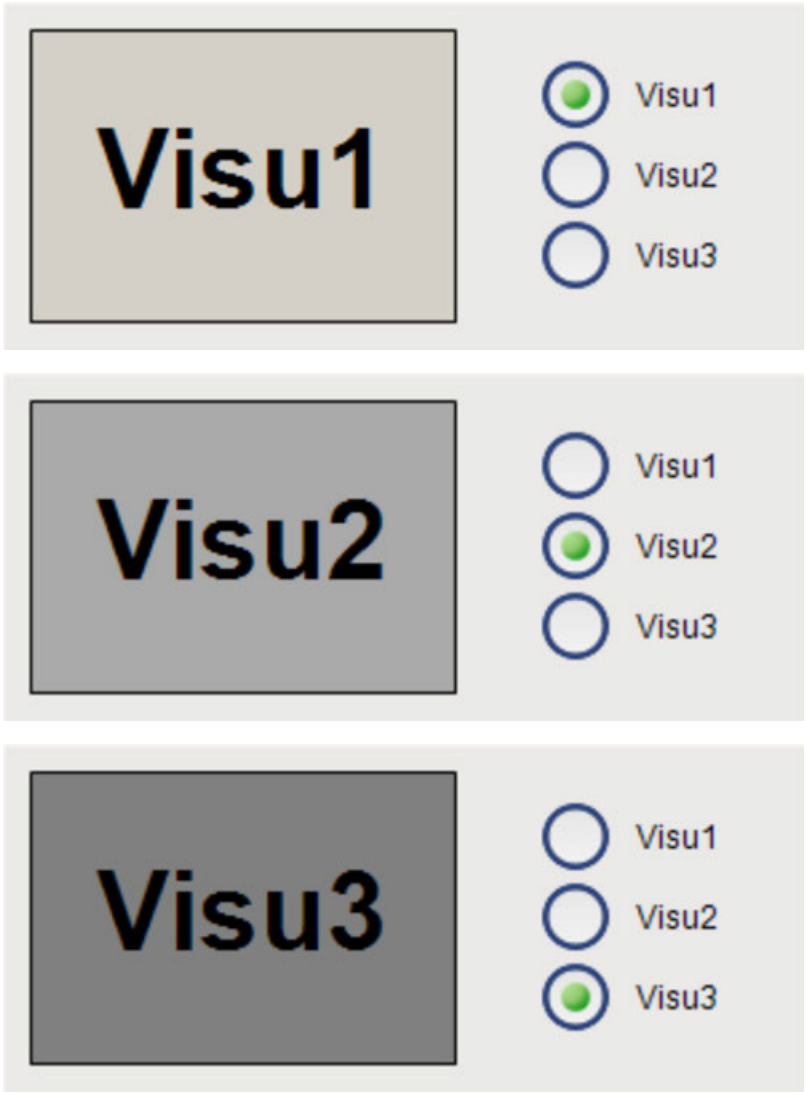
    ⇨ Property of the *“Frame”* element:
    - Property *“Switch frame variable ”*, *“Variable”* = `PLC_PRG.iActiveVisu`

    The control variable of the *“Radio Buttons”* element is also the switch frame variable of the *“Frame”* element. User input for the *“Radio Buttons”*element switches the frame visualization.

28. Click *“Build ➔ Generate Code”*.

29. Click *“Online ➔ Login”* and start the application.

    ⇨ The visualization starts. One of the referenced visualizations is running in the frame. When you click an unselected option of the *“Radio Buttons”* element, the visualization switches the contents in the frame to the desired visualization.



In the example, the switch frame variable is connected to an input variable. Instead, you can also set the switch frame variable programmatically in the IEC code.

Switching frame visualizations by means of a follow-up action

In the main visualization, the *“Frame”* element displays one of the frame visualizations at runtime. The user can use buttons to control the display in the frame. The user input triggers the *“Switch frame visualization”* input action.

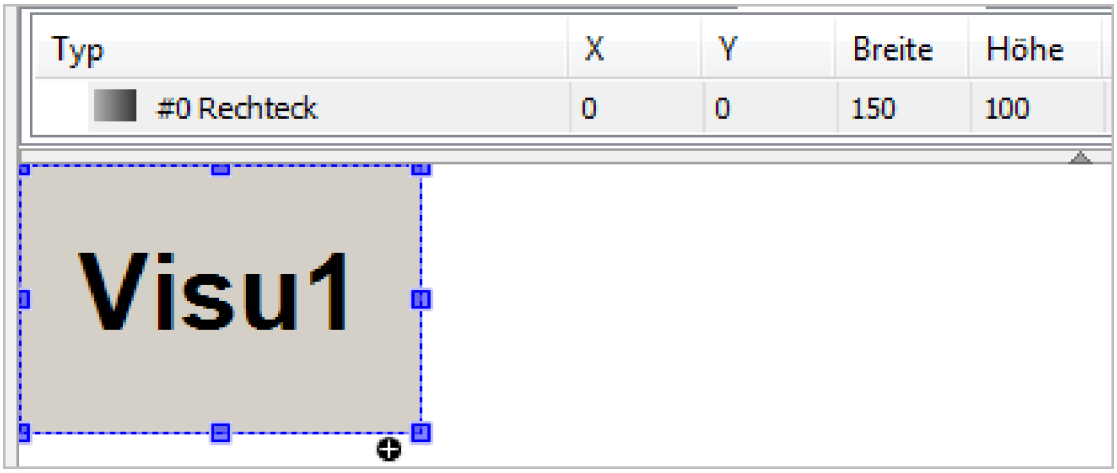
Programming a visualization

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
3. In the *“Add Visualization”* dialog, specify the name `VisuMain` and click *“Add”* to close the dialog.
4. Select the application in the device tree and click *“Add Object ➔ Visualization”*.
5. In the *“Add Visualization”* dialog, specify the name `Visu1` and click *“Add”* to close the dialog.
6. Select the application in the device tree and click *“Add Object ➔ Visualization”*.

7. In the *"Add Visualization"* dialog, specify the name `Visu2` and click *"Add"* to close the dialog.
8. Select the application in the device tree and click *"Add Object ➔ Visualization"*.
9. In the *"Add Visualization"* dialog, specify the name `Visu3` and click *"Add"* to close the dialog.

   ⇨ In addition to the main visualization, there are three more visualization objects.
10. Open the `Visu1` object.
11. In the *"Visualization Toolbox"*, in the *"Basic"* category, select and drag the *"Rectangle"* element to the visualization editor.

    ⇨ The *"Properties"* view of the element opens.
12. Configure the properties of the rectangle as follows:
    - Property *"Texts"*, *"Text"* = `Visu1`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Light gray"*



13. Program the object `Visu2` accordingly.

    ⇨ Properties of the rectangle:
    - Property *"Texts"*, *"Text"* = `Visu2`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Gray"*
14. Program the object `Visu3` accordingly.

    ⇨ Properties of the rectangle:
    - Property *"Texts"*, *"Text"* = `Visu3`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Dark gray"*
15. Open the `VisuMain` object.
16. In the *"Visualization Toolbox"*, in the *"Basic"* category, select and drag the *"Frame"* element to the visualization editor.

    ⇨ The *"Frame Configuration"* dialog opens.
17. In the *"Available Visualizations"* window area, on the *"By Visualization Name"* tab, select the object `Visu1`. In *"Selected Visualizations"*, click *"Add"*.
18. Then select the object `Visu2` and click *"Add"* in *"Selected Visualizations"*.
19. Then select the object `Visu3` and click *"Add"* in *"Selected Visualizations"*.

20. Click *“OK”* to exit the dialog.

    ⇨ Now the *“Frame”* element references the three selected visualizations. The references (1) are listed in the *“References”* property in the element properties of the *“Frame”* element. In addition to the visualization name, the corresponding index value (2) is also displayed.

    Note: You can open the dialog independently when you click the *“Configure”* button in the value field of the *“References”* property. See (3). You can influence the index by means of the visualization order in the *“Selected Visualizations”* list.

21. In the *“Visualization Toolbox”*, in the *“Common Controls”* category, drag the *“Button”* element to the visualization editor.

    ⇨ The element is selected and its properties are visible in the *“Properties”* view.

22. Configure the *“Texts”*, *“Text”* property with `Visu1`.

23. In the *“Input configuration”**“OnMouseDown”* property, click *“Configure”*.

    ⇨ The *“Input Configuration”* dialog opens.

24. Select the *“Switch frame visualization”* action and click .

    ⇨ The action is displayed in the window on the right.

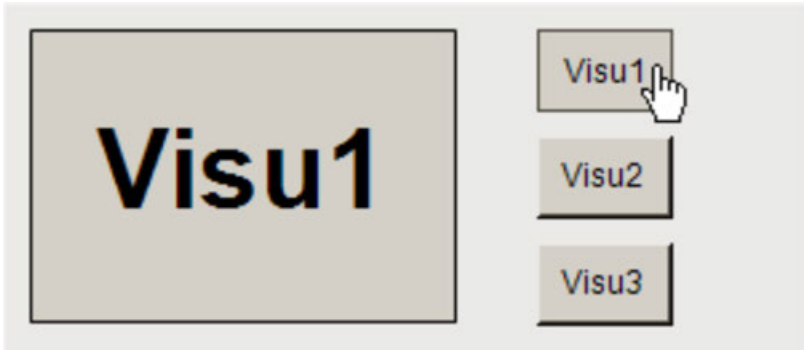
25. Configure the action:

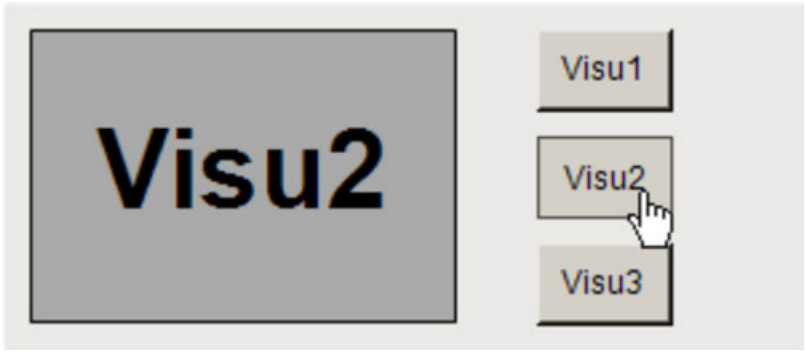
    - Select the *“Switch local visualization”* option.
    - Set the *“Visualization selection”* to `Visu1`.
    - Click *“OK”* to exit the dialog.

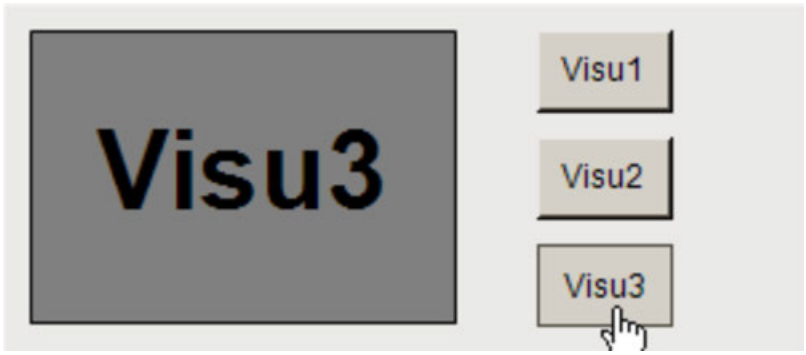
    ⇨ The follow-up action is configured in the *“Input configuration”* property.

    Property *“Input configuration”*, *“OnMouseDown”*, *“Switch frame visualization”* = `0`

26. Drag another *“Button”* element to the visualization editor. Configure the button accordingly.
    ⇨ Properties of the button:
    - Property *“Texts”*, *“Text”* = `Visu2`
    - Property *“Input configuration”*, *“OnMouseDown”*, *“Switch frame visualization”* = `1`
27. Drag another *“Button”* element to the visualization editor. Configure the button accordingly.
    ⇨ Properties of the button:
    - Property *“Texts”*, *“Text”* = `Visu3`
    - Property *“Input configuration”*, *“OnMouseDown”*, *“Switch frame visualization”* = `2`
28. Click *“Build ➔ Generate Code”*.
29. Click *“Online ➔ Login”* for the device and start the application.
    ⇨ The visualization starts. One of the referenced visualizations is running in the frame. When you click one of the buttons, the visualization switches the contents in the frame to the respective visualization.







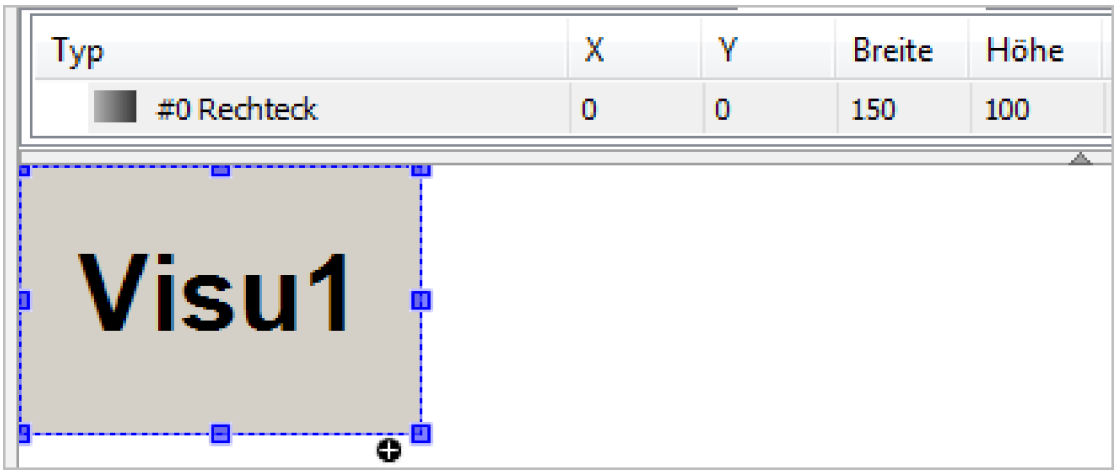
Displaying visualizations on a tabs element

For the *“Tabs”*, the navigation of the referenced visualizations is provided automatically. The first of the referenced visualizations is in the foreground, while the others are hidden behind it. The user can navigate between them by means of the tabs which are provided automatically.

Configuring a tabs element

1. Create a new standard project in CODESYS.
2. Select the application in the device tree and click *“Add Object ➔ Visualization”*.

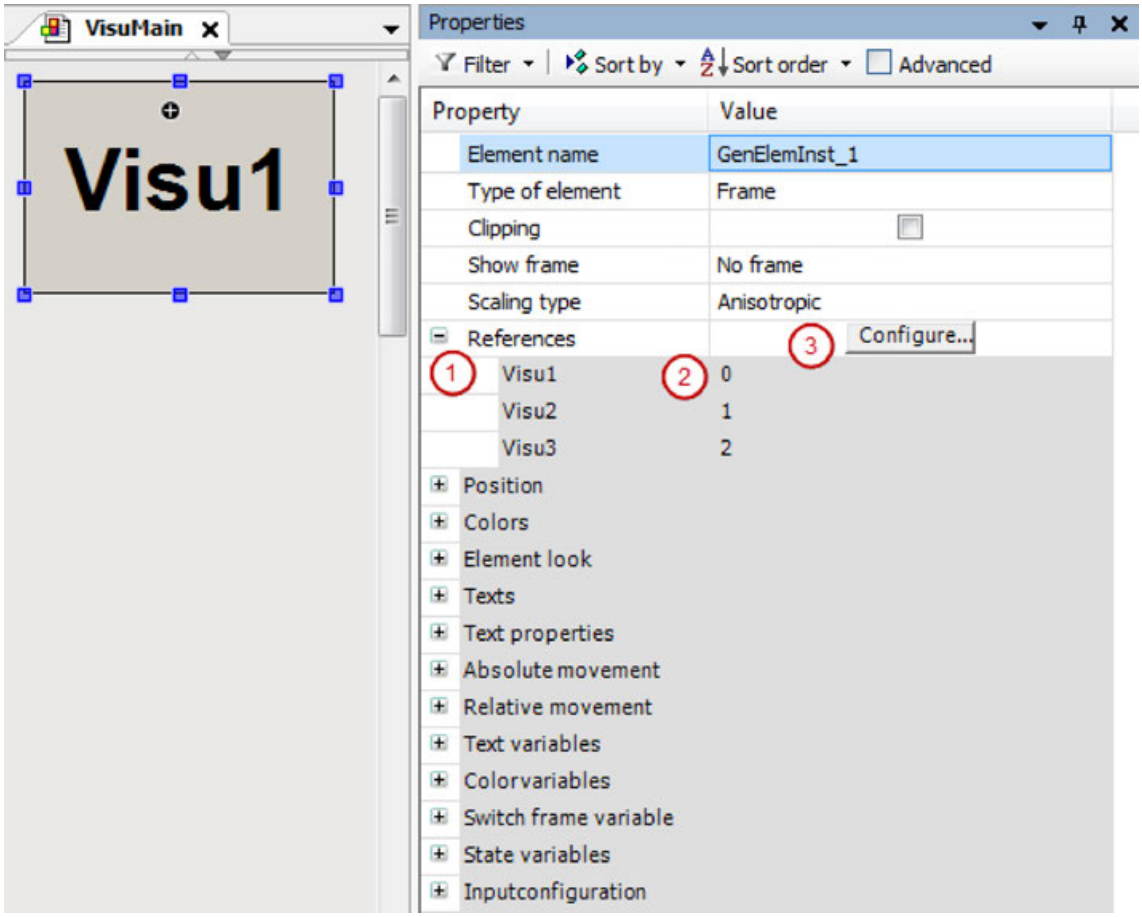
3. In the *"Add Visualization"* dialog, specify the name `VisuMain` and click *"Add"* to close the dialog.
4. Select the application in the device tree and click *"Add Object ➔ Visualization"*.
5. In the *"Add Visualization"* dialog, specify the name `Visu1` and click *"Add"* to close the dialog.
6. Select the application in the device tree and click *"Add Object ➔ Visualization"*.
7. In the *"Add Visualization"* dialog, specify the name `Visu2` and click *"Add"* to close the dialog.
8. Select the application in the device tree and click *"Add Object ➔ Visualization"*.
9. In the *"Add Visualization"* dialog, specify the name `Visu3` and click *"Add"* to close the dialog.
   ⇨ In addition to the main visualization, there are three more visualization objects.
10. Open the `Visu1` object.
11. Drag a *"Rectangle"* element to the visualization editor.
    ⇨ The *"Properties"* view of the element opens.
12. Configure the properties of the rectangle as follows:
    - Property *"Texts"*, *"Text"* = `Visu1`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Light gray"*



13. Program the object `Visu2` accordingly.
    ⇨ Properties of the rectangle:
    - Property *"Texts"*, *"Text"* = `Visu2`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Gray"*
14. Program the object `Visu3` accordingly.
    ⇨ Properties of the rectangle:
    - Property *"Texts"*, *"Text"* = `Visu3`
    - Property *"Text properties"*, *"Font"* = *"Title"*
    - Property *"Colors"*, *"Normal state"*, *"Fill color"* = *"Dark gray"*
15. Open the `VisuMain` object.
16. In the *"Visualization Toolbox"*, in the *"Basic"* category, select and drag the *"Frame"* element to the visualization editor.
    ⇨ The *"Frame Configuration"* dialog opens.

17. In the *“Available Visualizations”* window area, on the *“By Visualization Name”* tab, select the object `Visu1`. In *“Selected Visualizations”*, click *“Add”*.
18. Then select the object `Visu2` and click *“Add”* in *“Selected Visualizations”*.
19. Then select the object `Visu3` and click *“Add”* in *“Selected Visualizations”*.
20. Click *“OK”* to exit the dialog.

    ⇨ Now the *“Tabs”* element references the three selected visualizations. The references (1) are listed in the *“References”* property in the element properties of the *“Frame”* element. In addition to the visualization name, the corresponding index value (2) is also displayed.

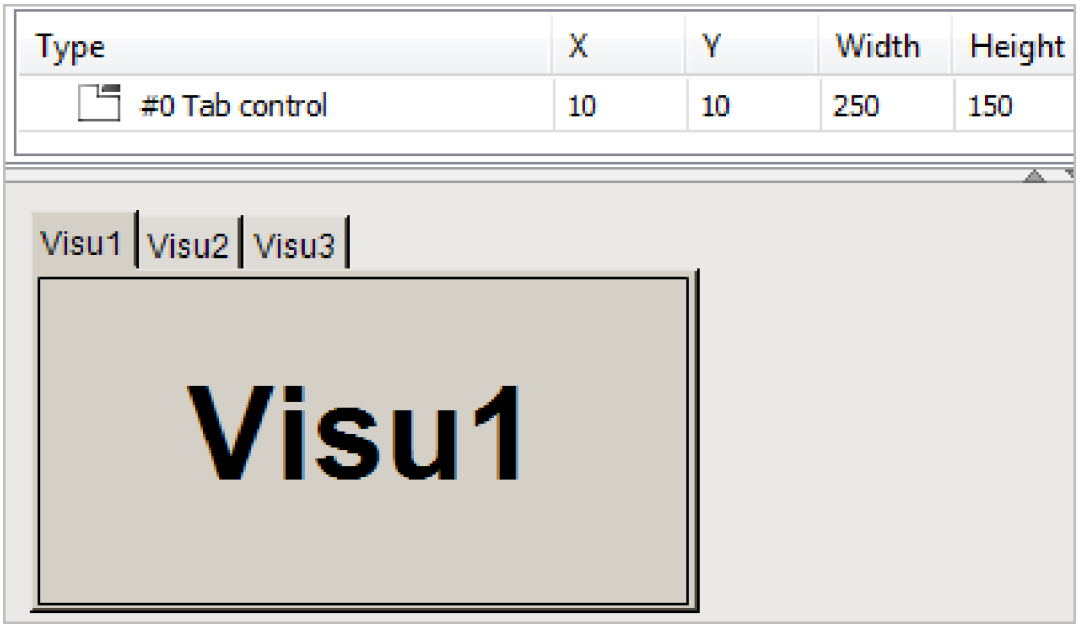


Note: You can open the dialog *“Frame Configuration”* dialog independently when you click the *“Configure”* button in the value field of the *“References”* property. See (3). You can influence the index by means of the visualization order in the *“Selected Visualizations”* list.

21. In the *“Visualization Toolbox”*, in the *“Common Controls”* category, drag the *“Tabs”* element to the visualization editor.

    ⇨ The *“Properties”* view of the element opens.

22. Configure the properties of the tab as follows:
    - Property *“Tab width”*: `40`
    - Property *“References”*, `Visu1`, *“Header”* = `Visu1`
    - Property *“References”*, `Visu2`, *“Header”* = `Visu2`
    - Property *“References”*, `Visu3`, *“Header”* = `Visu3`



23. Click *“Build ➔ Generate Code”*.
24. Click *“Online ➔ Login”* for the device and start the application.
    ⇨ The visualization starts. One of the referenced visualizations is running in the *“Tabs”* element. Click the tab to switch to the respective visualization.

1.4.5.15.2 Calling a Visualization with an Interface

You can declare an interface for parameters for a visualization that is to be referenced. The actual parameters are passed to the interface (similar as in the case of a function block) when the visualization is called at runtime.

First of all, declare the interface variables in the visualization interface editor. Then configure the parameters that are transferred to the interface by assigning a data-type-compliant application variable to each interface variable. The assignment is configured in the *"References"* property in the case of a *"Frame"* or a *"Tabs"*.

Depending on the display variant, the parameter transfer of local variables (with the `VAR` scope) is limited. If you execute the visualization as an integrated visualization, you can only transfer local variables having a basic data type as parameters. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then you can also transfer parameters with a user-defined data type.

User-controlled update of the transfer parameters

If you have configured visualization references and then save a change to the variable declaration for one of these visualizations in an interface editor, then the *"Updating the Frame Parameters"* dialog appears automatically. The dialog prompts you to edit the references. A list of all the visualizations affected is displayed there, so that the parameter transfers can be reassigned at the changed interface.

When the dialog is closed, the changes are accepted and the elements affected are displayed in the *"References"* property.

Calling visualization with interface (`VAR_IN_OUT`)

☑ Requirement: The project contains a visualization and a main visualization. The main visualization contains an element that the visualization references.

1. Open the visualization.
2. Click *"Visualization ➔ Interface Editor"*.
3. Declare a variable in the interface editor.
   ⇨ The visualization has an interface and the *"Updating the Frame Parameters"* dialog appears.
4. Assign a type-compliant transfer parameter to the interface variables in all calls by entering an application variable in *"Value"*. Close the dialog.
   ⇨ A transfer parameter is assigned at the points where the visualization is to be referenced. These now appear in the main visualization in the *"References"* property.

Example

The `visPie` visualization contains an animated, colored pie. The `visMain` main visualization calls the `visPie` visualization multiple times in a *"Tabs"* control. Color information, angle information, and label are transferred via the `pieToDisplay` interface variable. The pies vary at runtime.

Visualization `visPie`:

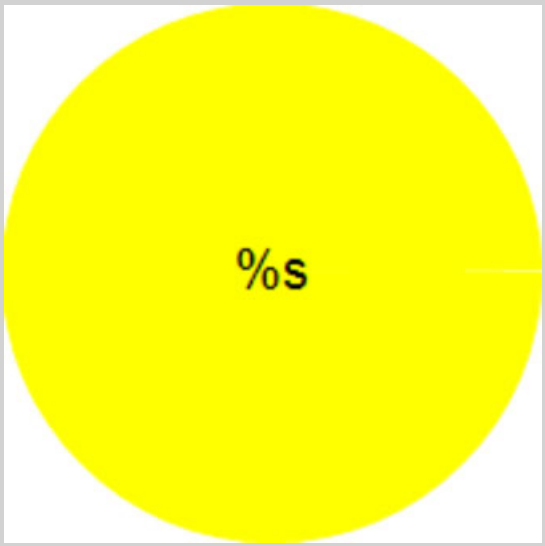

Table 263: Properties of the "Pie" element:

"Variable for begin"	`pieToDisplay.iStart`
"Variable for end"	`pieToDisplay.iEnd`
"Texts ➔ Text"	%s
"Text variables ➔ Text variable"	`pieToDisplay.sLabel`
"Color variable ➔ Normal state"	`pieToDisplay.dwColor`

Interface of the visualization `visPie`:

```
VAR_IN_OUT
    pieToDisplay : DATAPIE;
END_VAR
```

Main visualization `visMain`:

Table 264: Properties of the "Tabs" element:

"References"	
"visPie"	
"Heading"	`A`
`pieToDisplay`	`PLC_PRG.pieA`
"visPie"	
"Heading"	`B`
`pieToDisplay`	`PLC_PRG.pieB`
"visPie"	
"Heading"	`C`
`pieToDisplay`	`PLC_PRG.pieC`

DATAPIE (STRUCT)

```
TYPE DATAPIE : // Parameter type used in visPie
STRUCT
    dwColor : DWORD; // Color data
    iStart : INT; // Angle data
    iEnd : INT;
    sLabel : STRING;
END_STRUCT
END_TYPE
```

GVL

```
{attribute 'qualified_only'}
VAR_GLOBAL CONSTANT
    c_dwBLUE : DWORD := 16#FF0000FF; // Highly opaque
    c_dwGREEN : DWORD := 16#FF00FF00; // Highly opaque
    c_dwYELLOW : DWORD := 16#FFFFFF00; // Highly opaque
    c_dwGREY : DWORD :=16#88888888; // Semitransparent
    c_dwBLACK : DWORD := 16#88000000; // Semitransparent
    c_dwRED: DWORD := 16#FFFF0000;  // Highly opaque
END_VAR
```

PLC_PRG

```
PROGRAM PLC_PRG
VAR
    iInit: BOOL := TRUE;

    pieA : DATAPIE; // Used as argument when visPie is called
    pieB : DATAPIE;
    pieC : DATAPIE;

    iDegree : INT; // Variable center angle for the pie element
used for animation
END_VAR

IF iInit = TRUE THEN
    pieA.dwColor := GVL.c_dwBLUE;
    pieA.iStart := 0;
    pieA.sLabel := 'Blue';

    pieB.dwColor := GVL.c_dwGREEN;
    pieB.iStart := 22;
    pieB.sLabel := 'Green';

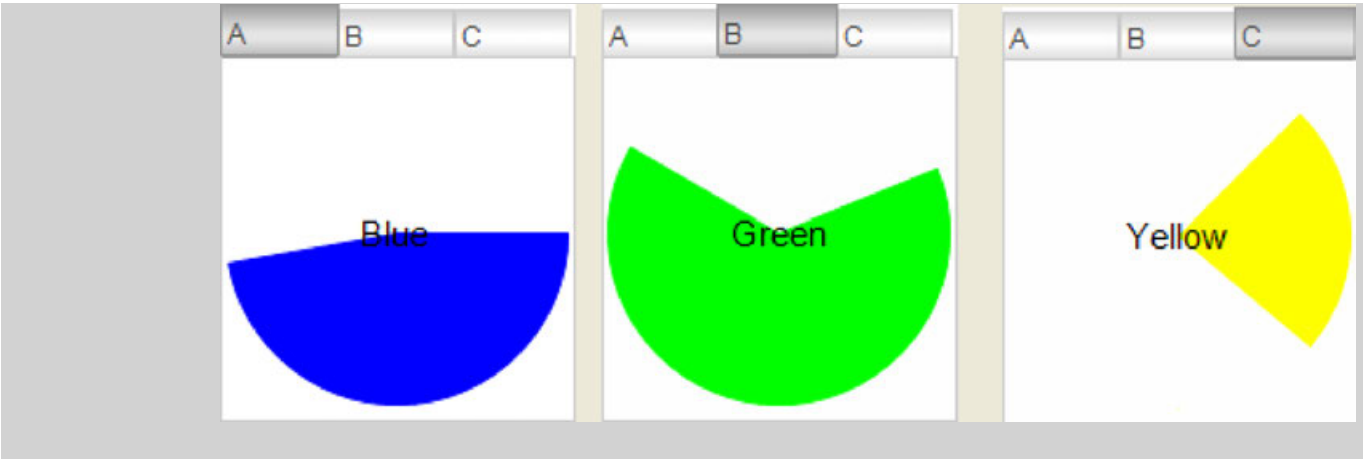
    pieC.dwColor := GVL.c_dwYELLOW;
    pieC.iStart := 45;
    pieC.sLabel := 'Yellow';

    iInit := FALSE;
END_IF

iDegree := (iDegree + 1) MOD 360;

pieA.iEnd := iDegree;
pieB.iEnd := iDegree;
pieC.iEnd := iDegree;
```

Main visualization `visMain` at runtime:



Printing the instance name of a transfer parameter

In order to obtain and output the instance name of a transfer parameter, you can implement an interface variable (data type `STRING`) with the pragma `{attribute 'parameterstringof'}` in the `VAR_INPUT` scope.

☑ The project contains a visualization and a main visualization. The main visualization contains elements that the visualization references.

1. Open the visualization.
2. Click *"Visualization ➔ Interface Editor"*.
3. Declare an interface variable (`VAR_IN_OUT`).

   ⇨ `pieToDisplay : DATAPIE;`
4. In the interface editor, declare a variable (`VAR_INPUT`) with attribute `{attribute 'parameterstringof'}`.

   ⇨ `{attribute 'parameterstringof' := 'pieToDisplay'}`

   `sNameToDisplay : STRING;`
5. Save the changes.

   ⇨ The *"Updating the Frame Parameters"* dialog does not open.
6. Insert a *"Text Field"* element.
7. In the *"Texts"*, *"Text"* property, assign an output text to the text field.

   ⇨ `Visualization of %s`
8. In the *"Text variables""Text variable"* property, assign the interface variable to the text field.

   ⇨ `sNameToDisplay`

   `visPie` has a heading.

Example

The `visPie` visualization consists of one pie until now. The `visMain` main visualization calls `visPie` in a *"Tabs"* control three times with different transfer parameters.

The `visPie` is extended with a text field that outputs the name of the parameters actually passed to the visualization. For this, the interface of `visPie` is extended with a string variable that contains the instance name of the specified transfer parameter. At runtime, each pie is overwritten.

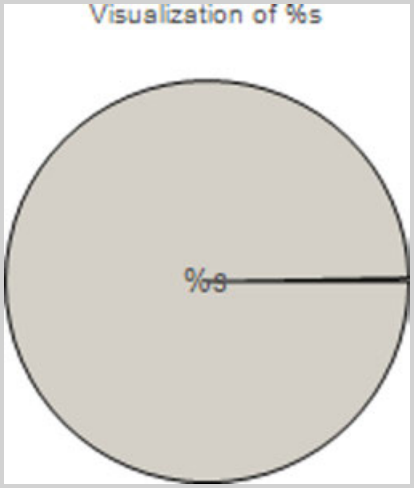


Table 265: Properties of the "Text field" element:

"Texts", *"Text"*	`Visualization of %s`
"Text variables", *"Text variable"*	`sNameToDisplay`

Interface of the 'visPie' visualization:

```
VAR_INPUT
    {attribute 'parameterstringof' := 'pieToDisplay'}
    sNameToDisplay : STRING;
END_VAR
VAR_IN_OUT
    pieToDisplay : DATAPIE;
END_VAR
```

Main visualization `visMain` at runtime:

- *Chapter 1.4.5.18.1.6 “Visualization Element 'Frame'” on page 1432*
- *Chapter 1.4.5.18.1.10 “Visualization Element 'Tabs'” on page 1463*
- *Chapter 1.4.5.19.3.3 “Dialog 'Update Frame Parameters'” on page 1746*

1.4.5.15.3 Calling a dialog in a visualization

You can configure a user input for a visualization that causes a referenced visualization to open as a dialog. For example, a user clicks on a button, whereupon a dialog opens requesting the input of values. A dialog is used to collect user inputs and, if it is modal, it can lead to inputs outside the dialog being blocked.

Only visualizations with the visualization type *“Dialog”* can be opened as dialog. The visualization type is configured in the dialog *“Properties”* of a visualization object.

Basic procedure:

☑ Requirement: The project contains a main visualization and a dialog.

1. Configure a user input for the main visualization with the action *“OpenDialog”* for the dialog.

   ⇨ The opening of the dialog is configured.

2. Configure a user input for an element of the dialog with the action *“CloseDialog”*.

   Hint: in the case of non-modal dialogs you can also configure the user input for closing outside the dialog.

   ⇨ The closing of the dialog is configured.

You can also use dialogs from the library instead of self-made dialogs. For example, if the library `VisuDialogs` is integrated in the project, you can use the dialogs `VisuDialogs.Login` or `VisuDialogs.FileOpenSave` contained in it.

See also

- *Chapter 1.4.5.4 “Configuring user inputs” on page 1267*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*
- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Configuring a visualization object as a dialog

1. Select the object in the view *“Devices”*, open the context menu and select the command *“Properties”*.
2. Select the tab *“Visualization”*.
3. Activate the option *“Dialog”* and close the dialog with *“OK”*.

   ⇨ The visualization has the visualization type *“Dialog”* and can be called as such.

Configuring a dialog call

When calling a dialog, a user normally clicks on a button, whereupon a dialog opens requesting an input.

In the following example, a dialog representing a calendar enables a date to be entered.

☑ Requirement: The project contains the visualizations `visMain` and `dlgCalender`.

1. Set the visualization type of `dlgCalender` to Dialog.
2. Drag a rectangle into the visualization `visMain`.
3. Configure the property *"Texts ➔ Text"* with the text `Due Date: %t[yyyy-MM-dd]`.

   Configure the property *"Text variables ➔ Text variable"* with `PLC_PRG.dateDue`.
4. Drag a button into the visualization.
5. Configure the property *"Texts ➔ Text"* with the text `Open dialog`.

   Configure the property *"Input configuration ➔ OnMouseClick"* for the action *"Open Dialog"* with `dlgCalender`.

   ⇨ The user input for the opening of the dialog is configured.
6. Double-click on the dialog `dlgCalender`.
7. Drag the element *"Date picker"* into the visualization editor.
8. Configure the property *"Texts ➔ Text"* with `Due Date: %t[yyyy-MM-dd]`.

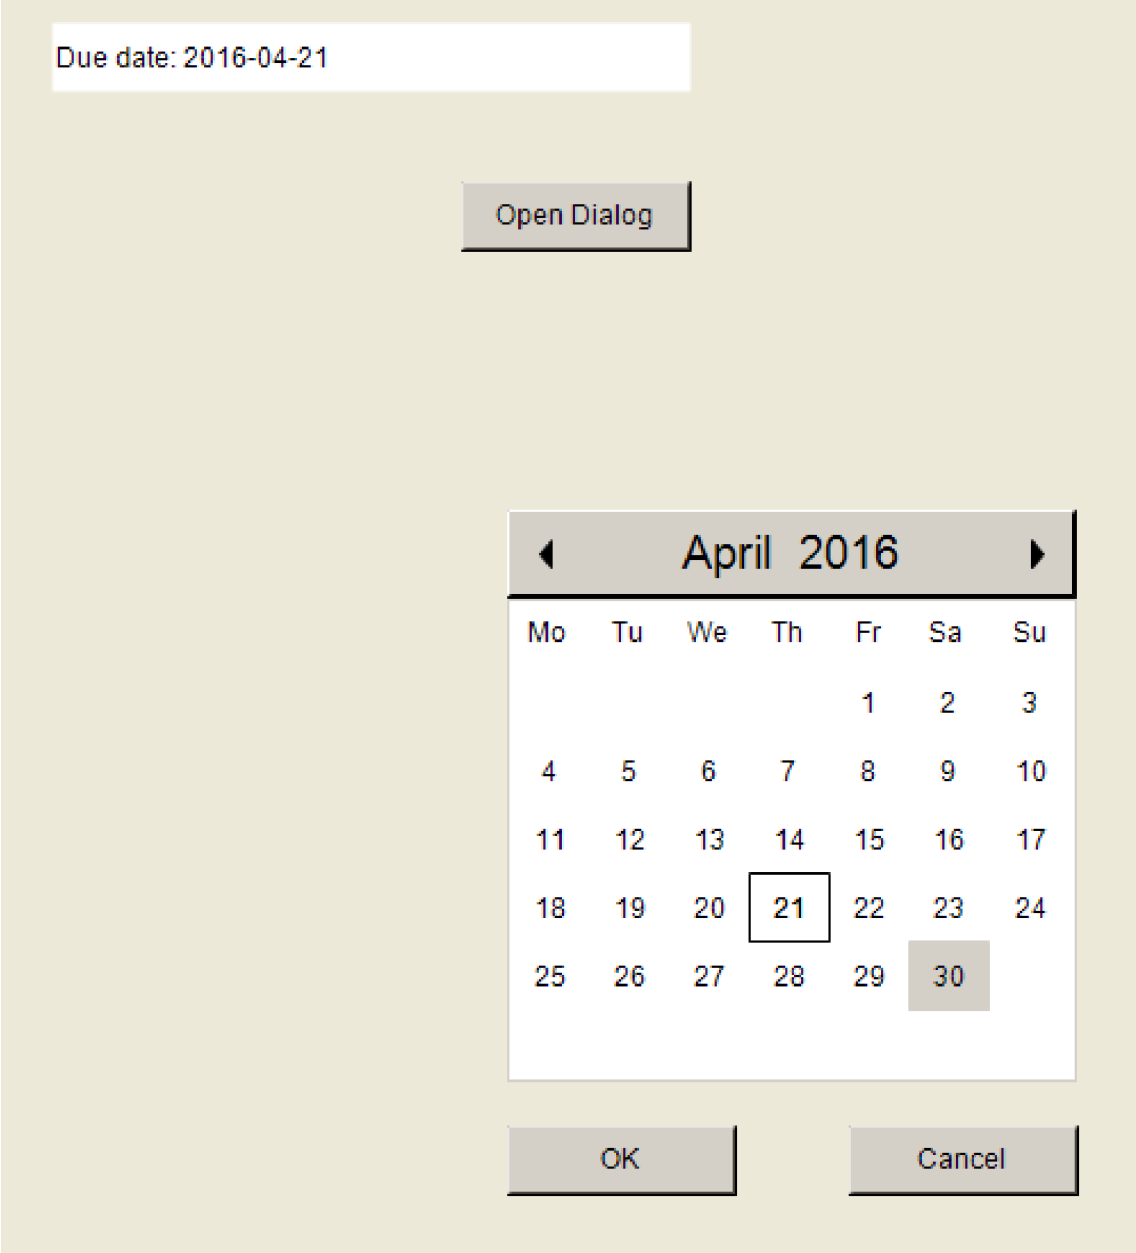
   Configure the property *"Variable"* with `PLC_PRG.dateCalender`.

   ⇨ The element is configured.
9. Drag a button into the visualization editor.
10. Configure the property *"Texts ➔ Text"* with `OK`:
11. Configure the property *"Input configuration ➔ OnMouseClick"* for the action *"Close Dialog "* with `dlgCalender, Result: OK`.
12. Configure a further property *"Input configuration ➔ OnMouseClick"* for the action *"Execute ST-Code"* with `PLC_PRG.dateDue := PLC_PRG.dateCalendar;`.

    ⇨ The user input for the closing of the dialog is configured.
13. Drag a further button into the visualization editor.
14. Configure the property *"Texts ➔ Text"* with `Cancel`:
15. Configure the property *"Input configuration ➔ OnMouseClick"* for the action *"Close Dialog "* with `dlgCalender, Result: Cancel`.

    ⇨ The user input for the cancellation of the dialog is configured.

17. Compile, load and start the application.



Variable declaration:

```
PROGRAM PLC_PRG
                VAR
                dateDue : DATE := DATE#2000-01-01;
                dateCalendar : DATE;
                END_VAR
```

Opening a dialog globally

Normally a dialog appears only on the display variant on which the user has executed the triggering event.

However, you can configure the opening of the dialog in such a way that the dialog appears simultaneously on all active display variants configured under the visualization manager. This way, for example, an input request can appear simultaneously on all display variants although a user only entered something on the CODESYS TargetVisu.

If a user closes the dialog on a CODESYS TargetVisu display variant, it will be closed on all display variants.

You can open and close a global dialog with the functions `OpenDialog3` and `CloseDialog2` from the library `VisuElems`.

Implementing an application access to a dialog

In the application code you can implement the access to a dialog that is managed in the dialog manager. The dialog manager automatically instances and manages all visualizations of the type *"Dialog"*. The access takes place via the internal visualization manager.

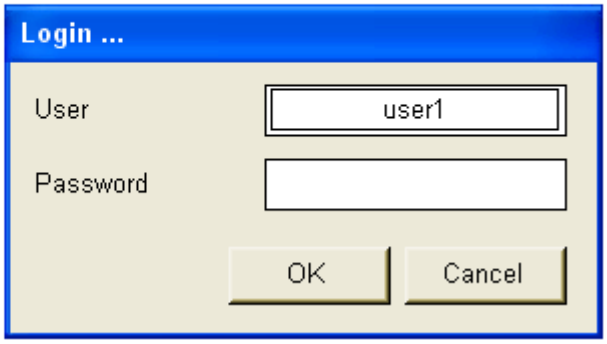
First of all, implement the access to the dialog manager by calling the `GetDialogManager()` method of the internal visualization manager. You can then use the methods of the dialog manager to program the program sequence of a dialog.

In the following example a button is configured so that it opens the preconfigured dialog `Login` when clicked on. The user can enter a name and a password in the dialog. The dialog `Login` is contained in the library `VisuDialogs`. You can also call a self-made dialog in the same way.

Implementing an application access to the dialog `Login` from the library `VisuDialogs`:

☑ Requirement: The library `VisuDialogs` is integrated in the project.

1. Insert a new visualization `visMain` under the application.
   ⇨ The visualization editor opens.
2. Drag a button into the visualization editor.
3. Enter in its property *"Text"* `Login`.
   ⇨ The button is labelled.
4. Click on *"Configure "*in the property *"Input configuration ➔ OnMouseDown"*.
5. Select the input action *"Execute ST-Code"* and click on ▫.
6. Enter the following function call in the ST editor: `OpenLoginDialog(pClientData);`
   ⇨ The main visualization contains a button. If a user clicks on the button, the dialog `Login` opens and the function `OpenLoginDialog()` is called.
7. Click on *"Configure "*in the property *"Input configuration ➔ OnDialogClosed"*.
8. Select the input action *"Execute ST-Code"* and click on ▫.
9. Enter the following function call in the ST editor:
   `OnLoginDialogClosed(pClientData);`
   ⇨ If a user closes the dialog, the function `OnLoginDialogClosed()` is called.



Implementation of the function OpenLogin-Dialog():

```
FUNCTION OpenLoginDialog : BOOL
                VAR_INPUT
                pClientData : POINTER TO VisuStructClientData;
                END_VAR

                VAR
                dialogMan : IDialogManager;
```

```
                loginDialog : IVisualisationDialog;
                pLoginInfo : POINTER TO Login_VISU_STRUCT; //
Login_VISU_STRUCT contains the parameters defined in the interface of
visualization "Login".
                result : Visu_DialogResult;
                stTitle : STRING := 'Login ...';
                stPasswordLabelText: STRING;
                stUserLabelText: STRING;
                stUsername: STRING;
                END_VAR

                dialogMan := g_VisuManager.GetDialogManager(); // The
DialogManager is provided via the implicitly available VisuManager
                IF dialogMan <> 0 AND pClientData <> 0 THEN
                loginDialog :=
dialogMan.GetDialog('VisuDialogs.Login'); // Dialog to be opened is
specified
                IF loginDialog <> 0 THEN
                pLoginInfo :=
dialogMan.GetClientInterface(loginDialog, pClientData);
                IF pLoginInfo <> 0 THEN      // In the following the
parameters of the login dialog in the Login_VISU_STRUCT will be read
                pLoginInfo^.stTitle := stTitle;
                pLoginInfo^.stPasswordLabelTxt := stPasswordLabelText;
                pLoginInfo^.stUserLabelTxt := stUserLabelText;
                dialogMan.OpenDialog(loginDialog, pClientData, TRUE,
0);
                END_IF
                END_IF
                END_IF
```

`OnLoginDialogClosed()` defines the reaction to the closing of a dialog.

Implementation of the function `OnLoginDialogClosed()`:

```
 FUNCTION OnLoginDialogClosed : BOOL
                VAR_INPUT
                pClientData : POINTER TO VisuStructClientData;
                END_VAR

                VAR
                dialogMan : IDialogManager;
                loginDialog : IVisualisationDialog;
                pLoginInfo : POINTER TO Login_VISU_STRUCT;
                result : Visu_DialogResult;
                stPassword: STRING;
                stUsername: STRING;
                END_VAR

                dialogMan := g_VisuManager.GetDialogManager(); // The
DialogManager is provided via the implicitly available VisuManager
                IF dialogMan <> 0 AND pVisuClient <> 0 THEN
                loginDialog :=
dialogMan.GetDialog('VisuDialogs.Login'); // Gets the login dialog
                IF loginDialog <> 0 THEN
                result := loginDialog.GetResult(); // Gets the result
(OK, Cancel) of the dialog
                IF result = Visu_DialogResult.OK THEN
                loginDialog.SetResult(Visu_DialogResult.None); //
Reset to default (none)
                pLoginInfo :=
dialogMan.GetClientInterface(loginDialog, pVisuClient); // Structure
Login_VISU_STRUCT gets read;
                // In the following the structure parameters can be
set
                IF pLoginInfo <> 0 THEN
                stPassword :=
```

```
pLoginInfo^.stPasswordpLoginInfo^.stPassword := ''; // Reset the
passwword
                stUsername := pLoginInfo^.stUsername;
                END_IF
                ELSIF result = Visu_DialogResult.Cancel THEN
                loginDialog.SetResult(Visu_DialogResult.None); //
React on 'Cancel'
                ELSE
                // nothing to do
                END_IF
                END_IF
                END_IF
```

- *Chapter 1.4.5.18.3 “Methods of the Dialog Manager” on page 1714*

1.4.5.15.4 Calling a Dialog with an Interface

You can define an interface for a visualization that is called as a dialog.

Create a visualization for this with visualization type *“Dialog”* and declare an interface for the dialog. The reference the visualization in a primary visualization by means of a user input and transfer the parameters to the interface.

If you call the visualization as an integrated visualization, then the parameter that are transferred must be variables of a basic data type. If the visualization is called as CODESYS TargetVisu or CODESYS WebVisu, then the parameters can have user-defined data types as well.

See also

- *“Scopes” on page 1719*
- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Main procedure

1. Set the visualization types of the visualization to dialog.
2. Declare variables in the interface editor of the dialog.
   ⇨ The dialog has an interface. You can transfer parameters when calling the dialog.
3. Configure the elements of the dialog and use the interface variables.
4. Select an element in another visualization (usually the main visualization) for configuring how the dialog opens.
5. Click *“Configure”* in the property *“Input configuration ➔ OnMouseDown”*.
   ⇨ The *“Input Configuration”* dialog box opens.
6. Select *“Open dialog”* in the list of selected input actions.
7. Select one from the *“Dialog”* drop-down list.
   ⇨ If the selected dialog has an interface, then the interface variables are listed below.
8. Assign a transfer parameter to the interface variables in the *“Value”* column.
9. Select the result for which the parameters were updated in the list *“Update”* *“and”* *“Parameter in case of results”*.
10. Activate the option *“Open dialog modal”*. Click *“OK”* to close the dialog box.
    ⇨ The dialog opening is configured.

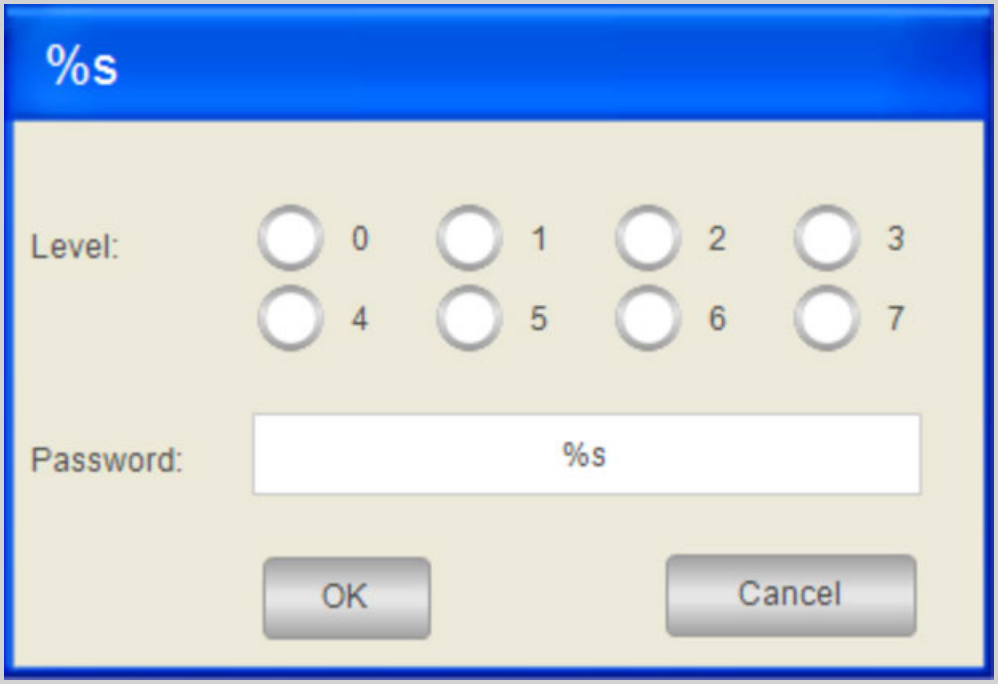
Executing a dialog several times at the same time requires multiple instances of the dialog. These must have already been downloaded to the visualization device when downloading the application. For this purpose, set the number of instances to download in the visualization manager (“Visualizations” tab).

See also

- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*
- *Chapter 1.4.5.15.4 “Calling a Dialog with an Interface” on page 1343*

Example the following application calls the *“Change User Level”* dialog and prompts the user to select a level and specify a password. If the password agrees, then the *“OK”* button is enabled. Then the user can close the dialog. The input of the level is also applied.

Dialog `visChangeUserLevel`:



Declaration of the interface of dialog `visChangeUserLevel`:

```
VAR_INPUT
    sTitle: STRING; // titel of the dialog box
    sItfLevel0: STRING; //password level 0
    sItfLevel1: STRING; //password level 1
    sItfLevel2: STRING; //password level 2
    sItfLevel3: STRING; //password level 3
    sItfLevel4: STRING; //password level 4
    sItfLevel5: STRING; //password level 5
    sItfLevel6: STRING; //password level 6
    sItfLevel7: STRING; //password level 7
END_VAR
VAR_IN_OUT
    iItfLevel: INT; // user input: level
    sItfPwd: STRING; //user input: password
END_VAR
```

Table 266: Element list of the `visChangeUserLevel` dialog box:

Type	Name	Element properties	Description
`#0 Image`	`Background`	*"Static ID"*: `VisuDialogs.ImagePoolDialogs.Login`	The property assigns the image of a blank dialog with a gray background and a blank blue caption bar to the element. The image is included in the *"VisuDialogs"* library.
`#1 Box`	`Title`	*"Texts ➔ Text"*: `%s`	Output with placeholder for text variable
		"Text variables ➔ Text variable": `sItfTitle`	Assignment of interface variable `sItfTitle` for which a parameter is transferred at call time.
`#2 Radio Buttons`	`Input level`	*"Variable"*: `iItfLevel`	Assignment of interface variable `iItfLevel` for which a parameter is transferred at call time. Includes the user input at runtime.
		"Number of columns": `4`	

Type	Name	Element properties	Description
		"Radio button order": *"Left to right"*	Display
		"Radio button settings ➔ Radio button ➔ Areas": [0] bis [7]*""* *"[<n>] ➔ Text"*: <n>	Label of eight radio buttons with numbers from 0 to 7
#3 Text Field	Input password	*"Texts ➔ Text"*: `%s`	Output with placeholder for text variable
		"Text variables ➔ Text variable": `sItfPwd`	Assignment of interface variable `sItfPwd` for which a parameter is transferred at call time. Includes the user input at runtime.
		"Input configuration ➔ OnMouseDown ➔ Write variable": `Variable:,InputType:Edit, Use text output variable : TRUE`	In the *"Input configuration"* dialog, *"Text input"* is selected for the *"Input type"* drop-down list and the option *"Use text output variable"* is activated.
#4 Text Field	Label for level	*"Texts ➔ Text"*: `Level:`	Label
#5 Text Field	Label for password	*"Texts ➔ Text"*: `Password`	Label
#6 Button	OK	*"Texts ➔ Text"*: `OK`	Label
		"Colors ➔ Color": `Element base color` *"Colors ➔ Alarm color"*: `Alarm fill color`	Configuration of the display in state-dependent colors. You can switch between colors.
		"Color variables ➔ Toggle color": `sItfPwd <> MUX(iItfLevel, sItfLevel0, sItfLevel1, sItfLevel2, sItfLevel3, sItfLevel4, sItfLevel5, sItfLevel6, sItfLevel7);`	If the password and the user input do not agree, then the expression is `TRUE`. Then the button is displayed in the alarm color.
		"State variables ➔ Deactivate inputs": `sItfPwd <> MUX(iItfLevel, sItfLevel0, sItfLevel1, sItfLevel2, sItfLevel3, sItfLevel4, sItfLevel5, sItfLevel6, sItfLevel7);`	If the password and the user input do not agree, then the expression is `TRUE`. The button is deactivated. If the password agrees, then the button is enabled.
		"Input configuration ➔ OnMouseDown ➔ Close dialog": `Close Dialog: visChangeUserLevel, Result : OK`	If a user clicks the *"OK"* button, then the `visChangeUserLevel` dialog is closed and the parameters are updated.
#7 Button	Cancel	*"Texts ➔ Text"*: `Cancel`	Label

Type	Name	Element properties	Description
		"Colors ➔ Color": `Element base color`	Display
		"Input configuration ➔ OnMouseDown ➔ Close dialog": `Close Dialog: visChangeUserLevel, Result : Cancel`	If a user clicks the *"Cancel"* button, then the `visChangeUserLevel` dialog is closed.

Main visualization `visMain`:

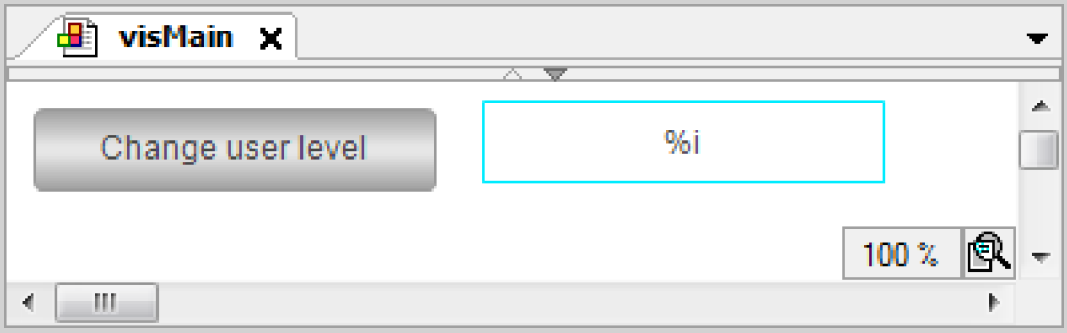


Table 267: Element list of the `visMain` visualization:

Type	Name	Element properties	Description
`#5 Text Field`	`Button for change user level`	*"Texts ➔ Text"*: `%s`	Output with placeholder
		"Text variables ➔ Text variable": `PLC_PRG.iLevel`	Assignment of the `PLC_PRG.iLevel` variables to the placeholder. Includes the level number.
`#6 Button`	`Title`	*"Texts ➔ Text"*: `Change user level`	
		"Input configuration ➔ OnMouseDown ➔ Open dialog": `Open Dialog: visChangeUserLevel`	If a user clicks the `Change user level` button, then the `visChangeUserLevel` dialog opens with the parameter list stored here. Tip: Click *"Configure"* to view the stored configuration in the *"Input Configuration"* dialog (input action *"Open dialog"*).

Table 268: Configuration of the call of dialog `visChangeUserLevel`:

Parameter	Type	Value	Description
The parameter list is stored in the *"Input Configuration"* dialog (input action *"Open dialog"*).			
`sItfTitle`	`STRING`	`'ChangeUse user level'`	Transfer of a string for the title.
`sItfLevel0`	`STRING`	`'pwd0'`	Transfer of a string as password for Level0.
`sItfLevel1`	`STRING`	`'pwd1'`	Transfer of a string as password for Level1.
`sItfLevel2`	`STRING`	`'pwd2'`	Transfer of a string as password for Level2.

Parameter	Type	Value	Description
sItfLevel3	STRING	'pwd3'	Transfer of a string as password for Level3.
sItfLevel4	STRING	'pwd4'	Transfer of a string as password for Level4.
sItfLevel5	STRING	'pwd5'	Transfer of a string as password for Level5.
sItfLevel6	STRING	'pwd6'	Transfer of a string as password for Level6.
sItfLevel7	STRING	'pwd7'	Transfer of a string as password for Level7.
iItfLevel	INT	PLC_PRG.iLevel	Transfer of a variable for the level specified by the user.
sItfPwd	STRING	PLC_PRG.sPwd	Transfer of a variable for the password specified by the user.

Table 269: List “Update” and “Parameter in case of result”

“Value”	**Description**
“OK”	activated

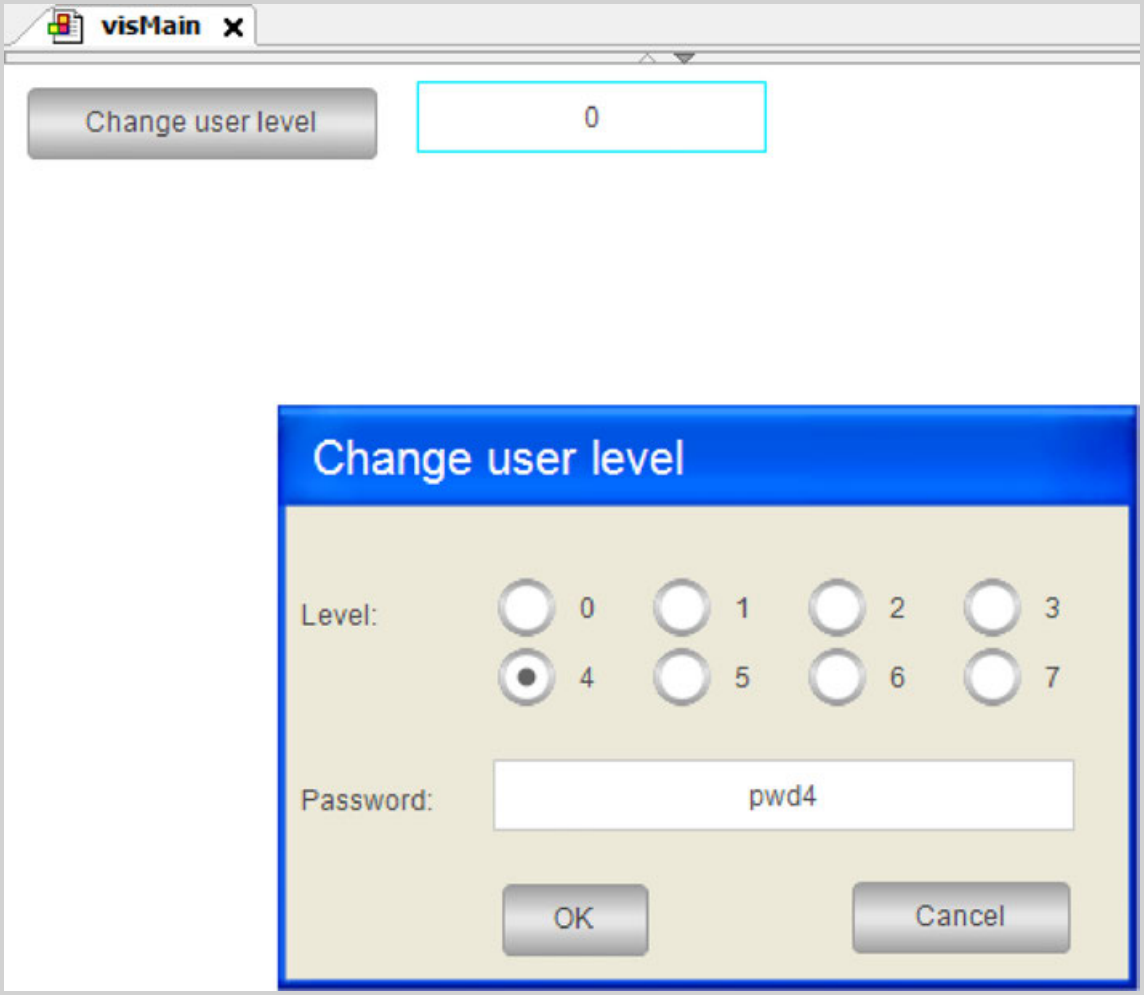
“Open in dialog mode”	activated Input outside of the dialog is not possible.

Application code `PLC_PRG`:

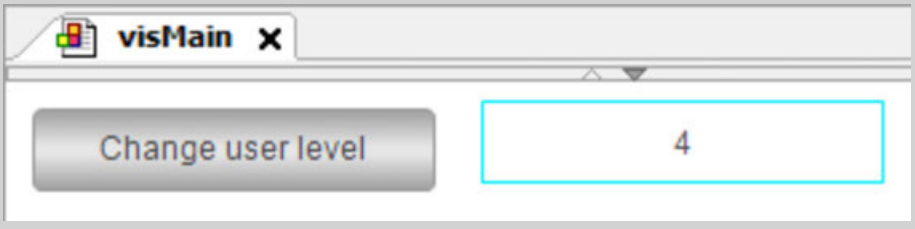
```
PROGRAM PLC_PRG
VAR
    iLevel: INT;
    sPwd : STRING;
END_VAR
```

Visualization at runtime

After clicking the button, the dialog opens and permits input. If the specified text agrees with the stored text, then *"OK"* is enabled:



After clicking *"OK"*, the selection is applied.



The example shows the procedure for multiple return values. However, the password can be returned more easily with a local variable in the dialog.

Accessing parameters programmatically

The variables declared in the interface of a visualization are available automatically as structure variables. They are identified by `<Name of visualization>_VISU_STRUCT`. Therefore, you can access the interface variables of visualizations that appear as a dialog. Normally you use the structure in the application code of a function that is called by a user input.

Passing pointers as parameters

To pass a complex data structure, you can flag an interface variable of type `VAR_IN_OUT` with the pragma attribute `VAR_IN_OUT_AS_POINTER` and pass a pointer or reference to it as a parameter.

