10. Move the elements together so that the completed refrigerator is formed. Position the open doors precisely on the closed doors.
11. Select the "Open doors" group.
12. In the properties, double-click the input field *"State variable ➔ Invisible"*.
13. Press *[F2]* to open the Input Assistant.
14. Select the `rDoorOpen` variable in the *"Variables"* category (below *"Application ➔ Glob_Var"*).
15. Negate the variable with `NOT` (--> NOT Glob_Var.rDoorOpen).

    ⇨ If the `rDoorOpen` variable is FALSE (door is closed), then the element is invisible. Then the underlying doors are visible.

16. Copy the following elements from the `Visualization` screen:

    - Potentiometer for setting the temperature
    - Rectangle for displaying the set temperature
    - `Door open` switch
    - `Cooling compressor` lamp
    - `Signal (beep)` lamp

17. Insert the elements from the clipboard to the `Live_Visu` visualization screen.

18. Reduce the elements and position them on the refrigerator.

Visualization in online mode (simulation)

When the visualization is complete, test it in simulation mode.

1. Click *“Online ➔ Simulation”*.
2. Click *“Online ➔ Login”*.
   ⇨ A dialog opens and prompts you to create and download the application.
3. Click *“Yes”* to confirm the dialog.
4. Click *“Debug ➔ Start”*.
5. Open the visualization `Live_Visu` in the editor.
   ⇨ The refrigerator is in online mode.
6. Open the doors with the switch and monitor the temperature and the alarms. Change the parameters in the screen `Diagnosis` and watch the reaction in the temperature curve.

1.4.5.21.4 Displaying Array Data in a Histogram

Setting element properties for the histogram

Requirements

- A project contains a visualization object and a program.
- A one-dimensional array is declared in the program (example: `histogram : ARRAY[1...10] OF INT;`).
- In the program, `histogram` data is assigned to the array (example: within the range from `0` to `50`).

☑

1. Double-click the *"Visualization"* object in the device tree.
2. In the *"Visualization Toolbox"* view, click *"Measurement Controls"* and drag the *"Histogram"* element to the visualization editor.
3. In the visualization editor, click the inserted *"Histogram"*.

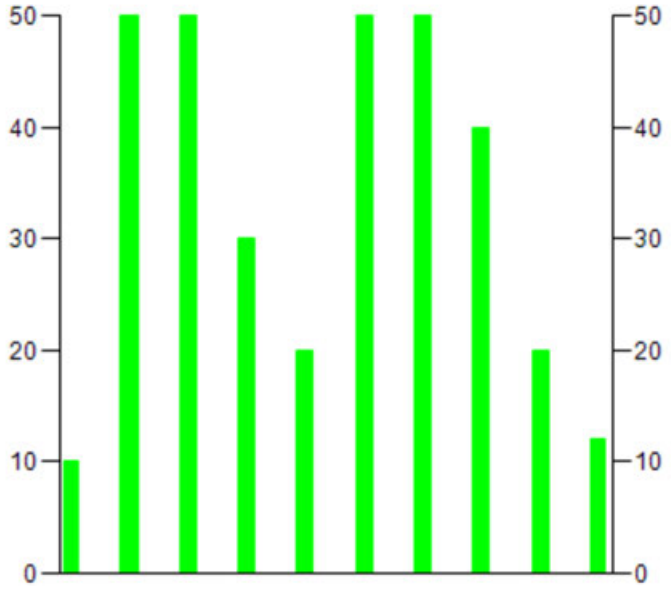
   ⇨ The *"Properties"* view opens.
4. In the *"Properties"* view, double-click the *"Value"* input field in the *"Data array"* element property. Then click ...
5. In the *"Input Assistant"* dialog in the *"Variables"* category of the *"PLC (PRG)"* program, select the array (example here: `histogram : ARRAY[1..10] OF INT;`) and click *"OK"*.
6. To display only part of the array as a histogram, activate the *"Use subrange"* option and specify the index values of the array in *"Start index"* and *"End index"* to define the subrange.
7. Select the *"Display type"* (example: *"Bar"*).
8. Specify a value between `1` and `100` (example: `30`) for the *"Relative bar width"*.
9. Click the histogram in the visualization editor and change the size and position as desired.

   ⇨ The *"Position"* property changes its values accordingly.
10. Specify the values for the *"Scale"* element property. Select the values for *"Scale start"* and *"Scale end"* so that the array is displayed completely. For the example: *"Scale start"* `0`, *"Scale end"* `50`.

    For the distance between values on the main scale, specify the value `10`, for example, in *"Main scale"*.
11. In the *"Label"* element property, specify the *"Unit"* for the display values.
12. Click *"Build ➔ Generate Code"*.

13. If the project has been compiled without errors, then click *“Online ➔ Login”* and click *“Debug ➔ Start”* to start the application.

    ⇨ The histogram is displayed in the visualization as follows:



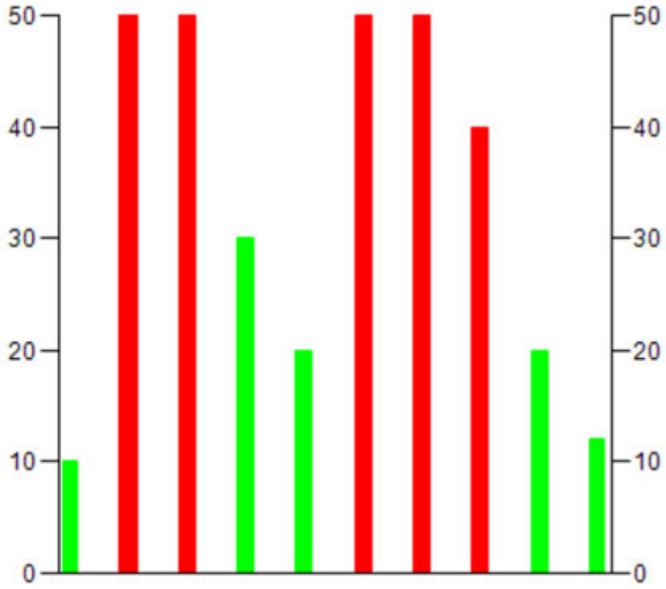
Defining alarm colors for the histogram

☑ The visualization displays a histogram with bars all the same color (example: green). Now you want the bars with values less than `30`, for example, to be displayed in another color (example: red).

1. Click the element property *“Colors ➔ Alarm color”*.
2. Specify the limiting value in *“Alarm value”* above or below which the bars should be displayed in another color.
3. Select *“More”* from the list box in *“Alarm condition”* if all values greater than the *“Alarm value”* should be displayed in another color. Otherwise, select *“Less”*.
4. Select an *“Alarm color”* (example: *“Red”*).
5. Click *“Build ➔ Generate Code”*.

6. If the project has been compiled without errors, then click *“Online ➔ Login”* and click *“Debug ➔ Start”* to start the application.

   ⇨ In the example histogram, all bars with values greater than `30` are displayed in red.



See also

- *Chapter 1.4.5.19.5.29 “Visualization Element 'Histogram'” on page 2019*

1.4.5.21.5 Displaying Array Variables in Tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element *“Table”* for this.

In the configuration of the element *“Table”*, enter an array variable in the property *“Data array”*. The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the `MYSTRUCT` DUT and the declarations in the `PLC_PRG` program.

```
TYPE MYSTRUCT :
    STRUCT
        iNo : INT;
        bOnStock : BOOL;
        strPartNumber : STRING;
    END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
    arrStruct : ARRAY[0..6] OF MYSTRUCT;
    iSelectedColumn : INT;
END_VAR
```

1. Drag the *"Table"* visualization element to the visualization editor.
2. Assign the array variable `arrStruct` to the *"Data array"* property.
   ⇨ The structure members are displayed as column headings and the array index as row headings.
3. Change the *"Columns ➔ Column ➔ [0] ➔ Column header"* property to an informative heading (example: `Number`).
4. Change the heading of column [1] to `in stock` and column [2] to `Part number`. Adjust the column width.
5. Assign a color to the *"Selection ➔ Selection color"* property.
6. Define the *"Selection ➔ Selection type"* property as `Row selection`.
7. In the *"Selection ➔ Variable for selected row"* property, define the `PLC_PRG.iSelectedColumn` variable.
   ⇨ The following display results in online mode:

	Number	in Stock	Part Number
0	0	FALSE	
1	0	FALSE	
2	0	FALSE	
3	0	FALSE	

See also

- ↳ *Chapter 1.4.5.19.5.13 "Visualization Element 'Table'" on page 1909*

1.4.5.21.6 Displaying Web Contents

Displaying web-sites in a visual-ization

☑ Requirement: A visualization open in a CODESYS project. The *"Visualization Toolbox"* and *"Properties"* views of the visualization are also open.

1. Drag the *"Web Browser"* element from *"Special Controls"* to the visualization editor.
2. Select the element in the editor.
   ⇨ In the *"Properties"* view, the element properties are listed for the *"Web Browser"* element.
3. In the *"Position"* property, specify the size (in pixels) for the *"Width"* and the *"Height"* (example: `600`).
4. In *"Control variables ➔ URL"*, specify the URL for the website (example: `'http://de.wikipedia.org'`). You can also specify a variable here (`STRING` or `WSTRING`) where the URL is assigned in the project.
5. In *"Control variables ➔ Display"*, specify a Boolean variable (example: `bSetURL`).
   ⇨ If the variable `bSetURL` has the value `TRUE`, then the website `'http://en.wikipedia.org'` is displayed at runtime.

Configuring the buttons for forward and back navigation of the website

☑ Requirement: The *"Web Browser"* element of your visualization is configured as described above.

1. In a POU, declare both Boolean variables `bGoBack` and `bGoForward`.
2. In the visualization editor, click the *"Web browser"*.
3. For the property *"Control variables ➔ Back"*, select the variable `bGoBack` from the Input Assistant. For the property *"Control variables ➔ Forward"*, select the variable `bGoForward`.
4. In *"General Controls"*, add the *"Button"* element to your visualization two times.
5. Click a *"Button"* in the visualization editor and drag the *"Button"* to the required position (for example above the *"Web Browser"* element).
6. In the property *"Texts ➔ Text"*, specify the character `>`. In *"Text properties ➔ Font"*, select a font from the Input Assistant (example: `Arial, Bold, 14`).
7. Configure the property *"Input configuration ➔ OnMouseClick"* so that the variable `bGoForward` switches.
8. Configure the second button for back navigation in the same way as described in Steps 5 to 7.

   ⇨ If the variable `bSetURL` has the value `TRUE`, then the website `'http://de.wikipedia.org'` is displayed with the forward and back buttons. When you click the buttons, navigation to the previous and next websites is successful.

See also

- ↳ *Chapter 1.4.5.19.5.38 "Visualization Element 'Web Browser'" on page 2065*
- ↳ *"Input action 'Toggle Variable'" on page 1758*

1.4.5.21.7 Using Client Animation

The example shows a visualization with 3 screens. A menu controls the navigation of the screens. The menu is hidden until it moves into view by means of a hamburger button. During the movement, the transparency of the menu is changed. After the screen is selected, the menu moves back out of view. The animation is computed entirely on the target system. The CODESYS visualization only defines the target values (positions, transparency).

1. Preparation

1. Create a new standard project with the CODESYS Control Win V3 controller.
2. Add a *"Visualization"* object below the *"Application"*. Choose the name `Visu_Main`.
3. Open the Visualization Manager in the editor and select the *"Support client animations and overlay of native elements"* option.

2. Creating the PLC_PRG program

The program checks whether the menu button has been pressed. If the menu bar is not visible (position –300), then the position is moved to the visible area (0). If the menu bar is already visible (position 0), then the position is moved to the hidden area.

1. Open the *“PLC_PRG”* program in the editor.
2. Input the following code into the declaration editor:

```
PROGRAM PLC_PRG
VAR
    iSelection : INT;                   // to switch the
referenced visualization page
    xVisible: BOOL;                     // auxiliary variable to
toggle the menu bar
    iMenuPos : INT := -300;             // position of the menu bar
    xToggle: BOOL;                      // button variable to
toggle the menu bar
END_VAR
```

3. Input the following code into the implementation:

```
IF xToggle THEN
    xToggle := FALSE;
    IF xVisible THEN
        xVisible := FALSE;
        iMenuPos := -300;
    ELSE
        xVisible := TRUE;
        iMenuPos := 0;
    END_IF
END_IF
```

3. Creating the menu bar

The menu bar has 3 menu items. A visualization screen is displayed by clicking the corresponding menu item.

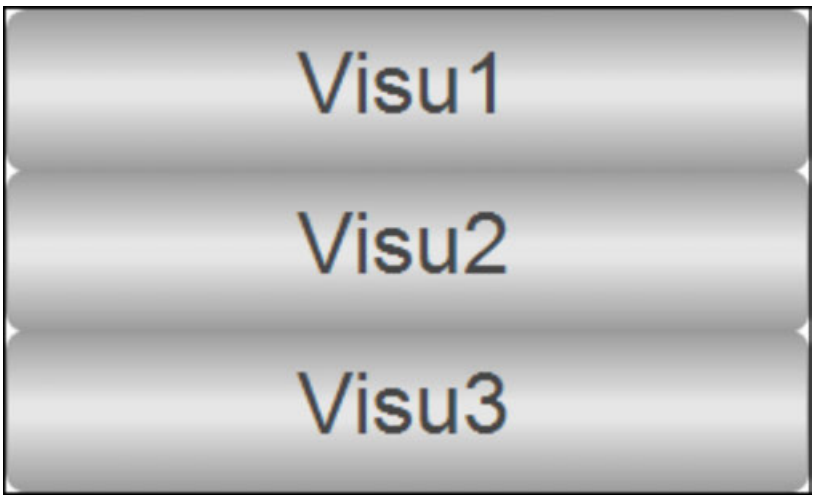
1. Insert a *“Visu_Menu”* visualization below the application.
2. Open the object properties. In the *“Visualization”* tab, set the *“Visualization size”* to a *“Width”* of 300 and a *“Height”* of 180.
3. Open the visualization in the editor.
4. Select the *“Advanced”* option in the *“Properties”* view.
5. In the upper left corner, add a button with a *“Width”* of 300 and a *“Height”* of 60.
6. Label the button as "Visu 1". Set the font size to 24.
7. Open the *“Input configuration ➔ OnMouseClick”* property.
8. Select the *“Execute ST code”* action.
9. Input the following ST code:

```
PLC_PRG.iSelection := 0;
PLC_PRG.xToggle := TRUE;
```

10. Set the *“Button state variable ➔ Digital variable”* property to `PLC_PRG.iSelection=0`
11. Add two more buttons named "Visu 2" and "Visu 3".

12. Edit the button properties of "Visu2" (PLC_PRG.iSelection = 1) and "Visu3" (PLC_PRG.iSelection = 2).

    ⇨ Result:



4. Creating more visualization screens

1. Insert the "Visu1" visualization below the application.
2. Open the object properties. In the *"Visualization"* tab, set the *"Visualization size"* to a *"Width"* of 800 and a *"Height"* of 600.
3. Change the background color of the screen (for example, light gray).
4. Insert a *"Label"* object into the visualization screen and name the element (example: "Visu 1").
5. Insert two more visualizations "Visu2" and "Visu3" below the application. Edit the properties in the same way as for "Visu1".

5. Creating the main visualization screen

On this screen, you can see the menu bar and a button to show or hide the menu bar. The different visualization screens are navigated in a *"Frame"* visualization element.

1. Open the properties of the *"Visu_Main"* visualization. In the *"Visualization"* tab, set the *"Visualization size"* to a *"Width"* of 800 and a *"Height"* of 600.
2. Open the visualization in the editor.
3. Insert a *"Frame"* element into the visualization.

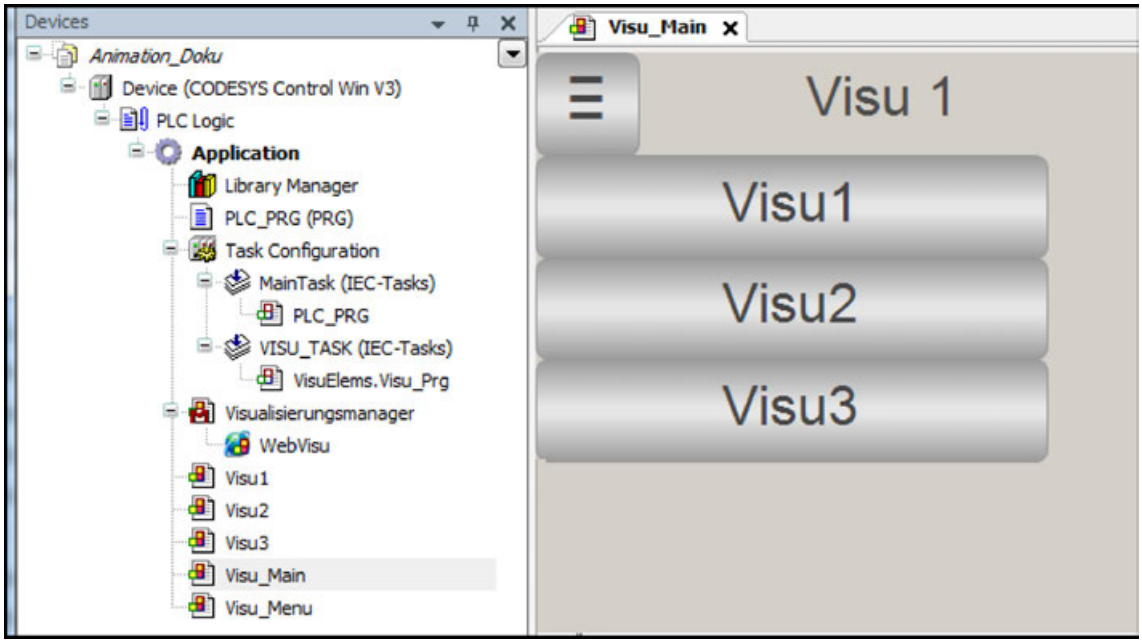
   ⇨ The *"Frame Configuration"* dialog opens.
4. Add the *"Visu1"* (Index 0), *"Visu2"* (Index 1), and *"Visu3"* (Index 2) visualizations.
5. Set the property values of *"Position"* as follows: *"X"* = `0`, *"Y"* = `0`, *"Width"* = `800`, and *"Height"* = `600`.
6. Set the property value of *"Switch frame variable ➔ Variable"* to `PLC_PRG.iSelection`.
7. Insert a *"Button"* element into the visualization.
8. Set the property values of *"Position"* as follows: *"X"* = `0`, *"Y"* = `0`, *"Width"* = `800`, and *"Height"* = `600`.
9. Set the property value of *"Texts ➔ Text"* to `=`.
10. Set the property value of *"Text properties ➔ Font"* to `Arial; 36`.
11. Open the *"Input configuration ➔ OnMouseClick"* property.

12. Select the *“Execute ST code”* action.
13. Input the following ST code:

    ```
    PLC_PRG.xToggle := TRUE;
    ```

14. Set the property value of *“Button state variable ➔ Digital variable”* to `PLC_PRG.xVisible`.
15. Insert the *“Visu_Menu”* visualization element from the *“Current Project”* category into the visualization.
16. Set the property values of *“Position”* as follows: *“X”* = `0`, *“Y”* = `0`, *“Width”* = `300`, and *“Height”* = `180`.
17. Set the property value *“Absolute movement ➔ Movement ➔ X”* to `PLC_PRG.iMenuPos`.
18. Set the property value of *“State variables ➔ Invisible”* to `not(PLC_PRG.xVisible)`.
19. Set the property value of *“Animation duration”* to `2000`.

    ⇨ Result:



See also

- *Chapter 1.4.5.19.5.6 “Visualization Element 'Frame'” on page 1856*

6. Downloading the project to the controller and starting the WebVisu

1. Build the project and download it to the PLC.
2. Start the project.
3. In the browser, connect to the visualization (`http://localhost:8080`).

   ⇨ The WebVisu connects to the controller and the visualization opens.
4. In the visualization, click the menu button.

   ⇨ The menu moves into view.

5. Select a menu item.
   ⇨ The visualization screen is selected and the menu moves back out of view.

1.5 Libraries and solutions

1.5.1 Information on libraries

System libraries

When upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically. Older library versions will be removed as coexistence of a new library version and an older library version is not possible. Check the available library version in the Library Manager.

Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.

As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.

↳ *Chapter 1.6.2.9 “Converting an AC500 V2 project to an AC500 V3 project” on page 2430*

Customer libraries

Target change from AC500 V2 to AC500 V3

After a target change from AC500 V2 to AC500 V3 the customer libraries have to be converted manually using the Library Converter . For further information see ↳ *Chapter 1.6.6.1.3 “Later change-over of a target system” on page 3648*.

Some Standard CODESYS libraries are automatically converted during the target change.

Documentation for libraries

- Description for the use of and information about selected libraries ↳ *Chapter 1.5 “Libraries and solutions” on page 2146*.
- Reference for function blocks, functions, structures etc. ↳ *Chapter 1.10 “Reference, function blocks” on page 4292*

1.5.2 Reference to CODESYS (V3)

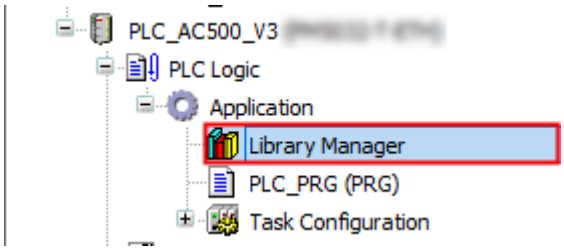
Note that CODESYS V3 libraries are used.

For information on programming, see ↳ *Chapter 1.4.1.16.1 “Information for Library Developers” on page 449*.

1.5.3 Library Manager functionality

The Library Manager contains descriptions of libraries and function blocks.

In the Automation Builder the Library Manager is located under the node *“Application”*.



The Library Manager offers a wide array of functionality for the user. Use cases and how to handle the function blocks of a certain library is described in application examples:

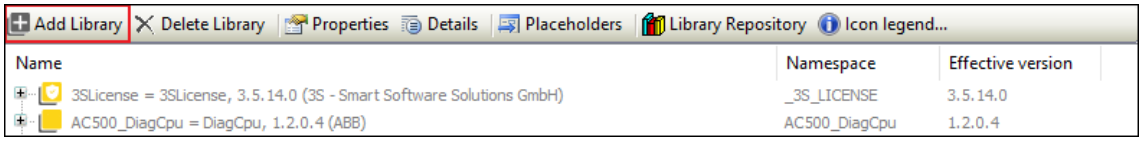
- *StringUtils library*.

1.5.3.1 Search function

In the Library Manager the search function allows you to quickly find any library or function.

To search for a library or function:

1. Select *“Add Library”*.



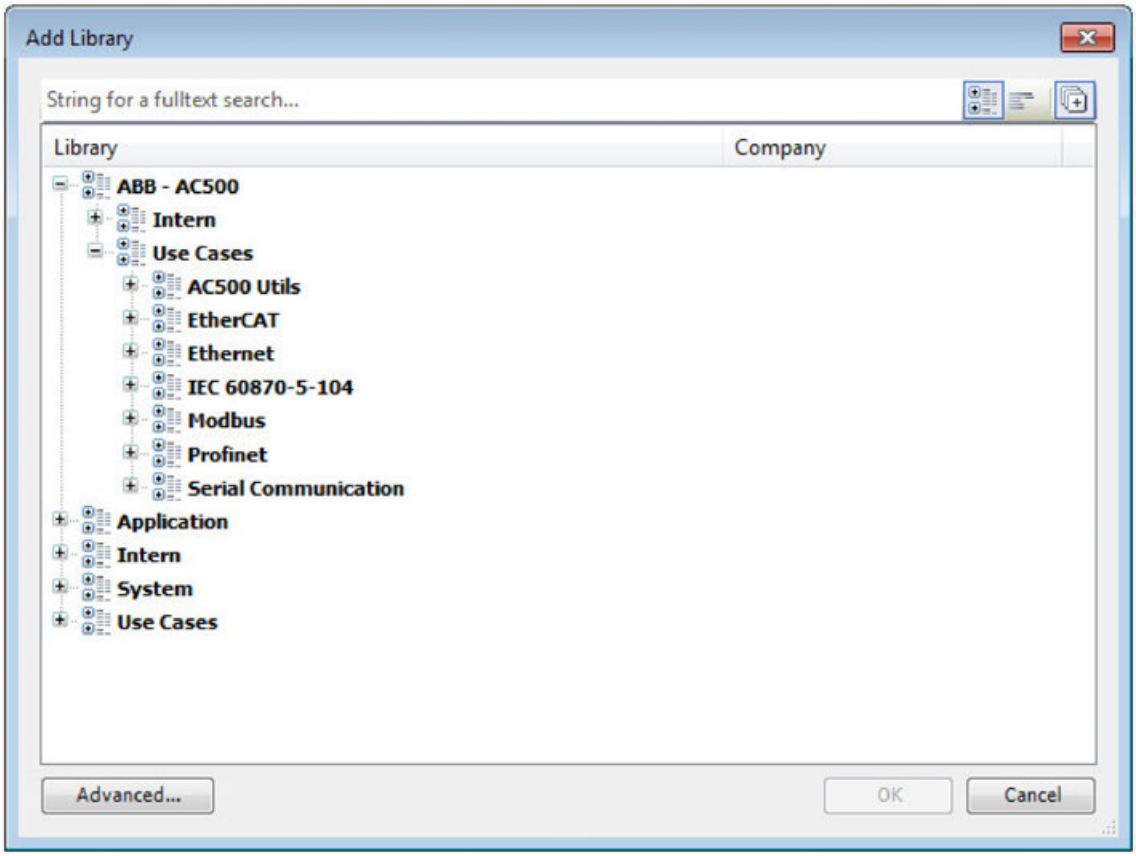
⇨ The Add Library Window opens and a list of all available libararies is displayed.

Libraries in folder *“ABB - AC500”* are created by ABB and tested in combination with Automation Builder.

We recommend to use libraries of subfolder *“Use Cases”* for your project.

Libaries in subfolder *“Intern”* are necessary for internal procedures.

All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libaries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.



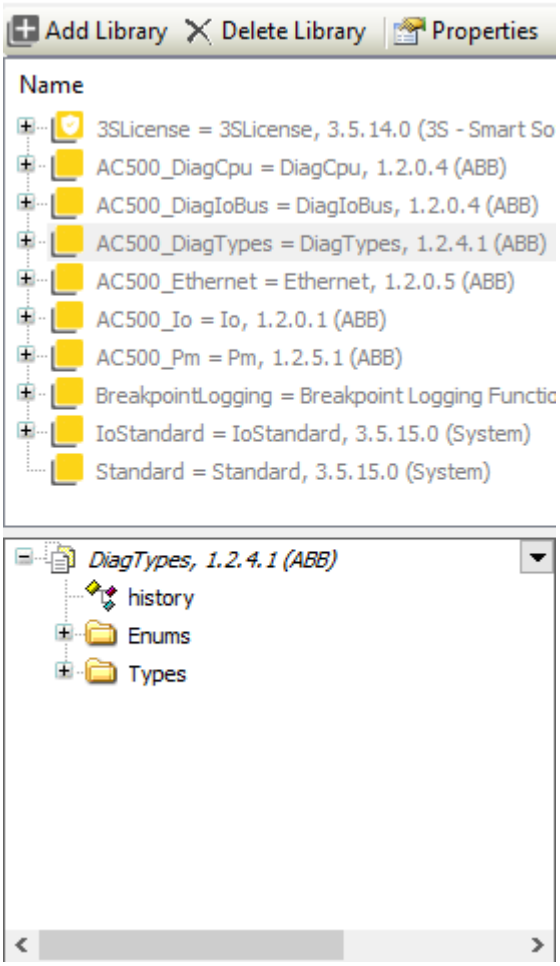
2. Enter the name of the library or function you are searching for.

1.5.3.2 View embedded documentation of all libraries

In the Library Manager you can view embedded documentation of any ABB and 3S libraries.

Precondition: Library must be available in Library Manager.

1. Select a library.
   ⇨ The contents of the library are shown.



2. From the contents select an object.
   ⇨ The corresponding documentation is opened.

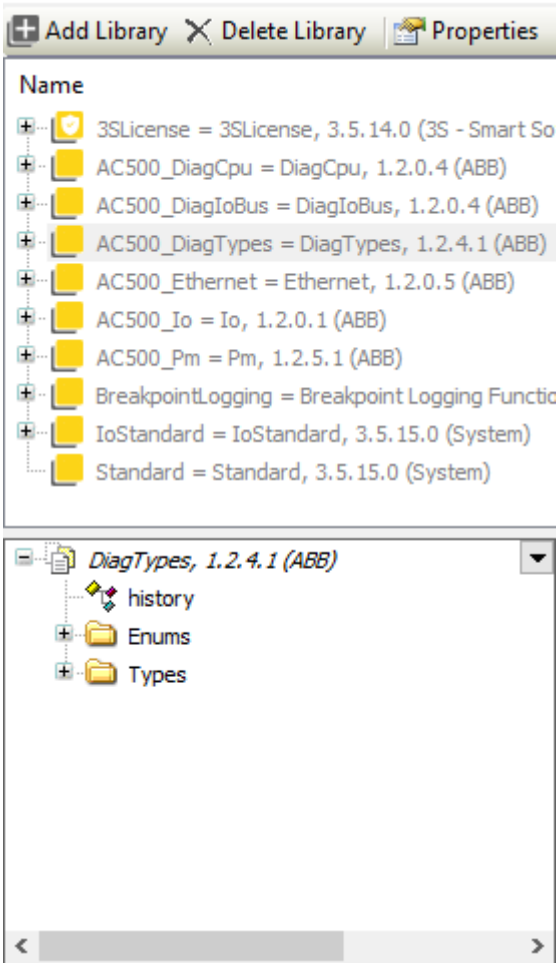
1.5.3.3 Access version history

The Library Manager allows you to access the version history of ABB libraries.

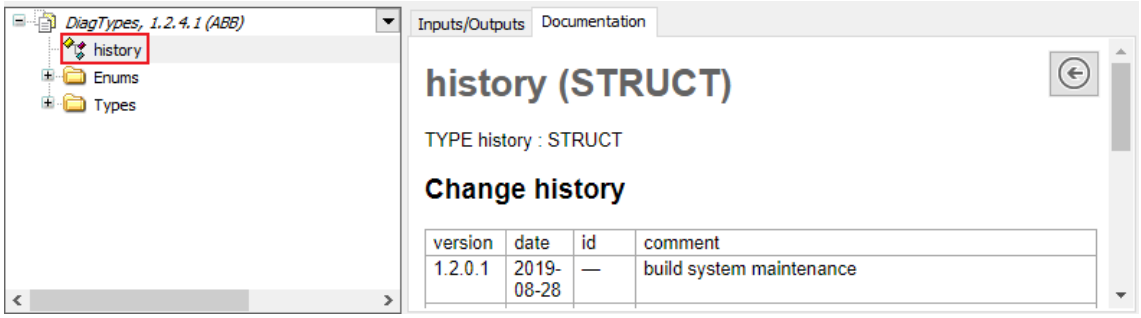
The version history is not available for non ABB libraries

To access the version history of an ABB library:

1. Select a library.
   ⇨ The contents of the library are shown.



2. Select *“history”*.
   ⇨ The version history is shown.

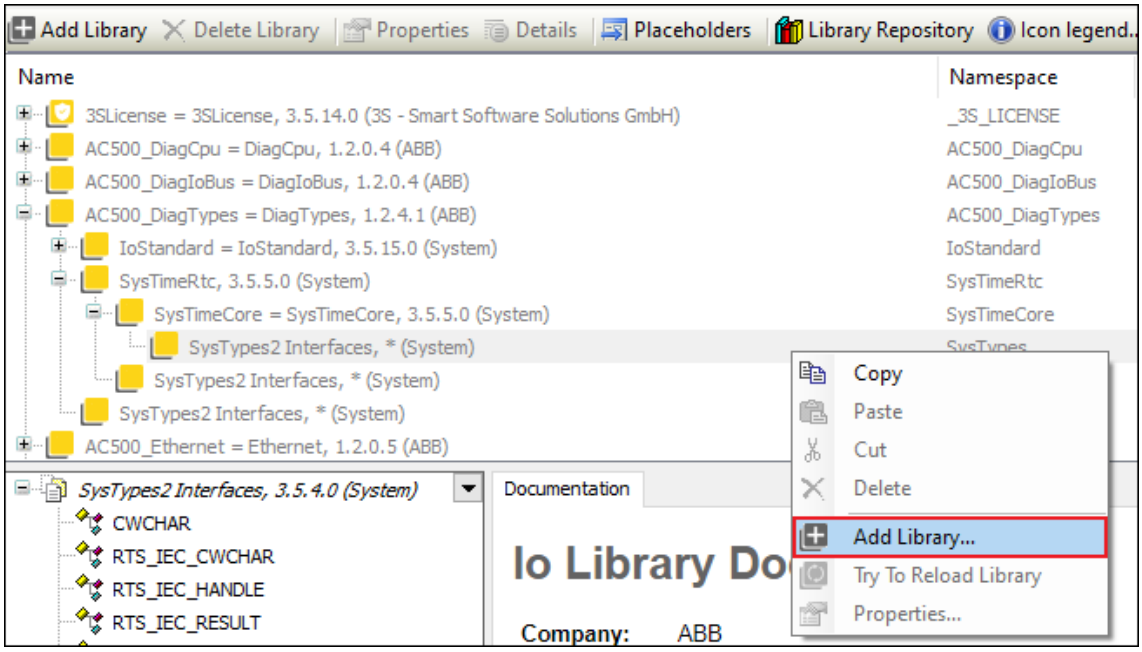


1.5.3.4 Add user defined libraries

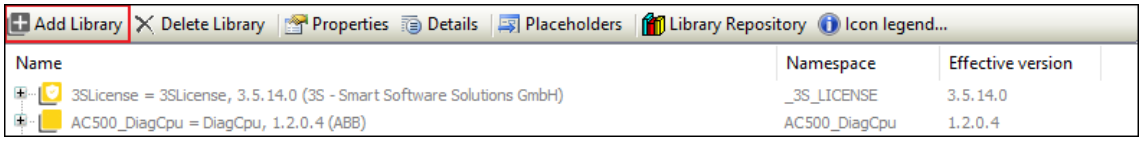
If there are any unresolved library references, you can add user defined libraries.

To add libraries:

1. Right-click on a library.
2. Select *“Add Library”*.



⇨ The Add Library Window opens.



3. Choose the library you want to add.

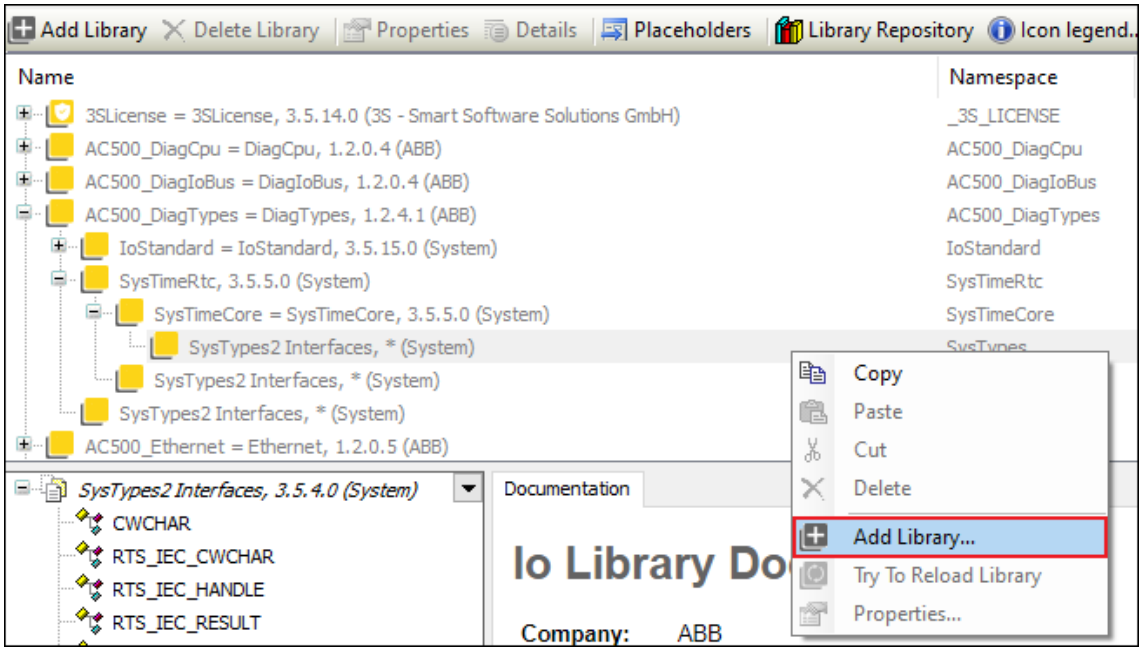
1.5.3.5 Download missing libraries

The Library Manager allows you to automatically download missing 3S libraries from the project that are not available from the library repository.

To download missing libraries:

1. Select *“Download missing libraries”*.

   ⇨ The 'Download missing libraries' window is opened.



2. Select which libraries you want to download.

1.5.4 ACS/DCS drives libraries

1.5.4.1 Introduction

1.5.4.1.1 Scope of the document

The purpose of system technology document is to give an overview and explain the overall concepts of the Drives library in V3. The library contains function blocks to establish communication, to control the ABB ACS / DCS drives from AC500 V3 PLCs.

1.5.4.1.2 Safety instructions and preconditions to use drives library

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the devices you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 in the online help in Automation Builder.
- Read the user information of the devices and functions you are using, see online help in Automation Builder.
- Installation and commissioning of the drive(s) is not part of this document nor the online help of Automation Builder. Installation and commissioning of the drive(s) must be done according to the related drives manuals and safety instructions.

The library package has been released for the software and firmware versions listed in the readme file of the package only.

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the Drives V3 Library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

The user must follow all applicable safety instructions and the guidelines mentioned in the user documents of the ABB products.

Read the complete safety instructions for the AC500 before installation and commissioning.

CAUTION!
Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

1.5.4.1.3 Comparison of V2 and V3 drives library

The below table compares the FBs in the V2 library package and corresponding adapted FBs in the V3 library package.

The V2 package (PS553-Drives) has different library files for each protocol and the same is replaced with a single library in V3 (ABB_Drives_AC500).

PS553-Drives Library package (V2)		PS5605-Drives Library package (V3)	
Library Name	**Function Block**	**Library**	**Function Block**
ACSDrives-Base_AC500_V2	ACS3XX_DRIVES_CTRL_BASIC	Not supported – use DrvControlModbusACS	
	ACS_DRIVES_CTRL_ENG	ABB_Drives_AC500	DrvControlModbusEng
	ACS_DRIVES_CTRL_STANDARD		DrvControlModbusACS
	ACS_DRIVES_CTRL_STANDARD_GEN		DrvControlACS
	ACS_MOD_READ_N_PRM		DrvModbusRead
	ACS_MOD_WRITE_N_PRM		DrvModbusWrite
	ACS_REF_SCALING		DrvScaling
ACSDrivesCom-ModRTU_AC500_V20	ACS3XX_COM_MOD_RTU	Not supported	
	ACS_COM_MOD_RTU	ABB_Drives_AC500	DrvModbusRtu
	ACS_COM_MOD_RTU_ENHANCED		DrvModbusRtu
	ACS_COM_MOD_RTU_GEN	ABB_ModbusRtu_AC500	ModRtuToken
	ACS_COM_MOD_RTU_GEN_READ_N_PRM		ModRtuRead
	ACS_COM_MOD_RTU_GEN_WRITE_N_PRM		ModRtuWrite
			ModRtuReadWrite23
ACSDrivesCom-ModTCP_AC500_V22	ACS_COM_MOD_TCP	ABB_Drives_AC500	DrvModbusTcp
	ACS_COM_MOD_TCP_ENHANCED		DrvModbusTcp
ACSDrivesCom-ModTCP_Ext_AC500_V24	ACS_COM_MOD_TCPx	ABB_Drives_AC500	DrvModbusTcp
	ACS_COM_MOD_TCPx_ENHANCED		DrvModbusTcp
DCSDrives_AC500_V24	DCS_DRIVES_CTRL	ABB_Drives_AC500	DrvControlModbusDCS
	DCS_DRIVES_CTRL_GEN		DrvControlDCS
ACSDrives-ComPN_AC500_V24	ACS_PN_WRITE_N_PRM_DPV1	ABB_Drives_AC500	DrvPnWrite
	ACS_PN_READ_N_PRM_DPV1		DrvPnRead
ACSDrives-ComPB_AC500_V24	ACS_PB_READ_N_PRM_DPV1	Will be supported in next Release	
	ACS_PB_WRITE_N_PRM_DPV1		
	ACS_COM_PB	Not supported	
	ACS_COM_PB_PZD		
	ACS_PB_READ_PRM_DPV0		

PS553-Drives Library package (V2)		PS5605-Drives Library package (V3)	
Library Name	**Function Block**	**Library**	**Function Block**
	ACS_PB_WRITE_PRM_DPV0		
		ABB_Drives_AC500	DrvModbusReadWrite23
		ABB_Drives_AC500	DrvModbusRtuBroadcast
		ABB_Drives_AC500	DrvControlCANCiA402

1.5.4.1.4 Overview of the drives library for V3 PLC

This document will briefly explain about communication settings between PLCs with drives, how to control the drives from PLC using the control function blocks.

Each input and output of the function blocks are explained in the integrated documentation in the library.

This library is released for the following products:

- AC500 V3 CPU
- ABB Drives:
  - ACS380, ACS480, ACS580, ACH580, ACQ580, ACSM1, ACS880, DCS550, DCS800, DCS880. Other drives may still work, but are not tested.
  - To use the control blocks the Communication Profile must be *“ABB Drives Profile”* or *“ABB Drives Profile enhanced”*
- Fieldbus Adapters: FENA-01, FENA-11, FENA-21, FSCA-01, FCAN-01, FECA-01, RETA-01, RETA-02, RCAN-01, FPNO-21, FMBT-21.
  Fieldbus adapter support is dependent on the drive and for more details refer the corresponding drive manual.

Drives Library in V3 will support following protocols for the communication:

- Modbus TCP (onboard ETH1 and ETH2 ports)
- Modbus RTU (onboard COM1 port)
- PROFINET (using communication module CM579-PNIO)
- EtherCAT (using communication module CM579-ETHCAT)
- CANopen (onboard CAN port)

Modbus TCP

The following hardware components must be available:

- AC500 V3 PLC with ETH option. Configure onboard ETH1 or ETH2 for Modbus TCP.
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21 or FMBT-21
  - DCS550 and DCS800: RETA-01
- RJ45 Ethernet cable

ACS drives

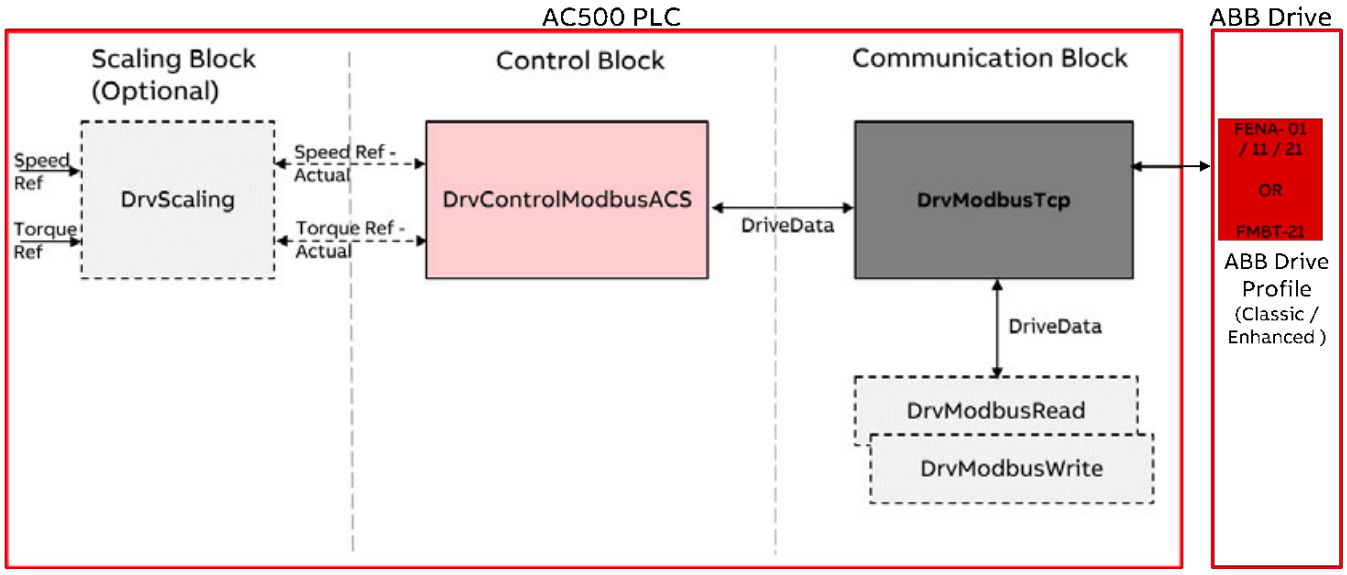


Fig. 12: FB - Overview of Modbus TCP connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block ‘DrvModbusTcp’. *Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181*
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. *Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177*
- Scaling of the speed or torque (optional):
  Use function block ‘DrvScaling’. *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. *Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181*
- DrvModbusTcp
- Control function block in AC500 program:
  Use function block ‘DrvControlModbusACS’. *Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177*
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block ‘DrvModbusRead’. ↳ *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block ‘DrvModbusWrite’. ↳ *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read Write the values:
  Use the function block ‘DrvModbusReadWrite23’. ↳ *Chapter 1.5.4.2.3.1.11 “DrvModbus-ReadWrite23” on page 2201*

DCS drives

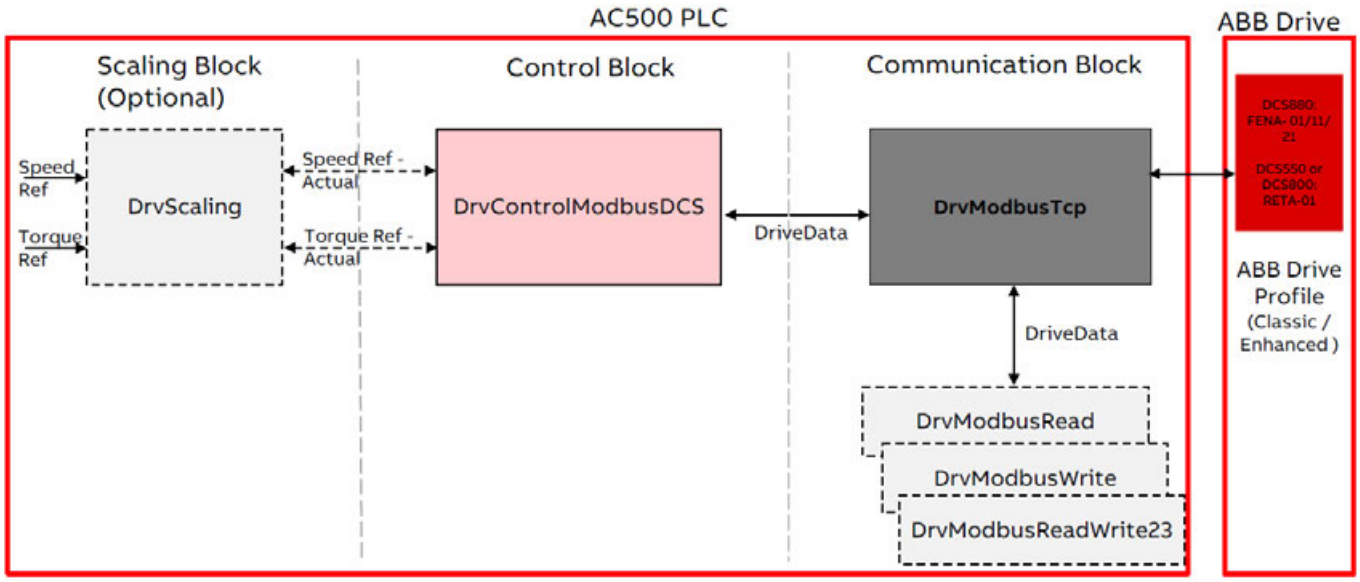

Fig. 13: FB - Overview of Modbus TCP connection with DCS drives

DCS550 and DCS800 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:
  Use function block *“DrvModbusTcp”*. ↳ *Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181*
- *“DrvModbusTcp”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlMod-busDCS” on page 2179*
- Scaling of the speed or torque (optional):
  Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block *“DrvModbusRead”*. ↳ *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block *“DrvModbusWrite”*. ↳ *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read write the values:
  Use the function block *“DrvModbusReadWrite23”*. ↳ *Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201*

DCS880 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block *“DrvModbusTcp”*. ↳ *Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181*
- *“DrvModbusTcp”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179*
- Scaling of the speed or torque (optional):
  Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB drives enhanced
- Communication function block in AC500 program:
  Use the function block *“DrvModbusTcp”* with input EnhancedProfile = TRUE. ↳ *Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181*
- *“DrvModbusTcp”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179*
- Scaling of the speed or torque (optional): Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block *“DrvModbusRead”*. ↳ *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block *“DrvModbusWrite”*. ↳ *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read Write the values:
  Use the function block *“DrvModbusReadWrite23”*. ↳ *Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201*

Modbus RTU

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard COM1 for the Modbus RTU communication.
- Drive with
  - ACS Drives and DCS880: Embedded fieldbus or FSCA-01
  - DCS550 and DCS800: Embedded fieldbus or RMBA-01
  - Twisted pair serial cable

ACS drives

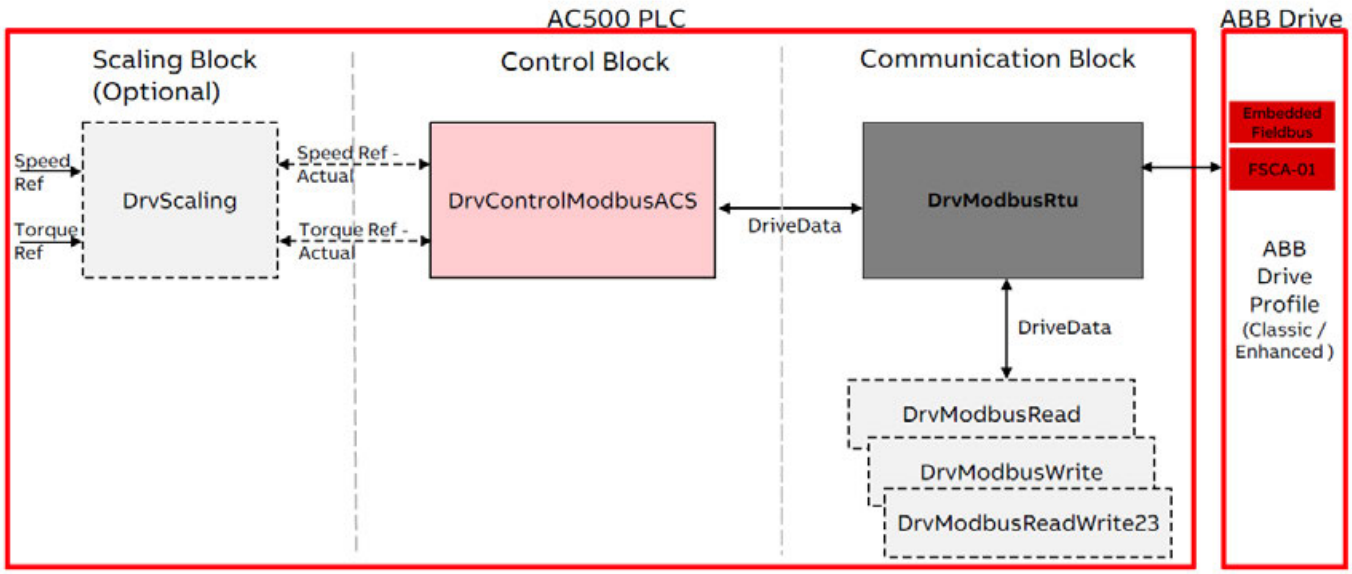

Fig. 14: FB - Overview of Modbus RTU connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block *“DrvModbusRtu”*. ↳ *Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188*
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block *“DrvControlModbusACS”* . ↳ *Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177*
- Scaling of the speed or torque (optional):
  Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block *“DrvModbusRtu”*. ↳ *Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188*
- *“DrvModbusRtu”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusACS”*. ↳ *Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177*
- Scaling of the speed or torque (optional): Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block *“DrvModbusRead”*. ↳ *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block *“DrvModbusWrite”*. ↳ *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read Write the values:
  Use the function block *“DrvModbusReadWrite23”*. ↳ *Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201*

DCS drives

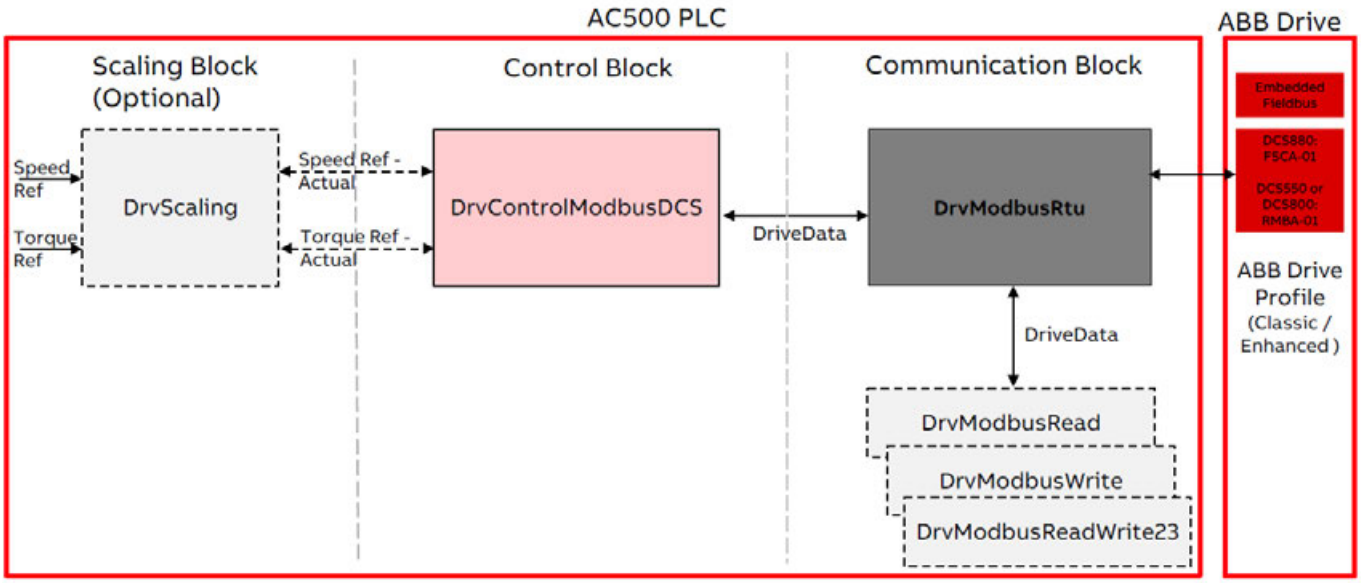

Fig. 15: FB - Overview of Modbus RTU connection with DCS drives

DCS550 and DCS800 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:
  Use function block *“DrvModbusRtu”*. ↳ *Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188*
- *“DrvModbusRtu”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179*
- Scaling of the speed or torque (optional):
  Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block *“DrvModbusRead”*. ↳ *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block *“DrvModbusWrite”*. ↳ *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read Write the values:
  Use the function block *“DrvModbusReadWrite23”*. ↳ *Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201*

DCS880 drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block *“DrvModbusRtu”*. ↳ *Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188*
- *“DrvModbusRtu”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179*
- Scaling of the speed or torque (optional):
  Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block *“DrvModbusRtu”*. ↳ *Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188*
- *“DrvModbusRtu”*
- Control function block in AC500 program:
  Use function block *“DrvControlModbusDCS”*. ↳ *Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179*
- Scaling of the speed or torque (optional): Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block *“DrvModbusRead”*. *Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180*
- Write the values:
  Use the function block *“DrvModbusWrite”*. *Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181*
- Read Write the values:
  Use the function block *“DrvModbusReadWrite23”*. *Chapter 1.5.4.2.3.1.11 “DrvModbus-ReadWrite23” on page 2201*

PROFINET

The following hardware components must be available:

- AC500 V3 PLC with CM579-PNIO (PROFINET Master communication module)
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-02
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block ‘DrvControlACS’. *Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2173*.
  - DCS Drives: Use function block ‘DrvControlDCS’. *Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2175*.
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*.
- PROFINET read function block. *Chapter 1.5.4.2.3.1.14 “DrvPNRead” on page 2205*
- PROFINET write function block. *Chapter 1.5.4.2.3.1.15 “DrvPnWrite” on page 2206*

ACS drives

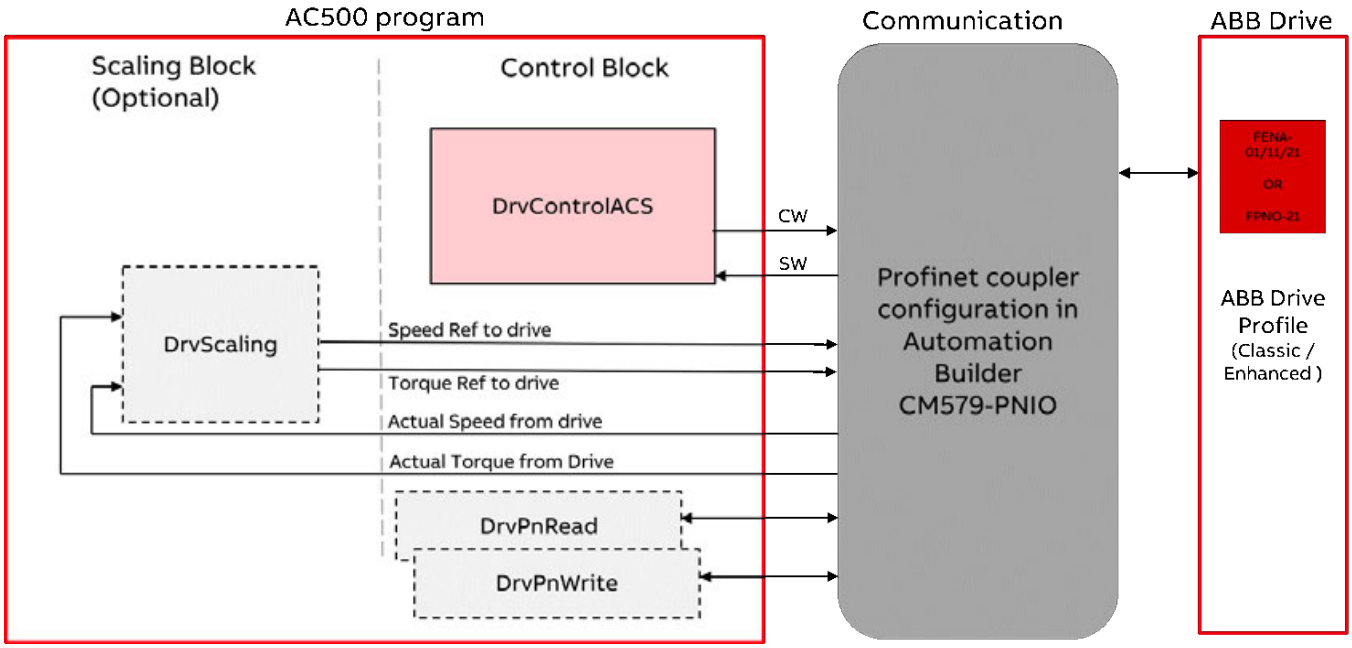

Fig. 16: FB - Overview of PROFINET connection with ACS drives

DCS drives

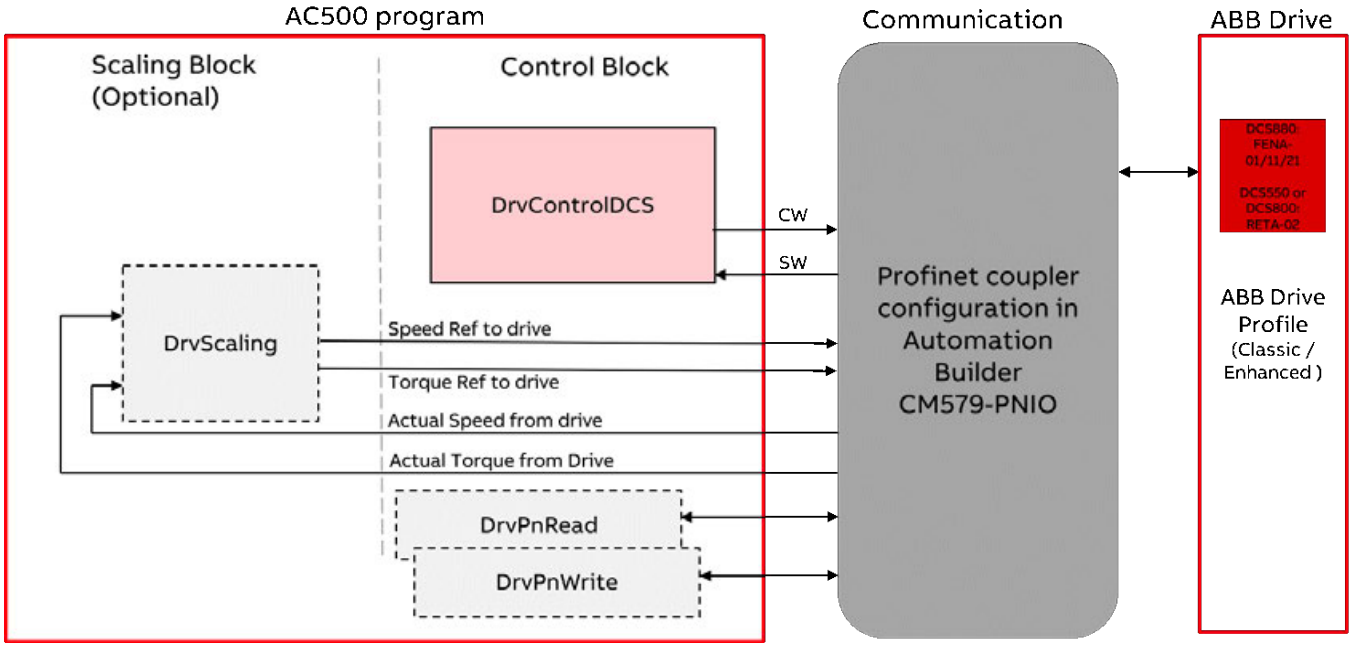

Fig. 17: FB - Overview of PROFINET connection with DCS drives

EtherCAT

The following hardware components must be available:

- AC500 V3 PLC with CM579-ETHCAT (EtherCAT Master communication module)
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FECA-01
  - DCS550 and DCS800: RECA-01
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block *“DrvControlACS”*. ↳ *Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2173*
  - DCS Drives: Use function block *“DrvControlDCS”*. ↳ *Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2175*
- Scaling of the speed or torque (optional): Use function block *“DrvScaling”*. ↳ *Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172*

ACS drives

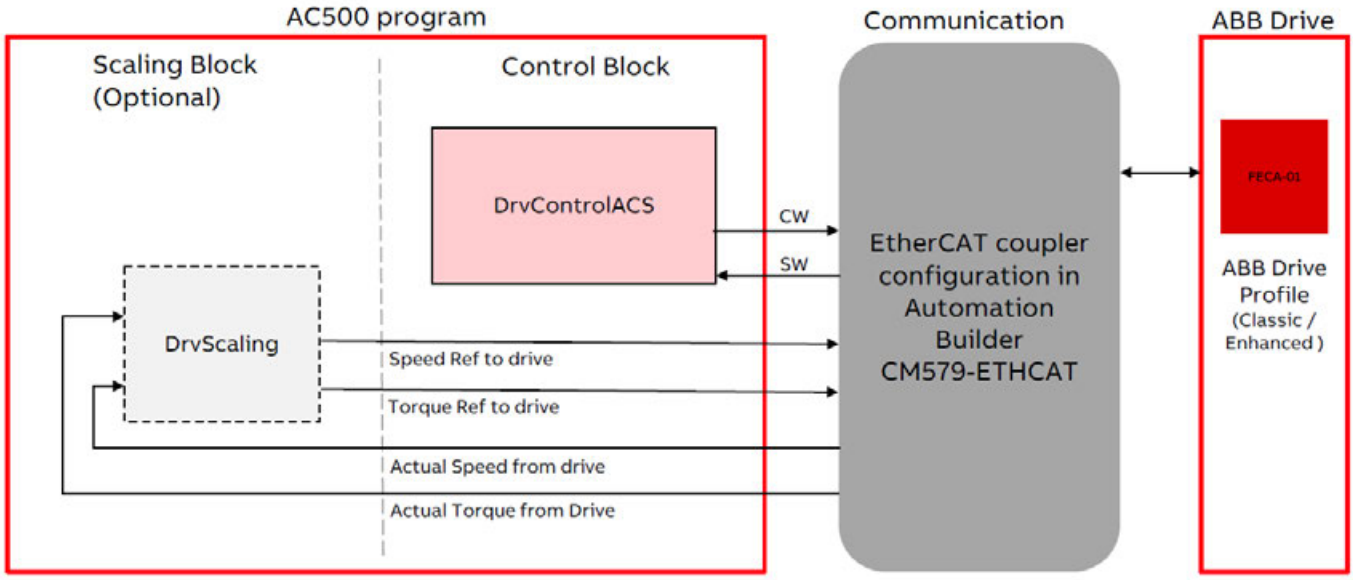

Fig. 18: FB - Overview of EtherCAT connection with ACS drives

DCS drives

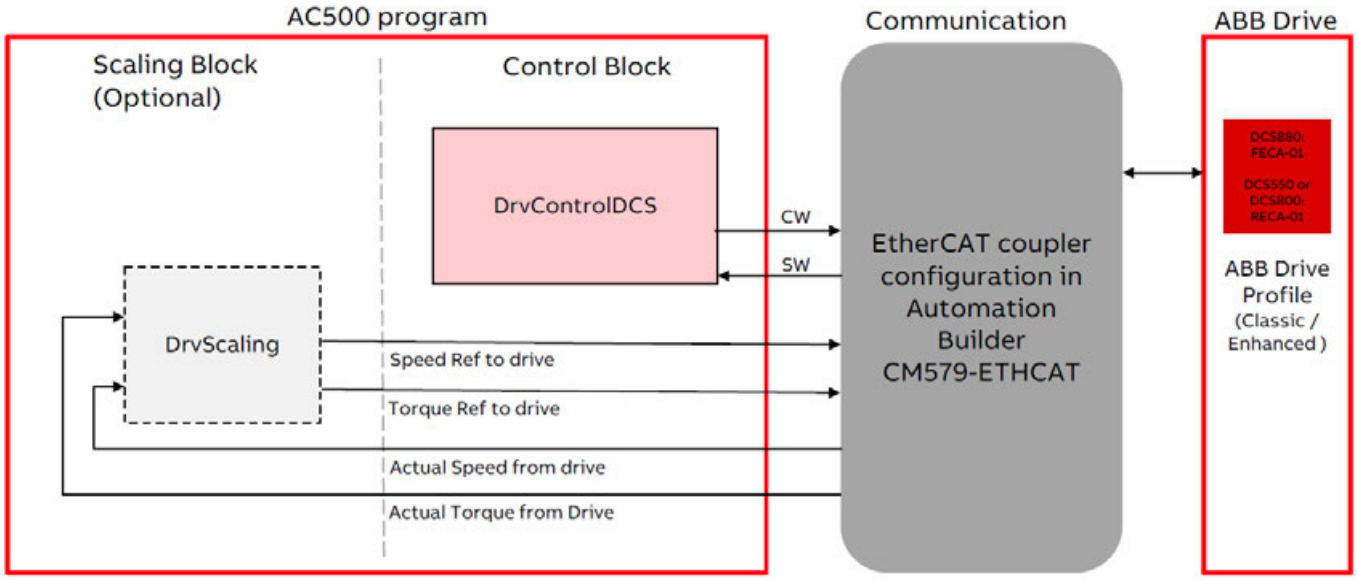

Fig. 19: FB - Overview of EtherCAT connection with DCS drives

CANopen

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FCAN-01
  - DCS550 and DCS800: RCAN-01
- CANopen communication cable with 120 Ω resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block *"DrvControlACS"*. ↳ *Chapter 1.5.4.2.3.1.2 "DrvControlACS" on page 2173*
  - DCS Drives: Use function block *"DrvControlDCS"*. ↳ *Chapter 1.5.4.2.3.1.3 "DrvControlDCS" on page 2175*
- Scaling of the speed or torque (optional): Use function block *"DrvScaling"*. ↳ *Chapter 1.5.4.2.3.1.1 "DrvScaling" on page 2172*

ACS drives

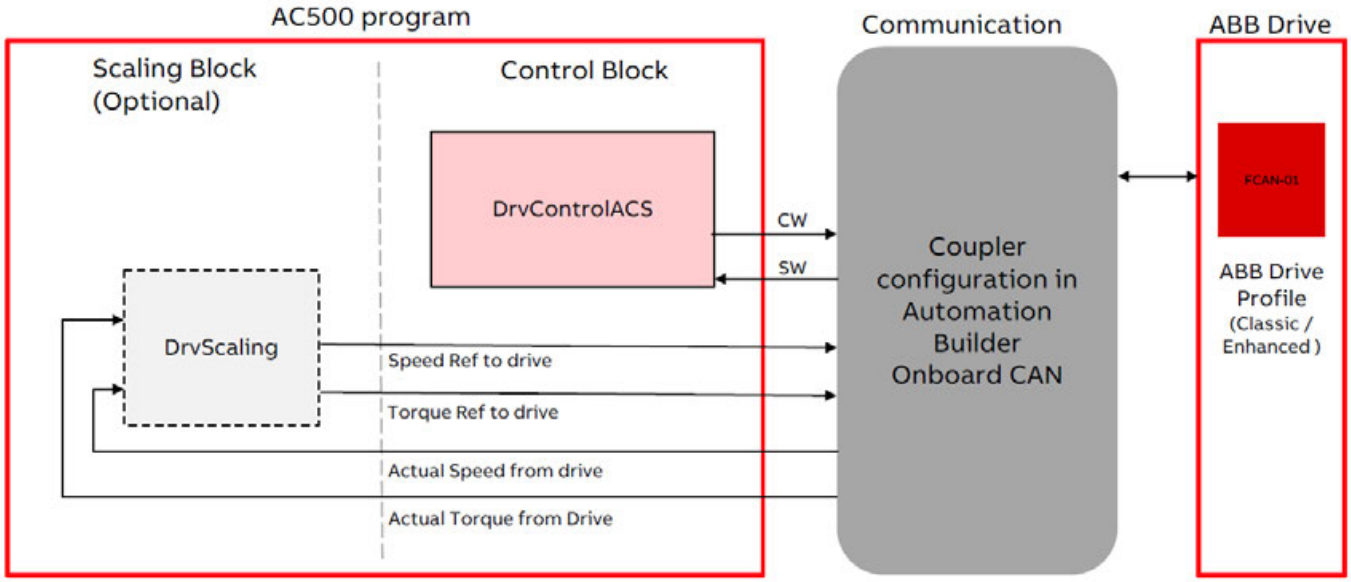

Fig. 20: FB - Overview of CANopen connection with ACS drives

DCS drives

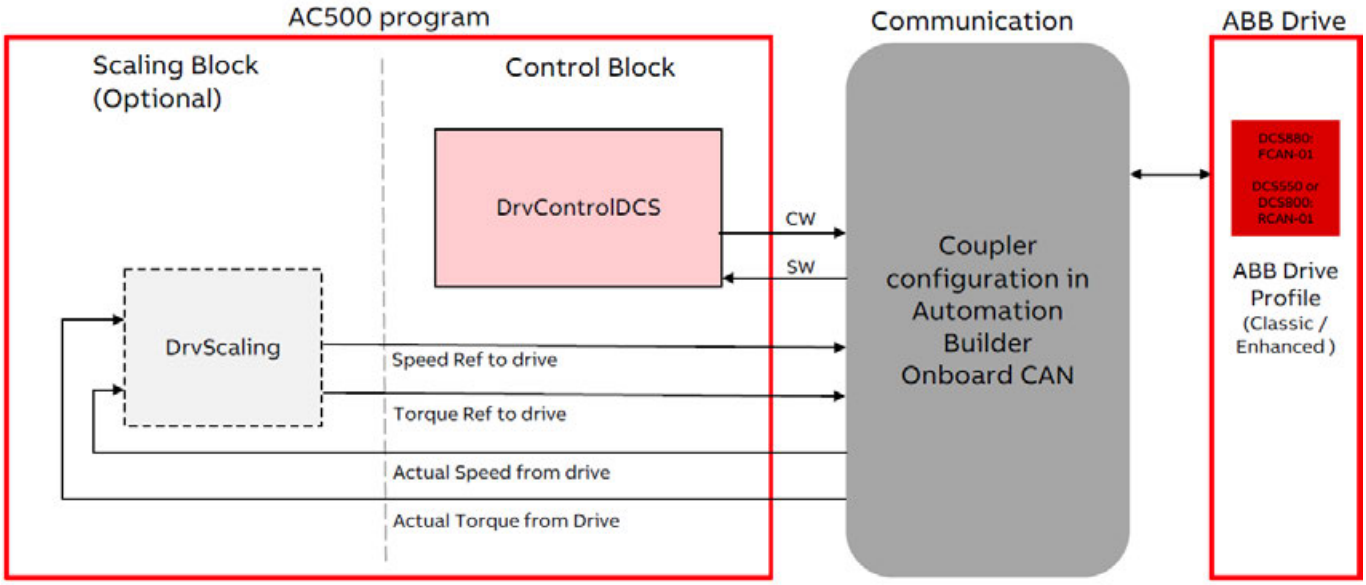

Fig. 21: FB - Overview of CANopen connection with DCS drives

CANopen with CAN CiA402 Profile for generic Drives

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Any drive with CAN fieldbus adapter module and CAN CiA402 profile.
- CANopen communication cable with 120 Ω resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual speed.
- AC500 → Drive: Control word and reference speed.

The following function blocks can be configured in the AC500 program.

- Communication profile: CANopen device profile CiA402
- Control block: Use function block *“DrvControlCANCiA402”*. ↳ *Chapter 1.5.4.2.3.1.13 “DrvControlCANCiA402” on page 2204*

General drives with CAN CiA402 interface

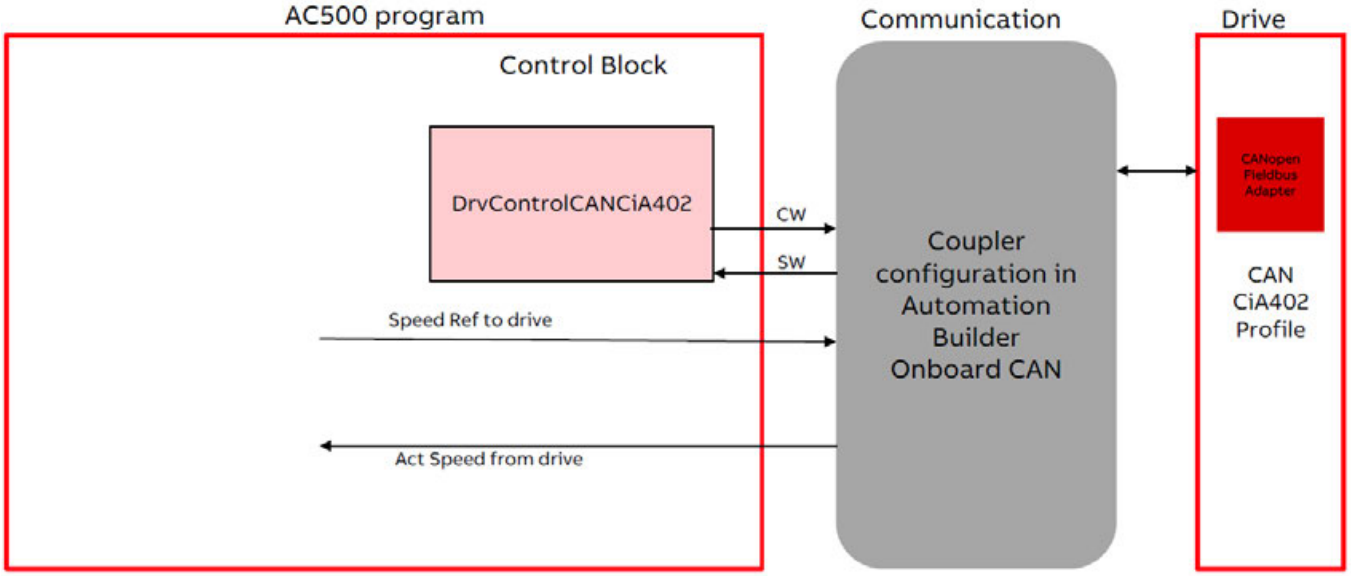

Fig. 22: FB - Overview of CANopen CiA402 with any drives

1.5.4.1.5 Compatibility

To check the compatibility of the drives and their communication modules please refer to the following table, it shows the tested combinations.

Communication	PLC communication modules		Drive fieldbus adapter module			Drive		
	PLC coupler	Firmware version	FBA	FBA comm sw ver	FBA appl sw ver	Drive	Firmware version	Drive rating ID
Modbus RTU - Classic	Onboard		FSCA-01		1.63	ACS580	1.70.4.0 (CCON-11)	ACS580-01-12A6-4
			Embedded			ACS380	2.04.0.3	ACS380-04-XX-01A8-4
			Embedded			ACS480	2.06.255.5	ACS480-04-02A7-4
Modbus RTU – Enhanced	Onboard		FSCA-01		1.63	ACS880	2.8.2	ACS880-01-04A0-3
Modbus TCP	Onboard ETH1 / ETH2		RETA-01	1.30	3.05	DCS800	3.7	
Modbus TCP - Enhanced	Onboard ETH1 / ETH2		FENA-21		3.20	ACH580	2.06.0.2	ACH580-01-02A6-4
PROFINET	CM579-PNIO	2.8.6.21	FENA-21		3.20	ACS880	2.82	ACS880-01-04A0-3
			FENA-21		3.20	ACSM1	UMFI2000 (N2020)	ACSM1-03A0-4
EtherCAT	CM579-ETHCAT	4.4.3.21	FECA-01		1.31	ACQ580	2.05.0.4	ACQ580-01-02A6-4
CANopen (ABB Profile)	Onboard		FCAN-01		1.16	ACSM1	UMFI2000 (N2020)	ACSM1-03A0-4
CANopen (CiA402)	Onboard		FCAN-01		1.16	ACS380	2.04.0.3	ACS380-04-XX-01A8-4

1.5.4.2 Overview of the library

1.5.4.2.1 Installation

The library is part of the Automation Builder 2.2. or higher. Use the Library manager to add the library into project.

For more details on the package, refer to the release notes of the latest Automation Builder.

1.5.4.2.2 Hardware and software requirement

Hardware	Software
AC500 V3 PLCs: PM5630-2ETH, PM5650-2ETH, PM5670-2ETH and PM5675-2ETH	Automation Builder 2.2. or higher
ABB Drive: ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1, DCS550, DCS800, DCS880. (other drives may work, but are not tested)	Drive Composer Pro, Drive Studio, Drive Window or Drive Window Light
Fieldbus adapter module: FSCA-01, RMBA-01 FENA-01 / FENA-11 / FENA-21, RETA-01, FPNO-21, FMBT-21 FECA-01, RETA-02 FCAN-01, RCAN-01 (other fieldbus adapter modules may work, but are not tested)	

Drive configuration tool and fieldbus adapter module support is dependent on the drive used, for the compatible tool details refer to the drive manual.

1.5.4.2.3 Description of the library

This chapter briefly explains the functions, function blocks, structures, enumerations and visualization present in the library.

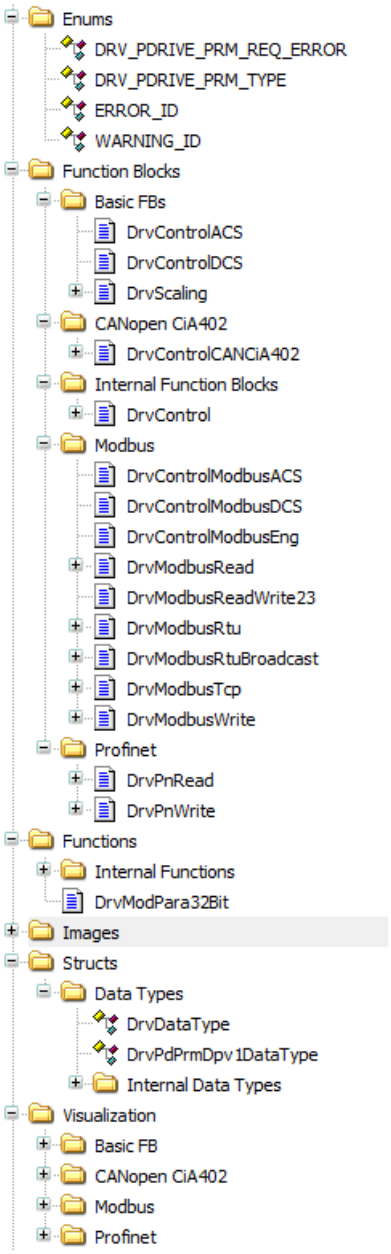

Fig. 23: FB - Overview of the Drives Library

Function blocks

DrvScaling

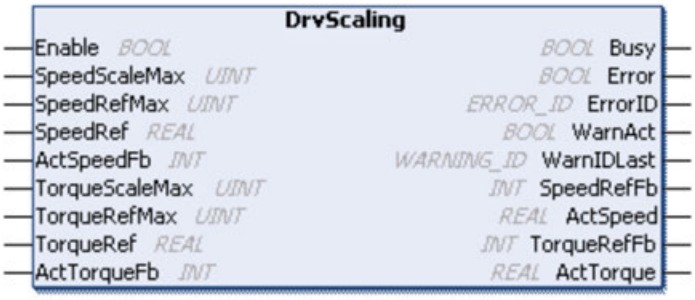

Fig. 24: DrvScaling

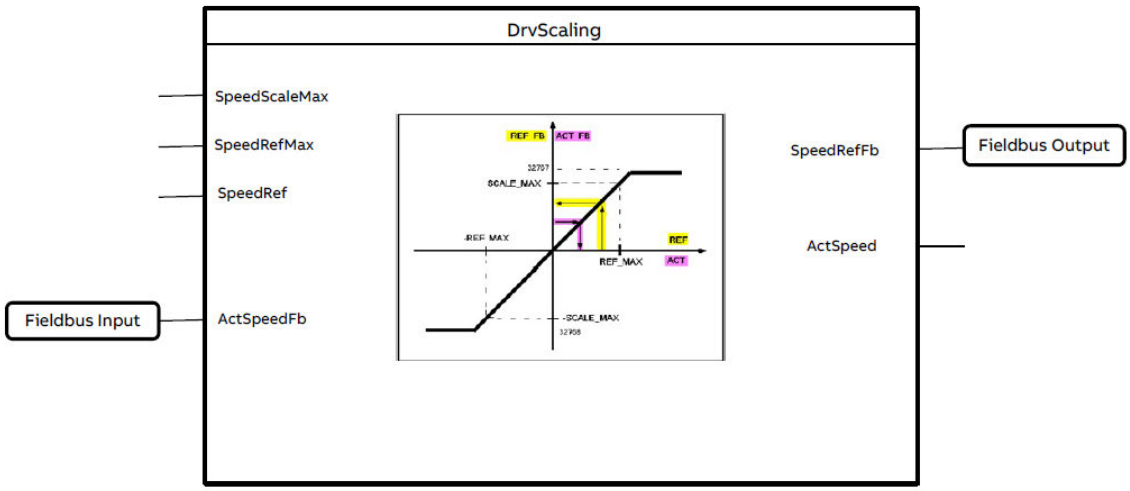
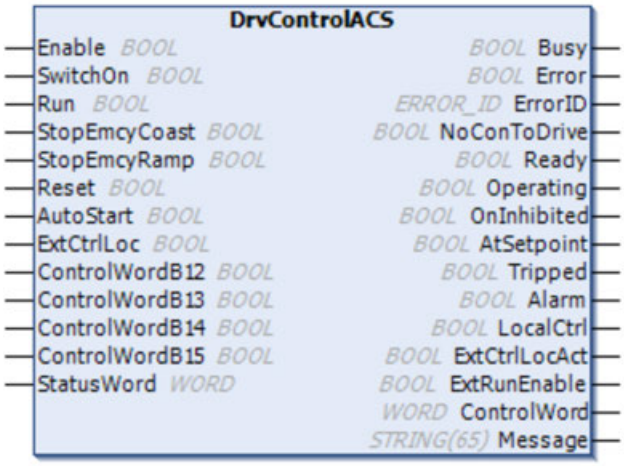
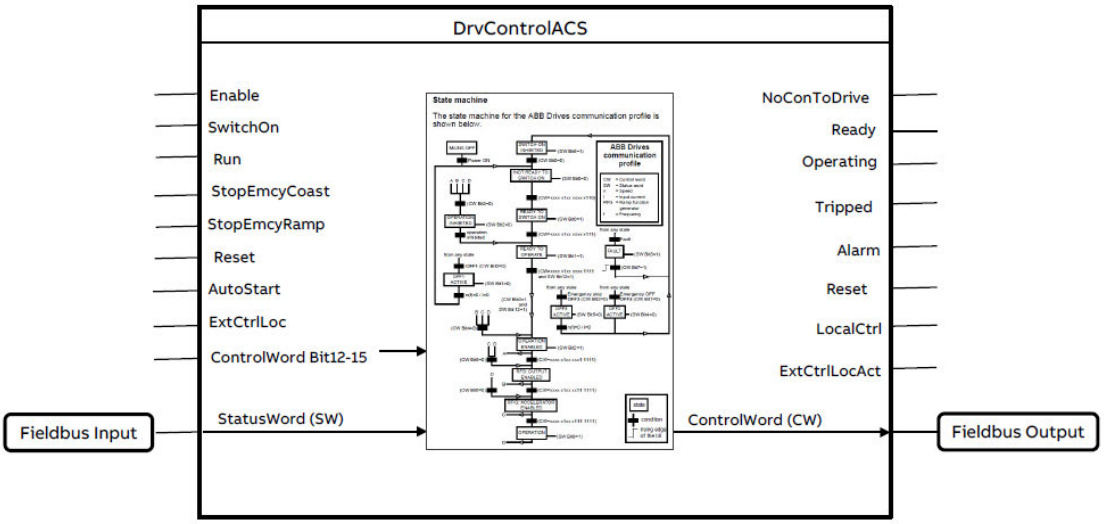


DrvScaling function block is used to scale the speed or torque reference to the drive based on the maximum values defined.

Function block *"DrvScaling"* can be used to scale the variables from fieldbus equivalent values to values used in the program. Fieldbus variables are given in fieldbus equivalent values as INT values. With the scaling a conversion from INT (fieldbus) to REAL (program) and vice versa is performed. Reference1 and Actual Value1 (speed) are mostly given in the range of -20000 ... +20000. Reference2 and Actual Value2 (torque) are mostly given in the range of 0 ... +10000.

DrvControlACS



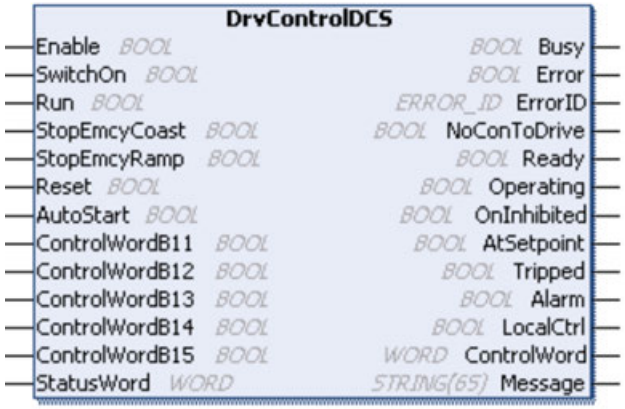


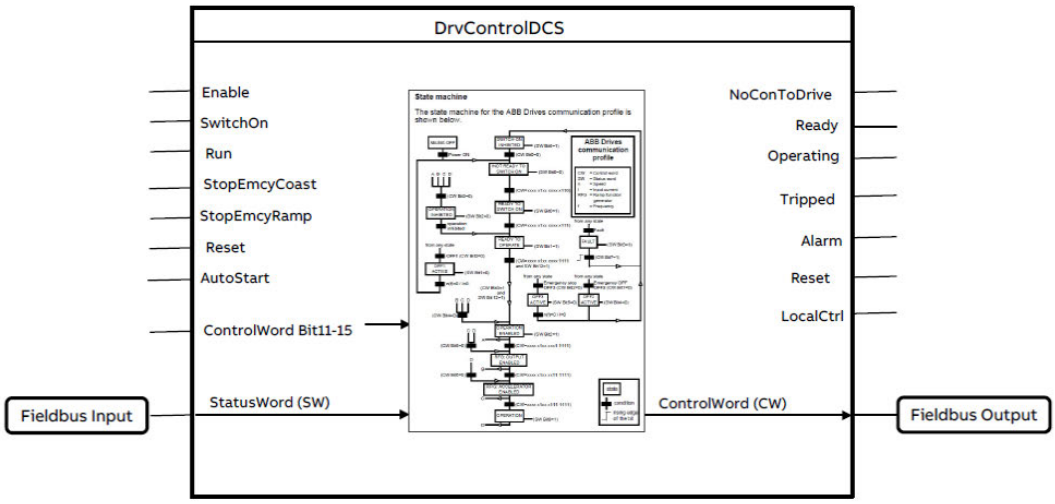
This function block can be used to control ACS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW has to be send to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

Drive Parameter	**ACS380/ ACS480/ ACS580/ ACH580/ ACQ580/ ACS880**	**ACSM1**	**Comment**
EXT1 COMMANDS	20.01 = Fieldbus A	10.01 = FBA	Fieldbus interface as source for start and stop
EXT1 / EXT2 SEL	19.11 = MCW Bit11 (06.01)	34.01 = P02.12 bit 15	Fieldbus interface as source to switch to EXT2 control place
REF1 SELECT	22.11 = FBA ref1	24.01 = FBA ref1	Fieldbus interface as source to speed reference
FAULT RESET SELECT	31.11 = P06.01 bit 7	10.08 = P02.12 bit 8	Fieldbus interface as source for fault reset
PROFILE	51.02 = Drives Classic / Enhanced	51.02 = Drives Classic / Enhanced	Control profile to ABB Drives profile classic or enhanced

DrvControlDCS



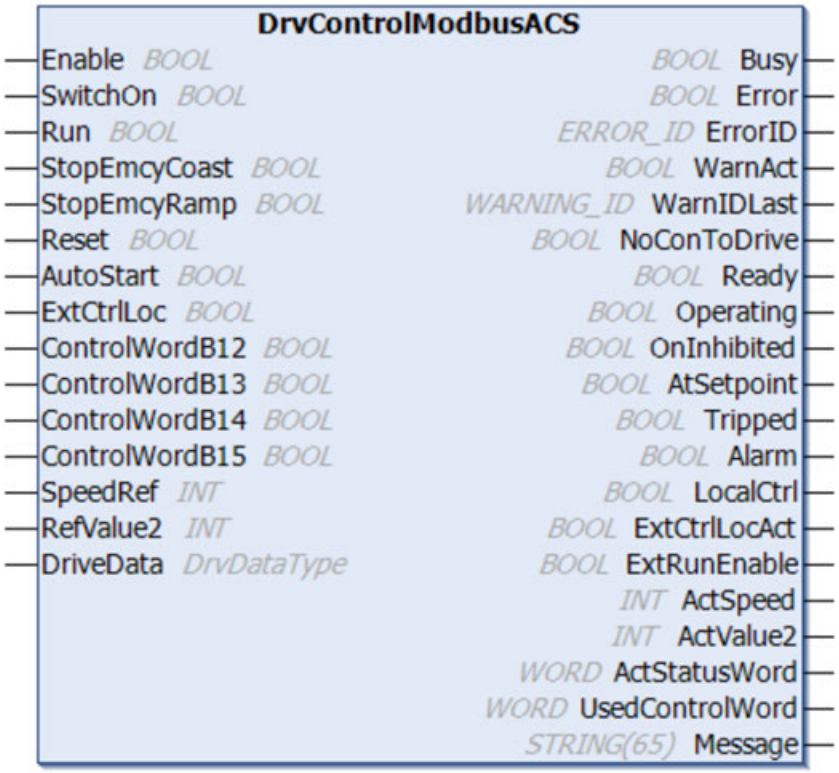


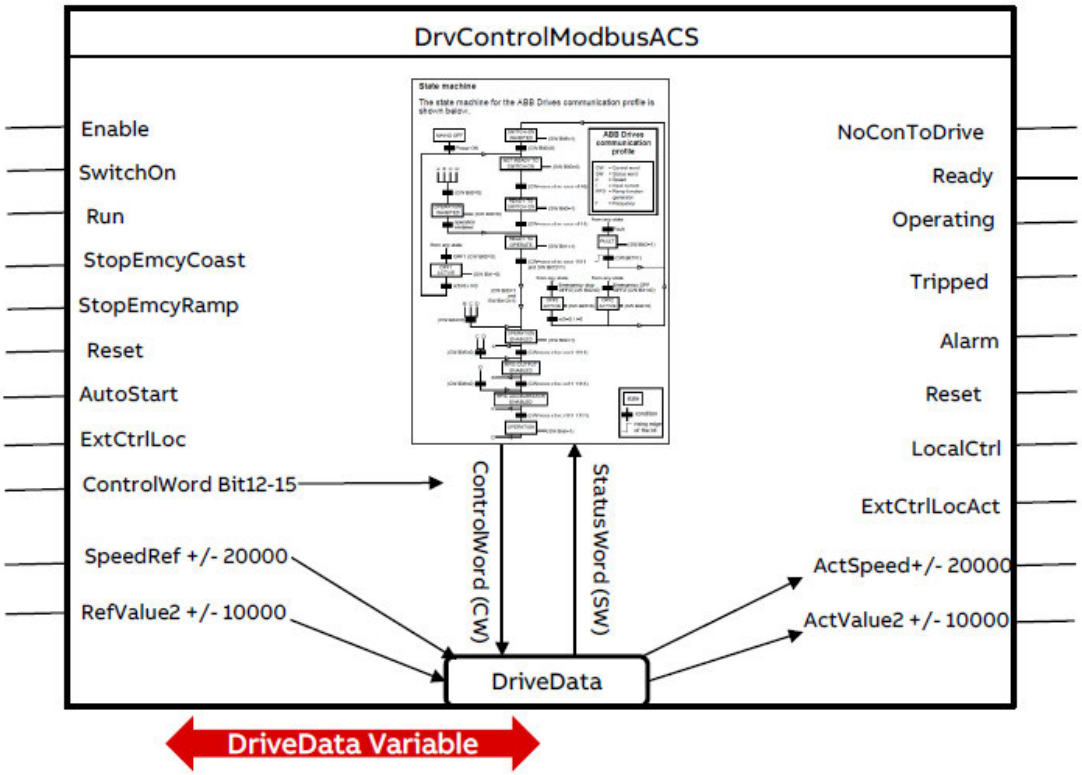
This function block can be used to control DCS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW must be sent to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

Drive Parameter	DCS550	DCS800	DCS880	Comment
EXT1 COMMANDS	10.01 = Main Ctrl Word	10.01 = Main Ctrl Word	20.01 = Main Ctrl Word	Fieldbus interface as source for start and stop
EXT1 / EXT2 SEL	10.07 (HandAuto) MCW: Bit11 11.02 (Ref1Mux) MCW: Bit11 11.12 (Ref2Mux) Invert 11.02	10.07 (HandAuto) MCW: Bit11 11.02 (Ref1Mux) MCW: Bit11 11.12 (Ref2Mux) Invert 11.02	19.11 = MCW Bit11 (06.01)	Fieldbus interface as source to switch to EXT2 control place
REF1 SELECT	11.03 = SpeedRef2301	11.03 = SpeedRef2301	22.11 = FBA ref1	Fieldbus interface as source to speed reference
FAULT RESET SELECT	NA	NA	NA	Fieldbus interface as source for fault reset
PROFILE	NA	NA	51.02 = Drives Classic / Enhanced	Control profile to ABB Drives profile classic or enhanced

DrvControlModbusACS





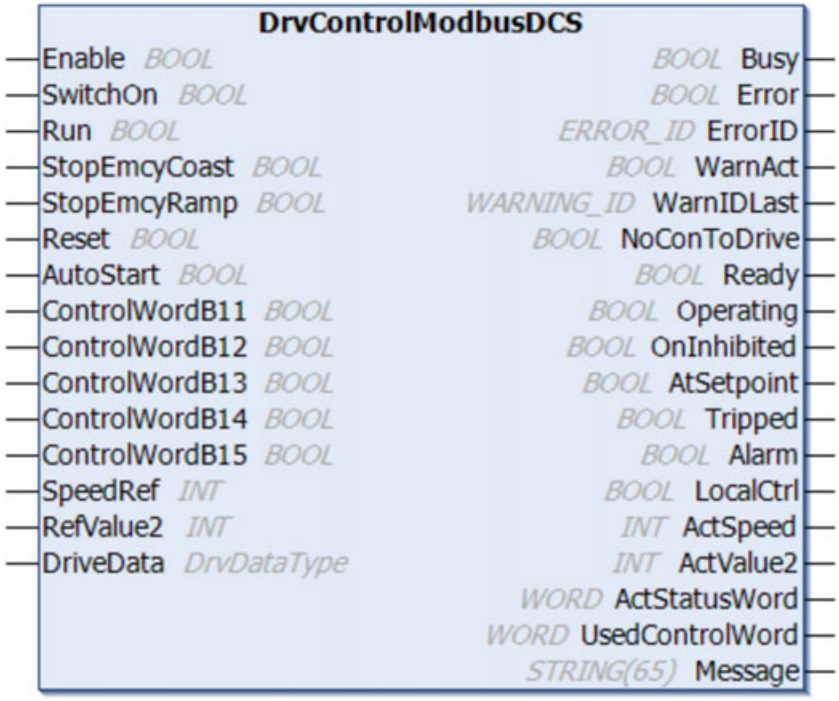
This function block can be used to control ACS drives with ABB Drives profile or ABB Drives enhanced profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu.

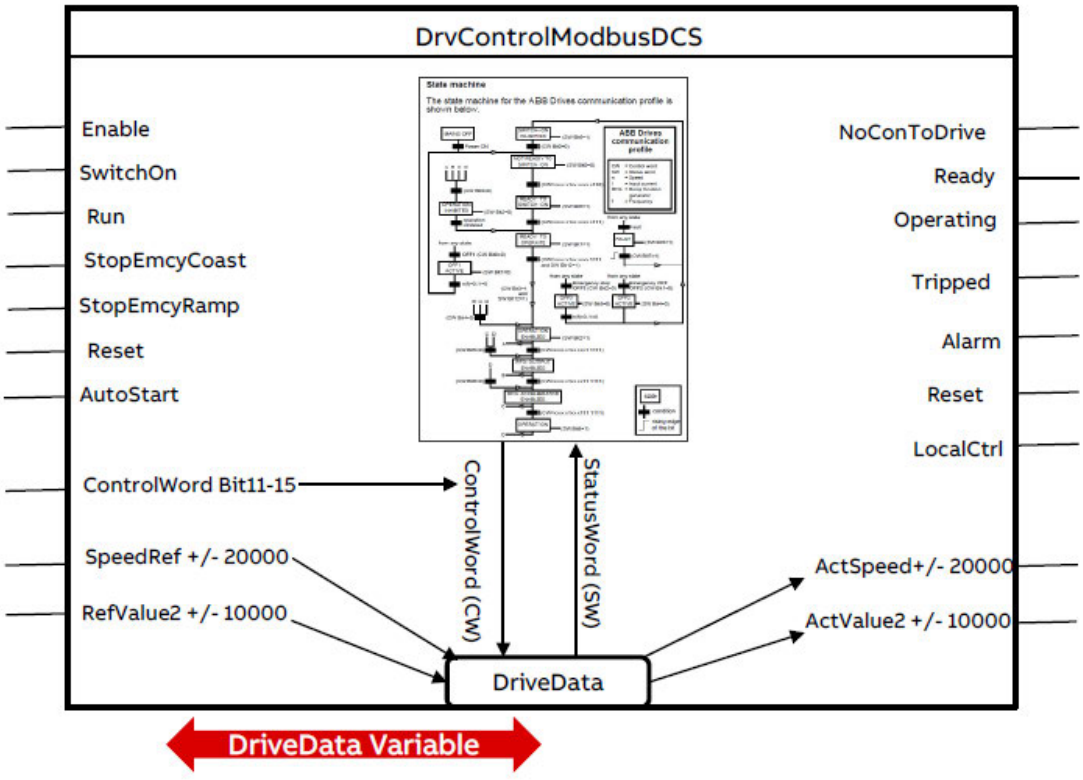
Status Word (SW) is read from drive through Modbus communication block using *“DriveData”* interface. *Chapter 1.5.4.2.3.3 “Structure: DrvDataType” on page 2207*

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for ACS drives using ABB drive (Classic/ Enhanced) profile for Modbus protocol only. The data transfer to the ACS drive is realized via the “IN_OUT” variable DriveData, which must be connected to “DrvModbusTcp” or “DrvModbusRtu” function block.

DrvControlModbusDCS





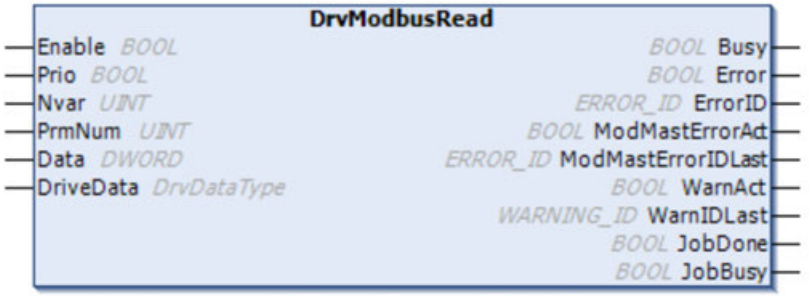
This function block can be used to control DCS drives with ABB Drives profile using Modbus communication block like *“DrvModbusTcp”* or *“DrvModbusRtu”*.

Status Word (SW) is read from drive through Modbus communication block using DriveData interface. *Chapter 1.5.4.2.3.3 “Structure: DrvDataType” on page 2207*

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for DCS drives using ABB drive profile for Modbus protocol only. The data transfer to the DCS drive is realized via the "IN_OUT" variable DriveData, which must be connected to "DrvModbusTcp" or "DrvModbusRtu" function block.

DrvModbusRead



The function block 'DrvModbusRead' reads one or more parameters / values of the drive. The number of data to be read is specified at the input 'Nvar'. The first parameter number is specified at the input 'PrmNum'. All parameters must be accessible from consecutive Modbus registers in the drive. The values of the parameters are stored in the PLC memory area, defined at the input 'Data'.

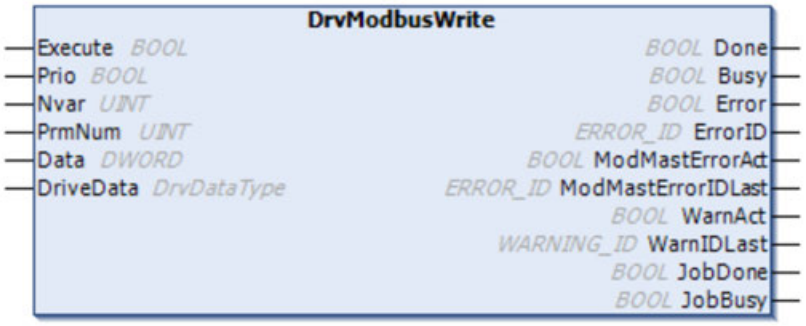
The values in the PLC memory area are updated when the read job was performed without error. This is indicated by JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Enable is set from TRUE to FALSE.

As long as the Enable = TRUE a new read job is requested automatically one cycle after the further read job was terminated. The Modbus job is started from the Communication Block which is connected to the same 'DriveData' variable. It uses the Modbus function code 03 (read n words). The drive (Modbus device) from which the parameter is read is specified at this Communication Block. The Communication Blocks are available from the library e.g. DrvModbusTcp or DrvModbusRtu.

The function block is activated (Enable = TRUE) or deactivated (Enable = FALSE) via input Enable. If the block is active, the current values are available at the outputs. To start a new read job the input Enable must be set to TRUE. If the input values are valid, a request to perform a Modbus job is send to the Communication Block via the 'DriveData' variable. If at least 1 input is invalid, no job is generated, and the error is displayed at the outputs Error and ErrorID instead.

DrvModbusWrite



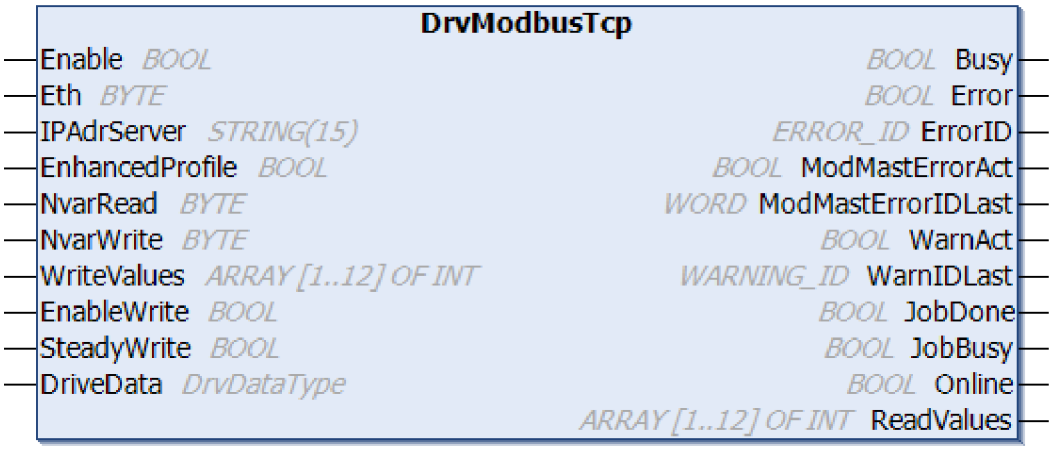
Function block 'DrvModbusWrite' writes 'n' parameters to the drive. The number of parameters to be written must be available in the PLC memory area, defined at the input Data. The write job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

To start a new write job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the Communication Block which is connected to the same DriveData variable. It uses the Modbus function code 16 (write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

> *Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.*
>
> *Please see drive manuals for the parameter details.*

DrvModbusTcp



Function block DrvModbusTcp controls the Modbus TCP communication to ACS/DCS drives and provides the basic values (CW, Ref1, Ref2, SW, Act1, Act2) which are used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	**Mapping configuration in drive**			**Written in AC500**	**Condition at function block**
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**DCS880**		
Communication module	FENA-01/ 11/21 FMBT-21	RETA-01	FENA-01/11/21 FMBT-21		
400004	Status Word (SW)	Status Word (SW)	Status Word (SW)	DriveData.wStatusWord	Enable = TRUE
400005	Actual Value 1	Actual Value 1	Actual Value 1	DriveData.iActValue1	Enable = TRUE
400006	Actual Value 2	Actual Value 2	Actual Value 2	DriveData.iActValue2	Enable = TRUE

Writing control word and reference value to drives

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.

If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written from AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**DCS880**		
Communication module	FENA-01/ 11/21 FMBT-21	RETA-01	FENA-01/11/21 FMBT-21		
400001	Control Word (CW)	Control Word (CW)	Control Word (CW)	DriveData.wControlWord	Enable = TRUE
400002	Reference Value 1	Reference Value 1	Reference Value 1	DriveData.iRefValue1	Enable = TRUE
400003	Reference Value 2	Reference Value 2	Reference Value 2	DriveData.iRefValue2	Enable = TRUE

ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters.

Using the input NvarRead the function block can be configured to read between 0 and 12 parameters from the drive. All read data is then written to the array at the ReadValue output array. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

Modbus register address in drive	Mapping configuration in drive			Written in AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**DCS880**		
Communication module	FENA-01/ 11/21 FMBT-21	RETA-01	FENA-01/11/21 FMBT-21		
400051	Status Word (SW)	Status Word (SW)	Status Word (SW)	DriveData.wStatusWord	Enable = TRUE
400052	Actual Value 1	Actual Value 1	Actual Value 1	DriveData.iActValue1	Enable = TRUE
400053	Actual Value 2	Actual Value 2	Actual Value 2	DriveData.iActValue2	Enable = TRUE
400054	FBA Data IN 1	FBA Data IN 1	FBA Data IN 1	ReadValues[1]	Enable = TRUE NVarRead >= 1
400055	FBA Data IN 2	FBA Data IN 2	FBA Data IN 2	ReadValues[2]	Enable = TRUE NVarRead >= 2
...	...	...	...	...	...
400064	FBA Data IN 11	FBA Data IN 11	FBA Data IN 11	ReadValues[11]	Enable = TRUE NVarRead >= 11
400065	FBA Data IN 12	FBA Data IN 12	FBA Data IN 12	ReadValues[12]	Enable = TRUE NVarRead >= 12

If 32-bit parameters are mapped to DATA IN,

- *The following field in DATA IN must be left open (= 0)*
- *The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.*
  (using FENA-X1: Par. 51.22)
- *To retrieve the original 32-bit value from the drive in AC500 the HW and LW from ReadValues fields must be recombined in the program.*

Function block DATA IN has to be configured in drive in the following groups see also FENA-x1 manual.

Drive	Parameter Group
ACS355	54.01 ... 54.10
ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	52.01 ... 52.12 52.01 ... 52.12 if installed as adapter A

Writing control word and reference value to drives

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.

If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

Apart from these three there parameters there is also an option to write 12 additional drive parameters.

Using the input NvarWrite the function block can be configured to write between 0 and 12 parameters to the drive. The necessary values must be present in the array connected to WriteValues input. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

Modbus register address in drive	**Mapping configuration in drive**			**Written from AC500**	**Condition at function block**
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**DCS880**		
Communication module	FENA-01/ 11/21 FMBT-21	RETA-01	FENA-01/11/21 FMBT-21		
400001	Control Word (CW)	Control Word (CW)	Control Word (CW)	DriveData.wControlWord	Enable = TRUE
400002	Reference Value 1	Reference Value 1	Reference Value 1	DriveData.iRefValue1	Enable = TRUE
400003	Reference Value 2	Reference Value 2	Reference Value 2	DriveData.iRefValue2	Enable = TRUE
400004	FBA Data OUT 1	FBA Data OUT 1	FBA Data OUT 1	WriteValues[1]	Enable = TRUE NVarWrite >= 1
400005	FBA Data OUT 2	FBA Data OUT 2	FBA Data OUT 2	WriteValues[2]	Enable = TRUE NVarWrite >= 2
...	...	...	...	...	...
400014	FBA Data OUT 11	FBA Data OUT 11	FBA Data OUT 11	WriteValues[11]	Enable = TRUE NVarWrite >= 11
400015	FBA Data OUT 12	FBA Data OUT 12	FBA Data OUT 12	WriteValues[12]	Enable = TRUE NVarWrite >= 12

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information then job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used 'NvarRead' and 'NvarWrite' input number respectively.

If 32-bit parameters are mapped to DATA OUT,

- *The next/following field in DATA OUT must be left open (= 0)*
- *The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.*
  (using FENA-X1: Par. 51.22)
- *To retrieve the original 32-bit value from the drive in AC500 the HW and LW from WriteValues fields must be recombined in the program.*

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

Diagnosis

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information the job is aborted with an error.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModTcpMast job. The ModMastErrorIDLast will keep this Error ID until a new rising edge of the Enable is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusTcp”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

Drive parameter settings

Settings in the drive according to AC500 configuration	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1**	**DCS550, DCS800**	**DCS880**

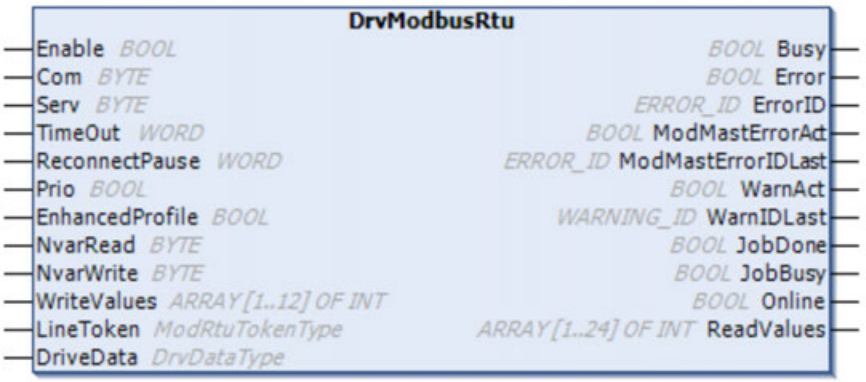
Modbus timeout. Depending on timeout mode. Value in 100 ms	51.20	51.17	51.20
Modbus timeout mode: If input “SteadyWrite” is false set to “Any message“ If input “SteadyWrite” is true can also be set to “Control RW“	51.21		51.21
Refresh settings in drive	51.27	51.27	51.27

- *Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.*
- *For RETA-01/-02 IP address could also be set via hardware Dip-Switches.*
  If any switch is set (192.168.0.xxx) with xxx = Dip-Switches setting
- *ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.*
  Please see also drive manuals which parameter must be set.
  For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
  For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

DrvModbusRtu



Function block DrvModbusRtu controls the Modbus RTU communication to ACS/DCS drives and is used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

With input NvarRead the function block can be configured to read in the same job between 0 ... 24 data more from the drive. These additional data are written to the array at the ‘ReadValues’ output. These data must be configured in the drive and are only accessible if the embedded Modbus is used.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written in AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880,DCS880**		
Communication module	FSCA-01	RMBA-01	Embedded fieldbus		
400004	Status Word (SW)	Status Word (SW)	Status Word (SW) 58.104 = 4	DriveData.wStatusWord	Enable = TRUE
400005	Actual Value 1	Actual Value 1	Actual Value 1 58.105 = 5	DriveData.iActValue1	Enable = TRUE
400006	Actual Value 2	Actual Value 2	Actual Value 2 58.106 = 6	DriveData.iActValue2	Enable = TRUE
400007	-	-	58.107 DATA I/O 7	ReadValues[1]	Enable = TRUE
400008	-	-	58.108 DATA I/O 8	ReadValues[2]	Enable = TRUE
...	...	...	...	...	...
400014	-	-	58.114 DATA I/O 14	ReadValues[8]	Enable = TRUE
...	...	...	...	...	...
400024	-	-	58.124 DATA I/O 24	ReadValues[18]	Enable = TRUE

More details on the limits for the data read and write is explained in ↳ Chapter 1.5.4.2.4 “Limits for the data read and write between AC500 and drives” on page 2208. The value is dependent on the Drive used.

Writing control word and reference value to drives

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written from AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1DCS880 DCS880	**DCS550, DCS800**	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880DCS880**		
Communication module	FSCA-01	RMBA-01	Embedded fieldbus		
400004	Control Word (CW)	Control Word (CW)	Control Word (CW) 58.101 = 1	DriveData.wControlWord	Enable = TRUE
400005	Reference Value 1	Reference Value 1	Reference Value 1 58.102 = 2	DriveData.iRefValue1	Enable = TRUE
400006	Reference Value 2	Reference Value 2	Reference Value 2 58.103 = 3	DriveData.iRefValue2	Enable = TRUE

More details on the limits for the data read and write is explained in ↳ Chapter 1.5.4.2.4 “Limits for the data read and write between AC500 and drives” on page 2208. The value is dependent on the Drive used.

ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

The ABB Drives Profile Enhanced communication profile provides register mapped access to the Control, Status, Reference and Actual Values of the ABB Drives Profile Enhanced. The mapping of the registers has been enhanced to allow additional writing of up to 12 control and reading of up to 12 additional status parameters in a single Modbus job.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters in the same job.

Using the input NvarRead the function block can be configured to read between 1 and 12 more parameters from the drive. All read data is then written to the array at the ReadValues output. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written in AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1	**DCS550, DCS800**	**DCS880**		
Communication module	FSCA-01	RMBA-01	FSCA-01		
400051	Status Word (SW)	Status Word (SW)	Status Word (SW)	DriveData.wStatusWord	Enable = TRUE
400052	Actual Value 1	Actual Value 1	Actual Value 1	DriveData.iActValue1	Enable = TRUE
400053	Actual Value 2	Actual Value 2	Actual Value 2	DriveData.iActValue2	Enable = TRUE
400054	FBA Data IN 1	FBA Data IN 1	FBA Data IN 1	ReadValues[1]	Enable = TRUE NVarRead >= 1
400055	FBA Data IN 2	FBA Data IN 2	FBA Data IN 2	ReadValues[2]	Enable = TRUE NVarRead >= 2
...	...	...	...	...	...
400064	FBA Data IN 11	FBA Data IN 11	FBA Data IN 11	ReadValues[11]	Enable = TRUE NVarRead >= 11
400065	FBA Data IN 12	FBA Data IN 12	FBA Data IN 12	ReadValues[12]	Enable = TRUE NVarRead >= 12

Writing control word and reference value to drives

The function block checks if there are changes in any of the following values since last write job:

- Control Word (wControlWord),
- Reference Value 1 (iRefValue1),
- Reference Value 2 (iRefValue2) on the DriveData variable,
- values in the input array WriteValues – WriteValues[1..NvarWrite].

If there is a change a write job is requested to send the 3 control values and the values in WriteValues array (WriteValues[1..NvarWrite]) to the ACS/DCS drive starting at Modbus register 400001. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written from AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 DCS880	**DCS550, DCS800**	**DCS880**		
Communication module	FSCA-01	RMBA-01	FSCA-01		
400001	Control Word (CW)	Control Word (CW)	Control Word (CW)	DriveData.wControlWord	Enable = TRUE
400002	Reference Value 1	Reference Value 1	Reference Value 1	DriveData.iRefValue1	Enable = TRUE
400003	Reference Value 2	Reference Value 2	Reference Value 2	DriveData.iRefValue2	Enable = TRUE
400004	FBA Data OUT 1	FBA Data OUT 1	FBA Data OUT 1	WriteValues[1]	Enable = TRUE NVarWrite >= 1
400005	FBA Data OUT 2	FBA Data OUT 2	FBA Data OUT 2	WriteValues[2]	Enable = TRUE NVarWrite >= 2
...	...	...	...	...	...
400014	FBA Data OUT 11	FBA Data OUT 11	FBA Data OUT 11	WriteValues[11]	Enable = TRUE NVarWrite >= 11
400015	FBA Data OUT 12	FBA Data OUT 12	FBA Data OUT 12	WriteValues[12]	Enable = TRUE NVarWrite >= 12

Reconnection pause

When one or more drives in the Modbus RTU lines are offline, all the other drives have to wait for the TimeOut to elapse until a line token is assigned to next drive. Reconnection pause input helps in skipping the drives which are offline from the next Modbus job and execute Modbus job operations only for the drives which are online.

“ReconnectPause” is time in seconds before next retry to connect after a timeout was detected. Timeout is detected with ModMastErrorIDLast = 16#120 (ERR_TIMEOUT).

This feature can be used with the DrvModbusRtu function block in both ABB Drives Profile and ABB Drives Enhanced Profile. User must configure the reconnect pause input value using the input variable “ReconnectPause”.

For the generic RTU block ModRtuToken (part of AC500_ModbusRtu library), also the value for the reconnect pause must be configured at input variable “ReconnectPause”.

Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTU”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If several drives are used, for each drive a communication function block such as DrvModbusRtu must be programmed. Also, every other generic Modbus server device on the same Modbus RTU line must be programmed with its own ModRtuToken function block. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive/device, so only one drive/device at a time is communicating with the PLC.

ModRtuToken function block and ModRtuTokenType structure are part of AC500_ModbusRtu library. Kindly refer the same.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

If a Modbus RTU job tries to access a register in the drive which has no valid mapping information then the job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.

Modbus RTU using Embedded Fieldbus:

When embedded fieldbus is used for the Modbus RTU communication, user can read maximum of 24 parameters (based on the limitation in drive) from the DATA I/O parameters in the embedded fieldbus parameter group. These parameters can only be used for reading operation and cannot be configured to write data.

Drive parameter settings

Settings in the drive according to AC500 configuration	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1, DCS880**	**DCS550, DCS800**	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, DCS880**

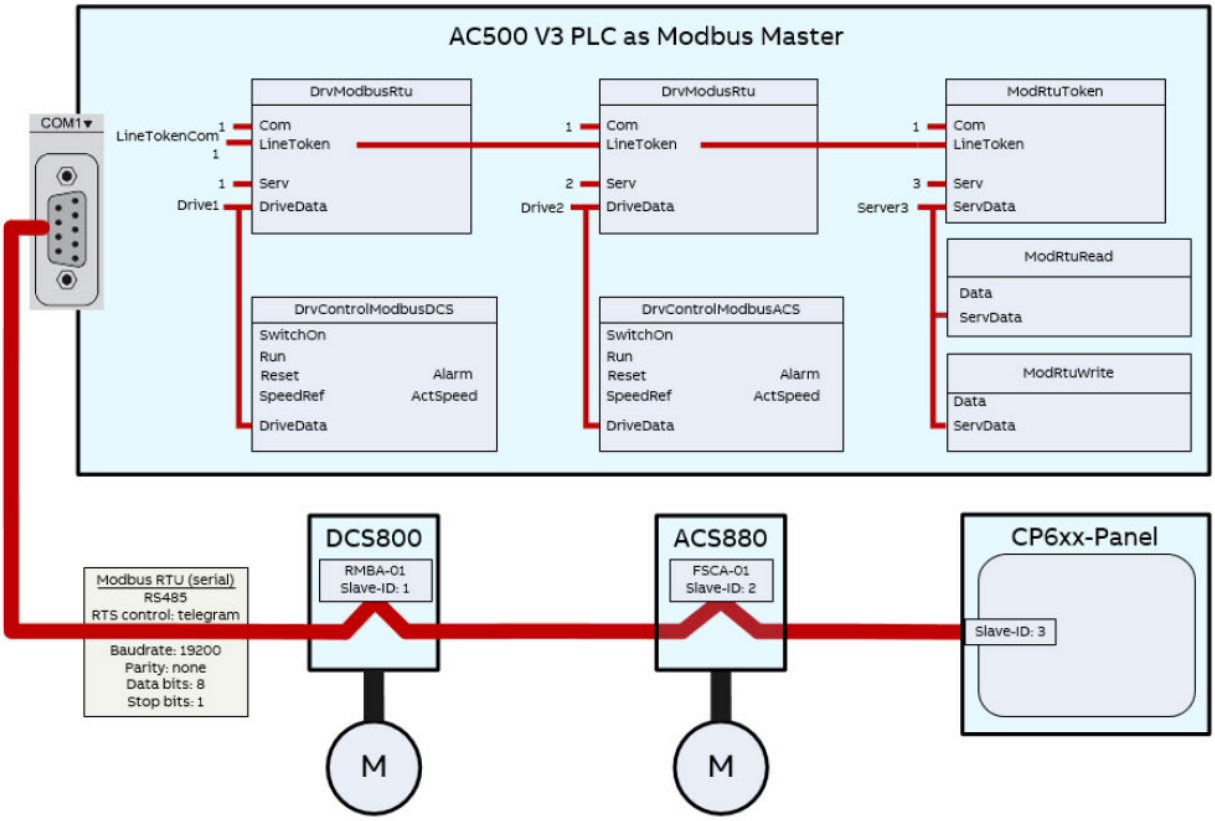
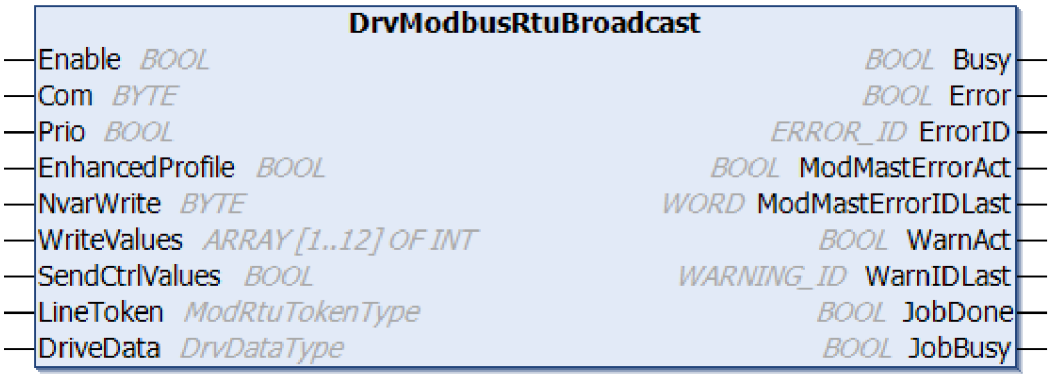
- *Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.*
- *ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.*
  Please see also drive manuals which parameter must be set.
  For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
  For ACSM1, DCS800 and DCS550 – Par 16.06 = 1



DrvModbusRtuBroadcast



Function block DrvModbusRtuBroadcast is a communication block which sends the broadcast messages via the Modbus RTU communication to all ACS/DCS drives and other Modbus devices connected to the same Modbus RTU line (physical line). The function block can be used with all drives with either ABB Drives Profile or ABB Drives Enhanced Profile but not a mix of both profiles.

As the broadcast job will be received by all devices on the same physical Modbus line it´s highly recommended to use this block only in case there are no other Modbus devices connected to this line and all drives use the same profile.

This function block does not perform any Modbus read operation, hence it does not read any values such as status word, actual value 1 and actual value 2 etc., from any of the drive.

This function block should not be used along with 'DrvModbusRead' and 'DrvModbusReadWrite23' function blocks. They will be ignored showing an error. This function block should be only used independently or in combination with 'DrvModbusWrite' function block for broadcasting write operation.

A successful broadcast message for writing control word, reference values and additional mapped parameters (only in case of Enhanced Profile) is indicated by JobDone = TRUE and ModMastErrorAct = FALSE. A next broadcast job for writing these values can once again started with a fresh rising edge at ‘SendCtrlValues’ input.

Apart from sending control values and up to 12 additional values from WriteValues array (only in case of ABB Drives Enhanced Profile) a normal Modbus write function block “DrvModbusWrite” can be used to send broadcast write messages to specific address on all drives connected to the Modbus RTU line. The requests to process broadcast write Modbus jobs is transferred via the DriveData structure at the InOut variable DriveData which can be connected to multiple instances of write function block 'DrvModbusWrite'.

After each successful broadcast write job a fixed pause of 250 ms is implemented before any other Modbus job within the same line will be started.

ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

Writing control word and reference value to drives

A rising edge from FALSE to TRUE at input 'SendCtrlValues' starts sending broadcast message with Control Word and Reference Values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) are taken from DriveData variable for sending broadcast message.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

Modbus register address in drive	Mapping configuration in drive			Written from AC500	Condition at function block and input SendCtrlvalues
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1DCS880 DCS880	**DCS550, DCS800**	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880DCS880 DCS880**		
Communication module	FSCA-01	RMBA-01	Embedded fieldbus		
400001	Control Word (CW)	Control Word (CW)	Control Word (CW) 58.101 = 1	DriveData.wControlWord	Enable = TRUE and Rising Edge at SendCtrlvalues
400002	Reference Value 1	Reference Value 1	Reference Value 1 58.102 = 2	DriveData.iRefValue1	Enable = TRUE and Rising Edge at SendCtrlvalues
400003	Reference Value 2	Reference Value 2	Reference Value 2 58.103 = 3	DriveData.iRefValue2	Enable = TRUE and Rising Edge at SendCtrlvalues

ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

With the ABB Drives Profile Enhanced profile, along with 3 control values Control Word , Reference Value 1, Reference Value 2 , up to 12 additional values can be sent as broadcast message in a single Modbus job.

Writing control word and reference values to drives

A rising edge from FALSE to TRUE at input 'SendCtrlValues' starts sending broadcast message with Control Word and reference values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) from DriveData along with values in the input array WriteValues – WriteValues[1..NvarWrite] are taken for sending broadcast message.

For the additional 12 values the configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus broadcast write job and the needed mapping in the drive as well as the area where the data is taken from the AC500.

Modbus register address in drive	Mapping configuration in drive			Written from AC500	Condition at function block
	ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1 DCS880	**DCS550, DCS800**	**DCS880**		
Communication module	FSCA-01	RMBA-01	FSCA-01		
400001	Control Word (CW)	Control Word (CW)	Control Word (CW)	DriveData.wControlWord	Enable = TRUE
400002	Reference Value 1	Reference Value 1	Reference Value 1	DriveData.iRefValue1	Enable = TRUE
400003	Reference Value 2	Reference Value 2	Reference Value 2	DriveData.iRefValue2	Enable = TRUE
400004	FBA Data OUT 1	FBA Data OUT 1	FBA Data OUT 1	WriteValues[1]	Enable = TRUE NVarWrite >= 1
400005	FBA Data OUT 2	FBA Data OUT 2	FBA Data OUT 2	WriteValues[2]	Enable = TRUE NVarWrite >= 2
...	...	...	...	...	...
400014	FBA Data OUT 11	FBA Data OUT 11	FBA Data OUT 11	WriteValues[11]	Enable = TRUE NVarWrite >= 11
400015	FBA Data OUT 12	FBA Data OUT 12	FBA Data OUT 12	WriteValues[12]	Enable = TRUE NVarWrite >= 12

Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects an actual error occurred in Modbus job. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTUBroadcast”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.

For all drives, which are connected to same Modbus RTU line, one instance of broadcast block DrvModbusRtuBroadcast is enough and it must be connected to same LineToken of DrvModbusRtu function blocks which are used for communication between PLC and each drive on Modbus RTU line. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive / device, so only one drive / device at a time is communicating with the PLC.

All the drives should be configured either in Classic Profile or Enhanced Profile and accordingly the function block DrvModbusRtuBroadcast should be parameterized. Mix of profile with few drives in Classic and few drives in Enhanced should not be used when using DrvModbusRtuBroadcast block, if using such configuration along with DrvModbusRtuBroadcast may lead to incorrect operation.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

The Modbus RTU broadcast job is sent to all devices on the same physical Modbus RTU line.

*Therefore, if other Modbus devices than ACS / DCS drives are connected to the same line using the ModRtuToken communication block it´s highly recommended **not** to use the DrvModbusRtuBroadcast function block.*

This might only be used, if the user is aware about the behavior of the connected devices if they receive the Modbus broadcast job.

If a Modbus RTU broadcast job is sent to access a register in the drive which has no valid mapping information then Modbus broadcast job is not aborted but will just send out the broadcast message without any error in the function block. This broadcast message is ignored by drives which have no valid mapping information.

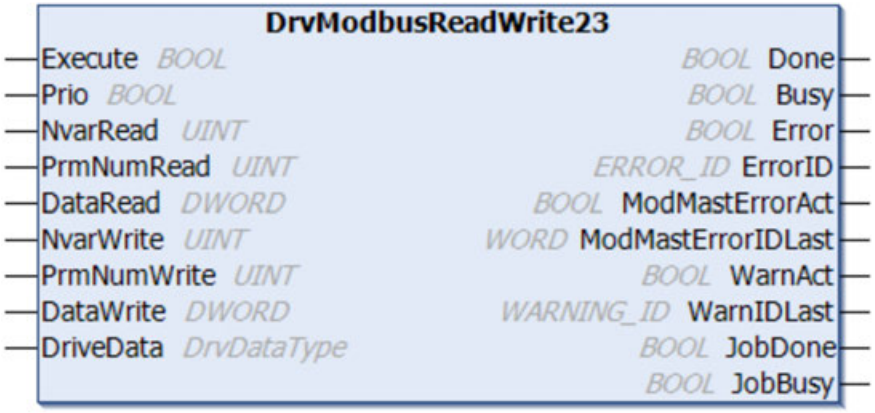
Therefore, the drive parameters in FBA DATA OUT have to be configured according to the used 'NvarWrite' input number respectively.

Drive parameter settings

Settings in the drive according to AC500 configuration	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, ACSM1, DCS880**	**DCS550, DCS800**	**ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880, DCS880**
Communication module	FSCA-01	RMBA-01	Embedded fieldbus
Fieldbus activation = Modbus / RS-485 comm	50.01	98.02	58.01
FBA A Comm loss func	50.02	30.35	50.02
Slave number	51.03	51.02	58.03
Transmission rate	51.04	51.03	58.04
Parity	51.05	51.05	58.05
Protocol / Profile = ABB Classic / ABB Enhanced	51.02	51.16	
Mapping of control word, Modbus reg 400001	Fix	Fix	58.101
Mapping of reference value 1, Modbus reg 400002	Fix	Fix	58.102
Mapping of reference value 2, Modbus reg 400003	Fix	Fix	58.103
Mapping of status word, Modbus reg 400004	Fix	Fix	58.104
Mapping of actual value 1, Modbus reg 400005	Fix	Fix	58.105
Mapping of actual value 2, Modbus reg 400006	Fix	Fix	58.106
Timeout mode = None (0) or Any Message (1), but not Ctrl write (2) as these values are only written after changes	51.07		58.15
Modbus timeout. Depending on timeout mode. Value in 100 ms		58.17	58.16
Refresh settings in drive	51.27	51.27	58.06

- *Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.*
- *ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.*
  Please see also drive manuals which parameter must be set.
  For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
  For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

DrvModbusReadWrite23



The function block 'DrvModbusReadWrite23' reads and writes one or more parameters of the drive via DriveData connected to Modbus TCP / Modbus RTU communication blocks with Modbus function code FCT = 23. This function block internally calls DrvModbusWrite to execute ReadWrite job with FCT = 23, used along with the internal structure for Fct23, DrvModFct23Type.

The number of parameters to be read is specified at the input 'NvarRead'. The first address for read operation is specified at the input 'PrmNumRead'. The values of the data are stored in the PLC memory area, defined at the input 'DataRead'.

The number of parameters to be written is specified at the input 'NvarWrite'. The first address for write operation is specified at the input 'PrmNumWrite'. The values of the data that should be written must be stored in the PLC memory area, defined at the input 'DataWrite'.

To start a new ReadWrite job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the communication block DrvModbusTcp or DrvModbusRtu which is connected to the same DriveData variable. It uses the Modbus function code 23 (Read and write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

The values in the PLC memory area are updated when the ReadWrite job was performed without error. The ReadWrite job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

After termination of this job, even if it was not successful, a next ReadWrite job can once again only be started with a rising edge at 'Execute' input.

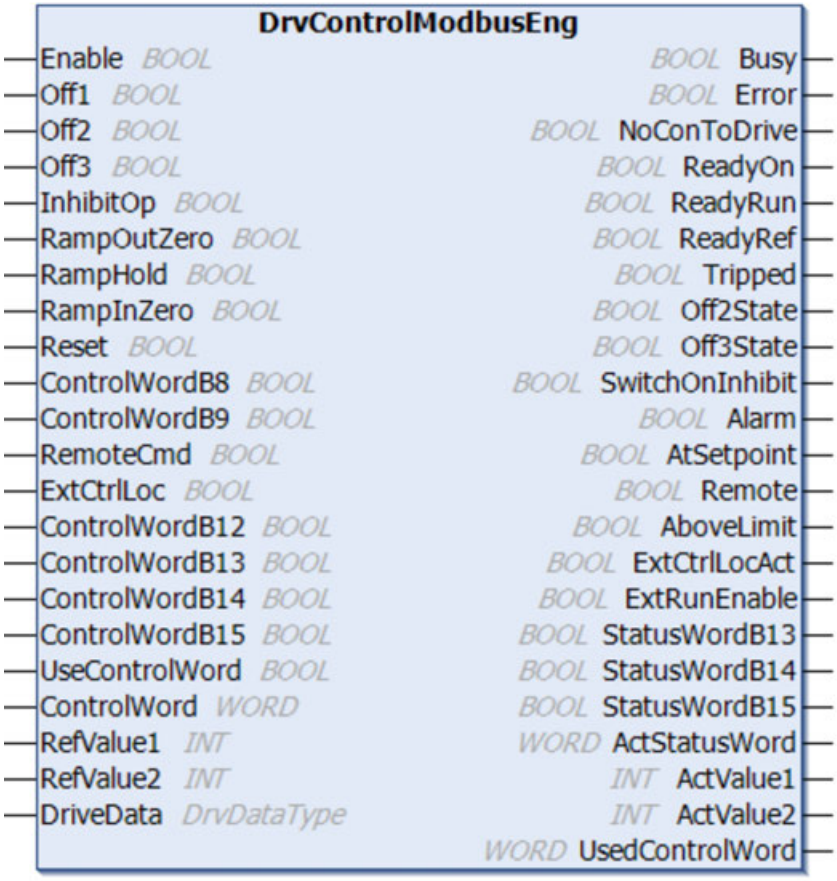
Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

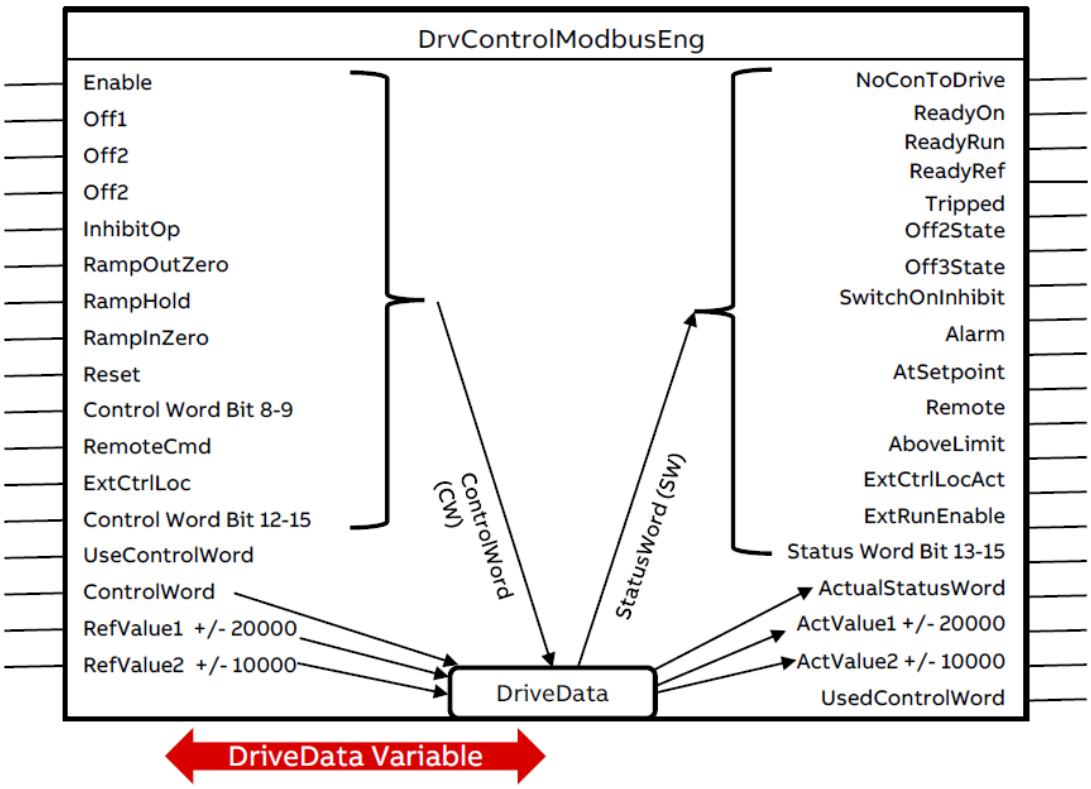
Please see drive manuals for the parameter details.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

DrvControlModbusEng





The function block *“DrvControlModbusEng”* is designed for user specific control of the drive by setting the control word (CW) by the user itself in the program.

Therefore, the user should have a detailed knowledge of the ABB drives profile handling.

The reference and actual values must be given in fieldbus equivalent , e.g. range -20000 ... +20000.

Inputs *“RefValue1”*, *“RefValue2”* and the generated control word are written to the *“DriveData”* variable which transfers these values to a communication function block, e.g. *“DrvModbusRtu”*, *“DrvModbusTcp”* or *“DrvModbusRtuBroadcast”* communication function block writes to the drive. In the same way *“ActValue1”*, *“ActValue2”* and the status word are transferred from the communication function block to the *“DrvControlModbusEng”* block, where they are written to the outputs.

The control word can be generated in 2 ways.

First way is to set the single bits of the control word separately at the inputs *“Off1”*, *“Off2”* ... *“ControlWordB15”* while the input *“UseControlWord”* = FALSE.

Second way is to set the input *“UseControlWord”* = TRUE and write the control word as a whole word directly to the input control word. The generated control word is written to the *“DriveData”* variable and for diagnosis purpose also available at output *“UsedControlWord”*.

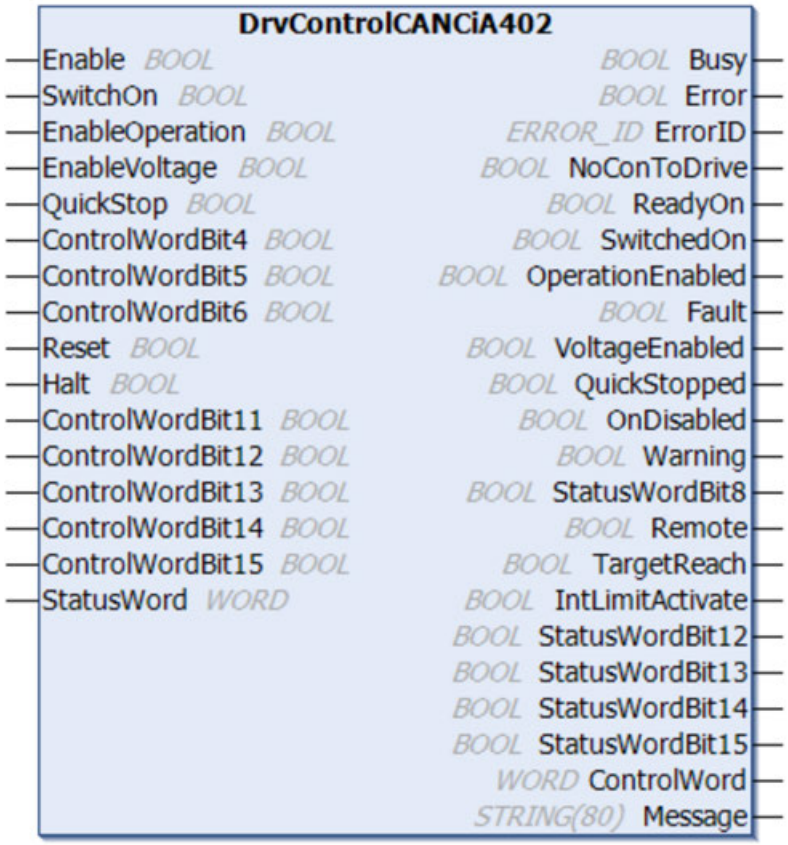
The input and output names of the bits in control word and status word reflect the functions used with ABB Drive Profile. So the block should be used with ABB Drives Profil setting in the drive.

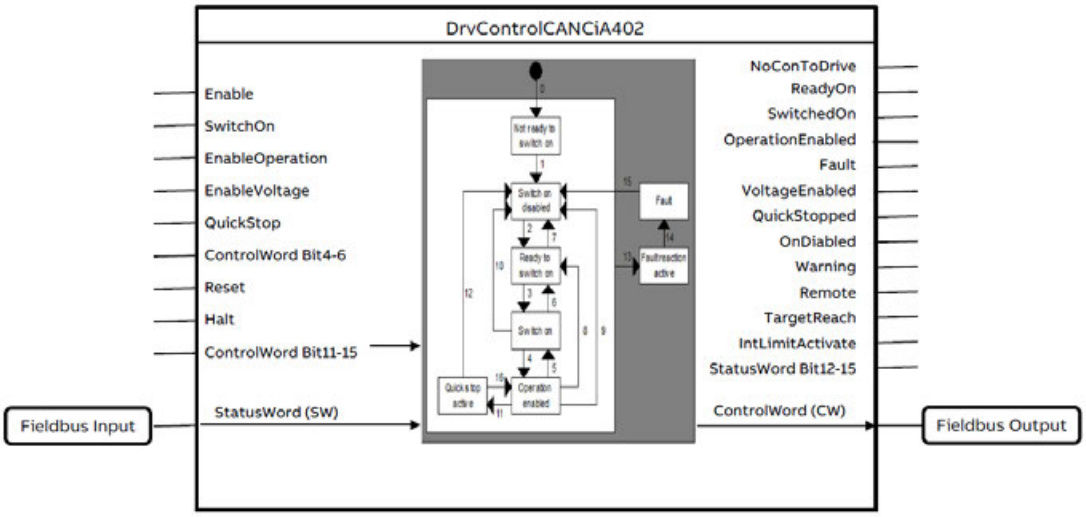
The function block does not execute any functionality expect data transfer to and from the “DriveData” variable. There is no special drive parameter setting necessary to use this block.

The programmer using this block should have a detailed understanding of how to set the control word according to the status word and the description of the used drive.

For standard speed and torque control application it is recommended to use the “DrvControlModbusACS” instead.

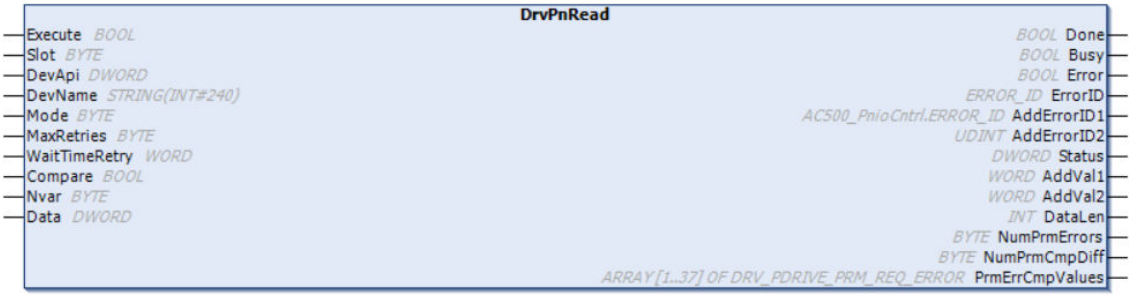
DrvControlCANCiA402





The function block *"DrvControlCANCiA402"* is used for the control of ABB ACS Drive or non-ABB drives from AC500 using CANCiA402 Profile . The CANopen CiA402 function block and visualization from the library can also be used for the 3rd party drives which comply to the CANopen CiA402 Profile.

DrvPNRead



Function block *"DrvPnRead"* reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be read is specified at the input Nvar.

Parameters to read from the drive are specified at the Data input. *"DrvPbPnPrmDpv1DataType"* structure must be declared to a variable and connected to Data input using ADR. This structure contains the group, index, which must be given to the variable. Read parameter type and values are stored in the same variable.

"DrvPdPrmDpv1DataType" structure has the following array elements:

Chapter 1.5.4.2.3.4 "Structure: DrvPdPrmDpv1DataType" on page 2208

- *"abyPrmGroup"*: Array of 37 WORD for specifying parameter group.
- *"abyPrmIndex"*: Array of 37 WORD for specifying parameter index.
- *"abyPrmType"*: Array of 37 DRV_PDRIVE_PRM_TYPE. READ parameter data type will be available here. For details refer to DRV_PDRIVE_PRM_TYPE. If a type is set here at the start, it can be compared with the type read from the drive if the compare input is TRUE.
- *"adwPrmValue"*: Array of 37 DWORD. Read parameter value will be available here. If a value is set at the start, it can be compared with the value read from the drive if the compare input is TRUE.

Read errors:

If the drive rejects to read a specific parameter, it returns the error code DRV_ERROR_PRM (16#44) in the corresponding abyPrmType element and a more specific error value in the corresponding adwPrmValue element.

The number of elements with errors from the drive are given at the output *"NumPrmErrors"*. The output *"PrmErrCmpValues"* gives an array, which contains the more specific error values in the elements (index). This can be used to quickly identify the erroneous elements.

Compare input:

As the *"DrvPnWrite"* function block does not return an error in case a parameter in the drive could not be written correctly it is recommended to verify the writing.

This can be done with the call of this function block *"DrvPnRead"* if the same parameters, types and values are connected to the DATA input (use the same struct as for the writing), and the input "Compare" is set to TRUE.

Then the types and values of the connected struct are copied at the rising edge of execute inputs and compared with the returned types and values from the drive.

In case of a difference this is set into the corresponding element of the output array *"PrmErrCmpValues"* with the possible three error codes DRV_CMP_DIFF_TYPE, DRV_CMP_DIFF_VALUE or DRV_CMP_DIFF_TYPE_AND_VALUE.

Mode input:

- Mode = 16#00 => Read direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the *"Data.awPrmGroup"* and *"Data.awPrmIndex"* array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#01 => Read direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the *"Data.awPrmGroup"* and *"Data.awPrmIndex"* array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#1x => to be used to access *"PROFIDrive"* parameters with Attribute = 16#10 (Value) and Number of Elements = x.

- Mode = 16#2x => to be used to access *"PROFIDrive"* parameters with Attribute = 16#20 (Description) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
- Mode = 16#3x => to be used to access PROFIDrive parameters with Attribute = 16#30 (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)

For *"PROFIDrive"* parameters using Mode = 16#1x, 16#2x or 16#3x the Number of Elements = x is used for all the parameters in the Data array.

DrvPnWrite

Function block *"DrvPnRead"* reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be written is specified at the input Nvar.

Another limit while using the *"DrvPnWrite"* function block is, it can process only up to 240-byte data in one request or 37 drive parameters whichever is lower. If the write data length is more than 240 bytes, the function block generates an error code `WRITE_PACKAGE_SIZE_TOO_LONG` 16#0004. At the output *"PackageSize"* the precalculated size of the request is shown.

Parameters to write to the drive are specified at the data input. *"DrvPdPrmDpv1DataType"* structure must be declared to a variable and connected to data input using ADR.

"DrvPdPrmDpv1DataType" structure has the following array elements:

↳ *Chapter 1.5.4.2.3.4 "Structure: DrvPdPrmDpv1DataType" on page 2208*

- *"abyPrmGroup"*: Array of 37 WORD for specifying parameter group.
- *"abyPrmIndex"*: Array of 37 WORD for specifying parameter index.
- *"abyPrmType"*: Array of 37 DRV_PDRIVE_PRM_TYPE for specifying parameter type, refer the respective drives manual for parameter data type and enter the respective enumeration. For details about enumeration refer DRV_PDRIVE_PRM_TYPE in the library.
- *"adwPrmValue"*: Array of 37 DWORD for specifying parameter value that should be written.

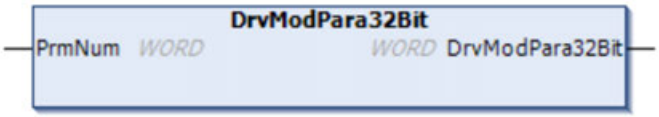
The values in the structure area are updated when the write job was performed without error. This is indicated by Done=TRUE.

Mode input:

- Mode = 16#00 => Write direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the *"Data.awPrmGroup"* and *"Data.awPrmIndex"* array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#01 => Write direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the *"Data.awPrmGroup"* and *"Data.awPrmIndex"* array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#1x => to be used to access *"PROFIDrive"* parameters with Attribute = 16#10 (Value) and Number of Elements = x.
- Mode = 16#2x => to be used to access *"PROFIDrive"* parameters with Attribute = 16#20 (Description) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
- Mode = 16#3x => to be used to access PROFIDrive parameters with Attribute = 16#30 (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)

For *"PROFIDrive"* parameters using Mode = 16#1x, 16#2x or 16#3x the Number of Elements = x is used for ALL the parameters in the Data array.