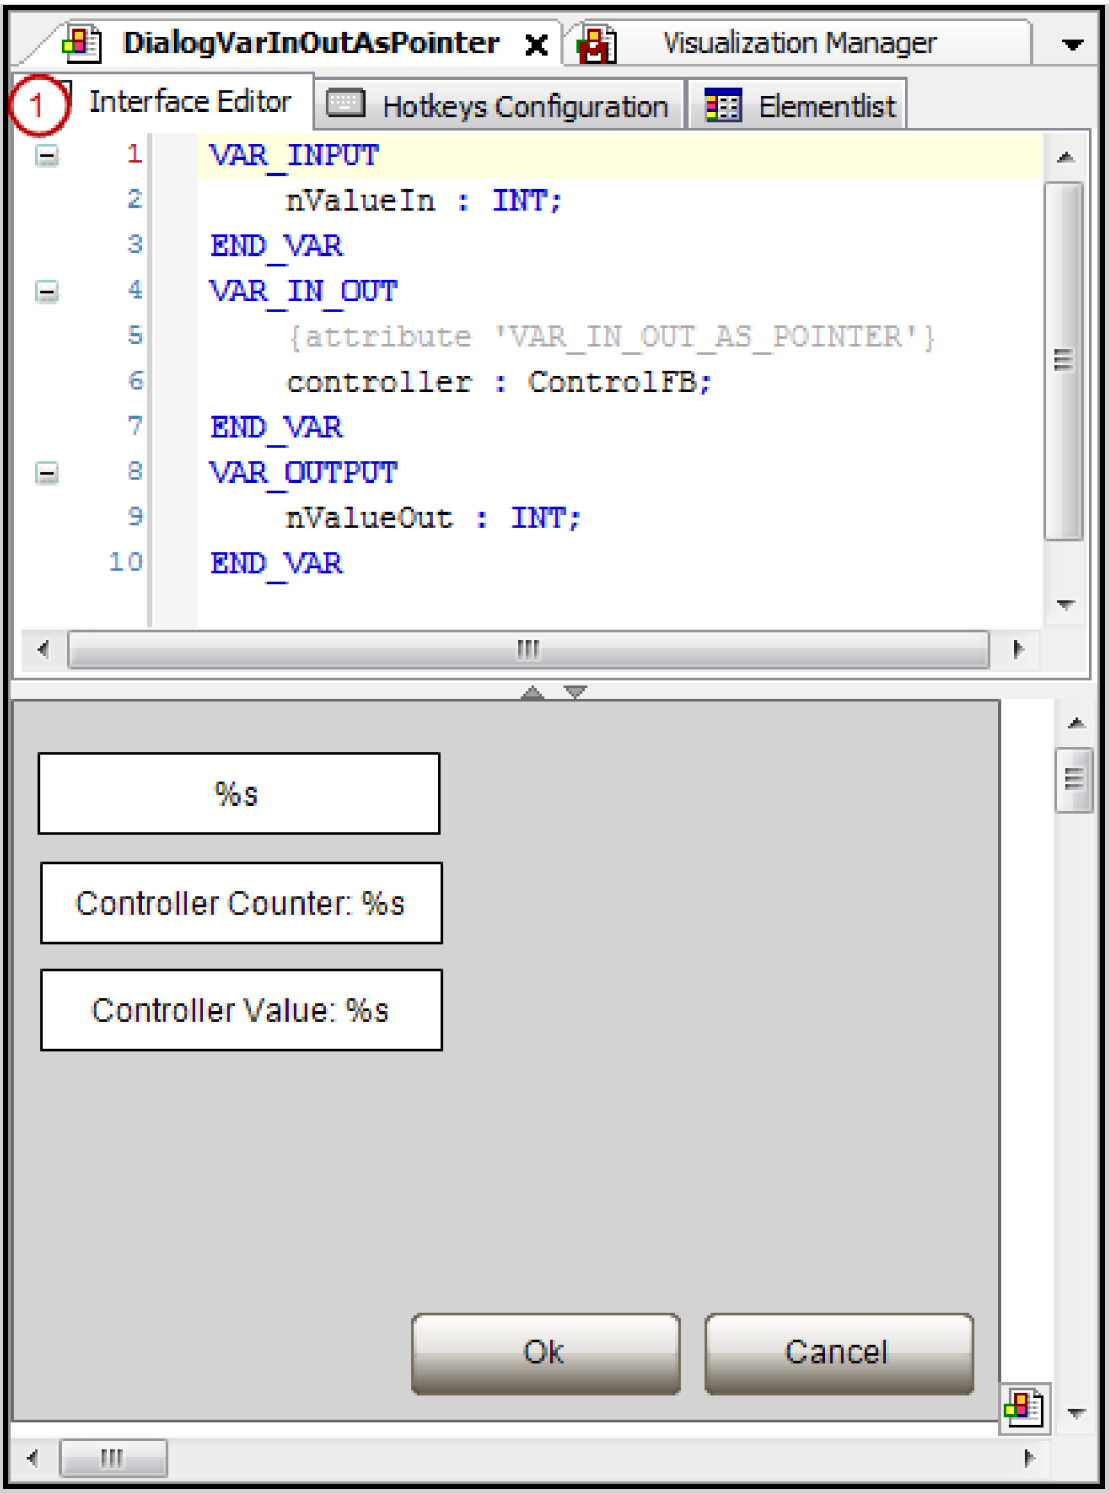
Procedure for using references

1. Declare the user data object (`DUT`).
2. In the interface editor of a dialog, declare an interface variable (`VAR_IN_OUT`) as a reference to the data object by assigning the attribute `'VAR_IN_OUT_AS_POINTER'` to the variable.
3. Program the user interface: use the dialog in a visualization or assign the dialog in the input configuration of a visualization element. Then access to the referenced data is possible.

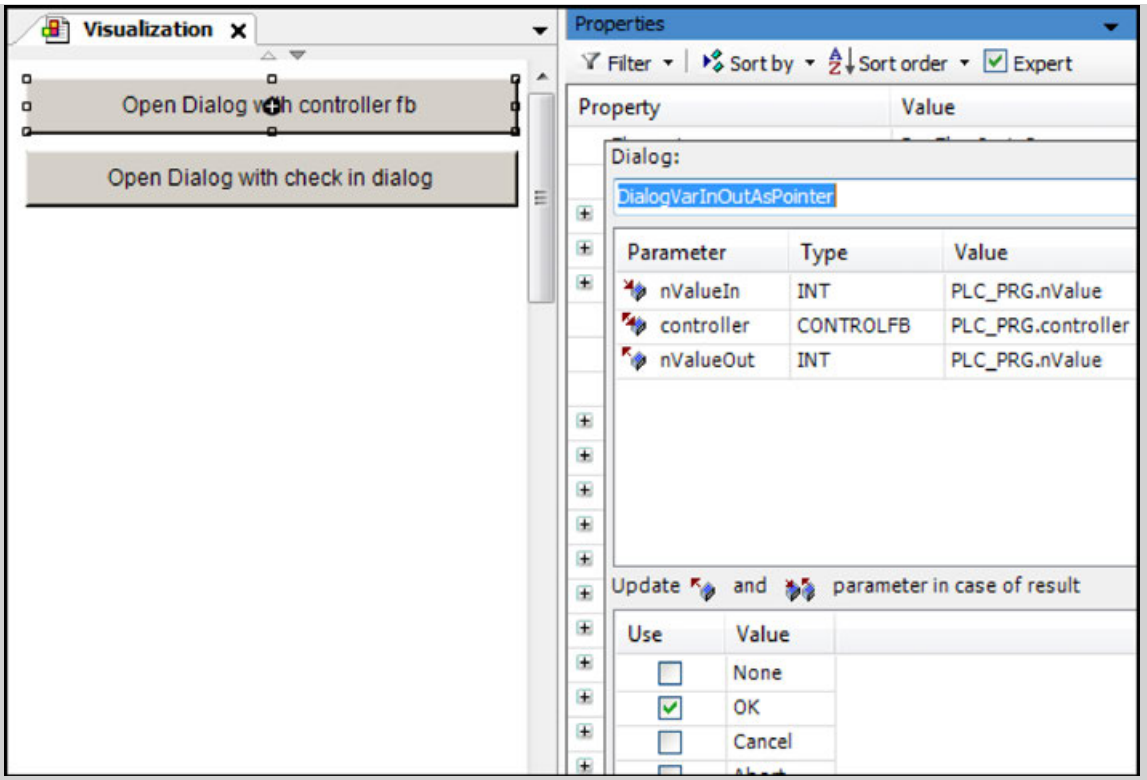
Example: Using an interface with the pragma 'VAR_IN_OUT_AS_POINTER'

```
FUNCTION_BLOCK ControlFB
VAR
    bOk : BOOL := TRUE;
    nCounter : INT;
    nValue : INT;
END_VAR
nCounter := nCounter + 1;
```

Declaration of an interface variable with `VAR_IN_OUT_AS_POINTER`



User interface: dialog opens:



See also

- *Chapter 1.4.5.18.4 “Attribute 'VAR_IN_OUT_AS_POINTER'” on page 1716*

1.4.5.16 Configuring and executing display variants

You can select from different variants for displaying your visualization created in CODESYS. An advantage is that you can have not only one, but multiple display variants running at the same time. During this time, the contents of the visualization are the same for all variants. This also applies to the integrated visualization: when the visualization editor is open in CODESYS, the visualization is also displayed there with the same active contents.

The following object types are available:

- *“TargetVisu”*
  The display as a variant of CODESYS TargetVisu is possible one time. You can insert an object of this type below the Visualization Manager.
- *“WebVisu”*
  The display as a variant of CODESYS WebVisu is possible any number of times. You can insert any number of objects.
- *“Remote TargetVisu”*
  The display as a variant of **[ERROR: Missing definition for variable "tvVisuDeviceRemoteTarget"!]** is possible any number of times. You can insert any number of objects.

When you insert a variant below the Visualization Manager, the task configuration is extended by the visualization task `VISU_TASK` (the flow unit of the visualizations). The task is automatically deleted when no more objects exist below the Visualization Manager or the objects below are excluded from compiling. You can set this in the *“Properties”* dialog of an object, on the *“Compile”* tab.

If no object is inserted below the Visualization Manager, then the visualization created there is displayed automatically as an integrated visualization when the application starts.

Exception handling at runtime

If an error or an exception occurs in a visualization at runtime, the execution of the visualization is stopped without stopping the execution of the application. An error screen appears informing you of this. In addition, the error screen (usually) enables you to restart the visualization. This exception handling takes place from visualization profile `CODESYS V3.5 SP7`, compiler version `3.5.7.0` and a runtime system from version `3.5.7.0`.

Select the command *"Stop Execution at Handled Exceptions"* in order to investigate the cause of the occurrence of exceptions and the error position.

See also

- *Chapter 1.4.1.20.3.6.19 "Command 'Stop Execution on Handled Exceptions'" on page 1043*

Identifying display variants

In order to programmatically identify a display variant, the `VisuFbClientTagDataHelper` library module from the `VisuElemBase` library is available to you. The library itself is referenced in `VisuElems`. The library module is typically called with `VisuElems.VisuFbClientTagDataHelper`.

Further information on this library module can be found in its documentation in the library manager.

- *Chapter 1.4.1.8.7 "Using Library POUs" on page 265*

1.4.5.16.1 Executing as CODESYS WebVisu

NOTICE!

Recommendations for data security

In order to minimize the risk of breaches of data security, we recommend the following organizational and technical measures for the system on which your applications run:

As far as possible, avoid exposing the PLC and control networks to open networks and the Internet. For protection, use additional data-link layers such as a VPN for remote access and install firewall mechanisms. Limit access to authorized persons, change any existing standard passwords during the initial commissioning and continue to change them regularly.

If you nevertheless wish to publish your web visualization, it is **urgently** recommended that you provide it at least with simple **password protection** in order to prevent anyone accessing your control functionality over the Internet. (See an example in the project `SimpleWebvisuLogin.project`, which is provided with the standard installation of the development system).

Use the latest versions of the gateway server and the web server.

You can execute a visualization as CODESYS WebVisu.

The requirement for this is that the runtime system contains a web server with WebVisu support. This enables communication between target system and web browser. The web server on the target system is started as soon as an application with WebVisu configuration is started and runs until all applications with WebVisu are ended. The device can then display visualizations in connected HTML5-capable web browsers.

The web-based display variant of the CODESYS Visualization enables remote access to a plant as well as its remote monitoring, service and diagnosis over the Internet. A web browser communicates by Java Script (optionally with SSL encryption) with the web server in the controller and displays the visualization by means of HTML5. This technology is supported by virtually all browsers and is thus also available on terminal devices with iOS or Android.

Configuring and starting display variants

☑ An executable visualization `visMain` exists in the project.

1. Select the object *"Visualization manager"* and select the command *"Add object"*.
2. Select the object *"WebVisu"* and enter the name `WebVisu_A`.

   ⇨ There is a new object in the device tree underneath the object *"Visualization Manager"*. The associated editor opens.

   The visualization task `VISU_TASK` is automatically added under the task configuration.
3. Select the visualization `visMain` in the *"Start Visualization"*.
4. In *"Name of .htm file"*, enter the name `webvisuA`.
5. Click on *"Show used visualizations"* and check whether the selected visualization is activated for a download to the associated device.

   ⇨ The visualization is configured. The settings under *"Scaling options"* determine the window size and the scaling.
6. Start a suitable runtime system with web server and WebVisu support.

   Configure the communication settings for your system.

   ⇨ The runtime system runs.
7. Compile, load and start the application.

   ⇨ The application and the web server run.
8. Start a web browser with the following address: `http://localhost:8080/webvisuA.htm`

   ⇨ The page is displayed and you can see the data of the application and operate the application.

See also

- ↳ *Chapter 1.4.5.19.4.7 "Object 'TargetVisu'" on page 1787*

Calling a page in the web server

☑ Requirement: A visualization with WebVisu is started.

1. Start a current browser with JavaScript and support of HTML5-Canvas, e.g. Firefox, Chrome, IE>=9.
2. Enter the following address in the web browser:

   `http://localhost:8080/webvisu.htm`

   Formal: `http://<IP address of webserver>:<port of webserver>/<name of HTM-file>`

   `<name of HTM-file>` is the HTML start page of the visualization defined in the object *"WebVisu"*.

   ⇨ The page is displayed and you can see the data of the application and operate the application.

Identifying WebVisu

In order to be able to identify a WebVisu with the help of the library block `VisuFbClientTagDataHelper`, the WebVisu needs a name. In order to be able to specifically address it in the application, expand the URL call by the parameter `ClientName=<Name>`.

Example: `http://localhost:8080/webvisu.htm?ClientName=VisClientxy`.

See also

- *Chapter 1.4.5.19.4.8 “Object 'WebVisu'” on page 1788*

1.4.5.16.2 Executing as an Integrated Visualization

You can execute the visualization as an integrated visualization. In this case a display variant of the visualization runs on the development system **without** the visualization code being loaded to the controller.

Use the integrated visualization for the testing and diagnosis of your application, or for the service and commissioning of a plant.

The requirement for this is that there are no objects under the visualization manager. Alternatively, any objects located there can be excluded from compilation. You can configure an individual object accordingly in its dialog *“Properties”* on the tab *“Compile”*.

See also

- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Configuring and starting display variants

☑ A visualization project is open.

1. Remove all objects from underneath the visualization manager or exclude the objects from compilation.
   ⇨ The `VISU_TASK` has been removed from under the task configuration.
2. Load the application to the controller.
   ⇨ Now no visualization code will be transferred on loading the application.
3. Start the application.
   ⇨ The visualization in the visualization editor is being executed. You can operate your application.

Use the command “Activate keyboard usage” in order to toggle between the keyboard usage of the integrated visualization and the keyboard usage of CODESYS.

See also

- *Chapter 1.4.5.19.2.4 “Command 'Activate Keyboard Usage'” on page 1722*
- *Chapter 1.4.5.19.1 “Keyboard Shortcuts for Default Keyboard Action” on page 1717*

Restrictions in the variable output

Numerical variable values, which are output within a text in an integrated visualization, are displayed according to the current display format. You can select the display format with the command *“Debug ➔ Display”*.

See also

- *Chapter 1.4.1.20.3.7.24 “Command 'Display Mode' - 'Binary', 'Decimal', 'Hexadecimal'” on page 1058*

Data server restrictions

A variable value that is transferred via the data server is **not** output. The integrated visualization only outputs the initialization or the last transferred value.

The integrated visualization thus only enables a passive observation of the application.

Restrictions in variable types

`VAR_INPUT` variables behave like integrated visualizations such as `VAR_IN_OUT` variables during execution.

Restrictions in expressions and monitoring

Only the following expressions, which are also used in the monitoring mechanism of the development system, are supported in an integrated visualization.

Variable access:

- Example: `PLC_PRG.myPou.nCounter`

Array access:

- Access to an array of scalar data types, where a variable is used as an index
  Example: `a[i]`
- Access to an array of complex data types (structure, function block, array), where a variable is used as an index
  Example: `a[i].x`
- Access to a multidimensional array of all kinds of data types with one or more variable indices
  Example: `a[i, 1, j].x`
- Access to an array with constant index
  Example: `a[3]`
- Accesses like those described above in which simple operators are used for the calculations inside the index brackets.
  Example: `a[i+3]`
- Nested combinations of the complex expressions listed above
  Example: `a[i + 4 * j].aInner[j * 3].x`

Operators in index calculations:

- `+`, `-`, `*`, `/`, `MOD`

Pointer monitoring:

- Example: `p^.x`

Methods and function calls are not supported **with the exception** of the following:

- Standard string functions
- Type conversion functions
  Example: `INT_TO_DWORD`
- Operators such as `SEL`, `MIN`, etc.

Restrictions in the input action *“Execute ST-Code”*

When the input action *“Execute ST-Code”* is called, only a list of assignments is supported.

If a list of assignments is used, the value of the left-hand side is not assigned until the next cycle. Processing in the next row immediately afterwards is not possible.

Example

```
PLC_PRG.n := 20 * PLC_PRG.m; // Don't use this!
                IF PLC_PRG.n < MAX_COUNT THEN
                PLC_PRG.n := PLC_PRG.n + 1;
                END_IF
                //Use the following!
                PLC_PRG.n := MIN(MAX_COUNT, PLC_PRG.n + 1);
```

Restrictions in the interface of a visualization

No interface (`INTERFACE`) may be declared in the interface editor of a visualization.

1.4.5.16.3 Configure File Transfer Mode

When downloading, usually files required by the visualization for displaying, are transmitted to the respective display unit. These are especially image files or text list files.

Alternatively, you can configure,that the visualization accesses local files. So no files are transferred with a download

The following configuration is required to allow the visualization access to local files:

- The file paths for image files or text files lists are relative.
- The link type for image files is *“Link to file”*.

Using local visualization files

☑ Requirement: You have opened a visualization project with a image pool.

1. Open the image pool.
2. Select for each image under *“Link Type”* the setting *“Link to file”*.
   ⇨ The image is linked.
3. Select the command *“Project ➔ Project Setting”* and select the category *“Visualization”*.
4. Insert in tab *“General”* in *“Image files”* the local paths of the image files with relative path names.
   ⇨ Example: `.\;.\images\`

   Note: When no path is specifiet, the setting in dialog box *“Options”*, category *“Visualization”*, tab *“File Options”* setting *“Image files”* is usesd.
5. Open the visualization manager.
6. Activate under *“Extended settings”* the option *“Visible”*.
7. Activate under *“File Transfer Mode”* the option *“Use local visualization files”*.
   ⇨ When downloading, no files are transferred. When displaying the visualization, the local files are used.

See also

- *Chapter 1.4.1.20.2.13 “Object 'Image Pool'” on page 873*
- *Chapter 1.4.5.19.3.13 “Dialog 'Project Settings' - 'Visualization'” on page 1766*
- *Chapter 1.4.5.19.3.9 “Dialog Box 'Options' - 'Visualization'” on page 1763*

1.4.5.17 Applying Visualization Styles

A visualization style is a collection of colors, fonts, images, and any values that are defined as style properties. When designing a visualization element, you can use these style properties only. The you have a uniform, style-dependent appearance.

An element that applies style colors and style fonts behaves according to the selected style design in each selected style. In this way, a style property, such as `Element basic color`, can be blue In one style and gray in another style. In contrast, if the color of an element has a fixed value, this color is fixed even when the style is switched.

All applicable styles are consistent because they define a fixed set of style properties. Therefore, you can switch smoothly between styles in order to customize your visualization. You can preview a style to get an impression of how it behaves.

CODESYS provides different styles, for example the styles `Flat style` and `White Style`.

These provided styles are installed in the visualization style repository.

The selected style that applies to all visualizations in the application is set in the *"Visualization Manager"* object (*"Settings"* tab, *"Style Settings"* group, *"Selected style"*). In addition, the *"Properties"* view provides its style properties when designing an element. For each element, you can assign these styles instead of fixed values.

The style is applied to all visualizations that are below an application. The settings of the *"Options - Visualization Styles"* dialog are also considered for a library visualization or a visualization in the POUs view.

See also

- I ↳ *Chapter 1.4.5.19.3.11 "Dialog 'Project Environment' - 'Visualization Styles'" on page 1765*
- ↳ *Chapter 1.4.5.19.3.7 "Dialog 'Options' - 'Visualization Styles'" on page 1761*
- ↳ *Chapter 1.4.5.19.4.2 "Object 'Visualization manager'" on page 1777*

Designing visualization elements with style properties

The set style includes style properties. These are provided in the *"Properties"* view of an element in the drop-down list of the *"Value"* column. It is checked which style properties are appropriate for which property. For example, only style properties with color definitions are available for a color assignment.

A style can have directly defined visualization element properties. If this style is used in the project, then these properties are not configurable anymore.

☑ Requirement: A project is open with a visualization.

1. Double-click the visualization.
2. Select an element.
3. Choose *"View ➔ Element Properties"*.
4. Click in the input field of a color in the window *"Properties"* (category *"Colors"*).
   ⇨ The list box opens with style properties. The style colors are based on the currently selected style.
5. Select a style property.
   ⇨ The visualization shows the element according to the style.

Example

A visualization uses the style `CompanyStyle8`, which defines the colors `CompanyRed`, `CompanyBlue`, and `CompanyGreen`. An element is selected in the visualization. You can configure the element in the *"Properties"* view. By clicking into the value field of the *"Color"* property, you receive a drop-down list with the entries `CompanyRed`, `CompanyBlue`, and `CompanyGreen`.

Switching visualization styles

When setting a style in the visualization manager, all complete styles in the repository are available for selection. It does not matter and it is not evident if a style have been derived from another style.

You can preview a style to get an impression of how it behaves.

How a visualization implements a style at runtime also depends on the display variant. For example, if a font that is defined in the style is not available, the display variant shows the visualization with a preset font.

☑ Requirement: A project is open with a visualization.

1. Double-click the *"Visualization Manager"* object in the device tree.
   ⇨ The editor opens.
2. Click in the input field of *"Selected style"* (*"Settings"* tab, *"Style Settings"* group).
   ⇨ All styles that are installed in the repository are listed.
3. Mouse over a style.
   ⇨ A preview of how the style is displayed appears in a new window.
4. Select a style.
   ⇨ The style is applied. The preview in *"Style Settings"* shows the new setting.
5. Double-click a visualization.
   ⇨ The visualization appears in the new style.

Updating versions

☑ Requirement: A project is open with a visualization.

1. Click *"Project ➔ Project Environment"*, *"Visualization Styles"* tab.
   ⇨ CODESYS lists all new versions of the currently used styles.
2. Click *"Set All to Newest"*.
   ⇨ The style is updated. Visualizations and their elements apply the new style.

1.4.5.17.1 Editing visualization styles in the visualization style editor

A style is an XML file with the file extension `*.visustyle.xml`. It contains a specific set of style properties. CODESYS checks the style properties in the consistency check.

You can create a new style or customize an existing style. The visualization style editor is available for this.

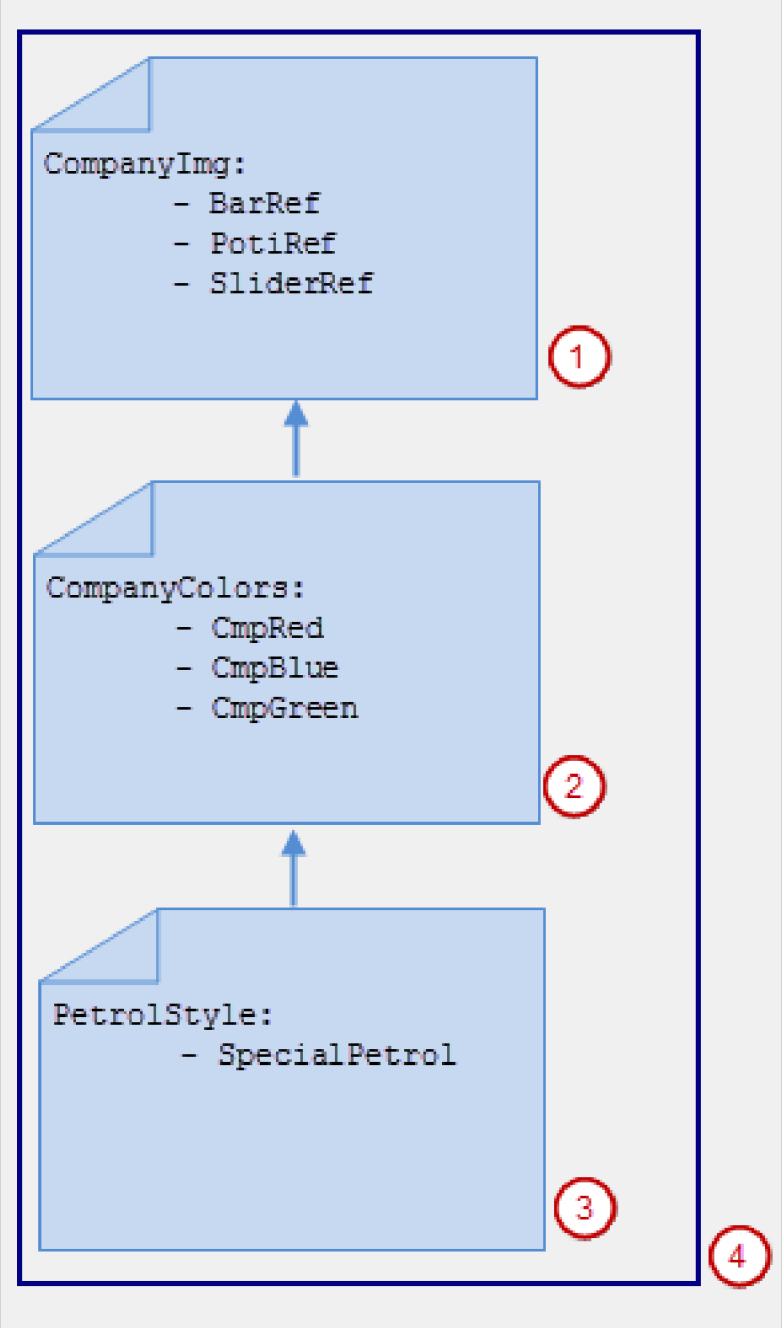
If you customize a style, then a new style is created as a hierarchy of styles. A hierarchy consists of at least two styles based on each other. The nesting depth is unrestricted. A hierarchy is identified simply with its top derived style. You can derive multiple different styles from one base style by extending the styles by differing style properties. This save memory and therefore should be your **preferred method**.

A base style does not have to be consistent for itself. Instead, you must identify it as an incomplete style. Only the top derived style must be consistent.

Example of a style hierarchy

Style `Petrostyle`

In a partial style, you can combine any style properties to form efficient hierarchies without having to worry about consistency. For example, you can collect all image references into one partial style. Then you derive the style and define more style properties for colors. This style is also incomplete. You derive the style again and define more style properties for its fonts. The top style is now completely.



- (1): `CompanyImg` is a partial style defining image references.
- (2): `CompanyColor` is a partial, derived style based on `CompanyImg` and also defines colors.
- (3): `PetrolStyle` is a complete, derived style based on `CompanyColor` and also defines a special color.
- (4): The hierarchy of styles comprises `PetrolStyle`, `CompanyColor`, and `CompanyImg`.

In the visualization style editor, you can open a style, define its style properties, and localize its name. If the style is consistent, then you can install it in the visualization style repository. The editor is not integrated in CODESYS. However, you can start the editor in CODESYS.

Names for style properties

A style property is an entry for a specific color, a specific font, or a specific image reference.

If this name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. Otherwise the names can be sorted in alphabetical order or sequential order or in sequential order (as saved in the XML file). CODESYS displays the style properties in the order of names actually saved in the XML file for the style.

Example: `Element-Alarm-Fill-Color`

See also

- *Chapter 1.4.5.20.3 “Editor 'Visualization Style Editor'” on page 2128*

Starting the editor in CODESYS

1. Double-click the *“Visualization Manager”* object.
   ⇨ The editor opens.
2. Click the symbol (*“Settings”* tab, *“Style Settings”* group).
3. Click *“Open Style Editor”* from the drop-down list.
   ⇨ The *“Visualization Style Editor”* opens.

Starting the editor independent of CODESYS

▷ Choose *“Visualization Styles Editor”* from the CODESYS install folder in the Start menu. If you have a standard installation, then this link is located in `CODESYS` (the program folder for CODESYS).
   ⇨ The visualization style editor opens.

Deriving visualization styles

This is the recommended way to create a style that combines existing style properties with new ones.

Starting the editor in CODESYS and deriving styles

☑ Requirement: CODESYS is open with a project containing a visualization.

1. Double-click the *“Visualization Manager”* object in the device tree.
   ⇨ The editor opens.
2. Click the symbol (*“Settings”* tab, *“Style Settings”* group).
   ⇨ A list of commands opens.
3. Choose *“Create and Edit Derived Style”*.
   ⇨ The visualization style editor starts and the *“Create a New Visualization Style”* dialog box opens.
4. Type a name.

5. Select a directory.
6. Select a base style. The default style is set in CODESYS. You can also select a style from the repository.
   ⇨ The new style appears in the visualization style editor. The style properties from the base style are displayed yellow.
7. Add a new style property or modify an existing value.
8. Provide a version for the style and click *"File ➔ Save and Install"*.
   ⇨ The style is installed in the repository. The memory requirement is low because only the style property added in step 7 is saved.

Copying visualization styles

☑ Requirement: CODESYS is open with a project containing a visualization.

1. Double-click the *"Visualization Manager"* object in the device tree.
   ⇨ The editor opens.
2. Click the symbol (*"Settings"* tab, *"Style Settings"* group).
   ⇨ A list of commands opens.
3. Choose *"Copy and Edit Style"*.
   ⇨ The visualization style editor starts and the *"Open Existing Style as a Copy"* dialog box opens.
4. Select which style should be copied (*"Style"*).
5. Type a directory in "Destination" and click *"OK"*.
   ⇨ The new style appears in the visualization style editor. All style properties are identical to those in the copied style.
6. Type a name.
7. Add a new style property or modify the value of an existing style property.
8. Provide a version for the style and click *"File ➔ Save and Install"*.
   ⇨ The style is installed in the repository and the style properties are identical to the added style property, except for the style property added in step 8. The memory requirement is high because the common style properties are defined in both styles.

Creating new visualization styles

☑ Requirement: CODESYS is open with a project containing a visualization.

1. Double-click the *"Visualization Manager"* object in the device tree.
   ⇨ The editor opens.
2. Click the symbol (*"Settings"* tab, *"Style Settings"* group).
   ⇨ A list of commands opens.
3. Click *"Open Style Editor"*.
   ⇨ The visualization style editor opens.
4. Click *"File ➔ New Style"*.
   ⇨ The *"Create a New Visualization Style"* dialog box opens.
5. Type a name. Specify a base style.

6. Specify a directory and click *“OK”* to close the dialog box.
   ⇨ The new style appears in the visualization style editor.
7. Add a new style property.
8. Provide a version for the style and click *“File ➔ Save and Install”*.
   ⇨ The style is installed in the Visualization Styles Repository with the version number.

Adding a style property

Using the visualization style editor, you can edit a style to save and install as a new version.

☑ Requirement: The visualization style editor is open with a style.

1. Select a style property and click *“Styles ➔ New Style (Afterwards)”* in the *“Style Properties”* tab.
   ⇨ A new style property is added.
2. In the *“General”* tab, type a new version number in the *“Version”* setting.
3. Choose *“File ➔ Save and Install”*.
   ⇨ The changes are saved and the style is installed in the repository as the new version.

Localizing style properties

You can assign a language-dependent name to a style property. CODESYS displays a style property by its localized name, depending on the language settings in category *“International Settings”* (menu *“Tools ➔ Options”*).

☑ Requirement: The visualization style editor is open with a style.

1. Translate the name of the style property into the localized language in the *“Localization”* tab.
2. Provide a version for the file in the *“General”* tab.
3. Choose *“Save and Install”*.
   ⇨ The edited style is installed in the repository currently selected in CODESYS.
4. Update the style.
5. Set the language settings in CODESYS to the localized language.
6. Open a visualization and select an element. The style settings in its properties are displayed in the localized language.

1.4.5.17.2 Managing visualization styles in repositories

The styles that are listed in CODESYS in the drop-down lists of different dialogs and editors are all checked for consistency and installed in the visualization style repository. For derived styles, the hierarchy is checked completely and all styles of the hierarchy are installed. The repository is a version control system within the development system.

You can open a style as write-protected from the visualization style repository in the visualization style editor. The *“Save”* and *“Save and Install”* commands are not available there for read-only files. However, you can derive it as the basis for a new style or as a copy.

See also

- *Chapter 1.4.5.20.3 “Editor 'Visualization Style Editor'” on page 2128*

Installing styles to repositories

1. Click *“Tools ➔ Visualization Style Repository”*.
   ⇨ The *“Visualization Styles”* dialog box opens.
2. Select the *“System”* repository in the drop-down list of *“Storage location”*.
   ⇨ All versions of the installed styles are listed in *“Installed Visualization Styles”*.
3. Click on the *“Install”* button.
   ⇨ The *“Select Visualization style(s)”* dialog box opens.
4. Select a style file and click *“Open”* to close the dialog box.
   ⇨ The style is installed in the *“System”* repository. It appears now in the tree view below *“Installed Visualization Styles”*.

Uninstalling styles

1. Click *“Tools ➔ Visualization Style Repository”*.
   ⇨ The *“Visualization Styles”* dialog box opens.
2. Select a repository in the drop-down list of *“Storage location”*.
   ⇨ All versions of the installed styles are listed in *“Installed Visualization Styles”*.
3. Select a style there.
4. Click the *“Uninstall”* button.
   ⇨ The *“Select Visualization Style(s)”* dialog box opens.

Managing repositories

1. Click *“Tools ➔ Visualization Style Repository”*.
   ⇨ The *“Visualization Styles”* dialog box opens.
2. Click on the *“Edit Locations”* button.
   ⇨ The dialog makes it possible to manage other repositories.

1.4.5.18 Reference, Programming

1.4.5.18.1 Visualization Elements

Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'

Symbol:

Category: *“Basic”*

The *“Rectangle”*, *“Rounded Rectangle”*, and *“Ellipse”* are the same type of element. They can be converted into another element type by changing the *“Element type”* property.

Element properties

“Element name”	Optional Example: `Werkstueck_3` Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Rectangle”*, *“Rounded Rectangle”*, *“Ellipse”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Y”	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Width”	Specified in pixels Example: `150`
“Height”	Specified in pixels Example: `30`
	Tip: You can change the values in *“X”*, *“Y”*, *“Width”*, and *“Height”* by dragging the corresponding symbols to another position in the editor.

"Angle"	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Radius setting

Visible only when *"Rounded Rectangle"* is selected in the *"Type of element"* property.

"Radius"	Rounding of the corners. *"From style"* *"Relative to the element size"* *"Explicit"*: Allows for specifying a custom value in the *"Value"* setting.
"Value"	Radius of the rounded corners (in pixels) Example: `5` Requirement: *"Explicit"* is selected in the *"Radius"* setting.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color"	Frame and fill color for the corresponding state of the variable.
"Fill color"	
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- ↳ *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- ↳ *" Element property 'Appearance variables'" on page 1430*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1373*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1371*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1370*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

“Text list”	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
“Text index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
“Tooltip index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1371*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels).
“Fill attributes”	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = `0`: Filled ● Variable value > `0`: Invisible; no fill color
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible; no line

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1382*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkey”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Events”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Events”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Line'

Symbol:

Category: *“Basic”*

The element draws a simple line.

Element properties

“Element name”	Optional. Example: `Separator_Header` Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Line”*

Element property 'Position'

The following properties define the position and length of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“Dots”	*“[0]”*: Coordinates of the starting point *“[1]”*: Coordinate of the end point You can also change the values by dragging the box symbols () to other positions in the editor.
“Angle”	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow  , you can rotate the element about its center as a handle. Example:  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *“Absolute movement ➔ Internal rotation”*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the  symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color of the line in normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color of the line in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- ↳ *" Element property 'Appearance variables'" on page 1430*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1385*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement point[0]” ● *“X”* ● *“Y”*	Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.
“Movement point[1]” ● *“X”* ● *“Y”*	Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.

See also

- *“Element property 'Absolute movement'” on page 1383*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1383*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1383*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable in the alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*
- *Chapter 1.4.5.19.4.2 "Object 'Visualization manager'" on page 1777*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

Element property 'Line width variable'

Dynamic definition of the weight of a line element using a variable.

"Integer value "	Variable (integer data type). Defines the line weight of the element (in pixels). This overwrites the fixed value that is defined in *"Appearance ➔ Line weight"*. Note: The value 0 codes the same as 1 and sets the line weight to one pixel.

Element property 'Line style variable'

"Integer value "	Variable (integer data type). Defines the appearance of the line at runtime. ● 1: Solid ● 2: Dashes ● 3: Dots ● 4: Dash Dot ● 5: Dash Dot Dot ● 6: Invisible: The line is not drawn.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Polygon', 'Polyline', 'Bézier Curve'

Symbol:

Category: *“Basic”*

The *“Polygon”*, *“Polyline”*, and *“Bézier Curve”* are the same element type. They can be converted into another type by changing the *“Element type”* property.

Elements can be dragged to the editor. The element is then drawn with five points: [0] to [4].

Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold *[Ctrl]* and click the left mouse button, another point is created. You can delete a point by pressing and holding *[Shift]+[Ctrl]* and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

Element properties

“Element name”	Optional. Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Werkstueck_1`
“Type of element”	● *“Polygon”* ● *“Polyline”* ● *“Bézier Curve”*

Element property 'Position'

The following properties define the position of the corner points in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"Dots"	[0]..[n]: Coordinates of the corner points Specified in pixels You can also change the values by dragging the box symbols (⊞) to other positions in the editor.
"Angle"	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow ↻, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color"	Frame and fill color for the corresponding state of the variable.
"Fill color"	
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

“Line width”	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Fill attributes”	The way in which the element is filled. ● *“Filled”*:The element is filled with the color from property *“Colors ➔ Fill color”*. ● *“Invisible”*: The fill color is invisible.
“Line style”	Type of line representation ● *“Solid”* ● *“Dashes”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“not visible”*

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *“ Element property 'Appearance variables'” on page 1430*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Text”*.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Tooltip”*.

See also

- *“Element property 'Text variables'” on page 1398*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Dynamic points'

“Array of points”	Variable (`POINTER TO`). Points to an array of the structure `VisuElems.VisuStructPoint`. The elements `iX` and `iY` of `VisuStructPoint` contain the xy-coordinates of a point The current number of array elements implicitly contains the variable in the property *“Number of points”*. The variable that is assigned to the property *“Number of points”* contains the number of array elements and therefore the number of corner points. Example: `pPoints : POINTER TO ARRAY[0..100] OF VisuElems.VisuStructPoint;`
“Number of points”	Variable (integer data type): Contains the number of array elements and therefore the number of corner points for displaying the element. Example: `PLC_PRG.iNumberOfPoints := 24;` In the example, the element has 24 points. This definition is necessary because the individual points are defined by a pointer and this does not allow control over the number of points. Note: In this way, it is possible to adapt the display of the element dynamically by updating the number of corner points.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1395*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in "Text properties".

See also

- *"Element property 'Text properties'" on page 1396*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels).
“Fill attributes”	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = 0: Filled ● Variable value > 0: Invisible; no fill color
“Line style”	Variable (DWORD). Controls the line style. Coding: ● 0: Solid line ● 1: Dashed line ● 2: Dotted line ● 3: Line type "Dash Dot" ● 3: Line type "Dash Dot Dot" ● 8: Invisible; no line

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1423*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime. Example: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR
“Deactivate inputs”	Variable (BOOL). Toggles the operability of the element. TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Pie'

Symbol:

Category: *“Basic”*

The element draws a pie of any angle.

Element properties

“Element name”	Example: `Error_rate_part_1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Pie”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Y”	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Width”	Specified in pixels Example: `150`
“Height”	Specified in pixels Example: `30`
	Tip: You can change the values in *“X”*, *“Y”*, *“Width”*, and *“Height”* by dragging the corresponding symbols to another position in the editor.

“Angle”	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *“Absolute movement ➔ Internal rotation”*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Begin”	Start angle of the pie. If you also define a variable for the start, then the start angle is calculated from the sum of the values for *“Begin”* and *“Variable for begin”*.	Example: • *“Begin”*: 330 • *“End”*: 90 “End”	End angle of the pie. If you also define a variable for the end, then the end angle is calculated from the sum of the values for *“End”* and *“Variable for end”*. The pie is drawn clockwise from the start angle to the end angle.	
“Variable for begin”	The start of the sector is defined dynamically by a variable.	
“Variable for end”	The end of the sector is defined dynamically by a variable.	
“Only show circle line”	☑: The pie is drawn without the radius line or filling color.	

Element property 'Center'

"X" *"Y"*	Display of the center coordinates. You cannot modify these values here in the properties. If the Pie is selected in the editor, then the center of the Pie (as well as the center of the enveloping box) is visualized with the symbol ⊕. Moreover, the element is decorated with a position, begin, and end boxes that you can move.  The center coordinates change when you move the center symbol ⊕ in the editor. This also changes the size of the Pie so that the position box retains its position and the center remains in the middle of the element.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color" *"Fill color"*	Frame and fill color for the corresponding state of the variable.
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- ↳ *" Element property 'Appearance variables'" on page 1430*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- ↳ *"Element property 'Text variables'" on page 1411*
- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (integer data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (integer data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.

"Interior rotation"	Variable (integer data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. If a static angle of rotation is specified in *"Position ➔ Angle"*, then the static angle of rotation and the angle of rotation are added.	
You can link the variables to a unit conversion.

The "X", "Y", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1409*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1409*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels).
“Fill attributes”	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = `0`: Filled ● Variable value > `0`: Invisible; no fill color
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible; no line

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1423*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

See also

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Image'

Symbol:

Category: *"Basic"*

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. You can also change the displayed image dynamically by using a variable instead of the static ID.

With the "Background" command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category "Visualization").

Element properties

"Element name"	Example: `Status bar` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Image"*
"Static ID"	Identifier of the image file for a static assignment ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: `imagepool2.button_image`. When a new ID is specified, a file selection dialog opens. The selected file is saved to the *"GlobalImagePool"*. See also: Help for the *"Image Pool"* object.
"Show frame"	☑: The image file is displayed with a frame.
"Clipping"	Requirement: The *"Scaling type"* property is *"Fixed"*. ☑: Only part of the visualization is displayed that fits in the element frame.
"Transparent"	☑: The image pixels that have the *"Transparent color"* are displayed as transparent.
"Transparent color"	Effective only if the *"Transparent"* option is activated. The … button opens the color selection dialog. This is where you select the transparent color.

"Scaling type"	Definition of how an image fits in the element frame. ● *"Isotropic"*: The entire image is displayed in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties *"Horizontal alignment"* and *"Vertical alignment"* to *"Centered"*. The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized. ● *"Anisotropic"*: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained. ● *"Fixed"*: The image retains its original size, even if the element frame is resized. Note also that the *"Clipping"* option is selected. For each reassignment of an image ID, the element size is adapted automatically to the image size.
"Horizontal alignment"	Horizontal alignment of the element within the element frame: ● *"Left"* ● *"Centered"* ● *"Right"* Requirement: The scaling type of the image is *"Isotropic"* or *"Fixed"*. Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. : The *"Variable"* property is shown below this.
"Variable"	Enumeration variable (`ENUM VisuElemBase.VisuEnumVerticalAlignment`). Contains the horizontal alignment. Example: `PLC_PRG.eHorizontalAlignment`
"Vertical alignment"	Vertical alignment of the element within the element frame: ● *"Top"* ● *"Centered"* ● *"Bottom"* Requirement: The scaling type of the image is *"Isotropic"* or *"Fixed"*. Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. : The *"Variable"* property is shown below this.
"Variable"	Enumeration variable (`ENUM VisuElemBase.VisuEnumVerticalAlignment`). Contains the vertical alignment. Example: `PLC_PRG.eVerticalAlignment`

Example A valid declaration is required for the variables used as an example in the table above.

Enumeration

```
TYPE VisuElemBase.VisuEnumHorizontalAlignment
    LEFT
    HCENTER
    RIGHT
END_TYPE

TYPE VisuElemBase.VisuEnumVerticalAlignment
    DOWN
    VCENTER
    BOTTOM
END_TYPE
```

Declaration

```
PROGRAM PLC_PRG
VAR
    eHorizontalAlignment :
VisuElemBase.VisuEnumHorizontalAlignment :=
VisuElemBase.VisuEnumHorizontalAlignment.HCENTER;
    eVerticalAlignment : VisuElemBase.VisuEnumVerticalAlignment :=
VisuElemBase.VisuEnumVerticalAlignment.VCENTER;
END_VAR
```

See also

- *Object 'Image Pool'*

Element property 'Position' The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.

"Angle"	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the frame Requirement: *"Show frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the frame in alarm state Requirement: *"Show frame"* property is activated. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- ↳ *" Element property 'Appearance variables'" on page 1430*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- ↳ *"Element property 'Text variables'" on page 1426*
- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Image ID variable'

"Image ID"	Variable (`STRING`). Contains the image ID. The contents of the string corresponds to the description of the *"Static ID"* property. Example: `PLC_PRG.stImageID := 'ImagePool_A.Image3';`

See also

- *Chapter 1.4.5.19.5.5 "Visualization Element 'Image'" on page 1842*
- *Chapter 1.4.1.20.2.13 "Object 'Image Pool'" on page 873*

Element property 'Dynamic image'

You can use this element property for animating a series of image files.

"Bitmap version"	Variable (integer data type). Contains the version of the image. If the variable changes, then the visualization re-reads the image referenced in the *"Image ID"* property and displays it. The visualization displays animations when the image file on the controller is updated continuously, thus incrementing the version variable. The application must be programmed for this. Possible applications ● Displaying graphics that are generated by the application ● Displaying images that are refreshed by a camera

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1396*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1423*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1423*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1423*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The *"Configure"* button opens the *"Input configuration"* dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

Example: *"Execute ST code"*: `PLC_PRG.i_x := 0;`

"OnDialogClosed"	Input event: The user closes the dialog box.
"OnMouseClick"	Input event: A user clicks the element completely. The mouse button is clicked and released.
"OnMouseDown"	Input event: A user clicks down on the element only.
"OnMouseEnter"	Input event: A user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: A user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: A user moves the mouse pointer over the element area.
"OnMouseUp"	Input event: The user releases the mouse button over the element area.

See also

● *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

“Hotkeys”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Event(s)”* property are triggered.
“Key”	Key pressed for input action. Example: *[T]*
“Event(s)”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

See also

- *Chapter 1.4.5.19.2.2 “Command 'Keyboard Configuration'” on page 1720*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Project Settings - Visualization*

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Frame'

Symbol:

Category: *“Basic”*

The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

Element properties

“Element name”	Example: `refVisUserInfo`
“Type of element”	*“Frame”*
“Clipping”	☑: Fixed size. Only that part of the referenced visualization that fits inside the frame is displayed. Requirement: The *“Scaling type”* property is *“Fixed”*.
“Show frame”	Displays the frame ● *“No frame”*: The displayed area of the frame does not have borders. ● *“Frame”*: The displayed area of the frame has borders. ● *“No frame with offset”*: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The gap prevents the referenced visualization from touching any adjacent elements.

“Scaling type”	The method with which the height and width of the **referenced** visualization are scaled. ● *“Isotropic”*: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio. ● *“Anisotropic”*: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other. ● *“Fixed”*: the visualization is displayed in its original size without taking into account the size of the element. ● *“Fixed and scrollable”*: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties *“Scroll position variable horizontal”* or *“Scroll position variable vertical”*. You can then edit the data of the scrollbar position in the application.

Element properties 'Scrollbar settings'

The properties contain variables for the position of the scrollboxes in the scrollbars. You can then edit the data of the scrollbox position in the application.

Requirement: the property *“Scaling type”* is *“fixed and scrollable”*.	

“Scroll position variable horizontal”
“Scroll position variable vertical”
	Variable (integer data type, also as array). Contains the position of the horizontal or vertical scrollbox. The array contains the position for every display variant. If the visualization runs on several display variants, then the position changes are decoupled from each other.
	Example:
	`PLC_PRG.iScrollHor[CURRENTCLIENTID]`
	`PLC_PRG.iScrollVer[CURRENTCLIENTID]`
	The variable is declared as an array in the example.
	`iScrollHor: ARRAY[0..20] OF INT;`
	`iScrollVer: ARRAY[0..20] OF INT;`
	`CURRENTCLIENTID` indexes the current display variant.

You can combine the variables with a unit conversion.

See also

- *Unit conversion*

“Deactivation of the background character”	☐: The background is drawn. The non-animated element of the referenced visualization is drawn as a background bitmap in order to optimize the performance of the visualization. Consequence: Elements can be displayed in an unexpected order at runtime. For example, an animated element can push itself behind the Frame at runtime. ☑: Background character is deactivated in order to avoid the behavior described above.

Element property 'References' Contains the currently configured visualization references as a subnode

“References”	Clicking *“Configure”* opens the *“Frame Configuration”* dialog. This is used to manage the referenced visualizations. Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the *“Switch to any visualization”* Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the *“Input configuration”* of an element: Action *“Switch Frame visualization”*.
List of the currently referenced visualizations	Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters. Example: `vis_FormA` • `iDataToDisplay_1 : PLC_PRG.iVar1` • `iDataToDisplay_2 : PLC_PRG.iVar2` Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the *“Configure”* button instead.

See also

- *Chapter 1.4.5.15 “Creating a structured user interface” on page 1321*
- *“Input action 'Switch Frame Visualization'” on page 1756*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for the colors.

"Color"	Color of the frame ▼: Selection list with style colors appears ...: Standard dialog *"Color"* opens for selecting a color. Please note: the normal state is when the boolean variable in the property *"Color variables ➔ Toggle color"* is not defined or its value is `FALSE`.
"Alarm color"	Color with which the element is filled during the alarm state. Please note: Alarm state is when the value of the boolean variable in the property *"Color variables ➔ Toggle color"* is `FALSE`.
"Transparency"	Integer number (value range from `255` to `0`). Specifies the transparency of the associated color. `255`: The color is opaque. `0`: The color is fully transparent. Please note: If the color is a style color and already contains a transparency value, then this property is write-protected.

See also

- ↳ *Chapter 1.4.5.3.3 "Assigning a color" on page 1258*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- ↳ *" Element property 'Appearance variables'" on page 1443*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1439*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. "Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.

You can link the variables to a unit conversion.

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*"Position"* property). The shape of the element can change.

"Movement top-left"	
"X"	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
"Y"	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
"Movement bottom-right"	

"X"	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
"Y"	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *"Element property 'Absolute movement'" on page 1396*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1436*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1437*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the Frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show Frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the Frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1436*

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

“Variable”	● Variable (integer data type) that contains the index of the active visualization Example: `PLC_PRG.uiIndexVisu` Hint: The *“Frame Configuration”* dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants. ● Array element (integer data type) for index access via `CURRENTCLIENTID` Example: `PLC_PRG.aIndexVisu[CURRENTCLIENTID]` Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

See also

- *Chapter 1.4.5.19.2.9 “Command 'Frame Selection'” on page 1727*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

Visualization Element 'Label'

Symbol:

Category: *"Common Controls"*

The element is used to label visualizations.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Header_Parameter`
"Type of element"	*"Label"*

Element property 'Texts'

The property requires a character string.

This text is entered automatically into the `GlobalTextList` text list and can be localized there.

"Text"	Character string (without single straight quotation marks) Example: `Main page`

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.

"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Combo Box, Integer'

Symbol:

Category: *"Common Controls"*

The element shows values as a list box. When the user clicks an entry, the ID of the entry is written to an integer variable. The entries in the list box can be from a list and contain images from an image pool.

Element properties

"Element name"	Example: `List of product numbers` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Combo Box, Integer"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	At runtime, the text list ID of the list entry that the user clicks is saved at runtime. If only one image pool is displayed, then the image ID is saved. Property value ● Variable (integer data type) Example: `PLC_PRG.iIDComboboxEntry` ● Enumeration variable with text list support Example: `PLC_PRG.eMyCombobox<COMBO>`
"Text List"	Displayed as a combo box. Every text list entry becomes a combo box entry. Note: A maximum of 32766 entries can be displayed. Transfer value ● Text list identifier as string Example: `'TextList_A'` Note: The IDs of the text list have to be within the range of values of `DWORD` or `DINT`. ● Blank – When an enumeration variable with text list support is specified in the *"Variable"* property – When only one image pool is displayed
"Image Pool"	Displayed as a combo box. Every image in the image pool becomes a combo box entry. Example: `'ImagePool_A'`

See also

- *Enumerations*
- *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

Element property 'Settings of the list'

Displayed list that expands when a visualization user clicks into the element.

"Number of rows setting"	● *"From style"*: ● *"Explicit"*: Then the *"Number of visible rows"* property appears below it.
"Number of visible rows"	Number of visible lines of the combo box drop-down list defined here ● Integer literal Example: `5` ● Variable (integer data type) Example: `PLC_PRG.iNumberOfVisibleRows` Note: The property is available when the *"Number of rows setting"* property is set to *"Explicit"*.
"Row height"	● *"From style"*: ● Literal Example: `20`
"Height of image"	Image height (in pixels) of the image displayed in the drop-down list entry ● *"From style"*: ● Integer literal Example: `30` Note: Images are displayed only when a value is specified in the *"Image pool"* property.

"Width of image"	Image width (in pixels) of the image displayed in the drop-down list entry ● *"From style"*: ● Literal Example: `30` Note: Images are displayed only when a value is specified in the *"Image pool"* property.
"Offset of image"	Makes the images in the selection list appear offset (in pixels) from the left margin. An offset of `0` means that the images are displayed directly on the margin. ● *"From style"*: ● Literal Example: `4` Note: Images are displayed only when a value is specified in the *"Image pool"* property.
"Scrollbar size"	Size of the scrollbar (in pixels). The scrollbar is displayed when more entries are specified in the drop-down list than in *"Number of visible rows"*. Default: `20`

Element property 'Texts'

"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode Example: `Products of customer A` Hint: The text is accepted automatically into the *"GlobalTextList"* text list and can be localized there.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Value range'

"Limit valuerange"	Limits the text list to one subrange. This subrange is displayed by the combo box. Requirement: A value is specified in the *"Text list"* property. ☑: Only the subrange that is defined by the *"Minimum value"* *"Maximum value"* properties is displayed as a drop-down list.
"Minimum value"	ID of the text list entry from which a combo box entry is displayed ● Literal (`ANY_NUM`) Example: `5` ● Variable (integer data type) Example: `PLC_PRG.iFirstEntry`

"Maximum value"	ID of the text list entry up to which combo box entries are displayed ● Literal (`ANY_NUM`) Example: `10` ● Variable (integer data type) Example: `PLC_PRG.iLastEntry`
"Filter missing textentries"	: Text list is refreshed and any unused texts (IDs) are removed. Requirement: A value is specified in the *"Text list"* property.

Element property 'Text properties' The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* : The *"Font"* dialog box opens. : Drop-down list with style fonts.
"Font color"	Example: *"Black"* : The *"Color"* dialog box opens. : Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement' The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

Visualization Element 'Combo Box, Array'

Symbol:

Category: *“Common Controls”*

The element shows values of an array as a list box. When the visualization user clicks an entry, the array index of the entry is written to an integer variable.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `List_Product_Number`
“Type of element”	*“Combo Box, Array”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10.`
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10.`
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	The array index of the list entry that the user clicks is saved at runtime. Property value ● Variable (integer data type) Example: `PLC_PRG.iIndexComboboxEntry` ● Enumeration variable with text list support Example: `PLC_PRG.eMyCombobox<COMBO>` Note: Value range of the enumeration value that lies within the `DWORD` or `DINT` value range
"Data array"	Displayed as a combo box. Every array component becomes a combo box entry. Property value ● Array variable (`ARRAY[...] OF`) Example: `PLC_PRG.astrCombobox` Declaration: `astrCombobox : ARRAY[0..4] OF STRING := ['First', 'Second', 'Third', 'Fourth'];`

See also

- *Enumerations*
- *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

Element property 'Columns'

The "Combo box – Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Two-dimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the *"Data array"* property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].

"Columns" ● [<n>]	Due to the structure of the variable that is defined in *"Data array"*, CODESYS determines the number of columns and defines them with the index <n>. Example: `StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW','Audi','Mercedes','VW','Fiat', '150','150','150','150','100','blue','gray','silver','blue','red'];`: three columns are formed `[0]`, `[1]` and `[2]`.
"Max. array index"	Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed.
"Row height"	Height of the rows (in pixels).
"Number visible rows"	Optional. If the array is larger than the number of visible rows, then a scrollbar is included.
"Scrollbar size"	Width of the vertical scrollbar (in pixels).

Table 270: “Element property 'Columns: Column [<n>]'”

“Width”	Column width (in pixels).
“Image column”	☑: Images can be displayed in the column. Images are used from the global image pool or user-defined image pools. The image IDs are shown in the cells of the table as defined in the image pool.
“Image configuration”	
“Fill mode”	• *“Fill cell”* The image resizes to the dimensions of the cell without fixing the height/ width ratio. • *“Centered”* The image is centered in the cell and retains its proportions (height-width ratio).
“Transparency”	☑: The color that is specified in *“Transparent color”* is displayed as transparent.
“Transparent color”	When the *“Transparent”* property is enabled, the color specified here is not displayed. Pixels with this color are transparent.
“Text alignment in column”	• *“Left”* • *“Centered”* • *“Right”*

Element property 'Texts'

“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode Example: `Products of customer A` Hint: The text is accepted automatically into the *“GlobalTextList”* text list and can be localized there.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Usage of”	• *“Default style values”*: The values of the visualization style are used. • *“Individual settings”*: The "Individual text properties" property group is shown The values can be customized here.
“Individual text properties” Requirement: The *“Individual settings”* text property is defined.	
“Font”	Example: *“Default”* ...: The *“Font”* dialog opens. ▼: List box with style fonts

"Font color"	Example: *"Black"* ...: The *"Color"* dialog opens. ▼: List box with style colors
"Transparency"	Integer (value range from `0` to `255`). This determines the transparency of the respective color. `255`: The color is opaque. `0`: The color is completely transparent. Note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Tabs'

Symbol:

Category: *"Common Controls"*

The element displays selected visualizations in tabs. The tabs can be used by means of the tab header without having to configure an input configuration. A visualization user switches between visualizations by clicking the tab header.

Element properties

"Element name"	Example: `Assembly A` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Tabs"*

"Tab width"	Width of the tab (in pixels). If there is not space for all tab headers, then a scroll bar is added. Example: `30`
"Tab height"	Height of the tab (in pixels) ● Integer literal Example: `15` ● *"From style"*

"Scaling type"	The method with which the height and width of the **referenced** visualization are scaled. ● *"Isotropic"*: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio. ● *"Anisotropic"*: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other. ● *"Fixed"*: the visualization is displayed in its original size without taking into account the size of the element. ● *"Fixed and scrollable"*: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties *"Scroll position variable horizontal"* or *"Scroll position variable vertical"*. You can then edit the data of the scrollbar position in the application.

"Deactivate background drawing"	☐: The non-animated elements of the referenced visualization are displayed as background images in order to optimize the performance of the visualization. Result: At runtime, the elements can be displayed in any order, for example when an element moves behind the frame at runtime. ☑: Deactivates the background display in order to prevent the behavior described above The property is not available for the following settings: ● The *"Scaling type"* property is set to *"Fixed and scrollable"* ● The client animation functionality is enabled.

Element property 'Scroll bar settings'

The properties include variables for the position of the scroll boxes in the scroll bars. You can process the data for the scroll box position in the application.

Requirement: The *"Scaling type"* property is *"Fixed and scrollable"*.	

"Scroll position variable horizontal"
"Scroll position variable, vertical"
	Variable (integer data type, also array). Includes the position of the horizontal or vertical scroll box. The array contains the position for each display variant. If the visualization is running on multiple display variants, then the position changes are disconnected from each other.
	Example:
	`PLC_PRG.iScrollHor[CURRENTCLIENTID]`
	`PLC_PRG.iScrollVer[CURRENTCLIENTID]`
	In this example, the variable is declared as an array:
	`iScrollHor: ARRAY[0..20] OF INT;`
	`iScrollVer: ARRAY[0..20] OF INT;`
	`CURRENTCLIENTID` indicates the current display variant.

See also

- *Unit conversion*

Element property 'References'

"References"	Clicking *"Configure"* opens the *"Frame Configuration"* dialog. You can select an existing visualization there. Selected visualization references are shown in the properties. Selected visualization references are listed here as subordinate properties.
Name pf the visualization reference (example: `PLC_PRG.S1`)	
"Heading"	Tab caption (example: `Panel`)
"Image ID"	Image ID in the theme `<image pool name>.<ID>` Example: `Imagepool_A.1` for the image with ID `1` in `Imagepool_A`
Interface parameter of the visualization reference Example: `iX`	If the visualization has an interface, then their parameters are displayed here as subordinate properties. Variable (data type conforms to data type of the interface parameter). Includes the initialization value for the instantiation of the visualization.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Switch frame variable'

“Variable”	Variable (integer data type). Specifies the index of the active visualization. Example: `PLC_PRG.uiActiveVisuID`. Tip: The *“Frame Configuration”* dialog box includes a list of selected visualizations. The visualizations are ordered automatically in numeric order in the list.

See also

- *Chapter 1.4.5.19.2.9 “Command 'Frame Selection'” on page 1727*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Button'

Symbol:

Category: *“Common Controls”*

The element triggers an action, such as setting a variable.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Voltage_on`
“Type of element”	*“Button”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.
"Use gradient color"	☑: The element is displayed with a color gradient.
"Gradient setting"	The *"Color gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Image'

"Static ID"	Reference to an image in an image pool of the format <name of image pool>.<image ID> (example: `image_pool.GreenButton`). If the image is from the *"GlobalImagePool"*, then you can omit the name of the image pool because CODESYS always searches this pool first. …: The *"Input Assistant"* dialog box opens and lists all available image pools and images in the entire project.
"Scale type"	Behavior of the image when resizing the button. ● *"Isotropic"*: The image retains its proportions. The ratio of height to width is retained, even if you change the height or width of the button separately. ● *"Anisotropic"*: The image resizes to the dimensions of the button. ● *"Fixed"*: The image retains its original size, even if you change the size of the button.
"Transparency"	The visualization displays the image with the transparency color that is selected in *"Transparency color"*.
"Transparency color"	Color that is transparent in the image (example: *"White"*). if the image background that is reference by *"Static ID"* is white, then this background is displayed transparent. Clicking … opens a color selection dialog. Requirement: The *"Transparency"* option is activated.
"Horizontal alignment"	Horizontal alignment of the image ● *"Left"* ● *"Centered"* ● *"Right"*
"Vertical alignment"	Vertical alignment of the image ● *"Top"* ● *"Centered"* ● *"Bottom"*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1473*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`

"Y"	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
"Movement bottom-right"	
"X"	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
"Y"	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *"Element property 'Absolute movement'" on page 1396*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1470*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1471*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the Frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show Frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the Frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Button state variable'

“Digital variable”	At runtime, the property controls whether the Button is displayed as pressed or not. Values: ● `FALSE`: The Button is displayed as not pressed. ● `TRUE`: The Button is displayed as pressed. Argument passed to the property: ● Placeholder for the user input variable to couple the representation of the Button with the input variable. – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the Button. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `prgA.xButtonState` Note: Implement a value assignment in the code for the variable specified here.

Element property 'Image ID variable'

“Image ID”	Variable (`STRING`). Contains the image ID. The contents of the string corresponds to the description of the *“Static ID”* property. Example: `PLC_PRG.stImageID := 'ImagePool_A.Image3';`

See also

- *Chapter 1.4.5.18.1.5 “Visualization Element 'Image'” on page 1418*
- *Chapter 1.4.1.20.2.13 “Object 'Image Pool'” on page 873*

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

See also

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Group Box'

Symbol:

Category: *“Common Controls”*

The element provides a visual grouping of visualization elements. The group box can have multiple levels of nesting.

> *You can also use drag&drop to add elements to a “Group Box”. To do this, drag the element to the window area of the “Group Box”. The appearance of the cursor changes (a small plus sign is displayed). When you click the [Shift] key at the same time, the element is not added.*
>
> *You can remove elements from the “Group Box” by dragging them out of the window area.*

Element properties

“Element name”	Example: `Parameter axis 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Group Box”*
“Clipping”	☑: Elements that protrude beyond the size of the group box are clipped.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

> *You can also change the values by dragging the box symbols (⊡) to other positions in the editor.*

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

The properties contains character strings for labeling the element.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Example: `Axis 1`.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Parameters of Axis 1`.

See also

- ↳ *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Table'

Symbol:

Category: *“Common Controls”*

The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

Element properties

“Element name”	Example: `Data set component 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	Table
“Data array”	Array whose data is visualized as a table Variable (`ARRAY`) whose data type determines the number of columns and rows in the table Array types ● One-dimensional array: The table has one column. ● Two-dimensional array: The second dimension determines the number of columns. ● Array of an array: The number of array elements of the back array determines the number of columns. ● Array of a structure: The number of structure members determines the number of columns. ● Array of a function block: The number of local variables determines the number of columns. Example: `PLC_PRG.aiTable` Declaration: `aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)];` Hint: If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the *[Enter]* key.
“Max. array index”	Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0. ● Variable (integer data type) Example: `PLC_PRG.iUpperIndexBoundToDisplay` ● Integer literal Example: `4` is displayed as 5 in the row of the table.

See also

- *Data Type 'ARRAY'*

Element property 'Columns'

The *“Table”* element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the *“Data array”* property. When a variable is assigned there, you can specify the display of the Table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [<n>].

“Show row header”	☑: The row header is visible. Example: For an array, the index of the array element is displayed in the header.
“Show column header”	☑: The column label is visible.
“Row height”	Height of the rows (in pixels)
“Row header width”	Width of the row label
“Scroll bar size ”	Size of the scroll bar (in pixels)

Table 271: “Element property 'Columns: Column [<n>]'”

“Column header”	By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for *“Data array”*, then the name of the array is applied to the column header with the local variables of the function block that belong to the column. The column label can be changed here by specifying a new title.
“Width”	Column width (in pixels)
“Image column”	☑: Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the Table as they are defined in the image pool.
“Image configuration”	
“Fill mode”	• `Fill cell`: The image resizes to the dimensions of the cell without fixing the height/width ratio. • `Centered`: The image is centered in the cell and retains its proportions (height/width ratio).
“Transparency”	☑: The color which is specified in *“Transparent color”* is displayed as transparent.
“Transparent color”	This color is displayed as transparent. Requirement: The *“Transparency”* property is activated.
“Text alignment of header”	Alignment of the column header: • `Left` • `Centered` • `Right`
“Use template”	☑: Another visualization element (type *“Rectangle”*, *“Rounded Rectangle”*, or *“Ellipse”*) is inserted into each line of this Table column. The properties list is extended automatically with the properties of this element in *“Template”*.
“Text alignment of the headline from the template”	Requirement: The *“Use template”* property is activated. ☑: When activated, the settings for font (size) and alignment in the inserted template are also applied to the column header.
“Template”	Requirement: The *“Use template”* property is activated. The properties of all elements assigned to the column are listed in *“Template”*. They can be modified there as described in *“Rectangle”*, *“Rounded Rectangle”*, and *“Ellipse”*.

See also

- *Chapter 1.4.5.18.1.1 “Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'” on page 1368*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables enable dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog box.
"Size"	Variable (integer data type). Contains the font size (in pixels). Example: `PLC_PRG.iFontHeight := 16;.` The selection of font sizes corresponds to the default *"Font"* dialog box.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Charset”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog box.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1495*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X.` Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y.` Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Selection'

“Background color on selection”	Fill color of the selected row.
“Selection font color”	Font color of the selected row.
“Selection type”	Selection when clicking the table row. ● `No selection`: No selection ● `Cell selection`: The clicked cell only. ● `Row selection`: Row of the clicked cell. ● `Column selection`: Column of the clicked cell. ● `Row and column selection`: Row and column of the clicked cell.
“Frame around selected cells”	☑: A frame is drawn around the selected cells.
“Variable for selected column”	Variable (INT). Contains the array index of the *“Column”* of the selected cell. If the data array points to a structure, then the structure components are indexed, starting at 0. Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.
“Variable for selected row”	Variable (INT). Contains the array index of the *“Row”* of the selected cell.
“Variable for valid column selection”	Variable (BOOL). TRUE: The *“Variable for selected column”* variable contains a valid value.
“Variable for valid row selection”	Variable (BOOL). TRUE: The *“Variable for selected row”* variable contains a valid value.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

- *Chapter 1.4.5.9.1 "Displaying Array Variables in Tables" on page 1298*
- *Data Type 'ARRAY'*

Visualization Element 'Text Field'

Symbol:

Category: *"Common Controls"*

The element is used for the following purposes:

- Static output of text. The contents of a variable can be part of the text.
- Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
- Dynamic output of text. Texts of a text list are displayed dynamically.
- Input of text. For example, a user can input a number or a text literal.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element properties

“Element name”	Optional Example: `FileName_A` Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Text Field”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Colors'

“Normal state”	The normal state is in effect if the variable in *“Color variables ➔ Toggle color”* is not defined or it has the value `FALSE`.
“Frame color”	Frame and fill color for the corresponding state of the variable.

“Fill color”	
“Transparency”	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
“Alarm state”	The alarm state is in effect if the variable in *“Color variables ➔ Toggle color”* has the value `TRUE`.

See also

- *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

“Line width”	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Fill attributes”	The way in which the element is filled. ● *“Filled”*:The element is filled with the color from property *“Colors ➔ Fill color”*. ● *“Invisible”*: The fill color is invisible.
“Line style”	Type of line representation ● *“Solid”* ● *“Dashes”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“not visible”*

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *“ Element property 'Appearance variables'” on page 1443*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Text”*.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Tooltip”*.

See also

- *“Element property 'Text variables'” on page 1495*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1494*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1495*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Selection and caret configuration'

The variables allow for controlling the caret position and the selection of the text.

"Caret position"	Variable (integer data type). Contains the position of the cursor.
"Selection start"	Variable (integer data type). Contains the position of the first selected character. Example: `PLC_PRG.iSelStart`
"Selection end"	Variable (integer data type). Contains the position of the last selected character. Example: `PLC_PRG.iSelEnd`
"All selected"	Variable (BOOL). Toggles the selection of the entered text. `TRUE`: The text in the text field is selected. `FALSE`: The selection starts with the value in *"Selection start"* and ends with *"Selection end"*.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.

"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Scroll Bar'

Symbol:

Category: *"Common Controls"*

The element sets the value of a variable, depending on the position of the scroll bar.

Element properties

"Element name"	Example: `Speed Conveyor Belt 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Scroll Bar"*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Value"	Variable as type integer that includes the position of the scroll bar.
"Minimum value"	Smallest value of the scroll bar (fixed value or variable).
"Maximum value"	Largest value of the scroll bar (fixed value or variable).

"Page size"	Page size ● As a fixed value, for example `10` ● As a variable of data type integer Requirement: Visible when the *"Move to click"* property is **not** selected.
"Move to click"	Behavior of the scroll bar at visualization runtime when it is clicked: ☑: The scrollbar moves to the clicked position. ☐: The scrollbar moves to one *"Page size"* in the direction of the click.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (↔) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Bar'

The property defines the representation of scaling and direction of travel.

"Orientation"	Alignment of the slider; defined by the ratio of width to height. ● *"Horizontal"* ● *"Vertical"* You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the Scroll Bar.
"Running direction"	The drop-down list varies depending on the alignment of the slider. Horizontal ● *"Left to right"*: Scale starts at the left. ● *"Right to left"*: Scale starts at the right. Vertical ● *"Bottom to top"*: Scale starts at the bottom. ● *"Top to bottom"*: Scale starts at the top.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *“Element property 'Texts'” on page 1506*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1495*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

● *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Slider'

Symbol:

Category: *"Common Controls"*

The element changes the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

Element properties

"Element name"	Example: `Speed controller conveyor belt 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Slider"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Variable”	Variable (numeric data type) Example: `PLC_PRG.rSlider` When executed, the variable assigns a value that corresponds to the position of the slider in the bar.
“Page size”	Page size ● As a fixed value, for example `10` ● As an IEC variable of data type integer Requirement: The *“Move to click”* element property is **not** selected.
“Move to click”	Behavior of the slider at visualization runtime when it is clicked: ☑: The slider moves to the clicked position. ☐: The slider moves to the value (defined in the *“Page size”* element property) in the direction of the click.

Element property 'Scale'

“Show scale”	☑: The element has a visible scale. Note: This option is available for the *“Slider”* only.
“Scale start”	Least value of the scale and the lower limit of the value range for the element. Example: `0` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale start.
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale end.
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two tick marks on the rough scale. Example: `10` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Subscale”	Distance between two dashes on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 5;`
	`END_VAR`

“Scale format (C Syntax)”	Formatting of the scale label (example: `%d %s`) Note: This property is available for the Slider only.
“Scale proportion”	Size of the scale (in %) of the total size

Element property 'Bar'

The property defines the representation of scaling and direction of travel.

"Diagram type"	The drop-down list varies depending on the alignment of the diagram. Horizontal ● *"Top"*: Scale is above the slider. ● *"Bottom"*: Scale is below the slider. ● *"Top and bottom"*: Two scales frame the slider above and below. Vertical ● `Left`: Scale is left of the slider. ● `Right`: Scale is right of the slider. ● `Left and right`: Two scales frame the slider on the left and the right.
"Orientation"	Alignment of the slider; defined by the ratio of width to height. ● *"Horizontal"* ● *"Vertical"* You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar.
"Running direction"	The drop-down list varies depending on the alignment of the slider. Horizontal ● *"Left to right"*: Scale starts at the left. ● *"Right to left"*: Scale starts at the right. Vertical ● *"Bottom to top"*: Scale starts at the bottom. ● *"Top to bottom"*: Scale starts at the top.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Spin Box'

Symbol:

Category: *“Common Controls”*

The element increments or decrements the value of a variable in defined intervals.

Element properties

“Element name”	Example: `Speed controller conveyor belt` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Spin Box”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	Variable (numeric data type) Example: `PLC_PRG.iTemp`
"Number format"	Format of the value in printf syntax Example: %d, %5.2f
"Interval"	Interval used for modification of the value

Element property 'Value range'

"Minimum value"	Lower limit of the output value ● fixed value ● Variable (INT)
"Maximum value"	Upper limit of the output value ● fixed value ● Variable (INT)

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The input configuration refers to the text area of the element only, not the two buttons.

The *“Configure”* button opens the *“Input configuration”* dialog box for creating or modifying a user input configuration. A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it. Example: *“Execute ST code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog box.
“OnMouseClick”	Input event: The user clicks the element completely. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the element only.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.
“OnMouseMove”	Input event: The user moves the mouse pointer over the element area.
“OnMouseUp”	Input event: The user releases the mouse button over the element area.

See also

- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

“Tap”	When a mouse click event occurs, the variable defined in *“Variable”* is described in the application. The coding depends on the options *“Tap FALSE”* and *“Tap on enter if captured”*.
“Variable”	Variable (`BOOL`). Contains the information whether a mouse click event exists. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *“Tap FALSE”* option is not activated.
“Tap FALSE”	☑: The mouse click event leads to a complementary value in *“Variable”*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
“Tap on enter if captured”	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

“Shift”	When a mouse click event occurs, the variable here is described in the application. When the mouse click event ends, its value is toggled with the *“Toggle on up if captured”* option.
“Variable”	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
“Toggle on up if captured”	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkeys”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Event(s)”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Event(s)”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Invisible Input'

Symbol:

Category: *"Common Controls"*

This element is displayed in the editor with a dashed line which is not visible in online mode. You define the behavior of the el in the input configuration.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Unsichtbare_Eingabe_1`
"Type of element"	*"Invisible Input"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkey”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Events”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Events”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

Visualization Element 'Progress Bar'

Symbol:

Category: *“Common Controls”*

The element displays the value of a variable as a progress bar.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Progress_Data_Transfer`
“Type of element”	*“Progress Bar”*
“Text ID”	ID of the global text list Requirement: Text is configured in the property *“Texts ➔ Text”*.
“Variable”	Variable (numeric data type). Represents the length of the progress bar.
“Minimum value”	Value range of the variable
“Maximum value”	
“Style”	● *“Blocks”* ● *“Bar”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊡) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Text"	String label for the element. Example: `Zoom`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

● *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Check Box'

Symbol:

Category: *"Common Controls"*

The element is used for setting and resetting a Boolean variable. The set state is identified by a check mark.

Element properties

"Element name"	Example: `signal_tone_for_parts_deficit` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Check Box"*
"Text ID"	ID for the text in the *"GlobalTextList"* Example: `22` The text ID cannot be changed. As soon as you specify and save a text in *"Texts"* - *"Text"*, CODESYS automatically creates an entry in the *"GlobalTextList"* and displays the ID here.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	Variable of type `BOOL` Example: *"PLC_PRG.xIsTrue"*
"Frame size"	Distance of the element to the edge Example: *"From style"*

Element property 'Texts'

The properties contains character strings for labeling the element.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Example: `Axis 1`.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Parameters of Axis 1`.

See also

- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	• *"Default style values"*: The values of the visualization style are used. • *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long • *"Default"*: The long text is truncated. • *"Line break"*: The text is split into parts. • *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.

"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

Visualization Element 'Radio Buttons'

Symbol:

Category: *"Common Controls"*

The element provides a series of radios buttons with an unlimited number of options.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Morning Shift`
“Type of element”	*“Radio Buttons”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Variable”	Variable (integer data type) that gives the index of the radio button that the visualization user has activated Example: `PLC_PRG.iNrOfActivatedRadioButton`
“Number of columns”	Definition of the number of list boxes displayed in a row Example: `2`
“Radio button order”	*“Left to right”*: The radio buttons are aligned by rows until the number of columns is reached. *“Top to bottom”*: The radio buttons are aligned row by columns until the number of columns is reached.
“Frame size”	Defines the distance from the list boxes to the edge (in pixels).
“Row height”	Height of the row (in pixels) Modifying the height of the row also changes the size of the list box.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Radio button settings'

“Radio button” ● *“Areas”* – *“[<n>]”*	*“Create new”*: Clicking this button creates a new selection button in the editor and lists an additional area in the properties editor. For each radio button, an area is visible that records the settings. ● [<n>] – *“[<n>]”*: This number indicates the area. Clicking *“Delete”* will delete the associated radio button with its settings *“Text”*, *“Tooltip”*, and *“Line spacing (in pixels)”*.
Areas: [<n>]	
“Text”	The button name is specified here. Default value: *“Radio_button”*
“Tooltip”	Text is specified here that is displayed in a tooltip.
“Line spacing (in pixels)”	The distance (in pixels) to the upper button can be specified here.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Alarm Table'

Symbol:

Category: *“Alarm Manager”*

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column – even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

If an alarm history has been created, then you can programmatically delete it at runtime. The recording starts again from the time of deletion. See the help page for "Visualizing Alarm Management".

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Alarm Table"*
"Data source"	Selection of the device and the application where the data to be visualized and the alarms are generated ● Remote data source which accesses a remote device, accesses a remote application, and then transfers the data to the alarm configuration Example: `DataSource_A` Below the (now visible) *"Application"* property, the remote application is displayed as configured in the data source. Example: `App_A` Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder. ● Local application below which the alarm configuration is located Example: *"<local application>"*

See also

- *Object 'Data Source'*

Element property 'Alarm configuration'

"Alarm groups"	Opens the *"Select Alarm Group"* dialog where you define the alarm groups that you want to display.
"Priority from"	Least priority for alarm display. (0 to 255).
"Priority to"	Greatest priority for alarm display. (0 to 255).
"Alarm classes"	Opens the *"Select Class Group"* dialog where you define the alarm classes that you want to display.
"Filter criterion"	For the *"Alarm Banner"* element only ● *"Most important"*: The alarm with the highest priority (lowest value) is displayed. ● *"Newest"*: The most recent alarm is displayed.

"Filter by latch 1"	The generated alarms (previous and current) can be filtered by the contents of *"Latch variable 1"*, which is specified in the configuration of the alarm group. In *"Filter type"*, you define whether or not the filtering is performed by a string value or a numerical value. ● *"Filter variable"*: Indicates what the alarms are filtered by. Possible entries: Application variable of data type `STRING` or `WSTRING`, or a literal value directly. Examples:`PLC_PRG.strFilterVariable`, `'STRING'`. ● *"Filter type"*: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: `PLC_PRG.diFilterType`, or a value directly (example: `2`). Possible values: – `0`: No filtering – `1`: Filter by alarms whose latch variable 1 contains the string specified in *"Filter variable"*. Example: The filter variable contains `'Error 1'` which is the latch variable 1 of different alarms of type `STRING` and has the value `'Error 1'` ->. Only these alarms are displayed. – `2`: Filter by alarms whose latch variable 1 contains the typed literal specified in *"Filter variable"* according to IEC 61131-3. Examples: `T#1h2s`, `DINT#15`, `REAL#1.5`, `FALSE` – `3`: Filter by alarms whose latch variable 1 contains the LINT literal value specified in *"Filter variable"*. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807. – All other values: The behavior is not defined and can change in the future.
"Filter by time range"	The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the *"Filter type"* to define whether filtering by time range is enabled or disabled. ● *"Filter variable, from"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeFrom`) for the start time that the alarms are displayed. ● *"Filter variable, to"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeTo`) for the end time that the alarms are displayed. ● *"Filter type"*: Variable of integer data type that determines whether *"Filter by time range"* is enabled or disabled. Possible values: – `1`: Filtering is enabled – `0`: Filtering is disabled

- *Chapter 1.4.5.19.3.16 "Dialog 'Selected Alarm Class'" on page 1768*

Element property 'General table configuration'

"Show row header"	☑: Display of the row number at the beginning of the row.
"Show column header"	☑: Display of the column heading as defined in *"Column heading"*.
"Row height"	Height of the table rows (in pixels).
"Row header width"	Width of the line header (in pixels).

"Scrollbar size"	Width of the scrollbar when it runs vertically. Width of the scrollbar when it runs horizontally. Specified in pixels
"Automatic line break for alarm message"	☑: The message text is truncated at the end of the line. ☐: The message text is truncated at the end of the column, if the text is too long.

Element property 'Columns: Column [<n>]'

By default, columns [0] and [1] are configured: *"Time stamp"* and *"Message text"*. You can create more columns by clicking the *"Create new"*, and remove columns by clicking *"Delete"*.

Animations (dynamic text, font variables), text, and tooltip are not supported.

"Column header"	The standard header is set and changed here by specifying a new text.
"Use text alignment in title"	☑: The text in the column header is aligned according to the current definition in *"Text alignment"*. ☐: The text in the column header is centered.
"Width"	Width of the column (in pixels).
"Data type"	Notice about time stamps: For use in a TargetVisu or WebVisu, you can control the date and time format with the help of the global string variables from the library `Alarmmanager.library`: `AlarmGlobals.g_sDateFormat` (example: `AlarmGlobals.g_sDateFormat := 'MM.yyyy'`) and `AlarmGlobals.g_sTimeFormat` (example: `AlarmGlobals.g_sTimeFormat := 'HH:mm'`). Define the information to be displayed in the column. ● *"Symbol"* ● *"Time stamp"*: Date and time of the last status change of the alarm. ● *"Time stamp active"*: Date and time of the last activation of the alarm. ● *"Time stamp inactive"*: Date and time of the last deactivation of the alarm. ● *"Time stamp acknowledge"*: Date and time of the last acknowledgment. ● *"Value"*: Current value of the printout ● *"Message text"*: Output of the message text ● *"Priority"*: Alarm priority ● *"Class"*: Alarm class ● *"State"*: Alarm state ● *"Latch Variable <n>"*: Value of the selected latch variables
"Text alignment"	Alignment of the text in this column ● *"Left"* ● *"Centered"* ● *"Right"*
"Color settings"	● *"Activate color settings"*: Boolean variable for activating and deactivating the color settings defined here. Example: `PLC_PRG.bColorSettings` ● *"Cell fill color"*: – *"Color variable"*: Variable for the cell fill color, example: `dwCellColor` (hexadecimal color definition: 16#TTRRGGBB) – *"Use color also for column header"*: ☑: The color defined via *"Color variable"* is used in the column header as well. ● *"Text color"*: – *"Color variable"*: Variable for the definition of the text color in the column, example: `dwTextColor` (hexadecimal color definition: 16#TTRRGGBB) – *"Use color also for column header"*: ☐: The color defined via *"Color variable"* is used in the column header as well.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Selection'

"Selection color"	Fill color of the selected row
"Selection font color"	Font color of the selected row
"Frame around selected cells"	☑: A frame is drawn around the selected cells at runtime.
"Variable for selected alarm group"	Name of the affected alarm group; type: `STRING`, `WSTRING`
"Variable for selected alarm ID"	Alarm ID of the affected alarm group; type: `STRING`, `WSTRING`
"Variable for selected line"	Index of the selected alarm line (0-based). The index can be read and written; integer data type
"Variable for valid selection"	TRUE: An alarm line is selected. FALSE: The selection is invalid. For example, for an empty alarm table or when an alarm is not selected yet.
"Variable for selected alarm information"	Information about the selected alarm. Type `AlarmSelectionInfo` For easy usage, the function block `AlarmSelectionInfoDefault` is provided. This FB fills the structure with the memory for 10 messages and 10 latch variables. Example: `myAlarmSelectionInfoDefault.AlarmSelectionInfo` The following information is available: • `sAlarmgroup` • `uialarmID` • `timeStampActive` • `timeStampInactive` • `timeStampAcknowledge` • `timeStampLast` • `paLatchVariables` • `iLatchVariablesCount` • `papwsAlarmMessages` • `dwAlarmMessageTextBufferSize` • `iAlarmMessagesCount` • `iSelectionChangedCounter`

Element property 'Control variables'

Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

“Acknowledge selected”	Variable (`BOOL`) Example: `PLC_PRG.bAckSelectedAlarms` If the assigned variable is `TRUE`, then the selected alarm is acknowledged.
“Acknowledge all visible”	Variable (`BOOL`) Example: `PLC_PRG.bAckVisibleAlarms` If the assigned variable is `TRUE`, then all alarms are acknowledged that are visible in the alarm table.
“History”	Variable (`BOOL`) Example: `PLC_PRG.bShowHistory` If the assigned variable is `TRUE`, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. Note: Acknowledgment is not possible in this view.
“Freeze scroll position”	Variable (`BOOL`) Example: `PLC_PRG.bFreezeScrollPosition` If the assigned variable is `TRUE`, then the scroll position set in the *“History”* view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).
“Count alarms”	Variable (integer data type) Example: `PLC_PRG.iNumberOfAlarms.` Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.
“Count visible rows”	Variable (integer data type) Example: `PLC_PRG.iNumberVisibleLines` Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.
“Current scroll index”	Variable (integer data type) Example: `PLC_PRG.iScrollIndex` The index of the first visible row if the alarm table (0-based). The variable can be read and written.
“Current column sorting”	Variable (integer data type) Example: `PLC_PRG.iColSort` The variable contains a value of the enumeration "VisuElemsAlarm.VisuEnumAlarmDataType". This value determines the column that sorts the alarm table.
“Variable for sorting direction”	Variable (BOOL) Example: `PLC_PRG.xSortAscending` The variable determines the sort order for the entries in the alarm table (`TRUE`: ascending; `FALSE`: descending).

You can also use the “Insert Elements for Acknowledging Alarms” command to define buttons with predefined control variables.

- *Chapter 1.4.5.19.2.23 “Command 'Add Elements for Alarm Acknowledgement'” on page 1744*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Alarm Banner'

Symbol:

Category: *"Alarm Manager"*

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Alarm Banner"*
"Data source"	If you intend to use a remote alarm configuration, then you have to specify the name of the remote application here. If you do not specify anything, the alarm configuration will be located locally.

Element property 'Alarm configuration'

"Alarm groups"	Opens the *"Select Alarm Group"* dialog where you define the alarm groups that you want to display.
"Priority from"	Least priority for alarm display. (0 to 255).
"Priority to"	Greatest priority for alarm display. (0 to 255).
"Alarm classes"	Opens the *"Select Class Group"* dialog where you define the alarm classes that you want to display.
"Filter criterion"	For the *"Alarm Banner"* element only ● *"Most important"*: The alarm with the highest priority (lowest value) is displayed. ● *"Newest"*: The most recent alarm is displayed.

"Filter by latch 1"	The generated alarms (previous and current) can be filtered by the contents of *"Latch variable 1"*, which is specified in the configuration of the alarm group. In *"Filter type"*, you define whether or not the filtering is performed by a string value or a numerical value. ● *"Filter variable"*: Indicates what the alarms are filtered by. Possible entries: Application variable of data type `STRING` or `WSTRING`, or a literal value directly. Examples:`PLC_PRG.strFilterVariable`, `'STRING'`. ● *"Filter type"*: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: `PLC_PRG.diFilterType`, or a value directly (example: `2`). Possible values: – `0`: No filtering – `1`: Filter by alarms whose latch variable 1 contains the string specified in *"Filter variable"*. Example: The filter variable contains `'Error 1'` which is the latch variable 1 of different alarms of type `STRING` and has the value `'Error 1'` ->. Only these alarms are displayed. – `2`: Filter by alarms whose latch variable 1 contains the typed literal specified in *"Filter variable"* according to IEC 61131-3. Examples: `T#1h2s`, `DINT#15`, `REAL#1.5`, `FALSE` – `3`: Filter by alarms whose latch variable 1 contains the LINT literal value specified in *"Filter variable"*. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807. – All other values: The behavior is not defined and can change in the future.
"Filter by time range"	The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the *"Filter type"* to define whether filtering by time range is enabled or disabled. ● *"Filter variable, from"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeFrom`) for the start time that the alarms are displayed. ● *"Filter variable, to"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeTo`) for the end time that the alarms are displayed. ● *"Filter type"*: Variable of integer data type that determines whether *"Filter by time range"* is enabled or disabled. Possible values: – `1`: Filtering is enabled – `0`: Filtering is disabled

- *Chapter 1.4.5.19.3.16 "Dialog 'Selected Alarm Class'" on page 1768*

Element property 'Columns: Column [<n>]'

By default, columns [0] and [1] are preconfigured: *"Time stamp"* and *"Message text"*. You create more columns by clicking *"Create new"*. You remove columns by clicking *"Delete"*.

Animations (dynamic text, font variables), texts, and tooltips are not supported.

"Width"	Width of the column (in pixels)
"Type of data"	About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library `Alarmmanager.library`: `AlarmGlobals.g_sDateFormat` (example: `AlarmGlobals.g_sDateFormat := 'MM.yyyy'`) and `AlarmGlobals.g_sTimeFormat` (example: `AlarmGlobals.g_sTimeFormat := 'HH:mm'`). Here you define the information to be displayed in the column. ● *"Bitmap"* ● *"Time stamp"*: Date and time of the last status change of the alarm ● *"Time stamp active"*: Date and time of the last activation of the alarm ● *"Time stamp inactive"*: Date and time of the last deactivation of the alarm ● *"Time stamp acknowledge"*: Date and time of the last acknowledgement ● *"Value"*: Actual value of the expression ● *"Message"*: Output of the message text ● *"Priority"*: Alarm priority ● *"Class"*: Alarm class ● *"State"*: Alarm state ● *"Latch Variable <n>"*: Value of the selected latch variables
"Text alignment"	Alignment of the contents in the column ● *"Left"* ● *"Centered"* ● *"Right"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

"Acknowledge variable"	A rising edge of this variable acknowledges the alarm.

Handling of multiple active alarms

"Automatic switch"	☑: The display in the alarm banner is switched automatically according to the time to the next alarm as configured in *"Every N second"*.
"Every N second"	Time period until the next switching. Available only if *"Automatic switch"* is selected.
"Next alarm"	Variable for switching to the next alarm. Available only if *"Automatic switch"* is not selected.
"Previous alarm"	Variable for switching to the previous alarm. Available only if *"Automatic switch"* is not selected.
"Multiple alarms active"	Variable that has the value `TRUE` if multiple alarms are active.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Bar Display'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element properties

“Element name”	Example: `GenElemInst_2`
“Type of element”	*“Bar Display”*
“Value”	Variable (numeric data type) The value of the variable is displayed as a bar length.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊡) to other positions in the editor.

See also

- ↳ *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Background color"	Drop-down list with background colors Note: This property depends on the style. For example, there are no heterochromatic background images for *"FlatStyle"* and *"Whitestyle"*.
"Own image"	● *"image"*: Image ID of the background image. You select the background image from an image pool by clicking the ... symbol. Info: If you specify the *"<default>"* value or select the image from the *"Default"* category in the input assistant, then the original element background image is used. ● *"Transparent color"*: Color of pixels that are displayed as transparent. Selection from drop-down list or input assistant.
"Optimized drawing"	☑: The background image is drawn one time. If there is a change in the foreground, then only the affected part of the image is redrawn. ☐: The background image is redrawn in cycles. Note: Deactivating this option is sensible only in certain exceptional cases.

Element property 'Bar'

"Diagram type"	Position of the scale ● *"Scale besides bar"* ● *"Scale in bar"* ● *"Bar in scale"* ● *"No scale"*
"Orientation"	Orientation depending on the ratio of width to height of the Bar Display: ● *"Horizontal"* ● *"Vertical"*
"Running direction"	Direction the values are increased. Drop-down list for *"Orientation Horizontal"*: ● *"Left to right"* ● *"Right to left"* Drop-down list for *"Orientation Vertical"*: ● *"Bottom to top"* ● *"Top to bottom"*
"Optimum size for bar"	☑: The bar width requires the majority of the element surface. Note: This property depends on the style. It is not provided for *"FlatStyle"* or *"WhiteStyle"*.

Element property 'Scale'

“Scale start”	Least value of the scale and the lower limit of the value range for the element. Example: `0` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale start.
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale end.
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between 2 values on the rough scale. Example: `10` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Subscale”	Distance between 2 values on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the spacing.
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels. Example: `3`
“Scale color”	Color of scale lines •  : The *“Color”* dialog box opens. • ▼: A drop-down list with color names opens.
“Scale in 3D”	☑: Tick marks are displayed with slight 3D shadowing. Note: This property depends on the style. Not available for *“FlatStyle”*.
“Element frame”	☑: A frame is drawn around the element.

Element property 'Label'

“Unit”	Text that is displayed in the element. Example: Units displayed in m/s.
“Font”	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *“”* button. 
“ Scale format (C Syntax)”	Values scaled in "printf" syntax Examples: `%d, %5.2f`
“Max. text width of labels”	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Text height of labels”	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Font color”	Selection from the drop-down list or by clicking the  button.

Element property 'Positioning'

“Horizontal offset”	Distance from the scale (bar) to the horizontal element frame Specified in pixels. Used for achieving the exact position relative to the background image.
“Vertical offset”	Distance from the scale (bar) to the vertical element frame Specified in pixels. Used for achieving the exact position relative to the background image.
“ Horizontal scaling”	Horizontal division of the scale Specified in pixels. Used for achieving the exact positioning relative to the background image.
“Vertical scaling”	Vertical division of the scale Specified in pixels. Used for achieving the exact positioning relative to the background image.

Element property 'Colors'

"Graph color"	Color of the bar
"Bar background"	☑: The background of the bar is black. ☐: The background of the bar is white.
"Frame color"	Color that the frames are drawn.
"Switch whole color"	☑: The total color of the bar is switched to the color of the color area of the current value.
"Use gradient color for bar"	☑: Bar is displayed with a gradient.
"Color range markers"	The color areas can be separated from each other inside the bar with a vertical mark. ● *"No markers"*: No display. ● *"Marker forwards"*: The color of the vertical mark corresponds to the color of the previous color area. ● *"Marker backwards"*: The color of the vertical mark corresponds to the color of the next color area.
"Color areas"	
"Create new"	A new color area is added.
" Delete"	The color area is removed from the list.
"Begin of area"	Start value of the color area
"End of area"	End value of the color area
"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Meter 90°'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Meter 90°”*
“Value”	Variable (numeric data type) The variable value determines the pointer direction of the element.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • : Drop-down list with color names
"Angle range"	Drop-down list for the alignment of the element
"Additional arrow"	: An additional arrow is shown inside the scale.

Element property 'Scale'

“Sub scale position”	● *“Outside”*: The subscale is displayed on the outer scale ring. (*“Frame outside”*) ● *“Inside”*: The subscale is displayed on the inner scale ring. (*“Frame inside”*)
“Scale type”	Type of scale ● *“Lines”* ● *“Dots”* ● *“Squares”*
“Scale start”	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *“Variable”* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

"Variable"	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

"Scale line width"	Specified in pixels Example: `3`
"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	• *"Preset style values"*: Values from the current style • *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.
"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254“”*

Visualization Element 'Meter 180°'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable on a scale. A meter is used to represent a tachometer, for example.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Meter 180°”*
“Value”	Variable (numeric data type) The variable value determines the pointer direction of the element.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.

"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • : Drop-down list with color names
"Angle range"	Drop-down list for the alignment of the element
"Additional arrow"	: An additional arrow is shown inside the scale.

Element property 'Scale'

"Sub scale position"	• *"Outside"*: The subscale is displayed on the outer scale ring. (*"Frame outside"*) • *"Inside"*: The subscale is displayed on the inner scale ring. (*"Frame inside"*)
"Scale type"	Type of scale • *"Lines"* • *"Dots"* • *"Squares"*
"Scale start"	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *"Variable"* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels Example: `3`

“Scale color”	Color of scale lines ● ...: The *“Color”* dialog opens. ● ▼: A list box with style colors opens.
“Scale in 3D”	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *“FlatStyle”*.
“Show scale”	☑: The scale is displayed.
“Frame inside”	☑: A frame is drawn at the inner end of the scale.
“Frame outside”	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

“Label”	Selection list ● *“Outside”*: Scale values are placed outside of the scale. ● *“Inside”*: Scale values are placed inside of the scale.
“Unit”	Text that is displayed in the element. Example: Units displayed in m/s.
“Font”	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *“”* button. ...
“ Scale format (C Syntax)”	Values scaled in "printf" syntax Examples: `%d, %5.2f`
“Max. text width of labels”	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Text height of labels”	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Font color”	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

“Usage of”	● *“Preset style values”*: Values from the current style ● *“User-defined settings”*: The subnode *“Positioning”* appears.
“Positioning” Requirement: *“User-defined settings”* is selected as *“Usage of”*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
“Needle movement”	Length of the needle (in pixels)
“Scale movement”	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *“Background”*.

"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Meter'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Meter”*
“Value”	Variable (numeric data type). The variable value determines the pointer direction of the element.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.

"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • ▼: Drop-down list with color names
"Arrow start"	Angle (in degrees) between the scale start and the horizontal axis
"Arrow end"	Angle (in degrees) between the right edge of the pointer instrument and the horizontal axis
"Additional arrow"	☑: An additional arrow is shown inside the scale.

Element property 'Scale'

"Sub scale position"	• *"Outside"*: The subscale is displayed on the outer scale ring. (*"Frame outside"*) • *"Inside"*: The subscale is displayed on the inner scale ring. (*"Frame inside"*)
"Scale type"	Type of scale • *"Lines"* • *"Dots"* • *"Squares"*
"Scale start"	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *"Variable"* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels Example: `3`

"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the "" button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	● *"Preset style values"*: Values from the current style ● *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.

"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Potentiometer'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable as a setting on the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Potentiometer”*
“Variable”	Variable (numeric data type). Contains the position of the pointer for the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • ▼: Drop-down list with color names
"Arrow start"	Angle (in degrees) between the left edge of the element and the horizontal axis
"Arrow end"	Angle (in degrees) between the right edge of the element and the horizontal axis

Element property 'Scale'

“Sub scale position”	● *“Outside”*: The subscale is displayed on the outer scale ring. (*“Frame outside”*) ● *“Inside”*: The subscale is displayed on the inner scale ring. (*“Frame inside”*)
“Scale type”	Type of scale ● *“Lines”* ● *“Dots”* ● *“Squares”*
“Scale start”	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *“Variable”* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

"Variable"	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

"Scale line width"	Specified in pixels Example: `3`
"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	• *"Preset style values"*: Values from the current style • *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.
"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` ◆: The property *"Variable"* is shown below.

“Variable”	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

“Color”	Color that is used for displaying the area.

Element property 'State variables' The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Absolute movement' The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Histogram'

Symbol:

Category: *“Measurement Controls”*

The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.

See also

- *Chapter 1.4.5.21.4 “Displaying Array Data in a Histogram” on page 2138*

Element properties

“Element name”	Example: `GenElemInst_35`
“Type of element”	*“Histogram”*
“Data array”	One-dimensional array with data displayed in this histogram. Example: `PLC_PRG.arr1`

Element property 'Subrange of array'

“Use subrange”	☑: Only part of the array is displayed in the histogram.
“Start index”	First array index with a displayed value. Requirement: *“Use subrange”* is activated.
“End index”	Last array index with a displayed value. Requirement: *“Use subrange”* is activated.

“Display type”	● *“Bars”*: Data is displayed as bars. ● *“Lines”*: Data is displayed as lines. ● *“Curve”*: Interpolation of data into a curve.
“Line width”	Specified in pixels Requirement: *“Curve”* is selected as the *“Display type”*.
“Show horizontal lines”	☑: Horizontal lines are drawn on the main scale. Note: Not all visualization styles have this property. This element property is not available for visualization styles that have striped backgrounds (example: *“Flat style”*).
“Relative bar width”	Integer value between `1` and `100` ● `1`: The bars are drawn as lines. ● `100`: The entire width of the histogram is filled with the bars.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Scale'

"Scale start"	Least value of the scale and the lower limit of the value range for the element. Example: `0` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the scale start. Example: `PLC_PRG.iScaleStart`
"Scale end"	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the scale end. Example: `PLC_PRG.iScaleEnd`

"Main scale"	Distance between 2 values on the rough scale. Example: `10` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the distance. Example: `PLC_PRG.iMainScale`
"Subscale"	Distance between 2 values on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the spacing. Example: `PLC_PRG.iSubScale`
"Scale color"	Color of scale lines • ...: The *"Color"* dialog box opens. • : A drop-down list with color names opens.
"Base line"	Value of the main scale where the horizontal base line of the Histogram is located. The drawing of the bar starts at the base line.

Example A valid declaration is required for the variables used as an example in the table above.

```
PROGRAM PLC_PRG
VAR
    iScaleStart : INT := 0;
    iScaleEnd : INT := 120;
    iMainScale : INT := 20;
    iSubScale : INT := 5;
END_VAR
```

Element property 'Label'

"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	Optional value that defines the maximum width of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	Optional value that defines the maximum height of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Colors'

"Graph color"	Color of the bar in normal state. Note: The normal state is in effect when the current value of the array component does not fulfill the alarm condition.
"Alarm value"	Threshold for the alarm
"Alarm condition"	If the current value of the array component fulfills the alarm condition, then the alarm condition is set. ● *"Less"*: The current value is less than the *"Alarm value"* ● *"More"*: The current value is greater than the *"Alarm value"*
"Alarm color"	Color of the bar in alarm state.
"Use color areas"	☑: The color areas defined in this element are used.
"Color areas"	
"Create new"	A new color area is added.
" Delete"	The color area is removed from the list.
"Begin of area"	The start value on the *"Scale"* of the Histogram where the color area begins.
"End of area"	The end value on the *"Scale"* of the Histogram where the color area ends.
"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Image Switcher'

Symbol:

Category: *"Lamps/Switches/Bitmaps"*

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the *"Image settings"* element properties. The effects of mouse clicks are defined in the *"Element behavior"* property.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `ImageSwitcher_1`
“Type of element”	*“Image Switcher”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Variable”	Variable (`BOOL`). The value of the variable changes according to user input and it is independent of the *“Element behavior”* element property.

Image settings

“Image "on"”	Image ID from an image pool. The image can be selected using the input assistant. The image is used if the variable of the *“Variable”* property has the value `TRUE`.
“Image "off"”	Image ID from an image pool. The image can be selected using the input assistant. The image is used if the variable of the *“Variable”* property has the value `FALSE`.
“Image "clicked"”	Image ID from an image pool. The image is selected using the input assistant. In runtime mode, the visualization displays the referenced image when the element is clicked (and the mouse button is held down). Requirement: The *“Element behavior”* is *“Image toggler”*.

"Transparency"	☑: The *"Transparent color"* is selected.
"Transparent color"	The image pixels that have the transparent color are displayed as transparent. Requirement: *"Transparency"* is activated. ● ...The *"Color"* dialog box opens. ● ▼: A drop-down list with color names opens.
"Scaling type"	Defines how an image fits in the element frame. ● *"Fixed"*: The original size of the image is retained, regardless of the dimensions of the element. ● *"Isotropic"*: The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. ● *"Anisotropic"*: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click switches the image. ● *"Image tapper"*: While a visualization user holds down the mouse button, the image of the *"Image on"* property is displayed. At the same time, the value `TRUE` is assigned to the *"Variable"* property.
"Tap FALSE"	☑: While the mouse button is pressed, the image of the *"Image"* property is displayed and the *"Variable"* property gets the value `FALSE` instead of the value `TRUE`, and back. Requirement: *"Image tapper"* is selected in the *"Element behavior"* property.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

Visualization Element 'Lamp'

Symbol:

Category: *“Lamps/Switches/Bitmaps”*

The element shows the value of a variable, and the element is displayed as illuminated or not.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Lamp_green`
"Type of element"	*"Lamp"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Variable"	Variable (`BOOL`). The variable value is displayed as a lamp that goes on (`TRUE`) or off (`FALSE`).

Image settings

"Transparency"	: The *"Transparent color"* property is selected.
"Transparent color"	Pixels in this color are displayed as transparent. Requirement: *"Transparency"* is activated. • The *"Color"* dialog box opens. • : A drop-down list with style colors opens.

"Scaling type"	Reaction of the element when the dimension of the *"Frame"* element is changed: ● *"Isotropic"*: The height and width of the image are resized proportionally to the *"Frame"*. Please note: To retain the alignment of elements also within a scaled *"Frame"* element, define the *"Horizontal alignment"* or *"Vertical alignment"* explicitly with *"Centered"*. ● *"Anisotropic"*: The image fills the entire *"Frame"* regardless of its proportions.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Background'

“Image”	Drop-down list with background colors Depends on the visualization style

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Dip Switch', 'Power Switch', 'Push Switch', 'Push Switch LED', 'Rocker Switch'

Symbols:

Category: *"Lamps/Switches/Bitmaps"*

The element assigns a value to a Boolean variable. The switch position "on" the value `TRUE` to the variable, and the switch position "off" assigns the value `FALSE`. Use the mouse to change the switch position.

Element properties

"Element name"	Example: `Operating_Switch` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	Depending on the element: *"Dip Switch"*, *"Power Switch"*, *"Push Switch"*, *"Push Switch LED"*, or *"Rocker Switch"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Variable"	Variable (`BOOL`) The value of the variables `TRUE` and `FALSE` indicates the switch position on/off.

Image settings

"Transparency"	☑: The *"Transparent color"* property is selected.
"Transparent color"	Pixels in this color are displayed as transparent. Requirement: *"Transparency"* is activated. ● ...The *"Color"* dialog box opens. ● ▼: A drop-down list with style colors opens.
"Scaling type"	Reaction of the element when the dimension of the *"Frame"* element is changed: ● *"Isotropic"*: The height and width of the image are resized proportionally to the *"Frame"*. Please note: To retain the alignment of elements also within a scaled *"Frame"* element, define the *"Horizontal alignment"* or *"Vertical alignment"* explicitly with *"Centered"*. ● *"Anisotropic"*: The image fills the entire *"Frame"* regardless of its proportions.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click changes the switch and the *" Variable"* value. ● *"Image tapper"*: The switch is "on" and the *"Variable"* value is `TRUE` while the mouse button is pressed.
"Tap FALSE"	☑: The value `TRUE` is assigned to the *"Variable"* property instead of the value `FALSE`, and back. Requirement: *"Image tapper"* is selected in the *"Element behavior"* property.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access.`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Background'

"Image"	Drop-down list with background colors Depends on the visualization style

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Rotary Switch'

Symbol:

Category: *“Lamps/Switches/Bitmaps”*

The element assigns a value to a Boolean variable. The switch position "on" the value `TRUE` to the variable, and the switch position "off" assigns the value `FALSE`. Use the mouse to change the switch position.

Element properties

“Element name”	Example: `Operating_Switch` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Rotary Switch”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Variable”	Variable (`BOOL`). The value of the variables `TRUE` and `FALSE` indicates the switch position on/off.

Image settings

"Transparency"	☑: The *"Transparent color"* property is selected.
"Transparent color"	Pixels in this color are displayed as transparent. Requirement: *"Transparency"* is activated. ● ...The *"Color"* dialog box opens. ● ▼: A drop-down list with style colors opens.
"Scaling type"	Reaction of the element when the dimension of the *"Frame"* element is changed: ● *"Isotropic"*: The height and width of the image are resized proportionally to the *"Frame"*. Please note: To retain the alignment of elements also within a scaled *"Frame"* element, define the *"Horizontal alignment"* or *"Vertical alignment"* explicitly with *"Centered"*. ● *"Anisotropic"*: The image fills the entire *"Frame"* regardless of its proportions.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click changes the switch and the " *Variable"* value. ● *"Image tapper"*: The switch is "on" and the *"Variable"* value is `TRUE` while the mouse button is pressed.
"Orientation"	● *"At top"*: The rotary switch turns from the top right to the top left. ● *"At side"*: The rotary switch turns from the top right to the bottom right.
"Color change"	☑: The element changes in color when " *Variable"* is `TRUE`.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Background'

“Image”	Drop-down list with background colors Depends on the visualization style

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Trace'

Symbol:

Category: *"Special Controls"*

The element displays the graphical curve of variable values. In addition, variables can be configured to control the view.

See also

- *Chapter 1.4.5.10 "Displaying data curve with trace" on page 1306*
- *"Dialog box 'Trace Configuration'" on page 1734*

Element properties

"Element name"	Example: `Velocity`
"Data Source"	Location where the trace data is buffered. : ● *"<local application>"*: The trace record is listed below the local application. The visualization that contains the trace is located below this application. When the application is downloaded, the trace configuration is downloaded to the local device. During execution, the data is stored locally in the trace buffer. ● *" <data source name>"*: Data source that identifies the remote device where the trace record is created. When the local application is downloaded with the visualization, the trace configuration is downloaded to the **remote** device. During execution, the trace buffer is filled, and the trace data is transferred and then displayed in the local visualization as HMI. Example: `DataSoure_PLC_A` Note: The trace buffer is filled only if the remote application is being executed. The data recording is started when the local visualization is started.
"Application"	Application where data was recorded. : Lists all applications that are present below the data source. Requirement: A remote data source (not *"<local application>"*) is referenced in the *"Data source"* property.
"Type of element"	*"Trace"*
"Trace"	*" <name of trace configuration>"*: Opens the *"Trace Configuration"* dialog where you can modify the trace configuration.

See also

- *"Dialog box 'Trace Configuration'" on page 1734*
- *Data Source Manager*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.
"Angle"	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Show cursor"	☑: A cursor (vertical line) is displayed at the mouse position. The trigger and variable values where the cursor points are displayed as a tooltip.
"Overwrite existing trace on PLC"	☑: If a trace with the same name is on the PLC, then it is overwritten at download with the configuration that is defined here.
"Number format"	Number format of values in the tooltip in printf syntax (example: %d, %5.2f).

Element property 'Control variables'

The control variables are assigned automatically when you click *"Insert elements for controlling Trace"*.

“Reset Trigger”	Variable (BOOL). Standard control variable: bResetTrigger TRUE: Resets the triggering. After the action is executed, the variable is set automatically to FALSE.
“Start Trace”	Variable (BOOL). Standard control variable: bStart TRUE: Starts the Trace. After the action is executed, the variable is set automatically to FALSE.
“Stop Trace”	Variable (BOOL). Standard control variable: bStop TRUE: Stops the Trace. After the action is executed, the variable is set automatically to FALSE.
“Save Trace to a file”	
“Save Trace”	Variable (BOOL). Standard control variable: bStore TRUE: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to FALSE.
“File name”	Variable (STRING) that contains the file name of the file to be saved. Standard control variable: sStoreFilename
“Load trace from file”	
“Load Trace”	Variable (BOOL). Standard control variable: bRestore TRUE: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to FALSE. Note: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y), then the file cannot be loaded.
“File name”	Variable (STRING) that contains the file name of the file to be read. Standard variable: sRestoreFilename

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Trend'

Symbol:

Category: *"Special Controls"*

The element displays the curve of variable values as a trend diagram. The trend diagram is suitable for representing a long-term data curve because the data is read from a trend recording and hence from a database. Moreover, you can run the *"Trend"* element together with the *"Date Range Picker"*, *"Legend"*, and *"Time Range Picker"* operating elements so that the user can navigate conveniently in the diagram.

> *You can programmatically delete the recorded trend curve at runtime. The recording starts again from the time of deletion. See the help page for "Programming a Trend Visualization".*

Element properties

"Element name"	Example: `Velocity`
"Data source"	Data source for the connection via the device and the application to the *"Trend Recording"* object where the trend data that you want to show was saved. If the *"Trend Recording"* object is on the local device, then it is sufficient when you specify the respective application. If the trend recording is on a remote device, then you need to specify the data source connection to this device. ● *" <local application>"* The *"Trend Recording"* object is located on the local device in the local application. ● `<device name> . <application name>` Example: `Device_A.App_A` The *"Trend Recording"* object is located on the local device `Device_A` below the application `App_A`. ● `<data source name>` Example: `DataSource_B` The *"Trend Recording"* object is located on a remote device that is connected via the data source `DataSource_B`. Below the (now visible) *"Application"* property, the remote application is displayed as configured in the data source. Example: `App_B` Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder.
"Type of element"	*"Trend"*
"Trend recording"	: Trend recording whose data is displayed as a diagram The trend recording is located on the device specified in the *"Data source"* property.
"Display Mode"	: Opens the *"Display Settings"* dialog.

- *Object 'Data Source'*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Y”	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Width”	Specified in pixels Example: `150`
“Height”	Specified in pixels Example: `30`
	Tip: You can change the values in *“X”*, *“Y”*, *“Width”*, and *“Height”* by dragging the corresponding symbols to another position in the editor.
“Angle”	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *“Absolute movement ➔ Internal rotation”*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

"Show cursor"	☑: A cursor (black triangle with vertical line) is shown in the trend diagram. Behavior at runtime: As soon as the graph is drawn, the user can move the cursor along the time axis in order to mark a specific time. Then the variable value belonging to the cursor position is displayed in the legend above the graph. "Show tooltip"	Requirement: *"Show cursor"* is activated. ☑: A tooltip opens at the cursor. Behavior at runtime: The variable value belonging to the cursor position is displayed as a tooltip.
"Show frame"	☑: The trend diagram is drawn with a frame.
"Number format"	Format specification in printf syntax, which determines how the values are displayed in the tooltip and in the legend Example: `%d` (integer variable) or `%5.2f` (floating-point number)

Element property 'Tick mark labels'

The time stored in the trend recording are in the UTC time zone. If the time is displayed in the trend of the visualization element, then the time stamps are converted to the local time zone of the operating system of the PLC.

Change the time zone in the operating system if the times in the trend diagram are not in the zone that you need.

“Time stamps”	X-value of the trend diagram ● *“Absolute time stamps”* The absolute time with date and time is displayed at each tick mark on the time axis. Example: `03/18/2016 12h30m50s` ● *“Relative time stamps”* The time period from the start of the recording (=0) is displayed at each tick mark. Example: `5m30s`
“Draw labels on two lines”	☑: The time stamps are displayed on two lines (for example, the date is displayed on the first line and the time on the second line). ☐: The time stamp is displayed on one line. Example: `2019-11-01-12:30:50.`
“ Omit irrelevant information in timestamps”	☑: The time stamps are displayed in a truncated form (without insignificant information). For example, the date is displayed at the first tick mark, and only the time is displayed at the following tick marks. The *“Internationalization (format strings)”* property is not visible and is ignored. ☐: The time stamps are displayed with all information. This takes into consideration the *“Internationalization (format strings)”* property which contains the format specification for the date and time display.
“Internationalization (format strings)”	Format specification for the date and time display of the time stamp (when it is displayed in full) Note: The property is visible only if the *“Omit irrelevant information in timestamps”* option is **not** selected.

"Date"	Format string that returns the date display according to the defined format. The operating system locale is used as the default setting.
	Defined format strings for the date:
	● Year: `yyyy`, `yy`, `y`
	● Month: `MM`, `M`
	● Day: `dd`, `d`
	● Recommended separator: `- . /`
	Example:
	`yyyy-MM-d` displays `2019-10-25`
	`yyyy-MM-dd` displays `2019-10-25`
	`dd.MM.yyyy` displays `25.10.2019`
	`dd/MM/yyyy` displays `25/10/2019`

"Time"	Format string that returns the time (or time of day) display according to the defined format. The operating system locale is used as the default setting.
	Defined format strings for the time:
	● 24-hour time definition: `HH`, `H`
	● 12-hour time definition: `hh`, `h`
	● AM/PM for 12-hour time definition: `tt`
	● Minutes: `mm`, `m`
	● Seconds: `ss`, `s`
	● Milliseconds: `ms`
	● Microseconds: `us`
	● Recommended separator: `:` or space character
	Example:
	`HH:mm:ss:ms` displays `15:30:59:123`
	`h:mm:ss tt` displays `3:30:59 PM`

Element property 'Assigned control elements'

These elements are created automatically when the control elements are added with the command *"Insert elements for controlling Trend"*.

"Date Range Picker"	Control element for changing the date and time of the displayed data sets. With ..., all elements are provided that have implemented the interface `IDateRangeSelector`. By default, instances of the *"Date Range Picker"* visualization element are available.
"Time Range Picker"	Control element for changing the time of the displayed data sets. With ..., all elements are provided that have implemented the interface `ITimeSelector`. By default, instances of the *"Time Range Picker"* visualization element are available.
"Legend"	Control element for displaying a legend for the graphs. With ..., all elements are provided that have implemented the interface `ILegendDisplayer`.

- *Chapter 1.4.5.19.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 1739*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

- *Object 'Trend Recording'*

Visualization Element 'Legend'

Symbol:

Category: *"Special Controls"*

The element is used as a legend for another element (for example, a trend). The legend is assigned in the properties of the other element.

See also

- *Chapter 1.4.5.11 “Displaying data curve with trend” on page 1309*

Element properties

“Element name”	Example: `LegendOfTrendA` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Legend”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Orientation"	Orientation of the element. The value is configured in the assigned element. ● *"Horizontal"* ● *"Vertical"*
"Attached element instance"	Example: `Element_A`
"Show frame"	☑: The element is displayed with frames.
"Number format"	The format of the value in printf syntax (example: %d, %5.2f)

Element Property 'Layout'

Defines how many variables can be displayed at a maximum and is calculated from the row and column number.	
"Max. number of rows"	Example: `3`
"Max. number of columns"	Example: `2`

Element Property 'Text properties' The property affects the text configured in the associated element.

"Text format"	*"Default"*: The text will be cut and displayed in only the part that fits into the visualization element. *"Linebreak"*: The text will be wrapped in rows. *"Ellipsis"*: The text is cut and ellipsis `...` are added to indicate that something is missing.
"Font"	Font of the text. The entries of the selection list are defined in the visualization style.
"Font color"	Text color, for example `Grey`. The entries of the selection list are defined in the visualization style.
"Transparency"	Transparency value (255 to 0), which defines the transparency of the corresponding color. Example: 255: The color is opaque. 0: The color is fully transparent.

Element property 'Absolute movement' The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'ActiveX'

Symbol:

Category: *"Special Controls"*

The element is used to link an existing ActiveX control in the visualization. You can configure the method calls and their parameters in the element properties of the *"ActiveX"* element.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“ActiveX”*
“Element”	Installed ActiveX component that is linked to the visualization. Hint: To avoid typing errors, select the required ActiveX component by means of the Input Assistant.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Initial calls'

These method calls are executed during initialization. They are executed in the first cycle only.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* with parameters for the method call.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

Element property 'Cyclic calls'

These method calls are executed in every cycle. They are executed in the refresh rate of the visualization.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* for a method call and its parameters.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

Element property 'Conditional calls'

These method calls are executed in the refresh rate of the visualization. You define the call condition in the property *“Methods ➔ [<number>] ➔ Call condition”*.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* with a call condition and parameters for the method call.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Call condition”*: Variable (`BOOL`). A rising edge of this variable triggers the call of this method. ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Web Browser'

Symbol:

Category: *“Special Controls”*

The element shows a website, PDF file, or video that has a URL.

NOTICE!
The display options of the *“Web Browser”* element depend on the operating system and the display variant of the visualization.

Requirement: The software components of the web browser are available in the runtime and configured accordingly (example: videos to be shown on Linux).

See also

- *Chapter 1.4.5.21.6 “Displaying Web Contents” on page 2141*

Element properties

“Element name”	Example: `GenElemInst_59`
“Type of element”	*“Web Browser”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Control variables'

“URL”	URL of the web page that is displayed in the visualization. ● Variable (`STRING` or `WSTRING`) Example: `PLC_PRG.stURL` ● Literal in single straight quotation marks Example: `'http://de.wikipedia.org'`
“Show”	Variable (`BOOL`). Example: `PLC_PRG.bSetURL` Controls the display of the *“Web browser”* element. If the variable contains a rising edge, then the visualization calls the web page given in *“URL”* and displays its contents in the 'Web browser' visualization element.
“Back”	Variable (`BOOL`). Example: `PLC_PRG.bGoBack` Controls the back navigation in the *“Web browser”*. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.
“Forward”	Variable (`BOOL`). Example: `PLC_PRG.bGoForward` Controls the forward navigation in the *“Web browser”*. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Busy Symbol, Cube'

Symbol:

Category: *“Special Controls”*

At runtime, this element indicates automatically that the runtime is busy or waiting for data.

Element properties

"Element name"	Example: `Data_Transfer` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Busy Symbol, Cube"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

Visualization Element 'Busy Symbol, Flower'

Symbol:

Category: *“Special Controls”*

The element indicates that the system is busy or waiting for data.

Element properties

“Element name”	Example: `Data_Transfer` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Busy Symbol, Flower”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Frame color"	
"Fill color"	
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *" Element property 'Appearance variables'" on page 1671*

“Symbol color”	Selection of a color for the flower symbol.
“Line”	Stroke width of the lines (in pixels).

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Text Editor'

Symbol:

Category: *"Special Controls"*

The element shows the contents of text files that are saved on the controller. Files can be encoded in ASCII or Unicode formats.

A visualization user can also edit the text.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Text Editor"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Font'

“Font name”	Non-proportional font used by the visualization to display the contents of the file Example: *“Courier New”*
“Size”	Font size Example: `12`

Element property 'Control variables'

Table 272: Element property “Control variables --> File”

“Variable”	Variable (`STRING`). Contains the file names and optionally the location of the file. It is located in the file system of the controller. Example: `PLC_PRG.strFile: STRING := '/Documentation/Info.txt';`
“Open”	Variable (`BOOL`). Controls opening the file which is defined in the *“Variable”* property Example: `bOpen: BOOL;` `TRUE`: The file is opened.
“Close”	Variable (`BOOL`). Controls closing the file which is defined in the *“Variable”* property Example: `bClose: BOOL;` `TRUE`: The file is closed.
“Save”	Variable (`BOOL`). Controls saving the file which is defined in the *“Variable”* property Example: `bStore: BOOL;` `TRUE`: The file is saved.
“New”	Variable (`BOOL`). Controls creating a new file. The name is defined in the *“Variable”* property. Example: `bCreate: BOOL;` `TRUE`: A file is created and opened.

Table 273: Element property “Control variables --> Edit ”

“Variable”	Variable (`STRING`). Contains the string to search for in the file Example: `strFind: STRING := 'abc';`
“Find”	Variable (`BOOL`). Controls executing the search for the string in the *“Variable”* property Example: `bFind: BOOL;` `TRUE`: The search is performed. The variable is automatically reset to `FALSE`.
“Find next”	Variable (`BOOL`). Controls the location to begin the search in the file Example: `bFindNext: BOOL;` `TRUE`: The search begins at the last search result location. `FALSE`: The search begins at the beginning of the file.

Table 274: Element property “Control variables --> Cursor position”

“Line”	Variable (integer data type). Contains the line of the cursor Example: `iRowCursor: INT;`
“Column”	Variable (integer data type). Contains the column of the cursor Example: `iColumnCursor: INT;`
“Position”	Output variable (integer data type). Shows the **absolute** cursor position in the text. Example: `iPosCursor: INT;`
“Set cursor”	Variable (`BOOL`). Controls the setting of the cursor at a specific location Example: `iSetCursor: INT;` `TRUE`: The cursor is moved. The new position is defined in the *“Line”* and *“Column”* properties. `FALSE`: The *“Line”*, *“Column”*, and *“Position”* properties contain the actual values. Note: The variable is used as the control variable for an input event triggered by a visualization user.

Table 275: Element property “Control variables --> Selection”

“Start position”	Output variable (integer data type). Shows the **absolute** position for starting the text selection Example: `iPosSelection: INT;`
“End position”	Output variable (integer data type). Shows the **absolute** position for ending the text selection. Example: `iPosEndSelection: INT;`
“Start line number”	Output variable (integer data type). Shows the line where the text selection begins Example: `iRowSelection: INT;`
“Start column index”	Output variable (integer data type). Shows the column where the text selection begins Example: `iColumnSelection: INT;`
“End line number”	Output variable (integer data type). Shows the line where the text selection ends Example: `iRowEndSelection: INT;`

"End column index"	Output variable (integer data type). Shows the column where the text selection ends Example: `iColumnEndSelection: INT;`
"Line to select"	Variable (integer data type). Contains the line number that is selected Note: The selection is controlled by the variables in the *"Trigger selection"* property.
"Set selection"	Variable (`BOOL`). Controls the selection of a line. Example: `bSetSelection: BOOL;` `TRUE`: The line from the *"Line to select"* property is selected and highlighted in the Text Editor. if the line is not in the current text segment of the Text Editor, then the text segment is moved to this line. Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization.

Table 276: Element property "Control variables --> Error handling"

"Variable for error code"	Variable (integer data type). Contains the error code when an error occurs Example: `iError: INT;` The error codes are declared in `GVL_ErrorCodes` in the `VisuElemTextEditor` library. To display the error text, the `VisuFctTextEditorGetErrorText()` function of the library must be called.

"Variable for content changed"	Variable (`BOOL`). Shows whether the contents have changed Example: `bIsContentEdited: BOOL;` `TRUE`: The contents of the Text Editor have changed.
"Variable for access mode"	Variable (`BOOL`). Controls the access privileges to the file Example: `bIsReadOnly: BOOL;` `TRUE`: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the Text Editor. `FALSE`: A visualization user has read/write permission. Note: The variable overwrites the setting in the *"Editor mode"* property.

"Maximum line length"	Maximum number of characters per line
"Editor mode"	● *"Read-only"*: A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor. ● *"Read/write"*: A visualization user has read-write permissions.

Element property 'New files'

"Encoding"	Character encoding of the new file: ● *"ASCII"* ● *"Unicode (Little endian)"* ● *"Unicode (Big endian)"*
"New line character sequence"	End of line character of the new file: ● *"CR/LF"*: Normal for Windows systems ● *"LF"*: Normal for UNIX systems Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

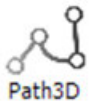
Visualization Element 'Path3D'

Symbol:



Category: *“Special Controls”*

The *“Path3D”* visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application `3D Path Generator`, which is available in CODESYS Forge, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library `SM3_CNC_Visu` help to generate the data from the path and track. These function blocks are used by the sample project `CNC_File_3DPath`, which is stored in the installation directory of CODESYS.

- `SMC_PathCopier`
- `SMC_PathCopierCompleteQueue`
- `SMC_PathCopierFile`
- `SMC_PositionTracker`

A description of the function blocks can be found in the Library Manager in the library `SM3_CNC_Visu`.

> *The element does not work with the CODESYS HMI display variant.*

- *CNC Example 6: Using Path3D with SoftMotion CNC*
- *Sample project in CODESYS Forge*

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Path3D”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Path description

"Path data (VisuStruct3DTrack)"	Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`. The data structure describes a path or track through a certain number of points. The points are determined and buffered by the application. The track typically displays the last n positions, so that only a certain part of them is ever displayed at any one time. `VisuStruct3DTrack.pProjection` is a variable that is set by the visualization element and contains information about the path/track projection. It can be read (only) by the application. In addition, the methods `Projection.Apply` or `.ApplyV` can be used in order to see whether the transformed position lies inside or outside the visualization display area, which is defined by `Projection.ElementRect`.
"Path color"	Color of the path drawn
"Path line width"	Path line width in pixels, e.g.: "2"
"Style of boundary points"	Display of the points between two successive objects in the path ● End points are not displayed ● End points are marked with a circle ● End points are marked with a cross ● End points are marked with a plus

Track description The track data are structured in exactly the same way as the path data: VisuStruct3DTrack

"Track data (VisuStruct3DTrack)"	Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`.
"Track color"	Color of the track drawn
"Track line width"	Track line width in pixels, e.g.: "2"

Camera control The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

"Control data (VisuStruct3DControl)"	Variable of the type `VisuStruct3DControl`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dc`. A description of the structure can be found in the library manager in the library `VisuElem3DPath`. The values can be set via the application itself or via the visualization element *"ControlPanel"*. The library `VisuElem3DPath` contains ready-to-use visualization frames that provide a possible user interface for these data.

Additional aspects

"Coordinate system"	☑: The coordinate system is displayed
"Grid"	☑: Grid lines are displayed
"Grid color"	Color of the grid lines

Highlighting Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

Highlight mode	Select one of the following highlight modes: ● Only the element whose ID corresponds to the value of the variable is highlighted. ● All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in Variable are highlighted.
Variable	Project variable that specifies the ID of an element. Example: `PLC_PRG.iVarElementID`. This "highlight ID" is taken into account for the setting of the highlight mode. The variable must be set in the IEC application.
Highlight color	

Element look

"Frame line width"	Width of the frame around the element, in pixels, for example: "1"
"Frame line style"	Select one of these style types for the frame line: ● `Solid` ● `Dashes` ● `Dots` ● `Dash Dot` ● `Dash Dot Dot` ● `Hollow`

"Transparent background"	☑: The background of the element is displayed transparently. ☐: The background of the element is displayed in the defined background color.
"Background color"	

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Control Panel'

Symbol:

Category: *“Special Controls”*

This visualization element is used in connection with the *“Path3D”* visualization element. It is used for changing the position and orientation to the CNC path shown with *“Path3D”*.

See also

- *Chapter 1.4.5.18.1.42 “Visualization Element 'Path3D'” on page 1658*

Element properties

“Element name”	Optional. Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Camera_Path_1`
“Type of element”	*“Frame”*
“Clipping”	☑: If you have set the *“Scaling type”* to *“Fixed”*, then only that part of the visualization is displayed that fits in the frame.
“Show frame”	Displays the frame ● *“No frame”*: The displayed area of the frame does not have borders. ● *“Frame”*: The displayed area of the frame has borders. ● *“No frame with offset”*: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The resulting gap prevents the referenced visualization from touching any adjacent elements.
“Scaling type”	Describes how the frame reacts when the visualization is resized: ● *“Isotropic”*: The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately. ● *“Anisotropic”*: The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately. ● *“Fixed”*: The original size of the frame is retained, regardless of the visualization size. If you have also selected the *“Clipping”* option, then only the fitting part is displayed. ● *“Fixed and scrollable”*: The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the *“Scroll position variable horizontal”* or *“Scroll position variable vertical”* property.
“Deactivation of the background drawing”	☐: To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order. ☑: Deactivation of the background drawing. This can prevent the behavior described above.

Element property 'References'

Contains the currently configured visualization references as a subnode

"References"	Clicking *"Configure"* opens the *"Frame Configuration"* dialog. This is used to manage the referenced visualizations. Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the *"Switch to any visualization"* Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the *"Input configuration"* of an element: Action *"Switch Frame visualization"*.
List of the currently referenced visualizations	Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters. Example: `vis_FormA` ● `iDataToDisplay_1 : PLC_PRG.iVar1` ● `iDataToDisplay_2 : PLC_PRG.iVar2` Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the *"Configure"* button instead.

- *Chapter 1.4.5.15 "Creating a structured user interface" on page 1321*
- *"Input action 'Switch Frame Visualization'" on page 1756*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.
"Use gradient color"	☑: The element is displayed with a color gradient.
"Gradient setting"	The *"Color gradient editor"* dialog box opens.
"Frame color"	Example: *"Black"*
"Fill color"	Example: *"Light gray"*

-

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- “ *Element property 'Appearance variables'” on page 1671*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Text”*.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Tooltip”*.