Function: DrvModPara32Bit



Creates the Modbus address for 32-bit parameters of the ACSxxx drives.

To access 32-bit parameters in ACSxxx drives using Modbus a special address calculation must be performed.

This block calculates the 6-digit address out of the 5-digit address used for 16-bit parameters.

Input is the 5-digit address: GGii, where GG = parameter group and ii = the index.

E.g. Par 12.02 ➨ address = 1202.

Output is the calculated address for 32-bit parameters according to the following rule:

DrvModPara32Bit = 20000 + (200 * GG) + (2 * ii) e.g. Par. 14.54 ➨ output = 22908

This output can be connected directly to the input "PrmNum" of one of the blocks DrvModbusRead or DrvModbusWrite or inputs “PrmNumRead” and “PrmNumWrite” of the block DrvModbusReadWrite23.

Structure: DrvDataType

Structure DrvDataType is used for the DriveData variable to exchange the data for one drive.

Structure DrvDataType is used for the DriveData variable which must be connected to all function blocks related to the same drive.

Besides the element “sName” all variables should not be written by the user directly. They are read and written within the function blocks. The DrvDataType contains some more internal, invisible variables which are used for internal functionality and not meant for user access.

The following table shows the visible variables of DrvDataType.

Variable	Data Type	Default value	Description
wStatusWord	WORD	0	Actual status word from drive
iActValue1	INT	0	Actual value1 from drive – mostly equal speed
iActValue2	INT	0	Actual value2 from drive – mapping is made in drive configuration
wControlWord	WORD	0	Control word to drive
iRefValue1	INT	0	Reference value1 to drive – mostly speed reference
iRefValue2	INT	0	Reference value2 to drive – mapping is made in drive configuration
xOnline	BOOL	FALSE	Connection established – set in Modbus communication function block after successful reading and writing one Modbus job
xCtrlBlockUsedf	BOOL	FALSE	A control block is used to generate the control word, ref1 and ref2 values
sName	STRING	‘Default Drive Name’	Name for drive, which can be set by user directly to DriveData variable

Structure: DrvPdPrmDpv1DataType

Structure *"DrvPdPrmDpv1DataType"* is required to exchange the data between AC500 and Drives using the PROFINET communication. *"DrvPdPrmDpv1DataType"* structure must be declared to a variable and connected to data input using ADR in the *"DrvPnRead"* or *"DrvPnWrite"* function blocks.

Variable	Data Type	Default value	Description
awPrmGroup	ARRAY [1..37] OF WORD	[37(0)]	ABB drive Group number from where the parameter to read or write - Profidrive Parameter Index.
awPrmIndex	ARRAY [1..37] OF WORD	[37(0)]	ABB drive index number from where the parameter to read or write - Profidrive Parameter Subindex.
abyPrmType	ARRAY [1..37] OFDRV_PDRIVE_PRM_TYPE	[37(DRV_EMPTY_PRM)]	Parameter Type in array. While using read block it will act as an output (and input at start of block with Compare=TRUE). While using write block it will act as an input.
adwPrmValue	ARRAY [1..37] OF DWORD	[37(0)]	Parameter Value in array. While using read block it will act as an output (and input at start of block with Compare=TRUE). While using write block it will act as an input.

1.5.4.2.4 Limits for the data read and write between AC500 and drives

The below table defines the limits for the reading of data from the drive and limits for writing data to drives from AC500 with cyclic data exchange.

If fieldbus adapter Plug (FBA) is used, then parameter group FBA DATA IN (e.g. 52) and group FBA DATA OUT (e.g. 53) is accessed in the drive. For the embedded fieldbus (EFB) parameters are used in EFB group (e.g. 58).

According to the table below, limits are defined for the variables 'NVarRead', 'NVarWrite' in DrvModbusRtu and DrvModbusTcp blocks.

Drive	Fieldbus Adapter (FBA)		Embedded Fieldbus (EFB)
	Data In (Group 52)	Data Out (Group 53)	Data I/O (group 58) Configurable as input or output.
ACS380	12	12	14
ACS480	12	12	14
ACS580	12	12	14
ACQ580	12	12	14
ACH580	12	12	14
ACS880	12	12	24
ACSM1	12	12	Not supported
DCS550			
DCS800			
DCS880	12	12	24

1.5.5 BACnet-BC

1.5.5.1 Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include 'Who is', 'I am', 'Who has' and 'I have' for device and object search and identification, *“Read Property”* and *“Write Property”* for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:

http://www.bacnet.org

http://www.bacnet.org/Bibliography

1.5.5.2 AC500 and BACnet

A BACnet device can be described by its *“BACnet Interoperability Building Blocks”* (BIBB)s, which are needed to establish services. They are grouped in different areas:

- *“Data Sharing”* (DS)
- *“Alarm and Event Management”*(AE)
- *“Scheduling”* (SCHED)
- *“Trending”* (T)
- *“Device and Network Management”* (DM)

“Data Sharing” for example contains two BIBBs which are needed for the *“Service Read Property”*:

- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. *“BACnet Simple Sensor”* (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).

		CP600	AC500 V3		AC500 V2		
Interoperability Areas (IA)	**BACnet Device-profiles**

The AC500 V2 supports BIBBs qualifying it as *"BACnet Application Specific Controller"* (B-ASC), by installing the BACnet B-ASC library.

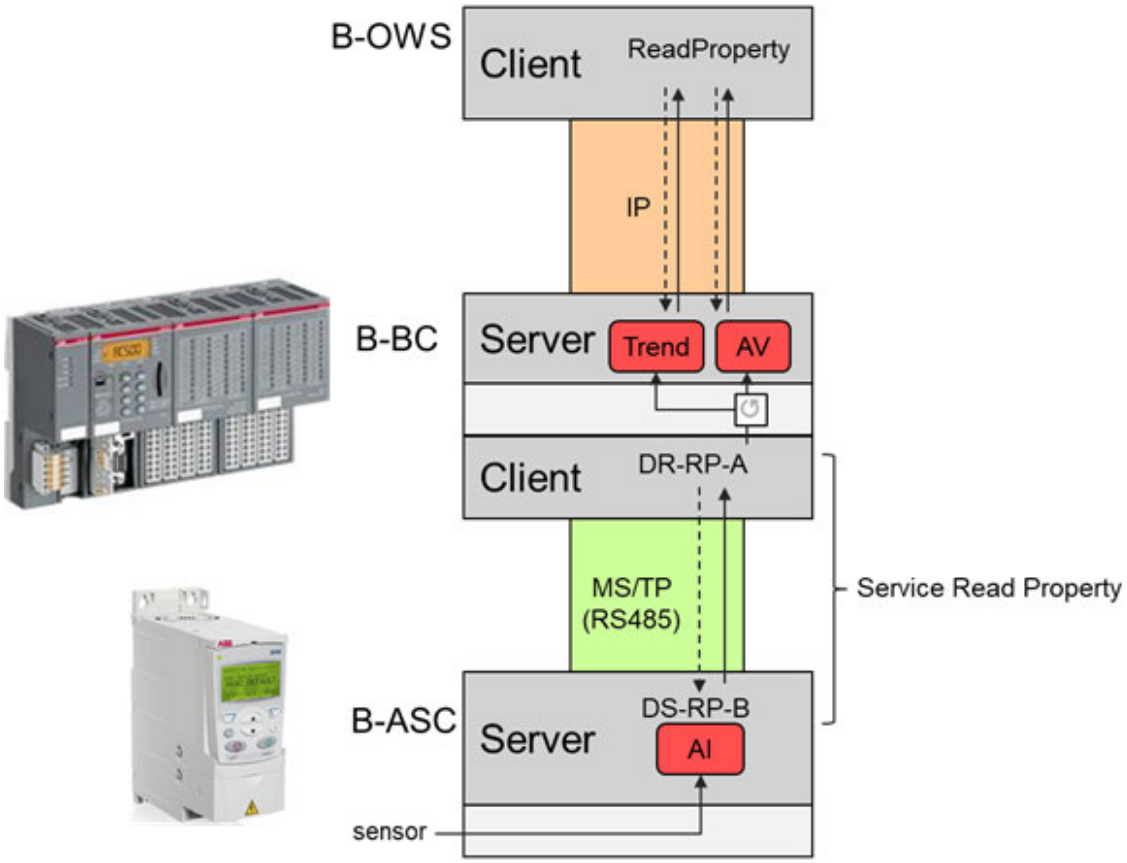
AC500 V3 supports many more BIBBs qualifying it as *"BACnet Building Controller"* (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

DS-COV-A, -B	(Change of Value-A, -B)
DS-COVP-A, -B	(Change of Value of Properties-A, -B)
AE-N-E-B	(Alarm and Event-Notification External-B)
AE-ASUM-B	(Alarm and Event-Alarm Summary-B)
SCHED-I-B	(Scheduling-Internal-B)
T-VMT-E-B	(Viewing and Modifying Trends External-B)
DM-TS-B	(Time Synchronization-B)
DM-UTC-B	(UTC Time Synchronization-B)
DM-MTS-A	(Manual Time Synchronization-A)
DM-LM-B	(List Manipulation-B)
DM-OCD-B	(Object Creation and Deletion-B)
NM-BBMDC-B	(BBMD Configuration-B)

...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.



A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as *"Analog Input"* (AI) object on the MS/TP network.

Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211

AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as *"Analog Value"* (AV) object and as *"Trend"* object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects *"Analog Value"* and *"Trend"* for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.

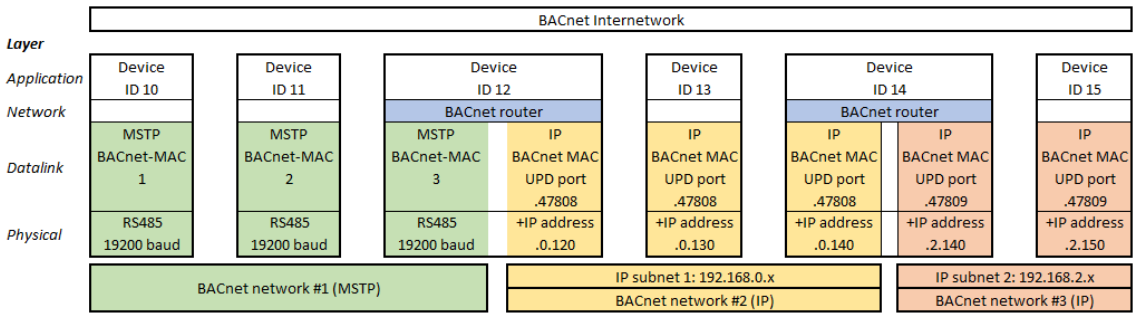
1.5.5.3 AC500 V3 as BACnet Building Controller (B-BC)

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

1.5.5.3.1 Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS-485
- BACnet IP, based on Ethernet / UDP / IP



Different networks can be combined to one common *"BACnet internetwork"*. The figure above shows an example of some BACnet devices in one *"BACnet internetwork"*. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example *"BACnet internetwork"* consists of different BACnet networks:

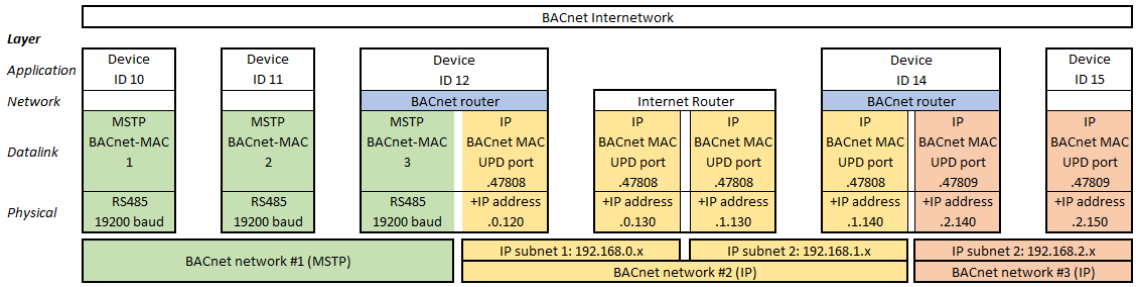
- BACnet MS/TP network connecting device 10, 11 and 12
- BACnet IP network (UDP port 47808), consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- BACnet IP network (UDP port 47809), consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
  ↳ *Chapter 1.5.5.3.4.4 "Configuration of datalinks " on page 2220*
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.
  ↳ *Chapter 1.5.5.3.4.4 "Configuration of datalinks " on page 2220*

To form a common *"BACnet internetwork"* the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.



The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by *"Broadcast Management Devices"* (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in ↳ *Chapter 1.5.5.3.4.4 "Configuration of datalinks " on page 2220*.

1.5.5.3.2 Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with *"ID 12"*. The device contains more objects like the *Analog Input* object, representing the input of a temperature measurement device. An object contains several properties, like *"ID, Description, Present Value, Unit"* etc.

Further possible objects of an AC500 B-BC are:

- *"Binary Input"* for example from connected to a switch
- *"Analog / Binary Output"* for actuators
- *"Analog / Binary Values"* for local variables
- *"Calender"*
- *"Schedule"*
- *"Trend Log"*
- ...
- A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.

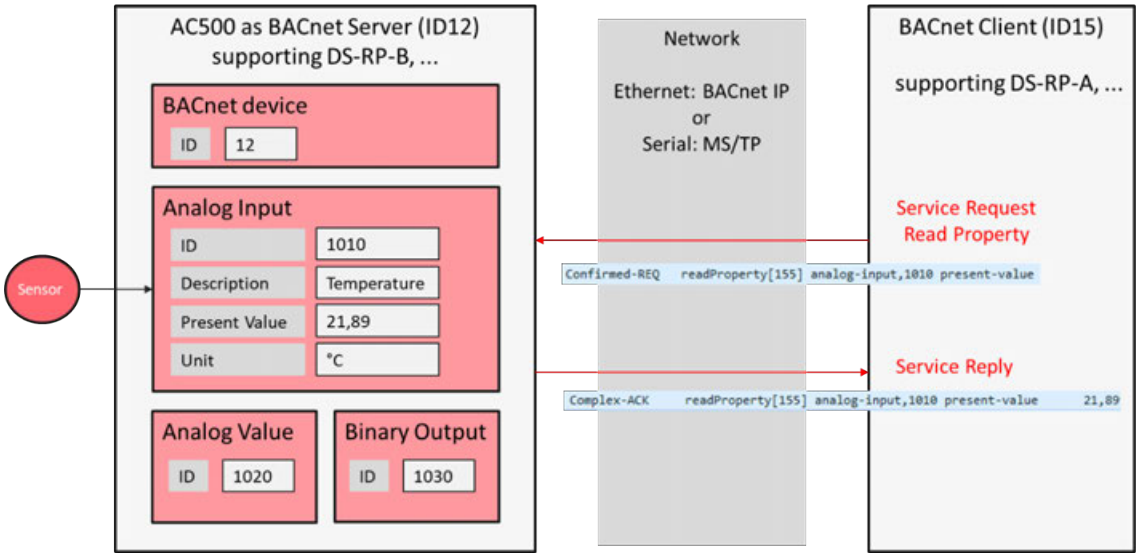


Fig. 25: BACnet objects, properties, services and BIBBs

1.5.5.3.3 Supported BIBBs and services

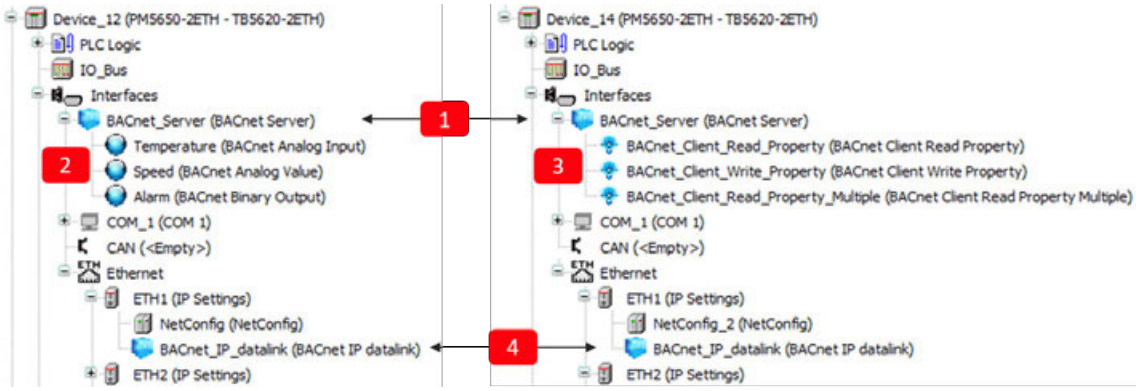
While objects and properties describe which data are communicated, the communication itself is done with services between clients and servers. A certain service can only be executed if client and server have the related BIBBs. The Fig. 25 *BACnet objects, properties, services and BIBBs* shows a simple *"Service Read Property"* which is possible because the client on the right supports DS-RP-A and the server on the left supports DS-RP-B. The service is executed in two steps:

1. The client initiates a confirmed request *"Read Property"*, asking for the present value of the *"Analog Input"* of object with *"ID 1010"*.
2. The server answers with an acknowledge, sending the present value which is 21,89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

1.5.5.3.4 BACnet configuration in Automation Builder

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.



Following objects need to be created:

1 *"BACnet Server"* root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. ↳ *Chapter 1.5.5.3.4.1 "Configuration of BACnet server root object " on page 2214*

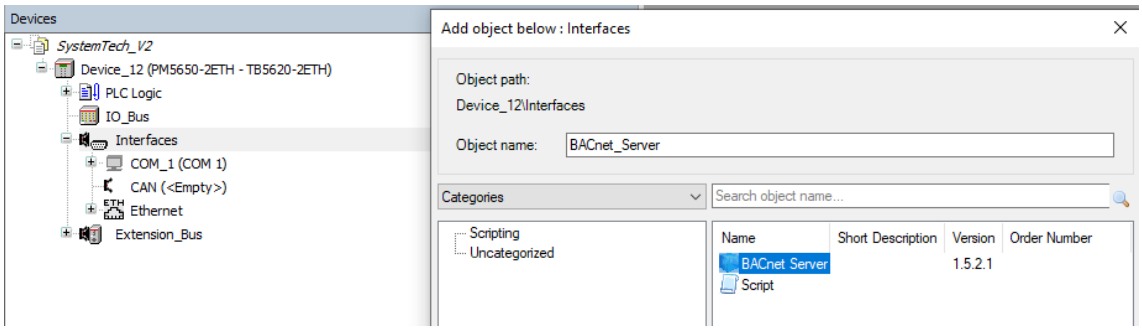
2 BACnet server objects, for example *"BACnet Analog Input"* `Temperature`. The properties of the objects must be controlled (written or read) by the PLC logic. ↳ *Chapter 1.5.5.3.4.2 "Adding BACnet server objects" on page 2216*

3 BACnet client objects, represented by a different symbol. For example, *"BACnet Client Read Property"*. The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. ↳ *Chapter 1.5.5.3.4.3 "Adding BACnet client functionality" on page 2217*

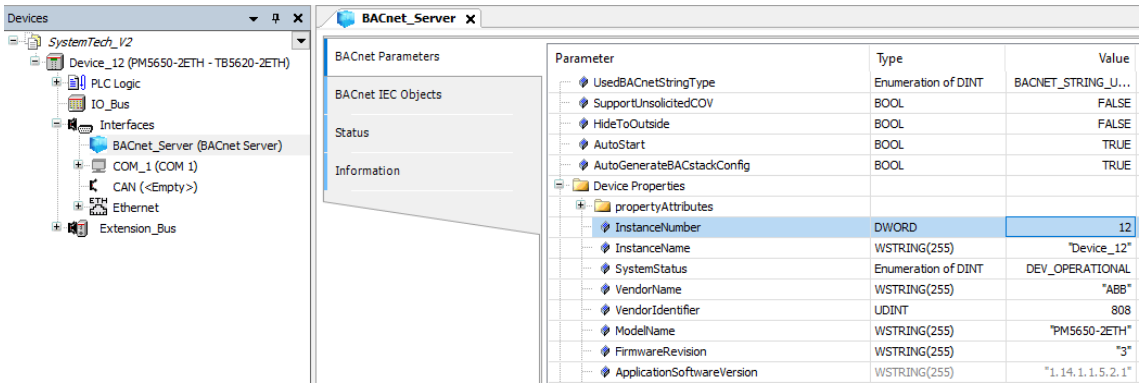
4 Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the *"BACnet Server"* object. In the example above the IP address of `ETH1` is automatically retrieved by inserting the *"BACnet IP datalink"* below the `ETH1` port. ↳ *"Configuration of an IP datalink" on page 2221*. For MS/TP refer to ↳ *"Configuration of an MS/TP datalink" on page 2220*.

Configuration of BACnet server root object

1. Create an empty project with an AC500 V3 CPU type and call it fpr example *"Device_12"*.
2. Insert a *"BACnet Server"* object below the interfaces object in the device tree.

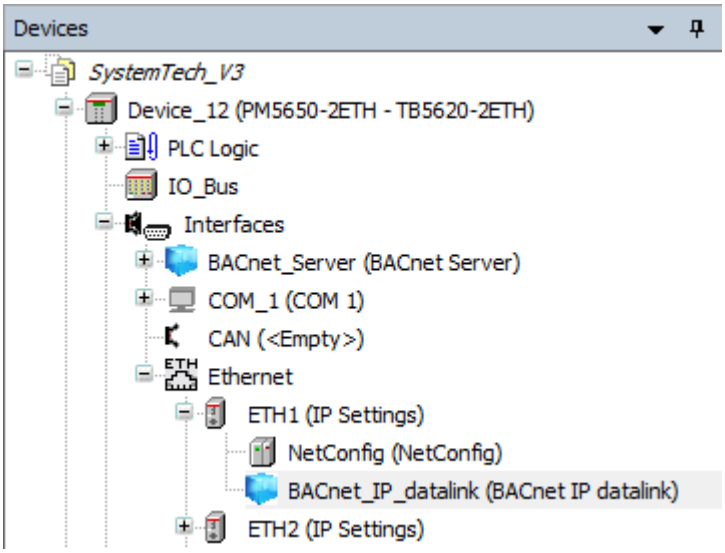


3. Set the device `InstanceNumber` in the *"BACnet Parameters"* of the *"BACnet Server"*, e.g. to `12` and the `InstanceName` to `Device_12` (according to Fig. 25 *BACnet objects, properties, services and BIBBs*).



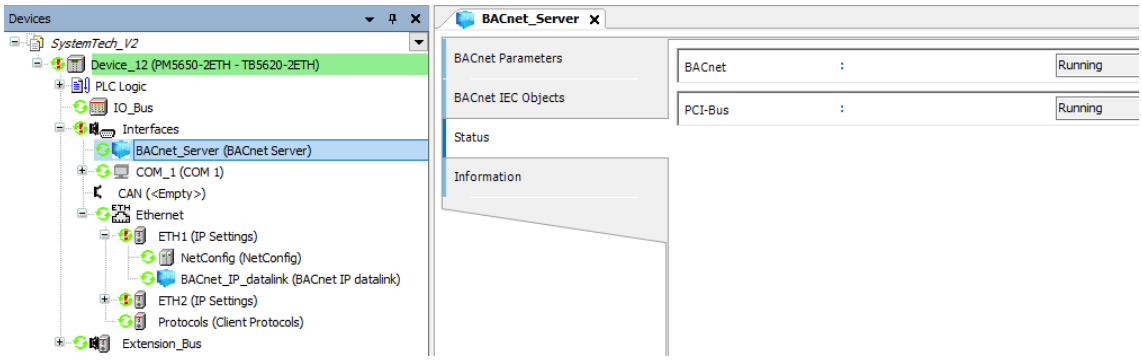
4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below `ETH1`. Default parameters are sufficient if only one datalink is used.

↳ *"Configuration of an IP datalink" on page 2221*

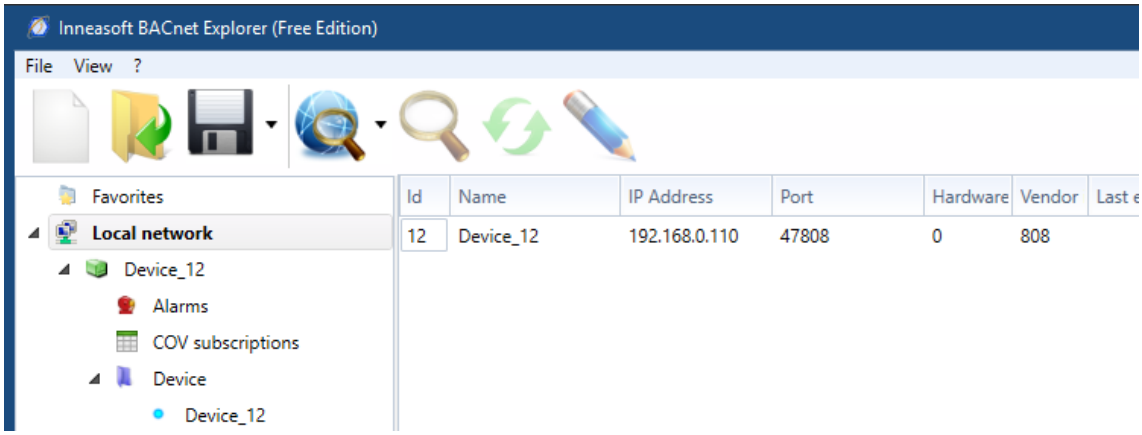


5. Build the project, download to the PLC and set it to *[RUN]*. The status of the *"BACnet Server"* should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select *[Show license information]* from the runtime licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

↳ *Chapter 1.6.6.2.2.2 "PLC runtime licensing" on page 3665*



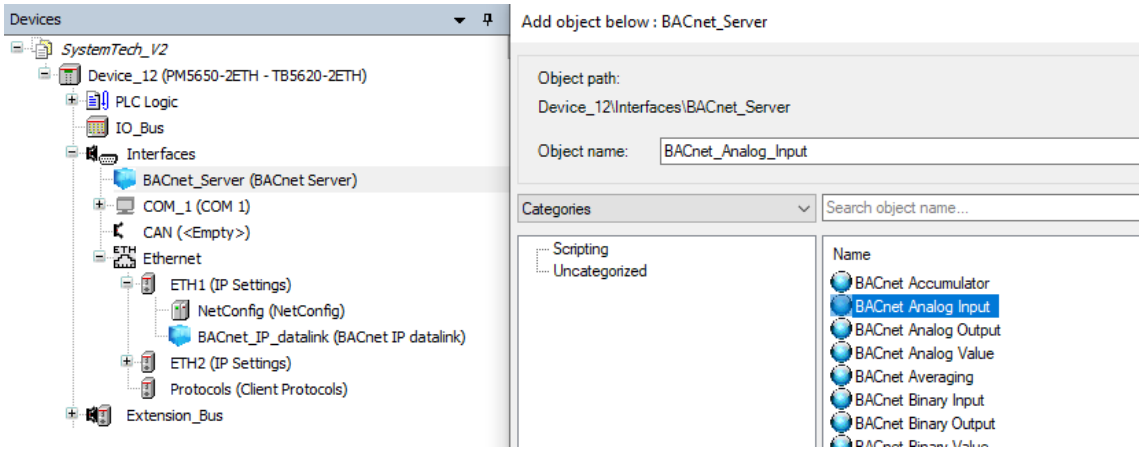
6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.



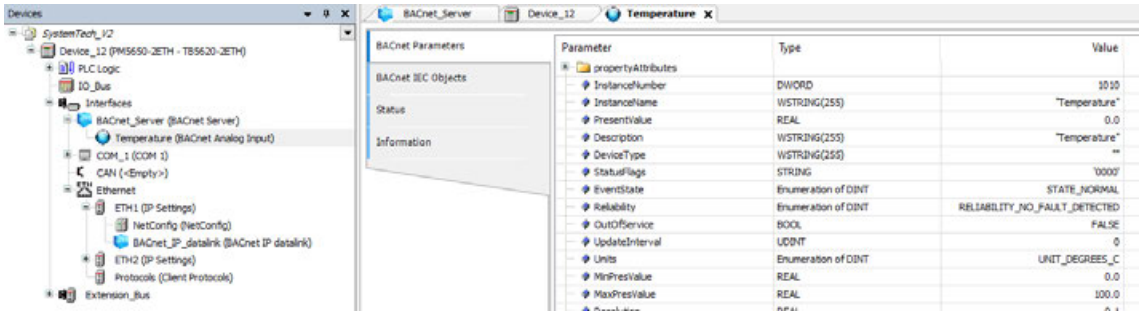
Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 25 *BACnet objects, properties, services and BIBBs*, left part containing a temperature value.

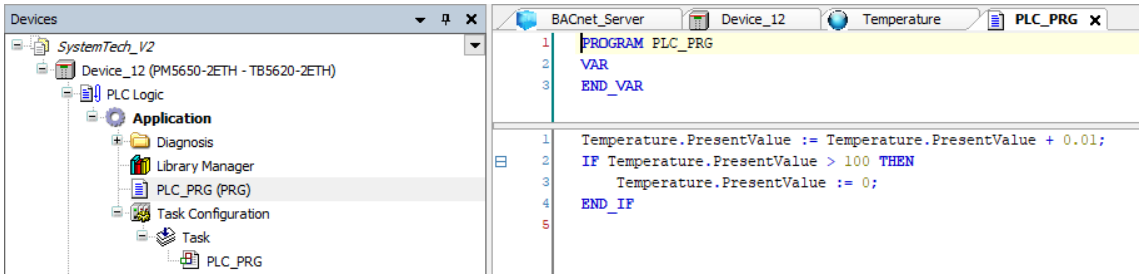
1. Configure a *"BACnet Server"* root object according to ↬ *Chapter 1.5.5.3.4.1 "Configuration of BACnet server root object " on page 2214*.
2. Add a *"BACnet Analog Input"* object below the *"BACnet Server"*.



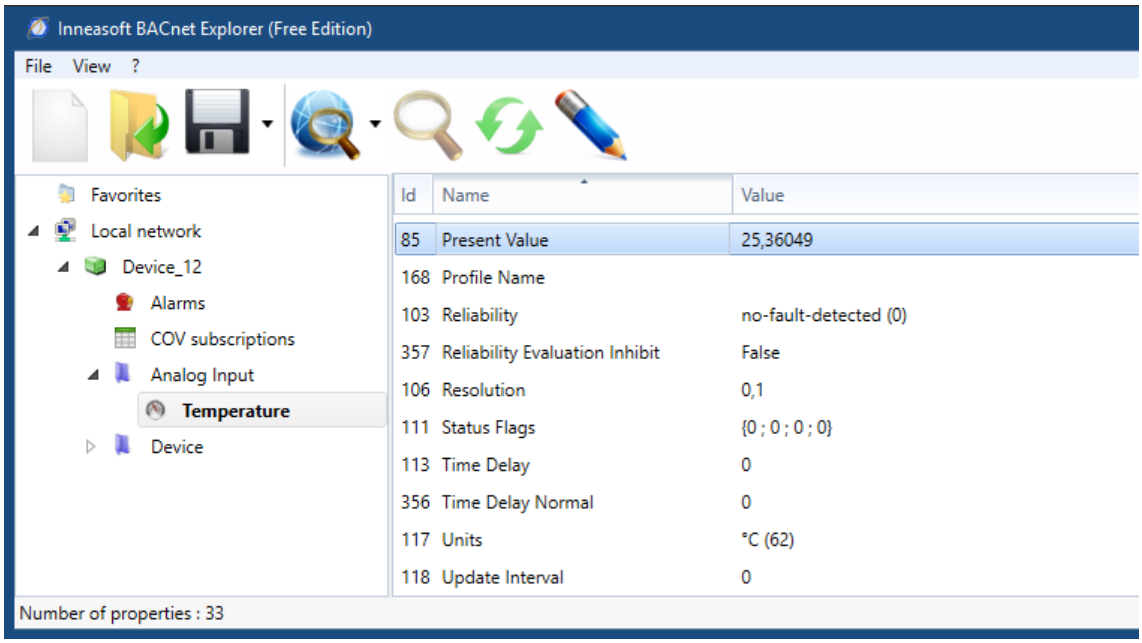
3. Rename it to `Temperature`, adjust the parameters: `InstanceNumber`: `1010`, `Description`: `Temperature`, `Units`: `UNIT_DEGREES_C`.



4. The present value of the objects `Temperature` needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.



5. Download the program and observe the temperature value in the BACnet client.

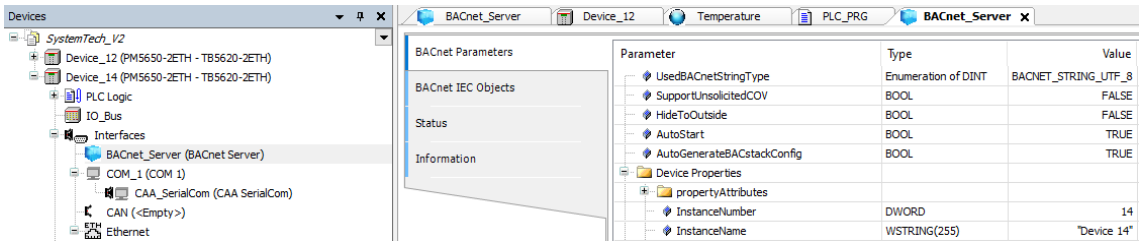


Adding BACnet client functionality

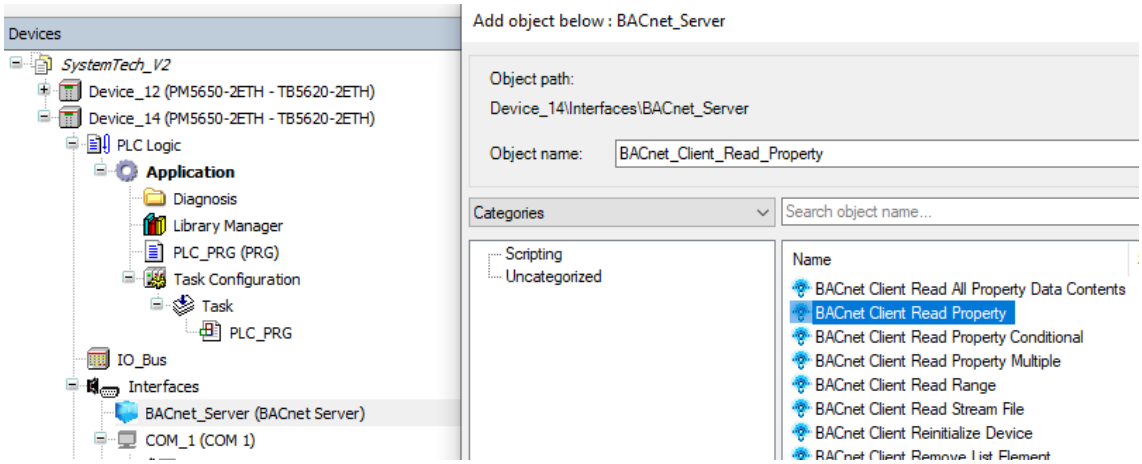
Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 25 *BACnet objects, properties, services and BIBBs*, right part.

1. Add a new controller and configure a *"BACnet Server"* root object according to ↳ *Chapter 1.5.5.3.4.1 "Configuration of BACnet server root object " on page 2214*.

2. Set `InstanceNumber` to `14` and `InstanceName` to `Device 14`.



3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a *“BACnet Server”*. Add a *“BACnet Client Read Property”* below the *“BACnet Server”* node.

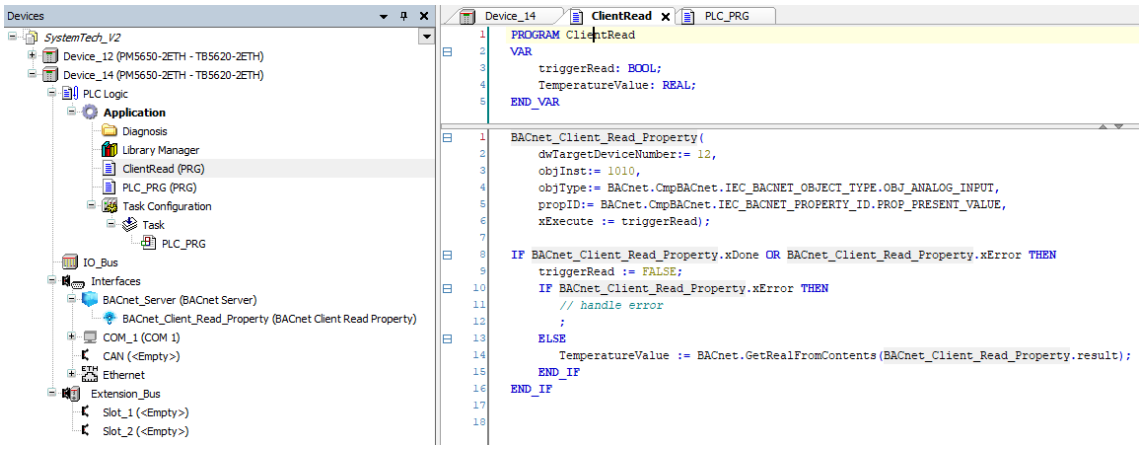


4. The created object *“BACnet Client Read Property”* generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

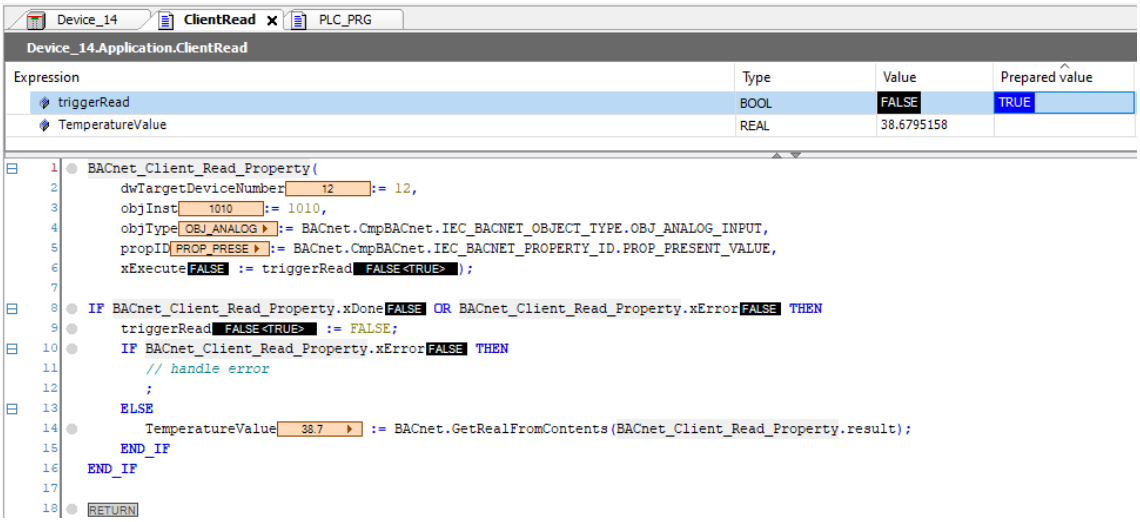
   In line 1-5 of the code part the function block is called with the following parameter:

   - Device ID of the server to read from (`12`) *Chapter 1.5.5.3.2 “Supported objects and properties ” on page 2213*
   - Object ID of the object to read from (`1010` for the *“Analog Input”*)
   - Object type (*“Analog Input”*)
   - Property to read (*“present value”*)
   - `triggerRead` to start the read operation

   When the user (or another program part) sets the variable `triggerRead` from `FALSE` to `TRUE` the edge triggered function block `BACnet_Client_Read_Property` starts operation and sends the read request to the server device. After receiving the reply from the Server, the output `.xDone` gets `TRUE` (line 8) and the temperature value can be read from the output `.result` (line 14).

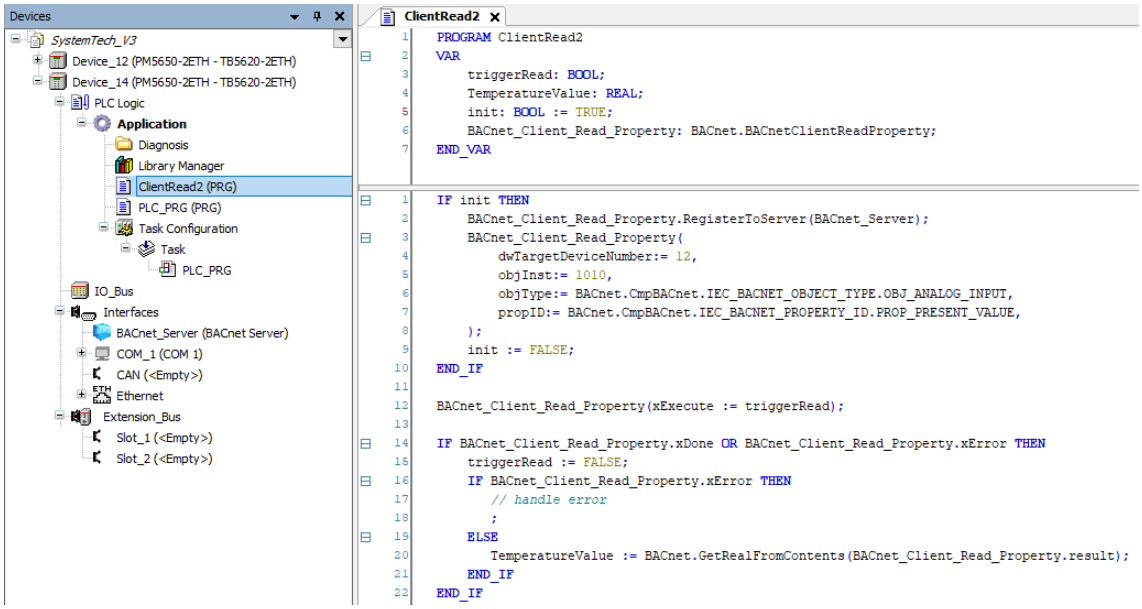


5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting `triggerRead` to `TRUE`. In online mode the read temperature value can be observed in line 14.

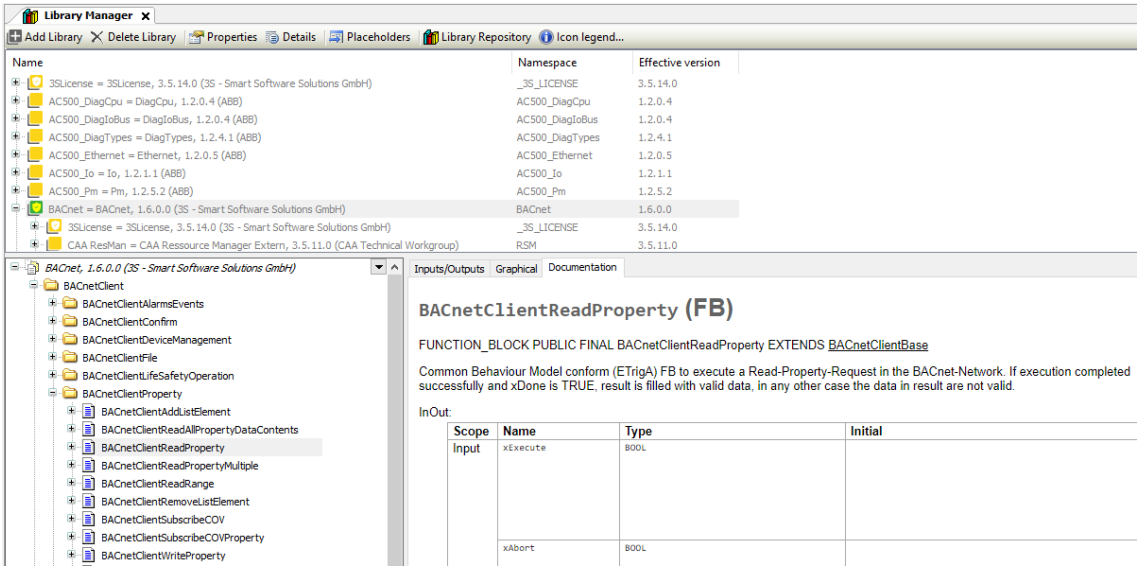


Alternative configuration

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.



There is no `BACnet_Client_Read_Property` object created below the *"BACnet Server"*. Instead a function block `BACnet_Client_Read_Property` must be declared in the PRG (line 6 in the declaration) and initially "connected" to its *"BACnet Server"* in IEC-code via `RegisterToServer()`, and thus get activated (line 2 in the code) ↳ *Chapter 1.10 "Reference, function blocks" on page 4292*.



Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

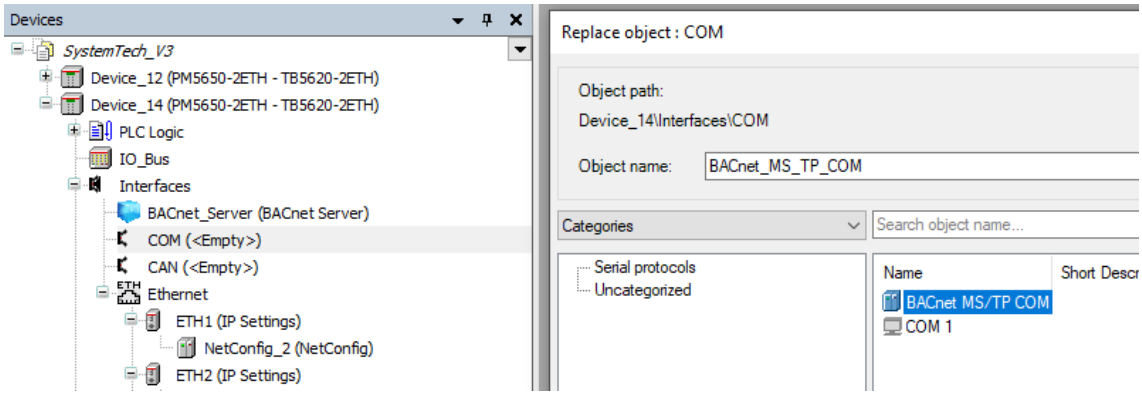
↳ *Chapter 1.5.5.3.1 “Supported BACnet networks ” on page 2211*

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.

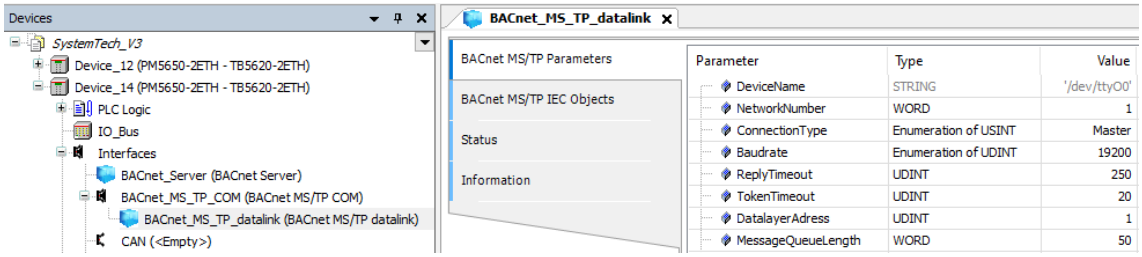
Configuration of an MS/TP datalink

- Add the *“BACnet MS/TP COM”* object below the COM port.



In fact the empty COM port is replaced by the *“BACnet MS/TP COM”*. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

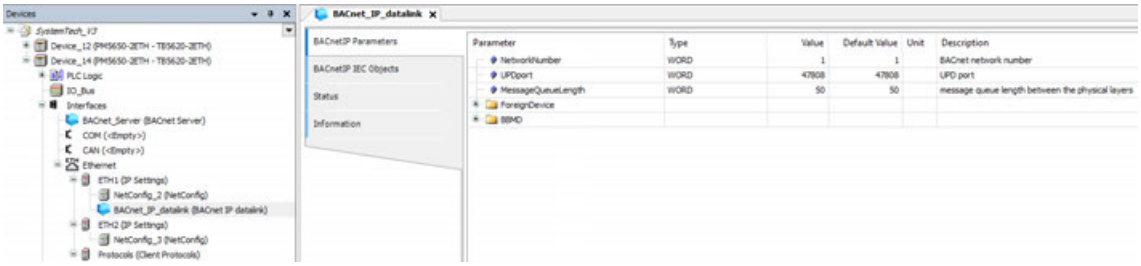
- Below the *“BACnet MS/TP COM”* port object an *“BACnet MS/TP datalink”* is inserted automatically which can be configured according to the requirements.



- `NetworkNumber`: Use the default value `1` if no routing is required. For routing, use a unique network number in one controller.
- `ConnectionType`: Use the default value `Master` if no routing is required. For routing, use *"Master – answering always postponed"*.
- `Baudrate` can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.
- `DatalayerAddress`: This is the MAC address as described in *Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211*. The MAC address must be unique in the MS/TP network.
- For all other parameters the default values are recommended for typical applications.

Configuration of an IP datalink

- Add a *"BACnet_IP_datalink"* object below the Ethernet port `ETH1` or `ETH2`.



- `NetworkNumber`: Use the default value if no routing is required. For routing, use a unique network number in one controller.
- `UPDport`: Use the default value (`47808` decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in *Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211*. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (`ETH1` or `ETH2`); its IP address is set in the communication settings of the CPU node, *"Device_14"* in the example.
- `ForeignDevice` and `BBMD`: Special configuration is only needed if an internet router is located between two BACnet devices.
  Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211
  AC500 can be configured as `ForeignDevice` or `BBMD`, but not the combination of both. An example for BBDM can be found in the example folder.

Configuration of Routing

Routing enables the combination of different BACnet networks to one common *"BACnet internetwork"*.

Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211

BACnet devices from different BACnet networks can communicate with each other.

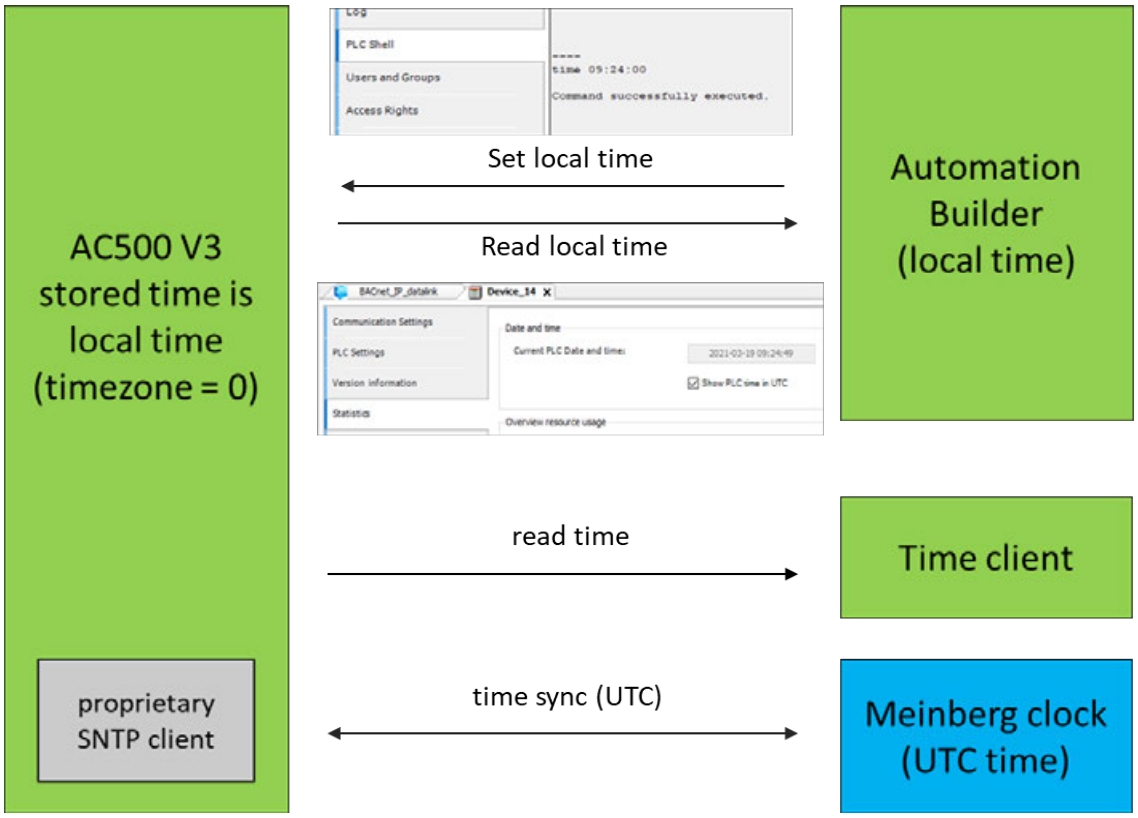
If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

Chapter 1.5.5.3.1 "Supported BACnet networks " on page 2211

For MS/TP the `ConnectionType` must be set to *"Master – answering always postponed"*. An example for routing can be found in the example folder.

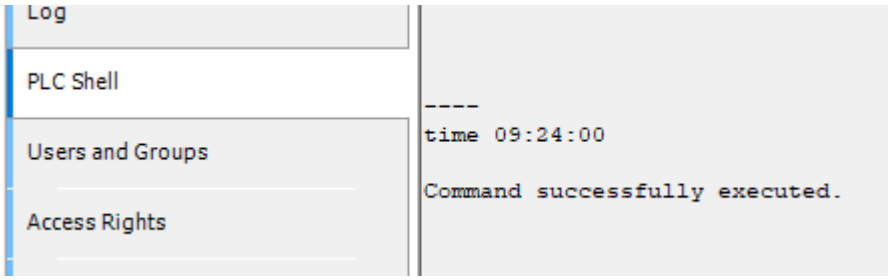
Time syncronisation

The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.

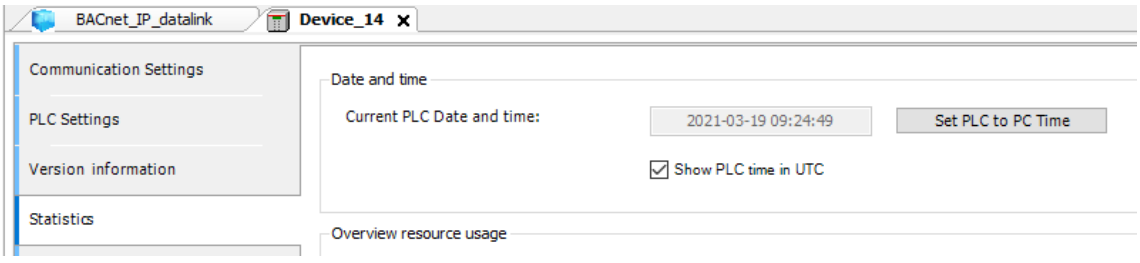


Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab *"PLC Shell"*:
  Set the time by the command "time hh:mm:ss"



- Read the local time from the Automation Builder Tab *"Statistics"*:
  "Current PLC Date and time" shows the PLC time as local time without conversion, if the tab *"Show PLC time in UTC"* is enabled.



For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab "Statistics"), since this is always converting from local time to UTC time.

- BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.
- If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.
  Please contact the PLC support for more information.

1.5.5.3.5 Package content

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
  - BACnet plug-in component
  - Device descriptions for *"BACnet Server"*, BACnet objects, BACnet client and datalinks
  - Libraries: `BACnet`, `BACnetDefaultImpl` and `CmpBACnet`.
    Chapter 1.5.5.3.5.1 "BACnet libraries" on page 2223

Example folder

- Example folder

    Chapter 1.5.5.3.5.2 "Application examples" on page 2224
  - Datasheet and FAQ
    BACnet Protocol Implementation Conformance Statement (PICS), acting as a datasheet, describing all BACnet objects, services and communication capabilities.
    BACnet Conformance Certificate
    FAQ – Frequently Asked Questions, including AC500 specific information, performance and limit

BACnet libraries

The IEC library `CmpBACnet` represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the `BACstack` methods. The sole use of the IEC library `CmpBACnet` (without the `BACnet` and `BACnetDefaultImpl` libraries) would result in complex and lengthy IEC application code.

The `BACnet` library simplifies BACnet application development considerably as compared to the sole use of `CmpBACnet`, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see `IBACnetEventConsumer`) and distributing the callbacks to multiple receivers in the application

Furthermore, the `BACnet` library provides a plug-in mechanism (`BACnetServerPlugin`) for extending certain aspects of the `BACnet` library. `BACnetServerPlugin` is the basis for the `BACnetDefaultImpl` library.

The `BACnetDefaultImpl` library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of `Trend Log`, `Trend Log Multiple`, and `Event Log` entries
- Update of the date/time information of the device object

The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have "facade" functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- Starting and stopping the BACnet stack
  Always use BACnetServer.StartBACnetStack and BACnetServer.StopBACnetStack or AutoStart. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetServerInit.
- Using BACnet server objects and their properties
  Always use the specified function blocks in IEC-lib-BACnet, such as BACnetAnalogValue. Never directly use the corresponding functions of the BACnet library, such as CmpBACnet.BACnetStorePropertyInstance.
- Triggering of asynchronous requests
  Always use the specified client function blocks of the BACnet library, such as BACnetClientReadProperty. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetReadProperty. All functions of the CmpBACnet library that require a BACnetAsyncTransactionToken belong to this category and should never be used directly.
- Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application
  Always use IBACnetEventConsumer and BACnetServer.RegisterHook/UnregisterHook/RegisterCallback/UnregisterCallback. Never directly use the corresponding functions of the CmpBACnet library, such as CmpBACnet.BACnetSetHook or CmpBACnet.BACnetSetCallback.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as BACnet*CbCompletion, BACnetIam(Ex), or BACnetIHave(Ex), BACnetUnconf*.

Most often, you will use BACnet*CbCompletion to implement your specific IBACnetEventConsumer.BACnetEventCallbacks. But first check whether or not the BACnetDefaultImpl library already contains an appropriate standard implementation.

Application examples

- AC500_V3_BACnet_B-BC_Example_ABxxx.project including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as *“BACnet Server”*, publish the analog value
- AC500_V3_BACnet_B-BC_Example_Routing_ABxxx.project
- Examples from 3S, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing

1.5.6 CAA library guidelines

Function block descriptions for the CAA library can be found in the Library Manager.

The guidelines for the CAA libraries correspond to the general guidelines for library development. For a detailed description see help chapter *Guidelines for Library Development*.

With the help of the CAA library, different use cases for dealing with AC500 PLCs can be programmed. A possible example is the use of the so-called CSV read function, with which information from CSV or other formatted DAT files can be read into Structured Text. This use case is described in the *application example*.

Another application example describes the file handling in order to *write, read and append files*.

1.5.7 Datalogging library

1.5.7.1 Overview

The Datalogging function block library (PS5609-Log) contains five function blocks for the purpose of advanced time-stamped data logging for different use cases.

In the most challenging use case it also can be called buffering: The AC500 application program generates data which are normally transmitted to a telecontrol system for storage and further processing or displaying to the end user. Typically, these may be remote applications like water- or oil-pumping or electrification stations or solar power plants. The connection between these remote stations with an AC500 and a central SCADA/telecontrol station is not always stable or only sporadically connected. Sporadically connected can be by intention, e.g. to save communication costs or open ports/connections to be used with a control station only in a limited way.

- Then the Datalogging function blocks buffer or store data in case of a broken or intentionally interrupted connection between AC500 and the telecontrol system.

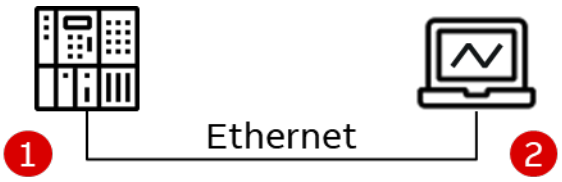

Fig. 26: Overview

1 AC500 application (remote substation)
2 Telecontrol (control station)

- The Datalogging library can be also used as an event recorder. In this special mode data is continuously recorded in a ring buffer which can be read out after a certain event x (e.g. outage) in order to analyze the values especially before but also after the event x.
  OR
- Data can be logged only and on command transferred to the ftp area to be analyzed offline or taken out via the memory card.

The following figure gives an overview of the described interaction of the data logging function blocks. There is always an input function block (*"LogInput"*) needed which transfers the input data into data sets with timestamp for use by the datalogger (*"LogHandling"*). An output function block (LogOutput) receives the current or retrieved data from the datalogger in case of communication or further processing. The input function blocks *"Logxx_Input"*, the function block

"LogHandling" and the output function blocks *"Logxx_Output"* communicate via SRAM FIFOin and FIFOout areas in the memory. The SRAM FIFOin is power-fail-safe intermediate buffer and help in decoupling time wise and speeding up the necessary write/read operations on the logging file structures significantly. These read/write operations on the files are done in blocks of Data sets, enabling a comparably fast interaction with the otherwise slow file system.

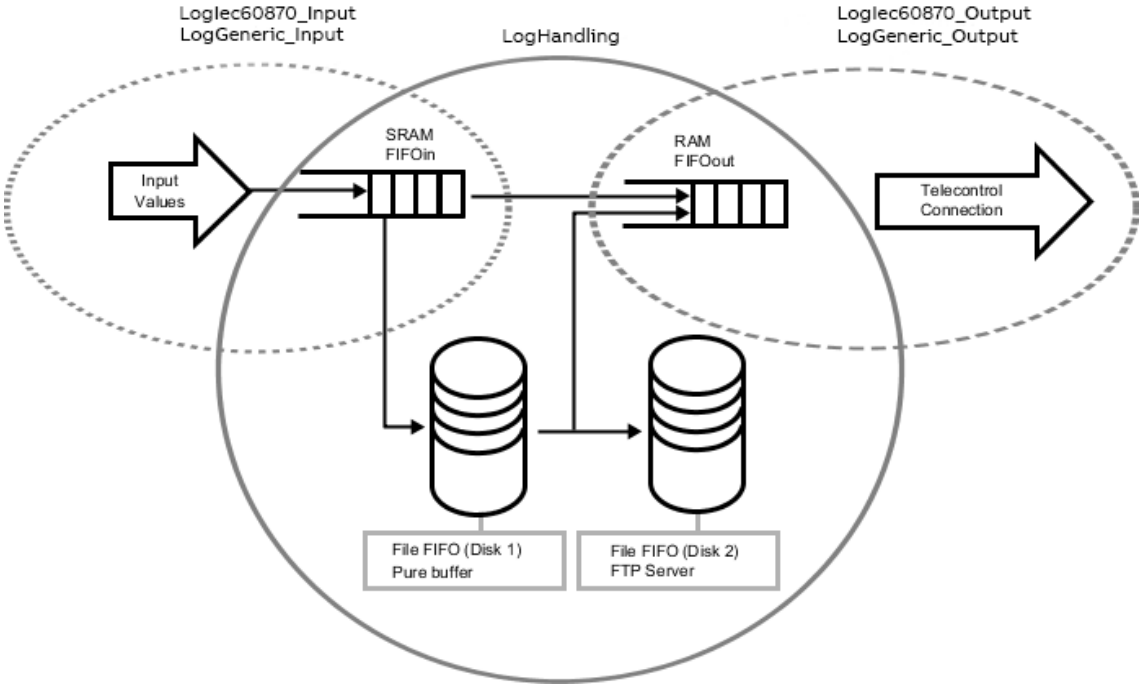

Fig. 27: Overview function blocks

Each Datalogging application requires the main function block *"LogHandling"*, one of the input function blocks to provide data to be logged and one output function block to retrieve the data and send the data to telecontrol (scada).

As input and output function blocks two different types exist:

- For logging data of an interrupted IEC60870 communication, the function blocks *"Loglec60870_Input"* and *"Loglec60870_Output"* are provided. The IEC60870 Datalogging function blocks support the IEC data types and work internally with the standard AC500 IEC60870 library. The IEC Datalogger output function block does not need special handling or control/inputs.
- For other types of general data *"LogGeneric_Input"* and *"LogGeneric_Output"* are provided. The generic Datalogging function blocks support an even larger variety of data types. The generic output function block needs to be hand-shake with for each data set, in order to retrieve the data from the Datalogging files. Therefore the generic function blocks can also be used to integrate the data logging into any other protocol, e.g. Modbus.

The function block *"LogHandling"* ensures that also several consecutive and fast interruptions can be handled without losing data. While the log file is replayed, arriving new data is stored in the SRAM FIFOin and added to the Datalogging files (File FIFO) if the SRAM FIFOin becomes full (during that short time the log file replay is paused). Nevertheless any data send to a control station via a communication is always with the oldest data first (FIFO = "First In First Out").

As it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols by the AC500 hardware/firmware), the data rate at which data should be logged in case of a communication break has to be calculated and limited.

As an improvement a ping mechanism should be implemented in the substation. This was done in the example program for the IEC logger. With this ping the interruption is already detected after 1-2 seconds (can be configured in the example program - the configurable *"SecureReadTime"* must be considered in this context. This ensures that the time delay - before a loss of connection is detected and is compensated).

As the SRAM FIFO has to store data during this time its size limits the data rate. The SRAM FIFO size is 160 Data sets. If data rate is too high, FIFO will overflow. The maximum data rate is depending on the CPU type, storage media (memory card / flash disk) and cycle time configured, must be determined by try and error.

The data rates for storing only without this detection can be much higher and depends on the CPU and memory type chosen. The data is always logged in directly readable csv format *Chapter 1.5.7.1.5 "CSV file formats" on page 2232*. Depending on the input function block and data type, the log file contains only one or up to 32 data variables per timestamped data set. The Datalogging files can be configured (up to 65k Data sets per file, up to 999 consecutive log files, name format).

1.5.7.1.1 Operating modes

This chapter describes the different operating modes of the Datalogging and their behavior.

- Mode 0/1: Buffer and disposal in chronologic order
  - Mode 0: Limited storage (keeps oldest, but stops if full)
  - Mode 1: Endless (ring buffer) operation modes (deletes oldest)
- Mode 2: Buffer and disposal via FTP, Log file(s) copied to ftp server area for further use
- Mode 3: Events Recorder, logs data before and after an event.

Mode 0/1: Buffer and disposal in chronologic order

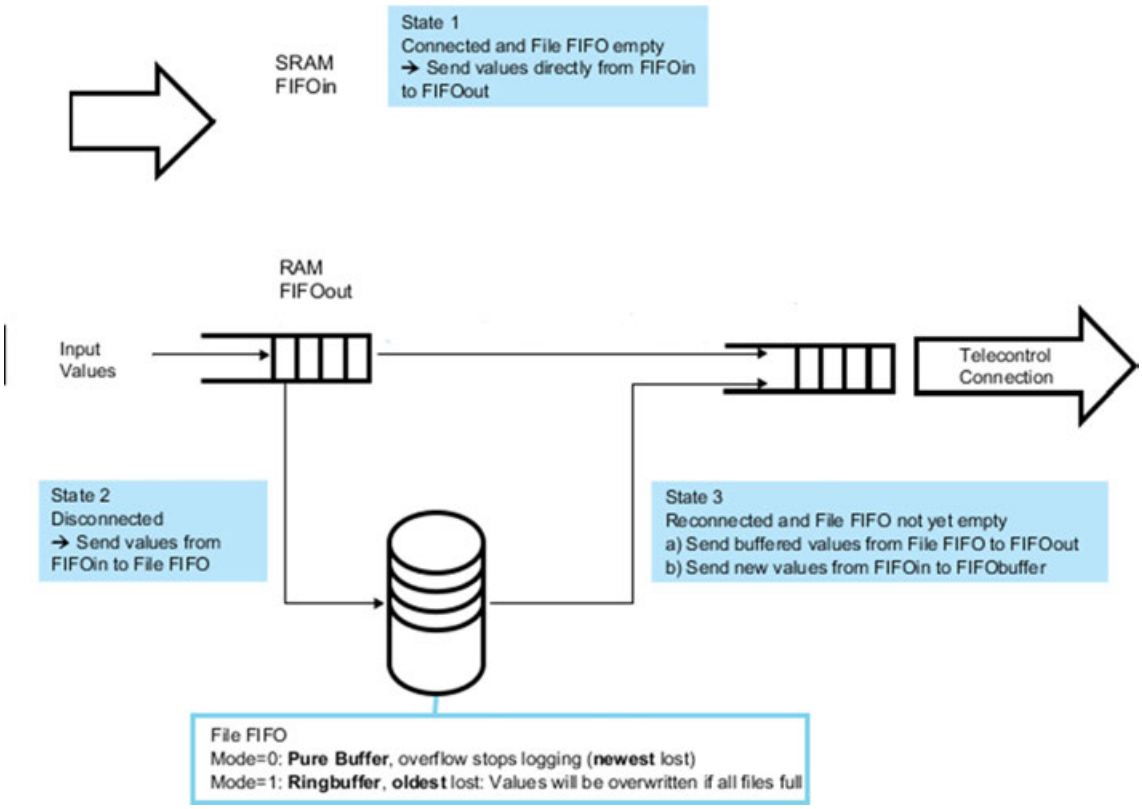

Fig. 28: Overview Mode 0/1

Mode 0/1 is for buffering the values from the AC500 application in case of a broken or intentionally interrupted connection between AC500 and telecontrol. In the normal state 1 the values are directly sent from the FIFOin (input values from application) to FIFOout (telecontrol connection). As soon as the connection is interrupted, the Datalogger changes to working state 2. The values are sent to the file FIFO instead. When the file FIFO is full, the Datalogging is stopped (Mode 0) or the oldest data will be overwritten (Mode 1 = ringbuffer). When the connection is established again and the *"ReleaseHistory"* pin is triggered, the datalogger changes to working state 3. It cares for disposal of the values in chronological order. The buffered values are

written to FIFOout (working state 3a). This may take some time during which new values are coming from the application and stored into FIFOin. Before the FIFOin overflows the datalogger switches to working state 3b and buffers the new values. After that it can continue with working state 3a. Only if the File FIFO is empty (all files deleted) the datalogger changes back to normal state 1.

The advantage of Mode 0/1 is that all values (directly and buffered) are sent to telecontrol in strictly chronological order which is expected by most control stations (SCADA systems/historians).

If a historical value is sent to the SCADA after a current value has already been sent, the historical value is normally rejected by the SCADA.

As it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols by the AC500 hardware/firmware), the data rate at which data should be logged in case of a communication break has to be calculated and limited. It therefore makes sense to use PING to detect a possible interruption in the connection. This enables an earlier detection of the connectionless state.

Mode 2: Buffer and disposal via FTP

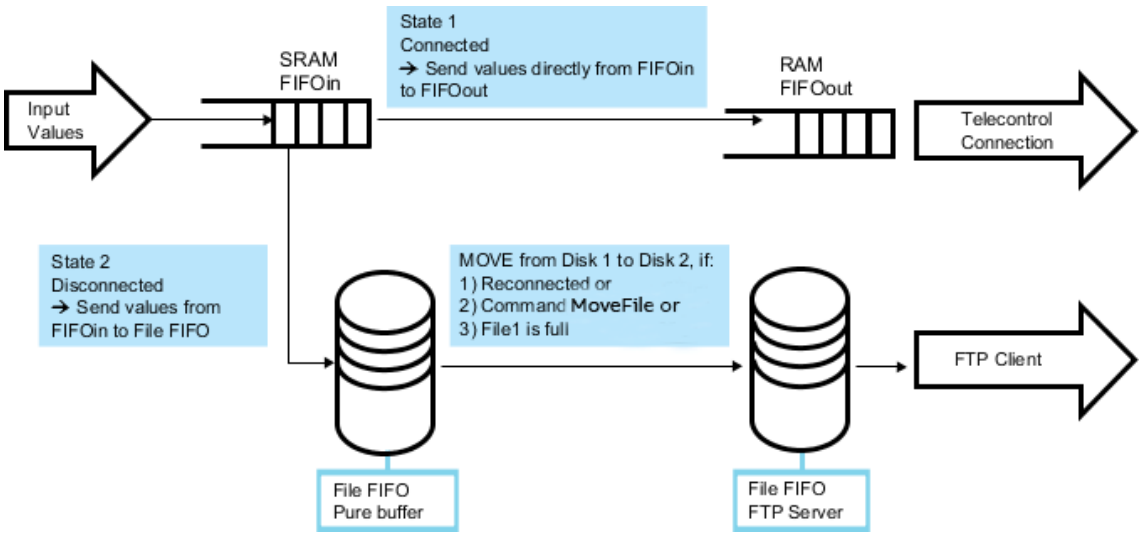

Fig. 29: Overview Mode 2

Mode 2 is also used for buffering the values from AC500 application in case of a broken connection between AC500 and telecontrol. State 1 and state 2 are similar to Mode 0/1. The difference is the disposal. When the connection is established again the Datalogger changes directly back to state 1 and the input values in FIFOin are directly sent to FIFOout (telecontrol connection). The buffered values in File FIFO are internally moved from disk 1 to disk 2 which can then be accessed or used by FTP (client or server). This move action can also be triggered by the command *"MoveFile"*, or when file 1 is full. The advantage of Mode 2 is the immediate availability of the latest and all current values after an outage.

Mode 3: Events recorder

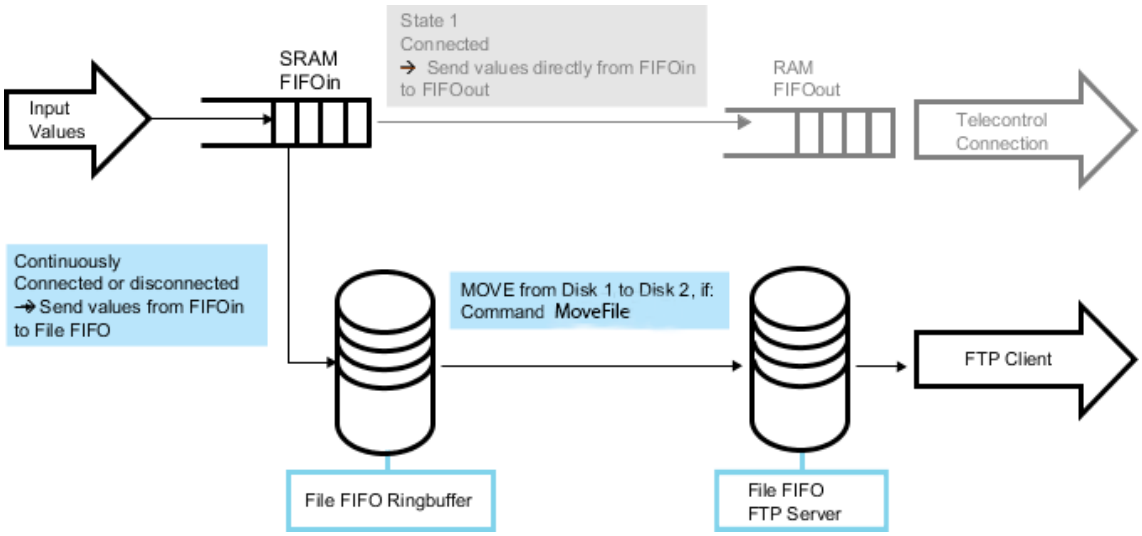

Fig. 30: Overview Mode 3

Mode 3 is used to record data values around an event, before and after the event X, e.g. outage of a part of the plant. The values are continuously recorded into the File FIFO file system independent of the connection status to telecontrol. If the File FIFO is full the oldest values are overwritten (ring buffer). Thus the file FIFO always contains the values from the past period n, which is depending on the number of values per second and on the size of the File FIFO. When a certain event x occurs, the command *"MoveFile"* can be given directly or after the period m. With the command *"MoveFile"* the values in File FIFO are internally moved from disk1 to disk 2 and can be read out by an FTP action (client or server) when required.

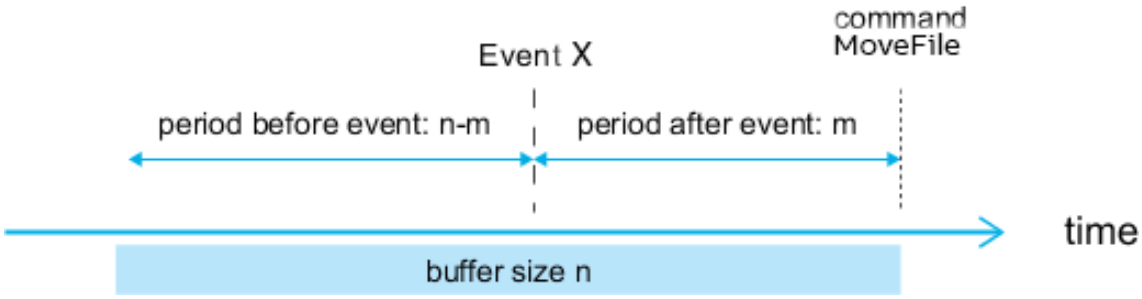

Fig. 31: The buffered values represent the time before the event (n-m) and after the event (m).

The advantage of Mode 3 is that the values from the time period before the event (n-m) and after the event (m) are recorded and can help to reconstruct the cause and effect of the event.

1.5.7.1.2 Technical details

Parameter	Value
IEC 60870-5-104 protocol integrated in Datalogging, IEC data types	SinglePoint SP1/16, DoublePoint DP, IntegratedTotal IT1/16, MeasurementValue ME1/16
Generic logging to file(s); AC500 data types	BIN, BYTE, INT, UINT, DINT, UDINT, REAL
Trigger	Cyclic, event, tolerance

Parameter	Value
File format	CSV, including local timestamp. Generic Logging with separate ID (max. 8 characters), IEC Logging with IEC addresses. Timestamped Data sets contain 1-16 values (IEC) depending on type logged. Generic contain different number of values, depending on type logged. BINARY: max. 58 BYTE: max. 88 INT: max. 50 UINT: max. 58 DINT: max. 29 UDINT: max. 31 REAL: max. 27
Datalogging target	Flash disk or memory card, power fail input for memory card (from UPS)
Datalogging file sizes and storage depth	FIFO storage in file system, Datalogging depth only limited by memory size
Configurable file FIFO	Number of files (max. 999); number of Data sets per file (max. 65535)
Internal SRAM FIFO size	160 Data sets
Block write mode into files	Up to 50 Data sets/second per max. 88 values
Operation modes	Mode 0: Buffer and disposal in chronologic order Limited storage (keeps oldest, but stops if full) Mode 1: Buffer and disposal in chronologic order Endless (ring buffer) operation modes (deletes oldest) Mode 2: Buffer and disposal via FTP, Log file(s) copied to ftp server area for further use Mode 3: Events Recorder, logs data before and after an event.
Supported software/firmware	V3.4 or higher
Current restrictions	One logger per PLC One IEC 60870 connection only: While log file is replayed, no other current information via IEC available Usable solutions: ● Delay replay of log file after connection returned to allow a “general inquiry” ● Use of Mode 2

Logging capacity:

- Data set: 1 data set always has 400 byte
- FIFOin: Has a maximum capacity of 161 data sets (a 400 byte = 64400 byte)
- FIFOout: Has a maximum capacity of 161 data sets (a 400 byte = 64400 byte)
- File: 1 file stores up to 65535 data records, which are copied block by block from the FIFOin in case of a communication lost
- A maximum of 999 files can be saved.

In purely mathematical terms, that would be 999 files * 65535 Data sets * 400 byte / Data set = 26,187,786,000 bytes = 26 GB

Since neither the flash disk nor the usable memory card have such a capacity, the user has to find a sensible compromise. The flash disk as a storage medium is fail-safe, i.e. in the event of a sudden power failure, data in the possibly currently open file is reconstructed when the power is restored. This is not the case with a memory card. There the file is destroyed. It is therefore advantageous if such a variant is operated with a power supply that keeps the PLC alive for at least a few seconds after the supply voltage failure (see *"Input ExternalPower"* on the *"LogHandling"* function block).

Time synchronization:

Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in near future. In the meantime, it is recommended to store the local time in the AC500 as a workaround.

Chapter 1.5.5.3.4.5 "Time syncronisation" on page 2221

1.5.7.1.3 File names

File names are renamed according to storing time with an accuracy of 100 ms. The files are renamed from *"filename.csv"* to a file name with timestamp and with or without file extension, according to input *"Disk2Extension"* is applicable only in Mode 2.

File name with timestamp	02281448.593 = February 28th, 2:48pm (14:48), 59s, 300ms
File name with timestamp and file extension	02281448.csv = February 28th, 2:48pm (14:48)

1.5.7.1.4 Preconditions

The Datalogging library supports CPU PM5650 or higher.

The Datalogging library does not support CPUs of the AC500-eCo series.

CAUTION!

Failure in Processing of the function blocks.

– The function blocks LOGxxxxxx_Input, LogHandling and LOGxxxxxx_Output must be put in the same task.

CPU firmware must be V 3.4.0 or higher.

Use memory card from ABB with sufficient free space, at least 1.5 x file size as configured (file size is depending on input *"MaxNumDatasetFile"* from *"LogHandling"* function block).

Maximum number of files (input of *"LogHandling"*) is limited to 999. ABB memory card is formatted with FAT by default.

Table 378: 1 Data set consists of the following parameters

Parameter	Explanation
IecType =	IecType of LogIec60870_Input (1…7)
Slot/Con/Idx/NoDP =	Pin group of LogIec60870_Input (1…7)
Quality_Bits(Byte) =	IV/NT/SB/BL/CA/CY/QOV (packed in 1 byte) of LogIec60870_Input (1…7)
Quality (SQ) =	SQ of LOG_IEC60870_INPUT (1…7)
GADU =	calculated internally, from Automation Builder Configurator (Gadu1+Gadu2)

Parameter	Explanation
IAD3/2/1(n) =	calculated internally, for every datapoint separately, from Automation Builder Configurator (IAD1+IAD2+IAD3)
n =	1 or 16, in case of DP is n=2
VAR(n) =	variable

IEC type	Values	Meaning
SP1	-	SinglePoint 1
SP16	-	SinglePoint 16
DP	-	DoublePoint
IT1	-	IntegratedTotal 1
IT16	-	IntegratedTotal 16
ME1	-	MeasurementValue 1
ME16	-	MeasurementValue 16
Quality_Bits(Byte):	Quality.0 := IV;	Quality with quality invalid
	Quality.1 := NT;	Quality not topical
	Quality.2 := SB;	Quality substituted
	Quality.3 := BL;	Quality blocked
	Quality.4 := CA;	Quality with quality carry
	Quality.5 := CY;	Quality with quality counter adjusted
	Quality.6 := QOV;	Quality Overflow Quality
	Quality.7 := Reserve;	(*Reserve - Quality*)
Quality SQ(Byte)	SQ	Quality sequence number (Range: 0 to 31)

1.5.8 High Availability Modbus TCP

1.5.8.1 HA-Modbus TCP - System technology

1.5.8.1.1 The AC500 High Availability system

The AC500 High Availability system is designed for the demand of automation systems that require a higher availability, which is realized by redundant devices and communications. The redundancy concept reduces the risk of losing production due to failure of parts of the automation system and thereby minimizes scheduled idle times.

For instance, control can be taken over by the secondary station automatically if the primary station fails.

AC500 High Availability system implements redundancy based on standard AC500 PLCs:

- PLC
- Field communication
- SCADA communication

General differences in high availability / redundancy systems are in which way and how fast the switchover between redundancies happens.

- Cold standby: A replacement system is there but not up and running - Process has (to allow) to completely stop for switchover – e.g. outputs may go to zero.
- Warm standby: Both CPU may be running (= warm) but e.g. communication need to be started/stopped for switch-over - Process needs to tolerate longer freeze times e.g. on outputs - e.g. several seconds.
- AC500 High Availability systems are "hot-standby":
  - Redundant CPUs and all communications are always up and running (hot)
  - Continuous failure detection in both CPU´s and mutual exchange of status
  - Continuous synchronization of critical/historical data from primary to secondary
  - Automatic switch-over in very short time in case of any failure in primary CPU

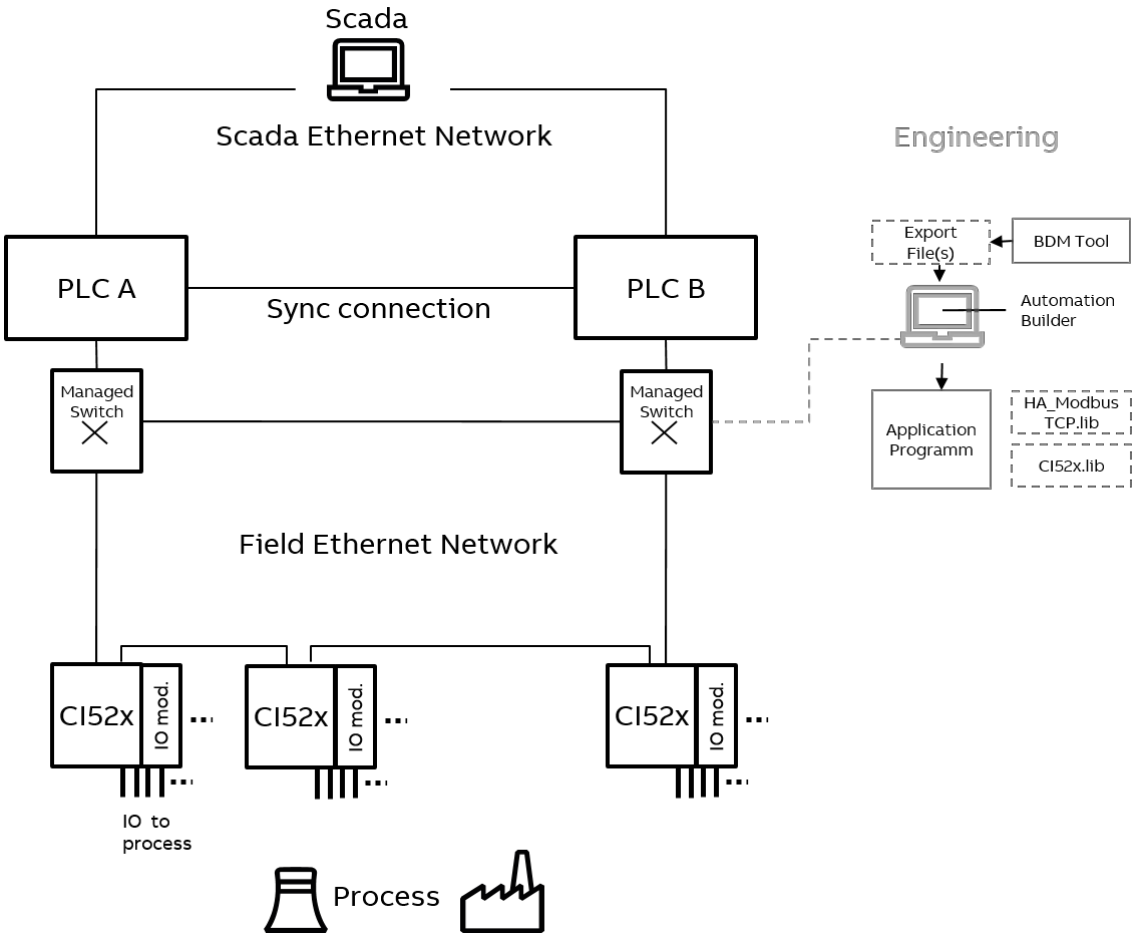

Fig. 36: Principle AC500 HA-Modbus TCP architecture example based on Ethernet redundancy

Details of AC500 HA operation along the figure above:

- PLC redundancy: The two PLCs (A and B) are running in parallel and calculating and reading.
  One is *"primary"* = active, which means also writing data to field devices.
  The other one is *"secondary"* (= stand-by), also calculating but only reading data from field and receiving synchronization (or short = sync) data from the primary.
- Synchronisation data are critical internal variables with e.g. historical content, which will be transmitted from primary to secondary CPU over the sync connection, so that secondary always has the latest data and can take over immediately. Automatically synced are the historic data of the special HA library function blocks (like counters, timers, integral controllers, …), additional Data e.g. of events and diagnosis can be synced by the user with sync blocks. The sync connection also transmits a *"lifecom1"* signal (back and forth) containing diagnosis data of each CPU, so that both CPU know the status of the other CPU. If secondary CPU receives no *"lifecom1"* anymore it assumes that primary CPU has a failure and takes over primary status. If the sync connection is broken both CPUs would try to adopt primary status, therefore, a separate connection *"lifecom2"* is used to differential a "sync link" failure from an "other PLC" failure. The *"lifecom2"* should be routed via a different physical communication path than the data sync/lifecom1, e.g. the Field or SCADA network.
- The field I/O connection is performed via the Ethernet protocol *ModbusTCP* - connecting the CI52x devices (*Chapter 1.6.3.7.4.1 "CI521-MODTCP" on page 3156* or *Chapter 1.6.3.7.4.2 "CI522-MODTCP" on page 3196*).

For high availability/redundancy of the field or SCADA network, proven Ethernet network redundancy mechanisms are used. (In AC500 this is assumed to be realized by at least 2 (to avoid a single point of failure) external, managed switches), which has the advantage to be able to use AC500 HA with any faster redundancy mechanism / protocol.

- For the I/O communication with CI52x modules two variants exist (see online help: PLC Automation with V2 CPUs ➔ PLC integration ➔ Device specifications ➔ Communication interface modules (S500) ➔ Modbus XY)
  For smaller systems, the CI52x modules can be directly daisy chained (as in previous figure above) if MRP (Media Redundancy Protocol) or DLR (Device Level Ring) is used. Ci52x are not actively participating in ring recovery however, a special FW allows fast ring detection and very short freeze times. Larger systems with e.g. many IO and clusters typically anyway connect to the network via a dedicated managed switch.
- SCADA connection is redundant by nature of the two Ethernet ports and can be extended with further redundancy level as well by managed switches. SCADA itself can also switch the primary PLC to ensure communication to the active PLC in case of a simple connection and a connection failure. If the redundancy mechanism of the OPC DA server is not used, SCADA level itself must be able to handle and differentiate primary and secondary PLC and IP addresses based on the HA-status bits. For CP600 a script exists to do the same for Modbus or AC500 communication protocol.

In most PLC applications the critical components to fail are, beneath PLC, typically the power supply or communication components such as wires or switches. Therefore a *SPOF (Single Point Of Failure)* has to be avoided by adding redundant devices or redundancy functions wherever a failure likelihood is high and failures are not tolerable.

HA core functionality typically can tolerate only a single failure in the different levels. Then, a repair of the failed part is highly advised to achieve and ensure redundancy again. As shown in the above figure, the I/O-network cabling already provides a second independent redundancy layer e.g. for cable failure by its redundancy mechanism (e.g. ring), which can keep up communication without switching the PLCs: There a second failure in the PLC level could be tolerated as long as both connecting, managed switched still work, but it is highly advised to repair immediately anyway.

The AC500 High Availability system itself only takes care of the first fault. For example, in case of a second fault the primary PLC remains primary PLC until the second fault occurs. This results in no further switchovers (manual switchovers included).

Due to the efficient data sync mechanism, which allows data sync over normal and shared ethernet networks, with a well-planned communication network, the PLCs can operate geographically separated (by many 10^{th} of kilometers). So even in catastrophic events with full mechanical destruction still one PLC will be available to control the process or infrastructure.

The secondary PLC or single CI52x modules can be exchanged in a running system without interruption of the primary PLC or the process. (Check document in “Examples” directory of Automation Builder if HA package was installed.)

Libraries

In order to achieve high availability, the CODESYS application must be enhanced with HA function blocks, from the HA-Modbus TCP library and the CI52x library. If the bulk data manager tool (BDM) is used for configuring the System and I/O modules - this is done automatically for the basic initial configuration step by code creation resulting in a prepared user specific “template” application (see below).

- HA-Modbus TCP library contains *HA control* and *HA utility* function blocks
  - *HA control* function blocks manage the core HA functionality by collecting diagnosis and switching if necessary.
  - *HA utility* function blocks provide standard functions in the application program with internal *sync* for integral data e.g. timers, counters, PI control.
- *CI52x library* contains a function block to configure and communicate to the communication interface modules and ensures that only the primary PLC writes to the outputs. The inputs are read by both PLCs.
- For both PLCs the same application must be used/downloaded.

Bulk data manager tool (BDM)

For configuration of the CI52x Modbus TCPs, a separate Bulk Data Manager tool (BDM) is provided. Especially in larger systems usage of BDM is recommended to comfortably engineer HA and create CI52x related configuration and variable data in one place:

- Configuration and parameters of the used I/O modules
- Program code creationfor variable naming, configuration, communication and all basic HA functionality

The BDM tool can serve SCADA programming and documentation as well in an efficient manner.

1.5.8.1.2 Hardware, requirements and options overview

Two same type AC500 PLCs are required as central hardware components. Each PLC is equipped with at least two Ethernet ports at a processor module or at a communication module. The two PLCs, called PLC A and PLC B, are linked by Ethernet to exchange and synchronize information (*Sync*). Connections to the AC500 peripheral field devices (I/O) are performed via Ethernet as well.

For further information on which CPU type and library to be used refer to *Table 379 “Overview of AC500 HA systems and options” on page 2238*.

The following table gives an overview of the different High Availability variants possible with AC500.

The figures are indicative, depend on chosen architectures, system size, network and CPU/CM modules used.

Table 379: Overview of AC500 HA systems and options

Library version		HA-CS31	HA-Modbus TCP					
CPU version		V2 CPUs	V2 CPUs			V3 CPUs		
I/O communication		Parallel serial	Ethernet			Ethernet		
CPUs		PM573 - 595	PM573	PM591	PM595	PM5630	PM5650	PM5670
		Parallel serial	I/O network based on Ethernet and ext.edundancy mechanism					
Max. system size CI52x [1, 6]		3 - 50 [2]	3	< 25 / 50	< 60 / 92	< 30	< 50	< 120
I/O modules		CI590: S500	CI52x: S500 and S500-eCo usable [4]					
Switch-over times	CPU	25 -120 ms [3]	Typically < 50 ms ~[6]					
	Field	15 - 120 ms [3]	Depends mainly on network size, redundancy mechanism of external switches [7]					
SCADA connectivity		OPC DA, IEC60870, …	OPC DA, IEC60870, …			OPC DA, OPC UA, IEC60870, …		
Interfaces		Several CS31 and Ethernet	Several ETH ports, via CM597			2 ETH ports [5] + 1 CAN Interface		
Sync		UDP	UDP			UDP		
Lifecom1		-	UDP			UDP		
Lifecom2		-	Modbus TCP			Modbus TCP / CAN		
Overview of AC500 HA system								

[1] Number of CI52x recommendation based on performance or max. number of sockets (CPU and CM modules).

For more details of Modbus clients supported in AC500 V3 PLCs refer to *Chapter 1.6.1.3.3 “Limitation of connections per protocol” on page 2392*.

[2] Limited by CPU performance, number of CM574 modules number of CS31 clients and process data limits.

[3] Depends on system size and CPU type.

[4] For details on certain S500-eCo modules not supported, see the Automation Builder release notes, Appendix 1.

[5] CM597 not available for V3 CPUs.

[6] Based on HA bits switchover, depending on failure case *Chapter 1.5.8.1.3.2 “Use case descriptions” on page 2245* *Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258*.

[7] Field network: If CI52x are used with their 2 ports as part of a ring: In the moment of a network switchover single telegrams may be destroyed: - for V2 ETH onboard: Standard TCP delays repeats by 500 ms - for V3 CPUs onboard or V2 CPU using CM597: A special HA-FW ensures fast repeats of typ. ~50ms (settable).

CPU choice, system size and performance indications

The diagrams below indicate the example choices of AC500 CPU's (horizontal axes) based on the number of communication interface CI-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).

Further details can be found in *Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258*. The values in below graphs base on the assumption to use max. 50-60% as CPU loading by the bare fast IO communication and HA functionality. So the application load would come on top and cycle times (especially HA, Modbus) need to be relaxed (made higher) compared to below indication.

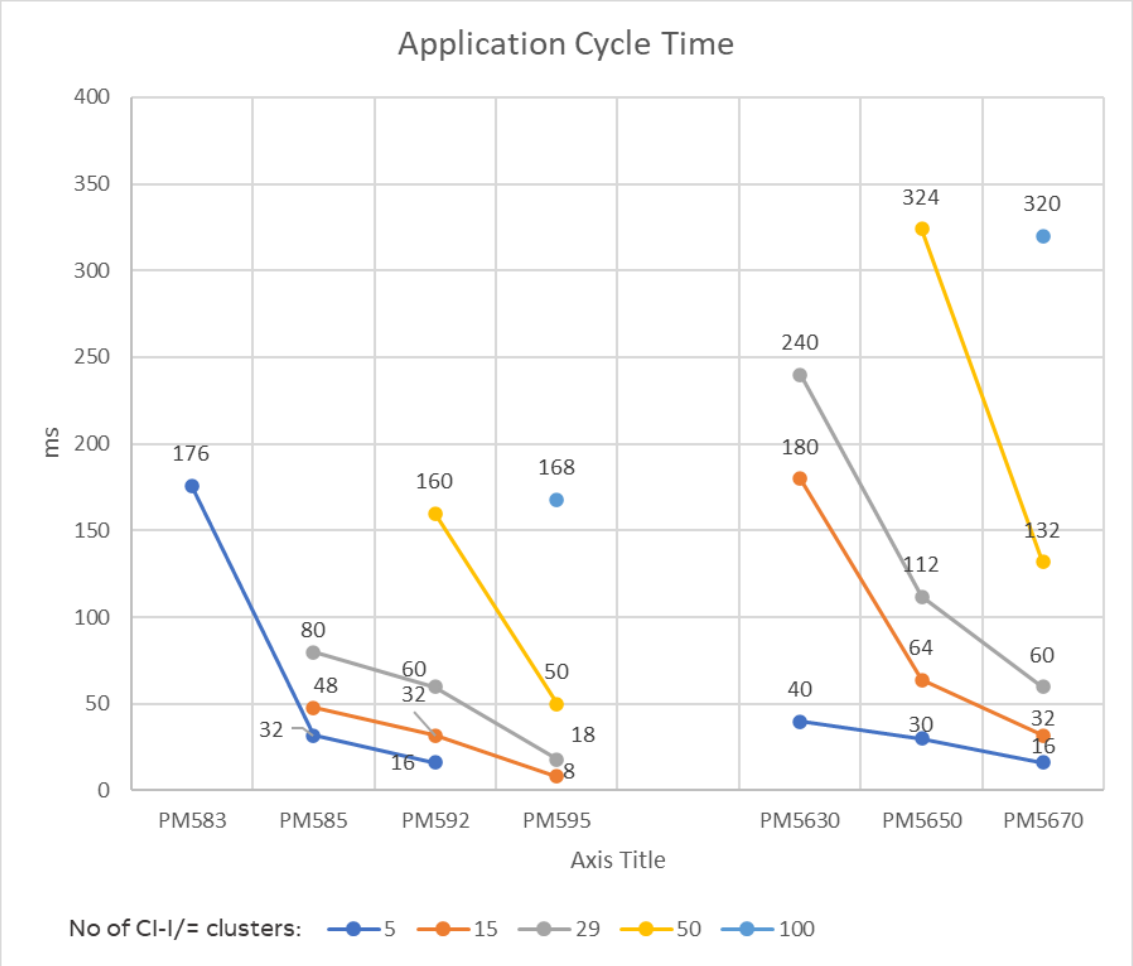

Fig. 37: Indication of AC500 CPU's performance (horizontal axes) based on the number of communication interface CI-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).

Example: If you need a system supporting min. 25 CI at application cycle time around 120 ms, suitable options based on above graph would be V2 PLCs - PM592 or PM595 and V3 PLCs – PM5650 or PM5670. The main parameter in the application cycle determination is the amount of overall Sync data, which is assumed 160 bytes per CI for the smaller systems, up to 250 bytes per CI for the larger ones. Sync data of the project of in total more than ~1200 byte necessitates several HA cycles to transfer within one application cycle.

The V2 or V3 PLCs types, also differ in available interfaces, protocols supported and memory size.

CI521-MODTCP or CI522-MODTCP can be used as peripheral devices which communicate via the Modbus TCP protocol with the PLCs. The HA-Modbus TCP library supports currently up to 120 CI52x, depending on the CPU type as listed in *Further information on page 2238*. Each CI52x supports up to a maximum of 10 S500-I/O modules. Nevertheless the standard Modbus TCP communication of the HA library transfers only 120 words per cycle: Therefore please check if for your module configuration matches: In case of many analog IO modules with high-density - like 16 channel AI523/AO523 or modules with fast counters - this limit might be surpassed by roughly 5-6 such modules (to help calculate exactly, there is an Excel sheet provided in the HA “Examples” subfolder of Automation Builder once installed).

For more details of Modbus clients supported in AC500 V3 PLCs refer to *Chapter 1.6.1.3.3 “Limitation of connections per protocol” on page 2392*.

Local I/O on a CPU can signal / interact for diagnosis or service with / from this CPU. This local I/O is not redundant and won't be available to communicate to in case of a CPU failure.

Hardware connections

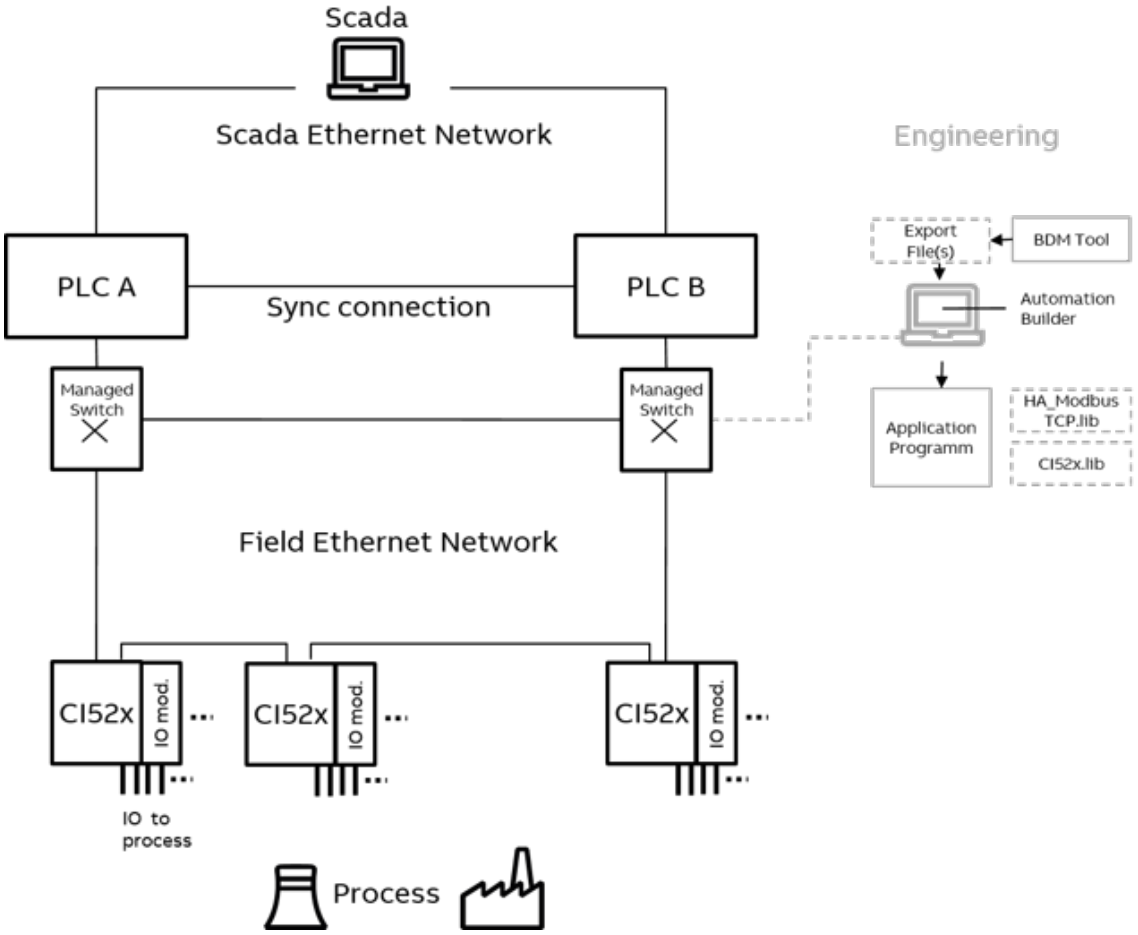

Fig. 38: AC500 HA and SCADA connection

SCADA/ Engineering connection is done using ETH ports of both PLCs and one or several managed Ethernet switches depending on the redundancy requirements in the Ethernet levels.

- HA communication between PLC A and PLC B must be done via two physical connections between PLC A and PLC B in order to distinguish a “sync link” failure from another PLC failure:
  - Sync (including *“lifecom1”*) over Ethernet
  - *“Lifecom2”*
    over Ethernet (Modbus TCP): Can be combined with Field or SCADA network or a separate Ethernet network
    over CAN (only possible with AC500 V3 CPU)
- Field devices (CI52x modules) will be connected via Ethernet switches, forming a redundant network (if requested). For details on network configuration see ↳ *Chapter 1.5.8.1.5.3 “Field I/O network topologies” on page 2260*.

The following table shows possible combinations of connections for different CPU types. There must be at least two physical connections. The availability can be increased with a third physical connection, e.g. CM597 for AC500 V2 CPUs or CAN for AC500 V3 CPUs.

	V2 CPU with 1 ETH onboard + CM597		V2 CPU with 2 ETH onboard (+CM597)			V3 CPU with 2 ETH onboard (+ CAN)			
Scada / Engineering	1	1	1	1	1	1	1	1	1
Sync / lifecom1	1	11	1	2	2	1	2	1	2
lifecom2	11	1	2	1	11	2	1	3	3
Field (Modbus TCP)	11	11	2	2	2	2	2	2	2
# of physical connections	2	2	2	2	3	2	2	3	3

1 ETH1 (orange)
2 ETH2 (green)
3 CAN (blue, applicable only in V3)
11 CM597 communication module at slot1 (grey)
The blue box indicates the example which is used in the next chapters.

The numbers in the figure above define the slot on which the connection is made. Last line # of physical connections define how many physical interfaces are used or connected between the PLCs.

It is also possible to realize an HA system without a communication interface CI module see chapter ↳ *Chapter 1.5.8.1.6.1.1 “Configuration without communication interface modules to establish redundancy” on page 2264*.

Hardware Example

HA hardware configuration based on V3 PLC to explain the minimal recommended Ethernet port configuration.

- The *Sync* connection is performed via SCADA network, the
- *“lifecom2”* is performed via field network (or the other way around).

The following figure represents the connection example with the details from the highlighted box (see previous figure).

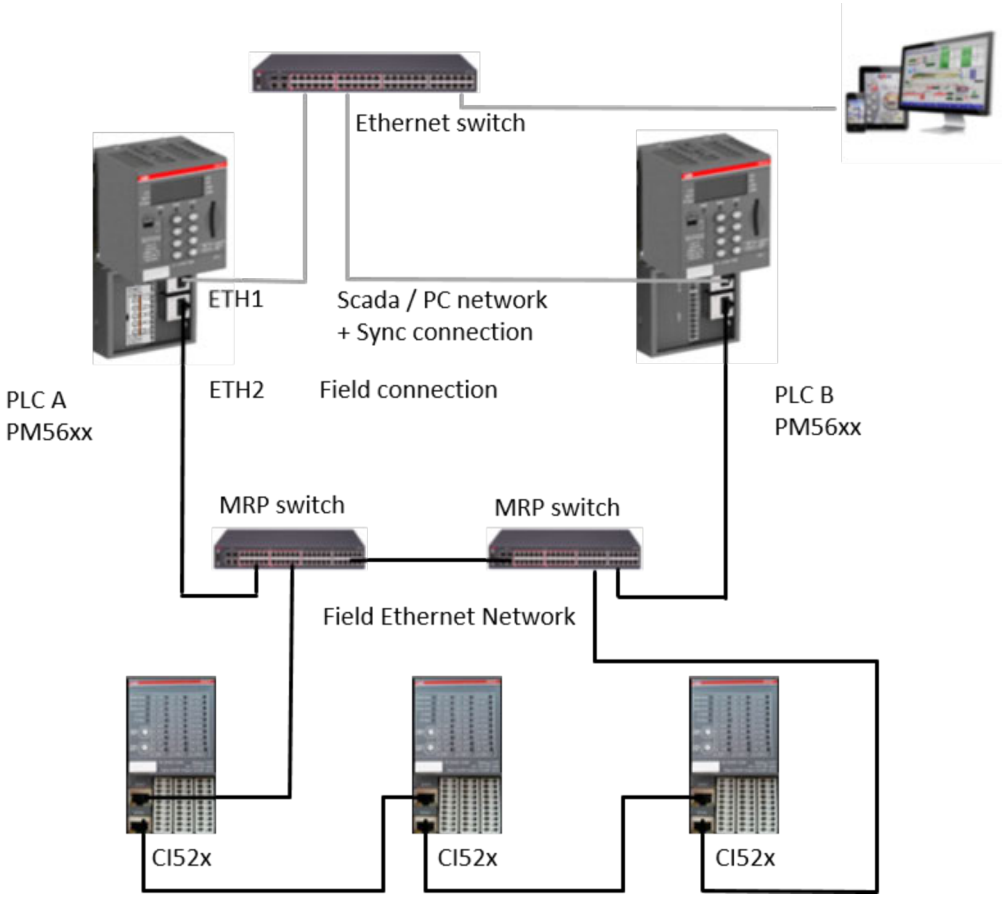

Fig. 39: Physical connection example: 2 ETH CPUs combining sync data / “lifefcom2” with SCADA / Field I/O network

Support of I/O modules (S500/S500-eCo) depends on the version of the library package. See the version details of the library in the Automation Builder release notes.

1.5.8.1.3 Functionality

Failures and use cases

The AC500 High Availability system performs a switch-over whenever the primary PLC is powered off, crashed or stopped or if the primary PLC loses fieldbus communication (cut of ETH or defect MRP switch) while the secondary PLC still has connection.

In the following the different use cases and reaction times are outlined.

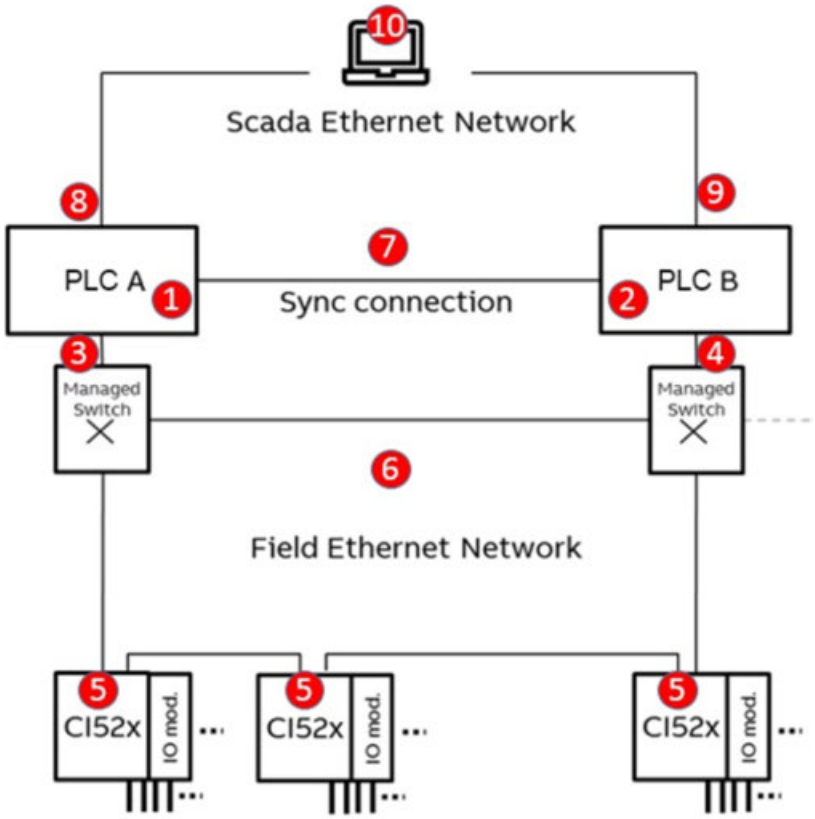

Fig. 40: HA use cases – failures, assuming PLC A is primary and "lifecom2" over field network

The below use case table with reaction and diagnosis messages are based on the setup where Sync is via SCADA network, *"lifecom2"* over field network and PLC A is primary.

Case	Use case	Reaction	Diagnosis message on *)
1	Primary PLC is powered off, crashed or stopped.	Switchover to secondary PLC. CI52x outputs are frozen during switchover period.	Secondary
2	Secondary PLC is powered off, crashed or stopped.	No switchover, process continues.	Primary
3	Primary PLC loses connection to fieldbus CI52x modules while secondary PLC still has a connection.	Switchover to the secondary PLC. CI52x outputs are frozen during switchover period.	Primary
4	Secondary PLC loses connection to one or more CI52x modules.	No switchover, process continues.	Secondary
5	CI52x module is stopped/ powered off.	No switchover, process continues.	Primary and secondary
6	Connection lost in Field Ethernet network.	Depending on Ethernet network structure, and redundancy mechanisms used a reconfiguration time exists.	Lifecom2 lost and CI module lost errors will be generated in primary and secondary.
7	*Sync* and/ or *"lifecom2"* are broken.	No switchover, process continues.	Primary and secondary

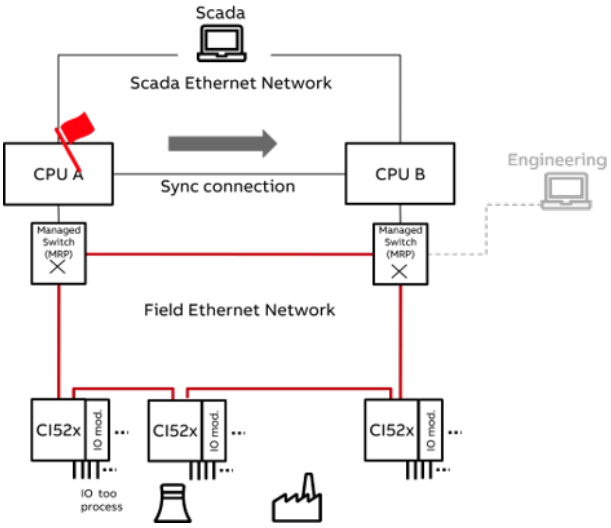
Case	Use case	Reaction	Diagnosis message on *)
8	Primary PLC loses connection to SCADA.	SCADA is responsible to detect and to switch over.	-
9	Secondary PLC loses connection to SCADA.	SCADA is responsible to detect and to switch over.	-
10	SCADA is broken	SCADA is responsible to detect and to switch over.	-
11	Manual switchover by the user.	Switchover to the secondary PLC. CI52x outputs are frozen during switchover period.	-
*) Diagnosis description, see function block description.			

Use case descriptions

The below cases explain the behavior of the system during different use cases.

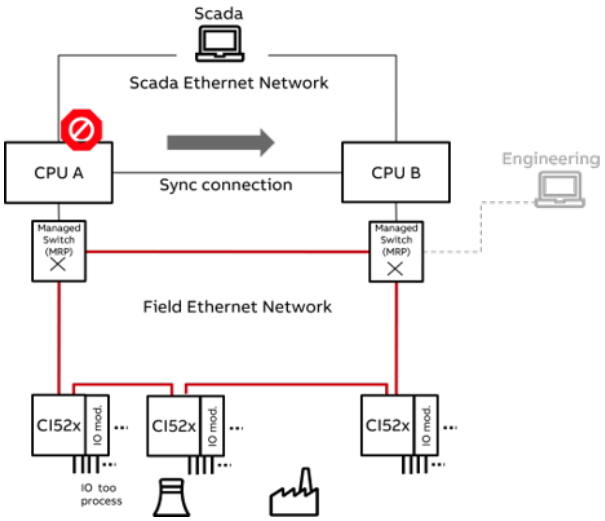
Basic diagnosis information is provided for each case. For diagnosis description refer to *Chapter 1.5.8.1.8 “Diagnosis” on page 2269*.

Case 1 a): Primary PLC is powered off or crashes



Reaction	Switchover to secondary PLC. The communication interface modules are updated by the new primary PLC.
Comment	CI52x outputs are frozen during switchover period.
Diagnosis message on function block	Primary PLC is powered off. Secondary PLC: control block output Runtime Error = 16#001E and xHaModPrimary = TRUE

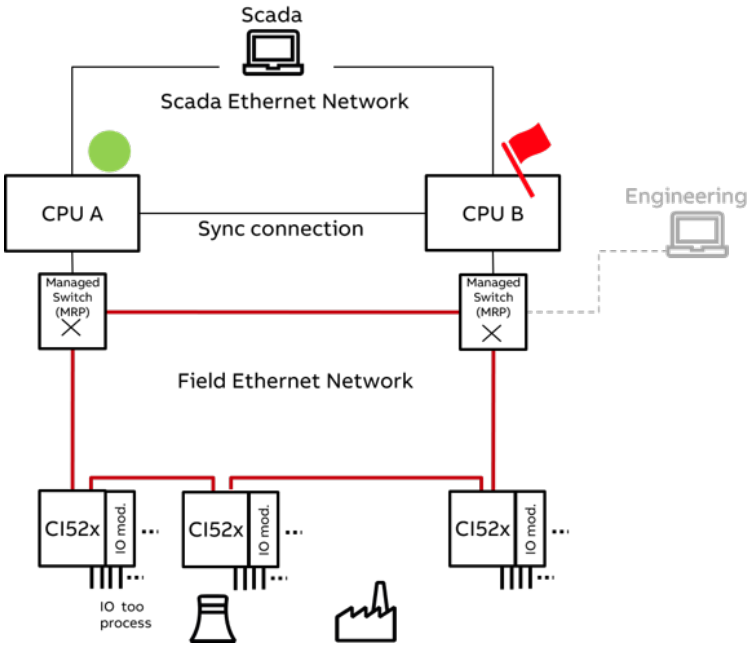
Case 1 b): Primary PLC is stopped



Reaction	Switchover to secondary PLC. The communication interface modules are updated by the new primary PLC.
Comment	CI52x outputs are frozen during switchover period.
Diagnosis message on function block	Primary PLC is stopped. Secondary PLC: control block output Runtime Error = 16#0016 and xHaModPrimary = TRUE

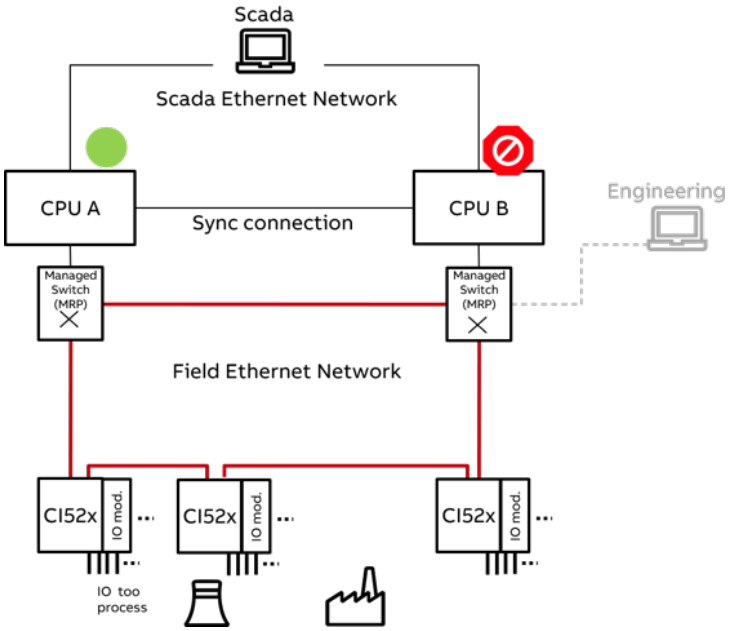
If “lifecom2” is lost and the PLC is in STOP mode RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

Case 2 a): Secondary PLC is powered off or crashes



Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#001E and xHaModPrimary = TRUE Secondary PLC is stopped.

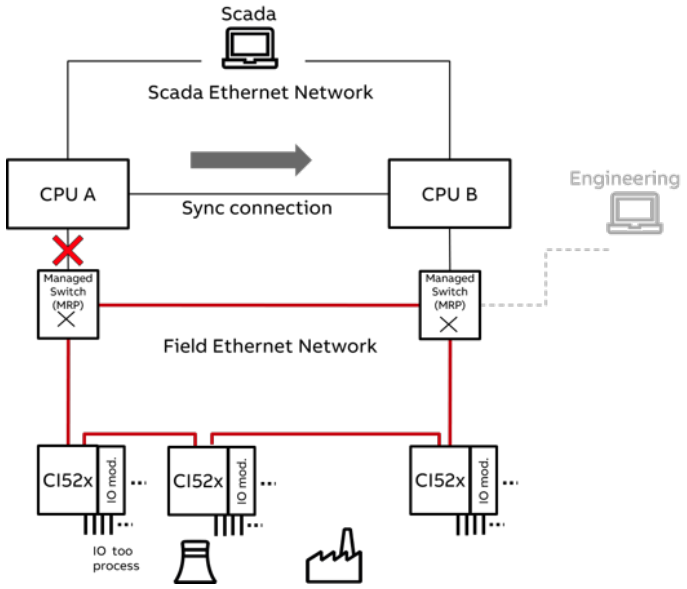
Case 2 b): Secondary PLC stop



Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0016 and xHaModPrimary = TRUE Secondary PLC is stopped.

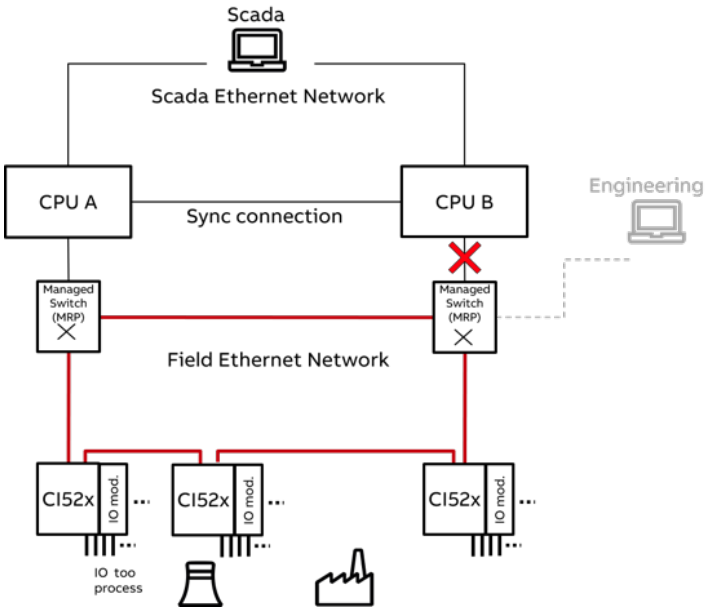
If “lifecom2” is lost and the PLC is in STOP mode RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

Case 3: Primary PLC loses connection to fieldbus CI52x modules



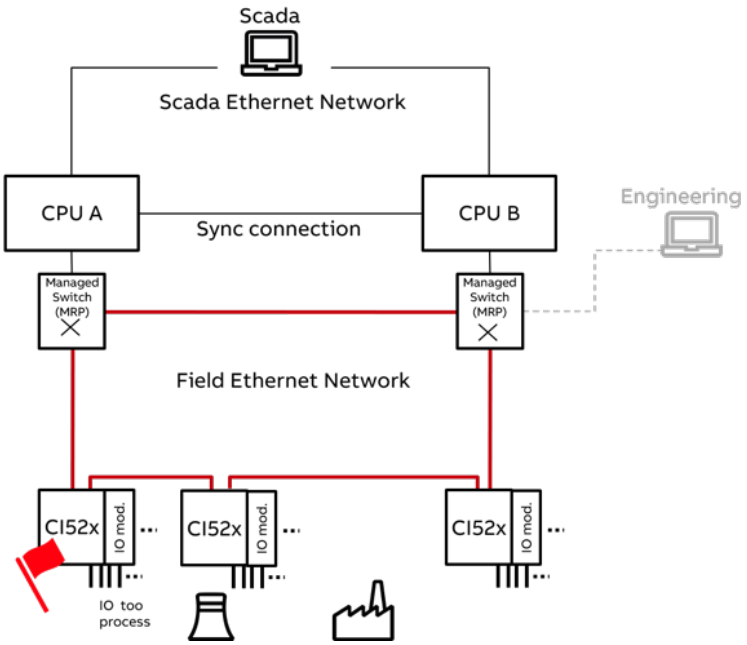
Reaction	Switchover to secondary PLC. The communication interface modules are updated by the new primary.
Comment	CI52x outputs are frozen during the switchover period.
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0094 and xHaModPrimary = FALSE Secondary PLC: control block output Runtime Error = 16#0015 and xHaModPrimary = TRUE

Case 4: Secondary PLC loses connection to fieldbus CI52x modules



Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0015 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0094 and xHaModPrimary = FALSE

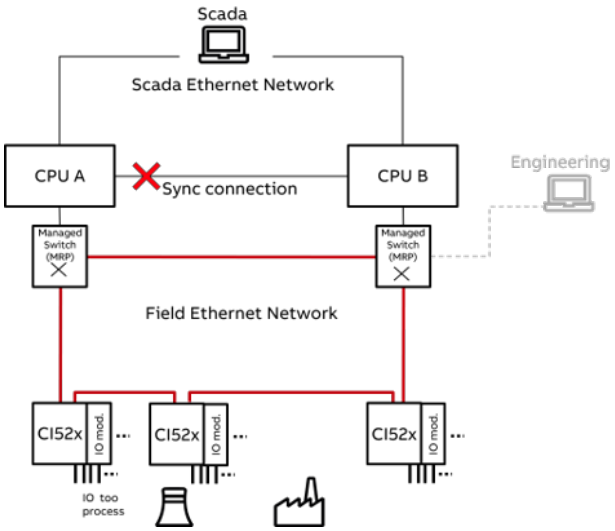
Case 5: CI52x is powered off or stopped



Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0081 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0081 and xHaModPrimary = FALSE

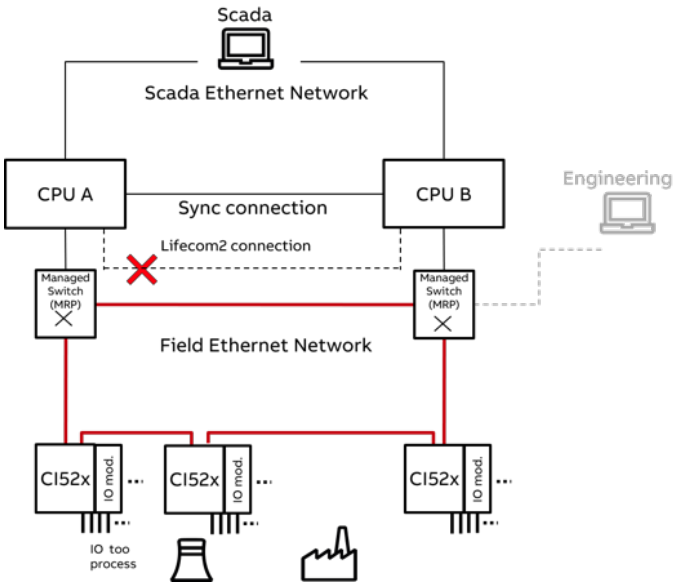
If any CI52x-MODTCP module is powered off and on, there is no need to power restart the complete system. The module will be recognized once the communication is reestablished.

Case 7 a): Sync connection is broken between the PLCs



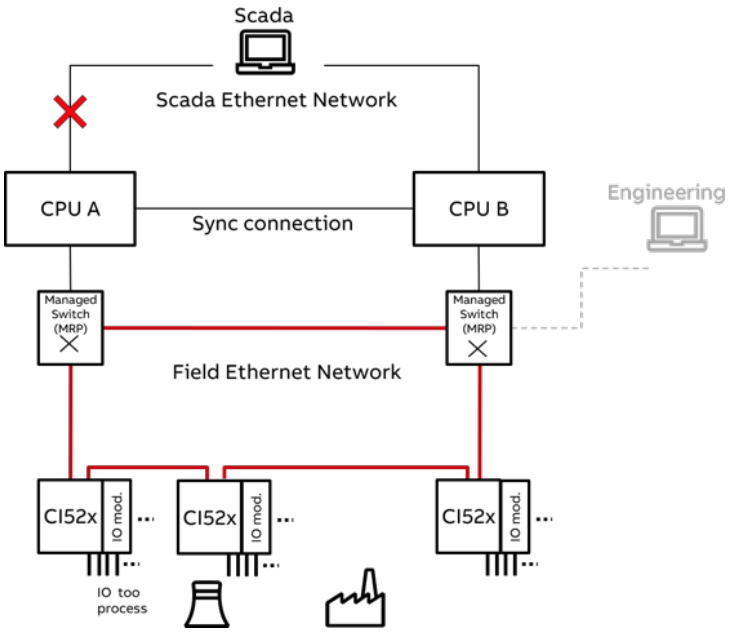
Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0014 / 16#0094 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0014 / 16#0094 and xHaModPrimary = FALSE

Case 7 b): Lifecom2 connection is lost between the PLCs



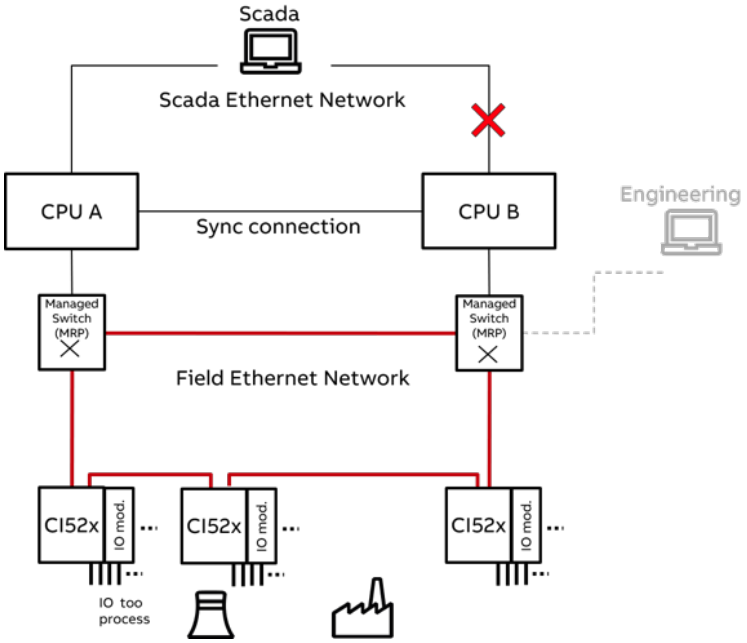
Reaction	No switchover
Comment	Process continues
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0008 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0008 and xHaModPrimary = FALSE

Case 8: Primary PLC loses SCADA connection



Reaction	No switchover
Comment	Process continues, SCADA is responsible to detect and switchover
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = FALSE

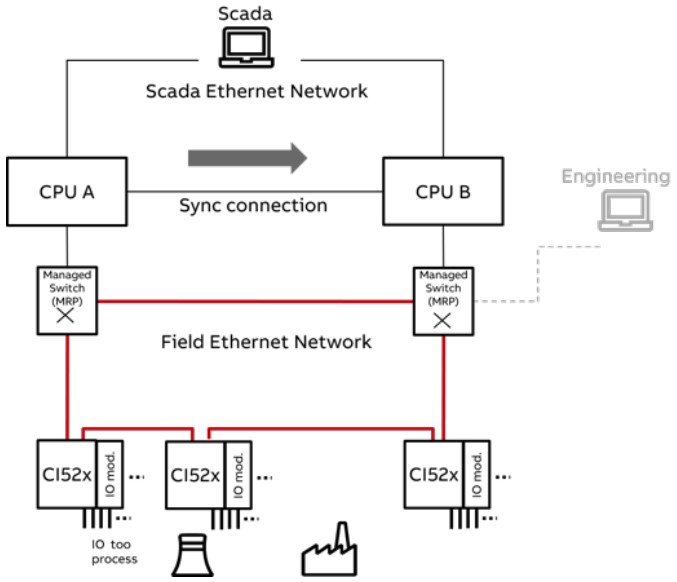
Case 9: Secondary PLC loses SCADA connection



Reaction	No switchover
Comment	Process continues, SCADA is responsible to detect and switchover
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = TRUE Secondary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = FALSE

SCADA link may be combined with sync connection or “lifecom2” connection. In that case runtime error and system behavior will be as described in the cases above (Sync connection lost / “lifecom2” connection broken).

Case 11: Manual changeover by user



Reaction	Changeover from primary PLC to secondary PLC.
Comment	CI52x outputs will be frozen during switchover
Diagnosis message on function block	Primary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = FALSE Secondary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = TRUE

A manual switchover can be triggered from both PLCs. For each trigger a switchover from primary PLC to secondary PLC will take place.

1.5.8.1.4 How to get and install the AC500 High Availability system package

The PS5601- High Availability Modbus library package can be installed from the *Automation Builder Installation Manager* by selecting the component.

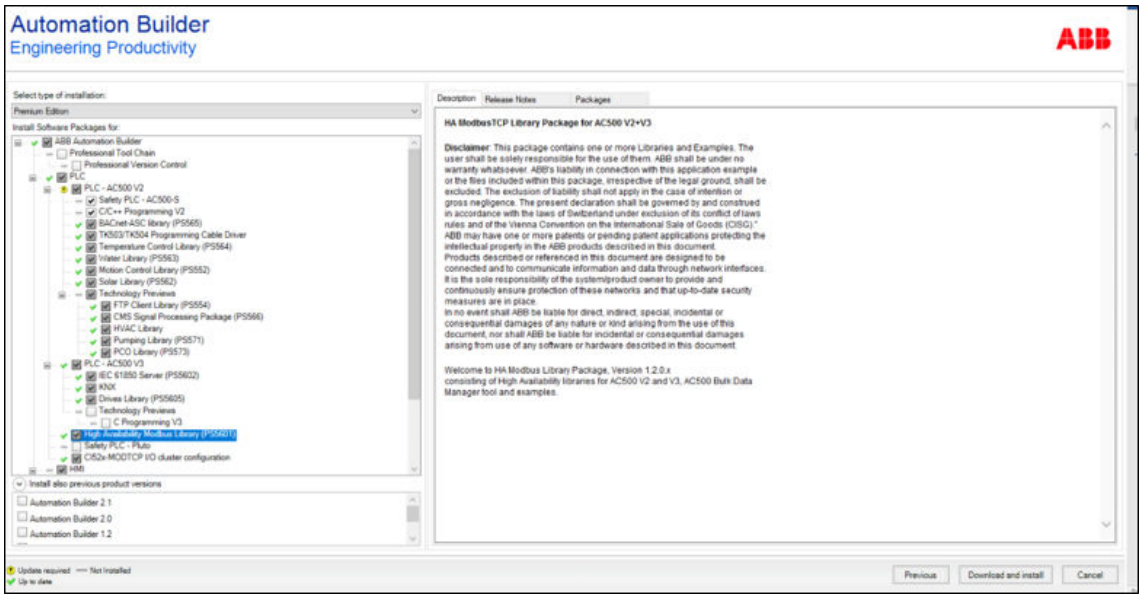


Fig. 41: Automation Builder Installation Manager

The following components are installed:

- Libraries
  - AC500 V2 libraries: *C:\Program Files (x86)\Common Files\CAA-Targets\ABB_AC500\AC500_V12\library\PS5601-HA-MTCP*
    CI52x_AC500_Vxx.lib, HAModbus_AC500_Vxx.lib.
  - AC500 V3 libraries available in library repository:
    ABB_CI52x_AC500.compiled-library, ABB_HaModbus_AC500.compiled-library
- Online help: HA-CS31, HA Modbus V2 function block description
- Automation Builder Example folder: *C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP*
  - AC500_V2: Examples for AC500 V2 including documentation
  - AC500_V3: Examples for AC500 V3 including documentation
  - BulkDataManager: Bulk Data Manager (BDM) tool which helps efficient engineering in larger projects. This requires a separate installation. Further information can be found in the document: *C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation*.
  - HA-Modbus TCP System Technology.pdf (this document)

1.5.8.1.5 System structure

This chapter explains the detailed structure of the HA system in CODESYS. A HA-Modbus TCP system is characterized by two AC500 PLCs with the following features:

- Identical programs (application with additional HA and Modbus function blocks) that are loaded to both PLCs.
- Communication interface modules CI52x-MODTCP that are connected via Modbus TCP.
- Synchronization of both PLCs (*sync/lifecom1* and *lifecom2* logical connections).

Programming

Each PLC contains at least three main tasks/ programs:

- HA program
- Application program
- Modbus program

The programs in one PLC communicate via internal structures of the libraries and dedicated internal memory areas for HA-Sync array and the Modbus CI52x memory(ies) CiModDataxx.

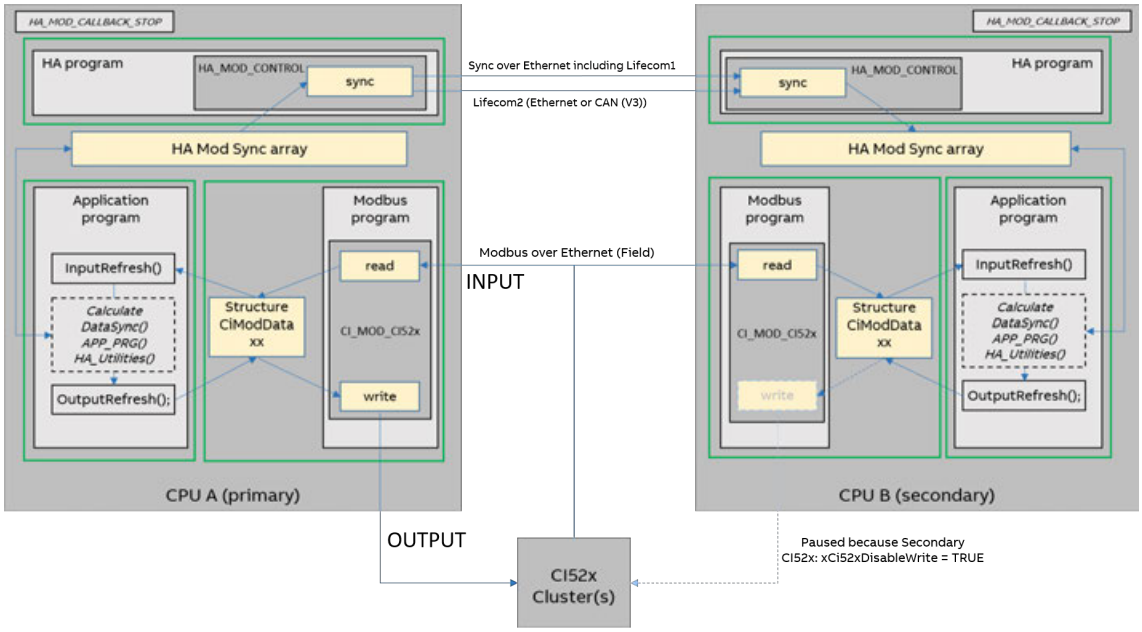

Fig. 42: Principle structure of the HA system and recommended tasks: HA, Modbus, Application

Table 380: Image description

Layout element	Meaning
Dotted outline box	Indicates optional function block or programs.
Solid outline box	Indicates the mandatory function blocks or programs. All mandatory blocks are called when an export is created from Bulk data manager.
Italic font	Indicates the program or functions user should call in his project and not created by Bulk data manager.
Light yellow background block / blue arrow	Indicates the operations which are handled internally in the library.
Green solid box	Indicates the three different tasks which user has to configure.

Modbus program

The function block CIModCI52x (V3) / CI_MOD_CI52x (V2) reads the input values from the CI52x modules and stores them in the structure CiModDataxx. If the CPU is primary it also writes the outputs to the CI52x modules. The Function block also parametrizes the CI Module as configured in e.g. Bulk data manager tool during the first startup or when a CI module is exchanged.

Normally the HA-Modbus TCP library takes care of communication monitoring. Nevertheless if com- munication is cut completely, the CI52x communication interfaces and its I/O modules have to react on their own to achieve a bumpless or desired behavior: The following parameters for the CI52x com- munication interfaces and I/O modules need to be considered:

- *– CI52x: parameter "Timeout" for Bus supervision: [2)]*
  Allows to detect errors from communication interface side as well and take action to ensure a fail- safe behavior if communication is cut. It can be set in 10 ms steps. If set to 0 no bus supervision is active. Proposed value: 50 = 500 ms = default in Bulk data manager; this value should be increased, e.g. to value 65 if AC500 V2 CPU ports are used for field communication to take care of the larger TCP retransmit time.
- *"Behaviour Outputs" at "Timeout for Bus supervision" [1), 2)]. This fail-safe parameter has to be con- sciously set: separate settings are possible for each module (and communication interface): "off"; "last" or "substitute": 5 s, 10 s, ∞ s [1)].*

Remarks:

[1)] The parameters "Behaviour Outputs at comm. Error" is only analyzed if the Failsafe-mode is [ON].

[2)] Both are CI52x parameters set e.g. via Bulk data manager tool in the program.

Application program

- At the start of the application task the InputRefresh program has to be called. It copies data from Modbus via the structure CiModDataxx to the user variables, which were defined in BDM as signals. For further information refer to BDM documentation, chapter 7 which is available in the path: *C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation*.
- Only the main application programs should be in this task and use these variables for the user defined functions. E.g here the user programs and logic should be called and use the HA libraries utility blocks (which *sync* their historic data automatically) and HA_MOD_DATA_SYNC blocks for further user data which should be synchronized.
- Data of utility blocks and HA_MOD_DATA_SYNC blocks are copied to the HA Sync array of the primary CPU (which is sent to the secondary CPU by the HA program).
- OutputRefresh program is called as a last step. It copies data from the user variables via structure CiModDataxx to Modbus.

Example of a utility function block (with integrated sync data)

Consider the on-delay timer HA_MOD_TON (V2)/ HaModTon (V3).

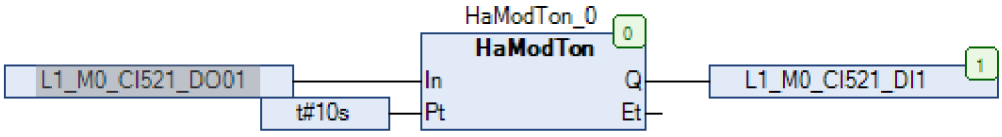

Fig. 43: HaModTon utility function block with internal synchronization

Both PLCs require the same function block called in the program. Under normal operating conditions the elapsed time ET and output Q of the timer is synchronized internally from primary to the secondary CPU. ET and Q data are available and can be attached to local or global variables in the program as per application requirements. If PLC A shuts down due to a fault, the primary status switches over to PLC B.

In the event of a switchover, the moment PLC B becomes the primary, the timer on this PLC will keep running. Until the time of PLC A failure, the timer on PLC B was synchronized. This is most important in cases when one CPU was not in run or off and needs to “catch up” such integral or historic system values (timers, counters, operator settings, …). The actual process remains then unaffected by the switchover.

HA program

HA_MOD_CONTROL has two functions:

- Exchange status data (lifecom1 and lifecom2) and switch from secondary to primary PLC (or vice versa) based on the status according to the use cases described in *Chapter 1.5.8.1.3.1 “Failures and use cases” on page 2243*.
- Send sync “HA SYNC” array from primary to secondary PLC to ensure that the secondary PLC is always in hot-stand-by and can take over immediately. UDP protocol is used for data synchronization between the CPUs.

Data synchronization via UDP

This chapter explains how the data synchronization happens between primary and secondary PLC via UDP.

All prepared sync data is synchronized with the secondary PLC. Typically only integral values (timers, counters, PID, …) or settings which might have been received have to be synchronized. For example for fast start-up cases when a secondary CPU was restarted, as both PLCs are running and calculating closely in parallel and based on the same input values, synchronization will make the secondary start with current value instead of default value. For details on how to configure or use the data sync function block refer example projects.

Following steps are performed:

- HA SYNC array is transferred via UDP to the secondary CPU. This includes the exchange of lifecom1 status between primary and secondary CPU.
- In the HA program the HA_MOD_CONTROL function block collects all diagnosis, sync and lifecom2 data from the field and/ or the other PLC. Whether a switchover is necessary is decided based on a simple decision matrix.
- Lifecom2 is exchanged between CPUs over Modbus TCP every cycle.
- One task per program, see figure above.
- Status of the inputs connected to CI52x decentralized I/O stations is transferred to both PLCs simultaneously in every PLC cycle. They are received by the CI52x function block.
- At the end of the program, the generated output values are sent, by transferring from the primary PLC respective buffers to the CI52x-MODTCP module(s) via CI52x function block and Modbus TCP. The secondary PLC is prepared to send but stays “silent” (not sending output values).

PLC needs one HA cycle to send one ETH frame data from primary to secondary CPU and receive acknowledge from secondary CPU. Similarly V3 PLC needs two HA cycles.

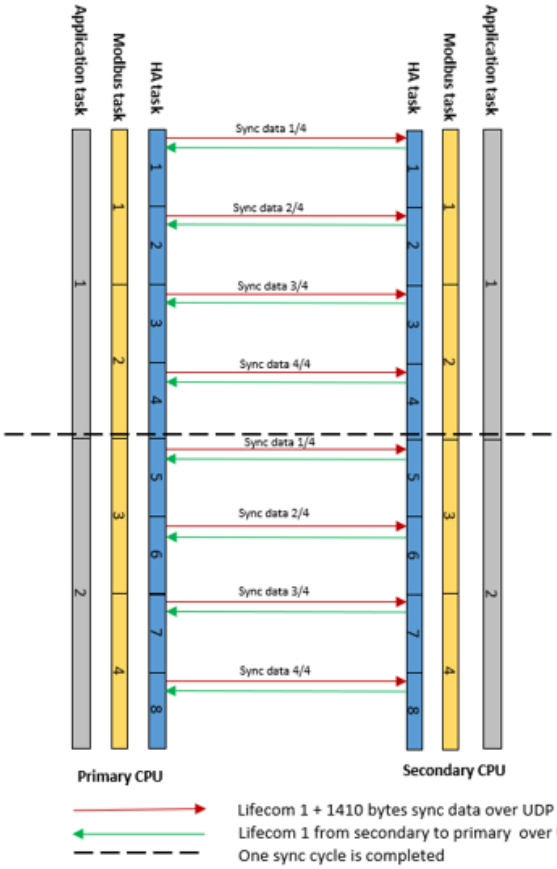
One ETH frame copies approx. 1412 data bytes. The number of ETH frames needed to synchronize HA Sync Array completely depends on the number of data sync bytes. Global variable *iNoOfEthFrames* gives the user this information, which should be used to calculate the cycle time for the application task.

Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258

Up to max. 60 kB of Sync data can be synchronized.

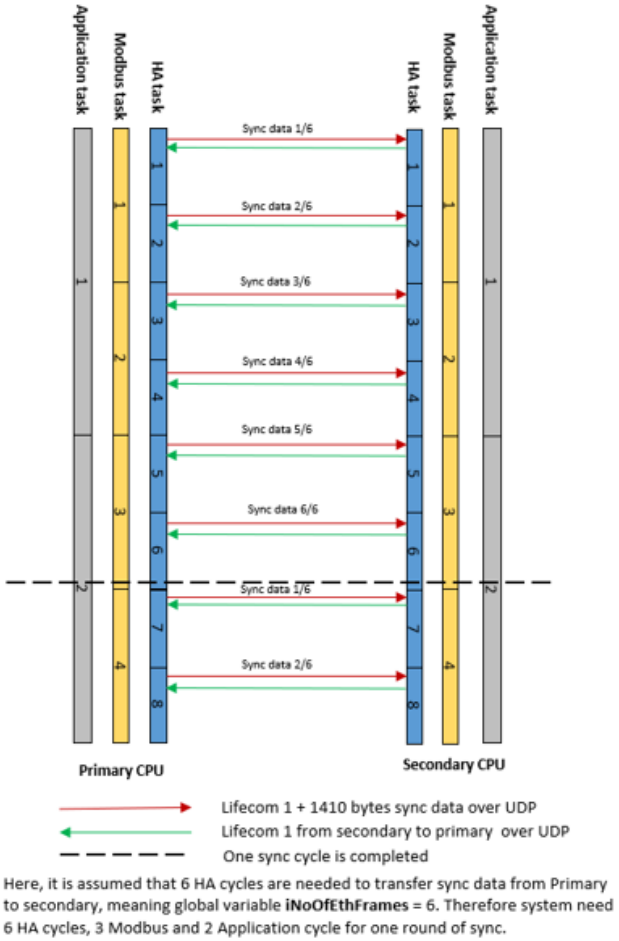
Synchronization between the primary and the secondary PLC happens over a few cycles of HA task time depending on the total sync data bytes configured in the system. Lifecom1 is also exchanged between the primary and the secondary PLC. The primary PLC sends lifecom1 to the secondary PLC along with sync data. Backwards the secondary PLC sends lifecom1 to the primary PLC every cycle.

The following figures shows an example for V2 PLC. When in the project the sync data is equal to 4 *iNoOfEthFrames* then it takes 4 HA cycles to synchronize the data between the PLCs.



Here, it is assumed that 4 HA cycles are needed to transfer sync data from Primary to secondary, meaning global variable **iNoOfEthFrames** = 4. Therefore system need 4 HA cycles, 2 Modbus and 1 Application cycle for one round of sync.

When sync data in the project is equal to 6 *iNoOfEthFrames* then it takes 6 HA cycles to synchronize the data between the PLCs.



Here, it is assumed that 6 HA cycles are needed to transfer sync data from Primary to secondary, meaning global variable **iNoOfEthFrames** = 6. Therefore system need 6 HA cycles, 3 Modbus and 2 Application cycle for one round of sync.

Task configuration recommendations for HA system

For a balanced performance of the HA system consider the following recommendations in your project task configuration:

General

- Use the real time priorities for all HA related tasks. The HA program/ task should be called at highest priority as it is responsible for the core HA functionality and should be the fastest task.
- The Modbus task contains the Modbus communication function blocks at lower priority and (depending on CPU performance) also a faster cycle time to ensure sufficient update rates on Modbus without over- loading the CPU with communication.
- The application program parts should be called in the application task with even lower priority and a larger cycle time than above tasks.
- Configuration to improve standard Modbus TCP for a fast switch over between PLCs.
- AC500 V2
  - CM597ETH_SET_TCP_RTO function block from CM597_ETH_AC500_V28.lib needs to be called inside HA task. User needs to call this function block for each CM597 module connected. For recommended values see example description.
- AC500 V3
  - RTO retransmission time function block “EthSetRtoMin” for the ETH port where fieldbus communication is configured. By default, minimum retransmission time configured is 15 ms.

Task	Priority	PM57x, PM58x, PM59x	PM595-4ETH	V3 PLCs
HA	10 (high)	4 ms or higher	2 ms or higher	4 ms or higher
Modbus	11 (medium)	Maximum of (HA cycle time *2), (3 ms + roundup (#CI/2))	Maximum of (HA cycle time *2), (3 ms + roundup (#CI/2))	Maximum of (HA cycle time *2), (3 ms + roundup (#CI/2))
Application	12 (low)	Maximum of (Modbus cycle time *2), (iNoOfEthFrames * HA cycle time)	(iNoOfEthFrames * HA cycle time)	Maximum of (Modbus cycle time *2), (iNoOfEthFrames * HA cycle time *2)

Procedure for task configuration

1. Choose suitable CPU type according to chapter CPU choice, system size, performance indications
2. Configure task priorities according to the table
3. Set HA task to minimum according to above table
4. Calculate Modbus cycle time according formulas in the table, based on HA cycle and number of CI modules “#CI”
5. Calculate Application cycle time according to formulas in the table, based on Modbus cycle time and variable iNoOfEthFrames, which is defined in the global variables of HA-Modbus TCP library.
6. Measure PLC and CPU load during trial operation.

   V3: PLC Utilisation: *Chapter 1.6.5.1.2.1.4 “PLC utilization” on page 3470*

   If the PLC load is higher than 40 % or CPU load higher than 60 % then increase HA cycle time (e.g. to 8 ms / 12 ms / 24 ms, …) and go to step 4, repeat the steps until loading is within defined range.

> *A new **V3 CPU configuration option** is introduced from Automation Builder 2.4.1 and onwards which allows to change the priority for Ethernet communication in PLCs.*
>
> *Set this configuration in the device tree of the CPU in Automation Builder double click on PLC “CPU_Parameters Parameters ➔ Communication Schema ➔ Select “Onboard Ethernet””.*
>
> *The above parameter should be set to “Onboard” Ethernet for HA systems and it will consequently increase the loading due to the higher priority. PLC Load < 50 % and CPU load < 70 % should be considered as guidelines here instead, while setting the task times while setting the task times.*

7. Following timeout values has to be defined in the user project according to the relation defined.

Timeout variables (see definitions in box below table)	HA in V2	HA in V3
timCI52xTimeOut	1 * Modbus Task time	50 ms or Modbus Task time, whichever is higher
timHaModSyncTimeOut	1* HA Task time	2 * HA Task time
timResponseTimeout	Not applicable	50ms or (2 * Modbus Task time), whichever is higher
timCanTimeOut	Not applicable	100 ms or (2 * Application Task time) whichever is higher

8. Add additional applications and SCADA communication: Check PLC and CPU load again vs. your requirements.

In the HA Modbus system different timeouts must be configured for the fine operation of the system as described above in the task configuration for V2 and V3 PLCs. These different timeouts meaning, and relation is explained below:

timHaModSyncTimeOut:

Time limit to check if the new sync data is received or not in the secondary PLC. If this timeout is not defined properly, Sync lost error/ “lifecom1” lost error will be generated.

timCanTimeOut:

Time used for the check whether “lifecom2” is received when configured via CAN. This value is applicable only in AC500 V3. Lifecom2 via CAN won’t be stable between the PLCs and runtime error "lifecom2 lost" will be flickering if not the right value is configured.

timCI52xTimeOut:

Time limit to check whether new data is received in the Modbus field modules. It is also used to check whether “lifecom2” is received when configured via Modbus TCP. If 'timCI52xTimeOut' is not defined as described, “lifecom2” error / communication interface diagnosis error will not be generated as expected.

timResponseTimeOut:

Timeout value to check whether CPU has lost the communication interface modules connected in the network. If this value is not defined as described, communication interface module lost detection will not be indicated properly.

Field I/O network topologies

Modbus TCP communication between PLC and communication interface modules CI521-MODTCP or CI522-MODTCP can be done using different network topologies. In the following subchapters different simple combinations with their pros and cons are explained.

If a CI52x module of a daisy chain is powered off, next following modules will lose connection/ data provided there is no redundancy in the Ethernet network (e.g. ring and managed switch).

Simple ring topology (smaller systems)

In a simple configuration, CI52x modules can be part of a ring if MRP (or DLR) protocol is used in the managed switches. Then the CI52x are connected from one to another device (“daisy chained") through e.g. two network switches. The redundancy protocol detects a closed ring and opens one port of a managed switch to avoid the ring. The user has to configure the necessary ring configurations and enable the ring manager for the used ring ports in one switch.

It is recommended that time interval between ETH cable disconnection and re-connection should be greater than 2-3 seconds.

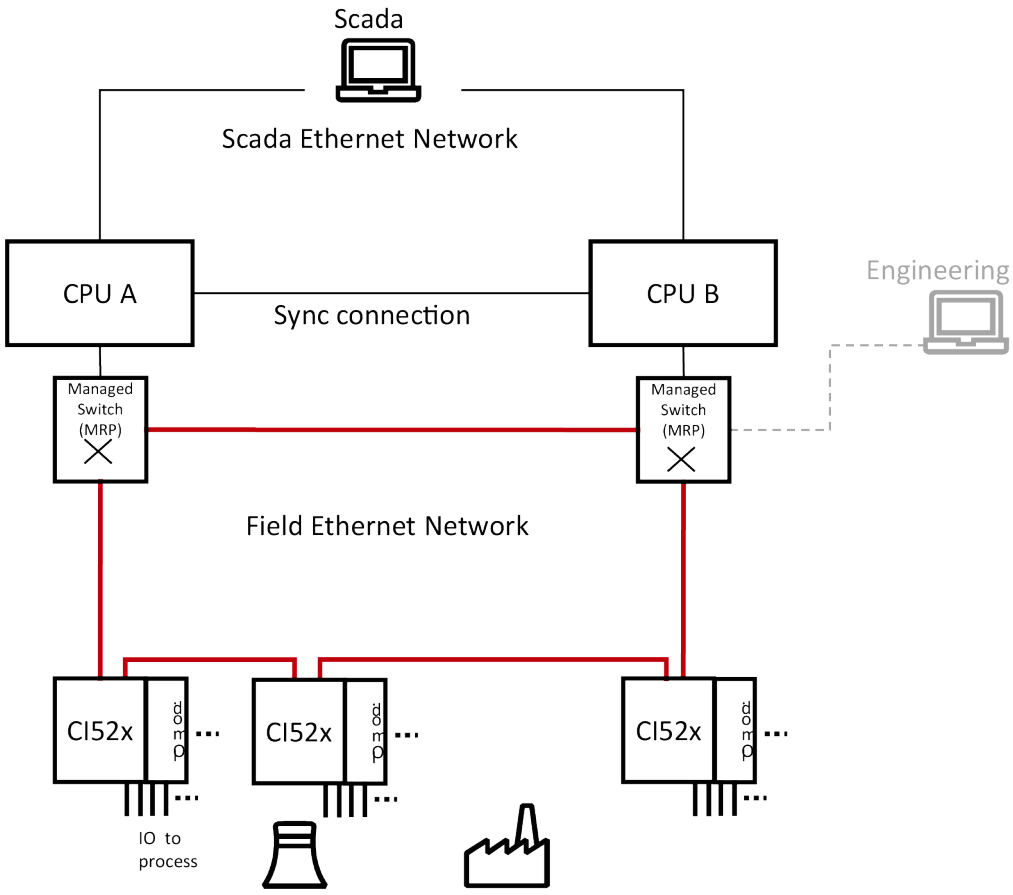


Fig. 44: Redundant ring topology with 2 MRP switches (avoids a SPOF (Single Point Of Failure))

Standard network topology (large systems)

In the standard redundant network, which is often done by third party dedicated telecommunication companies, managed switches are used for every connection point to this network. It’s the network's (and operator's) responsibility to repair any failure fast enough so that no influence on the HA system or its outputs occur.

The network can use other fast redundancy algorithms, also having other than ring structures, if redundancy links are activated fast enough.

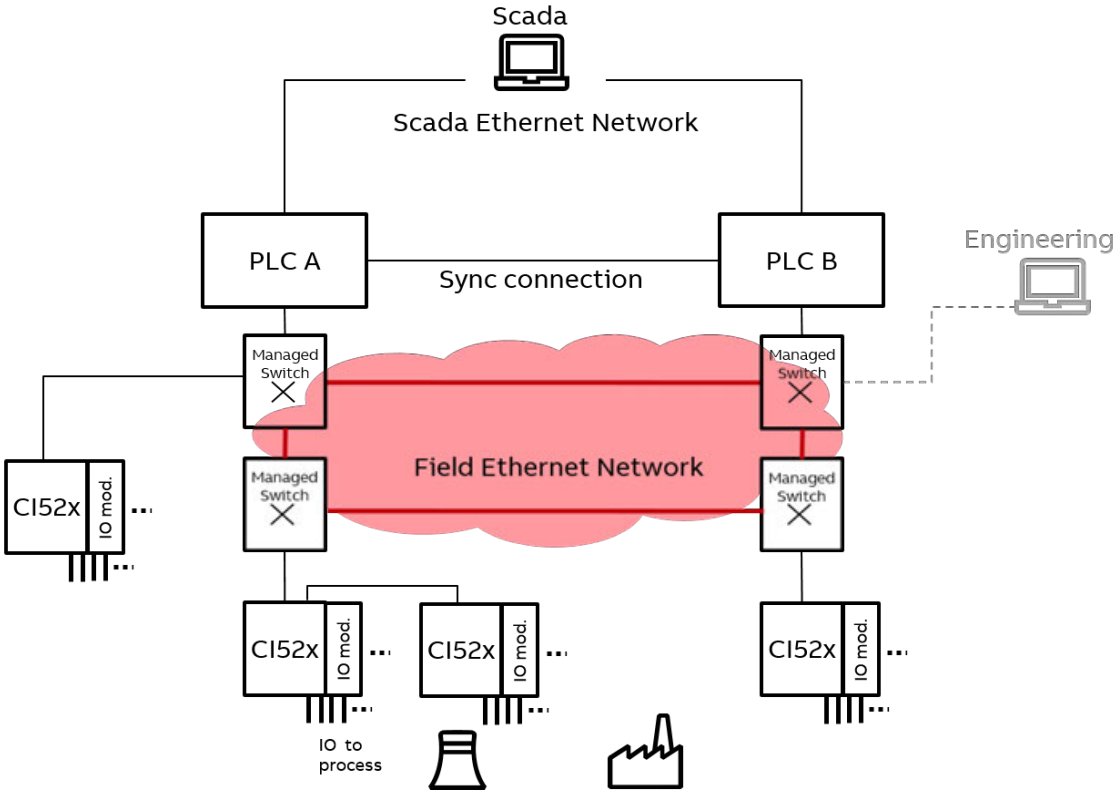

Fig. 45: Redundant ring topology with independent network (using any fast redundancy mechanism internally in a ring or meshed network)

Parallel network topology (using PRP)

Each CI52x module and PLCs as single ended devices are connected by PRP switches to both networks. Here the failure of the switch which connects the primary CPU will also lead to a switchover.

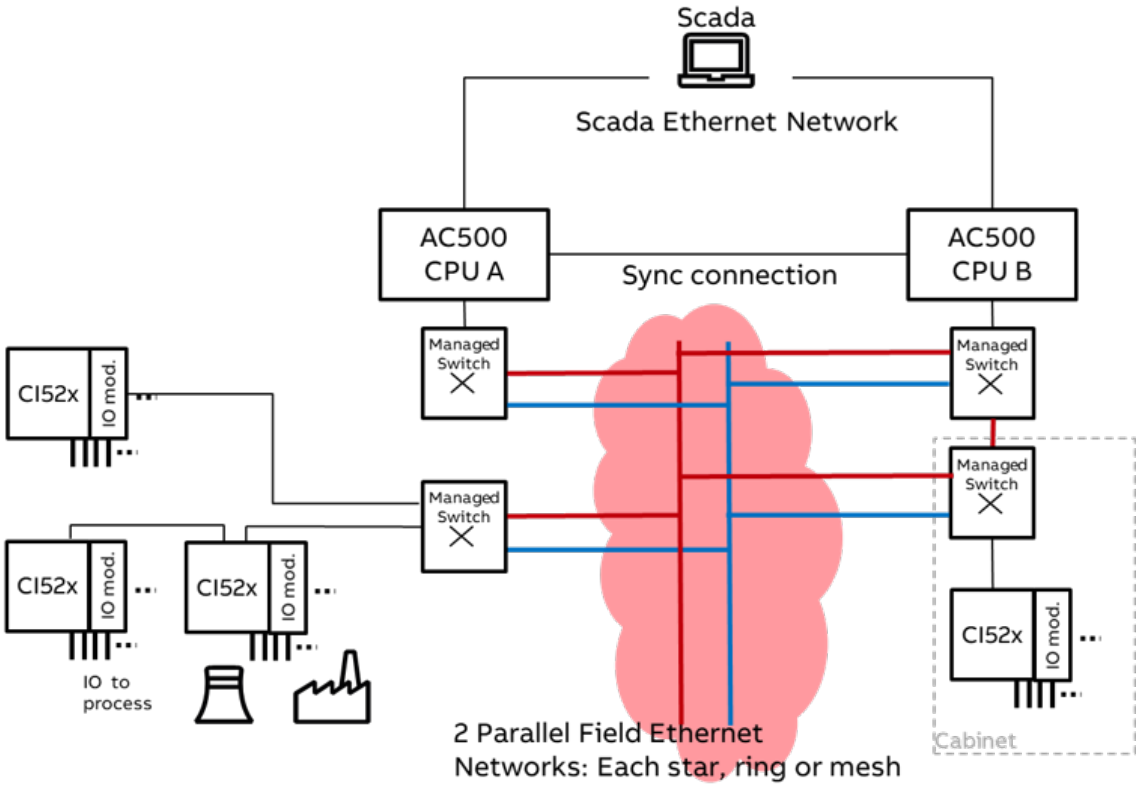

Fig. 46: Parallel-redundant network, PRP switches to connect each device, CPU and communi-cation inter- face modules

Redundancy switchover timing should match the settings in the program and communication interface modules for time-out and freeze periods. The networks for larger systems are often seen as a separate entity and done by a separate company. Make sure to have the redundancy status information of the network at least in SCADA, to repair in time. If the I/O field network responsibility is with the automation/ PLC part, the redundancy status should be also monitored by the PLC. A warning to initiate repair may be created from the managed switches in the I/O field network.

Examples

- Alarm output(s) wired (e.g. to a CI52x input and related settings of the switch(es)).
- Settings of the switch(es) to send (e.g. SNMP traps, which can be received in PLC (AC500 SNMP library)).
- Use of “automation switches” which can also communicate their status directly via Modbus.

It is also possible to connect switches in ring combination with CI modules connected to them in daisy chain. User needs to do the relevant setting based on type of switch and protocol (Ex: MRP, RSTP).

If RSTP ring configuration is used in the system, ring reconfiguration time is slower than other ring protocols. During this reconfiguration, connection to the CI modules will be lost.

HA Modbus system without communication interface modules in the network

It is also possible to have a HA Modbus system without connecting any field devices, CI521-MODTCP / CI522-MODTCP in the network. This system can be used for establishing a redundant PLC system with data synchronization between two AC500 controllers, either without field IO or with user integration of other protocols to field-IO or “intelligent” IO: CPUs as field devices.

Secondary will be on hot standby with primary PLC, during a power off/ stop of the primary PLC. Secondary will take over the control and continue the process. Any user integrated field-IO or CPUs can establish communication mapped with the primary bit: parallel reading but prevent parallel writing.

HA without CI modules can be also used during commissioning to check the data sync, OPC and SCADA related communications without any field devices configured. The user has to set the global variable 'xNoCiBus' to TRUE defined in the HA_GLOBAL_VARIABLES. This variable has to be set to TRUE in both PLCs. Note: It is not advised to update this variable during run time.

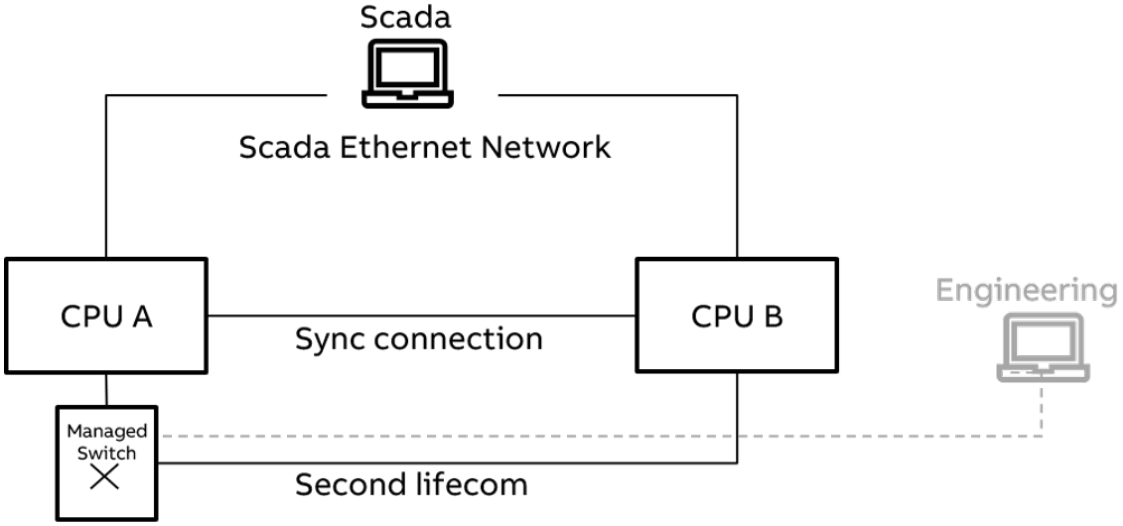

Fig. 47: Simple SCADA connection

1.5.8.1.6 Getting started

Quick start list and guidelines

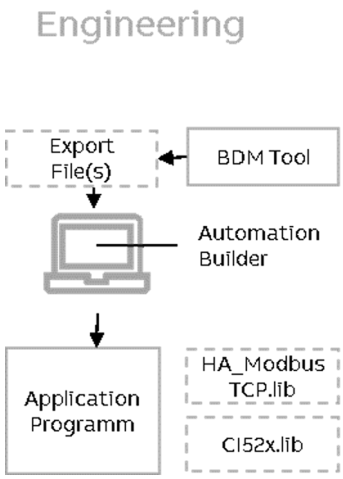

Fig. 48: Engineering workflow using Automation Builder

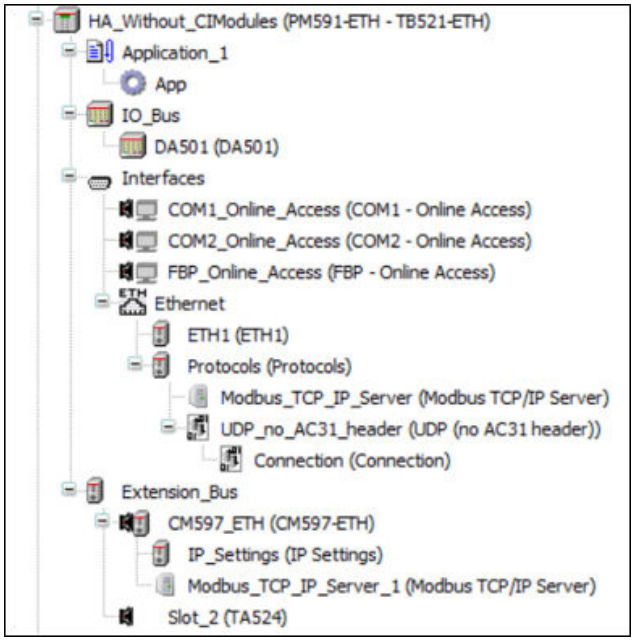
Simple steps to engineer the HA Modbus system is explained in the following chapters.

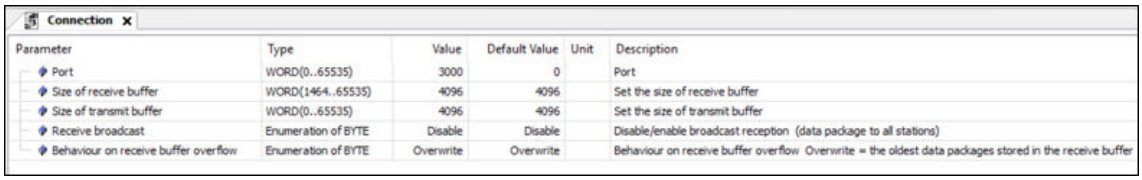
Configuration without communication interface modules to establish redundancy

Configuration of the HA system without communication interface modules to establish redundancy is done by the following steps (for details see the example documentations):

1. Install the hardware ↳ *Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237*.
2. Select the CPUs based on the requirements ↳ *Chapter 1.5.8.1.2.1 “CPU choice, system size and performance indications” on page 2239*.
3. Install Automation Builder including the latest libraries ↳ *Chapter 1.5.8.1.4 “How to get and install the AC500 High Availability system package” on page 2252*.
4. Create a new project in Automation Builder for the chosen CPUs.
5. Configure the required Modbus and UDP configuration in the Automation Builder device tree of the CPU.

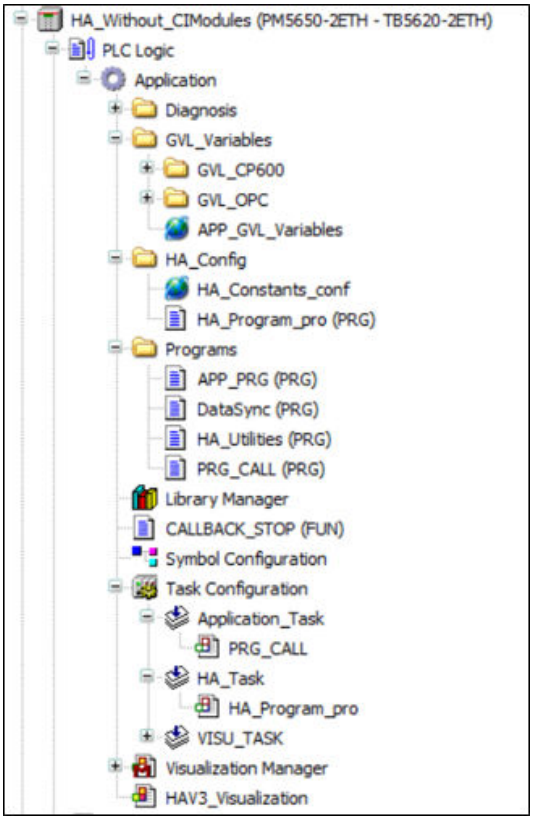


6. For UDP in AC500 V2 PLC, configure *“UDP_no_AC31_header”* and set the port number to value '3000'.



7. Assign the IP addresses in ≥ 2 different Ethernet networks:
   - SCADA network: SCADA, connected PLC A and PLC B
   - Field network: connected CI52x module(s)
8. Configure the mandatory HA_MOD_CONTROL function block for the HA task ↳ *“HA program” on page 2256*.
9. Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event “stop”.
10. Add optional HA utility function blocks or function block HA_MOD_DATASYNC.

11. Make the global variable xNoCiBus = TRUE to run the system without communication interface module configured in the system. Refer to *Chapter 1.5.8.1.5.3.4 “HA Modbus system without communication interface modules in the network” on page 2263*.



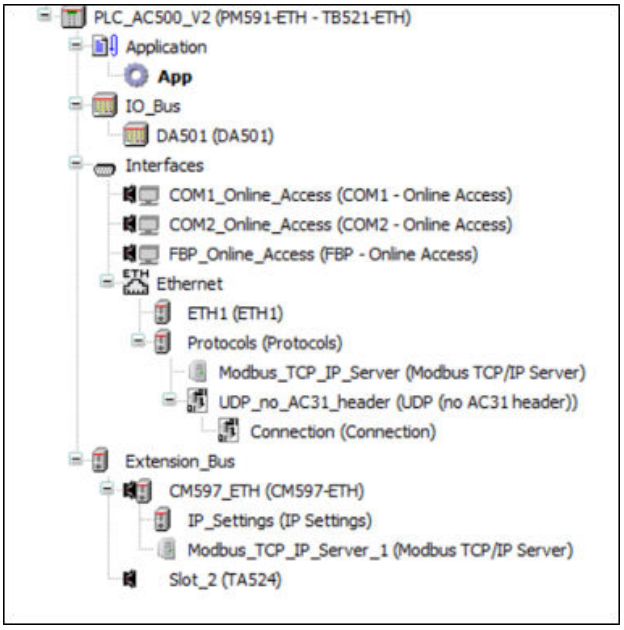
12. Add the task configuration *Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258*.
13. Activate the runtime license if it is a V3 PLC to enable HA system. Refer to *Chapter 1.6.6.2.2.2 “PLC runtime licensing” on page 3665*.
14. Compile and download to both PLCs (simplified in V3 via integrated download manager).
15. Create a boot project, restart the complete system and RUN.
16. Operation: Test use cases (e.g. by putting the primary PLC to STOP mode and observe the switchover). For different use cases and behavior refer to .
17. Runtime error and diagnosis function block can be used to monitor the system . For details refer to chapter Diagnosis *Chapter 1.5.8.1.8 “Diagnosis” on page 2269*.

Configuration with communication interface modules and redundancy

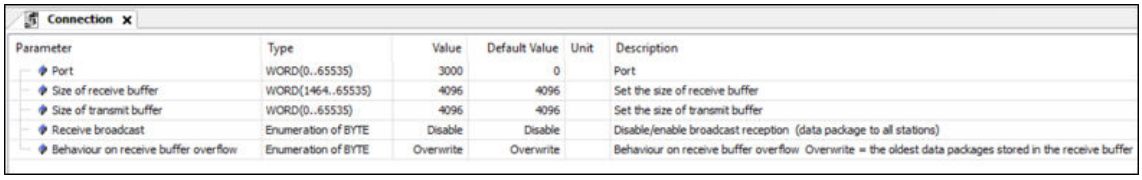
For medium or large HA systems the configuration with communication interface modules and redundancy is done by the following steps. For details see the example documentations:

1. Install the hardware *Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237*.
2. Select the CPUs based on the requirements *Chapter 1.5.8.1.2.1 “CPU choice, system size and performance indications” on page 2239*.
3. Install Automation Builder including the latest libraries *Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237*.
4. Install the Bulk Data Manager tool (BDM) *Chapter 1.5.8.1.4 “How to get and install the AC500 High Availability system package” on page 2252*.
5. Create a new project in Automation Builder for the chosen CPUs.

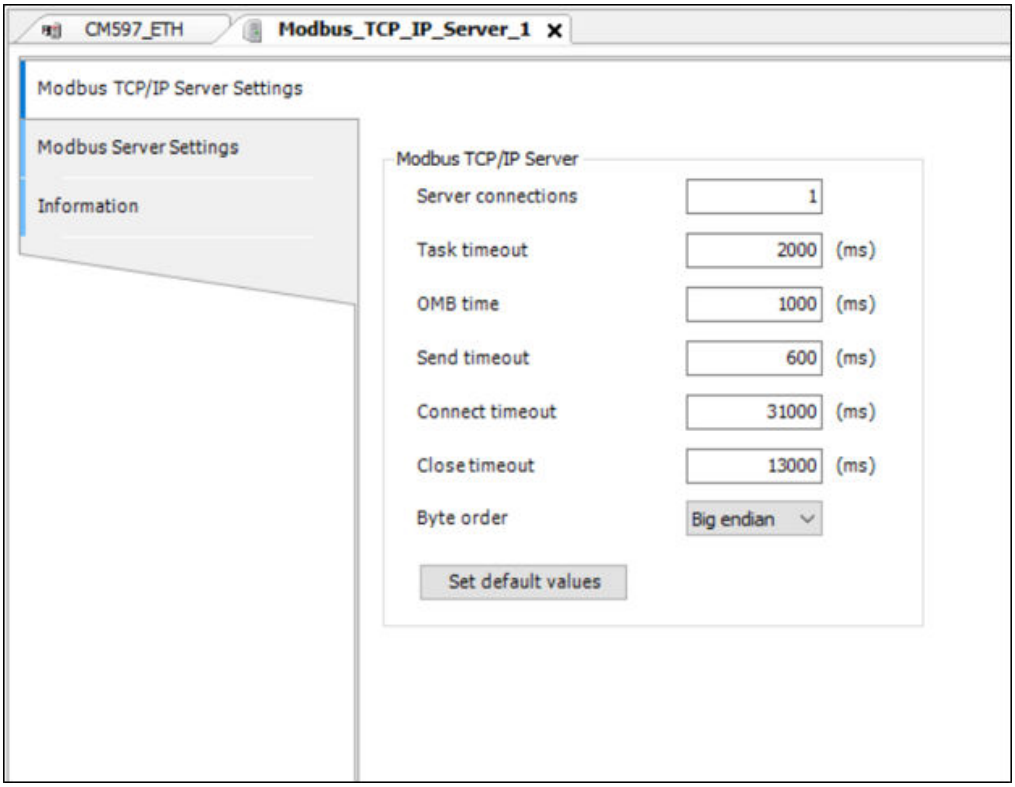
6. Configure the required Modbus and UDP configuration in the Automation Builderdevice tree of the CPU. UDP settings are only required in AC500 V2 PLCs.



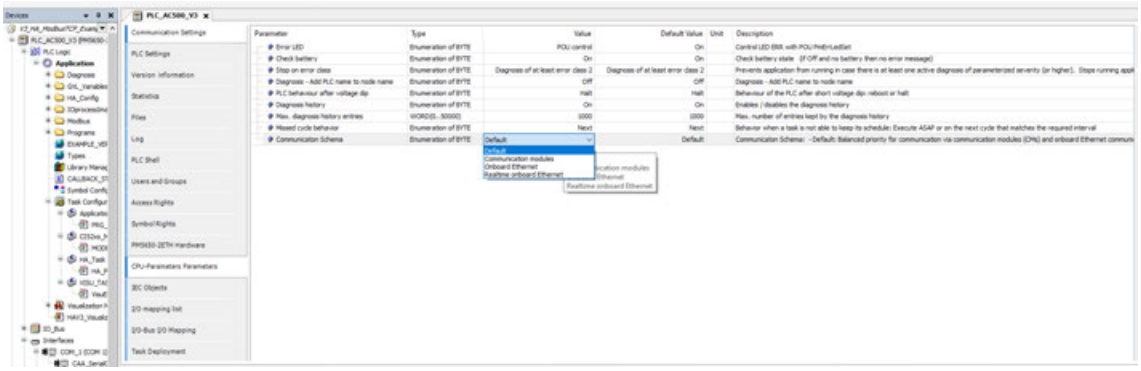
7. For UDP in AC500 V2 PLC, configure *"UDP_no_AC31_header"* and define the port number as '3000'.



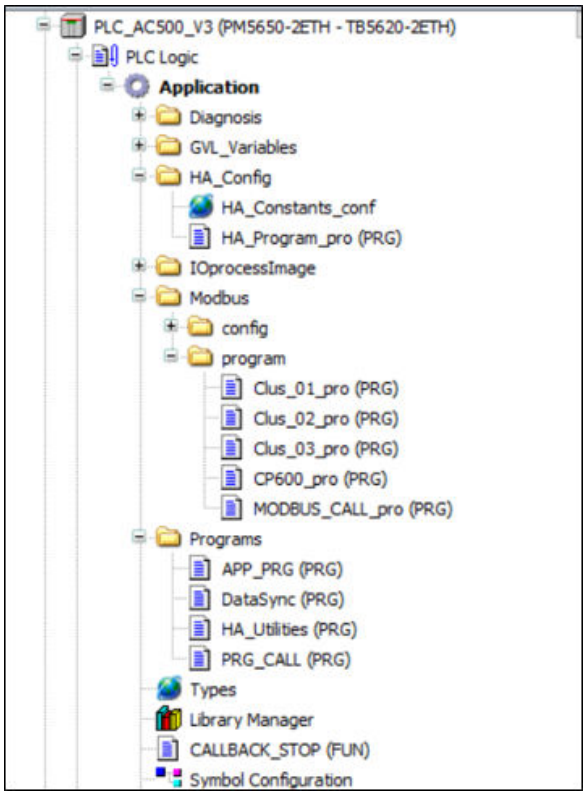
8. In AC500 V2 PLCs for each CM597-ETH communication module added the *"Send timeout"* value has to be changed to 600 ms for the Modbus TCP server.



9. Assign the IP addresses in ≥ 2 different Ethernet networks:
   - SCADA network: SCADA, connected PLC A and PLC B.
   - Field network: connected CI52x module(s).
10. Configure a network switch in the field network (if managed /redundant) based on network redundancy required ↳ *Chapter 1.5.8.1.5.3 “Field I/O network topologies” on page 2260*.
11. Run BDM tool to configure CI52x network.
12. Export the files. Refer for details in the document: *C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation*.
13. Import the Bulk data export files to the Automation Builder project.
14. Add Modbus TCP configuration for the ETH ports.
15. For the system with V3 PLCs, set the Communication Schema to “Onboard Ethernet” *“CPU-Parameters Parameters”* for better performance.



16. Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event *“stop”*.
17. Add optional HA utility function blocks or function block HA_MOD_DATASYNC.



18. Add the task configuration ↳ *Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258*.

19. Activate the runtime license if it is a V3 PLC to enable HA system. Refer to *Chapter 1.6.6.2.2 “PLC runtime licensing” on page 3665*.
20. Compile and download to both PLCs (simplified in V3 via integrated download manager).
21. Create a boot project, restart the complete system and RUN.
22. Operation: Test use cases (e.g. by putting the primary PLC to STOP mode and observe the switchover).
23. For different use cases and behavior refer to *Chapter 1.5.8.1.3.1 “Failures and use cases” on page 2243*.
24. Runtime error and diagnosis function block can be used to monitor the system. For details refer to *Chapter 1.5.8.1.8 “Diagnosis” on page 2269*.

1.5.8.1.7 HA-Modbus TCP Limits

HA-Modbus TCP is supported as of Automation Builder 2.0 or higher and the corresponding AC500 CPUs mentioned previously. AC500 V3 PLC is currently not supporting external ETH communication modules. Therefore, onboard ETH1, ETH2 (and eventually CAN) ports are to be used for communication.

3000 sync instances can be used: Either 3000 HA_MOD_DATA_SYNC function block instances alone or together 3000 instances of HA_MOD_DATA_SYNC inclouding + HA utility function block can be used. If more than 3000 instances are configured user can see the error at xHaModDataErr = True and wHaModDataErNo = 16#2022 in HA_GLOBAL_VARIABLES.

The maximum length of sync data at an instance of HA_MOD_DATA_SYNC function block would be 1412 bytes. The maximum size of sync data which can be synced between PLCA and PLCB in total can be max. 60 000 bytes.

The HA-Modbus TCP system takes care of the first fault only. This fault must be visualized by the programmer and overall system (e.g. HMI, SCADA) to the operator, to plan and repair as soon as possible as redundancy might be lost. If more than one error occurs, system may not react to second or following faults.

SCADA/ HMI has to be configured/programmed to:

- Only read data from the primary PLC.
- Parameters and control data should be always written to both PLCs or has to be synchronized via the function block.

This is given automatically when using OPC DA, where the CODESYS OPC Server does this switching for the connected clients according to the primary status. For CP600 HMI a script is available to switch likewise (connected via the internal AC500 protocol or Modbus). Zenon as a SCADA also uses the AC500 protocol to automatically switchover.

1.5.8.1.8 Diagnosis

This chapter explains the diagnosis information available to the user in the HA Modbus library and CI52x library. Diagnosis information is available at the outputs of HA control function block, HA Diagnosis function block and at the CI52x function block.

Depending on the use case defined in *Chapter 1.5.8.1.3 “Functionality” on page 2243* different diagnosis information can be accessed.

Primary CPU currently can read-out the diagnosis information (CI52x function block outputs) from communication interface module only once, hence secondary PLC will not be able to read the diagnosis information from the CI52x module.

So if any change happens in CI52x diagnosis it is not reflected in the secondary CPU.

This can lead to different diagnosis information of CI52x module in the primary and the secondary CPU. Hence it is recommended to customers that diagnosis information should be handled in the application (e.g. SCADA).

Diagnosis in HA-Modbus TCP library

In the HA Modbus library diagnosis information is available at the control block and diagnosis block.

Output System Configuration

This output at the HA control block gives the information of system configuration. Each bit of the word represents a different configuration.

Bit	Description
0	Sync is configured via CAN
1	Sync is configured via UDP
2	Lifecom2 is configured via CAN
3	Lifecom2 is configured via UDP
4	Lifecom2 is configured via Modbus TCP
5	Initialization for Ethernet configuration

Output System Configuration error

This output at the HA control block gives the details of error in the configuration. Each bit of the word represents different configuration errors. It is valid only when Error = TRUE.

Bit	Description
0	Communication interface module is not configured properly
1	1< SyncSlot >3. Invalid value at input sync slot
2	1<SecSlot>3. Invalid value at input second slot
3	Value at IpAdrCpuASync is invalid
4	Value at IpAdrCpuBSync is invalid
5	Value at IpAdrCpuALifecom2 is invalid
6	Value at IpAdrCpuBLifecom2 is invalid
7	IpAdrCpuASync = IpAdrCpuBSync or IpAdrCpuALifecom2 = IpAdrCpuBLifecom2 The IP addresses assigned at sync or lifecom2 inputs are wrong

Output Runtime error

This output at the HA control block gives the details of the error during run time of the system. Each bit of the word represents different runtime errors. It will not set Error = FALSE.

Bit	Description
0	Communication interface modules are lost
1	Other CPU is not active
2	Lifecom1 is lost (part of sync)
3	Lifecom2 is lost. This error will not be TRUE if the PLC is in STOP status. This is because Modbus is still responding even when PLC is in STOP
4	Synchronization is lost
5	Error in synchronization
6	Ethernet status error
7	Other PLC lost communication to CI52x modules
8	CAN_HEADER function block has error
9	CAN_DATA function block has error
10	fbGetOwnIP function block has error

Diagnosis function block

Outputs at the HA Diagnosis function block, HaModDiag (V3) / HA_MOD_DIAG (V2) provides the following diagnosis information of the HA system.

Output	Description
CpuAPrimary / CPUA_PRIMARY	TRUE indicates CPU A is primary
CpuBPrimary / CPUB_PRIMARY	TRUE indicates CPU B is primary
CpuARun / CPUA_RUN	TRUE means CPU A is in RUN mode
CpuBRun / CPUB_RUN	TRUE means CPU B is in RUN mode
CpuACI52xBusActive / CPUA_CI52x_BUS_ACTIVE	Modbus TCP CI52x bus active on CPU A
CpuBCI52xBusActive / CPUB_CI52x_BUS_ACTIVE	Modbus TCP CI52x bus active on CPU B
CpuACi52xCfg / CPUA_CI52x_CFG	Total number of CI52x configured on CPU A
CpuBCi52xCfg / CPUB_CI52x_CFG	Total number of CI52x configured on CPU B
CpuACi52xAct / CPUA_CI52x_ACT	Total number of CI52x active on CPU A line
CpuBCi52xAct / CPUB_CI52x_ACT	Total number of CI2x active on CPU B line
SyncInstances / SYNC_INSTANCES	Number of data sync and utility blocks initialized in the system
SyncDataCheckSum / SYNC_DATA_SUM	Checksum of all address pointer blocks in bytes, indicates total number of bytes getting synchronized.

Output	Description
StHACpuStatus / stHA_CPU_STATUS	HA own CPU status. It will show the status details of logged in CPU for the following parameters: ● HA1: CPU A is primary ● HA2: CPU B is primary ● bit_CI52x_BUS_active: CI52x bus with one or more communication interface modules active ● bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost ● RUN: Run status of CI52x ● cnt: Count of data sync communication, indicates data sync between CPUs is okay.
StHAotherCpuStatus / stHA_OTHER_CPU_STATUS	HA other CPU status. It will show the status details of other CPU for the following parameters: ● HA1: CPU A is primary ● HA2: CPU B is primary ● bit_CI52x_BUS_active: CI52x bus with one or more communication interface modules active ● bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost ● RUN: Run status of CI52x ● byETH_ACT_CI52x_Count: CI52x alive identification count.

Other diagnosis variables

Apart from the errors / diagnosis information available in the control and diagnosis block, few other variables can be monitored too.

Variable	Value	Description
wHA_ER_NO_SYNC_LINK	16#7487	No sync link between the PLCs
HA_MOD_INVALID_LENGTH	16#2017	Invalid length at the input of the data sync block
HA_MOD_ERNO_TBL_OVERFLOW	16#2022	HA data reference table is full
xHaModDataErr	TRUE	IF TRUE – HA data sync is in error state
wHaModDataErNo		HA data sync error code
xHaModErr	TRUE	HA system is in error state
dwHaModServerAlive		Life counter incremented by OPC DA server

Diagnosis in CI52x library

In addition to the diagnosis information in the HA Modbus library, additional diagnosis information for each communication interface module can be obtained from the CI52x library.

System Configuration error

This output at the CI52x function block gives the details of the configuration error in the CI52x module. Each bit of the byte represents different configuration errors:

Bit	Description
0	Reserved
1	Wrong ETH port is configured at input Config ETH
2	Wrong IP address is configured for communication interface module

Runtime error

RuntimeError (v3) / RUNTIME_ERROR (v2) of the function block CiModCi52x (v3) / CI_MOD_CI52x (v2). Runtime error is a combination of error bits that are described in the following:

Runtime Error	Description
Bit 0	Indicates communication error i.e., when CPU is not able to get any response from CI52x module. This error will get reset when communication is reestablished.
Bit 1	Indicates parameter state is not equal to 2 (PARA_STATE_PARA_DONE). If not true, then system gives I/O bus error. System resets this error when parameter state is equal to 2.
Bit 2	Indicates the cluster error [1]) in the system, if there is an error in the diagnosis buffer. ACK input is needed to reset this error.
Bit 3	Indicates the hardware configuration error, mismatch between configuration and actual hardware detected. System automatically resets this error when the hardware matches.
S-ERR (LED on communication interface module)	Indicates that there is some issue with channel configuration in the cluster [1]). It is not linked with Runtime Error. User can read DiagBuffer (v3) / DIAG_BUFFER (v2) from CiModDiag (v3)/ CI_MOD_DIAG (v2) function block to get more information. This error does not get reset using ACK. It will only reset when all channel errors are removed.
[1]) "Cluster" means a combination of one communication interface module and several I/O modules attached to it.	

Runtime error in different scenarios:

Error	Run-time error	PLC A: Primary				PLC B: Secondary			
		Bit0 - comm error	Bit1 - I/O bus error	Bit2 - cluster error	Bit3 - HW config error	Bit0 - comm error	Bit1 - I/O bus error	Bit2 - cluster error	Bit3 - HW config error
Wrong IP address configured	16#1	TRUE	FALSE	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE
Wrong slot address configured [1])	16#0	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE
Communi-cation cable dis-connected	16#2	TRUE	TRUE	FALSE	FALSE	TRUE	TRUE	FALSE	FALSE
Wrong I/O module plugged in the CI module	16#B	BLINK	TRUE	FALSE	TRUE	BLINK	TRUE	FALSE	TRUE
Wrong hotswap I/O module plugged at the start	16#B	BLINK	TRUE	FALSE	TRUE	BLINK	TRUE	FALSE	TRUE
Wrong hotswap I/O module swapped online	16#4	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	FALSE	FALSE
Configured I/O module not con-nected at start [2])	16#B	BLINK	TRUE	FALSE	TRUE	BLINK	TRUE	FALSE	TRUE
Configured hotswap I/O module not con-nected at start [2])	16#B	BLINK	TRUE	FALSE	TRUE	BLINK	TRUE	FALSE	TRUE
I/O module powered off in CI module [2])	16#4	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	FALSE	FALSE
Hotswap I/O module powered off in CI module [2])	16#4	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	FALSE	FALSE
Remove hotswap I/O module when online [2])	16#4	FALSE	FALSE	TRUE	FALSE	FALSE	FALSE	FALSE	FALSE

Error	Run-time error	PLC A: Primary				PLC B: Secondary			
		Bit0 - comm error	Bit1 - I/O bus error	Bit2 - cluster error	Bit3 - HW config error	Bit0 - comm error	Bit1 - I/O bus error	Bit2 - cluster error	Bit3 - HW config error
CI module is powered off	16#2	TRUE	TRUE	FALSE	FALSE	TRUE	TRUE	FALSE	FALSE
Mismatch in Channel configura-tion and wiring [3])	16#0	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE
Regular I/O module mounted on hotswap terminal unit [4])	16#0	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE
During an error stage if HA system changeover is initiated [5])	16#0	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE	FALSE

[1]) Slot input in the block can be ignored. Similar to ETH input of the ModMast blocks.

[2]) Error generated only in the primary PLC, to reset ACK input to be used.

[3]) No runtime error in function block. Module generates S-Err and ZP Blinks.

[4]) No runtime error in function block. Module generates S-Err.

[5]) Runtimer Error bit2 gets reset when the PLC is switched over and error won’t be available in any of the PLC regardless of its Primary status.

Communication interface diagnosis

Table 381: Function block CiModDiag (V3) and CI_MOD_DIAG (V2)

Output	Description
DevState / DEV_STATE	CI521 or CI522 device current status is displayed. ● STATE_PREOP: Device is booting ● STATE_OPERATION: Device is operational, no bus supervision is active ● STATE_ERROR: Device detected a bus error, bus supervision is active ● STATE_IP_ERROR: Device has an IP address error ● STATE_CYLIC_OPERATION: Device is operational, bus supervision is active ● STATE_NA: Not available
ParaState / PARA_STATE	CI521 or CI522 device parameter status. ● PARA_STATE_NO_PARA: Device has no parameters ● PARA_STATE_PARA_ACTIVE: Parameterization process is running ● PARA_STATE_PARA_DONE: Device used valid parameters and parameterization is done ● PARA_STATE_ERROR: Device has invalid parameters ● PARA_STATE_NA: Not available
DeviceInfo / DEVICE_INFO	CI521 or CI522 type and extended module types. This will give the details of the module configured in the communication interface module including the I/O modules. If module is with suffix F, then fast counter is enabled for that module.
DiagBuffer / DIAG_BUFFER	CI521 or CI522 module diagnosis buffer. Refer to *Chapter 1.6.5.3.1.2.3.2 “Diagnosis data” on page 3611*.
ErClass / ERR_CLASS	Communication interface error class. Refer to *Chapter 1.7.3 “Diagnosis messages” on page 4062*
ErNo / ERR_NO	Communication interface error number. Refer to *Chapter 1.7.3 “Diagnosis messages” on page 4062*
ModMastErr / MODMAST_ERR	Latest 22 Modbus TCP error message status of the ModMastTcp (V2) / COM_MOD_MAST (V2) function block.
ModMastErNo / MODMAST_ERR_NO	Latest 22 Modbus TCP error numbers. Refer to the error details in Modbus library *Chapter 1.5.8.1.8.1 “Diagnosis in HA-Modbus TCP library” on page 2270*. V3: Refer to the ERROR_ID enumeration in the Modbus TCP library (in the Library Manager)

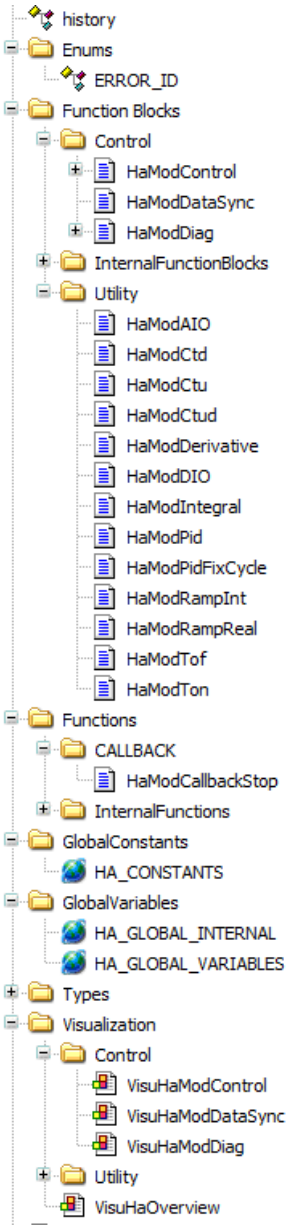
1.5.8.1.9 Library overview

Documentation

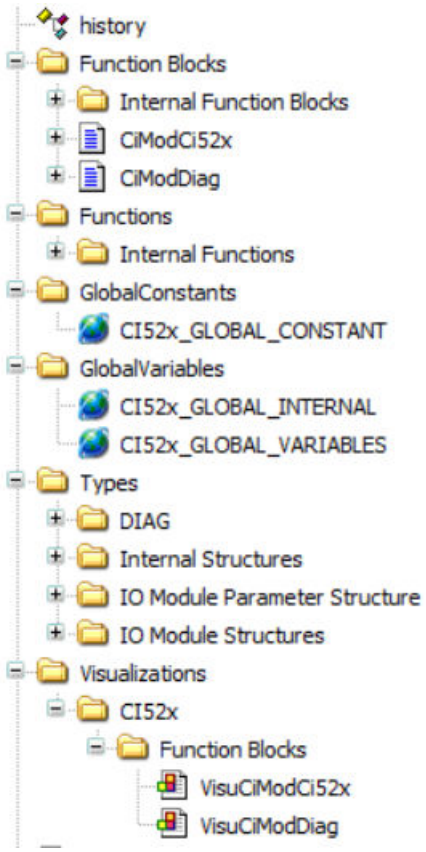
CODESYS V3 libraries are described in the Library Manager as an integrated documentation. Refer to the documentation section within the Library Manager.

The following function blocks are contained in the libraries:

HA-Modbus TCP library



HA_CI52x library

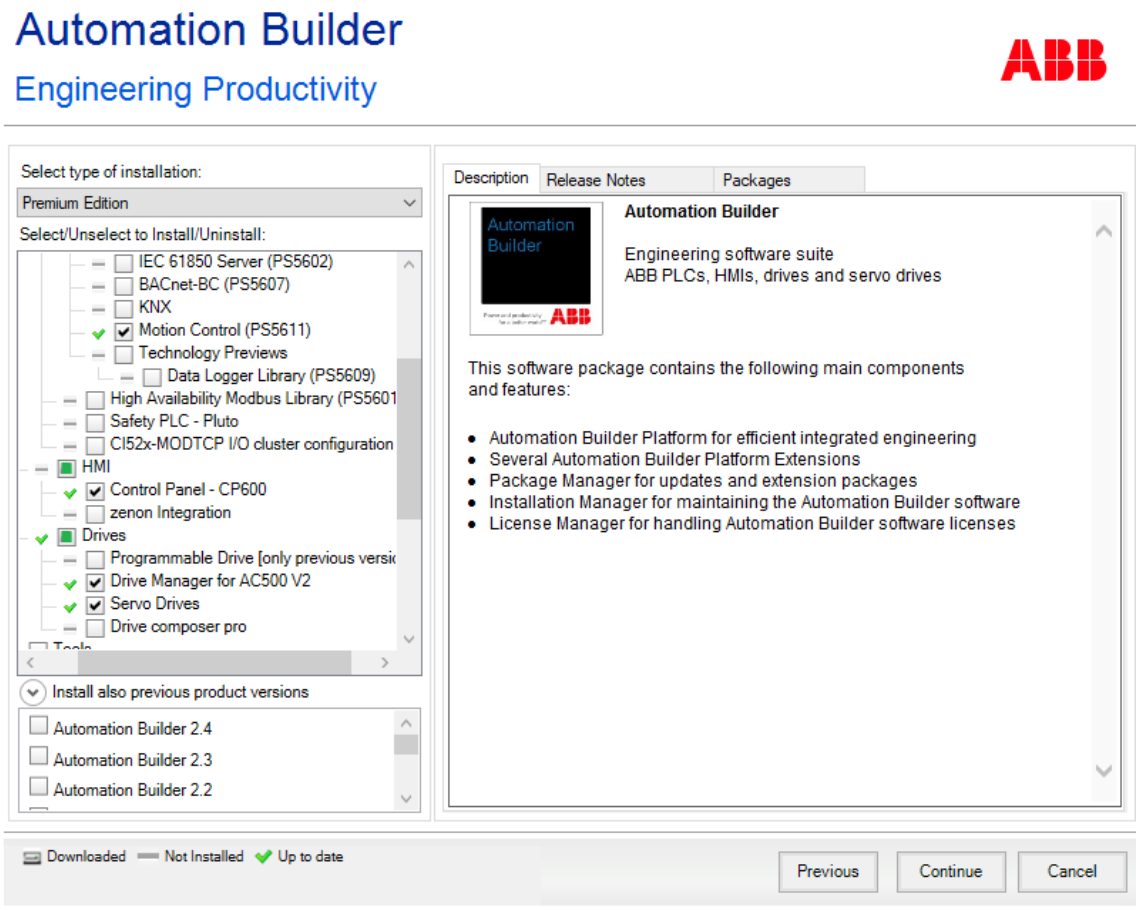


1.5.9 Motion Solution Wizard

Preconditions for the use of the *"Motion Solution Wizard"*

To be able to use the Motion Solution Wizard and the detailed information pdf, the following software packages must be installed:

- *"Motion Control (PS5611)"*
- *"Servo Drives"*



1. Select *“Tools”* and *“Installation Manager”* to open it.
2. Select *“Modify”*.
3. Mark the mentioned software packages.
4. Click the *“Continous”* button.
   ⇨ The various packages are downloaded and installed.

In the installation process, some operations must be confirmed.

Further detailed information about the “Motion Solution Wizard” and the “CAM editor” which are both basing on the “Motion control library” according PLCopen can be found in “AC500_V3_Motion Control_Wizard&Cam_Editor_Quick_Start_Guide_3ADR010899.pdf”:

C:\Users\Public\Documents\AutomationBuilder\Examples\PS5611-Motion

Or via the Automation Builder: “Help ➔ Project examples ➔ PS5611-Motion”

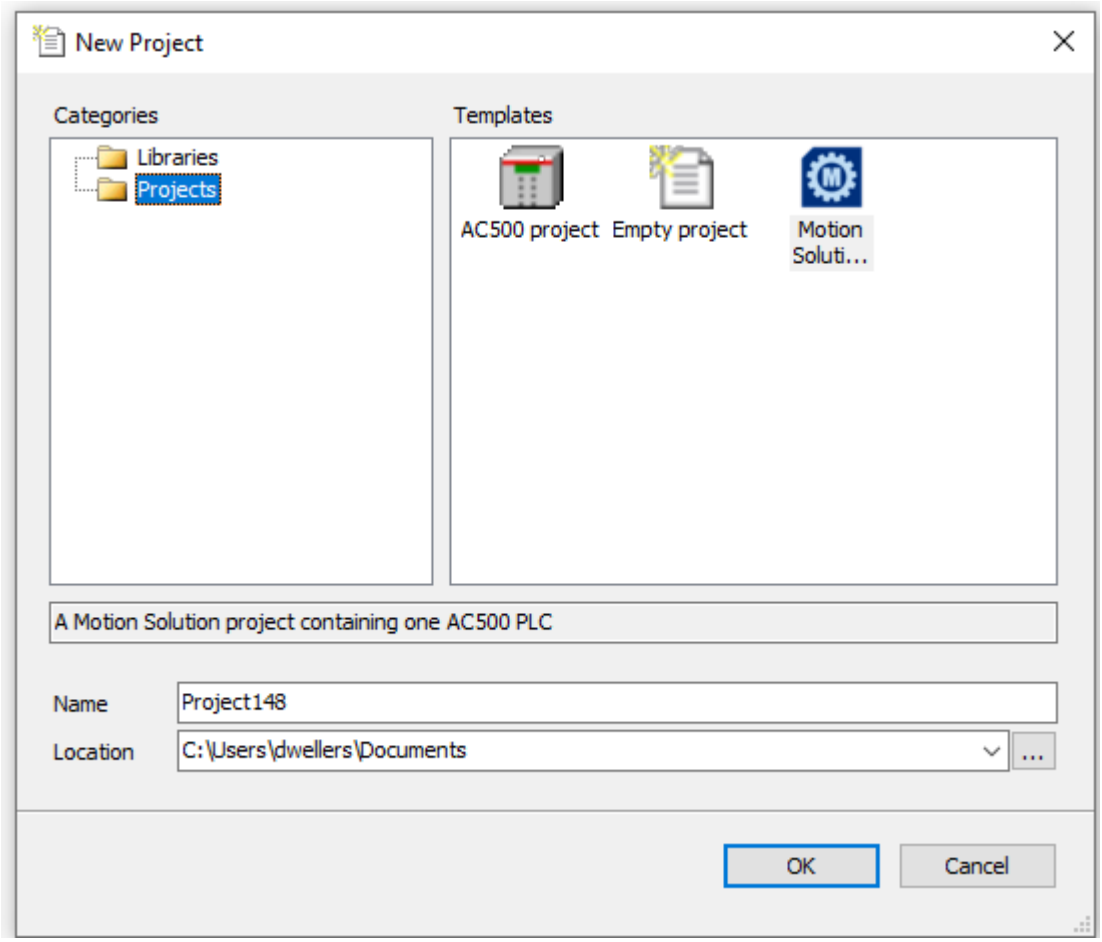
↬ Chapter 1.4.1.8.23.1 “Basic Motion” on page 317

Currently the “Motion Solution Wizard” supported only the ABB EtherCAT servo drives (E180/E190).

More information about additional software packages is available here: ↳ *Chapter 1.3 “Automation Builder installation manager” on page 169*

1.5.9.1 Create new project

Select *“File”* ➔ *“New Project”*.

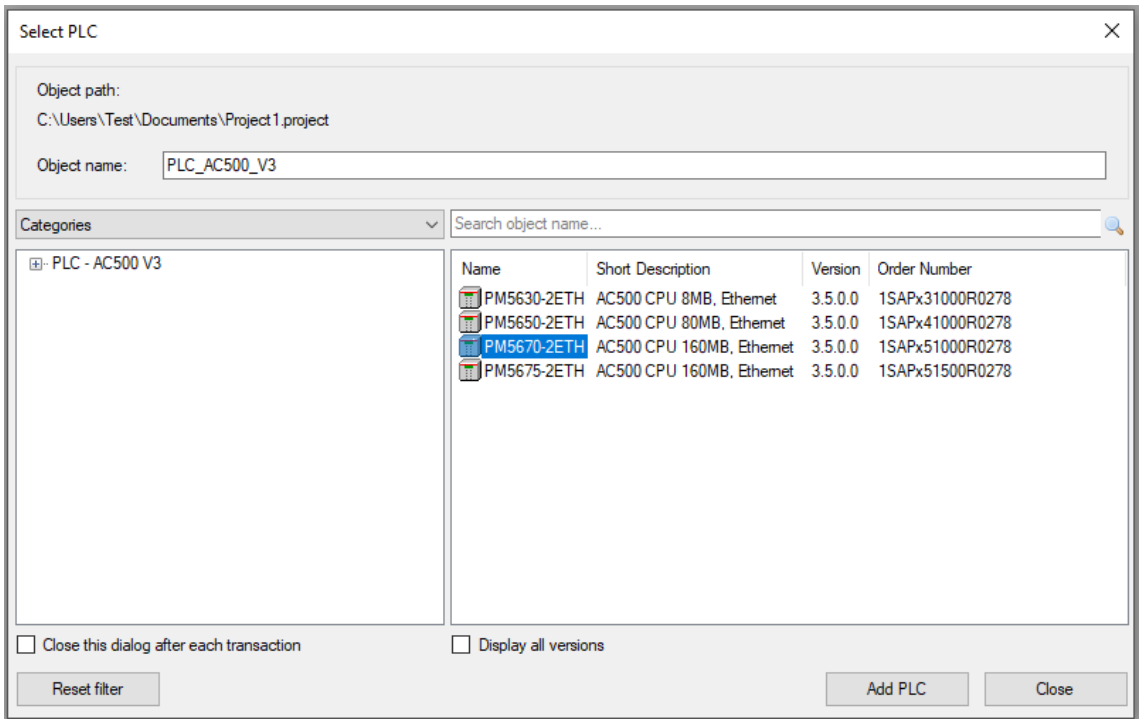


After successful download and installation of the missing software packages, the *“Motion Solution Project”* icon is showed in the *“Templates”*.

1. Select the *“Motion Solution Project”* icon.
2. Enter a project name.
3. Specify the storage location for the new project.
4. Click the *[OK]* button.
   ⇨ A new project is created and can be configured.

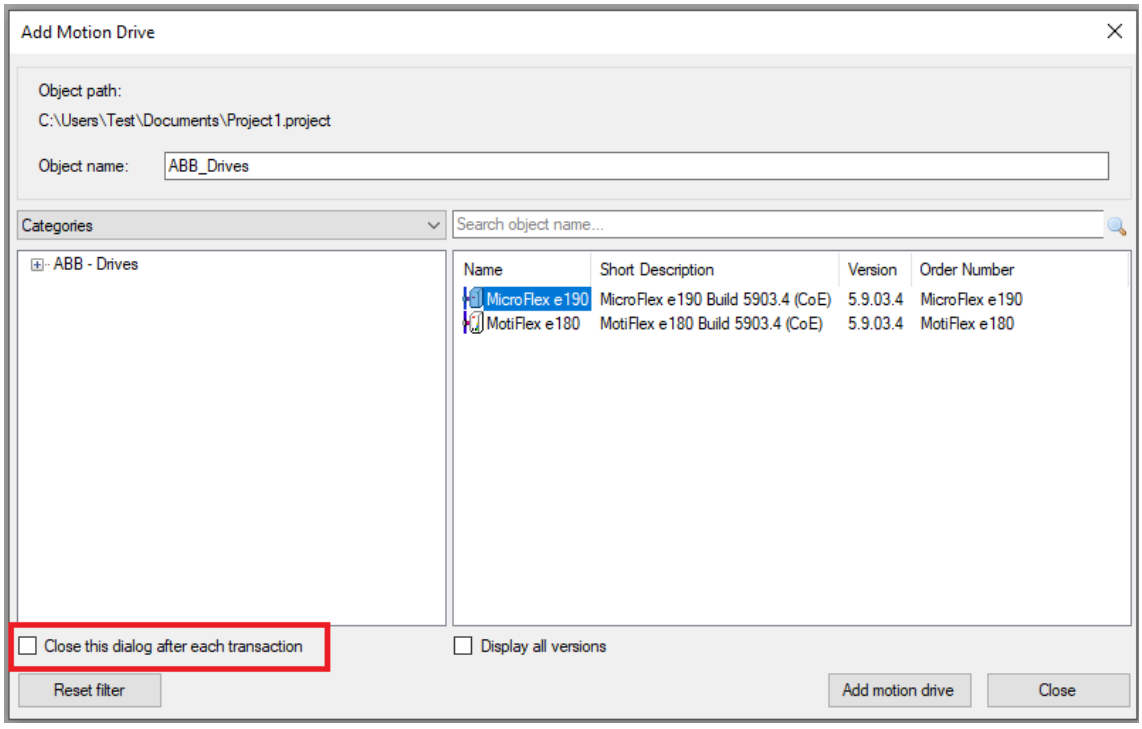
1.5.9.2 Select PLC

The Motion Solution Wizard can only be executed in an EtherCAT environment.



1. Select the desired PLC device.
2. Click the *[Add PLC]* button.
   ⇨ Along with the PLC added, Motion Solution Wizard and CM579-EtherCAT module also get added (Slot 1).

1.5.9.3 Select servo drive (motion axis)



After creating the hardware tree, Automation Builder will now pop up *"Add Motion Drive"* window. Here it shows all the installed EtherCAT supported ABB Servo drives.

Each servo drive added under the EtherCAT master will be counted as a motion axis in Automation Builder.

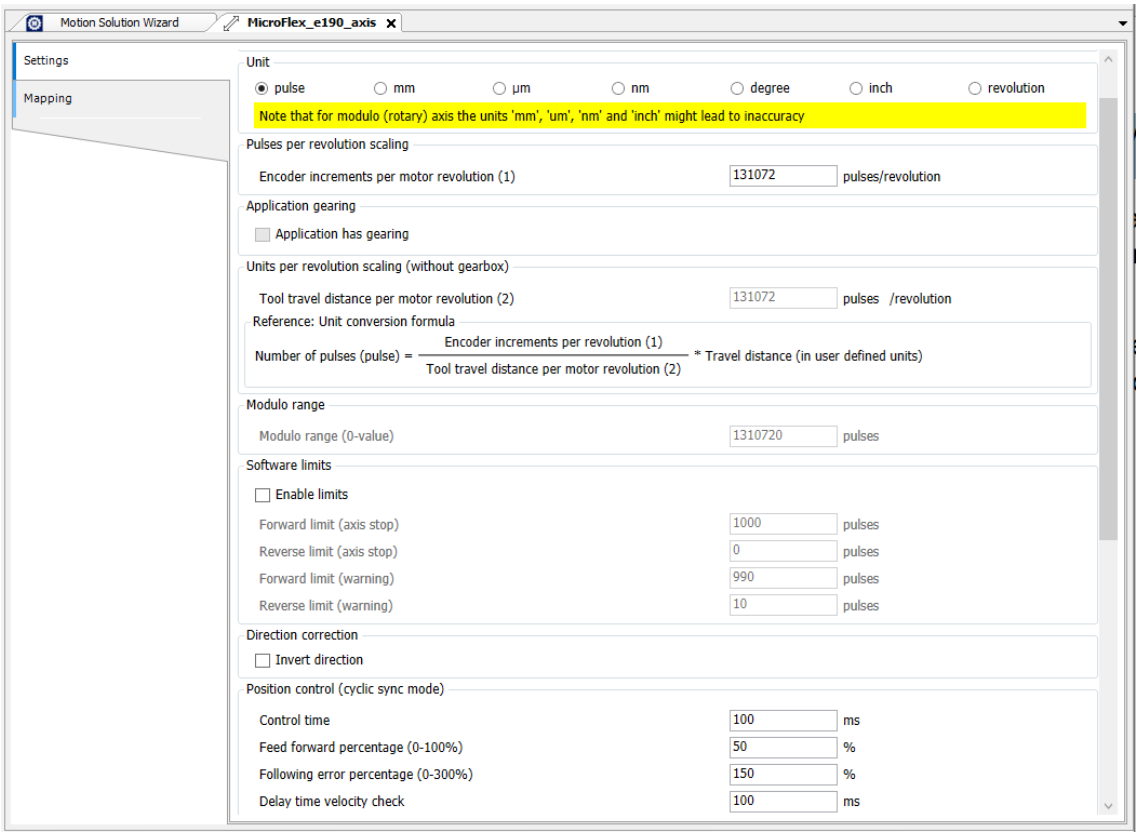
1. Delete the check mark of *“Close the dialog after each transaction”* (Red rectangle in the figure above).
   ⇨ Now several axes can be selected one after the other without closing the window.
2. Click on the motion drive you want to install.
3. Click *“Add motion drive”*.
   ⇨ In the *“Devices”* tree, the selected axis is displayed.
4. For more axes repeat the procedure.
   ⇨ The selected axes are displayed in the *“Devices”* tree.
5. Click the *[Close]* button if the required axes have been selected.

1.5.9.4 Configure servo drive (motion axis)

Users need to configure each axis separately as per the application requirement by opening the motion axis object which is added under the servo drive.

1. Double-click on the axis you want to configure.
   ⇨ The *“Settings”* and the *“Mapping”* tab are shown.
2. Now select the desired settings.

Depending on the selected axis type, the view and selection of setting options may change.



Settings

All settings related to the application and axis specific will be done here and needs to be carefully updated for each axis. Based on the inputs provided here, wizard will compile and generated the code.

The following *"Settings"* are available:

Parameter		Value	Description
Axis type			
	Modulo (rotary)		By selecting the Modulo (rotary) the axis will be configured as a roll-over axis and the desired modulo range can be configured later.
	Finite (rotary)	Default	The axis will be configured as a roll-over axis where in modulo range it is non editable by the user and calculated based on the *"Unit"* selection, *"Inc_Per_R, U_Per_Rev_Nominator and U_Per_Rev_Denominator setting"*.
	Linear (rotary screw)		Rotary motor with linear movements (linear axis).
	Linear (linear motor)		Configure if the axis is a linear motor.
	Virtual axis		This option is an additional check which user can do along with the axis type selection to make the configured axis type (physically configured) as virtual axis.
Units			
	Supported units are: Pulse, mm, µm, nm, degree inch and revolution. For *"Modulo (rotary)"* axis the units mm, µm, nm, and inch might lead to inaccuracy.		
Feedback device scaling			
	Forcer distance between an A and a B pulse(1)	40000 nm	Only available with an *"Axis type" "Linear (linear motor)"*.
Pulse per revolution scaling			
	Encoder increments per motor revolution (1)	131072 pulses / revolution	User can update this parameter with the actual encoder increments per motor revolution. Not available with an *"Axis type" "Linear"*.
Application gearing			
	Application has gearing	☐	Based on the actual application requirement, here user can check / uncheck the *"Application has gearing"* check box. Here user can also update the required tool travel distance per motor revolution. Not available with an *"Axis type" "Linear"*.
Units per revolution scaling (without gearbox)			
	Tool travel distance per motor revolution (2)	131072 pulses / revolution	When the user unchecks the check box, user can update the *"Tool travel distance per motor revolution"* as per the application requirement. Not available with an *"Axis type" "Linear"*.
	Number of pulses (pulse) =	$\frac{(1)}{(2)}$	* Travel distance (in user defined units)

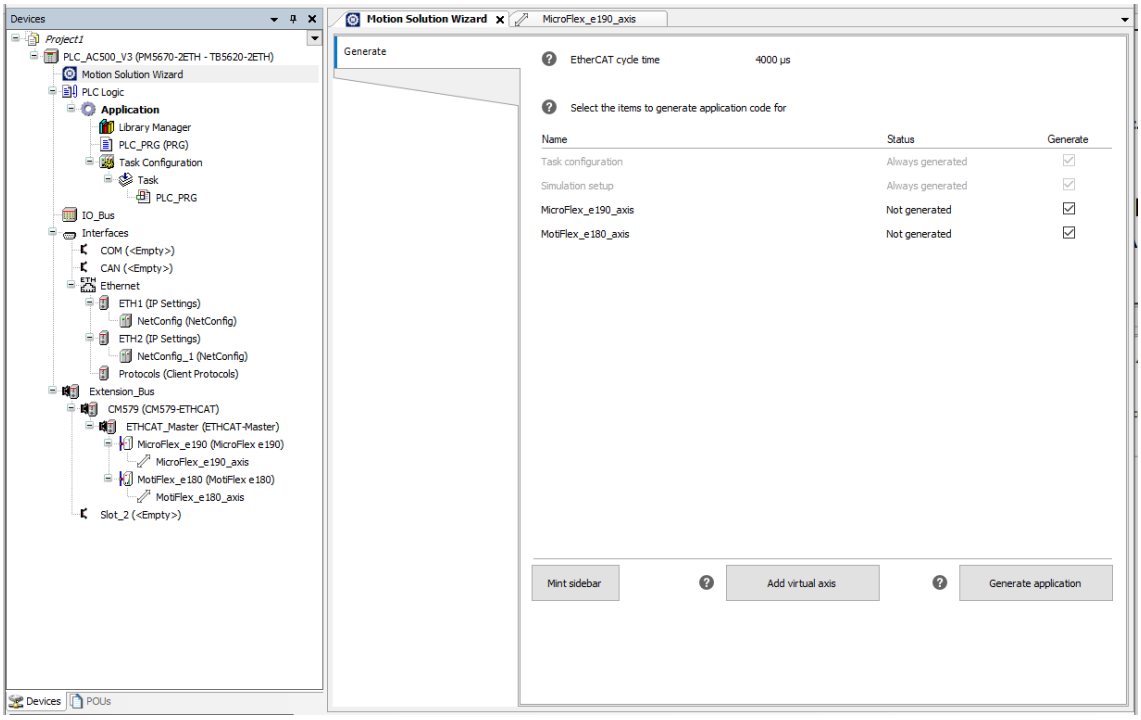
Parameter		Value	Description
Units per revolution scaling (with gearbox)			
	Tool travel distance per Gearbox output side revolution	1 mm /revolution	When the user checks the check box, user will be prompted to provide the gear box details additionally and during the generate application, the wizard will update the same accordingly. Not available with an *“Axis type” “Linear”*.
	Gearbox output turns: Tooling side (Numerator of reducation ratio) (4)	1	
	Gearbox input turns: Motor side (Denuminator of reducation ratio) (5)	1	
	Number of pulses (pulse) =	$\frac{(1)*(4)}{(3)*(5)}$	* Travel distance (in user defined units)
Modulo range			
	Modulo range (0-value)	131072 pulses	User can provide the modulo range here. Active only when the user selects the axis type as any of the “rotary” axis.
Software limits			
	Enable limits	☐	User can configure some of the common *“Software limits”* from the wizard itself. By default, *“Software limits”* in wizard are not enabled and user need to enable the same by enabling the check box.
	Forward limit (axis stop)	1000 pulses	
	Reverse limit (axis stop)	0 pulses	
	Forward limit (warning)	990 pulses	
	Reverse limit (warning)	10 pulses	
Direction correction			
	Invert direction	☐	In some of the application it is neccessary to change the direction for actual and reference positions. By default, the check box will be unchecked, and the direction will be normal. By selecting the check box *“Invert direction”* both actual and reference position will be inverted.
Position control (cyclic sync mode)			
	Control time	100 ms	User can configure the parameters related to position control and supervision. ↳ *Chapter 1.5.10.4.3 “Axis parameters” on page 2353*
	Feed forward percentage (0-100%)	50 %	
	Following error percentage (0-300%)	150 %	
	Delay time velocity check	100 %	
	Position lag supervision	Activated (default)	
		Deactivated	
Dynamic limits			
	Maximum application velocity	36000 pulse /sec	The units defined for each parameter and update the same accordingly since each parameter here is having a separate unit. Some parameters are depending on the drive settings and needs to be set correctly to get the desired result.
	Maximum speed reference value	13107200 Unit dependant on drive settings	
	Maximum speed (user defined)	6000 rpm	

Parameter		Value	Description
	Maximum acceleration	10000 pulses / sec²	It is recommended to keep the same maximum speed at the drive and the PLC parameter as the same and if user can set the maximum application velocity to a desired value to limit the maximum application speed.
	Maximum deceleration	10000 pulses / sec²	
	Maximum jerk	2000 pulses / sec²	
Drive based limits			
	Maximum positiv torque	300 %	Define the torque limits in wizard and the same will be written to the SDO startup parameter if the user select *"Torque limits"* in *"Mapping"* page. There parameters are currently not used in the program by default.
	Maximum negative torque	-300 %	
Results (calculated)			
	Position resolution	1	Based on the inputs provided, wizard will calculate the results and can be viewed immediately at the end of the configuration page.
	Maximum possible velocity	1.31072E+07 pulses /sec	
	Maximum allowed following error	1966080 pulses	

Mapping tab

Parameter		Value	Description
Control type			
	Cyclic synchronous position mode (CSP)	Cyclic synchronous velocity mode (CSV)	By default, wizard is selected for *"Cyclic synchronous position mode (CSP)"*. User can change the same based on his application requirement. CSVL is an ABB specific mode to achieve load control / profiling. By using this mode user can use the *"MotionControlLoad"* library. *Chapter 1.5.10.4.7 "PLC-based motion control — Load control / fluid power extensions" on page 2367*
		Cyclic synchronous velocity mode for load control (CSVL)	
Additional PDO mapping			
	Touch probe 1 pos	☐	Most of the applications needs additional PDO mapping and the wizard helps the user to add most used PDO mapping just by selecting the same here. User can add other PDO mapping which are not listed here manually by enabling the expert settings from the axis configuration page.
	Touch probe 1 neg	☐	
	Touch probe 2 pos	☐	
	Touch probe 2 neg	☐	
	Master encoder	☐	
	Following error	☐	
	Digital input states	☐	
	Digital output force	☐	
SDO startup parameter mapping			
	Give EtherCAT control	☑	By default, two of the SDO startup parameters are always checked and it is recommended not to change them.
	Operating mode	☑	
	Torque limits	☐	

1.5.9.5 Open Motion Solution Wizard editor page and generate application



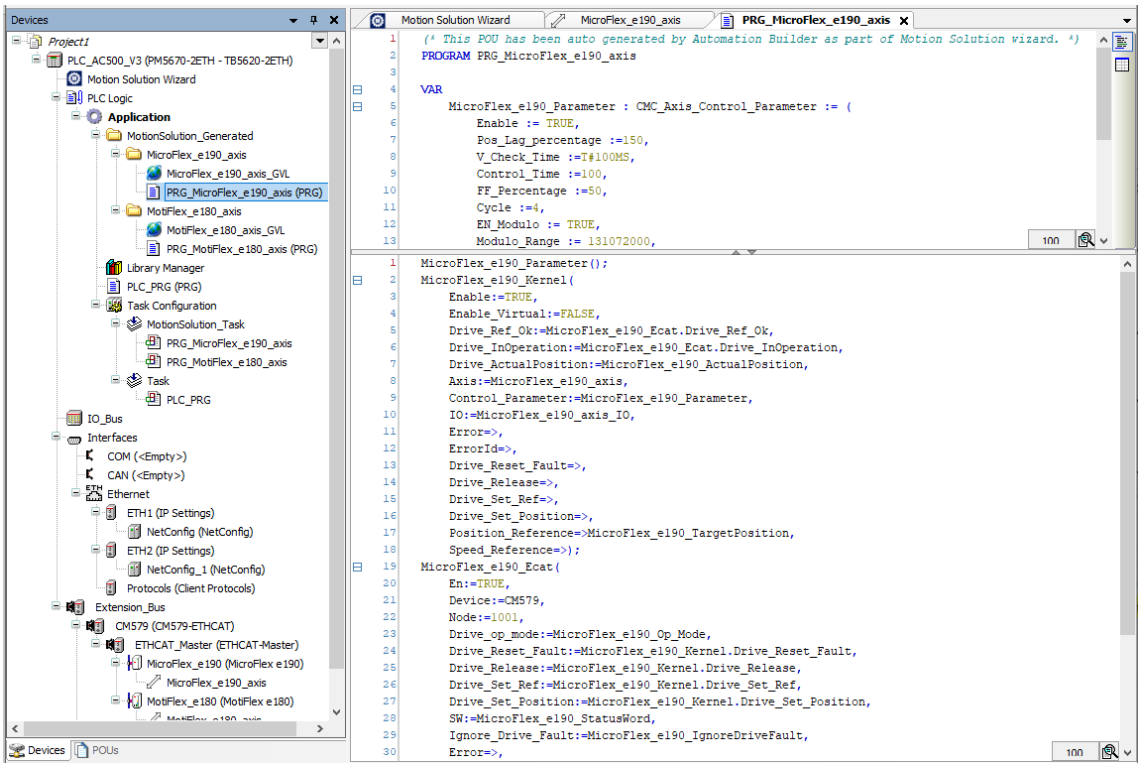
Once all the settings have been made, double-click to switch to the *“Motion Solution Wizard”* icon in the *“Devices”* tree.

All existing axes are listed here with their status. In the screenshot above *“Not generated”*.

1. Set a check mark for the axes that are to be generated under the column *“Generate”*.
2. Click the button *“Generate application”*.
   ⇨ The application code/s will now be generated.
3. Confirm the *“Generation successful”* window by cklicking the *[OK]* button.

1.5.9.6 Check generated application

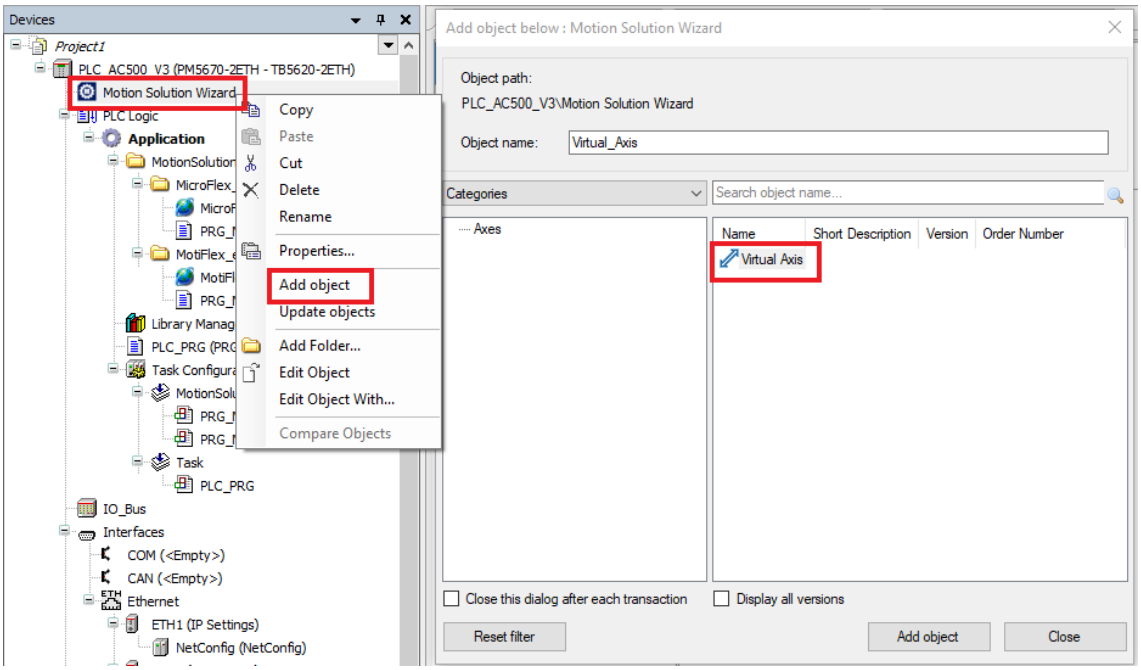
A new folder has been created in the *“Application”* - *“MotionSolution_Generated”*. In this folder are the folders of the generated axis with the global variables and function block calls. The added axes are mapped in the *“Devices”* tree under *“Extension_Bus”*.



These application codes can now be copied as required and integrated into your own PLC programming.

1.5.9.7 Optional: Add and configure virtual axis for simulation without real axis

Some of the applications needs virtual axis to be configured to fulfill the application requirement.



1. Right click on the *“Motion Solution Wizard”*.

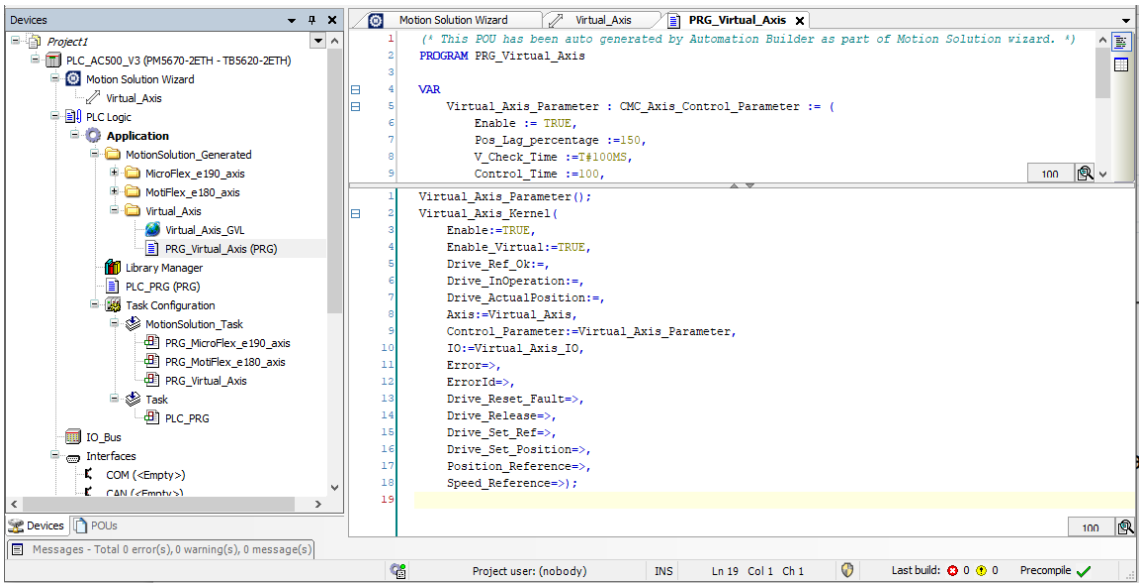
   ⇨ A new window opens.

2. Click *“Add object”*.

   ⇨ A new window opens.

3. Mark the *“Virtual Axis”* object.
4. Click the *[Add object]* button and the *[Close]* button.
   ⇨ A virtual axis was created.

After adding the virtual axis, user can find the same under *“Motion Solution Wizard”* object in Automation Builder. User can double-click on the added virtual axis object to get the settings page and configure it as per the requirement. Settings here is similar to the motion axis.



1.5.10 Motion control library

Safety instructions

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the drives you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 or chapter *Chapter 1.6.2.4 “Regulations” on page 2406* in the online help.
- Read the Important user Information. See chapter *Chapter 1.6.2.1 “Safety instructions” on page 2395* in the online help.

1.5.10.1 Preconditions for the use of the libraries

The user has to read the following instructions and documents before using the libraries:

The library package has been released for the software and firmware versions listed in the readme file of Automation Builder only (see “Help ➔ Automation Builder Release Notes”) . In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the HA library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e. g. of example programs.

The first version of Motion Control Library Package PS5611-Motion has been released with Automation Builder 2.4.0.There after the package is updated with several changes. For details on all changes please refer PS5611-Motion release note area from Automation Builder release notes.

The Motion control package contains follows libraries:

Library	Automation Builder	PLC firmware
ABB_MotionControl_AC500	AB 2.4.0 or higher	AC500 V3 firmware version 3.3.1 or higher AC500-eCo V3 firmware version 3.4.0 or higher
ABB_Ecat_CiA402_AC500		
ABB_MathFunctions_AC500		
ABB_MotionContro-lEco_AC500 (kernel blocks for Eco V3 PLCs)		
ABB_MotionControl-Load_AC500	AB 2.5.0 or higher	AC500 V3 firmware version 3.5.0 or higher

The PS5611-Motion libraries have been tested with the following product / firmware / software versions:

- AC500 V3 PLC firmware 3.3.1 or higher
- AC500-eCo V3 (PTO & PWM) firmware 3.4.0 or higher
- CM579-ETHCAT EtherCAT Communication Module firmware 4.4.3.21 or higher
- ABB e190 Drive
- CD522 module

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product / software / firmware versions. The error-free operation of the PS5611 - Motion with other devices / software / firmware versions should be possible but can not be guaranteed and may need adaptations e. g. of example programs.

CAUTION!
Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

Limits on number of synchronized axis

There are limits on the minimum EtherCAT cycle time, user can configure in each PLC type.

Table 382: Details on the limits on the minimum EtherCAT cycle time

PLC type	PM5630	PM5650	PM5670
Min. EtherCAT master cycle time	2 ms	1 ms	0,5 ms

Other than the above limits, there is also limits on configuring the number of synchronized axis in each PLC type. This limits is based on the EtherCAT master cycle time configured under EtherCAT master.

Table 383: Details on the limits for each PLC type

PLC type	PM5630	PM5650	PM5670
Number of synchronized axis in 1 ms	-	8	16
Number of synchronized axis in 2 ms	4	16	32
Number of synchronized axis in 4 ms	8	32	64

"Number of axis" is counted in Automation Builder is based on the number of Kernel function block instance declared in the IEC application. In this way, it is made sure all real and virtual axis are counted.

User can increase the EtherCAT cycle time to accommodate more "Number of axis" in the same PLC type.

User can use the *[Statistics]* tab from Automation Builder to see how many axis are supported for the particular PLC type and for the EtherCAT master cycle time configured. Once the axis is configured user need to update the *[Statistics]* tab by *"Generate Code"* to get the updated information.

Automation Builder allows an additional axis than what is mentioned in the above table to support one virtual axis additionally.

Please remove any Kernel function block instance which is declared but not used in the application to get the correct number of axis calculated by Automation Builder under the [Statistics] tab.

1.5.10.2 Overview

The PS5611-Motion is a Motion Control library for AC500 V3 CPUs, to create Motion Control applications based on function blocks according to the standard of PLCopen Motion Control. These function blocks can be used for PLC-based Motion Control and cover a wide range of possible Motion Control functionalities. Starting from single axis movements to master-follower axes to perform electronic gearing and CAM functions.

This documentation contains the following chapters:

- Overview
  In the subsequent chapters general information are provided for a better understanding of Motion Control with AC500 PLC and PS5611-Motion. There is also a tabular overview of the available PLCopen function blocks and their compatibility with PLC-based Motion Control and the provided drive-based Motion Control axis implementations.
- PLCopen
  The principle of the PLCopen Motion Control standard is explained as well as how PLCopen function blocks can be used to create PLC Motion Control application programs.
- PLC-based Motion Control
  This chapter explains how PLC-based Motion Control with AC500 can be realized and how it can be used in combination with the available PLCopen function blocks.
- PLC-based Motion Control Fluid Power Extension or Load Control
  This chapter explains how the PLCopen part 6 Fluid Power - extension also called "Load Control" can be used to practically realize also a form of Torque control (or -profiling) and how it can be used in combination with the available PLCopen function blocks and switch between Torque/Load control and position control.

The detailed functionality of each function block is defined in the integrated documentation of the library.

1.5.10.2.1 PLC-based motion control

With PS5611-Motion the application program and the profile generator are realized in the PLC.The implementation of the profile generator is based on a set of function blocks which are named Central Motion Control (CMC).

The profile generator of many possible axes is centrally placed inside the AC500 PLC. Therefore multiaxis motion functionalities become easily available and can be accessed by PLCopen function blocks. As a result, Motion Control functionalities are almost drive independent.

The detailed functionality of each function block is defined in the integrated documentation of the library.

Available motion control functionalities:

- Simple axis Movements
- Electronic Gearin
- Electronic CAMs
- Position Profiles
- Velocity Profiles
- Acceleration Profiles
- Load control (Torque profilling)

Then the output is a position reference signal which the drive will follow. A new position reference value will be calculated with every cycle of the PLC and has to be transferred to the drive, which demands real time capabilities to the PLC and to the communication channel. A real time fieldbus like EtherCAT is needed. The feedback of the actual position can be used for supervision purposes during operation and is needed to adjust the value of the position reference before the drive will be enabled.

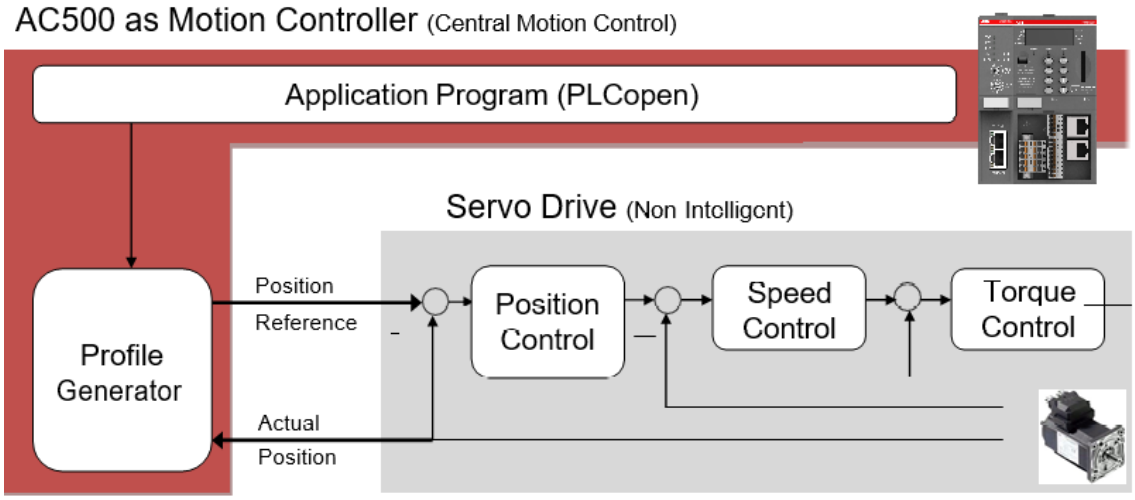


Fig. 49: System structure of PLC-based Motion Control with AC500 PLC and PS5611-Motion

With PLC-based Motion Control it is also possible to include the position control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory.

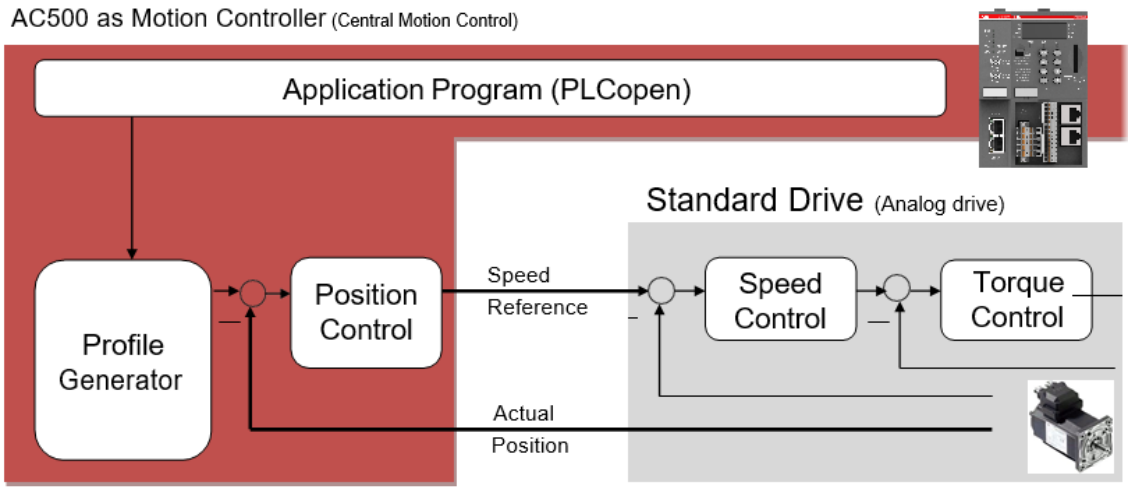

Fig. 50: PLC-based Motion Control with AC500 PLC and PS5611-Motion, closed position control loop

With PLC-based Motion Control it is also possible to include the load control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory and to close the load control loop, feedback of the actual load / torque is mandatory.

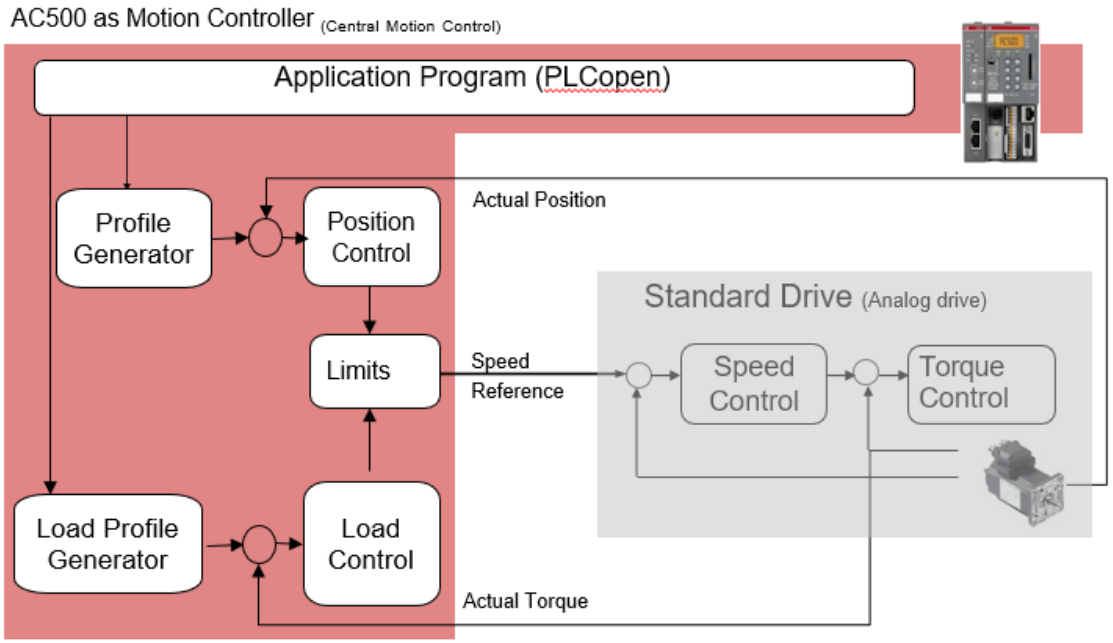

Fig. 51: PLC-based Motion Control with AC500 PLC and PS5611-Motion, closed load control loop

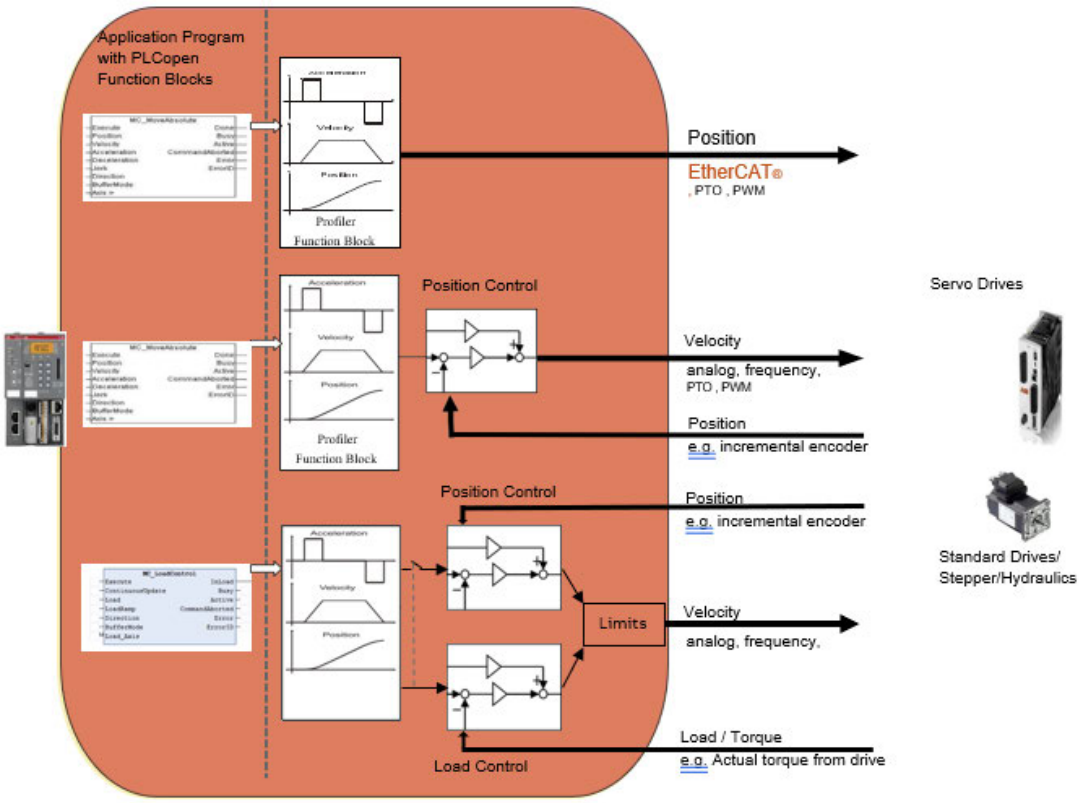

Fig. 52: Central Motion Control with AC500 PLC and PS5611-Motion, different axis implementations at the same time

1.5.10.2.2 Overview of PLCopen function blocks

The following tables give an overview of the defined function blocks, divided into administrative (not driving motion) and motion related sets. They give an overview which function block could be used for the different possible configurations.

These function blocks are part of the ABB_MotionControl_AC500 and ABB_MotionControl-Load_AC500 library.

If there are restrictions concerning a certain drive ("XXX") which lead to a different or limited behavior compared to the standard the respective chapter is supplemented with an additional paragraph "Notes for XXX".

The “KERNEL” function blocks are available in different variants.

The *“CMC_Basic_Kernel”* and *“CMC_Load_Motion_Kernel”* function block is designed to be used in standard V3 PLCs, and can either work with drives connected to a fieldbus or IOs.

The *“OBIO_PTOMotionKernel”* or *“OBIO_PWMMotionKernel”* function blocks (part of AC500_MotionControlEco) are solely to be used in AC500-eCo V3 CPUs and to make use of the integrated stepper-IO along with PLCopen function blocks. It connects automatically to the internal IOs.

For details of the limitations of PTO and PWM outputs in eCo V3 PLCs, refer to Automation Builder help file.

1.5.10.2.3 Overview of libraries

▷ Add the following libraries for the listed applications.

⇨ In some cases by adding a library, there will be other libraries added automatically.

Application	Library to be added manually
PLC-based motion control	ABB_MotionControl_AC500.-compiled-library
	ABB_MathFunctions_AC500.-compiled-library
PLC-based motion control, optional for EtherCAT	ABB_Ecat_CiA402_AC500.-library
Motion control with eCo V3 (OBIO_PTOMo-tionKernel & OBIO_PWMMotionKernel)	ABB_MotionControlEco_AC500.compiled ibrary
PLC-based motion control - Fluid Power Extensions	ABB_MotionControlLoad_AC500.compiled ibrary

The features of the function blocks provided with PS5611-Motion can be used from the PLC program according to PLCopen standard. Different drives and different Motion Control realizations could be used and can be combined with each other as well as different fieldbuses. ABB_Ecat_CiA402_AC500.library is editable and can be adapted based on the drive configuration and drive type.

1.5.10.2.4 Overview of data types

The following data types are used for the Motion Control library. The data types are defined in the library file ABB_MotionControl_AC500 compiled-library. The corresponding elements can be used for the function blocks inputs.

Table 390: Structures

Data type	Elements	Element data type
CMC_AXIS_IO	limitSwitchPos	BOOL
	limitSwitchNeg	BOOL
	absRefSwitch	BOOL
MC_PPROFILE *Chapter 1.5.10.4.6.1 "PositionPositionProfile" on page 2364*	master_position	LREAL
	interpolation_point	LREAL
	velocity_ratio	LREAL
	acceleration_ratio	LREAL
MC_TPROFILE *Chapter 1.5.10.4.6.2 "PositionTimeProfile" on page 2364*	interpolation_point	LREAL
	first_derivative	LREAL
	second_derivative	LREAL
	delta_time	TIME

Table 391: Enum

Data type	Possible values
MC_ABB_iTYPES_ENUM *Chapter 1.5.10.4.6.3 "Interpolation types for profiles" on page 2364*	MCA_SPLINE_COMPLETE
	MCA_SPLINE_NATURAL
	MCA_POLY5
	MCA_POLY3
	MCA_LINEAR
MC_BUFFERMODE	mcABORTING

1.5.10.2.5 Naming of function blocks and data structures

PLCopen

All function blocks and data types named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation. They may have additional inputs but according to PLCopen rules.

All function blocks and data types named MCA_xxx are implemented corresponding to PLCopen rules with adaptations specific to AC500. They are AC500 specific extensions to the PLCopen library.

PLC-based motion control

All function blocks named CMC_xxx belong to the implementation of PLC-based motion control.

All data types named CMC_xxx belong to the implementation of PLC-based motion control.

All data types named AXIS_xxx exist according to PLCopen definition. The content is ABB specific and not documented.

All function blocks named zCMC_xxx belong to the implementation of PLC-based motion control. These are not documented and not intended for customer use.

All function blocks and data types named MC_xxx are implemented according PLCopen definition and follow the PLCopen documentation.

All function blocks and data types named OBIO_xxx in the ABB_MotionControlEco_AC500 library are intended for use with AC500-eCo V3 PLCs only.

All function blocks named xxx_APP are not write protected and may be modified for adaptations. Editable library is available in the example folder.

Editable library is available in the example folder.

1.5.10.3 PLCopen

Based on application requirements and project specifications engineers are required to use or select a wide range of Motion Control hardware. In the past this required unique software to be created for each application even though the functions are the same. PLCopen motion standard provide a way to have standard application libraries that are reusable for multiple hardware platforms. This lowers development, maintenance and support costs while eliminating confusion. In addition, engineering becomes easier, training costs decrease, and the software is reusable across platforms. Effectively, this standardization is done by defining libraries of reusable components. In this way the programming is less hardware dependent, the reusability of the application software increased, the cost involved in training and support reduced, and the application becomes scalable across different control solutions. Due to the data hiding and encapsulation, it is usable on different architectures, for instance ranging from centralized to distributed or integrated to networked control. It is not specifically designed for one application, but will serve as a basic layer for ongoing definitions in different areas. As such it is open to existing and future technologies.

ABB is a member of the PLCopen organization. More Information about PLCopen can be read on the *PLCopen website*.

Fig. 53: PLCopen Motion Control logo

Function blocks according to PLCopen are designed for controlling axes via the language elements consistent with those defined in the IEC 61131-3 standard. It was decided by the task force that it would not be practical to encapsulate all the aspects of one axis into only one function block. The retained solution is to provide a set of command-oriented function blocks that have a reference to the axis, e.g. the abstract data type Axis, which offers flexibility, ease of use and reusability.

Implementations based on IEC 61131-3 (for instance via function blocks and SFC) will be focused towards the interface (look-and-feel/proxy) of the function blocks. This specification does not define the internal operation of the function blocks.

PLCopen Motion Control function blocks can be used in any IEC 61131-3 programming language. The following picture shows an example of a function block used in Function Block Diagram (FBD) language.

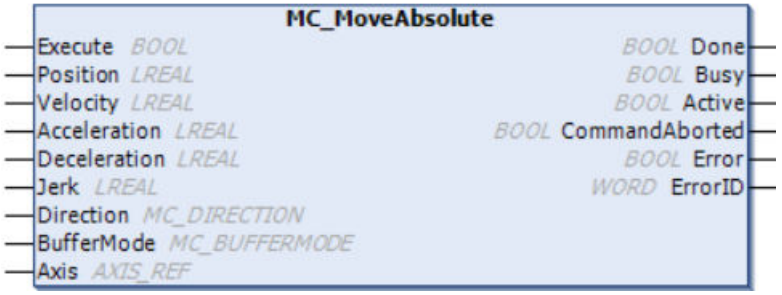

Fig. 54: Command for absolute positioning according to PLCopen standard

Application programs which use the manufacturer independent function blocks according to PLCopen will lead to the following advantages:

- Reusable software structure for different platforms.
- Programming based on function blocks.
- Function blocks can be used in any IEC 61131-3 language.

All function blocks which are defined by PLCopen will have the following qualities independently to the manufacturer of the motion control system:

- Same inputs/outputs
- Same functional behavior
- Same name

The following parts of the PLCopen motion control definition are completely or partly included in this product:

- Part 1: Function blocks for motion control
- Part 2: Extensions
- Part 3: User Guidelines
- Part 4: Homing Procedures
- Part 6: Function blocks for motion control – Fluid Power Extensions

1.5.10.3.1 Programming guidelines

This chapter explains some rules on the usage of the libraries and the structure Axis_Ref.

- In general, the kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.
- If Axis_Ref is used as input on a user defined function block or program or function, always use it as VAR_IN_OUT and never use it as VAR_INPUT or VAR_OUTPUT. The reason is that this would
  - Break the consistency and destroy data.
  - Consume a lot of computing power by copying data.

- Any instance of a function block should be called only once per cycle and in only one specific task.
  If the instance is used in several tasks, it has to be checked that is not called several times.
  Because this could corrupt the handshake from function block to Axis_Ref to CMC_Basic_Kernel and vice versa.
- Some PLCopen function blocks are only allowed to be called within the same task as the CMC_Basic_Kernel function block. This is mentioned in the function block descriptions.
- If PLCopen function blocks are called from a different task, the cycle time should be at least 2 times the cycle time for CMC_Basic_Kernel function block.

Axis data type Axis_Ref

The Axis_Ref is a structure that contains information on the corresponding axis. It is used as a VAR_IN_OUT in all Motion Control function blocks defined in this document. The content of this structure is implementation dependent and can ultimately be empty. If there are elements in this structure, the supplier shall support the access to them, but this is outside of the scope of this document. The refresh rate of this structure is also implementation dependent. According to IEC 61131-3 it is allowed to switch the Axis_Ref for an active function block, for instance from Axis1 to Axis2. However, the behavior of this can vary across different platforms, and is not encouraged to do.

Axis_Ref data type declaration:

TYPE Axis_Ref : STRUCT

(Content is implementation dependent)

END_STRUCT

Example:

TYPE Axis_Ref : STRUCT

AxisNo: UINT; AxisName: STRING (255);

…….

END_STRUCT

1.5.10.3.2 The single axis state diagram

The following diagram normatively defines the behavior of the axis at a high level when multiple motion control function blocks are simultaneously activated. This combination of motion profiles is useful in building a more complicated profile or to handle exceptions within a program. (In real implementations there may be additional states at a lower level defined). The basic rule is that motion commands are always taken sequentially, even if the PLC had the capability of real parallel processing. These commands act on the axis' state diagram.

The axis is always in one of the defined states (see diagram below). Any motion command that causes a transition changes the state of the axis and, as a consequence, modifies the way the current motion is computed. The single axis state diagram is an abstraction layer of what the real state of the axis is, comparable to the image of the I/O points within a cyclic (PLC) program. A change of state is reflected immediately when issuing the corresponding motion command.

The response time of immediately is system dependent, coupled to the state of the axis, or an abstraction layer in the software.

The diagram is focused on a single axis. The multiple axis function blocks, MC_CamIn, MC_GearIn and MC_Phasing, can be looked at, from a single axis state diagram point of view, as multiple single-axes all in specific states. For instance, the CAM-master can be in the state Continuous Motion. The corresponding slave is in the state Synchronized Motion. Connecting a slave axis to a master axis has no influence on the master axis.

The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the function blocks. The axis feedback is operational. If the MC_Power function block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.

Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating function block controls an axis, while the MC_Power function block with Enable=FALSE is called, the motion generating function block is aborted (CommandAborted).

The intention of the state ErrorStop is that the axis goes to a stop, if possible. There are no further inputs from function blocks accepted until a reset has been done from the ErrorStop state.

The transition Error refers to errors from the axis and axis control, and not from the function block instances. These axis errors may also be reflected in the output of the function blocks instances errors.

Issuing MC_Home in any other state than StandStill will go to ErrorStop, even if MC_Home is issued from the state Homing itself.

Function blocks which are not listed in the single axis state diagram do not affect the state of the axis, meaning that whenever they are called the state does not change. They are:

MC_ReadStatus; MC_ReadAxisError; MC_ReadParameter; MC_ReadBoolParameter; MC_WriteParameter; MC_WriteBoolParameter; MC_ReadActualPosition and MC_CamTable-Select.

Calling the function block MC_Stop in state StandStill changes the state to Stopping and back to Standstill when Execute = FALSE. The state Stopping is kept as long as the input Execute is TRUE. The output Done is set when the stop ramp is finished.

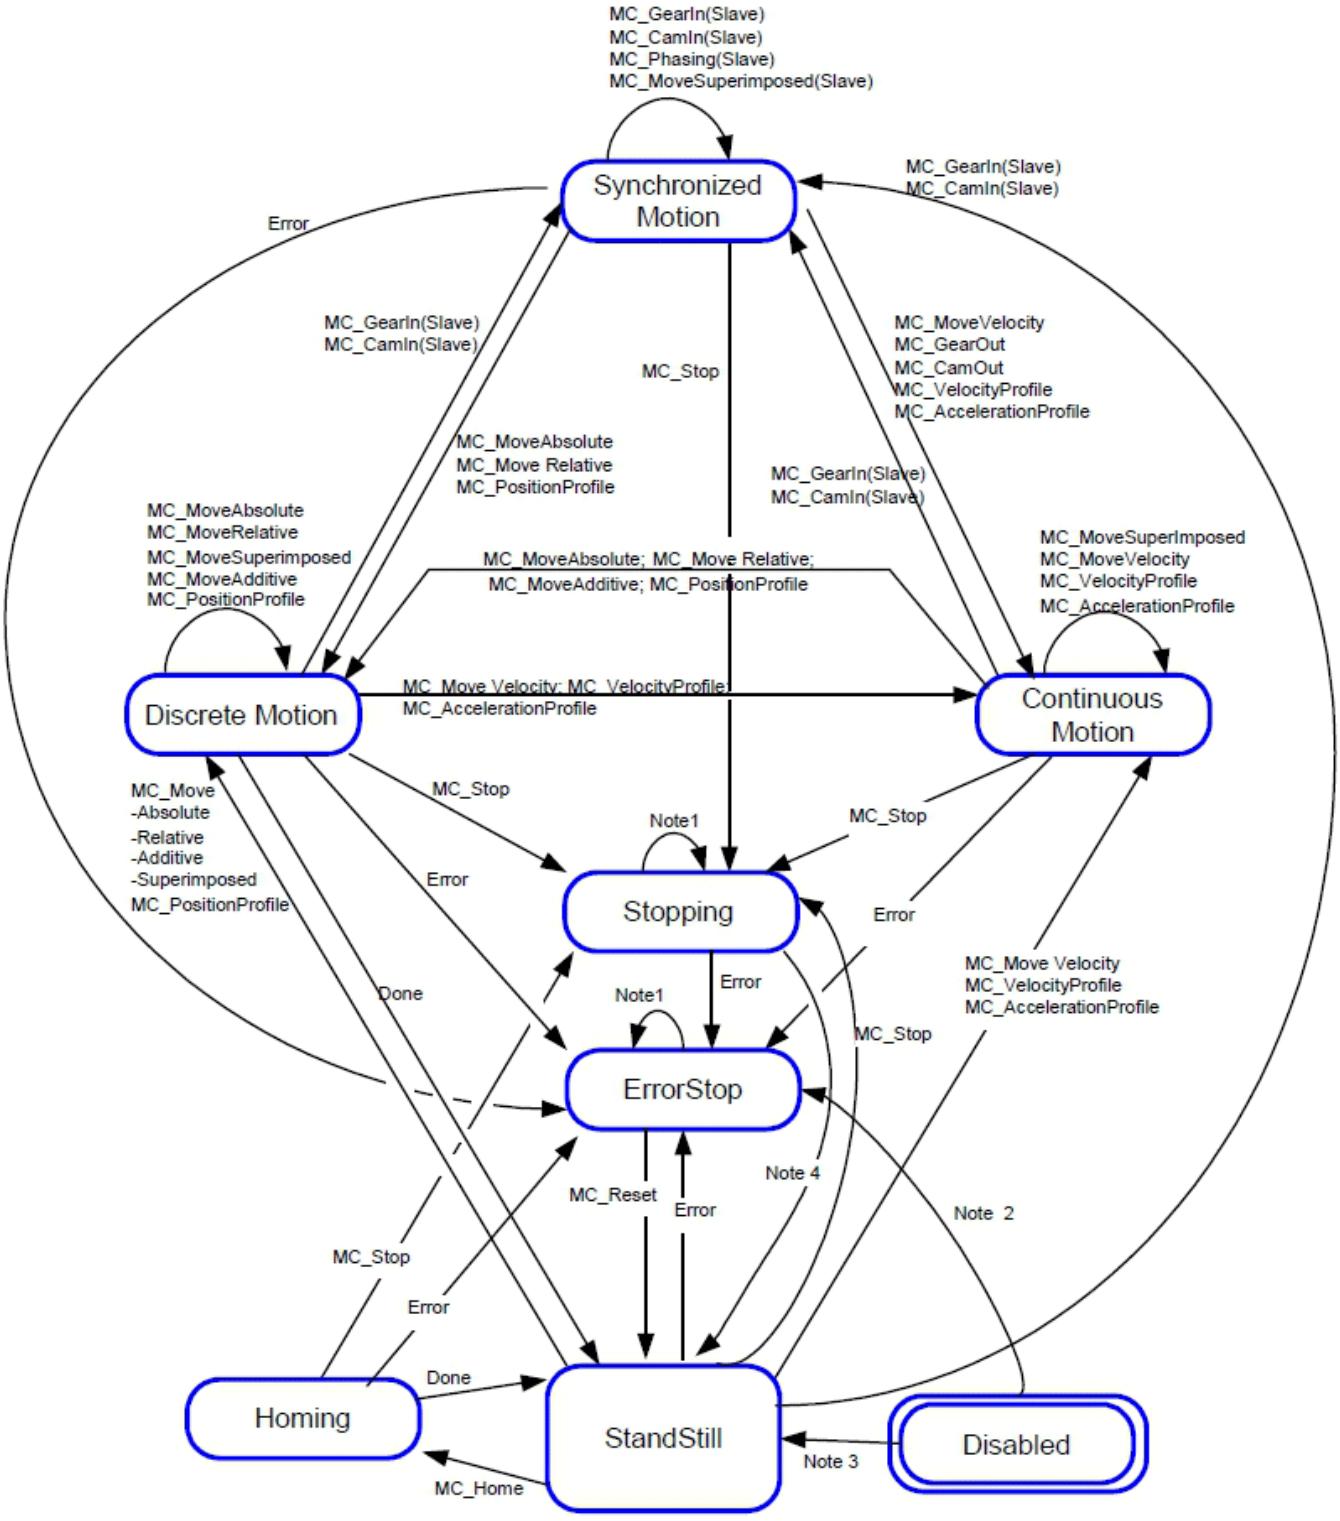

Fig. 55: Function block state behavior

1. In this state ErrorStop or Stopping, all function blocks can be called, although they will not be executed, except MC_Reset and Error – they will generate the transition to StandStill or ErrorStop respectively.

2. Power.Enable=TRUE and there is an error in the Axis.

3. Power.Enable=TRUE and there is no error in the Axis.

4. MC_Stop.Done AND NOT MC_Stop.Execute.

1.5.10.3.3 Visualizations

For usage with the PLCopen Library, a set of visualization objects is defined. These visualizations use the placeholder concept, which means that they could be used in an actual visualization several times and be instantiated by replacing the “placeholder” with an effective data-structure.

Two types of visualizations exist:

- As placeholder, an instance of Axis_Ref should be used. These are named: MC_VISU_Axis_name. Here the name could be state machine or its actual.
- As placeholder, an instance of the respective PLCopen function block should be used. These visualizations are named MC_VISU_FB_name where "name" could be MoveAbsolute or MoveVelocity, so the complete element is named MC_VISU_FB_MoveAbsolute or MC_VISU_FB_MoveVelocity.

The background colour and the colour for the title of each element could be changed. The colours are defined in some global predefined variables in MC_VISU_COLOR_INFORMATION. By changing these values, different colours will be used.

MC_VISU_COLOR_INFORMATION (GVL)

InOut:

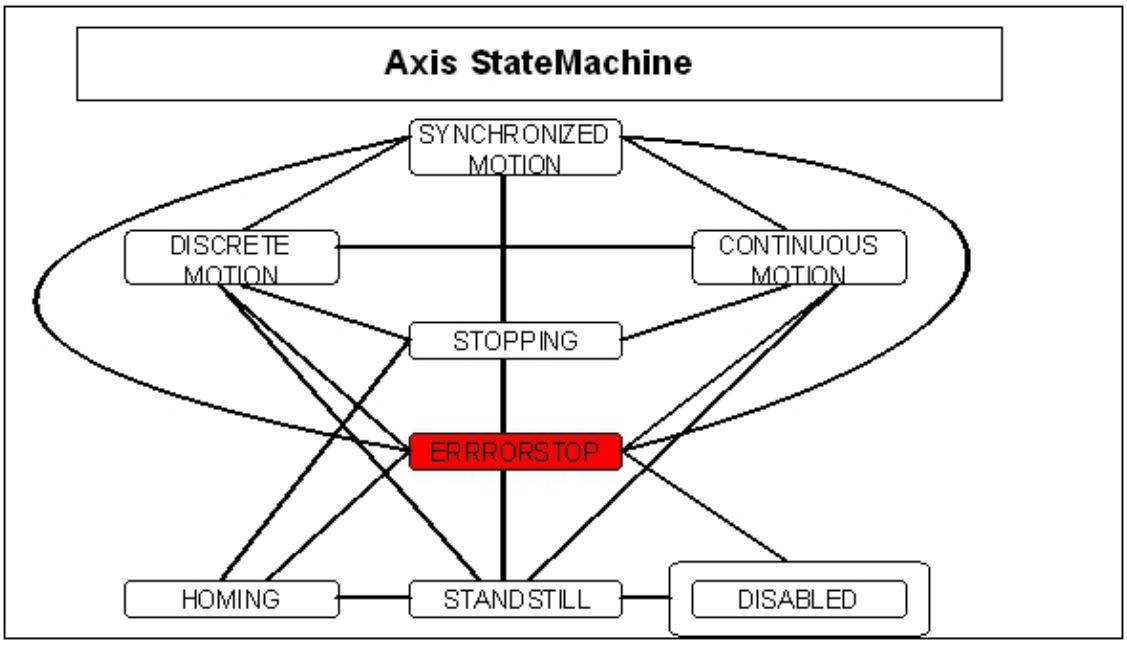
Name	Type	Initial	Comment
MC_VISU_BACKGROUND_COLOR	DWORD	16#FF888888	16#FFRRGGBB (* Color combination for the Grey color*)
MC_VISU_TITLE_COLOR	DWORD	16#FFFFFF00	16#FFRRGGBB (* Color combination for yellow*)

Below, some existing visualizations are shown.

MC_VISU_Axis_StateMachine

This shows the state machine of the axis according to PLCopen definition. The active state is shown green except the ErrorStop which is shown red. Usually, it starts with Disabled. When no remote connection to the drive is available, it will switch to ErrorStop immediately.

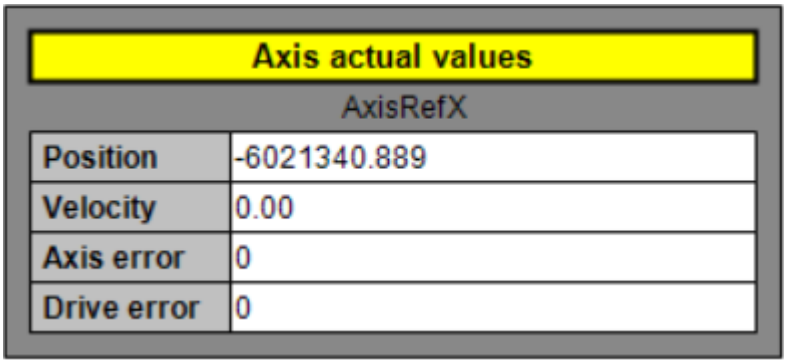
The placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.



MC_VISU_Axis_actual

This object shows some actual values.

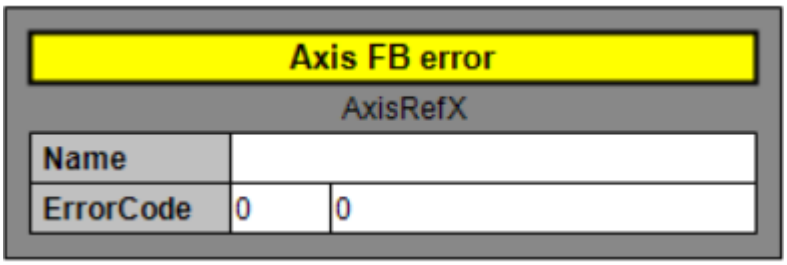
The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.



MC_VISU_Axis_FB_error

This object shows the error information connected to the PLCopen function blocks. This is NOT a drive error. If no error occurs in the execution of a function block, just the name is shown. If an error occurred, it shows the name of the function block as well as the error number and a short description. In the example below, the MC_Power function block recognized that no fieldbus connection to the drive was available.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.



1.5.10.3.4 Error codes

Besides the diagnosis information of the drive which is described in the respective drive documentation, there are a number of error codes directly related to the function blocks. These error codes are displayed at the output “ErrorID” of the function block.

Error Code	Mnemonic	Explanation
0	MC_Ok	No Error
1	WRONG_STATE	A function block was activated not according to the state machine, e.g. tried to start a movement while in state Disabled.
2	DRIVE_PROBLEM	The drive indicates an error, e.g. tripped.
3	PARAM-ETER_EXCEEDS_LIMIT	A parameter at the function block is outside the possible range. This does not refer to the parameter range which is allowed for the drive but just to the 32-Bit Integer which is used for internal calculation.
4	NO_FIELD_ACCESS	No fieldbus connection to the drive.
5	BUS_PROBLEM	Not used
6	ABS_SWITCH_ERROR	During Homing, (when done by function blocks) limit switch not according to moving direction e.g. the positive switch occurred when moving in negative direction.
7	TIMEOUT	Timeout in block execution.

Error Code	Mnemonic	Explanation
8	NAK	Parameter access not applicable
9	MC_TimeLimitExceeded	Used by function blocks with TimeLimit.
10	MC_DistanceLimitExceeded	Used by function blocks with DistanceLimit.
11	MC_TorqueLimitExceeded	Used by function blocks with TorqueLimit.
12	NOT_IMPLEMENTED	Functionality not implemented for certain axis type.
101	ErrorID_POSITION_FOLLOW	Following error, caused by > position error => ERRORSTOP. (parameter POS_LAG_PERCENTAGE)
102	ErrorID_POSSW	Positive software limit switch => ERRORSTOP. The actual position did exceed the positive Software limit switch position. This supervision has to be activated with MC_WriteParameter.
103	ErrorID_NEGSW	Negative software limit switch => ERRORSTOP. The actual position did exceed the negative Software limit switch position. This supervision has to be activated with MC_WriteParameter.
104	ErrorID_VELOCITY_FAULT	The measured velocity and commanded velocity are > 50% (related to maximum velocity) apart, for a certain time =>ERRORSTOP (parameter V_CHECKTIME)
105	ErrorID_INTERPOLATION_FAULT	following error, caused by interpolation problem =>ERRORSTOP. Position following error occurred, but reason most likely a interpo- lation problem, not drive problem (e.g. CAM Table, position step).
110	ErrorID_WARNING_VELOCITYLIMIT	Velocity or acceleration/deceleration are in limitation, set by parameter EnableLimitVelocity, MaxVelocityAppl, MaxDecelerationAppl
111	ErrorID_WARNING_POSITIONLIMITPOS	Position is in limitation towards position limit (SWLimit2DecPos), axis decelerates near positive software limit switch
112	ErrorID_WARNING_POSITIONLIMITNEG	Position is in limitation towards position limit (SWLimit2DecNeg)., axis decelerates near negative software limit switch
113	ErrorID_WARNING_POSITIONOVERRUN	A linear axis created a 32bit position overrun (> 2147483647 u=>inc) =>configure modulo
114	ErrorID_WARNING_ABORT	Axis aborted due to too large position gap due to velocity limitation
115	ErrorID_WARNING_MOVEMENT_DIRECTION	Either positive or negative direction blocked by MC_Power

1.5.10.3.5 Error handling

All access to the drive/motion control is via function blocks. Internally these function blocks provide basic error checking on the input data. Exactly, how this is done is implementation dependent. For instance, if MaxVelocity is set to 6000, and the Velocity input to a function block is set to 10,000, a basic error report is generated. In the case where an intelligent drive is coupled via a network to the system, the MaxVelocity parameter is probably stored on the drive. The function block must take care of the errors generated by the drive internally. With another implementation, the MaxVelocity value could be stored locally. In this case the function block will generate the error locally.

Both centralized and decentralized error handling methods are possible when using the motion control function blocks.

Centralized error handling is used to simplify programming of the function block. Error reaction is the same independent of the instance in which the error has occurred.

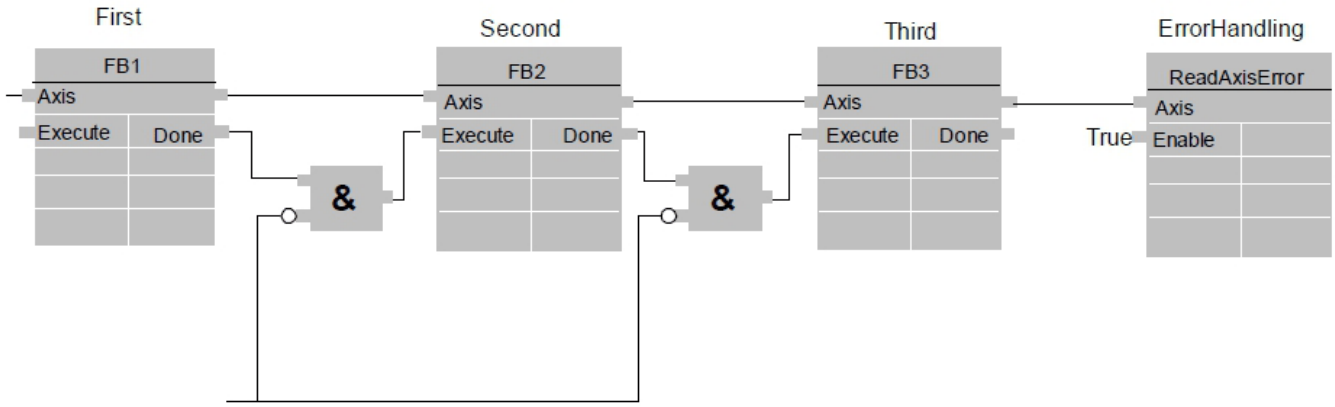


Fig. 56: Function blocks with centralized error handling

Decentralized error handling gives the possibility of different reactions depending on the function block in which an error occurred.

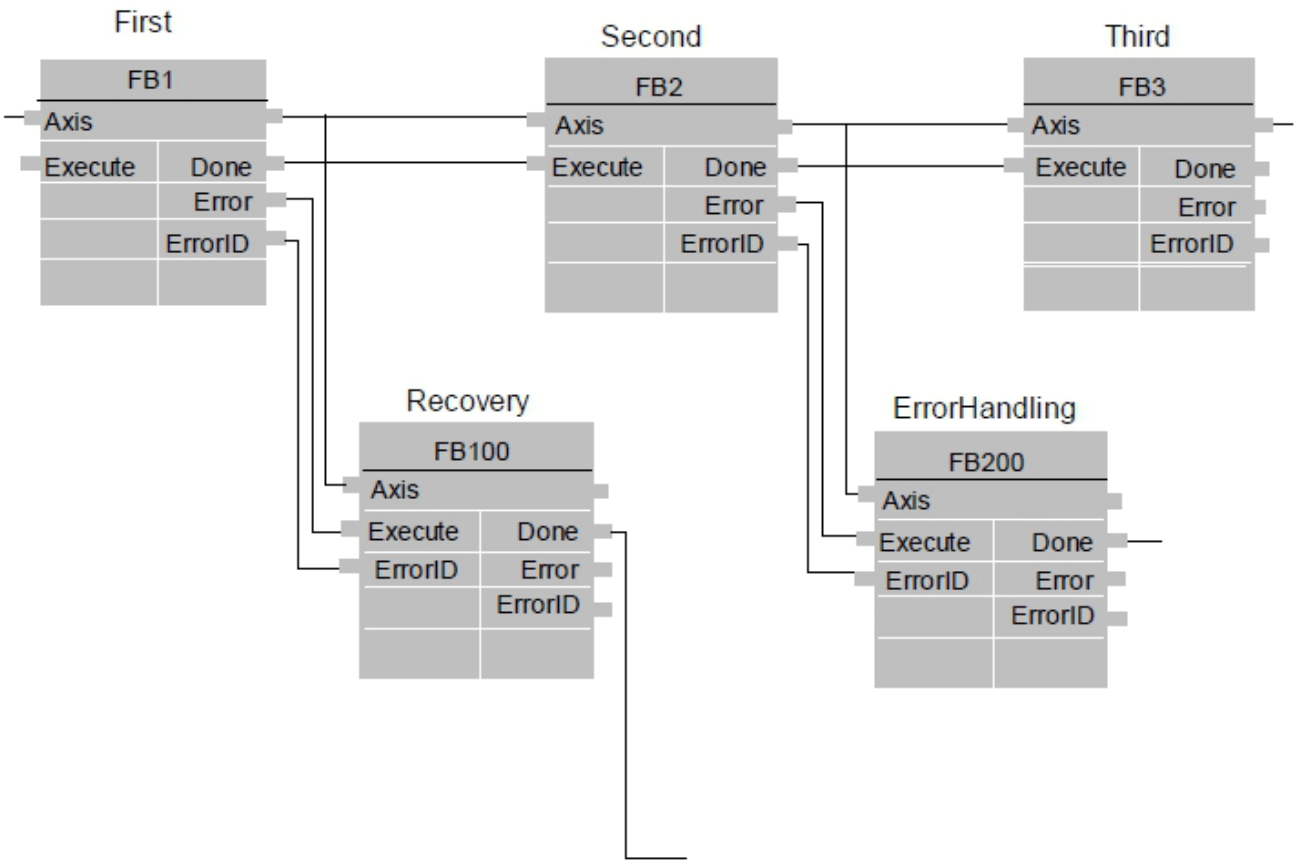

Fig. 57: function blocks with decentralized error handling

1.5.10.3.6 PLCopen parameter

Additional parameters are available by ReadParameter and WriteParameter function blocks.

Following function blocks can be used for the read and write operation. Functionality of these blocks and its variables are explained in the integrated documentation

- *MC_ReadParameter*
- *MC_WriteParameter*
- *MC_ReadBoolParameter*
- *MC_WriteBoolParameter*

Parameter number (PN)	Name	Datatype	Min.	Max.	Default	R/W	Comments
1	CommandedPosition	DINT				R	Commanded position.
2	SWLimitPos	DINT	-2147483647	2147483647	2147483647	R/W	Positive Software limit switch position.
3	SWLimitNeg	DINT	-2147483647	2147483647	-2147483647	R/W	Negative Software limit switch position.
4	EnableLimitPos	BOOL	FALSE	TRUE	FALSE	R/W	Enable positive software limit switch.
5	EnableLimitNeg	BOOL	FALSE	TRUE	FALSE	R/W	Enable negative software limit switch.
6	EnablePosLagMonitoring	BOOL	FALSE	TRUE	TRUE	R/W	Enable monitoring of position lag (following error).
7	MaxPositionLag	DINT	1	2147483647 ***		R	Maximal position lag.
8	MaxVelocitySystem	DINT			32767	R	Maximal allowed velocity of the axis in the motion system.
9	MaxVelocityAppl	DINT	0**	32767	32767	R/W	Maximal allowed velocity of the axis in the application.
10	ActualVelocity	DINT	-32767	32767		R	Actual velocity.
11	CommandedVelocity	DINT	-32767	32767		R	Commanded velocity.
12	MaxAccelerationSystem	DINT			32767	R	Maximal allowed acceleration of the axis in the motion system.

Parameter number (PN)	Name	Datatype	Min.	Max.	Default	R/W	Comments
13	MaxAccelerationAppl	DINT	10	32767	32767	R/W	Maximal allowed acceleration of the axis in the application.
14	MaxDecelerationSystem	DINT			32767	R	Maximal allowed deceleration of the axis.
15	MaxDecelerationAppl	DINT	10	32767	32767	R/W	Maximal allowed deceleration of the axis.
16	MaxJerk	DINT	0*	2147483647	2147483647	R/W	Maximal allowed jerk of the axis.
2001	MODULO_NOMINATOR	DINT	1	2147483647	1	R/W	ABB specific parameter. Used for PLC-based Motion Control implementation: Gearbox modifier to MODULO_RANGE
2002	MODULO_DENOMINATOR	DINT	1	2147483647	1	R/W	ABB specific parameter. Used for PLC-based Motion Control implementation: Gearbox modifier to MODULO_RANGE
2003	EnableLimit2Decelerate	BOOL	FALSE	TRUE	FALSE	R/W	Enable software limit switches to decelerate

Parameter number (PN)	Name	Datatype	Min.	Max.	Default	R/W	Comments
2004	EnableLimitAbort	BOOL	FALSE	TRUE	FALSE	R/W	Enable that software limit switches will abort ongoing movement FALSE = Limits position and velocity, decelerates and shows a warning until the position limit is reached, then ERROR STOP TRUE = Switches off any ongoing motion and decelerates to the position limit, then ERROR STOP
2005	EnableLimtVelocity	BOOL	FALSE	TRUE	FALSE	R/W	If the velocity is limited the unmoved position will be covered whenever possible
2006	SWLimit2DecPos	LREAL	-2147483647	2147483647	2147483647	R/W	Used as end position for EnableLimit2Decelerate
2007	SWLimit2DecNeg	LREAL	-2147483647	2147483647	2147483647	R/W	Used as end position for EnableLimit2Decelerate
2008	MaxPositionGapLL	LREAL	0	214748364700	0	R/W	Used to stop the ongoing movement if position is behind

0* means: no limitation of jerk is performed.

**Axis will stay in stop.

***is modified by CMC_Axis_Control_Parameter, the max. Value is calculated in increments, the value which is delivered by ReadParameter will be given in [u].

In addition to the above parameters certain other operation can be done using the below parameters from the data type "Axis_Parameter"

Name	Type	Initial	Comment
paraFilterVariant	INT		Filter for actual velocity 0 = PT1 1 = LinearRegression
paraFilterTime	INT	10	Time in PLC cycles, used with paraFilter-Variant
paraFilterForecast	INT	0	Time in PLC cycles, used with paraFilter-Variant = 1
paraReverseDirection	INT	0	Changes the direction for actual and reference positions based on the mode selected. 0 = normal direction 1 = reverse input position 2 = reverse output position and speed reference 3 = reverse both
paraEarlyClosedLoop	BOOL	FALSE	TRUE: hold the position when Drive_Release is set (not wait for Drive_InOperation = TRUE)
paraLateOpenLoop	BOOL	FALSE	TRUE: hold the position until Drive_InOperation = FALSE

1.5.10.3.7 Limits

Table 392: Limitations for the inputs of PLCopen function blocks when used with CMC_Basic_Kernel

Parameter	Min.	Max.
Velocity	0	x
Acceleration, Deceleration	0	x
Position	-2147483647	2147483647

1.5.10.3.8 General restrictions

Restrictions for the available function blocks

- As buffered mode, MC_Aborting is realized as a default. This does NOT mean that the axis stops when another movement is started while an ongoing movement is still active. It means instead that the new movement will take control immediately and change the velocity to its own velocity by using its own acceleration or deceleration.
- The buffered mode MC_Buffered could be reached with using the axis state StandStill as enable signal for the Execute of the next block.
- From the Extended Inputs and Outputs at the function blocks, the following are not realized:
  - BufferedMode: The realization just supports the MC_Aborting mode.
  - The following Outputs at ReadStatus are not supported: ConstantVelocity, Accelerating and Decelerating.
  - TorqueLimit for Homing function blocks.

MC_Aborting Mode

The diagram shows the behavior with BufferMode MC_Aborting, which is the only available BufferMode. When the second Block is activated, it will take control and will continue on its own velocity. The velocity is changed by using the acceleration value from the second function block. The movement will not be stopped in between. The first function block shows CommandAborted when the second function block is activated.

MC_Buffered

A behavior according to BufferMode MC_Buffered could be reached by using the Done output from the first function block to enable the Execute of the second function block.

1.5.10.3.9 Behavior of the function block inputs and outputs

General rules

Table 393: General rules

Output exclusivity	The outputs Busy, Done, Error, and CommandAborted are mutually exclusive: Only one of them can be TRUE on one function block. If Execute is TRUE, one of these outputs has to be TRUE. Only one of the outputs Active, Error, Done and CommandAborted is set at the same time.
Output status	The outputs Done, InGear, InSync, InVelocity, Error, ErrorID and CommandAborted are reset with the falling edge of Execute. However, the falling edge of Execute does not stop or even influence the execution of the actual function block. It must be guaranteed that the corresponding outputs are set for at least one cycle if the situation occurs, even if execute was reset before the function block completed. If an instance of a function block receives a new execute before it has finished (as a series of commands on the same instance), the function block will not return any feedback, like Done or CommandAborted, for the previous action.
Input parameters	The parameters are used with the rising edge of the execute input. To modify any parameter, it is necessary to change the input parameter(s) and to trigger the motion again.
Missing input parameters	According to IEC 61131-3, if any parameter of a function block input is missing (open) then the value from the previous invocation of this instance will be used. In the first invocation the initial value is applied.
Position versus distance	Position is a value defined within a coordinate system. Distance is a relative measure related to technical units. Distance is the difference between two positions.
Sign rules	Velocity, Acceleration, Deceleration and Jerk are always positive values. Position and Distance can be both positive and negative.
Error Handling Behavior	All function blocks have two outputs, which deal with errors that can occur while executing that function block. These outputs are defined as follow:
	Error Rising edge of Error informs that an error occurred during the execution of the function block. ErrorID: Error number

	The outputs Done, InVelocity, InGear, and InSync mean successful completion so these signals are logically exclusive to Error. Types of errors: ● Function blocks (e.g. parameters out of range, state machine violation attempted), ● Communication, ● Drive Instance errors do not always result in an axis error (bringing the axis to StandStill). The error outputs of the relevant function block are reset with falling edge of Execute.
Function block naming	In case of multiple libraries within one system (to support multiple drive/ motion control systems), the function block naming may be changed to MC_FunctionBlockName_SupplierID.
Behavior of Done output	The outputs Done, InGear, InSync... are set when the commanded action has been completed successfully. With multiple function blocks working on the same axis in a sequence, the following applies: When one movement on an axis is interrupted with another movement on the same axis without having reached the final goal, Done of the first function block will not be set.
Behavior of CommandAborted output	CommandAborted is set, when a commanded motion is interrupted by another motion command. The reset-behavior of CommandAborted is like that of Done. When CommandAborted occurs, the other output-signals such as **InVelocity** are reset.
Inputs exceeding application limits	If a function block is commanded with parameters which result in a violation of application limits, the instance of the function block generates an error. The consequences of this error for the axis are application specific and thus should be handled by the application program.
Behavior of Busy output	Every function block can have an output Busy, reflecting that the function block is not finished. Busy is SET at the rising edge of Execute and RESET when one of the outputs Done, Aborted, or Error is set. It is recommended that this function block should be kept in the active loop of the application program for at least as long as Busy is true, because the outputs may still change. For one axis, several function blocks might be busy, but only one can be active at a time. Exceptions are MC_SuperImposed and MC_Phasing, where more than one function block related to one axis can be active.
Output **Active**	The output Active is required on buffered function blocks. This output is set at the moment the function block takes control of the motion of the according axis. For un-buffered mode the outputs Active and Busy can have the same value.
Enable and Valid/Status	The input Enable is coupled to output Valid. Enable is level sensitive, and Valid shows that a valid set of outputs is available at the function block. The output Valid is TRUE as long as an output value of Valid is available and the input Enable is TRUE. The relevant output value can be refreshed as long as the input Enable is TRUE. If there is a function block error, the output is not Valid (Valid set to FALSE). When the error condition disappears, the values will reappear and output Valid will be set again.

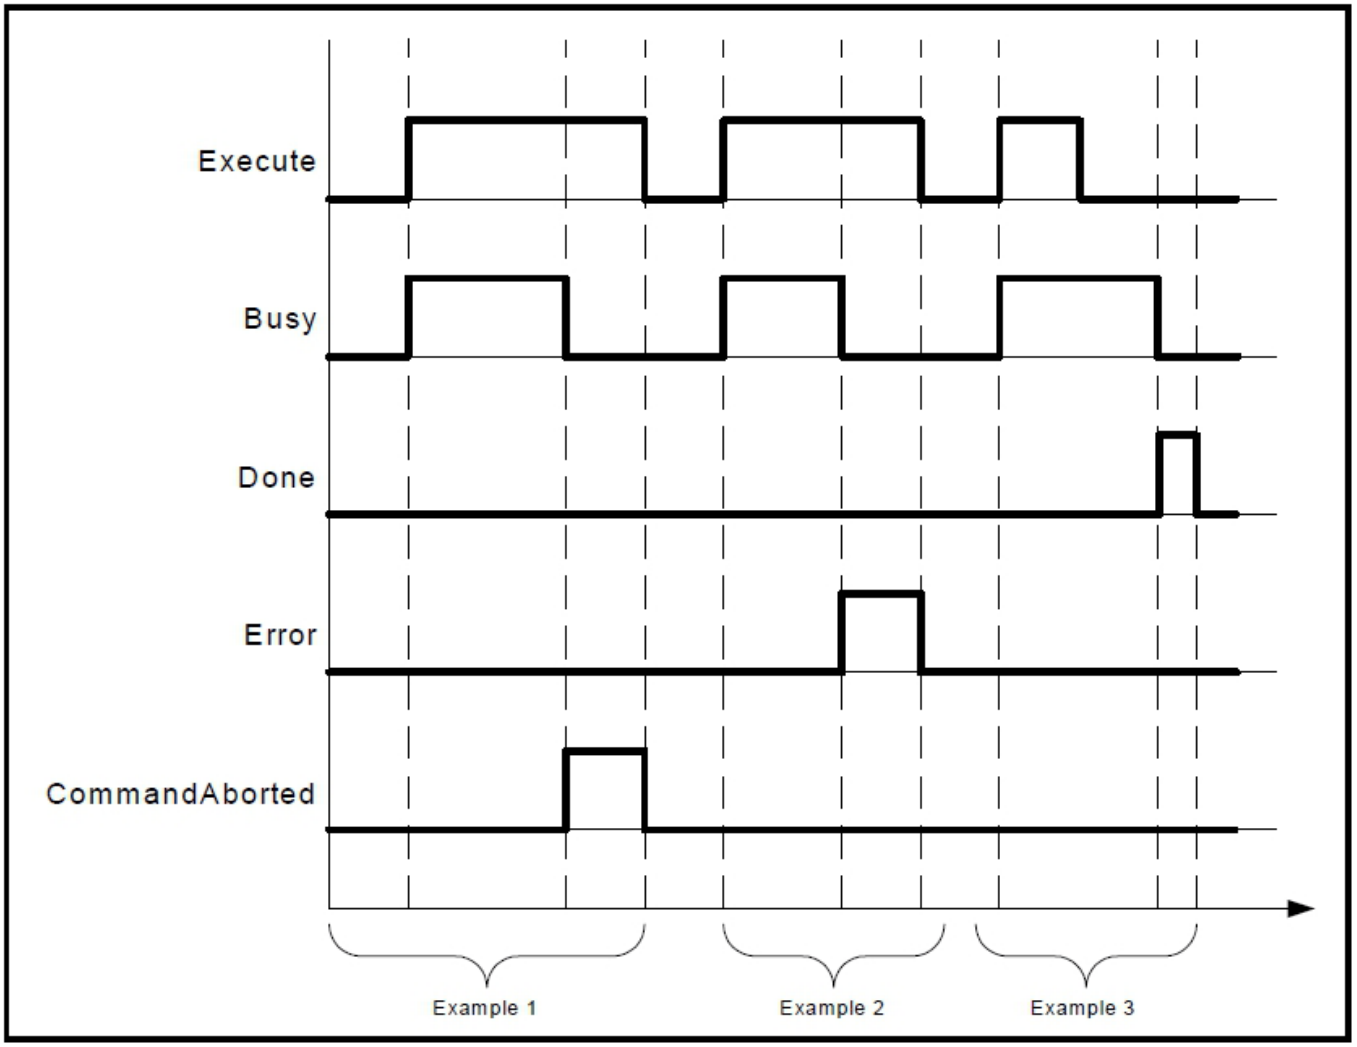

Fig. 58: Behavior of the Execute/Done style function blocks.

Why is the command input edge sensitive?

The input Execute for the different function blocks described in this document always triggers the function with its rising edge. The reason for this is that with edge triggered Execute new input values may be commanded during execution of a previous command. The advantage of this method is a precise management of the instant a motion command is performed. Combining different function blocks is then easier in both centralized and decentralized models of axis management. The output Done can be used to trigger the next part of the movement. The example given below is intended to explain the behavior of the function block execution.

The following figure illustrates the sequence of three function blocks First, Second and Third controlling the same axis. These three function blocks could be for instance various absolute or relative move commands. When First is completed the motion its rising output First.Done triggers Second.Execute. The output Second.Done AND In13 triggers the Third.Execute.

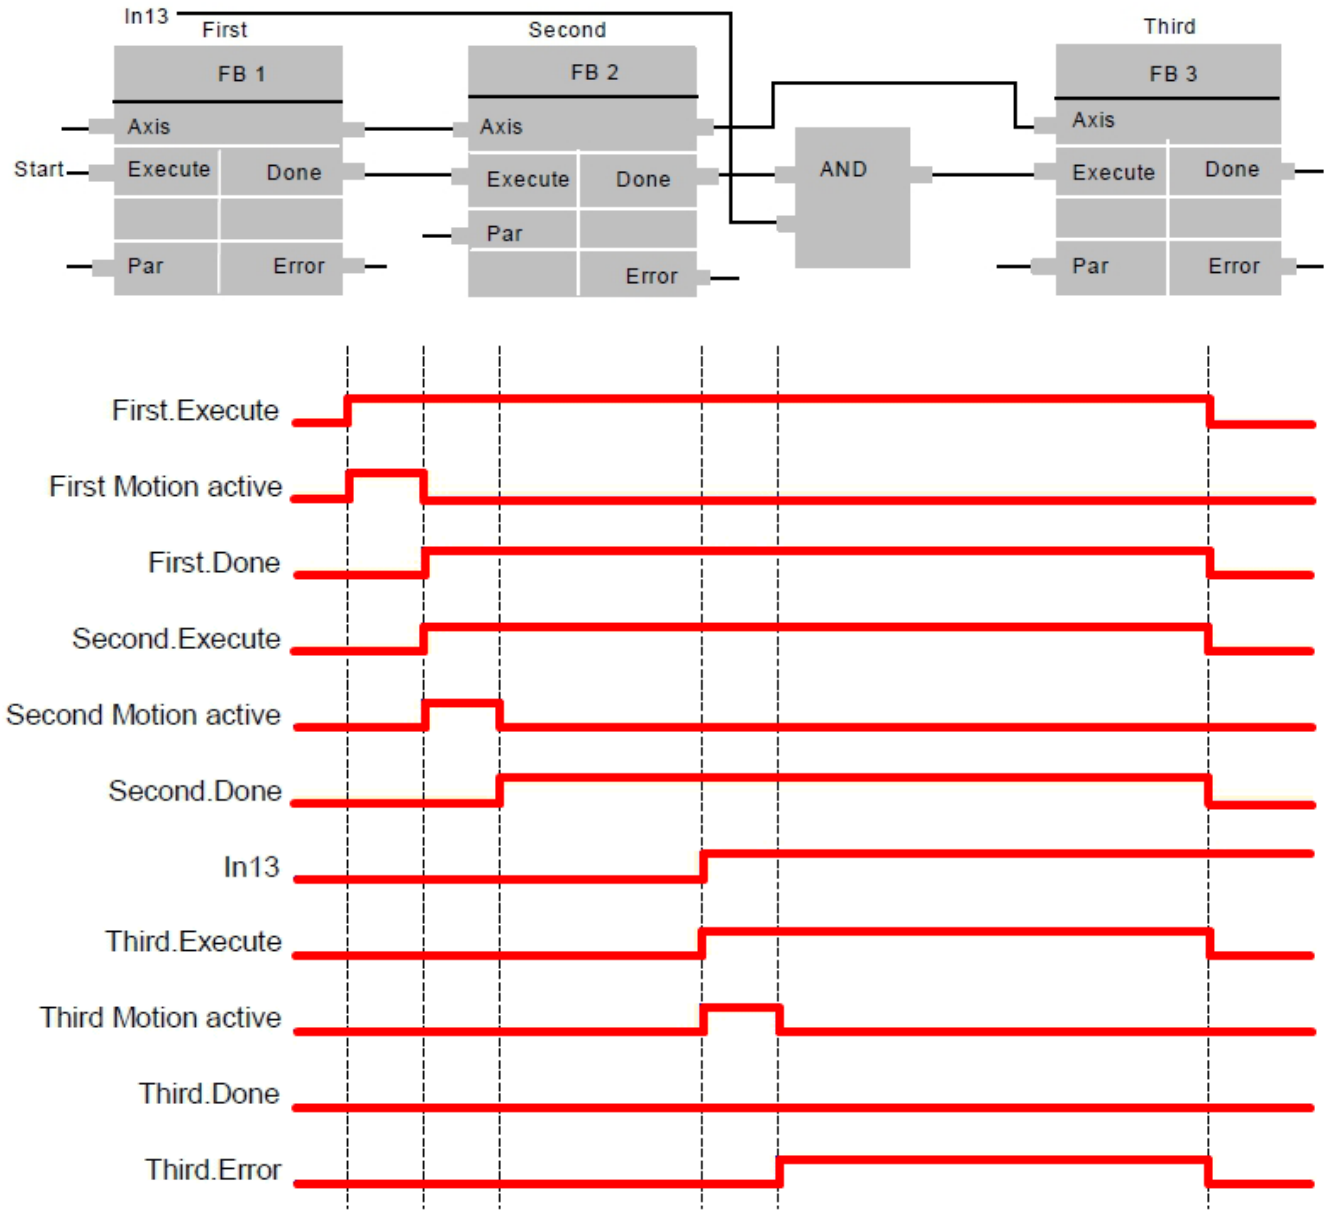

Fig. 59: Function blocks to perform a complex movement

The input ContinuousUpdate

Like described in the previous chapter, the input Execute triggers a new movement. With a rising edge of this input the values of the other function block inputs are defining the movement. Until version 1.1 of PLCopen there was the general rule that a later change in these input parameters does not affect the ongoing motion.

Nevertheless, there are numerous application examples, where a continuous change of the parameters is needed. The user could retrigger the input Execute of the function block, but this complicated the application.

Therefore, the input ContinuousUpdate has been introduced. It is an extended input to all applicable function blocks. If it is TRUE, when the function block is triggered (rising Execute), it will - as long as it stays TRUE – make the function block use the current values of the input variables and apply it to the ongoing movement. This does not influence the general behavior of the function block nor does it impact the single axis state diagram. In other words it only influences the ongoing movement and its impact ends as soon as the function block is no longer Busy or the input ContinuousUpdate is set to FALSE.