See also

- *“Element property 'Text variables'” on page 1667*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1698*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1665*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

“Text list”	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
“Text index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
“Tooltip index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1665*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1664*

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

"Variable"	● Variable (integer data type) that contains the index of the active visualization Example: `PLC_PRG.uiIndexVisu` Hint: The *"Frame Configuration"* dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants. ● Array element (integer data type) for index access via `CURRENTCLIENTID` Example: `PLC_PRG.aIndexVisu[CURRENTCLIENTID]` Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

See also

- *Chapter 1.4.5.19.2.9 "Command 'Frame Selection'" on page 1727*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Visualization Element 'Cartesian XY Chart'

Symbol:

Category: *"Special Controls"*

The element displays the curve of array values graphically as a line or bar chart in the Cartesian coordinate system. The chart can display multiple curves at one time.

NOTICE!
Constraint
The element can be used with controller with V3.5 SP11 and higher.

in CODESYS Forge, you will find a sample project for using “Cartesian XY Chart” elements in visualizations.

See also

- *Sample project in CODESYS Forge*

Element properties

“Element name”	Example: `Velocity chart`
“Type of element”	*“Cartesian XY Chart”*
“Cartesian XY Chart”	`XYChart`: Opens the *“XY Chart Configuration”* dialog. This is where the chart is configured.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Element look'

The properties contain fixed values for defining the look of the element.

“Border line width”	Value (in pixels) Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *“Border line style”* property must be set to the option *“Invisible”*.
“Border line style”	● *“Solid”* ● *“Dash”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“Invisible”*
“Frame line color”	● Style color from the list box. Example: `Black` ● Fixed value that is selected in the color dialog. Example: `0; 0; 0`

Element property 'Axis font'

“Font”	Example: *“Default”* ...: Opens the *“Font”* dialog. ▼: List box with style fonts

Element property 'Control variables'

Table 277: “Zoom”

	Zooming the displayed curve is done by means of the mouse, or the pinch gesture on a multitouch device. It also applies to all axes. At runtime when *“Enable”* is `TRUE`, you can draw a box with the mouse by holding down the left mouse button. When you release the mouse button, the display zooms in on the box and the curve is magnified. To zoom in and out on a multitouch device, move two fingers together or away from each other, respectively. Zooming and panning can work together.
“Enable”	Variable (`BOOL`) that enables or disables zooming. `TRUE`: Enables zooming Example: `PLC_PRG.xZoomEnable`
“Home”	Variable (`BOOL`) Rising edge: Reset the displayed curve to the initial state after the display has changed due to zooming. Example: `PLC_PRG.xZoomHome`

“Undo”	Variable (`BOOL`) Rising edge: Reset the displayed curve to the previous position after the display has changed due to zooming. Example: `PLC_PRG.xZoomUndo`
“Is zoomed”	Variable (`BOOL`) that indicates whether or not the displayed curve was modified due to zooming. `TRUE`: Curve setting was zoomed. Example: `PLC_PRG.xIsZoomed`

Table 278: “Pan”

	Panning the displayed curve is done by means of the mouse or the pinch gesture on a multitouch device. It also applies to all axes. At runtime if *“Enable”* is `TRUE`, then you can drag the displayed curve to another position by holding down the left mouse button. To pan the displayed curve on a multitouch device, drag it with one finger to another position.
“Enable”	Variable (`BOOL`) to enable or disable panning. `TRUE`: Enables panning Example: `PLC_PRG.xPanEnable`
“Home”	Variable (`BOOL`) Rising edge: Reset the displayed curve to the initial position after the display has changed due to panning. Example: `PLC_PRG.xPanHome`
“Is panned”	Variable (`BOOL`) whose state indicates whether or not the displayed curve was modified due to zooming. `TRUE`: Curve setting was panned. Example: `PLC_PRG.xIsPanned`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Date Range Picker'

Symbol:

Category: *“Date/Time Controls”*

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the *“Trend”* visualization element.

Element properties

“Element name”	Example: `DateTrend1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Date Range Picker”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

"Show frame"	☑: The visualization element is drawn with a frame.
"Resolution"	Resolution saved for the time stamp: *"Millisecond"* or *"Microsecond"*
"Attached element instance"	The element can be assigned to a *"Trend"* visualization element. As a result, the time range of the trend element can be changed. The available visual elements are selected with the help of the Input Assistant (...).

Element property 'Tick mark labels'

"Two-line labelling"	☑: The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line. ☐: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.
" Omit irrelevant information in time stamp"	☑: The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in *"Internationalization (format strings)"* are ignored for this setting. ☐: All information is displayed for all time stamps.
"Internationalization (format strings)"	Only active when the parameter *"Omit irrelevant information in timestamps"* is deactivated.
"Date"	Definition of the date format. The default setting is taken from the Windows control panel.
"Time"	Definition of the time format. The default setting is taken from the Windows control panel.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Additional buttons'

"Jump to the largest possible time stamp"	☑: An additional button ( ) is displayed for jumping to the last time stamp.
"Jump to the smallest possible time stamp"	☑: An additional button ( ) is displayed for jumping to the first time stamp.
"Zoom out"	☑: An additional button ( ) is displayed for setting the current min./max. range to the maximum range. The selected range is left.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Time Range Picker'

Symbol:

Category: *"Date/Time Controls"*

The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `TimeRangeTemperature`
"Type of element"	*"Time range picker"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Orientation"	Specifies whether the time picker element is aligned horizontally or vertically in the editor. Hint: Change the width to height ratio of the element in the editor.
"Show frame"	☑: The visualization element is drawn with a frame.
"Resolution"	Resolution saved for the time stamp: *"Millisecond"* or *"Microsecond"*
"Attached element instance"	Assignment to the element that processes the time picker The element can be assigned for example to a *"Trend"* visualization element. Then the time range of the trend element can be changed. The available visual elements are selected with the help of the input assistance (...). Example: `GenElemInst_1`

Element property 'Texts'

"Text"	String label for the element. Example: `Zoom`

Element property 'Text properties' The properties contain fixed values for the text properties.

“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Property 'Times' In *“Times”*, the buttons that the element provides at runtime are defined and configured in an array.

“Provide "All" selection”	☑:Time Range Picker bar extended by "All" button. The diagram represents a time interval that covers all time stamps.
“Times”	: Adds another button to the Time Range Picker bar and increases the array by one entry. An additional index is present in the property *“Times ➔ Times ➔ Times ➔ [<new>]”*. *“Time”* is located under this index. The configuration of the button is to be entered there.
“Times” ● *“ [Index]”* with index ∈ {0, 1, 2,...}	Array of all buttons in the time selection bar. Index corresponds to the number of buttons. ✕: The associated button is removed from the Time Range Picker bar. The configuration entry is deleted from the *“Times”* property list.
“ [Index]” ● *“Time”*	: Time interval in standardized notation. Example: `3M` for 3 months; `30m` for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty.

Element property 'Control variables'

“Time”	Displays which time is currently selected. Variable (`STRING`) Example: `PLC_PRG.strSelcetedTime`
“"All" selected”	Displays the state of the "All" button Variable (`BOOL`) Example: `PLC_PRG.AllTimesAreSelected`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Date Picker'

Symbol:

Category: *“Date/Time Controls”*

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Language-dependent texts of the element

The element contains language-dependent texts that are managed in the `System` text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

Example

`System` text list

ID	Default
`Apr`	`Apr`
`April`	`April`

Element properties

“Element name”	Example: `DueDateCalendar`
“Type of element”	*“Date Picker”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.

“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Variable”	Input variable (`DATE`). Contains the date that a user selects in the calendar. Example: `PLC_PRG.dtDueDate`
“Design”	• *“From style”*: All settings are preconfigured according to the style. • *“Explicit”*: The *“Design settings”* property is available. You can customize the calendar here.

Design settings

Requirement: This property is visible only if the *“Design”* property is set to *“Explicit”*.

The values of the property can be predefined in the style. Then they are available in the drop-down list.

Table 279: “Header of Date Picker”

Design of the header	
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Arrows”	
“Arrow color”	Style color or user-defined color
“Color of printed arrow”	
“Background”	

“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Fill color”	Style color or user-defined color

Table 280: Design of the main display area

Design of the main display area	
“Today”	Design of today
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The style defines whether and which background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	Style color or user-defined color. Used if *“Yes”* is selected in *“Draw background”*.
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Selected day”	Design of the selected day
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	Style color or user-defined color
“Show frame”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Current month”	Design of the current month
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color

“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Other months”	Design of the previous and subsequent months
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Display other month”	Design of the previous and subsequent months
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Day of week heading”	Design of the heading with the days of the week
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The background is filled with the style color *“From style”*. The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

"Display separator line"	*"From style"*: The style defines whether and how a separator line is drawn. *"Yes"*: Display with the following properties. *"No"*: A separator line is not displayed.
"Color of the separator line"	Used if *"Yes"* is selected in *"Display separator line"*.
"Width of separator line"	

"Background"	Design of the calendar days
"Draw background"	*"From style"*: The style defines whether and how a background is drawn. *"Yes"*: The background is filled with the color in the *"Fill color"* property and framed in the *"Frame color"*. *"No"*: The background is not filled with a color.
"Fill color"	Style color or user-defined color
"Frame color"	

Element property 'Display type'

"Rows"	Number of month calendars per row (preset: `1`)
"Columns"	Number of month calendars per column (preset: `1`)

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

● *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Analog Clock'

Symbol:

Category: *"Date/Time Controls"*

The element is a clock that displays the current time of day. The clock can also display a random time.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Analog Clock"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Time Display'

"Use system time"	☑: The system time of the PLC is displayed.
"Variable"	Variable (time data type `TOD`, `TIME_OF_DAY`). This receives the time of day that is not the system time. Example: `PLC_PRG.todTimeTokio` Requirement: The *"Use system time"* property is not activated.

See also

- *Chapter 1.4.1.19.5.5 "Data Type 'TIME'" on page 649*

"Design"	• *"From style"*: All settings are preconfigured according to the style. • *"Explicit"*: The *"Settings"* property is available. Here you can customize the analog clock.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	

“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	“Use REAL values”	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

Element property 'Settings'

Requirement: The *“Property”* is *“Explicit”*. Only then is the *“Clock Settings”* category visible.

Table 281: “Background”

“Background color”	Color variants of the default background image ● *“Yellow”* ● *“Red”* ● *“Blue”* ● *“Green”* ● *“Black”*
“Own background”	Background display with the specific *“Image”*. Replaces the default background image.

"Image"	Image from an image pool or library Example: `myImagepool.myImage`
"Transparency color"	The transparent color in the image representation. Example: *"White"*. The white parts of the image are transparent.
"Use background color"	☑: The image background is displayed using the color defined in the *"Background color"* property. Requirement: No image reference is given in the *"Image"* property.
"Background color"	Style color or color Requirement: *"Use background color"* is activated.

Table 282: "Hands"

"Hand style"	Example: *"Thin arrow"*
"Color hour hand"	Style color or color for the hands
"Color minute hand"	
"Color second hand"	

Table 283: "Lines"

"Lines style"	Clock face graduation ● *"None"* ● *"Line"*: Graduation lines by hour ● *"Hours and minutes"*: Graduation lines by hours and minutes ● *"Dots"*: Graduation dots by hour
"Color"	Color of the clock face graduation
"Line width"	Line weight of the clock face graduation
"Scale in 3D"	☑: Representation of the clock face with 3D effect

Table 284: "Numerics"

"Style of numerics"	Digits on the clock face ● *"None"* ● *"Quarter"* ● *"All"*
"Font"	Font for displaying the digits
"Font color"	Font for displaying the digits

Table 285: "Center point"

"Color"	Color of the center of the clock

Table 286: "Positioning"

"Usage of"	● *"Default style values"*: Presetting of the style values ● *"Individual settings"*: User-defined settings in the subordinate *"Positioning"* property.
"Positioning"	Requirement: Visible when the *"Usage or"* property is set to *"Individual settings"*.

"Numerics movement"	Value (in pixels) for shifting the digits. Example: `80`
"Line movement"	Value (in pixels) for shifting the hour lines. Example: `100`
"Hands scaling"	Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image. Example: `100`

"Scaling type"	Defines the scaling of the height and width of the element. ● *"Anisotropic"*: The background image is scaled to the size of the element The height and width are scaled independently of each other. ● *"Isotropic"*: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed.

"Optimized drawing"	☑: The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn. ☐: The background image is redrawn in cycles. Hint: Disable this option only for extreme exceptions.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Date/Time Picker'

Symbol:

Category: *"Date/Time Controls"*

The element provides the capability of selecting the date and time. The value can be changed by means of the arrow keys on the keyboard. The date can be selected from a calendar.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `StartDateAndTime`
"Type of element"	*"Date/Time Picker"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	Variable (`DATE, DT, TIME, LTIME, TOD`) The value of the value of the variable is displayed and modified by means of the element. The data type automatically determines the displayed value units: ● `TIME`: Day, hour, minute, and second (by default, milliseconds are not displayed) ● `DATE`: Year, month, and day ● `DT`: Year, month, day, hour, minute, and second ● `TOD`: Hour, minute, and second (by default, milliseconds are not displayed) ● `LTIME`: Day, hour, minute, and second (by default, milliseconds, microseconds, and nanoseconds are not displayed)
"Format string"	The format can restrict the output to individual values. Example for `LTIME`: Format: `HH:mm:ss.ms.us.ns` --> displayed: 08:15:12.780.150.360 `LTIME` restricted: format: `HH:mm` --> displayed: 08:15 Example for `DATE`: Format: `yyyy/MM/dd` --> displayed: 2015/12/17 . Basically, all usual formats available for %t are also supported.
"Design date time picker"	● *"From style"*: All settings are preconfigured according to the style. ● *"Explicit"*: The *"Design settings"* property is available. You can customize the calendar here.
"Design date picker"	● *"From style"*: All settings are preconfigured according to the style. ● *"Explicit"*: The *"Design settings"* property is available. You can customize the calendar here.
"Positioning date picker"	● *"Dynamic"*: The calendar is adapted and positioned automatically. ● *"Manual"*: The *"Position settings"* property is available. You can customize the calendar here.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

1.4.5.18.2 Placeholders with Format Definition in the Output Text

A character string which is output in the visualization can include the placeholder `%` for a variable. At runtime, the placeholder is replaced by the actual value of the variable in the defined format. The data type in the format definition and of the variable have to be identical. A character string can contain a maximum of one placeholder.

Character strings for output are listed in the *“Text”* property. The assigned variable is listed in the *“Text variable”* property.

- *Integer Data Types*
- *REAL/LREAL Data Type*
- *Time Data Types*

For the output of integers

`%d` `%i`	Output of variable (integer data type) as decimal number	Code: `iCounter : INT := 12;` Property *“Text”*: `Value: %i` Property *“Text variable”*: `PLC_PRG.iCounter` Output: `Value: 12`
`%b`	Output of variable (integer data type) as binary number	Code: `byCode : BYTE := 255;` Property *“Text”*: `Coding: %b` Property *“Text variable”*: `PLC_PRG.byCode` Output: `Coding: 11111111`
`%o`	Output of variable (integer data type) as unsigned octal number without a preceding zero	Code: `byCode : BYTE := 8#377;` Property *“Text”*: `Coding: %o` Property *“Text variable”*: `PLC_PRG.byCode` Output: `Coding: 377`
`%x`	Output of variable (integer data type with max. 32 bits) as unsigned hexadecimal number without a preceding "0x"	Code: `dwCode : INT := 16#FFFFFFFF;` Property *“Text”*: `Coding: %x` Property *“Text variable”*: `PLC_PRG.dwCode` Output: `Coding: ffffffff`
`%llX` `%012llX`	Output of 64-bit variable (`LWORD`, `LINT`, `ULINT`) as hexadecimal number. Note: `llx` means "long long hexadecimal"	Code: `lwCode : LWORD := 16#4FFF_3FFF_2FFF_1FFF;` Property *“Text”*: `Coding: %llx` Property *“Text variable”*: `PLC_PRG.lwCode` Output: `Coding: 4fff3fff2fff1fff`
`%u`	Output of variable (integer data type) as unsigned decimal number	Code: `uiNumber : UINT := 1234;` Property *“Text”*: `Number: %u` Property *“Text variable”*: `PLC_PRG.uiNumber` Output: `Number: 1234`

For the output of floating-point numbers

Floating-point numbers have the data type `REAL` or `LREAL`.

`%f`	In decimal form with decimal point in format 1.6	Code: `rWeight : REAL := 1.123456789;` Property *"Text"*: `Weight: %f` Property *"Text variable"*: `PLC_PRG.rWeight` Output: `Weight: 1.123456`
`%<alignment><minimum width>.<accuracy>f`	As decimal number in user-defined format ● `<alignment>`: `-` or `+`, optional `-`: Left-aligned `+`: Right-aligned ● `<minimum width>`: Number of places to the left of the decimal point ● `<accuracy>`: Number of places to the right of the decimal point	Code: `rWeight : REAL := 12.1` Property *"Text"*: `Weight: %2.3f` Property *"Text variable"*: `PLC_PRG.rWeight` Output: `Weight: 12.100`
`%e`	Output of floating-point number (`REAL` or `LREAL`) in exponential notation of base `10`	Code: `rValue : REAL := 1.234567%e-003;` Property *"Text"*: `Value: %E` Property *"Text variable"*: `PLC_PRG.rValue` Output: `Value: 1.23E-6`
`%E`		Code: `rValue : REAL := 1.234567%e-003;` Property *"Text"*: `Value: %e` Property *"Text variable"*: `PLC_PRG.rValue` Output: `Value: 1.23e-6`

For the output of text

`%c`	Output of single character in ASCII character set	Code: `bChar := 16#41;` Property *"Text"*: `Key: %c` Property *"Text variable"*: `PLC_PRG.bChar` Output: `Key: A`
`%s`	Output of character string	Code: `strName := 'Paul Smith';` Property *"Text"*: `Name: %s` Property *"Text variable"*: `PLC_PRG.strName` Output: `Name: Paul Smith`

For the output of the percent sign

`%%`	Output of percent sign in character string	Property *"Text"*: `Valid until 90%%` Output: `Valid until 90%`
		Code: `iPercentage : INT := 80;` Property *"Text"*: `Valid until %d%%.` Property *"Text variable"*: `PLC_PRG.iPercentage := 80;` Output: `Valid until 80%`

For the output of the date and time

If the output text in the element *"Text"* property contains the placeholder "%t", then a date and/or time is output. If a variable is **not** specified in the *"Text variable"* property, then the **system time** is output; otherwise it is the value of the variable.

By default, the names of the days and months are displayed in English. If localized texts are used, then the text list `System` has to be supplemented. This text list is created automatically in the *"POUs"* view when the placeholder %t is used. The English terms have to be used as the ID here. The localization can be done for both the abbreviated names and full names.

Time data types include `LTIME`, `TIME`, `TIME_OF_DAY`, `TOD`, `DATE`, `DATE_AND_TIME`, and `DT`.

Compatibility Notice

In order to get the usual display, in V3.5 SP17 and higher, as a rule three digits are used for the output of fractions of a second (ms/µs/ns). Example: In `%t[dd-HH:mm:ss:ms], ms` is specified with three digits for the milliseconds. For this purpose, the two-digit ms number is prepended with a zero. If a two-digit output is desired (like before V3.5 SP17), then a special compiler define has to be set in the compiler properties of the application: `VISU_MILLISEC_NOLEADING_ZERO`.

Date and time formats		
`%t[yyyy]`	Year with century	Code: `dateBy : DATE := DATE#2020-1-1;` Property *"Text"*: `By the year %t[yyyy]` Property *"Text variable"*: `PLC_PRG.dateBy` Output: `By the year 2020`
`%t[yy]`	Year without century (00–99)	Code: `dateSince : DATE := DATE#2000-1-1;` Property *"Text"*: `Since: %t[yy]` Property *"Text variable"*: `PLC_PRG.dateSince` Output: `Since: 00`
`%t[y]`	Year without century (0–99)	Code: `dateSince : DATE := DATE#2000-1-1;` Property *"Text"*: `Since: %t[y]` Property *"Text variable"*: `PLC_PRG.dateSince` Output: `Since: 0`

`%t[MMMM]`	Month as full name	Code: `dateMonth : DATE := DATE#2016-1-1;` Property *"Text"*: `Month: %t[MMMM]` Property *"Text variable"*: `PLC_PRG.dateMonth` Output: `Month: January`
`%t[MMM]`	Month as abbreviated name	Code: `dateMonth : DATE := DATE#2016-1-1;` Property *"Text"*:: `Month: %t[MMM]` Property *"Text variable"*: `PLC_PRG.dateMonth` Output: `Month: Jan`
`%t[MM]`	Month as number (01–12)	Code: `dateMonth : DATE := DATE#2016-1-1;` Property *"Text"*:: `Month: %t[MM]` Property *"Text variable"*: `PLC_PRG.dateMonth` Output: `Month: 01`
`%t[M]`	Month as number (1–12)	Code: `dateMonth : DATE := DATE#2016-1-1;` Property *"Text"*:: `Month: %t[M]` Property *"Text variable"*: `PLC_PRG.dateMonth` Output: `Month: 1`
`%t[ddddd]`	Day of week as number (1=Monday – 7=Sunday)	Code: `iDay : INT := 7;` Property *"Text"*:: `Day: %t[ddddd]` Property *"Text variable"*: `PLC_PRG.iDay` Output: `Day: 7`
`%t[dddd]`	Day of week as full name	Code: `iDay : INT := 7;` Property *"Text"*:: `Day: %t[dddd]` Property *"Text variable"*: `PLC_PRG.iDay` Output: `Day: Sunday`
`%t[ddd]`	Day of week as abbreviated name	Code: `iDay : INT := 7;` Property *"Text"*:: `Day: %t[ddd]` Property *"Text variable"*: `PLC_PRG.iDay` Output: `Day: Sun`
`%t[dd]`	Day of month as number (01–31)	Code: `iDay : INT := 1;` Property *"Text"*:: `Day: %t[dd]` Property *"Text variable"*: `PLC_PRG.iDay` Output: `Day: 01`

`%t[d]`	Day of month as number (1–31)	Code: `iDay : INT := 1;` Property *"Text"*:: `Day: %t[d]` Property *"Text variable"*: `PLC_PRG.iDay` Output: `Day: 1`
`%t[jjj]`	Day of year as number (001–366)	Code: `dateOfNoReturn : DATE := DATE#2016-09-01;` Property *"Text"*:: `Day of no return: %t[jjj]` Property *"Text variable"*: `PLC_PRG.dateOfNoReturn` Output: `Day of no return: 245`
`%t[HH]`	Hour in 24-hour format (00–23)	Code: `todEnd : TOD := TIME_OF_DAY#17:0:0;` Property *"Text"*: `Ends at: %t[HH]:00` Property *"Text variable"*: `PLC_PRG.todEnd` Output: `Ends at 17:00`
`%t[hh]`	Hour in 12-hour format (01–12)	Code: `todEnd : TOD := TIME_OF_DAY#17:0:0;` Property *"Text"*: `Ends at: %t[hh] o'clock` Property *"Text variable"*: `PLC_PRG.todEnd` Output: `Ends at: 05 o'clock`
`%t[mm]`	Minutes with leading zero (00–59)	Code: `tPeriod : TIME := T#5M;` Property *"Text"*: `Period: %t[mm]m` Property *"Text variable"*: `PLC_PRG.tPeriod` Output: `Period: 05m`
`%t[m]`	Minutes without leading zero (0–59)	Code: `tPeriod : TIME := T#5m;` Property *"Text"*: `Period: %t[m 'm']` Property *"Text variable"*: `PLC_PRG.tPeriod` Output: `Period: 5 m`
`%t[ss]`	Seconds with leading zero (00–59)	Code: `tPeriod : TIME := T#5m3s;` Property *"Text"*: `Period: %t[mm'm'ss's']` Property *"Text variable"*: `PLC_PRG.tPeriod` Output: `Period: 05m03s`
`%t[s]`	Seconds without leading zero (0–59)	Code: `tPeriod : TIME := T#5m3s;` Property *"Text"*: `Period: %t[m'm' s's']` Property *"Text variable"*: `PLC_PRG.tPeriod` Output: `Period: 5m 3s`

`%t[ms]`	Milliseconds without leading zero (0–999)	Code: `tPeriod : TIME := T#500ms;` Property *"Text"*: `Period: %t[ms 'ms']` Property *"Text variable"*: `PLC_PRG.tPeriod` Output: `Period: 500 ms`
`%t[us]`	Only for `LTIME` variables: microsecond definition (0–999)	Code: `ltPeriod :LTIME := LTIME#1000D23H44M12S34MS2US44NS;` Property *"Text"*: `'Period': %t[dd.HH.m.s.ms.us.ns]` Property *"Text variable"*: `PLC_PRG.ltPeriod` Output: `Period: 1000.23.44.12.34.2.44` Hint: Overflow is permitted in the greatest time unit of a definition.
`%t[ns]`	Only for `LTIME` variables: nanosecond definition (0–999)	
`%t[t]`	If the value is a time < 12h, then A is output; otherwise P is output.	Code: `tClosed : TOD := TOD#17:17:17.17;` Property *"Text"*: `Closed at %t[hh:mm t]` Property *"Text variable"*: `PLC_PRG.tClosed` Output: `Closed at 05:17 P`
`%t[tt]`	If the value is a time < 12h, then AM is output; otherwise PM is output.	Code: `tClosed : TOD := TOD#17:17:17.17;` Property *"Text"*: `Closed at %t[hh:mm tt]` Property *"Text variable"*: `PLC_PRG.tClosed` Output: `Closed at 05:17 PM`
`%t[' ']`	If character strings should be output which correspond to a format definition, then these have to be represented in single straight quotation marks.	
`TIME` and `LTIME` values can be specified with integer values or with decimal places:		

`%t[<f><n>]`	A number (<n>) which defines the number of decimal places of the time value follows the letters which define the time unit (<f>). As a result, the hours, minutes, and seconds (for TIME values) and also the microseconds and nanoseconds (for LTIME values) can be specified or displayed as values with decimal places. Note: Even if a decimal number is not desired for the input or display, at least the number "0" has to be specified to allow for fractional input.	Examples of the formating `%t[hh4]` or `%t[HH4]`: The time can be specified/displayed with a hour definition of four decimal places. `%t[mm2]` or `%t[m2]`: The time can be specified/displayed with a minute definition of four decimal places. Then for a value of `t#1h20m15s`, this leads to the following output: `80.25`. `%t[ss0]`: The time can be specified/displayed with a second definition without decimal places.
The format definitions can be represented in a series.		
`%t[HH:mm:ss:ms]`	Output of the time	Code: `dwTime : DWORD := 4294967295;` Property *"Text"*: `Time: %t[HH:mm:ss:ms]` Property *"Text variable"*: `PLC_PRG.dwTime` Output: `Time: 23:59:59:999`
%t[yyyy-MM-dd dddd]	Output of the date and day of the week	Code: `dateSet : DATE := DATE#2016-02-12;` Property *"Text"*: `Date: %t[yyyy-MM-dd dddd]` Property *"Text variable"*: `PLC_PRG.dateSet` Output: `Date: 2016-02-12 Friday`

1.4.5.18.3 Methods of the Dialog Manager

Visualizations that are a *"Dialog"* visualization type and are used to prompt an input are instantiated automatically and managed by the internal dialog manager.

In the application, the dialog manager can be accessed via the also internal Visualization Manager by calling the method `GetDialogManager`.

The dialog manager is provided with the following methods for handling a dialog.

NOTICE!

You can program the method calls in function blocks or functions which are themselves called from the visualization by the action `Execute ST Code`.

Moreover, you can program the method calls in the application code. Make sure that the call runs in `VISU_TASK`. If this is not the case, then the behavior is undefined.

Method 'GetDialog' Returns the instance (`IVisualisationDialog`) of the dialog whose name is passed.

Table 287: Inputs (VAR_INPUT)

Name	Data Type	Description
`stName`	`STRING`	Name of the dialog

Table 288: Outputs (VAR_OUTPUT)

Name	Data Type	Description
`GetDialog`	`VisuElems.IVisualisationDialog`	Instance (`IVisualisationDialog`) of the dialog

Method 'GetClientInterface' Returns a pointer to the dialog structure.

Respective dialog data held for each display variant.

Table 289: Inputs (VAR_INPUT)

Name	Data Type	Description
`dialog`	`VisuElems.IVisualisationDialog`	Name of the visualization
pClient	`POINTER TO VisuElems.IVisualisationDialogVisuStructClientData`	Pointer to the display variant

Table 290: Outputs (VAR_OUTPUT)

Name	Data Type	Description
`GetClientInterface`	Example: `POINTER TO Login_VISU_STRUCT`	Pointer to the dialog structure

Method 'OpenDialog' Opens the dialog of the client.

Next to it, there is the extended method 'OpenDialog(number)'.

Table 291: Inputs (VAR_INPUT)

Name	Data Type	Description
`dialog`	`VisuElems.IVisualisationDialog`	Name of the visualization
`pClient`	`POINTER TO VisuElems.VisuStructClientData`	

Name	Data Type	Description
bModal	BOOL	
pRect	POINTER TO	

Table 292: Outputs (VAR_OUTPUT)

Name	Data Type	Description
OpenDialog		

Method 'Close-Dialog' Closes the dialog of the client.

Table 293: Inputs (VAR_INPUT)

Name	Data Type	Description
dialog	VisuElems.IVisualisationDialog	Dialog object as received by GetDialog
pClient	POINTER TO VisuElems.VisuStructClientData	

Table 294: Outputs (VAR_OUTPUT)

Name	Data Type	Description
CloseDialog		

Method 'Close-Dialog2' Closes the dialog of the client. Extension of the method CloseDialog.

Table 295: Inputs (VAR_INPUT)

Name	Data Type	Description
dialog	VisuElems.IVisualisationDialog	Dialog object as received by GetDialog
pClient	POINTER TO VisuElems.VisuStructClientData	
DialogFlags	DWORD	Specification of possible options for closing the dialogs. Only the values 0 (behavior as for CloseDialog) and 16#40 are relevant in the case that a dialog should be closed on all connected clients.

Table 296: Outputs (VAR_OUTPUT)

Name	Data Type	Description
CloseDialog2		

1.4.5.18.4 Attribute 'VAR_IN_OUT_AS_POINTER'

Function: The pragma {attribute 'VAR_IN_OUT_AS_POINTER'} allows for the passing of a reference to a data object to the interface variable of a visualization.

Requirement: The referenced visualization must be used as a dialog.

Syntax:

```
{attribute 'VAR_IN_OUT_AS_POINTER'}
```

> **NOTICE!**
> Uppercase and lowercase characters must be maintained.

Example: Declaration of an interface

```
VAR_IN_OUT
    {attribute 'VAR_IN_OUT_AS_POINTER'}
    itfController : ControlFB;
END_VAR
```

See also

- *Chapter 1.4.5.15.4 “Calling a Dialog with an Interface” on page 1343*
- *Chapter 1.4.5.19.2.1 “Command 'Interface Editor'” on page 1719*

1.4.5.18.5 Attribute 'parameterstringof'

The pragma `{attribute 'parameterstringof'}` allows that the instance name of the specified parameter is made accessible for the referenced visualization. An interface variable (`STRING`) will contain the instance name of the specified parameter. The interface variable is visible within the referenced visualization and can for example be used in a text output.

Syntax:

{attribute 'parameterstringof' := '<variable>'}

Example: declaration of a interface

```
VAR_INPUT
    {attribute 'parameterstringof' := 'iftDut_A'}
    sItfNameDut_A: STRING;
END_VAR
VAR_IN_OUT
     iftDut_A : DUT_A;
END_VAR
```

1.4.5.19 Reference, user interface

1.4.5.19.1 Keyboard Shortcuts for Default Keyboard Action

Requirement: The *“Activate default keyboard handling”* option is activated in the *“Visualization Manager”* object.

The keyboard shortcuts for default keyboard action make it possible for users to operate the visualization with the keyboard only. Elements that respond to user input can process a keyboard event instead of a mouse event. You do **not** have to change their input configuration for this purpose. The universal keyboard shortcuts are supported by all devices and are available on all display variants when needed.

Keyboard shortcuts	
[Tab]	Focus jumps to the next element. The next element that responds to a configured or preconfigured user input receives the focus. The order of elements corresponds to the order that the elements were added to the editor. If the focused element is a table, then the upper left cell in the table is the next focus. After that, each next cell until all cells have been focused. It also applies here that only cells that require input are focused. If the focused element is a frame, then an element of the referenced visualization is set next in focus in the frame. After that, each next element until all elements have been focused. It also applies here that only elements that require input are focused.
[Shift]+[Tab]	Focus jumps to the previous element. The element is focused that is before the currently focused element in the added order. Therefore, the order is the opposite as for *“Tab”*.
[Arrow]	The focus jumps to the element that is in the direction as indicated by the arrow.
[Input]	The visualization detects the input at the focused element and triggers the input action.

1.4.5.19.2 Commands

Command 'Interface Editor'

Symbol: ; keyboard shortcut: *[Alt]+[F6]*.

Function: The command opens and closes the *"Interface Editor"* tab above the visualization editor.

Call: Menu bar: *"Visualization ➔ Interface Editor"* Also by clicking on the small down arrow at the top of the visualization editor

Tab 'Interface Editor'

Symbol:

The tab contains an editor for the declaration of interface variables. The editor behaves in a similar way to the declaration editor of a function block, however interface variables are not initialized.

Syntax

```
<scope>
    ( {attribute '<attribute name>' ( := '<expression>' )? } )?
    <identifier> : <data type>;
END_VAR

<scope> : VAR_INPUT | VAR_OUTPUT | VAR_IN_OUT
// (...)? : Optional
```

Example

Declaration in the interface editor

```
VAR_INPUT
    {attribute 'parameterstringof'}
    sIdentifier : STRING; // String for instance name
    iCounter : INT;
END_VAR
VAR_IN_OUT
    {attribute 'VAR_IN_OUT_AS_POINTER'}
    fbController: FB_Controller;
END_VAR
```

Scopes

Possible scopes for interfaces of visualizations or dialogs

VAR_IN_OUT	• When transferring a structure When the visualization is instanced, it gets a reference to the current application data. • When transferring a control variable, if the variable is written to when a user input is made. Only then can the visualization write to it. Note: In the case of dialogs, the data is written back only when the dialog is closed. Hint: We strongly recommend that you use this scope so that the return of values is possible. Moreover, no data needs to be copied.
VAR_IN_OUT Pragma `{attribute 'VAR_IN_OUT_AS_POINTER' }`	When transferring a pointer to a data object In contrast to the VAR_IN_OUT scope (without an attribute), the variable changes are effective immediately and not just when the dialog is closed. Note: Use this scope only if the visualization implements a **Dialog**.

VAR_INPUT	When transferring data that will only be read Note: ● If the visualization is executed as an integrated visualization, then only input variables of a basic data type (scalar type) are permitted to be transferred. ● If the visualization is executed as a CODESYS TargetVisu or a CODESYS WebVisu, then input variables of any data type (including POUs) can also be transferred.
VAR_INPUT Pragma `{attribute 'parameterstringof'}`	When transferring a variable (data type `STRING`) for the instance name of the transfer parameter specified in the attribute

- *Chapter 1.4.5.18.4 “Attribute 'VAR_IN_OUT_AS_POINTER'” on page 1716*

Command 'Keyboard Configuration'

Symbol: ; keyboard shortcut: *[Alt]+[F6]*.

Function: This command opens and closes the *“Keyboard Configuration”* tab above the visualization editor.

Call: Menu bar: *“Visualization”*.

Requirement: A visualization is open and active in the visualization editor.

See also

- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Tab 'Keyboard configuration'

Symbol:

This tab contains a list of keyboard shortcuts with an editing option.

A keyboard shortcut can refer specifically to an element. Then the configuration appears here and in the *“Input configuration”* property of the associated element.

A keyboard shortcut can also have several configurations. If a keyboard shortcut has multiple keyboard configurations, then its input actions are executed in the order listed here.

Keyboard shortcuts of the default keyboard action are **not** listed here.

“Key”	Key that a keyboard configuration is defined. Example: *[M]* Note: You can combine the key with *[Ctrl]*, *[Alt]*, and/or *[Shift]*.
“Key down”	☑: The input action is executed when the user presses the key. ☐: The input action is executed when the user releases the key. Double-click: Drop-down list of all keys. Note: If the input action should be executed for both pressing the key (`KeyDown`) and releasing the key (`KeyUp`), then you must define a keyboard configuration for both input actions.
“Shift”	☑: The input event is triggered for *[Shift]+[key]*.

“Ctrl”	☑: The input event is triggered for *[Ctrl]+[key]*.
“Alt”	☑: The input event is triggered for *[Alt]+[key]*.
“Action type”	input action Double-click: Drop-down list of input actions. Tip: For a description of input actions, refer to the *“Input configuration”* dialog box.
“Action”	Configuration of the input action that was selected next. Double-click: A dialog box opens that varies according to the input action. It allows the user-prompted customization of the settings. Tip: For a description of dialog boxes, refer to the *“Input configuration”* dialog box. The input action is configured in the same way here.
“Element ID”	ID of the visualization element where the user can execute the key event. The ID is relevant only if the event is also assigned to an element. Tip: The assignment of ID to element name is listed in the *“Element list”*.
“Access rights”	Access privileges of the action per user group Requirement: The visualization has a user management.

↓	Clicking the symbol on the right of the list moves the selected row one line down.
↑	Clicking the symbol on the right of the list moves the selected row one line up.
Blank line	Allows adding a new keyboard configuration.

See also

- *Chapter 1.4.5.19.2.3 “Command 'Visualization Element List'” on page 1721*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Command 'Visualization Element List'

Symbol: 

Function: The command opens the *“Visualization Element List”* tab for the current visualization. It is displayed in the upper part of the visualization editor.

Call: Menu bar: *“Visualization”*

Requirement: A visualization is open in the editor.

Tab 'Visualization Element List'

This view contains a list of the visualization elements in the open visualization. Grouped elements are displayed in a tree structure and have their own order within the group (other hierarchy level).

The current selection in the list is always synchronized with the selection in the main window of the editor.

The order in the element list from top to bottom describes the order of the elements on the display layers of the visualization from back to front. When you insert elements consecutively, they are arranged starting from the back (position 0) on one layer forward. When you use the commands in the menu *“Visualization ➔ Order”* to move an element from front to back in the editor window, the element list refreshes accordingly.

"Type"	Element type and symbol, as used in the *"Visualization Toolbox"* view, as well as the element number that specifies the display layer. `#0` = layer furthest back.
"X",	Position of the upper left corner of the element (0,0 = upper left corner of the visualization area).
"Y"	
"Width"	Dimensions of the element (in pixels).
"Height"	
"ID"	Internally assigned element identifier
"Name"	Element name as defined in *"Properties ➔ Element name"*.
"Access Rights"	The lock symbol indicates the restricted behavior of an element for some user groups.
"Tab Order"	Position within the order in which you can jump from element to element in the editor by means of the tab key when the default keyboard usage is activated. The activation is done in the visualization manager, on the settings tab. Note that elements within a group or group box have their own order (different hierarchy level). The tab order initially corresponds to the order in which the elements are arranged on the layers from back to front (*"Type"* above). To change the position in the order for an element, you can specify a different number directly in the table field. You can also use the *"Move to Position"* context menu command to open a dialog for specifying a new position. Bold fonts indicate changed position specifications. By removing the displayed value, you exclude the element from the selection using tab or arrow keys. You can use the *"Reset to Default"* context menu command to reset a changed position to the original position. This can be done simultaneously for a multiselection of elements when they do not belong to different hierarchy levels (groupings).

- *Chapter 1.4.5.19.2.5 "Command 'Order'" on page 1723*
- *"Moving the visualization element forward and back" on page 1257*

Command 'Activate Keyboard Usage'

Symbol:

Function: This command activates and deactivates the keyboard usage when a visualization is executed in online mode (integrated in CODESYS).

Call: Menu bar: *"Visualization"*; context menu.

Requirement: A visualization is open.

When this command is active, the visualization executes the keyboard events that you specified as a visualization user.

When the command is inactive, CODESYS executes the keyboard events that you specify.

See also

- *Chapter 1.4.5.4.4 "Configuring Keyboard Shortcuts" on page 1274*

Command 'Order'

Function: The command makes further commands available. They are for specifying the order of the elements in levels, since elements in the rear levels are concealed by those in the front levels.

Call: Menu *"Visualization"*, context menu

Requirement: The visualization elements are positioned behind one another.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Command 'Bring to Front'

Symbol: 

Function: The command positions the selected visualization element in the front level. The element becomes completely visible.

Call: Menu *"Visualization ➔ Order"*, context menu

Command 'Bring One to Front'

Symbol: 

Function: The command positions the selected visualization element one level further forwards.

Call: Menu *"Visualization ➔ Order"*, context menu

Command 'Send to Back'

Symbol: 

Function: The command positions the selected visualization element in the back level.

Call: Menu *"Visualization ➔ Order"*, context menu

Command 'Send One to Back'

Symbol: 

Function: The command positions the selected visualization element one level further backwards.

Call: Menu *"Visualization ➔ Order"*, context menu

Command 'Alignment'

Function: the command makes further commands available. It is used for the alignment of visualization elements in the window area of the visualization.

Call: Menu *"Visualization"*, context menu

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Command 'Align Left'

Symbol: 

Function: the command aligns the selected visualization elements along a line through the left-hand edge of the element that is positioned furthest left.

Call: Menu *"Visualization ➔ Alignment"*, context menu

Requirement: Several elements are selected.

Command 'Align Top'

Symbol: 

Function: the command aligns the selected visualization elements along a line through the upper edge of the element that is positioned highest.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Align Right'

Symbol: 

Function: the command aligns the selected visualization elements along a line through the right-hand edge of the element that is positioned furthest right.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Align Bottom'

Symbol: 

Function: the command aligns the selected visualization elements along a line through the lower edge of the element that is positioned lowest.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Align Vertical Center'

Symbol: 

Function: the command aligns the selected visualization elements to their common vertical center.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Align Horizontal Center'

Symbol: 

Function: The command aligns the selected visualization elements to their common horizontal center.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Make Horizontal Spacing Equal'

Symbol: 

Function: The command aligns the selected visualization elements so that the elements positioned furthest left and furthest right retain their position and the elements between them are positioned with the same horizontal spacing.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

Command 'Increase Horizontal Spacing'

Symbol: 

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger horizontal spacing. The spacing increases by 1 pixel each time.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Decrease Horizontal Spacing'

Symbol: 

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller horizontal spacing. The spacing decreases by 1 pixel each time.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Remove Horizontal Spacing'

Symbol:

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Make Vertical Spacing Equal'

Symbol:

Function: The command aligns the selected visualization elements so that the uppermost and lowermost elements retain their position and the elements between them are positioned with the same vertical spacing.

Call: Menu *“Visualization”*, context menu

Requirement: 3 or more elements are selected. The first element is blue, while the other elements are displayed in grey.

Command 'Increase Vertical Spacing'

Symbol:

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a larger vertical spacing. The spacing increases by 1 pixel each time.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Decrease Vertical Spacing'

Symbol:

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with a smaller vertical spacing. The spacing decreases by 1 pixel each time.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Remove Vertical Spacing'

Symbol:

Function: The command aligns the selected visualization elements so that the blue element retains its position and the other elements are positioned with no horizontal spacing between them.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected.

Command 'Make Same Width'

Symbol:

Function: The command makes the width of the selected visualization elements the same as the width of the blue selected element.

Call: Menu *“Visualization ➔ Alignment”*, context menu

Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

> *The command does not work with lines or polygons.*

Command 'Make Same Height'

Symbol: 

Function: The command makes the height of the selected visualization elements the same as the height of the blue selected element.

Call: Menu *"Visualization ➔ Alignment"*, context menu

Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

> *The command does not work with lines or polygons.*

Command 'Make Same Size'

Symbol: 

Function: The command makes the size of the selected visualization elements the same as the size of the blue selected element.

Call: Menu *"Visualization ➔ Alignment"*, context menu

Requirement: Several elements are selected. The first element is blue, while the other elements are displayed in grey.

> *The command does not work with lines or polygons.*

Command 'Size to Grid'

Symbol: 

Function: The command aligns the size and position of the selected visualization elements to the grid.

Call: Menu *"Visualization ➔ Alignment"*, context menu

Requirement: Several elements are selected.

> *The command does not work with lines or polygons.*

Command 'Group'

Symbol: 

Function: The command groups the selected visualization elements and displays them as one.

Call: Menu *"Visualization"*, context menu

Requirement: At least 2 elements are selected.

To select more elements you can drag a window around the desired elements with the mouse. Alternatively you can click on the desired elements while keeping the *[Shift]* key pressed.

To select all elements you can open the context menu of the visualization editor and choose the *"Select All"* command.

You can also drag and drop elements to a group. For that, press the [Shift] key while dragging the element to the group. Meanwhile the cursor changes its appearance (display a small plus sign).

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*
- *Chapter 1.4.5.19.2.8 "Command 'Ungroup'" on page 1727*
- *Chapter 1.4.5.19.2.22 "Command 'Select None'" on page 1744*

Command 'Ungroup'

Symbol: 

Function: The command ungroups elements again.

Call: Menu *"Visualization"*, context menu

Requirement: A grouping is selected.

See also

- *Chapter 1.4.5.19.2.7 "Command 'Group'" on page 1726*

Command 'Frame Selection'

Function: The command opens the *"Frame Configuration"* dialog.

Call:

- Menu bar: *"Visualization"*
- Click the *"Configure"* button in the *"References"* property.

Requirement: A *"Frame"* element or *"Tabs"* element is selected in the editor. The *"Element Properties"* view is open.

Dialog 'Frame Configuration'

The dialog allows you to select one or more of all available visualizations. The selected visualizations are displayed at runtime in the window area of the *"Frame"* element or *"Tabs"* element.

NOTICE!

Visualizations can be nested at any depth by means of *"Frame"* elements. In order to use the *"Switch to any visualization"* frame selection type without any problems, a *"Frame"* must not contain more than 21 referenced visualizations.

For more information, see also the description for the *"Input configuration"* of an element: Action *"Switch frame visualization"*.

Table 297: “Available Visualizations”

“By Visualization Name”	The list of available visualizations of the project and libraries is sorted alphabetically.
“By Type or Instance”	The list of available visualizations of the project and libraries is sorted by type or instance.
Input field for a filter	If a filter text is specified, then only those visualizations whose names contain the filter text are listed.
	Project with project visualizations below it
{}	Library with project visualizations below it

Table 298: “Selected Visualizations”

 *“Add”*	Click the symbol to add a visualization to the list of selected visualizations. Requirement: This is selected in *“Available Visualizations”*. Hint: To add a visualization, double-click a visualization in *“Available Visualizations”*.
 *“Delete”*	Click the symbol to delete a visualization from the list. Requirement: This is selected in *“Selected Visualizations”*.
The visualizations are automatically numerically indexed via the order in the list. The top visualization has the index `0`. The next visualization has the index `1` and so on. Note: A *“Frame”* and a *“Tabs”* element use the variables specified in the index of the *“Switch frame variable”* property.	
↑ *“Move Up”*	Click the symbol to move a visualization up in the list. Requirement: This is selected in *“Selected Visualizations”*.
↓ *“Move Down”*	Click the symbol to move a visualization down in the list. Requirement: This is selected in *“Selected Visualizations”*.

See also

- *Chapter 1.4.5.19.5.6 “Visualization Element 'Frame'” on page 1856*
- *Chapter 1.4.5.19.5.10 “Visualization Element 'Tabs'” on page 1887*
- *“Element property 'Switch frame variable'” on page 1671*

Command 'Background'

Symbol: 

Function: The dialog *“Background”* opens. You can define here whether the background of the visualization is colored or displayed with an image.

Call: Menu *“Visualization”*, context menu

See also

- *Chapter 1.4.5.3.7 “Designing a background” on page 1266*

Dialog 'Background'

Table 299: “Color Settings”

“Use Color”	☑: Background in color Color defined as a style color or as a fixed value.

Table 300: “Image Setting”

“Use Image”	☑: Display of a background image Reference to an image from an image pool in the project, formally specified as an instance path: `<Name of the image pool>.<ID>` Example: ● `ImagePool_A.Factory` ● `ImagePool_B.ID_B`

Command 'Multiply Visu Element'

Symbol: 

Function: The command opens the *“Multiply Visu Element”* dialog, which contains a configuration derived from the template element and the array declaration. You can rearrange the elements here, as well as their quantity and the index access to the array data. When you exit the dialog, a field of similar elements is created from the template element. In the properties of the new elements, array variables are now configured with precise array indexes. These new elements are those in which you have configured an array variable with index access placeholders in the template.

Call: Menu bar: *“Visualization”*; context menu

Requirement: The visualization is active and a configured template element is selected.

Dialog 'Multiply Visu Element'

Table 301: Tab “Basic Settings”

“Total number of elements”	The total number is determined by the index range of the placeholders, including the setting on the *“Advanced Settings”* tab. The layout of the elements can be one-dimensional (as a column or row) or two-dimensional (as a table field).
“Horizontal”	Number of elements per row Default: Number of array components (index range) of the placeholder `$FIRSTDIM$` Example for array: `axLampIsOn: ARRAY[0..4] OF BOOL; = 5`
“Vertical”	Number of rows required for the layout of all elements Default ● When using index access placeholder `$FIRSTDIM$`: If the index range of the placeholder is less than five, then the layout of elements is horizontal. If the index range is greater than five, then the layout the elements is quadratic whenever possible. ● When using index access placeholders `$FIRSTDIM$` and `$SECONDDIM$`: The number of horizontal elements is equal to the number of index ranges specified by the placeholder `$FIRSTDIM$`. The number of vertical elements is equal to the number of index ranges specified by the placeholder `$SECONDDIM$`.
“Offset between elements”	Distance between the new elements; affects the positions of the new elements ● *“ 0 ”*: The frames of the elements overlap by one pixel. ● *“1 ”*: The elements touch. ● *“<n> ”*: A distance of n-1 pixel is visible between the elements.
“Horizontal”	Distance between the elements within a row (in pixels) Example: `2` for a distance of one pixel

“Vertical”	Distance between the elements within the columns (in pixels) Example for a distance of three pixels: `4`
“Arrangement of elements”	Origin from which the new elements are positioned and arranged If *“Vertical”* or *“Horizontal”* <> 1 ● *“From top left”* ● *“From top right”* ● *“From bottom left”* ● *“From bottom right”* If *“Horizontal”* or *“Vertical”* = 1 ● *“From top”* ● *“From bottom”*
“Orientation”	Determines the layout of the elements in the field (row by row, or column by column) ● *“Line by line”* ● *“Column by column”*
“Preview”	Displays the set layout and orientation of the elements as an arrow

Table 302: Tab “Advanced Settings”

“Array access”	Based on the template element, the precise index for accessing the array variable is calculated for each new element. The calculation is based on the array index limits as specified in the array declaration. The settings are also taken into account here.
“1st dimension”	Calculation guideline for the index of the first dimension that replaces `$FIRSTDIM$` The first new element gets the value specified below in *“Start index”* in the first dimension. The other elements each get an index incremented by *“Increment”* until an index is calculated for all elements. Example ● *“Start index”*: `1` ● *“Increment”*: `1`
“2nd dimension”	Calculation guideline for the index of the second dimension that replaces `$SECONDDIM$` The first new element gets the value specified below in *“Start index”* in the second dimension. The other elements each get an index incremented by *“Increment”*. Example ● *“Start index”*: `1` ● *“Increment”*: `1`

“OK”	First, it is validated whether the calculated indices are in the index range of the array variable. If so, then the elements that match the template element are created and arranged as a field (row, column, or table). The placeholder indexes are replaced by the calculated indexes.

Example

Declaration of array variables

```
VAR
asTexts_Example: ARRAY[1..2,1..2] OF STRING :=
    [
        '1A Text', '2A Text',
        '1B Text', '2B Text'
    ];
    asToolTips_Example: ARRAY[1..2,1..2] OF STRING :=
     [
        '1A Tooltip', '2A Tooltip',
        '1B Tooltip', '2B Tooltip'
    ];

    axUserInput_Example: ARRAY[1..2,1..2] OF BOOL;
END_VAR
```

Visualization with template element and its property configuration

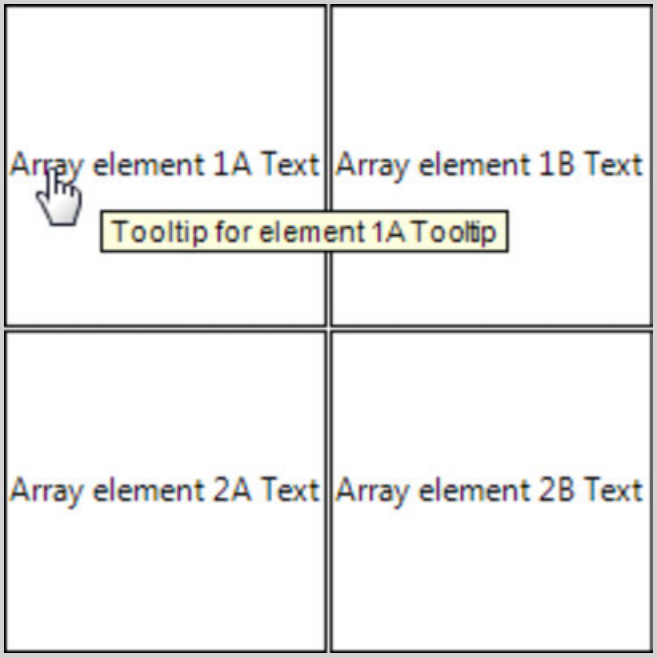
Visualization at runtime:



See also

- *Chapter 1.4.5.9.2 “Configuring and Multiplying Visualization Elements as Templates” on page 1299*

Command 'Configure Display Settings of Trend'

Symbol:

Function: When you execute this command in *“Visualization”* or in the context menu, the *“Edit Display Settings”* dialog opens.

Call:

- Menu bar: *“Visualization”*
- Context menu of a *“Trend”* element in the visualization editor
- Property *“Diagram”*

Requirement: A trend is selected in the active visualization editor.

Tab *“X Axis”*

“Grid”	☑: Trend diagram with grid lines in the X-direction in the selected color
“Font”	Font for the axis label

Tab *“Y axis”*

Table 304: “Display mode”

• *“Auto”*:	◉: The visualization scales automatically.
• *“ Fixed”*	◉: Fixed range from *“Minimum”* to *“Maximum”*
“Minimum”	Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The *“Display Mode”* is *“Fixed”*. Examples: `20`,`PLC_PRG.iLimit_Min`, `GVL.c_iLimit_Min` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Min : INT := 20`
“Maximum”	Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The *“Display Mode”* is *“Fixed”*. Examples: `80`,`PLC_PRG.iLimit_Max`, `GVL.c_iLimit_Max` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Max : INT := 80`
“Grid”	☑: Trend diagram with grid lines in the Y-direction in the selected color
“Description”	☑: Text for labeling the Y-axis (for example, `DC/mA`)

Table 305: “Tick marks”

“Fixed spacing”	☑: Axis scale with tick marks for *“Distance”* and *“Subdivisions”*
“Distance”	Distance between the tick marks (example: `2`)
“Subdivisions”	Number of subdivisions between tick marks (example: `4`)

“Font”	Font for the axis label

Table 306: “Background”

“From visualization style”	Background color as defined in the visualization style
“Draw background”	Background color which is selected in the lower input field
“No background”	Trend diagram with transparent background
Background color of the trend diagram	Requirement: *“Draw background”* is activated.

"Reset"	Resets the settings to the default settings
"Use as default"	Saves the settings as default

"Add Y-axis"	Extends the trend diagram by one Y-axis Result: The *"Trend Recording"* editor contains an extended selection of Y-axes in the *"Additional axes"* option of the *"Variable Settings"*.
"Delete Y-axis"	Deletes the Y-axis of the visible tab.

- *Editor 'Trend Recording'*

Command 'Configure Trace'

Symbol:

Function: This command opens the *"Trace Configuration"* dialog box.

Call: Context menu of the visualization element; *"Trace"* property of the visualization element.

Requirement: An element of type *"Trace"* is open in the editor.

Dialog box 'Trace Configuration'

The tree view shows the trace configuration and allows navigation.

The top entry contains the trace name. When this entry is selected, the *"Record Settings"* group appears in the adjacent view.

An entry is located here for each variable that data was recorded continuously. When a variable is selected, the *"Variable Settings"* group appears in the adjacent view.

"Add variable"	Adds a new entry to the trace configuration. Result: A blank configuration appears next to the new variable under *"Variable Settings"*. You configure the variable there.
"Delete variable"	Removes the selected variable.

'Recording Settings'

A trigger can be configured in the trace only.	
"Task"	Task where data was recorded.
"Record condition"	Recording condition for which the application records data in runtime mode: Variable (BOOL)
"Comment"	Example: `Acquiring data only when all conditions are true.`
"Resolution"	Measure for the time stamp that is recorded per data set. ● *"ms"*: Time stamp (in milliseconds). ● *"µs"*: Time stamp (in microseconds) for a task cycle time of 1 ms or less
"Automatic restart"	☑: Recording starts automatically as soon as the trace has been started one time and then the controller was restarted. The trace configuration and the contents of the trace buffer are saved persistently to a file on the target system. Format: `.trace.csv`
"Display"	The *"Edit Appearance"* dialog box opens.

"Advanced"	The *"Advanced Trace Settings"* dialog box opens.
"Copy from Trace"	The *"Copy Settings from Trace Instance"* dialog box opens. If you have already created an existing trace configuration from a trace object, then you can copy the configuration data to the visualization element. To do this, select the respective object.

See also

- *Chapter 1.4.5.19.3.18 "Dialog 'Advanced Trace Settings'" on page 1770*
- *Chapter 1.4.5.18.1.34 "Visualization Element 'Trace'" on page 1619*

'Variable Settings'

"Variable"	Variable for recorded value. ● Variable (valid data type) ● property ● Reference ● Contents of the pointer ● Array element (base type with valid data type) ● Enumeration (base type with valid data type) Valid data types are all standard types, **except** `STRING`, `WSTRING`, and `ARRAY`.
"Parameters"	Parameter whose value is acquired. ...: Input assistance lists ale valid parameters of the PLC.
	Enables toggling between *"Variable"* and *"Parameter"*
"Attached axis"	Y-axis of the trace diagram for the *"Variable"*. : Selection of the standard y-axis and the additional configured y-axes Note: The additional configured y-axes are configured in the *"Edit Display Settings"* dialog box.
"Display variable name"	: The trace graphs are displayed in tooltip with their variable names. If a text is also specified in *"Description"*, then the text is displayed first with the variable names in parentheses. Example: `Sensor A (PLC_PRG.iSensor_A)` If *"Description"* does not contain any text, then the *"Display Variable Name"* property is activated automatically. Then only the name is displayed (example: `PLC_PRG.iSensor_A`). : The trace graphs are displayed in tooltip without their variable names. Only the text in *"Description"* is displayed.
"Description"	Text for the tooltip. It is displayed when a visualization user moves the cursor in the trace diagram. Example: `Sensor A` The text is also entered into the *"GlobalTextList"* object and can be translated there.
"Color"	Color of the graph in the diagram.
"Line type"	Representation of the graph as a line chart ● *"Line"*: Values are linked to form a line. ● *"Step"*: Values are linked in the form of steps. ● *"None"*: Values are not linked.

"Line width"	In pixels Example: `1`
"Line style"	The display of the line is solid, dash, dot, dash-dot, or dash-dot-dot.
"Dot type"	Representation of the graph as a scatter chart. This configuration entry with the *"Line type"* determines the appearance of the graph. ● *"Dot"*: Each value as a dot. ● *"Cross"*: Each value as a cross. ● *"None"* Note: For *"Dot"* or *"Cross"*, a paint buffer overflow can result from many recorded variables.
"Warning at minimum"	☑: When below the lower limit, the visualization shows the trace graphs in the alert color.
"Critical lower limit"	Minimum Value Example: `10.`
"Color"	Warning color on falling below the limit
"Warning at maximum"	☑: When above the upper limit, the visualization shows the trace graphs in the alert color.
"Critical upper limit"	Maximum value Example: `90`
"Color"	Warning color on exceeding the limit
"Dynamic appearance options"	
"Variable for visibility"	Variable (`BOOL`) or as bit access. This controls the visibility of the variables in the trace diagram. ● `TRUE`: Visible ● `FALSE`: Invisible

See also

- *Chapter 1.4.5.19.2.13 "Command 'Configure Trace'" on page 1734*

Command 'Export Trace Configuration'

Function: This command opens the *"Export Trace Configuration"* dialog box.

Call: context menu (right-click) the upper node in the tree view of the trace configuration.

Requirement: The dialog box *"Trace Configuration"* is active and the name of the trace configuration is selected in the tree view (example: `Visu_Trace1`).

Dialog box 'Export Trace Configuration'

This dialog is used for saving the trace configuration to a text file that can be read by the runtime system.

"File name"	Name of text file to be created.
"File type"	*"Trace file (*.trace)"*: Format that the runtime system component `CmpTraceMgr` expects for reading.

See also

- *Chapter 1.4.5.19.2.13 “Command 'Configure Trace'” on page 1734*

Command 'Insert Elements for Controlling Trace'

Symbol: 

Function: The command opens the *“Trace Wizard”* dialog. In this dialog, you select predefined visualization elements for controlling the trace recording. These elements are then inserted as configured into the visualization editor.

Call: Menu bar: *“Visualization”*; context menu of the trace element.

Requirement: The view is active and a trace element is selected.

Dialog 'Trace wizard'

“Control variable”	Corresponds to the *“Control variables”* property that is available in the element properties of the trace element. ☑: The control element for this trace control variable is created in the visualization editor.
“Variable”	Project variables that are assigned to the control element below the *“Input configuration”* property. In addition, the project variables are declared as local variables in the visualization when needed (in the interface editor). This list corresponds to the assignments that are defined in the element properties of the trace element. If nothing is configured in the properties of the trace element (no project variables assigned as control variables), then a pre-allocation is offered with default variable names.
“Type of element to insert”	For a Boolean variable, this element can be inserted as a button or rectangle. For a string variable, a rectangle or a text field is provided.
“OK”	At the closing of the dialog, the selected control elements are inserted into the visualization editor and (when needed) its control variables are created as local variables of the visualization. They are declared in the interface editor and they are used by the control element (property *“Input configuration ➔ Toggle ➔ Variable”*) and by the trace element (*“Control variables”* property). The control element writes to the variable and the trace element reads the variable.

Example

Standard control variables:

```
VAR
    bResetTrigger : BOOL;
    bStart : BOOL;
    bStop : BOOL;
    bStore : BOOL;
    sStoreFilename : STRING;
    bRestore : BOOL;
    sRestoreFilename : STRING;
END_VAR
```

Command 'Configure Display Settings of Trend'

Symbol: 

Function: When you execute this command in *"Visualization"* or in the context menu, the *"Edit Display Settings"* dialog opens.

Call:

- Menu bar: *"Visualization"*
- Context menu of a *"Trend"* element in the visualization editor
- Property *"Diagram"*

Requirement: A trend is selected in the active visualization editor.

Tab *"X Axis"*

"Grid"	☑: Trend diagram with grid lines in the X-direction in the selected color
"Font"	Font for the axis label

Tab *"Y axis"*

Table 307: "Display mode"

• *"Auto"*:	◉: The visualization scales automatically.
• *" Fixed"*	◉: Fixed range from *"Minimum"* to *"Maximum"*
"Minimum"	Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*. Examples: `20`,`PLC_PRG.iLimit_Min`, `GVL.c_iLimit_Min` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Min : INT := 20`
"Maximum"	Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*. Examples: `80`,`PLC_PRG.iLimit_Max`, `GVL.c_iLimit_Max` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Max : INT := 80`
"Grid"	☑: Trend diagram with grid lines in the Y-direction in the selected color
"Description"	☑: Text for labeling the Y-axis (for example, `DC/mA`)

Table 308: "Tick marks"

"Fixed spacing"	☑: Axis scale with tick marks for *"Distance"* and *"Subdivisions"*
"Distance"	Distance between the tick marks (example: `2`)
"Subdivisions"	Number of subdivisions between tick marks (example: `4`)

"Font"	Font for the axis label

Table 309: "Background"

"From visualization style"	Background color as defined in the visualization style
"Draw background"	Background color which is selected in the lower input field

“No background”	Trend diagram with transparent background
Background color of the trend diagram	Requirement: *“Draw background”* is activated.

“Reset”	Resets the settings to the default settings
“Use as default”	Saves the settings as default

“Add Y-axis”	Extends the trend diagram by one Y-axis Result: The *“Trend Recording”* editor contains an extended selection of Y-axes in the *“Additional axes”* option of the *“Variable Settings”*.
“Delete Y-axis”	Deletes the Y-axis of the visible tab.

See also

- *Chapter 1.4.5.19.2.12 “Command 'Configure Display Settings of Trend'” on page 1732*
- *Editor 'Trend Recording'*

Command 'Edit Trend Recording'

Symbol:

Function: This command opens the *“Trend Recording”* object.

Call:

- Menu bar: *“Visualization”*
- Context menu of a *“Trend”* element in the visualization editor
- Property *“Trend recording”*

Requirement: An element of type *“Trend recording”* is selected in the visualization editor.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.1.20.2.31 “Object 'Trend Recording'” on page 949*

Command 'Insert Elements for Controlling the Trend'

Symbol:

Function: When you execute this command in *“Visualization”*, the *“Trend Wizard”* dialog box opens.

Call: Menu bar: *“Visualization”*; context menu of a *“Trend”* element in the visualization editor.

Requirement: A trend is selected in the active visualization editor.

Dialog 'Trend wizard'

Each row of the table contains a control element that can assigned to the trend. The elements are placed in the visualization next to the trend. The control elements are saved in the *“Assigned control elements”* property and can be modified there.