It can be that certain inputs like BufferMode are not really intended to change every cycle. However, this has to be dealt with in the application, and is not forbidden in the specification

If ContinuousUpdate is FALSE with the rising edge of the input Execute, a change in the input parameters is ignored during the whole movement and the original behavior of previous versions is applicable. The ContinuousUpdate is not a retriggering of the input Execute of the function block. A retriggering of a function block which was previously aborted, stopped, or completed, would regain control on the axis and modify its single axis state diagram. Opposite to this, the ContinuousUpdate only effects an ongoing movement. Also, a ContinuousUpdate of relative inputs (e.g. Distance in MC_MoveRelative) always refers to the initial condition (at rising edge of Execute).

Example

- MC_MoveContinuousRelative is started at Position 0 with Distance 100, Velocity 10 and ContinuousUpdate set TRUE. Execute is Set and so the movement is started to position 100.
- While the movement is executed (let the drive be at position 50), the input Distance is changed to 130, Velocity 20.
- The axis will accelerate (to the new Velocity 20) and stop at Position 130 and set the output Done and does not accept any new values.

1.5.10.3.10 Unit of length

The only specification for physical quantities is made on the unit of length (noted as [u]) that is to be coherent with its derivatives i.e. (velocity [u/s]; acceleration [u/s^2]; jerk [u/s^3]). Nevertheless, the unit [u] is not specified (manufacturer dependent). Only its relations with others are specified.

1.5.10.3.11 Aborting versus buffered modes

Some of the function blocks have an input called BufferMode. With this input, the function block can either work in a Non-buffered mode (default behavior) or in a Buffered mode. The difference between those modes is when they should start their action:

- A command in a non-buffered mode acts immediately, even if this interrupts another motion,
- A command in a buffered mode waits till the current function block sets its output Done (or InPosition, InVelocity...).
- The library just supports the mode "aborting" (MCAborting)

The following examples describe the different behavior of these modes:

Example 1: Standard behavior of two following absolute movements

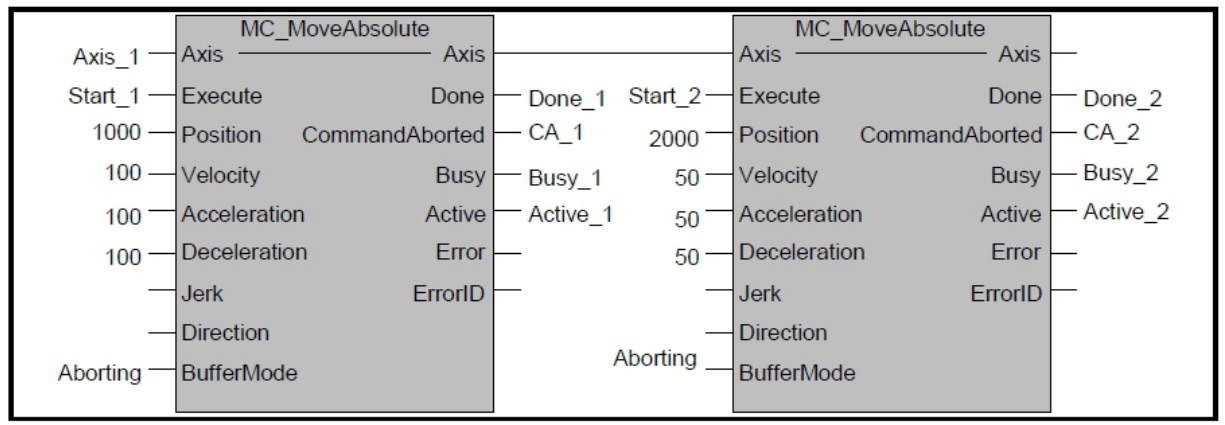

Fig. 60: Basic example with two MC_MoveAbsolute on same axis

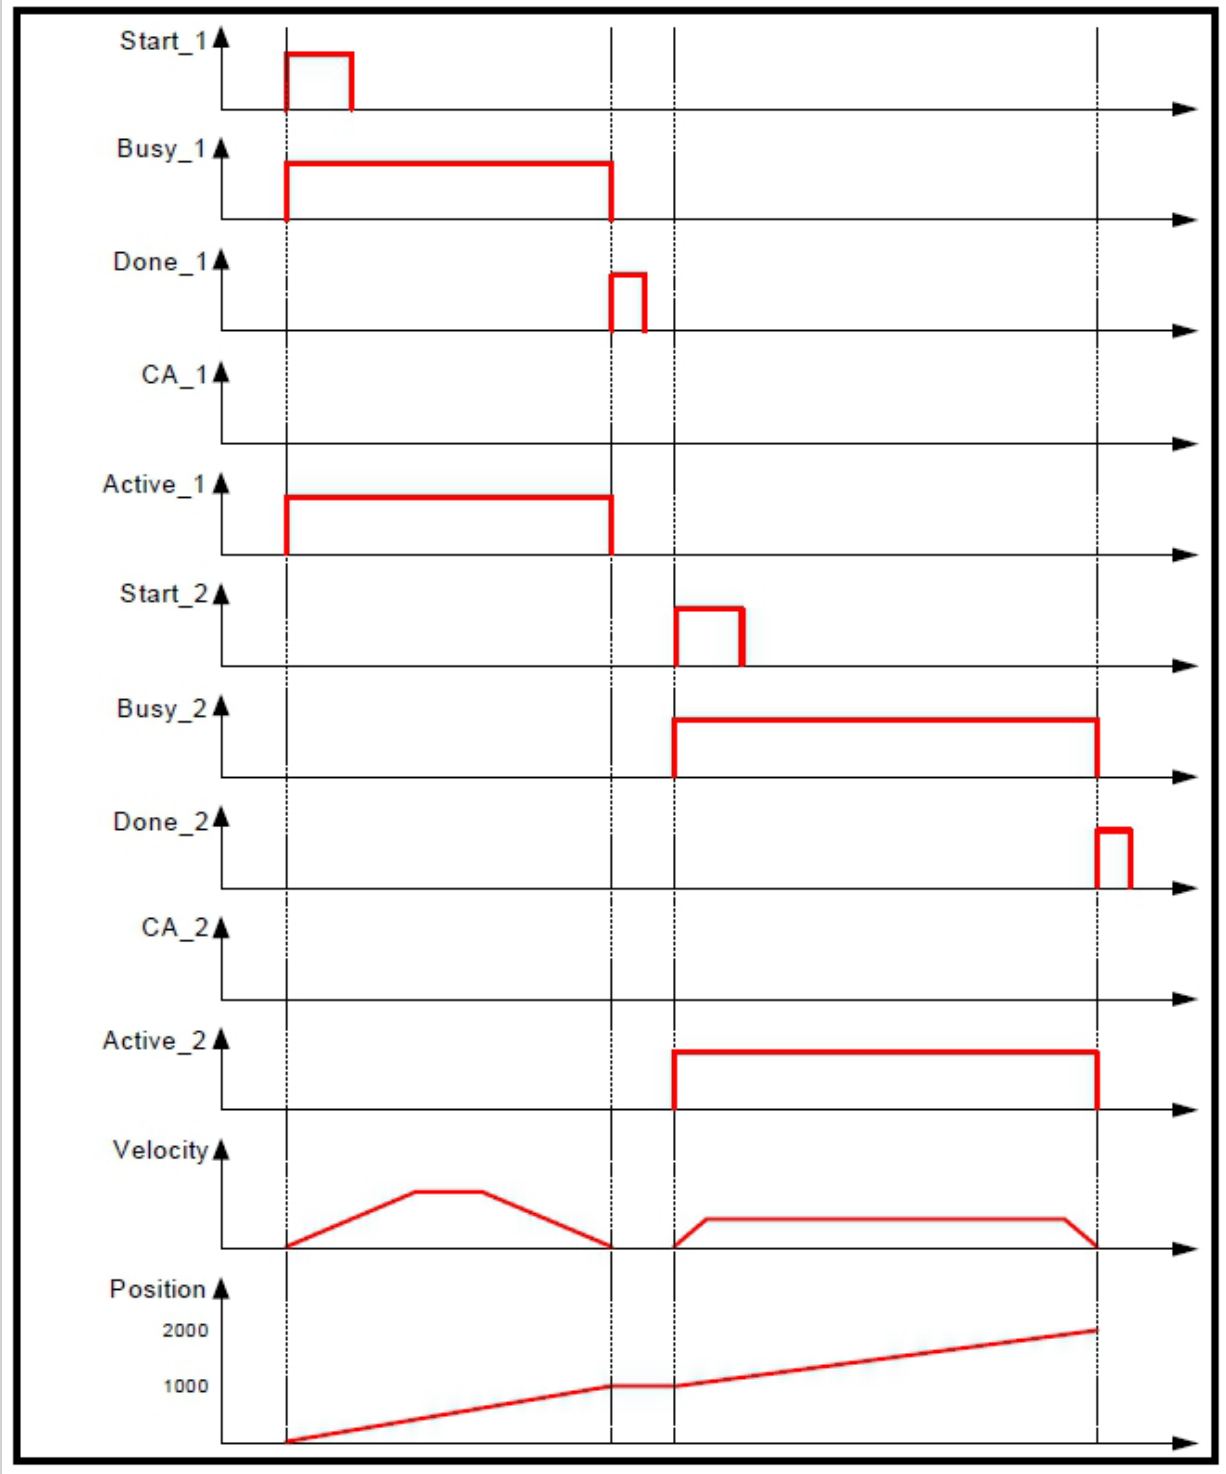

Fig. 61: Timing diagram for example above without interference between function block 1 and function block 2

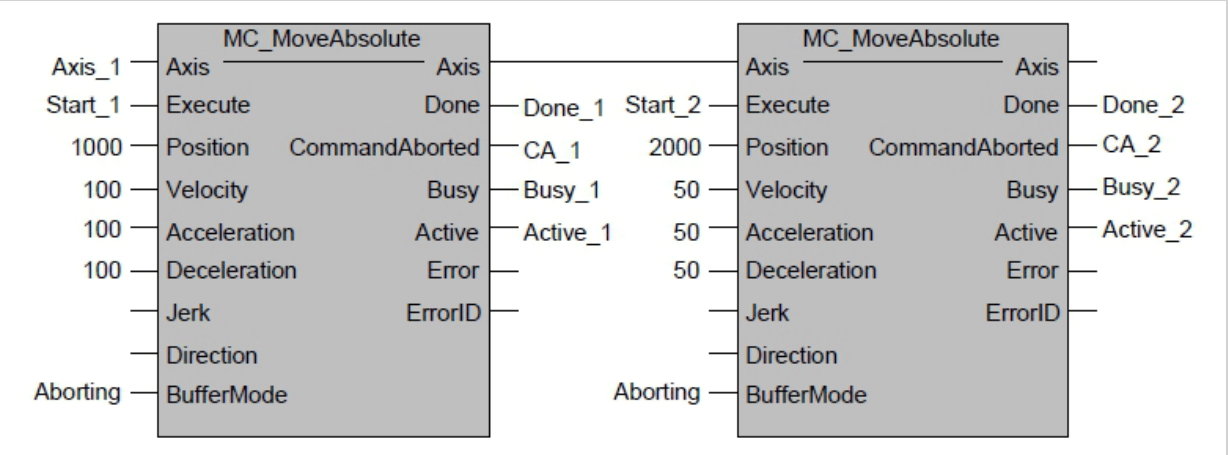
Example 2: Aborting motion



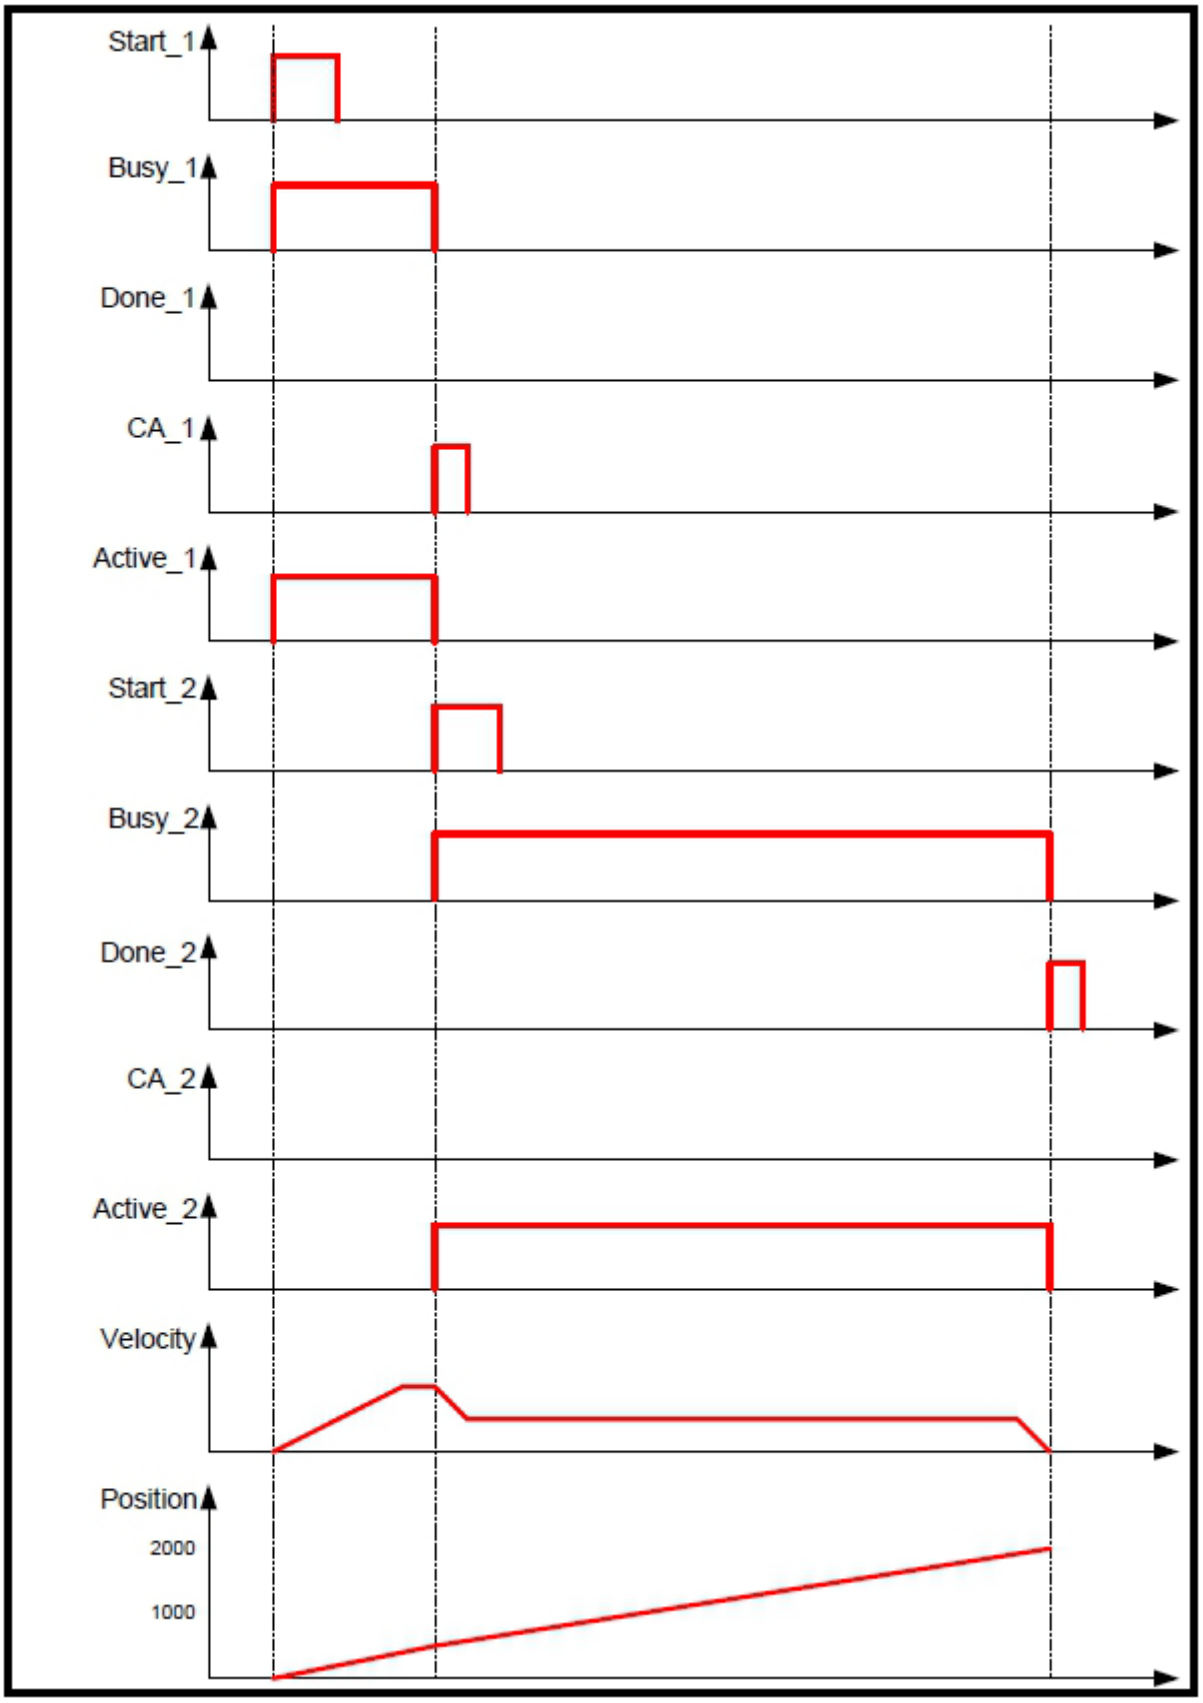


Fig. 62: Timing diagram for example above with function block 2 interrupting function block 1 (McAborting Mode)

If an on-going motion is aborted by another movement, it can occur that the braking distance is not sufficient due to deceleration limits.

In rotary axis, a modulo can be added. A modulo axis could go to the earliest repetition of the absolute position specified, in cases where the axis should not change direction and reverse to attain the target position.

In linear systems, the resulting overshoot can be resolved by reversing, as each position is unique and therefore there is no need to add a modulo to reach the correct position..

1.5.10.3.12 PLCopen examples

Example: A function block instance controls different motions of an axis

The following figure shows an example where the function block (MC_MoveVelocity) is used to control AxisX with three different values of Velocity. In a Sequential Function Chart (SFC) the velocity 10, 20, and 0 is assigned to V. To trigger the input Execute with a rising edge the variable E is stepwise set and reset.

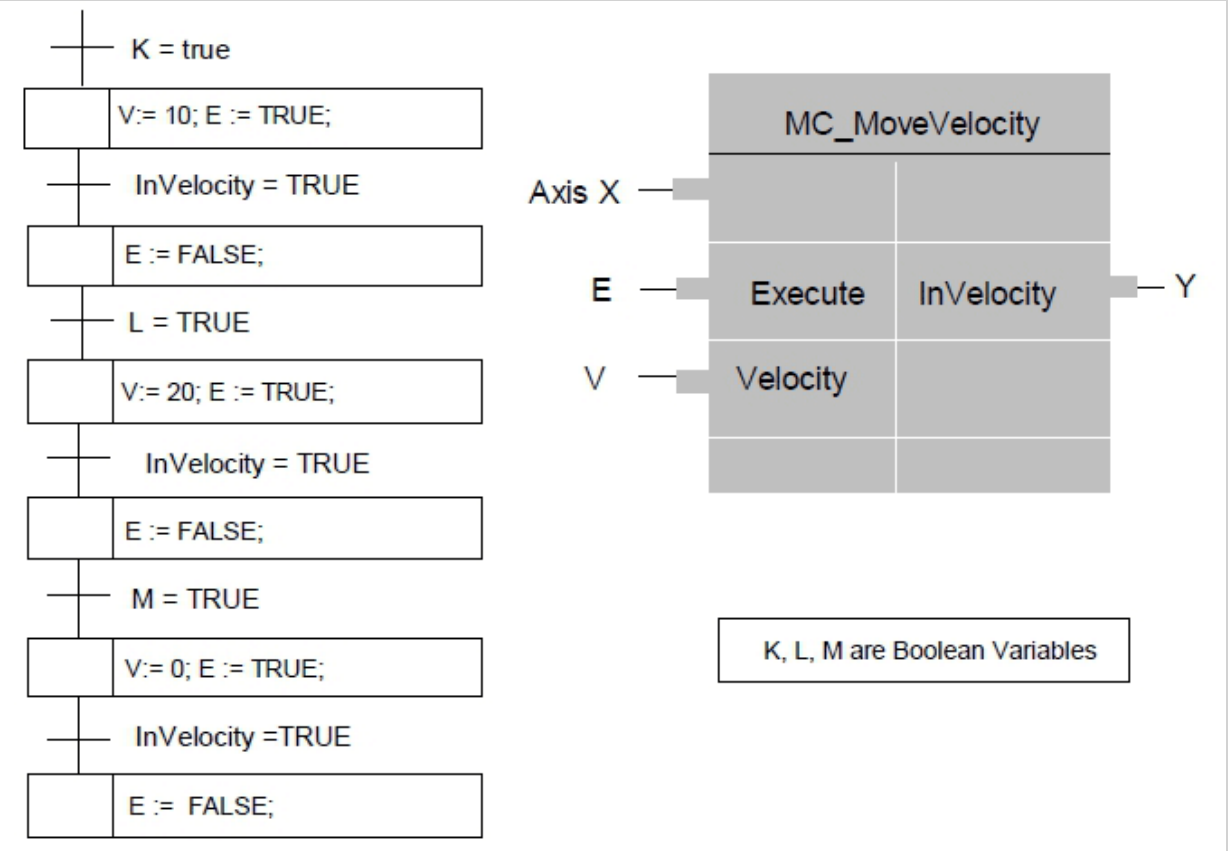

Fig. 63: Single function block with SFC

The following timing diagram explains how it works:

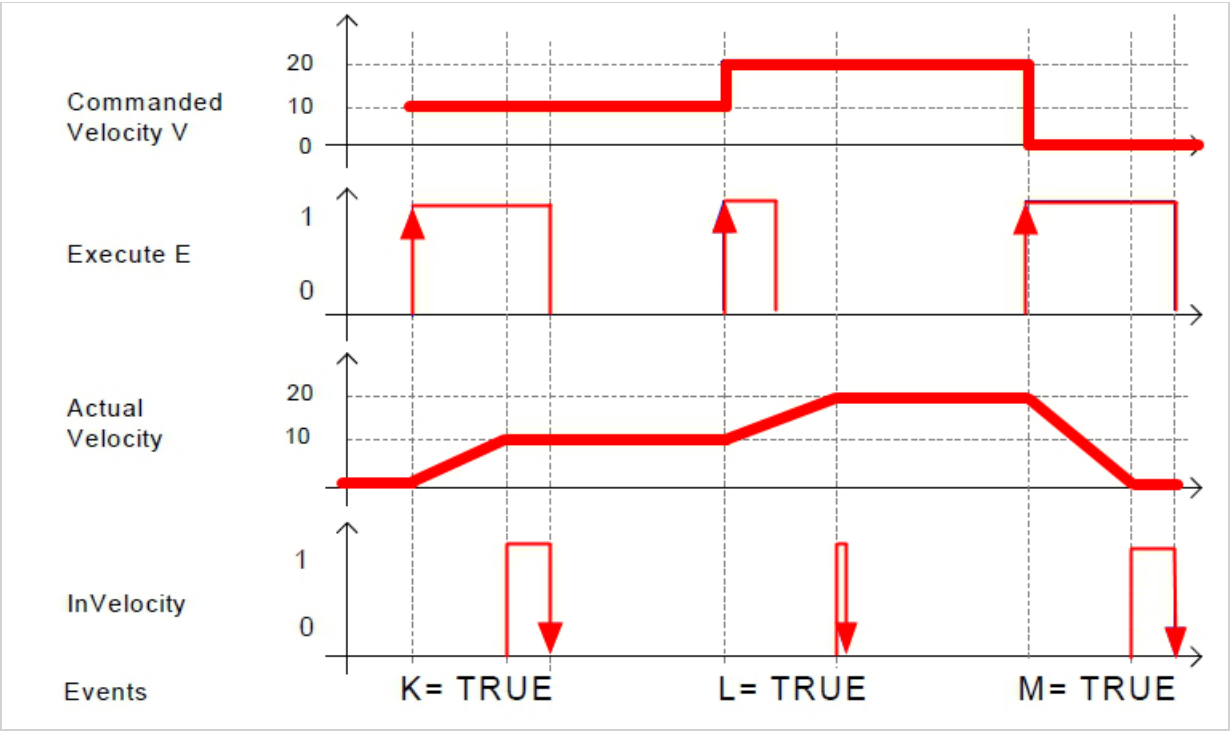

Fig. 64: Timing diagram for a usage of single function block

The second InVelocity is set for only one cycle because the Execute has gone low before the ActualVelocity equals CommandedVelocity.

Example: Different function blocks instances control the motions of an axis

Different instances related to the same axis can control the motions on an axis. Each instance will then be responsible for one part of the global profile.

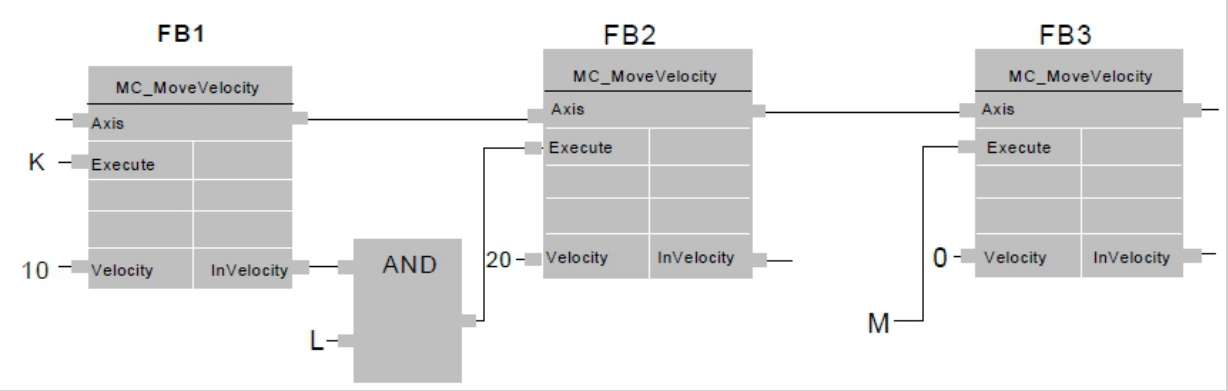

Fig. 65: Cascaded function blocks

The timing diagram:

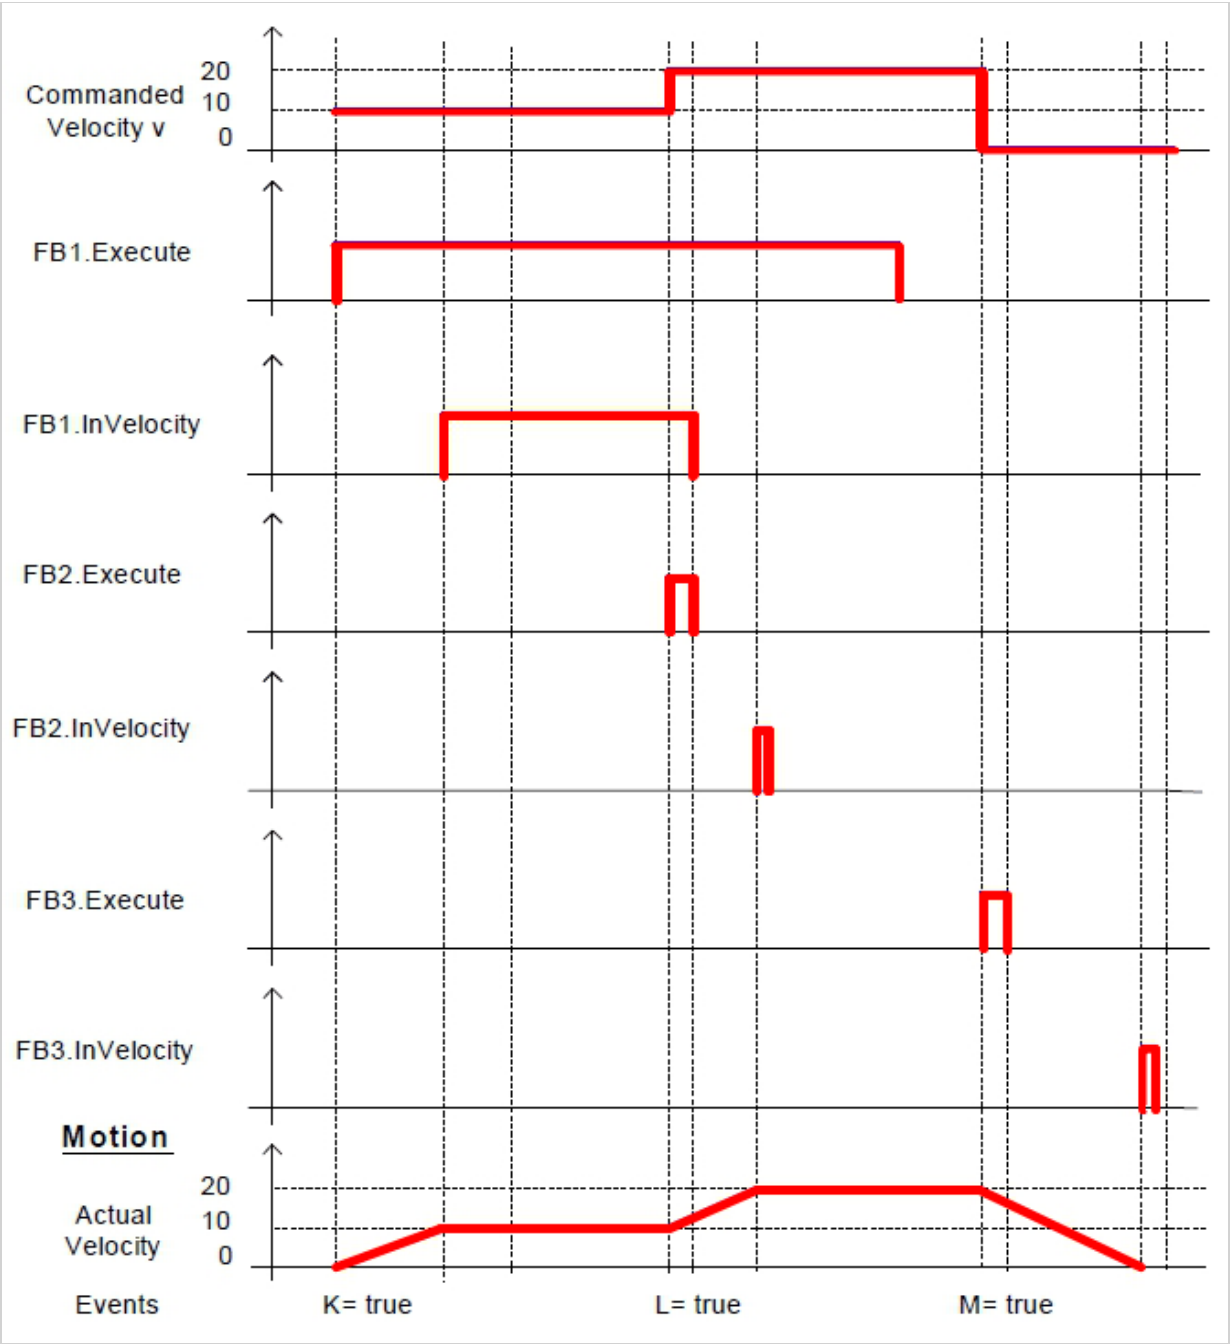

Fig. 66: Cascaded function blocks timing diagram

A corresponding solution written in LD looks like:

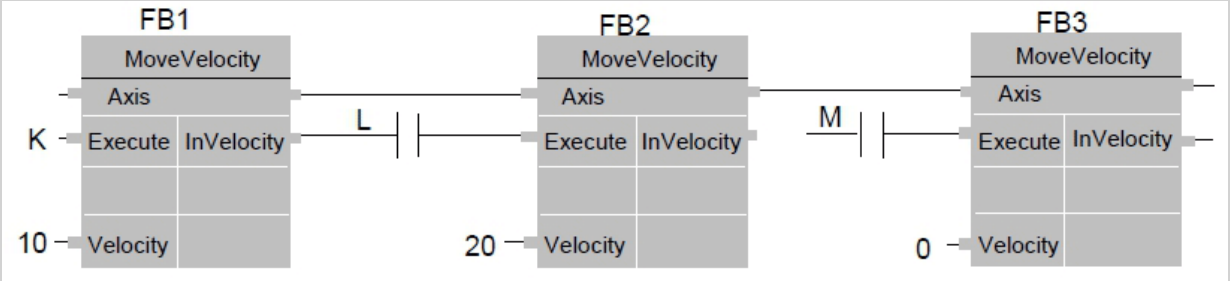

Fig. 67: Cascaded function blocks with LD

1.5.10.4 PLC-based motion control

1.5.10.4.1 PLC-based motion control architecture

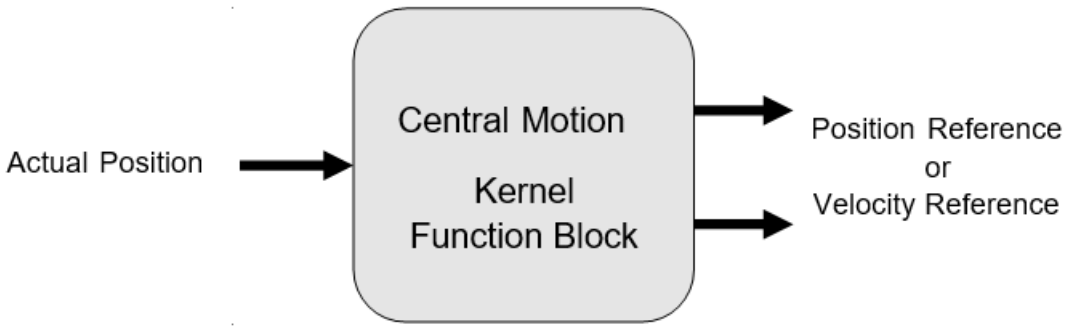
With PS5611-Motion different motion control system structures are possible. Independent of the system structure a typical motion control application consists of the following system elements:

- An application program which contains PLCopen function blocks that defines the general application behavior and logics.
- A profile generator which generates a position profile based on the dynamic specifications of the application program to guide the axis to the desired positions.
- A position control loop which outputs a speed reference signal to minimize the following error.

To achieve the best system structure for an application these components can be separated into different devices. Each type of structure has its own kind of interface and type of signals which need to be transferred between the interacting devices.

> *All shown motion control system structures (Central motion control with or without position control loop) can be combined together in the same application program for a motion control project.*

With the function blocks of motion library a motion control profiler can be used inside the PLC. As shown in the following figure it is needed to provide the actual position of the drive. The output can be either a position or a velocity reference signal. The used output signal will then be used to move the axis in the desired way.



There are 2 possibilities to send a reference value to the drive:

- When the position control loop is closed by the PLC by a CMC_Basic_Kernel function block, the output Speed_Reference should be connected to the drive. The value of Speed_Reference can be scaled with the axis parameters Max_Rpm and Ref_Max.
- When the position control loop is closed by the drive, the output Position_Reference should be connected to the drive. The unit for the output Position_Reference is incremented as well as the input Drive_ActualPosition.

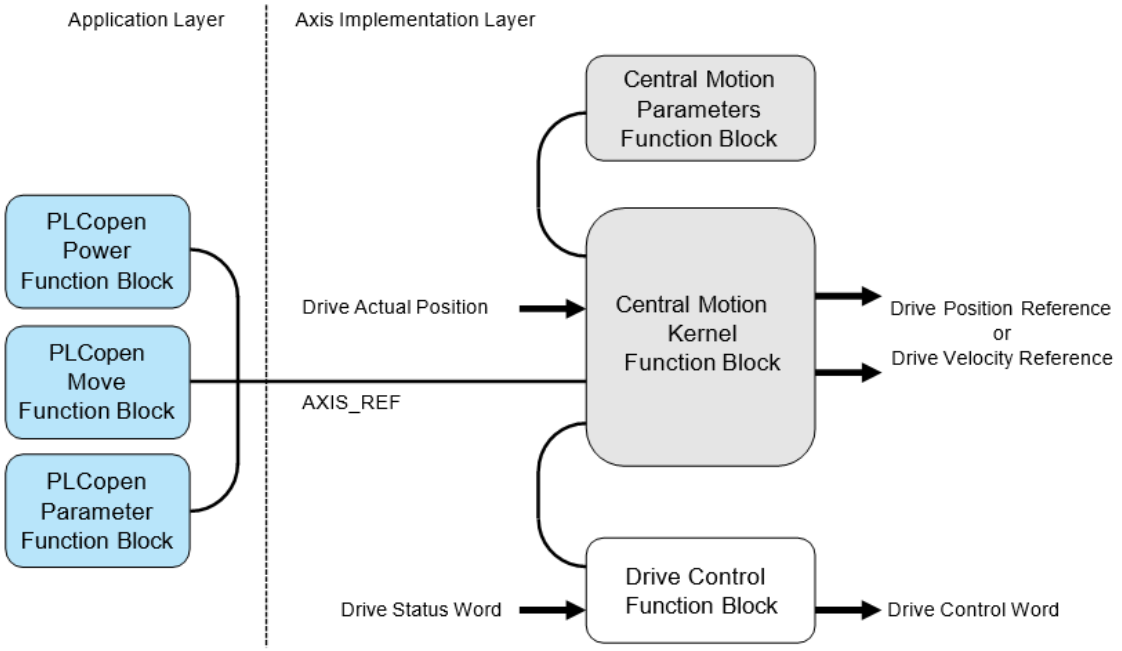


Fig. 68: Architecture for centralized motion control

In general the programming of a machine consists of two layers as shown in the figure above.

In the application layer function blocks according to PLCopen motion control are used to program the application sequences with all necessary types of movements and administrational commands. Due to the standard PLCopen motion control this can be reused in any other machine programs that used PLCopen function blocks.

The axis implementation layer is responsible for the execution of the commands from the application layer and can be programmed for each axis in a different way depending on the used hardware components.

Table 394: Needed function blocks for an application with PLC-based Motion Control

Library	Content
ABB_MotionControl_AC500.library	Kernel function block, Parameters function block, Axis Simulation function block
	Data types for AC500 Motion Control
	Motion Control function blocks according to PLCopen

For a central motion axis implementation the use of the function blocks CMC_Basic_Kernel and CMC_Axis_Control_Parameter are mandatory.

The library design is independent from any bus architecture or any specific drive features.

Example for a possible system architecture

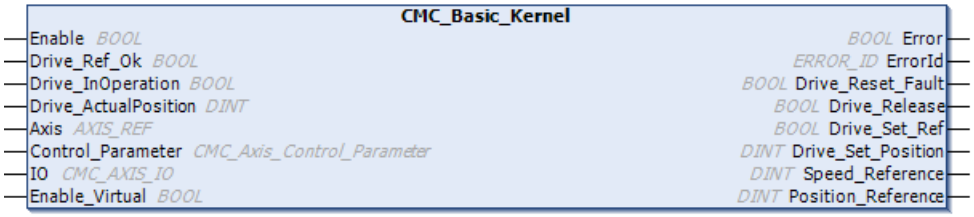
System	Velocity reference	Position feedback
System A	Output via analog output channel as voltage or current	From incremental encoder connected to CD522 I/O module
System B	Output via EtherCAT network	Input via EtherCAT network
System C	Output as frequency signal of CD522 I/O module	From incremental encoder connected to CD522 I/O module
System D	Output via PROFINET IO network	Input via PROFINET IO network
System E	Output via PTO & PWM channel in eCo V3	Input via either encoder (included in onboard IO), or the PTO or PWM pulse count.

In case the velocity reference value is used from the kernel function block the position control loop is closed inside the drive. In this case, it is necessary to adjust the related parameters from the parameters function block. When the position reference will be used the position control loop is closed inside the drive. In this case, the internal control loop is just used to monitor the position and velocity.

When the position reference is used for the drive the following aspects have to be taken care of:

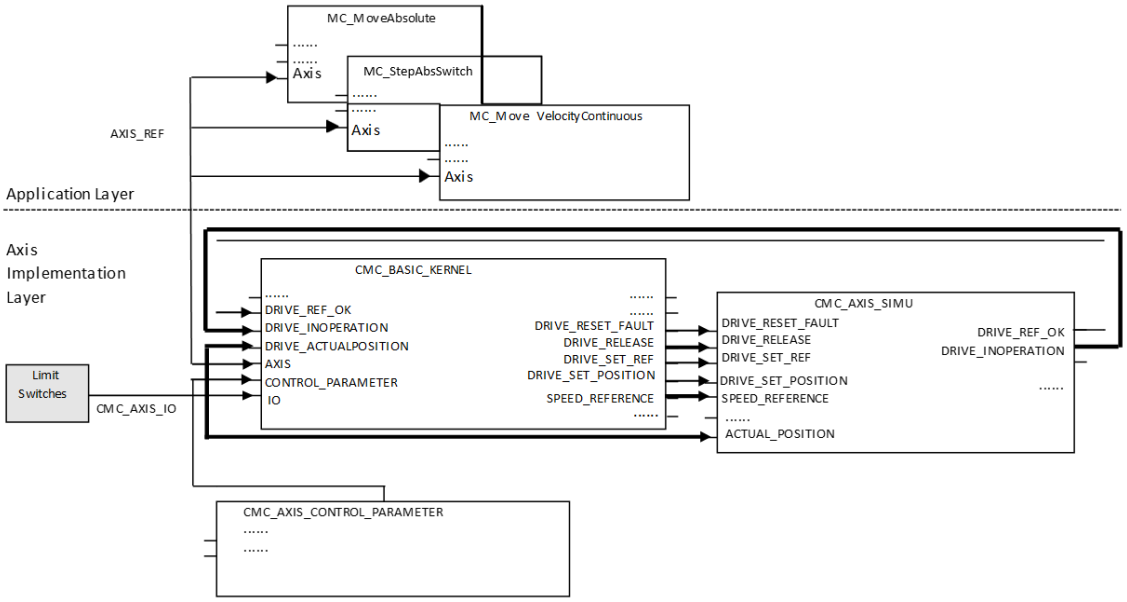
- *It is necessary to use a real time fieldbus, like EtherCAT.*
- *The PLC cycle has to be synchronized to the fieldbus cycle.*
- *The task calculation times may not exceed the used cycle time.*

The drive's status should be managed by a specialized function block that supports the used type of drive as shown in the figure above. The kernel function block is the main function block which is needed to operate an axis with PLC-based Motion Control. It must be used with the parameter function block which is the interface to input parameters which are used to setup the axis.

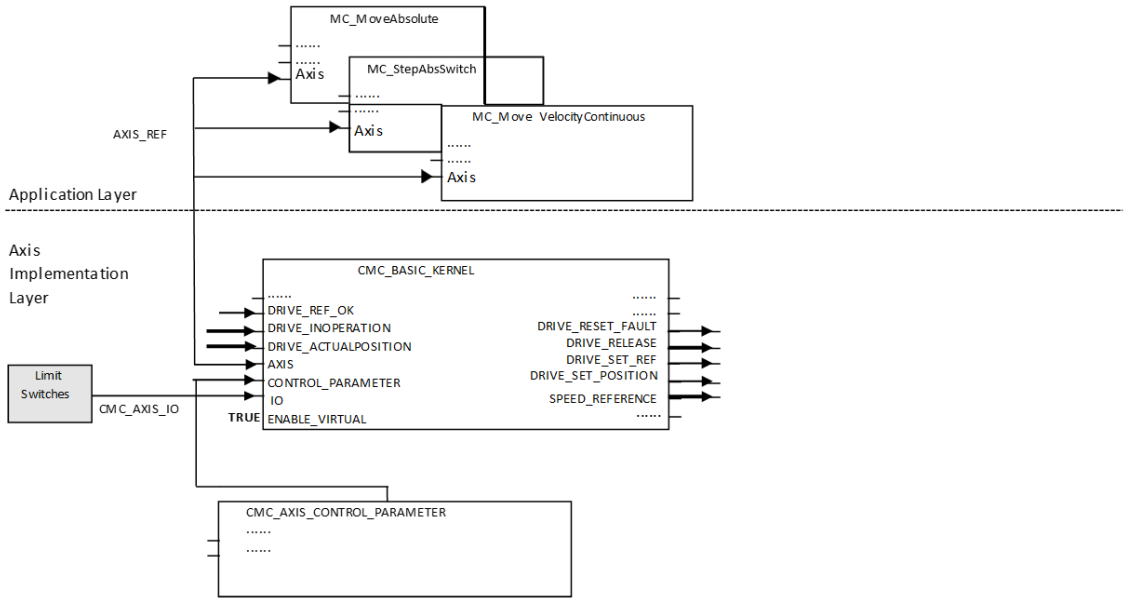


The drive has to be accessed outside the CMC_Basic_Kernel function block. Actual values and reference values might be transferred by a synchronized fieldbus or by I/Os. The function block CMC_Basic_Kernel has to be called every cycle and at least once before any function block MC or MCA is activated.

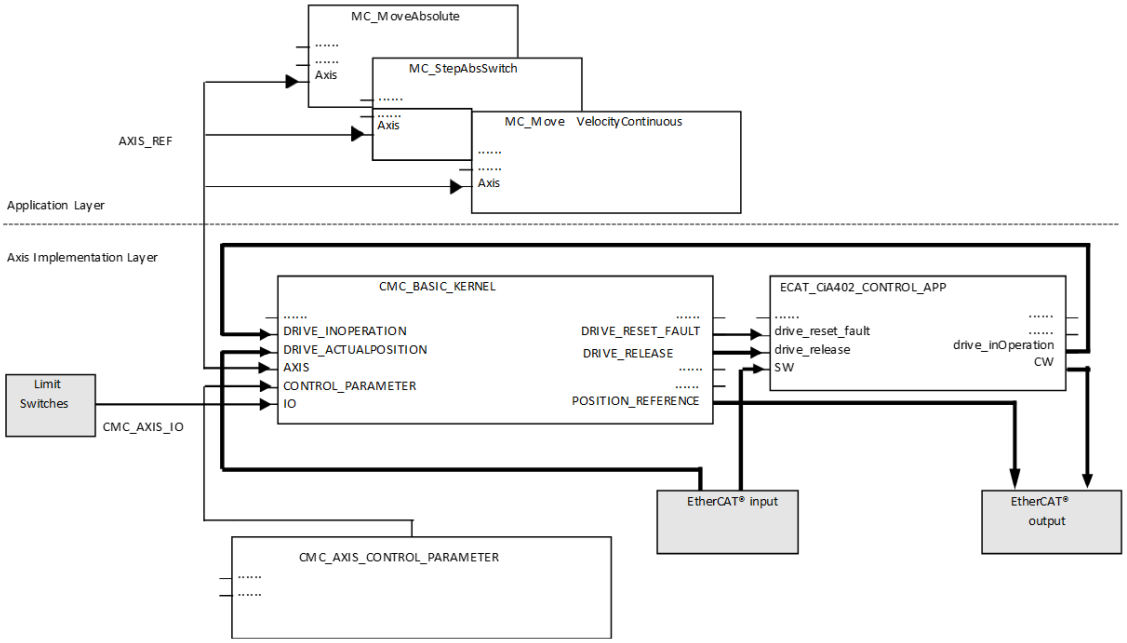
The following figure shows an example with an axis simulation. The main data signals are drawn in bold lines. Here, the drive will receive a speed reference signal which means that the position control loop is closed inside the PLC by the Central Motion function blocks. The time behavior of the simulated drive can be set by the parameter T1 at the axis simulation function block. If the time constant is to slow and the axis parameter Control_Time is too short the simulation axis will run into instability – like a real drive. Sample values: ↳ *Chapter 1.5.10.4.2.3 "How to use the axis simulation" on page 2337*



A different option to create a virtual or simulated axis is to engage the Enable_Virtual input at CMC_Basic_Kernel. This virtual axis will follow the speed reference without additional delay, whereas the CMC_Axis_Simu creates a first order delay.



The following figure shows an example with a CiA402 drive on an EtherCAT network. The main data signals are drawn in bold lines. Here, the drive will receive a position reference signal which means that the position control loop is closed inside the drive.



In the example the main signals are to be transferred via EtherCAT network. The drive control function block for the Microflex e190 can be found in the ABB_Ecat_CiA402_AC500.library.

If using the eCo V3 PLCs, use the OBIO_PTOMotionKernel function block (separate library ABB_MotionControlEco_AC500.library) instead of CMC_Basic_Kernel for the PTO functionality.

In the eCo V3 PLC, if PWM is used in the configuration, use the kernel function block OBIO_PWMMotionKernel function block instead of CMC_Basic_Kernel function block.

Kernel function block

Kernel Arithmetic

The “KERNEL” function blocks are available in two variants.

The OBIO_PTOMotionKernel / OBIO_PWMMotionKernel function blocks are solely to be used in eCo V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs. Use the PTO or PWM specific kernel block based on your configuration ↳ *Chapter 1.6.3.3.1.1.7.2 “Functionality” on page 2451*.

The CMC_Basic_Kernel block is designed to be used in any V3 PLCs and can either work with drives connected to a fieldbus or IOs.

Topic	OBIO_PTOMotion-Kernel/ OBIO_PWMMotion-Kernel	CMC_Basic_Kernel
Recommended PLC	eCo V3 PLC	All V3 PLC`s

How does the parameter for jerk influence the axis movements

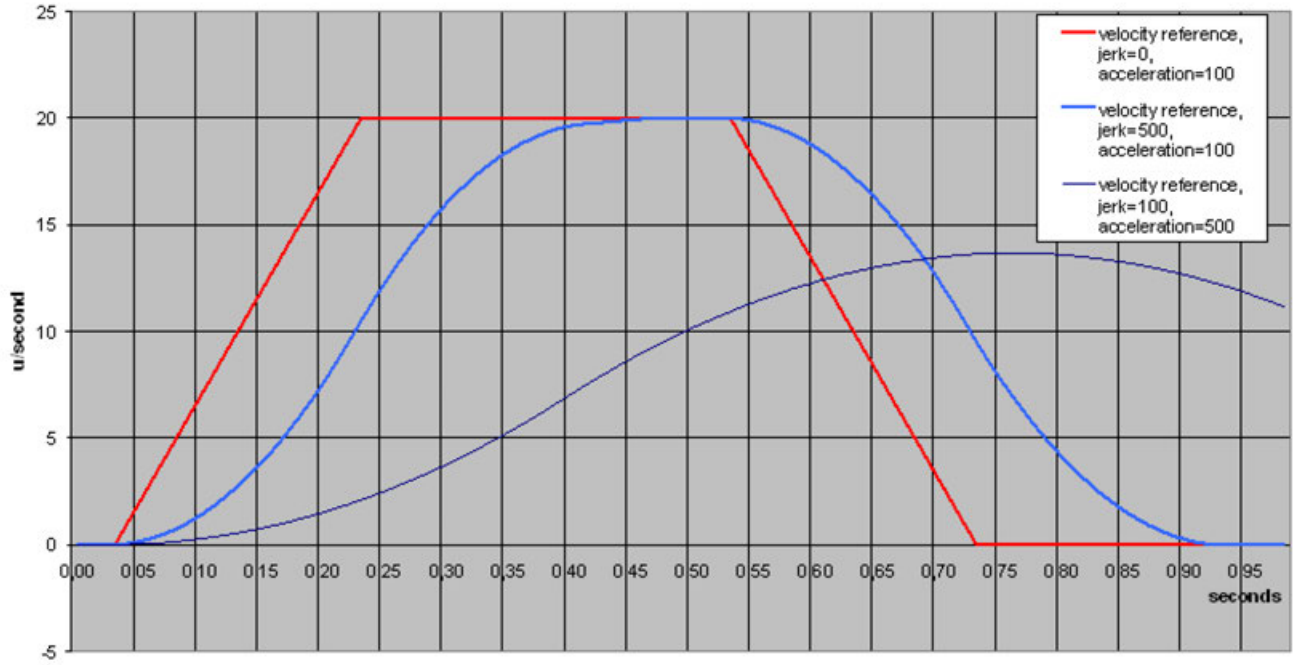


Fig. 69: Velocity reference with different jerk values

The diagram shows the result with different jerk values and the same velocity and acceleration. The time needed for acceleration with jerk=0 is:

Time1=velocity/acceleration=(20/100)s=0.2s

The additional time with jerk=500 will be:

Time2=acceleration/jerk=(500/100)s = 5s

So the total time is:

Time=Time1 + Time2=0.2s + 5s=5.2s

In the last example with jerk=100, the velocity and acceleration values are not reached.

1.5.10.4.2 Basic functionalities

How to connect a drive

The connection to a drive must be done with the inputs and outputs of the function block CMC_Basic_Kernel. All inputs and outputs of the kernel function block with the prefix “Drive_” are intended to be used with a drive, but in some cases not all of them are needed. In all cases the input Drive_ActualPosition has to be connected with the actual position of the axis. This value can be received by an I/O module of the PLC or via a fieldbus.

Depending on which device closes the position control loop either the output Speed_Reference or Position_Reference output has to be used. The value of Speed_Reference can be connected to an analog output module or be transferred via a fieldbus. The value of Position_Reference should be exclusively sent via a real-time fieldbus like EtherCAT.

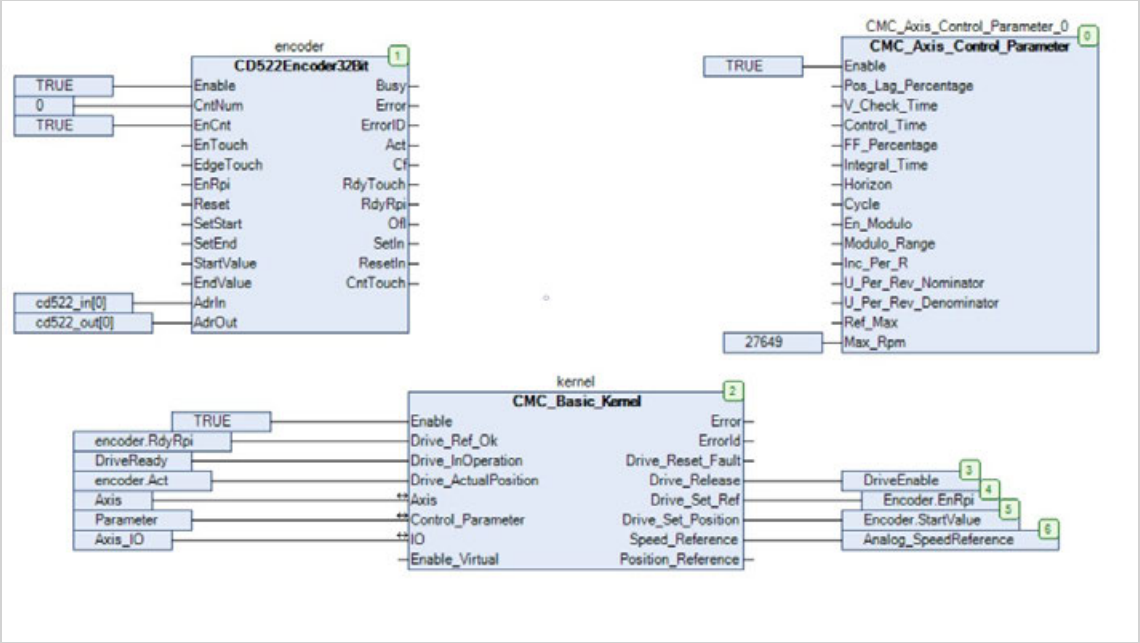
Example 1: Analog drive - Motor with incremental encoder

In the example the position control loop will be closed by the PLC, therefore the input Drive_ActualPosition and the output Speed_Reference are to be used.

In combination with the I/O module CD522 and the corresponding function block CD522Encoder32Bit the position of the encoder can be used. For the effective resolution of the encoder parameter Inc_Per_R of the parameter function block has to be used.

The output Speed_Reference can be written directly to the global variable of an output channel of an analog module but can also be transferred via a fieldbus. The scaling of this output value can be done with the parameters Ref_Max and Max_Rpm of the function block CMC_Axis_Control_Paramter_Real.

The scaling of the Speed_Reference value can be set with the inputs Ref_Max and Max_Rpm of the parameter function block.



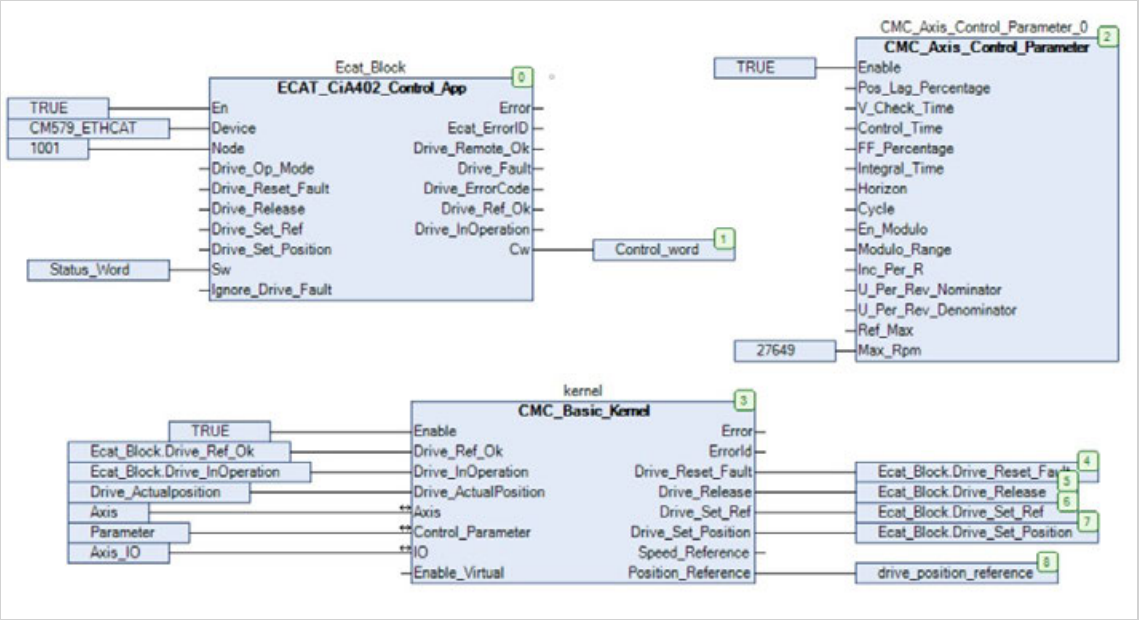
In order to finish a homing sequence which is done by the function block MC_StepRefPulse the outputs Drive_Set_Ref and Drive_Set_Position from the kernel function block have to be connected with the inputs EN_RPI and START_VALUE of the CD552 I/O module function block. Also the output RdyRpi of the CD552 I/O module function block has to be connected with Drive_Ref_Ok from the kernel function block.

To enable and disable the drive Drive_Release could be connected to a binary output to activate the drive. Drive_InOperation could be connected to a binary input to get the information that Drive_Release was successful.

Example 2: Servo Drive - Microflex e190 via EtherCAT in continuous positioning mode (csp)

In the example the position control loop will be closed by the drive, therefore the input Drive_ActualPosition and the output Position_Reference are to be used. The inputs referring to the position control loop of the parameter function block do not have to be set.

For the effective resolution of the motor's encoder parameter Inc_Per_R of the parameter function block has to be adjusted.



To enable and disable the drive Drive_Release and Drive_Inoperation have to be connected to the control function block ECAT_CiA402_Control_App of the library ABB_Ecat_CiA402_AC500.library, which controls the status and control word of the drive.

All function blocks from this library are not password protected and free to be changed in order to be adapted for different drives. The library and the function blocks are marked with the ending _APP.

How to enable and disable a drive

In order to enable a drive the function block MC_Power has to be used within the applicational layer. The kernel function block will then, if possible, output a rising edge on the output Drive_Release which can be connected to the drive-control function block which performs the needed actions on the drives control word to enable the drive. As soon the drive states enabled, this signal can be connected to the input Drive_In_Operation of the kernel function block. The axis state according to the single axis state diagram of PLCopen will then switch from Disabled to Standstill.

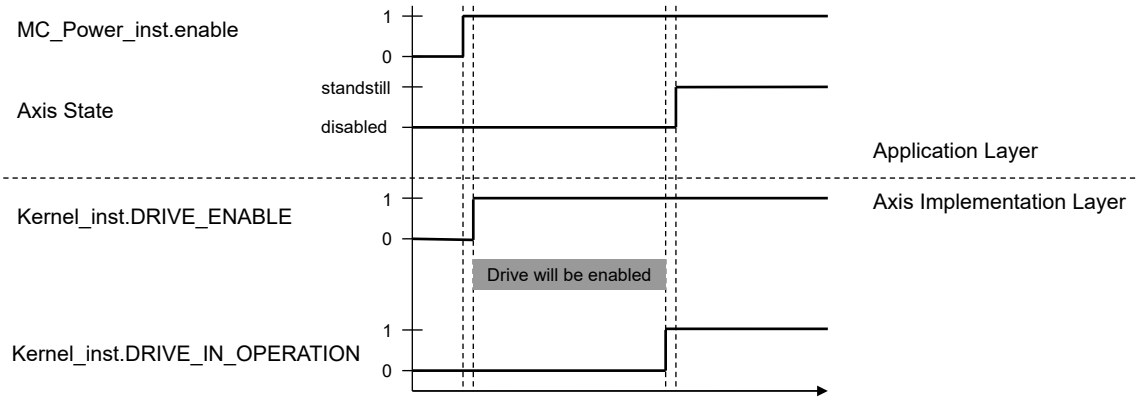


Fig. 70: Enabling sequence of a drive

As long as the drive is in state Disabled or ErrorStop the input Drive_Actual_Position will be copied to the output Position_Reference of the kernel function block. The output Speed_Reference will be zero.

When the axis is in operation, which means it is not in state Disabled or ErrorStop, then the output Position_Reference will be calculated by the kernel function block and the position control loop will be closed, which outputs non zero value for the output Speed_Reference in case of a following error. The input Actual_Position should then follow the position reference. The difference of both values is the following error and will be supervised by the kernel function block.

In case of drive problem, Drive_InOperation should be reset. The function block will open the position control loop and Speed_Reference will be set to zero.

For the most drives the status is control by the drives control word whereas the drives status word represents its actual status. In order to enable the drive it might be necessary to pass through several drives states according a defined scheme which depends on the used drive. Therefore the library ABB_Ecat_CiA402_AC500.library is added to PS5611-Motion package which contains function blocks to operate with different drives on an EtherCAT network. There is also the PS5605-DRIVES library package which can be used to control the state of other ABB drives and other protocols.

How to use the axis simulation

It is possible to use a simulated axis instead of a real drive.

The axis simulation can be used in the following use cases:

- When the real drive is not available the simulation can be used to test all available motion functionalities to verify the application program.
- The simulation can be used to create a virtual master axis and synchronize other axes to it.

The simulation is realized by the function block CMC_Axis_Simu or input Enable_Virtual = TRUE can be used at the KERNEL-block.

Homing will be possible if the limit-switches (data type CMC_Axis_IO) are simulated also. This is not done by CMC_Axis_Simu but could be realized in the PLC program.

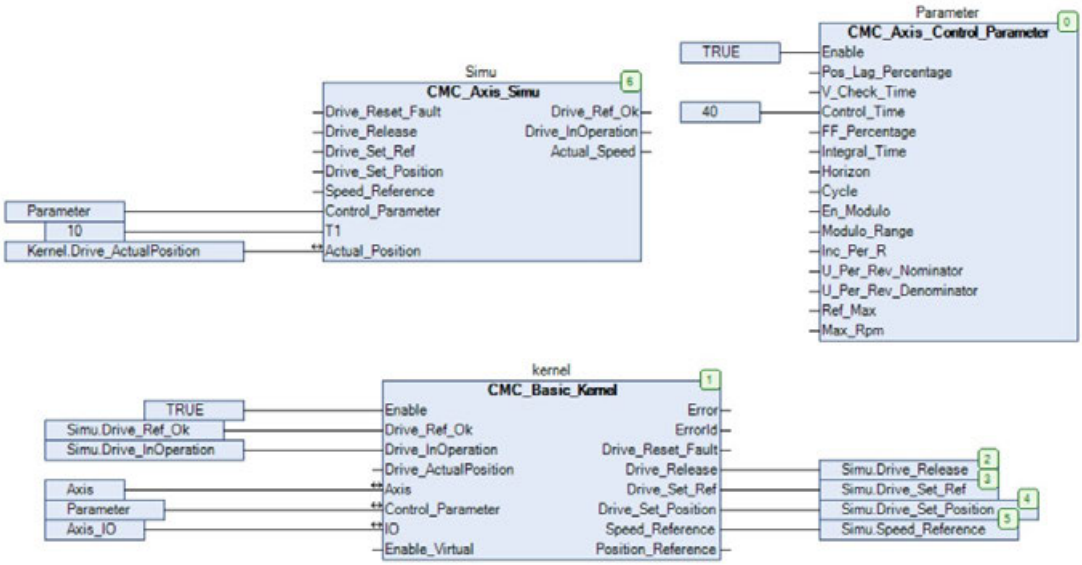

Fig. 71: Example for Simulation

The drive velocity is simulated by PT1-Characteristic. The input T1 gives the time constant for this PT1 as multiple of the cycle time. All other properties are simulated according to the CMC_Axis_Control_Parameter.

The value of the time behavior from the axis simulation function block set by the input T1 has to be at least four times smaller than the value of the axis parameter Control_Time from the parameter function block. If Enable_Virtual = TRUE is used, no delay will be applied to the simulated drive speed, and it will not be possible to test the position-control loop, but it will be fine to be used as virtual axis.

How to perform a homing

The homing of an axis is a procedure which consists of up to two phases. For each phase there are different function blocks available. The available function blocks are according to PLCopen and belong to the application layer.

Table 395: Overview of the available homing function blocks

	Phase 1	Phase 2/Finish Homing
MC_StepAbsSwitch	X	
MC_StepDirect		X
MC_StepLimitSwitch	X	
MC_StepRefPulse		X

In order to create a complete homing sequence one function block of each phase can be used.

First phase

The used function blocks will change the axis state to Homing and will move the axis to approach installed limit switches or a dedicated absolute switch in the desired directions. No manipulation of a position value will be done in this phase. The use of function blocks of this phase is optional for a homing.

The signals of the installed limit switches have to be written to a variable of the data type CMC_Axis_IO.

Second phase

Function blocks from this phase will also change the axis state to Homing if this has not already happen and will finish the homing. Therefore a new position will be set to the axis. The axis state will then switch back to Standstill.

The use of a function block of the second phase is mandatory for a homing.

In general with AC500 PLC-based Motion Control there are two position values: One position value will represent the encoder counts of a drive or the CD522 module which is connected to the input Drive_ActualPosition of the kernel function block. The other position is a user defined scaled unit which is used for PLCopen function blocks.

There are different ways to finish the homing by manipulate and adjust a position value. Which value should be manipulated depends on the used drive or module and its capabilities. See the following types A, B and C.

Type A

The user defined position unit will be changed only. The function block MC_StepDirect must be used here. This type of homing is less complex than the other types but also less precise.

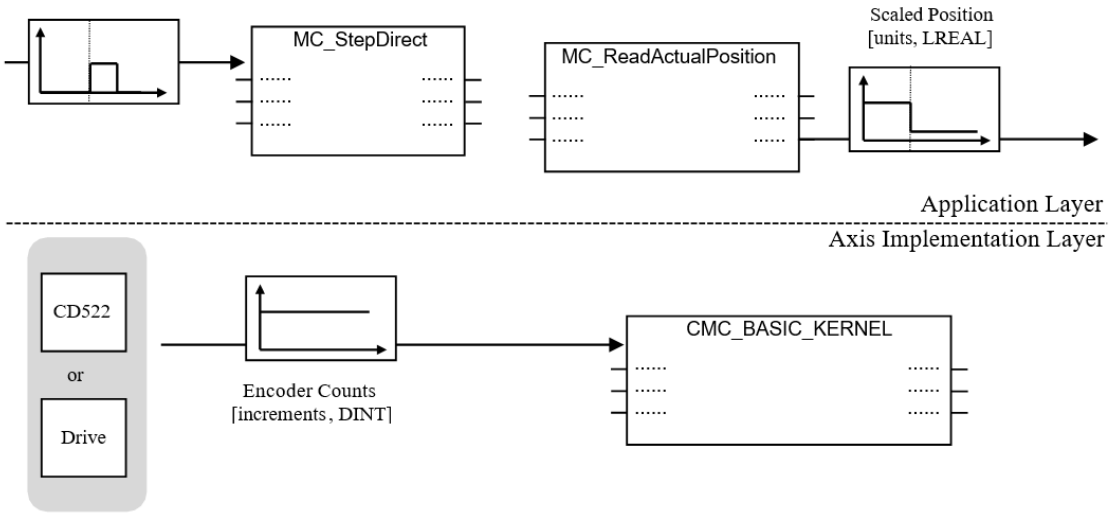

Fig. 72: Homing Type A

Type B

The Drive or the CD522 module will change its own position value, the encoder counts.

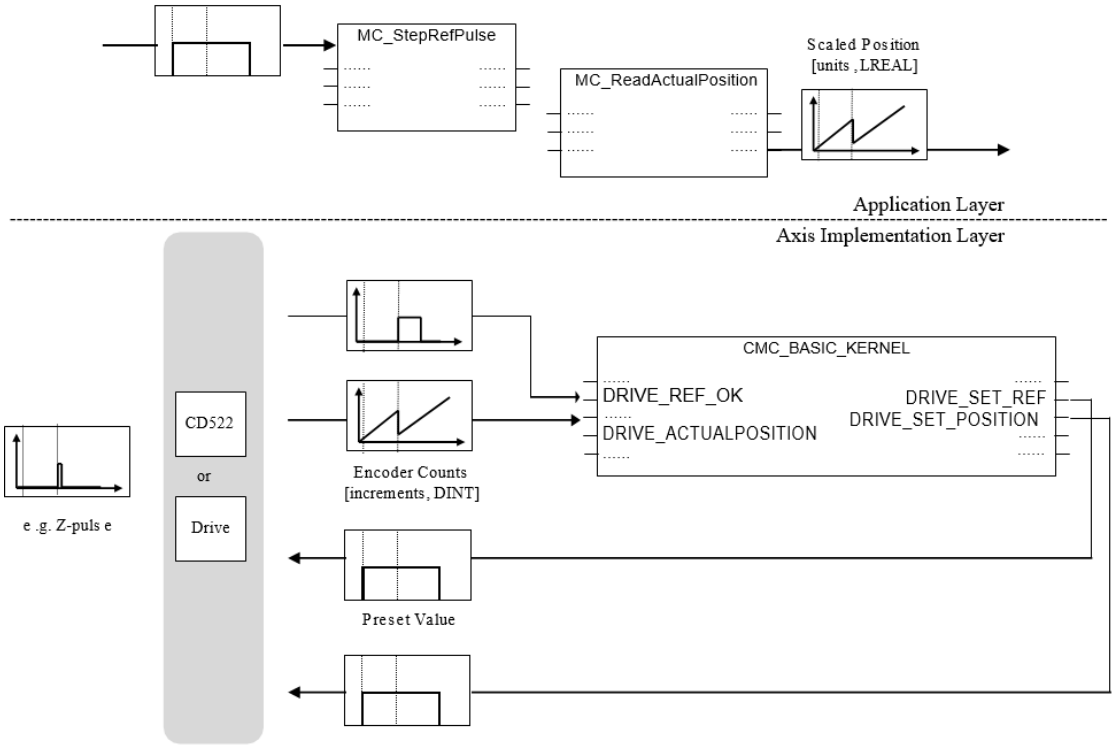

Fig. 73: Homing Type B

The process will be started by the execution of the function block MC_StepRefPulse.

The axis will start to move.

The output Drive_Set_Ref of the kernel function block will then set the drive to sense for a digital signal. At the same time the kernel function block outputs a preset value which will replace the actual encoder count value at the moment the digital signal occurs.

This signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In the same cycle when the new position value is set there also has to be a boolean signal stating a new position value at the input Drive_Ref_Ok of the kernel function block. The user defined position value will then be shifted accordingly.

Example of type B for phase 2: ↳ *Chapter 1.5.10.4.2.1 “How to connect a drive” on page 2334*

Type C

The encoder count position value will not be changed but involves registration capabilities of a drive or the CD522 module.

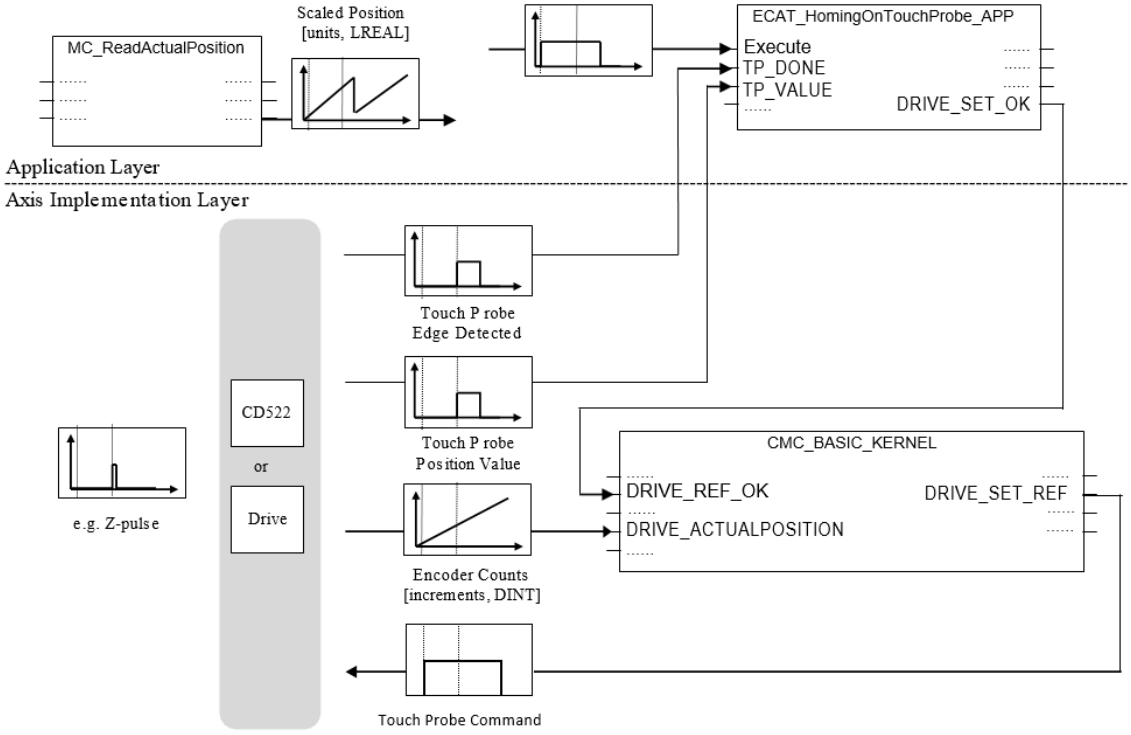

Fig. 74: Homing Type C

The process will be started by the execution of the function block ECAT_HomingOnTouchP-robe_APP (ABB_Ecat_CiA402_AC500.library).

The axis will start to move.

The output Drive_Set_Ref of the kernel function block will then command the drive or the CD522 module to activate the Touch Probe functionality. This will configure the drive to latch a position at the moment a digital signal occurs. The digital signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In combination with the latched position value there is a boolean signal which states that a new latch value has been received. In case of the module CD522 this encoder count position value has to be converted from encoder counts to equivalent user scaled units by the use of the function “CMC_Get_Units_From_Inc” (ABB_MotionControl_AC500.library) before it can be connected to the function block ECAT_HomingOnTouchProbe_APP.

To manage the Touch Probe objects of a drive within the CiA402 profile (e.g. Microflex e190) the function block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library) can be used. This will also cover the conversion from encoder counts to user scaled units.

At the end of the process the function block ECAT_HomingOnTouchProbe_APP will manipulate the user scaled position value according to the latched position from the drive and the users settings.

For further information see: *AN00220-001 - AC500 and MicroFlex e190 - EtherCAT Homing Methods*

How to Use a CAM curve

The CAM functionality is only available in combination with the kernel function block CMC_Basic_Kernel.

From Automation Builder 2.5.0 onwards user can make use of inbuild Cam Configurator to generate Cam Table. For more details on how to use Cam Configurator please refer Automation Builder Help file.

It is recommended to use the CAM Editor from Automation Builder for those who are new to Cam table or to get the structure of the Cam Table. User can create the complete CAM Table using Cam Editor or can make a copy of CAM Table (IEC Code) and adapt it directly in the IEC code if needed.

Details on the CAM Table structure and different parameters to be considered while creating the CAM is described below.

General usage

The usage of a CAM function is based on the following elements:

- CAM table defined with the data type MC_PProfile.
- An instance of the function block MC_CamTableSelect
- An instance of the function block MCA_Cam_Extra (optional)
- An instance of function block MC_CamIn
- An instance of function block MC_CamOut

The following steps are necessary to use a CAM table

1. Declare a CAM table as an array of the data type MC_PProfile in the program.
2. Write data to this array.
3. Use the address of the CAM table at the input CamTable of the function block MC_CamTableSelect.
4. Execute the function block MC_CamTableSelect to process the data of the CAM table with the function block's input parameters
5. Additionally you can execute the function block MCA_Cam_Extra for optional parameters after the processing of the function block MC_CamTableSelect.
6. Execute the function block MC_CamIn to start the slave axis movement according to the CAM table data and parameters.
   ⇨ The axis will operate in the axis state Synchronized Motion.
7. To leave the axis state you can execute the function block MC_CamOut.
   ⇨ The axis state will switch to state Continuous Motion and maintains its last velocity as long as there is no other command.
8. You can also use any other motion command interrupt the Synchronized Motion.

CAM table

CAM data is done with one table (two dimensional – describing master and slave positions together).

The data of the elements (array of data type MC_PProfile) can either be assigned within the declaration or can be assigned during run time before the execution of the function block MC_CamTableSelect.

It can be filled with data in the following ways:

- To use a predefined variable list.
- To calculate the values within the program (before using the MC_CamTableSelect).
- To send values by any communication access to the PLC.

In order to use the new data it is necessary to execute the function block MC_CamTableSelect again. In case the CAM table is executed the function block MC_CamTableSelect may not be executed.

Elements of the data type MC_PProfile: ↳ *Chapter 1.5.10.2.4 “Overview of data types” on page 2297*

The inputs MasterSyncPosition and MasterSyncDistance of the function block MC_CamIn can be used to define a distance to synchronize the slave axis onto the CAM table during the start. In case master axis moves with negative velocity the parameter MasterSyncDistance can be negative. The MasterSyncPosition should always be within the range of the CAM table master position.

MasterSyncDistance = 0 will deactivate the synchronization. In this case the slave axis should be moved on the CAM curve before MC_CamIn is executed, otherwise a following error can occure.

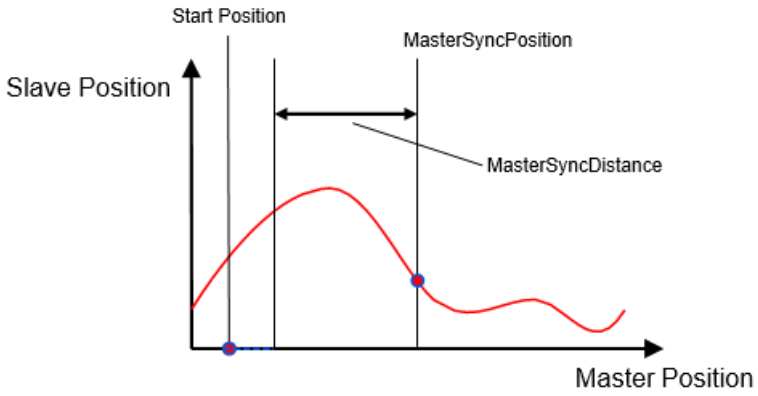

Fig. 75: CAM profile figure

The master position in the CAM table must be strictly monotonic rising.

The length of a CAM table is just restricted by the memory size of the PLC. When long tables are used, it is recommended to call CamTableSelect in a task with lower priority as it will need a considerable computing time.

It is possible to hold several CamTables as a pool and to switch from one to another. This has to be done at matching positions as no means for synchronization are available.

The offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

The parameters at MC_CamTableSelect, MC_CamIn and function and MCA_Cam_Extra also modify the behavior:

Parameter MC_CamTableSelect	Type	Default value	Comment
MasterAbsolute	BOOL	FALSE	TRUE=Master_position from MC_PProfile equals the master axis absolute position. FALSE=CAM is executed relative to the master axis actual position at start.
SlaveAbsolute	BOOL	FALSE	TRUE=interpolation_point from MC_PProfile equals the slave axis absolute position. FALSE=CAM is started from actual slave position. The values "interpolation_point" are relative to the slave axis position at start.
iType	MC_ABB_iTypes_ENUM		Interpolationtype.
Number_of_pairs	INT		Number of points used in TimePosition Array.

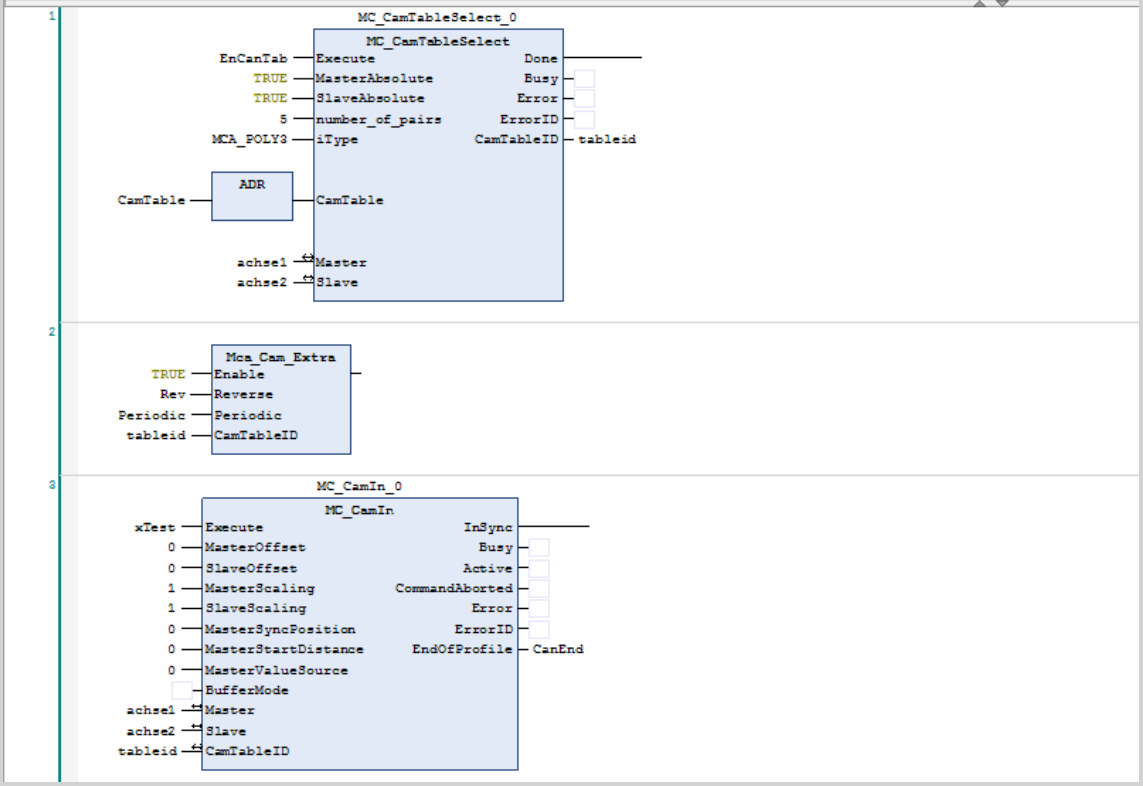
Parameter MC_CamIn	Type	Default value	Comment
MasterOffset	LREAL	0	Just used with MasterAbsolute=TRUE, ignored otherwise. Used position for cam-table is: Master axis position-Masteroffset.
SlaveOffset	LREAL	0	Just used with SlaveAbsolute=TRUE, ignored otherwise. Used position is slave axis position=interpolation_point+Slaveoffset.
MasterScaling	LREAL	1	The position used for interpolation is multiplied by MasterScaling, e.g MasterScaling=2, the scaled master will pass the position range with double velocity and within the half distance compared to its real velocity and position.
SlaveScaling	LREAL	1	Interpolation result is multiplied by Slave-Scaling, e.g SlaveScaling=2: Slave axis will run twice the distance.
MasterSyncPosition	LREAL	0	Start synchronization at master axis position=MasterSyncPosition-Master-StartDistance+MasterOffset, meet the CamTable at master axis position=MasterSyncPosition. In case of MasterAbsolute=FALSE: start at "actualPosition+MasterSyncPosition-MasterStartDistance", meet the CamTable at "actualPosition+MasterSyncPosition"!!! It is just possible to use the "sync" mechanism when the axis is in StandStill on start.
MasterStartDistance	LREAL	0	A negative value will create a reverse synchronization mode, which means the master should move in negative direction to synchronize. It is independent from the Reverse-Bit which indicates how to end the movement.
These 2 parameters are "extras" to be written with the MCA_Cam_Extra function. When the parameters are used, the MCA_Cam_Extra has to be called after the MC_CamTableSelect.			
Periodic	BOOL	TRUE for master “Modulo”, FALSE for master linear axis	CamTable will not reach "EndOfProfile" but will be repeated periodically. When the master is a linear axis, it has to move forward and backward within the CamTable position range, but even when it leaves this position range, the CamTable will stay active.
Reverse	BOOL	FALSE	Just necessary when a CamTable is NOT "periodic" and will run in reverse direction (master with negative velocity) Reverse=FALSE, the CamTable is ready when the master leaves the position range in positive direction, e.g. when it moves from 359° to 0° on a rollover axes Reverse=TRUE, the CamTable is ready when the master leaves the position range in negative direction.

Example for CAM curve

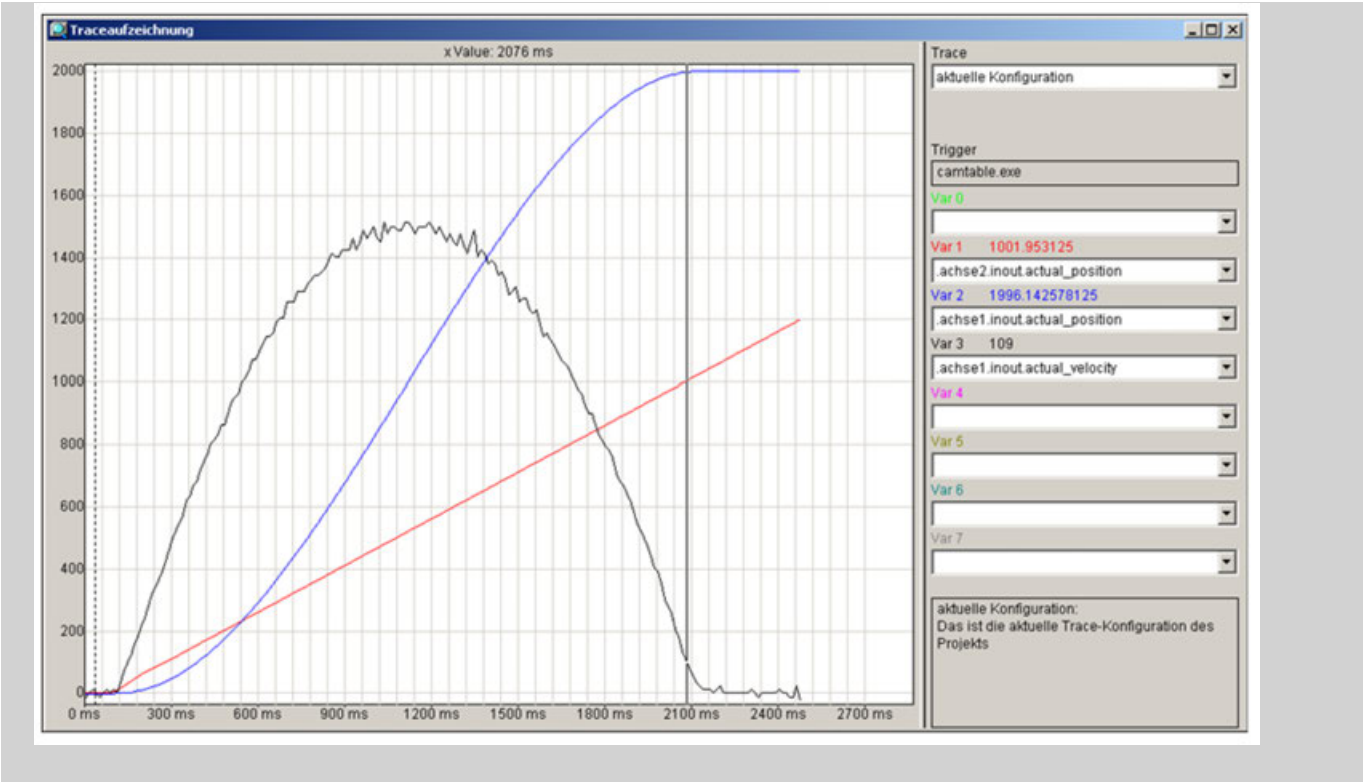
```
PROGRAM CamIn
VAR

    CamTable:ARRAY[1..5]OF MC_PProfile := [
    (Master_position:= 0   ,interpolation_point := 0   , Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
    (Master_position:= 150 ,interpolation_point := 100, Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
    (Master_position:= 300 ,interpolation_point := 300, Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
    (Master_position:= 600 ,interpolation_point := 350, Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
    (Master_position:= 800 ,interpolation_point := 400, Velocity_ratio:= 0 , Acceleration_ratio:= 0 )];

    MC_CamIn_0: MC_CamIn;
```



In the example, the slave will run from 0 to 2000 while the master runs from 0 to 1000. The slave will start and end with velocity=0, no matter which velocity the master has during start. The slave will reach the maximum velocity when it is at position 1000 and the master is at position 500.



How to use an external axis

To use multiaxis PLCopen function blocks with an externally sensed axis as master axis the following structure can be used for the axis implementation:

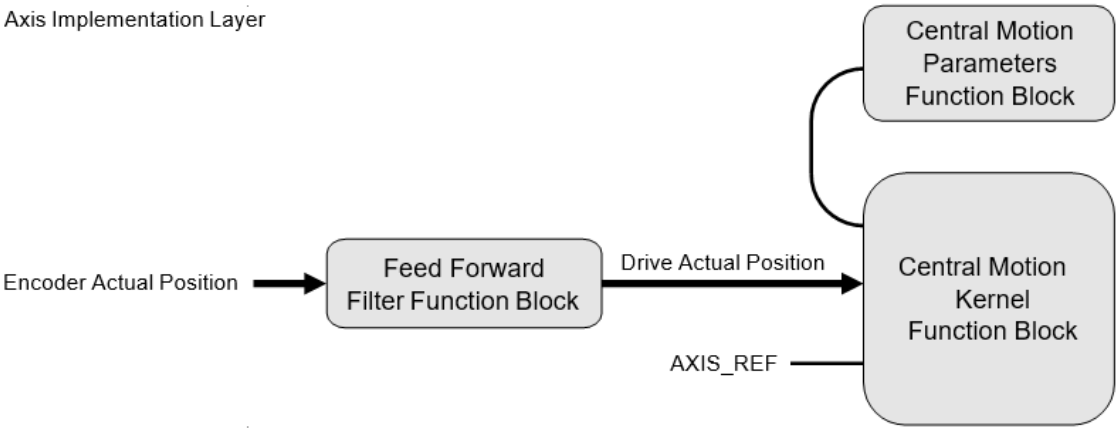


Fig. 76: Structure synchronization to an external axis

The use of a feed forward filter function block is needed if the slave axis has to follow the position of the external axis. In this case there will be a time delay between sensing the position of the external axis and moving the follower axis along the sensed position. The filter function block will then add a certain distance to the external axis' position depending of its speed.

The filter function block MATH_LINEAR_REGRESSION from the library ABB_MathFunctions_AC500.library can be used here.

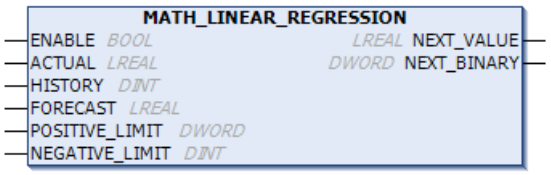

Fig. 77: Filter function block to feed forward an externally sensed position

For an axis which is following the external axis, the value “mcActualValue” (from MC_Source enumeration) for the input “MasterValueSource” for multi-axis PLCopen function blocks has to be used.

When the filter function block MATH_LINEAR_REGRESSION is used to process an actual position, 2 different purposes are fulfilled:

- A jitter or noise can be compensated
- It is possible to calculate a forecast-position to compensate for a delay in position measurement

> *Process the actual position or any other master axis always before the slave axis.*
>
> *Otherwise, an additional one cycle-delay is introduced.*

The MATH_LINEAR_REGRESSION function block calculates the progress for a variable which is captured in equidistant periods of time and is assumed to follow a linear curve. It uses the Gauss “least squares” -algorithm to do so. The line is calculated in a way that the sum of squares for the distances from the measured points to the assumed straight line is minimized.

A noise or jitter influence of the value is compensated and a predictive value for the variable with an adjustable forecast horizon can be calculated.

Linear equation:

$$\text{Line[i]} = \text{gradient} * \text{i} + \text{offset}$$

Sum of squares:

$$sum = \sum_{i=1}^{\infty history} (\text{x[i]} - \text{line[i]})^2$$

The gradient and offset for the line are calculated in a way that “sum” is minimized. Then these 2 values are used to calculate the forecast value:

$$\text{NEXT\_VALUE} := \text{gradient} * \text{FORECAST} + \text{offset}$$

FORECAST=0 would mean: value right now, no future or past considered.

When the ACTUAL value is a modulo value, for example a single turn encoder or a rollover axis, this has to be considered in the calculation. The 2 input values POSITIVE_LIMIT and NEGATIVE_LIMIT can be used to configure this. They define the upper and lower limit for ACTUAL. Also, the NEXT_BINARY will as a result be limited to these borders.

Example

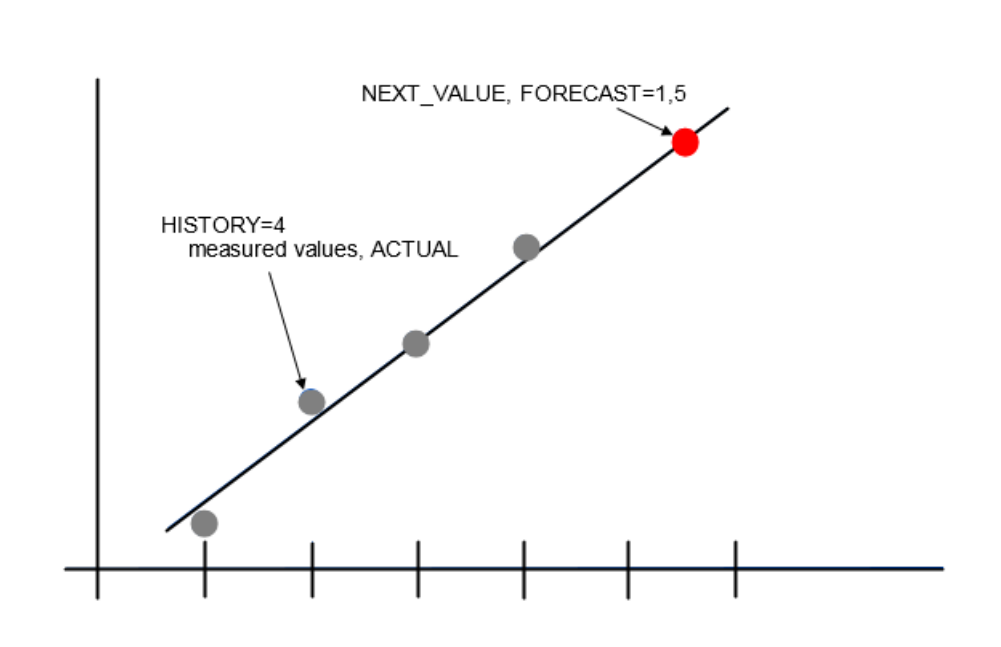

Fig. 78: Next Value_Forecast

How to use an encoder/drive with <> 32-bit position overrun

The incremental position as actual position at the function block CMC_Basic_Kernel is usually assumed as position with a 32-bit position overrun. As well as it is the reference position which is sent to the drive.

Any modulo-axis configuration should be done inside the PLC.

Some drives are requested to correct their positions themselves for a non-linear axis which should constantly run into the same direction.

In this case, the drive has to be configured as a modulo-axis and the function block CMC_Basic_Kernel needs some additional function blocks to create the 32-bit value ↳ *Chapter 1.5.10.4.3.4 “Roll-Over axis” on page 2357*.

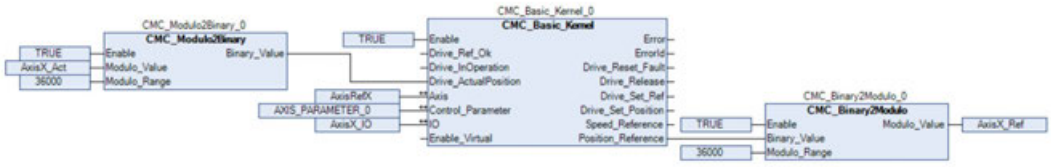

Fig. 79: Kernel

The function block CMC_Modulo2Binary will convert any position with any Modulo_Range to a 32-bit binary position.

The actual_position is assumed to run between 0 to Modulo_Range.

The actual_position should not change > 1/4 Modulo_Range between two scan cycles.

The function block CMC_Modulo2Binary will convert the 32-bit binary position reference from CMC_Basic_Kernel to a position reference which runs from 0 to Modulo_Range.

How to do position correction “on the fly”

Sometimes it is required to have a position correction "on the fly". For example, it can happen that a position is wrong due to mechanical slip and that a switch which is passed by during the movement is used to capture a position value.

In other cases, it is required to synchronize the position to a print mark, so an actual_position has to be corrected, but not the movement of the printed material.

For both applications, the function block MCA_SetPositionContinuous can be used. It will use ramps and a limited velocity for the correction, so it will be tolerable to execute it during an ongoing movement and while the axis is activated in a multi-axis movement.

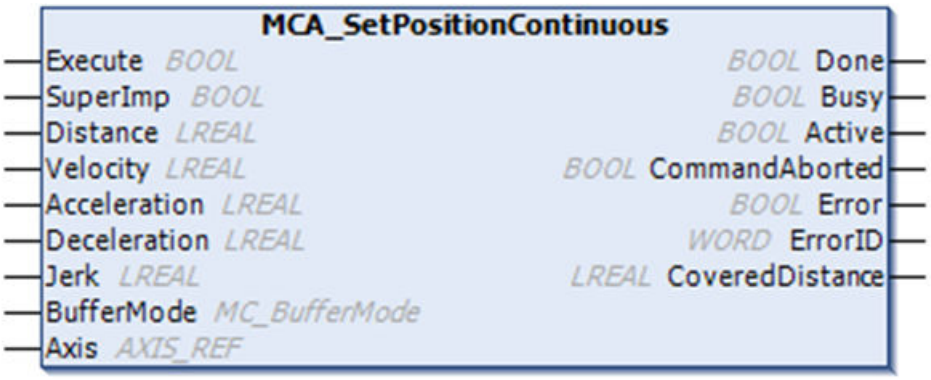

Fig. 80: MCA_Set_PositionContinuous_V3

The block can be used in any axis state except ERRORSTOP and HOMING.

Two different operation modes are possible:

1. SuperImp=FALSE
   - The actual_position will be modified.
   - The block will not cause any movement.
   - If a PLCopen block in DISCRETE_MOTION (positioning) is active during the execution, this block will not reach Done as the actual_position is modified.
   - If a slave axis is coupled to an axis while MCA_SetPositionContinuous is executed (with SuperImp=FALSE) it will follow.
   - This mode is possible while the axis is in state DISABLED.
2. SuperImp=TRUE
   - The actual_position will stay constant.
   - A mechanical movement is executed (without changing the axis state machine).
   - A slave axis will not follow.
   - This behavior is similar to a superimposed movement.
   - It is not possible when the axis is in state DISABLED.

The block can just be aborted by another MCA_SetPositionContinuous.

How to limit the movement

It is possible to limit the movement by position (software limit switches) and by velocity. By default, no software limit switches are activated in PS5611-Motion. It is possible to activate them by accessing some PLCopen parameter.

The functionality described below is just available with linear axes.

	Parameter	Data type	Minimum	Maximum	Default	R/W	Description
2	SWLimitPos	DINT	-2147483647	2147483647	2147483647	R/W	Positive software limit switch position.
3	SWLimitNeg	DINT	-2147483647	2147483647	2147483647	R/W	Negative software limit switch position.
4	EnableLimitPos	BOOL	FALSE	TRUE	FALSE	R/W	Enable positive software limit switch.
5	EnableLimitNeg	BOOL	FALSE	TRUE	FALSE	R/W	Enable negative software limit switch.
2003	EnableLimit2Decelerate	BOOL	FALSE	TRUE	FALSE	R/W	Enable software limit switches to decelerate
2004	EnableLimitAbort	BOOL	FALSE	TRUE	FALSE	R/W	Enable that software limit switches will abort ongoing movement FALSE = Limits position and velocity, decelerates and shows a warning until the position limit is reached, then ERROR STOP TRUE = Switches off any ongoing motion and decelerates to the position limit, then ERROR STOP
2005	EnableLimtVelocity	BOOL	FALSE	TRUE	FALSE	R/W	If the velocity is limited the unmoved position will be covered whenever possible
2006	SWLimit2DecPos	LREAL	-2147483647	2147483647	2147483647	R/W	Used as end position for EnableLimit2Decelerate
2007	SWLimit2DecNeg	LREAL	-2147483647	2147483647	2147483647	R/W	Used as end position for EnableLimit2Decelerate
2008	MaxPositionGap	LREAL	0	21474836 4700	0	R/W	Used to stop the ongoing movement if position is behind

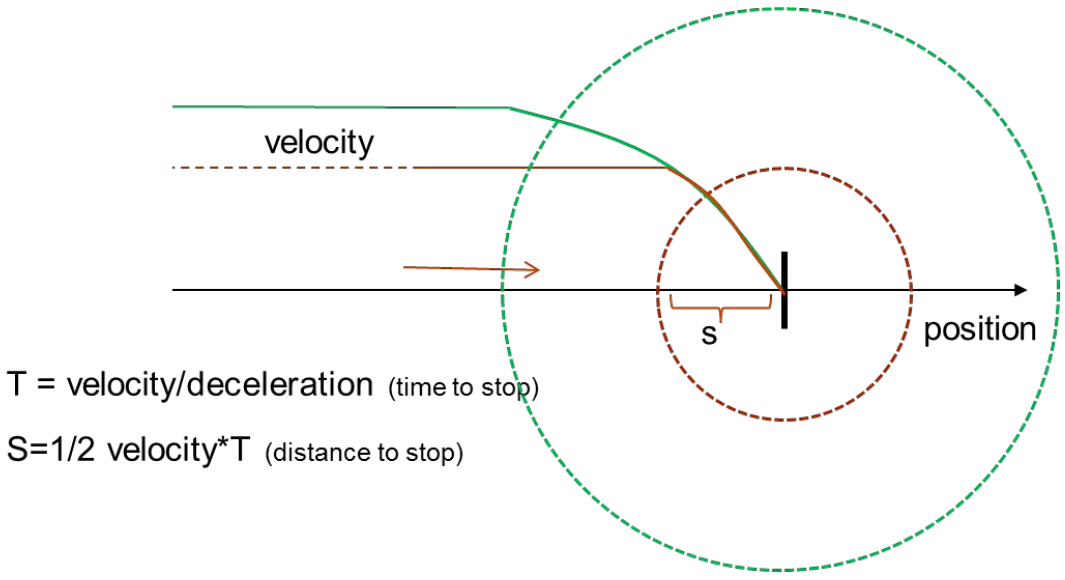
The following different behavior is possible:

- No limitation at all (default)
- Limit position with ERRORSTOP:
  - Limit position between SWLimitNeg to SWLimitPos, axis to state ERRORSTOP in case the position range is left.
- Limit velocity and acceleration:
  - Limit velocity to paraMaxVelocityAppl and acceleration/deceleration to paraMaxDecelerationAppl, create WARNING_VELOCITY, not state changes for axis, abort movement is optional when MaxPositionGap is reached due to limitation.
- Limit Position with ramp-down:
  - In addition, it is possible to limit the position between SWLimit2DecNeg and SWLimit2DecPos. paraMaxDecelerationAppl is used to ramp down.

When activated with EnableLimitPos or EnableLimitNeg, the reaction will be as follows:

- When the control position reaches the respective limit switch, the axis will go to state ERRORSTOP, and Drive_Release will be switched off. The actual_position might be behind, depending on the following error. It is assumed that a drive or application specific braking is performed. The axis will be stopped behind the limit.
- The axis could be switched on again by MC_Power. A movement in the opposite direction will be possible.
- The functionality of EnableLimitPos and EnableLimitNegis unchanged.

You can use the limitation of movement to achieve a soft or adjustable braking in advance before reaching the software limit switch. The limitation is activated by three Boolean parameter and will calculate a position distance to the limit switch, which depends on the actual velocity and given deceleration ramp. “paraMaxDecelerationAppl” is used for deceleration. It will decelerate the axis by the given deceleration ramp when the calculated position is reached and stop at the software limit switch. The original behavior is not modified, so if also these software limit-switches are activated, the axis might be set to state ERRORSTOP.



There are 2 different modes:

- EnableLimitAbort = TRUE
  Any ongoing motion will be aborted immediately (when the distance to stop is reached, as shown in the above diagram), a warning is shown
  The axis will be decelerated to reach the software limit switch.
- EnableLimitAbort =FALSE, EnableLimitDecelerate=TRUE
  A warning is shown and the velocity is reduced, with respect to the given deceleration and position limit.
  The ongoing motion is not aborted. If it was just a “tight fit”, e.g. in a master slave movement and the direction is turned soon enough, it might be possible to continue the movement.
  As the ongoing movement is not interrupted, an activated movement might not be completed, for example a MC_MoveAbsolute will never reach its target position. A warning is shown at function block CMC_Basic_Kernel.

When EnableLimitPos = TRUE or EnableLimitNeg = TRUE, and the values for SWLimitPos or SWLimitNeg are set, the axis will be set to state ERRORSTOP when these position limits are reached.

In addition, the function block will allow to limit the velocity. With EnableLimitVelocity = TRUE, it will monitor the velocity demand from the position reference and limit the position reference, so the given velocity limit will not be exceeded. A warning will be shown. The velocity used for limitation is MaxVelocityAppl.

The velocity limitation can be used to prevent short-term velocity peeks. The limited position will be caught up later, whenever possible. This can result in not-expected behavior. The WARNING issued by CMC_Basic_Kernel can be checked and used to stop a movement. The movement will be aborted automatically when the position is by MaxPositionGap behind.

- *For a single axis movement, the commanded velocity is limited at the beginning. No position gap will occur.*
- *In a multi-axis movement, the slave axis follows a master. This can result in a position gap. A velocity peek from the master axis can be reduced by using the limitation. If the master is too fast because of the value for MaxPositionGap, the movement will be aborted.*

When EnableLimit2Decelerate or EnableLimitAbort are used, the velocity is limited to MaxVelocitySystem with EnableLimitVelocity = FALSE. The function modifies the position reference. This modified position reference is used to control the drive. Whenever the limitation interferes the kernel will show a warning or an error. The warning or error message will disappear when the situation is cleared.

Parameter Number	Parameter Name	Value	Comments
4	EnableLimitPos	TRUE	ERRORSTOP when positions exceed, no previous warning or deceleration.
5	EnableLimitNeg	TRUE	
2003	EnableLimit2Decelerate	FALSE	
2004	EnableLimitAbort	FALSE	
2005	EnableLimtVelocity	FALSE	

Parameter Number	Parameter Name	Value	Comments
4	EnableLimitPos	FALSE/TRUE	Reduce the velocity when reaching a position limit within the deceleration distance calculated by using MaxDecelerationAppl. Display a warning at CMC_Basic_Kernel. The underlying movement stays active. With EnableLimitPos = TRUE or EnableLimitNeg = TRUE: When the Position limit is reached, the axis is set to mode ERRORSTOP also if EnableLimitPos or EnableLimitNeg are used. Otherwise, just the movement is limited, without affecting the state machine. An activated positioning movement will not reach its target. Velocity is limited to MaxVelocitySystem.
5	EnableLimitNeg	FALSE/TRUE	
2003	EnableLimit2Decelerate	TRUE	
2004	EnableLimitAbort	FALSE	
2005	EnableLimtVelocity	FALSE	

Parameter Number	Parameter Name	Value	Comments
4	EnableLimitPos	FALSE/TRUE	Reduce the velocity when reaching a position limit within the deceleration distance calculated by using MaxDecelerationAppl. Display a warning at CMC_Basic_Kernel. The underlying movement stays active. With EnableLimitPos = TRUE or EnableLimitNeg = TRUE: When the Position limit is reached, the axis is set to mode ERRORSTOP also if EnableLimitPos or EnableLimitNeg are used. Otherwise, just the movement is limited, without affecting the state machine. An activated positioning movement will not reach its target. Velocity is limited to MaxVelocitySystem. The active PLCopen function block is aborted as soon as the warning is issued. With EnableLimitPos = TRUE or EnableLimitNeg = TRUE: When the Position limit is reached, the axis is set to mode ERRORSTOP.
5	EnableLimitNeg	FALSE/TRUE	
2003	EnableLimit2Decelerate	---	
2004	EnableLimitAbort	TRUE	
2005	EnableLimtVelocity	FALSE	

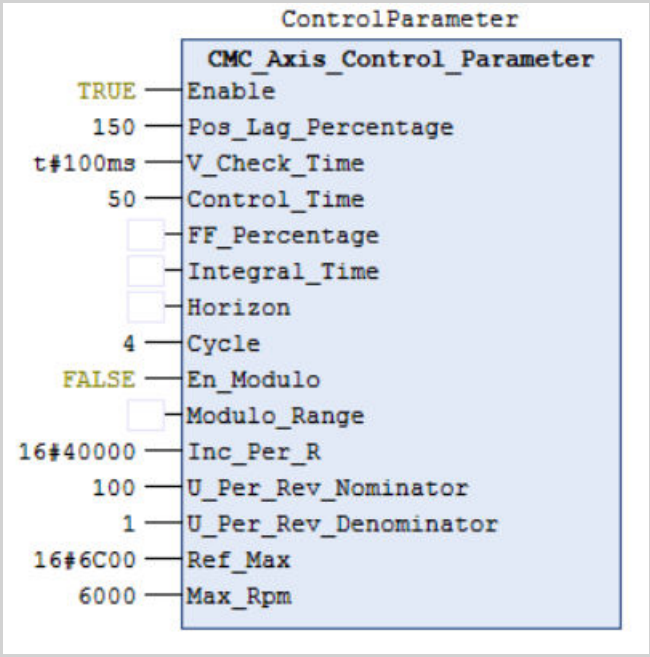
Parameter Number	Parameter Name	Value	Comments
4	EnableLimitPos	---	The velocity is checked and also limited to the value Max-VelocityAppl. A warning is shown. The active movement is not aborted. This function-ality works independent from software limit switches.
5	EnableLimitNeg	---	
2003	EnableLimitDecelerate	---	
2004	EnableLimitAbort	---	
2005	EnableLimtVelocity	TRUE	

1.5.10.4.3 Axis parameters

The parameters for axis configuration and adjustment are set by the function blocks CMC_Axis_Control_Parameter.

Depending on the version of the kernel function block the corresponding version of the parameters function block has to be used. The instance will then be connected to the kernel function block by its instance name.

Example



In the example the control structure is a simple position control loop with just proportional gain. When the application does not require minimized position following error it should be used this way as it is simple to adjust, robust and requires minimal performance. The proportional gain is then adjusted by Control_Time. Just change values at CMC_Axis_Control_Parameter when the position control loop is open (Drive_Release=FALSE, the axis state is Disabled). The values are sending to the control loop whit a positive edge at "Enable". The CMC_Basic_Kernel function block needs to be already enabled.

Supervision

Pos_Lag_Percentage

This parameter configures the position window for the supervision of the following error.

The default value is 150[%]. A value of 0[%] will deactivate the supervision function.

The size of the position window depends on the setting of the parameters Control_Time and Max_Rpm ↳ *"Control_Time" on page 2354*.

Position Window [Increments] = (Inc_Per_R) * (Max_Rpm/60) * (Control_Time/1000)

Position Window [Units] = (U_Per_Rev_Nominator/ U_Per_Rev_Denominator) * (Max_Rpm/60) * (Control_Time/1000)

Example

Position Window [Increments] = (10000) * (6000/60) * (50/1000) = 50000 [Increments]

Position Window [Units] = (1/1) * (6000/60) * (50/1000) = 5 [Units]

A value of 100% will result in a position window which corresponds to the expected following error with the giving Control_Time at Max_Rpm. Therefore it is recommended to use values higher than 100[%]. In case the parameter FF_Percentage is used smaller values can be used.

If the supervised position window is exceeded the axis state will change to ERRORSTOP.

V_Check_Time

After the configured time the drive's actual velocity has to be at least 50 % of the commanded velocity. This function can also be used in case the Position Reference is transferred to the drive.

A value of 0 will deactivate this supervision function.

If the supervised velocity window is exceeded the axis state will change to ERRORSTOP.

Position control loop

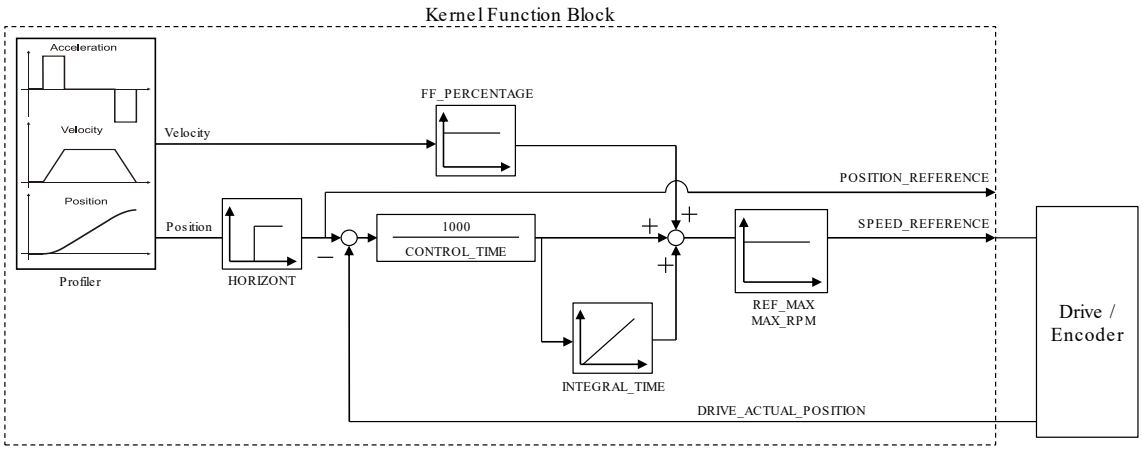


Fig. 81: Basic structure of position control loop

Control_Time

The default value is 100 which leads to a proportional gain of 10.

In case the value of Control Time is too short the position control loop will run into instability.

In case the position control loop is not used this parameter must not be set to 0.

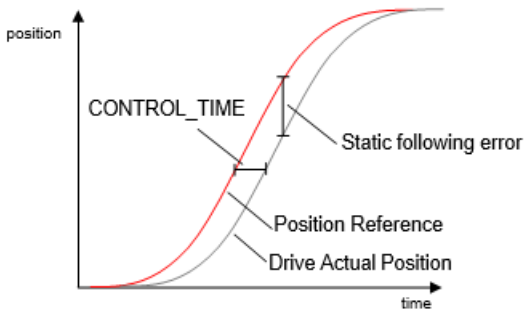

Fig. 82: Control Time and static following error in case the feed forward of velocity and the integrational part of the position control loop is not used.

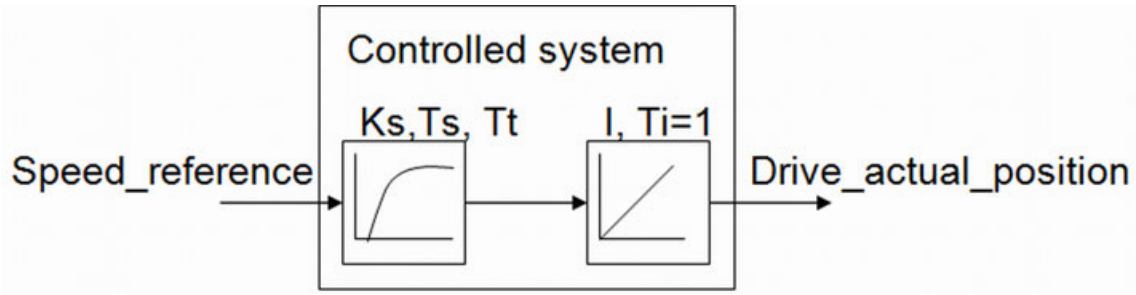
The static following error depends on the axis velocity and can be calculated easily: Control Time multiplied by the axis velocity (p_error = v * CT).

In general it should be aimed to reach a high position control loop gain with a short Control Time to achieve a small following error. As the reaction times take account in the possible Control Time of the complete system (parameters of the drive control loop, PLC cycle time as well as the communication fieldbus) should be considered.

As a basic rule the Control Time should be at least four times longer than the reaction time between the output of the Speed Reference and the input of actual position.

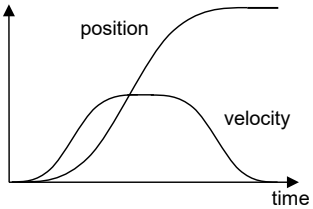


When the time Ts and Tt is measured, a control_time of 4 * (Ts + Tt) will result in an aperiodic damping of the position control loop. It is important to measure the values from inside the PLC (e.g. Trace) to have the complete reaction times included. Practical values for Control_Time might be from 50 - 500ms. The PLC cycle time as well as bus cycle times and mechanical reaction will influence the value.

FF_Percentage The default value is 0.

In case a velocity feedforward has to be configured a value of up to 80 is recommended. For larger values than 80 the parameter Horizon needs to be used as the resulted position will overshoot otherwise.

A value of 100 adds a velocity to the Speed Reference output which corresponds exactly to the ongoing Position Reference value.



Integral_Part The integral part of the position control loop can be used to eliminate a permanent positioning error, e.g. in case of hanging loads.

The time value can be regarded as the time the integrator needs to sum up the input value to reach the same value for its output.

In case the Integral Part Time is too short the position control loop will run into instability.

Horizon

A communication delay of the Speed Reference value to the drive system can cause an overshoot during positioning caused by the velocity feedforward gain.

This function will compensate this communication delay to prevent an overshoot by time shifting the signals Velocity Feed Forward and Position Reference relatively to each other.

The value of Horizon can be approximately assumed to be the time delay of the communication delay.

The delay time might be caused by the cycle time of the control loop and by any delay in sending the speed reference, delay in the drive to build up the torque and delay to receive the actual position. To overcome this delay, a Horizon > 0 might be used. The feed forward reference will be created in advance, while the proportional gain is applied to the original motion profile. The delay is then compensated.

This function should not be used if the feed forward parameter FF_Percentage is 0.

A value of 0 will deactivate this function, which is the default value.

While this function is used, it will increase the needed PLC calculation time for this axis.

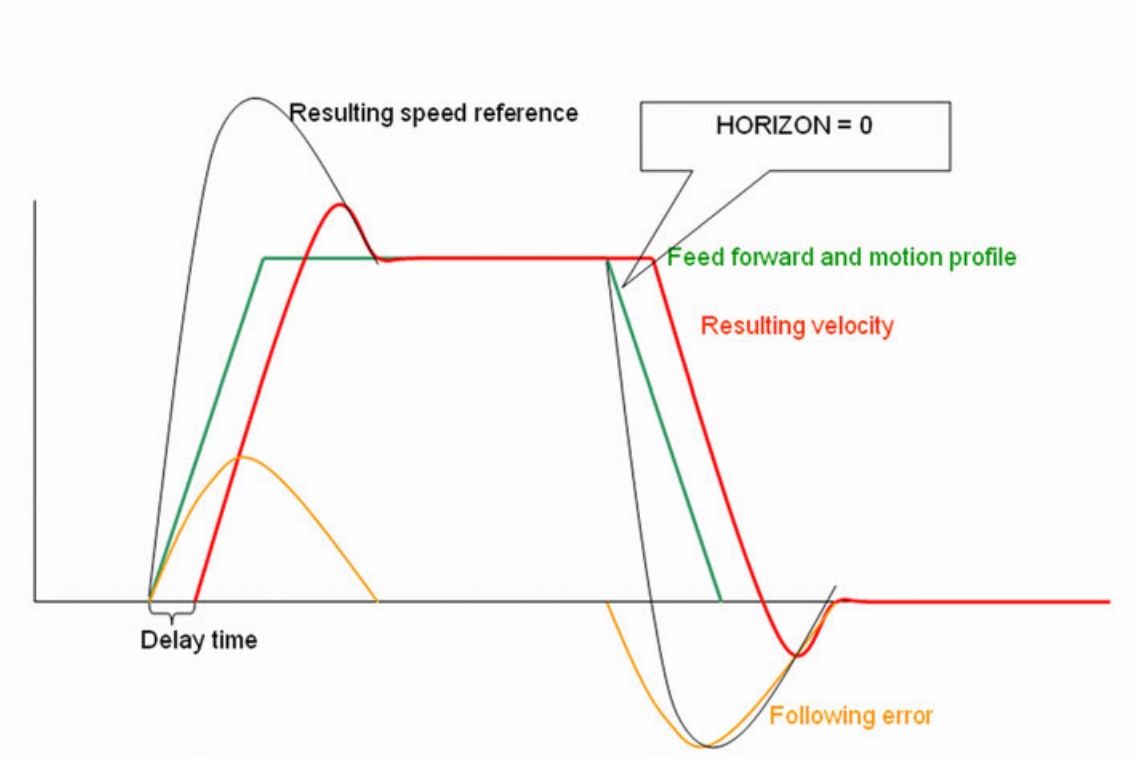


Fig. 83: Result with Horizon=0

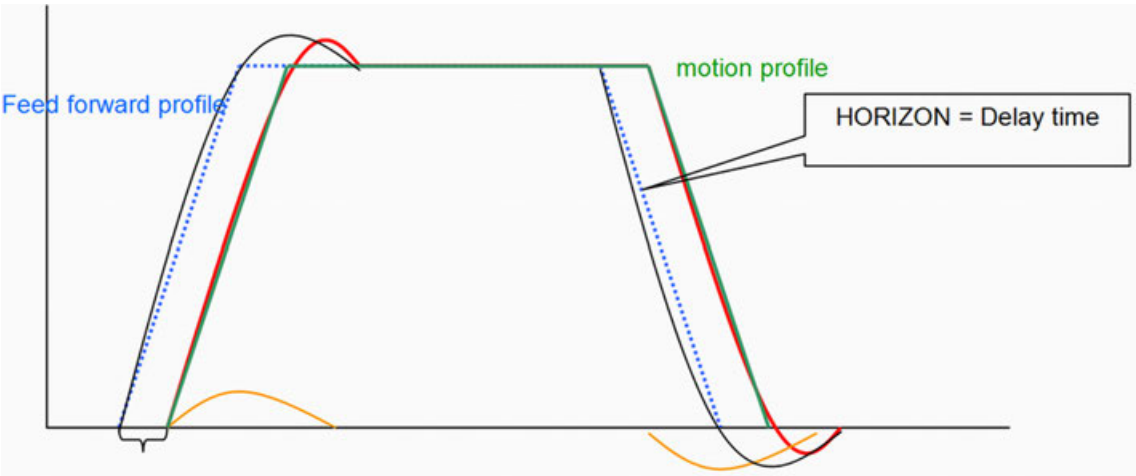

Fig. 84: Result with Horizon>0

PLC cycle time

Cycle

This parameter represents the cycle time in which the kernel function block of the axis is called. If the configured cycle time is not correct the resulting acceleration and speed of an axis will be not correct also.

In case the task execution of the axis is synchronized to a fieldbus (e.g. EtherCAT) the cycle time of the fieldbus has to be used.

Roll-Over axis

If the Position Reference value is used, the drive must able to perform a position over-run after 32 bit. If the drive's position over-run is different, it can be adapted with the function blocks CMC_Binary2Modulo and CMC_Modulo2Binary from the library ABB_MotionControl_AC500.library. Incompatibility can cause an axis to trip after hours of operation.

The possible position following error has to be smaller the ½ Modulo_Range. Make sure that the modulo range is large enough.

Position following error = (100 - FF_Percentage) * Max_Rpm * Inc_Per_R * Control_Time/6000000. This is the maximum value at constant velocity.

En_Modulo

With this parameter the axis can be configured as a roll-over axis.

Modulo_Range

The modulo range will be defined in drive position counts (DINT). It will result that the scaled unit position which is used by the PLCopen function blocks will stay within the defined range.

Example

```
En_Modulo             = TRUE
Modulo_Range          = 20000
Inc_Per_Rev             = 10000
U_Per_Rev_Nominator      = 360      (e.g. degree)
U_Per_Rev_Denominator      = 1
```

The scaled unit's position will cover the range from 0 to 720 (degrees).

In some cases it is not suitable to set the modulo range of an application with the DINT value of the parameter Modulo_Range only. In such cases the parameters 2001 Modulo_Nominator and 2002 Modulo_Denominator can be used to scale the parameter Modulo_Range to a more precise value.

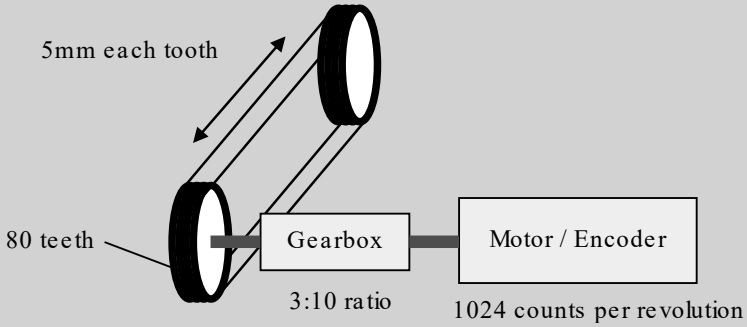
Parameter Modulo_Nominator and Modulo_Denominator (supported with CMC_Basic_Kernel)

These parameters can be used to modify the Modulo_Range in a way that fractions of an increment could be used for 1 modulo (=rollover) distance

- Default: Modulo_Nominator=1 and Modulo_Denominator=1: the actual position for an axis is limited between 0 and Modulo_Range increments.
- Limitations: Modulo_Range*Modulo_Nominator < 2147483647. Otherwise: default values will be used.
- When modifying these parameters, the position control loop should be opened.

Example

```
En_Modulo             = TRUE
Modulo_Range          = 1024
Modulo_Nominator          = 10
Modulo_Denominator          = 3
Inc_Per_R             = 1024
U_Per_Rev_Nominator      = 80*5*3
U_Per_Rev_Denominator      = 10
```



Result of parameters Modulo_Range, Modulo_Nominator and Modulo_Denominator: The modulo range will cover one revolution of the toothed-belt wheel.

Result of parameters U_Per_Rev_Nominator and U_Per_Rev_Denominator: One scaled unit corresponds to one mm of the tooth belt.

Example: Gearbox 10.1

	Option1	Option2
En_Modulo	TRUE	TRUE
Modulo_Range	10240	10240
Modulo_Nominator	1	1
Modulo_Denominator	1	1
Inc_Per_R	1024	10240
U_Per_Rev_Nominator	36	360
U_Per_Rev_Denominator	1	1
Max_Rpm	3000	300

The two options above describe exactly the same configuration. The Modulo_Range is equivalent to 10 motor revolutions and is 10240 increments. For the position, 1u means 1° and the resolution is 360°/10240inc = 0,035°/Inc = 1°/28,44 Inc.

Example: Gearbox 10.3

	Option1	Option2
En_Modulo	TRUE	TRUE
Modulo_Range	1024	10240
Modulo_Nominator	10	1
Modulo_Denominator	3	3
Inc_Per_R	1024	10240
U_Per_Rev_Nominator	108	1080
U_Per_Rev_Denominator	1	1
Max_Rpm	3000	300

The two options above describe exactly the same configuration. The gearbox is 10:3, so the Modulo_Range is equivalent to 1024*10/3 = 3413 + 1/3 increments. For the first option, the resulting modulo range is calculated 1024*10/3, for option2, it is 10240*1/3. For the position, 1u means 1° and the resolution is 108°/1024inc = 0,105°/Inc = 1°/9.481 Inc.

Scaling of the unit of length

Inc_Per_R With this parameter the number of the drive position counts each revolution of the motor (DINT) have to be entered.

U_Per_Rev_Denominator & U_Per_Rev_Nominator With these two parameters the number of units which correspond to one revolution of the motor have to be entered.

The units of length can be scaled to values like: mm, inch, degree, …

All dynamic parameters of the PLCopen function blocks like velocity, acceleration and jerk are based on seconds. Velocity [units/s], acceleration [units/s²], jerk [units/s³]

Example 1

```
Inc_Per_Rev            = 10000
U_Per_Rev_Nominator     = 360
U_Per_Rev_Denominator     = 1
```

This will scale one unit to one degrees of the motor shaft. Correspondingly a velocity [units/s] of 360 will turn the motor shaft one revolution per second.

Example 2 In the example one unit will be scaled to one millimeter of the conveyor.

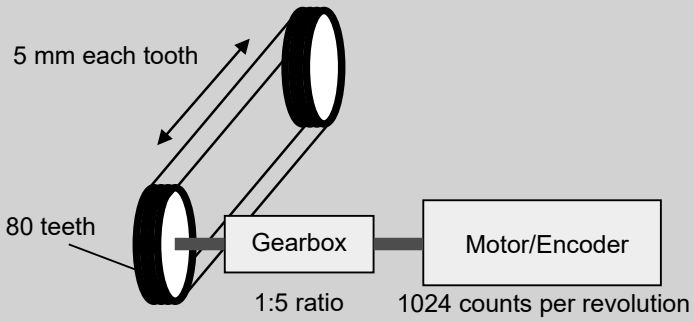


Fig. 85: Scaling units

How many units will pass after one revolution of the motor? (80*5mm) / 5 = 80

```
Inc_Per_Rev            = 1024
U_Per_Rev_Nominator     = 80
U_Per_Rev_Denominator     = 1
```

Example 3 In the example one unit will be scaled to one millimeter of the conveyor.

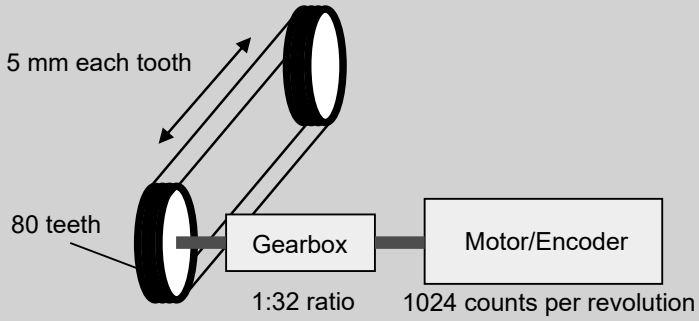

Fig. 86: Scaling units

How many units will pass after one revolution of the motor? (80*5mm) / 32 = 12,5 = 125 / 10

```
Inc_Per_Rev             = 1024
U_Per_Rev_Nominator      = 125
U_Per_Rev_Denominator      = 10
```

Scaling of the speed reference output

These two parameters are used to scale Speed Reference output of the kernel FB in order to reach the intended velocity by the output value and to limit the highest possible output value.

Ref_Max Highest possible output value of the Speed Reference output. The Speed Reference value that corresponds to the parameter Max_Rpm should be used.

Max_Rpm Maximum speed of the motor in revolutions per minute.

Example

- Analog Drive: 1000 rpm at 2 Volts, 3200 rpm at 6,4 Volts (max.)
- Analog output module: 10 Volts output at digital value 27648
- Ref_Max = 17695 (= 27648 / 10 * 6,4)
- Max_Rpm = 3200

Access and modify parameters

All modifications will be effective immediately. There is no extra plausibility check and values are not checked for limitations.

Use this functionality with care.

Some parameters are collected inside a structure in Axis_Ref, and can be accessed and modified immediately. They are the same parameters as used with function blocks MC_Write-Parameter and MC_ReadParameter *Chapter 1.5.10.3.6 “PLCopen parameter” on page 2308*.

The differences are:

- Only available with CMC_Basic_Kernel
- The parameter values are LREAL instead of DINT and can be used with decimals.
- The parameters will be effective immediately.
- There is no check for consistency or limits.
- The parameters for position control can be checked and modified by accessing the structure Axis_Parameter.CMC_Pos_Control in addition.

Parameter for position control	Description
KP	Proportional gain in positive direction. Used directly to multiply the following error and create the Reference_Prop.
KF	Feed forward in positive direction. Used directly to multiply the speed reference and create the Reference_FF.
KP_BACK	Proportional gain in negative direction. Used directly to multiply the following error and create the Reference_Prop.
KF_BACK	Feed forward in negative direction. Used directly to multiply the speed reference and create the Reference_FF.
TI	Integration time. When parameter is used the position control loop has an additional integral part. In TI cycle, the Reference_ITG will reach the value of Reference_Prop, when KI=100*KP.
KI	Proportional gain, used for integral part of position control loop.
KF_100	Value for feed forward gain, if 100% would be used.
Max_Time	Delay time used for supervision of velocity. With Max_Time=0, no supervision is executed.
D_XS_Max	Maximum possible velocity in [u/cycle]. The maximum allowed following error is part of the parameter structure, PLCopen parameter paraMaxPositionLag.
Ref_Max	Limit for Speed_Reference.

Element actual of Axis_Ref

The element `actual` represents actual values from inside the position control loop.

Value	Description
Position	Actual position in [u] to control the axis.
Control_Position	Reference position in [u] which is actually used for control loop.
D_XS	Distance in [u] to be moved per cycle.
D_XSS	Following error in [u].
Reference_Prop	Proportional part for Speed_Reference.
Reference_FF	Feed forward part for Speed_Reference.
Reference_ITG	Integral part for Speed_Reference.

Possible to use different gain for forward/ backward movement , possible improvement for hydraulic axis or vertical movement

See parameter KP/KP_BACK and KF/KF_BACK.

Limitation for velocity and acceleration and deceleration

From library version 3.1 on, these values are not limited to the 16-bit range of values (32767). The limit for velocity is calculated by the values given at CMC_Axis_Control_Parameter and the acceleration is limited such that this velocity can not be reached faster than 1 cycle.

1.5.10.4.4 Programming guidelines

To achieve the best results for Motion Control the actual position has to be transferred in best possible quality (with minimal jitter) to the PLC. The position feedback is expected to be in increments as the data type is a DINT.

The kernel function block (CMC_Basic_Kernel or OBIO_PTOMotionKernel or OBIO_PWMMotionKernel) has to be called every cycle and its task requires a fixed cycle time.

A variable of type Axis_Ref is used to connect to the PLCopen function blocks and their kernel function block.

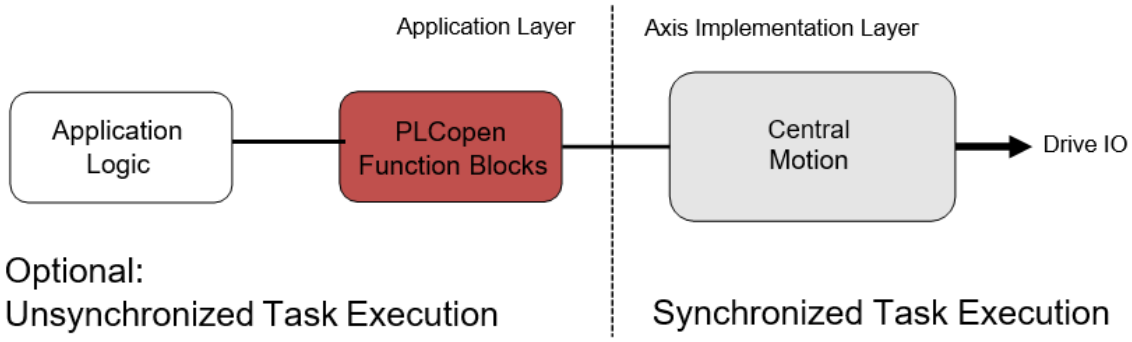
The function block CMC_Axis_Control_Parameter has to be used for the axis configuration.
↳ *Chapter 1.5.10.4.3 “Axis parameters” on page 2353*

The signal of the limits switches and the absolute switch should be connected to the elements of the data type CMC_Axis_IO. The signal of the absolute switch must be TRUE in case the axis hits the sensor. The signal of a corresponding limit switch has to be true when the axis leaves the area surrounded by the limit switches. If needed the signal has to be inverted before it is connected to the elements of the data type.

Task configuration

The kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.

In order to save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real-time task with the axis implementation as shown in the figure below.



All PLCopen function blocks which must be called in the same task than the kernel function block:

- MC_CombineAxes
- MCA_MoveByExternalReference

In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following figures show an example for EtherCAT:

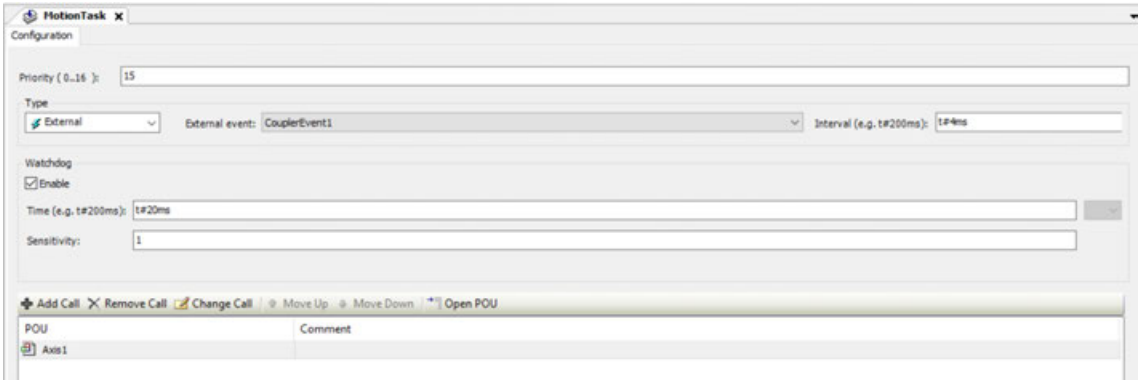


Fig. 87: Task of axis layer

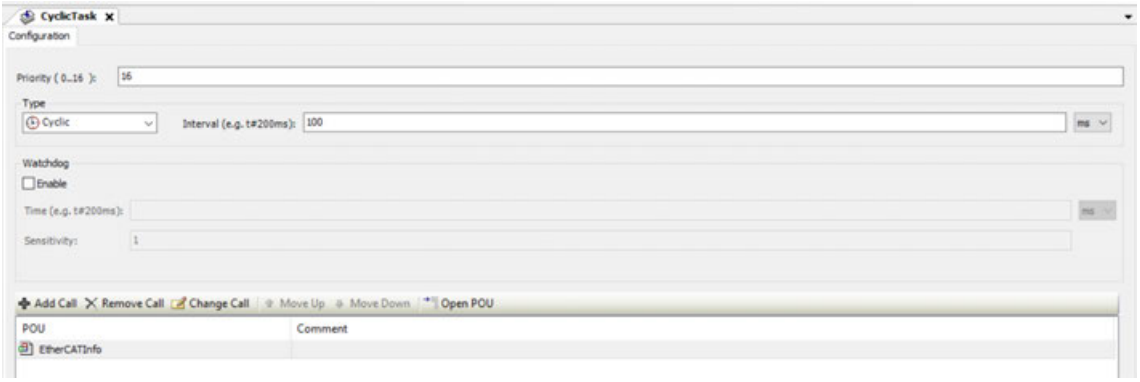

Fig. 88: Task of application implementation

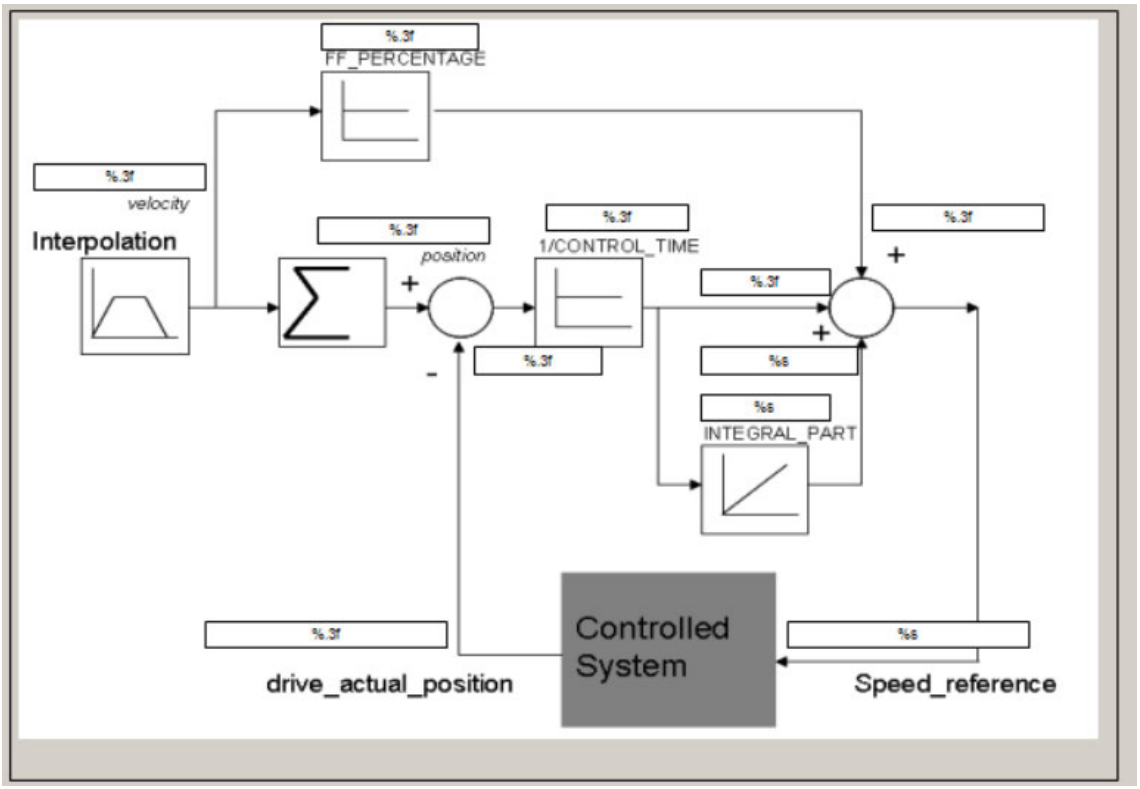
1.5.10.4.5 Visualization

The structure of the position control loop is also as visualization element CMC_Visu_FB_Basic_Kernel. included in ABB_MotionControl_AC500.library. As placeholder, an instance of CMC_Basic_Kernel has to be used. The visualization shows all numbers as they are really used inside the block, the adjustment for different resolution or cycle times is already included.



1.5.10.4.6 ABB specific data structures

Not all data structures are defined by PLCopen. Some specific structures are described in the following chapter. In addition to the data in these arrays, the movement is modified by offset and scaling values at the respective function block. These offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

PositionPositionProfile

The data type MC_PProfile is used for CamTable. An array has to be defined and provided at MC_CamTableSelect. Several CamTables could be defined and the axis could change between them on the fly. There is no routine of smooth movement from one table to the next so the user has to take care just to switch on appropriate positions. Details are described in the documentation included with the library.

Declaration example CAM_table

```
ARRAY[1..3] OF MC_PProfile:=
    (Master_position:=    0    ,interpolation_point :=
0    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 ),
(Master_position:=    50    ,interpolation_point :=
25    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 ),
(Master_position:=    100    ,interpolation_point :=
0    ,Velocity_ratio:= 0    ,Acceleration_ratio:= 0 );
```

PositionTimeProfile

This structure is used for time based profiles, e.g. MC_PositionProfile:

Interpolation types for profiles

The curves defined by an array of MC_PProfile hold master position points and according slave positions. When the master position is between 2 points, the according position for the slave is interpolated. Different types of interpolation are possible. The type is defined in MC_ABB_iTypes_Enum . The master could be a real axis or some virtual axis which could be created by just writing values for position and velocity to the Axis_Master variable as shown in the example. The same interpolation types could be used on MC_TProfile.

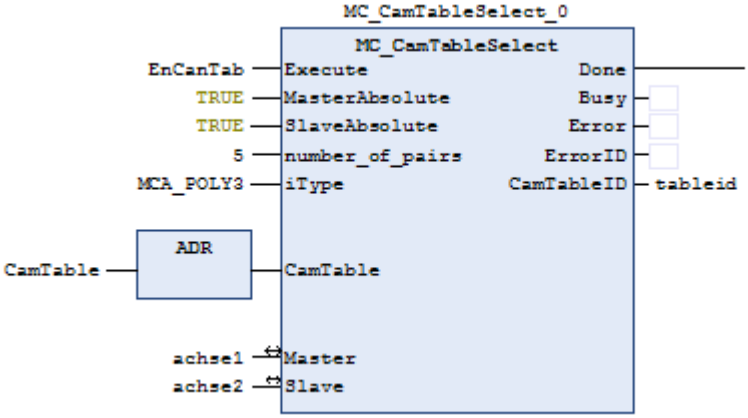


Table 396: Overview of different interpolations

Interpolation Types	Results in	Requires
MCA_LINEAR	Linear interpolation with constant velocity between interpolation points.	profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point
MCA_SPLINE_NATURAL	Cubic spline interpolation without jerk.	profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point

Interpolation Types	Results in	Requires
MCA_SPLINE_COMPLETE	Cubic spline interpolation without jerk, start and end of profile with velocity=0.	profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point
MCA_POLY3	Polynomial interpolation with linear velocity between interpolation points.	profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio
MCA_POLY5	Polynomial interpolation with linear acceleration between interpolation points.	profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio, profile.MC_PProfile_Array[x].acceleration_ratio

The interpolations allow to run on smooth curves without the need to define a large number of points. The following chapter shows the results with different interpolation modes for a sinus-curve with 10 interpolation points. The following table gives the mean deviation.

Interpolation Type	Mean deviation [ppm]
MCA_LINEAR	19686 =1.9%
MCA_SPLINE_NATURAL	151=0.0151%
MCA_SPLINE_COMPLETE	25510=2.5%
MCA_POLY3	131=0.0131%
MCA_POLY5	0.37

The original curve is represented by y_sinus for position and v_sinus for velocity. The diagrams show the result which is achieved by different interpolation types.

MCA_LINEAR

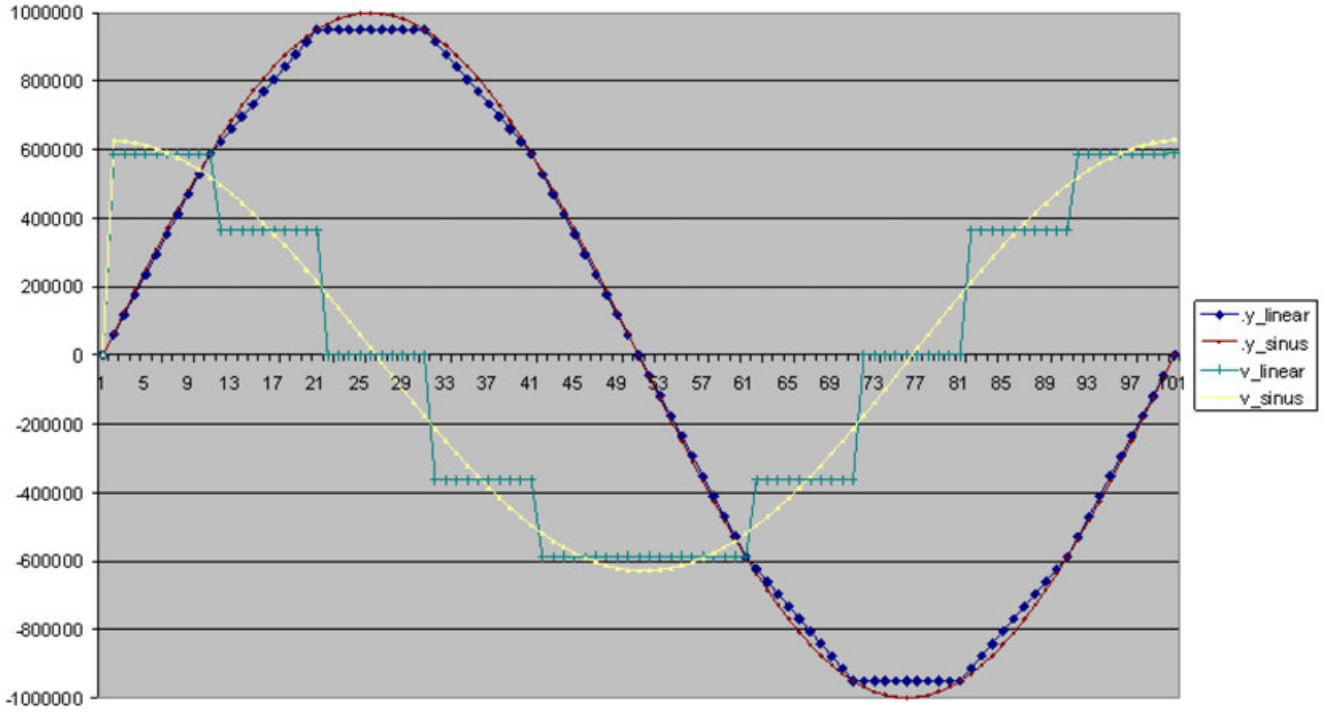

Fig. 89: Results from linear interpolation

The velocity is constant between the interpolation points.