“Attached control element”	☑: The associated element is available in the visualization and connected with the trend via the property *“Assigned Visu element”*. The element is inserted into the visualization. ☐: Deactivating the option does **not** cause the element to be deleted from the visualization.
“Position”	Position of the control element in relation to the trend.
“Type of element to insert”	Drop-down list with the installed types of the control element
“Instance name”	Instance name of the control element

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Command 'Visualization Element Repository'

Symbol: 

Function: This command opens the *“Visualization Element Repository”* dialog box opens for editing the storage location and visualization profile.

Call: Menu bar: *“Tools”*.

Requirement: No project is open.

The visualization element repository is used for creating a visualization profile or visualization extension. This is necessary when developing you own visualization elements with the CODESYS VisuElement Toolkit. The CODESYS VisuElement Toolkit is required for this with a valid license. Users who do not wish to create their own visualization elements can use this dialog to find out which elements are included in which visualization profile. A reconfiguration of the storage location for a repository is also important only for element developers.

NOTICE!

1. Only an empty directory can be selected as a new storage location for a repository.

2. The "System" repository cannot be modified. This is indicated by the entry in italics in the repository list.

Currently only a single version of an element can be installed.

Dialog box 'Visualization Element Repository'

Table 310: Editing the repository

“Location”	Storage location for the repository in the file system. The drop-down list contains the configured repositories for visualization elements.
“Edit locations”	Opens the *“Edit Repositories”* dialog box for modifying the repository currently selected in *“Location”* or for creating a new repository.

Table 311: “Profile or extension selection”

A profile is a collection of visualization elements in a specific version. These elements originate from one or more libraries. They are available in the toolbox of the visualization editor when the profile is used in the project. You can use an extension to add a specific selection of elements to an existing profile. Creating and editing a profile is possible only if the CODESYS VisuElement Toolkit is installed. In this case, the buttons on the right side of the dialog box can be used.	
“Create or update profile”	You can configure a new profile in the dialog or modify an existing one. Then, the *“New”*, *“Copy”*, and *“Delete”* buttons are operable, as well as the *“Installed Elements”* and *“Available Elements”* views.
“Create or update extension”	In the dialog, you can configure an extension for the selected profile. Another drop-down list *“Extension”* appears with all currently available extensions. To configure a new extension, use the *“New”* or *“Copy”* buttons (see below). In both cases, the *“Specify Visualization Extension”* dialog box opens for you to define a new extension. In this dialog box, the *“Name”*, *“Company”*, and *“Version”* of the extension are displayed. Version syntax: Sequence of numbers and points with a number at the end.
“Profile”	Currently selected profile. The drop-down list provides all profiles available in the repository set above.
“Extension”	The extension that is currently selected for the specified profile. The drop-down list provides all extensions available for the profile.
“New”	Pressing the button opens the *“Specify Name of Visualization Profile”* dialog or the *“Specify Visualization Extension”* dialog. Specify a unique name for the new profile, or for an extension also the company name and the version. CODESYS automatically enters the previously used name, appended with "_0". The *“Installed elements”* list is empty.
“Copy”	Pressing the button opens the *“Specify Name of Visualization Profile”* dialog or the *“Specify Visualization Extension”* dialog (see above: *“New”*). The elements of the selected profile are accepted and they appear in the *“Installed elements”* view.
“Delete”	The currently set profile or the extension is deleted, and then the drop-down list is removed.

Table 312: “Installed Elements”

“Name, Vendor, Library”	Elements that are assigned to the selected profile.
“Uninstall”	All elements currently selected in the list are uninstalled and removed from the *“Available Elements”* list.
“Update code”	The list is refreshed with any changes in the implementation code of the library POUs.
“Update all”	The list is refreshed with any changes in the implementation code and in the interfaces (declaration part) of the library POUs.

Table 313: “Available Elements”

“Name” *“Library”* *“Vendor”* *“Version”* *“Repositories”* *“Profiles”*	Elements that are available in the system and can be installed into the current profile or extension. The selection depends on the installed element libraries and element packages. The tree structure displays the libraries with the contained elements below them. Elements display in green are already installed for the specified profile or extension. *“Profiles”* shows the elements installed for the profiles.
“Install element”	The elements selected in the list are added to the *“Installed Elements”* view. Existing elements are overwritten.
“Install library”	The *“Library Repository”* dialog box opens where another library can be installed in order to accept its elements in the *“Available Elements”* view.

“Note current library versions only”	☑: When refreshing the list, only the most current version of the library is searched, not all libraries.
“Overwrite profiles without prompting”	☑: For actions that change the profile, the usual prompt does not appear for confirming the change.

Dialog box 'Edit Repositories'

“Storage location, Name”	For managing the visualization elements, one or more repositories can be used. All currently defined storage locations are listed here with file path and name. The order from top to bottom is also the search order for the visualization elements. File path and name of the storage location selected previously in the *“Repository for Visualization Elements”* dialog. Note: A storage location "System" is always defined automatically, which cannot be modified or deleted.
“Add” *“Edit”*	Opens the *“Storage Location for Repository”* dialog for creating a new storage location or for editing the current storage location. Specify: *“Storage location”* (file path of an empty directory) and *“Name”*. The name is symbolic (example: "Elements category 1").
“Remove”	Deletes the repository currently selected in the repository list.
“Move Up, Move Down”	Moves the entries within the list. Note: The repositories are searched from top to bottom.

Command 'Visualization Style Repository'

Symbol: 

Function: This command opens the *“Visualization Styles”* dialog box. It makes it possible to edit visualization style repositories.

Call: Menu bar: *“Tools”*.

See also

- ↳ *Chapter 1.4.5.17.2 “Managing visualization styles in repositories” on page 1365*

Dialog Box 'Visualization Styles'

"Storage location"	Name of the currently selected repository Preset: *"System"* ▾: Lists the repositories installed in the development system.
"(...)"	Storage location of the repository Example: `(C:\ProgramData\CODESYS\Visualization Styles)`
"Edit locations"	The *"Edit Repository Locations"* dialog box opens.

Table 314: "Installed Visualization Styles"

"Company"	When a company name is specified here, the tree view is filtered and only the styles of the selected company are listed. Preset: *"(All companies)"*. It is not filtered. ▾: Lists all companies that are specified in the styles.
Windows with styles	Tree view of all versions of the installed visualization styles in the selected repository
"Display localized names"	☑: The style name is localized and displayed in the language that is set in CODESYS. ☐: The style is display as the source name.
"Install"	The *"Select Visualization Style(s)"* dialog box opens.
"Uninstall"	The selected style version is removed from the repository.
"Preview"	The windows closes. A preview is displayed of the selected style in the selected version. Specific elements are displayed in the style.

Dialog box 'Edit Repository Locations'

Table 315: "Repositories (elements are searched in that order)"

"Location"	Storage location of the configured repository on the development system Example: `C:\ProgramData\CODESYS\Visualization Styles`
"Name"	Preset: `System`
"Add"	The *"Repository Locations"* dialog box opens. It makes it possible to manage other repositories.
"Edit"	
"Remove"	
"Move Up"	The order in the list of repositories is adapted. It defines the processing order when searching for elements.
"Move Down"	

Command 'Add Visual Element'

Function: The command opens a menu containing all available visualization elements as menu items.

Requirement: You have configured the command in the dialog box *"Customize"* in a way that you have a call in a (any) menu.

When you select an element in the menu, the element is added in the visualization editor in the upper left corner.

See also

- *Chapter 1.4.5.3.1 “Select Element” on page 1255*
- *Chapter 1.4.1.20.3.8.16 “Command 'Customize'” on page 1071*

Command 'Select None'

Function: The command cancels at once any selection in the current visualization editor.

Requirement: You have configured the command in the dialog box *“Customize”* in a way that you have a call in a (any) menu.

See also

- *Chapter 1.4.5.3.1 “Select Element” on page 1255*
- *Chapter 1.4.5.19.2.7 “Command 'Group'” on page 1726*
- *Chapter 1.4.1.20.3.8.16 “Command 'Customize'” on page 1071*

Command 'Add Elements for Alarm Acknowledgement'

Symbol: 

Function: This command adds buttons automatically to the visualization for acknowledging alarms. It opens an assistant for inserting controls below the table.

Call: Menu bar: *“Visualization”*; context menu of visualization element "Alarm table"

Requirement: An "Alarm table" visualization element is selected.

Dialog box 'Alarm Table Wizard'

“Type of element(s) to insert”	● *“Button”* ● *“Rectangle”*
“ Action”	☑: A button or a rectangle with the selected function is added to the visualization.
“Variable”	If you have already specified a variable for an action, then this is displayed here in the *“Variable”* column. If you have not defined a variable yet, then a local visualization variable is created automatically.

See also

- *Chapter 1.4.5.19.5.22 “Visualization Element 'Alarm Table'” on page 1969*

1.4.5.19.3 Dialog Boxes

Dialog 'Access Rights'

Function: This dialog defines the permissions of user groups for a visualization element.

Call: Click in the *“Value”* field of the *“Access Rights”* element property of a visualization element.

Requirement: A visualization element is selected in a visualization element and the *“Properties”* is open.

“User Groups”	Groups that were configured in the *“Visualization Manager”* (tab *“User Management ➔ Groups”*).
“Operable”	☑: The visualization element is available with full functionality.
“Only Visible”	☑: The visualization element is visible only and does not provide any functionality.
“Invisible”	☑: The visualization element is not displayed.
“Group hierarchy is used”	Display whether the option *“Use group hierarchy”* is activated in the *“Visualization Manager”* (tab *“User Management ➔ Settings”*). A group of a higher hierarchy cannot have fewer permissions for an element than an element of a lower hierarchy.

If no user is logged in, then the permissions apply for the visualization elements that are configured for the user group “None”. If the permissions for a visualization element is restricted, then the group “None” should be granted the lowest permissions.

See also

- *Chapter 1.4.5.19.4.5 “Tab 'Visualization manager' - 'User management'” on page 1782*

Dialog 'Add Visualization'

Function: The dialog is used to create a new object of type *"Visualization"*.

Call: Menu bar: *"Project* ➔ *Add Object* ➔ *Visualization"*; context menu of an application

Requirement: An application is selected in the device tree.

"Name"	Name of the visualization Example: `Visu_A`

The following settings are displayed only when you add a *"Visualization"* object to the project for the first time.	
"Symbol library"	List of all installed symbol libraries
"Assigned"	: Symbol library is selected Hint: CODESYS manages this setting in the project settings.

"Add"	CODESYS creates a new visualization, assigns the selected symbol libraries to the project, and lists them in the *"Visualization Toolbox"* view.

See also

- *Chapter 1.4.5.3.1 "Select Element" on page 1255*
- *Dialog 'Project Settings' - 'Visualization'*
- *Command 'Add Object'*

Dialog 'Update Frame Parameters'

Function: The dialog requests you, after changing an interface in the visualization references concerned, to re-assign the variables for the parameter transfer.

Call: The dialog appears automatically.

Requirement: You have changed the interface of a visualization, for example by adding an additional variable. After that, you have clicked either *"File* ➔ *Save Project"* or *"Build* ➔ *Generate Code"*, or opened a visualization.

"Parameter"	Hierarchical structure of the interface parameters as a tree view
	Top node of the visualization hierarchy with the name of the visualization. This contains an element of type *"Frame"* or *"Tabs"*.
	Name of the element (*"Frame"* or *"Tabs"* type)
	Name of the referenced visualization
"(Recent)"	Interface of the referenced visualization with the new parameters You can edit the parameter transfer here.
"(Previous)"	Interface of the referenced visualization with the previously valid parameters. You cannot edit the parameter transfer, but you can use it as a template.
`<name>`	Variable for the parameter transfer (`VAR_INPUT` scope)
`<name>`	Variable for the parameter transfer (`VAR_IN_OUT` scope)

"Type"	Data type of the variable Example: `INT`
"Value"	Variable that is transferred as a parameter and with whose value the visualization is initialized during instantiation. Example: `PLC_PRG.iVisNr` If the variable lies under the current interface, which is marked in the tree view with *"(Current)"*, then you can edit the parameter transfer. ● Click in the field to open the input field. ● Double-click in the field to open the Input Assistant. ● Accept the settings by copying assignments in the *"Value"* column and pasting them into another cell. Use the *"Copy"* and *"Paste"* links to do this.

"Copy"	Link for copying an assignment from the *"Value"* column. Requirement: An assignment is selected.
"Paste"	Link for inserting an assignment Requirement: You have copied an assignment.

"OK"	Click the button to close the dialog and confirm the changes made under *"(Recent)"*. Result: The assignment is entered in the *"References"* property and on the *"Interface Editor"* tab.

See also

- *Chapter 1.4.5.19.5.6 "Visualization Element 'Frame'" on page 1856*
- *Chapter 1.4.5.19.2.1 "Command 'Interface Editor'" on page 1719*

Dialog 'Configure Categories and Items'

Function: The dialog is used to manage the categories in a tree view. The assigned elements are listed below a category. You can create custom categories and edit the assignment to the visualization elements. The name of the category is displayed in the *"Visualization Toolbox"* view as a label of the button to open the element selection.

Call: Click the symbol in the *"Visualization Toolbox"* view.

See also

- *Chapter 1.4.5.3.1 "Select Element" on page 1255*
- *Chapter 1.4.5.19.4.1.2 "View 'Visualization Toolbox'" on page 1773*

Tree view

"Category"	Tree view ● *"<name>"*: Default category ● *"<name>"*: Custom category Example: *"Favorite"*
+	Lists the assigned visualization elements. To remove a selected visualization element, click the *[Del]* key. Hint: The assignment is created in the *"Visualization Toolbox"* view with the help of the context menu of a selected element.
"Active"	: A button for the category is visible in the *"Visualization Toolbox"* view.

Toolbar

+	The *"Add Category"* dialog opens.
− or *[Del]*	The category selected in the tree view is removed. After you click *"OK"* to close the dialog, the button is also removed from the *"Visualization Toolbox"* view.

Dialog 'Add Category'

Call: Click the + symbol in the *"Configure Categories and Items"* dialog.

"Name"	Name of the category Example: `tagA`
"Description"	Example: `Tagged with A`

Dialog 'Gradient Editor'

Function: The dialog is for setting the color gradient of visualization elements. If you define two colors, the color graduates between them. If you only select 1 color, the color graduates within this color through its brightness. The detailed settings are for a special specification of the initial position and the angle of the color gradient.

Call: Click in the value field of the property *"Gradient settings"*

Requirement: You have selected a visualization element in the editor that has the property *"Gradient settings"*.

"Gradient type"	● *"Linear"* ● *"Radial"* ● *"Axial"*: The color gradient runs along an axis, with the colors extending perpendicular to the axis on both sides.
"Color 1"	First color of the gradient.
"Color 2"	Second color of the gradient.
"Transparency"	Transparency of the associated color. Permissible values: Integers in the range of values from `255` to `0`. 255: The color is opaque. 0: The color is fully transparent.
"Standard linear"	Requirement: *"Linear"* color gradient. Standard direction of the linear color gradient.
"Standard radial"	Requirement: *"Radial"* color gradient. Standard setting.

“Standard axial”	Requirement: *“Axial”* color gradient. Direction of the color gradient
“Angle (degrees)”:	Requirement: *“Linear”* or *“Axial”* color gradient.
“Center X (%):”	Requirement: *“Radial”* color gradient. X-position of the center point (0 – 100%)
“Center Y (%):”	Requirement: *“Radial”* color gradient. Y-position of the center point (0 – 100%)
“Use one color”	Color gradient between *“Color 1”* and the same color with a different brightness.
“Brightness”	Requirement: The option *“Use one color”* is selected. Setting from 0 (black) to 100 (white)
“Use two colors”	Color gradient between the two selected colors *“Color 1”* and *“Color 2”*.

See also

- *Chapter 1.4.5.3.3 “Assigning a color” on page 1258*
- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Dialog 'Input Configuration'

Symbol: 

Function: The dialog is used to assign input actions to specific input events. It also includes specific settings for the selected input action.

Call: In the *“Input configuration”* property, click *“Configure”*.

Requirement: An element is selected in the editor.

Input action 'User Management'

“Dialogs and actions”	Configures which one of the possible user management dialogs or which action follows the input event Note: The dialog used at runtime is configured in the *“Dialog Settings”* tab of the Visualization Manager. See also ● *“ Login dialog”* ● *“Change password dialog”* ● *“Change configuration dialog”* Default: Dialogs from the `VisuUserManagement` library
“Login”	The login prompt opens. Default: `VisuUserManagement.VUM_Login` in *“Login dialog”*
“Logout”	The current user is logged out.
“Change User Password”	The dialog for changing the password opens. Default: `VisuUserManagement.VUM_ChangePassword` in *“Change password dialog”*
“Open User Configuration”	The dialog opens for changing the configuration. Default: `VisuUserManagement.VUM_UserManagement` in *“Change configuration dialog”*

See also

- *Chapter 1.4.5.5 “Setting Up User Management” on page 1282*
- *“Tab 'Visualization manager' – 'Settings'” on page 1777*

Input action 'Close Dialog'

“Dialog”	The visualization of type *“Dialog”* that will be closed. : List box with all *“Dialog”* type visualizations available in the project. Example: Default dialogs of the `VisuDialogs` library, which is usually integrated in the project. • `FileOpenSave` • `Keypad` • `Login` • `Numpad` • `NumpadExtended` • `TextinputWithLimits` Note: The setting in the object property (*“Visualization”* tab) of a visualization determines whether or not a visualization can be used as a dialog.

“Result”	Return value for closing the dialog. Note: If there are more input actions after closing, then they configured in the *“Input configuration ➔ OnDialogClosed”* property of the element.
“None”	: No return value
“OK”	: The set return value is returned. The return value refers to the button in the dialog. The value `OK` is returned for the OK button. The value `Cancel` is returned for the cancel button.
“Cancel”	
“Abort”	
“Retry”	
“Ignore”	
“Yes”	
“No”	

See also

- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*

Input action 'Open Dialog'

“Dialog”	Visualization (type *“Dialog”*). The dialog opens. : List box with all dialogs available in the project. Note: The *“VisuDialogs”* library provides visualizations (type *“Dialog”*). • `VisuDialogs.FileOpenSave` • `VisuDialogs.Login`

Transfer parameters of the dialog	
"Parameter"	Interface parameter as declared in the interface editor of the visualization Example: `filelistProvider`
"Type"	Data type of the parameter as declared in the interface editor of the visualization. Example: `VISU_FBFILELISTPROVIDER`
"Value"	Variable (data type corresponds to the data type of the parameter). The value of the variable is read when the dialog opens and passed to the parameter. Example: `PLC_PRG.fileListProvider // Instance of function block VisuDialogs.Visu_FbFileListProvider` : The input assistance offers all variables available in the entire project.

Here the return value of the dialog is activated for which the `Var_OUTPUT` variable and `VAR_IN_OUT` variable are written. The dialog closes afterwards.	
"Update" "and" "parameter in case of result"	Note: The parameters are updated before the dialog is closed. Until then, the values are stored temporarily. They are stored as a copy, not as a reference.
"None"	: No return value
"OK"	: Defines the return value for which the transfer parameter is written
"Cancel"	
"Abort"	
"Retry"	
"Ignore"	
"Yes"	
"No"	

"Open dialog modal"	: Only the dialog processes user inputs. The remaining visualizations are blocked to user input.

"Position to open"	
"Centered"	The dialog opens in the center of the visualization.
"Position"	The dialog opens at the position defined by *"X"* and *"Y"*.
"X"	Position (in pixels) or variable (integer data type)
"Y"	Position (in pixels) or variable (integer data type)

See also

- *Chapter 1.4.5.15.3 "Calling a dialog in a visualization" on page 1338*

Input action 'Change Language'

"Language"	Language to be switched Example: `en` : The input assistance offers all languages available in the project.

Input action 'Change Shown Visualization'

Table 316: “Zoom to visualization”

Visualization that is shown at the user input	
“Assign”	Visualization that is selected from all available visualizations in the project or libraries. Example: `visMain`
“Assign expression”	Variable (`STRING`) that contains the name of the visualization Example: `PLC_PRG.strVisu` for the following application code: `strVisu: STRING := 'visMain';`
The order in which visualizations are displayed by user inputs is saved internally. The following options use this information.	
“Previous shown visualization”	☑: Visualization that has already been shown before the current one Requirement: A visualization switch has already occurred.
“Next shown visualization”	☑: Visualization that is next in the call order after the current one. Requirement: A visualization switch has already occurred which was called by *“Previous shown visualization”*.

Input action 'Execute Command' Commands are listed here with transfer parameters that the visualization processes when an input event occurs.

“Configure commands”	▾ ● *“Execute program on the plc”* ● *“Execute program on client”* ● *“Print”* ● *“Navigate to URL (WebVisu)”* ● *“Create Recipe”* ● *“Read Recipe”* ● *“Write Recipe”* ● *“Write Recipe in File”* ● *“Load Recipe from File”* ● *“Delete Recipe ”* Click + to add the selected command to the lower command list.

+	The command in *“Configure commands”* is added to the list.
−	The command is removed. Requirement: A command is selected.
The order in the list defines the order of execution.	
▼	The selected command is moved down one position in the list.
▲	The selected command is moved up one position in the list.

Table 317: Command “Execute program on the plc”

“Command”	*“1st parameter”*	*“2nd parameter”*
`ExecutePlcProgram`	`'C:\programs\notepad.exe'`	`'Notes_A.txt'`
EXE file that is executed on the controller The program is executed on the PLC and therefore it must not be interactive or have any user interfaces. It is possible, for example, for a program to copy a file.	Program name with directory as `STRING` in single straight quotation marks	Arguments of the program as `STRING` in single straight quotation marks Example: Name of the file that the program opens

Table 318: Command “Execute program on client”

“Command”	*“1st parameter”*	*“2nd parameter”*
`ExecuteClientProgram`	`'C:\programs\notepad.exe'`	`'Notes_A.txt'`
EXE file that is executed on the display variant. Exception: WebVisu. The program is executed within the context of the display variant. After this, the program may be interactive and have a user interface.	Program name with directory as `STRING` in single straight quotation marks	Arguments of the program as `STRING` in single straight quotation marks Example: Name of the file that the program opens

NOTICE!
If the visualization is displayed as a CODESYS WebVisu, then no program (EXE file) can be started.

Table 319: Command “Navigate to URL (WebVisu) ”

“Command”	*“1st parameter”*	*“2nd parameter”*
`NavigateURL`	`'http://en.wikipedia.org'` `PLC_PRG.stURL`	`'replace'`
The visualization navigates to the web page of the URL. Requirement: The visualization is executed as a CODESYS WebVisu.	URL ● As a literal in single straight quotation marks ● As a variable (`STRING`)	If a parameter is not specified, then the web page is displayed in a new window or a new tab. If `'replace'` is specified, then the CODESYS WebVisu is replaced by the web page.

Table 320: Command “Read Recipe”

“Command”	*“1st parameter”*	*“2nd parameter”*
`ReadRecipe`	`'RecipeDefinitionForModules'`	`'RecipeModuleA'`

	Name of the recipe definition ● As a literal ● As a variable (STRING)	Name of the recipe ● As a literal ● As a variable (STRING)
At visualization runtime, the controller reads the actual values from the variables of the recipe definition and writes them to the specified recipe. The values are saved implicitly (to a file on the controller) and shown in the recipe definition in the Recipe Manager of CODESYS. In other words, the recipe that is managed in CODESYS is updated with values from the controller.		

Table 321: Command “Write Recipe”

“Command”	*“1st parameter”*	*“2nd parameter”*
`WriteRecipe`	`PLC_PRG.stRecipeDef`	`PLC_PRG.stRecipe`
	Name of the affected recipe definition ● As a literal ● As a variable (STRING)	Name of the recipe (from the recipe definition) ● As a literal ● As a variable (STRING)
At visualization runtime, the values of the recipe are written to the variables on the controller as they are in the Recipe Manager.		

Table 322: Command “Save Recipe in File”

“Command”	*“1st parameter”*	*“2nd parameter”*
`SaveRecipeAs`	`PLC_PRG.stRecipeDef`	`PLC_PRG.stRecipe`
	Name of the affected recipe definition ● As a literal ● As a variable (STRING)	Name of the affected recipe that is updated and saved to a file ● As a literal ● As a variable (STRING) Optional parameter: If you do not specify a transfer parameter here, then the values from the recipe variables are saved only the file that is specified later. The implicit recipe files are not updated.
At visualization runtime, the *“Save Recipe as”* dialog opens and prompts the user for a file name and a storage location on the controller. The file name must not be `<recipe>.<recipe definition>`. The file extension is `.txtrecipe`. The user can then save the file that includes the actual values from the recipe variables. If a transfer parameter is **not** specified in the 2nd parameter, then the file is saved without changing an implicit recipe file. If a transfer parameter is given in the 2nd parameter, then the implicit recipe file is also updated. Note: If the *“Save recipe changes to recipe files automatically”* option is selected in the *“Recipe Manager - General”* tab, then the recipe definition in CODESYS and the implicit recipe files are kept the same automatically. Note: Implicit (automatically generated) recipe files exist on the controller with names in the following syntax: `<recipe>.<recipe definition>.txtrecipe`. These are typically used in the application as a buffer when reading and writing recipe variables.		

Table 323: Command "Load Recipe from File"

"Command"	*"1st parameter"*	*"2nd parameter"*
`LoadRecipeFrom`	`PLC_PRG.stRecipeDef`	`PLC_PRG.stRecipe`
	Name of the affected recipe definition ● As a literal ● As a variable (STRING)	Name of the affected recipe ● As a literal ● As a variable (STRING)
At visualization runtime, the *"Load Recipe"* dialog opens. It provides the visualization user with a file list that is located in the file system of the controller and filters by the extension `txtrecipe`. The selected file is downloaded. Then the recipes from the file are written to the implicit files and read to the given recipe in the recipe definition of the Recipe Manager. Requirement: The file was created with the `SaveRecipeAs` command.		

Table 324: Command "Create Recipe"

"Command"	*"1st parameter"*	*"2nd parameter"*
`CreateRecipe`	`PLC_PRG.stRecipeDef`	`PLC_PRG.stRecipe_New`
	Name of the affected recipe definition ● As a literal ● As a variable (STRING)	Name of the new recipe ● As a literal ● As a variable (STRING)
At visualization runtime, a new recipe is created in the given recipe definition.		

Table 325: Command "Delete Recipe"

"Command"	*"1st parameter"*	*"2nd parameter"*
`DeleteRecipe`	`PLC_PRG.stRecipeDef`	`PLC_PRG.stRecipe`
	Name of the affected recipe definition ● As a literal ● As a variable (STRING)	Name of the recipe ● As a literal ● As a variable (STRING)
At visualization runtime, the specified recipe is deleted from the recipe definition.		

Table 326: Command "Print"

"Command"	*"1st parameter"*	*"2nd parameter"*
`Print`	Optional: File name for the visualization screen to be printed (example: 'Start screen')	A second parameter cannot be specified for the `Print` command.
The default *"Printer"* dialog opens while the visualization is running. In the dialog, you select a printer and configure additional print settings. When you confirm the dialog, the currently displayed visualization screen is printed. Note: The command can be executed in the TargetVisu only.

- *Changing Values with Recipes*
- *Object 'Recipe Definition'*

Input action 'Switch Frame Visualization'

When the input event occurs, the display switches to another visualization within one frame.

"Frame selection type"	
"Switch local visualization"	The *"Frame Selection"* group is visible.
"Switch to any visualization"	The *"Frame and visualization selection"* group is visible.

Requirement: *"Switch local visualization"* is selected.	
"Frame selection"	List of all frames that contain the active visualization. The referenced visualizations are listed below each frame, as determined in the *"References"* property of the respective frame. Example: "Assign selection"	The selection in the *"Frame selection"* input field is accepted. Then it appears in the *"Selected frame"* and *"Selected visualization"* settings. Requirement: A visualization is selected in the *"Frame selection"* input field.
"Selected Frame"	Name of the frame to be switched to Example: `MainArea` Hint: Use the *"Assign selection"* command for changing the setting here.
"Selected Visu"	Name of the switched visualization. Example: `visMainArea` Hint: Use the *"Assign selection"* command for changing the setting here.

Requirement: The *"Switch to any visualization"* option is selected.	
"Frame and visualization selection"	Contains the frame to be switched to
"Assign"	Frame to be switched to (with complete path). The index determines the visualization. Example: `visMain.frameA.visB.frameB` The path is specified in the following syntax: `<visualization name>.<frame name> { <visualization name>.<frame name> }` Caution: Visualizations can be nested at any depth by means of frame elements. In order to use the *"Switch to any visualization"* frame selection type without any problems, a frame must not contain more than 21 referenced visualizations.

“Assign expression”	Variable (`STRING`). Contains the path of the frame to be switched to Example: `strFrane: STRING := 'visMain.frameA.visB.frameB';`
“Index to select”	Index that determines which of the referenced visualizations is displayed ● As an integer ● As a variable (integer data type) Example :`PLC_PRG.iIndex` Note: The referenced visualizations of a frame are indexed automatically according to their order.

Requirement: The project contains visualizations that form a structure.

See also

- *“Dialog 'Frame Configuration'” on page 1727*

Input action 'Write Variable'

The configuration of the input action defines how a visualization user specifies a value and to which variable the value is written.

Check all inputs for there validity. Be sure that only values within the range can be added to a numeric field. Depending on the datatype of the input value, the limitations can be different.

“Input type” How the input is prompted.	
“Default”:	An input field also opens, or if necessary a virtual keyboard (when the display variant does not have a physical keyboard). Note: The default option for text input at runtime is set in the Visualization Manager: *“Dialog Settings”* tab, *“Settings for Default Text Input”*.
“Text input”	An input field appears. You use the keyboard to specify a number or a text. Requirement: The display variant has a keyboard as input device.
“Text input with limits”	An input field appears. You use the keyboard to specify a number or a text. The field also shows the range of values for the input. When a limit is passed, the input value is displayed in red. Requirement: The display variant has a keyboard as input device.
“VisuDialogs.Keypad”	A virtual keyboard opens. You use it to specify a number or a text.
“VisuDialogs.Numpad”	A virtual keyboard opens. You use it to specify a number.
“VisuDialogs.NumpadExtended”	A virtual keyboard opens. You use it to specify a number. Hexadecimal and exponential notation are also permitted here.

“Choose variable to edit”	
“Use text output variable”	: The input value is written to the text output variable of the element. This is the variable that is assigned in the *“Text variable ➔ Text”* property.
“Use another variable”	: Variable where the input value is written. Example: `PLC_PRG.iVariable`
“Initial display format”	Placeholder with format definition. It defines the output format for the variable value and the input limits. Example: `%2.3f` for displaying the value as a decimal fraction.

"Min"	Minimum value of the input limit. If a user specifies a lesser value, then it is not accepted. ● As a fixed value ● As a variable (data type corresponds to selected variable)
"Max"	Maximum value of the input limit. If a user specifies a greater value, then it is not accepted. ● As a fixed value ● As a variable (data type corresponds to selected variable)
"Dialog title"	Text displayed in the title bar of the dialog. Optional. ● As a fixed string Example: `Insert value` ● As a variable (`STRING`) Example: `PLC_PRG.stTitle : STRING := 'Insert value';`

"Password field"	☑: Unseen text input. `***` is shown instead of the input text.

Table 327: "Position to open input dialog"

"Use global setting (from the Visualization Manager)"	◉: This option is applies only for use in a TargetVisu or WebVisu. The settings are used which are available in the *"Dialog Settings"* tab of the Visualization Manager.
"Centered"	◉: The dialog opens in the center of the visualization window.
"Position"	◉: The dialog opens in the visualization at the position defined here. *"X"*, *"Y"*: Variable or explicit number (in pixels) for the definition of the upper left corner of the dialog in the coordinate system of the visualization window. You can use the placeholders `ElementRectangle.ptTopLeft.iX` and `.iY` `ElementRectangle.ptBottomRight.iY`. It is replaced at runtime by the coordinates of the calling element.

- *Chapter 1.4.5.19.3.15 "Dialog 'Properties' of Visualization Objects" on page 1767*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Tab 'Visualization manager' – 'Settings'" on page 1777*

Input action 'Execute ST Code'

Input field	Editor for code as Structured Text

Input action 'Toggle Variable'

"Variable"	Variable (`BOOL`). It toggles between `TRUE` and `FALSE` for an input event. Example: `PLC_PRG.bSwitch`

Input action 'File Transfer' With the *"File Transfer"* input action, a file can be transferred from an operating variant (target or web visualization) to the PLC as well as to and from the PLC. This works either by means of a file transfer (*"Type"*: *"File"*) or streaming (*"Type"*: *"Streaming"*).

The action has the effect that a file selection dialog is displayed in the visualization at runtime. There the visualization user can select a file which will be transferred either to or from the PLC: For a transfer from a PLC to the visualization, the *“Save File”* dialog opens. For the transfer from the visualization to the PLC, the *“Open File”* dialog opens.

“Transfer”

“Direction”	Direction of file transfer
“From PLC to Visualization”	The object specified in *“File name”* or *“Streaming instance name”* is transferred from the PLC to the visualization. The *“Save File”* file selection dialog is displayed in the visualization at runtime.
“From Visualization to PLC”	The file specified by the visualization user is transferred to the PLC and saved in the file path specified in *“File name”* or *“Streaming instance name”*. The *“Open File”* file selection dialog is displayed in the visualization at runtime.

“Type”	Determines how the file is transferred ● Transfer type *“File”*: By file transfer ● Transfer type *“Streaming”*: By streaming

“Type”	*“File”* The data transfer is done by file transfer.
“File name”	File path (type `STRING`) which describes the file in the file system ● Variable Example: `strTransferFile: STRING;` ● Literal with relative path Example: `'/Recipes/Recipe_1.txt'` saves the file in the directory `Recipes`. ● Literal with placeholder `$PLCLOGIC$` `PlcLogic` is the default resolution for the directory placeholder `$PLCLOGIC$`. Example: `'$$PLCLOGIC$$/test.txt'` saves the file in the directory `PlcLogic`. Example: `'$$PLCLOGIC$$/MyData/test.txt'` saves the file in the directory `PlcLogic/MyData`. ● Literal with placeholder `$VISU$` `visu` is the default resolution for the placeholder `$VISU$`. Example: `'$$VISU$$/test.txt'` save the file in the subdirectory `PlcLogic/visu`. Alternatively, `'visu/test.txt'` can also be specified. ● Literal with absolute path Example: `'E:\temp\test.txt'` Note: These kinds of file paths are not always supported. Note: If a user specifies the file path in the visualization by means of a *“Text Field”* element, the masking character `$` must not be included: `$VISU$/dummy.txt` Note: In the case that the file path is specified by the user, it should be checked by the application in order to prevent files from being read or overwritten accidentally.

"Type"	*"Streaming"* The data transfer is done by streaming.
"Streaming instance name"	Instance path (type `IVisuStreamWriter` or `IVisuStreamReader`) which describes the object in the file system of the controller Type `IVisuStreamReader` for transfer direction *"From PLC to Visualization"* Type `IVisuStreamWriter` for transfer direction *"From Visualization to PLC"*

"Control flags"	Note: The variable is evaluated only for transfer direction *"From Visualization to PLC"*. Variable (type `DWORD`) Determines how the object (file or instance object) is handled on the file system of the PLC. Two flags are provided for this with which the variable can be set. ● Flag 1: `VisuElems.VisuEnumFileTransferControlFlags.UseOriginalFileName` ● Flag 2: `VisuElems.VisuEnumFileTransferControlFlags.ConfirmFileOverwriteInPlc` Options ● No flag set: The user selects a file which is saved in the path specified in *"File name"* or *"Streaming instance name"*. ● Flag 1 is set: The path, which is specified by the user at visualization runtime, is applied and used as the path in the PLC file system. ● Both flags are set: The path is also checked. If an object already exists in the path specified on the client side, then a message prompt is displayed in the visualization. There the visualization user can confirm that the file will be overwritten. Example: `dwControlFlag`

Example

The transfer direction is *"From Visualization to PLC"* (write).

Example: A new recipe file `Recipes/Recipe_2021.txt` has been created in the visualization device. The visualization user selects this file and wants to save the file on the PLC under the same name. Because the control flags are set accordingly, a message window opens and the visualization user can confirm that the file will be overwritten.

```
PROGRAM PLC_PRG
VAR
    xVisuToggle : BOOL;
    dwControlFlag : DWORD:=
VisuElems.VisuEnumFileTransferControlFlags.UseOriginalFileName +
VisuElems.VisuEnumFileTransferControlFlags.ConfirmFileOverwriteInPlc
;
    strFileName: STRING := '/Recipes/Recipe_new.txt';
END_VAR
```

Table 328: “Status Variables”

“Transfer active”	Boolean variable (optional) `TRUE`: The transfer is in progress.
“Transfer successful”	Boolean variable (optional) `TRUE`: The transfer has completed successfully.
“Error code”	● `0`: No errors ● `1`: Unspecified error ● `2`: Cancellation of file dialog ● `3`: Other file transfer in progress ● `4`: Error during file transfer ● `5`: Cancellation by timeout ● `6`: File read error – The file is not available or cannot be read. ● `7`: No device support for file transfer Possible causes: – CODESYS WebVisu: File transfer is not possible by default. – Communication with a controller of a version < 3.5.11: Functionality not implemented. – Communication with a controller of a version >= 3.5.11: File transfer not activated (device description). Note: In this case, contact the CODESYS support team.

Dialog 'Options' - 'Visualization Styles'

Symbol: 

Function: This dialog is used for configuring the display of library visualizations and visualizations in the POUs view in the visualization editor. In addition, it is used for configuring the tab *“Visualization Manager”* - *“Settings”* (group *“Style Settings”*).

Call: Menu bar: *“Tools* ➔ *Options”* (*“Visualization Styles”* category).

These settings are not applied at visualization runtime. In runtime mode, only the settings of the visualization manager are available in the *“Settings”* tab.

See also

- *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*

'Style Configuration for Libraries and Global Visualizations'

These settings are applied for library visualizations and for visualizations in the POUs view.	
“Use no visualization style”	: Display without using style properties. Elements are displayed as defined by presets.
“Use the following visualization style”	: Style with style properties used for displaying visualizations.

"Derive visualization style automatically"	: Display with the style that was selected in the application in the visualization manager (when possible). Therefore, the display is derived from this style. It is actually possible for this to cause an incorrect display. Then the fallback solution is used.
"Fallback if no visualization style could be derived "	Another style that is applied after the selected style. Then a style property is assigned from the style specified here. This is done for element properties that could not be assigned style properties. Requirement: The selected style causes a device-specific, deficient display on the display variant.

'Style Selection'

The drop-down list of *"Selected style"* can be configured in the visualization manager (*"Settings"* tab, *"Style settings"* group).	
"Display all versions"	: All other styles of the repository, including the selected style, are listed for selection, but only in the latest version. If newer versions are installed for the selected style, then these are also listed. : All installed styles in all installed versions are available for selection.

'Style for New Visualization Managers'

"Last used: <style, version, vendor>"	Style that is selected automatically when you add a new visualization application. Note: It is actually possible that a display variant is displayed another way depending on the device despite this setting.
"Preset: <style, version, vendor>"	
"<style, version, vendor>"	

Dialog 'Options' - 'Visualization User Management'

Symbol:

Function: The options define the use of visualization user management for global visualizations in the *"POUs"* view and for visualizations that are linked from libraries.

Call: Menu bar: *"Tools"*.

Requirement: A visualization user management exists.

Table 329: "User Management Configuration for Libraries and Global Visualizations"

"Do not use visualization user management"	The affected visualizations behave as when no user management is configured.
"Use the following visualization user group list"	• You can edit the list. • The list is created in the *"Visualization manager"* (*"User management ➔ Groups"*) by clicking *"Export groups for global visualizations"*.
" Derive visualization user management automatically"	The affected visualizations use the user management configuration of the visualization manager selected here. The drop-down list shows all visualization managers of the project. If this is not possible, then the user groups are used from the option *"Use the following user group list for the visualization"*.

The user management for a visualization in the "Devices" view is configured in the "Visualization Manager" (tab "User Management").

See also

- *Chapter 1.4.5.19.4.5 "Tab 'Visualization manager' - 'User management'" on page 1782*

Dialog Box 'Options' - 'Visualization'

Symbol: 

Function: The dialog serves for the configuration of the visualization editor and during runtime it serves the configuration of the Integrated Visualization.

Call: Main menu *"Tools ➔ Options"*, category *"Visualization"*

Tab 'General'

*These settings will **not** be applied for the following visualization clients: CODESYS TargetVisu, CODESYS WebVisu.*

Table 330: "Presentation options (visualization editor in the programming system)"

"Fixed"	The visualization maintains its original size
"Isotropic"	The visualization maintains its proportions
"Anisotropic"	The visualization adapts to the size of the visualization window
"Antialiased Drawing"	☑: The visualization is drawn with the help of antialiasing methods. This applies while you are editing and also when the visualization is running as Diagnosis Visualization.

Table 331: "Editing options"

"Link to toggle/tap variable when appropriate"	☑: The placeholder *"<toggle/tap variable>"* in the visualization element properties is enabled. Effect: If you drag an element having the property *"Color variable ➔ Toggle color"* in the visualization editor, this property will be configured with the placeholder *"<toggle/tap variable>"*. The following elements are affected: *"Button"*, *"Frame"*, *"Image"*, *"Line"*, *"Pie"*, *"Polygon"*, *"Rectangle"*, *"Text field"*, *"Scrollbar"*.

- *Chapter 1.4.5.19.5.15 "Visualization Element 'Scroll Bar'" on page 1928*

Tab 'Grid'

"Visible"	☑: The visualization editor contains a grid. The spacing of the grid lines is defined by *"Size"*.
"Active"	☑: The visualization elements get aligned to the grid, defined by *"Size"*, even if the grid lines are not visible. When you insert or move an element, its center will be positioned on the grid. When you modify the size of an element, you can move the position markers onto grid lines only. Elements already available in a visualization, will not be aligned automatically, until you change their position.
"Size"	Spacing of the grid lines in pixel.

Tab 'File options'

"Text list files for textual "IntelliSense"	File name and path of a file of type `.csv`. The file contains texts in the format of a text list. The file entries will be available when using the function "List Components" as input assistance. Note: You can create this file as an export file of the global text list. For this purpose use the command *"Import/Export Text Lists"*.
"Visualization Directories"	
"Text list files"	Storage path for text lists. Note: This setting will be used in CODESYS only if no storage path for *"Text list files"* is defined in the *"Project Settings"*, category*"Visualization"*.
"Image files"	Storage path for image files. Multiple paths get separated by semicolons. CODESYS uses this path for example when exporting or importing image files. Note: This setting will be used in CODESYS only if no storage path for *"Image files"* is defined in the *"Project Settings"*, category*"Visualization"*.

Dialog 'Project Environment' - 'Visualization Profile'

Function: The dialog displays the current visualization profile of the project. The profile can be updated here.

Call: Main menu *"Project ➔ Project Environment"*, Tab *"Visualization Profile"*.

"Current visualization profile in project"	The currently set visualization profile of the opened project.
"Recommended, newest profile"	The newest profile
"Action"	
"Do not update"	The visualization profile of the project remains unchanged.

“Update to x.x.x.x”	CODESYS updates the project to the chosen visualization profile.
“Check for updates when loading this project”	☑: CODESYS checks for new profiles when the project is opened. If there are updates available an update dialog opens automatically. ☐: No check of the profile when loading the project. The update dialogs do not open automatically any longer.
“Set All to Newest”	CODESYS updates the profile.

Dialog 'Project Environment' - 'Visualization Styles'

Function: The dialog displays the currently used visualization style of the project. The visualization style can be updated here.

Call: Main menu *“Project ➔ Project Environment”*, tab *“Visualization Styles”*

“For the following visualization styles currently in use, newer versions are available:”	
“Visualization Styles”	Version of the currently set visualization style of the opened project.
“Current”	Current version of the visualization style, for example `3.5.6.0`
“Recommended”	Recommenden version of the visualization style, for example `3.5.7.0`
“Action”	
“Do not update”	The visualization style of the project remains unchanged.
“Update to x.x.x.x”	CODESYS updates the project to the version of the chosen visualization style.
“ Check for updates when loading the project”	☑: CODESYS checks for new versions when the project is opened. If there are updates available an update dialog opens automatically. ☐: No check of the version. The update dialogs do not open automatically any longer.
“Set All to Newest”	CODESYS updates the version.

See also

- *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*

Dialog 'Project Environment' – 'Visualization Symbols'

Function: The dialog lists installed symbol libraries and allows for you to assign symbol libraries to a project.

Call: Menu bar: *“Project ➔ Project Environment”*, *“Visualization Symbols”* tab

Requirement: The open project contains a visualization and has been saved with a compiler version `< 3.5.7.0`. CODESYS recognizes symbol libraries in compiler version `3.5.7.0` and higher.

“Symbol library”	List of all installed symbol libraries
“Active”	☑: Symbol library is selected for the project. CODESYS provides its symbols in the *“Visualization Toolbox”* view. ☐: Symbol library has been previously installed only in the library repository.

See also

- *Chapter 1.4.5.3.1 “Select Element” on page 1255*

Dialog 'Project Settings' - 'Visualization'

Symbol:

Function: The dialog is used to configure the project-wide settings for objects of type *"Visualization"*.

Call: Menu bar: *"Project ➔ Project Settings"*, *"Visualization"* category

Requirement: A project is open.

Tab 'General'

Table 332: "Visualization Directories"

"Text list files"	Directory which contains text lists that are available in the project to configure texts for different languages. CODESYS uses the directory, for example to import or export text lists. After clicking ..., the *"Select Directory"* dialog opens which allows for the selection of a directory in the file system.
"Image files"	Directory which contains image files that are available in the project. Multiple folders are separated with a semicolon. CODESYS uses the directory, for example to import or export image files. After clicking ..., the *"Select Directory"* dialog opens which allows for the selection of a directory in the file system.

Table 333: "Advanced"

"Activate property handling in all element properties"	☑: You can also configure a visualization element with a property in those of its properties in which you select an IEC variable. Then CODESYS creates additional code for the property handling when a visualization is compiled. Requirement: Its IEC code contains at least an object of type *"Interface property"* (a property).  Requirement: *"Visible"* is selected.

See also

- *Object 'Property'*

Tab 'Symbol Libraries'

Table 334: "Visualization Symbol Libraries"

"Symbol libraries"	List of all installed symbol libraries Example: `VisuSymbols`
"Assigned"	☑: Symbol library is selected in the project and CODESYS makes it available in the *"Visualization ToolBox"* view of a visualization. ☐: Symbol library is installed in the library repository, but CODESYS does **not** make it available in the *"Visualization ToolBox"* view of a visualization.

See also

- *Chapter 1.4.5.19.3.2 "Dialog 'Add Visualization'" on page 1746*

Dialog ‘Project Settings’ - ‘Visualization Profile’

Symbol: 

Function: The dialog box enables the setting of the visualization profile.

Call: Menu *“Project ➔ Project Settings”*, category *“Visualization Profile”*

Requirement: A project is open.

Table 335: “Visualization Profile”

“Specific profile”	Profile that CODESYS uses in the project and that determines the visualization elements that are available in the project. The selection list contains all the profiles installed so far.

Dialog 'Properties' of Visualization Objects

Function: This dialog is used for configuring object-dependent properties.

Call: Menu bar: *“View”*; context menu of the visualization object in the *“Devices”* view or *“ POUs”* view.

Tab 'General'

“Name ”	Example: `visMain`
“Object type ”	visualization
“Open with ”	visualization

See also

- *Chapter 1.4.1.20.4.10.1 “Dialog Box 'Properties' - 'Common'” on page 1157*

Tab 'Access Control'

This tab is used for defining which user group can execute which actions on the object.

See also

- *Chapter 1.4.1.20.4.10.6 “Dialog 'Properties' - 'Access Control'” on page 1161*

Tab 'Visualization'

This tab assigns a visualization type to a visualization.

In addition, it includes settings for window size that are used at runtime.

Table 336: “Use visualization as”

“Visualization”	Visualization type for an ordinary or referenced visualization. Preset.
“Dialog ”	Visualization type for a visualization that opens as a dialog in its own window for an input event. The input action for this is *“Open dialog”*. The *“Close dialog”* input action closes the window. Tip: A dialog usually includes an *“OK”* button or *“Cancel”* button at the bottom edge for confirming or rejecting user input, and for closing the dialog. A simple dialog or a dialog prompt includes only a question or information and buttons for closing the dialog with either *“Yes”* or *“No”*. A dialog is part of a user interface. While a dialog is open, the rest of the user interface is usually disabled.
“Numpad / keypad / dialog for input configuration”	Visualization type for a visualization that displays a virtual numeric keypad or a virtual keyboard. It appears when the user is prompted to specify text. The input action for this is *“Write variable”*. Note: The interface of this visualization must also conform with the interfaces for the standard visualizations for the numeric keypad or that keyboard that provides the `VisuDialogs` library: `Numpad`, `Keypad`, `NumpadExtended`, or `TextinputwithLimits`. Tip: The `VisuDialogs` library contains templates for virtual keyboards or numeric keypads.

“Dialog is opaque”	☑: The screen area that is covered by the dialog is not refreshed. This has a positive effect on the character and input performance. Use this option when your drawn dialog is rectangular and opaque, containing no transparent parts.
“Use automatic detected visualization size”	◉: The size is determined so that all visualization elements are enclosed.
“Include background image”	☑: All elements and the background image are completely visible. ☐: All elements are visible, but a larger background image is truncated.
“Use specified visualization size”	◉: The values *“Height”* and *“Width”* define the window size of the visualization (in pixels).

“Internal”	☑: The visualization is internal. It is used exclusively as an internal module of a complete visualization in a library. When editing as a library project while the project is open in CODESYS, an internal visualization is handled like all visualizations. The internal visualization appears in drop-down lists. Or in the visualization manager (*“Visualizations”* tab). The internal visualizations that include a linked library are not visible to you.

See also

- *“Dialog 'Frame Configuration'” on page 1727*

Tab 'Build'

This tab includes options for compiling the object.

See also

- *Chapter 1.4.1.20.4.10.4 “Dialog 'Properties' - 'Build'” on page 1159*

Dialog 'Selected Alarm Class'

Function: In this dialog box, you define the alarm classes that are considered for the alarm table or alarm banner.

Call: Property *“Alarm configuration”* / *“Alarm classes”* of the alarm table or alarm banner visualization element.

Requirement: An alarm table visualization element or alarm banner visualization element is added to the visualization.

“Available Alarm Classes”	Shows all alarm classes created in the project.
“Selected Alarm Classes”	The alarm classes in this column are displayed in the alarm table.
“All”	☑: All alarm classes are listed in an alarm table.
>>	Moves all available alarm classes to the *“Selected Alarm Classes”* column.
>	Moves the selected alarm classes to the *“Selected Alarm Classes”* column.
<	Removes the selected alarm classes from the *“Selected Alarm Classes”* column.
<<	Removes all selected alarm classes from the *“Selected Alarm Classes”* column.

- *Chapter 1.4.5.19.5.22 “Visualization Element 'Alarm Table'” on page 1969*
- *Chapter 1.4.5.7 “Visualizing alarm management” on page 1289*

Dialog 'Selected Alarm Group'

Function: In this dialog box, you define the alarm groups that are considered for the alarm table or alarm banner.

Call: Property *“Alarm configuration”* / *“Alarm groups”* of the alarm table or alarm banner visualization element.

Requirement: An alarm table visualization element or alarm banner visualization element is added to the visualization.

“Available Alarm Groups”	Shows all alarm groups created in the project.
“Selected Alarm Groups”	The alarm groups in this column are displayed in the alarm table.
“All”	☑: All alarm groups are listed in an alarm table.
>>	Moves all available alarm groups to the *“Selected Alarm Groups”* column.
>	Moves the selected alarm groups to the *“Selected Alarm Groups”* column.
<	Removes the selected alarm groups from the *“Selected Alarm Groups”* column.
<<	Removes all alarm groups from the *“Selected Alarm Groups”* column.

- *Chapter 1.4.5.7 “Visualizing alarm management” on page 1289*

Dialog 'Advanced Trace Settings'

Function: The recording rate of the *"Trace"* visualization element is configured in this dialog box.

Call

- Properties: *"Trace"* , *"Advanced"*
- Context menu: *"Configure trace"*, *"Advanced"*

Requirement: A trace is selected in the active visualization editor.

Table 337

"Measurement in every nth cycle"	The task where the trace is running is the basis for the measurement. The measurement interval is a multiple of the trace task according to the selected value. The measurement interval is displayed on the right side.
"Buffer size (samples)".	The number of measurements is calculated according to the time range of the x-axis.

See also

- *Chapter 1.4.5.19.2.13 "Command 'Configure Trace'" on page 1734*

Dialog 'Display Settings'

Function: The dialog includes the configuration for the display settings of the trace diagram (for both the X-axis and Y-axis) and provides a preview in the trace diagram.

Call: *"Display"* button in *"Trace Configuration"* dialog.

"Add Y-Axis"	Extends the trace diagram by one Y-axis. Result: The *"Trace Configuration"* dialog contains an extended selection of Y-axes in the *"Additional axes"* option of the variable settings.
"Delete Y-axis"	Deletes the Y-axis with the visible tab.

Tab 'X-axis'

"Display Mode"	Scaling ● *"Auto"*: ☑: CODESYS Scales automatically. ● *"Fixed length"*: ☑: CODESYS displays a segment of constant *"Length"*. ● *"Fixed"*: ☑: CODESYS displays a segment from *"Minimum"* to *"Maximum"*.
"Minimum"	Initial value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*.
"Maximum"	End value of the segment. Requirement: The *"Display Mode"* is *"Fixed"*.
"Length"	Constant length of the segment.
"Grid"	☑: Diagram with vertical grid lines. Select the line color from the list box of colors.

Table 338: "Tick marks"

"Fixed spacing"	☑: CODESYS draws tick marks with *"Distance"* and *"Subdivisions"*.
"Distance"	Distance between tick marks
"Subdivisions"	Number of subdivisions between two tick marks

“Font”	Font for the X-axis

Tab 'Y-Axis'

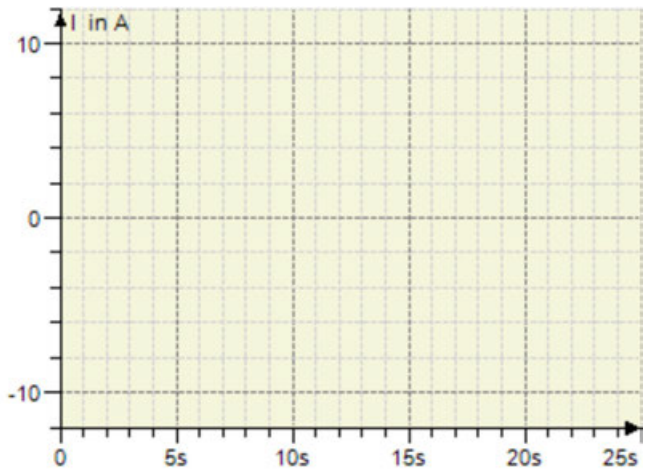
“Display Mode”	Scaling ● *“Auto”*: ☑: CODESYS Scales automatically. ● *“Fixed”*: ☑: CODESYS displays a segment from *“Minimum”* to *“Maximum”*.
“Minimum”	Literal, variable (integer data type), or constant variable (integer data type). It contains the initial value of the segment. Requirement: The *“Display Mode”* is *“Fixed”*. Examples: `20,PLC_PRG.iLimit_Min, GVL.c_iLimit_Min` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Min : INT := 20`
“Maximum”	Literal, variable (integer data type), or constant variable (integer data type). It contains the end value of the segment. Requirement: The *“Display Mode”* is *“Fixed”*. Examples: `80,PLC_PRG.iLimit_Max, GVL.c_iLimit_Max` Note: The variable has to have an initial value. This is important for the offline display and the scaling subdivision. Example: `iLimit_Max : INT := 80`
“Grid”	☑: Diagram with a grid line. Select the line color from the list box of colors.
“Label”	☑: The description is displayed on the axis.

Table 339: “Tick marks”

“Fixed spacing”	☑: CODESYS draws tick marks with *“Distance”* and *“Subdivisions”*.
“Distance”	Distance between tick marks
“Subdivisions”	Number of subdivisions between two tick marks

“Font”	Font for the Y-axis

Preview of the trace diagram



“Background color”	● *“No background”*: Transparent display without background color. ● *“Draw background”*: Background color according to selection below. ● *“From visualization style”*: Background color as defined in the visualization style.

“Reset”	CODESYS resets all settings to the defaults.
“Use as default”	CODESYS saves the settings as default

1.4.5.19.4 Objects

Object 'Visualization' and visualization editor

Symbol: 

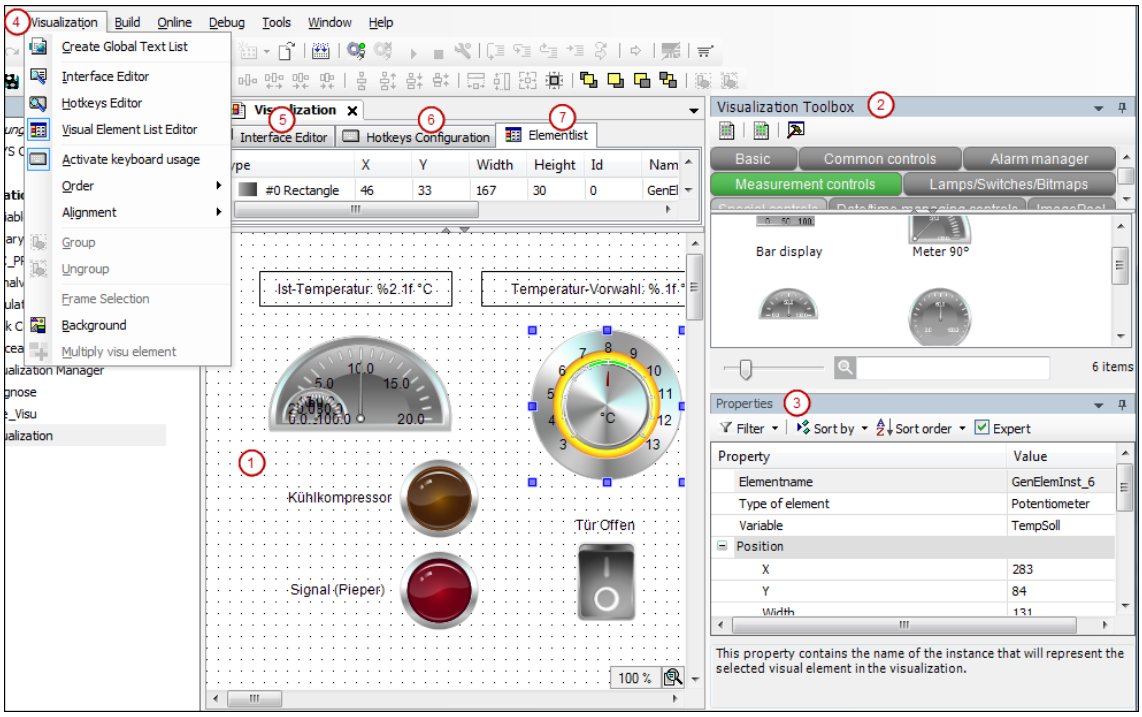
The object represents a single visualization. You can insert a visualization under an application or, so that it is available project-wide, under the root node of the view *“Devices”* or directly in the view *“POUs”*. You can open the visualization editor for editing by double-clicking on the object entry in the device tree or in the view POUs.

See also

- *Chapter 1.4.5.19.3.15 “Dialog 'Properties' of Visualization Objects” on page 1767*
- *Chapter 1.4.5.19.4.1.1 “Visualization Editor” on page 1772*

Visualization Editor

The visualization editor opens when you double-click a visualization object.



- (1) Graphical editor: Here you create the visualization from the visualization elements which are provided in the visualization toolbox view.
- (2) View *“Visualization Toolbox”*: available visualization elements
- (3) View *“Properties”*: Configuration editor for the visualization element currently selected in the editor area
- (4) Menu *“Visualization”*: Commands for working in the visualization editor

The *“Visualization”* menu contains, for example, commands for opening additional editors.

- (5) *“Interface Editor”*: Declaration of variables which can be used to parameterize references of the visualization.
- (6) *“Hotkeys Configuration”*: Definition of keyboard shortcuts for inputs on the visualization in online mode.
- (7) *“Element List”*: List of all elements used in the visualization; possibility to change their position on the Z-axis.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

- *Chapter 1.4.5.19.2.1 “Command 'Interface Editor'” on page 1719*
- *Chapter 1.4.5.19.2.2 “Command 'Keyboard Configuration'” on page 1720*
- *Chapter 1.4.5.19.2.3 “Command 'Visualization Element List'” on page 1721*

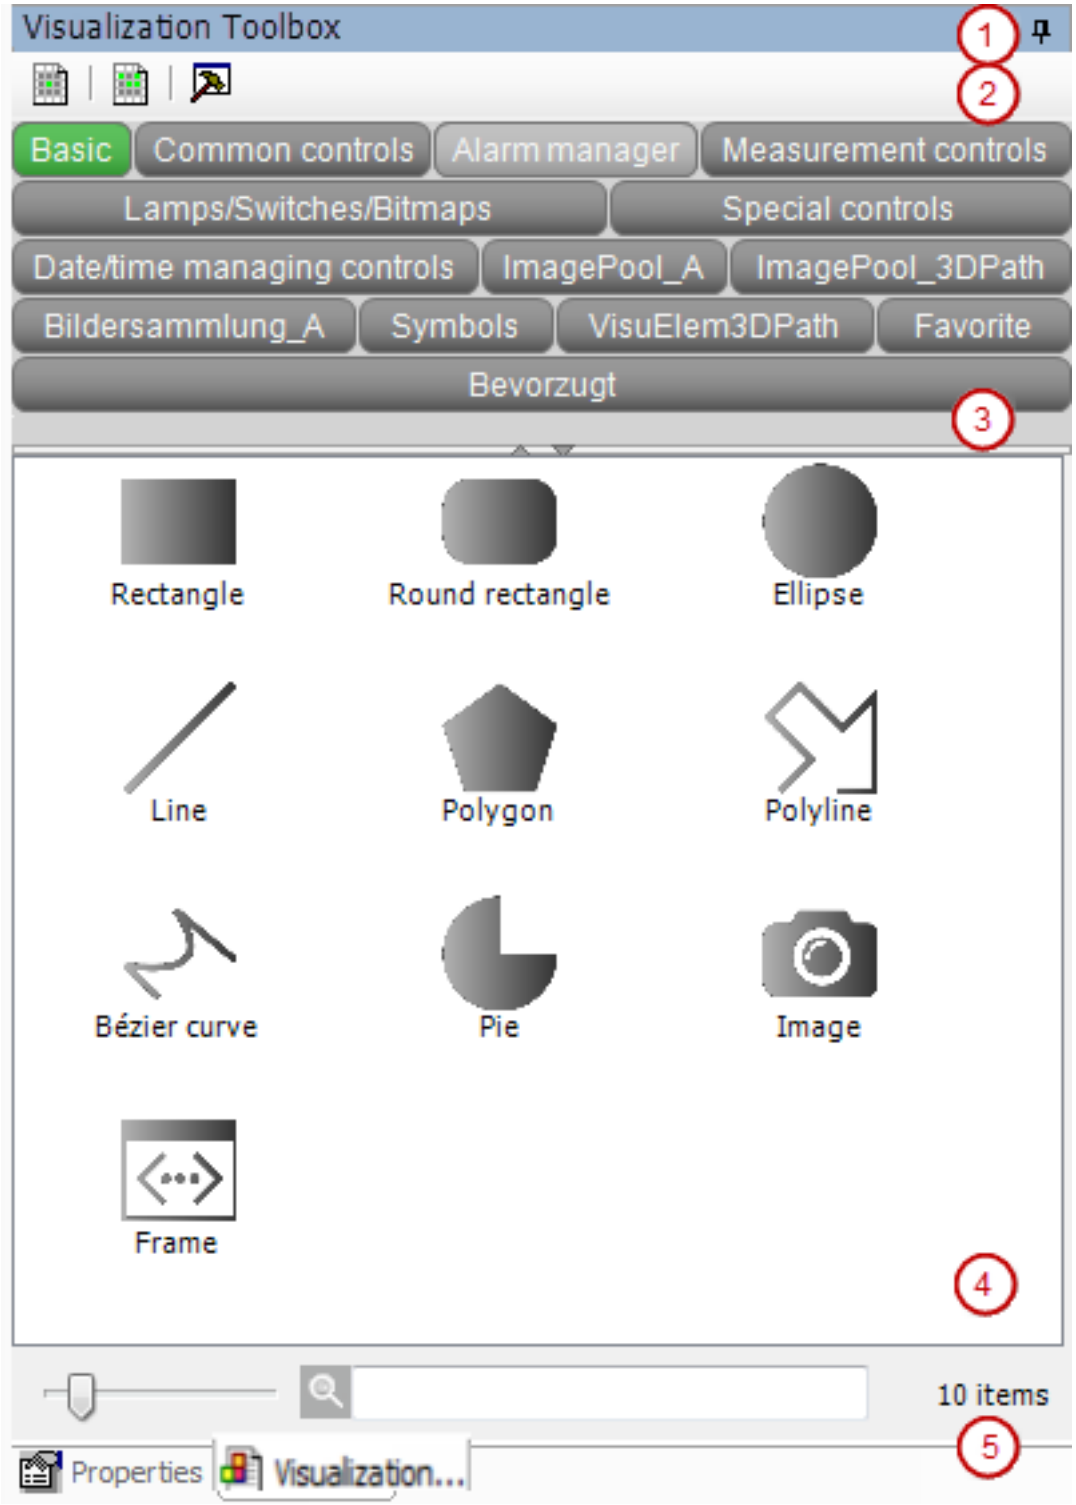
View 'Visualization Toolbox'

Symbol:

Function: The view provides the elements that can be used in the editor. The individual elements are assigned with specific categories. There is a button for each category. The elements of selected categories are displayed with thumbnails which can be dragged into the editor. In addition to the standard categories, you can also define your own categories. You can resize the thumbnails with the slider or perform a full-text search of element names.

Call: Menu bar: *"View ➔ "*

Requirement: A visualization is active.



- (1) *"Visualization Toolbox"* view
- (2) Toolbar with commands
- (3): Buttons fro selecting element categories
- (4) Selection of individual visualization elements
- (5) Controls

See also

- *Command 'Toolbox'*

Toolbar with commands

Symbol: 	Only one button can be selected.
Symbol: 	Multiple buttons can be selected.
Symbol: 	The *“Configure Categories and Items”* dialog opens.

See also

- *Chapter 1.4.5.19.3.4 “Dialog 'Configure Categories and Items'” on page 1747*

Buttons for selecting element categories

A button is displayed for each defined element category. A selected button is displayed in green.

[Shift] + click a button	Changes the selection of the category and the selection type (single or multiple selection possible)
Right-click a button	The context menu opens.

Table 340: Context menu of a button

“Hide Category”	Removes the button. Then the category is removed from view.
“Enable Category”	The button turns green and the category is enabled, irrespective of the selection type.
“Disable Category”	The button turns gray and the category is disabled, irrespective of the selection type.

See also

- *Chapter 1.4.5.3.1 “Select Element” on page 1255*
- *Chapter 1.4.5.19.3.4 “Dialog 'Configure Categories and Items'” on page 1747*
- *Command 'Toolbox'*

Selection of visualization elements

The visualization elements are displayed as thumbnails and labeled with names. The selection depends on the search query in  or on the chosen buttons.

Slider 	To resize of the thumbnails.
 with input field	For a full-text search by element name of all available elements
“<number> items”	Number of visualization element items that are currently displayed as a result of the selected buttons and the search query in  .

View 'Properties' of a visualization element

Symbol: 

Function: This view is used for configuring the element properties of the selected visualization element.

Call: Menu bar: *“View ➔ Element Properties”*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Menu bar

Table 341: “Filters”

“All categories”	List of all element properties
“Default”	List of the most frequently used element properties
“Simple”	List of certain basic element properties, such as *“Texts”*, *“Colors”*, and *“Input configuration”*
“Animation”	List of element properties for animation with variables
“Colors”	List of element properties for designing with color
“Texts”	List of element properties for designing with text
“Input”	List of element properties for configuring user input

Table 342: “Sort”

“Sort by type”	☑: Element properties are sorted by the original order of categories.
“Sort by name”	☑: Element properties are sorted in alphabetical order.

Table 343: “Order”

“Sort ascending”	☑: The properties are sorted from A to Z.
“Sort descending”	☑: The properties are sorted from Z to A.

“Expert”	☑: The table includes all properties. The menu command *“Filter ➔ Show all categories”* is enabled at the same time.

Element properties display in a table

Column *“Property”*	Element properties of the selected element
Column *“Value”*	The assigned value is applied in the editor view.

Double-click in the *“Value”* column	A line editor, drop-down list, or dialog opens for editing the value. ... opens the *“Input Assistant”* dialog for help, for example when assigning variables or image references.
Single-click for a selected field	
[Blank] for a selected field	

A style selected in the visualization manager can include single, predefined element properties. As a result, these do not appear in this view because a fixed value is already assigned to them. They do not have to be configured anymore.

Visualizations can be configured with device-specific restrictions that block the availability of element properties.

Device-specific restrictions :

- Elements with restricted availability
- Fonts with restricted availability
- Colors with restricted display
- Image formats with restricted display
- Maximum number of visualization elements
- Maximum number of visualizations below the device

Object 'Visualization manager'

Symbol: 

The visualization manager manages the configuration settings for all display variants of the visualizations of the current application.

The object is automatically inserted when a visualization object is inserted below the application. On a double-click the configuration dialog opens with several tabs.

If the device employed supports display variants of the visualization, the visualization manager automatically brings along the corresponding objects (CODESYS WebVisu, CODESYS TargetVisu).

If the device employed supports CODESYS TargetVisu, the visualization manager automatically brings along the corresponding object CODESYS TargetVisu.

See also

- *Chapter 1.4.5.16 “Configuring and executing display variants” on page 1354*
- *Chapter 1.4.5.19.4.7 “Object 'TargetVisu'” on page 1787*
- *Chapter 1.4.5.19.4.8 “Object 'WebVisu'” on page 1788*

Tab 'Visualization manager' – 'Settings'

Symbol: 

Function: the tab contains settings for all visualizations that are available application-wide.

'General settings'

“Use unicode strings”	☑: The visualization codes character strings as Unicode.
“Use CurrentVisu variable”	☑: the application knows and uses the global variable `VisuElems.CurrentVisu` of the type `STRING`. It contains the name of the currently active visualization at the runtime of the application. The application can read from the variable in order to obtain the name of the currently active visualization. The application can cause a visualization change by a write access. Requirement: the application contains a visualization that calls further visualizations. Example ● Variable assignment: `VisuElems.CurrentVisu:=strVisuName;` ● Visualization name assignment: `VisuElems.CurrentVisu:='visu1';`

'Style settings'

The “Visualization Style Editor” enables new styles to be generated, checked and installed in the visualization styles repository.

“Selected style”	• Style from the visualization styles repository that every visualization in the application uses, for example *“Flat Style”*. • *“<None>”*: The visualization displays its elements without style or according to the internal default. A standard dialog appears instead of a selection list for selection in the element properties *“Color”* und *“Font”*.
	Opens a selection list with styles that are installed in the visualization styles repository.
“Display all versions (for experts only)”	 : The selection list contains only the latest version of each selected style and all other styles. If a newer version of the selected style is installed it is also displayed.  : The selection list contains all versions of all installed styles.
Button 	Opens a selection list with commands for the use of the *“Visualization Styles Editor”*.
“Open Style Editor”	The *“Visualization Styles Editor”* opens.
“Create and edit derived style”	The *“Visualization Styles Editor”* opens with the dialog *“Create a new visualization style”*. The dialog contains the settings for the first configuration step. Requirement: a style is selected in *“Selected style”*.
“Copy and edit the selected style”	The *“Visualization Style Editor”* opens with the dialog *“Open existing style as a copy”*. The dialog contains the settings for the first configuration step. Requirement: a style is selected in *“Selected style”*.
“Preview”	The elements displayed represent the style specified in *“Selected style”*.

See also

- *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*
- *Chapter 1.4.5.17.2 “Managing visualization styles in repositories” on page 1365*
- *Chapter 1.4.5.20.1 “Dialog 'Create a New Visualization Style'” on page 2127*
- *Chapter 1.4.5.20.2 “Dialog 'Open Existing Style as a Copy'” on page 2127*
- *Chapter 1.4.5.19.3.7 “Dialog 'Options' - 'Visualization Styles'” on page 1761*

'Language settings'

“Selected language”	Language used by the display variants at the start of a visualization.

'Settings for default text input'

For an element with standard text input, a dialog that supports the input appears at runtime. You can specify which dialog appears.

"Numpad"	Dialog that calls the visualization if a user activates the input field for a number at runtime. The dialog represents a numeric keypad. Default: *"VisuDialogs.Numpad"*
"Keypad"	Dialog that calls the visualization if a user activates the input field for a text at runtime. The dialog represents a keyboard. Preset: *"VisuDialogs.Keypad"*
"Use text input with limits"	Requirement: CODESYS TargetVisu or CODESYS WebVisu are configured as display variants and the *"standard text input"* is *"keyboard"*. The visualization then supports input via keyboard at runtime. The input thus generally takes place via an input field. ☑: Instead of the input field you can call a dialog that displays the value range for inputs with a limited value range. Default: *"VisuDialogs.TextinputWithLimits"*. This dialog displays the value range and doesn't accept any value outside these limits.

See also

- *Chapter 1.4.5.19.4.7 "Object 'TargetVisu'" on page 1787*
- *Chapter 1.4.5.19.4.8 "Object 'WebVisu'" on page 1788*

'Settings for user management dialogs'

You can configure your visualization with a user management. To do this, configure an input to an element that causes a user management dialog to appear. The `VisuUserManagement` library contains ready-to-use dialog visualizations for this purpose. The library is located in the installation directory, for example in `C:\Program Files (x86)\3S CODESYS\CODESYS\Projects\Visu\Dialogs\VisuUserMgmtDialogs.library`. You can also use other visualizations as user management dialogs. To do that you have to change the defaults here.	
"Login dialog"	User management dialog that enables logging in; typically a request to enter a username and a password. It appears upon an input event on an element that executes as a consequential action *"User management"*, action *"Login"*. Preset: `VisuUserManagement.VUM_Login`
"Change password dialog"	User management dialog that enables a password to be changed; typically a request to enter the current password and a new one. It appears upon an input event on an element that executes as a consequential action *"User management"*, action *"Change user password"*. Preset: `VisuUserManagement.ChangePassword`
"Change configuration dialog"	User management dialog that enables a configuration change of the user management, i.e. typically a display of the current user configuration and a possibility to change it. It appears upon an input event on an element that executes as a consequential action *"User management"*, action *"Open user configuration"*. Preset: `VisuUserManagement.VUM_UserManagement`

See also

- *Chapter 1.4.5.5 "Setting Up User Management" on page 1282*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

'Additional settings'

"Activate multitouch handling"	☑: At runtime the visualization expects user inputs via gestures and touch events. Elements concerned ● Elements with input configuration ● Element of the type *"Frame"* ● Component of the type *"Tab control"*
"Activate semi-transparent drawing"	☑: The visualization draws the elements in a semi-transparent color. To do this you can additionally specify a graduation value for the transparency when defining a color. The transparency is defined in the *"Transparency"* property. The leading byte is evaluated in color variables. Preset: Activated. Requirement: you create a new visualization and the display variants can paint semi-transparently.
"Activate standard keyboard handling"	● *[Tab]* ● *[Shift] + [Tab]* ● *[Input]* ● *[Up arrow]* ● *[Down arrow]* ● *[Right arrow]* ● *[Left arrow]*

See also

- *Chapter 1.4.5.3.3 "Assigning a color" on page 1258*
- *Chapter 1.4.5.19.1 "Keyboard Shortcuts for Default Keyboard Action" on page 1717*

'Extended settings'

Table 344: "Memory settings"

"Size of memory for visualization"	Memory size in bytes allocated by the visualization at runtime. Preset: *"400000"*
"Size of the paintbuffer (per client)"	Memory size in bytes allocated by the visualization per display variant and used for painting actions. Preset: *"50000"*

Table 345: "File transfer mode"

"Transfer visualization files to the PLC"	◉: When downloading the application from the visualization directories to the controller, CODESYS copies image files and text list files that the visualization references. A CODESYS TargetVisu needs the files on the PLC and similarly the dialogs that support a numerical input or a keyboard input.
Use local visualization files	◉: The visualization uses image files and text list files from local directories Note: In order to achieve that the visualization can access the files stored locally, it is necessary thatthat the file paths are **relative**. The paths are given in dialog box *"Project ➔ Project settings"* in tab *"Visualization"*. Note: It is also necessary that the link type of a image is *"Link to file"*. The link type is specified in the image pool.

- *Chapter 1.4.5.19.3.9 “Dialog Box 'Options' - 'Visualization'” on page 1763*
- *Chapter 1.4.1.20.2.13 “Object 'Image Pool'” on page 873*

Display variant denotes the type of visualization, for example WebVisu, TargetVisu. A visualization client is a currently connected display medium. Thus, several browsers (clients) can be connected in parallel for the display variant WebVisu.

Table 346: “Client settings”

“Maximum number of visualization clients”	Limits the number of visualization clients that are executed at the same time. If you configure the elements so that they vary depending on the display variant, then you have to limit the number of display variants. A visualization is given an ID at runtime that identifies the display variant and then processes data accordingly. CODESYS can the query the ID using the system variable `CURRENTCLIENTID` and thus obtains the information as to which of the running variants is concerned. Example: `arr[CURRENTCLIENTID].dwColor` Requirement: `VisuGlobalClientManager` library is integrated in the project. Tip: You can find in the CODESYS store. example "Global Client Manager"

“Transfer both svg images and converted images”	This option is visible only if both a WebVisu and a TargetVisu exist. It concerns images in svg format only. The option is available if the device description for the controller of the TargetVisu does not support the svg (full) format. ☑: The images are transmitted in the png or bmp formats (for TargetVisu) and additionally in svg format (for WebVisu).

Not all settings are available with an integrated CODESYS visualization.

Tab 'Visualization Manager' - 'Default Hotkeys'

Symbol: 

The tab includes a list of configured keyboard shortcuts that are valid for all visualizations available throughout the application. Therefore, the tab is the central location for defining keyboard shortcuts for all visualizations that are below an application.

Keyboard shortcuts of the default keyboard action are **not** listed here.

The tab is similar to the *“Keyboard Configuration”* tab and provides the same editing options.

See also

- *“Tab 'Keyboard configuration'” on page 1720*

Tab 'Visualization manager' – 'Visualizations'

Symbol: 

Function: The tab lists all visualizations that are available project-wide and enables an assignment of the visualizations for the loading behaviour, depending on the display variants.

Tab 'Flags'

"Standard behaviour"	☑: The visualizations of the application and the actually referenced visualizations are automatically loaded to the target system. The activated checkboxes show which one that is. ☐: The loading behaviour is explicitly defined for each visualization. Hint: use the explicit selection if you reference visualizations indirectly via IEC variables.
"Visualizations"	The list contains all created visualizations from the device tree and the POU view.
"Dialogs"	The list contains all the referenceable visualizations that are available via the libraries of the library management.

Only those visualizations selected here using checkboxes are loaded.	
"Remote target visualization, target visualization, web visualization,"	The column settings affect the loading behaviour for the display variants *"remote target visualization"*, *"target visualization"* and *"web visualization"*.

Tab 'Visualization manager' - 'User management'

Symbol: 

The *"User management"* tab is used for creating and configuring the user management for visualizations and their users and groups.

If a user management has not been configured yet, then the following buttons are available:	
"Create empty user management"	The user management opens. The *"None"* group is created.
"Create user management with default groups and users"	The user management opens. The following groups and users are created: ● *"Admin"* group with *"Admin"* user ● *"Service"* group with *"Service"* user ● *"Operator"* group *"Operator"* user ● *"None"* group

Project with multiple visualization user managements

Table 347: "Choose between local and remote user management"

Requirement: The project includes several devices with a visualization user management.	
"Use local user management"	The user management of this visualization manager is used for the visualization.
"Use remote user management"	Drop-down list with all devices of the project that have their own visualization user management.

Visualization user management on the controller for a visualization without a display variant

Even if there are no display variants of the visualization in the application, it may be required that the visualization user management is located on the controller. This is the case, for example, when HMIs connect to the controller.

Requirement: The visualization does not have any display variants. This means that the objects *"Web visualization"*, *"Target visualization"*, or *"Remote target visualization"* are inserted below the visualization manager.

See also

- ↳ *Chapter 1.4.5.5.2 "Configuring users and groups" on page 1283*

Tab 'Groups'

"Group name"	When you click the node, all users are listed that belong to the group.
"Automatic logout"	☑: The *"Logout time"* input field is active and editable.
"Logout time"	Input field for integer value Drop-down list for time unit *"Min"*, *"Sec"*, or *"Hr"*
"Permission to change user data"	☑: The group is granted permission to edit user data when the visualization is in online mode.
"Description"	The text is visible in the development system only. It is not downloaded to the controller.
"ID"	Unique ID for each group. Assigned automatically by the system.
Add a new group	In the last row of the table, click in the *"Group name"* field and specify the name for the new group.
Delete a group	Select a group and press *[Del]*. The *"None"* group cannot be deleted.

Table 348: Buttons

"Update visualizations / hotkeys"	Opens the *"Update visualizations and hotkeys"* dialog box. Update, if groups were changed at a time when visualizations or keyboard shortcuts already had restricted permissions.
"List usage of groups"	List of visualizations and keyboard shortcuts with restricted permissions. The list is displayed in the *"Messages"* view.
"Export groups for global visualizations"	The defined group names are transmitted to *"Tools ➔ Options ➔ Visualization user management"*. They are then listed in *"Use the following user group list for the visualization"*. The list can be changed there as well.
"Delete complete user management"	The user management is deleted and the start view is shown with the following buttons: *"Create empty user management"* and *"Create user management with default groups and users"*.
"Export user management"	The drop-down list opens. ● *"Before V3.5 SP6"* ● *"V3.5 SP6 and later"* A standard dialog opens for saving the user management as a CSV file with any name in any directory.

“Import user management”	A standard dialog opens for importing a user management. the user management must be a CSV file.
↑, ↓	Moves the selected group one line up/down, thus changing the hierarchy of the group. A group of a higher hierarchy cannot have fewer permissions for an element than a group of a lower hierarchy.

Table 349: Dialog box “Update visualizations and hotkeys”

This dialog updates only visualization elements and keyboard shortcuts with configured permissions.	
“Add new group”	Drop-down list with all new created groups of this user management. Requirement: A new user group was created.
“Setting for new group”	● *“new group in visualization / hotkey will get the right like group”*: Drop-down list with all existing groups of this user management ● *“new group should get the following right”* – *“for visualization elements”*: Drop-down list with the permissions: *“Operable”*, *“Only visible”*, and *“Invisible”*. – *“for hotkeys”*: Drop-down list with the permissions: *“Operable”*, *“Not operable”*.
“Delete not existing groups”	If no affected visualization elements or keyboard shortcuts are found for updating, then this is displayed as a message in the *“Messages”* view (*“Visualization”* category).
“Rename groups”	
“Update”	Updates the permissions of the affected visualization elements and keyboard shortcuts

Tab 'User'

“Login name”	Name for the user to log in to the visualization at runtime. This name is unique.
“Full name”	This name may exist more than one time in the user management.
“ Password”	Encrypted by CODESYS. By default, the *“Login name”* is displayed here. If you click the *“Password”* field of a selected line, then the *“Change password”* dialog box opens.
“User group”	Group(s) that the user belongs to. Clicking the *“User group”* field of a selected user opens the dialog box *“User groups the user belongs to”*. ● *“Groups”* ● *“Assigned”*: ☑: The user is assigned to this group.
“Deactivate”	☑: The user is deactivated.
“Description”	Descriptive text is available in the development system only and is not downloaded to the controller.

Table 350: Buttons

“Upload user from device”	The data of the user management is uploaded from the controller. If user data is already configured. then it is overwritten.
“Download user to device”	The data of the user management is downloaded to the controller. The existing user management on the controller is overwritten.

“Export user management”	The drop-down list opens. ● *“Before V3.5 SP6”* ● *“V3.5 SP6 and later”* A standard dialog opens for saving the user management as a CSV file with any name in any directory.
“Import user management”	A standard dialog opens for selecting the user management (in CSV format) from the file system.

Tab 'Settings'

“Settings for download of user data”	
“Download user data on every login”	The data of the user management is downloaded to the controller at login. Existing data is overwritten.
“Never download user data on login”	The data of the user management is never downloaded to the controller, even if it changes.
“Allow decision on every download”	A *“Warning”* dialog box opens for you to accept or refuse the download.
“Access rights for elements”	
“Use group hierarchy”	☑: The permissions can be granted to the group hierarchy of the *“Groups”* tab only. The group in the first line of the *“Group”* list is the highest in the hierarchy. A group of a higher hierarchy cannot have fewer permissions for an element than a group of a lower hierarchy.
“Logout behavior”	
“Change to start visualization at logout”	☑: Switches at logout to the visualization that is configured as the *“Start visualization”* in the respective display variant.

CSV file with the data for user management

The data for user management is saved to a CSV file in the following format:

- User groups: `ID;group name; automatic logoff TRUE/FALSE;logoff time;unit logoff time;permission to change user date TRUE/FALSE`
- Users: `login name;full name;password encrypt TRUE/FALSE;password;group ID;user deactivated TRUE/FALSE`

Use this format when you want to edit data for user management by means of any tool. If you set `password encrypt` to `FALSE`, then an unencrypted password can be used. In the example, the unencrypted password `Yellow` was specified for the user `Hugo`. If you import the CSV file with the command *“Import user management”*, then the password is encrypted automatically.

Example

```
V1.0.0.1
Usergroups:
1;Admin;TRUE;1;Minute;TRUE
3;Operator;FALSE;1;Minute;FALSE
7;Service;FALSE;1;Minute;FALSE
0;None;FALSE;1;Minute;FALSE
4;Early and late shift;FALSE;1;Minute;FALSE
2;Early shift;TRUE;1;Minute;FALSE
6;Late shift;FALSE;1;Minute;FALSE
User:
Service;Service;TRUE;C08298D42A35732CFFB7DF43771B7607;2;FALSE
Operator;Operator;TRUE;3D94AB9540B025B07773DE7037F19837;3;FALSE
John;Blue;TRUE;62ED5DE29E5DD4164A01F3AF1B81EFA0;4;FALSE
Paul;White;TRUE;01E2CBD4AE5442D9EACE33669549A3CC;2;FALSE
Hugo;Green;FALSE;Yellow;6;FALSE
```

Tab 'Visualization Manager' - 'Font'

Symbol: 

Function: This tab provides settings for adapting the font and font size in the visualization according to the language. The settings apply to all visualizations of the application, including the visualization manager.

Table 351: “Language Specific Font Settings”

“Language”	Language used in the project. A column is created for each language. All text lists, including those from integrated libraries, are scanned for this.
“Font”	Font used by the visualization depending on the language.
“Size factor”	The factor affects the type size of all texts in the visualization. Preset: 1 If the factor is smaller than 1, this leads to a reduction of the type size. If the factor is 1, all texts are displayed unchanged as defined in *“Properties”*.
Red highlighting of a cell	The highlighted language is no longer present in the text lists of the project or the libraries. This highlighting is not available in runtime mode.

Context menu of a selected table row	
“Delete Language”	The associated column is removed. This is advisable above all if settings in the column are highlighted in red.
“Copy Language Settings”	All settings in the column are copied to the clipboard.
“Paste Language Settings”	All settings in the column are overwritten with the values from the clipboard.

Table 352: “General Font Settings”

“Automatic decrease of font size”	☑: If the text to be displayed does not fit in the text field in the set format, then the font size is decreased automatically until the text fits completely in the text field. Tip: This prevents a text from being truncated when changing to a language that needs more space. The requirement is that a font is available which has a sufficiently small font.

See also

- *Chapter 1.4.5.6 “Setting Up Multiple Languages” on page 1286*

Object 'TargetVisu'

Symbol:

Function: The object is used for configuring CODESYS TargetVisu in order to display the visualization directly on the controller of an integrated or connected panel.

Requirement: The CODESYS control runtime environment is equipped with the CODESYS TargetVisu component. The object itself is inserted below the visualization manager.

CODESYS TargetVisu can be executed on different platforms, from embedded controllers to powerful PC-based systems on different operating systems. Therefore, it can be run on Windows, Windows Embedded CE, Linux, QNX, or VxWorks. A ready-made adaptation to the graphics interface of the systems is available on these operating systems. An adaptation is required for embedded controllers or other operating systems. In addition, there are device manufacturers that integrate visualizations into external applications by means of ActiveX controls.

“Start Visualization”	Name of the visualization where the start is displayed as CODESYS TargetVisu. Hint: Use input assistance for selecting another visualization.
“Update rate (ms)”	Refresh rate (in milliseconds) in the visualization Example: `200`
“Show used visualizations”	The link opens the *“Visualizations”* tab in the *“Visualization manager”* editor. The tab provides information of the visualizations loaded on the display variants.

See also

- *Chapter 1.4.5.19.4.4 “Tab 'Visualization manager' – 'Visualizations'” on page 1781*

Table 353: “Scaling Options”

“Fixed”	◉: Fixed size of the visualization (original size).
“Isotropic”:	◉: The size of the visualization is adapted to the dimensions of the display device, retaining the proportions of the visualization.
“Anisotropic”:	◉: The size of the visualization is adjusted to the size of the display device, for example a screen.
“Use scaling options for dialogs”	☑ The dialogs, also for keypad and numpad, are scaled like the visualization (drawn with the same scaling factor). This is an advantage when a dialog was created to match the visualization because then they are scaled together.
“Use automatically detected client size”	☑: The visualization fills the screen of the display device completely.
“Use specified client size”	☑: The values in *“Client height”* and *“Client width”* are used for the size of the visualization. The visualization fills this screen area only.

“Client height”	Height of the visualization (in pixels).
“Client width”	Width of the visualization (in pixels).

Table 354: “Presentation Options”

“Antialiased drawing”	☑: Antialiasing is used in the visualization editor for drawing a visualization as a TargetVisu and a TargetVisu variant. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness (see element property *“Absolute movement”*, option *“Use REAL values”*). Requirement: The platform in use supports using REAL coordinates.

Table 355: “Default Text Input”

“Input with”	
“Touchscreen”	Text input on the display variant with touchscreen. The keypad or numpad dialog opens.
“Keyboard”	Text input on the display variant with an ordinary keyboard or a virtual keyboard (on Linux for example)
Effect: When you configure a user input for default text input, select an input configuration for input action *“Write variable”*, and configure the *“Input type”* as *“Default”*, then the settings are used here.	

See also

- *Chapter 1.4.5.4 “Configuring user inputs” on page 1267*
- *“Input action 'Write Variable'” on page 1757*

Object 'WebVisu'

Symbol: 

Function: The object is used to configure the web-based display variant for remote display of the visualization of the controller in a web browser. This allows for remote access, remote monitoring, as well as service and diagnostics of an application over the Internet.

Requirement: The object is inserted below the Visualization Manager, and the target system has a web server with CODESYS WebVisu support. The web server allows for the communication between the target system and the web browser.

See also

- *Chapter 1.4.5.16.1 “Executing as CODESYS WebVisu” on page 1355*

“Start Visualization”	Name of the visualization where the start is displayed as CODESYS WebVisu. Hint: Use the Input Assistant to select another visualization.
“Name of the .htm file”	Base URL of the web page. The URL is also specified as the address in the web browser. Example: `http://localhost:8080/webvisu.htm` Note: If you use a BeagleBone Black as a visualization device, then you have to note that a BeagleBone Black uses port 9090 for its web server. A valid IP address is as follows: `http://192.168.7.2:9090/webvisu.htm`

"Use as default page"	☑: The page specified in *"Name of .htm file"* is preset as the default page. Now this page will always open when a user specified in the web browser the IP address and port of the web server that is running on the controller: `http://<IP address web server>:<port web server>`. Example: `http://localhost:8080` Notice: Even if you have created multiple web visualizations, you can activate this option for exactly one web page only and therefore preset only one page as the default page.
"Update rate (ms)"	Refresh rate (in milliseconds) in the web browser
"Default communication buffer size"	Default size for communication buffer (in bytes). Defines the maximum available memory for data transfer between the web client and the web server. Example: `50000`
"Show Used Visualizations"	The link opens the *"Visualizations"* tab in the *"Visualization Manager"* editor. The tab provides information about the visualizations downloaded to the display variants.

See also

- *Chapter 1.4.5.19.4.4 "Tab 'Visualization manager' – 'Visualizations'" on page 1781*
- *Chapter 1.4.5.16.1 "Executing as CODESYS WebVisu" on page 1355*

Table 356: "Scaling Options"

"Fixed"	◉: Fixed size of the visualization. The values used are *"Client height"* and *"Client width"*.
"Isotropic"	◉: The size of the visualization is adapted to the dimensions of the web browser, retaining the proportions of the visualization.
"Anisotropic"	◉: The size of the visualization is adapted to the web browser.
"Use scaling options for dialogs"	☑ The dialogs (also for keypad and numpad) are scaled as the visualization (drawn with the same scaling factor). This is an advantage when a dialog was created to match the visualization because then they are scaled together.
"Client height"	Height of the visualization (in pixels).
"Client width"	Width of the visualization (in pixels).

Table 357: "Presentation Options"

"Antialiased drawing"	☑: Antialiasing is used when drawing the visualization in the web browser.

Table 358: "Input handing options"

"Standard text input with"	• *"Touchscreen"*: Text input on the WebVisu with touchscreen. The keypad or numpad dialog opens. • *"Keyboard"*: Text input on the WebVisu with an ordinary keyboard or a virtual keyboard (on Android OS for example) Effect: When you configure a user input for default text input, select an input configuration for input action *"Write Variable"*, and configure the *"Input type"* as *"Default"*, then the settings are used here.
"Treat touch as mouse actions"	☑: On devices with a touchscreen, gestures are treated as mouse actions. This option is required, for example, to operate a slider or scrollbar on a touch device.

See also

- *Chapter 1.4.5.4 “Configuring user inputs” on page 1267*
- *“Input action 'Write Variable'” on page 1757*

1.4.5.19.5 Visualization Elements

Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'

Symbol:

Category: *"Basic"*

The *"Rectangle"*, *"Rounded Rectangle"*, and *"Ellipse"* are the same type of element. They can be converted into another element type by changing the *"Element type"* property.

Element properties

"Element name"	Optional Example: `Werkstueck_3` Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Rectangle"*, *"Rounded Rectangle"*, *"Ellipse"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.

"Angle"	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Radius setting

Visible only when *"Rounded Rectangle"* is selected in the *"Type of element"* property.

"Radius"	Rounding of the corners. *"From style"* *"Relative to the element size"* *"Explicit"*: Allows for specifying a custom value in the *"Value"* setting.
"Value"	Radius of the rounded corners (in pixels) Example: `5` Requirement: *"Explicit"* is selected in the *"Radius"* setting.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color"	Frame and fill color for the corresponding state of the variable.
"Fill color"	
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- ↳ *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- ↳ *" Element property 'Appearance variables'" on page 1854*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1797*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1795*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1794*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

“Text list”	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
“Text index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
“Tooltip index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1795*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels).
“Fill attributes”	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = `0`: Filled ● Variable value > `0`: Invisible; no fill color
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible; no line

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1806*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Line'

Symbol:

Category: *“Basic”*

The element draws a simple line.

Element properties

“Element name”	Optional. Example: `Separator_Header` Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Line”*

Element property 'Position'

The following properties define the position and length of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“Dots”	*“[0]”*: Coordinates of the starting point *“[1]”*: Coordinate of the end point You can also change the values by dragging the box symbols () to other positions in the editor.
“Angle”	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow  , you can rotate the element about its center as a handle. Example:  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *“Absolute movement ➔ Internal rotation”*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the  symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color of the line in normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color of the line in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- ↳ *" Element property 'Appearance variables'" on page 1854*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1809*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement point[0]” ● *“X”* ● *“Y”*	Variable (numeric data type). It contains the number (in pixels) that the starting point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.
“Movement point[1]” ● *“X”* ● *“Y”*	Variable (numeric data type). It contains the number (in pixels) that the end point of the line is moved. Incrementing the X value moves the element to the right. Incrementing the Y value moves the element to the down.

See also

- *“Element property 'Absolute movement'” on page 1807*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1807*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1807*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable in the alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*
- *Chapter 1.4.5.19.4.2 "Object 'Visualization manager'" on page 1777*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

Element property 'Line width variable'

Dynamic definition of the weight of a line element using a variable.

"Integer value "	Variable (integer data type). Defines the line weight of the element (in pixels). This overwrites the fixed value that is defined in *"Appearance ➔ Line weight"*. Note: The value 0 codes the same as 1 and sets the line weight to one pixel.

Element property 'Line style variable'

"Integer value "	Variable (integer data type). Defines the appearance of the line at runtime. ● 1: Solid ● 2: Dashes ● 3: Dots ● 4: Dash Dot ● 5: Dash Dot Dot ● 6: Invisible: The line is not drawn.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Polygon', 'Polyline', 'Bézier Curve'

Symbol:

Category: *“Basic”*

The *“Polygon”*, *“Polyline”*, and *“Bézier Curve”* are the same element type. They can be converted into another type by changing the *“Element type”* property.

Elements can be dragged to the editor. The element is then drawn with five points: [0] to [4].

Other positions are added as follows: Move the mouse pointer over a corner point; the mouse pointer changes shape. Now if you press and hold *[Ctrl]* and click the left mouse button, another point is created. You can delete a point by pressing and holding *[Shift]+[Ctrl]* and click the selected point.

As an alternative, you can select the element in the toolbox area and in the editor click multiple times. At the same time, a connecting line is drawn from one point to the other. End by double-clicking the element or right-clicking it one time.

Element properties

“Element name”	Optional. Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Werkstueck_1`
“Type of element”	● *“Polygon”* ● *“Polyline”* ● *“Bézier Curve”*

Element property 'Position'

The following properties define the position of the corner points in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"Dots"	[0]..[n]: Coordinates of the corner points Specified in pixels You can also change the values by dragging the box symbols (⊞) to other positions in the editor.
"Angle"	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow ↻, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color"	Frame and fill color for the corresponding state of the variable.
"Fill color"	
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

“Line width”	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Fill attributes”	The way in which the element is filled. ● *“Filled”*:The element is filled with the color from property *“Colors ➔ Fill color”*. ● *“Invisible”*: The fill color is invisible.
“Line style”	Type of line representation ● *“Solid”* ● *“Dashes”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“not visible”*

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *“ Element property 'Appearance variables'” on page 1854*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Text”*.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Tooltip”*.

See also

- *“Element property 'Text variables'” on page 1822*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Dynamic points'

“Array of points”	Variable (`POINTER TO`). Points to an array of the structure `VisuElems.VisuStructPoint`. The elements `iX` and `iY` of `VisuStructPoint` contain the xy-coordinates of a point The current number of array elements implicitly contains the variable in the property *“Number of points”*. The variable that is assigned to the property *“Number of points”* contains the number of array elements and therefore the number of corner points. Example: `pPoints : POINTER TO ARRAY[0..100] OF VisuElems.VisuStructPoint;`
“Number of points”	Variable (integer data type): Contains the number of array elements and therefore the number of corner points for displaying the element. Example: `PLC_PRG.iNumberOfPoints := 24;` In the example, the element has 24 points. This definition is necessary because the individual points are defined by a pointer and this does not allow control over the number of points. Note: In this way, it is possible to adapt the display of the element dynamically by updating the number of corner points.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1819*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in "Text properties".

See also

- *"Element property 'Text properties'" on page 1820*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

"Line width"	Variable (integer data type). Contains the line weight (in pixels).
"Fill attributes"	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = `0`: Filled ● Variable value > `0`: Invisible; no fill color
"Line style"	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible; no line

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also

- *"Element property 'Appearance'" on page 1847*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *“Configure”* button opens the *“Input Configuration”* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *“Execute ST Code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog.
“OnMouseClick”	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the mouse button.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkey”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Events”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Events”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

- *Chapter 1.4.5.19.2.2 “Command 'Keyboard Configuration'” on page 1720*
- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Pie'

Symbol:

Category: *“Basic”*

The element draws a pie of any angle.

Element properties

“Element name”	Example: `Error_rate_part_1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Pie”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Y”	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
“Width”	Specified in pixels Example: `150`
“Height”	Specified in pixels Example: `30`
	Tip: You can change the values in *“X”*, *“Y”*, *“Width”*, and *“Height”* by dragging the corresponding symbols to another position in the editor.

“Angle”	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *“Absolute movement ➔ Internal rotation”*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Begin”	Start angle of the pie. If you also define a variable for the start, then the start angle is calculated from the sum of the values for *“Begin”* and *“Variable for begin”*.	Example: • *“Begin”*: 330 • *“End”*: 90 “End”	End angle of the pie. If you also define a variable for the end, then the end angle is calculated from the sum of the values for *“End”* and *“Variable for end”*. The pie is drawn clockwise from the start angle to the end angle.	
“Variable for begin”	The start of the sector is defined dynamically by a variable.	
“Variable for end”	The end of the sector is defined dynamically by a variable.	
“Only show circle line”	☑: The pie is drawn without the radius line or filling color.	

Element property 'Center'

"X" *"Y"*	Display of the center coordinates. You cannot modify these values here in the properties. If the Pie is selected in the editor, then the center of the Pie (as well as the center of the enveloping box) is visualized with the symbol ⊕. Moreover, the element is decorated with a position, begin, and end boxes that you can move.  The center coordinates change when you move the center symbol ⊕ in the editor. This also changes the size of the Pie so that the position box retains its position and the center remains in the middle of the element.

Element property 'Colors'

"Normal state"	The normal state is in effect if the variable in *"Color variables ➔ Toggle color"* is not defined or it has the value `FALSE`.
"Frame color" *"Fill color"*	Frame and fill color for the corresponding state of the variable.
"Transparency"	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
"Alarm state"	The alarm state is in effect if the variable in *"Color variables ➔ Toggle color"* has the value `TRUE`.
"Use gradient color"	☑: The element is displayed with a gradient of two colors.
"Gradient setting"	The *"Gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- ↳ *" Element property 'Appearance variables'" on page 1854*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- ↳ *"Element property 'Text variables'" on page 1835*
- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (integer data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (integer data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.

“Interior rotation”	Variable (integer data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. If a static angle of rotation is specified in *“Position ➔ Angle”*, then the static angle of rotation and the angle of rotation are added.	
You can link the variables to a unit conversion.

The “X”, “Y”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1833*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1833*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Appearance variables'

The properties contain IEC variables for controlling the appearance of the element dynamically.

"Line width"	Variable (integer data type). Contains the line weight (in pixels).
"Fill attributes"	Variable (DWORD). Controls whether the fill color of the element is visible. ● Variable value = `0`: Filled ● Variable value > `0`: Invisible; no fill color
"Line style"	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible; no line

Fixed values can be set in the "Appearance" property. These values can be overwritten by dynamic variables at runtime.

See also

- *"Element property 'Appearance'" on page 1847*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

See also

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Image'

Symbol:

Category: *"Basic"*

The element adds an image to the visualization. The displayed image is managed in the image pool and referenced in the visualization element by means of a static ID. You can also change the displayed image dynamically by using a variable instead of the static ID.

With the "Background" command, you can define a background for the entire visualization.

Directories that contain the images for use in visualizations can be defined in the project settings (category "Visualization").

Element properties

"Element name"	Example: `Status bar` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Image"*
"Static ID"	Identifier of the image file for a static assignment ID of the image file on, as it is defined in the corresponding image pool. If the image is not included in the global image pool in the POU view, then the instance path must be specified. Then the name of the image pool is preceded to make the entry unique. Example: `imagepool2.button_image`. When a new ID is specified, a file selection dialog opens. The selected file is saved to the *"GlobalImagePool"*. See also: Help for the *"Image Pool"* object.
"Show frame"	☑: The image file is displayed with a frame.
"Clipping"	Requirement: The *"Scaling type"* property is *"Fixed"*. ☑: Only part of the visualization is displayed that fits in the element frame.
"Transparent"	☑: The image pixels that have the *"Transparent color"* are displayed as transparent.
"Transparent color"	Effective only if the *"Transparent"* option is activated. The … button opens the color selection dialog. This is where you select the transparent color.

"Scaling type"	Definition of how an image fits in the element frame. ● *"Isotropic"*: The entire image is displayed in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. If the alignment of the elements to each other should also be retained within a scaled frame element, then note the following. Unwanted horizontal or vertical offsets can be prevented by setting the properties *"Horizontal alignment"* and *"Vertical alignment"* to *"Centered"*. The alignment of the elements is retained and there are no resulting horizontal or vertical offsets. Example: A lamp is centered above a switch. The lamp should remain in the horizontally centered position, even if the frame is resized. ● *"Anisotropic"*: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained. ● *"Fixed"*: The image retains its original size, even if the element frame is resized. Note also that the *"Clipping"* option is selected. For each reassignment of an image ID, the element size is adapted automatically to the image size.
"Horizontal alignment"	Horizontal alignment of the element within the element frame: ● *"Left"* ● *"Centered"* ● *"Right"* Requirement: The scaling type of the image is *"Isotropic"* or *"Fixed"*. Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. : The *"Variable"* property is shown below this.
"Variable"	Enumeration variable (`ENUM VisuElemBase.VisuEnumVerticalAlignment`). Contains the horizontal alignment. Example: `PLC_PRG.eHorizontalAlignment`
"Vertical alignment"	Vertical alignment of the element within the element frame: ● *"Top"* ● *"Centered"* ● *"Bottom"* Requirement: The scaling type of the image is *"Isotropic"* or *"Fixed"*. Note: If the visualization is referenced, then the horizontal alignment takes effect within the frame position. : The *"Variable"* property is shown below this.
"Variable"	Enumeration variable (`ENUM VisuElemBase.VisuEnumVerticalAlignment`). Contains the vertical alignment. Example: `PLC_PRG.eVerticalAlignment`

Example A valid declaration is required for the variables used as an example in the table above.

Enumeration

```
TYPE VisuElemBase.VisuEnumHorizontalAlignment
    LEFT
    HCENTER
    RIGHT
END_TYPE

TYPE VisuElemBase.VisuEnumVerticalAlignment
    DOWN
    VCENTER
    BOTTOM
END_TYPE
```

Declaration

```
PROGRAM PLC_PRG
VAR
    eHorizontalAlignment :
VisuElemBase.VisuEnumHorizontalAlignment :=
VisuElemBase.VisuEnumHorizontalAlignment.HCENTER;
    eVerticalAlignment : VisuElemBase.VisuEnumVerticalAlignment :=
VisuElemBase.VisuEnumVerticalAlignment.VCENTER;
END_VAR
```

See also

- *Object 'Image Pool'*

Element property 'Position' The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.

"Angle"	Static angle of rotation (in degrees). Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the frame Requirement: *"Show frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the frame in alarm state Requirement: *"Show frame"* property is activated. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- ↳ *" Element property 'Appearance variables'" on page 1854*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- ↳ *"Element property 'Text variables'" on page 1850*
- ↳ *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- ↳ *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Image ID variable'

"Image ID"	Variable (`STRING`). Contains the image ID. The contents of the string corresponds to the description of the *"Static ID"* property. Example: `PLC_PRG.stImageID := 'ImagePool_A.Image3';`

See also

- *Chapter 1.4.5.18.1.5 "Visualization Element 'Image'" on page 1418*
- *Chapter 1.4.1.20.2.13 "Object 'Image Pool'" on page 873*

Element property 'Dynamic image'

You can use this element property for animating a series of image files.

"Bitmap version"	Variable (integer data type). Contains the version of the image. If the variable changes, then the visualization re-reads the image referenced in the *"Image ID"* property and displays it. The visualization displays animations when the image file on the controller is updated continuously, thus incrementing the version variable. The application must be programmed for this. Possible applications ● Displaying graphics that are generated by the application ● Displaying images that are refreshed by a camera

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1820*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1847*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1847*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The *"Configure"* button opens the *"Input configuration"* dialog box for creating or modifying a user input configuration.

A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it.

Example: *"Execute ST code"*: `PLC_PRG.i_x := 0;`

"OnDialogClosed"	Input event: The user closes the dialog box.
"OnMouseClick"	Input event: A user clicks the element completely. The mouse button is clicked and released.
"OnMouseDown"	Input event: A user clicks down on the element only.
"OnMouseEnter"	Input event: A user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: A user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: A user moves the mouse pointer over the element area.
"OnMouseUp"	Input event: The user releases the mouse button over the element area.

See also

- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

"Hotkeys"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Event(s)"* property are triggered.
"Key"	Key pressed for input action. Example: *[T]*
"Event(s)"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed in the "Keyboard configuration" tab.

See also

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

Visualization Element 'Frame'

Symbol:

Category: *“Basic”*

The element serves as a frame in which to display one or more already existing visualizations. You get a structured user interface. The size of the frame can be fixed or scaled. The display area of the referenced visualization then adapts itself to the frame size.

Element properties

“Element name”	Example: `refVisUserInfo`
“Type of element”	*“Frame”*
“Clipping”	☑: Fixed size. Only that part of the referenced visualization that fits inside the frame is displayed. Requirement: The *“Scaling type”* property is *“Fixed”*.
“Show frame”	Displays the frame ● *“No frame”*: The displayed area of the frame does not have borders. ● *“Frame”*: The displayed area of the frame has borders. ● *“No frame with offset”*: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The gap prevents the referenced visualization from touching any adjacent elements.

“Scaling type”	The method with which the height and width of the **referenced** visualization are scaled. ● *“Isotropic”*: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio. ● *“Anisotropic”*: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other. ● *“Fixed”*: the visualization is displayed in its original size without taking into account the size of the element. ● *“Fixed and scrollable”*: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties *“Scroll position variable horizontal”* or *“Scroll position variable vertical”*. You can then edit the data of the scrollbar position in the application.

Element properties 'Scrollbar settings'

The properties contain variables for the position of the scrollboxes in the scrollbars. You can then edit the data of the scrollbox position in the application.

Requirement: the property *“Scaling type”* is *“fixed and scrollable”*.	

“Scroll position variable horizontal”
“Scroll position variable vertical”
	Variable (integer data type, also as array). Contains the position of the horizontal or vertical scrollbox. The array contains the position for every display variant. If the visualization runs on several display variants, then the position changes are decoupled from each other.
	Example:
	`PLC_PRG.iScrollHor[CURRENTCLIENTID]`
	`PLC_PRG.iScrollVer[CURRENTCLIENTID]`
	The variable is declared as an array in the example.
	`iScrollHor: ARRAY[0..20] OF INT;`
	`iScrollVer: ARRAY[0..20] OF INT;`
	`CURRENTCLIENTID` indexes the current display variant.

You can combine the variables with a unit conversion.

See also

- *Unit conversion*

“Deactivation of the background character”	☐: The background is drawn. The non-animated element of the referenced visualization is drawn as a background bitmap in order to optimize the performance of the visualization. Consequence: Elements can be displayed in an unexpected order at runtime. For example, an animated element can push itself behind the Frame at runtime. ☑: Background character is deactivated in order to avoid the behavior described above.

Element property 'References' Contains the currently configured visualization references as a subnode

“References”	Clicking *“Configure”* opens the *“Frame Configuration”* dialog. This is used to manage the referenced visualizations. Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the *“Switch to any visualization”* Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the *“Input configuration”* of an element: Action *“Switch Frame visualization”*.
List of the currently referenced visualizations	Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters. Example: `vis_FormA` • `iDataToDisplay_1 : PLC_PRG.iVar1` • `iDataToDisplay_2 : PLC_PRG.iVar2` Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the *“Configure”* button instead.

- *Chapter 1.4.5.15 “Creating a structured user interface” on page 1321*
- *“Input action 'Switch Frame Visualization'” on page 1756*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for the colors.

"Color"	Color of the frame ▼: Selection list with style colors appears ...: Standard dialog *"Color"* opens for selecting a color. Please note: the normal state is when the boolean variable in the property *"Color variables ➔ Toggle color"* is not defined or its value is `FALSE`.
"Alarm color"	Color with which the element is filled during the alarm state. Please note: Alarm state is when the value of the boolean variable in the property *"Color variables ➔ Toggle color"* is `FALSE`.
"Transparency"	Integer number (value range from `255` to `0`). Specifies the transparency of the associated color. `255`: The color is opaque. `0`: The color is fully transparent. Please note: If the color is a style color and already contains a transparency value, then this property is write-protected.

See also

- *Chapter 1.4.5.3.3 "Assigning a color" on page 1258*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values are defined here.

See also

- *" Element property 'Appearance variables'" on page 1867*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1863*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. "Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.

You can link the variables to a unit conversion.

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*"Position"* property). The shape of the element can change.

"Movement top-left"	
"X"	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
"Y"	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
"Movement bottom-right"	

"X"	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
"Y"	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *"Element property 'Absolute movement'" on page 1820*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1860*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1861*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the Frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show Frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the Frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 1860*

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

“Variable”	● Variable (integer data type) that contains the index of the active visualization Example: `PLC_PRG.uiIndexVisu` Hint: The *“Frame Configuration”* dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants. ● Array element (integer data type) for index access via `CURRENTCLIENTID` Example: `PLC_PRG.aIndexVisu[CURRENTCLIENTID]` Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

See also

- *Chapter 1.4.5.19.2.9 “Command 'Frame Selection'” on page 1727*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

Visualization Element 'Label'

Symbol:

Category: *"Common Controls"*

The element is used to label visualizations.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Header_Parameter`
"Type of element"	*"Label"*

Element property 'Texts'

The property requires a character string.

This text is entered automatically into the `GlobalTextList` text list and can be localized there.

"Text"	Character string (without single straight quotation marks) Example: `Main page`

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.

"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Combo Box, Array'

Symbol:

Category: *"Common Controls"*

The element shows values of an array as a list box. When the visualization user clicks an entry, the array index of the entry is written to an integer variable.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `List_Product_Number`
"Type of element"	*"Combo Box, Array"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	The array index of the list entry that the user clicks is saved at runtime. Property value ● Variable (integer data type) Example: `PLC_PRG.iIndexComboboxEntry` ● Enumeration variable with text list support Example: `PLC_PRG.eMyCombobox<COMBO>` Note: Value range of the enumeration value that lies within the `DWORD` or `DINT` value range
"Data array"	Displayed as a combo box. Every array component becomes a combo box entry. Property value ● Array variable (`ARRAY[...] OF`) Example: `PLC_PRG.astrCombobox` Declaration: `astrCombobox : ARRAY[0..4] OF STRING := ['First', 'Second', 'Third', 'Fourth'];`

See also

- *Enumerations*
- *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

Element property 'Columns'

The "Combo box – Array" element visualizes an array variable or structure variable in a tabular view. The index of array elements or structure members is shown in a column or row. Two-dimensional arrays or structure arrays are shown in several columns. You specify the visualized variable in the *"Data array"* property. If a variable is assigned there, then you can specify the display of the table columns where the array elements are shown. You can customize each column that is assigned to an index [<n>].

"Columns" ● [<n>]	Due to the structure of the variable that is defined in *"Data array"*, CODESYS determines the number of columns and defines them with the index <n>. Example: `StringTable : ARRAY [0..2, 0..4] OF STRING := ['BMW','Audi','Mercedes','VW','Fiat', '150','150','150','150','100','blue','gray','silver','blue','red'];`: three columns are formed `[0]`, `[1]` and `[2]`.
"Max. array index"	Optional. Variable (integer data type) or value. Defines up to which array index the data is displayed.
"Row height"	Height of the rows (in pixels).
"Number visible rows"	Optional. If the array is larger than the number of visible rows, then a scrollbar is included.
"Scrollbar size"	Width of the vertical scrollbar (in pixels).

Table 359: "Element property 'Columns: Column [<n>]'"

"Width"	Column width (in pixels).
"Image column"	☑: Images can be displayed in the column. Images are used from the global image pool or user-defined image pools. The image IDs are shown in the cells of the table as defined in the image pool.
"Image configuration"	

"Fill mode"	• *"Fill cell"* The image resizes to the dimensions of the cell without fixing the height/ width ratio. • *"Centered"* The image is centered in the cell and retains its proportions (height-width ratio).
"Transparency"	☑: The color that is specified in *"Transparent color"* is displayed as transparent.
"Transparent color"	When the *"Transparent"* property is enabled, the color specified here is not displayed. Pixels with this color are transparent.
"Text alignment in column"	• *"Left"* • *"Centered"* • *"Right"*

Element property 'Texts'

"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode Example: `Products of customer A` Hint: The text is accepted automatically into the *"GlobalTextList"* text list and can be localized there.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	• *"Default style values"*: The values of the visualization style are used. • *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Font"	Example: *"Default"* ...: The *"Font"* dialog opens. ▼: List box with style fonts
"Font color"	Example: *"Black"* ...: The *"Color"* dialog opens. ▼: List box with style colors
"Transparency"	Integer (value range from `0` to `255`). This determines the transparency of the respective color. `255`: The color is opaque. `0`: The color is completely transparent. Note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Combo Box, Integer'

Symbol:

Category: *“Common Controls”*

The element shows values as a list box. When the user clicks an entry, the ID of the entry is written to an integer variable. The entries in the list box can be from a list and contain images from an image pool.

Element properties

“Element name”	Example: `List of product numbers` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Combo Box, Integer”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	At runtime, the text list ID of the list entry that the user clicks is saved at runtime. If only one image pool is displayed, then the image ID is saved. Property value ● Variable (integer data type) Example: `PLC_PRG.iIDComboboxEntry` ● Enumeration variable with text list support Example: `PLC_PRG.eMyCombobox<COMBO>`
"Text List"	Displayed as a combo box. Every text list entry becomes a combo box entry. Note: A maximum of 32766 entries can be displayed. Transfer value ● Text list identifier as string Example: `'TextList_A'` Note: The IDs of the text list have to be within the range of values of `DWORD` or `DINT`. ● Blank – When an enumeration variable with text list support is specified in the *"Variable"* property – When only one image pool is displayed
"Image Pool"	Displayed as a combo box. Every image in the image pool becomes a combo box entry. Example: `'ImagePool_A'`

See also

- *Enumerations*
- *Chapter 1.4.5.6 "Setting Up Multiple Languages" on page 1286*

Element property 'Settings of the list'

Displayed list that expands when a visualization user clicks into the element.

"Number of rows setting"	● *"From style"*: ● *"Explicit"*: Then the *"Number of visible rows"* property appears below it.
"Number of visible rows"	Number of visible lines of the combo box drop-down list defined here ● Integer literal Example: `5` ● Variable (integer data type) Example: `PLC_PRG.iNumberOfVisibleRows` Note: The property is available when the *"Number of rows setting"* property is set to *"Explicit"*.

“Row height”	● *“From style”*: ● Literal Example: `20`
“Height of image”	Image height (in pixels) of the image displayed in the drop-down list entry ● *“From style”*: ● Integer literal Example: `30` Note: Images are displayed only when a value is specified in the *“Image pool”* property.
“Width of image”	Image width (in pixels) of the image displayed in the drop-down list entry ● *“From style”*: ● Literal Example: `30` Note: Images are displayed only when a value is specified in the *“Image pool”* property.
“Offset of image”	Makes the images in the selection list appear offset (in pixels) from the left margin. An offset of `0` means that the images are displayed directly on the margin. ● *“From style”*: ● Literal Example: `4` Note: Images are displayed only when a value is specified in the *“Image pool”* property.
“Scrollbar size”	Size of the scrollbar (in pixels). The scrollbar is displayed when more entries are specified in the drop-down list than in *“Number of visible rows”*. Default: `20`

Element property 'Texts'

“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element in runtime mode Example: `Products of customer A` Hint: The text is accepted automatically into the *“GlobalTextList”* text list and can be localized there.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Value range'

"Limit valuerange"	Limits the text list to one subrange. This subrange is displayed by the combo box. Requirement: A value is specified in the *"Text list"* property. ☑: Only the subrange that is defined by the *"Minimum value"* *"Maximum value"* properties is displayed as a drop-down list.
"Minimum value"	ID of the text list entry from which a combo box entry is displayed ● Literal (`ANY_NUM`) Example: `5` ● Variable (integer data type) Example: `PLC_PRG.iFirstEntry`
"Maximum value"	ID of the text list entry up to which combo box entries are displayed ● Literal (`ANY_NUM`) Example: `10` ● Variable (integer data type) Example: `PLC_PRG.iLastEntry`
"Filter missing textentries"	☑: Text list is refreshed and any unused texts (IDs) are removed. Requirement: A value is specified in the *"Text list"* property.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

- ↳ *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- ↳ *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Tabs'

Symbol:

Category: *“Common Controls”*

The element displays selected visualizations in tabs. The tabs can be used by means of the tab header without having to configure an input configuration. A visualization user switches between visualizations by clicking the tab header.

Element properties

“Element name”	Example: `Assembly A` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Tabs”*
“Tab width”	Width of the tab (in pixels). If there is not space for all tab headers, then a scroll bar is added. Example: `30`
“Tab height”	Height of the tab (in pixels) ● Integer literal Example: `15` ● *“From style”*

“Scaling type”	The method with which the height and width of the **referenced** visualization are scaled. ● *“Isotropic”*: The visualization is scaled to the size of the element. The visualization retains its proportions with a fixed height/width ratio. ● *“Anisotropic”*: The visualization is scaled to the size of the element. The height and width are adapted to the element independently of each other. ● *“Fixed”*: the visualization is displayed in its original size without taking into account the size of the element. ● *“Fixed and scrollable”*: The visualization is displayed fixed in the element. If it is larger than the element, the element will be provided with scrollbars. Please note: assign variables to the properties *“Scroll position variable horizontal”* or *“Scroll position variable vertical”*. You can then edit the data of the scrollbar position in the application.

"Deactivate background drawing"	☐: The non-animated elements of the referenced visualization are displayed as background images in order to optimize the performance of the visualization. Result: At runtime, the elements can be displayed in any order, for example when an element moves behind the frame at runtime. ☑: Deactivates the background display in order to prevent the behavior described above The property is not available for the following settings: ● The *"Scaling type"* property is set to *"Fixed and scrollable"* ● The client animation functionality is enabled.

Element property 'Scroll bar settings'

The properties include variables for the position of the scroll boxes in the scroll bars. You can process the data for the scroll box position in the application.

Requirement: The *"Scaling type"* property is *"Fixed and scrollable"*.	

"Scroll position variable horizontal"
"Scroll position variable, vertical"
	Variable (integer data type, also array). Includes the position of the horizontal or vertical scroll box. The array contains the position for each display variant. If the visualization is running on multiple display variants, then the position changes are disconnected from each other.
	Example:
	`PLC_PRG.iScrollHor[CURRENTCLIENTID]`
	`PLC_PRG.iScrollVer[CURRENTCLIENTID]`
	In this example, the variable is declared as an array:
	`iScrollHor: ARRAY[0..20] OF INT;`
	`iScrollVer: ARRAY[0..20] OF INT;`
	`CURRENTCLIENTID` indicates the current display variant.

See also

- *Unit conversion*

Element property 'References'

"References"	Clicking *"Configure"* opens the *"Frame Configuration"* dialog. You can select an existing visualization there. Selected visualization references are shown in the properties. Selected visualization references are listed here as subordinate properties.
Name pf the visualization reference (example: `PLC_PRG.S1`)	
"Heading"	Tab caption (example: `Panel`)
"Image ID"	Image ID in the theme `<image pool name>.<ID>` Example: `Imagepool_A.1` for the image with ID `1` in `Imagepool_A`
Interface parameter of the visualization reference Example: `iX`	If the visualization has an interface, then their parameters are displayed here as subordinate properties. Variable (data type conforms to data type of the interface parameter). Includes the initialization value for the instantiation of the visualization.

- *Chapter 1.4.5.19.2.9 “Command 'Frame Selection'” on page 1727*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Switch frame variable'

"Variable"	Variable (integer data type). Specifies the index of the active visualization. Example: `PLC_PRG.uiActiveVisuID`. Tip: The *"Frame Configuration"* dialog box includes a list of selected visualizations. The visualizations are ordered automatically in numeric order in the list.

See also

- *Chapter 1.4.5.19.2.9 "Command 'Frame Selection'" on page 1727*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Button'

Symbol:

Category: *"Common Controls"*

The element triggers an action, such as setting a variable.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Voltage_on`
"Type of element"	*"Button"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.
"Use gradient color"	☑: The element is displayed with a color gradient.
"Gradient setting"	The *"Color gradient editor"* dialog box opens.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Image'

"Static ID"	Reference to an image in an image pool of the format <name of image pool>.<image ID> (example: `image_pool.GreenButton`). If the image is from the *"GlobalImagePool"*, then you can omit the name of the image pool because CODESYS always searches this pool first. ...: The *"Input Assistant"* dialog box opens and lists all available image pools and images in the entire project.
"Scale type"	Behavior of the image when resizing the button. ● *"Isotropic"*: The image retains its proportions. The ratio of height to width is retained, even if you change the height or width of the button separately. ● *"Anisotropic"*: The image resizes to the dimensions of the button. ● *"Fixed"*: The image retains its original size, even if you change the size of the button.
"Transparency"	The visualization displays the image with the transparency color that is selected in *"Transparency color"*.
"Transparency color"	Color that is transparent in the image (example: *"White"*). if the image background that is reference by *"Static ID"* is white, then this background is displayed transparent. Clicking ... opens a color selection dialog. Requirement: The *"Transparency"* option is activated.
"Horizontal alignment"	Horizontal alignment of the image ● *"Left"* ● *"Centered"* ● *"Right"*
"Vertical alignment"	Vertical alignment of the image ● *"Top"* ● *"Centered"* ● *"Bottom"*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *“Element property 'Text variables'” on page 1897*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 1820*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 1894*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

“Text list”	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
“Text index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
“Tooltip index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Element property 'Font variables' The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1895*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Color"	Color variable for the Frame ● Variable (`DWORD`) for the color Example: `PLC_PRG.dwColor` ● Color literal Example of gray and opaque: `16#FF888888` Requirement: *"Show Frame"* property is activated. Please note that the normal state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color variable for the Frame in alarm state ● Variable (`DWORD`) for the alarm color Example: `PLC_PRG.dwAlarmColor` ● Color literal Example of red and opaque: `16#FFFF0000` Please note that the alarm state is in effect if the expression in the *"Colorvariables ➔ Toggle color"* property has the value `TRUE`.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*
- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Button state variable'

“Digital variable”	At runtime, the property controls whether the Button is displayed as pressed or not. Values: ● `FALSE`: The Button is displayed as not pressed. ● `TRUE`: The Button is displayed as pressed. Argument passed to the property: ● Placeholder for the user input variable to couple the representation of the Button with the input variable. – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the Button. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `prgA.xButtonState` Note: Implement a value assignment in the code for the variable specified here.

Element property 'Image ID variable'

"Image ID"	Variable (`STRING`). Contains the image ID. The contents of the string corresponds to the description of the *"Static ID"* property. Example: `PLC_PRG.stImageID := 'ImagePool_A.Image3';`

See also

- *Chapter 1.4.5.19.5.5 "Visualization Element 'Image'" on page 1842*
- *Chapter 1.4.1.20.2.13 "Object 'Image Pool'" on page 873*

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Group Box'

Symbol:

Category: *“Common Controls”*

The element provides a visual grouping of visualization elements. The group box can have multiple levels of nesting.

> *You can also use drag&drop to add elements to a “Group Box”. To do this, drag the element to the window area of the “Group Box”. The appearance of the cursor changes (a small plus sign is displayed). When you click the [Shift] key at the same time, the element is not added.*
>
> *You can remove elements from the “Group Box” by dragging them out of the window area.*

Element properties

“Element name”	Example: `Parameter axis 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Group Box”*
“Clipping”	☑: Elements that protrude beyond the size of the group box are clipped.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

> *You can also change the values by dragging the box symbols (⊡) to other positions in the editor.*

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

The properties contains character strings for labeling the element.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Example: `Axis 1`.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Parameters of Axis 1`.

See also

- ↳ *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Table'

Symbol:

Category: *“Common Controls”*

The element displays data that can be represented as an array in a table. Therefore, the data type of the visualizing variable can be 1) a one-dimensional array, 2) a maximum two-dimensional array, 3) an array of an array, 4) an array of structures, or 5) an array of a function block.

Element properties

“Element name”	Example: `Data set component 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	Table
“Data array”	Array whose data is visualized as a table Variable (`ARRAY`) whose data type determines the number of columns and rows in the table Array types ● One-dimensional array: The table has one column. ● Two-dimensional array: The second dimension determines the number of columns. ● Array of an array: The number of array elements of the back array determines the number of columns. ● Array of a structure: The number of structure members determines the number of columns. ● Array of a function block: The number of local variables determines the number of columns. Example: `PLC_PRG.aiTable` Declaration: `aiTable : ARRAY[0..3, 0..4] OF INT := [4(1, 2, 3, 4, 5)];` Hint: If the declaration of the array changes, then the table can be refreshed by placing the cursor in the data array value field and pressing the *[Enter]* key.
“Max. array index”	Top index limit for the displayed table. Limits the number of displayed rows. The index begins at 0. ● Variable (integer data type) Example: `PLC_PRG.iUpperIndexBoundToDisplay` ● Integer literal Example: `4` is displayed as 5 in the row of the table.

See also

- *Data Type 'ARRAY'*

Element property 'Columns'

The *“Table”* element shows the values of a variable in a tabular view. The array elements of structure members are shown in a column or in a row. Two-dimensional arrays or arrays of a structure are shown in multiple columns. The visualized variable is defined in the *“Data array”* property. When a variable is assigned there, you can specify the display of the Table columns where the array elements are shown. An individual configuration is possible for each column that is assigned to an index [<n>].

“Show row header”	☑: The row header is visible. Example: For an array, the index of the array element is displayed in the header.
“Show column header”	☑: The column label is visible.
“Row height”	Height of the rows (in pixels)
“Row header width”	Width of the row label
“Scroll bar size ”	Size of the scroll bar (in pixels)

Table 360: “Element property 'Columns: Column [<n>]'”

“Column header”	By default, the name of the array or structure is applied as the heading with the index or structure member for the column. If an array of a function block has been selected for *“Data array”*, then the name of the array is applied to the column header with the local variables of the function block that belong to the column. The column label can be changed here by specifying a new title.
“Width”	Column width (in pixels)
“Image column”	☑: Images can be displayed in the column. Images are used from the global image pool or custom image pools. The image IDs are shown in the cells of the Table as they are defined in the image pool.
“Image configuration”	
“Fill mode”	• `Fill cell`: The image resizes to the dimensions of the cell without fixing the height/width ratio. • `Centered`: The image is centered in the cell and retains its proportions (height/width ratio).
“Transparency”	☑: The color which is specified in *“Transparent color”* is displayed as transparent.
“Transparent color”	This color is displayed as transparent. Requirement: The *“Transparency”* property is activated.
“Text alignment of header”	Alignment of the column header: • `Left` • `Centered` • `Right`
“Use template”	☑: Another visualization element (type *“Rectangle”*, *“Rounded Rectangle”*, or *“Ellipse”*) is inserted into each line of this Table column. The properties list is extended automatically with the properties of this element in *“Template”*.
“Text alignment of the headline from the template”	Requirement: The *“Use template”* property is activated. ☑: When activated, the settings for font (size) and alignment in the inserted template are also applied to the column header.
“Template”	Requirement: The *“Use template”* property is activated. The properties of all elements assigned to the column are listed in *“Template”*. They can be modified there as described in *“Rectangle”*, *“Rounded Rectangle”*, and *“Ellipse”*.