MCA_POLY3

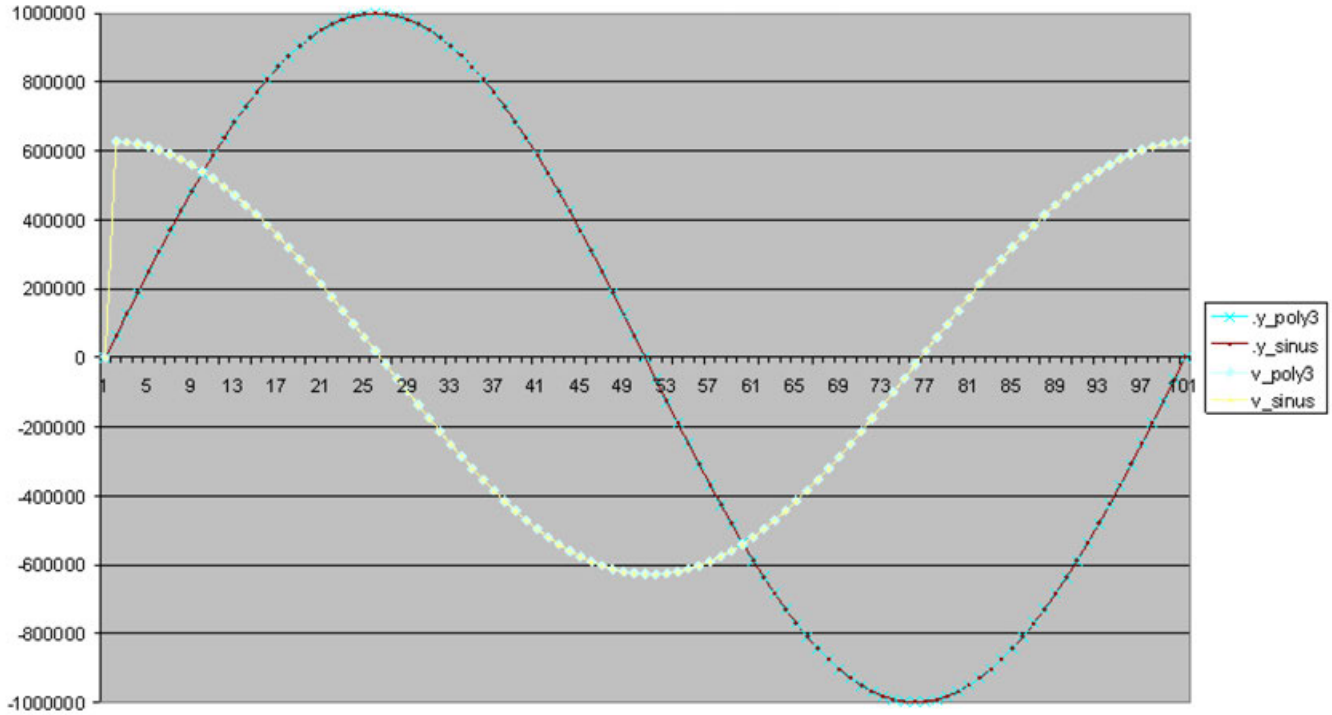

Fig. 90: Results from polynomial interpolation

The result looks almost identical to the original curve. The mean deviation shows that MCA_POLY3, MCA_POLY5 and MCA_SPLINE_NATURAL produce results which follow the original curve really good and are almost identical. The spline interpolation produces a jerk-free curve without the need of providing velocity values and acceleration values in advance.

MCA_COMPLETE

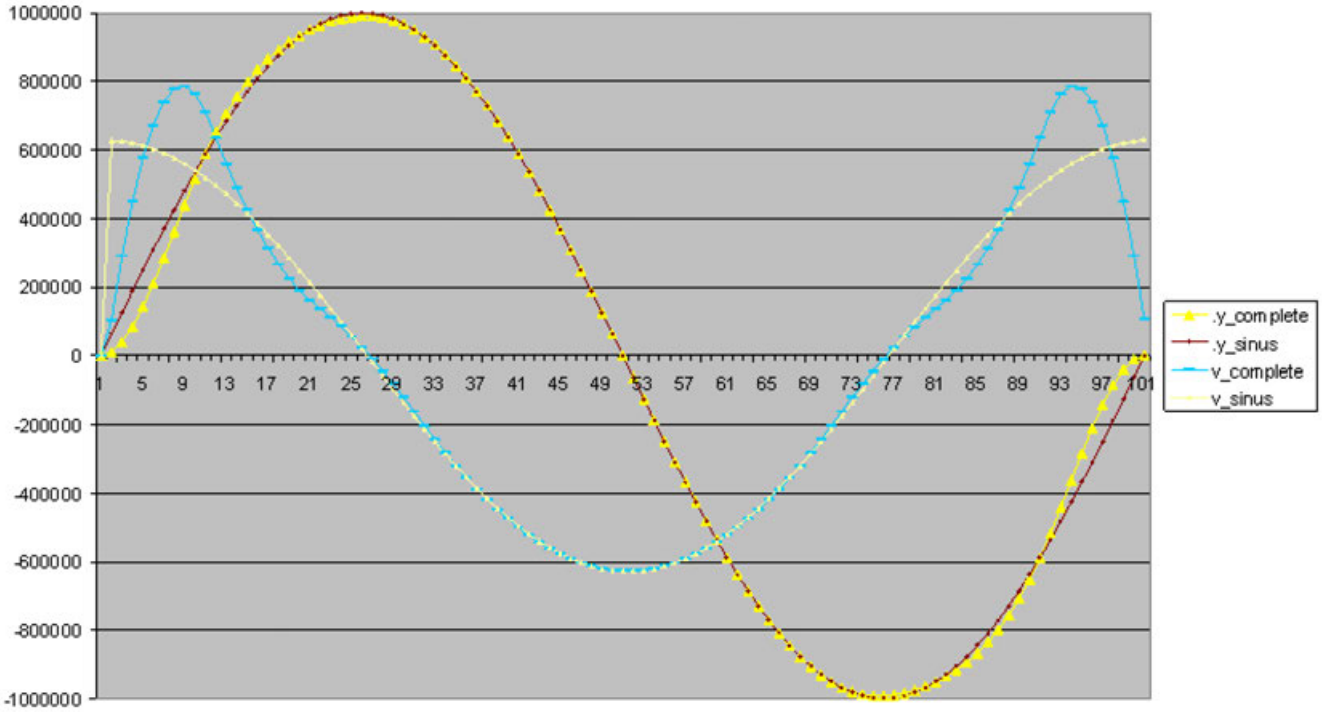

Fig. 91: Results from complete spline interpolation

In the beginning and the end, the curve does not follow the original curve. The reason is that it starts with velocity=0 and produces a jerk free result.

So the favoured result has to be considered in advance to choose the right interpolation method. With these different methods it is not necessary to provide a large number of interpolation points to get good results and smooth acceleration and deceleration ramps.

1.5.10.4.7 PLC-based motion control — Load control / fluid power extensions

The ABB_MotionControlLoad_AC500 library is an extension to ABB_MotionControl_AC500 library based on PLCopen part 6 called “fluid power” and basically can be used to implement load control as a simple form of torque profiling. It can be used together with all other motion control package libraries. The same structure and general rules are applied and all the above chapters in this document is relevant for ABB_MotionControlLoad_AC500 library as well. It is recommended to read through all the above chapters before start using the function blocks from this library. A difference is that the position control loop has to be closed inside the PLC as it is to be synchronized with the load control loop which is also realized. The implementation of Load function blocks is based on the PLCopen part 6 – Fluid power.

Overview of the defined extended function blocks:

Table 397: Overview of the defined function blocks

Administrative		**Motion**	
Single axis	**Multiple axis**	**Single axis**	**Multiple axis**
MC_LimitLoad	-	MC_LoadControl	-
MC_LimitMotion	-	MC_LoadSuperIm-posed	-
-	-	MC_LoadProfile	-
-	-	MC_TorqueControl	-

As per PLCopen MC_TorqueControl is a part 1 function block, however due to its implementation as a wrapper for the load control and limit load blocks this is added to ABB_MotionControlLoad_AC500 library.

The following state diagram is based on the version as defined in 'Part 1 – Function Blocks for Motion Control', Version 2.0.

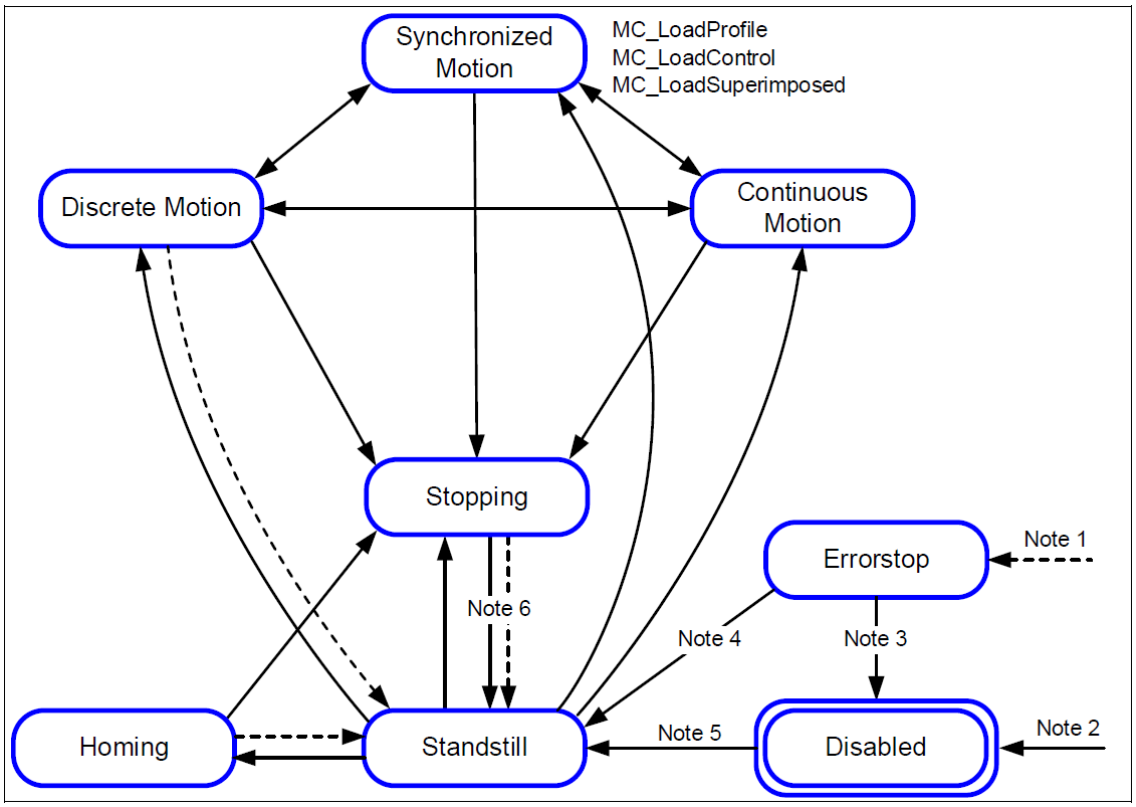
This specification adds three load function blocks to the state diagram:

- MC_LoadControl
- MC_LoadSuperImposed
- MC_LoadProfile

MC_TorqueControl function block also follows the same state diagram.

Function blocks not listed in the state diagram do not affect the state diagram, meaning that whenever they are called the state does not change.

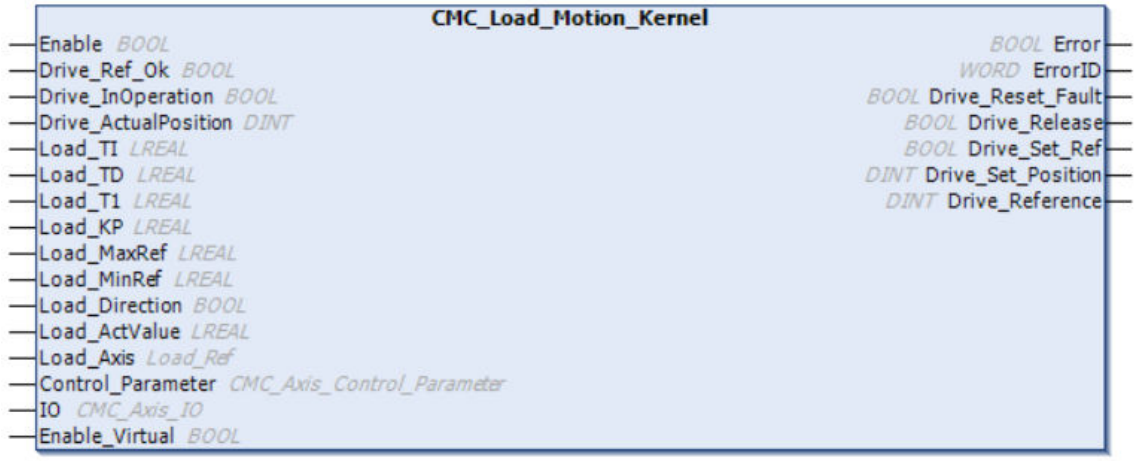
The state diagram shows synchronized motion because the position-axis follows the load, and the state is related to the position axis.

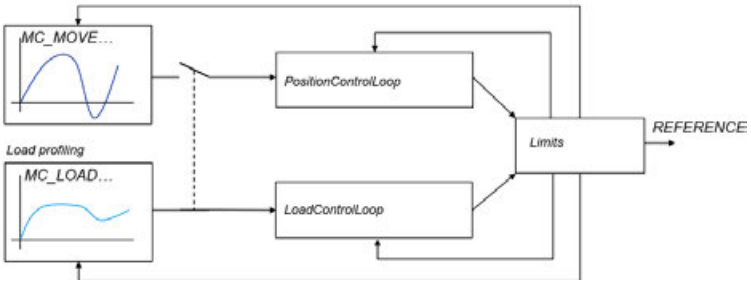


Note 1: From any state. An error in the axis occurred.
Note 2: From any state. MC_Power.Enable = FALSE and there is no error in the axis
Note 3: MC_Reset and MC_Power.Status = FALSE
Note 4: MC_Reset and MC_Power.Status = TRUE and MC_Power.Enable = TRUE
Note 5: MC_Power.Enable = TRUE and MC_Power.Status = TRUE
Note 6: MC_Stop.Done = TRUE and MC_Stop.Execute = FALSE

Kernel function block - Fluid power

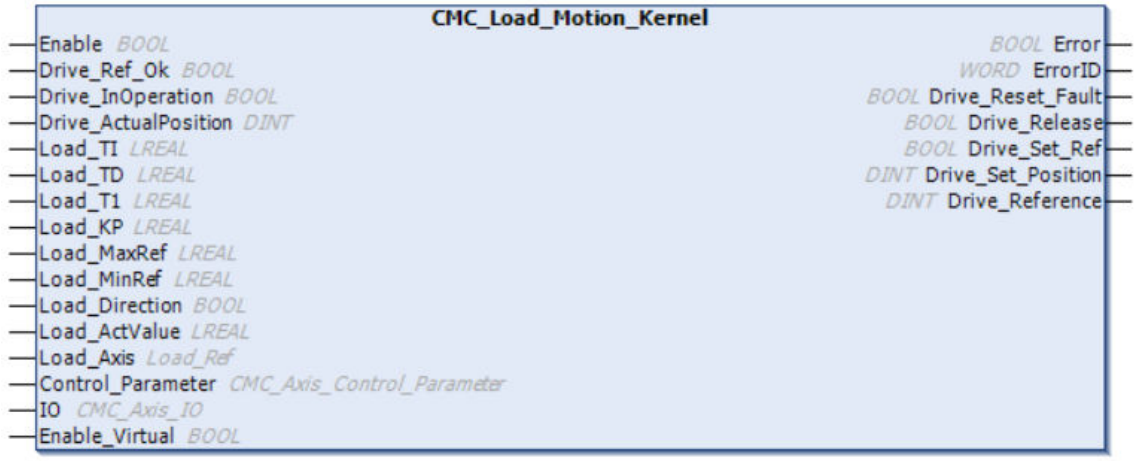
The basic block is the CMC_Load_Motion_Kernel. It has to be called every cycle and at least once before any MC… block is activated. It is used to combine the position and velocity functionality from CMC_Basic_Kernel with the load control functionality which is utilized by the MC_Load... blocks.





The reference which is used by the CMC_Load_Motion_Kernel is equivalent with the Speed_Reference at CMC_Basic_Kernel, as long as no LOAD-functionality is activated. The documentation from CMC_Basic_Kernel applies to the identical inputs and outputs. Some inputs and outputs are added to serve the load control functionality.

> *The Load_Ref is used instead of Axis_Ref for the MC_Loadxxx blocks. When the CMC_Load_Motion_Kernel is used, Load_Ref replaces Axis_Ref and user can use all PLCopen-Blocks.*



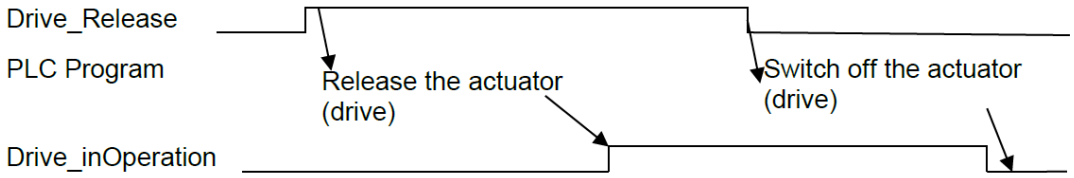
The actuator (drive) has to be accessed outside the CMC_Load_Motion_Kernel block. Actual values and reference values might be transferred by a synchronised bus or by I/Os.

- •All inputs and outputs of the function block which are named “DRIVE_xxxx” should be used to connect to the actuator (drive). It does not matter whether this connection is done by fieldbus or by conventional IOs.

  The Axis-structure is used to connect to the PLCopen blocks
- The Load_Axis structure is used to connect the fluid-power PLCopen blocks

- The control_parameter-structure is used for configuration of control loop.
- The IO-structure gives a connection to limit- or reference switches.

When the function block will take control (close loop) the output “Drive_Release“ is set. The PLC-Program should then start the actuator (actuator (drive)) and set “Drive_InOperation = TRUE” when successful. In case of actuator (actuator (drive)) problem, “Drive_InOperation” should be reset. The function block will then open the position control loop and Speed_Reference will be 0.



The homing is done with PLCopen-blocks. As the interface to the actual position is outside the CompactMotion, the bit “Drive_Set_Ref” is set when the state is reached to evaluate the zero-track. When the zero-track was found, Drive_ActualPosition has to be set to “Drive_Set_Position”, this has to be indicated by “Drive_Ref_Ok”.

The output “Drive Reference” should be send to the actuator (drive). This value is scaled with Max_Rpm and Max_Reference which means: when “Drive_Reference” equals Max_Reference, the motor is expected to run with Max_Rpm.

Load control

The function block holds a position control loop and a load control loop. The load control loop is a PIDT1-Block. Both control loops are alternately activated, depending if a MC_Load..block or a MC_Move… block is active. There is a bumbless transition realized between the different control loops.

The PIDT1 controller has a proportional, integral and derivative part. The integral and derivative part can be switched of by using a time value = 0.

Transfer function

$$F(s) = KP * \left(1 + \frac{1}{s * TN} + \frac{s * TV}{1 + (s\,T1)}\right)$$

Control algorithm: Simple rectangle rule:

$$Y = \frac{KP*XD}{100} + \frac{KP}{100} * \frac{XD}{TN\_TZ} + YI(z\text{-}1) + \frac{T1\_TZ}{1+(T1\_TZ)} * (YDTI(z\text{-}1) + \frac{1}{T1\_TZ} * \frac{TV}{TZ} * \frac{KP}{100} * (XD - XD(z\text{-}1)))$$

Where:
YI(z-1): The integral portion from the previous program cycle

(YDTI(z-1) The differential portion from the previous program cycle

XD(z-1): Control system difference from the previous program cycle

All 3 parts of the control loop are added up. The integral or derivative part could be disabled by setting the respective time constant to 0, so the following structures are possible:

- P
- PDT1
- PI
- PIDT1

The Load_MaxRef and Load_MinRef values will limit the controllers output Y and also apply to the controller’s internal integral part. I.e the integral part can only hold values between the high and low limits. If the manipulated variable Y reaches one of the two limits, the controller's integral part is no longer changed. This prevents the integral part from holding meaningless values and, in certain circumstances, not returning to the operating range for a long time. This behavior of a controller is also referred to as a "special anti-reset windup measure".

Example - Fluid power extensions

MC LimitLoad

In the diagram below, an example is explained. SFC is used here to distinguish between a movement where the MC_LimitLoad functionality has become ‘Active’ or not. In Step 2 there is a movement like ‘MoveAbsolute’, which is limited by the MC_LimitLoad functionality. If the absolute position is reached without MC_LimitLoad becoming active, the transition via done to step 3 is applicable. However, if the MC_LimitLoad becomes ‘Active’, the transition to the ‘Halt’ step is applicable, issuing a MC_Halt.

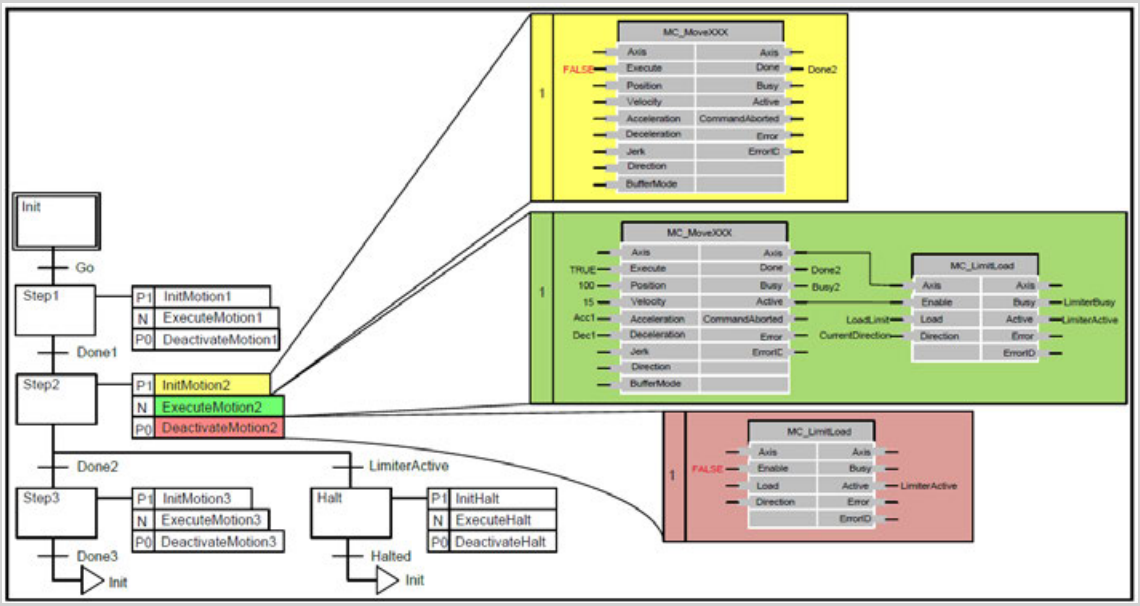


Fig. 92: MC_LimitLoad used in SFC

MC_LimitMotion e.g. force fitting

The function block is intended to be used in conjunction with a MC_LoadControl or MC_TorqueControl having primary control on the axis. The MC_LimitMotion should be enabled by the ‘Active’ output of the MC_LoadControl / MC_TorqueControl. If motion values on the axis exceed the given limit, appropriate measures are taken to keep to these limits, implying that the load/torque will not follow the programmed trajectory but depend on the external load conditions. However, the ‘Active’ output of the MC_LoadControl/MC_TorqueControl will stay TRUE in this case, following the modified PLCopen definition “The ‘Active’ output indicates, that the FB has control on the set-value generation of the axis”. This is despite the fact, that physically only the load-conditions or the movement of an axis can be controlled. With actual motion states below programmed limits, the programmed load/torque trajectory will proceed. Enabling the limiter block with activation of the MC_LoadControl/MC_TorqueControl ensures that limits are only supervised when the MC_LoadControl/MC_TorqueControl takes control on the axis for the first time. Disabling the limiter block with de-activation of the MC_LoadControl/MC_TorqueControl ensures that limits are no more supervised when the MC_LoadControl/MC_TorqueControl loses control on the axis by ‘CommandAborted’ or ‘Error’.

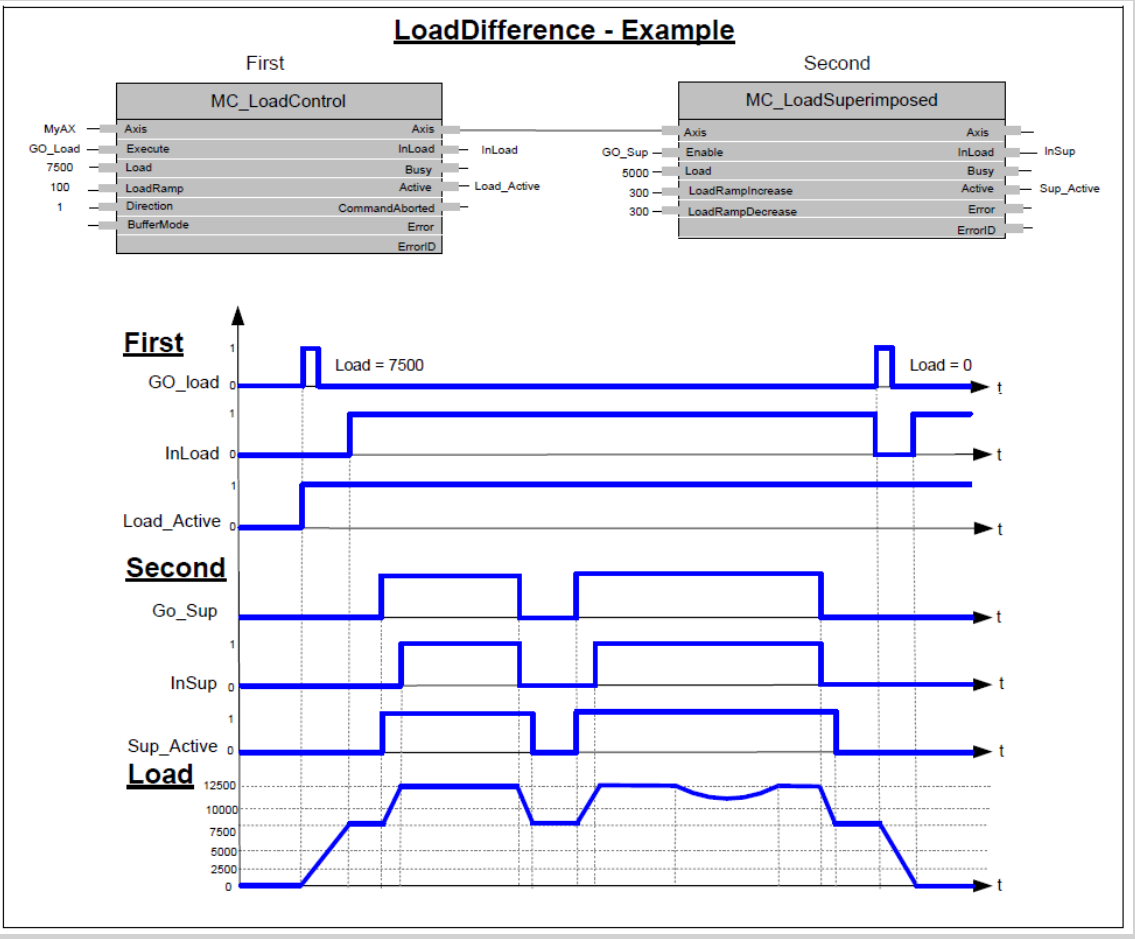
MC_ LoadSuperImposed

Possible Application: Actuator: hydraulic cylinder with fluid pressure sensor actuates the press of plastic injection molding machine in a continuous load operation.

Request: Prior to MC_LoadSuperImposed call, a MC_LoadControl block is ‘Active’ with a command of 7,500 kPa to press melted plastic into the mold. Once the MC_LoadControl ‘InLoad’ condition is achieved a superimposed pressure of 5,000 kPa is added several times to cause a hammering effect to relieve stresses in the plastic.

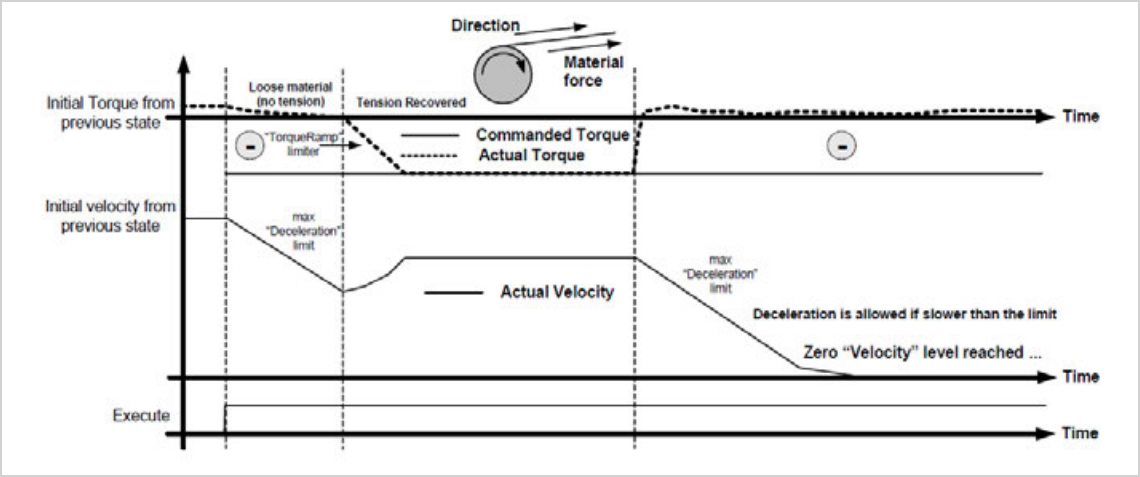
Result: the MC_LoadControl pressure command of 7,500 kPa is superimposed with a discrete pressure command of 5,000 kPa. Once the ‘LoadSuperImposed’ command is active the system pressure rises to 12,500 kPa.

When the superimposed pressure command has been achieved the MC_LoadSuperImposed block is done and the original command given by the MC_LoadControl resumes the original pressure command. The MC_LoadSuperImposed block is executed several times without affecting the original pressure command given by the MC_LoadControl block.



MC_Torque-Control

The example (below) opposite signs for ‘Direction’ & ‘Torque’ are used (e. g. Retention or brake control). (In the function block: +Direction –Torque). It is like an unwinding application with torque on the material, and a break in the material. When the material breaks, as shown in the middle of the figure this causes a drop in the real Torque value (in absolute terms): The velocity will decrease, limited by the fastest “deceleration” limit specified by the ‘Deceleration’ VAR_INPUT down to zero velocity (with no tension there is a risk of having shock breakings, so we have to limit to the fastest). In this case the torque setpoint might not be achieved.



In an unwinding application (derived from this brake control) material tension is the target, not motor torque. The instantaneous diameter of the roll should be taken into account to transform the “User tension setpoint”. Also, additional inertia compensation by modification of the torque setpoint for acceleration / deceleration is common from instantaneous weight data (weight is commonly estimated from diameter). Additionally, in unwinding applications, in the case of loose material (same condition as material break), a negative slow velocity reference is usually applied to “rewind” the loose material. In this case, this must be provided by external programming.

1.5.10.4.8 Appendix

List of all PLCopen and ABB specific function blocks in PS552-MC (for V2 PLC) and PS5611-Motion (for V3)

SNo	Funktion block type	Funktion block name	Motion Library V2 (PS552-MC)	Motion Library V3 (PS5611-Motion)

1.5.11 MQTT client library

1.5.11.1 Structures and enumerations

MQTT_ERROR_ID (Enum)

Parameter	Value	Description
MQTT_ERR_NO_ERROR	0	No error.
MQTT_ERR_CONN_SERVICE_UNAVAIL	16#3001	The Network Connection has been made but the MQTT service is unavailable on the specified port.
MQTT_ERR_COMMUNICATION_TIMEOUT	16#3013	The timeout value for the communication has been exceeded.
MQTT_ERR_REC_PACKET_TOO_LONG	16#3017	Received topic is too long.
MQTT_ERR_PING_NO_ANSWER	16#301A	The MQTT broker did not answer the ping. MQTT client has passed the KeepAlive or MQTT broker is unreachable.
MQTT_ERR_CONN_CLIENT_ID_NOT_ALLOWED	16#301F	The Client identifier is correct UTF-8 but not allowed by the Server.
MQTT_ERR_CONN_REFUSED_PROTOCOL	16#3020	The Server does not support the level of the MQTT protocol requested by the Client.
MQTT_ERR_CONN_REFUSED_CONNECTION	16#3025	Connection refused, maybe the IP address is malformed.
MQTT_ERR_UNSPECIFIED_ERROR	16#302B	Internal library returned an unspecified error.
MQTT_ERR_NETWORK_ERROR	16#302D	General network error.
MQTT_ERR_CONN_AUTH_FAILED	16#3217	Authentication failed: Bad username, password OR client id.
MQTT_ERR_CONN_TLS_HANDSHAKE_FAILED	16#3230	Error on TLS handshake.
MQTT_ERR_CONN_SERVER_CERT_NOT_VALID	16#3231	Server certificate not valid. Check if PLC date has been set correctly.
MQTT_ERR_CONN_SERVER_CERT_NOT_PEM	16#3232	Server certificate format is not formatted as PEM.
MQTT_ERR_CONN_SERVER_CERT_EXPIRED	16#3233	Server certificate has expired.
MQTT_ERR_CONN_CLIENT_CERT_NOT_VALID	16#3234	Client certificate not valid. Check if PLC date has been set correctly.
MQTT_ERR_CONN_CLIENT_CERT_NOT_PEM	16#3235	Client certificate or client key format is not formatted as PEM.
MQTT_ERR_CONN_CLIENT_CERT_EXPIRED	16#3236	Client certificate has expired.

Parameter	Value	Description
MQTT_ERR_INPUT_02_0	16#4020	Function block Input 02 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertBuffer (FB): Parameter Conn of function block was not set. ● MqttConnectWithCertFile (FB): Parameter Conn of function block was not set. ● MqttGetReceivedPacket (FB): Parameter Conn of function block was not set. ● MqttPublish (FB): Parameter Conn of function block was not set. ● MqttSubscribe (FB): Parameter Conn of function block was not set. ● MqttUnsubscribe (FB): Parameter Conn of function block was not set. MqttPing (FB): Parameter Conn of function block was not set.
MQTT_ERR_INPUT_03_0	16#4030	Function block Input 03 error (error case 0), specific error depends on used function block: ● MqttGetReceivedPacket (FB): Pointer payload not initialized. ● MqttPublish (FB): Publish topic name must not contain wildcard characters (+ or #). ● MqttSubscribe (FB): Topic is missing. ● MqttUnsubscribe (FB): Topic is missing.
MQTT_ERR_INPUT_03_1	16#4031	Function block Input 03 error (error case 1), specific error depends on used function block: ● MqttPublish (FB): Payload is not set in MQTT_MESSAGE.
MQTT_ERR_INPUT_04_0	16#4040	Function block Input 04 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertBuffer (FB): Check if Port number has been set correctly (0 is not accepted). ● MqttConnectWithCertFile (FB): Check if Port number has been set correctly (0 is not accepted).
MQTT_ERR_INPUT_06_0	16#4060	Function block Input 06 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertFile (FB): Server certificate file was not found.
MQTT_ERR_INPUT_07_0	16#4070	Function block Input 07 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertFile (FB): Client certificate file was not found.

Parameter	Value	Description
MQTT_ERR_INPUT_08_0	16#4080	Function block Input 08 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertFile (FB): Client key file was not found.
MQTT_ERR_INPUT_12_0	16#4120	Function block Input 12 error (error case 0), specific error depends on used function block: ● MqttConnectWithCertBuffer (FB): Couldn't initialize Last Will message because the topic is not set. ● MqttConnectWithCertFile (FB): Couldn't initialize Last Will message because the payload is not set.
MQTT_ERR_INPUT_12_1	16#4121	Function block Input 12 error (error case 1), specific error depends on used function block: ● MqttConnectWithCertBuffer (FB): Couldn't initialize Last Will message because the topic is not set. ● MqttConnectWithCertFile (FB): Couldn't initialize Last Will message because the payload is not set.
MQTT_ERR_FATAL_ERROR	16#5FFFF	Fatal error state machine.

MQTT_QOS (Enum)

Parameter	Value	Description
QOS_0	-	Fire and forget (At most once delivered).
QOS_1	-	Simple acknowledgement (At least once delivered).
QOS_2	-	Complex acknowledgement (Exactly once delivered).

MQTT_MESSAGE

This structure is used for messages which can be published or used for LastWill on MqttConnect(FB).

Variable name	Data type	Default value	Description
sTopic	STRING(MQTT_MAX_TOPIC_LEN)	Empty string	Topic where this message belongs to.
pbyPayload	POINTER TO BYTE	0	Payload which should be sent.
dwLen	DWORD	0	Length of the payload.
eQos	MQTT_QOS	QOS_0	Quality of Service level.
xRetainFlag	BOOL	FALSE	True = message must be stored by the server, False = server must not store this message.

MQTT_CONNECTION

Internal data required by the library to operate. This structure allocates memory and it is used to identify the MQTT connection you want to work with

Parameter	Data type	Range
abyConn	Array	MQTT_CLIENT_STRUCT_SIZE
abyTxBuf	Array	MQTT_TX_BUF_SIZE
abyRxBuf	Array	MQTT_RX_BUF_SIZE
abyMsgBuf	Array	MQTT_MSG_BUF_SIZE

1.5.11.2 Global variables

MQTT_CONSTANTS

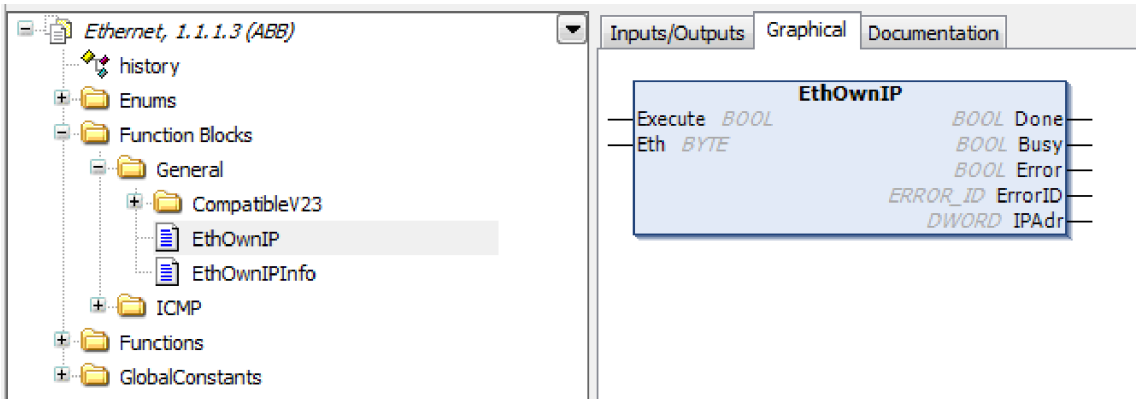
Parameter	Datatype	Value	Description
MQTT_MAX_IP_ADDRESS_LEN	Word	15	Maximum length of the IP address.
MQTT_MAX_PEM_KEY_LEN	Word	2048	Maximum length of the PEM key.
MQTT_MAX_PEM_CERT_LEN	Word	3072	Maximum length of the PEM certificate.
MQTT_MAX_FILE_PATH_LEN	Word	255	Maximum length of the file path to the certificate files.
MQTT_MAX_CLIENT_ID_LEN	Word	250	Maximum length of the client id.
MQTT_MAX_USERNAME_LEN	Word	250	Maximum length of the username.
MQTT_MAX_PASSWORD_LEN	Word	250	Maximum length of the password.
MQTT_MAX_TOPIC_LEN	Word	255	Maximum length of the topic.
MQTT_CLIENT_STRUCT_SIZE	Word	336	Size of the internal connection structure representing the connection state.
MQTT_TX_BUF_SIZE	Word	1024	Size of the internally used output buffer.
MQTT_RX_BUF_SIZE	Word	1024	Size of the internally used input buffer.
MQTT_MSG_BUF_SIZE	Word	2148	Size of the internally used message buffer.

1.5.12 PLCopen libraries

1.5.12.1 Common function block state machine

Most of the V3 function blocks follow the behavior model and style as recommended by PLC Open.

- Clear separation between *“Edge triggered FBs”* (*“Execute”*) or *“Level triggered FBs”* (*“Enable”*)
- Binary status outputs: *“Done”*, *“Busy”*, *“Error”* (exclusive)
- Standardized state machine
- CamelCase naming for function block and all inputs and outputs



Example: Edge_Triggerd_Function_Block_EthOwnIP according to PLCopen

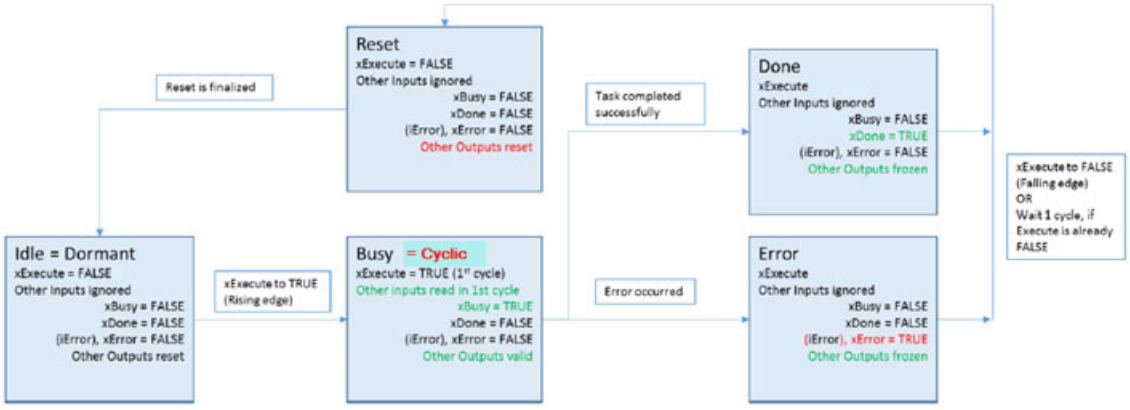
Currently the following *"function block state machines"* are used:

- *"Edge Triggered"* (Input *"Execute"*), for example EthOwnIP
- *"Level Controlled"* (Input *"Enable"*)
- *"Level Controlled Continuous"* (Input *"Enable"*, no *"Done"* output, for example PID)

> *In contrast to AC500 V2 POUs, either "Done" or "Error" is set, not both outputs at the same time in case of an error.*

The state machines are explained in the following chapters.

1.5.12.1.1 Edge triggered (AbbETrig)



After a rising edge at the input *"Execute"* the state goes from *"Dormant"* to *"Busy"*. In the first cycle all inputs are sampled and stored.

When the task is completed successfully the state goes from *"Busy"* to *"Done"*.

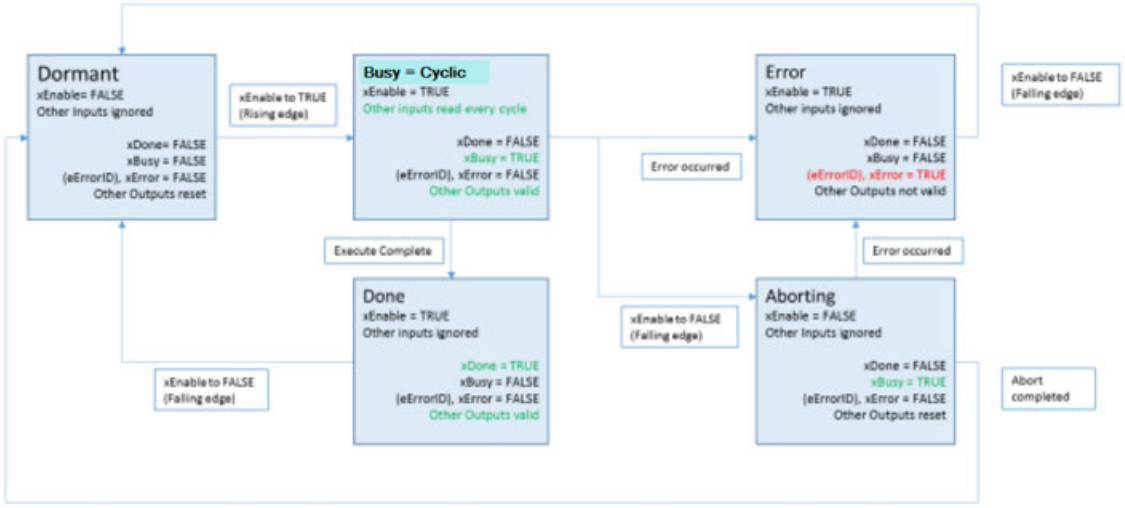
In case of an error the state goes to *"Error"*.

The states *"Done"* or *"Error"* are stable for minimum one cycle and as long as *"Execute"* is *"TRUE"*. With a falling edge of *"Execute"*, the state goes via Reset to *"Dormant"*.

Description of standard inputs and outputs:

- *"Execute"*
  A rising edge starts the operation, the output *"Busy"* goes to *"TRUE"*. In the first cycle all other inputs are read and stored, afterwards they are ignored.
  A falling edge does not stop the operation.
  After *"Done = TRUE"* or *"Error = TRUE"* and *"Execute = FALSE"* all outputs will be reset.
- *"Busy"*
  Operation is running (while outputs *"Done"* and *"Error"* are *"FALSE"*)
- *"Done"*
  Operation is completed without error (while outputs *"Busy"* and *"Error"* are *"FALSE"*).
  This output is *"TRUE"* for at least one cycle or until *"Execute"* is set to *"FALSE"*
- *"Error"*
  Operation is stopped with error (while outputs *"Busy"* and *"Done"* are *"FALSE"*).
  This output is *"TRUE"* for at least one cycle or until *"Execute"* is set to *"FALSE"*.
  The output *"ErrorID"* gives more details about the error.

1.5.12.1.2 Level controlled (AbbLCon)



After a rising edge at the input *"Enable"* the state goes *"Dormant"* to *"Busy"*. All inputs are sampled and considered continuously.

When the task is completed successfully the state goes from *"Busy"* to *"Done"*.

In case of an error the state goes to *"Error"*.

The states *"Done"* or *"Error"* are stable for minimum one cycle and as long as *"Enable is TRUE"*. With a falling edge of *"Enable"*, the state goes via Reset to *"Dormant"*.

The Busy state can be aborted from outside by setting the *"Enable"* input to *"FALSE"*.

After Aborting is done the state goes back to *"Dormant"*.

Description of standard inputs and outputs:

- *"Enable"*
  A rising edge (*"Enable = TRUE"*) starts the operation, the output *"Busy"* goes to *"TRUE"*. All other inputs are read and considered continuously. A falling edge (*"Enable = FALSE"*) aborts the operation.
  During Aborting the Busy is still *"TRUE"*. Afterward all outputs are reset.
- *"Busy"*
  Operation is running (while outputs *"Done"* and *"Error"* are *"FALSE"*)

- *"Done"*
  Operation is completed without error (while outputs *"Busy"* and *"Error"* are *"FALSE"*).
  This output is *"TRUE"* for at least one cycle or until *"Enable"* is set to *"FALSE"*
- *"Error"*
  Operation is stopped with error (while outputs *"Busy"* and *"Done"* are *"FALSE"*).
  This output is *"TRUE"* for at least one cycle or until *"Enable"* is set to *"FALSE"*.
  The output *"ErrorID"* gives more details about the error.

Level controlled continous (AbbLConC)

This state machine is a special case of *"Level Controlled"*. Only difference is that this function block type is never done, for example a PID which never stops.

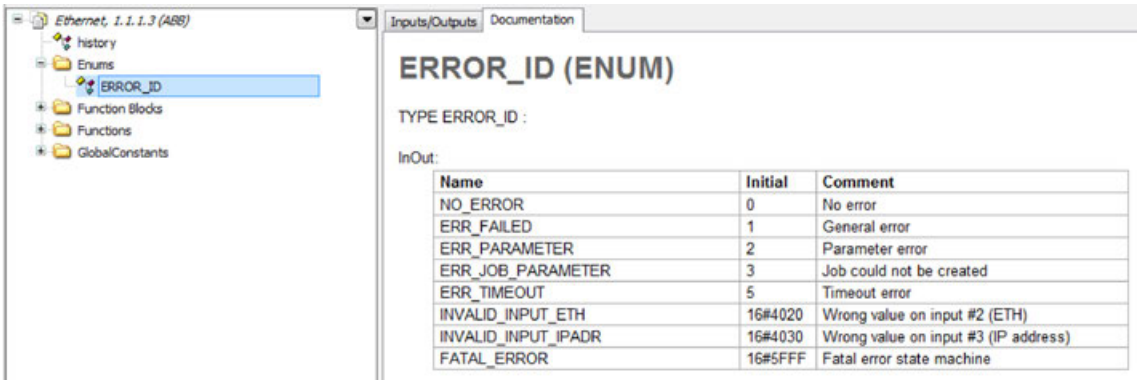
Therefore these function blocks have no *"Done"* output.

Description of standard inputs and outputs:

- *"Enable"*
  A rising edge (*"Enable = TRUE"*) starts the operation, the output *"Busy"* goes to *"TRUE"*. All other inputs are read and considered continuously.
  A falling edge (*"Enable = FALSE"*) aborts the operation.
  During Aborting the *"Busy"* is still *"TRUE"*. Afterward all outputs are reset.
- *"Busy"*
  Operation is running (while output *"Error is FALSE"*)
- *"Error"*
  Operation is stopped with error (while output *"Busy is FALSE"*).
  This output is *"TRUE"* for at least one cycle or until *"Enable"* is set to *"FALSE"*.
  The output *"ErrorID"* gives more details about the error.

1.5.12.1.3 Error_ID

Each library contains an enumeration *"ERROR_ID"*, which is valid for this library but not across all libraries

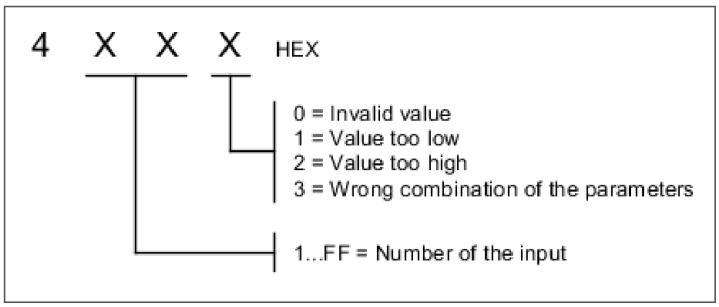


Only the following errors are unique:

- 16#5FFF FATAL_ERROR from state machine
- 16#4000 errors are used for input errors, same scheme like in V2:

4000hex...4FFFhex - Block Input Error

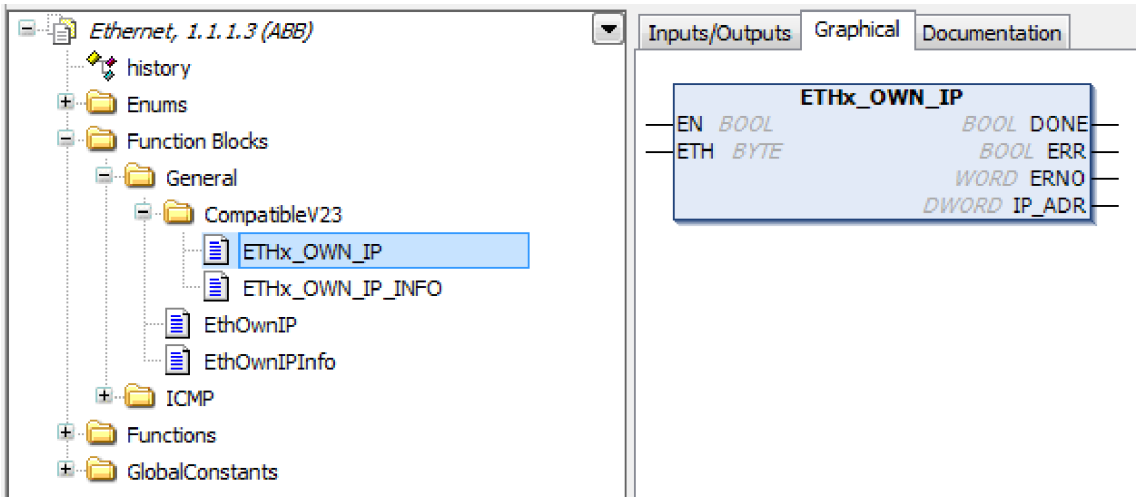
The error 4xxxhex is used in case of detected Function Block input parameter errors. The error is structured as follows:



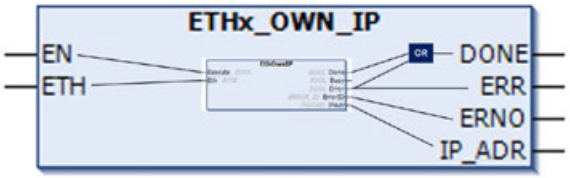
1.5.12.1.4 Compatibility with V2 function blocks

In order to ensure compatibility with V2 applications a lot of ABB function blocks are delivered together with a compatible version in classic style:

Names in CAPITAL letters, input *“EN”* and outputs *“DONE”*, *“ERR”* and *“ERNO”*:



The classic blocks internally use the PLCopen style function blocks. The inputs and outputs are mapped in the following way:

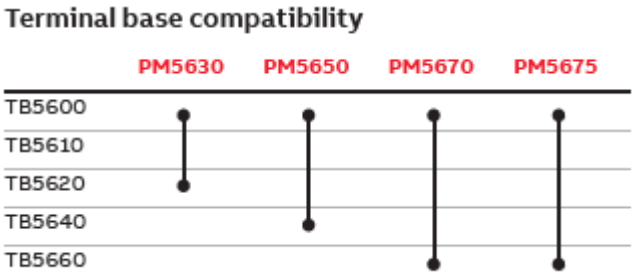


1.6 PLC integration (hardware)

1.6.1 Product overview and comparison

1.6.1.1 Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:



The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.

Table 398: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

Processor module	PM5630	PM5650	PM5670	PM5675
TB5600-2ETH	0 slot	0 slot	0 slot	0 slot
TB5610-2ETH	1 slot	1 slot	1 slot	1 slot

Processor module	PM5630	PM5650	PM5670	PM5675
TB5620-2ETH	2 slots	2 slots	2 slots	2 slots
TB5640-2ETH	-	4 slots	4 slots	4 slots
TB5660-2ETH	-	-	6 slots [1])	6 slots [1])
Remarks: The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base. [1]) PM567x must have an index ≥ C0.				

Supported devices

The AC500 V3 terminal bases can be equipped with the following supported devices:

Table 399: Comparison: TB56xx

Processor module		PM5630	PM5650	PM5670	PM5675
Max. number of variables allowed for each communication module supported					
	Input variables	4 kB	4 kB	5 kB	5 kB
	Output variables	4 kB	4 kB	5 kB	5 kB
Type of communication module supported					
	CM574-RS/RCOM - serial interface	No	No	No	No

1.6.1.3 Ethernet protocols and ports for AC500 V3 products

Supported as of Automation Builder V 2.1

Description	PM5630 -2ETH	PM5650 -2ETH	PM5670 -2ETH	PM567 5-2ETH	≥ CPU firm-ware
ABB netConfig	x	x	x	x	V3.0.0
Online access with driver 3S TCP/IP BlkDrvTcp	x	x	x	x	V3.0.0
Modbus TCP server	x	x	x	x	V3.0.3
Modbus TCP client with POU ETHx_MOD_MAST	x	x	x	x	V3.0.1
UDP out of user program with library netBaseService.lib	x	x	x	x	V3.0.0
UDP data exchange, Network variables	x	x	x	x	V3.0.0
TCP/IP out of user program with library netBaseService.lib	x	x	x	x	V3.0.0
Web server on PLC with web visualization	x	x	x	x	V3.0.0
NTP/SNTP ((Simple) Network Time Protocol) client with 3S licenced store package SNTPService.package. Library container: SNTPService	x	x	x	x	V3.0.0
IEC60870-5-104 control station incl. 2nd connection and 2nd port	x	x	x	x	V3.0.0
IEC60870-5-104 substation incl. 2nd port	x	x	x	x	V3.0.0
FTP server (See *Chapter 1.6.6.3.5.1 "Configuration of FTP server" on page 3917*)	x	x	x	x	V3.0.0
CODESYS network variables	x	x	x	x	V3.0.0
OPC DA server	x	x	x	x	V3.0.0
OPC UA server	x	x	x	x	V3.0.0
ICMP – ping out of user project with POU *ETHx_ICMP_PING*	x	x	x	x	V3.0.0
DHCP client	x	x	x	x	V3.1.0
NTP/SNTP ((Simple) Network Time Protocol) client system solution (See *Chapter 1.6.6.3.4.2.1 "(S)NTP client configuration" on page 3913*)	x	x	x	x	V3.1.0
NTP/SNTP ((Simple) Network Time Protocol) server system solution (See *Chapter 1.6.6.3.4.2.2 "(S)NTP server configuration" on page 3916*)	x	x	x	x	V3.1.0

Description	PM5630 -2ETH	PM5650 -2ETH	PM5670 -2ETH	PM567 5-2ETH	≥ CPU firm- ware
Maximum number of Input/output allowed variable on Ethernet for the protocol	2 kB /2 kB	4 kB /4 kB	5 kB /5 kB	5 kB /5 kB	V3.4.0
IEC 61850 (MMS server, GOOSE) [2])	x	x	x	x	V3.1.0
EthernetIP Scanner [1, 2])	x	x	x	x	AB 2.4.1/ FW 3.4.1
EthernetIP Adapter [1, 2])	x	x	x	x	AB 2.4.1/ FW 3.4.1
KNX - Building communication [2])	x	x	x	x	V3.2.x
BACnet-BC - Infrastructure communication [2])	x	x	x	x	V3.3.1
HTTPS – secure web server on PLC with CODESYS web visualization (See *Chapter 1.6.6.3.7.3.2 "Secure web server" on page 3922*)	x	x	x	x	V3.1.0
WebVisu for data visualisation on web server HTML5	x	x	x	x	V3.0.0
FTPS – secure FTP (See *Chapter 1.6.6.3.7.3.3 "Secure FTP" on page 3923*)	x	x	x	x	V3.1.0
Secure online access with driver 3S UDP BlkDrvUdp	x	x	x	x	V3.1.0
Secure online access with driver 3S TCP/IP BlkDrvTcp	x	x	x	x	V3.1.0
ICMP – ping out of user project with POU ETHx_ICMP_PING or EthIcmpPing (PLCopen style)	x	x	x	x	V3.1.0
Modbus TCP client (master) with POU ETHx_MOD_MAST or ModTcpMast (PLCopen style)	x	x	x	x	V3.1.0
RTV (Remote Target Visualization)	x	x	x	x	V3.1.0
Remarks: [1]): in preparation [2]): feature is licensed					

1.6.1.3.1 Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

Protocol	Port
ABB NetConfig [1])	UDP 24576
Online access with driver 3S UDP BlkDrvUdp (with scan)	UDP 1740
Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)	TCP 11740
OPC UA server [2])	TCP 4840
Remarks: [1]): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2. [2]): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.	

All other ports are closed by default.

1.6.1.3.2 Overview of protocols, sockets and ports

Protocol	Port	Sockets
ABB netConfig	24576	1 permanent socket per interface
3S gateway client (e.g. CODESYS) to gateway server	1217	1 permanent socket
Online access with driver 3S UDP BlkDrvUdp (with scan)	1740	1 socket per connection + 4 listen
Online access with driver 3S block driver TCP/IP (no scan)	11740	1 socket per connection + 1 listen
Modbus TCP server	502 or configurable	1 socket listen + 1 socket per server connection, number of server connections is configurable in AB
Modbus TCP client with POU *ETHx_MOD_MAST*	Random	1 socket per connection with POU *ETHx_MOD_MAST*
UDP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
TCP/IP out of user program with library SysLibSockets.lib	1 ... 65535	1 socket per connection
Web server on PLC with web visualization	80	1 listen and 1 per connection
NTP/SNTP client	123	1 permanent socket
IEC60870-5-104 control station	Random	1 per connection
IEC60870-5-104 substation	2404	1 per connection
FTP server (See ↪ *Chapter 1.6.6.3.5.1 "Configuration of FTP server" on page 3917*)	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
CODESYS network variables	1202	(UDP broadcast)
OPC DA server (default 3S block driver)	UDP = 1740 or TCP/IP =11740	1 socket per connection

Protocol	Port	Sockets
OPC UA server	4840	1 permanent socket
ICMP – ping out of user project with POU ETHx_ICMP_PING DHCP	none	No socket
DHCP	67	1 socket during startup
NTP/SNTP ((Simple) Network Time Protocol) client system solution (See *Chapter 1.6.6.3.4.2.1 "(S)NTP client configuration" on page 3913*)	123	1 permanent socket
NTP/SNTP ((Simple) Network Time Protocol) server system solution (See *Chapter 1.6.6.3.4.2.2 "(S)NTP server configuration" on page 3916*)	123	1 permanent socket
HTTPS – secure web server on PLC with CODESYS web visualization (See *Chapter 1.6.6.3.7.3.2 "Secure web server" on page 3922*)	443	1 listen and 1 per connection
FTPS – secure FTP (See *Chapter 1.6.6.3.7.3.3 "Secure FTP" on page 3923*)	Command port = 21 Data active mode = 20 Data passive mode = random	1 per session, max. 4 allowed
Secure online access with driver 3S UDP BlkDrvUdp	1740	1 socket per connection + 1 listen
Secure online access with driver 3S TCP/IP BlkDrvTcp	11740	1 socket per connection + 1 listen
ICMP – ping out of user project with POU *ETHx_ICMP_PING* or EthIcmpPing (PLCopen style)	None	No socket
Modbus TCP client (master) with POU *ETHx_MOD_MAST* or *ModTcpMast* (PLCopen style)	Random	1 socket per connection with POU *ETHx_MOD_MAST* or *ModTcpMast*

1.6.1.3.3 Limitation of connections per protocol

Protocol	PM5630-2ETH	PM5650-2ETH	PM5670-2ETH	PM5675-2ETH	≥ CPU firmware
Modbus TCP server (e.g. for SCADA access)	30	100	100	100	3.0.3
	40	40	40	40	3.1.0
	15	25	50	50	3.1.3
Modbus TCP client with POU *ETHx_MOD_MAST*	n/a	100	n/a	n/a	3.0.1
	40	40	40	40	3.1.0
	30	50	120	120	3.1.3
Modbus TCP client with POU *ETHx_MOD_MAST* or *ModTcpMast* (PLCopen style)	30	100	100	100	3.1.0
	30	50	120	120	3.1.3

Protocol		PM5630-2ETH	PM5650-2ETH	PM5670-2ETH	PM5675-2ETH	≥ CPU firm-ware
IEC60870-5-104 control station incl. 2nd connection and 2nd port		10 5	10 10	10 20	10 20	3.1.0 3.4.0
IEC60870-5-104 substation incl. 2nd port		10 5	10 10	10 20	10 20	3.1.0 3.4.0
IEC60870-5-104: No. of free tags + additional license for extension [1])		1.000	5.000	10.000	10.000	3.4.0
FTP server		4	4	4	4	3.1.0
Online access with driver 3S UDP BlkDrvUdp		n/a 8	4 8	n/a 8	n/a 8	3.0.0 3.1.0
Online access with driver 3S TCP/IP BlkDrvTcp		n/a 8	4 8	n/a 8	n/a 8	3.0.0 3.1.0
OPC DA server (number of connections)		n/a 8	4 8	n/a 8	n/a 8	3.0.0 3.1.0
OPC UA server (number of connections)		50 10	50 20	50 50	50 50	3.1.0 3.4.0
	No. of free tags + additional license for extension [1])	1.000	5.000	30.000	30.000	3.4.0
	min sampling rate (limit)	500 ms	100 ms	50 ms	50 ms	3.4.0
Secure online access with driver 3S UDP BlkDrvUdp		8	8	8	8	3.1.0
Secure online access with driver 3S TCP/IP BlkDrvTcp		8	8	8	8	3.1.0
FTPS - secure FTP server		4	4	4	4	3.1.0
RTV (Remote Target Visualization)		5	5	5	5	3.1.0
Remarks: [1]): in preparation						

The PLC types PM5630-2ETH, PM5670-2ETH and PM5675-2ETH are available as of SystemFW 3.1.0.

1.6.1.3.4 Ethernet configuration

Default Ethernet configuration

Module	IP Address	Netmask	Comment
PM5xx2-x-ETH	ETH: 192.168.0.10	255.255.255.0	
PM5072-T-2ETH	ETH1: 192.168.0.10 ETH2: 192.168.1.10	255.255.255.0	The Ethernet ports must be configured in different sub networks.
PM56xx-2ETH	ETH1: 192.168.0.10 ETH2: 192.168.1.10	255.255.255.0	The Ethernet ports must be configured in different sub networks.

For changing the default addresses or the description of the function keys CFG see:

↳ *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675*

↳ *Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491*.

1.6.1.3.5 Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC's.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver "BlkDrvTcp" on port 11740
- 1x listen on port 11740 if PLC has established online connection

Online access can be established from:

- *Automation Builder command 'Login' Chapter 1.4.1.20.3.6.2 "Command 'Login'" on page 1028*
- *CODESYS OPC DA server*
- *Panel CP600 series*

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   ⇨ One socket on port 11740 (listen).
2. Login from Automation Builder via driver "BlKDrvTcp".
   ⇨ 2 sockets on port 11740 (1x online, 1x listen)
3. Additional login out of OPC server with the same driver.
   ⇨ 3 sockets on port 11740 (2x online, 1x listen)
4. Additional connect CP600 via driver "BlkDrvTcp".
   ⇨ 4 sockets on port 11740 (3x online, 1x listen)

1.6.2 PLC introduction

1.6.2.1 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

PLC specific safety notices

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!

PLC damage due to operation conditions

Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction

Do not use cleaning agent for cleaning the device.

Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!

Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!

PLC damage due to missing grounding

- Ensure to earth the devices.
- The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.

In the description for the devices (operating manual or AC500 system description), reference is made at several points to grounding, galvanic isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the grounding via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the grounding (in this respect, see also VBG 4 and the relevant VDE regulations).

CAUTION!

Do not obstruct the ventilation for cooling!

The ventilation slots on the upper and lower side of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!

Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

WARNING!

Splaying of strands can cause hazards!

During wiring of terminals with stranded conductors, splaying of strands shall be avoided.

– Ferrules can be used to prevent splaying.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Information on batteries

CAUTION!

Use only ABB approved lithium battery modules!

At the end of the battery's lifetime, always replace it only with a genuine battery module.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations

Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

Environment and enclosure information

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2.000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.2.2 Cyber security

Cyber security disclaimer

This product is designed to be connected to and to communicate information and data via a network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware exchanges, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected. This also applies to the operating system. Security measures (such as but not limited to the installation of latest patches, installation of firewalls, application of authentication measures, installation of anti-virus programs, etc.) are in your responsibility. You have to be aware that operating systems provide a considerable number of open ports that should be monitored carefully for any threats.

It has to be considered that online connections to any devices are not secured. It is your responsibility to assure that connections are established to the correct device (and e.g. not to an unknown device pretending to be a known device type). Furthermore you have to take care that confidential data exchanged with the PLC is either compiled or encrypted.

Security related deployment guidelines for industrial automation

Security details for industrial automation is provided in a *whitepaper* on ABB website.

Signed firmware updates

The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

Open ports and services

As part of the ABB security concept the AC500 V3 PLC comes with minimal services opened by default. Only the services needed for initial setup and programming are open before any user application is downloaded ↬ *Chapter 1.6.1.3 “Ethernet protocols and ports for AC500 V3 products” on page 2389*.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

Secure communication

Whenever possible, use an encrypted communication between AC500 V3 devices and third party devices, such as HMI devices. This is necessary to protect passwords and other data.

Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

Frequently asked questions

For more information around cyber security please see our *FAQ*.

1.6.2.2.1 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor’s recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:

- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks

Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

> *Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).*

References: *CODESYS Security Whitepaper*

Security zones

IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewallsFig. 93. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.

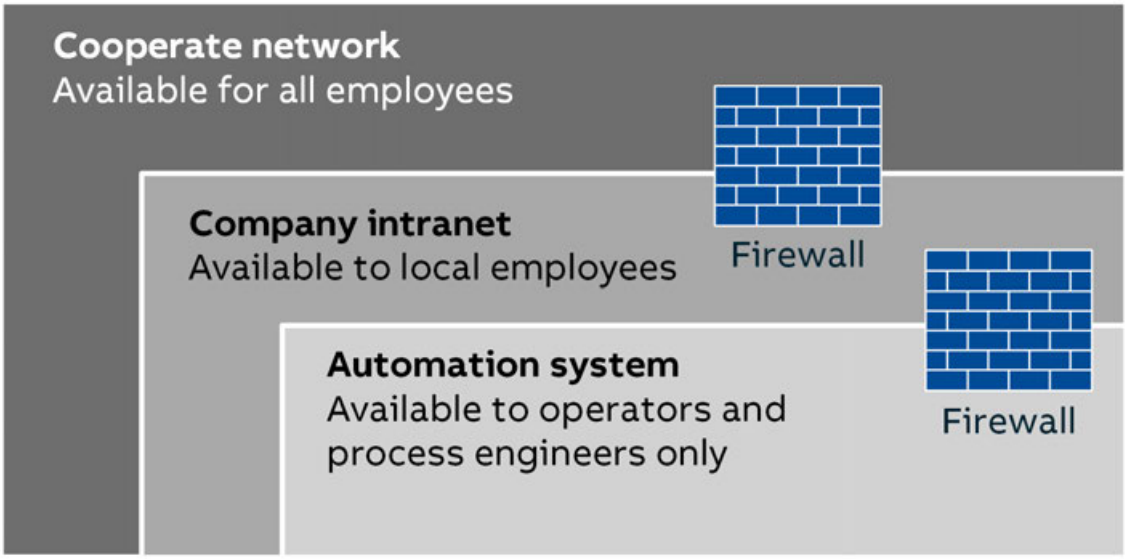

Fig. 93: Security zones

Fig. 93 shows three security zones, but the number of zones does not have to be as many or as few as three. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.

High-security zones should be kept small and independent. They need to be physically protected, i.e. physical access to computers, network equipment and network cables must be limited by physical means to authorized persons only. A high-security zone should obviously not depend on resources in a less secure zone for its security. Therefore, it should form its own domain that is administered from the inside, and not depend on, e.g., a domain controller in a less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compromised resource that is inside the trusted zone, or by an outside user or resource that succeeds to penetrate the secure interconnection. Trust therefore depends also upon the types of measures taken to detect and prevent compromise of resources and violation of the security policy.

References: *Security for Industrial Automation and Control Systems*

1.6.2.2.2 Secure operation

The controller must be located in a protected environment in order to avoid accidental or intended access to the controller or the application.

A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers and field devices via standard communication protocols (fieldbus systems) using appropriate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional measures, such as encryption. Open physical or data access to fieldbus systems and their components is a serious security risk.
- Physically protect all equipment, i.e., ensure that physical access to computers, network equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized persons
- When connecting a trusted network zone to outer networks, make sure that all connections are through properly configured secure interconnections only, such as a firewall or a system of firewalls, which is configured for “deny by default”, i.e., blocks everything except traffic that is explicitly needed to fulfill operational requirements.
- Allow only authorized users to log on to the system, and enforce strong passwords that are changed regularly.
- Continuously maintain the definitions of authorized users, user groups, and access rights, to properly reflect the current authorities and responsibilities of all individuals at all times. Users should not have more privileges than they need to do their job.
- Do not use the system for e-mail, instant messaging, or internet browsing. Use separate computers and networks for these functions if they are needed.
- Do not allow installation of any unauthorized software in the system.
- Restrict temporary connection of portable computers, USB memory sticks and other removable data carriers. Computers that can be physically accessed by regular users should have ports for removable data carriers disabled.
- If portable computers need to be connected, e.g., for service or maintenance purposes, they should be carefully scanned for viruses immediately before connection.
- All CDs, DVDs, USB memory sticks and other removable data carriers, and files with software or software updates, should also be checked for viruses before being introduced into the trusted zone.
- Continuously monitor the system for intrusion attempts.

- Define and maintain plans for incident response, including how to recover from potential disasters.
- Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.

A protected local control cabinet could look like in figure 94, page 2402. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.

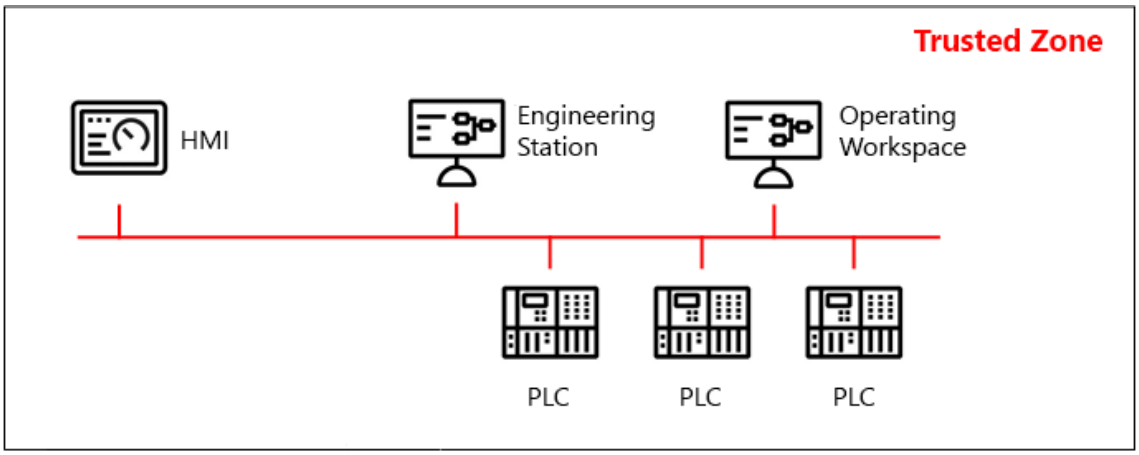

Fig. 94: Isolated automation system

Servers and workplaces that are not directly involved in the control and monitoring of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.

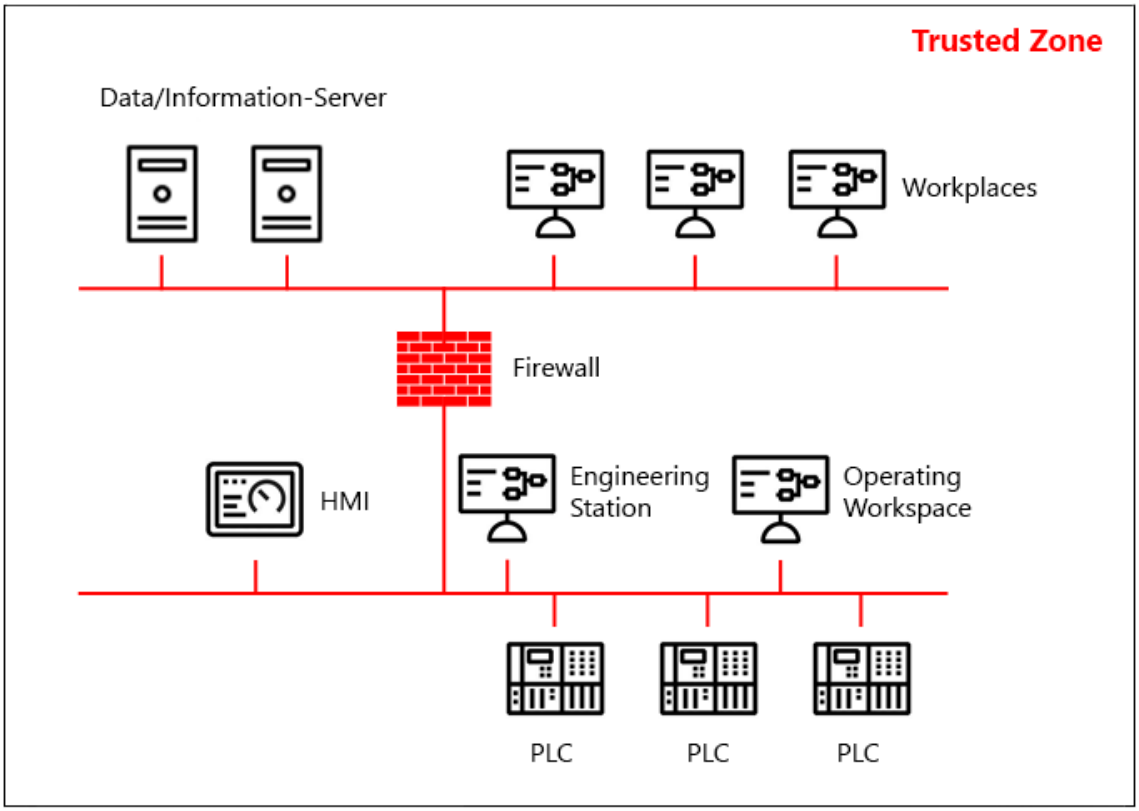

Fig. 95: Plant information network connected to an automation system

For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.

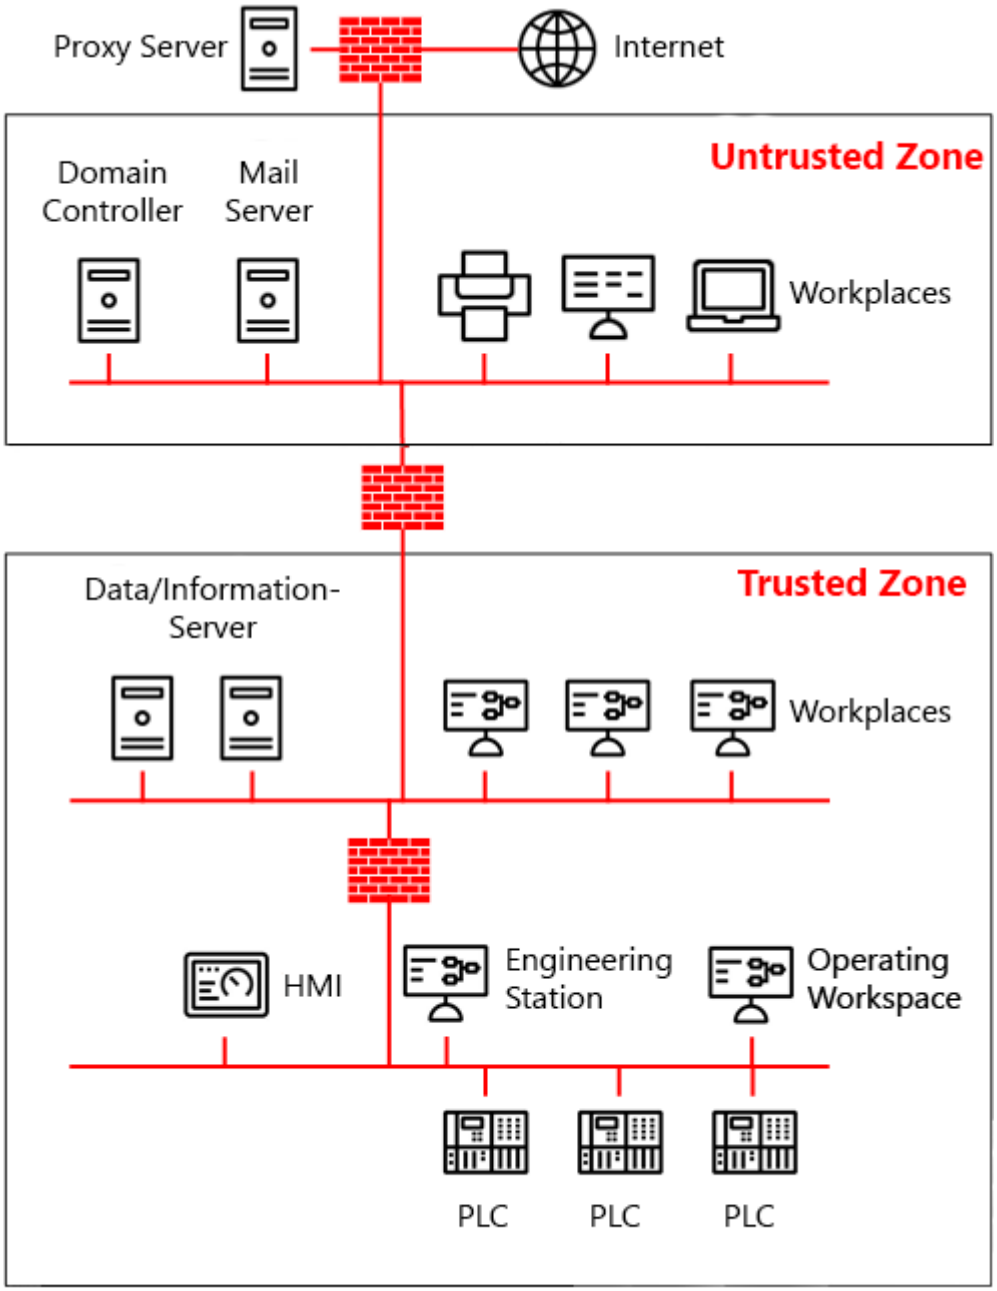

Fig. 96: Automation system and IS network

1.6.2.2.3 Hardening

System hardening means to eliminate as many security risks as possible. Hardening your system is an important step to protect your personal data and information. This process intends to eliminate attacks by patching vulnerabilities and turning off inessential services. Hardening a system involves several steps to form layers of protection.

Commissioning phase

- Protect the hardware from unauthorized access
- Be sure the hardware is based on a secure environment
- Disable unused software and services (network ports)
- Install firewalls
- Disallow file sharing among programs
- Install virus and spyware protection

- Use containers or virtual machines
- Create strong passwords by applying a strong password policy
- Create and keep backups
- Use encryption when possible
- Disable weak encryption algorithms
- Separate data and programs
- Enable and use disk quotas
- Strong logical access control
- Adjust default settings, especially passwords

Verification phase

- Verification of antivirus - Check antivirus is active and updated
- Verification of the identification - Check that test and unauthorized accounts are removed
- Verification of intrusion detection systems - Check malicious traffic is blocked
- Verification of audit logging - Check audit log is enabled
- You can use the checklist out of the *cyber security white paper*

Operation phase

- Keep software up-to-date, especially by applying security patches
- Keep antivirus up and running
- Keep antivirus definitions up-to-date
- Delete unused user accounts
- Lock an active session whenever it is unattended, e.g., lock the screen of the PC or of the control panel (HMI)

Decommissioning phase

- Delete all credentials stored in the device like certificates and user data *Chapter 1.6.4.4.6 “Decommissioning” on page 3351*.

1.6.2.2.4 Open Ports and Services

Overview of minimum cyber security requirements for open ports and services settings.

Port	Protocol	Description
1217	TCP	CODESYS Gateway V3
1210	TCP	CODESYS Gateway V2
1211	TCP	CODESYS Gateway V2
22350	TCP/UDP	CodeMeter License Server (runtime) – license
22352	HTTP	CodeMeter License Server (runtime) – WebAdmin
22353	HTTPS	CodeMeter License Server (runtime) – WebAdmin
11030	HTTP	Python editor server

1.6.2.3 License and third party information

Information on Automation Builder licensing and Third Party software can be found in the "About" window of the Automation Builder Installation Manager.

Further information on licensing.

1.6.2.4 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0113 Part 1 & Part 200: "Working & Process Machinery"
- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.6.2.5 Definitions: PLC system start-up

Cold start

> *The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the “cold start” mode does not exist in this product.*

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see *Chapter 1.4.1.20.3.6.10 “Command 'Reset Cold'” on page 1038*).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

Warm start

- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see *Chapter 1.4.1.20.3.6.11 “Command 'Reset Warm'” on page 1038*).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP

- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP

- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for $\geq$ 5 s in STOP mode.

Reset (cold)

- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)

- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN

- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START

- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.

Download

- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change

- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process (see *Chapter 1.6.5.1.1 “Handling of remanent variables for AC500 V3 products” on page 3456*).

1.6.2.6 Device lists

1.6.2.6.1 Device list: Terminal bases

Terminal bases for AC500 (Standard):

V3 products

Type	Description
TB5600-2ETH ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5600-2ETH, terminal base AC500, slots: 1 processor module, no communication module, 2 Ethernet RJ45 connector, 1 CAN connector
TB5600-2ETH-XC ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5600-2ETH-XC, terminal base AC500, slots: 1 processor module, no communication module, 2 Ethernet RJ45 connector, 1 CAN connector, XC version
TB5610-2ETH ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5610-2ETH, terminal base AC500, slots: 1 processor module, 1 communication module, 2 Ethernet RJ45 connector, 1 CAN connector
TB5610-2ETH-XC ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5610-2ETH-XC, terminal base AC500, slots: 1 processor module, 1 communication module, 2 Ethernet RJ45 connector, 1 CAN connector, XC version
TB5620-2ETH ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5620-2ETH, terminal base AC500, slots: 1 processor module, 2 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector
TB5620-2ETH-XC ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5620-2ETH-XC, terminal base AC500, slots: 1 processor module, 2 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector, XC version
TB5640-2ETH ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5640-2ETH, terminal base AC500, slots: 1 processor module, 4 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector
TB5640-2ETH-XC ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5640-2ETH-XC, terminal base AC500, slots: 1 processor module, 4 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector, XC version
TB5660-2ETH ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5660-2ETH, terminal base AC500, slots: 1 processor module, 6 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector
TB5660-2ETH-XC ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*	TB5660-2ETH-XC, terminal base AC500, slots: 1 processor module, 6 communication modules, 2 Ethernet RJ45 connector, 1 CAN connector, XC version

1.6.2.6.2 Device list: Processor modules (CPUs)

Processor modules for AC500-eCo

V3 products

Type	Description
PM5012-T-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5012-T-ETH, processor module, programmable logic controller 1 MB, 6DI/4DO-Transistor, Ethernet, 24 V DC, option slot
PM5012-R-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5012-R-ETH, processor module, programmable logic controller 1 MB, 6DI/4DO-Relay, Ethernet, 24 V DC, option slot
PM5032-T-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5032-T-ETH, processor module, programmable logic controller 2 MB, 12DI/8DO-Transistor/2DC, Ethernet, 24 V DC, 2 option slots
PM5032-R-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5032-R-ETH, processor module, programmable logic controller 2 MB, 12DI/6DO-Relay/2DC, Ethernet, 24 V DC, 2 option slots
PM5052-T-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5052-T-ETH, processor module, programmable logic controller 4 MB, 12DI/8DO-Transistor/2DC, Ethernet, 24 V DC, 3 option slots
PM5052-R-ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5052-R-ETH, processor module, programmable logic controller 4 MB, 12DI/6DO-Relay/2DC, Ethernet, 24 V DC, 3 option slots
PM5072-T-2ETH ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5072-T-2ETH, processor module, programmable logic controller 8 MB, 12DI/8DO-Transistor/2DC, 2 Ethernet, 24 V DC, 3 option slots
PM5072-T-2ETHW ↳ *Chapter 1.6.3.3.1.1 “PM50xx” on page 2440*	PM5072-T-2ETHW, processor module, programmable logic controller 8 MB, 12DI/8DO-Transistor/2DC, 2 Ethernet, 24 V DC, 3 option slots, wide temperature

Option boards for AC500-eCo V3 processor modules

Type	Description
TA5101-4DI ↳ *Chapter 1.6.3.3.1.2.1 “TA5101-4DI - Option board for digital I/O extension” on page 2478*	TA5101-4DI: AC500-eCo V3, option board for digital I/O extension, 4DI 24 V DC, spring/cable front terminal 3.50 mm pitch
TA5105-4DOT ↳ *Chapter 1.6.3.3.1.2.2 “TA5105-4DOT - Option board for digital I/O extension” on page 2484*	TA5105-4DOT: AC500-eCo V3, option board for digital I/O extension, 4DO-T 24 V DC / 0.5 A, spring/cable front terminal 3.50 mm pitch

Type	Description
TA5110-2DI2DOT ↳ *Chapter 1.6.3.3.1.2.3 "TA5110-2DI2DOT - Option board for digital I/O extension" on page 2490*	TA5110-2DI2DOT: AC500-eCo V3, option board for digital I/O extension, 2DI 24 V DC, 2DO-T 24 V DC / 0.5 A, spring/cable front terminal 3.50 mm pitch
TA5130-KNXP ↳ *Chapter 1.6.3.3.1.2.4 "TA5130-KNXPB - Option board KNX adress push button" on page 2498*	TA5130-KNXPB: AC500-eCo V3, option board KNX adress push button
TA5131-RTC ↳ *Chapter 1.6.3.3.1.2.5 "TA5131-RTC - Option board for real-time clock" on page 2500*	TA5131-RTC:AC500-eCo V3, real-time clock without battery, option board for AC500-eCo V3 Basic CPU only
TA5141-RS232I ↳ *Chapter 1.6.3.3.1.2.6 "TA5141-RS232I - Option board for COMx serial communication" on page 2502*	TA5141-RS232I: AC500-eCo V3, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch
TA5142-RS485I ↳ *Chapter 1.6.3.3.1.2.7 "TA5142-RS485I - Option board for COMx serial communication" on page 2504*	TA5142-RS485I: AC500-eCo V3, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch
TA5142-RS485 ↳ *Chapter 1.6.3.3.1.2.8 "TA5142-RS485 - Option board for COMx serial communication" on page 2510*	TA5142-RS485: AC500-eCo V3, option board for COMx serial communication, spring/cable front terminal 3.50 mm pitch

Processor modules for AC500 (Standard)

V3 products

Type	Description
PM5630-2ETH ↳ *Chapter 1.6.3.3.2.1 "PM56xx-2ETH for AC500 V3 products" on page 2516*	PM5630-2ETH, processor module, memory 8 MB, 24 V DC, memory card slot, interface 1 RS-232/485, display, 2 RJ45 independent onboard Ethernet TCP/IP interfaces with Modbus TCP, web server, IEC60870-5-104 or selectable Ethernet based protocols
PM5630-2ETH-XC ↳ *Chapter 1.6.3.3.2.1 "PM56xx-2ETH for AC500 V3 products" on page 2516*	PM5630-2ETH-XC, processor module, memory 8 MB, 24 V DC, memory card slot, interface 1 RS-232/485, display, 2 RJ45 independent onboard Ethernet TCP/IP interfaces with Modbus TCP, web server, IEC60870-5-104 or selectable Ethernet based protocols, XC version

Type	Description
PM5650-2ETH ↳ *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2516*	PM5650-2ETH, processor module, memory 80 MB, 24 V DC, memory card slot, interface 1 RS-232/485, display, 2 RJ45 independent onboard Ethernet TCP/IP interfaces with Modbus TCP, web server, IEC60870-5-104 or selectable Ethernet based protocols

1.6.2.7 PLC system description

1.6.2.7.1 AC500 product family

AC500 programmable logic controllers (PLCs)

The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide solutions for small, middle and high-end applications. Our AC500 platform offers different performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

Features of AC500 PLCs

- Scalable and consistently expandable system
- Different performance classes of processor modules (CPUs) available
- Several field busses available
- Parallel connection to several field busses which can be combined arbitrarily

The AC500 product family consists of the product groups:

- AC500 (standard):
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.
- AC500-eCo:
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.
- AC500-S:
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.
- AC500-XC:
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

Extensions in the product name

AC500 devices support different protocols and technologies (e.g. Ethernet, PROFIBUS etc.) in variable number. AC500 devices with onboard interfaces for support of a certain protocol or technology can be identified easily by the extension in the product name of the AC500 device. For example the AC500 Communication Module PM592**-DP** provides onboard support for PROFIBUS DP, the AC500 processor module PM595**-4ETH** provides onboard support for four provided Ethernet interfaces.

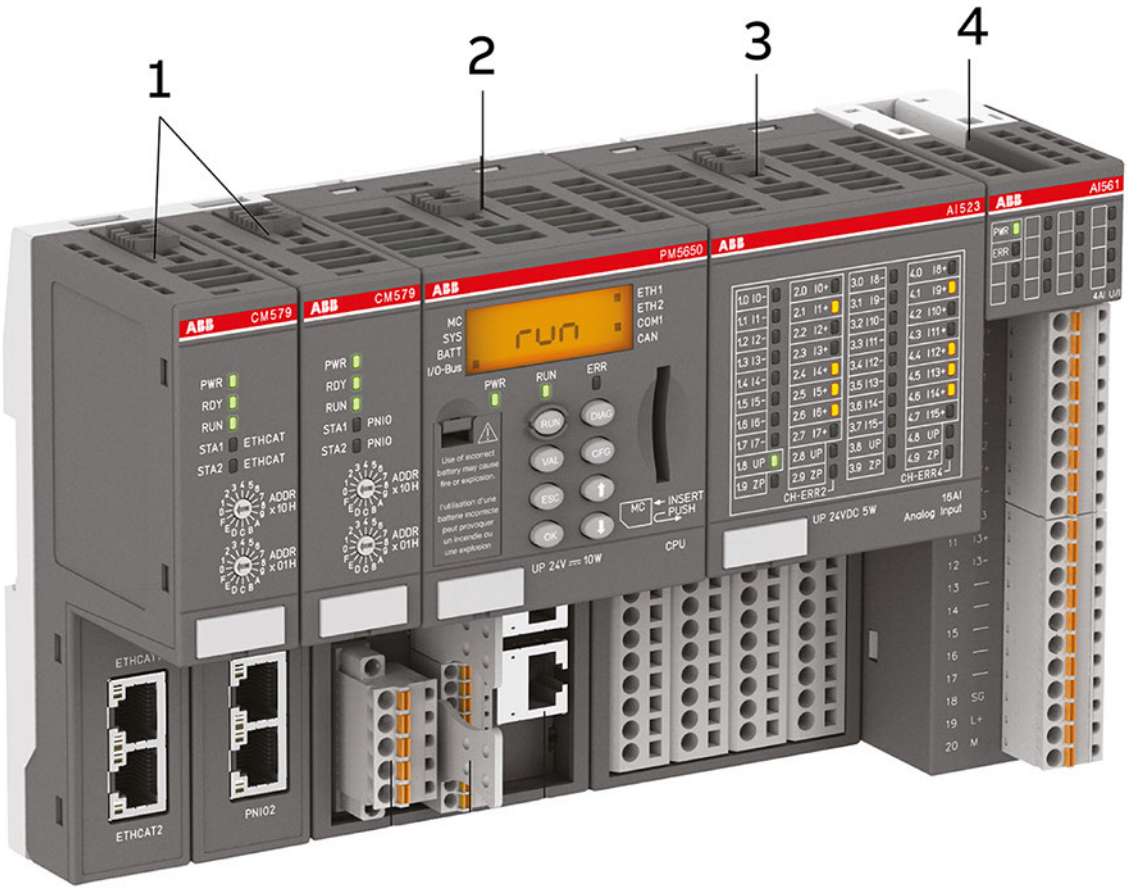
Further extensions in AC500 device names:

- -ETH: Ethernet
- -ARC: ARCNET
- -DP: PROFIBUS DP
- -CAN: CAN/CANopen
- -ETHCAT: EtherCAT
- -PNIO: PROFINET
- -RCOM: RCOM/RCOM+
- -RS: Serial interface

1.6.2.7.2 AC500/S500 system structure

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the CPU with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

Example of an AC500 PLC system:



1 Plug-in communication module
2 Processor module
3 Plug-in I/O module
4 Plug-in function module (AC500-eCo)
- Plug-in communication module (AC500-S), not displayed
- Plug-in I/O module (AC500-S), not displayed

Centralized I/O extension

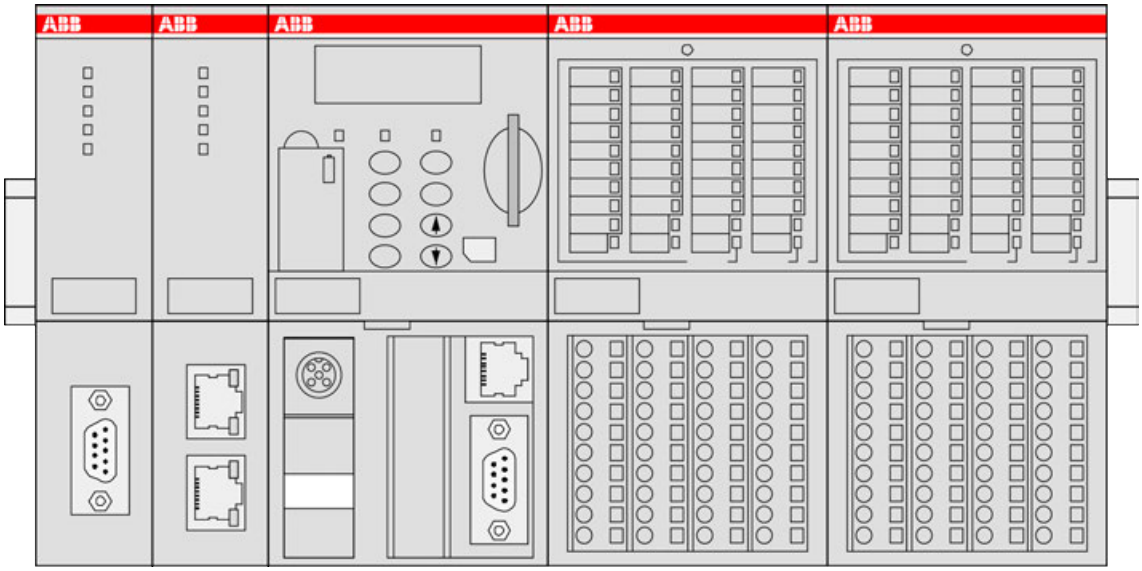


Fig. 97: S500 I/O modules directly connected to a processor module

Decentralized I/O extension

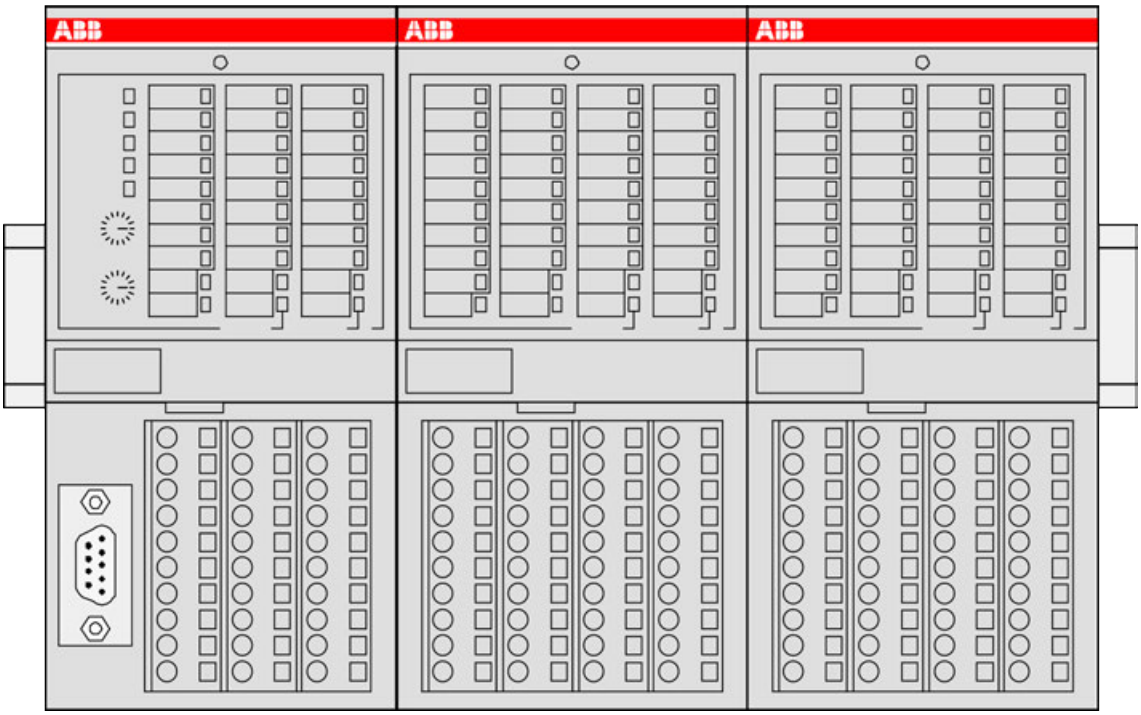

Fig. 98: S500 I/O modules connected via communication interface module

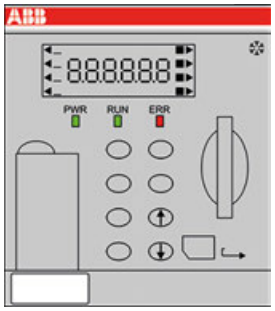
1.6.2.7.3 AC500/S500: Short description hardware

Processor modules



AC500 processor modules contains the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the system program to command the PLC for operation.

Its functions include:

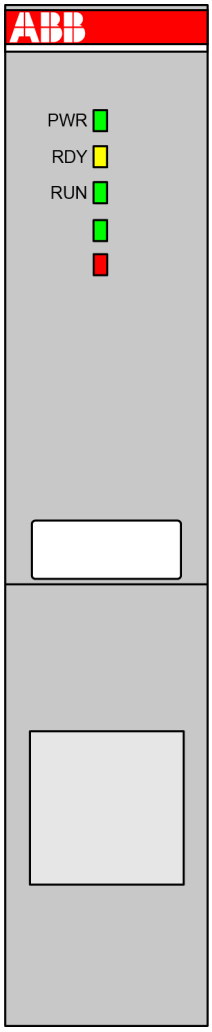
- To receive user program and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax error in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user program in the memory one by one and execute it after interpretation
- To update the state of related flag bits and output shadow register contents according to execution results and realize output control by means of output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.

There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.

If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).

Communication modules



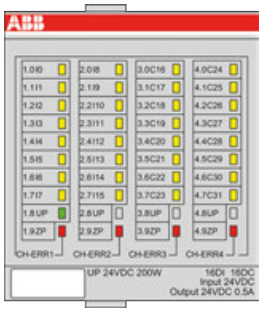
AC500 communication modules are required for

- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.

I/O modules



The I/O modules are the input / output unit which connects the PLC with the industrial production site. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to realize the control purpose.

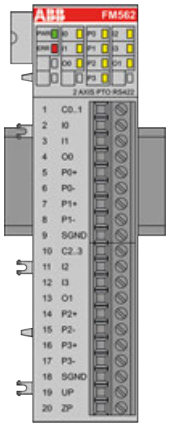
External input equipment and output equipment need various signal levels while the information processed by the CPU in the PLC only can be the standard level. In order to realize such conversion, the I/O interface generally shall perform optical isolation and filtering to improve interference immunity of the PLC. In addition, the I/O interface generally can indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interface for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC have the number of input / output signals taken as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system is insufficient in the I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.

The modules can be simply plugged onto a terminal unit for a centralized I/O extension or for a decentralized I/O extension via communication interface modules.

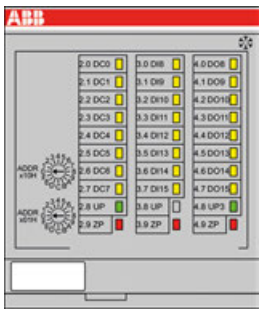
Function modules



Function modules extend the PLC system to perform special task control. Those modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus.

It is connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC.

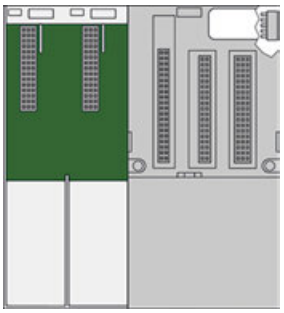
Communication interface modules



Communication interface modules enable a decentralized I/O station. It contains embedded digital I/Os and a fieldbus interface.

Communication interface modules act as I/O slave devices within a master-slave-arrangement.

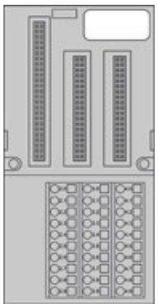
Terminal bases



On a terminal base the processor module and the communication modules are plugged.

> *For AC500-eCo processor modules and special AC500 (Standard) processor modules the terminal base cannot be removed.*

Terminal units



On a terminal unit the I/O modules are plugged.

Terminal units enable simple prewiring without electronics and are available for 24 V DC and 230 V AC, optionally for spring or screw-type terminals.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. The following memory types can be distinguished:

- Volatile memory:
  All saved data will be lost after power failure of the memory but the memory can provide high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).
- Nonvolatile memory:
  All saved data will not be lost after power failure of the memory, but the memory is subject to low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to get protected from power failure. The programs are exported to the volatile memory under operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access in the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains existing state by using built-in supercapacitors or backup batteries in case of power failure. The memory area for data saving in case of power failure is called the data retention area.

Power supply

The PLC is equipped with a switch power supply for internal circuit. Compared with ordinary power supply, the PLC power supply has the higher stability and interference immunity. A number of PLC products provide 24 V DC stabilized voltage supply to meet external sensors.

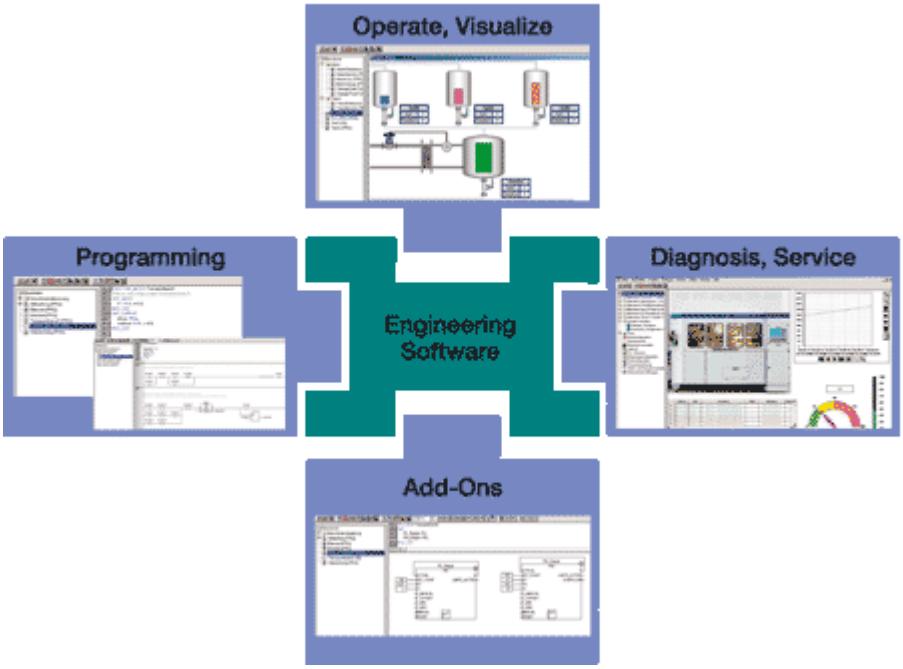
1.6.2.7.4 Short description software

Configuration and programming

Configuration and programming of all AC500 control systems (CPUs) is done by using Automation Builder software.

Features:

- Standardized programming according to IEC 61131-3 - five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), free graphical function chart (CFC), debugging functions for program test
- Application programming in C/C++
- Online diagnosis
- Debugging functions for the program test: Single step, Single cycle, Breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting



Offline simulation

IEC 61131-3 commands can be simulated without a PLC being connected, including the relevant malfunctions. After the program test, the application can be downloaded to the control system.

Sampling trace

Timing diagrams for process variables and storage of data in a ring buffer with event trigger.

Recipe management and watch lists Values of selected variables are displayed. Pre-defined values can be assigned to variables which can then be downloaded to the control system all at once ("Write recipe"). Actual values from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe). These functions are also helpful, for example, for setting and entering control parameters.

Visualization Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

Programming Serial or via Ethernet networks.

Engineering interface Provides access from the programming system to an external project database in which the program source code of one or several automation projects is managed. Optionally, a version control system, such as Visual Source Safe, can be used in order to ensure data consistency of the program code for several different users and projects.

1.6.2.7.5 CP600 control panels (HMI)

ABB control panels offer a wide range of features and functionalities for maximum operability. The panels are distinguished by their robustness and easy usability, providing all the relevant information from production plants and machines at a single touch.

HMI - human control and operation of machines and processes.

Individual solutions for each application - this enables an operator at any time to have an overview on a profitable production and intervene manually if necessary.

Control panels with TFT graphical display and touch screen.

Available in various resolutions.

1.6.2.8 AC500-S

The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the *AC500-S safety user manual* is only available on our website.

The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S / SM560-S-FD-1 / SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

1.6.2.9 Converting an AC500 V2 project to an AC500 V3 project

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example

Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.

1.6.3 Device specifications

1.6.3.1 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- Status LEDs:
  Indicates the availability of devices/components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking
- I/O LEDs:
  Displays the status of the the inputs and outputs.
- LED display:
  Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.
  ↳ *Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486*
  ↳ *Chapter 1.7.1.2 “Diagnosis in CPU display” on page 4013*
- Function keys and switches:
  Allows to change the current operating modes/status manually ↳ *Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491*.

1.6.3.2 Terminal bases (AC500 standard)

AC500-eCo V3 processor modules do not have a separate terminal base

1.6.3.2.1 TB56xx for AC500 V3 products

- TB5600-2ETH: 1 processor module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5610-2ETH: 1 processor module, 1 communication module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1

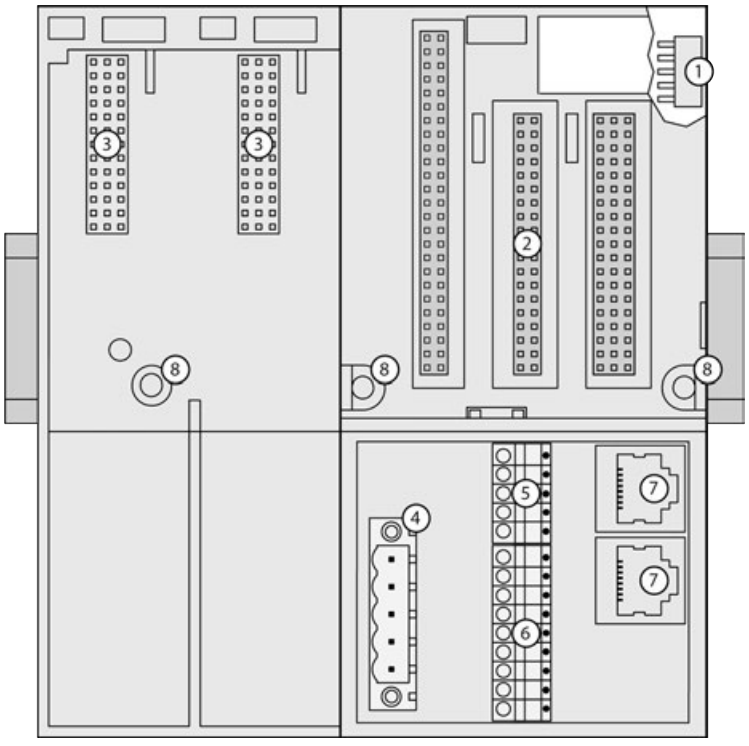
- TB5620-2ETH: 1 processor module, 2 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5640-2ETH: 1 processor module, 4 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5660-2ETH: 1 processor module, 6 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- XC version for use in extreme ambient conditions available

Terminal bases TB56xx-2ETH can only be used with processor modules PM56xx-2ETH.

Table 407: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

Processor module	PM5630	PM5650	PM5670	PM5675
TB5600-2ETH	0 slot	0 slot	0 slot	0 slot
TB5610-2ETH	1 slot	1 slot	1 slot	1 slot
TB5620-2ETH	2 slots	2 slots	2 slots	2 slots
TB5640-2ETH	-	4 slots	4 slots	4 slots
TB5660-2ETH	-	-	6 slots [1])	6 slots [1])
Remarks: The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base. [1]) PM567x must have an index ≥ C0.				

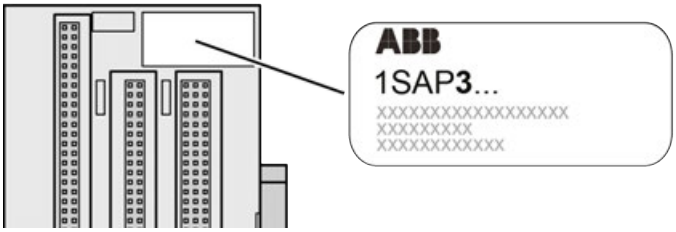
The following figure shows the TB5620-2ETH as example.



1 I/O bus (10-pin, female) to connect the I/O terminal units
2 One available slot for the processor module
3 Slots for communication modules
4 Interface for CAN (5-pin terminal block, removable)
5 Power supply (5-pin terminal block, removable)

6 Serial interface COM1 (9-pin terminal block, removable)
7 RJ45 female connector for Ethernet connection
8 Holes for screw mounting

XC version **XC** = e**X**treme **C**onditions



Extreme conditions

Terminal bases for use in extreme ambient conditions have no ❄ sign for XC version.

*The figure **3** in the Part no. 1SAP**3**... (label) identifies the XC version.*

Short description

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.

Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.

The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

Table 408: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

Processor module	PM5630	PM5650	PM5670	PM5675
TB5600-2ETH	0 slot	0 slot	0 slot	0 slot
TB5610-2ETH	1 slot	1 slot	1 slot	1 slot
TB5620-2ETH	2 slots	2 slots	2 slots	2 slots
TB5640-2ETH	-	4 slots	4 slots	4 slots
TB5660-2ETH	-	-	6 slots [1])	6 slots [1])

Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

[1]) PM567x must have an index ≥ C0.

NOTICE!

Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↳ *Chapter 1.6.3.8.2.5 “TA524 - Dummy communication module” on page 3328*.
– I/O bus connectors must not be touched during operation.

Connections

I/O bus

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added (see description for I/O bus in the system asembly chapter *Chapter 1.6.4.4.1 “Serial I/O bus” on page 3338*).

Power supply

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm^2 conductor) via these terminals, when the ambient temperature never exceeds 60 °C.

Pin assignment

Pin Assignment		Label	Function	Description
 Terminal block removed	 Terminal block inserted	L+	+24 V DC	Positive pin of the power supply voltage
		L+	+24 V DC	Positive pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		⏚	FE	Functional earth

Faulty wiring on power supply terminals

NOTICE!

Risk of damaging the processor module and terminal base!

Exceeding the maximum voltage could lead to unrecoverable damage to the system.

The system might be destroyed.

NOTICE!

Risk of malfunction!

To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s.

NOTICE!

Risk of damaging the terminal base and power supply!

Short circuits might damage the terminal base and power supply.

Make sure that the four clamps L+ and M (two of each) are not wrongly connected (e. g. +/- of power supply is connected to both L+/L+ or both M/M).

NOTICE!

Risk of damaging the terminal base!

Terminal base can be damaged by connecting the power supply terminal block (L+/M) to COM1.

Make sure that the COM1 terminal block is always connected to the terminal base even if you do not use COM1 to prevent this.

NOTICE!

Risk of damaging the terminal base!

Excessive current might damage the clamp and terminal base.

Make sure that the current flowing through the removable clamps never exceeds 8 A (with 1.5 mm^2 conductor).

NOTICE!

For applications using XC versions!

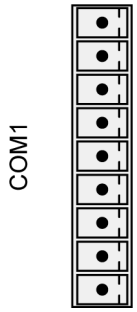
To ensure reliability and proper function, make sure the ambient temperature never exceeds 60 °C when the current flowing through the removable clamps is 8 A (with 1.5 mm^2 conductor).

Serial interface COM1

The serial interface COM1 is connected to a removable 9-pin terminal block.

From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).

Pin assignment (RS-485 / RS-232)



Pin	Signal	Interface	Description
1	Terminator P	RS-485	Terminator P
2	RxD/TxD-P	RS-485	Receive/Transmit, positive
3	RxD/TxD-N	RS-485	Receive/Transmit, negative
4	Terminator N	RS-485	Terminator N
5	RTS	RS-232	Request to send (output)
6	TxD	RS-232	Transmit data (output)
7	SGND	Signal Ground	Signal Ground
8	RxD	RS-232	Receive data (input)
9	CTS	RS-232	Clear to send (input)

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

For further information on connection and wiring please refer to .

Ethernet interface

This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.

TB56xx-2ETH for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces.

The two Ethernet interfaces can be configured as independent interfaces or with switch functionality.

In case of two independent interfaces they must be configured to different subnets.

For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.

Pin assignment

Interface	Pin	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NU	Not used
	5	NU	Not used
	6	RxD-	Receive data -
	7	NU	Not used
	8	NU	Not used
	Shield	Cable shield	Functional earth

NOTICE!

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices. *Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3333*

See supported protocols and used Ethernet ports for AC500 V3 products: *Chapter 1.6.1.3 “Ethernet protocols and ports for AC500 V3 products” on page 2389*.

See communication via Modbus for AC500 V3 products: *Chapter 1.6.5.1.11 “Communication with Modbus TCP/IP” on page 3558*.

See communication via Modbus for AC500 V3 products: *Chapter 1.6.5.1.10 “Communication with Modbus RTU” on page 3542*.

CAN interface

This interface is the connection to a processor module with onboard CAN e.g. PM56xx-2ETH.

Interface socket	COMBICON, 5-pin, female, removable plug with spring terminals
Transmission standard	ISO 11898, potential-free
Transmission protocol	CANopen (CAN), 1 Mbaud max.
Transfer rate (transmission rate)	50 kbit/s, 100 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s,

Pin assignment

Interface		PIN	Signal	Description
 Terminal block removed	 Terminal block inserted	1	CAN_GND	CAN reference potential
		2	CAN_L	Bus line, receive/transmit line, LOW
		3	CAN_SHLD	Shield of the bus line
		4	CAN_H	Bus line, receive/transmit line, HIGH
		5	NC	Not connected

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

Bit Rate (speed)	Bus Length
1 Mbit/s	40 m
800 kbit/s	50 m
500 kbit/s	100 m
250 kbit/s	250 m
125 kbit/s	500 m
50 kbit/s	1000 m

Types of bus cables

Only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. See *Chapter 1.6.4.6.4.6 “CANopen field bus” on page 3422*.

Bus terminating resistors

Both ends of the CAN bus have to be terminated with a 120 Ω (≥ 1/4 W, ≤ 5 %) bus terminating resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L). See *Chapter 1.6.4.6.4.6 “CANopen field bus” on page 3422*.

Technical data

The system data of AC500 and S500 are applicable to the standard version. *Chapter 1.6.4.6.1 “System data AC500” on page 3398*

The system data of AC500-XC are applicable to the XC version. *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Connection of the supply voltage 24 V DC at the terminal base of the processor module	Removable 5-pin terminal block spring type
Max. current consumption from 24 V DC	TB5600: 0.25 A [1]) TB5610: 0.35 A [1]) TB5620: 0.4 A [1]) TB5640: 0.6 A [1]) TB5660: 0.8 A [1])
Melting integral of a fuse at 24 V DC	Min. 1 A^2s [2])
Peak inrush current from 24 V DC	55 A [2])
Number of slots for processor modules	1 (on all terminal bases)
Processor module interfaces at TB56xx	I/O bus, ETH1, ETH2, CAN, COM1
Net weight (terminal base without processor module)	TB5600: 155 g TB5610: 180 g TB5620: 210 g TB5640: 260 g TB5660: 310 g
Mounting position	Horizontal or vertical

[1]) Including processor modules, communication modules and communication interface modules

[2]) The inrush current and the melting integral depends on the internal power supply of the processor module and the number and type of communication modules and I/O modules connected to the I/O bus.

Table 409: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

Processor module	PM5630	PM5650	PM5670	PM5675
TB5600-2ETH	0 slot	0 slot	0 slot	0 slot
TB5610-2ETH	1 slot	1 slot	1 slot	1 slot

1.6.3.3 Processor modules

The AC500 product family consists of the product groups:

- AC500 (standard):
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.
- AC500-eCo:
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.
- AC500-S:
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.
- AC500-XC:
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

1.6.3.3.1 AC500-eCo

PM50xx

The following table lists all AC500-eCo V3 CPUs with their most important properties.

Processor modules	Global user memory	Configurable input/output	Digital inputs	Digital outputs	Power supply	Ethernet interfaces	Option board slots
Basic CPUs							
PM5012-T-ETH	1 MB thereof 256 kB for user program code and data dynamically allocated	-	6	4 (Transistor)	24 V DC	1	1
PM5012-R-ETH	1 MB thereof 256 kB for user program code and data dynamically allocated	-	6	4 (Relay)	24 V DC	1	1
Standard CPUs							
PM5032-T-ETH	2 MB thereof 512 kB for user program code and data dynamically allocated	2 (Transistor)	12	8 (Transistor)	24 V DC	1	2
PM5032-R-ETH	2 MB thereof 512 kB for user program code and data dynamically allocated	2 (Transistor)	12	6 (Relay)	24 V DC	1	2
PM5052-T-ETH	4 MB thereof 768 kB for user program code and data dynamically allocated	2 (Transistor)	12	8 (Transistor)	24 V DC	1	3
PM5052-R-ETH	4 MB thereof 768 kB for user program code and data dynamically allocated	2 (Transistor)	12	6 (Relay)	24 V DC	1	3
Pro CPUs							

Processor modules	Global user memory	Configurable input/output	Digital inputs	Digital outputs	Power supply	Ethernet interfaces	Option board slots
PM5072-T-2ETH	8 MB thereof 1 MB for user program code and data dynamically allocated	2 (Transistor)	12	8 (Transistor)	24 V DC	2	3
PM5072-T-2ETHW *)	8 MB thereof 1 MB for user program code and data dynamically allocated	2 (Transistor)	12	8 (Transistor)	24 V DC	2	3

*) W = wide temperature

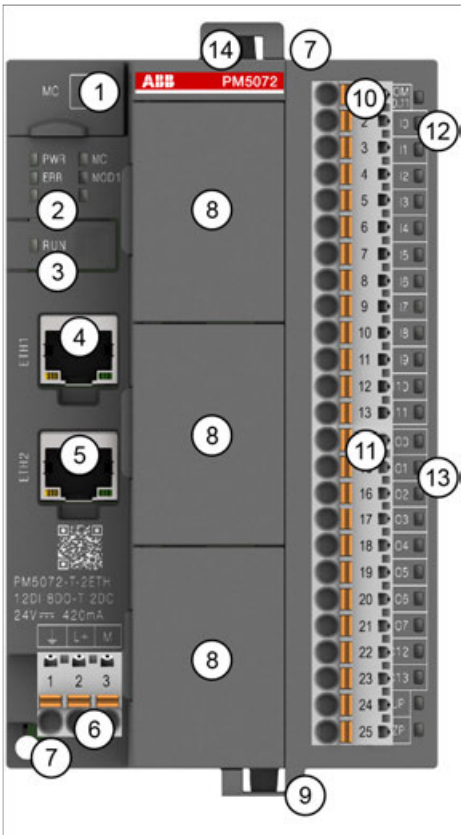

Fig. 99: Example: PM5072-T-2ETH

1 Micro memory card slot
2 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
3 RUN button
4 RJ45 female connector for Ethernet1 connection
5 RJ45 female connector for Ethernet2 connection (available for PM5072-T-2ETH(W))
6 3-pin terminal block for power supply 24 V DC
7 2 holes for screw mounting
8 Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9 Cable fixing

10 13-pin terminal block for onboard I/Os
11 12-pin terminal block for onboard I/Os (not available on PM5012-x-ETH)
12 12 LEDs to display the states of the signals
13 10 LEDs to display the states of the signals
14 Cable fixing accessory TA5301-CFA on the top of the housing (optional)

The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable fixing accessory on the top of the housing is optional.

Please use TA5301-CFA cable fixing accessory to provide strain relief.

It can also be used for AC500-eCo I/O modules.

The PM50x2 processor modules are supplied with option board slot covers as standard.

There are various TA51xx option boards for the processor modules that can be ordered separately.

Which and how many option boards can be plugged, depends on the respective processor module.

Short description

The processor modules PM50xx series are the central units of AC500-eCo V3 PLC. Their main characteristics are:

- Power supply 24 V DC
- I/O bus (not for PM5012-x-ETH)
- Real-time clock (PM5012-x-ETH needs additional RTC option board)
- Option board slots for extension on the CPU (1 for PM5012-x-ETH, 2 for PM5032-x-ETH, 3 for PM5052-x-ETH and PM5072-T-2ETH)
- 6 digital inputs (PM5012-x-ETH), 12 digital inputs (PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH)
- 4 transistor outputs (PM5012-T-ETH), 8 transistor outputs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH)
- 4 relay outputs (PM5012-R-ETH), 6 relay outputs (PM5032-R-ETH, PM5052-R-ETH)
- 2 configurable digital inputs/outputs (not for PM5012-x-ETH)

The various processor module variants differ in the following characteristics:

- Type of the digital outputs (transistor or relays)
- Ethernet interface one or two independent interfaces

All processor module variants include a micro memory card slot.

Details and technical data are provided in the technical data section *Chapter 1.6.3.3.1.1.8 “Technical data” on page 2472*.

Assortment

Processor module	Total max-imum download-able application size	Allocated global user memory for user program code and data	Cycle time for 1000 instructions [ns]	Numer digital inputs	Number digital outputs	Type of digital outputs	Config-urable digital inputs/ outputs	Number of option board slots	Max. number of I/O modules on I/O bus
PM5012-T-ETH	1 MB	256 kB	Binary: 20 Word: 50 Floating: 600	6	4	Tran-sistor	-	1	-
PM5012-R-ETH	1 MB	256 kB		6	4	Relay	-	1	-
PM5032-T-ETH	2 MB	512 kB		12	8	Tran-sistor	2	2	10 with max. 128 Bytes inputs/ 128 Bytes outputs variables
PM5032-R-ETH	2 MB	512 kB		12	6	Relay	2	2	10 with max. 128 Bytes inputs/ 128 Bytes outputs variables
PM5052-T-ETH	4 MB	768 kB		12	8	Tran-sistor	2	3	10
PM5052-R-ETH	4 MB	768 kB		12	6	Relay	2	3	10
PM5072-T-2ETH	8 MB	1 MB		12	8	Tran-sistor	2	3	10
PM5072-T-2ETHW	8 MB	1 MB		12	8	Tran-sistor	2	3	10

Connections and interfaces

I/O bus

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128 Bytes input/ 128 Bytes output variables) and 10 I/O modules for PM5052-x-ETH and PM5072-T-2ETH can be added.

Option board slot interface

Depending on the processor module variants, an additional option board can be connected to the option board slot to extend the feature of the processor module ↳ *Chapter 1.6.2.6.2.1.1 “Option boards for AC500-eCo V3 processor modules” on page 2410* .

Serial interface

RS-232 communication interface is available by using option board:

- TA5141-RS232I (isolated)
  ↳ *Chapter 1.6.3.3.1.2.6 “TA5141-RS232I - Option board for COMx serial communication” on page 2502*

RS-485 communication interface is available by using option boards:

- TA5142-RS485I (isolated)
  ↳ *Chapter 1.6.3.3.1.2.7 “TA5142-RS485I - Option board for COMx serial communication” on page 2504*
- TA5142-RS485 (non isolated)
  ↳ *Chapter 1.6.3.3.1.2.8 “TA5142-RS485 - Option board for COMx serial communication” on page 2510*

Ethernet interface

The Ethernet interface is carried out via a RJ45 jack.

Table 412: Pin assignment of the Ethernet interface

Interface	Pin	Description	
	1	Tx+	Transmit data +
	2	Tx-	Transmit data -
	3	Rx+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	Rx-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 413: Removable terminal block for the supply voltage 24 V DC

3-pin spring terminal block	3-pin screw terminal block
	

The terminal block is available as a set for AC500-eCo V3 processor modules.

Basic CPU (PM5012)		Standard CPUs (PM5032, PM5052) and Pro CPUs (PM5072)	
Spring type	**Screw type**	**Spring type**	**Screw type**
TA5211-TSPF-B	TA5211-TSCL-B	TA5212-TSPF	TA5212-TSCL

Further information on the terminal blocks concerning power supply and onboard inputs/outputs are provided under pluggable connectors for screw and spring connection *Chapter 1.6.3.8.1.2 “TA52xx(-x) - Terminal block sets” on page 3293*.

Pin assignment

Pin Assignment	Pin	Label	Function	Description
 Terminal block inserted	1	⏚	FE	Functional earth
	2	L+	+24 V DC	Positive pin of the power supply voltage
	3	M	0 V	Negative pin of the power supply voltage

Faulty wiring on power supply terminals

CAUTION!

Risk of damaging the AC500-eCo V3 processor module and the connected modules!

Voltages > 30 V DC might damage the processor module and the connected modules.

Make sure that the supply voltage never exceeds 30 V DC.

State LEDs and operating elements

RUN/STOP button

The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processer modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

State LEDs

The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

LED	State	Color	LED = ON	LED = OFF	LED flashing
PWR	Power supply	Green	Power supply present	Power supply missing	-
MC	Micro memory card indication	Yellow	Micro memory card is in the socket	Micro memory card is not in the socket	Micro memory card is in read/ write state: any file on card is opened, means activity on card

LED	State	Color	LED = ON	LED = OFF	LED flashing
ERR	Error indication	Red	An error occurred	No errors or only warnings encountered (E4 errors). The LED behavior for the error classes 2 to 4 is configurable.	Fast flashing (4 Hz) displays together with the RUN LED a currently running firmware-upgrade or writing data to the Flash-EPROM. Slow flashing (1 Hz) alone displays shutdown of Request To Send. Medium flashing (2 Hz) alone displays at start of PLC if reboot after watchdog.
MOD1	Mode 1 indication	Yellow	Processor module is in mode 1 state	Processor module is not in mode 1 state	-
RUN	RUN/STOP state	Green	Processor module is in state RUN	Processor module is in state STOP	Fast flashing (4 Hz): The processor module is reading/writing data from/to the memory card. If the ERR-LED is also flashing, data is being written to the Flash-EPROM.

LED	State	Color	LED = ON	LED = OFF	LED flashing
					Slow flashing (1 Hz): The firmware update from the memory card has been completed successfully or Boot project is being updated. Slow flashing (0.5 Hz) together with MOD1 LED ON: Mode1: Boot project is not loaded.
Two LEDs below “ERR” and “MOD1”	Configurable	Yellow	Configurable	Configurable	Additional two LEDs are reserved and can be controlled from IEC user code with FB PmLedSet

User configurable LEDs

The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application.

The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

I/O LEDs

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH) to display the states of the inputs and outputs.

Processor module	LED	State	Color	LED = ON	LED = OFF
PM5012-x-ETH	I0..I5	Digital input	Yellow	Input is ON	Input is OFF
	O0..O3	Transistor output	Yellow	Output is ON	Output is OFF
	NO0..NO3	Relay output	Yellow	Output is ON	Output is OFF
PM5032-x-ETH PM5052-x-ETH	I0..I11	Digital input	Yellow	Input is ON	Input is OFF
	O0..O7	Transistor output	Yellow	Output is ON	Output is OFF
	NO0..NO5	Relay output	Yellow	Output is ON	Output is OFF
	C12, C13	Digital configurable input/ output	Yellow	Input/Output is ON	Input/Output is OFF
PM5072-T-2ETH	I0..I11	Digital input	Yellow	Input is ON	Input is OFF

Processor module	LED	State	Color	LED = ON	LED = OFF
PM5072-T-2ETHW	O0..O7	Transistor output	Yellow	Output is ON	Output is OFF
	C12, C13	Digital configurable input/ output	Yellow	Input/Output is ON	Input/Output is OFF

Ethernet state LEDs

Table 414: State LEDs at Ethernet connector

LED	Color	OFF	ON	Flashing
Activity	Yellow	No activity	---	Activity
Link	Green	No link	Link	---

Diagnosis

The AC500 processor module can display various errors according to the error classes. The following error classes are possible. The reaction of the processor module is different for each type of error.

Error class	Type	Description	Example
E1 ERR-LED is ON	Fatal error	A safe function of the operating system is no longer guaranteed.	Checksum error in the system Flash or RAM error
E2 ERR-LED is ON	Severe error	The operating system is functioning without problems, but the error-free processing of the user program is no longer guaranteed.	Checksum error in the user Flash, independent of the task duration
E3 ERR-LED is ON/OFF *)	Light error	It depends on the application if the user program should be stopped by the operating system or not. The user should determine which reaction is necessary.	Flash could not be programmed, I/O module has failed
E4 ERR-LED is ON/OFF *)	Warning	Error in the periphery (e.g. I/O) which may show an impact in the future. The user should determine which reaction is necessary.	Short-circuit at an I/O module, the battery is run down or not inserted
*) The behaviour if the ERR-LED lights up at error classes E3 or E4 is configurable.			

Occurred errors can be displayed with the commands diagshow all in the PLC-Browser of Automation Builder software.

Onboard I/Os

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

Intended purpose

Table 415: Numbers and types of the onboard I/Os

Processor module	No. and type of digital inputs	No. and type of digital outputs	No. and type of configurable inputs/outputs
PM5012-T-ETH	6 24 V DC (one isolation group)	4 0.5 A max., transistor (one isolation group)	None
PM5012-R-ETH	6 24 V DC (one isolation group)	4 2 A max., relay (two isolation groups)	None
PM5032-T-ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5032-R-ETH	12 24 V DC (one isolation group)	6 2 A max., relay (two isolation groups)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5052-T-ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5052-R-ETH	12 24 V DC (one isolation group)	6 2 A max., relay (two isolation groups)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5072-T-2ETH	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)
PM5072-T-2ETHW	12 24 V DC (one isolation group)	8 0.5 A max., transistor (one isolation group)	2 24 V DC input or 0.5 A max., transistor output (one isolation group)

Connections

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

When replacing a processor module, it is recommended to mark each wire connected to the onboard I/O terminal block before disconnecting it. This should make sure that the wires can be reconnected in the same order.

The connection is carried out by using removable 12-pin and 13-pin terminal blocks.

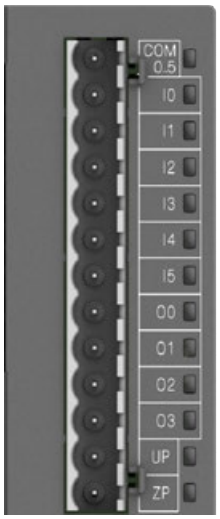

Table 416: Assignment of the terminals for PM5012-T-ETH:

Terminal	Signal	Description
1	COM 0..5	Input common for digital input signals I0 to I5
2	I0	Digital input signal I0 (5 kHz)
3	I1	Digital input signal I1 (5 kHz)
4	I2	Digital input signal I2 (5 kHz)
5	I3	Digital input signal I3 (5 kHz)
6	I4	Digital input signal I4 (5 kHz)
7	I5	Digital input signal I5 (5 kHz)
8	O0	Digital output signal O0 (5 kHz)
9	O1	Digital output signal O1 (5 kHz)
10	O2	Digital output signal O2 (5 kHz)
11	O3	Digital output signal O3 (5 kHz)
12	UP	Process supply voltage UP +24 V DC
13	ZP	Process supply voltage ZP 0 V DC

Table 417: Assignment of the terminals for PM5012-R-ETH:

Terminal	Signal	Description
1	COM 0..5	Input common for digital input signals I0 to I5
2	I0	Digital input signal I0 (5 kHz)
3	I1	Digital input signal I1 (5 kHz)
4	I2	Digital input signal I2 (5 kHz)
5	I3	Digital input signal I3 (5 kHz)
6	I4	Digital input signal I4 (5 kHz)
7	I5	Digital input signal I5 (5 kHz)

24	UP	Process supply voltage UP +24 V DC
25	ZP	Process supply voltage ZP 0 V DC

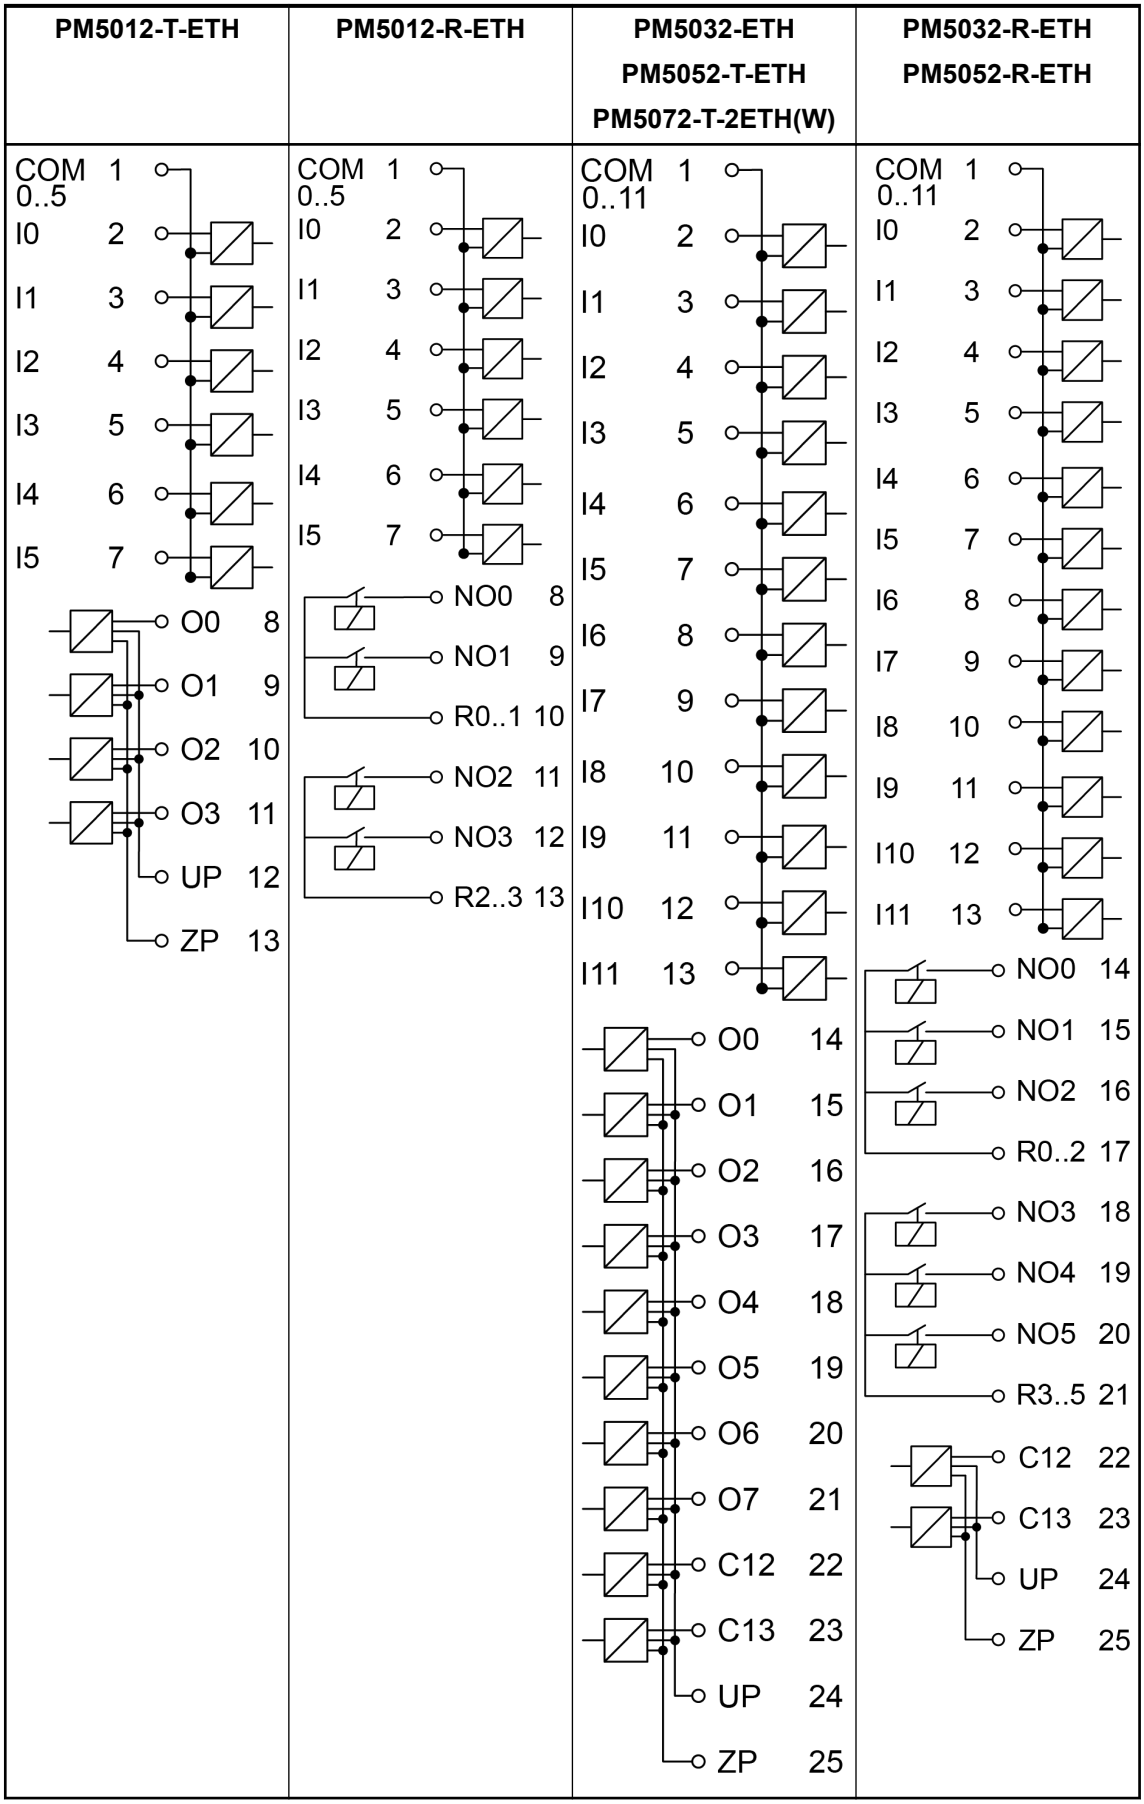
Block diagrams The following block diagram shows the internal structure of the onboard I/Os.



Connection of the digital inputs

The digital inputs can be used as source inputs or as sink inputs.

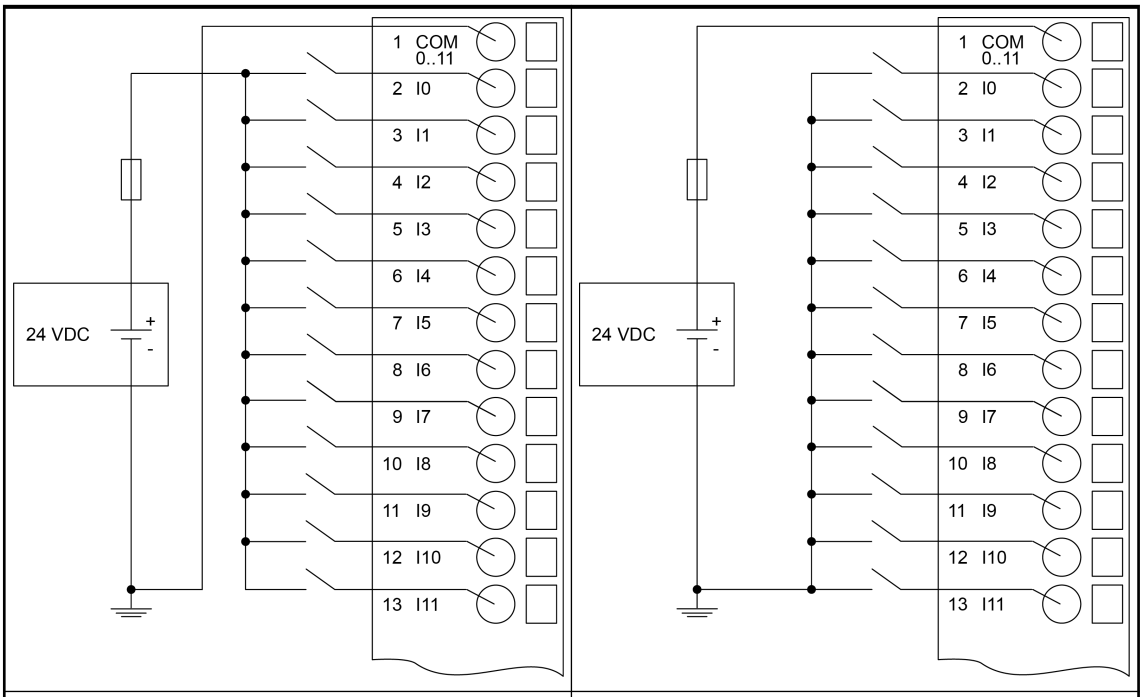
NOTICE!

Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital inputs to the PM50x2 processor modules:



Connection of digital inputs (sink inputs)	Connection digital inputs (source inputs)

Connection of the digital transistor outputs (PM50xx-T-ETH only)

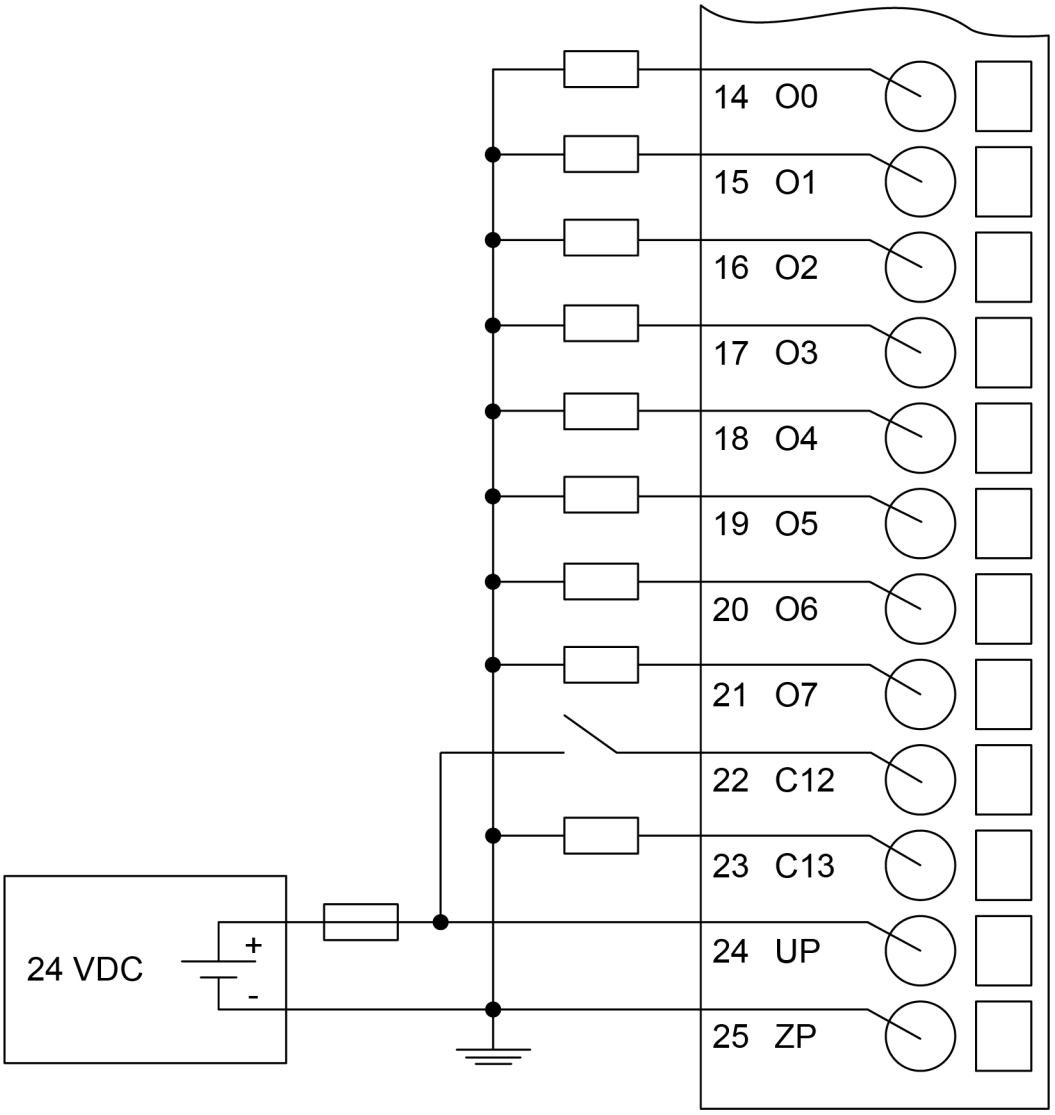


Fig. 100: Connection of digital transistor outputs and configurable digital inputs/outputs

C12 used as configurable digital input
C13 used as configurable digital transistor output

CAUTION!
Risk of damaging the processor module!
The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

Connection of the digital relay outputs (PM50xx-R-ETH only)

The following figures show the connection of the digital relay outputs to the processor modules:

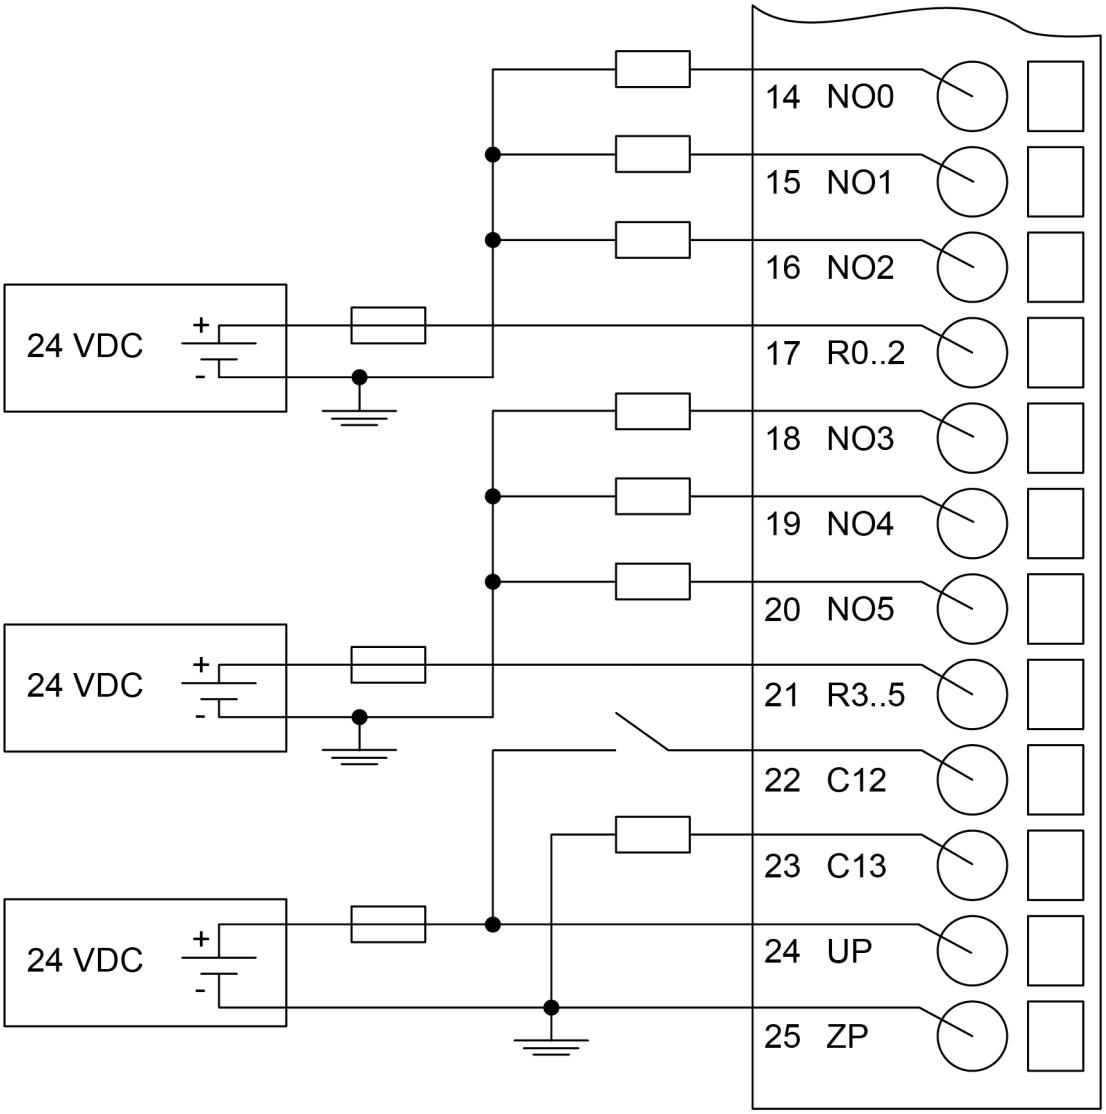

Fig. 101: Connection of digital relay outputs and configurable digital inputs/outputs

C12 used as configurable digital input
C13 used as configurable digital transistor output

WARNING!
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

CAUTION!
Risk of damaging the processor module!
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be fed from the same phase.
- Use an external fuse to protect the outputs.

I/O configuration

The configuration data of the onboard I/Os is stored in the processor modules PM50x2. See PLC configuration: *Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3700*

Parameterization

For information about parameterization, refer to the description for onboard I/Os for processor modules PM50x2. See PLC configuration: *“PM5012-x-ETH Basic CPU” on page 3702* and *“PM5032-x-ETH, PM5052-x-ETH Standard CPU” on page 3703*

Diagnosis

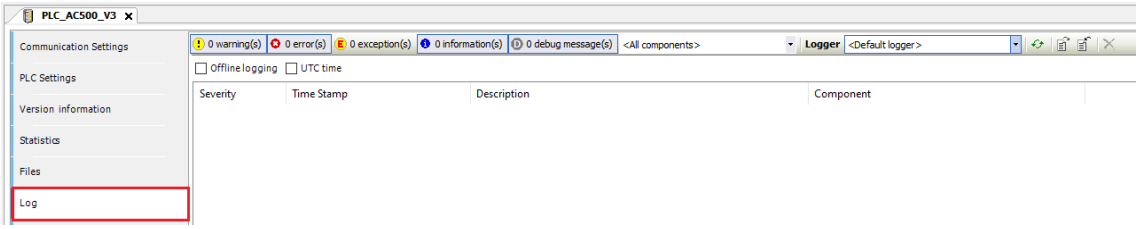
No diagnosis is generated for the onboard I/O.

There is only an error message if the configuration does not work. A log entry is generated.

The Automation Builder already prevents faulty values from being entered in the configuration.

If the configuration does not work, there is a system error, if e.g. faulty software or wrong versions are installed.

Otherwise there are error messages from the blocks for the individual functions.



Displays

Table 420: States of the I/Os

LED	Status	Color	LED = ON	LED = OFF
I	Digital input	yellow	Input is ON	Input is OFF
O	Digital transistor output	yellow	Output is ON	Output is OFF
NO	Digital relay output	yellow	Relay contact is closed	Relay contact is open
C	Digital configurable input/output	yellow	Configured input/ output is ON	Configured input/ output is OFF

Technical data

Technical data of the digital inputs

Parameter	Value
Number of channels per module	12
Distribution of the channels into groups	1 group of 12 channels
Galvanic isolation	Yes, per group
Connections of the channels I0 to I11	Terminals 2 to 13

Parameter		Value	
Reference potential for the channels I0 to I11		Terminal 1	
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1) and the module's logic is in operation	
Input type according to EN 61131-2		Type 1 source	Type 1 sink
Input signal voltage		-24 V DC	+24 V DC
	Signal 0	-5 V...+3 V	-3 V...+5 V
	Undefined signal	-15 V...- 5 V	+5 V...+15 V
	Signal 1	-30 V...-15 V	+15 V...+30 V
Ripple with signal 0		Within -5 V...+3 V	Within -3 V...+5 V
Ripple with signal 1		Within -30 V...-15 V	Within +15 V...+30 V
Input current per channel			
	Input voltage +24 V	Typ. 4.6 mA	
	Input voltage +5 V	Typ. 0.8 mA	
	Input voltage +15 V	> 2.5 mA	
	Input voltage +30 V	< 8 mA	
Max. permissible leakage current (at 2-wire proximity switches)		1 mA	
Input delay (0->1 or 1->0)		On request	
Max. cable length *)			
	Shielded	On request	
	Unshielded	On request	

*) For fast inputs and fast outputs including PTO and PWM, a shielded cable must be used and the max. cable length is 50 m.

Technical data of the fast counter inputs

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.

Further information:

Operating modes of the fast counter: ↳ Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3781

Configurarion of the fast counter: ↳ Chapter 1.6.6.2.7.2 “Fast counters in the onboard I/Os” on page 3710

	Unshielded	On request

*) For fast inputs and fast outputs including PTO and PWM, a shielded cable must be used and the max. cable length is 50 m.

Technical data of the digital relay outputs

Table 423: PM5012-R-ETH

Parameter		Value
Number of channels per module		4 normally-open relay outputs
Distribution of the channels into groups		2 groups for 2 channels
Galvanic isolation		Yes, per group
Connection of the channels NO0 to NO1		Terminals 8 to 9
Connection of the channels NO2 to NO3		Terminals 11 to 12
Reference potential R0..1 for the channels NO0 to NO1		Terminal 10
Reference potential R2..3 for the channels NO2 to NO3		Terminal 13
Relay output voltage		
	Rated value	24 V DC or 100 V AC...240 V AC 50 Hz/60 Hz
	Range	5 V DC...30 V DC or 5 V AC...250 V AC
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1)
Way of operation		Non-latching type
Output delay		
	0 to 1	Typ. 10 ms
	1 to 0	Typ. 10 ms
Rated protection fuse		On request
Output current		
	Rated current per channel (max.)	2.0 A (24 V DC resistance and general use, 100 V AC...240 V AC, resistance, general use and pilot duty)
	Rated current per group (max.)	6 A
	Rated current (all channels together, max.)	12 A
Demagnetization when inductive loads are switched off		External demagnetization measures must be implemented when switching inductive loads.
Spark suppression with inductive AC loads		Must be performed externally according to driven load specification
Switching frequencies		

Parameter		Value
	With resistive loads	Max. 1 Hz
	With inductive loads	On request
	With lamp loads	On request
Short-circuit-proof / Overload-proof		No, should be provided by an external fuse or circuit breaker
Rated protection fuse (for each channel)		On request
Overload message		No
Output current limitation		No
Resistance to feedback against 24 V DC		No
Connection of 2 outputs in parallel		Not possible
Lifetime of relay contacts (cycles)		100,000 at rated load
Max. cable length *)		
	Shielded	On request
	Unshielded	On request

*) For fast inputs and fast outputs including PTO and PWM, a shielded cable must be used and the max. cable length is 50 m.

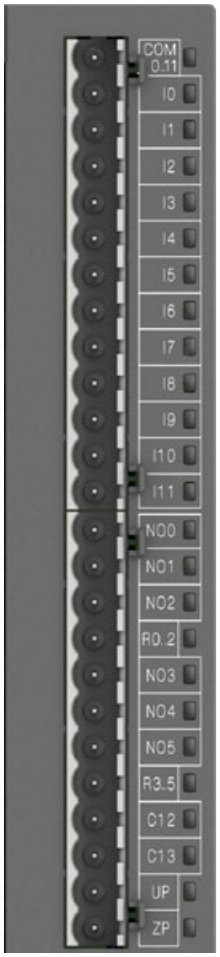

Table 424: PM5032-R-ETH and PM5052-R-ETH

Parameter		Value
Number of channels per module		6 normally-open relay outputs
Distribution of the channels into groups		2 groups for 3 channels
Galvanic isolation		Yes, per group
Connection of the channels NO0 to NO2		Terminals 14 to 16
Connection of the channels NO3 to NO5		Terminals 18 to 20
Reference potential R0..2 for the channels NO0 to NO2		Terminal 17
Reference potential R3..5 for the channels NO3 to NO5		Terminal 21
Relay output voltage		
	Rated value	24 V DC or 100 V AC...240 V AC 50 Hz/60 Hz
	Range	5 V DC...30 V DC or 5 V AC...250 V AC
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered through the I/O bus
Way of operation		Non-latching type
Output delay		
	0 to 1	Typ. 10 ms
	1 to 0	Typ. 10 ms
Rated protection fuse		On request

Parameter		Value
Output current		
	Rated current per channel (max.)	2.0 A (24 V DC resistance and general use, 100 V AC...240 V AC, resistance, general use and pilot duty)
	Rated current per group (max.)	6 A
	Rated current (all channels together, max.)	12 A
Demagnetization when inductive loads are switched off		External demagnetization measures must be implemented when switching inductive loads.
Spark suppression with inductive AC loads		Must be performed externally according to driven load specification
Switching frequencies		
	With resistive loads	Max. 1 Hz
	With inductive loads	On request
	With lamp loads	On request
Short-circuit-proof / Overload-proof		No, should be provided by an external fuse or circuit breaker

1SAP 187 400 R0014	TA5220-SPF7: spring terminal block, removable, 7-pin, spring front, cable front, 6 pieces per packing unit
1SAP 187 400 R0015	TA5220-SPF8: spring terminal block, removable, 8-pin, spring front, cable front, 6 pieces per packing unit
1SAP 187 500 R0001	TA5300-CVR: option board slot cover, removable plastic part, 6 pieces per packing unit

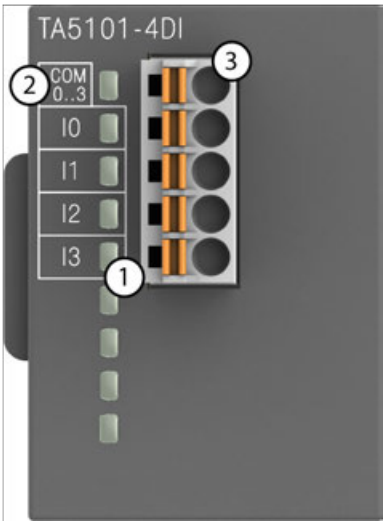
Option boards

TA5101-4DI - Option board for digital I/O extension

- 4 digital inputs 24 V DC (I0 to I3) in 1 group
- Module-wise galvanically isolated



1 4 yellow LEDs to display the signal states of the inputs I0 to I3
2 Allocation of signal name
3 5-pin terminal block for input signals

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).

The inputs/outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via internal CPU connection
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 5-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

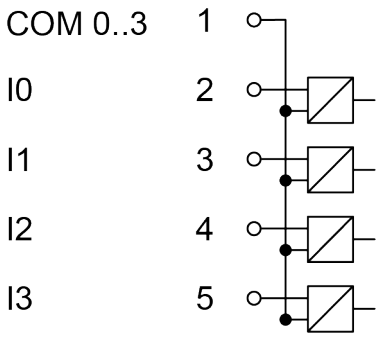


Table 429: Assignment of the terminals:

Terminal	Signal	Description
1	COM 0..3	Input common for signals I0 to I3
2	I0	Input signal I0
3	I1	Input signal I1
4	I2	Input signal I2
5	I3	Input signal I3

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5101-4DI.

An external power supply connection is not needed.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

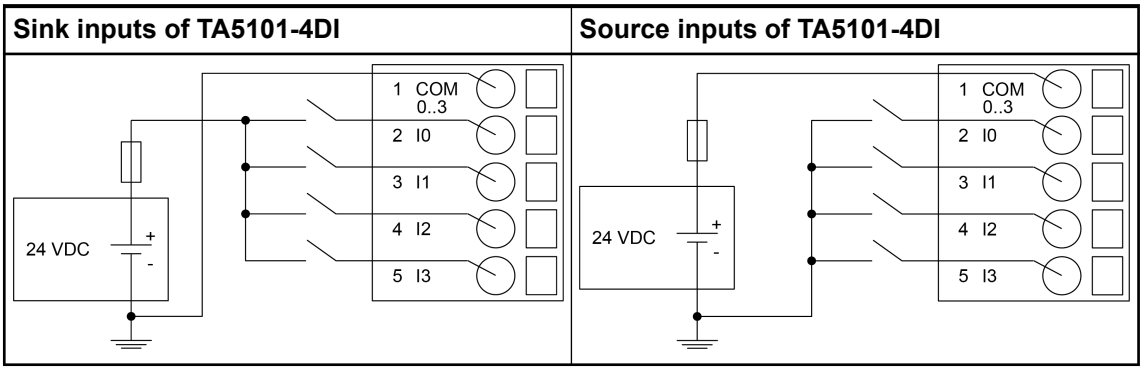
NOTICE!

Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the option board for digital I/O extension TA5101-4DI:



The module provides several diagnosis functions, see Diagnosis *“Diagnosis” on page 2482*.

The meaning of the LEDs is described in the section State LEDs *“State LEDs” on page 2482*.

I/O configuration

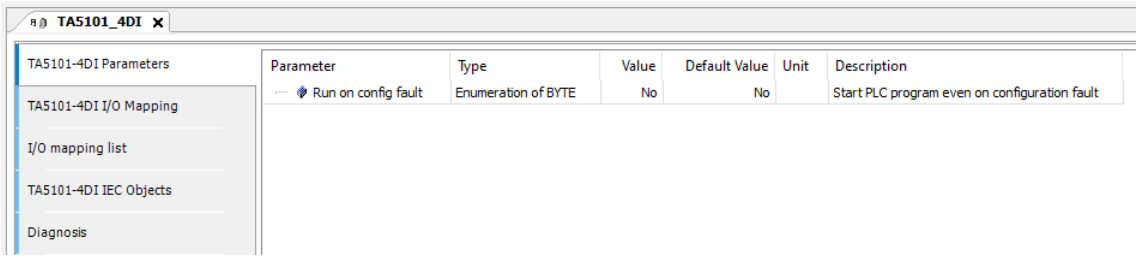
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing optional modules is possible without any re-parameterization via software.

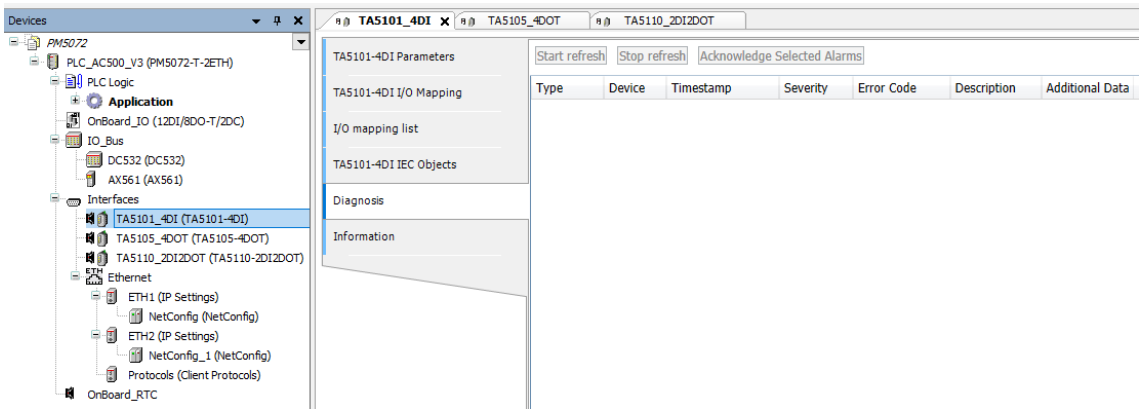
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *“TA51xx Parameters”* tab to edit the parameterization of the desired option board.



Diagnosis



1. In the device tree, double-click the desired option board.
2. Select the *“Diagnosis”* tab to view the diagnosis messages of the desired option board.

Table 430: Diagnosis messages

Device	Severity	Error code	Description	
			Error Message	Remedy
TA5101-4DI	11	1	Wrong or no board plugged	Replace with correct functional board
TA5101-4DI	11	2	Board defective	Replace with correct functional board
TA5101-4DI	11	3	Failed to set direction	Replace with correct functional board
TA5101-4DI	11	4	Parameter wrong	Verify setting of parameter “Run on config fault”

State LEDs

LED	State	Color	LED = OFF	LED = ON
Inputs I0...I3	Digital input	Yellow	Input is OFF	Input is ON

Technical data

The system data of AC500-eCo V3 apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter	Value
Galvanic isolation	Yes, between the input group and the rest of the module
Isolated groups	1 (4 channels per group)
Current consumption from 24 V DC power supply at the L+ and M terminals of the CPU	Ca. 10 mA
Max. power dissipation within the module	0.8 W
Weight	15 g

Parameter	Value
Mounting position	Horizontal or vertical
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

Table 431: Technical data of the digital inputs

Parameter		Value	
Number of channels per module		4 inputs 24 V DC	
Distribution of the channels into groups		1 (4 channels per group)	
Connections of the channels I0 to I3		Terminals 2 to 5	
Reference potential for the channels I0 to I3		Terminal 1 (plus or negative pole of the process supply voltage, signal name COM 0..3)	
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1). The module is powered through the CPU connection.	
Monitoring point of input indicator		LED	
Input type according to EN 61131-2		Type 1 source	Type 1 sink
Input signal range		-24 V DC	+24 V DC
	Signal 0	-5 V...+3 V	-3 V...+5 V
	Undefined signal	-15 V...-5 V	+5 V...+15 V
	Signal 1	-30 V...-15 V	+15 V...+30 V
Input current per channel			
	Input voltage 24 V	Typ. 5 mA	
	Input voltage 5 V	Typ. 1 mA	
	Input voltage 14 V		
	Input voltage 15 V	< 3 mA	
	Input voltage 27 V		
	Input voltage 30 V	< 7 mA	
Max. permissible leakage current (at 2-wire proximity switches)		1 mA	
Input delay (0->1 or 1->0)		Typ. 8 ms	
Input data length		1 byte	
Max. cable length			
	Shielded	On request	
	Unshielded	On request	

Ordering data

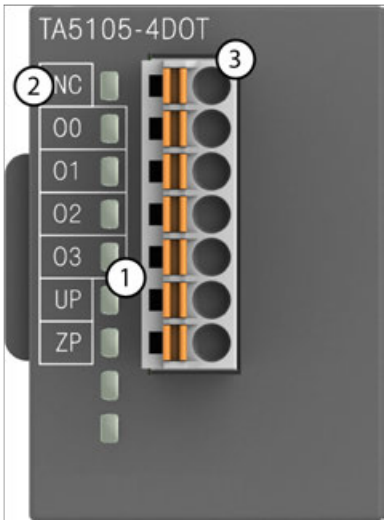
*) *Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

**) *The needed spring terminal block is always delivered with the option board.*

The terminal block listed in the table is for spare part only if needed.

TA5105-4DOT - Option board for digital I/O extension

- 4 digital outputs 24 V DC (O0 to O3) in 1 group
- Module-wise galvanically isolated



1 4 yellow LEDs to display the signal states of the inputs O0 to O3
2 Allocation of signal name
3 7-pin terminal block for output signals

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).

The inputs/outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via internal CPU connection
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

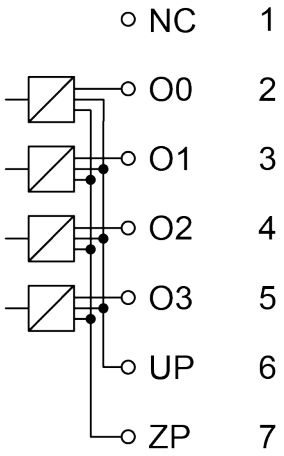


Table 432: Assignment of the terminals:

Terminal	Signal	Description
1	NC	Not connected
2	O0	Output signal O0
3	O1	Output signal O1

Terminal	Signal	Description
4	O2	Output signal O2
5	O3	Output signal O3
6	UP	Process supply voltage UP +24 V DC
7	ZP	Process supply voltage ZP 0 V DC

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5105-4DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

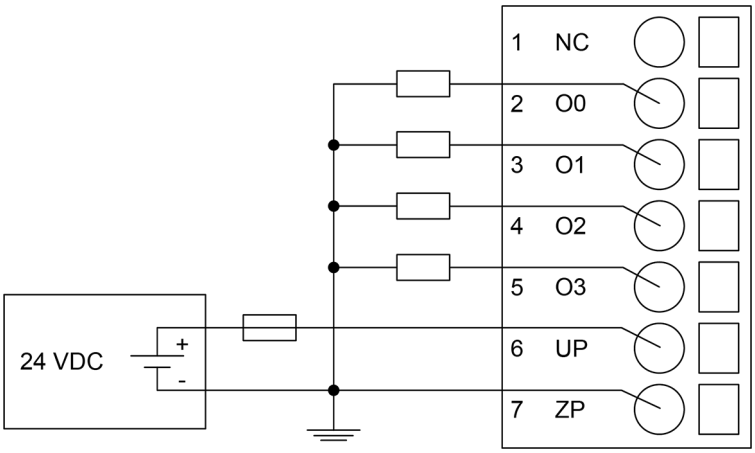
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The following figure shows the connection of the option board for digital I/O extension TA5105-4DOT:



NOTICE!

Risk of malfunctions in the plant!

Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.

This must be considered in the application planning.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis *“Diagnosis” on page 2488*.

The meaning of the LEDs is described in the section State LEDs *“State LEDs” on page 2488*.

I/O configuration

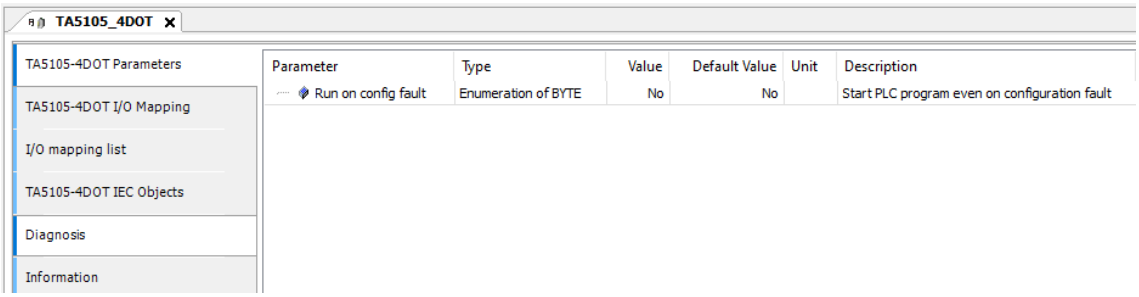
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

Hence, replacing optional modules is possible without any re-parameterization via software.

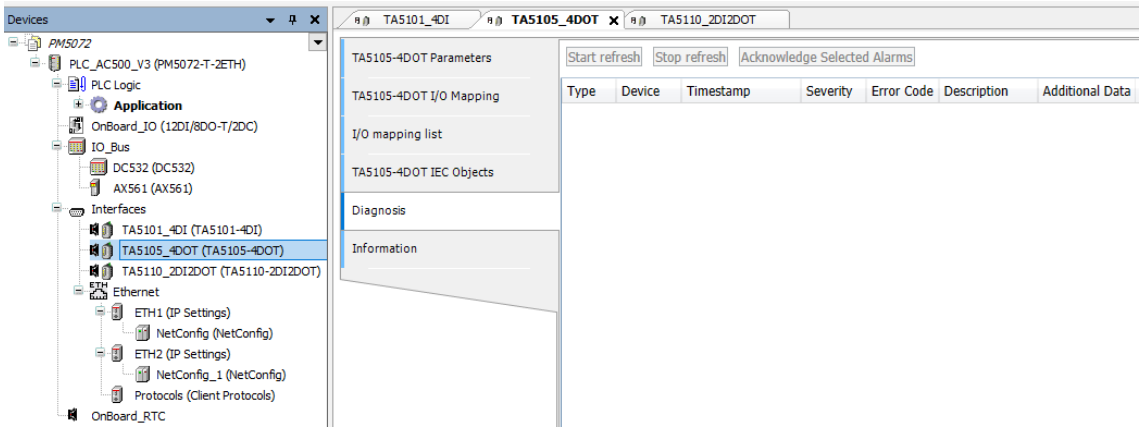
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *“TA51xx Parameters”* tab to edit the parameterization of the desired option board.



Diagnosis



1. In the device tree, double-click the desired option board.
2. Select the *“Diagnosis”* tab to view the diagnosis messages of the desired option board.

Table 433: Diagnosis messages

Device	Severity	Error code	Description	
			Error Message	Remedy
TA5105-4DOT	11	1	Wrong or no board plugged	Replace with correct functional board
TA5105-4DOT	11	2	Board defective	Replace with correct functional board
TA5105-4DOT	11	3	Failed to set direction	Replace with correct functional board
TA5105-4DOT	11	4	Parameter wrong	Verify setting of parameter “Run on config fault”

State LEDs

LED	State	Color	LED = OFF	LED = ON
Outputs O0...O3	Digital output	Yellow	Output is OFF	Output is ON (The output voltage (normally 24 V DC) is only displayed if UP/ZP and L+/M (supply voltages for the module) are switched ON)

Technical data

The system data of AC500-eCo V3 apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 6 for UP (+24 V DC) and terminal 7 for ZP (0 V DC)

Parameter		Value
	Rated value	24 V DC
	Current consumption via UP terminal	5 mA + max. 0.5 A per output
	Max. ripple	5 %
	Inrush current	0.000002 A^2s
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	On request
Current consumption from 24 V DC power supply at the L+/M terminals of the CPU		Ca. 10 mA
Galvanic isolation		Yes, between the output group and the rest of the module
Isolated groups		1 (4 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		0.5 W
Weight		16 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

Table 434: Technical data of the digital outputs

Parameter		Value
Number of channels per module		4 transistor outputs (24 V DC, 0.5 A max.)
Distribution of the channels into groups		1 (4 channels per group)
Connection of the channels O0 to O3		Terminals 2 to 5
Common power supply voltage		Terminal 6 (positive pole of the process voltage, signal name UP)
Reference potential for the channels O0 to O3		Terminal 7 (negative pole of the process voltage, signal name ZP)
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1). Only internal logic is powered from CPU. Outputs are powered from UP/ZP terminals.
Way of operation		Non-latching type
Min. output voltage at signal 1		UP - 0.1 V
Output delay (max. at rated load)		
	0 to 1	50 µs
	1 to 0	200 µs
Output data length		1 byte
Output current		
	Rated current per channel (max.)	0.5 A at UP 24 V DC (resistance, general use and pilot duty)
	Rated current per group (max.)	2 A (4 channels * 0.5 A)
Max. leakage current with signal 0		0.5 mA

Parameter		Value
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		On request
Demagnetization when inductive loads are switched off		Must be performed externally according to driven load specification
Switching Frequencies		
	With inductive loads	On request
Short-circuit-proof / Overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC	No
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	On request
	Unshielded	On request

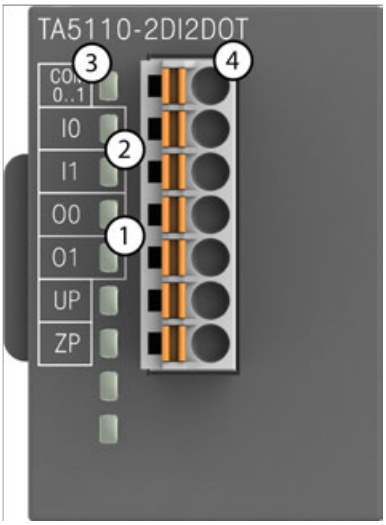
The terminal block listed in the table is for spare part only if needed.

TA5110-2DI2DOT - Option board for digital I/O extension

- 2 digital inputs 24 V DC (I0 to I1) in 1 group
- 2 digital transistor outputs 24 V DC (O0 to O1) in 1 group
- Group-wise galvanically isolated



1 2 yellow LEDs to display the signal states of the outputs O0 to O1
2 2 yellow LEDs to display the signal states of the inputs I0 to I1
3 Allocation of signal name
4 7-pin terminal block for input/output signals

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

Intended purpose

The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).

The inputs/outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via internal CPU connection
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.

The connection is carried out by using a removable 7-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module's scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:

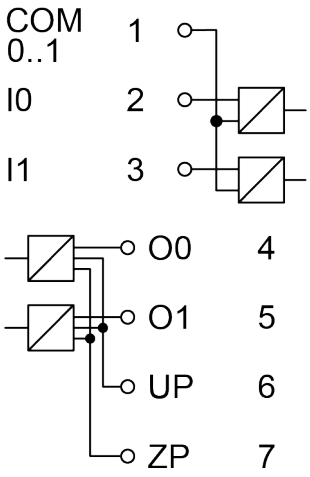


Table 435: Assignment of the terminals:

Terminal	Signal	Description
1	COM 0..1	Input common for signals I0 to I1
2	I0	Input signal I0
3	I1	Input signal I1
4	O0	Output signal O0
5	O1	Output signal O1
6	UP	Process supply voltage UP +24 V DC
7	ZP	Process supply voltage ZP 0 V DC

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5110-2DI2DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

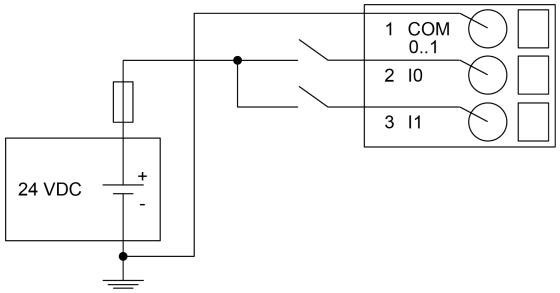
NOTICE!

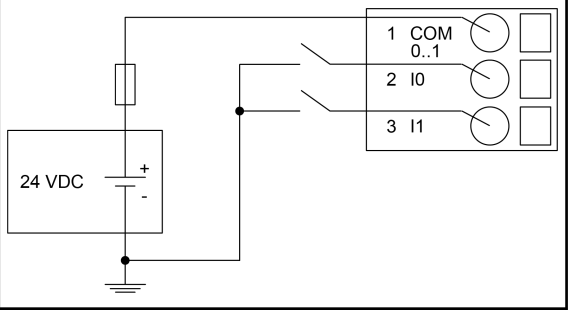
Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

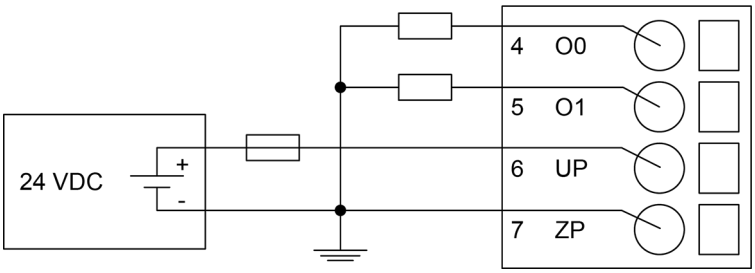
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection for inputs of the option board for digital I/O extension TA5110-2DI2DOT:

Sink inputs of TA5110-2DI2DOT	Source inputs of TA5110-2DI2DOT
	




The following figure shows the connection for outputs of the option board for digital I/O extension TA5110-2DI2DOT:



NOTICE!

Risk of malfunctions in the plant!

Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.

This must be considered in the application planning.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis *“Diagnosis” on page 2494*.

The meaning of the LEDs is described in the section State LEDs *“State LEDs” on page 2495*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.

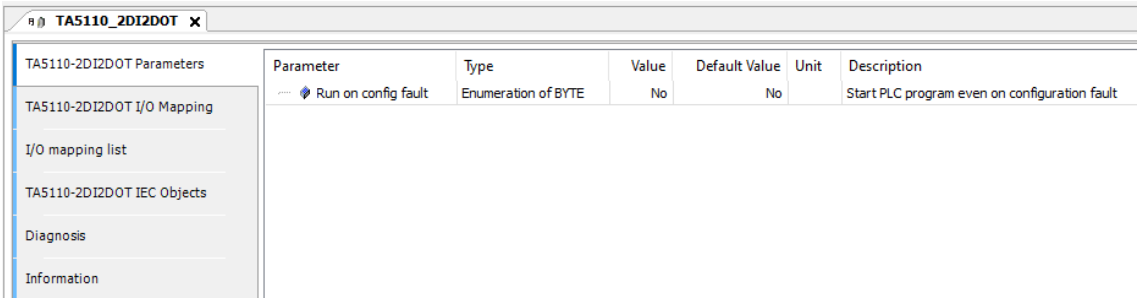
Hence, replacing optional modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

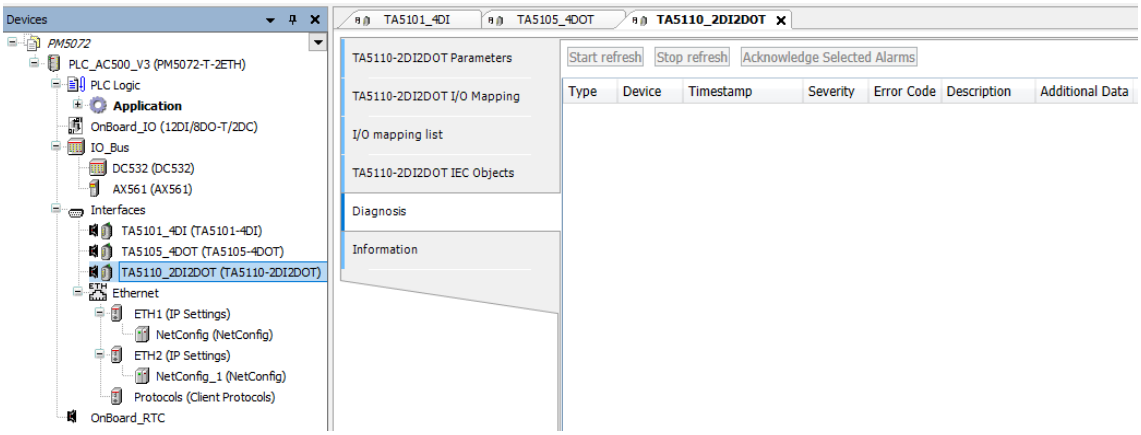
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *“TA51xx Parameters”* tab to edit the parameterization of the desired option board.



Diagnosis



1. In the device tree, double-click the desired option board.
2. Select the *“Diagnosis”* tab to view the diagnosis messages of the desired option board.

Table 436: Diagnosis messages

Device	Severity	Error code	Description	
			Error Message	Remedy

Outputs O0...O1	Digital output	Yellow	Output is OFF	Output is ON

Technical data

The system data of AC500-eCo V3 apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 6 for UP (+24 V DC) and terminal 7 for ZP (0 V DC)
	Rated value	24 V DC
	Current consumption via UP terminal	5 mA + max. 0.5 A per output
	Max. ripple	5 %
	Inrush current	0.000002 A^2s
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	On request
Current consumption from 24 V DC power supply at the L+/M terminals of the CPU		Ca. 10 mA
Galvanic isolation		Yes, between the input group and the output group and the rest of the module
Isolated groups		2 groups (1 group for 2 input channels, 1 group for 2 output channels)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		0.7 W
Weight		15 g

Parameter	Value
Mounting position	Horizontal or vertical
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

Table 437: Technical data of the digital inputs

Parameter		Value	
Number of channels per module		2	
Distribution of the channels into groups		1 group for 2 channels	
Connections of the channels I0 to I1		Terminals 2 to 3	
Reference potential for the channels I0 to I1		Terminal 1	
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1)	
Monitoring point of input indicator		LED It is not part of input circuit (its controlled by processor side, not process side)	
Input type according to EN 61131-2		Type 1 source	Type 1 sink
Input signal range		-24 V DC	+24 V DC
Signal 0		-5 V...+3 V	-3 V...+5 V
Undefined signal		-15 V...+ 5 V	+5 V...+15 V
Signal 1		-30 V...-15 V	+15 V...+30 V
Ripple with signal 0		-5 V...+3 V	-3 V...+5 V
Ripple with signal 1		-30 V...-15 V	+15 V...+30 V
Input current per channel			
	Input voltage +24 V	Typ. 5 mA	
	Input voltage +5 V	Typ. 1 mA	
	Input voltage +15 V	< 3 mA	
	Input voltage +30 V	< 7 mA	
Max. permissible leakage current (at 2-wire proximity switches)		1 mA	
Input delay (0->1 or 1->0)		Typ. 8 ms	
Input data length		1 byte	
Max. cable length			
	Shielded	On request	
	Unshielded	On request	

Table 438: Technical data of the digital outputs

Parameter	Value
Number of channels per module	2 transistor outputs (24 V DC, 0.5 A max.)
Distribution of the channels into groups	1 group of 2 channels

Parameter		Value
Connection of the channels O0 to O1		Terminals 4 to 5
Reference potential for the channels O0 to O17		Terminal 7 (negative pole of the process voltage, name ZP)
Common power supply voltage		Terminal 6 (positive pole of the process voltage, name UP)
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus
Monitoring point of output indicator		Controlled together with transistor
Way of operation		Non-latching type
Min. output voltage at signal 1		UP - 0.1 V
Output delay		
	0 to 1	50 µs
	1 to 0	200 µs
Output data length		1 byte
Output current		
	Rated current per channel (max.)	0.5 A at UP 24 V DC (resistance, general use and pilot duty)
	Rated current per group (max.)	1 A
	Rated current (all channels together, max.)	1 A
	Max. leakage current with signal 0	0.5 mA
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		On request
Demagnetization when inductive loads are switched off		Must be performed externally according to driven load specification
Switching Frequencies		
	With inductive loads	On request
Short-circuit-proof / Overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC	No
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	On request
	Unshielded	On request

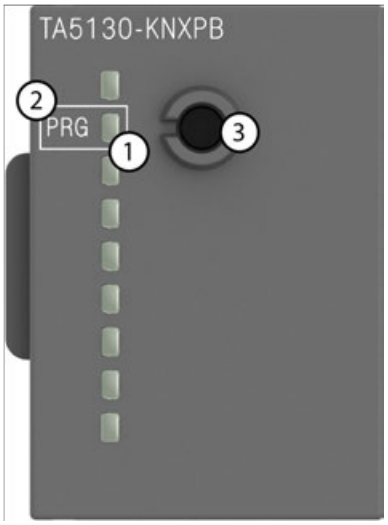
TA5130-KNXPB - Option board KNX adress push button



1 State LED
2 Allocation of signal name
3 Connector

For more information about TA5130-KNXPB, please refer to the Automation Builder online help.

Intended purpose

This option board is only intended to be used with PM5072-T-2ETH(W).

This option board can only be used once on one slot at a time!

The option board is not supported by other AC500-eCo V3 PLCs.

Information can be found in the chapter system technology: see ↳ Chapter 1.6.5.1.9 “KNX IP integration” on page 3527

Functionality

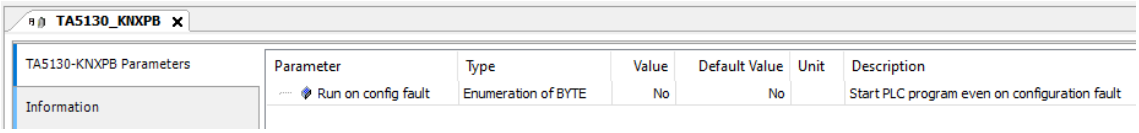
Information can be found in the chapter system technology: see ↳ Chapter 1.6.5.1.9 “KNX IP integration” on page 3527

Information about the integration of the PLC in KNX can be found here: ↳ “AC500-eCo V3 via TA5130-KNXPB” on page 3540

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *“TA51xx Parameters”* tab to edit the parameterization of the desired option board.



State LEDs

TA5131-RTC - Option board for real-time clock

1 TA5131-RTC option board

Intended purpose

This option board is only for the basic CPUs PM5012-T-ETH and PM5012-R-ETH.

All other AC500-eCo V3 CPUs have the real-time clock already integrated.

Information can be found in the chapter system technology: see ↳ Chapter 1.6.5.1.4 “Real-time clock and battery” on page 3478

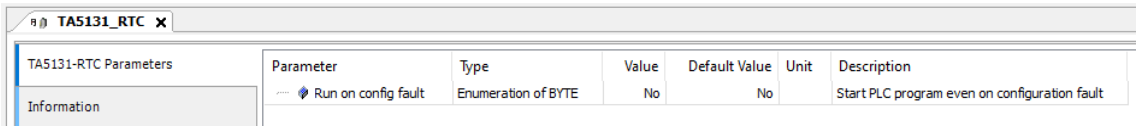
Functionality

Information can be found in the chapter system technology: see ↳ Chapter 1.6.5.1.4 “Real-time clock and battery” on page 3478

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *"TA51xx Parameters"* tab to edit the parameterization of the desired option board.



Technical data

The system data of AC500-eCo V3 apply *Chapter 1.6.4.5.1 "System data AC500-eCo V3" on page 3352*

Only additional details are therefore documented below.

Parameter	Value
Buffering time	7 days at room temperature
Usable CPUs	PM5012

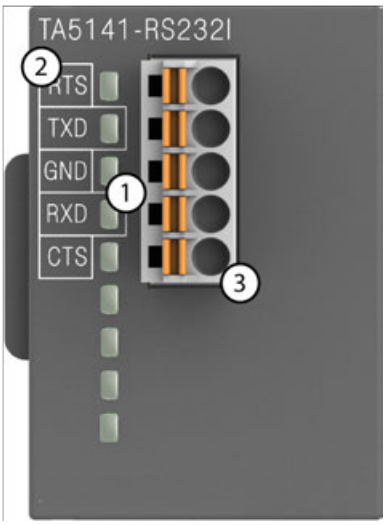
TA5141-RS232I - Option board for COMx serial communication



1 2 LEDs for communication state display (TxD and RxD)
2 Allocation of signal name
3 5-pin terminal block for communication interface

Intended purpose

Option board for COMx serial communication TA5141-RS232I is equipped with 1 RS-232 serial interface with handshake.

Connections

Serial interfaces

NOTICE!

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

Table 439: TA5141-RS232I

Serial interface	Pin	Signal	Description
	1	RTS	Request To Send DCE is ready to accept data from the DTE
	2	TxD	Transmit data (output)
	3	GND	Common Ground
	4	RxD	Receive data (input)
	5	CTS	Clear To Send (input) DCE is ready to accept data from the DTE

Cable length

The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

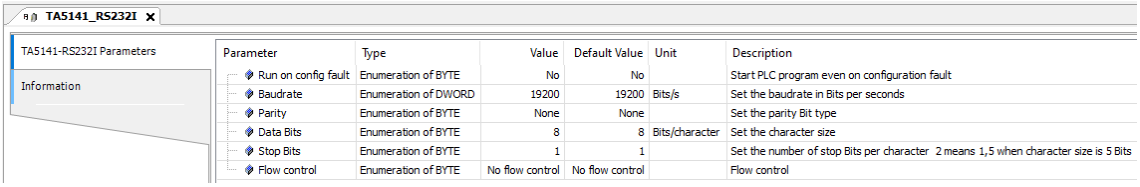
RS-232 for point-to-point connection:

Parameter	Value
Transmission rate	9.6 kBit/s to 115.2 kBit/s
Maximum cable length	On request

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *"TA51xx Parameters"* tab to edit the parameterization of the desired option board.



State LEDs

Signal	Color	State	Description
TxD	Yellow	ON (blinking)	Transmitting
RxD	Yellow	ON (blinking)	Receiving

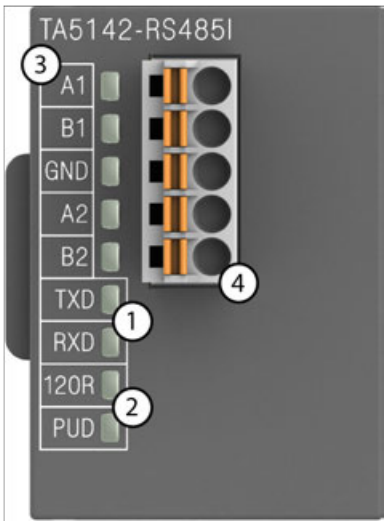
TA5142-RS485I - Option board for COMx serial communication



1 2 LEDs for communication state display (TxD and RxD)
2 2 LEDs for termination state display
3 Allocation of signal name
4 5-pin terminal block for communication interface

Intended purpose

Option board for COMx serial communication TA5142-RS485(I) is equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.

Bus terminations are built-in and configurable.

Connections

Serial interfaces

NOTICE!

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

Table 440: TA5142-RS485(I)

Serial interface	Pin	Signal
	1	A1 internally connected to A2
	2	B1 internally connected to B2
	3	GND
	4	A2 internally connected to A1
	5	B2 internally connected to B1

Protocols

No.	Protocol	Description
1	Modbus	Modbus RTU, master or slave
2	CAA SerialCom	Support for blocks contained in the CAA_SerialCom.lib library

Bus cable

Bus line	
Construction	2 cores, twisted, with common shield
Conductor cross section	> 0.22 mm² (24 AWG)
Twisting rate	> 10 per meter (symmetrically twisted)
Core insulation	Polyethylene (PE)
Resistance per core	< 100 Ω/km
Characteristic impedance	ca. 120 Ω (100 Ω...150 Ω)
Capacitance between the cores	< 55 nF/km (if higher, the max. bus length must be reduced)
Terminating resistors	120 Ω ¼ W at both line ends

Bus line	
Remarks	Commonly used telephone cables with PE insulation and a core diameter of > 0.8 mm are usually sufficient.
	Cables with PVC core insulation and core diameter of 0.8 mm can be used up to a length of approx. 250 m. In this case, the bus terminating resistor is approx. 100 Ω.

Cable length

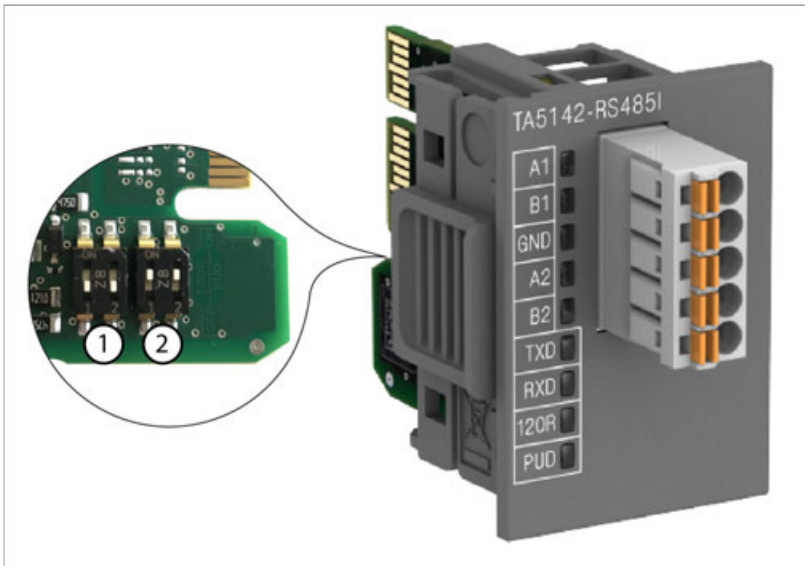
The maximum possible cable length of a serial connection subnet within a segment depends on the transmission rate.

RS-485 for point-to-point or bus connection:

Parameter	Value
Transmission rate	9.6 kbit/s to 115.2 kbit/s
Maximum cable length	On request

Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. These resistors are integrated in the module TA5142-RS485I. The pull-up and pull-down settings must also be made on the circuit board of the module.



1 Termination resistance settings
2 Pull-up and pull-down settings

Table 441: Configuration

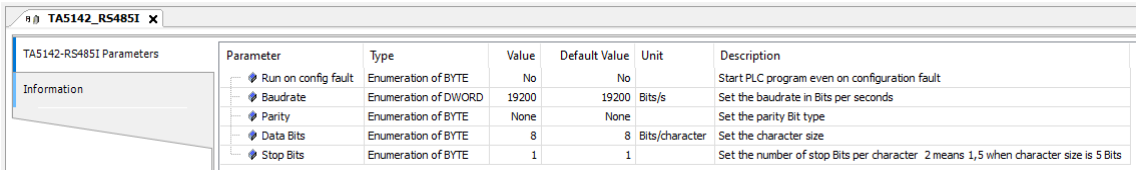
Settings on the module	State of LEDs	Internal wiring diagram	Description
			Master at the bus line end, pull-up and pull-down activated, bus termination 120 Ω
			Master within the bus line, pull-up and pull-down activated

Settings on the module	State of LEDs	Internal wiring diagram	Description
			Slave at the bus line end, bus termination 120 Ω
			Slave within the bus line

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the *"TA51xx Parameters"* tab to edit the parameterization of the desired option board.



State LEDs

Short description

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.

Table 446: Comparison: TB56xx

Processor module		PM5630	PM5650	PM5670	PM5675
Max. number of variables allowed for each communication module supported					
	Input variables	4 kB	4 kB	5 kB	5 kB
	Output variables	4 kB	4 kB	5 kB	5 kB
Type of communication module supported					
	CM574-RS/RCOM - serial interface	No	No	No	No
	CM582-DP - PROFIBUS DP V0/V1 slave	No	No	No	No
	CM592-DP - PROFIBUS DP V0/V1 master	[1])	[1])	[1])	[1])

	SM560-S-FD-1 - safety module with F-Device functionality for 1 PROFIsafe network	[1])	[1])	[1])	[1])
	SM560-S -FD-4 - safety module with F-Device functionality for 1 PROFIsafe network	[1])	[1])	[1])	[1])
Remarks: [1]) in preparation					

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1). *Chapter 1.6.3.2.1.3 “Technical data” on page 2437*

All other V3 processor modules can operate multiple communication modules via their communication module interface.

The communication modules are mounted on the left side of the processor module on the same terminal base.

On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.

Each processor module can be used as:

- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 V DC.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Connections

All terminals for connection are available on the terminal base. For information on connection and available interfaces see the descriptions for

- *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*.

Processor modules PM56xx-2ETH can only be used with TB56xx-2ETH terminal bases.

Table 447: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

Processor module	PM5630	PM5650	PM5670	PM5675
TB5600-2ETH	0 slot	0 slot	0 slot	0 slot
TB5610-2ETH	1 slot	1 slot	1 slot	1 slot
TB5620-2ETH	2 slots	2 slots	2 slots	2 slots
TB5640-2ETH	-	4 slots	4 slots	4 slots
TB5660-2ETH	-	-	6 slots [1])	6 slots [1])
Remarks: The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base. [1]) PM567x must have an index ≥ C0.				

Storage elements

Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery *Chapter 1.6.3.8.2.4 “TA521 - Battery” on page 3324*.

Memory card

AC500 processor modules are supplied without memory card. It must be ordered separately.

The memory card can be used

- to read and write user files
- to download a user program
- for firmware updates

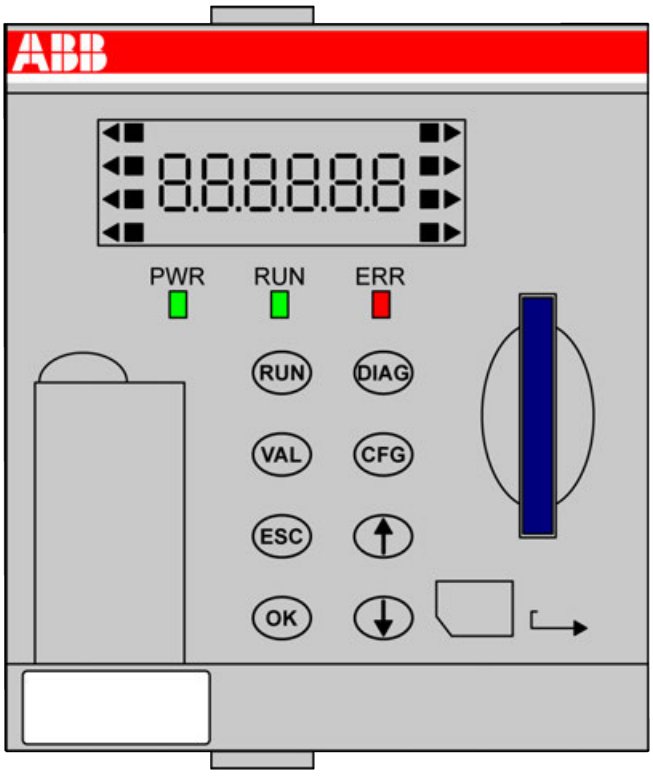
Detailed information can be found in the system technology chapter. *Chapter 1.6.5.1.2 “System processing” on page 3463*

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards.

> *Only genuine MC502 memory cards are supported.*

For more information on the technical data, handling instructions and the insertion/replacement of the memory card, please refer to the chapter memory card MC502. *Chapter 1.6.3.8.2.1 “MC502 - Memory card” on page 3311*

LEDs, display and function keys on the front panel



Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding is described in the system technology section Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486.

Technical data

The system data of AC500 and S500 are applicable to the standard version. *Chapter 1.6.4.6.1 “System data AC500” on page 3398*

The system data of AC500-XC are applicable to the XC version. *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Processor module and terminal base

Parameter	Value
Connection of the supply voltage 24 V DC at the terminal base of the processor module	Removable 5-pin terminal block with spring connection
Current consumption on 24 V DC	
Min. typ. (module alone)	PM5630-2ETH: 110 mA PM5650-2ETH: 120 mA PM5670-2ETH: 130 mA PM5675-2ETH: 140 mA
Max. typ. (all communication modules and I/Os)	PM5630-2ETH: 850 mA PM5650-2ETH: 900 mA PM5670-2ETH: 950 mA PM5675-2ETH: 950 mA
Number of slots for processor modules	1 (on all terminal bases)
Processor module interfaces at the terminal bases TB56xx	I/O bus, ETH1, ETH2, CAN, COM1
Connection system	See *Chapter 1.6.4.6.4 “Connection and wiring” on page 3416*
Weight (processor module without terminal base)	135 g
Mounting position	Horizontal or vertical

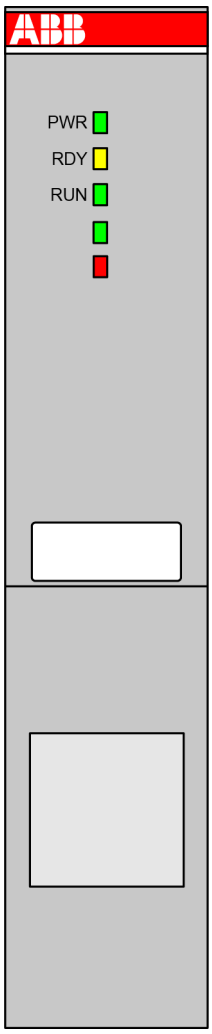
1.6.3.4 Communication modules (AC500 standard)

1.6.3.4.1 Overview



AC500 communication modules are required for

- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

For information on mounting and demounting, please refer to the chapter mounting and demounting the communication modules ↳ Chapter 1.6.4.6.3.5 “Mounting/Demounting the communication modules” on page 3414.

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*

There are no restrictions concerning which communication modules can be arranged for a processor module.

Within the AC500 control system, the communication modules can be used as

- bus master or
- slave.

It depends on the

- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:

- CMxyz-ETH: Ethernet
- CMxyz-DP: PROFIBUS
- CMxyz-PNIO: PROFINET
- CMxyz-ETHCAT: EtherCAT
- CMxyz-CN: CANopen
- CMxyz-RCOM: RCOM/RCOM+ protocol (and 2 serial interfaces)
- CMxyz-RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.

Compatibility of communication modules and communication interface modules

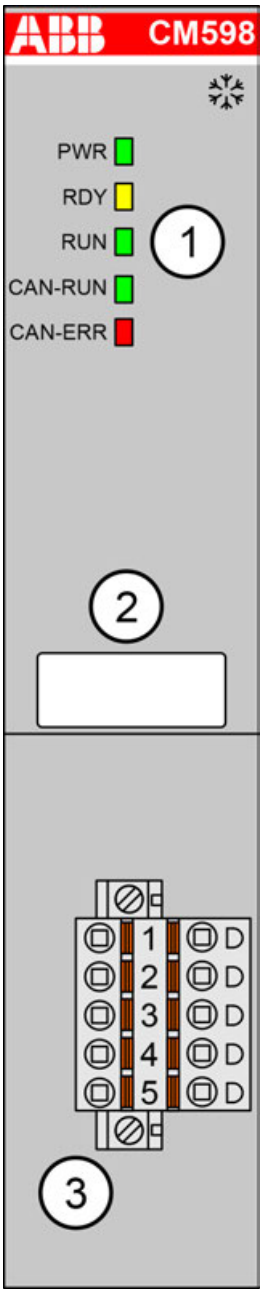
1.6.3.4.3 CANopen

CM598-CN - CANopen master

- CANopen master 1 Mbit/s
- XC version for use in extreme ambient conditions available



1 5 LEDs for state display
2 Label
3 Communication interface, 5-pin, Combicon, male, removable plug with spring terminals
❄ Sign for XC version

Purpose

Communication module CM598-CN enables communication over the CANopen field bus.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN ↬ Chapter 1.6.6.2.11.1.1.2 “Configuration of the protocols CAN 2.0 A / CAN 2.0 B” on page 3740.

Support of CANopen protocol is in preparation.

Connections

Field bus interface

Interface socket	5-pin COMBICON
Transmission standard	ISO 11898, potential-free
Transmission protocol	CANopen (CAN), 1 Mbaud max.
Transfer rate (transmission rate)	10 kbit/s, 20 kbit/s, 50 kbit/s, 100 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s,

The CANopen connector has the following pin assignment:

Pin assignment

Interface		PIN	Signal	Description
 Terminal block removed	 Terminal block inserted	1	CAN_GND	CAN reference potential
		2	CAN_L	Bus line, receive/transmit line, LOW
		3	CAN_SHLD	Shield of the bus line
		4	CAN_H	Bus line, receive/transmit line, HIGH
		5	NC	Not connected

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

Bit Rate (speed)	Bus Length
1 Mbit/s	40 m
800 kbit/s	50 m
500 kbit/s	100 m
250 kbit/s	250 m
125 kbit/s	500 m
50 kbit/s	1000 m

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

Length of segment [m]	Bus cable (shielded, twisted pair)			Max. transmission rate [kbit/s]
	Conductor cross section [mm²]	Line resistance [Ω/km]	Wave impedance [Ω]	
0...40	0.25...0.34 / AWG23, AWG22	70	120	1000 at 40 m
40...300	0.34...0.60 / AWG22, AWG20	< 60	120	< 500 at 100 m
300...600	0.50...0.60 / AWG20	< 40	120	< 100 at 500 m
600...1000	0.75...0.80 / AWG18	< 26	120	< 50 at 1000 m

Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

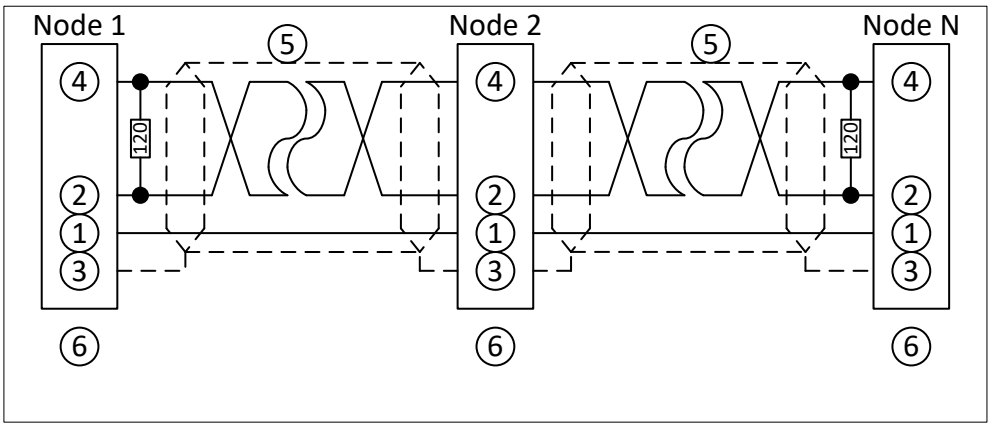


Fig. 102: CANopen interface, bus terminating resistors connected to the line ends

1	CAN_GND
2	CAN_L
3	Shield
4	CAN_H
5	Data line, shielded twisted pair
6	COMBICON connection, CANopen interface

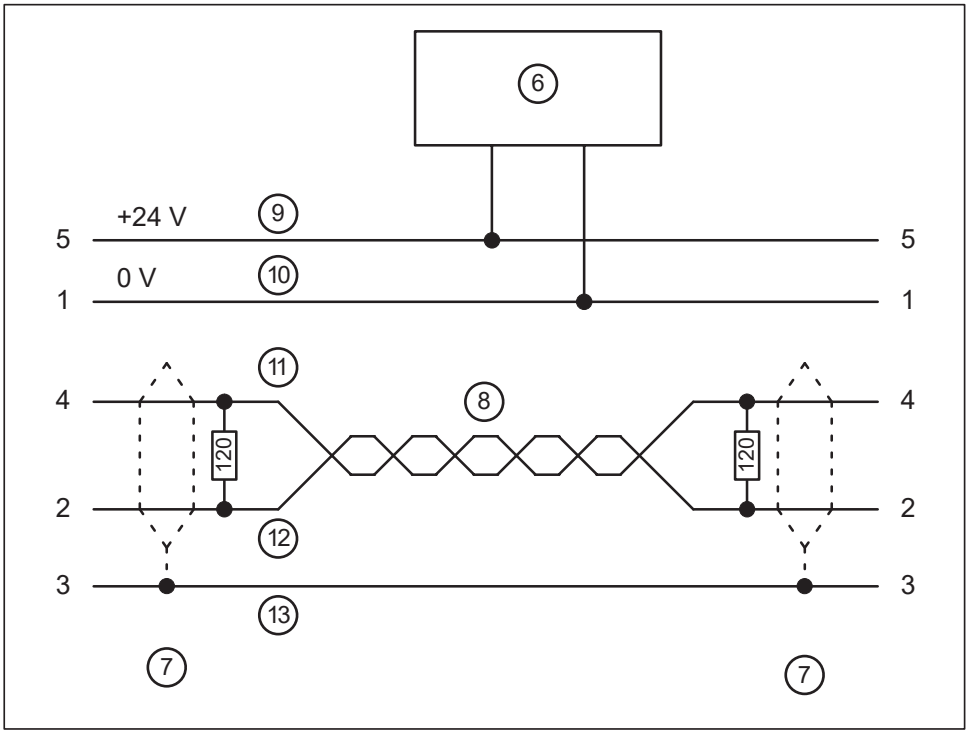

Fig. 103: DeviceNet interface, bus terminating resistors connected to the line ends

7	COMBICON connection, DeviceNet interface
8	Data lines, twisted pair cables
9	red
10	black
11	white
12	blue
13	bare

The grounding of the shield should take place at the switchgear. Please refer to Chapter 1.6.4.6.1 “System data AC500” on page 3398.

State LEDs

Table 462: Meaning of the diagnosis LEDs

LED		Color	State	Description
	PWR	Green	ON (light)	Power supply available
			OFF (dark)	Power supply not available or defective hardware
	RDY	Yellow	ON	Boot procedure
			Blinking	Boot failure
			OFF	---
	RUN	Green	ON	Communication module is operational
			Blinking	---
			OFF	Communication module is not operational
	CAN-RUN	Green	ON	Operational: Device is in the OPERATIONAL state
			Single Flash	Stopped: Device is in STOPPED state
			Blinking	Pre-operational: Device is in the PREOPERATIONAL state
			OFF	No communication or no power supply
	CAN-ERR	Red	ON	CANopen bus is off
			Single flash	Warning limit reached: At least one of the error counters of the CAN controller has reached or exceeded the warning level (too many error frames)
			Double flash	Error control event: A guard event (NMT Slave or NMTmaster) or a heartbeat event (Heartbeat consumer) has occurred
			OFF	No Error: Device is in working condition
	CAN-RUN	Yellow	Blinking (synchronously)	No production data available, no bus communication possible.
	CAN-ERR	Yellow		
LED state during firmware update	CAN-RUN	Green	Blinking (synchronously)	Firmware file transfers during communication module firmware update.
	CAN-ERR	Red		
	CAN-RUN	Green	Blinking (alternately)	Communication module writes the firmware file to the internal flash. Do not power off the PLC!
	CAN-ERR	Red		

Technical data

The system data of AC500 and S500 ↳ *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Protocol	CANopen master (in preparation), CAN2A, CAN2B
Transmission rate	10 kbit/s to 1 Mbit/s
Ambient temperature	see: System data AC500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* System Data AC500 XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*
Usable terminal bases	All TB5xx
Field bus connector	Pluggable connector COMBICON, 5-pin
Technology	Hilscher NETX 100
Indicators	5 LEDs
Internal power supply	Via the communication module interface of the terminal base
Current consumption from 24 V DC power supply at the Terminal Base of the CPU	Typ. 65 mA
Number of Slaves	Max. 126
Number of receive/transmit PDOs	Max. 512 (respectively for receive and transmit)
Total quantity of input and output data	Max. 3584 byte (respectively for input and output)
Weight	Ca. 150 g

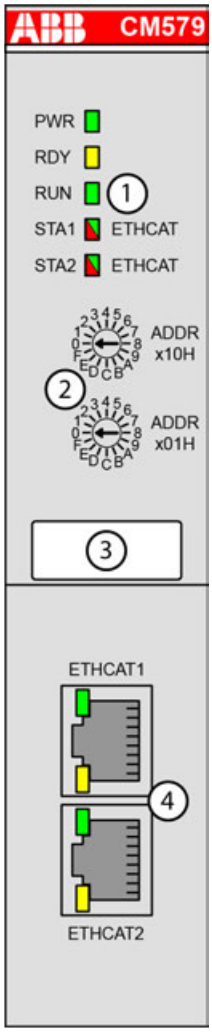
1.6.3.4.4 EtherCAT

CM579-ETHCAT - EtherCAT master



1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

Intended purpose

Communication module CM579-ETHCAT is for EtherCAT communication.

The comunication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

Chapter 1.7.3.4.1 “CM579-ETHCAT” on page 4074

Connections

Field bus interfaces

The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet
Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

Table 463: Meaning of the diagnosis LEDs

LED		Color	State	Description
	PWR	Green	On	Power supply available
			Blinking	---
			Off	Power supply not available or defective hardware
	RDY	Yellow	On	Boot procedure
			Blinking	Boot failure
			Off	---
	RUN	Green	On	Communication module is operational
			Blinking	---
			Off	Communication module is not operational
	STA1	Green	On	No bus error, communication running
			Blinking	Establishing communication
			Off	System error
	STA2	Red	On	Configuration error
			Blinking	---
			Off	No error
	STA1	Yellow	Blinking	No production data available,
	STA2	Yellow	(synchronously)	no bus communication possible.
LED state during firmware update	STA1	Green	Blinking	Firmware file transfers during communication module firmware update.
	STA2	Red	(synchronously)	
	STA1	Green	Blinking	Communication module writes the firmware file to the internal flash. Do not power off the PLC!
	STA2	Red	(alternately)	

The RJ45 Ethernet connector contains two LEDs showing the current Ethernet port connection state.

Table 464: Meaning of the diagnosis LEDs

LED		Color	State	Description
	ETHCAT1 LED "Link"	Green	On	Ethernet connection established
			Off	No Ethernet connection
	ETHCAT1 LED "RX/TX"	Yellow	On	Device sends/receives frames
			Off	No Ethernet connection
	ETHCAT2 LED "Link"	Green		Connector ETHCAT2 is not used
	ETHCAT2 LED "RX/TX"	Yellow		

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Internal Supply	Via the communication module interface of the terminal base
Protocol	EtherCAT
Field bus connector	2 x RJ45 (ETHCAT1 and ETHCAT2)
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Bus length (segment length max.)	100 m at 100 Mbit/s
Indicators	5 LEDs
Usable CPUs	PM56xx *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2516*

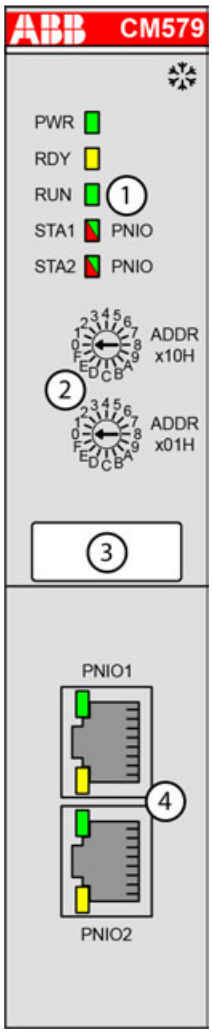
1.6.3.4.5 PROFINET

CM579-PNIO - PROFINET IO RT controller

- PROFINET IO controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available



1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (PNIO1 and PNIO2)
❄ Sign for XC version

Intended purpose

The communication module is for PROFINET RT communication.

The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Protocol	PROFINET IO RT
Usable CPUs	PM57x, PM58x, PM59x *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2516*

1.6.3.5 Terminal units (AC500 standard)

Hot swap

System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping

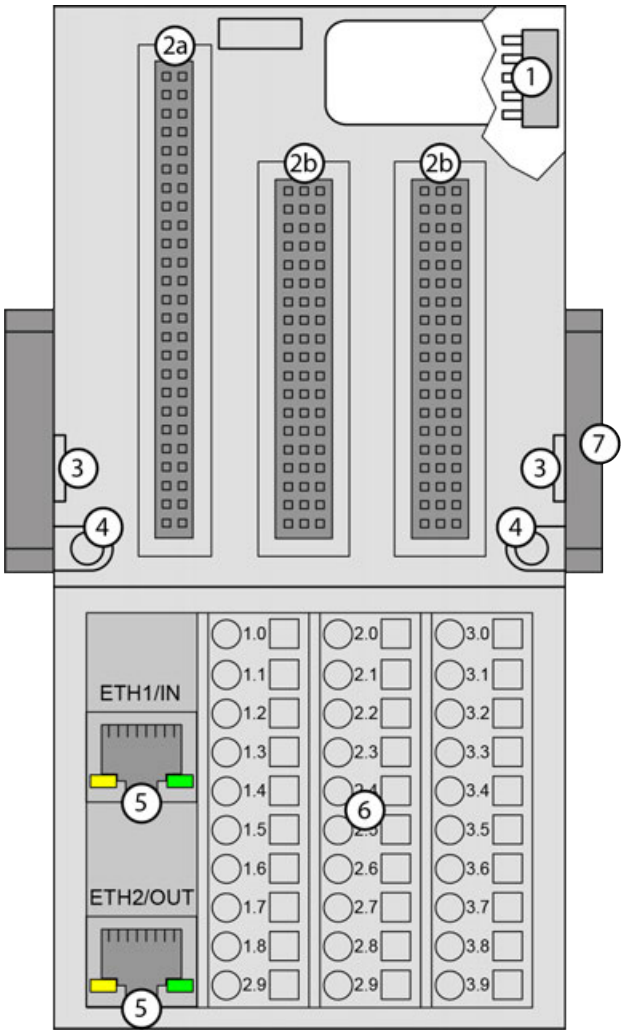
- *Digital outputs are not under load.*
- *Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.*
- *Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.*

Hot swap

Further information about hot swap: ↬ Chapter 1.6.5.1.8 “Hot swap” on page 3523.

1.6.3.5.1 TU507-ETH and TU508-ETH for Ethernet communication interface modules

- TU507-ETH, Ethernet terminal unit, 24 V DC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 V DC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 V DC, spring terminals, XC version



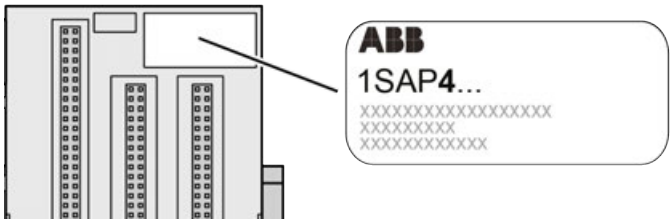
1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2x 25 pins) to connect the inserted Ethernet communication interface module
2b Plug (3x 19 pins) to connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 2 RJ45 interfaces with indication LEDs for connection with the Ethernet network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.

The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e. g. CI501-PNIO).

XC version

XC = e**X**treme **C**onditions



Extreme conditions

Terminal units for use in extreme ambient conditions have no ❄ sign for XC version.

*The figure **4** in the Part no. 1SAP**4**... (label) identifies the XC version.*

Terminals

Screw terminals			**Spring terminals**		
Conductor		Screwdriver	Conductor		Screwdriver (opens terminal)

- *For information about wiring specifications see the description of the terminal units ↳ Chapter 1.6.4.6.4.3 “Terminals at the terminal unit” on page 3417.*
- *For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*
- *For information about mechanical dimensions, please refer to the Mechanical dimensions S500 chapter ↳ Chapter 1.6.4.6.2.3 “Mechanical dimensions S500” on page 3406*

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

The assignment of the other terminals is dependent on the inserted communication interface module.

NOTICE!

Risk of corrosion!

Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices. *Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3333*

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Number of I/O channels per module	Max. 24 (depending on the inserted communication interface module)
Distribution of the channels into groups	3 groups of max. 8 channels each (1.0...1.7, 2.0...2.7, 3.0...3.7), the allocation of the channels is given by the inserted Ethernet bus module
Network interface connector	2 RJ45, 8-pole
Rated voltage	24 V DC
Max. permitted total current	10 A via the supply terminals (UP, UP3 and ZP)
Ethernet	10/100 base-TX or 100 base-TX (depending on CI5xx module plugged in), 2 RJ45 socket
Grounding	Direct connection to the grounded DIN rail or via the screws with wall mounting
Screw terminals	Front terminal, conductor connection vertically with respect to the printed circuit board
Spring-type terminals	Front terminal, conductor connection vertically with respect to the printed circuit board
Weight	200 g
Mounting position	Horizontal or vertical

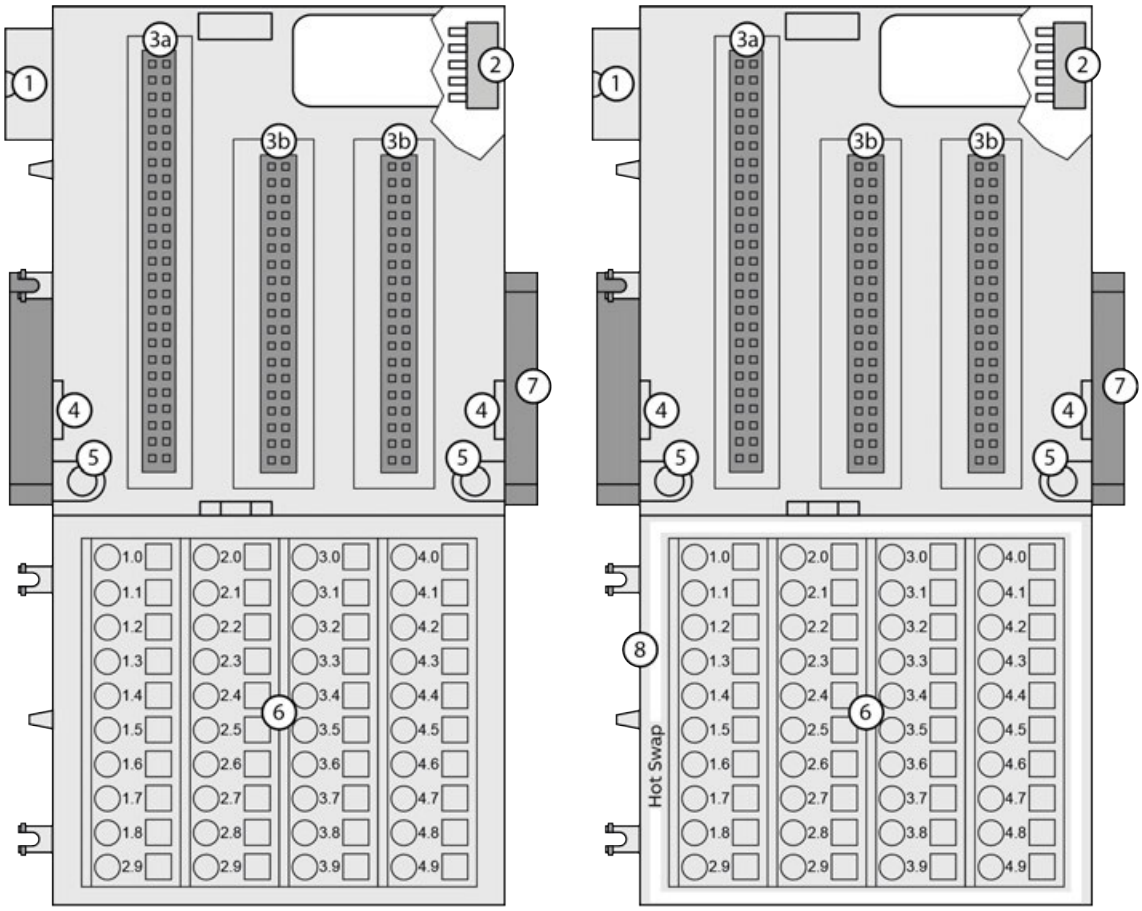
- TU542, I/O terminal unit, 24 V DC, spring terminals
- TU542-XC, I/O terminal unit, 24 V DC, spring terminals, XC version
- TU542-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 V DC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.



1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to connect other terminal units
3a Plug (2 x 25 pins) to connect the inserted I/O modules
3b Plug (2 x 19 pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
5 Holes for screw mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

Hot swap

WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

WARNING!

Electric shock due to negligent behavior during hot swapping!

To avoid electric shock

- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

H = **H**ot swap

Hot swap

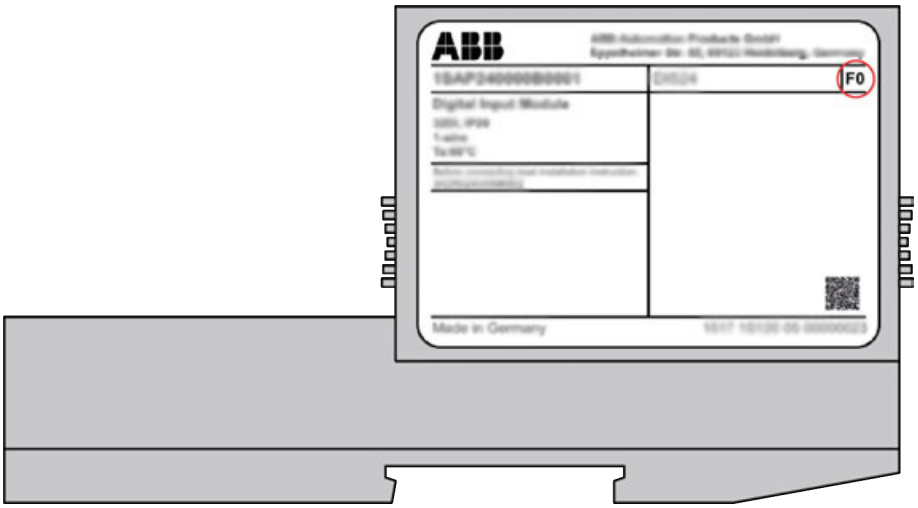
System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

Hot swap is not supported by AC500-eCo V3 CPU!



The index of the module is in the right corner of the label.

NOTICE!

Risk of damage to I/O modules!

Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!

Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

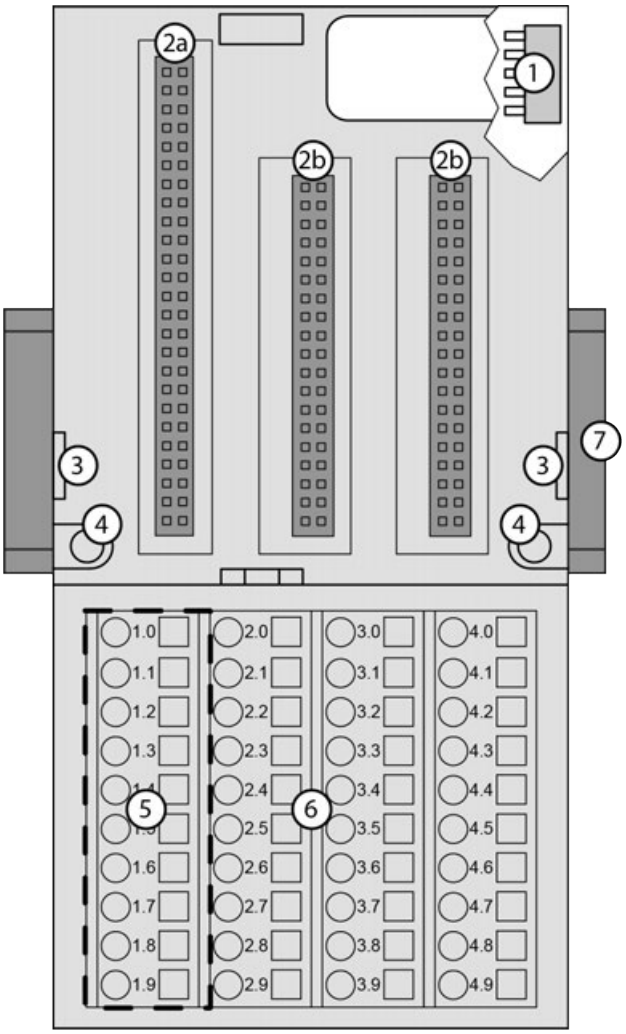
1.6.3.5.3 TU517 and TU518 for communication interface modules

- TU517, terminal unit, 24 V DC, screw terminals
- TU518, terminal unit, 24 V DC, spring terminals
- TU518-XC, terminal unit, 24 V DC, spring terminals, XC version



1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2 25 pins) to connect the inserted communication interface module
2b Plug (2 19 pins) to connect the inserted communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
4 2 holes for wall mounting
5 10 terminals for connection with the bus system
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

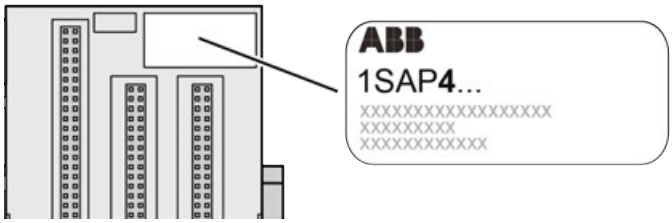
The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.

The terminal units TU517 and TU518 are specifically designed for use with AC500/S500 communication interface modules (e. g. CI581-CN, CI541-DP):

- CANopen communication interface modules
- DeviceNet modules
- PROFIBUS DP communication interface modules

XC version

XC = e**X**treme **C**onditions



Extreme conditions

Terminal units for use in extreme ambient conditions have no ❄ sign for XC version.

*The figure **4** in the Part no. 1SAP**4**... (label) identifies the XC version.*

Terminals

Screw terminals			**Spring terminals**		
Conductor		Screwdriver	Conductor		Screwdriver (opens terminal)

- *For information about wiring specifications see the description of the terminal units ↳ Chapter 1.6.4.6.4.3 “Terminals at the terminal unit” on page 3417.*
- *For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*
- *For information about mechanical dimensions, please refer to the Mechanical dimensions S500 chapter ↳ Chapter 1.6.4.6.2.3 “Mechanical dimensions S500” on page 3406*

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted communication interface module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
- Terminal 4.8: process supply voltage UP3 = +24 V DC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted communication interface module (see communication interface modules for CANopen and PROFIBUS).

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Number of I/O channels per module	Max. 24 (depending on the inserted communication interface module)
Distribution of the channels into groups	3 groups of max. 8 channels each (2.0...2.7, 3.0...3.7, 4.0...4.7), the allocation of the channels is given by the inserted communication interface module
Network interface connector	10 screw or spring terminals (1.0...1.9)
Rated voltage	24 V DC
Max. permitted total current	10 A via the supply terminals (UP, UP3 and ZP)
Grounding	Direct connection to the grounded DIN rail or via the screws with wall mounting
Screw terminals	Front terminal, conductor connection vertically with respect to the printed circuit board
Spring terminals	Front terminal, conductor connection vertically with respect to the printed circuit board
Weight	200 g
Mounting position	Horizontal or vertical

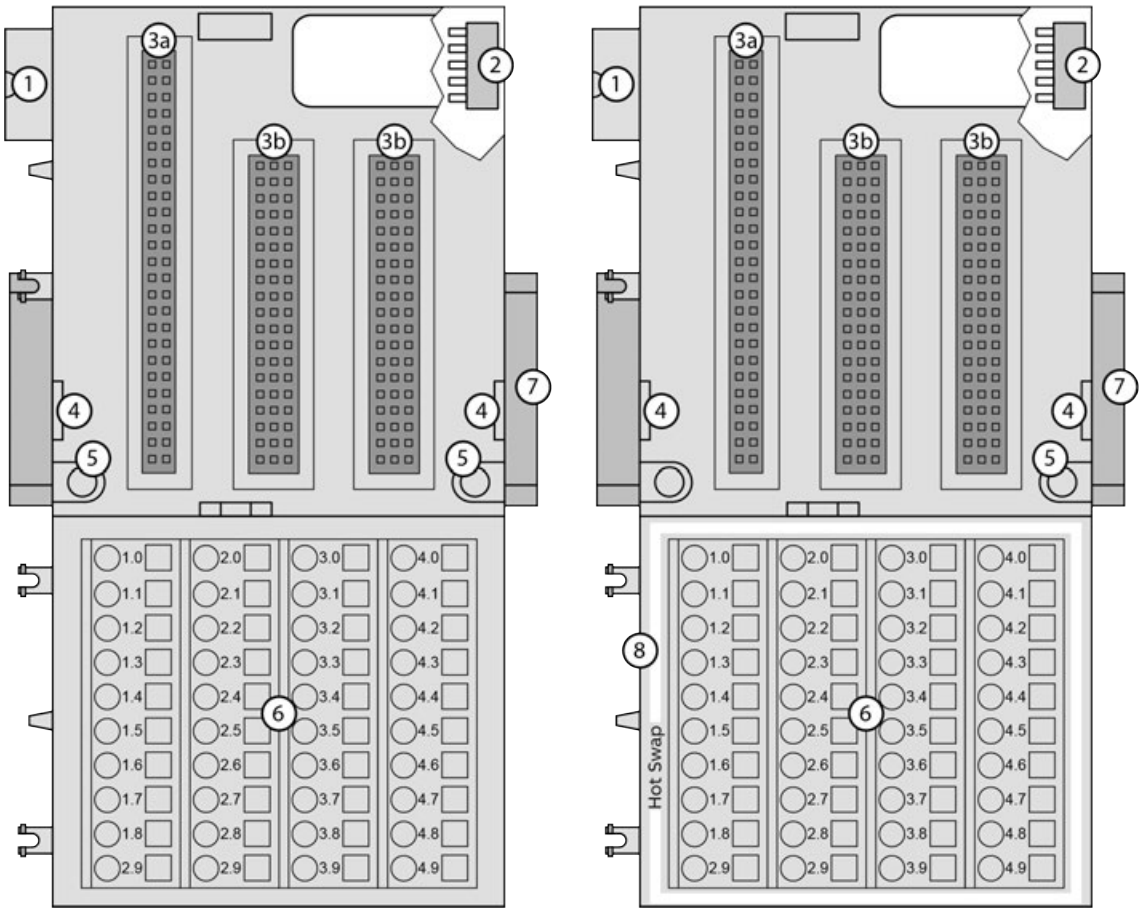
1.6.3.5.4 TU531 and TU532 for I/O modules

- TU531, I/O terminal unit, 230 V AC, screw terminals
- TU532, I/O terminal unit, 230 V AC, spring terminals
- TU532-XC, I/O terminal unit, 230 V AC, spring terminals, XC version

- TU532-H, I/O terminal unit, hot swap, 230 V AC, spring terminals
- TU532-H-XC, I/O terminal unit, hot swap, 230 V AC, spring terminals, XC version



1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to connect other terminal units
3a Plug (2 x 25 pins) to connect the inserted I/O modules
3b Plug (3 x 19 pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
5 Holes for screw mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

The input/output modules (I/O modules) plug into the I/O terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115-230 V AC inputs and/or 230 V AC relay outputs.

Hot swap

WARNING!

Risk of explosion or fire in hazardous environments during hot swapping!

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.

WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock

- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/ protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
- Never touch exposed contacts (dangerous voltages).
- Stay away from electrical contacts to avoid arc discharge.
- Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

H = **H**ot swap

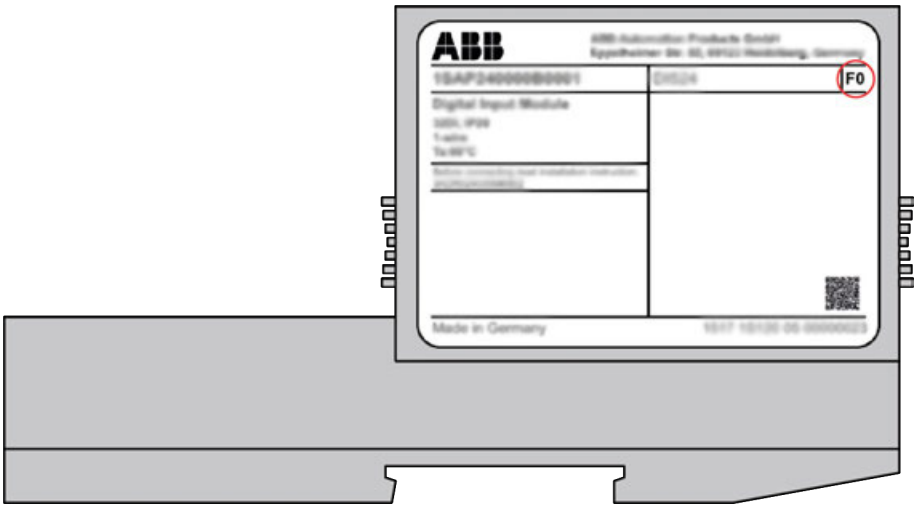
Hot swap
System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

Hot swap is not supported by AC500-eCo V3 CPU!



The index of the module is in the right corner of the label.

NOTICE!

Risk of damage to I/O modules!

Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!

Risk of damage to I/O modules!

Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.

For min. required device index see table below.

Device	Min. required device index for I/O module as of FW Version 3.0.14

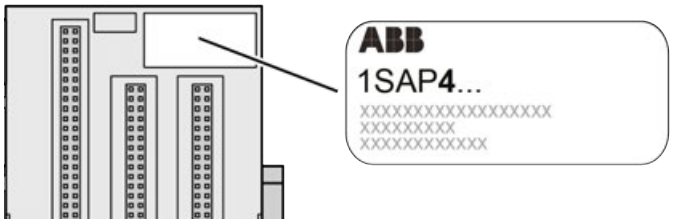
XC version

XC = e**X**treme **C**onditions



Extreme conditions

Terminal units for use in extreme ambient conditions have no ❄ sign for XC version.

*The figure **4** in the Part no. 1SAP**4**... (label) identifies the XC version.*

Terminals

Screw terminals			Spring terminals		
Conductor		Screwdriver	Conductor		Screwdriver (opens terminal)

- *For information about wiring specifications see the description of the terminal units ↳ Chapter 1.6.4.6.4.3 “Terminals at the terminal unit” on page 3417.*
- *For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*
- *For information about mechanical dimensions, please refer to the Mechanical dimensions S500 chapter ↳ Chapter 1.6.4.6.2.3 “Mechanical dimensions S500” on page 3406*

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).

The supply voltage of 24 V DC for the module's circuitry comes from the I/O expansion bus (I/O bus).

Technical data

The system data of AC500 and S500 ↳ *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Number of channels per module		32
Distribution of the channels into groups		4 groups of 8 channels each (1.0...1.7, 2.0...2.7, 3.0...3.7, 4.0...4.7), the allocation of the channels is given by the inserted I/O module
Terminals 1.8...4.8 and 1.9...4.9		
	Max. voltage	30 V DC
	Max. permitted total current	10 A
Terminals 1.0...1.7, 2.0...2.7, 3.0...3.7, 4.0...4.7		
	Max. voltage	300 V AC [1])
	Max. permitted current	3 A [2])
Grounding		Direct connection to the grounded DIN rail or via the screws with wall mounting
Screw terminals		Front terminal, conductor connection vertically with respect to the printed circuit board
Spring terminals		Front terminal, conductor connection vertically with respect to the printed circuit board
Weight		200 g
Mounting position		Horizontal or vertical

[1]) Only when the voltage is not limited by the specification of the I/O channel or the supply input which is internally connected to the terminal.

[2]) The terminals are connected to the electronic module via internal connectors (X22 (or 3b), X23 (or 3b), X32, X33 and X34). The current per terminal is limited by the permitted current of these connectors.

1.6.3.6 I/O modules

Hot swap

System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping

- *Digital outputs are not under load.*
- *Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.*
- *Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.*

Hot swap

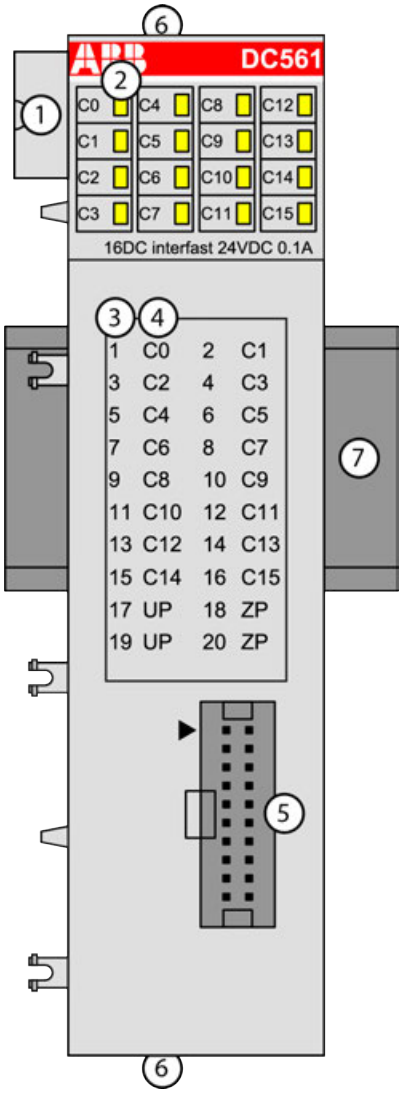
Further information about hot swap: ↬ Chapter 1.6.5.1.8 “Hot swap” on page 3523.

1.6.3.6.1 Digital I/O modules

S500-eCo

DC561 - Digital input/output module

- 16 configurable digital inputs/outputs 24 V DC,
- Connection via Interfast
- Module-wise galvanically isolated



1 I/O bus
2 16 yellow LEDs to display the states of the inputs/outputs C0 to C15
3 Terminal number
4 Allocation of signal name
5 Interfast connector (20-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The digital I/O module DC561 can be connected to the following devices via the I/O bus connector:

- S500 communication interface modules (e. g. CI501-PNIO, CI541-DP, CI581-CN)
- AC500 CPUs
- other AC500 I/O modules

> *The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*

The module contains 16 digital channels in 1 group, each channel can be used as a digital 24 V DC input or 24 V DC output.

The inputs/outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

Parameter	Value
Digital inputs	Max. 16 (24 V DC), can be used as sink inputs
Digital outputs	Max. 16 (transistor outputs 24 V DC, max. 0.1 A)
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)

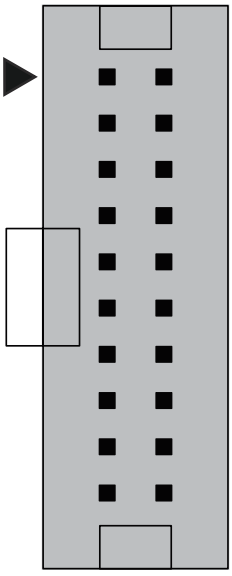
Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 "AC500-eCo" on page 3352.

The connection is established out by using the 20-pin Interfast connector. For further information, refer to the Interfast documentation.

The assignment of the terminals:

Table 467: Assignment of the terminals for DC561



PIN	Signal	Description
1	C0	Input/output signal C0
2	C1	Input/output signal C1
3	C2	Input/output signal C2
4	C3	Input/output signal C3
5	C4	Input/output signal C4
6	C5	Input/output signal C5
7	C6	Input/output signal C6
8	C7	Input/output signal C7
9	C8	Input/output signal C8
10	C9	Input/output signal C9
11	C10	Input/output signal C10
12	C11	Input/output signal C11
13	C12	Input/output signal C12
14	C13	Input/output signal C13
15	C14	Input/output signal C14
16	C15	Input/output signal C15
17	UP	Process voltage UP +24 V DC
18	ZP	Process voltage ZP 0 V DC

	PIN	Signal	Description
	19	UP	Process voltage UP +24 V DC
	20	ZP	Process voltage ZP 0 V DC

The arrow located next to the Interfast connector marks terminal 1.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

If DC561 with index A0 is used, the process supply voltage must stem from the same source as the power supply voltage of the CPU. The index consists of 1 letter, followed by 1 digit, and can be found on the type plate of the module next to the type designator "DC561".

The module provides several diagnosis functions *Chapter 1.6.3.6.1.1.1.6 “Diagnosis” on page 2574*.

The meaning of the LEDs is described in the section State LEDs *Chapter 1.6.3.6.1.1.1.7 “State LEDs” on page 2574*.

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal Value	Internal Value, Type	Default	Min.	Max.	EDS Slot Index
Module ID	Internal	6100 [1])	WORD	6100 0x17D4	0	65535	xx01
Ignore module	No Yes	0 1	BYTE	No (0x00)			
Parameter length [2])	Internal	1 - CPU	BYTE	0	0	255	xx02 [3])

Remarks:

[1])	With CS31 and addresses smaller than 70, the value is increased by 1
[2])	The module has no additional user-configurable parameters
[3])	Value is hexadecimal: HighByte is slot (xx: 0...7), LowByte is index (1...n)

GSD file:

Ext_User_Prm_Data_Len =	0x03
Ext_User_Prm_Data_Const(0) =	0x25, 0x17, 0x00;

Diagnosis

E1...E4	**d1**	**d2**	**d3**	**d4**	**Identifier 000...063**	**AC500-Display**	**<– Display in**
Class	**Comp**	**Dev**	**Mod**	**Ch**	**Err**	**PS501 PLC Browser**	
Byte 6 Bit 6...7	**-**	**Byte 3**	**Byte 4**	**Byte 5**	**Byte 6 Bit 0...5**	**PNIO diagnosis block**	
Class	**Interface**	**Device**	**Module**	**Channel**	**Error Identifier**	**Error message**	**Remedy**
	[1])	[2])	[3])	[4])			
Module error DI571							
3	14	1...10	31	31	19	Checksum error in the I/O module	Replace I/O module
	11 / 12	ADR	1...10				
3	14	1...10	31	31	43	Internal error in the module	Replace I/O module
	11 / 12	ADR	1...10				
3	14	1...10	31	31	9	Overflow diagnosis buffer	Restart
	11 / 12	ADR	1...10				
3	14	1...10	31	31	26	Parameter error	Check master
	11 / 12	ADR	1...10				

Remarks:

[1])	In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e. g. of the DC551-CS31)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

LED		**State**	**Color**	**LED = OFF**	**LED = ON**
	Inputs/outputs C0...C15	Digital input or digital output	Yellow	Input/output is OFF	Input/output is ON (the LEDs are only operating if the module's circuitry is supplied via the I/O bus)

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process voltage UP		
	Connections	Terminals 17 and 19 for UP (+24 V DC); terminals 18 and 20 for ZP (0 V)
	Rated value	24 V DC
	Current consumption via UP terminal	10 mA + 0.1 A per output (max.)
	Max. ripple	5 %
	Inrush current	0.000001 A^2s
	Protection against reversed voltage	Yes
	Protection fuse on UP	Recommended; the outputs must be protected by an 1 A fast-acting fuse
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 10 mA
Galvanic isolation		Yes, between the input/output group and the rest of the module
Isolated groups		1 group for 16 channels
Surge voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		On request
Input data length		2 bytes
Output data length		2 bytes
Weight		Ca. 115 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs/outputs if used as inputs

Parameter	Value
Number of channels per module	16 configurable inputs (24 V DC)
Distribution of the channels into groups	1 (16 channels per group)
Connections of the channels C0 to C15	Terminals 1 to 16
Reference potential for the channels C0 to C15	Terminals 18 and 20 (negative pole of the process voltage, name ZP)

Parameter		Value
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1). The module is powered via the I/O bus.
Input type according to EN 61131-2		Type 1 sink
Input signal range		+24 V DC
	Signal 0	-3 V...+5 V
	Undefined signal	+5 V...+15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		-3 V...+5 V
Ripple with signal 1		+15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	Typ. 1 mA
	Input voltage +15 V	> 2.5 mA
	Input voltage +30 V	< 8 mA
Max. permissible leakage current (at 2-wire proximity switches)		1 mA
Input delay (0->1 or 1->0)		Typ. 8 ms
Max. cable length		
	Shielded	500 m
	Unshielded	300 m

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		16 configurable transistor outputs
Distribution of the channels into groups		1 (16 channels per group)
Connections of the channels C0 to C15		Terminals 1 to 16
Reference potential for the channels C0 to C15		Terminals 18 and 20 (negative pole of the process voltage, signal name ZP)
Common power supply voltage		Terminals 17 and 19 (positive pole of the process voltage, signal name UP)
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1). The module is powered via the I/O bus.
Way of operation		Non-latching type
Output voltage at signal 1		UP -0.3 V at max. current
Output delay (max. at rated load)		
	0 to 1	50 µs
	1 to 0	200 µs
Output current		
	Rated current per channel (max.)	0.1 A at UP 24 V DC
	Rated current per group (max.)	1.6 A

Parameter		Value
	Rated current (all channels together, max.)	1.6 A
	Lamp load (max.)	Not applicable
	Max. leakage current with signal 0	< 0.5 mA
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		1 A fast
Demagnetization when inductive loads are switched off		Must be performed externally according to load specification
Switching frequency		
	With inductive loads	Max. 0.5 Hz
Short-circuit-proof / overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC signals	Yes
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

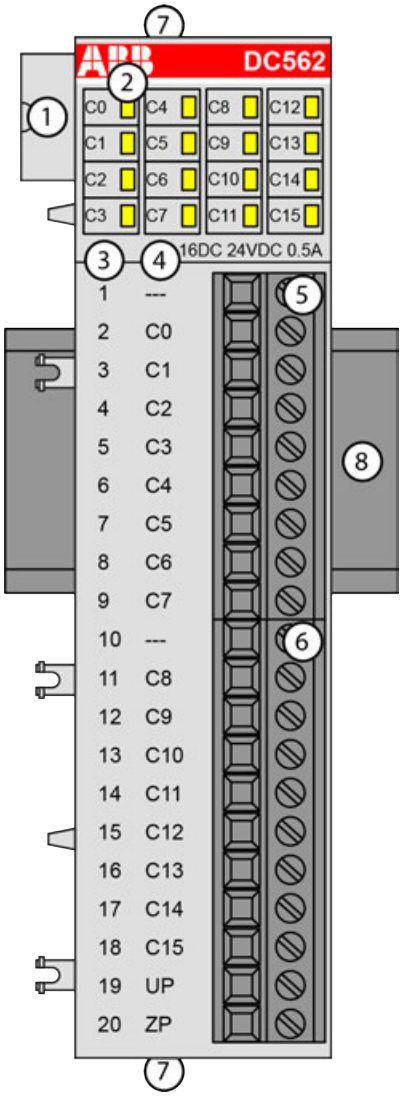
Ordering data

Part no.	Description	Product life cycle phase *)
1TNE 968 902 R2001	DC561, digital input/output module, 16 configurable inputs/outputs, transistor output, interfast connector	Classic

**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

DC562 - Digital input/output module

- 16 configurable digital inputs/outputs in 1 group, 24 V DC
- Module-wise galvanically isolated



1 I/O bus
2 16 yellow LEDs to display the states of the inputs/outputs C0 to C15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input and output signals (9-pin)
6 Terminal block for input and output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs/outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs/outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↪ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:

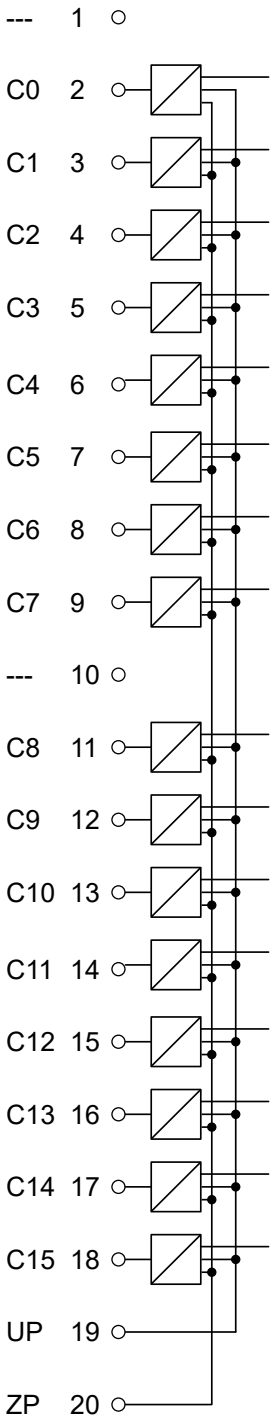


Table 468: Assignment of the terminals:

Terminal	Signal	Description
1	---	Reserved
2	C0	Input/output signal C0
3	C1	Input/output signal C1
4	C2	Input/output signal C2
5	C3	Input/output signal C3
6	C4	Input/output signal C4
7	C5	Input/output signal C5

Terminal	Signal	Description
8	C6	Input/output signal C6
9	C7	Input/output signal C7
10	---	Reserved
11	C8	Input/output signal C8
12	C9	Input/output signal C9
13	C10	Input/output signal C10
14	C11	Input/output signal C11
15	C12	Input/output signal C12
16	C13	Input/output signal C13
17	C14	Input/output signal C14
18	C15	Input/output signal C15
19	UP	Process voltage UP +24 V DC
20	ZP	Process voltage ZP 0 V DC

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

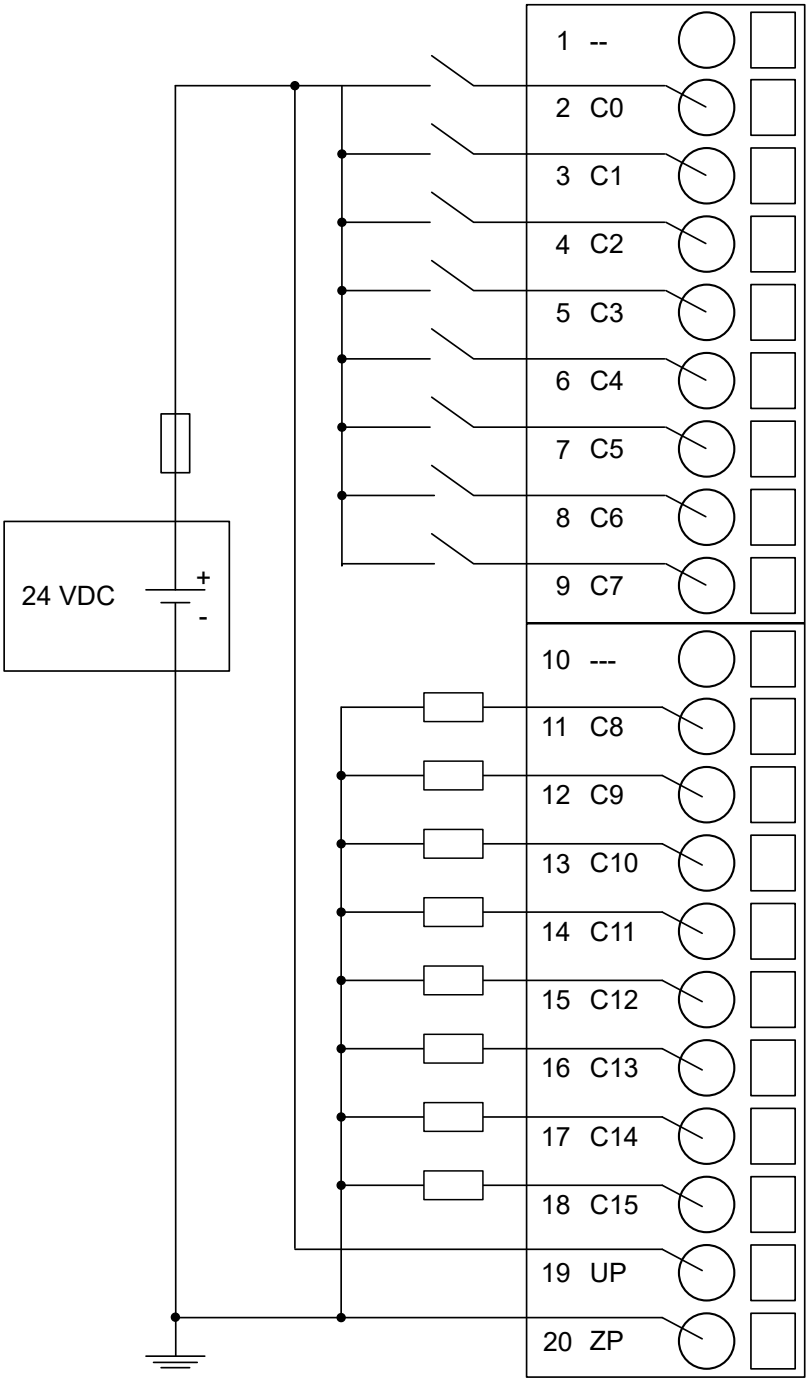
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

The following figure shows the connection of the digital input/output module DC562:



In this connection example, the inputs/outputs C0...C7 are connected as inputs and the inputs/outputs C8...C15 are connected as outputs.

The module provides several diagnosis functions *Chapter 1.6.3.6.1.1.2.6 “Diagnosis” on page 2584*.

The meaning of the LEDs is described in the section State LEDs *Chapter 1.6.3.6.1.1.2.7 “State LEDs” on page 2584*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal Value	Internal Value, Type	Default	Min.	Max.	EDS Slot Index
Module ID	Internal	6155 [1])	WORD	6155 0x180B	0	65535	xx01

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process voltage UP		
	Connections	Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V)
	Rated value	24 V DC
	Current consumption via UP terminal	90 mA + 0.5 A per output (max.)
	Max. ripple	5 %
	Inrush current	0.000001 A^2s
	Protection against reversed voltage	Yes
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 10 mA
Galvanic isolation		Yes, between the input/output group and the rest of the module
	Isolated groups	1 group for 16 channels
Surge voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		4.8 W
Input data length		2 bytes
Output data length		2 bytes
Weight		Ca. 125 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs/outputs if used as inputs

Parameter	Value
Number of channels per module	16 configurable inputs (24 V DC)
Distribution of the channels into groups	1 (16 channels per group)
Connections of the channels C0 to C15	Terminals 1 to 16
Reference potential for the channels C0 to C15	Terminal 20 (negative pole of the process voltage, name ZP)
Indication of the input signals	1 yellow LED per channel; the LED is ON when the input signal is high (signal 1). The module is powered through the I/O bus.
Input type according to EN 61131-2	Type 1 sink

Parameter		Value
Input signal range		+24 V DC
	Signal 0	-3 V...+5 V
	Undefined signal	+5 V...+15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		-3 V...+5 V
Ripple with signal 1		+15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	Typ. 1 mA
	Input voltage +15 V	> 2.5 mA
	Input voltage +30 V	< 8 mA
Max. permissible leakage current (at 2-wire proximity switches)		1 mA
Input delay (0->1 or 1->0)		Typ. 8 ms
Max. cable length		
	Shielded	500 m
	Unshielded	300 m

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		16 configurable transistor outputs

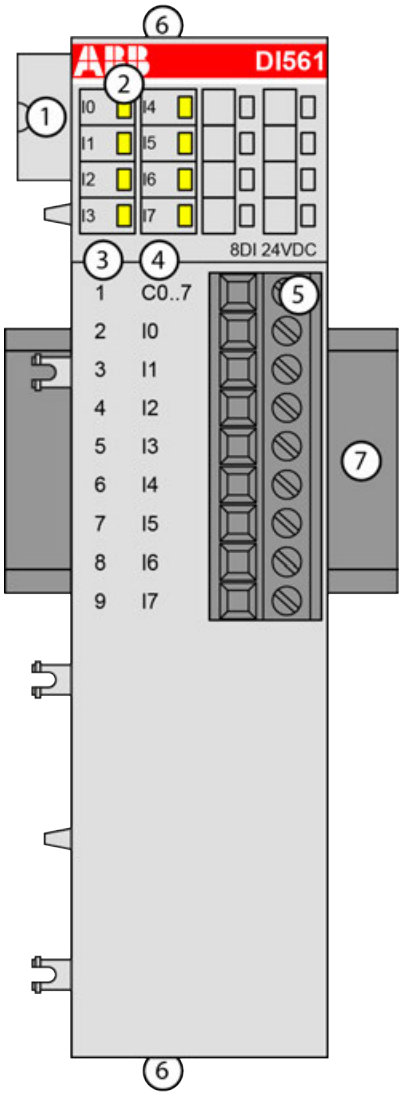
DI561 - Digital input module

- 8 digital inputs 24 V DC / 24 V AC (I0 to I7) in 1 group
- Module-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↳ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

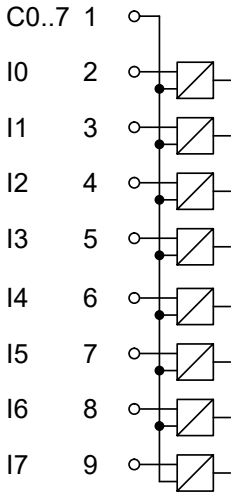


Table 469: Assignment of the terminals:

Terminal	Signal	Description
1	C0...7	Input common for signals I0 to I7
2	I0	Input signal I0
3	I1	Input signal I1

Terminal	Signal	Description
4	I2	Input signal I2
5	I3	Input signal I3
6	I4	Input signal I4
7	I5	Input signal I5
8	I6	Input signal I6
9	I7	Input signal I7

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI561.

An external power supply connection is not needed.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

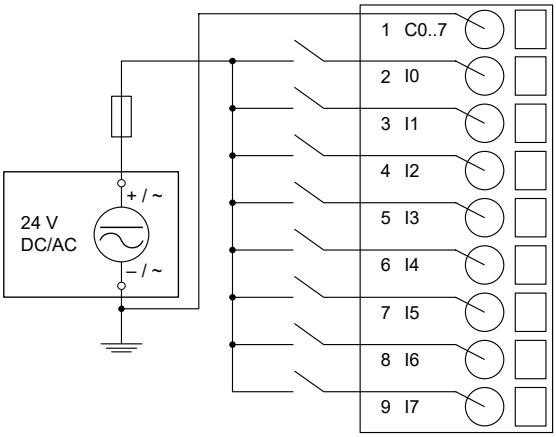
NOTICE!

Risk of malfunctions in the plant!

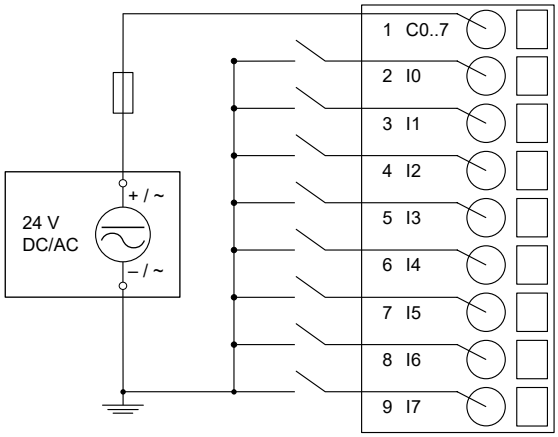
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital input module DI561:



Connection of DI561 - sink inputs



Connection of DI561 - source inputs

The module provides several diagnosis functions *Chapter 1.6.3.6.1.1.3.6 "Diagnosis" on page 2592*.

The meaning of the LEDs is described in the section State LEDs *Chapter 1.6.3.6.1.1.3.7 "State LEDs" on page 2593*.

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

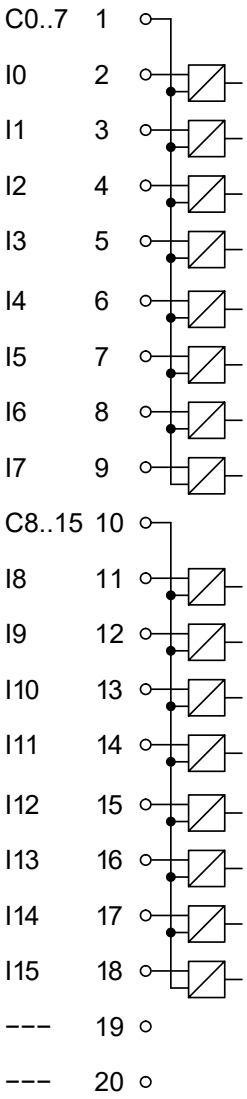
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:



The assignment of the terminals:

Terminal	Signal	Description
1	C0...7	Input common for signals I0 to I7
2	I0	Input signal I0
3	I1	Input signal I1
4	I2	Input signal I2
5	I3	Input signal I3
6	I4	Input signal I4
7	I5	Input signal I5
8	I6	Input signal I6
9	I7	Input signal I7
10	C8...15	Input common for signals I8 to I15
11	I8	Input signal I8
12	I9	Input signal I9
13	I10	Input signal I10
14	I11	Input signal I11
15	I12	Input signal I12
16	I13	Input signal I13
17	I14	Input signal I14
18	I15	Input signal I15
19	---	Reserved
20	---	Reserved

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI562.

An external power supply connection is not needed.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 1.6.3.6.1.1.4.6 “Diagnosis” on page 2600*.

The digital inputs can be used as source inputs or as sink inputs.

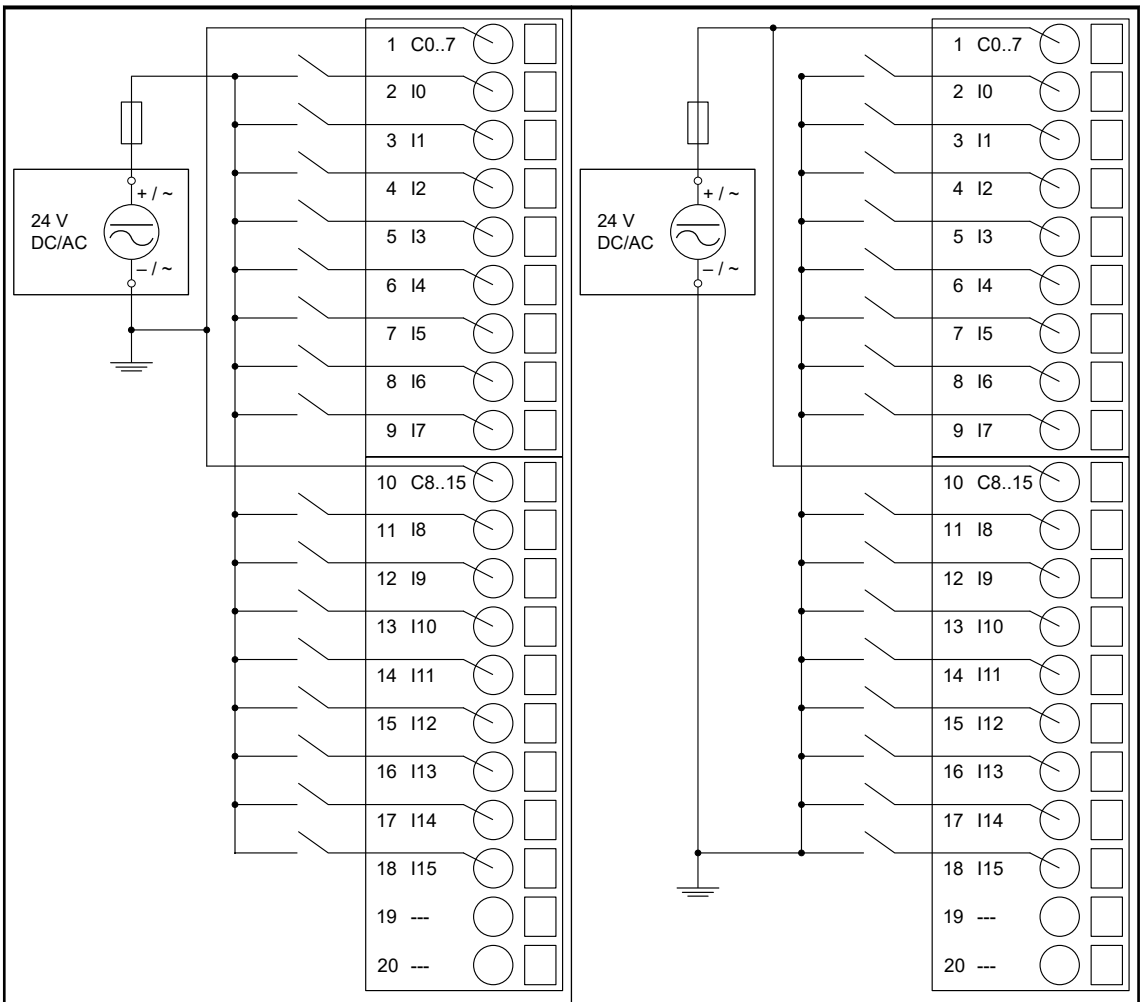
NOTICE!

Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital input module DI562:



Connection of DI562 - sink inputs | Connection of DI562 - source inputs

The meaning of the LEDs is described in section State LEDs *Chapter 1.6.3.6.1.1.4.7 “State LEDs” on page 2600*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal Value	Internal Value, Type	Default	Min.	Max.	EDS Slot Index
Module ID	Internal	6110 [1])	WORD	6110 0x17DE	0	65535	xx01

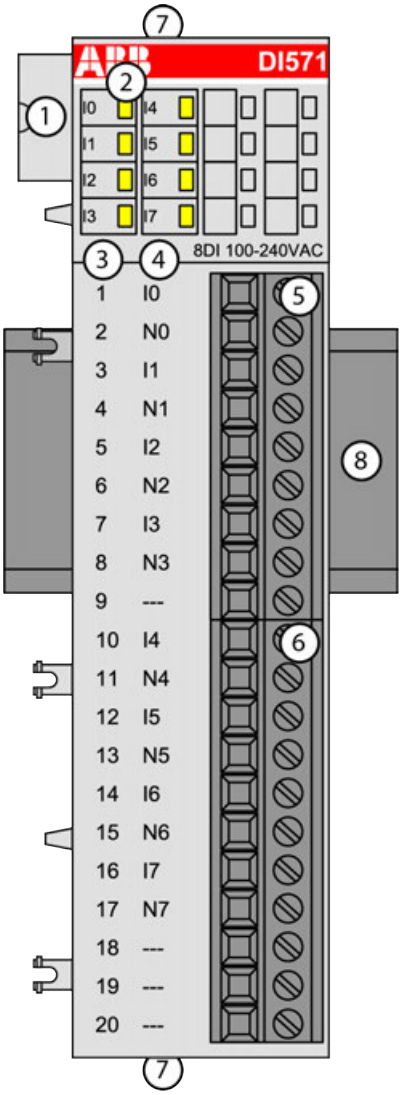
DI571 - Digital input module

- 8 digital inputs 100-240 V AC (I0 to I7) in 8 groups
- Module-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

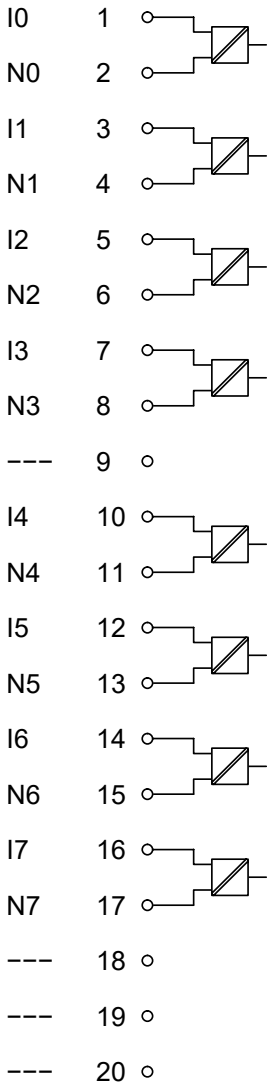


Table 470: Assignment of the terminals:

Terminal	Signal	Description
1	I0	Input signal I0
2	N0	Neutral conductor for the input signal I0
3	I1	Input signal I1
4	N1	Neutral conductor for the input signal I1
5	I2	Input signal I2

Terminal	Signal	Description
15	N6	Neutral conductor for the input signal I6
16	I7	Input signal I7
17	N7	Neutral conductor for the input signal I7
18	---	Reserved
19	---	Reserved
20	---	Reserved

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI571.

An external power supply connection is not needed.

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

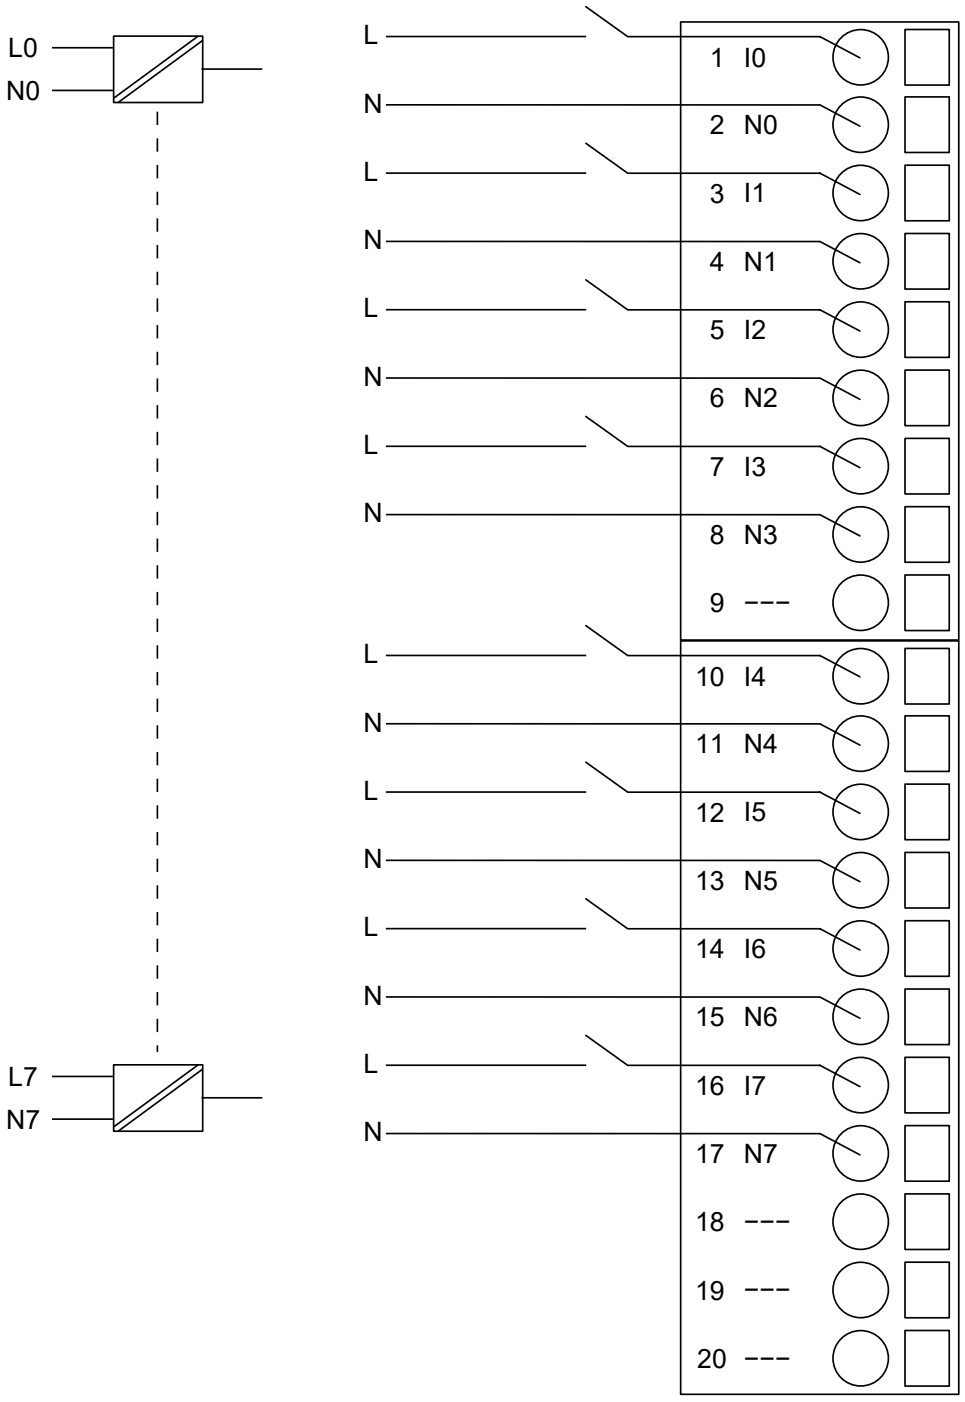
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the digital input module DI571:



NOTICE!

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions ↳ *Chapter 1.6.3.6.1.1.5.7 “Diagnosis” on page 2609*.

The meaning of the LEDs is described in the section State LEDs ↳ *Chapter 1.6.3.6.1.1.5.8 “State LEDs” on page 2609*.

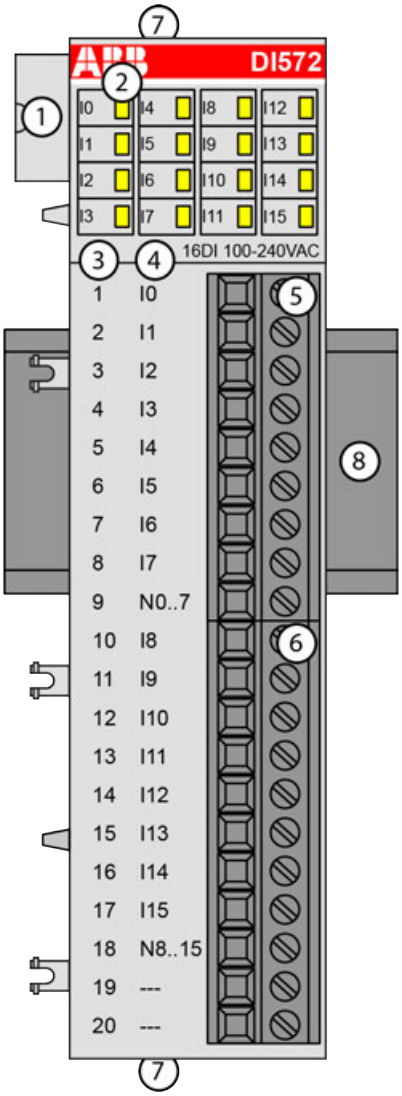
DI572 - Digital input module

- 16 digital inputs 100-240 V AC (I0 to I15) in 2 groups
- Module-wise galvanically isolated



1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 to I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

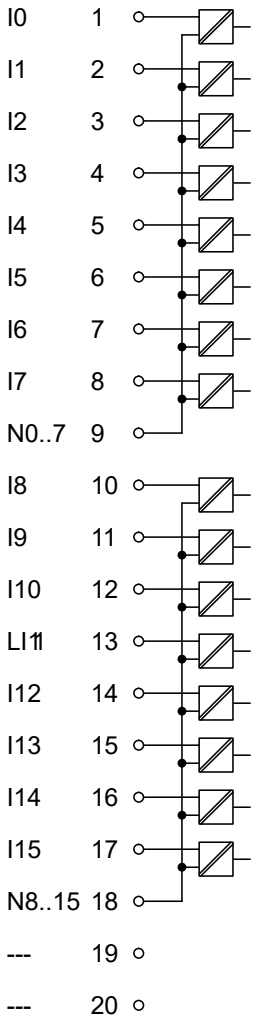


Fig. 104: Block diagram for the internal construction of the digital inputs.

17	I15	Input signal I15
18	N8...15	Neutral conductor for the input signals I8...I15
19	---	Reserved
20	---	Reserved

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI572.

An external power supply connection is not needed.

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

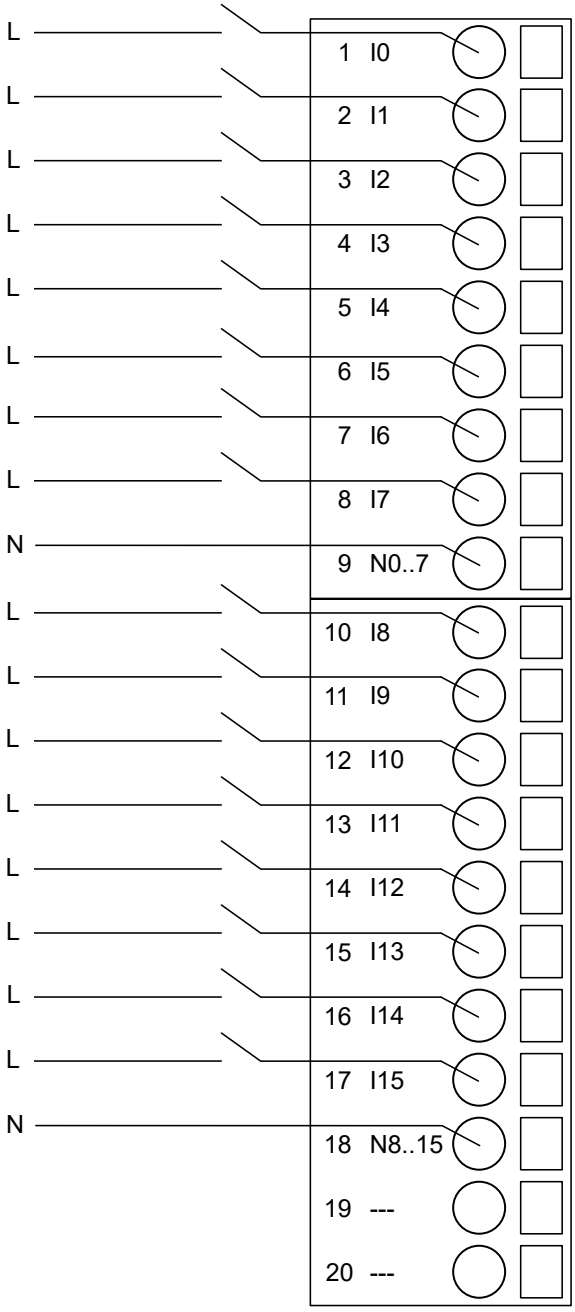
The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.



NOTICE!

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions ↬ *Chapter 1.6.3.6.1.1.6.6 “Diagnosis” on page 2618*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

	11 / 12	ADR	1...10				

Remarks:

Parameter	Remark
[1])	In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)
[3])	With "Module" the following allocation applies depending on the master: module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = module itself" is output.

State LEDs

LED		State	Color	LED = OFF	LED = ON
	Inputs I0...I15	Digital input	Yellow	Input is OFF	Input is ON (the input voltage is only displayed if the supply voltage of the module is ON)

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter	Value
Galvanic isolation	Yes, between the input groups and the rest of the module
Isolated groups	2 (8 channels per group)
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module	Ca. 10 mA
Max. power dissipation within the module	6 W
Weight	Ca. 222 g
Mounting position	Horizontal or vertical
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		16 AC inputs (100-240 V AC)
Distribution of the channels into groups		2 (8 channels per group)
Input voltage range		0 V AC...264 V AC (47 Hz...63 Hz)
Input current per channel (typically at 25 °C)		< 3 mA (at 40 V AC) > 6 mA (at 164 V AC) > 8 mA (at 240 V AC)
Connections of the channels I0..I7		Terminals 1...8
Connections of the channels I8...I15		Terminals 10...17
Reference potential for the channels I0...I7		Terminal 9
Reference potential for the channels I8...I15		Terminal 18
Indication of the input signals		1 yellow LED per channel. The LED is on when the input signal is high (signal 1).
Input type according to EN 61131-2		Type 1
Input signal range		
	Signal 0 (max.)	40 V AC
	Undefined signal	40 V AC < U < 79 V AC
	Signal 1 (min.)	79 V AC
Input delay		
	Signal 0 -> 1	Typ. 24 ms
	Signal 1 -> 0	Typ. 24 ms
Input data length		2 bytes

Parameter		Value
Max. permissible leakage current (at 2-wire proximity switches)		1 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

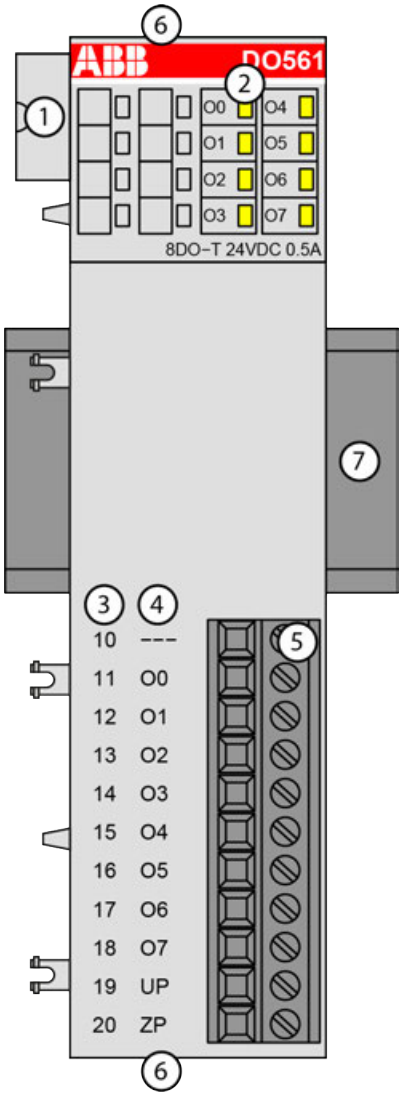
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

DO561 - Digital output module

- 8 digital outputs 24 V DC (O0 to O7) in 1 group
- Module-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 to O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

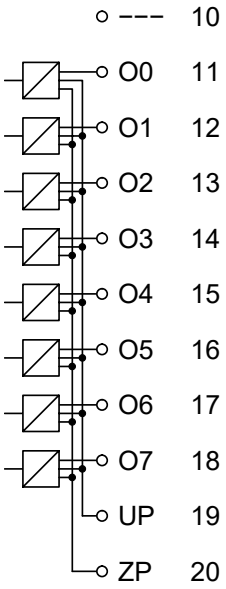


Table 472: Assignment of the terminals:

Terminals	Signal	Description
10	---	Reserved
11	O0	Output signal O0
12	O1	Output signal O1
13	O2	Output signal O2
14	O3	Output signal O3
15	O4	Output signal O4

Terminals	Signal	Description
16	O5	Output signal O5
17	O6	Output signal O6
18	O7	Output signal O7
19	UP	Process supply voltage UP +24 V DC
20	ZP	Process supply voltage ZP 0 V

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

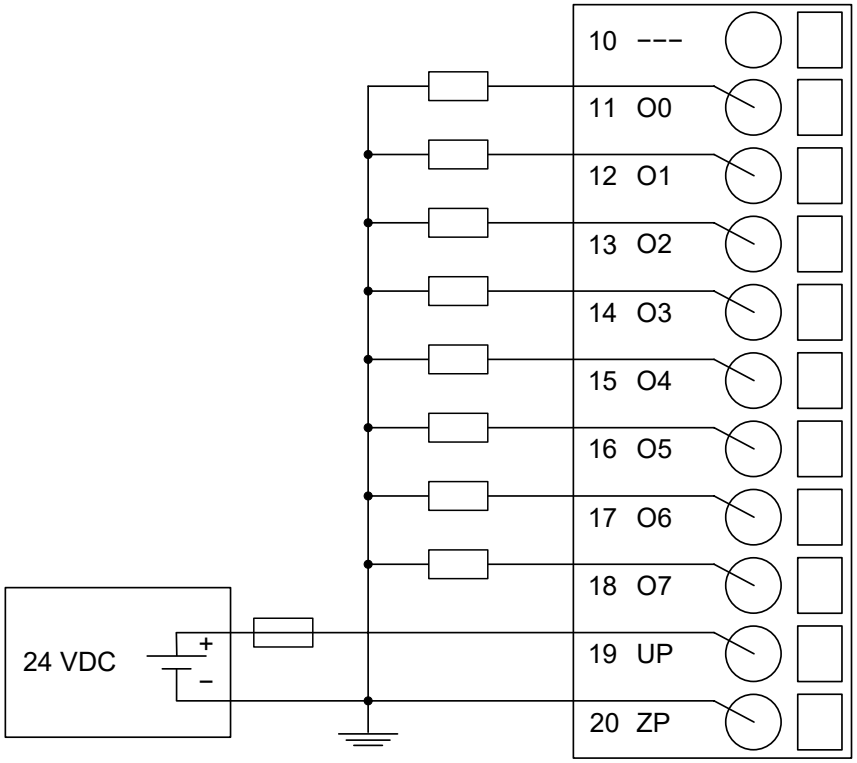
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the digital output module DO561:



NOTICE!

Risk of malfunctions in the plant!

The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis *Chapter 1.6.3.6.1.1.7.6 “Diagnosis” on page 2625*).

The meaning of the LEDs is described in the section State LEDs *Chapter 1.6.3.6.1.1.7.7 “State LEDs” on page 2626*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V DC)
	Rated value	24 V DC
	Current consumption via UP terminal	5 mA + max. 0.5 A per output
	Max. ripple	5 %
	Inrush current	0.000002 A^2s
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	Recommended; the outputs must be protected by an 3 A fast-acting fuse
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 10 mA
Galvanic isolation		Yes, between the output group and the rest of the module
Isolated groups		1 (8 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Power dissipation within the module (max.)		1.6 W
Weight		Ca. 115 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital outputs

Parameter	Value
Number of channels per module	8 transistor outputs (24 V DC, 0.5 A max.)
Distribution of the channels into groups	1 (8 channels per group)
Connection of the channels O0 to O7	Terminals 11 to 18
Common power supply voltage	Terminal 19 (positive pole of the process voltage, signal name UP)
Reference potential for the channels O0 to O7	Terminal 20 (negative pole of the process voltage, signal name ZP)
Indication of the output signals	1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus

Parameter		Value
Way of operation		Non-latching type
Min. output voltage at signal 1		20 V DC at max. current consumption
Output delay (max. at rated load)		
	0 to 1	50 µs
	1 to 0	200 µs
Output data length		1 byte
Output current		
	Rated current per channel (max.)	0.5 A at UP 24 V DC
	Rated current per group (max.)	4 A
	Lamp load (max.)	5 W
Max. leakage current with signal 0		0.5 mA
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		3 A fast
Demagnetization when inductive loads are switched off		Must be performed externally according to driven load specification
Switching Frequencies		
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz at max. 5 W
Short-circuit-proof / Overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC	No
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

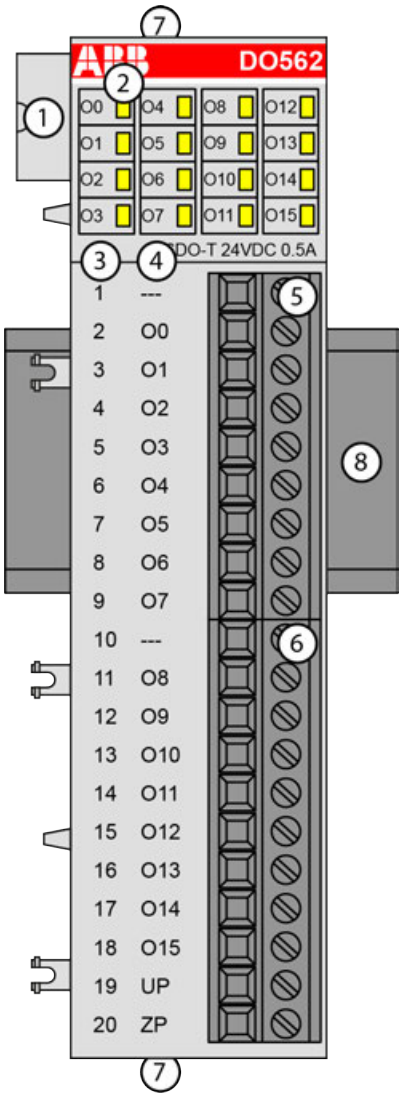
DO562 - Digital output module

- 16 digital outputs 24 V DC (O0 to O15) in 1 group
- Module-wise galvanically isolated



1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↳ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

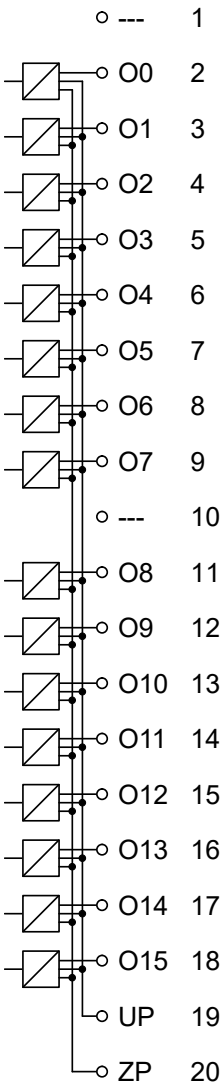


Table 473: Assignment of the terminals:

Terminal	Signal	Description
1	---	Reserved
2	O0	Output signal O0
3	O1	Output signal O1
4	O2	Output signal O2
5	O3	Output signal O3
6	O4	Output signal O4
7	O5	Output signal O5
8	O6	Output signal O6
9	O7	Output signal O7
10	---	Reserved
11	O8	Output signal O8
12	O9	Output signal O9
13	O10	Output signal O10
14	O11	Output signal O11

Terminal	Signal	Description
15	O12	Output signal O12
16	O13	Output signal O13
17	O14	Output signal O14
18	O15	Output signal O15
19	UP	Process voltage UP (24 V DC)
20	ZP	Process voltage ZP (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

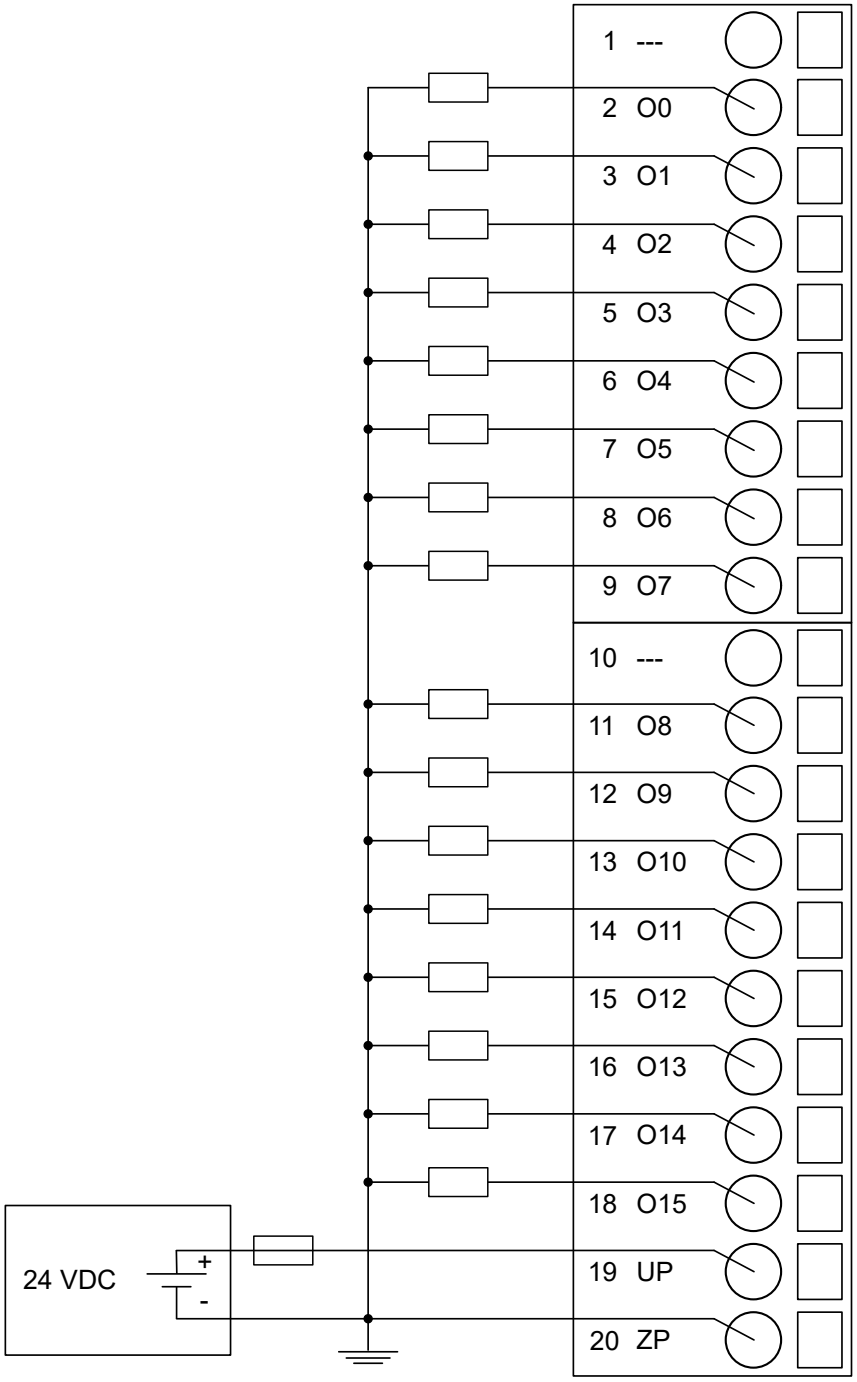
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the digital output module DO562:



NOTICE!

Risk of malfunctions in the plant!

The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis *Chapter 1.6.3.6.1.1.8.6 “Diagnosis” on page 2635*).

The meaning of the LEDs is described in the section Status LEDs *Chapter 1.6.3.6.1.1.8.7 “State LEDs” on page 2635*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V DC)
	Rated value	24 V DC
	Current consumption via UP terminal	20 mA + max. 0.5 A per output
	Max. ripple	5 %
	Inrush current	0.000002 A^2s
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	Recommended; the outputs must be protected by an 3 A fast-acting fuse
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 10 mA
Galvanic isolation		Yes, between the output group and the rest of the module
Isolated groups		1 (16 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		1.4 W
Weight		Ca. 125 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital outputs

Parameter	Value
Number of channels per module	16 transistor outputs (24 V DC, 0.5 A max.)
Distribution of the channels into groups	1 (16 channels per group)
Connection of the channels O0 to O7	Terminals 1 to 9
Connection of the channels O8 to O15	Terminals 11 to 18
Common power supply voltage	Terminal 19 (positive pole of the process voltage, signal name UP)
Reference potential for the channels O0 to O15	Terminal 20 (negative pole of the process voltage, signal name ZP)

Parameter		Value
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus
Way of operation		Non-latching type
Min. output voltage at signal 1		UP -0.3 V at max. current consumption
Output delay (max. at rated load)		
	0 to 1	50 µs
	1 to 0	200 µs
Output data length		2 bytes
Output current		
	Rated current per channel (max.)	0.5 A at UP 24 V DC
	Rated current per group (max.)	8 A
	Lamp load (max.)	5 W
Max. leakage current with signal 0		0.5 mA
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		3 A fast
Demagnetization when inductive loads are switched off		Must be performed externally according to driven load specification
Switching Frequencies		
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz at max. 5 W
Short-circuit-proof / Overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC	No
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

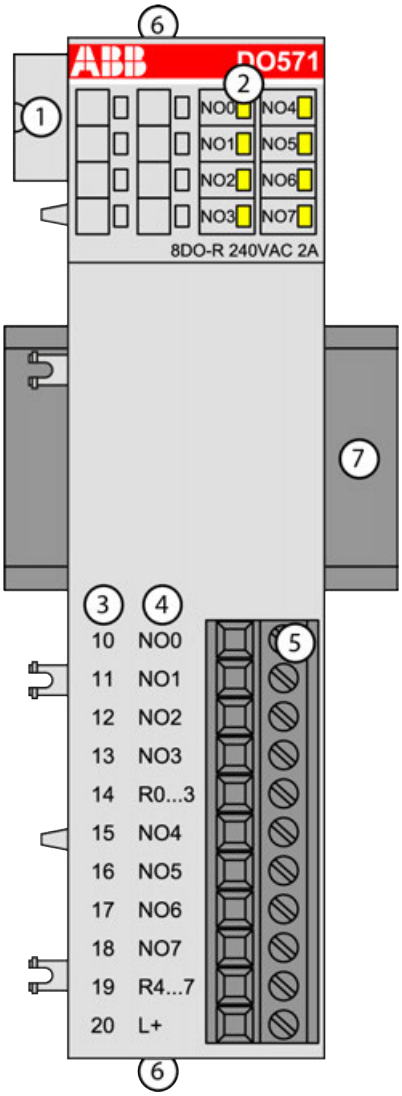
DO571 - Digital output module

- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100-240 V AC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 to O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminal L+ (process voltage 24 V DC). The negative pole is provided by the I/O bus.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

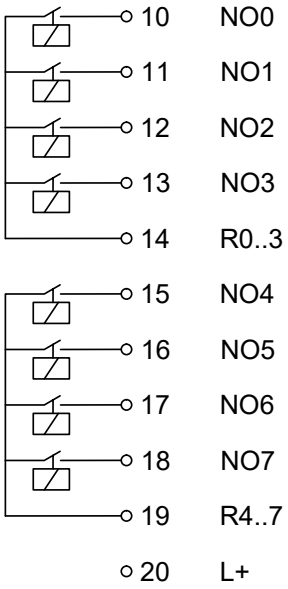


Table 474: Assignment of the terminals:

Terminal	Signal	Description
10	NO0	Normally-open contact of the output NO0
11	NO1	Normally-open contact of the output NO1
12	NO2	Normally-open contact of the output NO2
13	NO3	Normally-open contact of the output NO3
14	R0..3	Output common for signals NO0 to NO3
15	NO4	Normally-open contact of the output NO4

Terminal	Signal	Description
16	NO5	Normally-open contact of the output NO5
17	NO6	Normally-open contact of the output NO6
18	NO7	Normally-open contact of the output NO7
19	R4..7	Output common for signals NO4 to NO7
20	L+	Process voltage L+ +24 V DC

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/ communication interface module and the DO571 must have a common power supply.