See also

- *Chapter 1.4.5.19.5.1 “Visualization Element 'Rectangle', 'Rounded Rectangle', 'Ellipse'” on page 1792*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables enable dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog box.
"Size"	Variable (integer data type). Contains the font size (in pixels). Example: `PLC_PRG.iFontHeight := 16;.` The selection of font sizes corresponds to the default *"Font"* dialog box.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Charset”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog box.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1919*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X.` Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y.` Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Selection'

“Background color on selection”	Fill color of the selected row.
“Selection font color”	Font color of the selected row.
“Selection type”	Selection when clicking the table row. ● `No selection`: No selection ● `Cell selection`: The clicked cell only. ● `Row selection`: Row of the clicked cell. ● `Column selection`: Column of the clicked cell. ● `Row and column selection`: Row and column of the clicked cell.
“Frame around selected cells”	☑: A frame is drawn around the selected cells.
“Variable for selected column”	Variable (INT). Contains the array index of the *“Column”* of the selected cell. If the data array points to a structure, then the structure components are indexed, starting at 0. Warning: This index represents the correct position in the array only if no columns have been removed from the table in the display.
“Variable for selected row”	Variable (INT). Contains the array index of the *“Row”* of the selected cell.
“Variable for valid column selection”	Variable (BOOL). TRUE: The *“Variable for selected column”* variable contains a valid value.
“Variable for valid row selection”	Variable (BOOL). TRUE: The *“Variable for selected row”* variable contains a valid value.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

- *Data Type 'ARRAY'*

Visualization Element 'Text Field'

Symbol:

Category: *"Common Controls"*

The element is used for the following purposes:

- Static output of text. The contents of a variable can be part of the text.
- Showing a tooltip. The text is managed as static text and can also be defined so that the contents of a variable are also displayed.
- Dynamic output of text. Texts of a text list are displayed dynamically.
- Input of text. For example, a user can input a number or a text literal.

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element properties

“Element name”	Optional Example: `FileName_A` Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Text Field”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Colors'

“Normal state”	The normal state is in effect if the variable in *“Color variables ➔ Toggle color”* is not defined or it has the value `FALSE`.
“Frame color”	Frame and fill color for the corresponding state of the variable.

“Fill color”	
“Transparency”	Transparency value (0 to 255) for defining the transparency of the selected color. Example: 255: The color is opaque. 0: The color is completely transparent.
“Alarm state”	The alarm state is in effect if the variable in *“Color variables ➔ Toggle color”* has the value `TRUE`.

See also

- *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

“Line width”	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Fill attributes”	The way in which the element is filled. ● *“Filled”*:The element is filled with the color from property *“Colors ➔ Fill color”*. ● *“Invisible”*: The fill color is invisible.
“Line style”	Type of line representation ● *“Solid”* ● *“Dashes”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“not visible”*

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *“ Element property 'Appearance variables'” on page 1867*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl]* + *[Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

See also

- *"Element property 'Text variables'" on page 1919*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*
- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*
- *"Element property 'Texts'" on page 1918*
- *Chapter 1.4.1.19.5.17 "Enumerations" on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▼: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1919*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Selection and caret configuration'

The variables allow for controlling the caret position and the selection of the text.

"Caret position"	Variable (integer data type). Contains the position of the cursor.
"Selection start"	Variable (integer data type). Contains the position of the first selected character. Example: `PLC_PRG.iSelStart`
"Selection end"	Variable (integer data type). Contains the position of the last selected character. Example: `PLC_PRG.iSelEnd`
"All selected"	Variable (BOOL). Toggles the selection of the entered text. `TRUE`: The text in the text field is selected. `FALSE`: The selection starts with the value in *"Selection start"* and ends with *"Selection end"*.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.

"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.
"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

- *Chapter 1.4.5.19.2.2 "Command 'Keyboard Configuration'" on page 1720*
- *Chapter 1.4.5.19.3.6 "Dialog 'Input Configuration'" on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Scroll Bar'

Symbol:

Category: *"Common Controls"*

The element sets the value of a variable, depending on the position of the scroll bar.

Element properties

"Element name"	Example: `Speed Conveyor Belt 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Scroll Bar"*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Value"	Variable as type integer that includes the position of the scroll bar.
"Minimum value"	Smallest value of the scroll bar (fixed value or variable).
"Maximum value"	Largest value of the scroll bar (fixed value or variable).

"Page size"	Page size ● As a fixed value, for example `10` ● As a variable of data type integer Requirement: Visible when the *"Move to click"* property is **not** selected.
"Move to click"	Behavior of the scroll bar at visualization runtime when it is clicked: ☑: The scrollbar moves to the clicked position. ☐: The scrollbar moves to one *"Page size"* in the direction of the click.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊡) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Bar'

The property defines the representation of scaling and direction of travel.

"Orientation"	Alignment of the slider; defined by the ratio of width to height. ● *"Horizontal"* ● *"Vertical"* You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the Scroll Bar.
"Running direction"	The drop-down list varies depending on the alignment of the slider. Horizontal ● *"Left to right"*: Scale starts at the left. ● *"Right to left"*: Scale starts at the right. Vertical ● *"Bottom to top"*: Scale starts at the bottom. ● *"Top to bottom"*: Scale starts at the top.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Color"	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *"Color variables ➔ Toggle color"* property is not defined or it has the value `FALSE`.
"Alarm color"	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *"Color variables ➔ Toggle color"* property has the value `TRUE`.
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *"GlobalTextList"* text list. Therefore, these texts can be localized.

"Text"	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Text"*.
"Tooltip"	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *"Text variable ➔ Tooltip"*.

- *Chapter 1.4.5.18.2 "Placeholders with Format Definition in the Output Text" on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

"Text variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *"Texts ➔ Text"*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
"Tooltip variable"	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *"Texts ➔ Tooltip"*.

See also

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

"Text list"	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
"Text index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
"Tooltip index"	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 "Object 'Text List'" on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.

“Flags”	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
“Character set”	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *“Script”* setting of the standard *“Font”* dialog.
“Color”	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
“Flags for text alignment”	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 1919*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assignment options: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
"Normal state" *"Alarm state"*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *"Color variables"*, *"Toggle color"* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *"Colorvariables"*, *"Toggle color"* has the value `TRUE`.
"Frame color"	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
"Filling color"	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Slider'

Symbol:

Category: *"Common Controls"*

The element changes the value of a variable, depending on the position of the slider within the slider bar. You define the value range of the slider bar by means of the scale start and scale end.

Element properties

"Element name"	Example: `Speed controller conveyor belt 1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Slider"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	Variable (numeric data type) Example: `PLC_PRG.rSlider` When executed, the variable assigns a value that corresponds to the position of the slider in the bar.
"Page size"	Page size ● As a fixed value, for example `10` ● As an IEC variable of data type integer Requirement: The *"Move to click"* element property is **not** selected.
"Move to click"	Behavior of the slider at visualization runtime when it is clicked: ☑: The slider moves to the clicked position. ☐: The slider moves to the value (defined in the *"Page size"* element property) in the direction of the click.

Element property 'Scale'

"Show scale"	☑: The element has a visible scale. Note: This option is available for the *"Slider"* only.
"Scale start"	Least value of the scale and the lower limit of the value range for the element. Example: `0` : The property *"Variable"* is shown below.

“Variable”	Variable (integer data type). Contains the scale start.
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale end.
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two tick marks on the rough scale. Example: `10` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Subscale”	Distance between two dashes on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 5;`
	`END_VAR`

“Scale format (C Syntax)”	Formatting of the scale label (example: `%d %s`) Note: This property is available for the Slider only.
“Scale proportion”	Size of the scale (in %) of the total size

Element property 'Bar'

The property defines the representation of scaling and direction of travel.

"Diagram type"	The drop-down list varies depending on the alignment of the diagram. Horizontal ● *"Top"*: Scale is above the slider. ● *"Bottom"*: Scale is below the slider. ● *"Top and bottom"*: Two scales frame the slider above and below. Vertical ● `Left`: Scale is left of the slider. ● `Right`: Scale is right of the slider. ● `Left and right`: Two scales frame the slider on the left and the right.
"Orientation"	Alignment of the slider; defined by the ratio of width to height. ● *"Horizontal"* ● *"Vertical"* You can modify the alignment in the visualization editor by using the pointing device to adjust the width and height of the scrollbar.
"Running direction"	The drop-down list varies depending on the alignment of the slider. Horizontal ● *"Left to right"*: Scale starts at the left. ● *"Right to left"*: Scale starts at the right. Vertical ● *"Bottom to top"*: Scale starts at the bottom. ● *"Top to bottom"*: Scale starts at the top.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Spin Box'

Symbol:

Category: *“Common Controls”*

The element increments or decrements the value of a variable in defined intervals.

Element properties

“Element name”	Example: `Speed controller conveyor belt` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Spin Box”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

"Variable"	Variable (numeric data type) Example: `PLC_PRG.iTemp`
"Number format"	Format of the value in printf syntax Example: %d, %5.2f
"Interval"	Interval used for modification of the value

Element property 'Value range'

"Minimum value"	Lower limit of the output value ● fixed value ● Variable (INT)
"Maximum value"	Upper limit of the output value ● fixed value ● Variable (INT)

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

"Toggle color"	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *"Color"* property. ● `TRUE`: The element is displayed with the color specified in the *"Alarm color"* property. Assigning the property: ● Placeholder for the user input variable – *"<toggle/tap variable>"* – *"<NOT toggle/tap variable>"* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *"Tap"* or *"Toggle"* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *"Toggle"* and *"Tap"*, then the variable specified in *"Tap"* is used. Hint: Click the symbol to insert the placeholder *"<toggle/tap variable>"*. When you activate the *"Inputconfiguration"*, *"Tap FALSE"* property, then the *"<NOT toggle/tap variable>"* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.

The transparency part of the color value is evaluated only if the "Activate semi-transparent drawing" option of the visualization manager is selected.

Select the "Advanced" option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. User input is a user event from the perspective of the element.

The input configuration refers to the text area of the element only, not the two buttons.

The *“Configure”* button opens the *“Input configuration”* dialog box for creating or modifying a user input configuration. A configuration contains one or more input actions for the respective input event. Existing input actions are displayed below it. Example: *“Execute ST code”*: `PLC_PRG.i_x := 0;`	
“OnDialogClosed”	Input event: The user closes the dialog box.
“OnMouseClick”	Input event: The user clicks the element completely. The mouse button is clicked and released.
“OnMouseDown”	Input event: The user clicks down on the element only.
“OnMouseEnter”	Input event: The user drags the mouse pointer to the element.
“OnMouseLeave”	Input event: The user drags the mouse pointer away from the element.
“OnMouseMove”	Input event: The user moves the mouse pointer over the element area.
“OnMouseUp”	Input event: The user releases the mouse button over the element area.

See also

- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

“Tap”	When a mouse click event occurs, the variable defined in *“Variable”* is described in the application. The coding depends on the options *“Tap FALSE”* and *“Tap on enter if captured”*.
“Variable”	Variable (`BOOL`). Contains the information whether a mouse click event exists. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts while the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *“Tap FALSE”* option is not activated.
“Tap FALSE”	☑: The mouse click event leads to a complementary value in *“Variable”*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
“Tap on enter if captured”	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

“Shift”	When a mouse click event occurs, the variable here is described in the application. When the mouse click event ends, its value is toggled with the *“Toggle on up if captured”* option.
“Variable”	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Tip: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
“Toggle on up if captured”	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkeys”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Event(s)”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Event(s)”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed in the “Keyboard configuration” tab.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Invisible Input'

Symbol:

Category: *"Common Controls"*

This element is displayed in the editor with a dashed line which is not visible in online mode. You define the behavior of the el in the input configuration.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Unsichtbare_Eingabe_1`
"Type of element"	*"Invisible Input"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

“Hotkey”	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *“Events”* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
“Key”	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
“Events”	● *“None”* ● *“Mouse down”*: Pressing the key triggers the input actions that are configured in the *“OnMouseDown”* property. ● *“Mouse up”*: Releasing the key triggers the input actions that are configured in the *“OnMouseUp”* property. ● *“Mouse down/up”*: Pressing and releasing the key triggers the input actions that are configured in the *“OnMouseDown”* property and the *“OnMouseUp”* property.
“Shift”	☑: Combination with the Shift key Example: *[Shift]+[T]*.
“Control”	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
“Alt”	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

- *Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Check Box'

Symbol:

Category: *“Common Controls”*

The element is used for setting and resetting a Boolean variable. The set state is identified by a check mark.

Element properties

“Element name”	Example: `signal_tone_for_parts_deficit` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Check Box”*
“Text ID”	ID for the text in the *“GlobalTextList”* Example: `22` The text ID cannot be changed. As soon as you specify and save a text in *“Texts”* - *“Text”*, CODESYS automatically creates an entry in the *“GlobalTextList”* and displays the ID here.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Variable”	Variable of type `BOOL` Example: *“PLC_PRG.xIsTrue”*
“Frame size”	Distance of the element to the edge Example: *“From style”*

Element property 'Texts'

The properties contains character strings for labeling the element.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Example: `Axis 1`.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Parameters of Axis 1`.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Usage of”	● *“Default style values”*: The values of the visualization style are used. ● *“Individual settings”*: The "Individual text properties" property group is shown The values can be customized here.
“Individual text properties” Requirement: The *“Individual settings”* text property is defined.	
“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.

"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Progress Bar'

Symbol:

Category: *"Common Controls"*

The element displays the value of a variable as a progress bar.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Progress_Data_Transfer`
"Type of element"	*"Progress Bar"*
"Text ID"	ID of the global text list Requirement: Text is configured in the property *"Texts ➔ Text"*.
"Variable"	Variable (numeric data type). Represents the length of the progress bar.
"Minimum value"	Value range of the variable
"Maximum value"	
"Style"	● *"Blocks"* ● *"Bar"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

Element property 'Texts'

"Text"	String label for the element. Example: `Zoom`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Visualization Element 'Radio Buttons'

Symbol:

Category: *"Common Controls"*

The element provides a series of radios buttons with an unlimited number of options.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Morning Shift`
“Type of element”	*“Radio Buttons”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Variable”	Variable (integer data type) that gives the index of the radio button that the visualization user has activated Example: `PLC_PRG.iNrOfActivatedRadioButton`
“Number of columns”	Definition of the number of list boxes displayed in a row Example: `2`
“Radio button order”	*“Left to right”*: The radio buttons are aligned by rows until the number of columns is reached. *“Top to bottom”*: The radio buttons are aligned row by columns until the number of columns is reached.
“Frame size”	Defines the distance from the list boxes to the edge (in pixels).
“Row height”	Height of the row (in pixels) Modifying the height of the row also changes the size of the list box.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Usage of"	● *"Default style values"*: The values of the visualization style are used. ● *"Individual settings"*: The "Individual text properties" property group is shown The values can be customized here.
"Individual text properties" Requirement: The *"Individual settings"* text property is defined.	
"Horizontal alignment"	Horizontal alignment of the text within the element.
"Vertical alignment"	Vertical alignment of the text within the element.
"Text format"	Definition for displaying texts that are too long ● *"Default"*: The long text is truncated. ● *"Line break"*: The text is split into parts. ● *"Ellipsis"*: The visible text ends with "..." indicating that it is not complete.
"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Radio button settings'

“Radio button” ● *“Areas”* – *“[<n>]”*	*“Create new”*: Clicking this button creates a new selection button in the editor and lists an additional area in the properties editor. For each radio button, an area is visible that records the settings. ● [<n>] – *“[<n>]”*: This number indicates the area. Clicking *“Delete”* will delete the associated radio button with its settings *“Text”*, *“Tooltip”*, and *“Line spacing (in pixels)”*.
Areas: [<n>]	
“Text”	The button name is specified here. Default value: *“Radio_button”*
“Tooltip”	Text is specified here that is displayed in a tooltip.
“Line spacing (in pixels)”	The distance (in pixels) to the upper button can be specified here.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Alarm Table'

Symbol:

Category: *“Alarm Manager”*

The element displays alarms in a list. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

In online mode, you can sort an alarm table by a specific column – even in the classic view. Click into the column header. A small triangle indicates the current sort order (ascending, descending). Clicking the symbol reverses the order.

Sorting inside the column depends on the type of the contained information. The "Priority" column is sorted numerically, and the "Message" and "Class" columns alphabetically. The "Value" and "Latch" columns may contain different value types. In this case, sorting is first by type (blank, Boolean, numeric value, character string) and then either numerically or alphabetically depending on the type.

If an alarm history has been created, then you can programmatically delete it at runtime. The recording starts again from the time of deletion. See the help page for "Visualizing Alarm Management".

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Alarm Table"*
"Data source"	Selection of the device and the application where the data to be visualized and the alarms are generated ● Remote data source which accesses a remote device, accesses a remote application, and then transfers the data to the alarm configuration Example: `DataSource_A` Below the (now visible) *"Application"* property, the remote application is displayed as configured in the data source. Example: `App_A` Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder. ● Local application below which the alarm configuration is located Example: *"<local application>"*

See also

- *Object 'Data Source'*

Element property 'Alarm configuration'

"Alarm groups"	Opens the *"Select Alarm Group"* dialog where you define the alarm groups that you want to display.
"Priority from"	Least priority for alarm display. (0 to 255).
"Priority to"	Greatest priority for alarm display. (0 to 255).
"Alarm classes"	Opens the *"Select Class Group"* dialog where you define the alarm classes that you want to display.
"Filter criterion"	For the *"Alarm Banner"* element only ● *"Most important"*: The alarm with the highest priority (lowest value) is displayed. ● *"Newest"*: The most recent alarm is displayed.

"Filter by latch 1"	The generated alarms (previous and current) can be filtered by the contents of *"Latch variable 1"*, which is specified in the configuration of the alarm group. In *"Filter type"*, you define whether or not the filtering is performed by a string value or a numerical value. ● *"Filter variable"*: Indicates what the alarms are filtered by. Possible entries: Application variable of data type `STRING` or `WSTRING`, or a literal value directly. Examples:`PLC_PRG.strFilterVariable`, `'STRING'`. ● *"Filter type"*: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: `PLC_PRG.diFilterType`, or a value directly (example: `2`). Possible values: – `0`: No filtering – `1`: Filter by alarms whose latch variable 1 contains the string specified in *"Filter variable"*. Example: The filter variable contains `'Error 1'` which is the latch variable 1 of different alarms of type `STRING` and has the value `'Error 1'` ->. Only these alarms are displayed. – `2`: Filter by alarms whose latch variable 1 contains the typed literal specified in *"Filter variable"* according to IEC 61131-3. Examples: `T#1h2s`, `DINT#15`, `REAL#1.5`, `FALSE` – `3`: Filter by alarms whose latch variable 1 contains the LINT literal value specified in *"Filter variable"*. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807. – All other values: The behavior is not defined and can change in the future.
"Filter by time range"	The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the *"Filter type"* to define whether filtering by time range is enabled or disabled. ● *"Filter variable, from"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeFrom`) for the start time that the alarms are displayed. ● *"Filter variable, to"*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeTo`) for the end time that the alarms are displayed. ● *"Filter type"*: Variable of integer data type that determines whether *"Filter by time range"* is enabled or disabled. Possible values: – `1`: Filtering is enabled – `0`: Filtering is disabled

Element property 'General table configuration'

"Show row header"	☑: Display of the row number at the beginning of the row.
"Show column header"	☑: Display of the column heading as defined in *"Column heading"*.
"Row height"	Height of the table rows (in pixels).
"Row header width"	Width of the line header (in pixels).

"Scrollbar size"	Width of the scrollbar when it runs vertically. Width of the scrollbar when it runs horizontally. Specified in pixels
"Automatic line break for alarm message"	☑: The message text is truncated at the end of the line. ☐: The message text is truncated at the end of the column, if the text is too long.

Element property 'Columns: Column [<n>]'

By default, columns [0] and [1] are configured: *"Time stamp"* and *"Message text"*. You can create more columns by clicking the *"Create new"*, and remove columns by clicking *"Delete"*.

Animations (dynamic text, font variables), text, and tooltip are not supported.

"Column header"	The standard header is set and changed here by specifying a new text.
"Use text alignment in title"	☑: The text in the column header is aligned according to the current definition in *"Text alignment"*. ☐: The text in the column header is centered.
"Width"	Width of the column (in pixels).
"Data type"	Notice about time stamps: For use in a TargetVisu or WebVisu, you can control the date and time format with the help of the global string variables from the library `Alarmmanager.library`: `AlarmGlobals.g_sDateFormat` (example: `AlarmGlobals.g_sDateFormat := 'MM.yyyy'`) and `AlarmGlobals.g_sTimeFormat` (example: `AlarmGlobals.g_sTimeFormat := 'HH:mm'`). Define the information to be displayed in the column. ● *"Symbol"* ● *"Time stamp"*: Date and time of the last status change of the alarm. ● *"Time stamp active"*: Date and time of the last activation of the alarm. ● *"Time stamp inactive"*: Date and time of the last deactivation of the alarm. ● *"Time stamp acknowledge"*: Date and time of the last acknowledgment. ● *"Value"*: Current value of the printout ● *"Message text"*: Output of the message text ● *"Priority"*: Alarm priority ● *"Class"*: Alarm class ● *"State"*: Alarm state ● *"Latch Variable <n>"*: Value of the selected latch variables
"Text alignment"	Alignment of the text in this column ● *"Left"* ● *"Centered"* ● *"Right"*
"Color settings"	● *"Activate color settings"*: Boolean variable for activating and deactivating the color settings defined here. Example: `PLC_PRG.bColorSettings` ● *"Cell fill color"*: – *"Color variable"*: Variable for the cell fill color, example: `dwCellColor` (hexadecimal color definition: 16#TTRRGGBB) – *"Use color also for column header"*: ☑: The color defined via *"Color variable"* is used in the column header as well. ● *"Text color"*: – *"Color variable"*: Variable for the definition of the text color in the column, example: `dwTextColor` (hexadecimal color definition: 16#TTRRGGBB) – *"Use color also for column header"*: ☐: The color defined via *"Color variable"* is used in the column header as well.

- *Chapter 1.4.5.8.3 "Animating a color display" on page 1295*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Selection'

"Selection color"	Fill color of the selected row
"Selection font color"	Font color of the selected row
"Frame around selected cells"	☑: A frame is drawn around the selected cells at runtime.
"Variable for selected alarm group"	Name of the affected alarm group; type: `STRING`, `WSTRING`
"Variable for selected alarm ID"	Alarm ID of the affected alarm group; type: `STRING`, `WSTRING`
"Variable for selected line"	Index of the selected alarm line (0-based). The index can be read and written; integer data type
"Variable for valid selection"	TRUE: An alarm line is selected. FALSE: The selection is invalid. For example, for an empty alarm table or when an alarm is not selected yet.
"Variable for selected alarm information"	Information about the selected alarm. Type `AlarmSelectionInfo` For easy usage, the function block `AlarmSelectionInfoDefault` is provided. This FB fills the structure with the memory for 10 messages and 10 latch variables. Example: `myAlarmSelectionInfoDefault.AlarmSelectionInfo` The following information is available: • `sAlarmgroup` • `uialarmID` • `timeStampActive` • `timeStampInactive` • `timeStampAcknowledge` • `timeStampLast` • `paLatchVariables` • `iLatchVariablesCount` • `papwsAlarmMessages` • `dwAlarmMessageTextBufferSize` • `iAlarmMessagesCount` • `iSelectionChangedCounter`

Element property 'Control variables'

Boolean variables are defined here for executing specific actions in the table can be executed at runtime.

“Acknowledge selected”	Variable (`BOOL`) Example: `PLC_PRG.bAckSelectedAlarms` If the assigned variable is `TRUE`, then the selected alarm is acknowledged.
“Acknowledge all visible”	Variable (`BOOL`) Example: `PLC_PRG.bAckVisibleAlarms` If the assigned variable is `TRUE`, then all alarms are acknowledged that are visible in the alarm table.
“History”	Variable (`BOOL`) Example: `PLC_PRG.bShowHistory` If the assigned variable is `TRUE`, then the history alarms are displayed in addition to the active alarms. In the classic view, the same sort options apply as in normal mode. Note: Acknowledgment is not possible in this view.
“Freeze scroll position”	Variable (`BOOL`) Example: `PLC_PRG.bFreezeScrollPosition` If the assigned variable is `TRUE`, then the scroll position set in the *“History”* view is retained, even if a new alarm is active. If not, then the scroll position jumps to the first table row (the newest alarm).
“Count alarms”	Variable (integer data type) Example: `PLC_PRG.iNumberOfAlarms.` Number of alarms that are currently displayed in the alarm table. Defined by the alarm table.
“Count visible rows”	Variable (integer data type) Example: `PLC_PRG.iNumberVisibleLines` Number of alarms that can be displayed on one page of the alarm table. Defined by the alarm table.
“Current scroll index”	Variable (integer data type) Example: `PLC_PRG.iScrollIndex` The index of the first visible row if the alarm table (0-based). The variable can be read and written.
“Current column sorting”	Variable (integer data type) Example: `PLC_PRG.iColSort` The variable contains a value of the enumeration "VisuElemsAlarm.VisuEnumAlarmDataType". This value determines the column that sorts the alarm table.
“Variable for sorting direction”	Variable (BOOL) Example: `PLC_PRG.xSortAscending` The variable determines the sort order for the entries in the alarm table (`TRUE`: ascending; `FALSE`: descending).

You can also use the “Insert Elements for Acknowledging Alarms” command to define buttons with predefined control variables.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Alarm Banner'

Symbol:

Category: *"Alarm Manager"*

The element is a simplified version of the alarm table. It visualizes a single alarm only. In the element properties, you specify which information is shown. You define the appearance of the element and the variables that control the element behavior.

The alarm banner displays active alarms only. If the alarm is acknowledged, then it disappears from the alarm banner.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Alarm Banner"*
"Data source"	If you intend to use a remote alarm configuration, then you have to specify the name of the remote application here. If you do not specify anything, the alarm configuration will be located locally.

Element property 'Alarm configuration'

"Alarm groups"	Opens the *"Select Alarm Group"* dialog where you define the alarm groups that you want to display.
"Priority from"	Least priority for alarm display. (0 to 255).
"Priority to"	Greatest priority for alarm display. (0 to 255).
"Alarm classes"	Opens the *"Select Class Group"* dialog where you define the alarm classes that you want to display.
"Filter criterion"	For the *"Alarm Banner"* element only ● *"Most important"*: The alarm with the highest priority (lowest value) is displayed. ● *"Newest"*: The most recent alarm is displayed.

“Filter by latch 1”	The generated alarms (previous and current) can be filtered by the contents of *“Latch variable 1”*, which is specified in the configuration of the alarm group. In *“Filter type”*, you define whether or not the filtering is performed by a string value or a numerical value. ● *“Filter variable”*: Indicates what the alarms are filtered by. Possible entries: Application variable of data type `STRING` or `WSTRING`, or a literal value directly. Examples:`PLC_PRG.strFilterVariable`, `'STRING'`. ● *“Filter type”*: Integer value that determines by which criteria the latch variable value is used for filtering. Possible entries: Numerical variable from the application (example: `PLC_PRG.diFilterType`, or a value directly (example: `2`). Possible values: – `0`: No filtering – `1`: Filter by alarms whose latch variable 1 contains the string specified in *“Filter variable”*. Example: The filter variable contains `'Error 1'` which is the latch variable 1 of different alarms of type `STRING` and has the value `'Error 1'` ->. Only these alarms are displayed. – `2`: Filter by alarms whose latch variable 1 contains the typed literal specified in *“Filter variable”* according to IEC 61131-3. Examples: `T#1h2s`, `DINT#15`, `REAL#1.5`, `FALSE` – `3`: Filter by alarms whose latch variable 1 contains the LINT literal value specified in *“Filter variable”*. Therefore, the value of the latch variables has to be in the range of 9,223,372,036,854,775,808 to 9,223,372,036,854,775,807. – All other values: The behavior is not defined and can change in the future.
“Filter by time range”	The generated alarms (remote, historical, local) can be displayed for a specified time range. You use the *“Filter type”* to define whether filtering by time range is enabled or disabled. ● *“Filter variable, from”*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeFrom`) for the start time that the alarms are displayed. ● *“Filter variable, to”*: Variable of data type `DT` or `DATE_AND_TIME` (example: `PLC_PRG.filterTimeTo`) for the end time that the alarms are displayed. ● *“Filter type”*: Variable of integer data type that determines whether *“Filter by time range”* is enabled or disabled. Possible values: – `1`: Filtering is enabled – `0`: Filtering is disabled

Element property 'Columns: Column [<n>]'

By default, columns [0] and [1] are preconfigured: *“Time stamp”* and *“Message text”*. You create more columns by clicking *“Create new”*. You remove columns by clicking *“Delete”*.

Animations (dynamic text, font variables), texts, and tooltips are not supported.

"Width"	Width of the column (in pixels)
"Type of data"	About time stamps: When used in a TargetVisu or WebVisu, you can control the date and time format by means of the global string variables from the library `Alarmmanager.library`: `AlarmGlobals.g_sDateFormat` (example: `AlarmGlobals.g_sDateFormat := 'MM.yyyy'`) and `AlarmGlobals.g_sTimeFormat` (example: `AlarmGlobals.g_sTimeFormat := 'HH:mm'`). Here you define the information to be displayed in the column. ● *"Bitmap"* ● *"Time stamp"*: Date and time of the last status change of the alarm ● *"Time stamp active"*: Date and time of the last activation of the alarm ● *"Time stamp inactive"*: Date and time of the last deactivation of the alarm ● *"Time stamp acknowledge"*: Date and time of the last acknowledgement ● *"Value"*: Actual value of the expression ● *"Message"*: Output of the message text ● *"Priority"*: Alarm priority ● *"Class"*: Alarm class ● *"State"*: Alarm state ● *"Latch Variable <n>"*: Value of the selected latch variables
"Text alignment"	Alignment of the contents in the column ● *"Left"* ● *"Centered"* ● *"Right"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (■) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Text properties'

The properties contain fixed values for the text properties.

"Font"	Example: *"Default"* ...: The *"Font"* dialog box opens. ▼: Drop-down list with style fonts.
"Font color"	Example: *"Black"* ...: The *"Color"* dialog box opens. ▼: Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

"Acknowledge variable"	A rising edge of this variable acknowledges the alarm.

Handling of multiple active alarms

"Automatic switch"	☑: The display in the alarm banner is switched automatically according to the time to the next alarm as configured in *"Every N second"*.
"Every N second"	Time period until the next switching. Available only if *"Automatic switch"* is selected.
"Next alarm"	Variable for switching to the next alarm. Available only if *"Automatic switch"* is not selected.
"Previous alarm"	Variable for switching to the previous alarm. Available only if *"Automatic switch"* is not selected.
"Multiple alarms active"	Variable that has the value `TRUE` if multiple alarms are active.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Bar Display'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Element properties

“Element name”	Example: `GenElemInst_2`
“Type of element”	*“Bar Display”*
“Value”	Variable (numeric data type) The value of the variable is displayed as a bar length.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊡) to other positions in the editor.

See also

- ↳ *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Background color"	Drop-down list with background colors Note: This property depends on the style. For example, there are no heterochromatic background images for *"FlatStyle"* and *"Whitestyle"*.
"Own image"	● *"image"*: Image ID of the background image. You select the background image from an image pool by clicking the ... symbol. Info: If you specify the *"<default>"* value or select the image from the *"Default"* category in the input assistant, then the original element background image is used. ● *"Transparent color"*: Color of pixels that are displayed as transparent. Selection from drop-down list or input assistant.
"Optimized drawing"	☑: The background image is drawn one time. If there is a change in the foreground, then only the affected part of the image is redrawn. ☐: The background image is redrawn in cycles. Note: Deactivating this option is sensible only in certain exceptional cases.

Element property 'Bar'

"Diagram type"	Position of the scale ● *"Scale besides bar"* ● *"Scale in bar"* ● *"Bar in scale"* ● *"No scale"*
"Orientation"	Orientation depending on the ratio of width to height of the Bar Display: ● *"Horizontal"* ● *"Vertical"*
"Running direction"	Direction the values are increased. Drop-down list for *"Orientation Horizontal"*: ● *"Left to right"* ● *"Right to left"* Drop-down list for *"Orientation Vertical"*: ● *"Bottom to top"* ● *"Top to bottom"*
"Optimum size for bar"	☑: The bar width requires the majority of the element surface. Note: This property depends on the style. It is not provided for *"FlatStyle"* or *"WhiteStyle"*.

Element property 'Scale'

“Scale start”	Least value of the scale and the lower limit of the value range for the element. Example: `0` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale start.
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the scale end.
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between 2 values on the rough scale. Example: `10` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the distance.
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Subscale”	Distance between 2 values on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *“Variable”* is shown below.

“Variable”	Variable (integer data type). Contains the spacing.
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels. Example: `3`
“Scale color”	Color of scale lines • ...: The *“Color”* dialog box opens. • ▼: A drop-down list with color names opens.
“Scale in 3D”	☑: Tick marks are displayed with slight 3D shadowing. Note: This property depends on the style. Not available for *“FlatStyle”*.
“Element frame”	☑: A frame is drawn around the element.

Element property 'Label'

“Unit”	Text that is displayed in the element. Example: Units displayed in m/s.
“Font”	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the “” button. ...
“ Scale format (C Syntax)”	Values scaled in "printf" syntax Examples: `%d, %5.2f`
“Max. text width of labels”	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Text height of labels”	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Font color”	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

“Horizontal offset”	Distance from the scale (bar) to the horizontal element frame Specified in pixels. Used for achieving the exact position relative to the background image.
“Vertical offset”	Distance from the scale (bar) to the vertical element frame Specified in pixels. Used for achieving the exact position relative to the background image.
“ Horizontal scaling”	Horizontal division of the scale Specified in pixels. Used for achieving the exact positioning relative to the background image.
“Vertical scaling”	Vertical division of the scale Specified in pixels. Used for achieving the exact positioning relative to the background image.

Element property 'Colors'

"Graph color"	Color of the bar
"Bar background"	☑: The background of the bar is black. ☐: The background of the bar is white.
"Frame color"	Color that the frames are drawn.
"Switch whole color"	☑: The total color of the bar is switched to the color of the color area of the current value.
"Use gradient color for bar"	☑: Bar is displayed with a gradient.
"Color range markers"	The color areas can be separated from each other inside the bar with a vertical mark. ● *"No markers"*: No display. ● *"Marker forwards"*: The color of the vertical mark corresponds to the color of the previous color area. ● *"Marker backwards"*: The color of the vertical mark corresponds to the color of the next color area.
"Color areas"	
"Create new"	A new color area is added.
" Delete"	The color area is removed from the list.
"Begin of area"	Start value of the color area
"End of area"	End value of the color area
"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Meter 90°'

Symbol:

Category: *"Measurement Controls"*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Meter 90°"*
"Value"	Variable (numeric data type) The variable value determines the pointer direction of the element.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • : Drop-down list with color names
"Angle range"	Drop-down list for the alignment of the element
"Additional arrow"	: An additional arrow is shown inside the scale.

Element property 'Scale'

“Sub scale position”	● *“Outside”*: The subscale is displayed on the outer scale ring. (*“Frame outside”*) ● *“Inside”*: The subscale is displayed on the inner scale ring. (*“Frame inside”*)
“Scale type”	Type of scale ● *“Lines”* ● *“Dots”* ● *“Squares”*
“Scale start”	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *“Variable”* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

"Variable"	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

"Scale line width"	Specified in pixels Example: `3`
"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	• *"Preset style values"*: Values from the current style • *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.
"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Visualization Element 'Meter 180°'

Symbol:

Category: *“Measurement Controls”*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable on a scale. A meter is used to represent a tachometer, for example.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Meter 180°”*
“Value”	Variable (numeric data type) The variable value determines the pointer direction of the element.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.

"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • ▼: Drop-down list with color names
"Angle range"	Drop-down list for the alignment of the element
"Additional arrow"	☑: An additional arrow is shown inside the scale.

Element property 'Scale'

"Sub scale position"	• *"Outside"*: The subscale is displayed on the outer scale ring. (*"Frame outside"*) • *"Inside"*: The subscale is displayed on the inner scale ring. (*"Frame inside"*)
"Scale type"	Type of scale • *"Lines"* • *"Dots"* • *"Squares"*
"Scale start"	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *"Variable"* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels Example: `3`

"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the "" button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	● *"Preset style values"*: Values from the current style ● *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.

"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The "Invisible" property is supported by the "Client Animation" functionality.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

Visualization Element 'Meter'

Symbol:

Category: *"Measurement Controls"*

The element displays the value of a variable. The needle is positioned according to the value of the assigned variable. A meter is used to represent a tachometer, for example.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Meter"*
"Value"	Variable (numeric data type). The variable value determines the pointer direction of the element.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.

"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • ▼: Drop-down list with color names
"Arrow start"	Angle (in degrees) between the scale start and the horizontal axis
"Arrow end"	Angle (in degrees) between the right edge of the pointer instrument and the horizontal axis
"Additional arrow"	☑: An additional arrow is shown inside the scale.

Element property 'Scale'

"Sub scale position"	• *"Outside"*: The subscale is displayed on the outer scale ring. (*"Frame outside"*) • *"Inside"*: The subscale is displayed on the inner scale ring. (*"Frame inside"*)
"Scale type"	Type of scale • *"Lines"* • *"Dots"* • *"Squares"*
"Scale start"	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *"Variable"* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

“Scale line width”	Specified in pixels Example: `3`

“Scale color”	Color of scale lines ● ...: The *“Color”* dialog opens. ● ▼: A list box with style colors opens.
“Scale in 3D”	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *“FlatStyle”*.
“Show scale”	☑: The scale is displayed.
“Frame inside”	☑: A frame is drawn at the inner end of the scale.
“Frame outside”	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

“Label”	Selection list ● *“Outside”*: Scale values are placed outside of the scale. ● *“Inside”*: Scale values are placed inside of the scale.
“Unit”	Text that is displayed in the element. Example: Units displayed in m/s.
“Font”	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *“”* button. ...
“ Scale format (C Syntax)”	Values scaled in "printf" syntax Examples: `%d, %5.2f`
“Max. text width of labels”	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Text height of labels”	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
“Font color”	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

“Usage of”	● *“Preset style values”*: Values from the current style ● *“User-defined settings”*: The subnode *“Positioning”* appears.
“Positioning” Requirement: *“User-defined settings”* is selected as *“Usage of”*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
“Needle movement”	Length of the needle (in pixels)
“Scale movement”	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *“Background”*.

"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` : The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

> *The "Invisible" property is supported by the "Client Animation" functionality.*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Potentiometer'

Symbol:

Category: *"Measurement Controls"*

The element displays the value of a variable as a setting on the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Potentiometer"*
"Variable"	Variable (numeric data type). Contains the position of the pointer for the potentiometer. A visualization user can modify the value by dragging the pointer to another position.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Background'

"Image color"	List box containing background colors
"Own image"	• *"Image"*: ID of the background image. You select the background image from an image pool by clicking ... Info: If you specify the value *"<default>"* or select the image from the *"Default"* category in the Input Assistant, then the original element background image is used. • *"Transparency color"*: Selection from list box or Input Assistant.

Element property 'Arrow'

"Hand style"	Drop-down list with different arrow types
"Color"	• ...: The *"Color"* dialog box opens. • ▼: Drop-down list with color names
"Arrow start"	Angle (in degrees) between the left edge of the element and the horizontal axis
"Arrow end"	Angle (in degrees) between the right edge of the element and the horizontal axis

Element property 'Scale'

“Sub scale position”	● *“Outside”*: The subscale is displayed on the outer scale ring. (*“Frame outside”*) ● *“Inside”*: The subscale is displayed on the inner scale ring. (*“Frame inside”*)
“Scale type”	Type of scale ● *“Lines”* ● *“Dots”* ● *“Squares”*
“Scale start”	Least value of the scale and the lower limit of the value range for the element Example: `0` : The *“Variable”* property is displayed in the line below this.

“Variable”	Variable (integer data type). Contains the scale start
	Example: `PLC_PRG.iScaleStart`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleStart : INT := 0;`
	`END_VAR`

“Scale end”	Greatest value of the scale and the upper limit of the value range for the element Example: `100` : The *“Variable”* property is shown below this.

“Variable”	Variable (integer data type). Contains the scale end
	Example: `PLC_PRG.iScaleEnd`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iScaleEnd : INT := 120;`
	`END_VAR`

“Main scale”	Distance between two values on the main scale Example: `10` : The *“Variable”* property is shown below.

“Variable”	Variable (integer data type) Contains the distance between two values on the main scale
	Example: `PLC_PRG.iMainScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iMainScale : INT := 20;`
	`END_VAR`

“Sub scale”	Distance between two values on the fine scale You can hide the fine scale by setting the value to `0`. Example: `2` : The *“Variable”* property is shown below this.

"Variable"	Variable (integer data type) Contains the distance between two values on the fine scale
	Example: `PLC_PRG.iSubScale`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iSubScale : INT := 5;`
	`END_VAR`

"Scale line width"	Specified in pixels Example: `3`
"Scale color"	Color of scale lines ● ...: The *"Color"* dialog opens. ● ▼: A list box with style colors opens.
"Scale in 3D"	☑: Scale lines are displayed with soft 3D shadowing. Note: This property is not displayed in *"FlatStyle"*.
"Show scale"	☑: The scale is displayed.
"Frame inside"	☑: A frame is drawn at the inner end of the scale.
"Frame outside"	☑: A frame is drawn at the outer end of the scale.

Element property 'Label'

"Label"	Selection list ● *"Outside"*: Scale values are placed outside of the scale. ● *"Inside"*: Scale values are placed inside of the scale.
"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	(optional) Value that redefines the maximum width of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	(optional) Value that redefines the maximum height of the scale label. The correct value is normally set automatically. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Positioning'

"Usage of"	• *"Preset style values"*: Values from the current style • *"User-defined settings"*: The subnode *"Positioning"* appears.
"Positioning" Requirement: *"User-defined settings"* is selected as *"Usage of"*. The displayed positioning settings depend on the type of needle instrument and Potentiometer, and partially on whether a custom background image is selected. The following settings are used for achieving the exact position relative to the background image.	
"Needle movement"	Length of the needle (in pixels)
"Scale movement"	Distance from the tick marks to the center (in pixels) Requirement: A customer image is selected as *"Background"*.
"Scale length"	Length of the tick marks (in pixels) Requirement: A customer image is selected as *"Background"*.
"Label offset":	Distance from the labels to the tick marks (in pixels)
"Unit offset":	Distance of the unit text *"Label ➔ Unit"* from the upper scale edge (in pixels)
"Origin offset"	Offset of the element (in pixels) Requirement: For the elements *"Meter 180°"* and *"Meter 90°"*, this property is displayed only if a custom image is selected as *"Background"*.

Element property 'Colors'

"Color areas"	
"Durable color areas"	☐: All color areas are visible, regardless of the current value. ☑: Only the color area is visible that includes the current value.
"Use colors for scale"	☑: Colors in the color area are used only for the scale and frame.
"Color areas"	
"Create new"	A new color area is added to the *"Elements"* view.
" Delete"	The color area is removed from the list and the list is refreshed.
"Begin of area"	Start value of the color area Example: `20` ◆: The property *"Variable"* is shown below.

"Variable"	Variable (integer data type). Contains the start value.
	Example: `PLC_PRG.iColorAreaStart0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaStart0 : INT := 80;`
	`END_VAR`

"End of area"	End value of the color area Example: `120` ◆: The property *"Variable"* is shown below.

“Variable”	Variable (integer data type). Contains the end value.
	Example: `iColorAreaEnd0`
	Declaration:
	`PROGRAM PLC_PRG`
	`VAR`
	`  iColorAreaEnd0 : INT := 100;`
	`END_VAR`

“Color”	Color that is used for displaying the area.

Element property 'State variables' The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Absolute movement' The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Histogram'

Symbol:

Category: *“Measurement Controls”*

The element displays the data of a one-dimensional array as a histogram. You can define specific colors for certain value ranges.

See also

- *Chapter 1.4.5.21.4 “Displaying Array Data in a Histogram” on page 2138*

Element properties

“Element name”	Example: `GenElemInst_35`
“Type of element”	*“Histogram”*
“Data array”	One-dimensional array with data displayed in this histogram. Example: `PLC_PRG.arr1`

Element property 'Subrange of array'

“Use subrange”	☑: Only part of the array is displayed in the histogram.
“Start index”	First array index with a displayed value. Requirement: *“Use subrange”* is activated.
“End index”	Last array index with a displayed value. Requirement: *“Use subrange”* is activated.

“Display type”	● *“Bars”*: Data is displayed as bars. ● *“Lines”*: Data is displayed as lines. ● *“Curve”*: Interpolation of data into a curve.
“Line width”	Specified in pixels Requirement: *“Curve”* is selected as the *“Display type”*.
“Show horizontal lines”	☑: Horizontal lines are drawn on the main scale. Note: Not all visualization styles have this property. This element property is not available for visualization styles that have striped backgrounds (example: *“Flat style”*).
“Relative bar width”	Integer value between `1` and `100` ● `1`: The bars are drawn as lines. ● `100`: The entire width of the histogram is filled with the bars.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Scale'

"Scale start"	Least value of the scale and the lower limit of the value range for the element. Example: `0` ◆: The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the scale start. Example: `PLC_PRG.iScaleStart`
"Scale end"	Greatest value of the scale and the upper limit of the value range for the element. Example: `100` ◆: The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the scale end. Example: `PLC_PRG.iScaleEnd`

"Main scale"	Distance between 2 values on the rough scale. Example: `10` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the distance. Example: `PLC_PRG.iMainScale`
"Subscale"	Distance between 2 values on the fine scale. You can hide the fine scale by setting the value to `0`. Example: `2` : The property *"Variable"* is shown below.
"Variable"	Variable (integer data type). Contains the spacing. Example: `PLC_PRG.iSubScale`
"Scale color"	Color of scale lines • ...: The *"Color"* dialog box opens. • : A drop-down list with color names opens.
"Base line"	Value of the main scale where the horizontal base line of the Histogram is located. The drawing of the bar starts at the base line.

Example A valid declaration is required for the variables used as an example in the table above.

```
PROGRAM PLC_PRG
VAR
    iScaleStart : INT := 0;
    iScaleEnd : INT := 120;
    iMainScale : INT := 20;
    iSubScale : INT := 5;
END_VAR
```

Element property 'Label'

"Unit"	Text that is displayed in the element. Example: Units displayed in m/s.
"Font"	Font for labels (example: scale numbering). Selection from the drop-down list or by clicking the *""* button. ...
" Scale format (C Syntax)"	Values scaled in "printf" syntax Examples: `%d, %5.2f`
"Max. text width of labels"	Optional value that defines the maximum width of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Text height of labels"	Optional value that defines the maximum height of the scale label. Note: Change this value only if the automatic adjustment does not yield the expected result.
"Font color"	Selection from the drop-down list or by clicking the ... button.

Element property 'Colors'

"Graph color"	Color of the bar in normal state. Note: The normal state is in effect when the current value of the array component does not fulfill the alarm condition.
"Alarm value"	Threshold for the alarm
"Alarm condition"	If the current value of the array component fulfills the alarm condition, then the alarm condition is set. ● *"Less"*: The current value is less than the *"Alarm value"* ● *"More"*: The current value is greater than the *"Alarm value"*
"Alarm color"	Color of the bar in alarm state.
"Use color areas"	☑: The color areas defined in this element are used.
"Color areas"	
"Create new"	A new color area is added.
" Delete"	The color area is removed from the list.
"Begin of area"	The start value on the *"Scale"* of the Histogram where the color area begins.
"End of area"	The end value on the *"Scale"* of the Histogram where the color area ends.
"Color"	Color that is used for displaying the area.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Image Switcher'

Symbol:

Category: *"Lamps/Switches/Bitmaps"*

The element displays one of three referenced images. Mouse actions change the displayed image. The images are defined in the *"Image settings"* element properties. The effects of mouse clicks are defined in the *"Element behavior"* property.

Element properties

“Element name”	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `ImageSwitcher_1`
“Type of element”	*“Image Switcher”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

“Variable”	Variable (`BOOL`). The value of the variable changes according to user input and it is independent of the *“Element behavior”* element property.

Image settings

“Image "on"”	Image ID from an image pool. The image can be selected using the input assistant. The image is used if the variable of the *“Variable”* property has the value `TRUE`.
“Image "off"”	Image ID from an image pool. The image can be selected using the input assistant. The image is used if the variable of the *“Variable”* property has the value `FALSE`.
“Image "clicked"”	Image ID from an image pool. The image is selected using the input assistant. In runtime mode, the visualization displays the referenced image when the element is clicked (and the mouse button is held down). Requirement: The *“Element behavior”* is *“Image toggler”*.

"Transparency"	☑: The *"Transparent color"* is selected.
"Transparent color"	The image pixels that have the transparent color are displayed as transparent. Requirement: *"Transparency"* is activated. ● ...The *"Color"* dialog box opens. ● ▼: A drop-down list with color names opens.
"Scaling type"	Defines how an image fits in the element frame. ● *"Fixed"*: The original size of the image is retained, regardless of the dimensions of the element. ● *"Isotropic"*: The entire image is shown in the element frame, either larger or smaller. As a result, the proportion of height and width are retained. ● *"Anisotropic"*: The image resizes automatically to the dimensions of the element frame, filling the entire element frame. As a result, the proportions are not retained.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click switches the image. ● *"Image tapper"*: While a visualization user holds down the mouse button, the image of the *"Image on"* property is displayed. At the same time, the value `TRUE` is assigned to the *"Variable"* property.
"Tap FALSE"	☑: While the mouse button is pressed, the image of the *"Image"* property is displayed and the *"Variable"* property gets the value `FALSE` instead of the value `TRUE`, and back. Requirement: *"Image tapper"* is selected in the *"Element behavior"* property.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*

Visualization Element 'Lamp'

Symbol:

Category: *“Lamps/Switches/Bitmaps”*

The element shows the value of a variable, and the element is displayed as illuminated or not.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Lamp_green`
"Type of element"	*"Lamp"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Variable"	Variable (`BOOL`). The variable value is displayed as a lamp that goes on (`TRUE`) or off (`FALSE`).

Image settings

"Transparency"	: The *"Transparent color"* property is selected.
"Transparent color"	Pixels in this color are displayed as transparent. Requirement: *"Transparency"* is activated. • The *"Color"* dialog box opens. • : A drop-down list with style colors opens.

"Scaling type"	Reaction of the element when the dimension of the *"Frame"* element is changed: ● *"Isotropic"*: The height and width of the image are resized proportionally to the *"Frame"*. Please note: To retain the alignment of elements also within a scaled *"Frame"* element, define the *"Horizontal alignment"* or *"Vertical alignment"* explicitly with *"Centered"*. ● *"Anisotropic"*: The image fills the entire *"Frame"* regardless of its proportions.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Background'

“Image”	Drop-down list with background colors Depends on the visualization style

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

Visualization Element 'Dip Switch', 'Power Switch', 'Push Switch', 'Push Switch LED', 'Rocker Switch'

Symbols:

Category: *"Lamps/Switches/Bitmaps"*

The element assigns a value to a Boolean variable. The switch position "on" the value `TRUE` to the variable, and the switch position "off" assigns the value `FALSE`. Use the mouse to change the switch position.

Element properties

"Element name"	Example: `Operating_Switch` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	Depending on the element: *"Dip Switch"*, *"Power Switch"*, *"Push Switch"*, *"Push Switch LED"*, or *"Rocker Switch"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Variable"	Variable (`BOOL`) The value of the variables `TRUE` and `FALSE` indicates the switch position on/off.

Image settings

"Transparency"	☑: The *"Transparent color"* property is selected.
"Transparent color"	Pixels in this color are displayed as transparent. Requirement: *"Transparency"* is activated. ● ...: The *"Color"* dialog box opens. ● ▼: A drop-down list with style colors opens.
"Scaling type"	Reaction of the element when the dimension of the *"Frame"* element is changed: ● *"Isotropic"*: The height and width of the image are resized proportionally to the *"Frame"*. Please note: To retain the alignment of elements also within a scaled *"Frame"* element, define the *"Horizontal alignment"* or *"Vertical alignment"* explicitly with *"Centered"*. ● *"Anisotropic"*: The image fills the entire *"Frame"* regardless of its proportions.
"Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click changes the switch and the *" Variable"* value. ● *"Image tapper"*: The switch is "on" and the *"Variable"* value is `TRUE` while the mouse button is pressed.
"Tap FALSE"	☑: The value `TRUE` is assigned to the *"Variable"* property instead of the value `FALSE`, and back. Requirement: *"Image tapper"* is selected in the *"Element behavior"* property.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access.`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. "Horizontal alignment"	Horizontal alignment of the image within the element frame or element ● `Left` ● `Centered` ● `Right` Requirement: *"Scaling type"* is *"Isotropic"*.
"Vertical alignment"	Vertical alignment of the image within the element frame or element ● `Top` ● `Centered` ● `Bottom` Requirement: *"Scaling type"* is *"Isotropic"*.

"Element behavior"	● *"Image toggler"*: Every mouse click changes the switch and the *" Variable"* value. ● *"Image tapper"*: The switch is "on" and the *"Variable"* value is `TRUE` while the mouse button is pressed.
"Orientation"	● *"At top"*: The rotary switch turns from the top right to the top left. ● *"At side"*: The rotary switch turns from the top right to the bottom right.
"Color change"	☑: The element changes in color when *" Variable"* is `TRUE`.

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Texts'

"Tooltip"	String display as tooltip for the element Example: `Valid access`.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Trace'

Symbol:

Category: *“Special Controls”*

The element displays the graphical curve of variable values. In addition, variables can be configured to control the view.

See also

- *Chapter 1.4.5.10 “Displaying data curve with trace” on page 1306*
- *“Dialog box 'Trace Configuration'” on page 1734*

Element properties

“Element name”	Example: `Velocity`
“Data Source”	Location where the trace data is buffered. : ● *“<local application>”*: The trace record is listed below the local application. The visualization that contains the trace is located below this application. When the application is downloaded, the trace configuration is downloaded to the local device. During execution, the data is stored locally in the trace buffer. ● *“ <data source name>”*: Data source that identifies the remote device where the trace record is created. When the local application is downloaded with the visualization, the trace configuration is downloaded to the **remote** device. During execution, the trace buffer is filled, and the trace data is transferred and then displayed in the local visualization as HMI. Example: `DataSoure_PLC_A` Note: The trace buffer is filled only if the remote application is being executed. The data recording is started when the local visualization is started.
“Application”	Application where data was recorded. : Lists all applications that are present below the data source. Requirement: A remote data source (not *“<local application>”*) is referenced in the *“Data source”* property.
“Type of element”	*“Trace”*
“Trace”	*“ <name of trace configuration>”*: Opens the *“Trace Configuration”* dialog where you can modify the trace configuration.

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.
"Angle"	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Show cursor"	☑: A cursor (vertical line) is displayed at the mouse position. The trigger and variable values where the cursor points are displayed as a tooltip.
"Overwrite existing trace on PLC"	☑: If a trace with the same name is on the PLC, then it is overwritten at download with the configuration that is defined here.
"Number format"	Number format of values in the tooltip in printf syntax (example: %d, %5.2f).

Element property 'Control variables'

The control variables are assigned automatically when you click *"Insert elements for controlling Trace"*.

“Reset Trigger”	Variable (`BOOL`). Standard control variable: `bResetTrigger` `TRUE`: Resets the triggering. After the action is executed, the variable is set automatically to `FALSE`.
“Start Trace”	Variable (`BOOL`). Standard control variable: `bStart` `TRUE`: Starts the Trace. After the action is executed, the variable is set automatically to `FALSE`.
“Stop Trace”	Variable (`BOOL`). Standard control variable: `bStop` `TRUE`: Stops the Trace. After the action is executed, the variable is set automatically to `FALSE`.
“Save Trace to a file”	
“Save Trace”	Variable (`BOOL`). Standard control variable: `bStore` `TRUE`: Saves the current trace configuration and the data that is stored in the development system to a file. When the action is ended, the variable is set automatically to `FALSE`.
“File name”	Variable (`STRING`) that contains the file name of the file to be saved. Standard control variable: `sStoreFilename`
“Load trace from file”	
“Load Trace”	Variable (`BOOL`). Standard control variable: `bRestore` `TRUE`: Reads the file specified below and loads its contents into the trace editor. The file contains a trace configuration and possibly also trace data. To do this, the stored trace configuration must match the application where the trace configuration is located. When the action is ended, the variable is set automatically to `FALSE`. Note: A trace configuration can be loaded from a file only under special circumstances. The file must have been created with exactly the same (running) application with which it will then be loaded. The consequence of changing the running application (for example by downloading again) is that a file which was previously created from the application cannot no longer be read into the application. Even external manual changes to the file can cause this. You should edit only those configuration settings that have an effect on displaying the variables. If you change variable definitions directly in the file (for example by replacing variable x with v y), then the file cannot be loaded.
“File name”	Variable (`STRING`) that contains the file name of the file to be read. Standard variable: `sRestoreFilename`

- *Chapter 1.4.5.19.2.15 “Command 'Insert Elements for Controlling Trace'” on page 1737*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Trend'

Symbol:

Category: *"Special Controls"*

The element displays the curve of variable values as a trend diagram. The trend diagram is suitable for representing a long-term data curve because the data is read from a trend recording and hence from a database. Moreover, you can run the *"Trend"* element together with the *"Date Range Picker"*, *"Legend"*, and *"Time Range Picker"* operating elements so that the user can navigate conveniently in the diagram.

You can programmatically delete the recorded trend curve at runtime. The recording starts again from the time of deletion. See the help page for "Programming a Trend Visualization".

Element properties

"Element name"	Example: `Velocity`
"Data source"	Data source for the connection via the device and the application to the *"Trend Recording"* object where the trend data that you want to show was saved. If the *"Trend Recording"* object is on the local device, then it is sufficient when you specify the respective application. If the trend recording is on a remote device, then you need to specify the data source connection to this device. ● *" <local application>"* The *"Trend Recording"* object is located on the local device in the local application. ● `<device name> . <application name>` Example: `Device_A.App_A` The *"Trend Recording"* object is located on the local device `Device_A` below the application `App_A`. ● `<data source name>` Example: `DataSource_B` The *"Trend Recording"* object is located on a remote device that is connected via the data source `DataSource_B`. Below the (now visible) *"Application"* property, the remote application is displayed as configured in the data source. Example: `App_B` Note: If the data source is accessed symbolically by means of a symbol file (CODESYS symbolic), then the required symbol file and the corresponding project have to be saved in the same folder.
"Type of element"	*"Trend"*
"Trend recording"	: Trend recording whose data is displayed as a diagram The trend recording is located on the device specified in the *"Data source"* property.
"Display Mode"	: Opens the *"Display Settings"* dialog.

- *Chapter 1.4.5.11 "Displaying data curve with trend" on page 1309*
- *Chapter 1.4.5.19.2.16 "Command 'Configure Display Settings of Trend'" on page 1738*
- *Object 'Data Source'*

Element property 'Position'

The position defines the location and size of the element in the visualization window. This is based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	The x-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Y"	The y-coordinate of the upper left corner of the element Specified in pixels Example: `10`
"Width"	Specified in pixels Example: `150`
"Height"	Specified in pixels Example: `30`
	Tip: You can change the values in *"X"*, *"Y"*, *"Width"*, and *"Height"* by dragging the corresponding symbols to another position in the editor.
"Angle"	Static angle of rotation (in degrees) Example: `35` The element is displayed rotated in the editor. The point of rotation is the center of the element. A positive value rotates clockwise. Tip: You can change the value in the editor by focusing the element to the handle. When the cursor is displayed as a rotating arrow, you can rotate the element about its center as a handle.  (1): Handle Note: If a dynamic angle of rotation is also configured in the property *"Absolute movement ➔ Internal rotation"*, then the static and dynamic angles of rotation are added in runtime mode. The static angle of rotation acts as an offset.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

“Show cursor”	☑: A cursor (black triangle with vertical line) is shown in the trend diagram. Behavior at runtime: As soon as the graph is drawn, the user can move the cursor along the time axis in order to mark a specific time. Then the variable value belonging to the cursor position is displayed in the legend above the graph. “Show tooltip”	Requirement: *“Show cursor”* is activated. ☑: A tooltip opens at the cursor. Behavior at runtime: The variable value belonging to the cursor position is displayed as a tooltip.
“Show frame”	☑: The trend diagram is drawn with a frame.
“Number format”	Format specification in printf syntax, which determines how the values are displayed in the tooltip and in the legend Example: `%d` (integer variable) or `%5.2f` (floating-point number)

Element property 'Tick mark labels'

The time stored in the trend recording are in the UTC time zone. If the time is displayed in the trend of the visualization element, then the time stamps are converted to the local time zone of the operating system of the PLC.

Change the time zone in the operating system if the times in the trend diagram are not in the zone that you need.

“Time stamps”	X-value of the trend diagram ● *“Absolute time stamps”* The absolute time with date and time is displayed at each tick mark on the time axis. Example: `03/18/2016 12h30m50s` ● *“Relative time stamps”* The time period from the start of the recording (=0) is displayed at each tick mark. Example: `5m30s`
“Draw labels on two lines”	☑: The time stamps are displayed on two lines (for example, the date is displayed on the first line and the time on the second line). ☐: The time stamp is displayed on one line. Example: `2019-11-01-12:30:50.`
“ Omit irrelevant information in timestamps”	☑: The time stamps are displayed in a truncated form (without insignificant information). For example, the date is displayed at the first tick mark, and only the time is displayed at the following tick marks. The *“Internationalization (format strings)”* property is not visible and is ignored. ☐: The time stamps are displayed with all information. This takes into consideration the *“Internationalization (format strings)”* property which contains the format specification for the date and time display.
“Internationalization (format strings)”	Format specification for the date and time display of the time stamp (when it is displayed in full) Note: The property is visible only if the *“Omit irrelevant information in timestamps”* option is **not** selected.

"Date"	Format string that returns the date display according to the defined format. The operating system locale is used as the default setting.
	Defined format strings for the date:
	● Year: `yyyy`, `yy`, `y`
	● Month: `MM`, `M`
	● Day: `dd`, `d`
	● Recommended separator: `- . /`
	Example:
	`yyyy-MM-d` displays `2019-10-25`
	`yyyy-MM-dd` displays `2019-10-25`
	`dd.MM.yyyy` displays `25.10.2019`
	`dd/MM/yyyy` displays `25/10/2019`

"Time"	Format string that returns the time (or time of day) display according to the defined format. The operating system locale is used as the default setting.
	Defined format strings for the time:
	● 24-hour time definition: `HH`, `H`
	● 12-hour time definition: `hh`, `h`
	● AM/PM for 12-hour time definition: `tt`
	● Minutes: `mm`, `m`
	● Seconds: `ss`, `s`
	● Milliseconds: `ms`
	● Microseconds: `us`
	● Recommended separator: `:` or space character
	Example:
	`HH:mm:ss:ms` displays `15:30:59:123`
	`h:mm:ss tt` displays `3:30:59 PM`

Element property 'Assigned control elements'

These elements are created automatically when the control elements are added with the command *"Insert elements for controlling Trend"*.

"Date Range Picker"	Control element for changing the date and time of the displayed data sets. With ..., all elements are provided that have implemented the interface `IDateRangeSelector`. By default, instances of the *"Date Range Picker"* visualization element are available.
"Time Range Picker"	Control element for changing the time of the displayed data sets. With ..., all elements are provided that have implemented the interface `ITimeSelector`. By default, instances of the *"Time Range Picker"* visualization element are available.
"Legend"	Control element for displaying a legend for the graphs. With ..., all elements are provided that have implemented the interface `ILegendDisplayer`.

- *Chapter 1.4.5.19.2.18 "Command 'Insert Elements for Controlling the Trend'" on page 1739*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.11.2 "Programming a Trend Visualization" on page 1312*
- *Object 'Trend Recording'*

Visualization Element 'Legend'

Symbol:

Category: *"Special Controls"*

The element is used as a legend for another element (for example, a trend). The legend is assigned in the properties of the other element.

See also

- *Chapter 1.4.5.11 “Displaying data curve with trend” on page 1309*

Element properties

“Element name”	Example: `LegendOfTrendA` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Legend”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Orientation"	Orientation of the element. The value is configured in the assigned element. ● *"Horizontal"* ● *"Vertical"*
"Attached element instance"	Example: `Element_A`
"Show frame"	☑: The element is displayed with frames.
"Number format"	The format of the value in printf syntax (example: %d, %5.2f)

Element Property 'Layout'

Defines how many variables can be displayed at a maximum and is calculated from the row and column number.	
"Max. number of rows"	Example: `3`
"Max. number of columns"	Example: `2`

Element Property 'Text properties' The property affects the text configured in the associated element.

"Text format"	*"Default"*: The text will be cut and displayed in only the part that fits into the visualization element. *"Linebreak"*: The text will be wrapped in rows. *"Ellipsis"*: The text is cut and ellipsis `...` are added to indicate that something is missing.
"Font"	Font of the text. The entries of the selection list are defined in the visualization style.
"Font color"	Text color, for example `Grey`. The entries of the selection list are defined in the visualization style.
"Transparency"	Transparency value (255 to 0), which defines the transparency of the corresponding color. Example: 255: The color is opaque. 0: The color is fully transparent.

Element property 'Absolute movement' The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.

"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The "X", "Y", "Rotation", and "Interior rotation" properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'ActiveX'

Symbol:

Category: *"Special Controls"*

The element is used to link an existing ActiveX control in the visualization. You can configure the method calls and their parameters in the element properties of the *"ActiveX"* element.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"ActiveX"*
"Element"	Installed ActiveX component that is linked to the visualization. Hint: To avoid typing errors, select the required ActiveX component by means of the Input Assistant.

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”	
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. “Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. 
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Initial calls'

These method calls are executed during initialization. They are executed in the first cycle only.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* with parameters for the method call.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

Element property 'Cyclic calls'

These method calls are executed in every cycle. They are executed in the refresh rate of the visualization.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* for a method call and its parameters.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

Element property 'Conditional calls'

These method calls are executed in the refresh rate of the visualization. You define the call condition in the property *“Methods ➔ [<number>] ➔ Call condition”*.

“Method calls ”	Button '*“Create new”*' Creates a subnode below *“Methods”* with a call condition and parameters for the method call.
“Methods”	*“[<number>]”* ● *“Method”*: Name of the method ● *“Call condition”*: Variable (`BOOL`). A rising edge of this variable triggers the call of this method. ● *“Parameter”*: Parameter passed at the method call ● *“Result parameter”*: Optional variable for the return value of the method

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Web Browser'

Symbol:

Category: *“Special Controls”*

The element shows a website, PDF file, or video that has a URL.

NOTICE!
The display options of the *“Web Browser”* element depend on the operating system and the display variant of the visualization.

Requirement: The software components of the web browser are available in the runtime and configured accordingly (example: videos to be shown on Linux).

- *Chapter 1.4.5.21.6 “Displaying Web Contents” on page 2141*

Element properties

“Element name”	Example: `GenElemInst_59`
“Type of element”	*“Web Browser”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

> *You can also change the values by dragging the symbols (⊕) to other positions in the editor.*

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

Element property 'Control variables'

“URL”	URL of the web page that is displayed in the visualization. ● Variable (`STRING` or `WSTRING`) Example: `PLC_PRG.stURL` ● Literal in single straight quotation marks Example: `'http://de.wikipedia.org'`
“Show”	Variable (`BOOL`). Example: `PLC_PRG.bSetURL` Controls the display of the *“Web browser”* element. If the variable contains a rising edge, then the visualization calls the web page given in *“URL”* and displays its contents in the 'Web browser' visualization element.
“Back”	Variable (`BOOL`). Example: `PLC_PRG.bGoBack` Controls the back navigation in the *“Web browser”*. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.
“Forward”	Variable (`BOOL`). Example: `PLC_PRG.bGoForward` Controls the forward navigation in the *“Web browser”*. If the variable has a rising edge, then the visualization displays the contents of the previously displayed page.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Busy Symbol, Cube'

Symbol:

Category: *“Special Controls”*

At runtime, this element indicates automatically that the runtime is busy or waiting for data.

Element properties

"Element name"	Example: `Data_Transfer` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Busy Symbol, Cube"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

Visualization Element 'Busy Symbol, Flower'

Symbol:

Category: *“Special Controls”*

The element indicates that the system is busy or waiting for data.

Element properties

“Element name”	Example: `Data_Transfer` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
“Type of element”	*“Busy Symbol, Flower”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols (⊞) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

"Frame color"	
"Fill color"	
"Transparency"	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.

See also

- *Chapter 1.4.5.19.3.5 "Dialog 'Gradient Editor'" on page 1748*
- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

"Line width"	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of 1 pixel. If no line should be displayed, then the *"Line style"* property must be set to the option *"Invisible"*.
"Fill attributes"	The way in which the element is filled. ● *"Filled"*:The element is filled with the color from property *"Colors ➔ Fill color"*. ● *"Invisible"*: The fill color is invisible.
"Line style"	Type of line representation ● *"Solid"* ● *"Dashes"* ● *"Dots"* ● *"Dash Dot"* ● *"Dash Dot Dot"* ● *"not visible"*

You can assign variables in the "Appearance variables" property for controlling the appearance dynamically. The fixed values here are overwritten.

See also

- *" Element property 'Appearance variables'" on page 2095*

“Symbol color”	Selection of a color for the flower symbol.
“Line”	Stroke width of the lines (in pixels).

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Text Editor'

Symbol:

Category: *"Special Controls"*

The element shows the contents of text files that are saved on the controller. Files can be encoded in ASCII or Unicode formats.

A visualization user can also edit the text.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Text Editor"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Font'

“Font name”	Non-proportional font used by the visualization to display the contents of the file Example: *“Courier New”*
“Size”	Font size Example: `12`

Element property 'Control variables'

Table 361: Element property “Control variables --> File”

“Variable”	Variable (`STRING`). Contains the file names and optionally the location of the file. It is located in the file system of the controller. Example: `PLC_PRG.strFile: STRING := '/Documentation/Info.txt';`
“Open”	Variable (`BOOL`). Controls opening the file which is defined in the *“Variable”* property Example: `bOpen: BOOL;` `TRUE`: The file is opened.
“Close”	Variable (`BOOL`). Controls closing the file which is defined in the *“Variable”* property Example: `bClose: BOOL;` `TRUE`: The file is closed.
“Save”	Variable (`BOOL`). Controls saving the file which is defined in the *“Variable”* property Example: `bStore: BOOL;` `TRUE`: The file is saved.
“New”	Variable (`BOOL`). Controls creating a new file. The name is defined in the *“Variable”* property. Example: `bCreate: BOOL;` `TRUE`: A file is created and opened.

Table 362: Element property “Control variables --> Edit ”

“Variable”	Variable (`STRING`). Contains the string to search for in the file Example: `strFind: STRING := 'abc';`
“Find”	Variable (`BOOL`). Controls executing the search for the string in the *“Variable”* property Example: `bFind: BOOL;` `TRUE`: The search is performed. The variable is automatically reset to `FALSE`.
“Find next”	Variable (`BOOL`). Controls the location to begin the search in the file Example: `bFindNext: BOOL;` `TRUE`: The search begins at the last search result location. `FALSE`: The search begins at the beginning of the file.

Table 363: Element property “Control variables --> Cursor position”

“Line”	Variable (integer data type). Contains the line of the cursor Example: `iRowCursor: INT;`
“Column”	Variable (integer data type). Contains the column of the cursor Example: `iColumnCursor: INT;`
“Position”	Output variable (integer data type). Shows the **absolute** cursor position in the text. Example: `iPosCursor: INT;`
“Set cursor”	Variable (`BOOL`). Controls the setting of the cursor at a specific location Example: `iSetCursor: INT;` `TRUE`: The cursor is moved. The new position is defined in the *“Line”* and *“Column”* properties. `FALSE`: The *“Line”*, *“Column”*, and *“Position”* properties contain the actual values. Note: The variable is used as the control variable for an input event triggered by a visualization user.

Table 364: Element property “Control variables --> Selection”

“Start position”	Output variable (integer data type). Shows the **absolute** position for starting the text selection Example: `iPosSelection: INT;`
“End position”	Output variable (integer data type). Shows the **absolute** position for ending the text selection. Example: `iPosEndSelection: INT;`
“Start line number”	Output variable (integer data type). Shows the line where the text selection begins Example: `iRowSelection: INT;`
“Start column index”	Output variable (integer data type). Shows the column where the text selection begins Example: `iColumnSelection: INT;`
“End line number”	Output variable (integer data type). Shows the line where the text selection ends Example: `iRowEndSelection: INT;`

"End column index"	Output variable (integer data type). Shows the column where the text selection ends Example: `iColumnEndSelection: INT;`
"Line to select"	Variable (integer data type). Contains the line number that is selected Note: The selection is controlled by the variables in the *"Trigger selection"* property.
"Set selection"	Variable (`BOOL`). Controls the selection of a line. Example: `bSetSelection: BOOL;` `TRUE`: The line from the *"Line to select"* property is selected and highlighted in the Text Editor. if the line is not in the current text segment of the Text Editor, then the text segment is moved to this line. Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization.

Table 365: Element property "Control variables --> Error handling"

"Variable for error code"	Variable (integer data type). Contains the error code when an error occurs Example: `iError: INT;` The error codes are declared in `GVL_ErrorCodes` in the `VisuElemTextEditor` library. To display the error text, the `VisuFctTextEditorGetErrorText()` function of the library must be called.

"Variable for content changed"	Variable (`BOOL`). Shows whether the contents have changed Example: `bIsContentEdited: BOOL;` `TRUE`: The contents of the Text Editor have changed.
"Variable for access mode"	Variable (`BOOL`). Controls the access privileges to the file Example: `bIsReadOnly: BOOL;` `TRUE`: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the Text Editor. `FALSE`: A visualization user has read/write permission. Note: The variable overwrites the setting in the *"Editor mode"* property.

"Maximum line length"	Maximum number of characters per line
"Editor mode"	● *"Read-only"*: A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor. ● *"Read/write"*: A visualization user has read-write permissions.

Element property 'New files'

"Encoding"	Character encoding of the new file: ● *"ASCII"* ● *"Unicode (Little endian)"* ● *"Unicode (Big endian)"*
"New line character sequence"	End of line character of the new file: ● *"CR/LF"*: Normal for Windows systems ● *"LF"*: Normal for UNIX systems Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

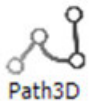
Visualization Element 'Path3D'

Symbol:



Category: *“Special Controls”*

The *“Path3D”* visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application `3D Path Generator`, which is available in CODESYS Forge, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library `SM3_CNC_Visu` help to generate the data from the path and track. These function blocks are used by the sample project `CNC_File_3DPath`, which is stored in the installation directory of CODESYS.

- `SMC_PathCopier`
- `SMC_PathCopierCompleteQueue`
- `SMC_PathCopierFile`
- `SMC_PositionTracker`

A description of the function blocks can be found in the Library Manager in the library `SM3_CNC_Visu`.

The element does not work with the CODESYS HMI display variant.

Element properties

“Element name”	Example: `GenElemInst_1`
“Type of element”	*“Path3D”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols () to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Path description

"Path data (VisuStruct3DTrack)"	Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`. The data structure describes a path or track through a certain number of points. The points are determined and buffered by the application. The track typically displays the last n positions, so that only a certain part of them is ever displayed at any one time. `VisuStruct3DTrack.pProjection` is a variable that is set by the visualization element and contains information about the path/track projection. It can be read (only) by the application. In addition, the methods `Projection.Apply` or `.ApplyV` can be used in order to see whether the transformed position lies inside or outside the visualization display area, which is defined by `Projection.ElementRect`.
"Path color"	Color of the path drawn
"Path line width"	Path line width in pixels, e.g.: "2"
"Style of boundary points"	Display of the points between two successive objects in the path ● End points are not displayed ● End points are marked with a circle ● End points are marked with a cross ● End points are marked with a plus

Track description The track data are structured in exactly the same way as the path data: VisuStruct3DTrack

"Track data (VisuStruct3DTrack)"	Variable of the type `VisuStruct3DTrack`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dt`. A description of the structure can be found in the library manager in the library `VisuElem3DPath.library`.
"Track color"	Color of the track drawn
"Track line width"	Track line width in pixels, e.g.: "2"

Camera control The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

"Control data (VisuStruct3DControl)"	Variable of the type `VisuStruct3DControl`, which is declared in the IEC code. Example: `PLC_PRG.pc.vs3dc`. A description of the structure can be found in the library manager in the library `VisuElem3DPath`. The values can be set via the application itself or via the visualization element *"ControlPanel"*. The library `VisuElem3DPath` contains ready-to-use visualization frames that provide a possible user interface for these data.

Additional aspects

"Coordinate system"	☑: The coordinate system is displayed
"Grid"	☑: Grid lines are displayed
"Grid color"	Color of the grid lines

Highlighting Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

Highlight mode	Select one of the following highlight modes: ● Only the element whose ID corresponds to the value of the variable is highlighted. ● All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in Variable are highlighted.
Variable	Project variable that specifies the ID of an element. Example: `PLC_PRG.iVarElementID`. This "highlight ID" is taken into account for the setting of the highlight mode. The variable must be set in the IEC application.
Highlight color	

Element look

"Frame line width"	Width of the frame around the element, in pixels, for example: "1"
"Frame line style"	Select one of these style types for the frame line: ● `Solid` ● `Dashes` ● `Dots` ● `Dash Dot` ● `Dash Dot Dot` ● `Hollow`

"Transparent background"	☑: The background of the element is displayed transparently. ☐: The background of the element is displayed in the defined background color.
"Background color"	

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Control Panel'

Symbol:

Category: *“Special Controls”*

This visualization element is used in connection with the *“Path3D”* visualization element. It is used for changing the position and orientation to the CNC path shown with *“Path3D”*.

See also

- *Chapter 1.4.5.19.5.42 “Visualization Element 'Path3D'” on page 2082*

Element properties

“Element name”	Optional. Hint: Assign individual names for elements so that they are found faster in the element list. Example: `Camera_Path_1`
“Type of element”	*“Frame”*
“Clipping”	☑: If you have set the *“Scaling type”* to *“Fixed”*, then only that part of the visualization is displayed that fits in the frame.
“Show frame”	Displays the frame ● *“No frame”*: The displayed area of the frame does not have borders. ● *“Frame”*: The displayed area of the frame has borders. ● *“No frame with offset”*: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The resulting gap prevents the referenced visualization from touching any adjacent elements.
“Scaling type”	Describes how the frame reacts when the visualization is resized: ● *“Isotropic”*: The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately. ● *“Anisotropic”*: The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately. ● *“Fixed”*: The original size of the frame is retained, regardless of the visualization size. If you have also selected the *“Clipping”* option, then only the fitting part is displayed. ● *“Fixed and scrollable”*: The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the *“Scroll position variable horizontal”* or *“Scroll position variable vertical”* property.
“Deactivation of the background drawing”	☐: To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order. ☑: Deactivation of the background drawing. This can prevent the behavior described above.

Element property 'References'

Contains the currently configured visualization references as a subnode

"References"	Clicking *"Configure"* opens the *"Frame Configuration"* dialog. This is used to manage the referenced visualizations. Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the *"Switch to any visualization"* Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the *"Input configuration"* of an element: Action *"Switch Frame visualization"*.
List of the currently referenced visualizations	Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters. Example: `vis_FormA` ● `iDataToDisplay_1 : PLC_PRG.iVar1` ● `iDataToDisplay_2 : PLC_PRG.iVar2` Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the *"Configure"* button instead.

See also

- *Chapter 1.4.5.19.2.1 "Command 'Interface Editor'" on page 1719*
- *Chapter 1.4.5.15 "Creating a structured user interface" on page 1321*
- *"Input action 'Switch Frame Visualization'" on page 1756*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Colors'

The properties contain fixed values for setting colors.

“Color”	Color for the element in its normal state. Please note that the normal state is in effect if the expression in the *“Color variables ➔ Toggle color”* property is not defined or it has the value `FALSE`.
“Alarm color”	Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the *“Color variables ➔ Toggle color”* property has the value `TRUE`.
“Transparency”	Value (0 to 255) for defining the transparency of the selected color. Example `255`: The color is opaque. `0`: The color is completely transparent.
“Use gradient color”	☑: The element is displayed with a color gradient.
“Gradient setting”	The *“Color gradient editor”* dialog box opens.
“Frame color”	Example: *“Black”*
“Fill color”	Example: *“Light gray”*

See also

- *Chapter 1.4.5.19.3.5 “Dialog 'Gradient Editor'” on page 1748*
-

Element property 'Appearance'

The properties contain fixed values for setting the look of the element.

“Line width”	Value in pixels Example: `2` Note: The values `0` and `1` both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Type of line representation ● *“Solid”* ● *“Dashes”* ● *“Dots”* ● *“Dash Dot”* ● *“Dash Dot Dot”* ● *“not visible”*

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.

See also

- “ *Element property 'Appearance variables'” on page 2095*

Element property 'Texts'

The properties contains character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the *“GlobalTextList”* text list. Therefore, these texts can be localized.

“Text”	Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut *[Ctrl] + [Enter]*. Example: `Accesses: %i` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Text”*.
“Tooltip”	Character string (without single straight quotation marks) that is displayed as the tooltip of an element. Example: `Number of valid accesses.` The variable that contains the current value for the placeholder is specified in the property *“Text variable ➔ Tooltip”*.

See also

- *“Element property 'Text variables'” on page 2091*
- *Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254*
- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*

Element property 'Text properties'

The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Text format”	Definition for displaying texts that are too long ● *“Default”*: The long text is truncated. ● *“Line break”*: The text is split into parts. ● *“Ellipsis”*: The visible text ends with "..." indicating that it is not complete.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (*“Position”* property). The shape of the element can change.

“Movement top-left”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **left** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaX`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **top** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaY`
“Movement bottom-right”	
“X”	Variable (integer data type). It contains the number (in pixels) that the **right** edge is moved horizontally. Incrementing the value moves the element to the right. Example: `PLC_PRG.iDeltaWidth`
“Y”	Variable (integer data type). It contains the number (in pixels) that the **bottom** edge is moved vertically. Incrementing the value moves the element to the down. Example: `PLC_PRG.iDeltaHeight`

See also

- *“Element property 'Absolute movement'” on page 2117*

Element property 'Text variables'

These properties are variables with contents that replace a format definition.

“Text variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccesses` Note: The format definition is part of the text in the property *“Texts ➔ Text”*. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: `PLC_PRG.enVar <enumeration name>`. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.
“Tooltip variable”	Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: `PLC_PRG.iAccessesInTooltip` Note: The format definition is part of the text in the property *“Texts ➔ Tooltip”*.

See also

- *Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708*
- *“Element property 'Texts'” on page 2089*
- *Chapter 1.4.1.19.5.17 “Enumerations” on page 676*

Element property 'Dynamic texts'

Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

“Text list”	Variable (string) or name of the text list as a fixed string in single straight quotation marks. Example: `'Errorlist'` ▾: Drop-down list with the dialogs available in the text lists.
“Text index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'1'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strTextID` Sample assignment: `PLC_PRG.strTextID := '1';`
“Tooltip index”	Text list ID. This refers to the desired output text. ● As fixed string with the ID in single straight quotation marks. Example: `'2'` ● As a variable (`STRING`) for dynamically controlling the text output. Example: `strToolTipID` Sample assignment: `PLC_PRG.strToolTipID := '2';`

See also

- *Chapter 1.4.1.20.2.24 “Object 'Text List'” on page 927*

Element property 'Font variables'

The variables allow for dynamic control of the text display.

"Font name"	Variable (`STRING`). Includes the font of the text. Example: `PLC_PRG.stFontVar := 'Arial';` The selection of fonts corresponds to the default *"Font"* dialog.
"Size"	Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name. ● <pt>: Points (default) Example: `PLC_PRG.iFontHeight <pt>` Code: `iFontHeight : INT := 12;` ● <px> : Pixels Example: `PLC_PRG.iFontHeight <px>` Code: `iFontHeight : INT := 19;`  If you click in the value field, a drop-down list opens on the right for setting the unit. Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property *"Text property ➔ Font"*.
"Flags"	Variable (`DWORD`). Contains the flags for displaying fonts. Flags: ● `1`: Italics ● `2`: Bold ● `4`: Underline ● `8`: Strikethrough Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: `PLC_PRG.dwFontType := 6;`
"Character set"	Variable (`DWORD`). Contains a character set number for the font. The selection of character set numbers corresponds to the *"Script"* setting of the standard *"Font"* dialog.
"Color"	Variable (`DWORD`). Includes the color of the text. Example: `PLC_PRG.dwColorFont:= 16#FF000000;`
"Flags for text alignment"	Variable (integer data type). Contains the coding for text alignment. Example: `PLC_PRG.dwTextAlignment.` Coding: ● `0`: Top left ● `1`: Horizontal center ● `2`: Right ● `4`: Vertical center ● `8`: Bottom Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: `PLC_PRG.dwFontType := 5;`

Fixed values for displaying texts are set in “Text properties”.

See also

- *“Element property 'Text properties'” on page 2089*

Element property 'Color variables'

The Element property is used as an interface for project variables to dynamically control colors at runtime.

“Toggle color”	The property controls the toggled color at runtime. Value assignment: ● `FALSE`: The element is displayed with the color specified in the *“Color”* property. ● `TRUE`: The element is displayed with the color specified in the *“Alarm color”* property. Assignment options: ● Placeholder for the user input variable – *“<toggle/tap variable>”* – *“<NOT toggle/tap variable>”* The color change is not controlled by its own variable, but by a user input variable. Note: Specify a variable for the mouse events *“Tap”* or *“Toggle”* in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both *“Toggle”* and *“Tap”*, then the variable specified in *“Tap”* is used. Hint: Click the symbol to insert the placeholder *“<toggle/tap variable>”*. When you activate the *“Inputconfiguration”*, *“Tap FALSE”* property, then the *“<NOT toggle/tap variable>”* placeholder is displayed. ● Instance path of a project variable (`BOOL`) Example: `PLC_PRG.xColorIsToggeled` Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.
“Normal state” *“Alarm state”*	The properties listed below control the color depending on the state. The normal state is in effect if the variable in *“Color variables”*, *“Toggle color”* is not defined or it has the value `FALSE`. The alarm state is in effect if the variable in *“Colorvariables”*, *“Toggle color”* has the value `TRUE`.
“Frame color”	Assignment options: ● Variable (`DWORD`) for the frame color Example: `PLC_PRG.dwBorderColor` ● Color literal Example of green and opaque: `16#FF00FF00`
“Filling color”	Assignment options: ● Variable (`DWORD`) for the fill color Example: `PLC_PRG.dwFillColor` ● Color literal Example of gray and opaque: `16#FF888888`

The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

See also

- *Chapter 1.4.5.8.3 “Animating a color display” on page 1295*

Element property 'Appearance variables'

The properties contain variables for controlling the appearance of the element dynamically.

“Line width”	Variable (integer data type). Contains the line weight (in pixels). Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the *“Line style”* property must be set to the option *“Invisible”*.
“Line style”	Variable (DWORD). Controls the line style. Coding: ● `0`: Solid line ● `1`: Dashed line ● `2`: Dotted line ● `3`: Line type "Dash Dot" ● `3`: Line type "Dash Dot Dot" ● `8`: Invisible: The line is not drawn.

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also

- *“Element property 'Appearance'” on page 2088*

Element property 'Switch frame variable'

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.

"Variable"	● Variable (integer data type) that contains the index of the active visualization Example: `PLC_PRG.uiIndexVisu` Hint: The *"Frame Configuration"* dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list. Note: This variant of switching usually affects all connected display variants. ● Array element (integer data type) for index access via `CURRENTCLIENTID` Example: `PLC_PRG.aIndexVisu[CURRENTCLIENTID]` Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

See also

- *Chapter 1.4.5.19.2.9 "Command 'Frame Selection'" on page 1727*

Element property 'State variables'

The variables control the element behavior dynamically.

"Invisible"	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
"Deactivate inputs"	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The "Invisible" property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *"Support client animations and overlay of native elements"* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Input configuration'

The properties contain the configurations for the user input when using the mouse or keyboard. A user input defines an event and one or more actions that are executed when an event occurs.

The *"Configure"* button opens the *"Input Configuration"* dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form. Example: *"Execute ST Code"*: `PLC_PRG.i_x := 0;`	
"OnDialogClosed"	Input event: The user closes the dialog.
"OnMouseClick"	Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.
"OnMouseDown"	Input event: The user clicks down on the mouse button.
"OnMouseEnter"	Input event: The user drags the mouse pointer to the element.
"OnMouseLeave"	Input event: The user drags the mouse pointer away from the element.

"OnMouseMove"	Input event: The user moves the mouse pointer over the element area.
"OnMouseUp"	Input events: ● The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area. ● The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button. Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for *"OnMouseDown"* and ends the action for *"OnMouseUp"*. Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because *"OnMouseUp"* is triggered.

"Tap"	When a mouse click event occurs, the variable defined in *"Variable"* is described in the application. The coding depends on the *"Tap FALSE"* and *"Tap on enter if captured"* options.
"Variable"	Variable (`BOOL`) that is set on mouse click event. Example: `PLC_PRG.bIsTapped` `TRUE`: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released. `FALSE`: A mouse click event does not exist. Requirement: The *"Tap FALSE"* option is not activated.
"Tap FALSE"	☑: The mouse click event leads to a complementary value in *"Variable"*. `TRUE`: A mouse click event does not exist. `FALSE`: While the mouse click event exists.
"Tap on enter if captured"	☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed. `TRUE`: While the mouse click event exists and the mouse pointer is moved over the element area. `FALSE`: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed. The value is `TRUE` again as soon as the user moves the pointer back to the element area. The mouse is then captured.

"Toggle"	With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset.
"Variable"	Variable (`BOOL`). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area. If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled. Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area.
"Toggle on up if captured"	☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured.

"Hotkey"	Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the *"Events"* property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.
"Key"	Key pressed for input action. Example: *[T]* Note: The following properties appear when a key is selected.
"Events"	● *"None"* ● *"Mouse down"*: Pressing the key triggers the input actions that are configured in the *"OnMouseDown"* property. ● *"Mouse up"*: Releasing the key triggers the input actions that are configured in the *"OnMouseUp"* property. ● *"Mouse down/up"*: Pressing and releasing the key triggers the input actions that are configured in the *"OnMouseDown"* property and the *"OnMouseUp"* property.
"Shift"	☑: Combination with the Shift key Example: *[Shift]+[T]*.
"Control"	☑: Combination with the Ctrl key Example: *[Ctrl]+[T]*.
"Alt"	☑: Combination with the Alt key Example: *[Alt]+[T]*.

All keyboard shortcuts and their actions that are configured in the visualization are listed on the "Keyboard Configuration" tab.

Visualization Element 'Date Range Picker'

Symbol:

Category: *"Date/Time Controls"*

The element provides the capability of selecting the date and time range of a saved data set. The element is used with the *"Trend"* visualization element.

Element properties

"Element name"	Example: `DateTrend1` Optional Hint: Assign individual names for elements so that they are found faster in the element list.
"Type of element"	*"Date Range Picker"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Show frame”	☑: The visualization element is drawn with a frame.
“Resolution”	Resolution saved for the time stamp: *“Millisecond”* or *“Microsecond”*
“Attached element instance”	The element can be assigned to a *“Trend”* visualization element. As a result, the time range of the trend element can be changed. The available visual elements are selected with the help of the Input Assistant (...).

Element property 'Tick mark labels'

“Two-line labelling”	☑: The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line. ☐: Time stamp is displayed in one line. The date and time can also be displayed in one line depending on the formatting.
“ Omit irrelevant information in time stamp”	☑: The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in *“Internationalization (format strings)”* are ignored for this setting. ☐: All information is displayed for all time stamps.
“Internationalization (format strings)”	Only active when the parameter *“Omit irrelevant information in timestamps”* is deactivated.
“Date”	Definition of the date format. The default setting is taken from the Windows control panel.
“Time”	Definition of the time format. The default setting is taken from the Windows control panel.

Element property 'Text properties' The properties contain fixed values for the text properties.

“Horizontal alignment”	Horizontal alignment of the text within the element.
“Vertical alignment”	Vertical alignment of the text within the element.
“Font”	Example: *“Default”* ...: The *“Font”* dialog box opens. ▼: Drop-down list with style fonts.
“Font color”	Example: *“Black”* ...: The *“Color”* dialog box opens. ▼: Drop-down list with style colors.
“Transparency”	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Element property 'Additional buttons'

"Jump to the largest possible time stamp"	☑: An additional button ( ) is displayed for jumping to the last time stamp.
"Jump to the smallest possible time stamp"	☑: An additional button ( ) is displayed for jumping to the first time stamp.
"Zoom out"	☑: An additional button ( ) is displayed for setting the current min./max. range to the maximum range. The selected range is left.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *"Position ➔ Angle"* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

● *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

Visualization Element 'Time Range Picker'

Symbol:

Category: *"Date/Time Controls"*

The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `TimeRangeTemperature`
"Type of element"	*"Time range picker"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

> *You can also change the values by dragging the box symbols ( ) to other positions in the editor.*

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

"Orientation"	Specifies whether the time picker element is aligned horizontally or vertically in the editor. Hint: Change the width to height ratio of the element in the editor.
"Show frame"	: The visualization element is drawn with a frame.
"Resolution"	Resolution saved for the time stamp: *"Millisecond"* or *"Microsecond"*
"Attached element instance"	Assignment to the element that processes the time picker The element can be assigned for example to a *"Trend"* visualization element. Then the time range of the trend element can be changed. The available visual elements are selected with the help of the input assistance ( ). Example: `GenElemInst_1`

Element property 'Texts'

"Text"	String label for the element. Example: `Zoom`

Element property 'Text properties' The properties contain fixed values for the text properties.

"Font"	Example: *"Default"* : The *"Font"* dialog box opens. : Drop-down list with style fonts.
"Font color"	Example: *"Black"* : The *"Color"* dialog box opens. : Drop-down list with style colors.
"Transparency"	Whole number (value range from `0` to `255`). This determines the transparency of the respective color. Example: `255`: The color is opaque. `0`: The color is completely transparent. Please note: If the color is a style color and already has a transparency value, then this property is write-protected.

Property 'Times' In *"Times"*, the buttons that the element provides at runtime are defined and configured in an array.

"Provide "All" selection"	:Time Range Picker bar extended by "All" button. The diagram represents a time interval that covers all time stamps.
"Times"	: Adds another button to the Time Range Picker bar and increases the array by one entry. An additional index is present in the property *"Times* ➔ *Times* ➔ *Times* ➔ *[<new>]"*. *"Time"* is located under this index. The configuration of the button is to be entered there.
"Times" ● *" [Index]"* with index ∈ {0, 1, 2,...}	Array of all buttons in the time selection bar. Index corresponds to the number of buttons. : The associated button is removed from the Time Range Picker bar. The configuration entry is deleted from the *"Times"* property list.
" [Index]" ● *"Time"*	: Time interval in standardized notation. Example: `3M` for 3 months; `30m` for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty.

Element property 'Control variables'

"Time"	Displays which time is currently selected. Variable (`STRING`) Example: `PLC_PRG.strSelcetedTime`
""All" selected"	Displays the state of the "All" button Variable (`BOOL`) Example: `PLC_PRG.AllTimesAreSelected`

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 “Dialog 'Access Rights'” on page 1745*

Visualization Element 'Date Picker'

Symbol:

Category: *“Date/Time Controls”*

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.

Language-dependent texts of the element

The element contains language-dependent texts that are managed in the `System` text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

Example

`System` text list

ID	Default
`Apr`	`Apr`
`April`	`April`

See also

Element properties

“Element name”	Example: `DueDateCalendar`
“Type of element”	*“Date Picker”*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

“X”	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Y”	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
“Width”	Specified in pixels. Example: `150`
“Height”	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

“X”	X-coordinate of the point of rotation
“Y”	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Variable”	Input variable (`DATE`). Contains the date that a user selects in the calendar. Example: `PLC_PRG.dtDueDate`
“Design”	● *“From style”*: All settings are preconfigured according to the style. ● *“Explicit”*: The *“Design settings”* property is available. You can customize the calendar here.

Design settings Requirement: This property is visible only if the *“Design”* property is set to *“Explicit”*.

The values of the property can be predefined in the style. Then they are available in the drop-down list.

Table 366: “Header of Date Picker”

Design of the header	
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Arrows”	
“Arrow color”	Style color or user-defined color
“Color of printed arrow”	
“Background”	
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Fill color”	Style color or user-defined color

Table 367: Design of the main display area

Design of the main display area	
“Today”	Design of today
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The style defines whether and which background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	Style color or user-defined color. Used if *“Yes”* is selected in *“Draw background”*.

“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Selected day”	Design of the selected day
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	Style color or user-defined color
“Show frame”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Current month”	Design of the current month
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Other months”	Design of the previous and subsequent months
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Display other month”	Design of the previous and subsequent months

“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	

“Day of week heading”	Design of the heading with the days of the week
“Font”	Style font or user-defined font
“Font color”	Style color or user-defined color
“Draw background”	*“From style”*: The background is filled with the style color *“From style”*. The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Background color”* property. *“No”*: The background is not filled with a color.
“Background color”	
“Show frame”	*“From style”*: The style defines whether and how a frame is drawn. *“Yes”*: The frame is displayed with the following properties. *“No”*: A frame is not displayed.
“Frame color”	Used if *“Yes”* is selected in *“Show frame”*.
“Rectangle type”	
“Line width”	
“Display separator line”	*“From style”*: The style defines whether and how a separator line is drawn. *“Yes”*: Display with the following properties. *“No”*: A separator line is not displayed.
“Color of the separator line”	Used if *“Yes”* is selected in *“Display separator line”*.
“Width of separator line”	

“Background”	Design of the calendar days
“Draw background”	*“From style”*: The style defines whether and how a background is drawn. *“Yes”*: The background is filled with the color in the *“Fill color”* property and framed in the *“Frame color”*. *“No”*: The background is not filled with a color.
“Fill color”	Style color or user-defined color
“Frame color”	

Element property 'Display type'

“Rows”	Number of month calendars per row (preset: `1`)
“Columns”	Number of month calendars per column (preset: `1`)

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”		
“X”	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
“Y”	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- ↳ *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"	Opens the *"Access rights"* dialog. There you can edit the access privileges for the element. Status messages: ● *"Not set. Full rights."*: Access rights for all user groups : *"operable"* ● *"Rights are set: Limited rights"*: Access is restricted for at least one group.

See also

- *Chapter 1.4.5.19.3.1 "Dialog 'Access Rights'" on page 1745*

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Analog Clock'

Symbol:

Category: *"Date/Time Controls"*

The element is a clock that displays the current time of day. The clock can also display a random time.

Element properties

"Element name"	Example: `GenElemInst_1`
"Type of element"	*"Analog Clock"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

Element property 'Time Display'

"Use system time"	☑: The system time of the PLC is displayed.
"Variable"	Variable (time data type `TOD`, `TIME_OF_DAY`). This receives the time of day that is not the system time. Example: `PLC_PRG.todTimeTokio` Requirement: The *"Use system time"* property is not activated.

See also

- *Chapter 1.4.1.19.5.5 "Data Type 'TIME'" on page 649*

"Design"	• *"From style"*: All settings are preconfigured according to the style. • *"Explicit"*: The *"Settings"* property is available. Here you can customize the analog clock.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	"Scaling"	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *"Center"* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	

"Interior rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *"Center"* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *"Position ➔ Angle"*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	"Use REAL values"	Note: Only available if the device supports the use of REAL coordinates. ☑: The properties of the absolute movement are interpreted as REAL values. The values are not rounded. The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation. Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.	

You can link the variables to a unit conversion.

The properties "X", "Y", "Rotation", and "Interior rotation" are supported by the "Client Animation" functionality.

- *Chapter 1.4.1.8.18 "Unit conversion" on page 298*

Element property 'Settings'

Requirement: The *"Property"* is *"Explicit"*. Only then is the *"Clock Settings"* category visible.

Table 368: "Background"

"Background color"	Color variants of the default background image ● *"Yellow"* ● *"Red"* ● *"Blue"* ● *"Green"* ● *"Black"*
"Own background"	Background display with the specific *"Image"*. Replaces the default background image.

“Image”	Image from an image pool or library Example: `myImagepool.myImage`
“Transparency color”	The transparent color in the image representation. Example: *“White”*. The white parts of the image are transparent.
“Use background color”	☑: The image background is displayed using the color defined in the *“Background color”* property. Requirement: No image reference is given in the *“Image”* property.
“Background color”	Style color or color Requirement: *“Use background color”* is activated.

Table 369: “Hands”

“Hand style”	Example: *“Thin arrow”*
“Color hour hand”	Style color or color for the hands
“Color minute hand”	
“Color second hand”	

Table 370: “Lines”

“Lines style”	Clock face graduation ● *“None”* ● *“Line”*: Graduation lines by hour ● *“Hours and minutes”*: Graduation lines by hours and minutes ● *“Dots”*: Graduation dots by hour
“Color”	Color of the clock face graduation
“Line width”	Line weight of the clock face graduation
“Scale in 3D”	☑: Representation of the clock face with 3D effect

Table 371: “Numerics”

“Style of numerics”	Digits on the clock face ● *“None”* ● *“Quarter”* ● *“All”*
“Font”	Font for displaying the digits
“Font color”	Font for displaying the digits

Table 372: “Center point”

“Color”	Color of the center of the clock

Table 373: “Positioning”

“Usage of”	● *“Default style values”*: Presetting of the style values ● *“Individual settings”*: User-defined settings in the subordinate *“Positioning”* property.
“Positioning”	Requirement: Visible when the *“Usage or”* property is set to *“Individual settings”*.

"Numerics movement"	Value (in pixels) for shifting the digits. Example: `80`
"Line movement"	Value (in pixels) for shifting the hour lines. Example: `100`
"Hands scaling"	Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image. Example: `100`

"Scaling type"	Defines the scaling of the height and width of the element. ● *"Anisotropic"*: The background image is scaled to the size of the element The height and width are scaled independently of each other. ● *"Isotropic"*: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed.

"Optimized drawing"	☑: The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn. ☐: The background image is redrawn in cycles. Hint: Disable this option only for extreme exceptions.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"		
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.	
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.	
"Rotation"	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *"Center"* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the *“Position ➔ Angle”* property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

"Animation duration"	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *"Absolute movement"*, *"Movement"*, *"X"*, *"Y"* ● *"Absolute movement"*, *"Rotation"* ● *"Absolute movement"*, *"Interior rotation"* ● *"Absolute movement"*, *"Exterior rotation"* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
"Move to foreground"	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

See also

- *Chapter 1.4.5.3 "Designing a visualization with elements" on page 1254*

Visualization Element 'Date/Time Picker'

Symbol:

Category: *"Date/Time Controls"*

The element provides the capability of selecting the date and time. The value can be changed by means of the arrow keys on the keyboard. The date can be selected from a calendar.

Element properties

"Element name"	Optional Hint: Assign individual names for elements so that they are found faster in the element list. Example: `StartDateAndTime`
"Type of element"	*"Date/Time Picker"*

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

"X"	X coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Y"	Y coordinate of the upper left corner of the element Specified in pixels. Example: `10`.
"Width"	Specified in pixels. Example: `150`
"Height"	Specified in pixels. Example: `30`

You can also change the values by dragging the box symbols ( ) to other positions in the editor.

See also

- *Chapter 1.4.5.3.2 "Positioning the Element, Adapting Size and Layer" on page 1256*

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⊕ symbol. The point is used as the center for rotating and scaling.

"X"	X-coordinate of the point of rotation
"Y"	Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

"Variable"	Variable (`DATE, DT, TIME, LTIME, TOD`) The value of the value of the variable is displayed and modified by means of the element. The data type automatically determines the displayed value units: ● `TIME`: Day, hour, minute, and second (by default, milliseconds are not displayed) ● `DATE`: Year, month, and day ● `DT`: Year, month, day, hour, minute, and second ● `TOD`: Hour, minute, and second (by default, milliseconds are not displayed) ● `LTIME`: Day, hour, minute, and second (by default, milliseconds, microseconds, and nanoseconds are not displayed)
"Format string"	The format can restrict the output to individual values. Example for `LTIME`: Format: `HH:mm:ss.ms.us.ns` --> displayed: 08:15:12.780.150.360 `LTIME` restricted: format: `HH:mm` --> displayed: 08:15 Example for `DATE`: Format: `yyyy/MM/dd` --> displayed: 2015/12/17 . Basically, all usual formats available for %t are also supported.
"Design date time picker"	● *"From style"*: All settings are preconfigured according to the style. ● *"Explicit"*: The *"Design settings"* property is available. You can customize the calendar here.
"Design date picker"	● *"From style"*: All settings are preconfigured according to the style. ● *"Explicit"*: The *"Design settings"* property is available. You can customize the calendar here.
"Positioning date picker"	● *"Dynamic"*: The calendar is adapted and positioned automatically. ● *"Manual"*: The *"Position settings"* property is available. You can customize the calendar here.

Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"	
"X"	Variable (numeric data type). Defines the X position (in pixels). Example: `PLC_PRG.iPos_X`. Increasing this value in runtime mode moves the element to the right.
"Y"	Variable (numeric data type). Defines the Y position (in pixels). Example: `PLC_PRG.iPos_Y`. Increasing this value in runtime mode moves the element downwards.

“Rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle1`. The midpoint of the element rotates at the *“Center”* point. This rotation point is shown as the ⊕ symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.	“Scaling”	Variable (integer data type). Causes centric stretching. Example: `PLC_PRG.iScaling`. The reference point is the *“Center”* property. The value `1` shrinks the element by a factor of `0.001`. The value `1000` returns the element to its original size.	
“Interior rotation”	Variable (numeric data type). Defines the angle of rotation (in degrees). Example: `PLC_PRG.iAngle2`. In runtime mode, the element rotates about the point of rotation specified in *“Center”* according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the ⊕ symbol. Note: If a static angle of rotation is specified in the property *“Position ➔ Angle”*, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.	
You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the "Client Animation" functionality.

See also

- *Chapter 1.4.1.8.18 “Unit conversion” on page 298*

Element property 'State variables'

The variables control the element behavior dynamically.

“Invisible”	Variable (`BOOL`). Toggles the visibility of the element. `TRUE`: The element is not visible at runtime. Example: `bIsVisible` with `VAR bIsVisible : BOOL := FALSE; END_VAR`
“Deactivate inputs”	Variable (`BOOL`). Toggles the operability of the element. `TRUE`: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the *“Support client animations and overlay of native elements”* option in the Visualization Manager.

“Animation duration”	Defines the duration (in milliseconds) in which the element runs an animation ● Variable (`integer value`) Example: `Menu.tContent` with `VAR tContent : INT := 500; END_VAR` ● Integer literal Example: `500` Animatable properties ● *“Absolute movement”*, *“Movement”*, *“X”*, *“Y”* ● *“Absolute movement”*, *“Rotation”* ● *“Absolute movement”*, *“Interior rotation”* ● *“Absolute movement”*, *“Exterior rotation”* The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.
“Move to foreground”	Moves the visualization element to the foreground Variable (`BOOL`) Example: `bIsInForeground` with `VAR bIsInForeground : BOOL := FALSE; END_VAR` `TRUE`: At runtime, the visualization element is displayed in the foreground. `FALSE`: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”	Opens the *“Access rights”* dialog. There you can edit the access privileges for the element. Status messages: ● *“Not set. Full rights.”*: Access rights for all user groups : *“operable”* ● *“Rights are set: Limited rights”*: Access is restricted for at least one group.

1.4.5.20 Reference, visualization style editor

1.4.5.20.1 Dialog 'Create a New Visualization Style'

Symbol: 

Function: The dialog prompts you to specify data for a new created style file.

Call:

- In CODESYS:
  In the *“Visualization Manager”* object (tab *“Settings”*, group *“Style Settings”*):
  Clicking opens a drop-down list. Click *“Create and Edit Derived Style”*.
- In the visualization style editor:
  Menu bar: *“File ➔ New Style”*

“Name”	Name of the new style. Example: `Style_CI`
“Storage location”	Working directory for style editing
“Base style”	Style to base the new style on The drop-down list includes all styles that are installed in the repository. *“<none>”*: The new style does not derive itself from an existing style.
“Visualization profile”	The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing. Example: `CODESYS V3.5 SP9`
Click *“OK”*	The new style is created and opened for editing in the visualization style editor. It already includes all required style entries and the localization in German (language column `de`).

- *Chapter 1.4.5.19.4.2 “Object 'Visualization manager'” on page 1777*
- *Chapter 1.4.5.17 “Applying Visualization Styles” on page 1360*

1.4.5.20.2 Dialog 'Open Existing Style as a Copy'

Function: This dialog prompts you to specify data for copying a style file.

Call:

- In CODESYS:
  In the editor of the *“Visualization Manager”* object (tab *“Settings”*, group *“Style Settings”*, click for a drop-down list). Click *“Copy and Edit Style”*.
- In the visualization style editor:
  Menu bar: *“File ➔ Open as Copy”*

"Style"	Style to be copied. Example: `Basic Style, 3.5.9.0` Note: You can also select a style from the repository.
"Destination"	Working directory for style editing
"OK"	A copy of the style is created and opened for editing in the visualization style editor.

- *Chapter 1.4.5.17 "Applying Visualization Styles" on page 1360*
- *Chapter 1.4.5.20.3 "Editor 'Visualization Style Editor'" on page 2128*
- *Chapter 1.4.5.19.4.2 "Object 'Visualization manager'" on page 1777*

1.4.5.20.3 Editor 'Visualization Style Editor'

Symbol:

Function: The editor is used for creating, deriving, editing, and localizing visualization styles. In addition, it makes it possible to check and install a style or a hierarchy of styles.

Call:

- In CODESYS:
  In the *"Visualization Manager"* object (tab *"Settings"*, group *"Style Settings"*, click for a drop-down list). Click *"Open Style Editor"*.
- Start menu > CODESYS installation folder > 'CODESYS' > 'Visualization Style Editor'

Menu 'File'

"New style"	The *"Create a New Visualization Style"* dialog box opens.
"Open"	The *"Open Dialog"* dialog box opens. This dialog prompts you to select a style file (format `.visustyle.xml`) to be opened and edited.
"Open as copy"	The *"Open Existing Style as Dialog"* dialog box opens. This dialog prompts you to select a style that is copied, saved to the target location, and opened for editing.
"Close"	Closes the style open in the editor.
"Save"	Saves the changes of the open style.
"Save As"	The *"Select Visualization Style(s)"* dialog box opens. This dialog prompts you to select a file to save the current settings.
"Save and Install"	Saves the open visualization style and installs it to the visualization style repository.
"Recently opened files"	Lists the files for selection that were last opened.
"Abort"	Closes the visualization style editor.

See also

- *Chapter 1.4.5.20.1 "Dialog 'Create a New Visualization Style'" on page 2127*

Menu 'Styles' The commands affect the contents of the *"Style Properties"* tab.

"New Entry (as Child) "	Creates another style entry as a child of the selected style property.
"New Entry (Afterwards)"	Creates a new style entry in the list after the selected style property.
"Move Down"	Moves the selected style entry down. Requirement: Sort order is flat.
"Move Up"	Moves the selected style entry up. Requirement: Sort order is flat.
"Sort Order"	Toggles between three sort orders: ● Flat structure and alphabetical order ● Flat structure and order according to the position of the entry in the XML style file This position also determines the position of the property in CODESYS. The property appears, for example, in the *"Properties"* view below the *"Values"* column in the drop-down list for style properties. ● Hierarchical structure of entries Requirement: The names of the style properties contain at least one dash.
"Check"	The settings of the style properties are checked for consistency errors. This check is also performed when saving the style.

Menu 'Localization' The commands affect the contents of the *"Localization"* tab.

"Add Language"	The dialog box *"Add New Language"* opens. The dialog prompts you to specify data for creating a new language column.
"Remove Selected Language"	Removes the columns of the selected cell.
"Rename Selected Language"	The *"Rename Language"* dialog box opens. The dialog is used for renaming the column that defines the selected cell and removes all previous translations.

Table 374: Dialog box "Add New Language"

"Name"	Name of the new language as a language code according to ISO 639-1. Examples: `de`, `en`, `es`, `it`, `fr`, `ja`
"Copy from existing"	All existing language columns are available for selection. The selected language is copied with all entered translations. *"<do not copy text>"*: The new language receives a blank translation column.

Tab 'General' This tab contains the general metadata of the open style file and allows it to be edited.

Table 375: "Identification"

"Company"	Example: `Xy-z GmbH` Tip: In the installed styles, CODESYS can filter by the company names specified here.
"Name"	Example: `Style_A`
" Version"	User-defined version number Example: `1.1.1.1`

Table 376: “General Settings”

“Base style”	Name and version of the style that the open style is based on. Tip: The derived style properties from the base style are highlighted in yellow in the *“Style Properties”* tab.
“Partial style (usable only as base for other visualization styles)”	☑: The style is identified as incomplete. Therefore, it can be used for other styles as a base style only. Example: Style only with color definitions that derive this to many other styles. Note: CODESYS does not check for consistency errors of an incomplete style for itself. ☐: The style is identified as complete.
“From”	The *“Select Base Style”* dialog box opens. This dialog prompts you to select a style file that is saved to the file system (and not does not have to be installed). The file is used as a base style.

Table 377: “Informational”

“Visualization profile”	The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing.

Tab 'Style Properties'

This tab lists the names of the style properties with the associated values and makes it possible to edit it, even by means of the commands in the *“Styles”* menu.

The style properties can be defined for colors, fonts, images, and any values.

The style properties defined in a base style are derived and highlighted in yellow.

“Name”	Name of the style property. If the name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. A name can contain more than one dash.
“Value”	Value that is assigned to the style property.
“Type”	Data type of the style property; selected from a drop-down list. Note: This is possible and necessary only for specific style properties with a data type that is not implicitly defined.
“Attribute”	*“hide”*: The associated style property is not listed in the drop-down lists in CODESYS.
“Used by”	Visualization element that can be configured with this style property. Can be edited.
Comment	Example: `Special setting for Bar Display`. Optional.
Double-click a cell.	An input field opens for editing.
[Del]	Removes the selected row.

Tab 'Localization'

This tab makes it possible to translate the names of the style properties into other languages.

“Name”	Lists the name of the style properties as they are defined in the *“Style Properties”* tab.
“<language>”	Identification of the language name (as language code according to ISO 639-1) in which the style property name should be translated.
Double-click a cell.	An input field opens for editing.

1.4.5.21 Tutorial

Here you find instructions specific to different use cases.

This collection of instructions is expanded regularly.

1.4.5.21.1 CODESYS visualization - first steps

If you are not yet familiar with the CODESYS visualization, we recommend the *application example*. The example demonstrates the main features of visualization and provides insights into possible use cases.

1.4.5.21.2 Show instance names

For complex visualizations, it can be helpful if the instance names are displayed within the visualization. How to show instance names is described in the *application example*.

1.4.5.21.3 Visualizing a Refrigerator Controller

This tutorial demonstrates how to add visualizations to the project and link the elements of the visualization to the variables of the control program.

Preparation

This tutorial is based on the sample program `RefigeratorControl`, which was created in the "Your First Program in CODESYS" chapter. The finished program can also be found in the installation directory of CODESYS, in the "Projects" subfolder.

See also

- *Your First CODESYS Program*

Creating the visualizations

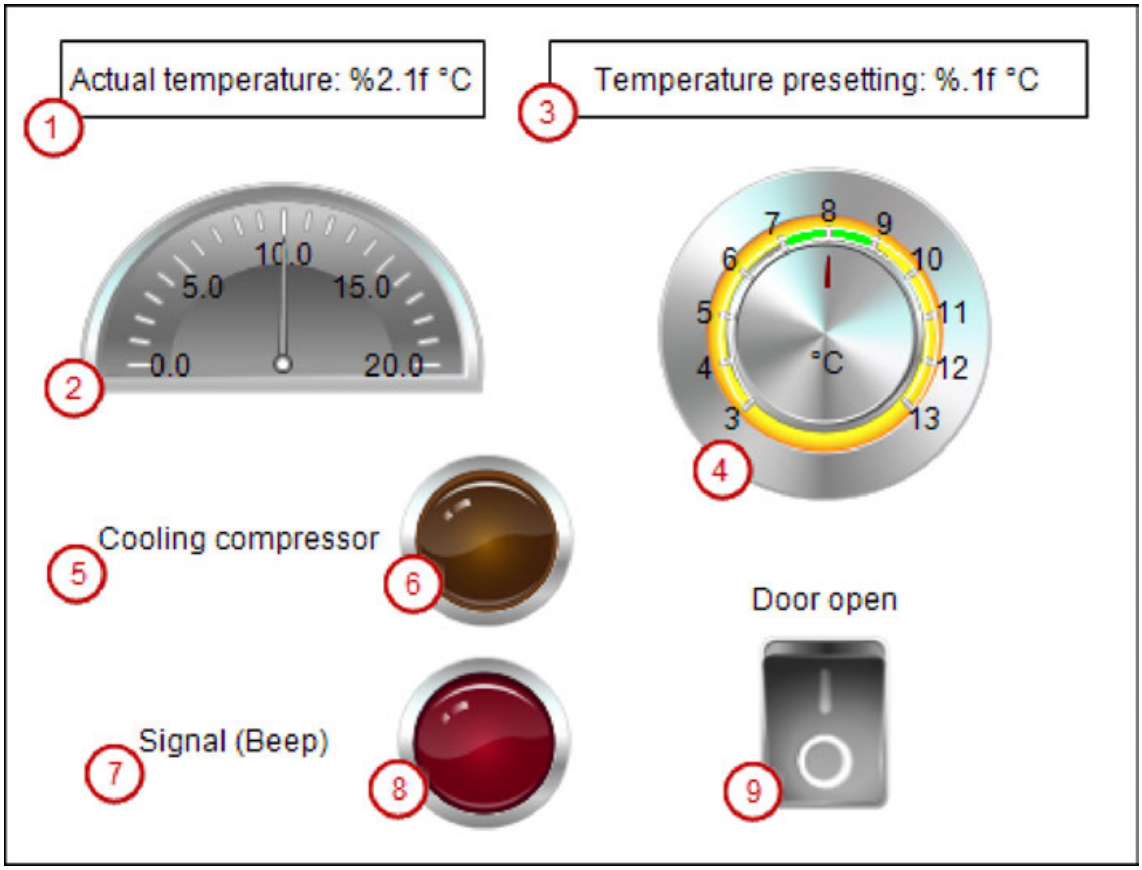
The visualization consists of the following three visualization screens:

- `Visualization`: Control elements and display of the refrigerator
- `Diagnosis`: History of the set and actual temperature, parameter settings
- `Live Visu`: Animation with refrigerator

1. Select the *“Application”* object in the device tree.
2. Click *“Project ➔ Add Object ➔ Visualization”*.
3. Specify `Live_Visu` as the name.
4. Create two more visualizations with the names `Diagnosis` and `Visualization`.

Structure of the visualization
`Visualization`

This screen consists of control and display elements that control the refrigerator.



- (1) Numeric display of the actual temperature
- (2) Pointer to display of the actual temperature
- (3) Numeric display of the set temperature
- (4) Potentiometer for setting the set temperature
- (5) Label for compressor lamp
- (6) Lamp for compressor on
- (7) Label for signal lamp
- (8) Lamp for signal "Close doors"
- (9) Switch for opening and closing the refrigerator door

1. Open the visualization `Visualization` in the editor.
2. Drag a *"Rectangle"* visualization element to the editor.

   Change the following properties

   - *"Texts ➔ Text"*: `Actual temperature: %2.1f °C`
   - *"Text variables ➔ Text variable"*: `Glob_Var.rTempActual`
3. Drag a *"Meter 180°"* visualization element to the editor.

   Change the following properties

   - *"Value"*: `Glob_Var.rTempActual`
   - *"Scale ➔ Scale end"*: 20
   - *"Scale ➔ Main scale"*: 5
   - *"Scale ➔ Subscale"*: 1
4. Drag a *"Rectangle"* visualization element to the editor.

   Change the following properties

   - *"Texts ➔ Text"*: `Temperature presetting: %.1f °C`
   - *"Text variables ➔ Text variable"*: `Glob_Var.rTempSet`

5. Drag a *"Potentiometer"* visualization element to the editor.

   Change the following properties

   - *"Variable"*: `Glob_Var.rTempSet`
   - *"Background ➔ Background color"*: *"yellow"*
   - *"Pointer ➔ Color"*: *"red"*
   - *"Scale ➔ Subscale position"*: *"Outward"*
   - *"Scale ➔ Scale start"*: 3
   - *"Scale ➔ Scale end"*: 13
   - *"Scale ➔ Subscale"*: 1
   - *"Scale ➔ Main scale"*: 1
   - *"Label ➔ Unit"*: °C
   - *"Label ➔ Scale format (C syntax)"*: %.0f
   - *"Label ➔ Max. text width of labels"*: 21
   - *"Label ➔ Height of labels"*:15

6. Drag a *"Label"* visualization element to the editor.

   Change the following properties

   - *"Texts ➔ Text"*: `Cooling compressor`

7. Drag a *"Lamp"* visualization element to the editor. Position it behind the text `Cooling compressor`.

   Change the following properties

   - *"Variable"*: `Glob_Var.bCompressor`

8. Drag a *"Label"* visualization element to the editor.

   Change the following properties

   - *"Texts ➔ Text"*: `Signal (beep)`

9. Drag a *"Lamp"* visualization element to the editor. Position it behind the text "Signal (beep)".

   Change the following properties

   - *"Variable"*: `Glob_Var.bSignal`
   - *"Background ➔ Image"*: `Red`

10. Drag a *"Rectangle"* visualization element to the editor.

    Change the following properties

    - *"Texts ➔ Text"*:`Door open`

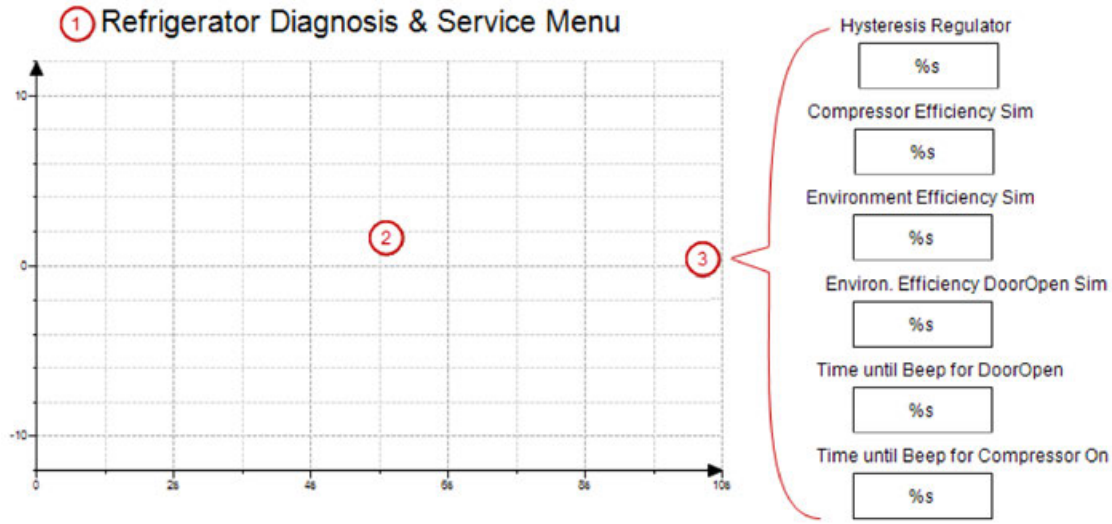
11. Drag a *"Rocker Switch"* visualization element to the editor.

    Change the following properties

    - *"Variable"*: `Glob_Var.rDoorOpen`

Structure of the visualization
`Diagnosis`

In this screen, you can monitor the temperature curve and optimize the parameters.



- (1) *"Label"* elements for the heading
- (2) *"Trace"* element for displaying the temperature curve
- (3) *"Rectangle"* elements for displaying the values

1. Open the visualization `Diagnosis` in the editor.
2. Drag a *"Label"* visualization element to the editor.

   Change the following properties

   - *"Texts ➔ Text"*: Refrigerator Diagnosis & Service Menu
   - *"Text properties ➔ Font"*: Arial, Standard, 18
3. Drag a *"Trace"* visualization element to the editor.
4. Click the `Diagnosis_Trace1` value of the *"Trace"* property.

   ⇨ The *"Trace Configuration"* dialog opens.
5. Select the *"MainTask"* in *"Task"*.
6. Click the *"Add Variable"* link.

   ⇨ A variable is added to the trace. The variable settings are displayed in the dialog.
7. Select `Glob_Var.bCompressor` for the variable.
8. Add the `Glob_Var.rTempSet` and `Glob_Var.rTempActual` variables to the trace. For the other settings, you can use the default values.
9. Click *"OK"* to exit the dialog.
10. Drag a *"Rectangle"* visualization element to the editor. Position it on he right next to the trace element.

    Change the following properties

    - *"Texts ➔ Text"*: %s
    - *"Text variables ➔ Text variable"*: PLC_PRG.rHysteresis
11. Configure the *"OnMouseDown"* input configuration of the element. Click *"Input configuration ➔ OnMouseDown ➔ Configure"*.

    ⇨ The *"Input Configuration"* dialog opens.
12. Assign the *"Write Variable"* command to the action. Accept the default values and click *"OK"*.
13. Drag a *"Label"* visualization element to the editor. Position it over the first rectangle.

    Change the following properties

    - *"Texts ➔ Text"*: Hysteresis Regulator

14. Adjust the size and position of both elements.
15. Select both of the *“Rectangle”* and *“Label”* elements and duplicate them by means of copy and paste.
16. Adjust the labels and variables of the copied elements.
    - *“Text”*: `Compressor Efficiency`, *“Text variable”*: `Simulation.P_Cooling`
    - *“Text”*: `Environment Efficiency`, *“Text variable”*: `Simulation.P_Environment`
    - *“Text”*: `Environ. Efficiency DoorOpen Sim`, *“Text variable”*: `Simulation.P_EnvironmentDoorOpen`
    - *“Text”*: `Time until Beep for DoorOpen`, *“Text variable”*: `Glob_Var.timDoorOpenThreshold`
    - *“Text”*: `Time until Beep for Compressor On`, *“Text variable”*: `Glob_Var.timAlarmThreshold`

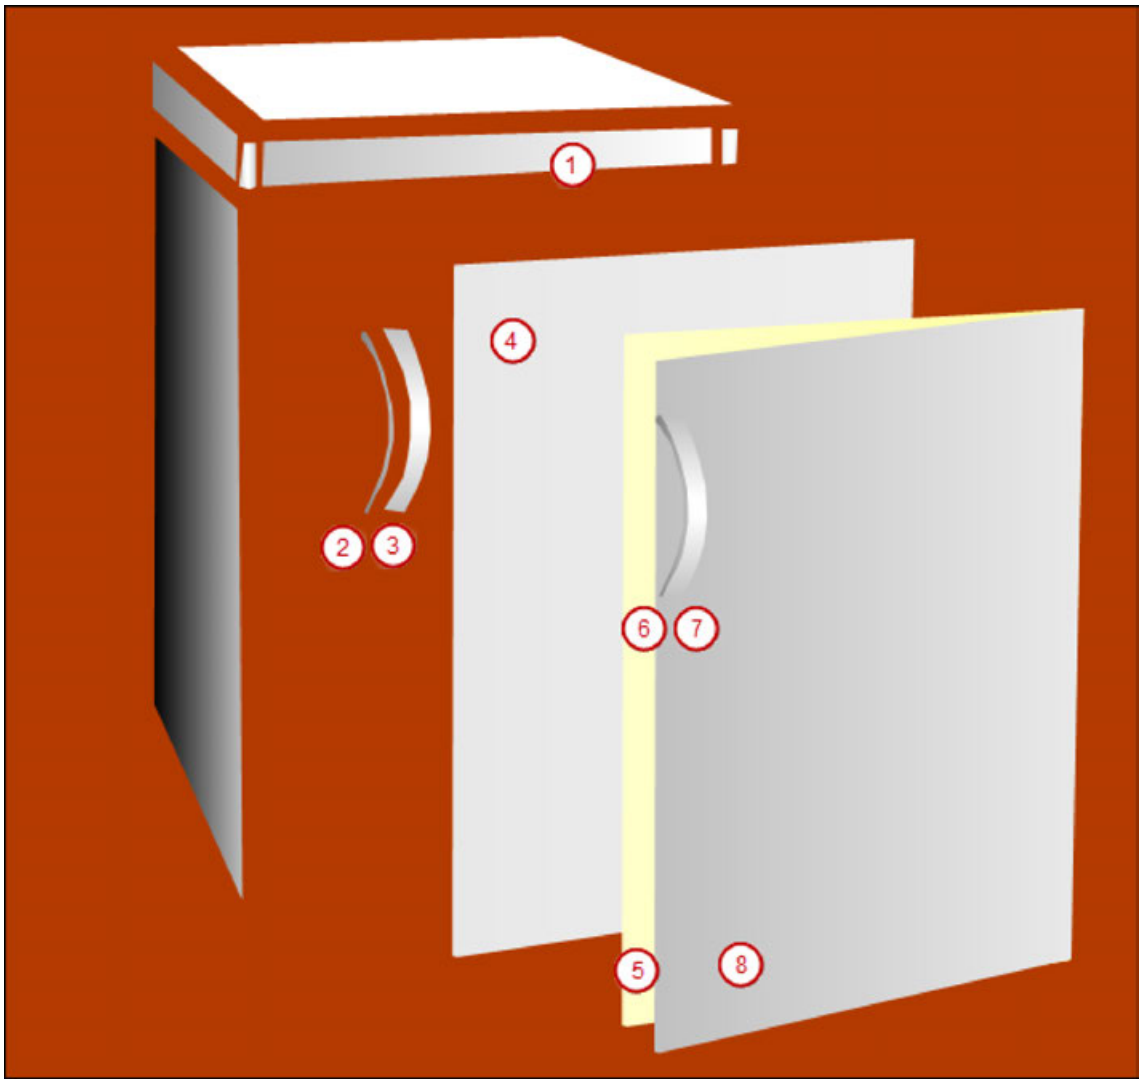
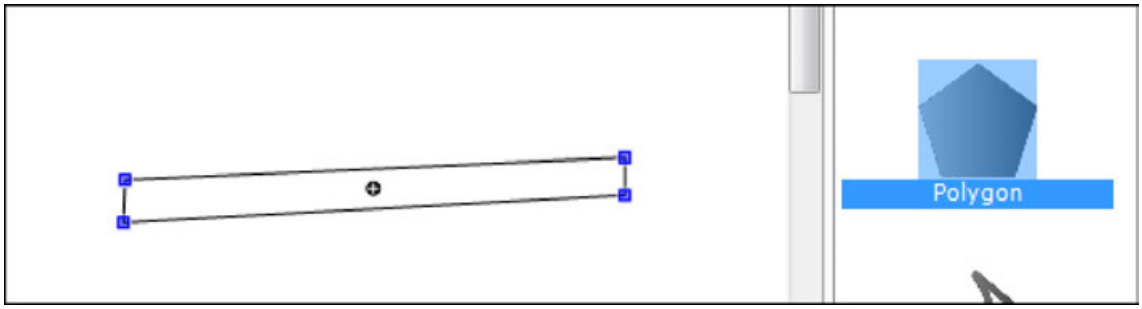
Structure of the visualization 'Live Visu'

This screen includes the representation of a refrigerator. The refrigerator consists of several polygon type visualization elements. The doors of the refrigerator are drawn in both the closed and open states. Both doors consist of a group of single elements.



1. Open the `Live_Visu` visualization in the editor.
2. Select the *“Polygon”* visualization element in the *“Visualization Toolbox”* view.

3. Click several times in the editor to create a surface. Right-click to stop adding corner marks.
4. Move the corner marks to the required position so that the element (1) is formed.



5. Select the element.

   Change the following properties:

   - *"Colors ➔ Use gradient color"*: ☑
   - *"Appearance ➔ Line style"*: *"Invisible"*

6. Click the *"Colors ➔ Use gradient color"* property.
7. Select the color *"Gray"* for *"Color 1"* in the *"Gradient Editor"* dialog.

8. Create all other elements with the *"Polygon"* visualization element.
9. Group the elements of the closed doors (2+3+4) and the open doors (5+6+7+8). To do this, press the *[Shift]* key and click *"Visualization ➔ Group"* to select the elements.