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

WARNING!

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..3 and R4..7) does not exceed 8 A.

Never connect total currents > 8 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:

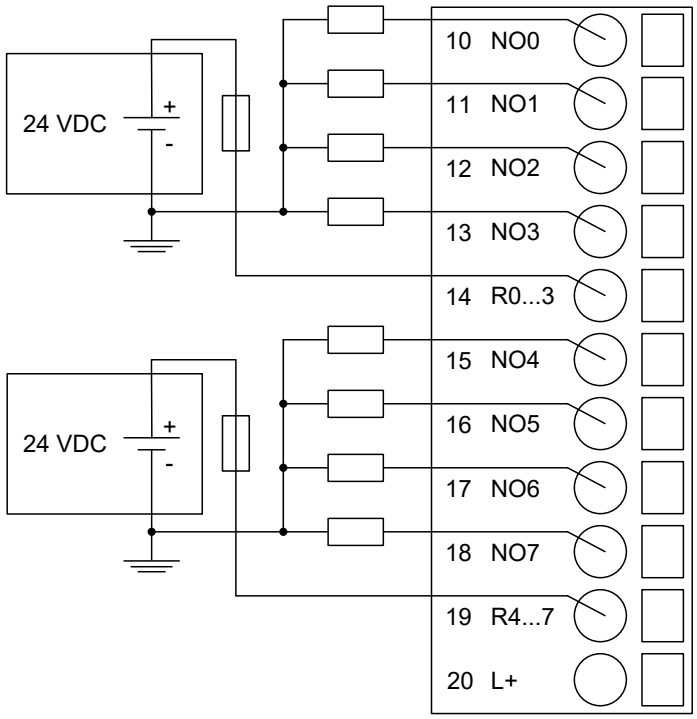

Fig. 105: Connection of 24 V DC actuators

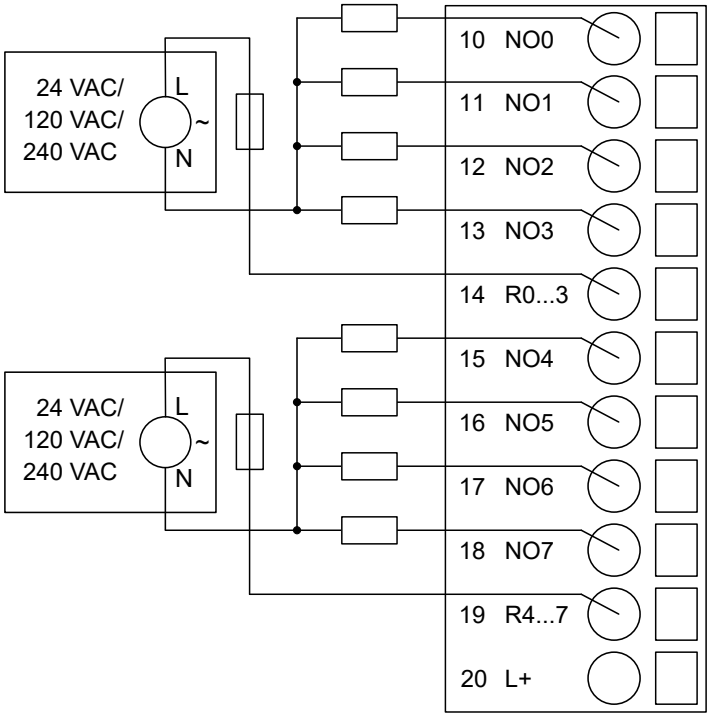

Fig. 106: Connection of 24 V AC or 100-240 V AC actuators

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

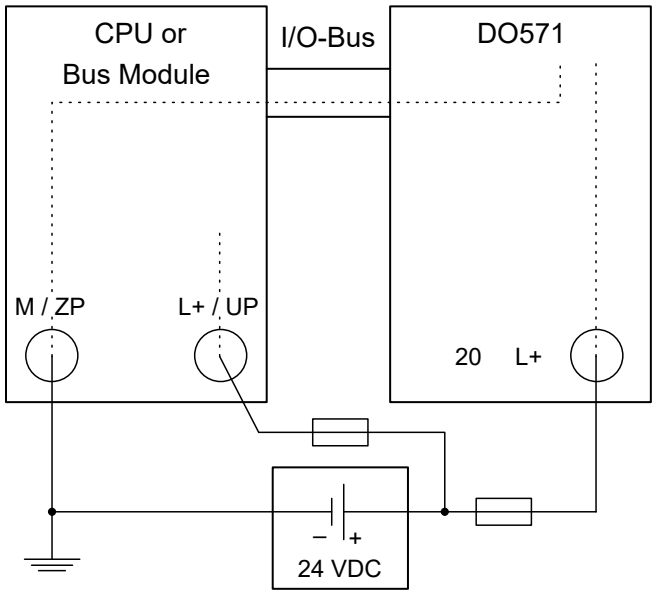

Fig. 107: Power supply - the negative connection is realized via the I/O bus

The L+ connection of the DO571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

The module provides several diagnosis functions (see Diagnosis *Chapter 1.6.3.6.1.1.9.6 "Diagnosis" on page 2645*).

The meaning of the LEDs is described in the section Status LEDs *Chapter 1.6.3.6.1.1.9.7 "State LEDs" on page 2646*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The System Data of AC500-eCo apply ↬ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminal 20 for L+ (+24 V DC). The negative pole is provided by the I/O bus.
	Rated value	24 V DC
	Current consumption via L+	50 mA
	Inrush current (at power-up)	0.0035 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	Recommended; the outputs must be protected by a 3 A fast-acting fuse
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 5 mA
Galvanic isolation		Yes, between the output group and the rest of the module
Isolated groups		2 (4 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		2.0 W
Weight		Ca. 150 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital outputs

Parameter		Value

8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Not necessary

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

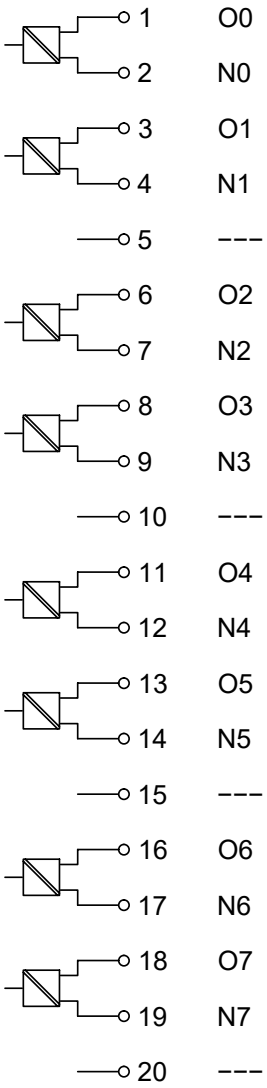

Table 475: Assignment of the terminals:

Terminal	Signal	Description
1	O0	Output signal O0
2	N0	Neutral conductor for the output signal O0
3	O1	Output signal O1
4	N1	Neutral conductor for the output signal O1
5	---	Reserved
6	O2	Output signal O2
7	N2	Neutral conductor for the output signal O2
8	O3	Output signal O3
9	N3	Neutral conductor for the output signal O3
10	---	Reserved
11	O4	Output signal O4

Terminal	Signal	Description
12	N4	Neutral conductor for the output signal O4
13	O5	Output signal O5
14	N5	Neutral conductor for the output signal O5
15	---	Reserved
16	O6	Output signal O6
17	N6	Neutral conductor for the output signal O6
18	O7	Output signal O7
19	N7	Neutral conductor for the output signal O7
20	---	Reserved

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO572.

An external power supply connection is not needed.

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

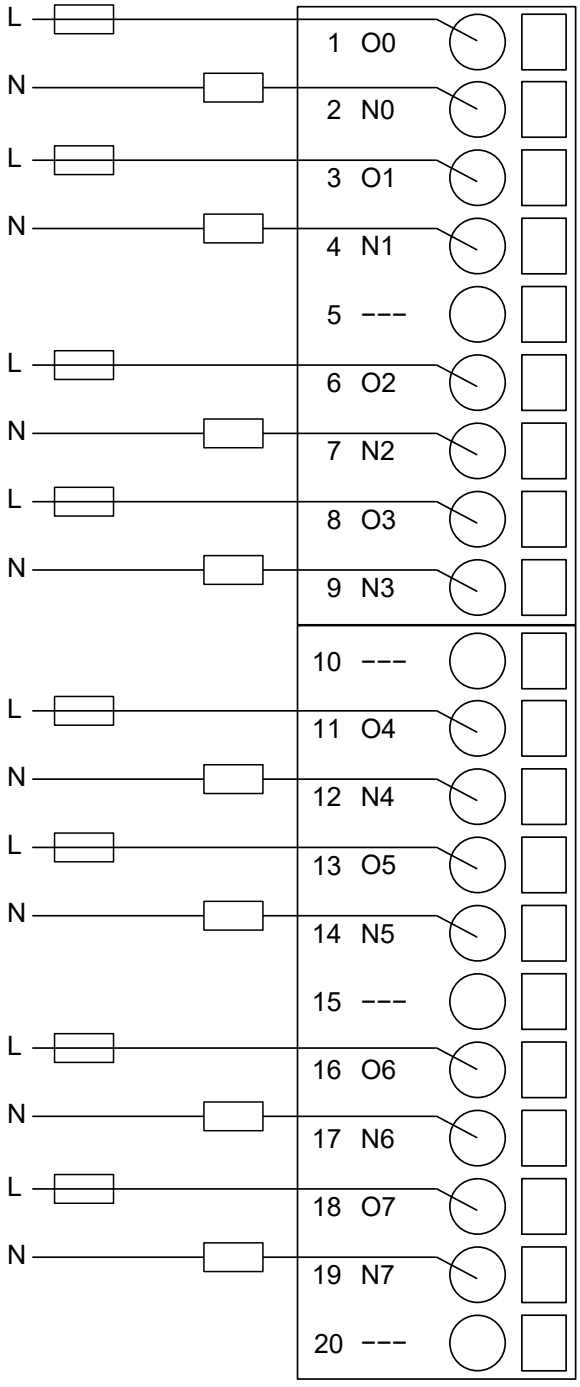
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the module:



NOTICE!

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions (see chapter Diagnosis *Chapter 1.6.3.6.1.1.10.6 “Diagnosis” on page 2655*).

The meaning of the LEDs is described in the section State LEDs *Chapter 1.6.3.6.1.1.10.7 “State LEDs” on page 2656*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

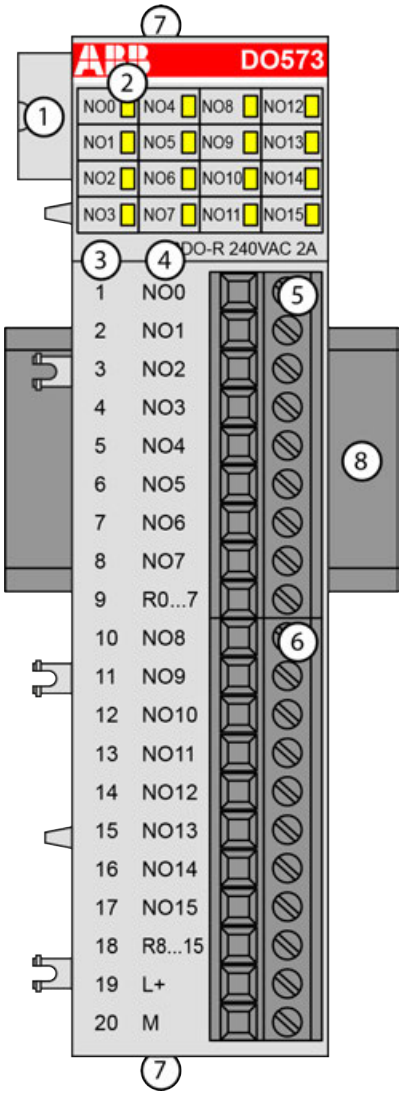
DO573 - Digital output module

- 16 digital normally open relay outputs 24 V DC or 100-240 V AC (NO0 to NO15) in 2 groups, 2 A max.
- Group-wise galvanically isolated



1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number

4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↳ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

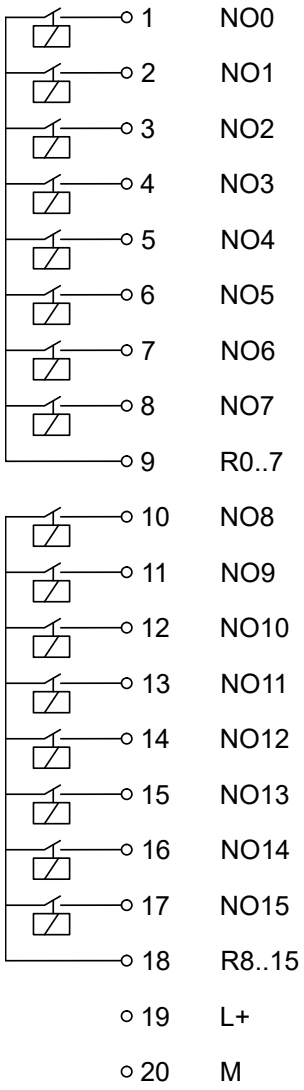


Table 476: Assignment of the terminals:

Terminal	Signal	Description
1	NO0	Normally-open contact of the output NO0
2	NO1	Normally-open contact of the output NO1
3	NO2	Normally-open contact of the output NO2
4	NO3	Normally-open contact of the output NO3
5	NO4	Normally-open contact of the output NO4
6	NO5	Normally-open contact of the output NO5
7	NO6	Normally-open contact of the output NO6
8	NO7	Normally-open contact of the output NO7
9	R0..7	Output common for signals NO0 to NO7
10	NO8	Normally-open contact of the output NO8
11	NO9	Normally-open contact of the output NO9
12	NO10	Normally-open contact of the output NO10
13	NO11	Normally-open contact of the output NO11
14	NO12	Normally-open contact of the output NO12

Terminal	Signal	Description
15	NO13	Normally-open contact of the output NO13
16	NO14	Normally-open contact of the output NO14
17	NO15	Normally-open contact of the output NO15
18	R8..15	Output common for signals NO8 to NO15
19	L+	Process voltage L+ (24 V DC)
20	M	Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO573.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/ communication interface module.

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

WARNING!

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..7 and R8..15) does not exceed 10 A.

Never connect total currents > 10 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:

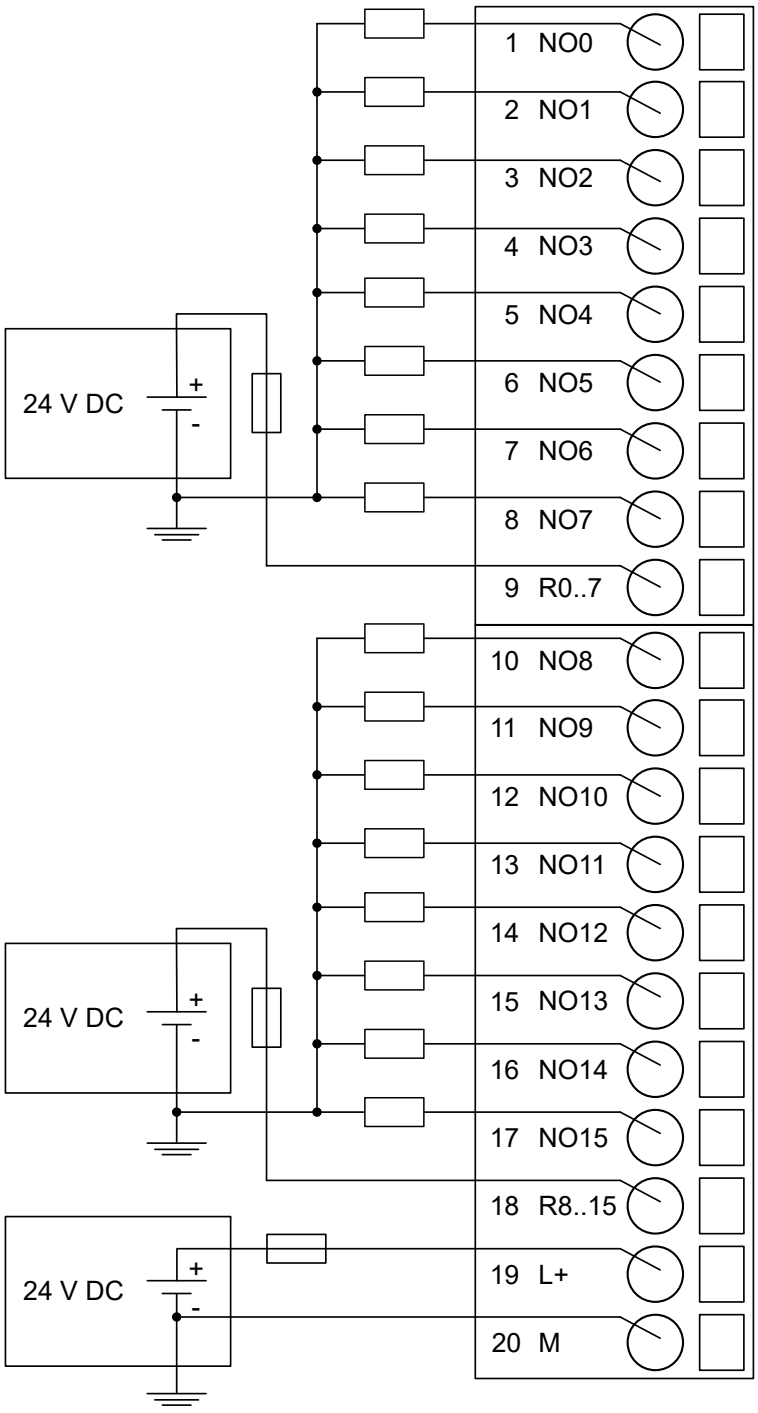

Fig. 108: Connection of 24 V DC actuators

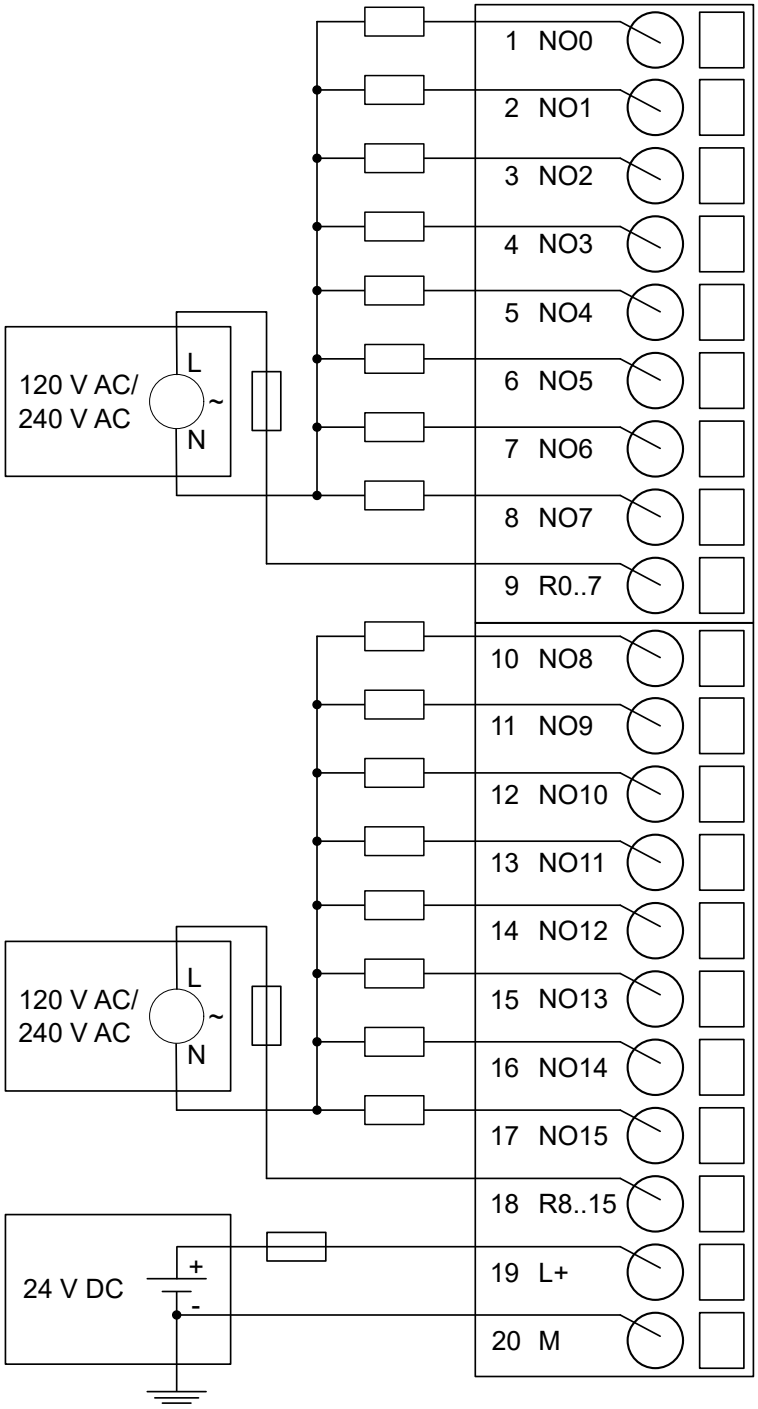

Fig. 109: Connection of 100-240 V AC actuators

The module provides several diagnosis functions (see section Diagnosis ↳ *Chapter 1.6.3.6.1.1.11.6 “Diagnosis” on page 2666*).

The meaning of the LEDs is described in the section State LEDs ↳ *Chapter 1.6.3.6.1.1.10.7 “State LEDs” on page 2656*.

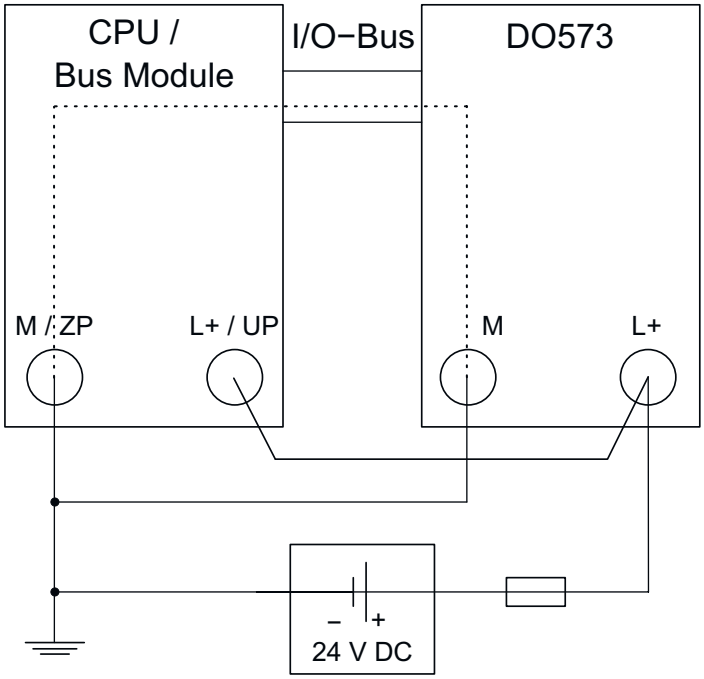

Fig. 110: Power supply - the negative connection is realized via the I/O bus

The L+ connection of the DO573 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply .

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The System Data of AC500-eCo apply ↬ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminals 19 for L+ (+24 V DC) and 20 for M (0 V DC)
	Rated value	24 V DC
	Current consumption via L+	50 mA
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse for L+	Recommended; the outputs must be protected by an 5 A fast-acting fuse
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module		Ca. 5 mA
Galvanic isolation		Yes, between the output groups and the rest of the module
Isolated groups		2 (8 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		2.0 W
Weight		Ca. 160 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital outputs

Parameter	Value
Number of channels per module	16 normally-open relay outputs
Distribution of the channels into groups	2 (8 channels per group)
Connection of the channels NO0 to NO7	Terminals 1 to 8
Connection of the channels NO8 to NO15	Terminals 10 to 17
Reference potential for the channels NO0 to NO7	Terminal 9 (signal name R0..7)
Reference potential for the channels NO8 to NO15	Terminal 18 (signal name R8..15)
Relay coil power supply	Terminals 19 and 20 (signal names L+ and M)
Indication of the output signals	1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus
Way of operation	Non-latching type

Parameter		Value
Relay output voltage		
	Rated value	24 V DC or 120/240 V AC
Output delay		
	Switching 0 to 1 (max.)	Typ. 10 ms
	Switching 1 to 0 (max.)	Typ. 10 ms
Output data length		2 bytes
Output current		
	Rated current per channel (max.)	2.0 A (24 V DC / 24 V AC / 48 V AC / 120 V AC / 240 V AC, only resistive loads) 2.0 A (24 V AC / 48 V AC / 120 V AC, only pilot duty) 1.5 A (240 V AC, only pilot duty)
	Rated current per group (max.)	10 A
Lamp load (max.)		200 W (230 V AC), 30 W (24 V DC)
Spark suppression with inductive AC loads		Must be performed externally according to driven load specification
Switching Frequencies		
	With resistive loads	Max. 1 Hz
	With inductive loads	On Request
	With lamp loads	Max. 1 Hz
Output type		Non-protected
Protection type		External fuse [1])
Rated protection fuse		5 A fast
Short-circuit-proof / Overload-proof		No, should be provided by an external fuse or circuit breaker
	Overload message	No
	Output current limitation	No
Connection of 2 outputs in parallel		Not possible
Lifetime of relay contacts (cycles)		100.000 at rated load
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

[1]) Per group in case of group fuse protection. For each channel in case of channel-by-channel fuse protection. The maximum current per group must not be exceeded.

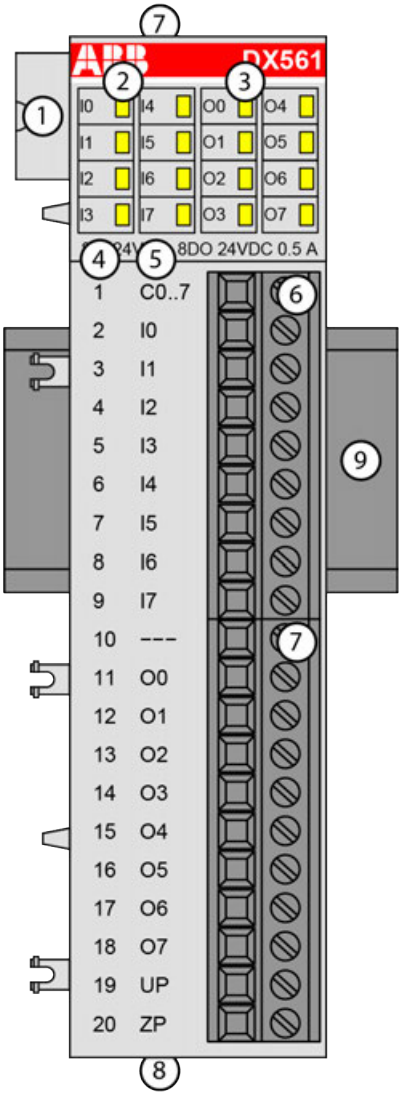
DX561 - Digital input/output module

- 8 digital inputs 24 V DC (I0 to I7) in 1 group
- 8 digital transistor outputs 24 V DC (O0 to O7) in 1 group
- Group-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs O0 to O7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:

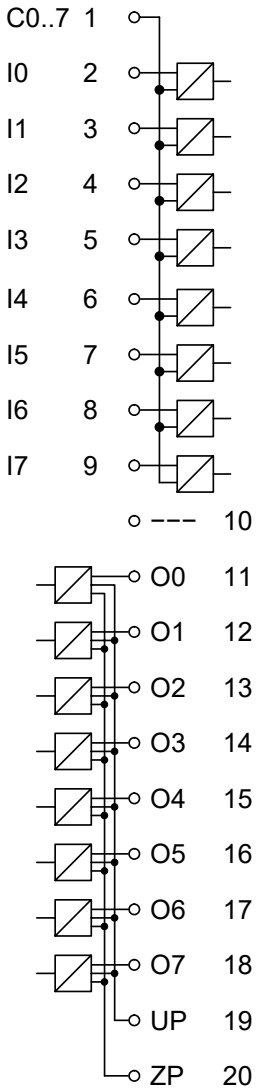


Table 477: Assignment of the terminals:

Terminal	Signal	Description
1	C0...7	Input common for signals I0 to I7
2	I0	Input signal I0
3	I1	Input signal I1
4	I2	Input signal I2
5	I3	Input signal I3
6	I4	Input signal I4
7	I5	Input signal I5
8	I6	Input signal I6
9	I7	Input signal I7
10	---	Reserved
11	O0	Output signal O0
12	O1	Output signal O1
13	O2	Output signal O2

Terminal	Signal	Description
14	O3	Output signal O3
15	O4	Output signal O4
16	O5	Output signal O5
17	O6	Output signal O6
18	O7	Output signal O7
19	UP	Process voltage UP +24 V DC
20	ZP	Process voltage ZP 0 V DC

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!

Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the inputs to the digital input/output module DX561:

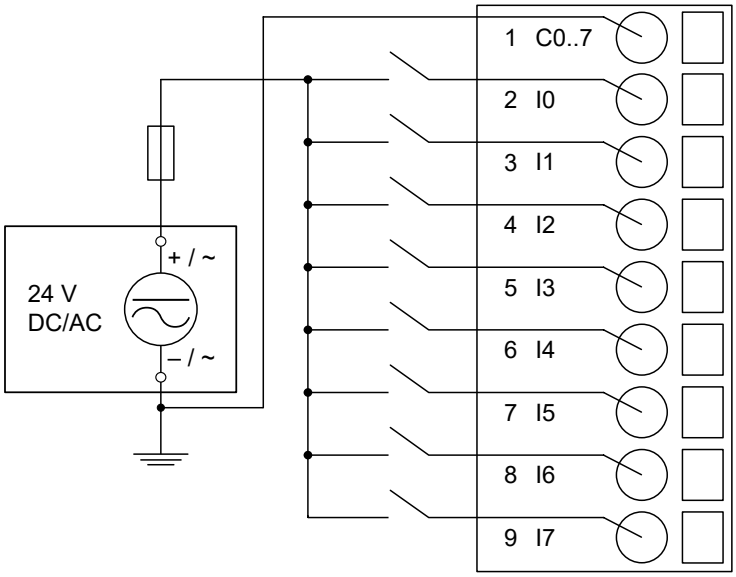

Fig. 111: Connection of inputs - sink inputs

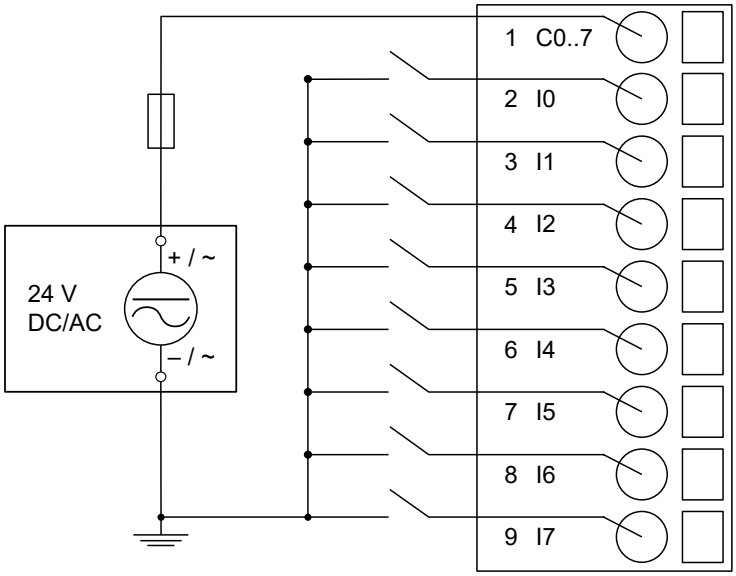

Fig. 112: Connection of inputs - source inputs

The following figure shows the connection of the outputs to the module:

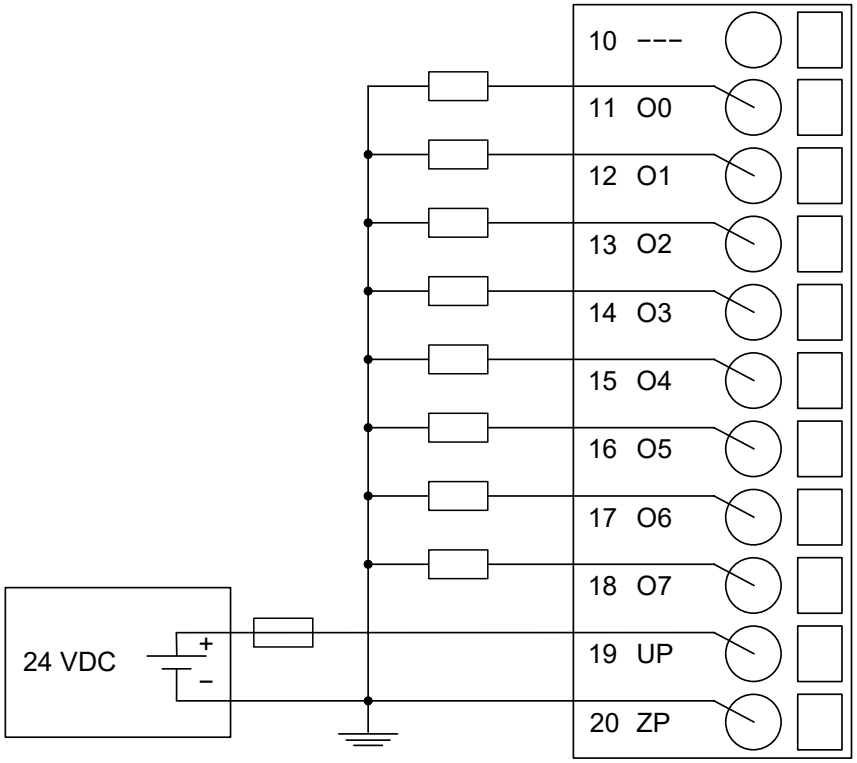

Fig. 113

NOTICE!

Risk of malfunctions in the plant!

The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuits and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see chapter Diagnosis ↬ *Chapter 1.6.3.6.1.1.12.6 “Diagnosis” on page 2678*).

The meaning of the LEDs is described in the Displays section ↬ *Chapter 1.6.3.6.1.1.12.7 “State LEDs” on page 2679* chapter.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data of the digital outputs

Parameter	Value
Number of channels per module	8 transistor outputs (24 V DC, 0.5 A max.)
Distribution of the channels into groups	1 group of 8 channels
Connection of the channels O0 to O7	Terminals 11 to 18
Reference potential for the channels O0 to O7	Terminal 20 (negative pole of the process voltage, name ZP)
Common power supply voltage	Terminal 19 (positive pole of the process voltage, name UP)
Indication of the output signals	1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered via the I/O bus
Monitoring point of output indicator	Controlled together with transistor

Parameter		Value
Way of operation		Non-latching type
Max. output voltage at signal 1		20 V DC at max. current consumption
Output delay		
	0 to 1	50 µs
	1 to 0	200 µs
Output data length		1 byte
Output current		
	Rated current per channel (max.)	0.5 A at UP 24 V DC
	Rated current per group (max.)	4 A
	Rated current (all channels together, max.)	4 A
	Lamp load (max.)	5 W
	Max. leakage current with signal 0	0.5 mA
Output type		Non-protected
Protection type		External fuse on each channel
Rated protection fuse (for each channel)		3 A fast
Demagnetization when inductive loads are switched off		Must be performed externally according to driven load specification
Switching Frequencies		
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz at max. 5 W
Short-circuit-proof / Overload-proof		No
	Overload message	No
	Output current limitation	No
	Resistance to feedback against 24 V DC	No
Connection of 2 outputs in parallel		Not possible
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

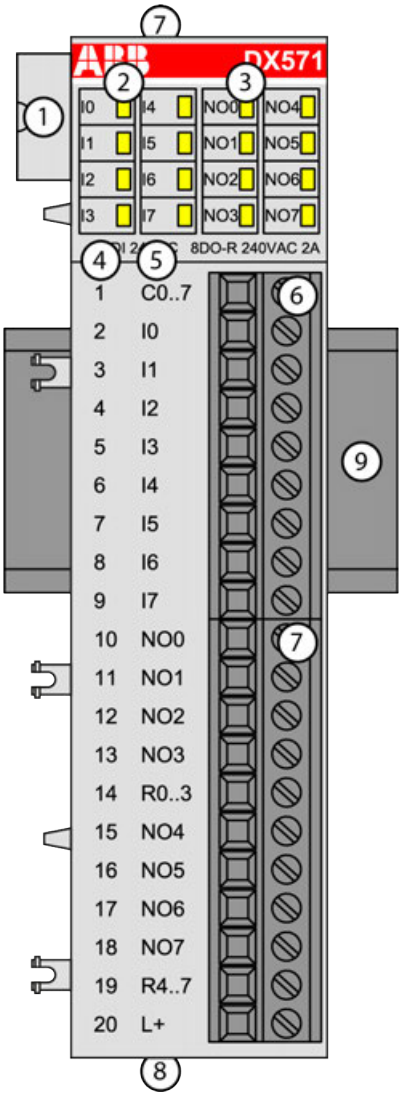
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DX571 - Digital input/output module

- 8 digital inputs 24 V DC / 24 V AC (I0 to I7) in 1 group
- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100-240 V AC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise galvanically isolated



1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs NO0 to NO7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

Parameter	Value
LED displays	For signal states
Internal power supply	Via I/O bus
External power supply	Via the terminal L+ (process voltage 24 V DC). The negative pole is provided by the I/O bus.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↪ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:

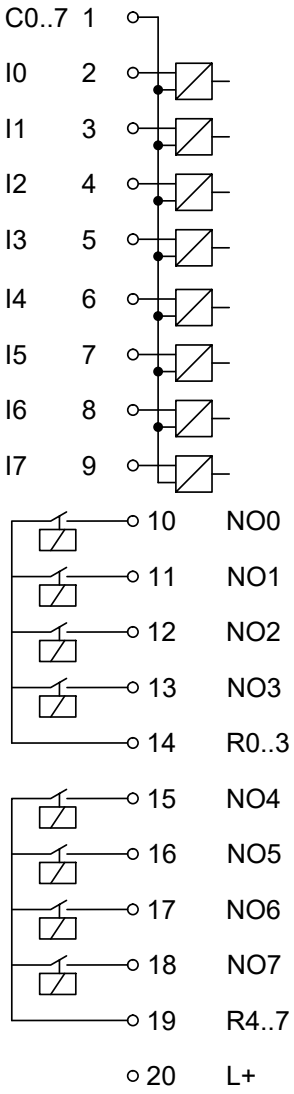


Table 478: Assignment of the terminals:

Terminal	Signal	Description
1	C0...7	Input common for signals I0 to I7
2	I0	Input signal I0
3	I1	Input signal I1
4	I2	Input signal I2
5	I3	Input signal I3
6	I4	Input signal I4
7	I5	Input signal I5
8	I6	Input signal I6
9	I7	Input signal I7
10	NO0	Normally-open contact of the output 0
11	NO1	Normally-open contact of the output 1
12	NO2	Normally-open contact of the output 2

Terminal	Signal	Description
13	NO3	Normally-open contact of the output 3
14	R0...3	Output common for signals O0 to O3
15	NO4	Normally-open contact of the output 4
16	NO5	Normally-open contact of the output 5
17	NO6	Normally-open contact of the output 6
18	NO7	Normally-open contact of the output 7
19	R4...7	Output common for signals O4 to O7
20	L+	Process voltage +24 V DC

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DX571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/ communication interface module and the DX571 must have a common power supply.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..3 and R4..7) does not exceed 8 A.

Never connect total currents > 8 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The module provides several diagnosis functions (see Diagnosis *Chapter 1.6.3.6.1.1.13.6 “Diagnosis” on page 2691*).

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!

Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figures show the connection of the inputs to the digital input/output module DX571:

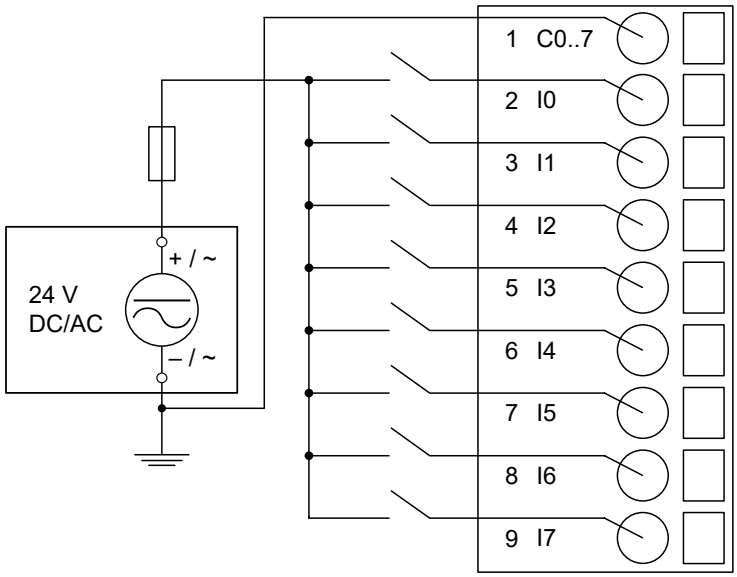

Fig. 114: Connection of inputs - sink inputs

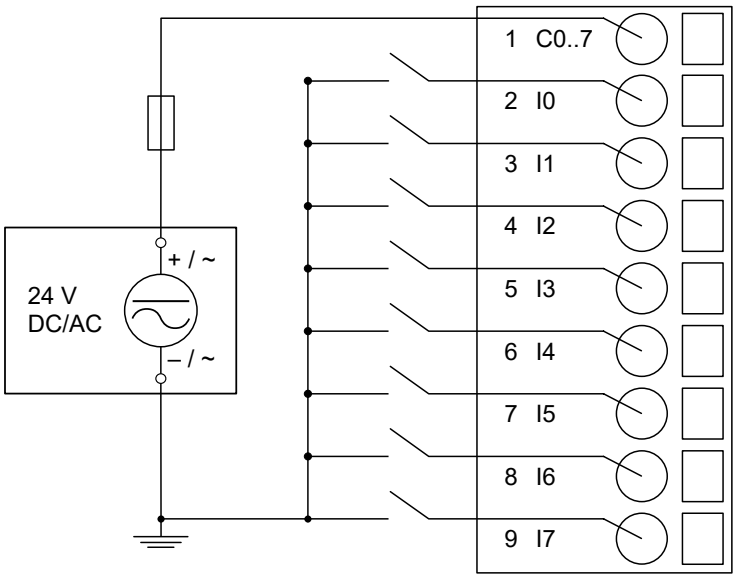

Fig. 115: Connection of inputs - source inputs

The following figures show the connection of the outputs to the module:

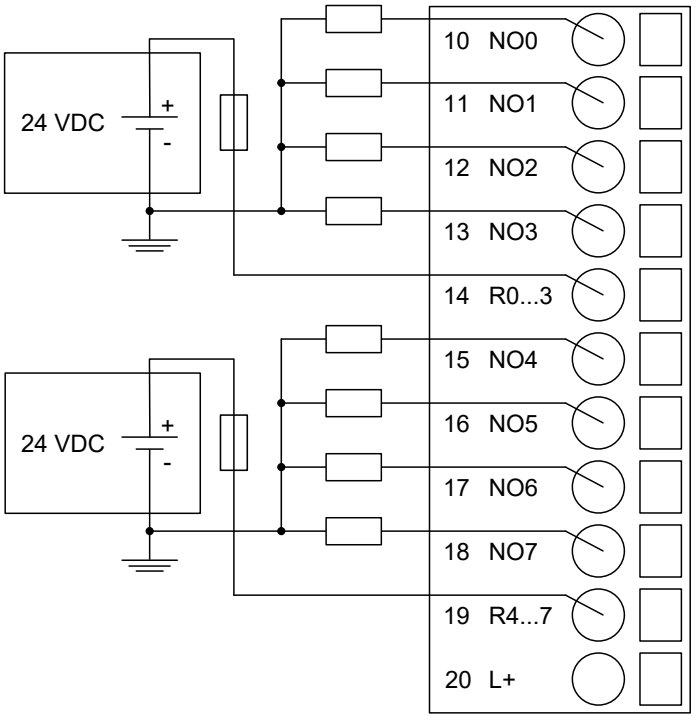

Fig. 116: Connection of 24 V DC actuators

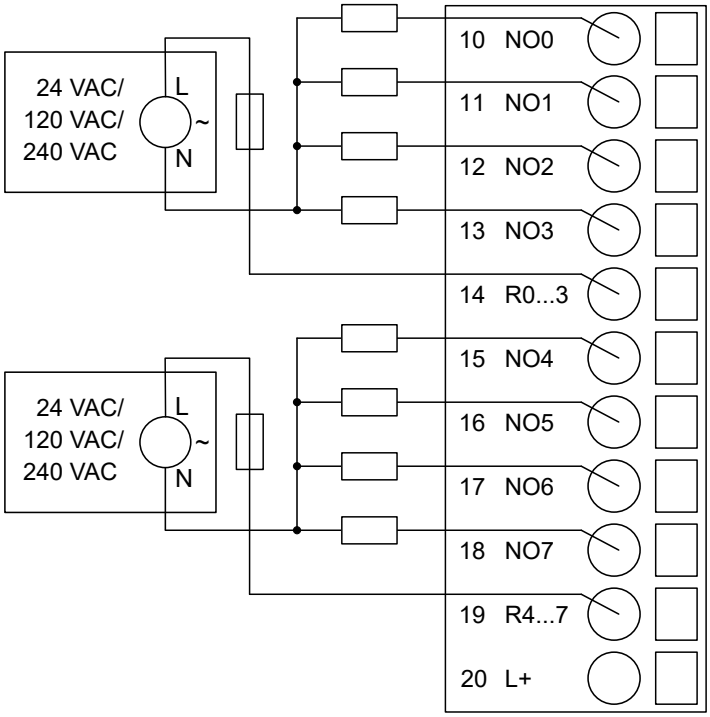

Fig. 117: Connection of 24 V AC or 100-240 V AC actuators

The L+ connection of the DX571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

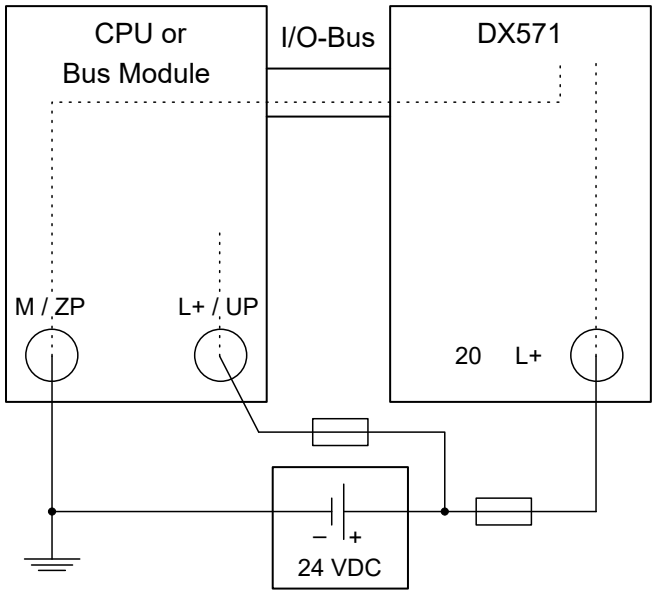

Fig. 118: Power supply - the minus connection is realized via the I/O bus

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

WARNING!

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

NOTICE!

Risk of damaging the I/O module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section *Chapter 1.6.3.6.1.1.13.7 “State LEDs” on page 2692*.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

[1])	In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = Module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e. g. of the DC551-CS31)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = module itself" is output.

State LEDs

LED		State	Color	LED = OFF	LED = ON
	Inputs I0...I7	Digital input	Yellow	Input is OFF	Input is ON
	Outputs NO0...NO7	Digital output	Yellow	Output is OFF	Output is ON

In the undefined signal range, the state LED for the inputs can be ON although the input state detected by the module is OFF.

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminal 20 for L+ (+24 V DC). The negative pole is provided by the I/O bus.
	Rated value	24 V DC
	Current consumption via L+	50 mA
	Inrush current (at power-up)	0.0035 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse for L+	Recommended; the outputs must be protected by a 3 A fast-acting fuse

Parameter	Value
Current consumption from 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module	Ca. 5 mA
Galvanic isolation	Yes, between the input group and the output group and the rest of the module
Isolated groups	3 groups (1 group for 8 input channels, 2 groups for 8 output channels)
Surge-voltage (max.)	35 V DC for 0.5 s
Max. power dissipation within the module	2.3 W
Weight	Ca. 150 g
Mounting position	Horizontal or vertical
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs

Parameter		Value		
Number of channels per module		8		
Distribution of the channels into groups		1 group for 8 channels		
Connections of the channels I0 to I7		Terminals 2 to 9		
Reference potential for the channels I0 to I7		Terminal 1		
Indication of the input signals		1 yellow LED per channel; the LED is ON when the input signal is high (signal 1)		
Monitoring point of input indicator		LED is part of the input circuitry		
Input type according to EN 61131-2		Type 1 source	Type 1 sink	Type 1 AC [1])

	Input voltage 5 V	Typ. 1 mA		Typ. 1 mA r.m.s.
	Input voltage 14 V			Typ. 2.7 mA r.m.s.
	Input voltage 15 V	> 2.5 mA		
	Input voltage 27 V			Typ. 5.5 mA r.m.s.
	Input voltage 30 V	< 8 mA		
Max. permissible leakage current (at 2-wire proximity switches)		1 mA		Typ. 1 mA r.m.s.

Parameter		Value
Input delay (0->1 or 1->0)		Typ. 8 ms
Input data length		1 byte
Max. cable length		
	Shielded	500 m
	Unshielded	300 m

[1]) When inputs are used with 24 V AC, external surge limiting filters are required.

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8 normally-open relay outputs
Distribution of the channels into groups		2 (4 channels per group)
Connection of the channels O0 to O3		Terminals 10 to 13
Connection of the channels O4 to O7		Terminals 15 to 18
Reference potential for the channels O0 to O3		Terminal 14 (signal name R0..3)
Reference potential for the channels O4 to O7		Terminal 19 (signal name R4..7)
Relay coil power supply		Terminal 20 (positive pole of the process supply voltage, signal name L+). The negative pole is provided by the I/O bus.
Indication of the output signals		1 yellow LED per channel; the LED is on when the output signal is high (signal 1) and the module is powered through the I/O bus
Monitoring point of output indicator		Controlled together with relay
Way of operation		Non-latching type
Relay output voltage		
	Rated value	24 V DC / 24 V AC or 120/240 V AC
Output delay		
	Switching 0 to 1 (max.)	Typ. 10 ms
	Switching 1 to 0 (max.)	Typ. 10 ms
Output data length		1 byte
Output current		
	Rated current per channel (max.)	2.0 A (24 V DC / 24 V AC / 48 V AC / 120 V AC / 240 V AC, only resistive loads) 2.0 A (24 V AC / 48 V AC / 120 V AC, only pilot duty) 1.5 A (240 V AC, only pilot duty)
	Rated current per group (max.)	8 A
Lamp load (max.)		200 W (230 V AC), 30 W (24 V DC)
Spark suppression with inductive AC loads		Must be performed externally according to driven load specification
Switching Frequencies		
	With resistive loads	Max. 1 Hz

Parameter		Value
	With inductive loads	On Request
	With lamp loads	Max. 1 Hz
Output type		Non-protected
Protection type		External fuse [1])
Rated protection fuse		5 A fast
Short-circuit-proof / Overload-proof		No, should be provided by an external fuse or circuit breaker
	Overload message	No
	Output current limitation	No
Connection of 2 outputs in parallel		Not possible
Lifetime of relay contacts (cycles)		100.000 at rated load
Max. cable length		
	Shielded	500 m
	Unshielded	150 m

[1]) Per group in case of group fuse protection. For each channel in case of channel-by-channel fuse protection. The maximum current per group must not be exceeded.

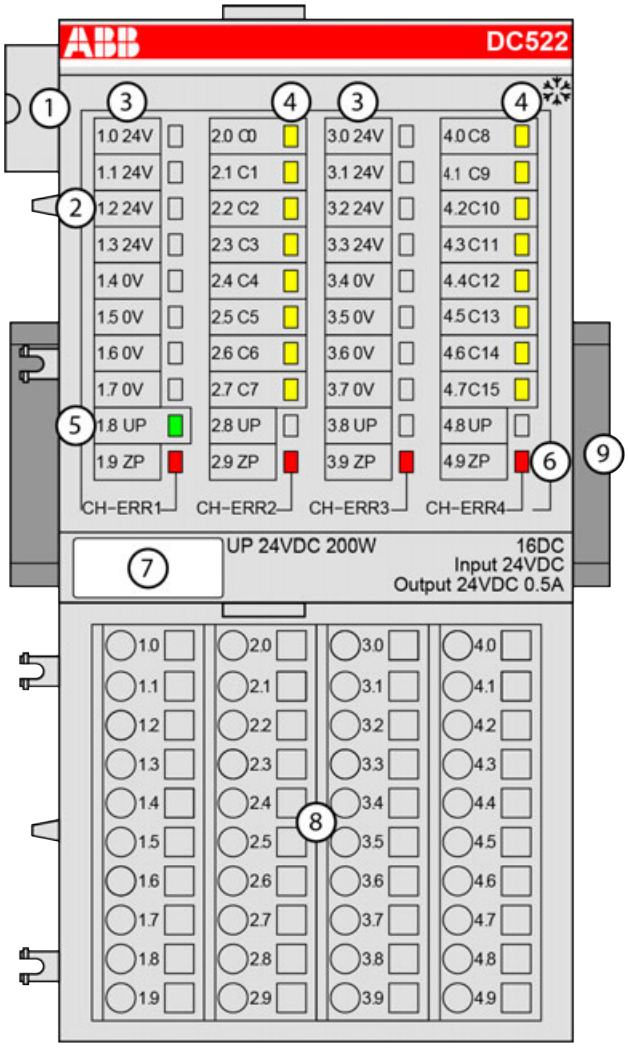
S500

DC522 - Digital input/output module

- 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 V DC / 0.5 A
4 16 yellow LEDs to display the signal states at the digital inputs/outputs (C0 - C15)
5 1 green LED to display the state of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 2 sensor supply voltages 24 V DC, 0.5 A, with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 V DC (C0 to C15) in 1 group (2.0...2.7 and 4.0...4.7), each of which can be used
  - as an input,
  - as a transistor output with short-circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Fast counter	Integrated, many configurable operating modes (only with AC500)
LED displays	For signal states, errors and supply voltage
Internal power supply	Through the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit	TU515 or TU516 ↬ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V

The device is plugged on a terminal unit ↬ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 ↬ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

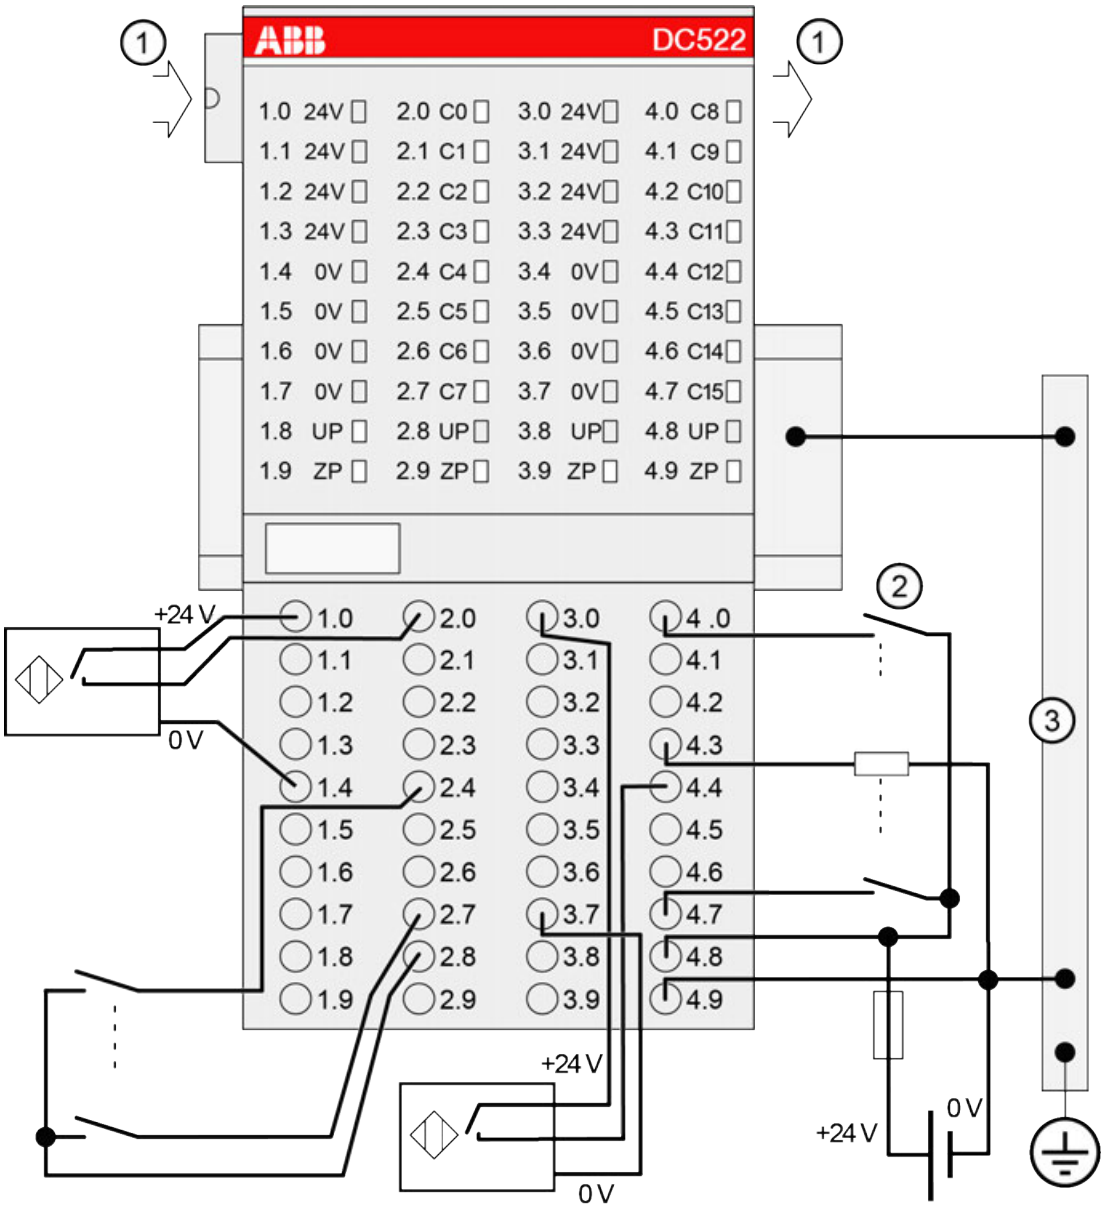
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC



1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
Connected with ZP (load) -> Output
3 Switchgear cabinet earth

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.3	+24 V	4 x sensor power supply sources (loadable with 0.5 A in total)
1.4 to 1.7	0 V	0 V (reference potential)
2.0 to 2.7	C0 to C7	8 digital inputs/outputs
3.0 to 3.3	+24 V	4 x sensor power supply sources (loadable with 0.5 A in total)
3.4 to 3.7	0 V	0 V (reference potential)
4.0 to 4.7	C8 to C15	8 digital inputs/outputs

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC522.

Connect a 470 Ω / 1 W resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	2	4
Digital outputs (bytes)	2	4
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

Name	Value	Internal value	Internal value, type	Default	Min.	Max.	EDS Slot/ Index
Module ID	Internal	1220 [1])	Word	1220 0x04C4	0	65535	0x0Y01

Remarks:

[1])	With CS31 and addresses smaller than 70 and FBP, the value is increased by 1
[2])	Not with FBP
[3])	For a description of the counter operating modes, please refer to the 'Fast Counter' section *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*
[4])	With FBP or CS31 without the parameter Fast Counter

GSD file:

Ext_User_Prm_Data_Len =	9
Ext_User_Prm_Data_Const(0) =	0x04, 0xc5, 0x06, \ 0x01, 0x02, 0x01, 0x00, 0x00, 0x00;

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Inputs/ outputs C0...C15	Digital input or digital output	Yellow	Input/output = OFF	Input/output = ON [1])	--
	UP	Process supply voltage 24 V DC via terminal	Green	Process supply voltage is missing	Process supply voltage OK	--
	CH-ERR1	Channel Error, error messages in groups (digital inputs/ outputs combined into the groups 1, 2, 3, 4)	Red	No error or process supply voltage is missing	Severe error within the corresponding group	Error on one channel of the corresponding group (e.g. short circuit at an output)
	CH-ERR2		Red			
	CH-ERR3		Red			
	CH-ERR4		Red			
	CH-ERR [2])	Module error	Red	--	Internal error	--
	[1]) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.					
	[2]) All of the LEDs CH-ERR1 to CH-ERR4 light up together					

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the L+/UP and M/ZP terminals of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation / with outputs	0.15 A + max. 0.5 A per output
	Inrush current from UP (at power up)	0.005 A^2s

Parameter		Value
Max. power dissipation within the module		6 W (outputs unloaded)
Sensor power supply		
	Connections	Terminals 1.0...1.3 = +24 V, 1.4...1.7 = 0 V Terminals 3.0...3.3 = +24 V, 3.4...3.7 = 0 V
	Voltage	24 V DC with short-circuit and overload protection
	Loadability	Terminals 1.0...1.3, in total max. 0.5 A Terminals 3.0...3.3, in total max. 0.5 A
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		16 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group of 16 channels
If the channels are used as inputs		
	Channels C0...C7	Terminals 2.0...2.7
	Channels C8...C15	Terminals 4.0...4.7
If the channels are used as outputs		
	Channels C0...C7	Terminals 2.0...2.7
	Channels C8 C15	Terminals 4.0...4.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)

Parameter	Value
Monitoring point of input/output indicator	LED is part of the input circuitry
Galvanic isolation	From the rest of the module

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		Max. 16 digital inputs
Reference potential for all inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Galvanic isolation		From the rest of the module
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Input type acc. to EN 61131-2		Type 1
Input delay (0->1 or 1->0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V *)
	Undefined signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V *)
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 5 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter	Value
Number of channels per module	Max. 16 transistor outputs
Reference potential for all outputs	Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)

Parameter		Value
Common power supply voltage		For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value, per channel	500 mA at UP = 24 V
	Maximum value (all channels together)	8 A
Leakage current with signal 0		< 0.5 mA
Rated protection fuse on UP		10 A fast
Demagnetization when inductive loads are switched off		With varistors integrated in the module (see figure below)
Switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz with max. 5 W
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

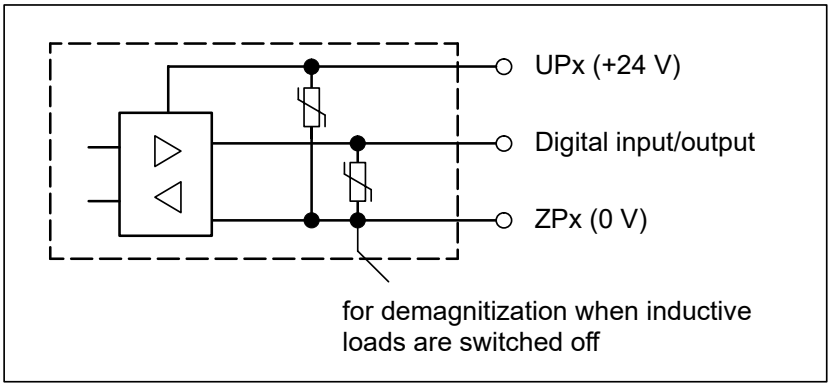

Fig. 119: Digital input/output (circuit diagram)

Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- *FBP interface module*
- *CS31 bus module*
- *CANopen communication interface module*

Parameter	Value
Used inputs	C8 / C9
Used outputs	C10
Counting frequency	Max. 50 kHz

↳ *Chapter 1.6.5.1.12 “Fast counters” on page 3570*

Ordering data

Part no.	Description	Product life cycle phase *)

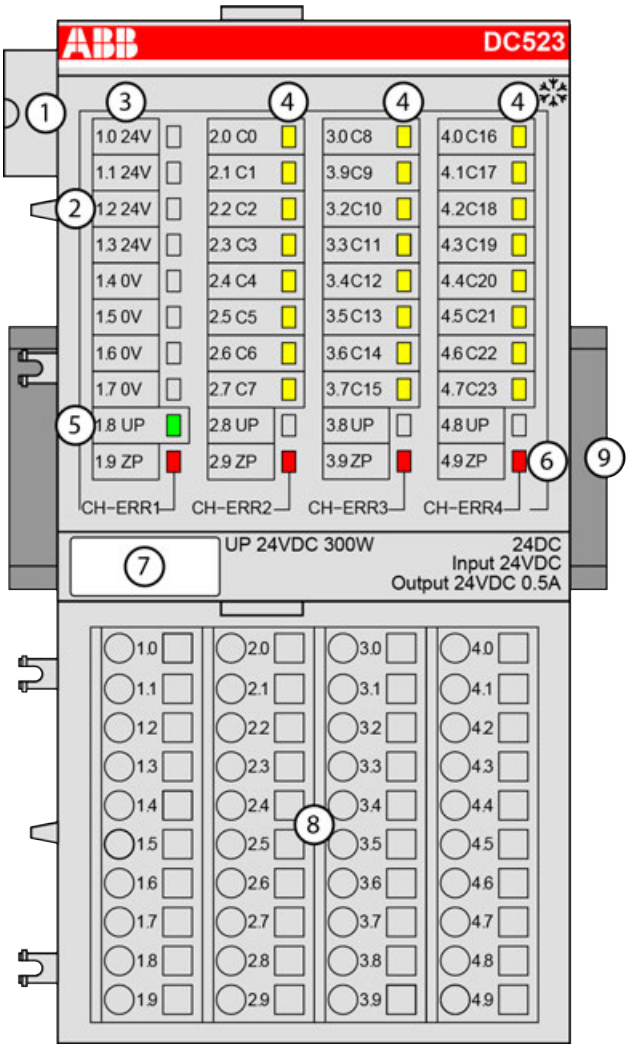
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

DC523 - Digital input/output module

- 24 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 Sensor power supply 24 V DC / 0.5 A
4 24 yellow LEDs to display the signal states at the digital inputs/outputs (C0 - C23)
5 1 green LED to display the status of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 1 sensor supply voltage 24 V DC, 0.5 A, with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 V DC (C0 to C23) in 1 group (2.0...2.7, 3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Fast counter	Integrated, many configurable operating modes (only with AC500)
LED displays	For signal states, errors and supply voltage
Internal power supply	Through the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit	TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

The device is plugged on a terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

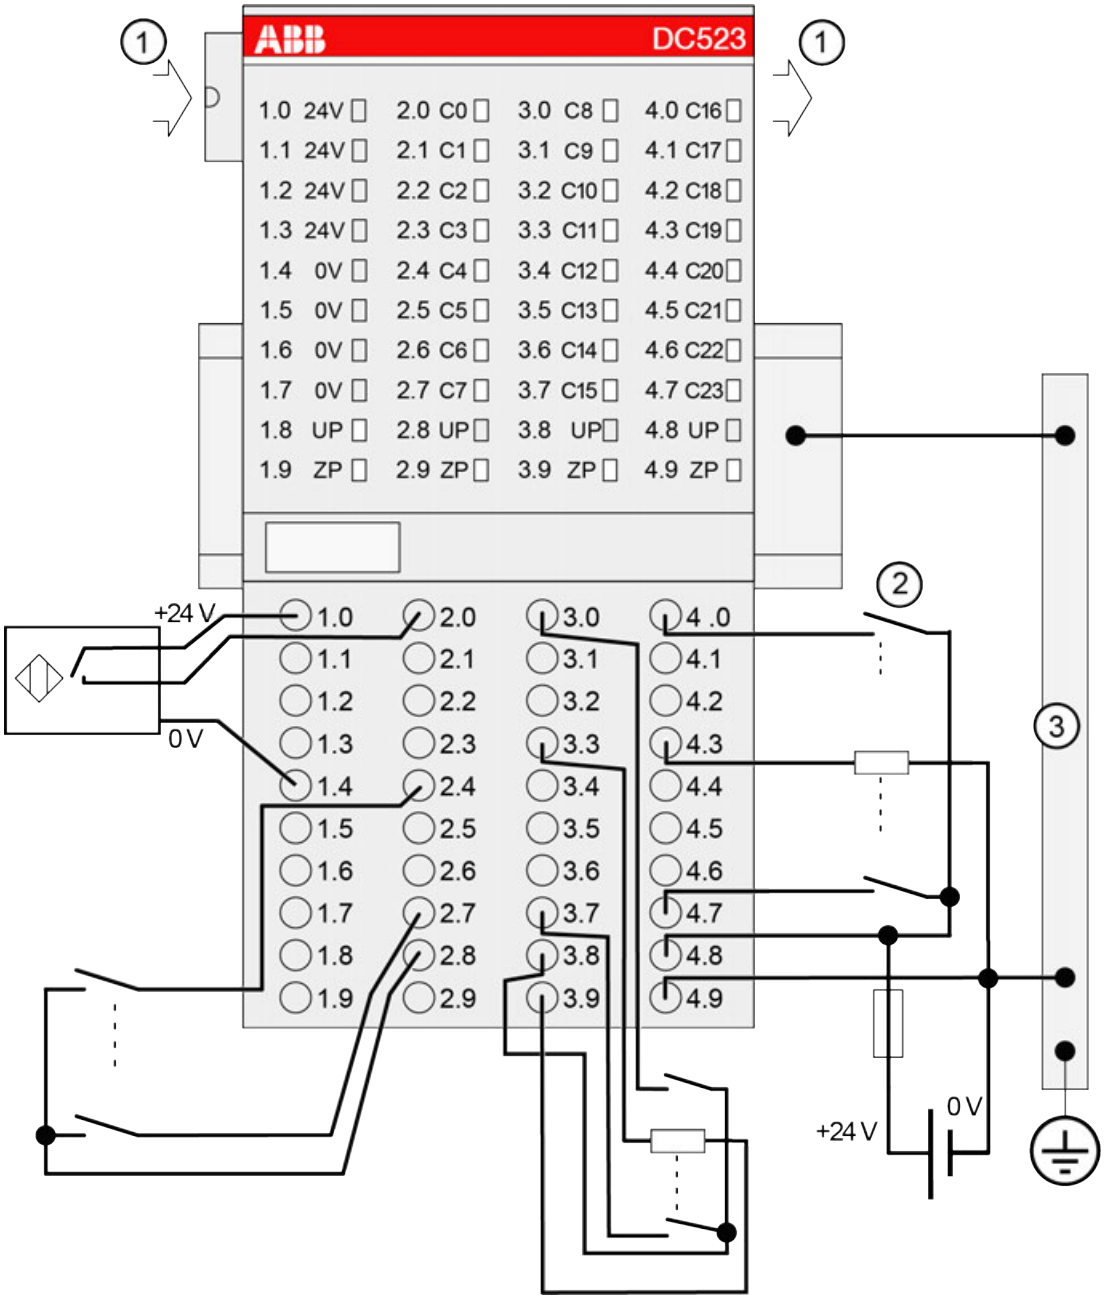
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC



1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
Connected with ZP (load) -> Output
3 Switchgear cabinet earth

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.3	+24 V	4 x sensor power supply sources (loadable with 0.5 A in total)
1.4 to 1.7	0 V	0 V (reference potential)
2.0 to 2.7	C0 to C7	8 digital inputs/outputs

Terminals	Signal	Description
3.0 to 3.7	C8 to C15	8 digital inputs/outputs
4.0 to 4.7	C16 to C23	8 digital inputs/outputs

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC523.

Connect a 470 Ω / 1 W resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	3	5
Digital outputs (bytes)	3	5
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

	[1]) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.					
	[2]) All of the LEDs CH-ERR1 to CH-ERR4 light up together					

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		

Parameter		Value
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/ communication interface module	Ca. 2 mA
	From UP at normal operation / with outputs	0.1 A + max. 0.5 A per output
	Inrush current from UP (at power up)	0.008 A^2s
Max. power dissipation within the module		6 W (outputs unloaded)
Sensor power supply		
	Connections	Terminals 1.0...1.3 = +24 V, 1.4...1.7 = 0 V
	Voltage	24 V DC with short circuit and overload protection
	Loadability	Terminals 1.0...1.3, in total max. 0.5 A
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		24 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group of 24 channels
If the channels are used as inputs		
	Channels C0...C7	Terminals 2.0...2.7
	Channels C8...C15	Terminals 3.0...3.7
	Channels C16...C23	Terminals 4.0...4.7
If the channels are used as outputs		

Parameter		Value

	Channels C8 C15	Terminals 3.0...3.7
	Channels C16...C23	Terminals 4.0...4.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Galvanic isolation		From the rest of the module

Technical data of the digital inputs/outputs if used as inputs

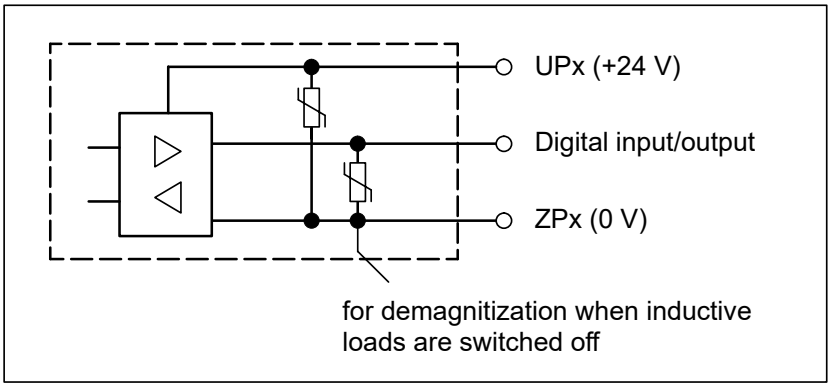
Parameter		Value
Number of channels per module		Max. 24 digital inputs
Reference potential for all inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Galvanic isolation		From the rest of the module
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Input type acc. to EN 61131-2		Type 1
Input delay (0->1 or 1->0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V *)
	Undefined signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V *)
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 5 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		Max. 24 transistor outputs
Reference potential for all outputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Common power supply voltage		For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value, per channel	500 mA at UP = 24 V
	Maximum value (all channels together)	8 A
Leakage current with signal 0		< 0.5 mA
Rated protection fuse on UP		10 A fast
Demagnetization when inductive loads are switched off		With varistors integrated in the module (see figure below)
Switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz with max. 5 W
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.



Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- *FBP interface module*
- *CS31 bus module*
- *CANopen communication interface module*

Parameter	Value
Used inputs	C16 / C17

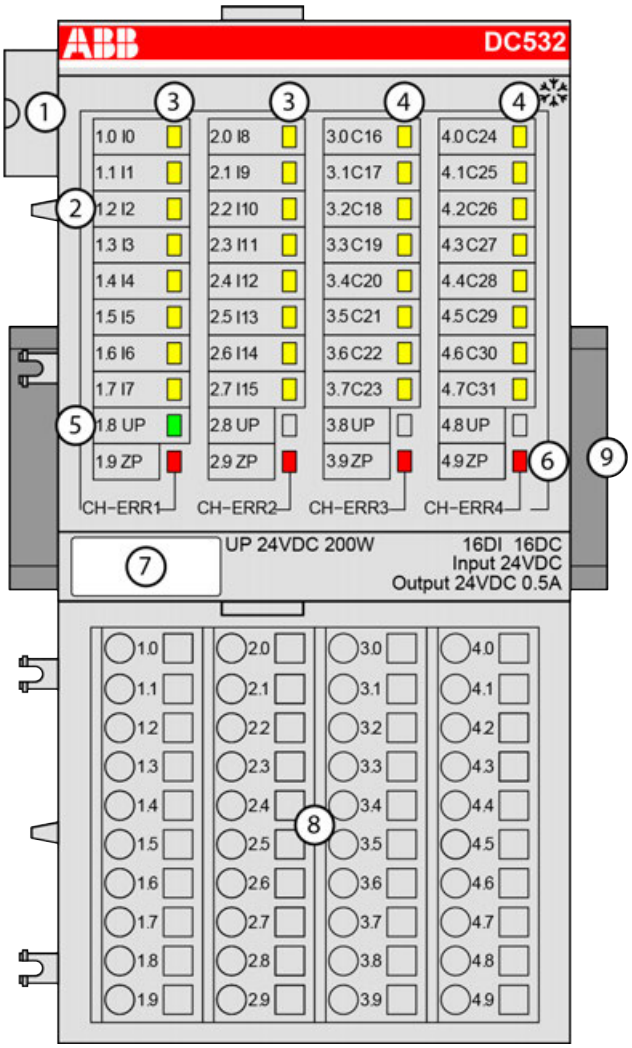
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

DC532 - Digital input/output module

- 16 digital inputs 24 V DC, 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the digital inputs (I0 - I15)
4 16 yellow LEDs to display the signal states at the digital inputs/outputs (C16 - C31)
5 1 green LED to display the state of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input / output unit.

- 16 digital inputs 24 V DC in 2 groups (1.0...1.7 and 2.0...2.7)
- 16 digital configurable inputs/outputs 24 V DC (C16 to C31) in 1 group (3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Digital inputs	16 (24 V DC)
Digital inputs/outputs	16 (24 V DC)
Fast counter	Integrated, many configurable operating modes (only with AC500)
LED displays	For signal states, errors and supply voltage
Internal power supply	Through the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit	TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V

The device is plugged on a terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

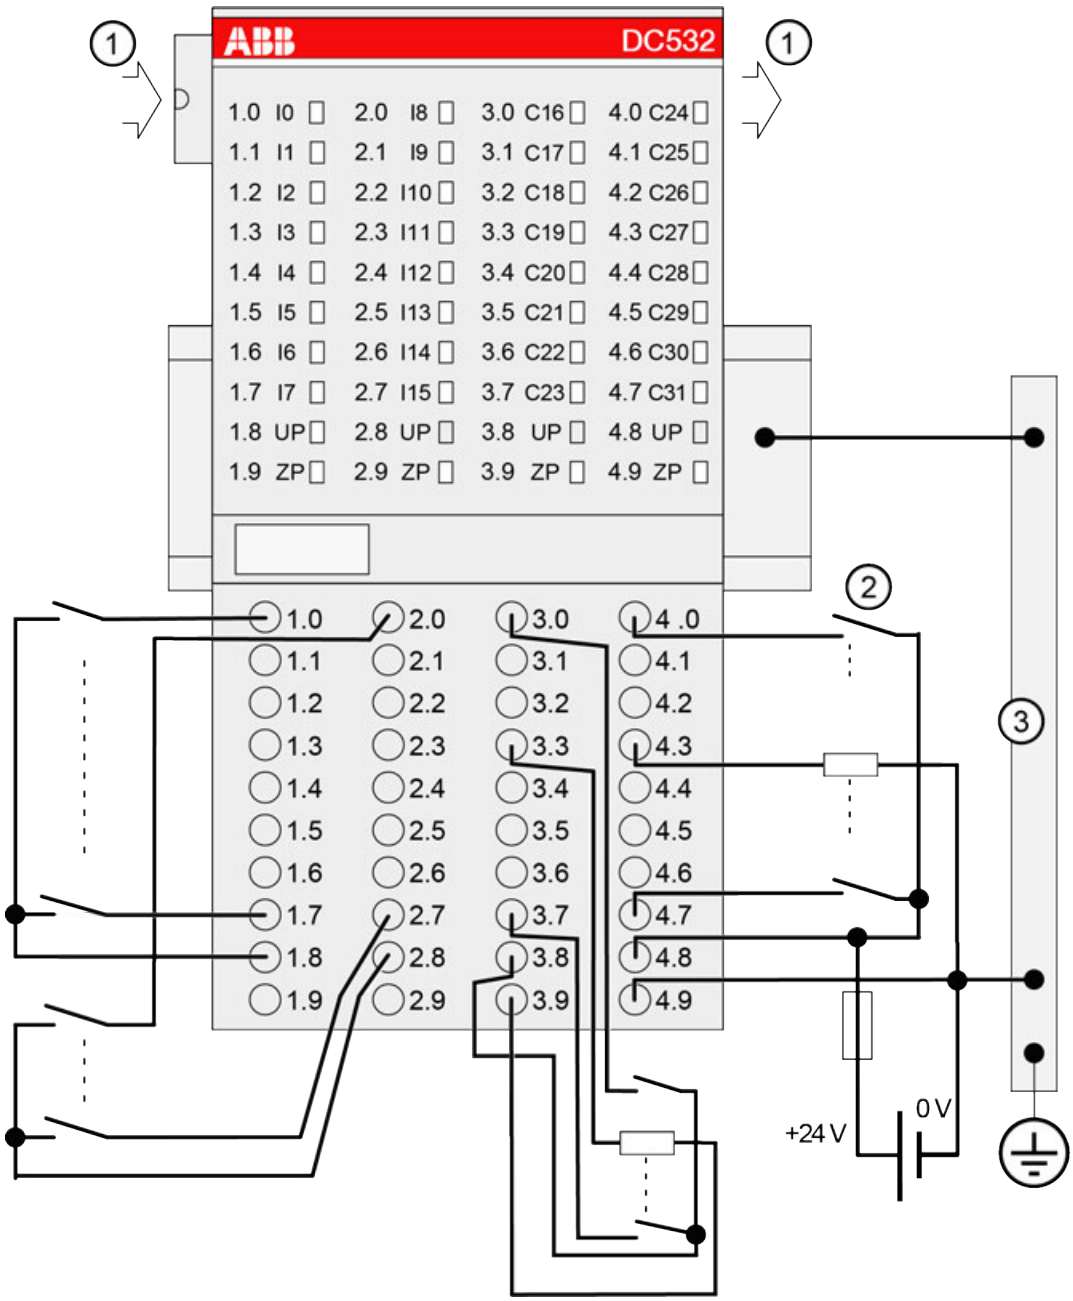
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC



1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
Connected with ZP (load) -> Output
3 switchgear cabinet earth

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	I0 to I7	8 digital inputs
2.0 to 2.7	I8 to I15	8 digital inputs
3.0 to 3.7	C16 to C23	8 digital inputs/outputs
4.0 to 4.7	C24 to C31	8 digital inputs/outputs

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC532.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DC532.

Connect a 470 Ω / 1 W resistor in series to inputs C24/C25 if using them as fast counter inputs to avoid any influences.

The module provides several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	4	6
Digital outputs (bytes)	2	4
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

Name	Value	Internal value	Internal value, type	Default	Min.	Max.

	CH-ERR3		Red			
	CH-ERR4		Red			
	CH-ERR [2])	Module Error	Red	--	Internal error	--
	[1]) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.					
	[2]) All of the LEDs CH-ERR1 to CH-ERR4 light up together					

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)

Parameter		Value
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation / with outputs	0.15 A + max. 0.5 A per output
	Inrush current from UP (at power up)	0.007 A^2s
Max. power dissipation within the module		6 W (outputs unloaded)
Weight (without terminal unit)		ca. 125 g
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	16
Distribution of the channels into groups	1 group of 16 channels
Terminals of the channels I0 to I7	1.0 to 1.7
Terminals of the channels I8 to I15	2.0 to 2.7
Reference potential for all inputs	Terminals 1.9, 2.8, 3.8 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Galvanic isolation	From the rest of the module (I/O bus)
Indication of the input signals	1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)

Parameter		Value
Monitoring point of input indicator		LED is part of the input circuitry
Input type acc. to EN 61131-2		Type 1
Input delay (0->1 or 1->0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V
	Undefined signal	> +5 V...< +15 V Parameter
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 5 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		16 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group of 16 channels
If the channels are used as inputs		
	Channels I16...I23	Terminals 3.0...3.7
	Channels I24...I31	Terminals 4.0...4.7
If the channels are used as outputs		
	Channels Q16...Q23	Terminals 3.0...3.7
	Channels Q24...Q31	Terminals 4.0...4.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Galvanic isolation		From the rest of the module

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		Max. 16 digital inputs
Reference potential for all inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Input current, per channel		See Technical Data of the Digital Inputs ↳ *Chapter 1.6.3.6.1.2.3.8.1 “Technical data of the digital inputs” on page 2725*
Input type acc. to EN 61131-2		Type 1
Input delay (0->1 or 1->0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
Signal 0		-3 V...+5 V *)
undefined signal		> +5 V...< +15 V
Signal 1		+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V *)
Ripple with signal 1		Within +15 V...+30 V
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

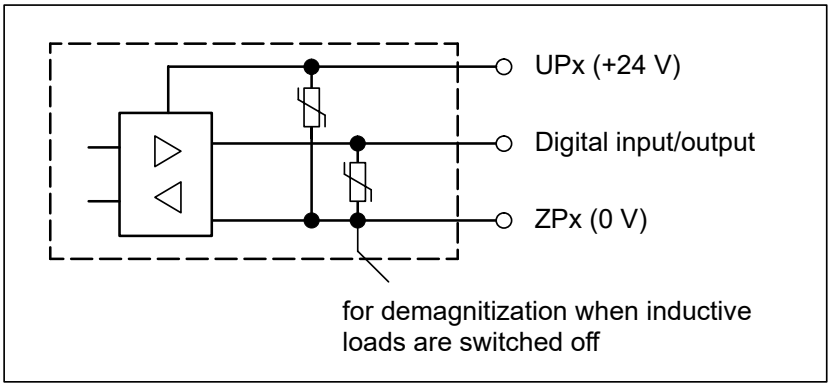
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		Max. 16 transistor outputs
Reference potential for all outputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Common power supply voltage		For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value, per channel	500 mA at UP = 24 V
	Maximum value (all channels together)	8 A
Leakage current with signal 0		< 0.5 mA
Rated protection fuse on UP		10 A fast
Demagnetization when inductive loads are switched off		With varistors integrated in the module (see figure below)
Switching frequency		
	With resistive load	On request

Parameter		Value
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz with max. 5 W
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.



Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- *FBP interface module*
- *CS31 bus module*
- *CANopen communication interface module*

Parameter	Value
Used inputs	C24 / C25
Used outputs	C26
Counting frequency	Max. 50 kHz

Chapter 1.6.5.1.12 “Fast counters” on page 3570

8 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Fast counter	Integrated, many configurable operating modes (only with AC500)
LED displays	For signal states, errors and supply voltage
Internal power supply	Via the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal units	TU515 or TU516 ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V

The device is plugged on a terminal unit ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 ↳ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

Table 479: Assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	I0 to I7	8 digital inputs
2.0 to 2.7	I8 to I15	8 digital inputs
3.0 to 3.7	I16 to I23	8 digital inputs
4.0 to 4.7	I24 to I31	8 digital inputs

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter ↳ *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

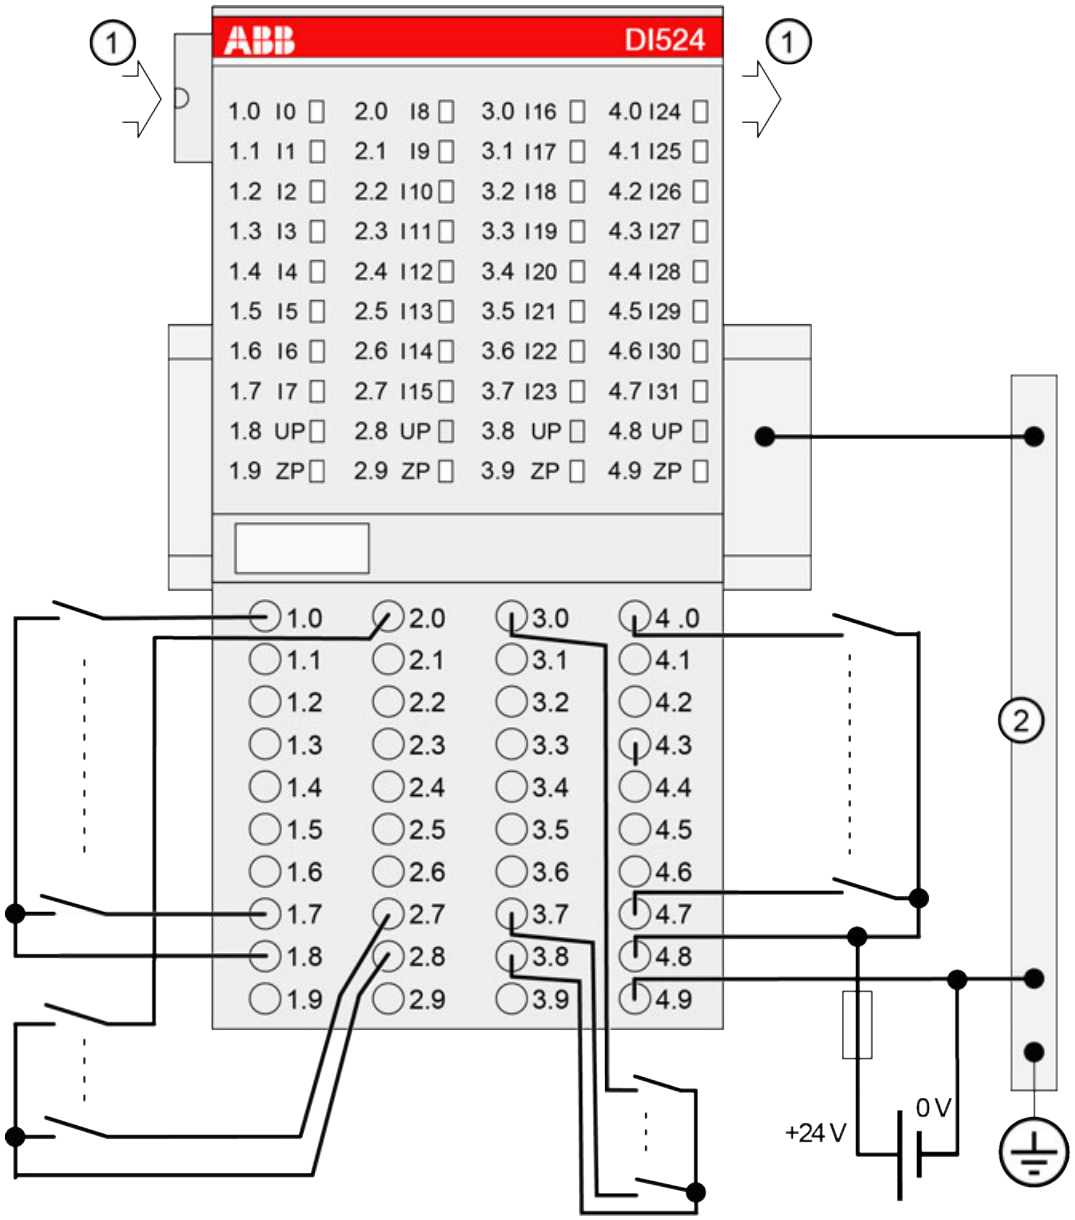
The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.



1 I/O bus
2 switchgear cabinet earth

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The module provides several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	4	6
Digital outputs (bytes)	0	2

	Without the fast counter	With the fast counter (only with AC500)
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/ communication interface module	ca. 2 mA
	From UP at normal operation	0.15 A
	Inrush current from UP (at power up)	0.008 A^2s
Weight (without terminal unit)		ca. 105 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		32
Distribution of the channels into groups		1 group of 32 channels
Terminals of the channels I0 to I7		1.0 to 1.7
Terminals of the channels I8 to I15		2.0 to 2.7
Terminals of the channels I16 to I23		3.0 to 3.7
Terminals of the channels I24 to I31		4.0 to 4.7
Reference potential for all inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Galvanic isolation		From the rest of the module (I/O bus)
Indication of the input signals		One yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input indicator		LED is part of the input circuitry
Input type acc. to EN 61131-2		Type 1
Input delay (0 -> 1 or 1 -> 0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V
	Undefined signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 5 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- *FBP interface module*
- *CS31 bus module*
- *CANopen communication interface module*

Parameter	Value
Used inputs	I24 / I25
Used outputs	None
Counting frequency	Max. 50 kHz

↳ *Chapter 1.6.5.1.12 “Fast counters” on page 3570*

Ordering data

Part no.	Description	Product life cycle phase *)

8 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels.

Functionality

Parameter	Value
LED displays	For signal states, errors and supply voltage
Internal power supply	Via the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit	TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

The device is plugged on a terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	O0 to O7	8 digital outputs
2.0 to 2.7	O8 to O15	8 digital outputs
3.0 to 3.7	O16 to O23	8 digital outputs
4.0 to 4.7	O24 to O31	8 digital outputs

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

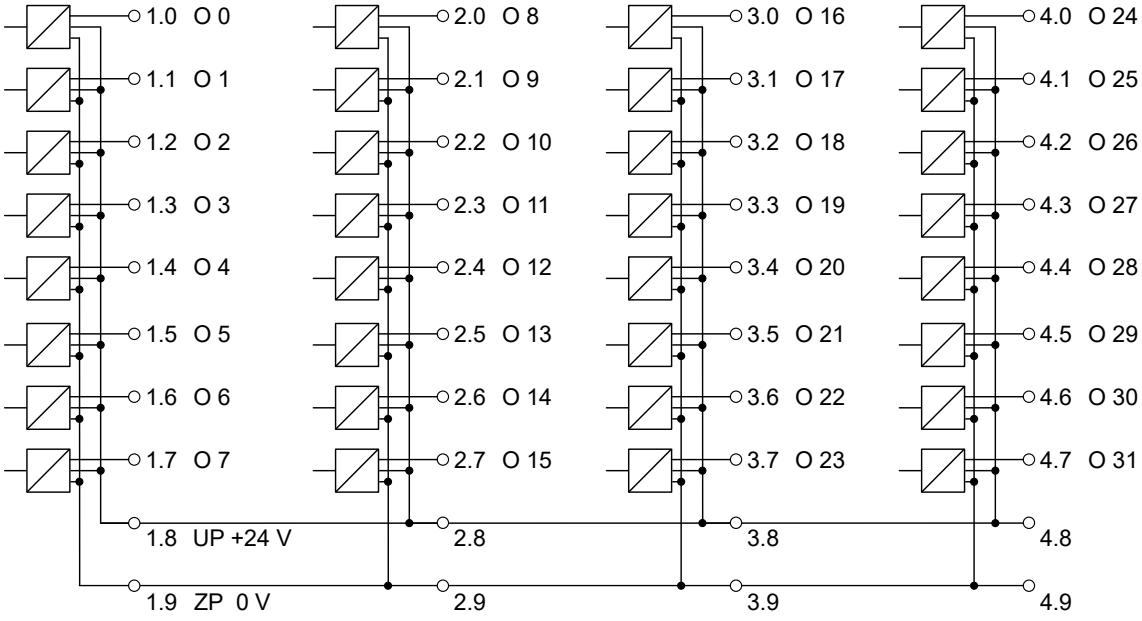
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:



The module provides several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	4

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation / with outputs	0.10 A + max. 0.5 A per output
	Inrush current from UP (at power up)	0.005 A^2s
Max. power dissipation within the module		6 W (outputs unloaded)
Weight (without terminal unit)		Ca. 100 g
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

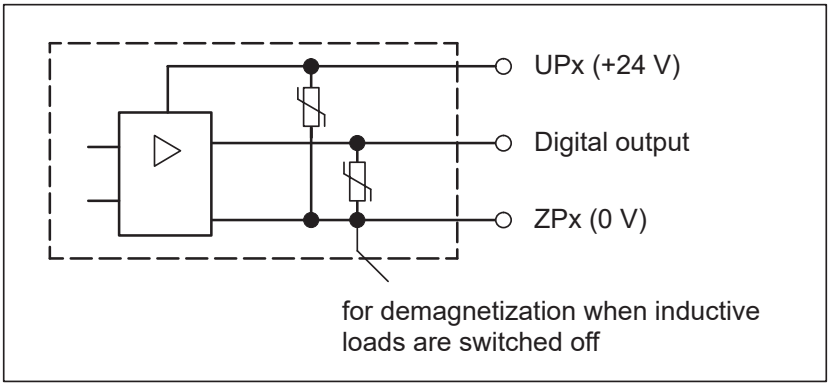
Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital outputs

Parameter		Value
Number of channels per module		32 outputs (with transistors)
Distribution of the channels into groups		1 group of 32 channels
Connection of the channels		
	O0 to O7	Terminals 1.0 to 1.7
	O8 to O15	Terminals 2.0 to 2.7
	O16 to O23	Terminals 3.0 to 3.7
	O24 to O31	Terminals 4.0 to 4.7
Indication of the output signals		1 yellow LED per channel, the LED is ON if the output signal is high (signal 1)
Reference potential for all outputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Common power supply voltage		For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0 -> 1 or 1 -> 0)		On request
Output current		
	Rated value, per channel	500 mA at UP = 24 V
	Maximum value (channels O0 to O15)	4 A
	Maximum value (channels O16 to O31)	4 A
	Maximum value (all channels together)	8 A
Max. leakage current with signal 0		< 0.5 mA
Rated protection fuse on UP		10 A fast
Demagnetization when inductive loads are switched off		With varistors integrated in the module (see figure below)
Switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz with max. 5 W
Short-circuit proof / overload proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short-circuit/overload
Resistance to feedback against 24 V signals		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital output with the varistors for demagnetization when inductive loads are switched off.



Ordering data

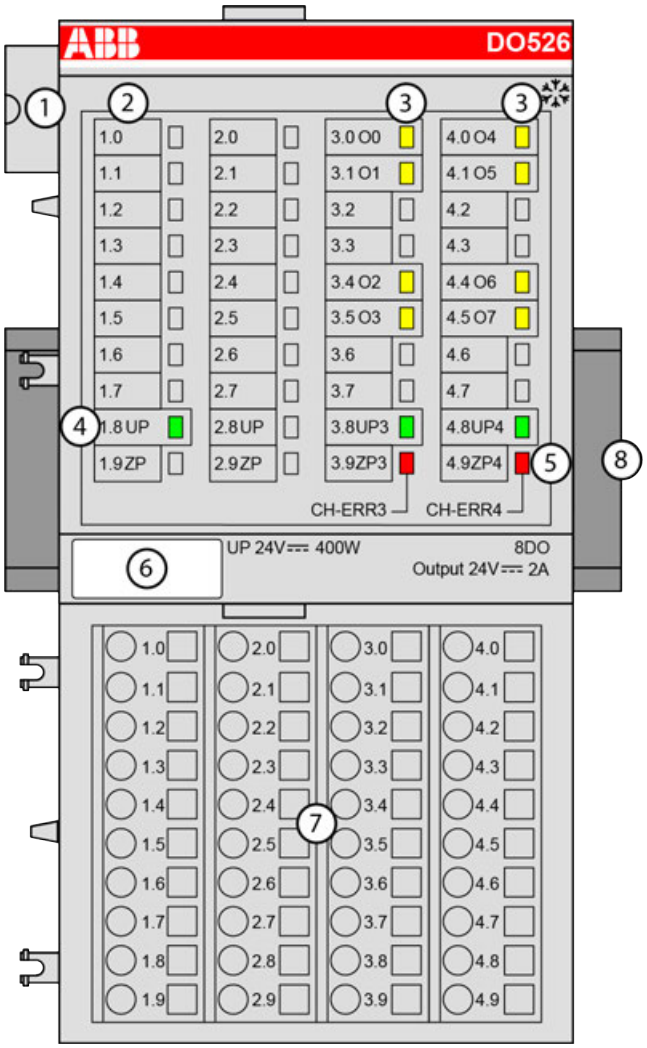
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

DO526 - Digital output module

- 8 digital outputs 24 V DC (O0 to O7) in 2 groups without short circuit and without overload protection.
- Module and group-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states of the outputs O0 to O7
4 3 green LEDs to display the states of the process supply voltage UP, UP3 and UP4
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN-rail
Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

Potential separation between the channel groups.

Functionality

Parameter	Value
LED displays	For signal states, errors and supply voltages
Internal power supply	Via I/O bus
External power supply	Via the terminals ZP, ZP3, ZP4, UP, UP3 and UP4 (process voltage 24 V DC)
Required terminal unit	TU542 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

The output module is plugged on the terminal unit TU542. Properly position the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 2.8 and 1.9 to 2.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 2.8:	Process voltage UP = +24 V DC
Terminals 1.9 to 2.9:	Process voltage ZP = 0 V
Terminal 3.8:	Process voltage UP3 = +24 V DC
Terminal 3.9:	Process voltage ZP3 = 0 V
Terminal 4.8:	Process voltage UP4 = +24 V DC
Terminal 4.9:	Process voltage ZP4 = 0 V

Terminals	Signal	Description
3.0, 3.1, 3.4, 3.5	O0 to O3	4 digital outputs
4.0, 4.1, 4.4, 4.5	O4 to O7	4 digital outputs

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO526.

The external power supply connection is carried out via the UP, UP3, UP4 (+24 V DC) and the ZP, ZP3, ZP4 (0 V DC) terminals.

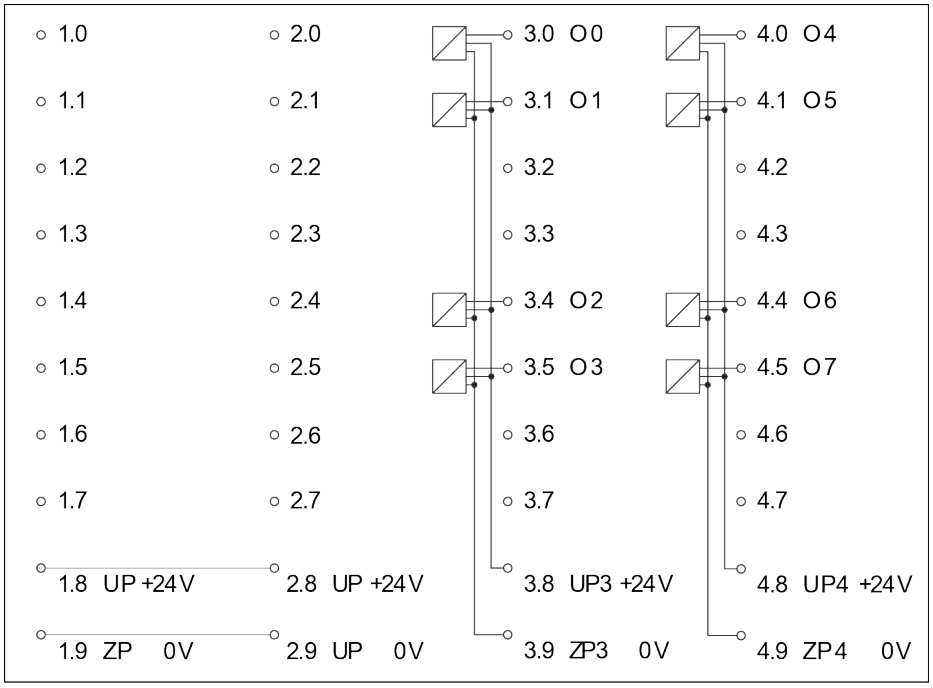
NOTICE!

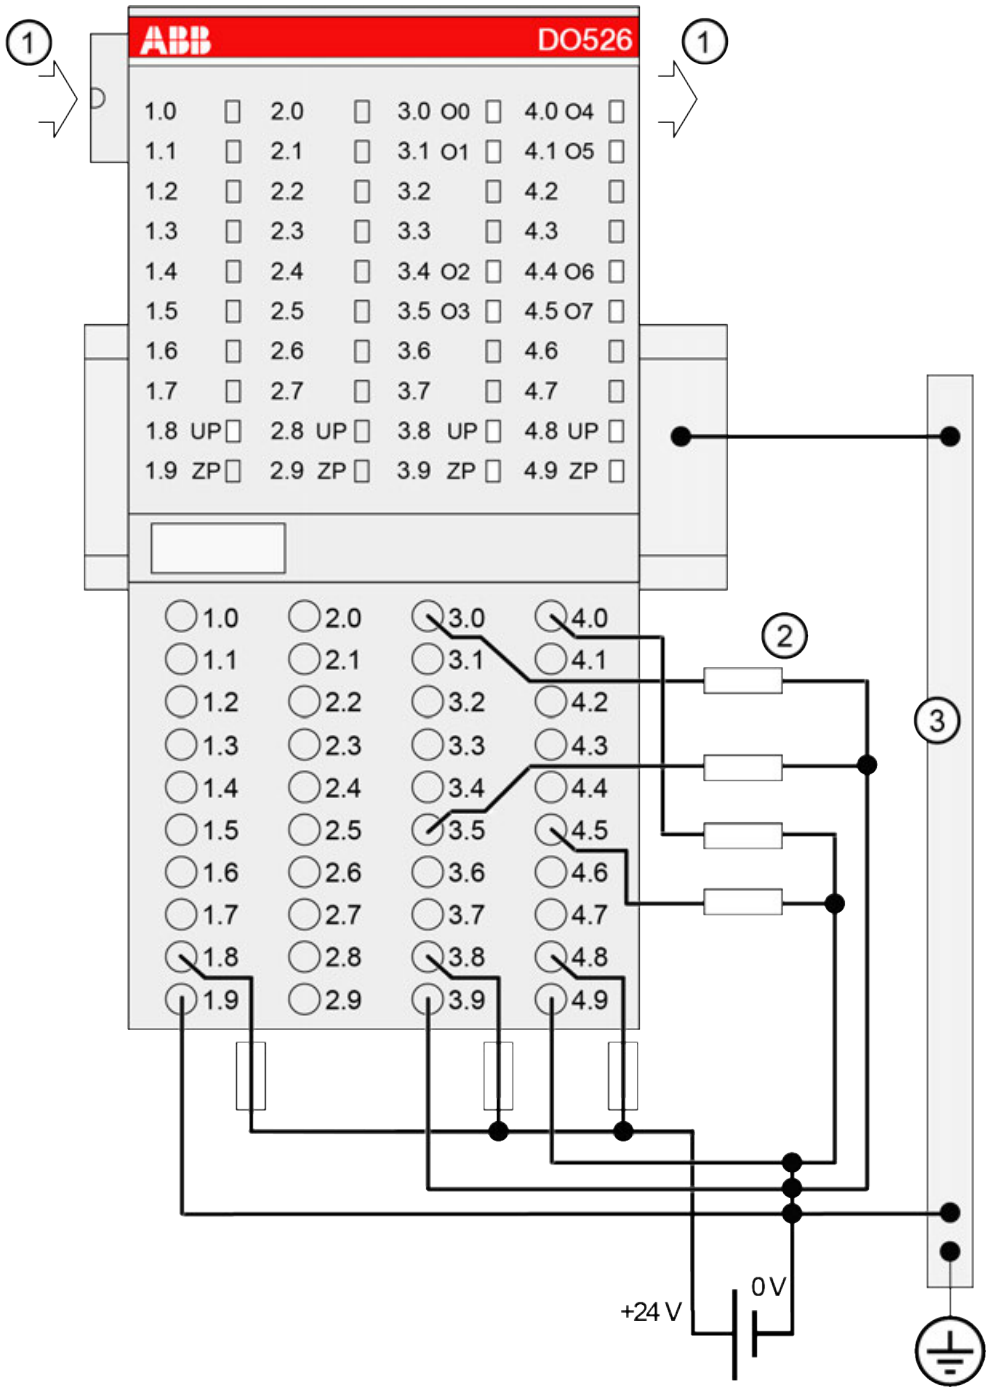
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:





1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
Connected with ZP (load) -> Output
3 Switchgear cabinet earth

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The module provides several diagnosis functions *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	1

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions ≥ 1.2.3.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

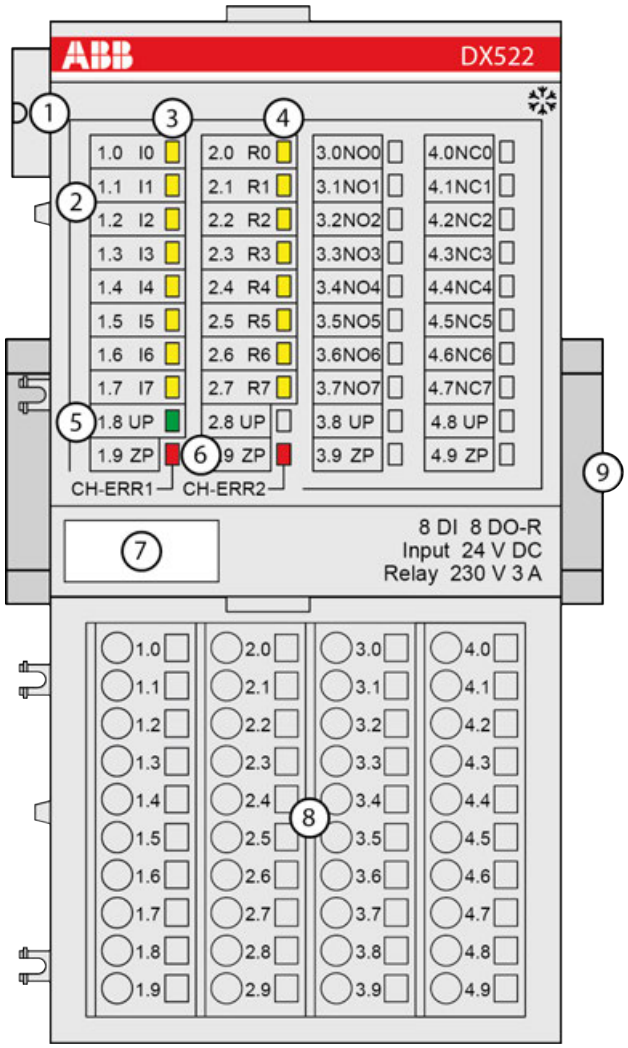
DX522 - Digital input/output module

- 8 digital inputs 24 V DC, module-wise galvanically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4 8 yellow LEDs to display the signal states at the digital relay outputs (R0 - R7)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.

- 8 digital inputs 24 V DC in 1 group (1.0...1.7)
- 8 digital relay outputs with one change-over contact each (R0...R7). All output channels are galvanically isolated from each other.
- Fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Fast counter	Integrated, many configurable operating modes (only with AC500)
LED displays	For signal states, errors and supply voltage
Internal power supply	Through the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)
Required terminal units	TU531 or TU532 ↳ *Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562*

The device is plugged on a terminal unit ↳ *Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 ↳ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Connections

WARNING!
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V DC

Table 480: Assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	I0 to I7	Input signals of the 8 digital inputs
1.8 to 4.8	UP	Process supply voltage +24 V DC
1.9 to 4.9	ZP	Reference potential for the 8 digital inputs and the process supply voltage
2.0	R0	Common contact of the first relay output
3.0	NO 0	Normally-open contact of the first relay output
4.0	NC 0	Normally-closed contact of the first relay output
2.1	R1	Common contact of the second relay output
3.1	NO 1	Normally-open contact of the second relay output
4.1	NC 1	Normally-closed contact of the second relay output
:	:	:
2.7	R7	Common contact of the eighth relay output
3.7	NO 7	Normally-open contact of the eighth relay output
4.7	NC 7	Normally-closed contact of the eighth relay output

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions (see Diagnosis and State LEDs *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*).

The following figure shows the connection of the digital input/output module DX522.

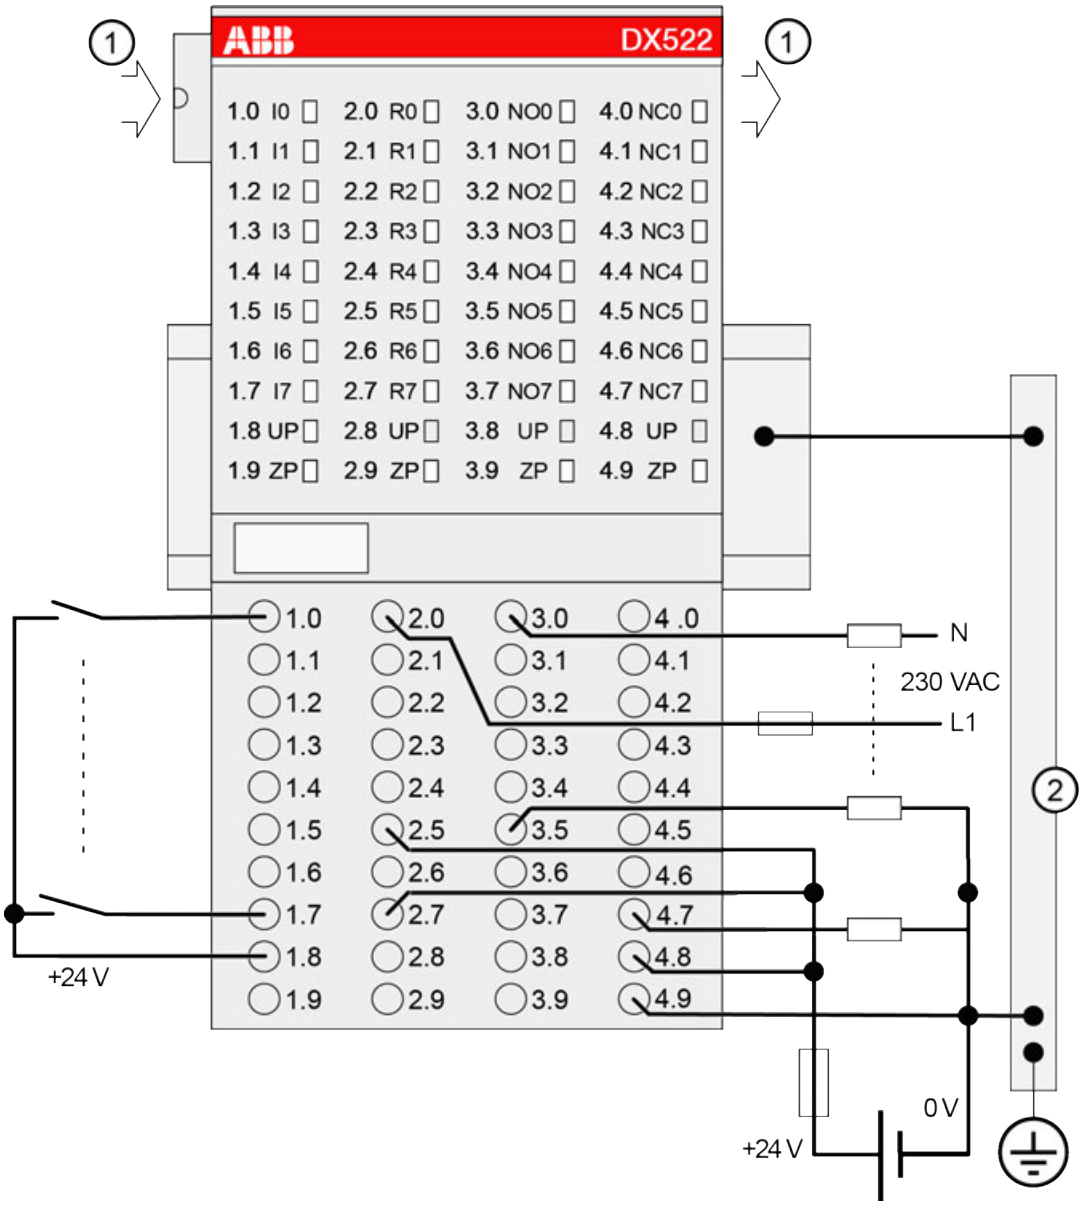


Fig. 120: Connection of the module

1 I/O bus
2 Switchgear cabinet earth

NOTICE!

– If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
– If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.

CAUTION!

The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

NOTICE!

Risk of damaging the PLC module!

The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single-phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 8 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

NOTICE!

Risk of damaging the PLC module!

There is no internal short-circuit or overload protection for the relay outputs.

Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	1	3
Digital outputs (bytes)	1	3
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

	[2]) All of the LEDs CH-ERR1 to CH-ERR2 light up together					

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/ communication interface module	ca. 2 mA
	From UP at normal operation / with outputs	0.05 A + output loads
	Inrush current from UP (at power up)	0.010 A^2s
Max. power dissipation within the module		6 W (outputs OFF)
Weight (without terminal unit)		ca. 300 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels I0 to I7	1.0 to 1.7
Reference potential for all inputs	Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Galvanic isolation	From the rest of the module (I/O bus)
Indication of the input signals	One yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input indicator	LED is part of the input circuitry
Input type acc. to EN 61131-2	Type 1

Parameter		Value
Input delay (0->1 or 1->0)		Typ. 8 ms, configurable from 0.1 to 32 ms
Input signal voltage		24 V DC
Signal 0		-3 V...+5 V
Undefined signal		> +5 V...< +15 V
Signal 1		+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 5 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the relay outputs

Parameter		Value
Number of channels per module		8 relay outputs
Distribution of channels into groups		8 groups of 1 channel each
Connection of the channel R0		Terminal 2.0 (common), 3.0 (NO) and 4.0 (NC)
Connection of the channel R1		Terminal 2.1 (common), 3.1 (NO) and 4.1 (NC)
Connection of the channel R6		Terminal 2.6 (common), 3.6 (NO) and 4.6 (NC)
Connection of the channel R7		Terminal 2.7 (common), 3.7 (NO) and 4.7 (NC)
Galvanic isolation		Between the channels and from the rest of the module
Indication of the output signals		One yellow LED per channel, the LED is ON when the relay coil is energized
Monitoring point of output indicator		LED is controlled by process CPU
Way of operation		Non-latching type
Output delay (0->1 or 1->0)		On request
Relay power supply		By UP process supply voltage
Relay outputs		
	Output short circuit protection	Should be provided externally with a fuse or circuit breaker
Rated protection fuse		6 A gL/gG per channel
Min. switching current		10 mA
Output switching capacity		
	Resistive load, max.	3 A; 3 A (230 V AC), 2 A (24 V DC)
	Inductive load, max.	1.5 A; 1.5 A (230 V AC), 1.5 A (24 V DC)
	Lamp load	60 W (230 V AC), 10 W (24 V DC)

Parameter		Value
Output switching capacity (XC version above 60 °C)		On request
Lifetime (cycles)		Mechanical: 300 000; Under load: 300 000 (24 V DC at 2 A), 200 000 (120 V AC at 2 A), 100 000 (230 V AC at 3 A)
Spark suppression with inductive AC load		Must be performed externally according to driven load specifications
Demagnetization with inductive DC load		A free-wheeling diode must be circuited in parallel to the inductive load
Switching frequency		
	With resistive load	Max. 10 Hz
	With inductive load	Max. 2 Hz
	With lamp load	On request
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a

- *FBP interface module*
- *CS31 bus module*
- *CANopen communication interface module*

Parameter	Value
Used inputs	I0 / I1
Used outputs	None
Counting frequency	50 kHz max.

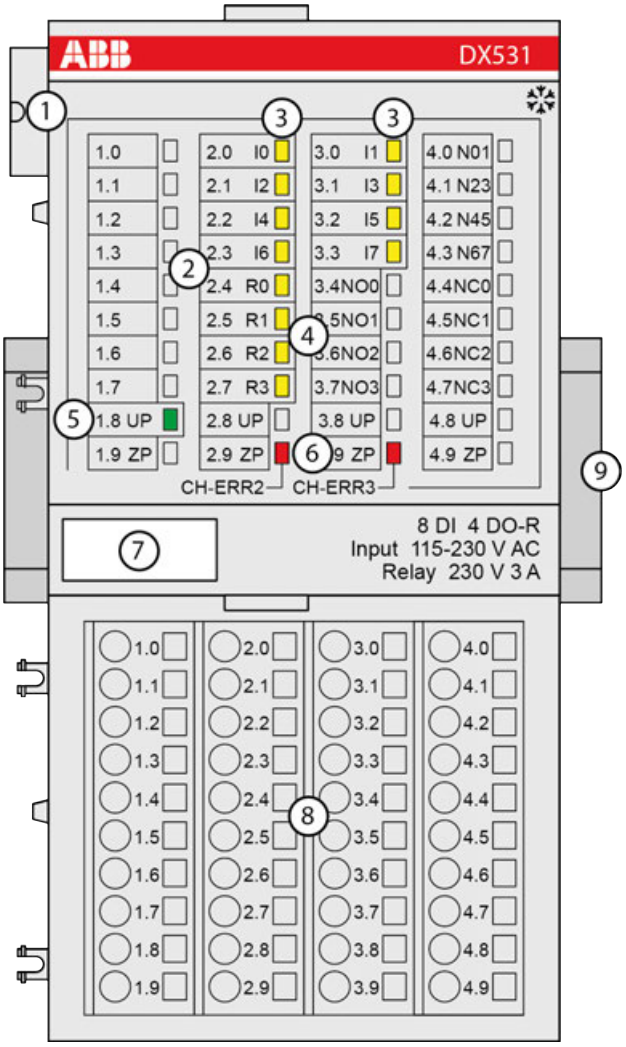
DX531 - Digital input/output module

- 8 digital inputs 120/230 V AC
- 4 relay outputs with one change-over contacts each
- Module-wise galvanically isolated



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4 4 yellow LEDs to display the signal states at the digital relay outputs (R0 - R3)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input / output unit.

- 8 digital inputs 120/230 V AC in 1 group (2.0...2.3 and 3.0...3.3)
- 4 digital relay outputs with one change-over contact each (R0...R3). All output channels are galvanically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
LED displays	For signal states, errors and supply voltage
Internal power supply	Through the I/O bus interface (I/O bus)
External power supply	Via the terminals ZP and UP (process supply voltage 24 V DC)
Required terminal units	TU531 or TU532 ↬ *Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562*

The device is plugged on a terminal unit ↬ *Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562*. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 ↬ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Connections

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	unused	
2.0 and 3.0	I0 and I1	Input signals for the digital inputs I0 and I1
4.0	N01	Neutral conductor for the digital inputs I0 and I1
2.1 and 3.1	I2 and I3	Input signals for the digital inputs I2 and I3
4.1	N23	Neutral conductor for the digital inputs I2 and I3
2.2 and 3.2	I4 and I5	Input signals for the digital inputs I4 and I5
4.2	N45	Neutral conductor for the digital inputs I4 and I5
2.3 and 3.3	I6 and I7	Input signals for the digital inputs I6 and I7
4.3	N67	Neutral conductor for the digital inputs I6 and I7
2.4	R0	Common contact of the first relay output
3.4 and 4.4	NO0 and NC0	NO and NC contacts of the first relay output
2.5	R1	Common contact of the second relay output
3.5 and 4.5	NO1 and NC1	NO and NC contacts of the second relay output
2.6	R2	Common contact of the third relay output
3.6 and 4.6	NO2 and NC2	NO and NC contacts of the third relay output
2.7	R3	Common contact of the fourth relay output
3.7 and 4.7	NO3 and NC3	NO and NC contacts of the fourth relay output

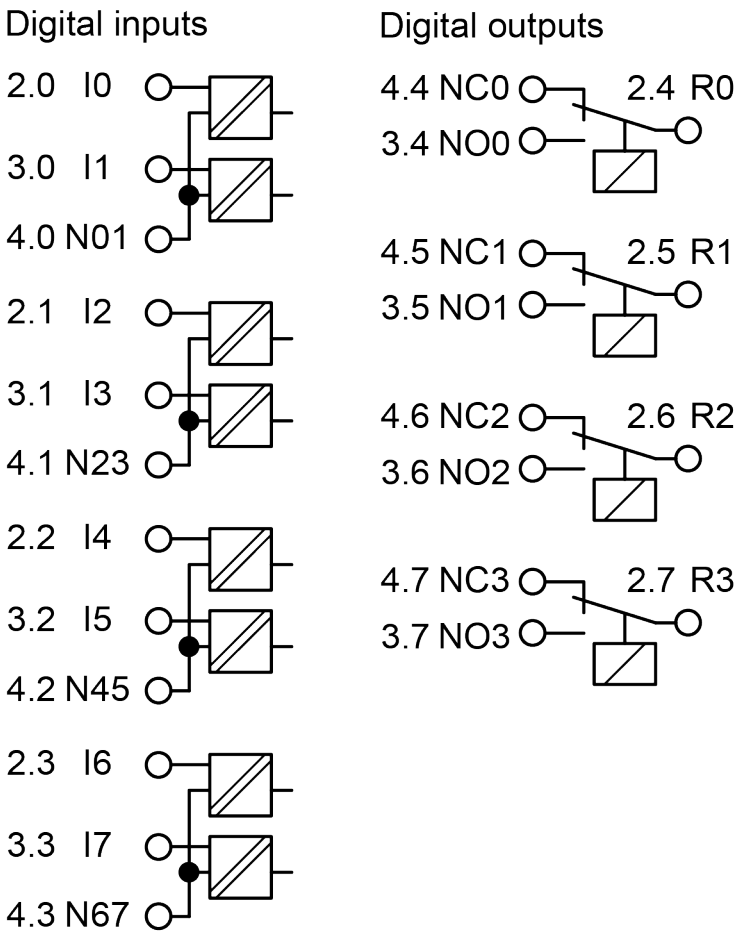


Fig. 121: Internal construction

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX531. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

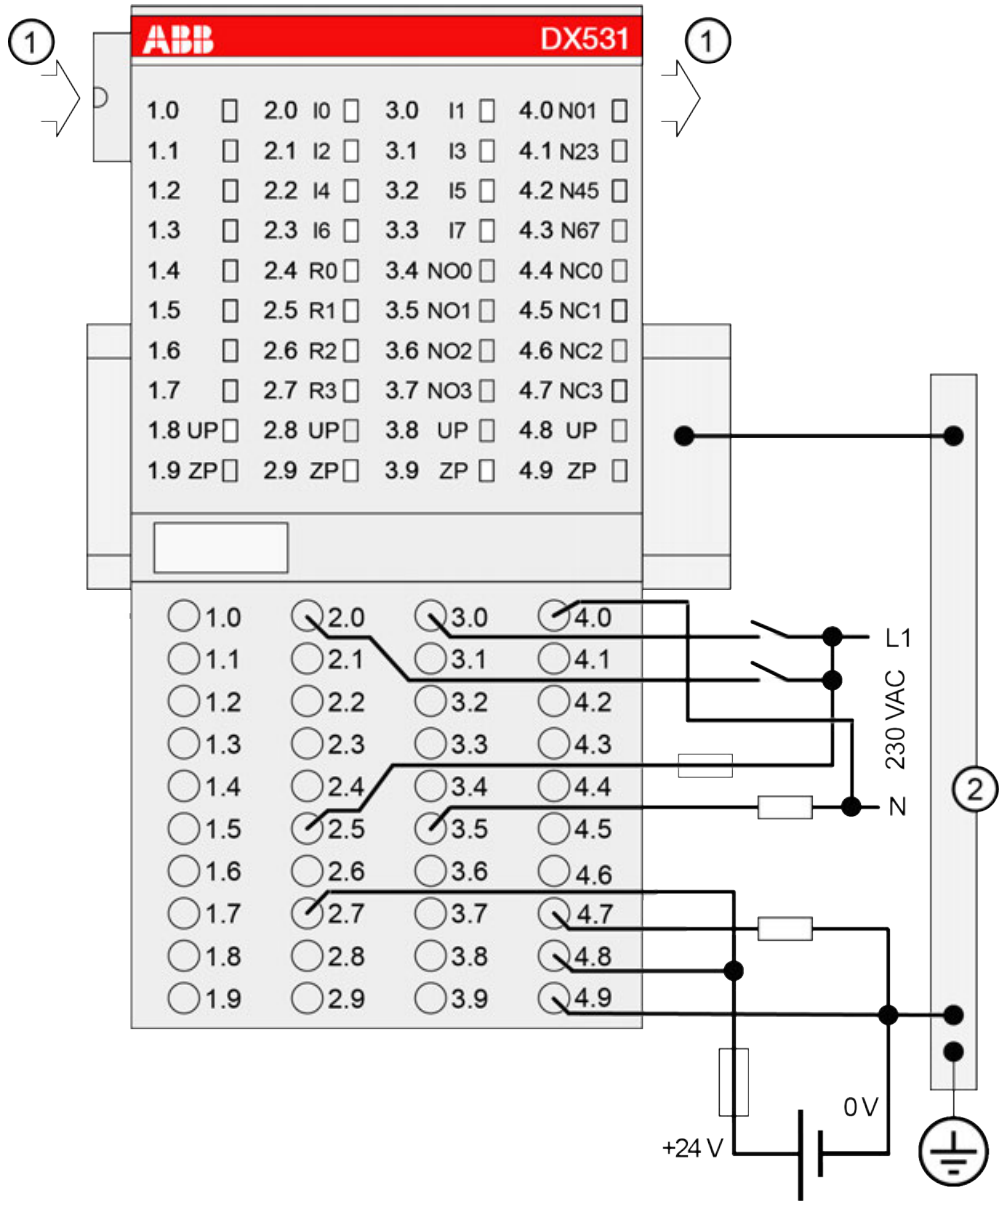
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the module:



1 I/O bus
2 Switchgear cabinet earth

NOTICE!

- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

NOTICE!
Risk of damaging the PLC module!
The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 4 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
- All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 V AC max., not for 400 V AC, not even between two input terminals.
- All neutral conductor connections must be common to the same supply system, since the terminals 4.0 to 4.3 are interconnected within the module. Otherwise, accidental energization could occur.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.

Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

The module provides several diagnosis functions (see chapter Diagnosis and State LEDs ↳ *Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065*).

Internal data exchange

Digital inputs (bytes)	1
Digital outputs (bytes)	1
Counter input data (words)	0
Counter output data (words)	0

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage UP		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V DC (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V DC (ZP)
	Rated value	24 V DC

Parameter		Value
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	ca. 2 mA
	From UP at normal operation / with outputs	0.15 A + output loads
Inrush current from UP (at power up)		0.004 A^2s
Max. power dissipation within the module		6 W (outputs OFF)
Weight (without terminal unit)		Ca. 300 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	4 groups of 2 channels each
Terminals of the channels I0 to I7	*Chapter 1.6.3.6.1.2.8.3 “Connections” on page 2767*
Galvanic isolation	2500 V AC from the rest of the module (I/O bus)
Indication of the input signals	1 yellow LED per channel The LEDs are only operating if the module is initialized
Monitoring point of input indicator	LED is controlled by process CPU
Input type acc. to EN 61131-2	Type 2
Input delay (0->1 or 1->0)	Typ. 20 ms
Input signal voltage	230 V AC or 120 V AC

Parameter		Value
Input signal range		0 V AC...265 V AC
Input signal frequency		47 Hz...63 Hz
Input characteristic		According EN 61132-2 Type 2
Signal 0		0 V AC...40 V AC
Undefined signal		> 40 V AC...< 74 V AC
Signal 1		74 V AC...265 V AC
Input current per channel		
	Input voltage = 159 V AC	> 7 mA
	Input voltage = 40 V AC	< 5 mA
Overvoltage protection		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the relay outputs

Parameter		Value
Number of channels per module		4 relay outputs
Distribution of channels into groups		4 groups of 1 channel each
Connection of the four relays		*Chapter 1.6.3.6.1.2.8.3 “Connections” on page 2767*
Galvanic isolation		Between the channels and from the rest of the module
Indication of the output signals		1 yellow LED per channel, the LED is ON when the relay coil is energized
Monitoring point of output indicator		LED is controlled by process CPU
Way of operation		Non-latching type
Output delay (0->1 or 1->0)		On request
Relay power supply		By UP process supply voltage
Relay outputs		
	Output short circuit protection	Must be provided externally with a fuse or circuit breaker
	Rated protection fuse	6 A gL/gG per channel
Output switching capacity		
	Resistive load, max.	3 A; 3 A (230 V AC), 2 A (24 V DC)
	Inductive load, max.	1.5 A; 1.5 A (230 V AC), 1.5 A (24 V DC)
	Lamp load	60 W (230 V AC), 10 W (24 V DC)
Lifetime (cycles)		Mechanical: 300 000; Under load: 300 000 (24 V DC at 2 A), 200 000 (120 V AC at 2 A), 100 000 (230 V AC at 3 A)
Spark suppression with inductive AC load		Must be performed externally according to driven load specifications

Parameter		Value
Demagnetization with inductive DC load		A free-wheeling diode must be circuited in parallel to the inductive load
Switching frequency		
	With resistive load	Max. 10 Hz
	With inductive load	Max. 2 Hz
	With lamp load	On request
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 245 000 R0001	DX531, digital input/output module, 8 DI, 230 V AC, 4 DO relays, 2-wires	Active

**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

Fast counter

More information can be found in the Automation Builder chapter, *“Fast counters in AC500 devices”*.

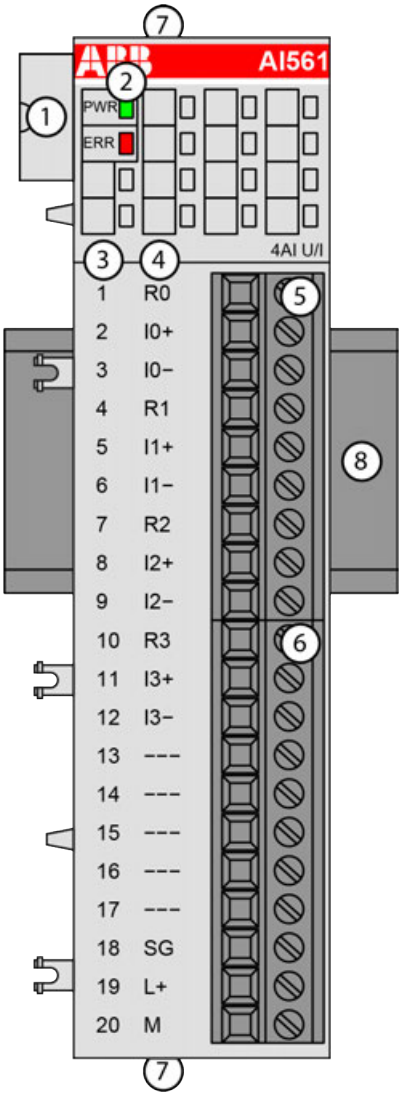
↳ *Chapter 1.6.5.1.12 “Fast counters” on page 3570*

1.6.3.6.2 Analog I/O modules

S500-eCo

AI561 - Analog input module

- 4 configurable analog inputs (I0 to I3) in 1 group
- Resolution: 11 bits plus sign or 12 bits



1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

All other circuitry of the module is not galvanically isolated from the inputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

4 analog inputs, individually configurable for

- Not used (default setting)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

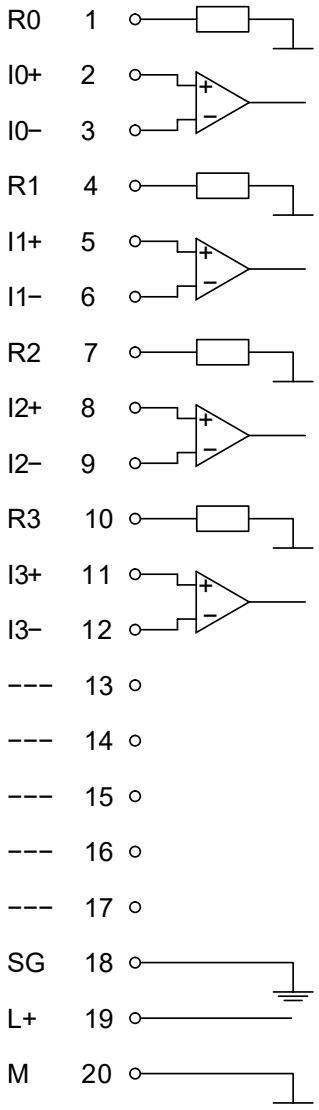
Parameter		Value
Resolution of the analog channels		
	Voltage bipolar (-2.5 V...+2.5 V; -5 V...+5 V)	11 bits plus sign
	Voltage unipolar (0 V...5 V; 0 V...10 V)	12 bits
	Current (0 mA...20 mA; 4 mA...20 mA)	12 bits
LED displays		2 LEDs for process voltage and error messages
Internal supply		Via I/O bus
External supply		Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:



The assignment of the terminals:

Terminal	Signal	Description
1	R0	Burden resistor for input signal 0 for current sensing
2	I0+	Positive pole of input signal 0
3	I0-	Negative pole of input signal 0
4	R1	Burden resistor for input signal 1 for current sensing
5	I1+	Positive pole of input signal 1
6	I1-	Negative pole of input signal 1
7	R2	Burden resistor for input signal 2 for current sensing
8	I2+	Positive pole of input signal 2
9	I2-	Negative pole of input signal 2
10	R3	Burden resistor for input signal 3 for current sensing
11	I3+	Positive pole of input signal 3

Terminal	Signal	Description
12	I3-	Negative pole of input signal 3
13	---	Reserved
14	---	Reserved
15	---	Reserved
16	---	Reserved
17	---	Reserved
18	SG	Shield grounding
19	L+	Process voltage L+ (24 V DC)
20	M	Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per AI561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!

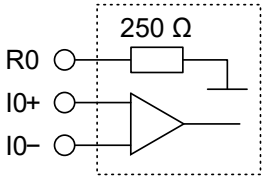
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

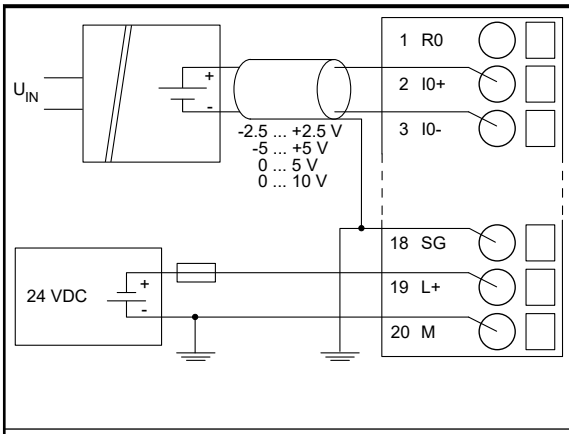
The module provides several diagnosis functions *Chapter 1.6.3.6.2.1.1.6 “Diagnosis” on page 2783*.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.

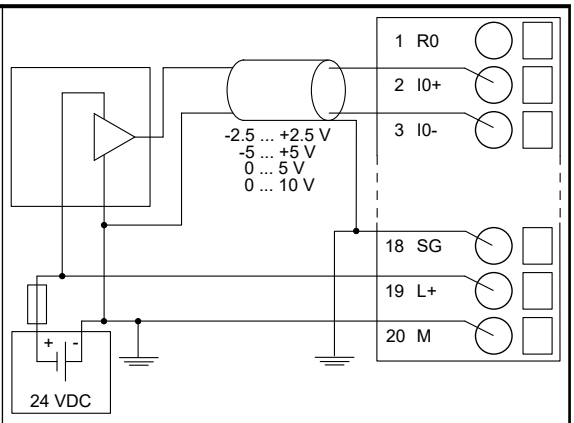


CAUTION!
Risk of damaging the analog input!
The 250 Ω input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the connection of analog sensors (voltage) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

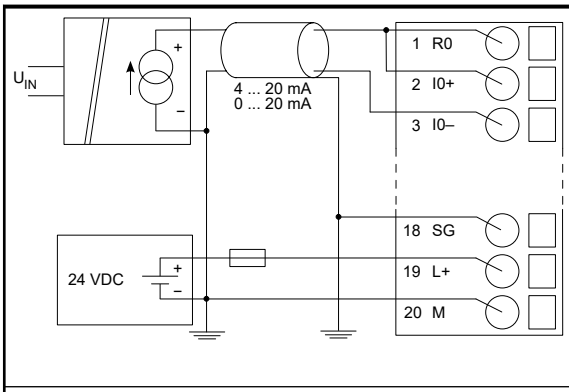


Connection of active-type analog sensors (voltage)

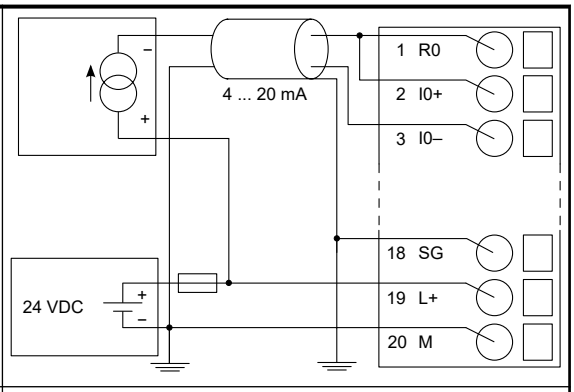


Connection of passive-type analog sensors (voltage)

The following figures are an example of the connection of analog sensors (current) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.



Connection of active-type analog sensors (current)



Connection of passive-type analog sensors (current)

The meaning of the LEDs is described in the Displays section *Chapter 1.6.3.6.2.1.1.7 “State LEDs” on page 2784*.

I/O configuration

The analog input module AI561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal Value	Internal value, Type	Default	Min.	Max.	EDS Slot Index
Module ID	Intern	6500 [1])	WORD	0x1964	0	65535	xx01
Ignore module	No Yes	0 1	BYTE	No 0x00			
Parameter length	Internal	6	BYTE	0	0	255	xx02 [2])
Check Supply	Off On	0 1	BYTE	On 0x01			
Analog Data Format	Default	0	BYTE	Default 0x00		255	

[1]) with CS31 and addresses smaller than 70, the value is increased by 1

[2]) Value is hexadecimal: HighByte is slot (xx: 0 ... 7), LowByte is index (1...n)

Diagnosis

E1...E4	d1	d2	d3	d4	Identifier 000...063	AC500 display	<− Display in	
Class	Comp	Dev	Mod	Ch	Err	PS501 PLC Browser		
Byte 6 Bit 6...7	-	Byte 3	Byte 4	Byte 5	Byte 6 Bit 0...5	PNIO diagnosis block		
Class	Interface	Device	Module	Channel	Error Identifier	Error message		Remedy
	[1])	[2])	[3])	[4])				
Module error								
3	14	1...10	31	31	19	Checksum error in the I/O module		Replace I/O module
	11 / 12	ADR	1...10					
3	14	1...10	31	31	9	Overflow diagnosis buffer		Restart
	11 / 12	ADR	1...10					
3	14	1...10	31	31	26	Parameter error		Check master
	11 / 12	ADR	1...10					
3	14	1...10	31	31	11	Process voltage too low		Check process voltage
	11 / 12	ADR	1...10					
Channel error								
4	14	1...10	1	0...3	48	Analog value overflow at an analog input		Check input value or terminal
	11 / 12	ADR	1...0					
4	14	1...10	1	0...3	7	Analog value underflow at an analog input		Check input value
	11 / 12	ADR	1...0					

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e. g. of the DC551-CS31)

[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1..10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

LED		State	Color	LED = OFF	LED = ON	LED flashes
	PWR	Process voltage 24 V DC via terminal	Green	CPU module voltage or external 24 V DC supply voltage is missing	3.3 V system voltage (I/O bus) and external 24 V DC supply voltage are present	---
	ERR	Channel or module error	Red	No error or process voltage is missing	Severe error in the module	Error on 1 or more channels of the module

Measuring ranges

Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

Range	-2.5 ... +2.5 V	-5 ... +5 V	0 ... 5 V	0 ... 10 V	0 ... 20 mA	4 ... 20 mA	Digital value	
							Decimal	Hex.
Overflow	>2.9397	>5.8795	>5.8795	>11.7589	>23.5178	>22.8142	32767	7FFF
Measured value too high	2.9397 : 2.5014	5.8795 : 5.0029	5.8795 : : : 5.0015	11.7589 : : : 10.0029	23.5178 : : : 20.0058	22.8142 : : : 20.0058	32511 : 27664 27658 27656	7EFF : 6C10 6C0A 6C08

Underflow	<-2.9398	<-5.8795	<-0.0300	<-0.0600	<-0.1200	<-0.1200	-32768	8000

The represented resolution corresponds to 12 bits respectively 11 bits plus sign.

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminal 19 for L+ (+24 V DC) and terminal 20 for M (0 V)
	Rated value	24 V DC
	Current consumption via L+ terminal	0.1 A
	Inrush current (at power up)	0.05 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Protection fuse for L+	Recommended
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module		Ca. 10 mA
Galvanic isolation		No
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		2.7 W
Weight		Ca. 120 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter		Value	
Number of channels per module		4 individually configurable voltage or current inputs	
Distribution of channels into groups		1 (4 channels per group)	
Resolution			
	Unipolar	Voltage: 0 V...+5 V; 0 V...+10 V: 12 bits Current 0 mA...20 mA; 4 mA...20 mA: 12 bits	
	Bipolar	Voltage -2.5 V...+2.5 V; -5 V...+5 V: 11 bits plus sign	
Connection of the signals I0- to I3-		Terminals 3, 6, 9, 12	
Connection of the signals I0+ to I3+		Terminals 2, 5, 8, 11	
Input type		Differential	
Galvanic isolation		No galvanic isolation between the inputs and the I/O bus	
Common mode input range		Signal voltage plus common mode voltage must be within ±12 V	
Indication of the input signals		No	
Channel input resistance		Voltage: > 1 MΩ Current: ca. 250 Ω	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale (voltage) ±0.5 % of full scale (current 0 mA...20 mA) ±0.7 % of full scale (current 4 mA...20 mA) at 25 °C	
	Max.	±2 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance	
Time constant of the input filter		Voltage: 300 µs Current: 300 µs	
Relationship between input signal and hex code		↳ *Chapter 1.6.3.6.2.1.1.8 “Measuring ranges” on page 2784*	
Analog to digital conversion time		Typ. 500 µs per channel	
Unused inputs		Can be left open and should be configured as "unused"	
Input data length		8 bytes	
Overvoltage protection		Yes, up to 30 V DC only for voltage input	

Parameter		Value
Max. cable length (conductor cross section > 0,14 mm²)		
	Unshielded wire	10 m
	Shielded wire	100 m

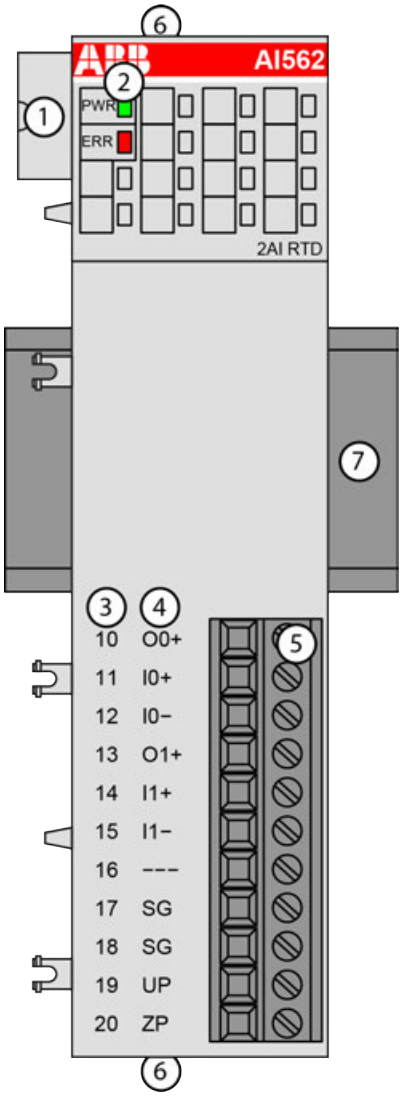
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

AI562 - Analog input module

- 2 configurable analog resistance temperature detector (RTD) inputs (I0 and I1) in 1 group
- Resolution: 15 bits plus sign



1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

2 analog RTD-inputs, individually configurable for

- Not used (default)
- Pt100, -50 °C...+400 °C, 2-wire
- Pt100, -50 °C...+400 °C, 3-wire
- Pt1000, -50 °C...+400 °C, 2-wire
- Pt1000, -50 °C...+400 °C, 3-wire
- Ni1000, -50 °C...+150 °C, 2-wire
- Ni1000, -50 °C...+150 °C, 3-wire
- Ni100, -50 °C...+150 °C, 2-wire
- Ni100, -50 °C...+150 °C, 3-wire
- Analog input resistance 0 Ω...150 Ω
- Analog input resistance 0 Ω...300 Ω

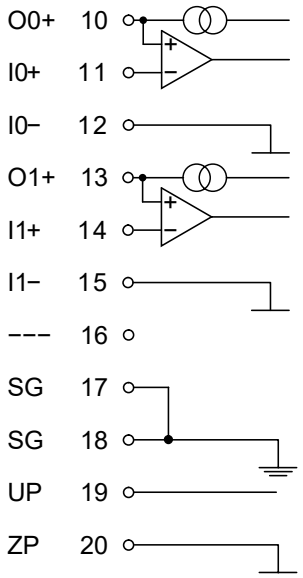
Parameter	Value
Resolution of the analog channels	
Temperature	0.1 °C
LED displays	2 LEDs for process voltage and error messages
Internal supply	Via I/O bus
External supply	Via the terminals UP (process voltage 24 V DC) and ZP (0 V DC)

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↯ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:



The assignment of the terminals:

Terminal	Signal	Description
10	O0+	Current source of channel 0
11	I0+	Sense input of channel 0
12	I0-	Return input of channel 0
13	O1+	Current source of channel 1
14	I1+	Sense input of channel 1
15	I1-	Return input of channel 1
16	---	Reserved
17	SG	Shield grounding
18	SG	Shield grounding
19	UP	Process voltage UP (24 V DC)
20	ZP	Process voltage ZP (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per AI562.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

NOTICE!

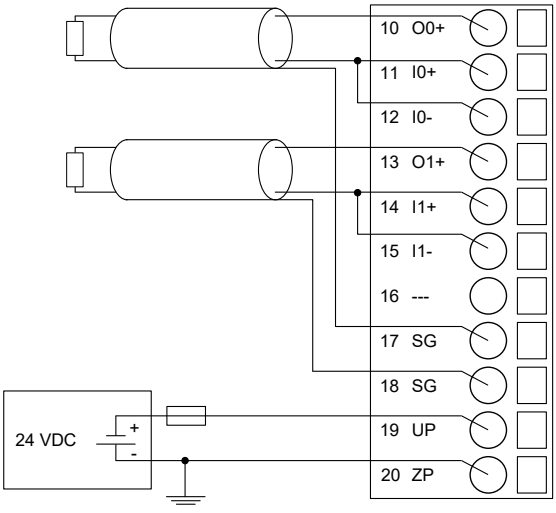
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

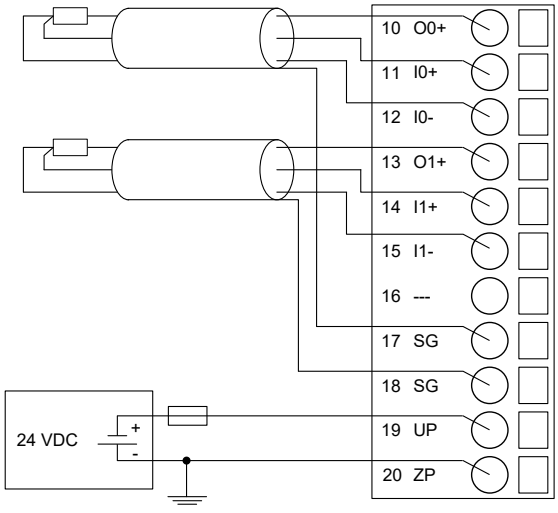
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 1.6.3.6.2.1.2.6 “Diagnosis” on page 2793*.

The following figures show the connection of RTDs to the inputs of the analog input module AI562.



2-wires input



3-wires input

With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.

The meaning of the LEDs is described in the Displays section *Chapter 1.6.3.6.2.1.2.7 “State LEDs” on page 2794*.

I/O configuration

The analog input module AI562 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal value	Internal value, Type	Default	Min.	Max.	EDS Slot Index

	[1])	[2])	[3])	[4])			
Module error							
3	14	1...10	31	31	19	Checksum error in the I/O module	Replace I/O module
	11 / 12	ADR	1...10				
3	14	1...10	31	31	9	Overflow diagnosis buffer	Restart
	11 / 12	ADR	1...10				
3	14	1...10	31	31	26	Parameter error	Check master
	11 / 12	ADR	1...10				
3	14	1...10	31	31	11	Process voltage too low	Check process voltage
	11 / 12	ADR	1...10				
Channel error							
4	14	1...10	1	0...1	48	Analog value overflow at an analog input	Check input value or terminal
	11 / 12	ADR	1...10				
4	14	1...10	1	0...1	7	Analog value underflow at an analog input	Check input value
	11 / 12	ADR	1...10				

Remarks:

[1])	In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e. g. of the DC551-CS31)
[3])	With "Module" the following allocation applies dependent of the master: Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

LED		State	Color	LED = OFF	LED = ON	LED flashes
	PWR	Process voltage 24 V DC via terminal	Green	CPU module voltage or external 24 V DC supply voltage is missing	3.3 V system voltage (I/O bus) and external 24 V DC supply voltage are present	---
	ERR	Channel or module error	Red	No error or process voltage is missing	Severe error in the module	Error on 1 or more channels of the module

Measuring ranges

Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

Resistance temperature detectors

Range	Pt100 / Pt1000 -50 ... +400 °C	Ni1000 / Ni100 -50 ... +150 °C	Digital value

Technical data

The System Data of AC500-eCo apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V)
	Rated value	24 V DC
	Current consumption	0.04 A
	Inrush current (at power-up)	0.05 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Protection fuse for UP	Recommended
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module		Ca. 5 mA
Galvanic isolation		Yes, between the input group and the rest of the module
	Isolated groups	1 (2 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		1.1 W
Weight		Ca. 120 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter		Value
Number of channels per module		2 configurable RTD (resistance temperature detector) inputs
Distribution of channels into groups		1 (2 channels per group)
Resolution		
	RTD	0.1 °C / 0.1 °F
	Resistance	15 bits + sign
Connection of the signals O0+ and O1+		Terminals 10 and 13
Connection of the signals I0- and I1-		Terminals 11 and 14
Connection of the signals I0+ and I1+		Terminals 12 and 15
Input type		Module ground referenced RTD for 2-wire and 3-wire resistance temperature detectors

Parameter		Value	
Galvanic isolation		Against internal power supply and other modules	
Input ranges		Pt100, Pt1000, Ni100, Ni1000	
		150 Ω, 300 Ω	
Indication of the input signals		No	
Module update time		All channels: < 1 s	
Channel input resistance		> 100 kΩ	
Input filter attenuation		-3 dB at 3.6 kHz	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ.	Depending on RTD max. ±0.6 % of full scale (guaranteed for 3-wires connection only) at 25 °C
		Max.	±2 % of full scale (guaranteed for 3-wires connection only) at 0 °C...60 °C or EMC disturbances
Measuring range		*Chapter 1.6.3.6.2.1.2.8 “Measuring ranges” on page 2794*	
Analog to digital conversion time		Typ. 140 ms per channel	
Unused inputs		Can be left open and should be configured as "unused"	
Input data length		4 bytes	
Power dissipation inside the sensor (max.)		1 mW	
Suppression of interference		On request	
Maximum input voltage		30 V DC (sense), 5 V DC (source)	
Basic error (resistance)		0.1 % of full-scale	
Repeatability		0.05 % of full-scale	
Overvoltage protection		Yes, up to 30 V DC	
Wire loop resistance		< 20 Ω	
Max. cable length (conductor cross section > 0.14 mm^2)			
	Unshielded wire	10 m	
	Shielded wire	100 m

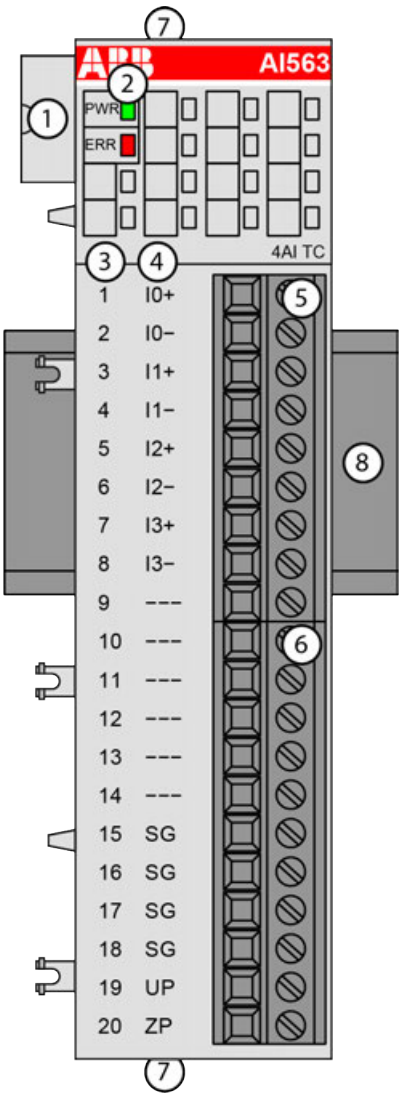
AI563 - Analog input module

- 4 configurable thermocouple (TC) / -80 mV...+80 mV inputs (I0 to I3) in 1 group
- Resolution: 15 bits plus sign



1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number

4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

4 analog TC inputs, individually configurable for

- Not used (default)
- Voltage -80 mV ... + 80 mV
- Thermocouple J-type -210 °C...+1200 °C
- Thermocouple K-type -270 °C...+1372 °C
- Thermocouple R-type -50 °C...+1768 °C
- Thermocouple S-type -50 °C...+1768 °C
- Thermocouple T-type -270 °C...+400 °C
- Thermocouple E-type -270 °C...+1000 °C
- Thermocouple N-type -270 °C...+1300 °C

Parameter	Value
Resolution of the analog channels	
Temperature	0.1 °C
LED displays	2 LEDs for process voltage and error messages
Internal supply	Via I/O bus
External supply	Via the terminals UP (process voltage 24 V DC) and ZP (0 V DC)

Connections

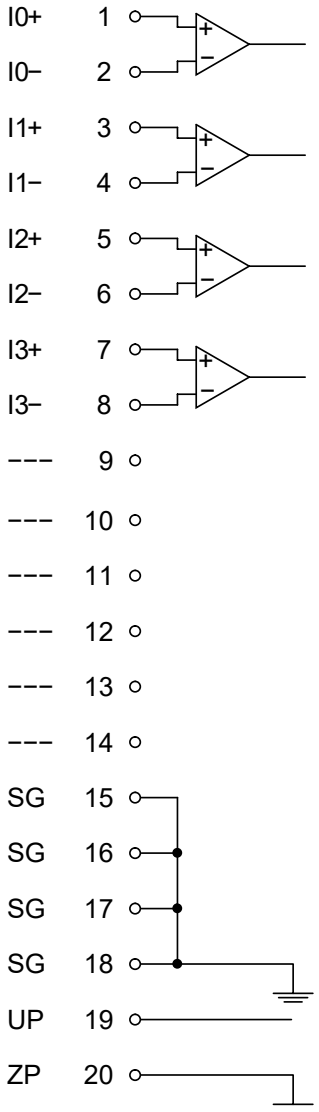
For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

After powering up the system, input channels, which are configured will have undefined values /diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET communication interface module, the firmware version of PROFINET communication interface module must be 1.2 or above.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:



The assignment of the terminals:

Terminal	Signal	Description
1	I0+	Positive pole of channel 0
2	I0-	Negative pole of channel 0

Terminal	Signal	Description
3	I1+	Positive pole of channel 1
4	I1-	Negative pole of channel 1
5	I2+	Positive pole of channel 2
6	I2-	Negative pole of channel 2
7	I3+	Positive pole of channel 3
8	I3-	Negative pole of channel 3
9	---	Reserved
10	---	Reserved
11	---	Reserved
12	---	Reserved
13	---	Reserved
14	---	Reserved
15	SG	Shield grounding
16	SG	Shield grounding
17	SG	Shield grounding
18	SG	Shield grounding
19	UP	Process voltage UP (24 V DC)
20	ZP	Process voltage ZP (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!

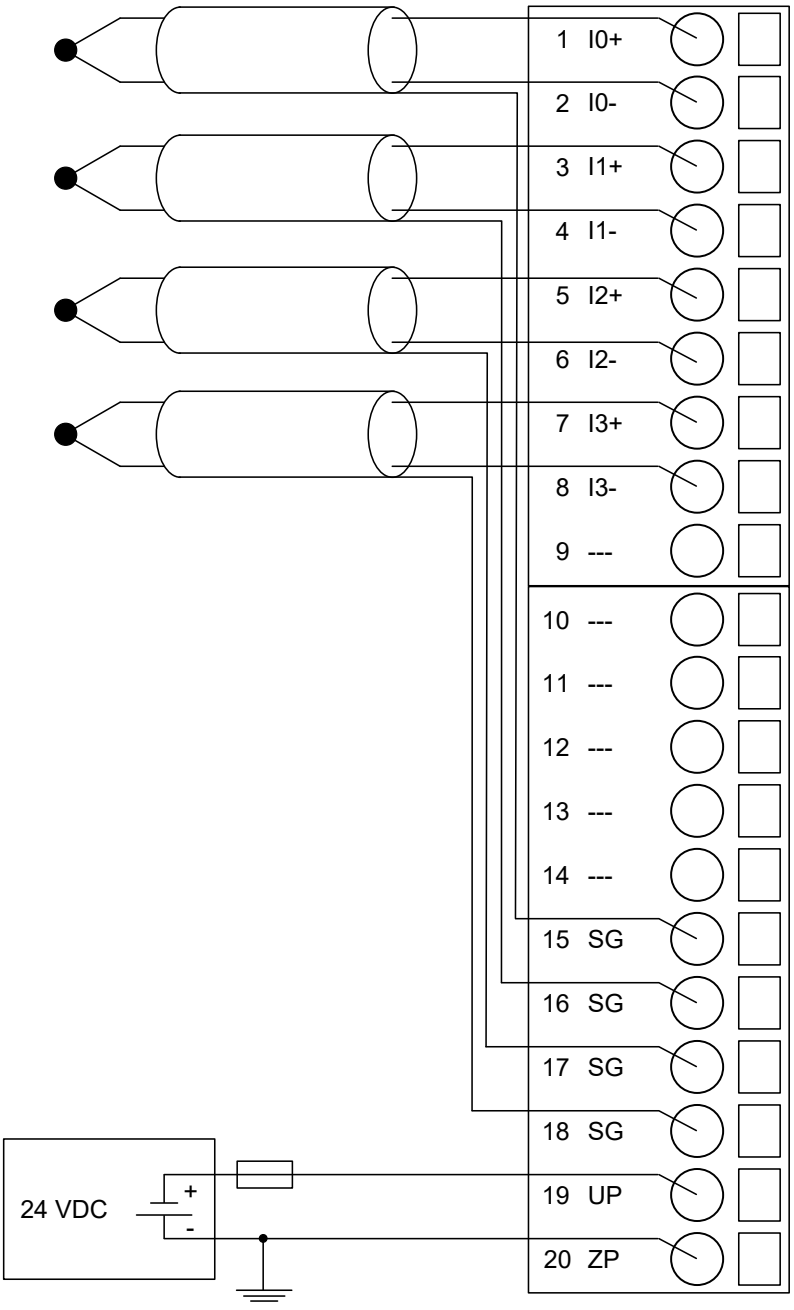
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 1.6.3.6.2.1.3.6 “Diagnosis” on page 2804*.

The following figure shows the connection of thermocouples to the inputs of the module:



The meaning of the LEDs is described in Displays *Chapter 1.6.3.6.2.1.3.7 “State LEDs” on page 2805* chapter.

I/O configuration

The analog input module AI563 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal value	Internal value, Type	Default	Min.	Max.	EDS Slot Index
Module ID	Intern	6510 [1])	WORD	0x196E	0	65535	xx01

	11 / 12	ADR	1...10				

Remarks:

[1])	In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e. g. of the DC551-CS31)
[3])	With "Module" the following allocation applies dependent of the master: Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

LED		State	Color	LED = OFF	LED = ON	LED flashes
	PWR	Process voltage 24 V DC via terminal	Green	CPU module voltage or external 24 V DC supply voltage is missing	3.3 V system voltage (I/O bus) and external 24 V DC supply voltage are present	---
	ERR	Channel or module error	Red	No error or process voltage is missing	Severe error in the module	Error on 1 or more channels of the module

Measuring ranges

AI563 needs typ. 6 to 8 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During this time, the accuracy of the measurement values is not within specification. After that, valid measurement values are provided by the module. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms, a re-initialization is performed by AI563.

Risk of invalid analog input values!

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

Technical data

The System Data of AC500-eCo apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage UP		
	Connections	Terminal 19 for UP (+24 V DC) and terminal 20 for ZP (0 V)
	Rated value	24 V DC
	Current consumption	0.10 A
	Inrush current (at power-up)	0.07 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse for UP	Not necessary
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module		Ca. 5 mA
Galvanic isolation		Yes, between the channels and the rest of the module
	Isolated groups	1 (4 channels per group)
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		2.6 W
Weight		Ca. 120 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter		Value	
Number of channels per module		4 configurable thermocouple (TC) inputs	
Distribution of channels into groups		1 (4 channels per group)	
Resolution			
	Temperature	0.1 °C	
	Voltage	15 bits plus sign	
Connection of the signals I0+ to I3+		Terminals 1, 3, 5 and 7	
Connection of the signals I0- to I3-		Terminals 2, 4, 6 and 8	
Input type		Floating thermocouple	
Galvanic isolation		Against internal power supply and other modules	
Common mode rejection		> 120 dB at 120 V AC	
Indication of the input signals		No	
Module update time		All channels: < 1.6 s	
Channel input resistance		On request	
Input filter attenuation		-3 dB at 15 kHz	
Cold junction error		±1.5 °C	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ.	0.1 % of full-scale (voltage) Depending on thermocouple, see table *Chapter 1.6.3.6.2.1.3.9.1.1 “Accuracy of thermocouple ranges at 25 °C (with cold junction compensation)” on page 2809* at 25 °C
		Max.	±2 % of full scale (T-Type: ±3 % for -240 °C...-270 °C) at 0 °C...60 °C
Relationship between input signal and hex code		*Chapter 1.6.3.6.2.1.3.8 “Measuring ranges” on page 2805*	
Analog to digital conversion time		400 ms per channel	
Unused inputs		Can be left open and should be configured as "unused"	
Input data length		8 bytes	
Overvoltage protection		Yes, up to 30 V DC	
Repeatability		On request	
Wire loop resistance		< 100 Ω	
Max. cable length (conductor cross section > 0.14 mm²)			
	Unshielded wire	10 m	
	Shielded wire	100 m	

Accuracy of thermocouple ranges at 25 °C (with cold junction compensation)

Thermocouple Type	Range	Accuracy
E	-270 °C...-220 °C	±2 %
	-220 °C...+1000 °C	±0.6 %
J	-210 °C...+1200 °C	±0.6 %
K	-270 °C...-220 °C	±1.5 %
	-220 °C...+1372 °C	±0.6 %
N	-270 °C...-150 °C	±2 %
	-150 °C...+1300 °C	±0.6 %
R	-50 °C...+150 °C	±1.5 %
	+150 °C...+1768 °C	±0.6 %
S	-50 °C...+150 °C	±1.5 %
	+150 °C...+1768 °C	±0.6 %
T	-270 °C...-240 °C	±3 %
	-240 °C...-0 °C	±2 %
	0 °C...+400 °C	±0.6 %

These accuracy values are valid only for stable module temperatures.

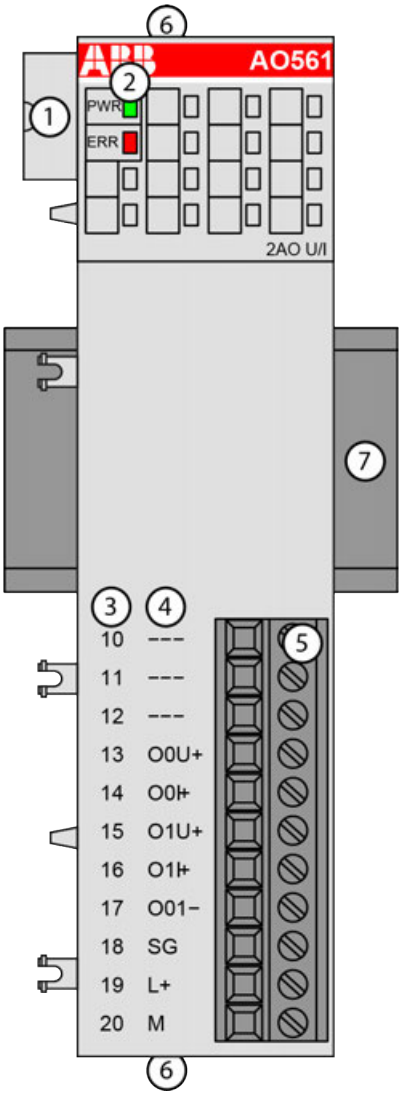
AO561 - Analog output module

- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bit



1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are not galvanically isolated from each other.

The other electronic circuitry of the module is not galvanically isolated from the outputs or from the I/O bus.

The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.

Functionality

2 analog outputs, individually configurable for

- Not used (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Parameter		Value
Resolution of the analog channels		
	Voltage bipolar (-10 V...+10 V)	11 bits plus sign
	Current (0 mA...20 mA; 4 mA...20 mA)	12 bits
LED displays		2 LEDs for process voltage and error messages
Internal supply		Via I/O bus
External supply		Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

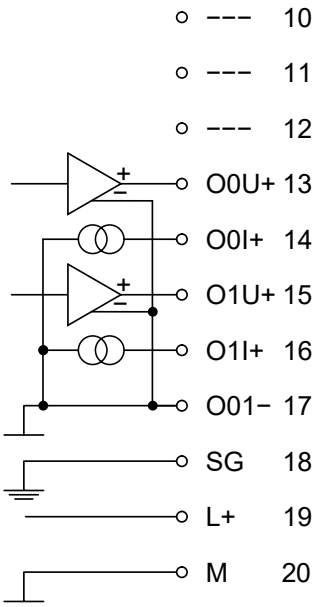
Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↪ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog outputs:



The assignment of the terminals:

Terminal	Signal	Description
10	---	Reserved
11	---	Reserved
12	---	Reserved
13	O0U+	Voltage output of channel 0
14	O0I+	Current output of channel 0
15	O1U+	Voltage output of channel 1
16	O1I+	Current output of channel 1
17	O01-	Negative pole of channels O0 and O1
18	SG	Shield grounding
19	L+	Process voltage L+ (24 V DC)
20	M	Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AO561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/ communication interface module.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

NOTICE!

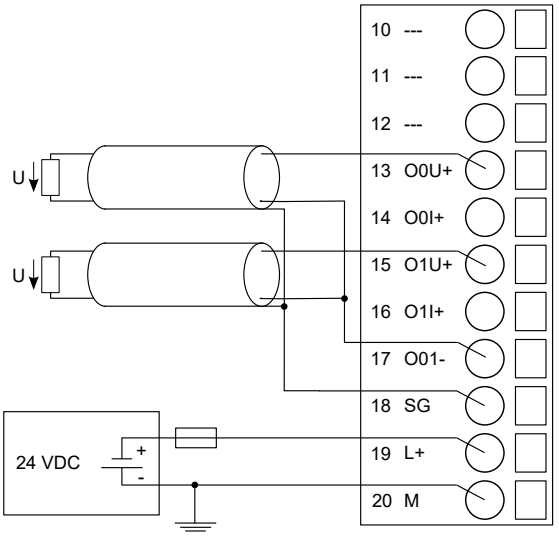
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

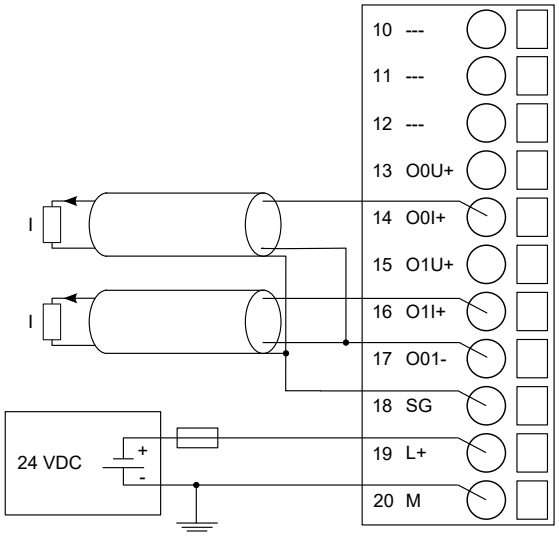
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 1.6.3.6.2.1.4.6 “Diagnosis” on page 2815*.

The following figures show the connection of analog actuators to the analog output module AO561.



Connection of analog voltage actuators



Connection of analog current actuators

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

I/O configuration

The analog output module AO561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Name	Value	Internal value	Internal value, Type	Default	Min.	Max.	EDS Slot Index

Technical data

The System Data of AC500-eCo apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminal 19 for L+ (+24 V DC) and terminal 20 for M (0 V)
	Rated value	24 V DC
	Current consumption	0.1 A + output load
	Inrush current (at power-up)	0.05 A^2s
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Protection fuse for L+	Recommended
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module		Ca. 5 mA
Galvanic isolation		No
Surge-voltage (max.)		35 V DC for 0.5 s
Max. power dissipation within the module		3.1 W
Weight		Ca. 120 g
Mounting position		Horizontal or vertical
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog outputs

Parameter		Value	
Number of channels per module		2 configurable voltage or current outputs	
Distribution of channels into groups		1 (2 channels per group)	
Connection of the signals O0U- and O1U+		Terminals 13 and 15	
Connection of the signals O0I+ and O1I+		Terminals 14 and 16	
Output type		Bipolar with voltage, unipolar with current	
Resolution		12 bits or 11 bits plus sign	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ.	±0.5 % of full scale at 25 °C
		Max.	±2 % of full scale at 0 °C...+60 °C or EMC disturbances
Indication of the output signals		No	
Output Resistance (load) as current output		0 Ω...500 Ω	
Output load ability as voltage output		±2 mA max.	
Output data length		4 bytes	
Relationship between output signal and hex code		*Chapter 1.6.3.6.2.1.4.8 “Output ranges” on page 2816*	
Unused outputs		Must not be connected and must be configured as "unused"	
Overvoltage protection		Yes, up to 30 V DC	
Max. cable length (conductor cross section > 0.14 mm^2)			
	Unshielded wire	10 m	
	Shielded wire	100 m

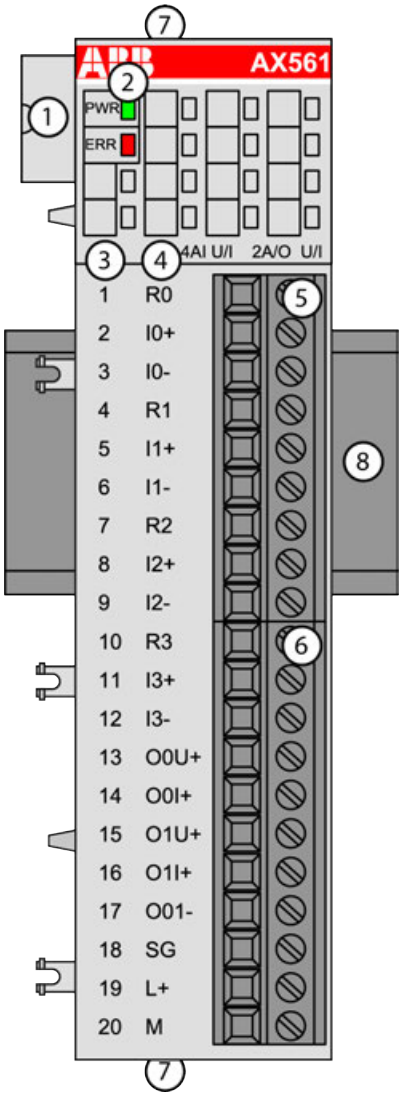
AX561 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bits



1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error

3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

The outputs are not galvanically isolated from each other.

All other circuitry of the module is not galvanically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

4 analog inputs, individually configurable for

- Not used (default)
- -2.5 V...+2.5 V
- -5 V...+ 5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

2 analog outputs, individually configurable for

- Not used (default)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Parameter		Value
Resolution of the analog channels		
	Voltage bipolar (-2.5 V...+2.5 V; -5 V...+5 V)	11 bits plus sign
	Voltage unipolar (0 V...5 V; 0 V...10 V)	12 bits
	Current (0 mA...20 mA; 4 mA...20 mA)	12 bits
LED displays		2 LEDs for process voltage and error messages

Parameter	Value
Internal supply	Via I/O bus
External supply	Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

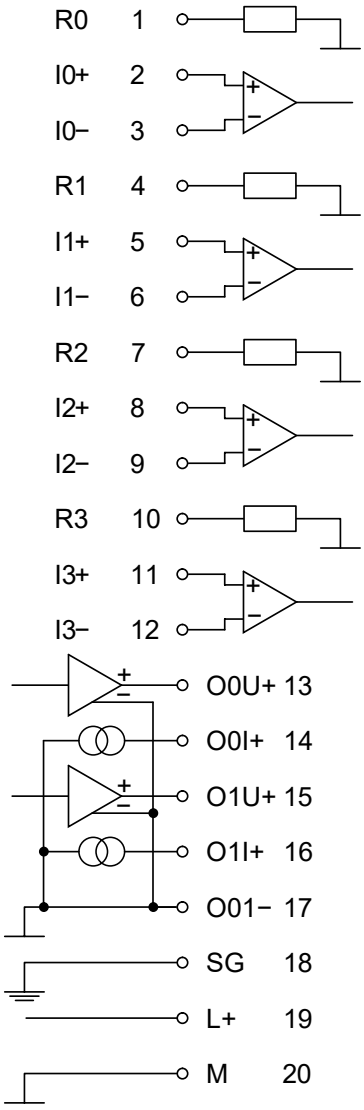
Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ↬ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs and outputs:



The assignment of the terminals:

Terminal	Signal	Description
1	R0	Burden resistor for input signal 0 for current sensing
2	I0+	Positive pole of input signal 0
3	I0-	Negative pole of input signal 0
4	R1	Burden resistor for input signal 1 for current sensing
5	I1+	Positive pole of input signal 1
6	I1-	Negative pole of input signal 1
7	R2	Burden resistor for input signal 2 for current sensing
8	I2+	Positive pole of input signal 2
9	I2-	Negative pole of input signal 2
10	R3	Burden resistor for input signal 3 for current sensing
11	I3+	Positive pole of input signal 3
12	I3-	Negative pole of input signal 3
13	O0U+	Voltage output of channel 0
14	O0I+	Current output of channel 0

Terminal	Signal	Description
15	O1U+	Voltage output of channel 1
16	O1I+	Current output of channel 1
17	O01-	Negative pole of channels O0 and O1
18	SG	Shield grounding
19	L+	Process voltage L+ (24 V DC)
20	M	Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AX561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

NOTICE!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

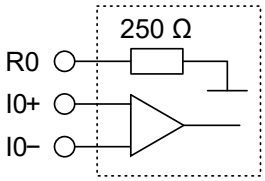
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions *Chapter 1.6.3.6.2.1.5.6 “Diagnosis” on page 2827*.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.



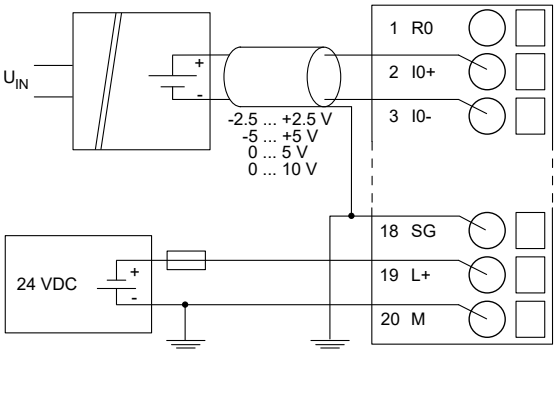
CAUTION!

Risk of damaging the analog input!

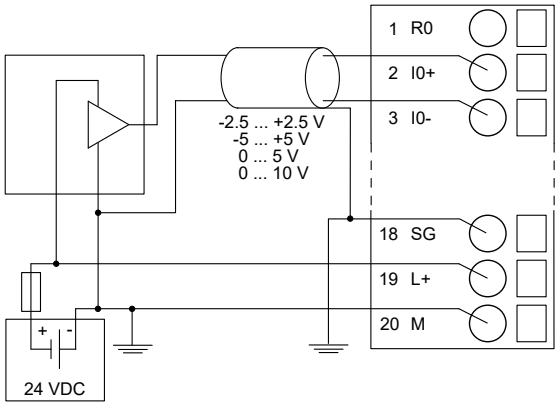
The 250 Ω input resistor can be damaged by overcurrent.

Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the connection of analog sensors (voltage) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

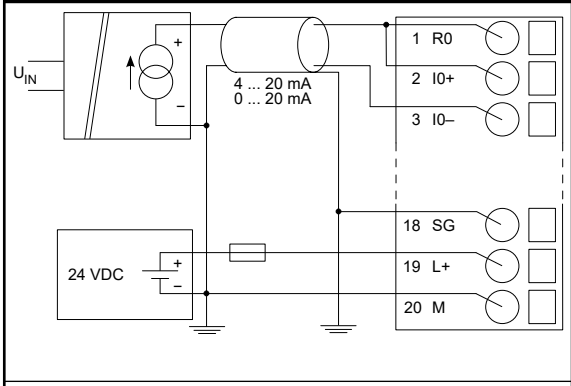


Connection of active-type analog sensors (voltage)

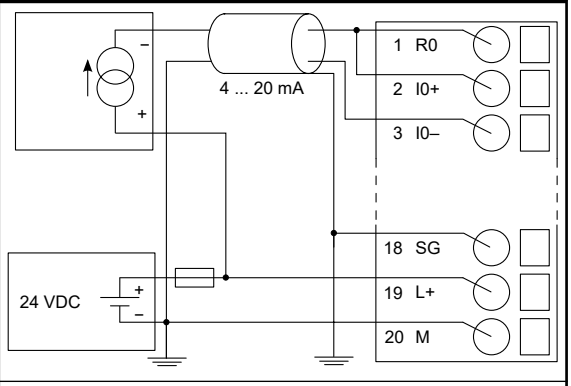


Connection of passive-type analog sensors (voltage)

The following figures are an example of the connection of analog sensors (current) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

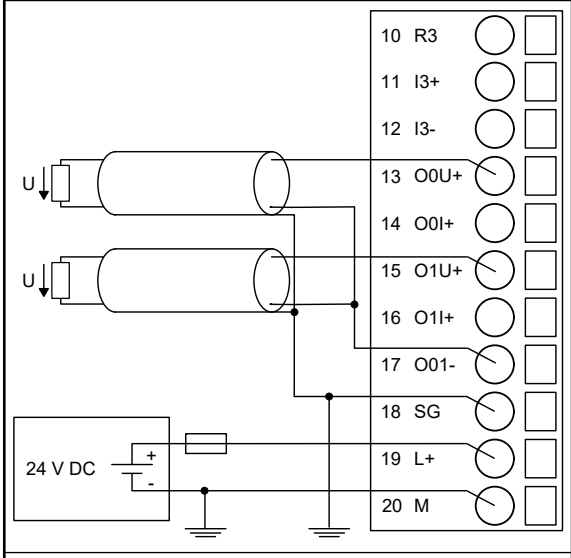


Connection of active-type analog sensors (current)

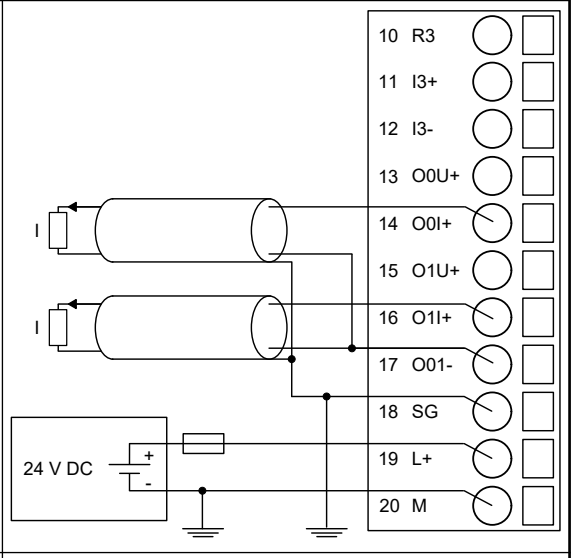


Connection of passive-type analog sensors (current)

The following figures are an example of the connection of analog actuators to the analog input/ output module AX561.



Connection of analog voltage actuators



Connection of analog current actuators

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter *Chapter 1.6.3.6.2.1.5.7 “State LEDs” on page 2828*.

I/O configuration

The I/O module does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Measuring ranges

CAUTION!

Risk of wrong analog input values!

The analog input values may be wrong if the measuring range of the inputs are exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

Range	-2.5 ... +2.5 V	-5 ... +5 V	0 ... 5 V	0 ... 10 V	0 ... 20 mA	4 ... 20 mA	Digital value

Technical data

The System Data of AC500-eCo apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter		Value
Process supply voltage L+		
	Connections	Terminal 19 for L+ (+24 V DC) and terminal 20 for M (0 V)
	Rated value	24 V DC
	Current consumption via L+ terminal	0.14 A + output load
	Inrush current (at power-up)	0.05 A
	Max. ripple	5 %
	Protection against reversed voltage	Yes

Parameter	Value
Protection fuse for L+	Recommended
Current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 5 mA
Galvanic isolation	No
Surge-voltage (max.)	35 V DC for 0.5 s
Max. power dissipation within the module	4.9 W
Weight	Ca. 120 g
Mounting position	Horizontal or vertical
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter		Value	
Number of channels per module		4 individually configurable voltage or current inputs	
Distribution of channels into groups		1 (4 channels per group)	
Resolution			
	Unipolar	Voltage: 0 V...+5 V; 0 V...+10 V: 12 bits Current 0 mA...20 mA; 4 mA...20 mA: 12 bits

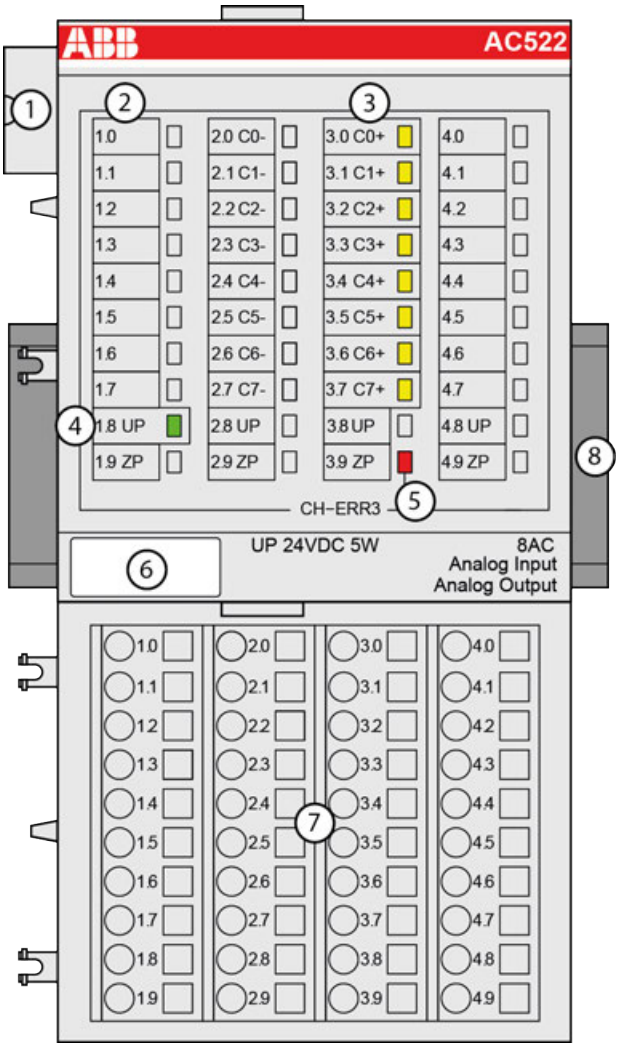
S500

AC522 - Analog input/output module

- 8 configurable analog inputs/outputs in one group (2.0...2.7 and 3.0...3.7)
- Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the analog inputs/outputs (C0 - C7)
4 1 green LED to display the state of the process supply voltage UP
5 1 red LED to display errors
6 Label
7 Terminal unit
8 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process voltage of 24 V DC.

The inputs and outputs are galvanically isolated from all other circuitry of the module.

Functionality

8 analog inputs (I0...I7), individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs (O4...O7), individually configurable for

- Unused (default setting)
- -10 V...+10 V

Parameter		**Value**
Resolution of the analog channels		
	Voltage -10 V...+10 V	12 bits plus sign
	Voltage 0 V...10 V	12 bits
	Current 0 mA...20 mA, 4 mA...20 mA	12 bits
	Temperature	0.1 °C
LED displays		10 LEDs for signals and error messages
Internal power supply		Via the I/O bus interface (I/O bus)
External power supply		Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit		TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The modules are plugged on an I/O terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC

Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	Unused	Unused
2.0 to 2.7	C0- to C7-	Negative poles of the 8 analog inputs/outputs
3.0 to 3.7	C0+ to C7+	Positive poles of the analog inputs/outputs
4.0 to 4.7	Unused	Unused

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

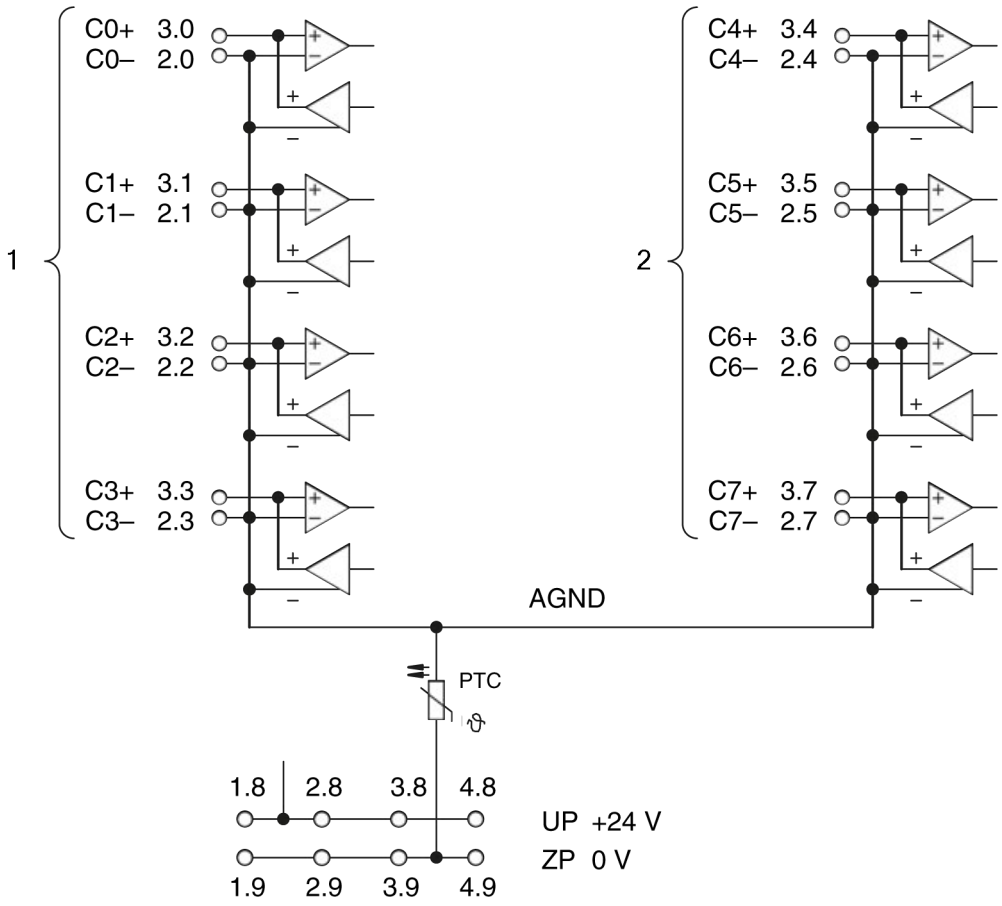
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the I/O module.



1 4 analog I/O channels
as inputs for 0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/Pt1000/Ni1000
digital signals
as outputs for -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA

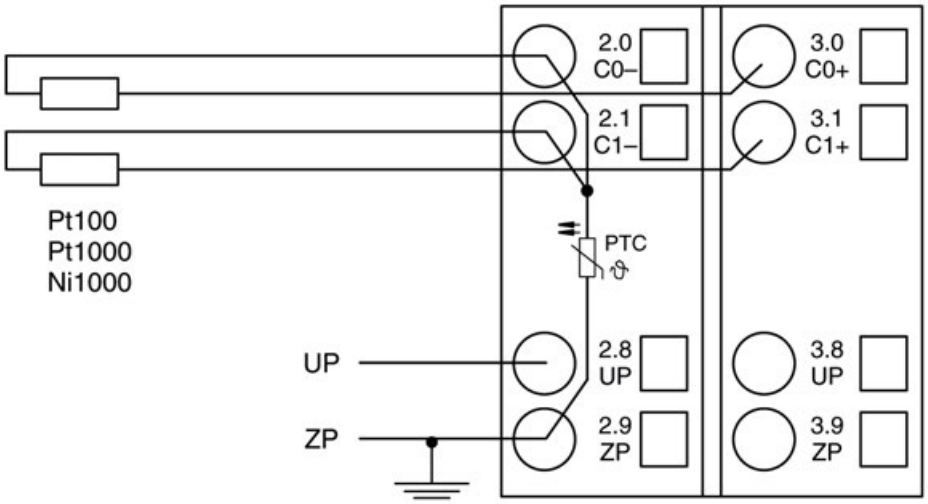
2 4 analog I/O channels
as inputs for 0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/Pt1000/Ni1000
digital signals
as outputs for -10 V...+10 V

The process voltage must be included in the grounding concept of the control system (e.g. grounding the negative pole).

By installing equipotential bonding conductors between the different parts of the system, it must be made ensured that the potential difference between ZP and AGND never exeeds 1 V.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.



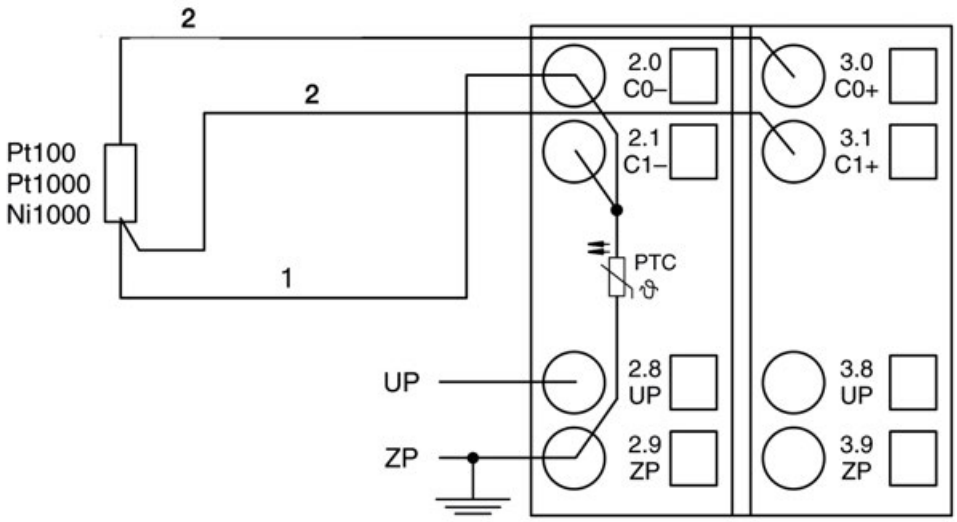
Pt100	-50 °C...+70 °C	2-wire configuration, one channel used
Pt100	-50 °C...+400 °C	2-wire configuration, one channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, one channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, one channel used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.



1 Return line
2 Twisted pair within the cable

> *If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.*

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. C1).

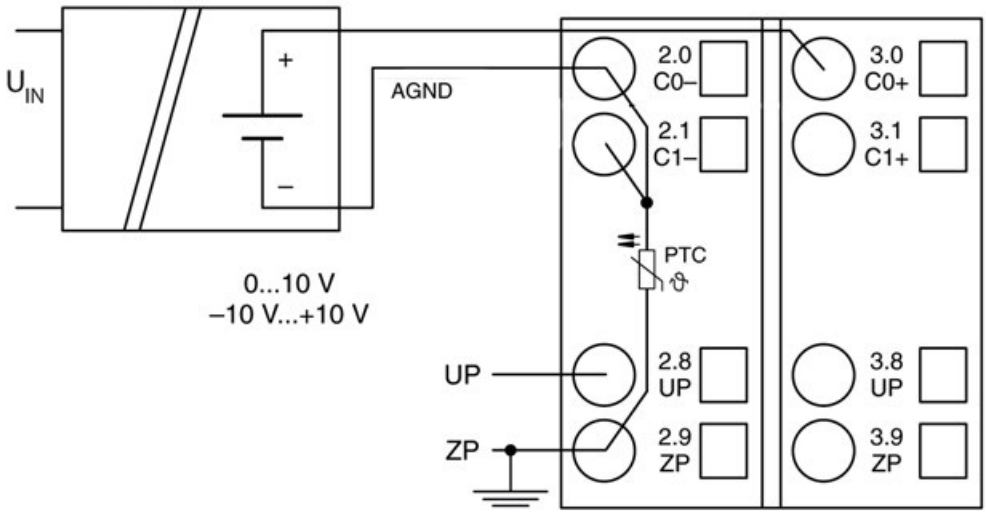
In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Pt100	-50 °C...+70 °C	3-wire configuration, two channels used
Pt100	-50 °C...+400 °C	3-wire configuration, two channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, two channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, two channels used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply



By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

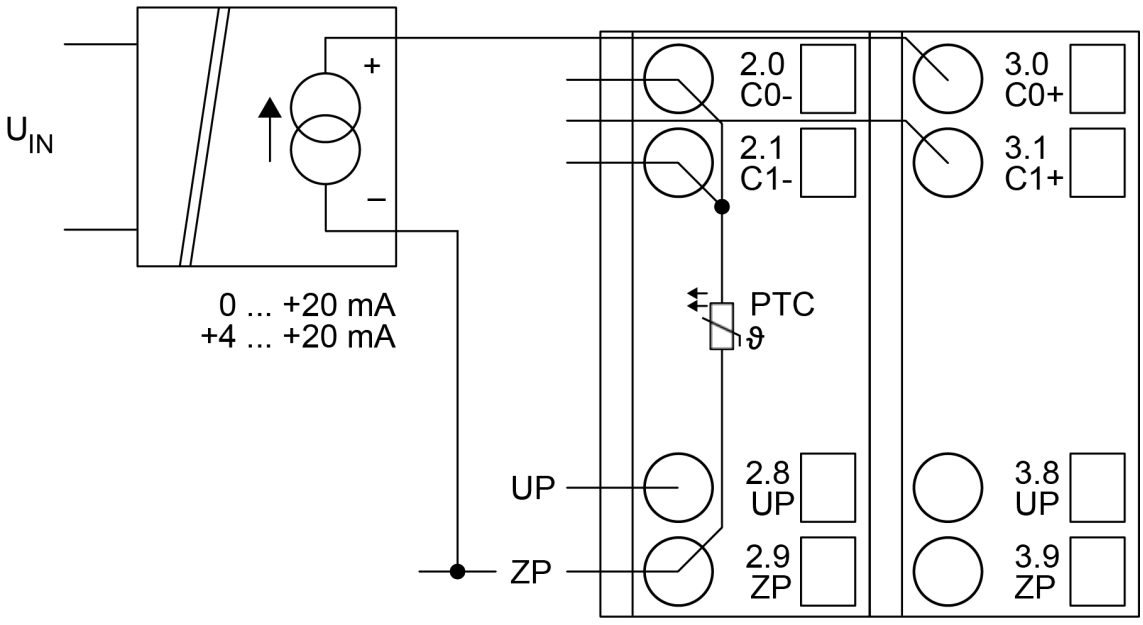
By connecting to AGND the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

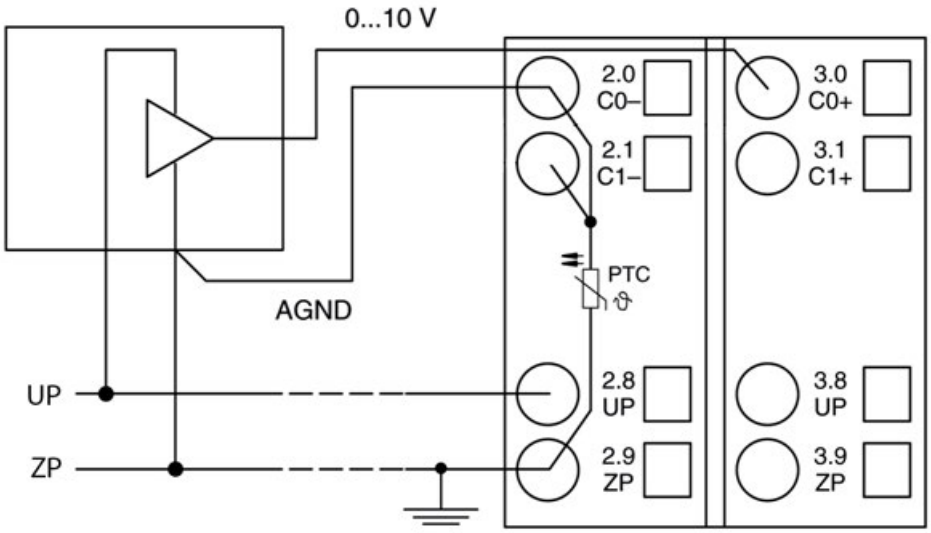


The following measuring ranges can be configured:

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply



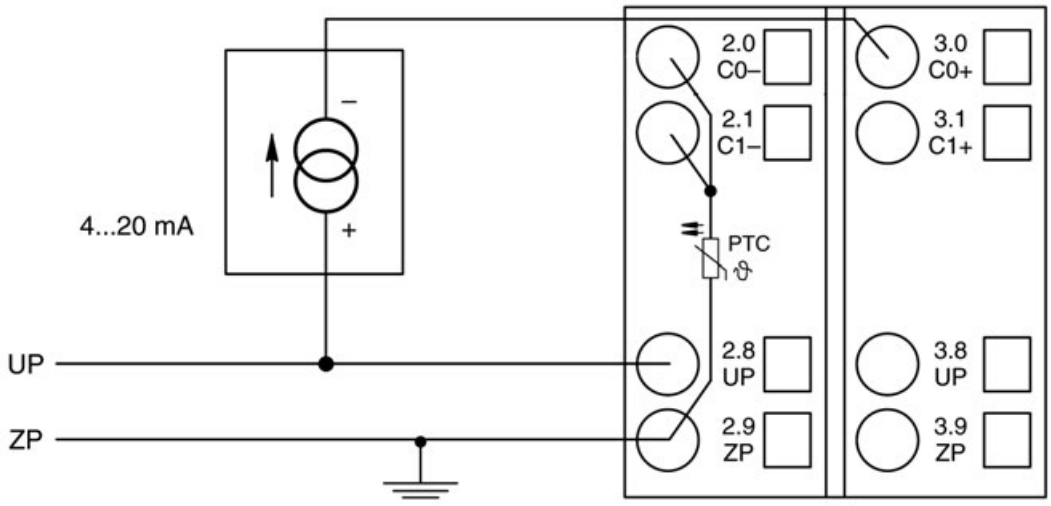
CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V *)	1 channel used
*) if the sensor can provide this signal range		

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)



Current	4 mA...20 mA	1 channel used

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

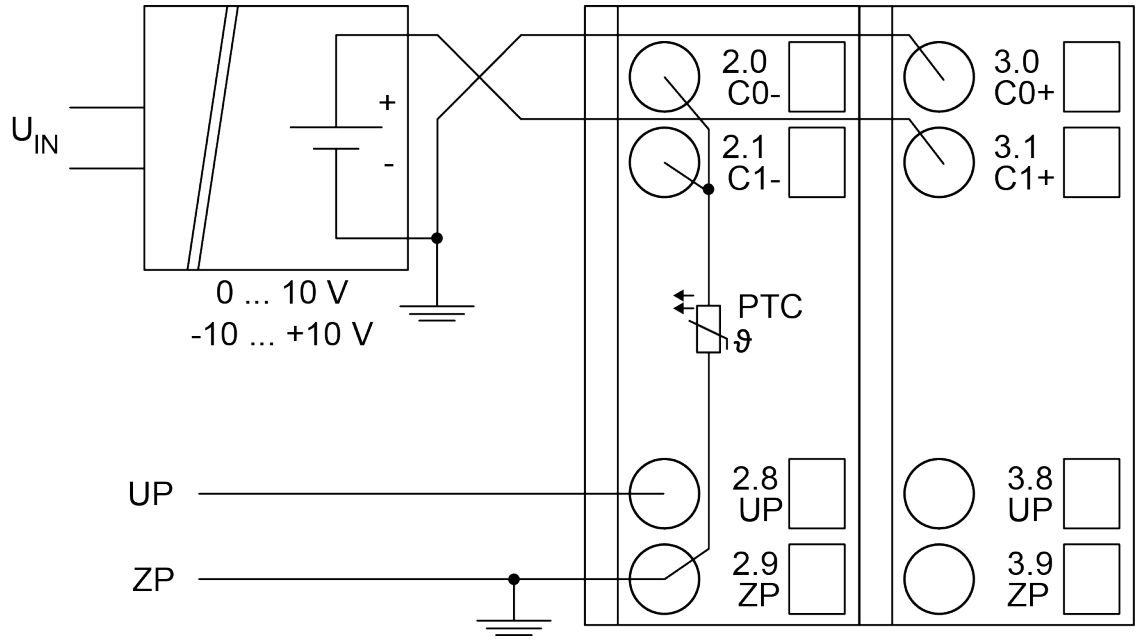
The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.



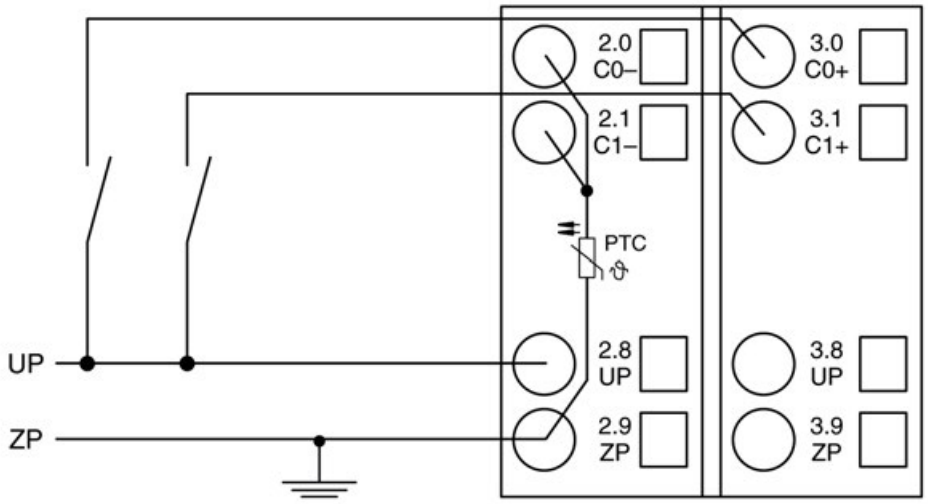
The negative pole of the sensor must be grounded next to the sensor.

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

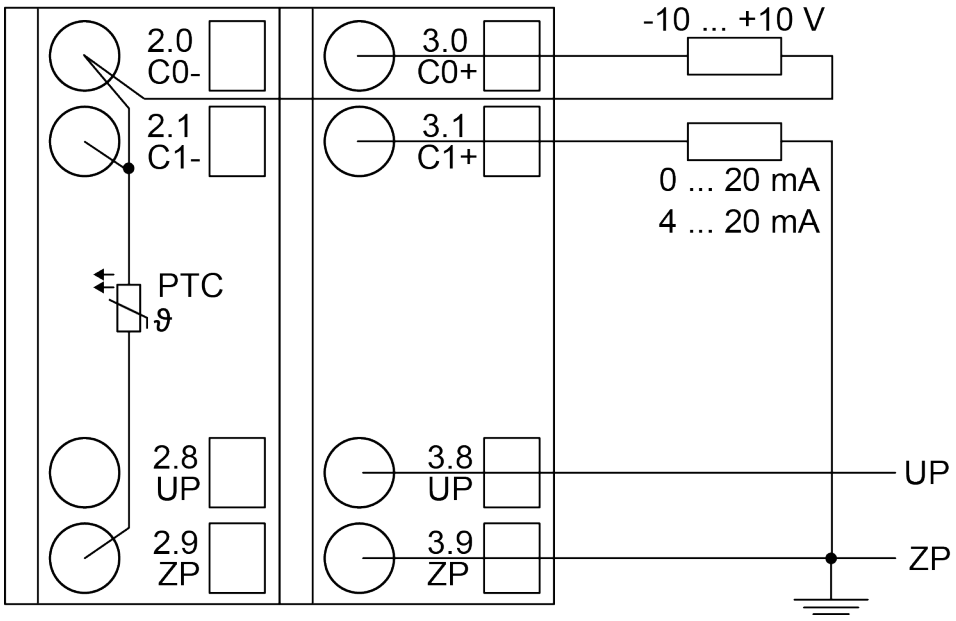
Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.



Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

Connection of analog output loads (Voltage, current)



Voltage	-10 V...+10 V	Load max. ±10 mA	1 channel used
Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

Unused analog outputs can be left open-circuited.

Internal data exchange

Analog inputs (words)	8
Analog outputs (words)	8

I/O configuration

The module does not store configuration data itself. The 8 configurable analog channels are defined as inputs or outputs by the configuration, i.e. each of the configurable channels can used as input or output (or re-readable output in case of voltage input/output).

When a channel is used as input, the corresponding output must be configured unused.

When a channel is used as output, the corresponding input must be configured unused.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

No.	Name	Value	Internal value	Internal value, type	Default	Min.	Max.	EDS Slot/ Index
1	Module ID	Internal	1520 [1])	Word	1520 0x05f0	0	65535	0x0Y01

	11 / 12	ADR	1...10					

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)

[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Inputs/ outputs 00...07	Analog input/ output	Yellow	Input/output is OFF	Input/output is ON (brightness depends on the value of the analog signal)	--
	UP	Process voltage 24 V DC via terminal	Green	Process voltage is missing	Process voltage OK	--
	CH-ERR3	Channel error, error messages combined into group 3	Red	No error or process voltage is missing	Severe error within the corresponding group	Error on one channel of the group

Measuring ranges

Input ranges of voltage, current and digital input

The represented resolution corresponds to 16 bits.

Technical data

The System Data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

Only additional details are therefore documented below.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 VDC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module	Ca. 2 mA
	From UP at normal operation	0.10 A + output loads
Inrush current from UP (at power up)		0.040 A^2s

Parameter	Value
Max. length of analog cables, conductor cross section > 0.14 mm²	100 m
Weight	300 g
Mounting position	Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter	Value	
Number of channels per module	8	
Distribution of channels into groups	1 group of 8 channels	
Connections of the channels C0- to C7-	Terminals 2.0 to 2.7	
Connections of the channels C0+ to C7+	Terminals 3.0 to 3.7	
Input type	Bipolar (not with current or Pt100/Pt1000/Ni1000)	
Galvanic isolation	Against internal supply and other modules	
Configurability	0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)	
Channel input resistance	Voltage: > 100 kΩ Current: ca. 330 Ω	
Time constant of the input filter	Voltage: 100 µs Current: 100 µs	
Indication of the input signals	One LED per channel	
Conversion cycle	2 ms (for 8 inputs + 8 outputs), with Pt/Ni... 1 s	
Resolution	Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between input signal and hex code	See table *Chapter 1.6.3.6.2.2.1.9.1 “Input ranges of voltage, current and digital input” on page 2853*	

Parameter	Value
Unused inputs	Must be configured as "unused".
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 8
Distribution of channels into groups		1 group of 8 channels
Connections of the channels C0+ to C7+		Terminals 3.0 to 3.7
Reference potential for the inputs		Terminals 1.9 to 4.9 (ZP)
Input signal delay		Typ. 8 ms, configurable from 0.1 to 32 ms
Indication of the input signals		1 LED per channel
Input signal voltage		24 VDC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 4.3 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		8, all channels for voltage, the first 4 channels also for current
Distribution of channels into groups		1 group of 8 channels
	Channels C0-...C7-	Terminals 2.0...2.7
	Channels C0+...C7+	Terminals 3.0...3.7
Output type		Bipolar with voltage, unipolar with current
Galvanic isolation		Against internal supply and other modules
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually), current outputs only channels 0...3
Output resistance (load), as current output		0 Ω...500 Ω
Output loadability, as voltage output		Max. ±10 mA
Indication of the output signals		One LED per channel
Resolution		12 bits (+ sign)

Parameter	Value	
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between output signal and hex code	See table *Chapter 1.6.3.6.2.2.1.9.3 "Output ranges voltage and current" on page 2855*	
Unused outputs	Must be configured as "unused".	

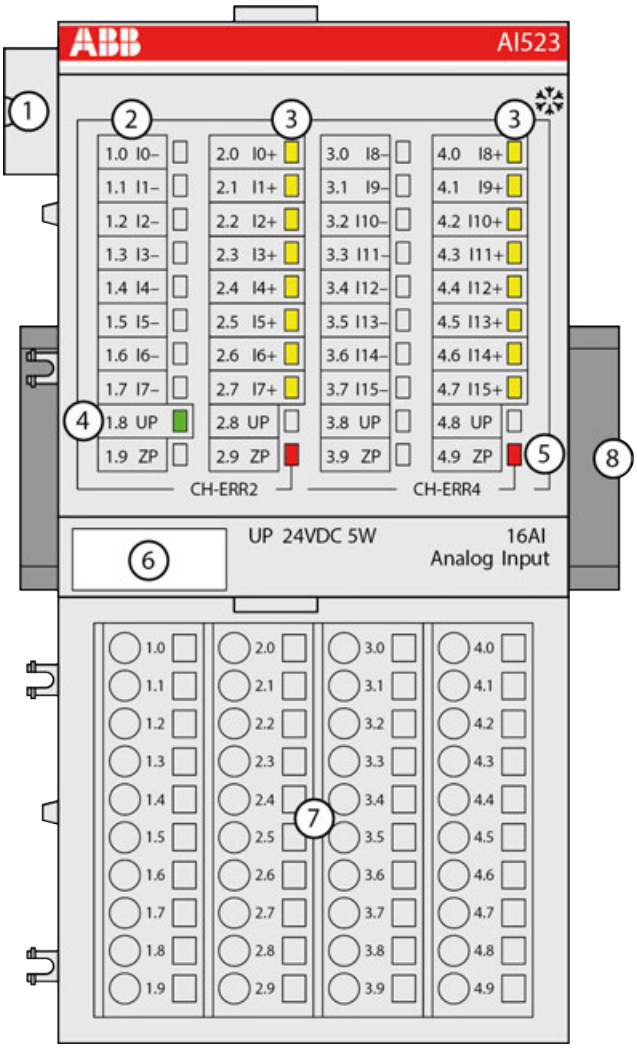
Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 250 500 R0001	AC522, analog input/output module, 8 AC, U/I/RTD, 12 bits + sign, 2-wires	Active
1SAP 450 500 R0001	AC522-XC, analog input/output module, 8 AC, U/I/RTD, 12 bits + sign, 2-wires, XC version	Active

**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

AI523 - Analog input module

- 16 configurable analog inputs (I0 to I15) in 2 groups (1.0...2.7 and 3.0...4.7)
  Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog inputs (I0 - I15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

16 analog inputs, individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

Parameter		Value
Resolution of the analog channels		
	Voltage -10 V... +10 V	12 bits plus sign
	Voltage 0 V...10 V	12 bits
	Current 0 mA...20 mA, 4 mA...20 mA	12 bits
	Temperature	0.1 °C
LED displays		19 LEDs for signals and error messages
Internal power supply		Via the I/O bus interface (I/O bus)
External power supply		Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit		TU515 or TU516 ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

The modules are plugged on an I/O terminal unit ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ↳ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	I0- to I7-	Negative poles of the first 8 analog inputs
2.0 to 2.7	I0+ to I7+	Positive poles of the first 8 analog inputs
3.0 to 3.7	I8- to I15-	Negative poles of the following 8 analog inputs
4.0 to 4.7	I8+ to I15+	Positive poles of the following 8 analog inputs

CAUTION!
The negative poles of the analog inputs are galvanically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also galvanically connected to each other to form an "Analog Ground" signal.

CAUTION!
There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

CAUTION!
Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the module:

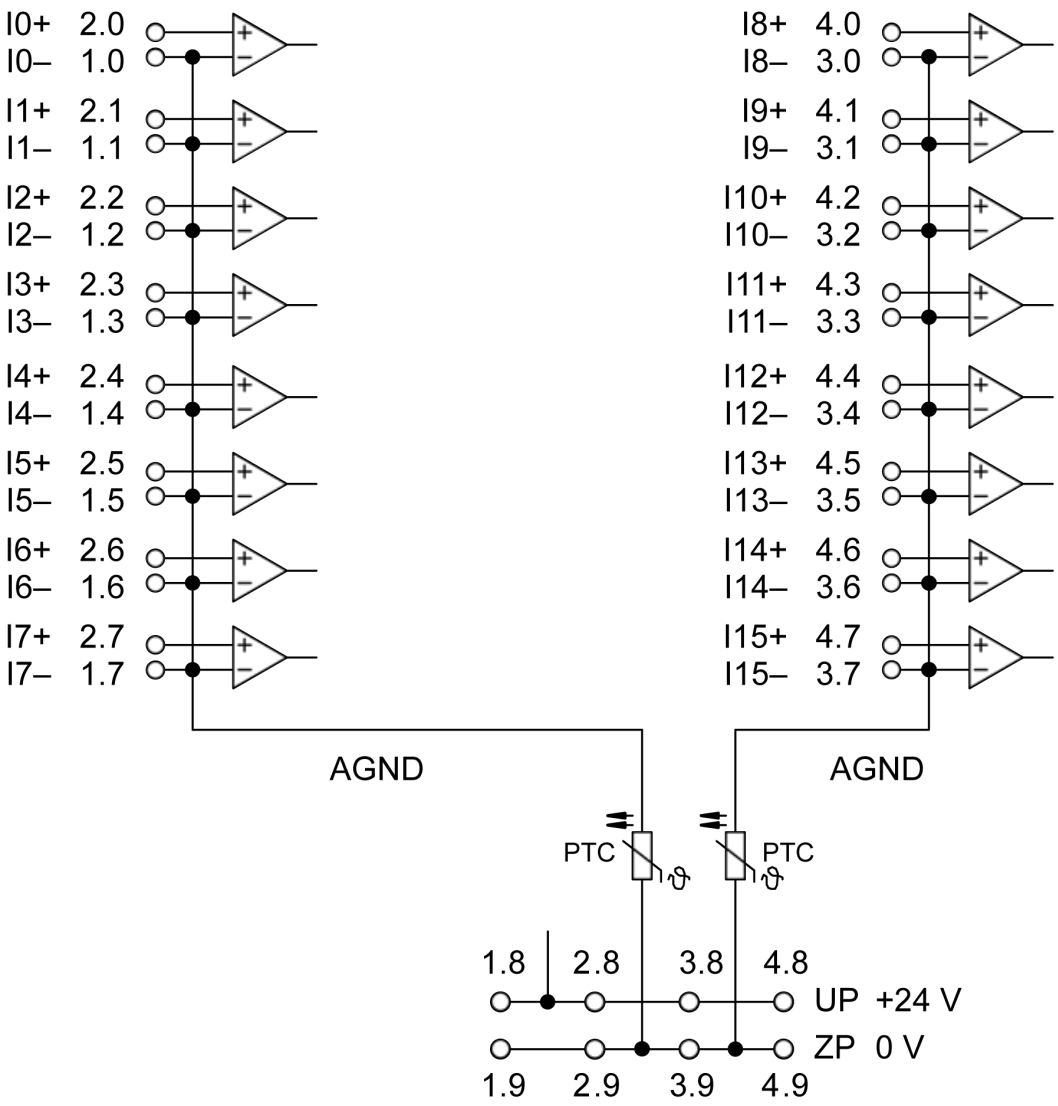


Fig. 122: 16 analog inputs in two groups, individually configurable *Chapter 1.6.3.6.2.2.2.2 “Functionality” on page 2859*

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The modules provide several diagnosis functions *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the 8 analog channels.

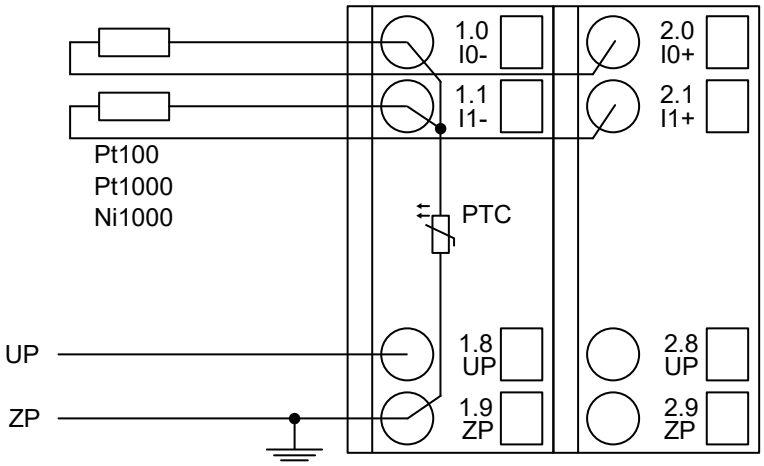

Fig. 123: Connection example

The following measuring ranges can be configured *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871*.

Pt100	-50 °C...+70 °C	2-wire configuration, one channel used
Pt100	-50 °C...+400 °C	2-wire configuration, one channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, one channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, one channel used

The function of the LEDs is described under Displays *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

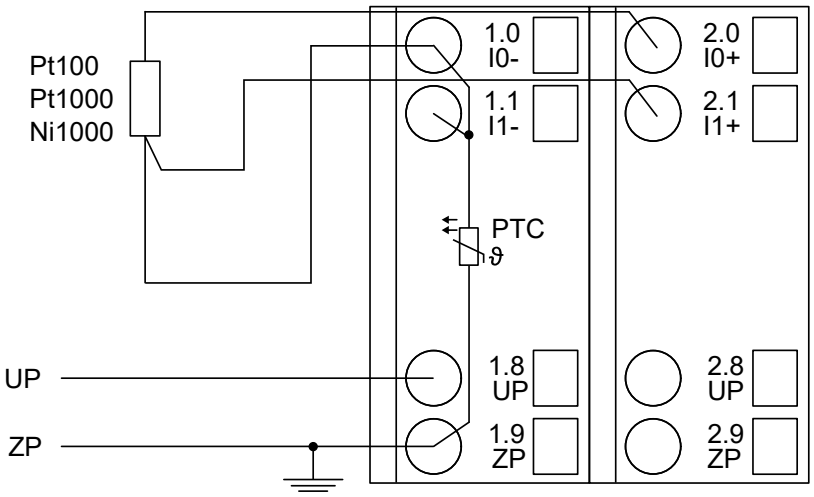

Fig. 124: Connection example

> *If several measuring points are adjacent to each other, the return line is necessary only once. This saves wiring costs.*

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871*

Pt100	-50 °C...+70 °C	3-wire configuration, two channels used
Pt100	-50 °C...+400 °C	3-wire configuration, two channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, two channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, two channels used

The function of the LEDs is described under Displays *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

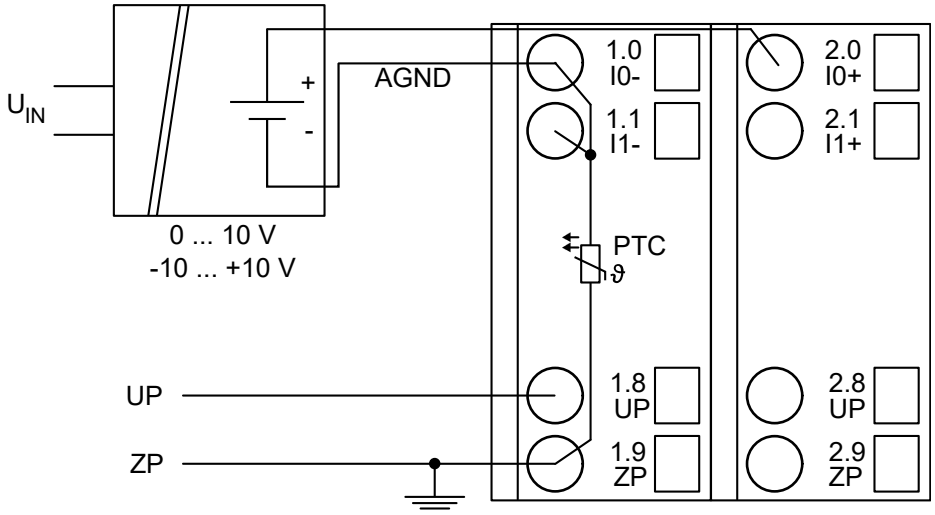

Fig. 125: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871* ↳ *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Displays ↳ *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

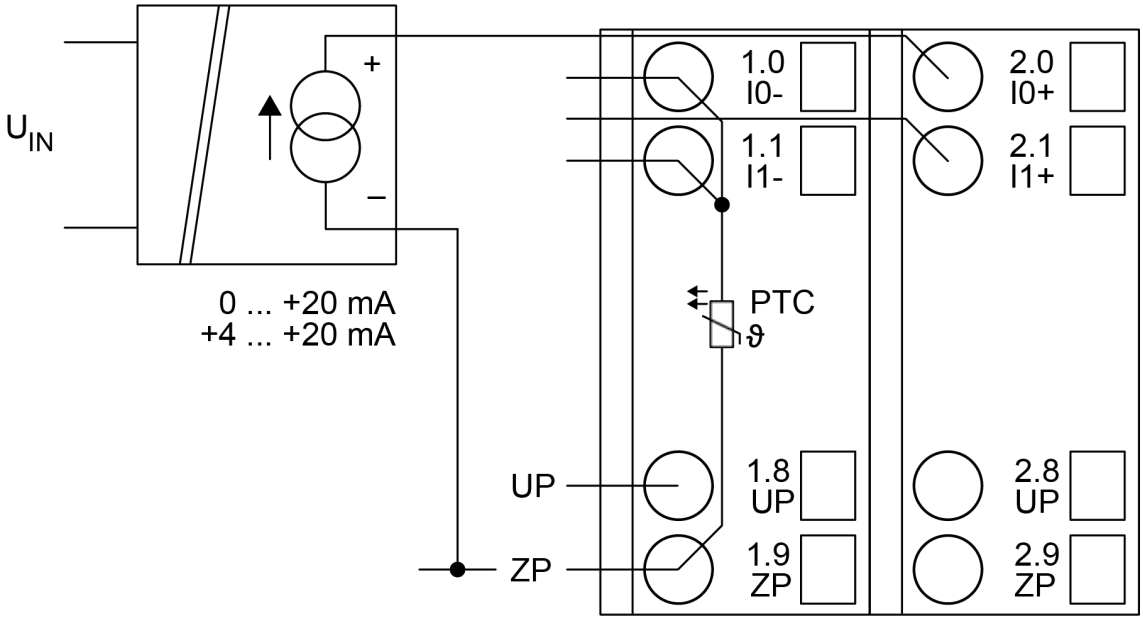

Fig. 126: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871* ↳ *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

The function of the LEDs is described under Displays ↳ *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

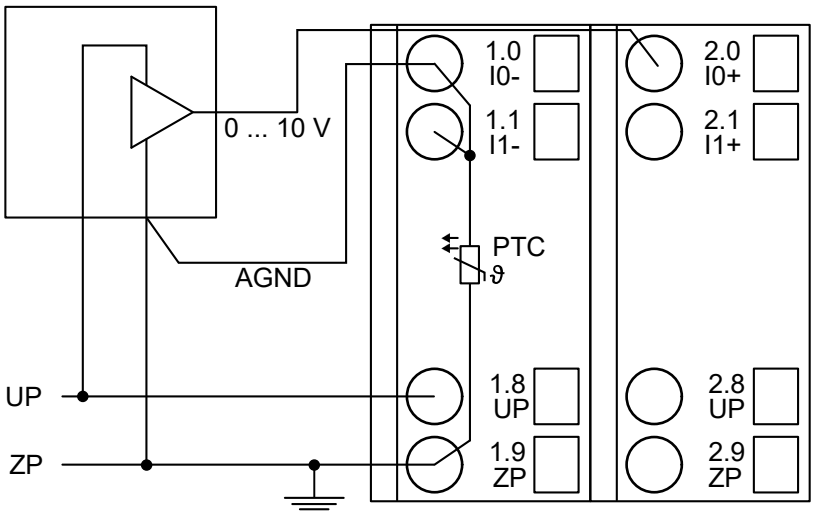

Fig. 127: Connection example

CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1 V, not even in case of long lines .

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V *)	1 channel used
*) if the sensor can provide this signal range		

The function of the LEDs is described under Displays *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

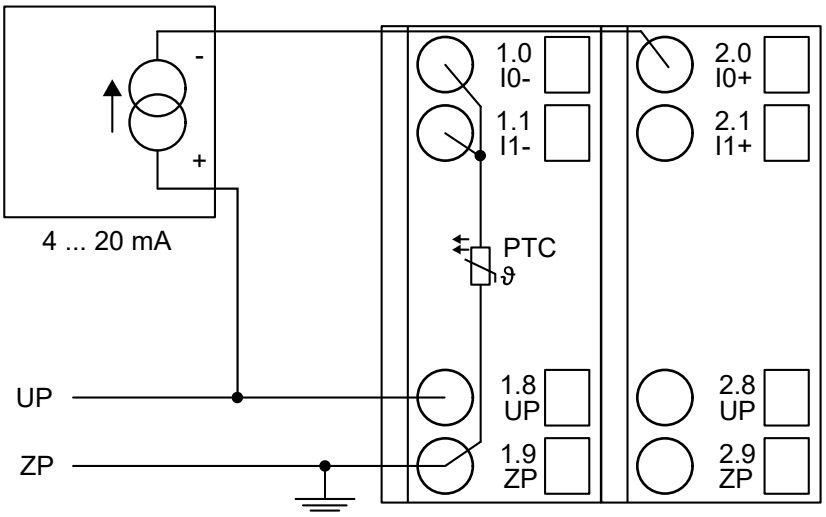

Fig. 128: Connection example

The following measuring ranges can be configured *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871* *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*

Current	4 mA...20 mA	1 channel used

The function of the LEDs is described under Displays *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 volt Zener diode (in parallel to I+ and I-). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

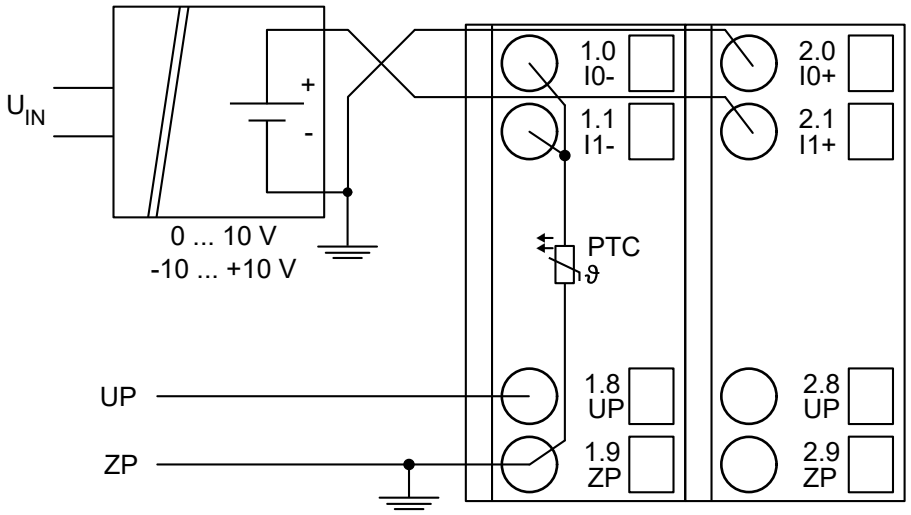

Fig. 129: Connection example

The negative pole of the sensor must be grounded next to the sensor.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871* ↳ *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*:

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

The function of the LEDs is described under Displays ↳ *Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

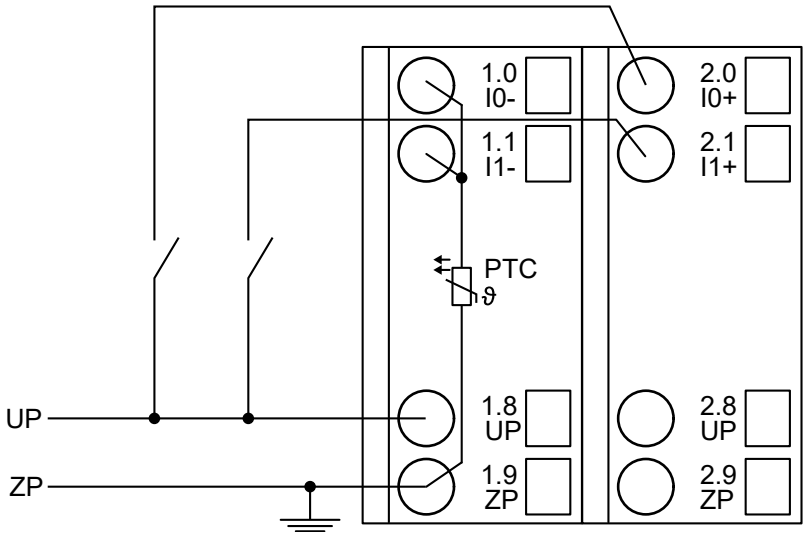

Fig. 130: Connection example

The following operating mode can be configured ↳ *Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871* ↳ *Chapter 1.6.3.6.2.2.2.9 “Measuring ranges” on page 2876*

Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

The function of the LEDs is described under Displays.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	0
Counter input data (words)	16
Counter output data (words)	0

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation / with outputs	0.15 A + output loads
Inrush current from UP (at power up)		0.050 A^2s

Parameter	Value
Max. length of analog cables, conductor cross section > 0.14 mm^2	100 m
Weight	300 g
Mounting position	Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter	Value	
Number of channels per module	16	
Distribution of channels into groups	2 groups of 8 channels each	
Connections of the channels I0- to I7- Connections of the channels I0+ to I7+	Terminals 1.0 to 1.7 Terminals 2.0 to 2.7	
Connections of the channels I8- to I15- Connections of the channels I8+ to I15+	Terminals 3.0 to 3.7 Terminals 4.0 to 4.7	
Input type	Bipolar (not with current or Pt100/ Pt1000/ Ni1000)	
Galvanic isolation	Against internal supply and other modules	
Configurability	0 V...10 V, -10 V...+10 V, 0/4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)	
Channel input resistance	Voltage: > 100 kΩ Current: ca. 330 Ω	
Time constant of the input filter	Voltage: 100 µs Current: 100 µs	
Indication of the input signals	1 LED per channel	
Conversion cycle	2 ms (for 16 inputs), with Pt/Ni... 1 s	
Resolution	Range 0 V...10 V: 12 bits	
	Range -10 V...+10 V: 12 bits + sign	
	Range 0 mA...20 mA: 12 bits	
	Range 4 mA...20 mA: 12 bits	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C

Parameter	Value	
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between input signal and hex code	↳ *Chapter 1.6.3.6.2.2.2.9.1 “Input ranges of voltage, current and digital input” on page 2876* ↳ *Chapter 1.6.3.6.2.2.2.9.2 “Input ranges resistance temperature detector” on page 2876*	
Unused voltage inputs	Are configured as "unused"	
Unused current inputs	Have a low resistance, can be left open-circuited	
Overvoltage protection	Yes	

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 16
Distribution of channels into groups		2 groups of 8 channels each
Connections of the channels I0+ to I7+		Terminals 2.0 to 2.7
Connections of the channels I8+ to I15+		Terminals 4.0 to 4.7
Reference potential for the inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)
Input signal delay		Typ. 8 ms, configurable from 0.1 to 32 ms
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 4.3 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

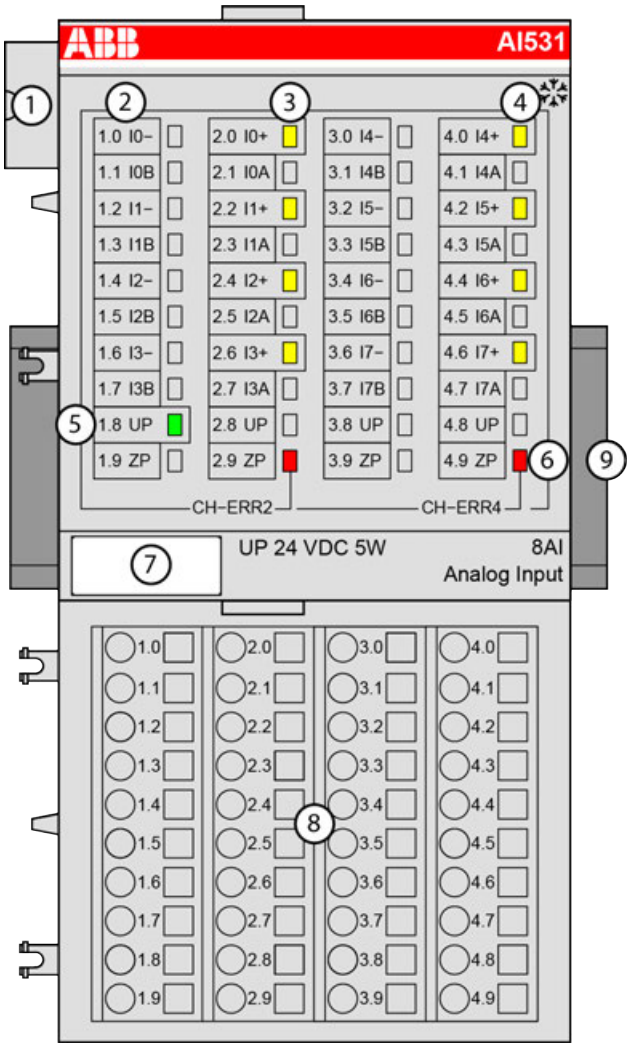
Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 250 300 R0001	AI523, analog input module, 16 AI, U/I/Pt100, 12 bits + sign, 2-wires	Active
1SAP 450 300 R0001	AI523-XC, analog input module, 16 AI, U/I/Pt100, 12 bits + sign, 2-wires, XC version	Active

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AI531 - Analog input module

- 8 configurable analog inputs (I0 to I7) in 2 groups (1.0...1.7 and 2.0...2.7 as well as 3.0...3.7 and 4.0...4.7)
  Resolution 15 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal names
3 4 yellow LEDs to display the states at the inputs I0 to I3
4 4 yellow LEDs to display the states at the inputs I4 to I7
5 1 green LED to display the process supply voltage UP
6 2 red LEDs to display errors (CH-ERR2 and CH-ERR4)
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

8 analog inputs, individually configurable for

- Unused (default setting)
- 0 V...5 V, 0 V...10 V
- -50 mV...+50 mV, -500 mV...+500 mV
- -1 V...+1 V, -5 V...+5 V, -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- -20 mA...20 mA
- Pt100, -50 °C...+70 °C or 400 °C (2-, 3- and 4-wire)
- Pt100, -200 °C...+850 °C (2-, 3- and 4-wire)
- Pt1000, -50 °C...+400 °C (2-, 3- and 4-wire)
- Ni1000, -50 °C...+150 °C (2-, 3- and 4-wire)
- Cu50 (1.426): -50 °C...+200 °C (2-, 3- and 4-wire)
- Cu50 (1.428): -200 °C...+200 °C (2-, 3- and 4-wire)
- 0 Ω...50 kΩ
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

Parameter		Value
Resolution of the analog channels		
	Voltage and current, bipolar	15 bits plus sign
	Voltage and current, unipolar	15 bits
	Temperature	0.1 °C (0,01°C at Pt100 -50 °C...+70 °C)
LED displays		11 LEDs for signals and error messages
Internal power supply		through the I/O bus interface (I/O bus)
External power supply		via terminals (process voltage UP = 24 V DC)
Required terminal unit		TU515 or TU516 ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The modules are plugged on an I/O terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8, 4.8, 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC

Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

Terminals	Signal	Description
2.0, 2.2, 2.4, 2.6	I0+ to I3+	Positive poles of the first 4 analog inputs
1.0, 1.2, 1.4, 1.6	I0- to I3-	Negative poles of the first 4 analog inputs
2.1, 2.3, 2.5, 2.7	I0A to I3A	Connections A (supply) of the first 4 analog inputs
1.1, 1.3, 1.5, 1.7	I0B to I3B	Connections B (analog ground) of the first 4 analog inputs
4.0, 4.2, 4.4, 4.6	I4+ to I7+	Positive poles of the following 4 analog inputs
3.0, 3.2, 3.4, 3.6	I4- to I7-	Negative poles of the following 4 analog inputs
4.1, 4.3, 4.5, 4.7	I4A to I7A	Connections A (supply) of the following 4 analog inputs
3.1, 3.3, 3.5, 3.7	I4B to I7B	Connections B (analog ground) of the following 4 analog inputs

CAUTION!
Analog sensors must be galvanically isolated against the ground. In order to avoid inaccuracy with the measuring results, the analog sensors should also be isolated against the power supply.

The "IxB" clamps (x=0..7) of the analog inputs are galvanically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix- may accept a potential difference up to ±20 V DC with regard to the common reference potential IxB (AGND, ZP). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.

For the open-circuit detection (cut wire), each positive analog input channel Ix+ is pulled up to "plus" by a high-resistance resistor and each negative analog input channel Ix- is pulled down to "minus" by a resistor. If cut wire occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI531.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

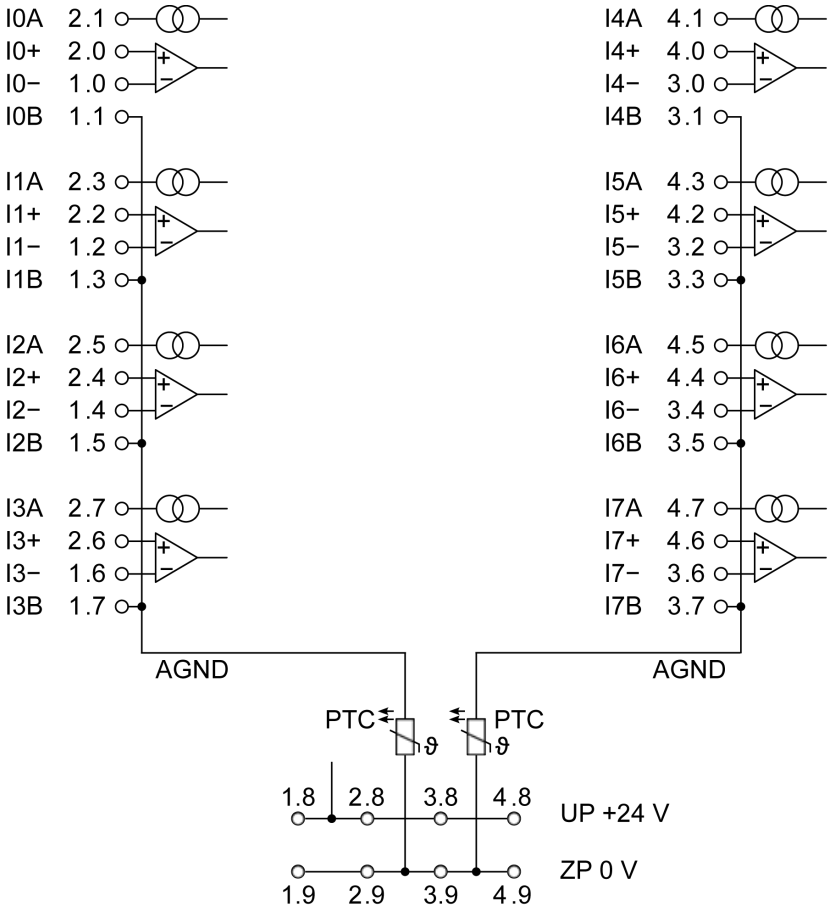


Fig. 131: 8 analog inputs in two groups, individually configurable ↳ *Chapter 1.6.3.6.2.2.3.2 “Functionality” on page 2881*

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The module provides several diagnosis functions ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

Standard ranges

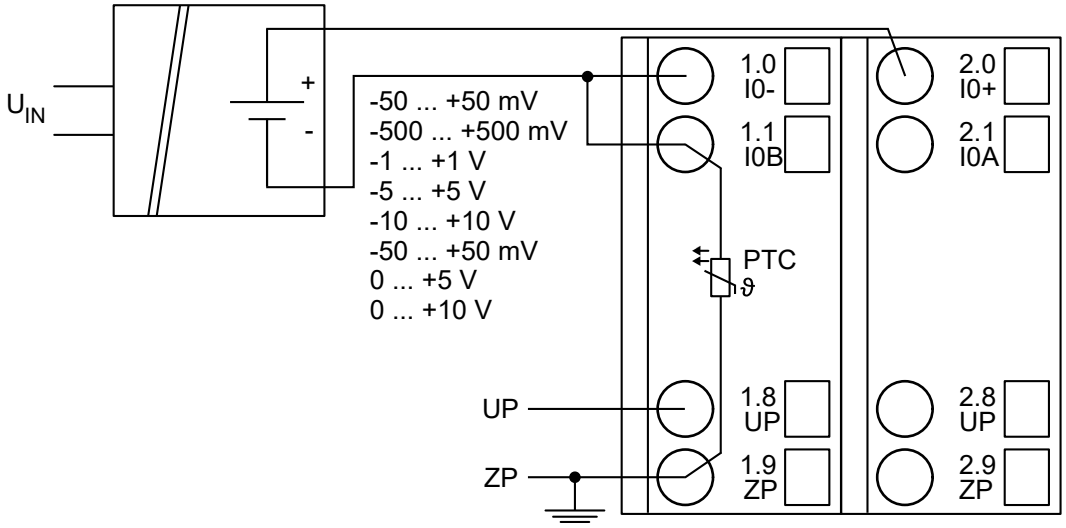

Fig. 132: Connection example

The measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Voltage	-50 mV...+50 mV	1 channel used
Voltage	-500 mV...+500 mV	1 channel used
Voltage	-1 V...+1 V	1 channel used
Voltage	-5 V...+5 V	1 channel used
Voltage	-10 V...+10 V	1 channel used
Voltage	0 V...+5 V	1 channel used
Voltage	0 V...+10 V	1 channel used

Common mode range (+/-20 V)

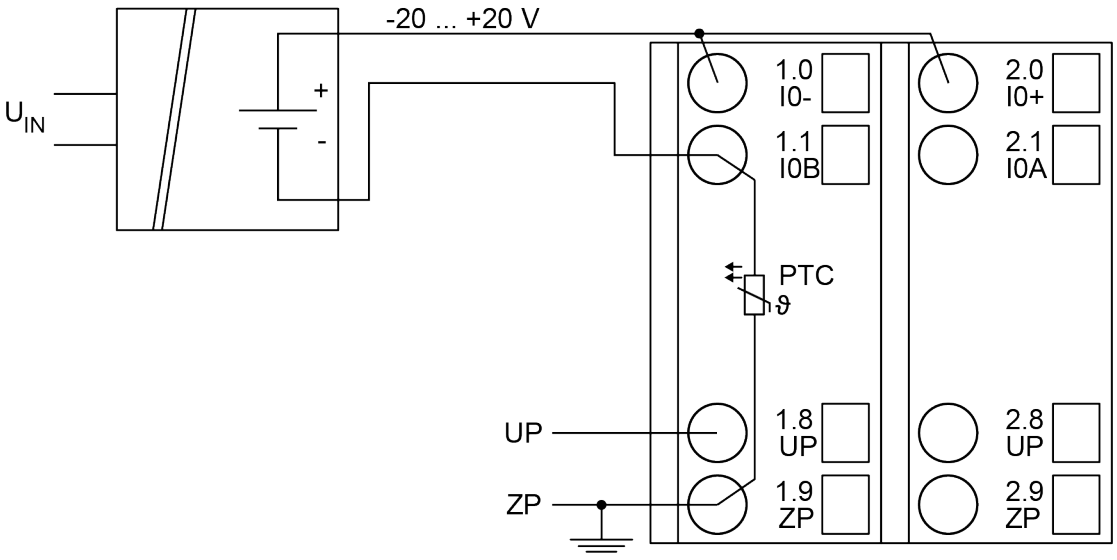

Fig. 133: Connection example

The measuring range can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Voltage	Common mode voltage	1 channel used

The function of the LEDs is described under Diagnosis and displays / displays *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

Standard ranges

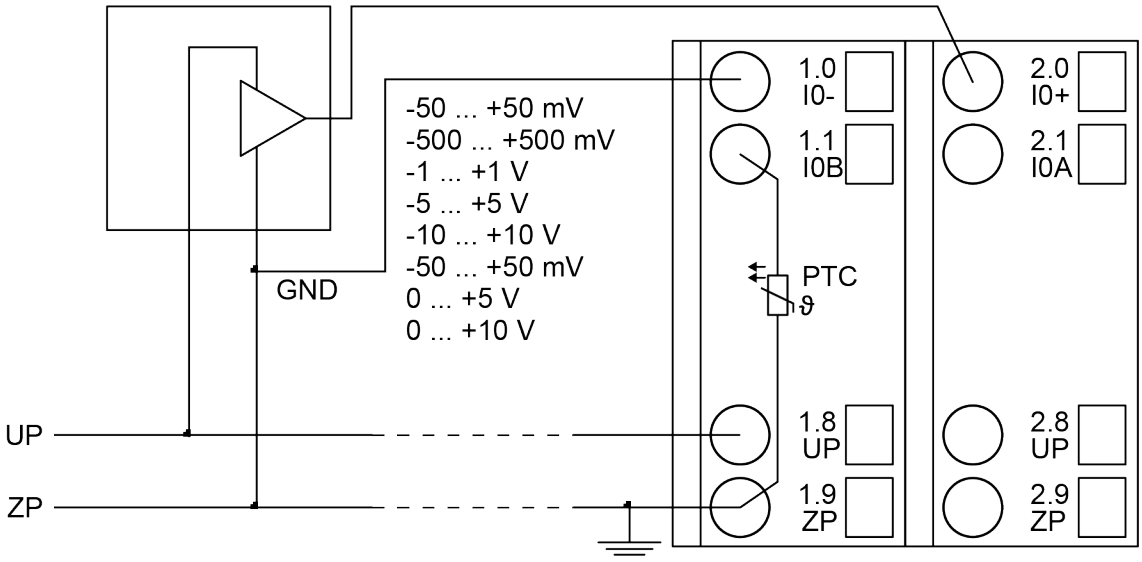

Fig. 134: Connection example

CAUTION!
If GND is not directly connected to ZP at the sensor, the supply current flows via the GND line to ZP. Measuring errors can only occur caused by voltage differences higher than ±20 V DC between GND and ZP.

The measuring ranges can be configured *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899* :

Voltage	-50 mV...+50 mV	1 channel used
Voltage	-500 mV...+500 mV	1 channel used
Voltage	-1 V...+1 V	1 channel used
Voltage	-5 V...+5 V	1 channel used
Voltage	-10 V...+10 V	1 channel used
Voltage	0 V...+5 V	1 channel used
Voltage	0 V...+10 V	1 channel used

Common mode range (+/-20 V)

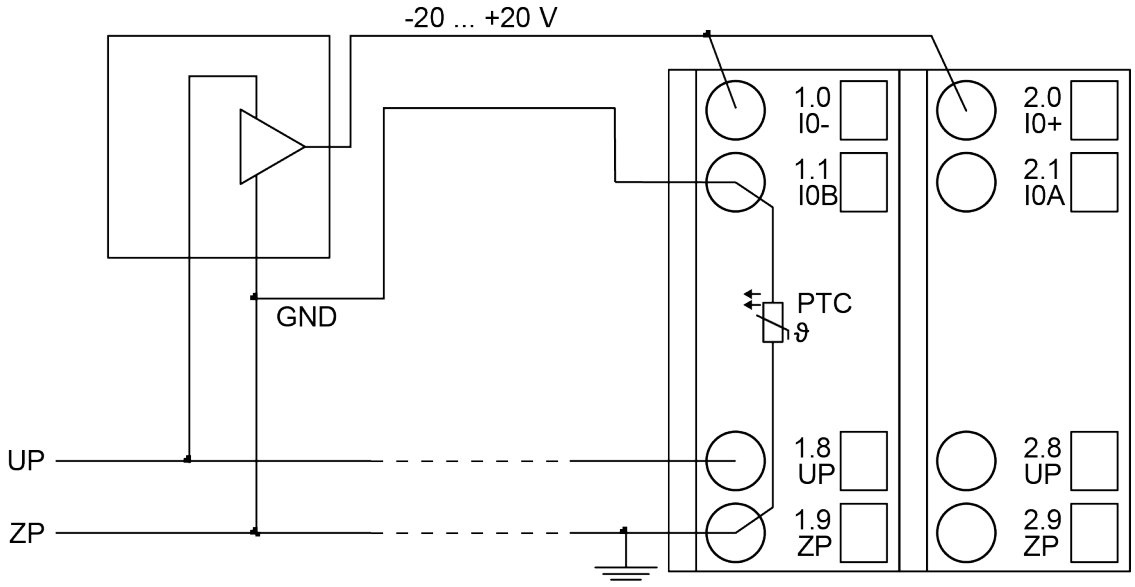

Fig. 135: Connection example

CAUTION!
If GND is not directly connected to ZP at the sensor, the supply current flows via the GND line to ZP. Measuring errors can only occur caused by voltage differences higher than ±20 V DC between GND and ZP.

The measuring range can be configured *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Voltage	Common mode voltage	1 channel used

The function of the LEDs is described under Diagnosis and displays / displays *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

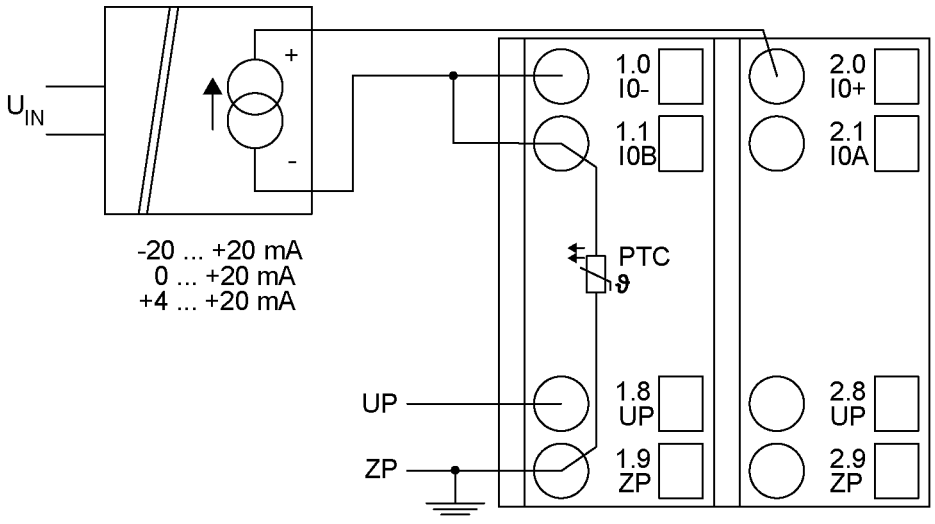

Fig. 136: Connection example

Figure:

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Current	-20 mA...20 mA	1 channel used
Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

The function of the LEDs is described under Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Unused input channels can be left open, because they are of low resistance.

Connection of active-type analog sensors (Current) with galvanically isolated power supply and series-connection of an additional input

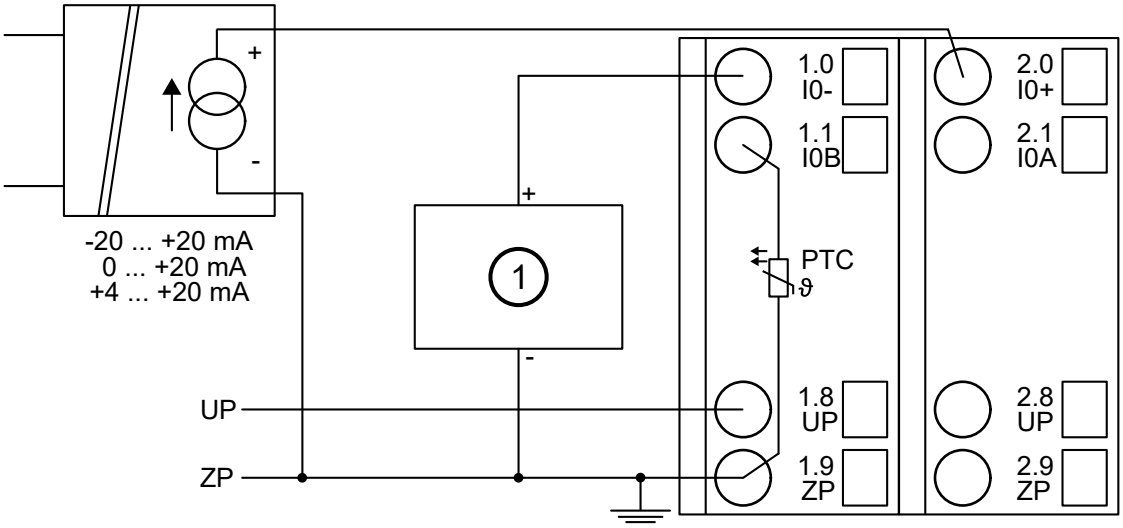

Fig. 137: Connection example

1 Analog input of the second device

> *If series-connection of an additional input is used, the input resistance of the module (ca. 330 Ω) must be added to the input resistance of the second device. Make sure that the maximum permitted load resistance of the analog sensor is not exceeded (see the data sheet of the analog sensor).*

> *The input of the module is not related to ZP. If the input of the second device is related to ZP, the order of sequence in the series-connection must be observed by all means (from the sensor to the module and then to the input of the second device).*

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Current	-20 mA...20 mA	1 channel used
Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

For a description of the functions of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Unused input channels can be left open, because they are of low resistance.

Connection of passive-type analog sensors (Current)

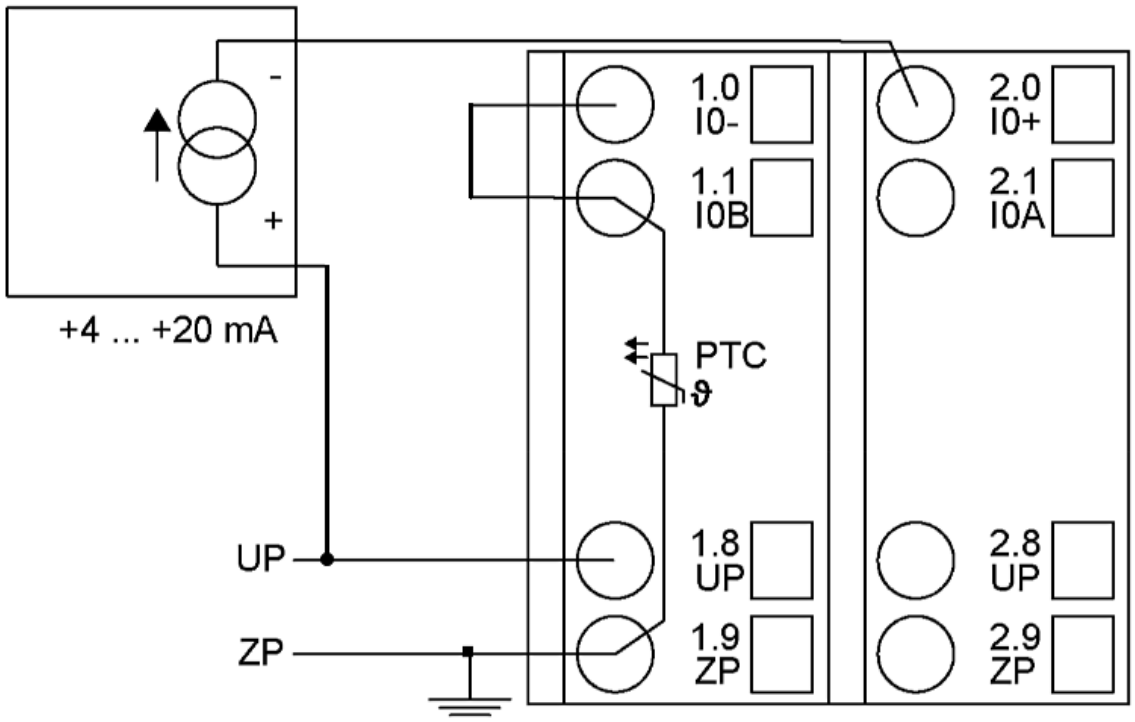

Fig. 138: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Current	-20 mA... 20 mA *)	1 channel used
Current	0 mA... 20 mA *)	1 channel used
Current	4 mA... 20 mA	1 channel used
*) This setting is not applicable with passive-type analog sensors (current).		

The function of the LEDs is described under Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Unused input channels can be left open, because they are of low resistance.

Connection of passive-type analog sensors (Current) and series-connection of an additional analog sensor

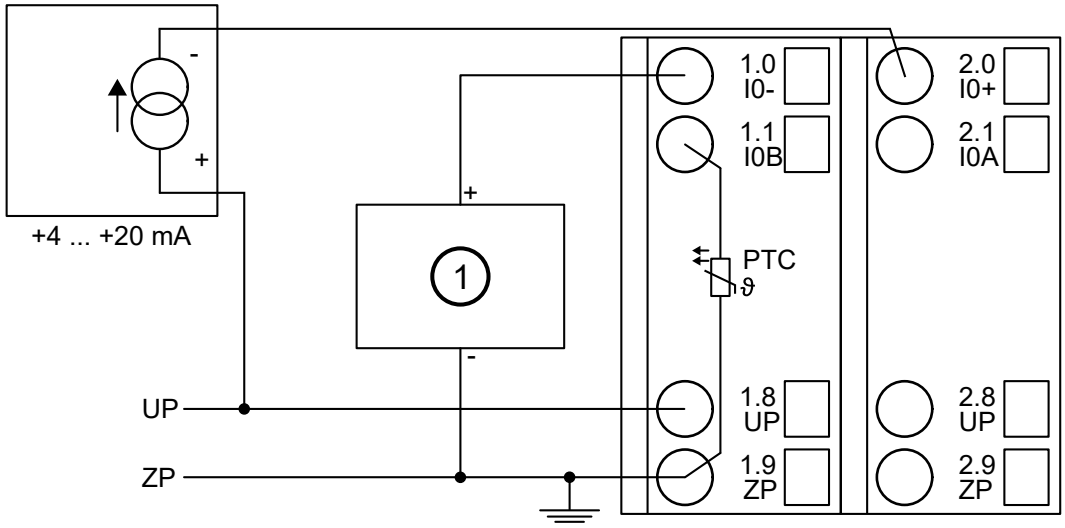

Fig. 139: Connection example

1 Analog input of the second device

> *If series-connection of an additional input is used, the input resistance of the module (ca. 330 Ω) must be added to the input resistance of the second device. Make sure that the maximum permitted load resistance of the analog sensor is not exceeded (see the data sheet of the analog sensor).*

> *The input of the module is not related to ZP. If the input of the second device is related to ZP, the order of sequence in the series-connection must be observed by all means (from the sensor to the module and then to the input of the second device).*

The following measuring ranges can be configured ↬ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Current	-20 mA...20 mA *)	1 channel used
Current	0 mA...20 mA *)	1 channel used
Current	4 mA...20 mA	1 channel used
*) This setting is not applicable with passive-type analog sensors (current).		

The function of the LEDs is described under Diagnosis and displays / displays ↬ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Unused input channels can be left open, because they are of low resistance.

Connection of digital signal sources at analog inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

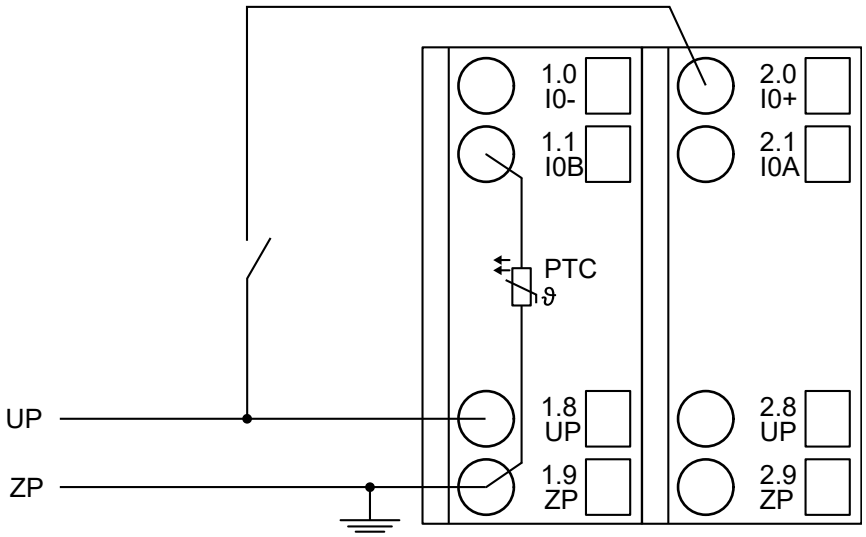

Fig. 140: Connection example

The following operating mode can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899* :

Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

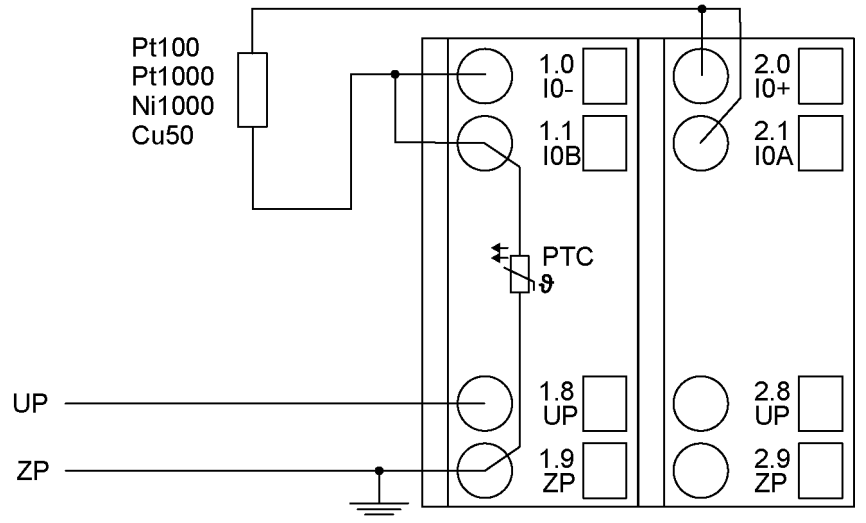

Fig. 141: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Pt100	-50 °C...+70 °C / +400 °C; -200 °C...+850 °C	1 channel used
Pt1000	-50 °C...+400 °C	1 channel used
Ni1000	-50 °C...+150 °C	1 channel used
Cu50	-50 °C...+200 °C (1.426); -200 °C...+200 °C (1.428)	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

The module linearizes the resistance thermometer characteristics.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

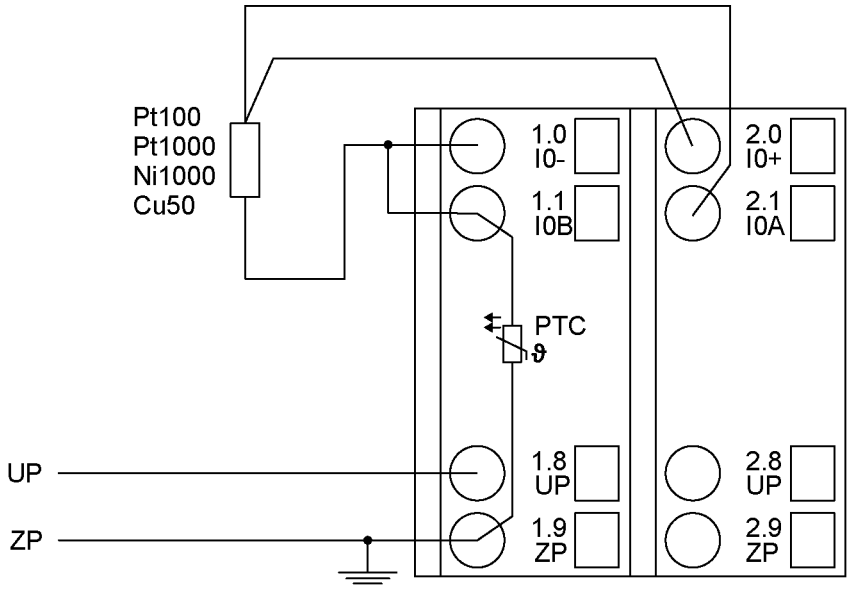

Fig. 142: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*:

Pt100	-50 °C...+70 °C / +400 °C; -200 °C ... +850 °C	1 channel used
Pt1000	-50 °C...+400 °C	1 channel used
Ni1000	-50 °C...+150 °C	1 channel used
Cu50	-50 °C...+200 °C (1.426); -200 °C...+200 °C (1.428)	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means to have all the involved conductors in the same cable. All the conductors must have the same cross section.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 4-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000, Cu50) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

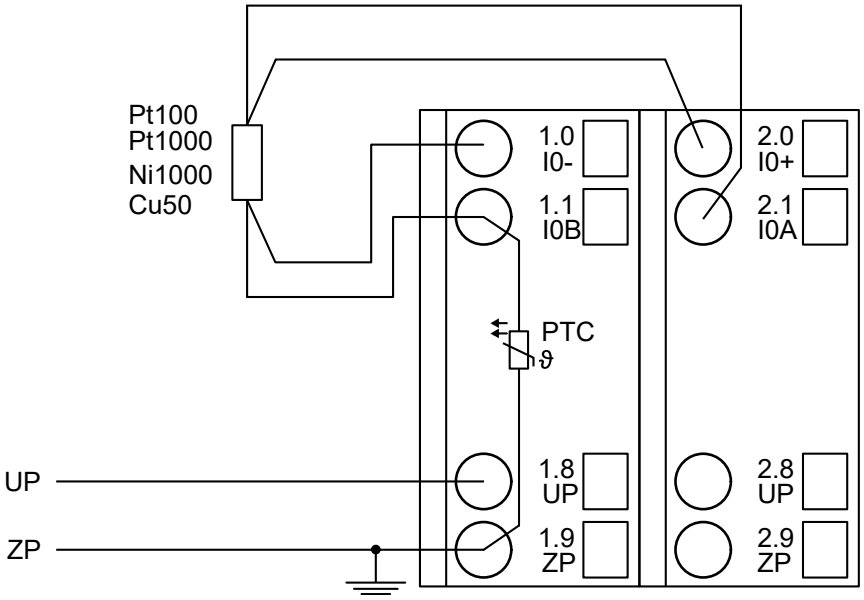

Fig. 143: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 "Parameterization" on page 2899*:

Pt100	-50 °C...+70 °C / +400 °C; -200 °C...+850 °C	1 channel used
Pt1000	-50 °C...+400 °C	1 channel used
Ni1000	-50 °C...+150 °C	1 channel used
Cu50	-50 °C...+200 °C (1.426); -200 °C...+200 °C (1.428)	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 "Diagnosis" on page 2902*.

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means, to have all the involved conductors in the same cable.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistors in 2-wire configuration

For evaluating resistors, a constant current must flow through them to build the necessary voltage drop. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.

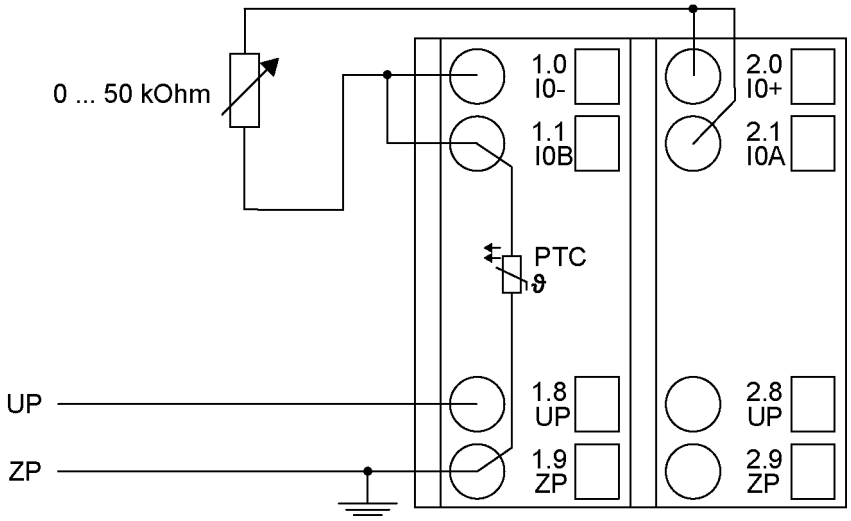

Fig. 144: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899* :

Resistor	50 kΩ	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of a resistance measuring bridge with internal supply

When resistance measuring bridges are connected, the short-circuit-proof voltage output (internal supply) at pin I0A (or I2A, I4A, I6A) must be used. This supply voltage is activated as soon as "Voltage Measurement" is configured for the relevant channel.

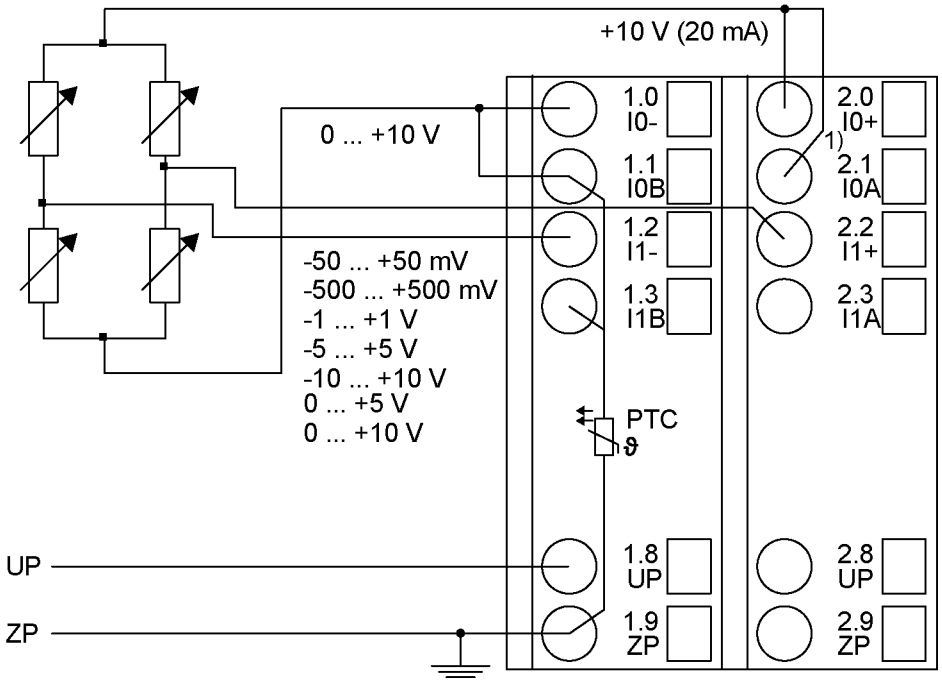

Fig. 145: Connection example

1 Internal supply

All voltage measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899*.

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

Connection of a resistance measuring bridge with external supply

With the connection of a resistance measuring bridge with external supply, the supply voltage is provided separately.

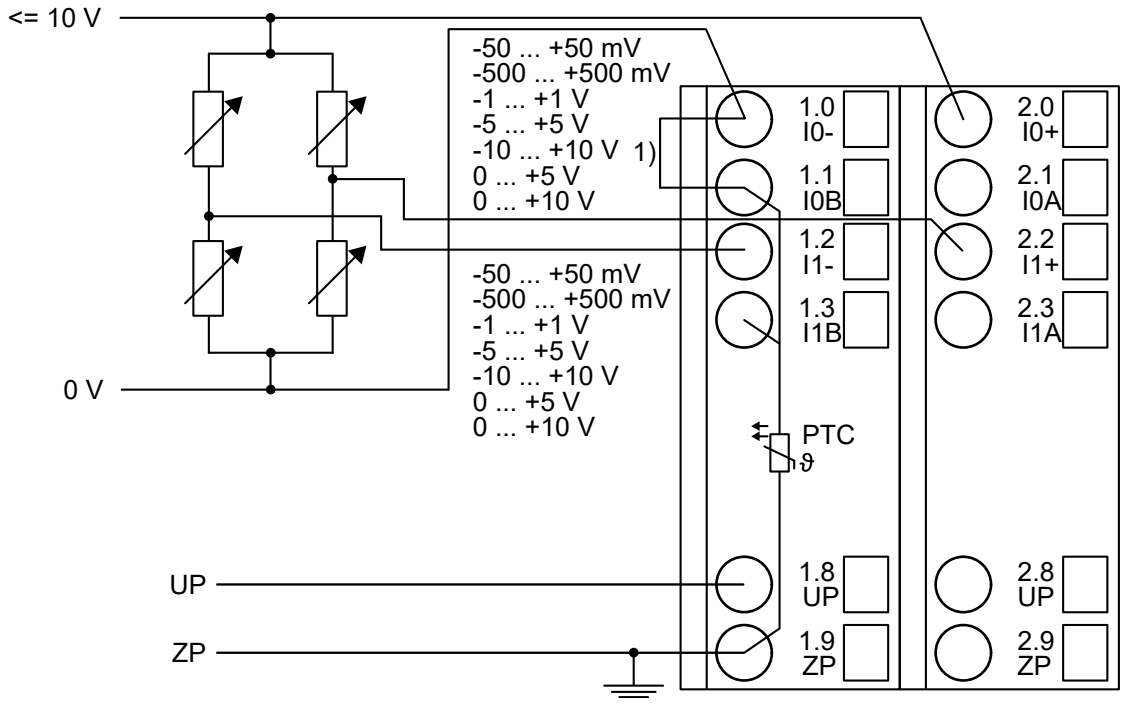

Fig. 146: Connection example

1 Bridge to IxB necessary with galvanically isolated supply

All voltage measuring ranges can be configured ↬ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899* .

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

Connection of thermocouples

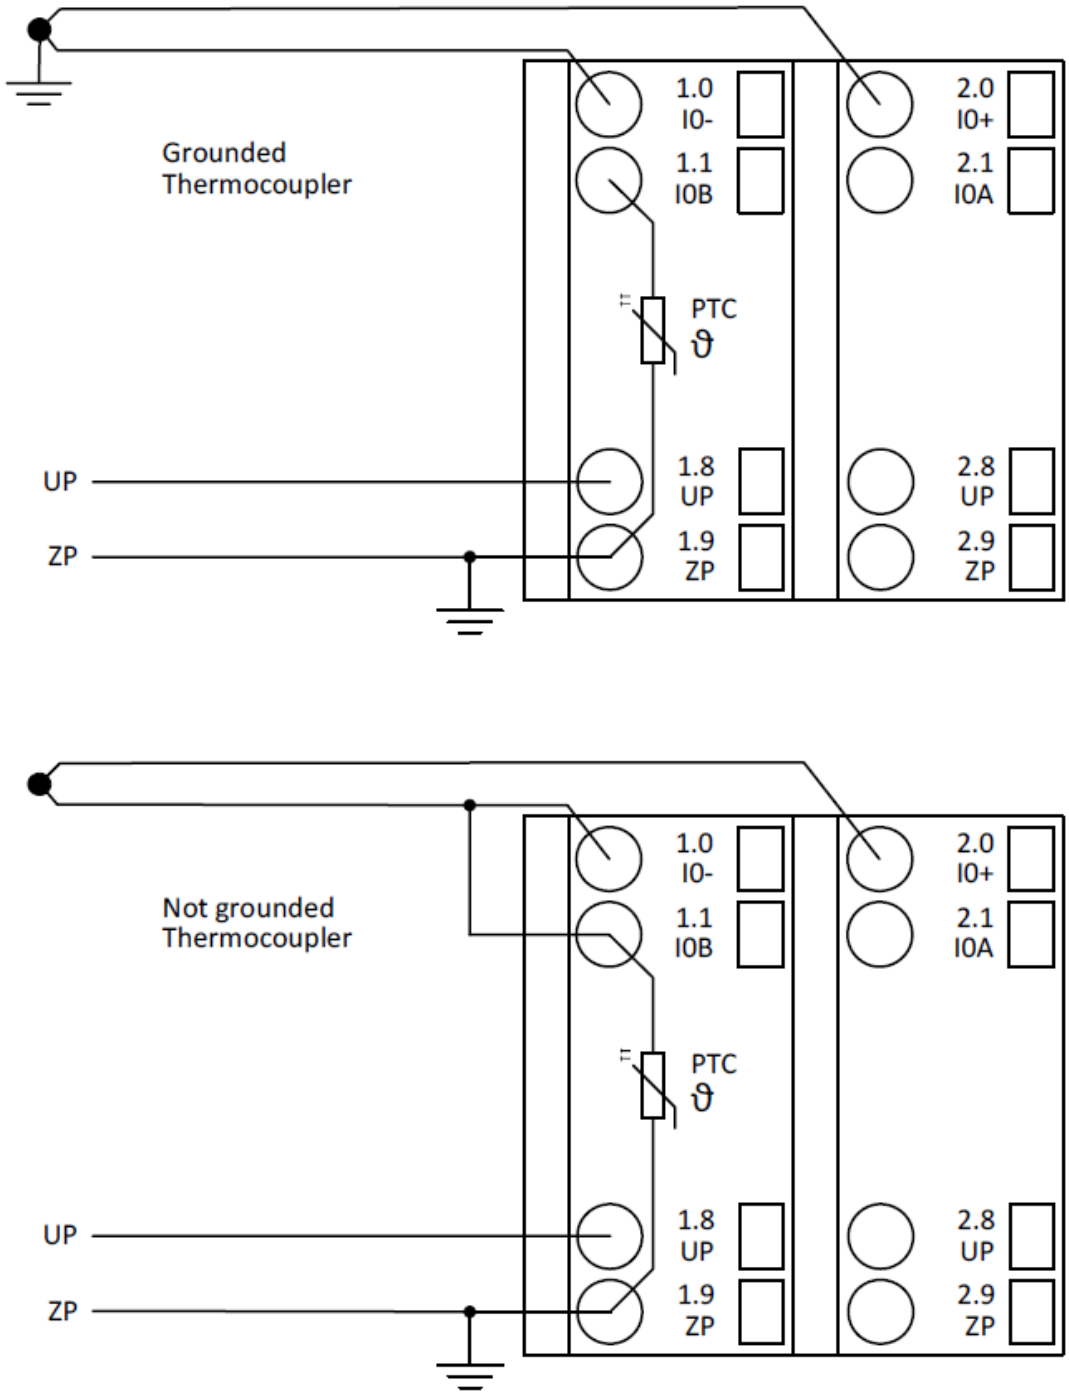

Fig. 147: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.3.6 "Parameterization" on page 2899* :

J type	-210 °C...1200 °C	Fe-CuNi	1 channel used
K type	-270 °C...1372 °C	Ni-CrNi	1 channel used
N type	-270 °C...1300 °C	NiCrSi-NiSi	1 channel used
S type	-50 °C...1768 °C	Pt10Rh-Pt	1 channel used
T type	-270 °C...400 °C	Cu-CuNi	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays ↳ *Chapter 1.6.3.6.2.2.3.7 “Diagnosis” on page 2902*.

The module linearizes the thermocouple characteristics. It supports the following possibilities of temperature compensation and handling with cold junctions:

Internal compensation

An internal temperature sensor which is located next to the terminal unit is used to detect the temperature of the cold junction. So the compensating cables must be connected directly to the terminal unit, where the cold junction is located.

The setting "Internal compensation (default)" for the parameter "Compensation channel" should be selected.

To get more precise temperature measurements, the use of an external compensation method is recommended.

External compensation with temperature input

The temperature for the cold junction can be determinated externally.

A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred to the module via the output data word to all required channels. The possible temperature range is from -25 °C to +60 °C and is monitored by the AI531.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

External compensation with compensation box

A compensation box balances the temperature difference between the cold junction and the reference temperature by generating a bridge voltage. The reference temperature is transferred via the output data word.

The compensation box must fit to the type of thermocouple and is located at the end of the compensating cables, where the cold junction is located. The cabling to the AI531 can be carried out with normal cables. The operating manual of the compensation box also has to be considered.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

External compensation with flanking channel

A flanking channel of the same input group can be used for compensation, e. g. for channel 3, the channels 0, 1 and 2 can be selected as reference channels. The type of sensor for the reference channel can be selected in the parameters for the flanking channel. For example, a RTD sensor which is located next to the thermocouple terminal can be used as reference point for other channels.

The setting "Channel x" for the parameter "Compensation channel" should be selected. Refer to Channel configuration ↳ *Chapter 1.6.3.6.2.2.3.6 “Parameterization” on page 2899* for possible settings.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	0
Analog inputs (words)	8
Analog outputs (words)	1

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

This means that replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

Name	Value	Internal value	Internal value, Type	Default	Min.	Max.	EDS Slot/ Index
Module ID	Internal	1535 [1])	Word	1535 0x05ff	0	65535	0x0Y01

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 expansion module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies dependent of the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

States of the LEDs (see also section Diagnosis LEDs in the S500 system data):

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Inputs I0...I3 and I4...I7	Analog input	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
	UP	Process voltage 24 V DC via terminal	Green	Process voltage is missing	Process voltage OK	--
	CH-ERR2	Channel error, messages in groups (analog inputs combined into the groups 2 and 4)	Red	No error, or process voltage is missing	Severe error within the corresponding group	Error on one channel of the group
	CH-ERR4		Red			
	CH-ERR *)	Module error	Red	--	Internal error	--
	*) Both LEDs CH-ERR2 and CH-ERR4 light up together

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		

Parameter		Value
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	Current consumption from UP in normal operation	130 mA
	Inrush current from UP (at power up)	0.056 A^2s
Max. length of analog cables, conductor cross section > 0.14 mm^2		100 m
Weight		130 g
Mounting position		Horizontal or vertical with derating (max. temperature 40 °C)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter	Value
Number of channels per module	8
Distribution of channels into groups	2 groups of 4 channels each
Connections of the channels I0 to I3	Terminals 1.0 to 1.7 and terminals 2.0 to 2.7
Connections of the channels I4 to I7	Terminals 3.0 to 3.7 and terminals 4.0 to 4.7
Input type	Bipolar (not with current or Pt100/ Pt1000/ Ni1000/ Cu50/ resistor)
Galvanic isolation	Against internal supply and other modules
Common mode input range	±20 V DC plus signal voltage
Configurability	Digital input, -50 mV...+50 mV, -500mV...+500 mV, -1 V...+1 V, -5 V...+5 V, -10 V...+10 V, 0 V...+5 V, 0 V...+10 V, -20 mA...+20 mA, 0 mA...20 mA, 4 mA...20 mA, Pt100, Pt1000, Ni1000, Cu50, resistor, thermocouple types J, K, N, S, T (each input can be configured individually)
Channel input resistance	Voltage: > 100 kΩ, current: ca. 330 Ω
Time constant of the input filter	Line-frequency suppression 50 Hz, 60 Hz, none
Indication of the input signals	1 yellow LED per channel, the brightness depends on the value of the analog signal

Parameter		Value		
Conversion time		1 ms (none), 100 ms (50 Hz / 60 Hz) per channel		
Resolution		Range	unipolar	15 bits
			bipolar	15 bits + sign
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ.	±0.1 % (voltage) ±0.3 % (current, resistor) at 25 °C	
		Max.	±0.7 % (voltage) ±0.9 % (current, resistor) ±0.5 % (thermocouple type J, N, S, T; thermocouple type K > -220 °C) 1.0 K (resistance temperature detectors) at 0 °C...60 °C or EMC disturbance	
Maximum permanent allowed overload (no damage)				
	Current input	When the input current exceeds the overflow value of the measurement range, the input impedance is switched to high impedance for protection. The maximum allowed overload is then 30 V. The digital value corresponds to the overflow value. Periodically, the input impedance is switched to the normal value and the input current is measured. If the input current is within the measurement range, the input impedance remains at the normal level and the digital value corresponds to the measured current.		
	Voltage input	30 V		
Relationship between input signal and hex code		*Table 500 “Channel monitoring” on page 2902*		
Unused voltage inputs		Are configured as "unused"		
Unused current inputs		Have a low resistance, can be left open-circuited		
Overvoltage protection		Yes		

Technical data of the analog inputs if used as digital inputs

Parameter	Value
Number of channels per module	Max. 8
Distribution of channels into groups	2 groups of 4 channels each
Connections of the channels I0+ to I3+	Terminals 2.0, 2.2, 2.4, 2.6
Connections of the channels I4+ to I7+	Terminals 4.0, 4.2, 4.4, 4.6
Reference potential for the inputs	Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)

Parameter		Value
Input delay		Typ. 2 ms
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	Typ. 1 mA
	Input voltage +15 V	Typ. 3.1 mA
	Input voltage +30 V	< 7 mA
Input resistance		Ca. 4.8 kΩ

Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 250 600 R0001	AI531, analog input module, 8 AI, U/I/Pt100, TC, 15 bits + sign, 4-wires	Active

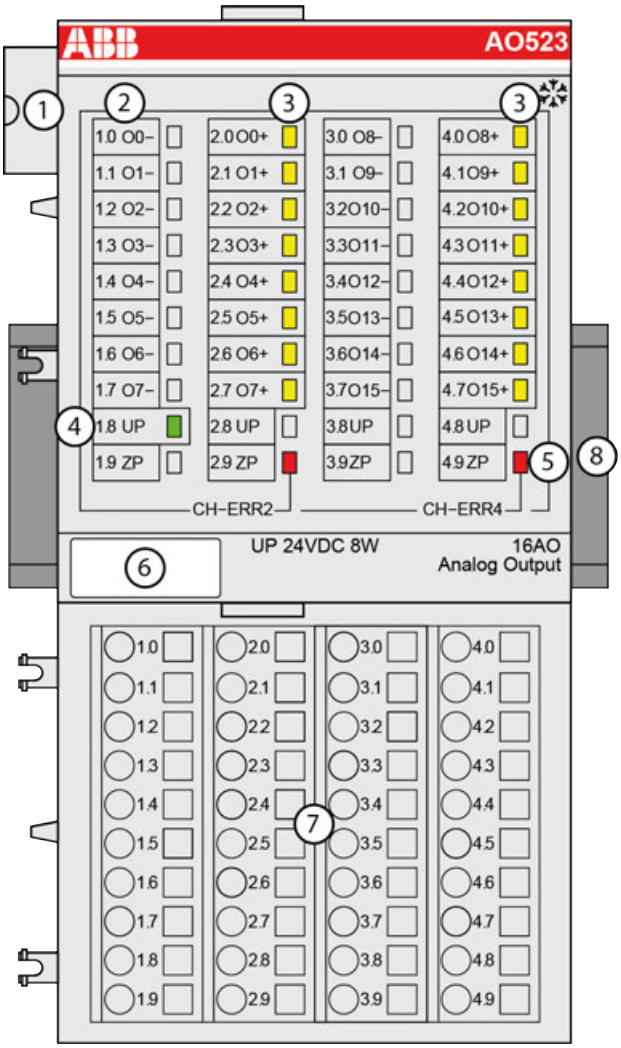
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

AO523 - Analog output module

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog outputs (O0 - O15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

- 16 analog outputs in two groups:
  - 8 channels configurable for voltage or currrent output (O0...O3 / O8...O11)
  - 8 channels for voltage output (O4...O7 / O12...O15)

  Resolution 12 bits plus sign

Parameter		Value
Resolution of the analog channels		
	Voltage -10 V...+10 V	12 bits plus sign
	Current 0 mA...20 mA, 4 mA...20 mA	12 bits
LED displays		19 LEDs for signals and error messages
Internal power supply		Through the I/O bus interface (I/O bus)
External power supply		Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit		TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The modules are plugged on an I/O terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC

Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	O0- to O7-	Negative poles of the first 8 analog outputs
2.0 to 2.7	O0+ to O7+	Positive poles of the first 8 analog outputs
3.0 to 3.7	O8- to O15-	Negative poles of the following 8 analog outputs
4.0 to 4.7	O8+ to O15+	Positive poles of the following 8 analog outputs

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AO523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the module:

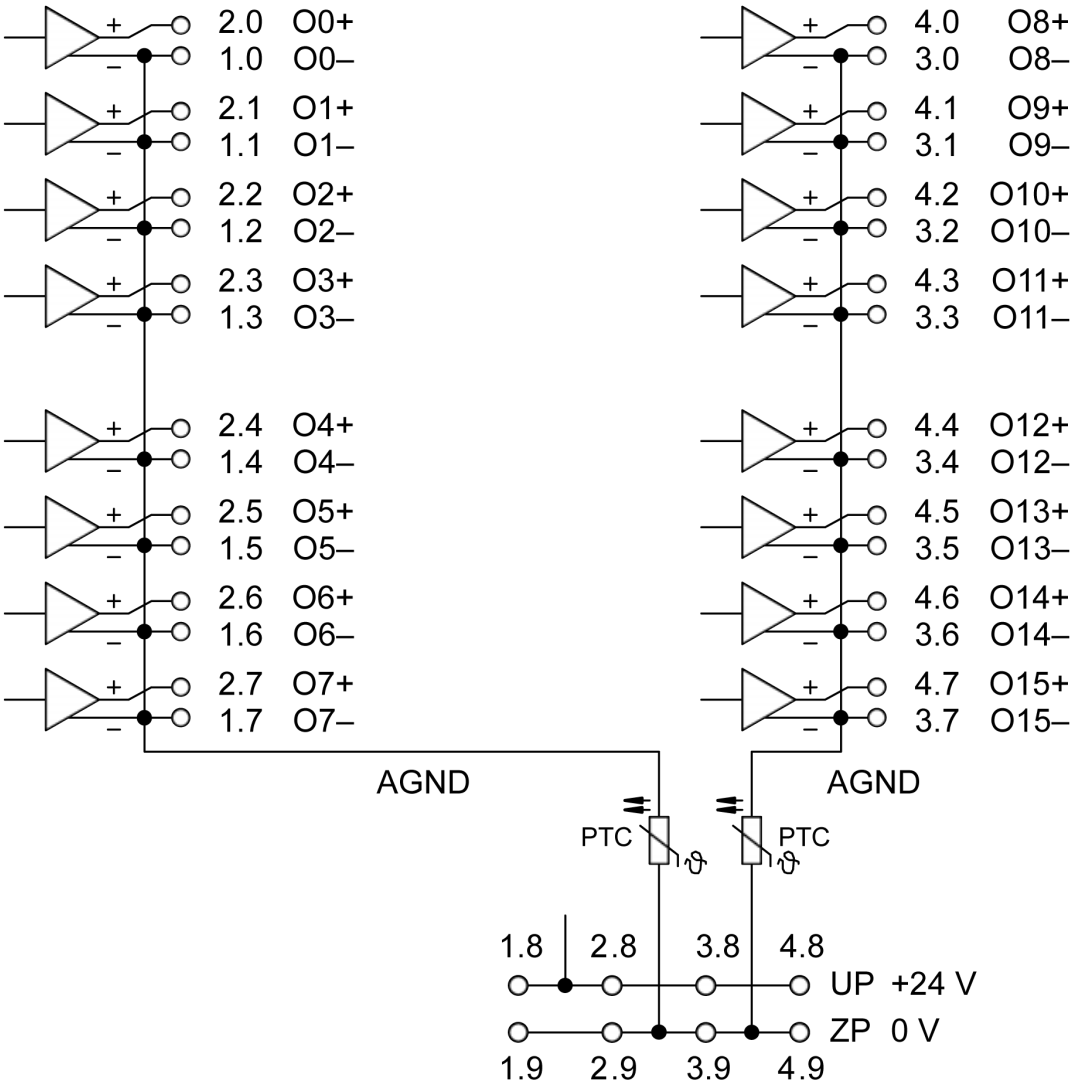


Fig. 148: 16 analog outputs in two groups *Chapter 1.6.3.6.2.2.4.2 “Functionality” on page 2913*

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The modules provide several diagnosis functions *Chapter 1.6.3.6.2.2.4.7 “Diagnosis” on page 2922*.

Connection of analog output loads (Voltage, current)

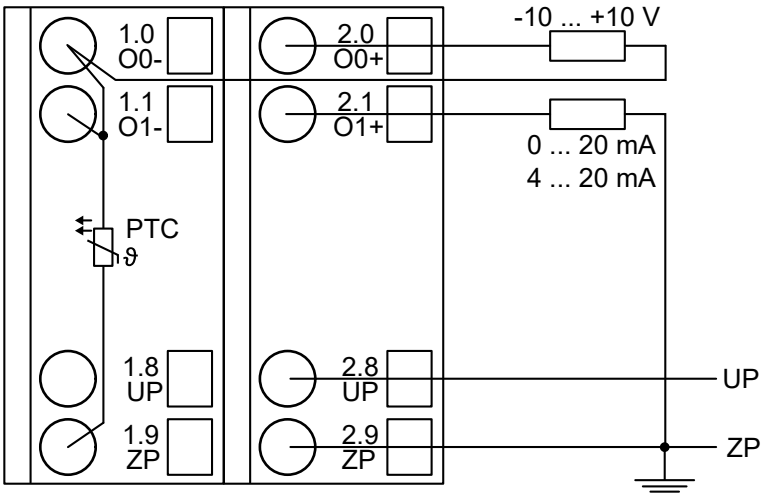

Fig. 149: Connection example

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.2.2.4.6 “Parameterization” on page 2918*:

Voltage	-10 V...+10 V	Load max. ±10 mA	1 channel used
Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4...20 mA	Load 0 Ω...500 Ω	1 channel used

Only the channels 0...3 and 8...11 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

The function of the LEDs is described under Displays.

Unused analog outputs can be left open-circuited.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	0
Counter input data (words)	0
Counter output data (words)	16

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies dependent of the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Outputs O0...O7 and O8...O15	Analog output	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
	UP	Process voltage 24 V DC via terminal	Green	Process voltage is missing	Process voltage OK	--
	CH-ERR2	Channel error, error messages in groups (analog inputs or outputs combined into the groups 2 and 4)	Red	No error or process voltage is missing	Severe error within the corresponding group	Error on one channel of the group
	CH-ERR4		Red			
	CH-ERR *)	Module error	Red	--	Internal error	--
	*) Both LEDs (CH-ERR2 and CH-ERR4) light up together

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	Current consumption from UP at normal operation	0.15 A + output loads
	Inrush current from UP (at power up)	0.040 A^2s
Max. length of analog cables, conductor cross section > 0.14 mm^2		100 m
Weight		300 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog outputs

Parameter		Value	
Number of channels per module		16, of which channnels O0...O3 and O8...O11 for voltage and current, and channels O4...7 and O12...15 only for voltage	
Distribution of channels into groups		2 groups of 8 channels each	
	Channels O0-...O7-	Terminals 1.0...1.7	
	Channels O0+...O7+	Terminals 2.0...2.7	
	Channels O8-...O15-	Terminals 3.0...3.7	
	Channels O8+...O15+	Terminals 4.0...4.7	
Output type		Bipolar with voltage, unipolar with current	
Galvanic isolation		Against internal supply and other modules	
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually), current outputs only channels 0...3 and 8...11	
Output resistance (load), as current output		0 Ω...500 Ω	
Output loadability, as voltage output		Max. ±10 mA	
Indication of the output signals		One LED per channel	
Resolution		12 bits (+ sign)	
Settling time for full range change (resistive load, output signal within specified tolerance)		Typ. 5 ms	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C	
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance	
Relationship between output signal and hex code		*Chapter 1.6.3.6.2.2.4.9 “Output ranges” on page 2924*	
Unused outputs		Can be left open-circuited	

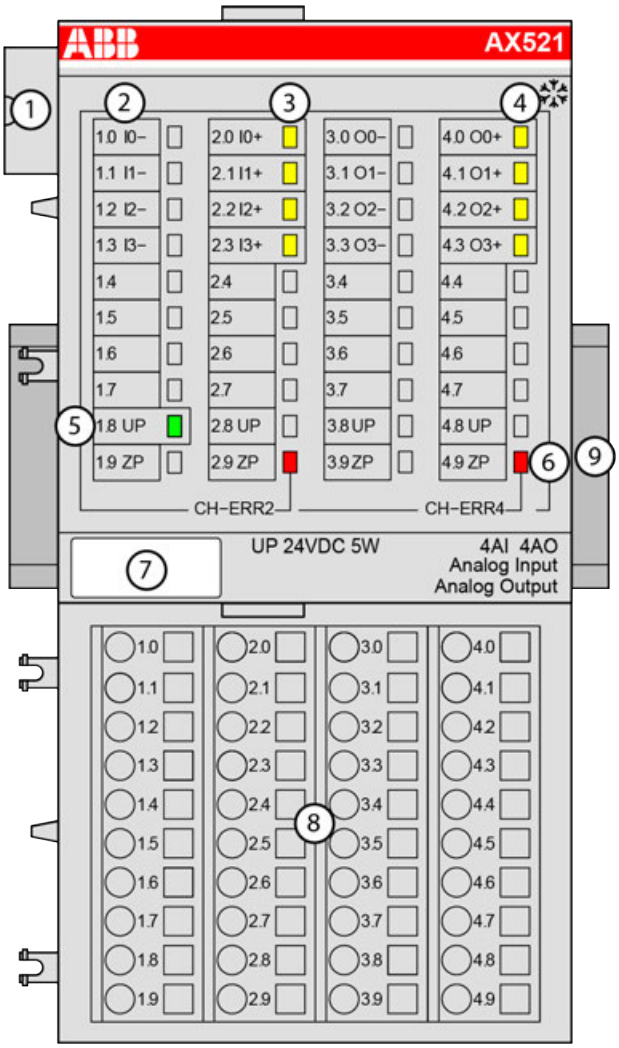
Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 250 200 R0001	AO523, analog output module, 16 AO, U/I, 12 bits + sign, 2-wires	Active
1SAP 450 200 R0001	AO523-XC, analog output module, 16 AO, U/I, 12 bits + sign, 2-wires, XC version	Active

**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

AX521 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group (1.0...2.3)
  Resolution 12 bits plus sign
- 4 configurable analog outputs (O0 to O3) in 1 group (3.0...4.3)
  Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 4 yellow LEDs to display the signal states at the analog inputs (I0 - I3)
4 4 yellow LEDs to display the signal states at the analog outputs (O0 - O3)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

AX521

4 analog inputs (I0...I3), individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Parameter		Value
Resolution of the analog channels		
	Voltage -10 V... +10 V	12 bits plus sign
	Voltage 0 V...10 V	12 bits
	Current 0 mA...20 mA, 4 mA...20 mA	12 bits
	Temperature	0.1 °C
LED displays		11 LEDs for signals and error messages
Internal power supply		Via the I/O bus interface (I/O bus)
External power supply		Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit		TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The modules are plugged on an I/O terminal unit *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC

Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.3	I0- to I3-	Negative poles of the 4 analog inputs
2.0 to 2.3	I0+ to I3+	Positive poles of the 4 analog inputs
3.0 to 3.3	O0- to O3-	Negative poles of the 4 analog outputs
4.0 to 4.3	O0+ to O3+	Positive poles of the 4 analog outputs

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the I/O module.

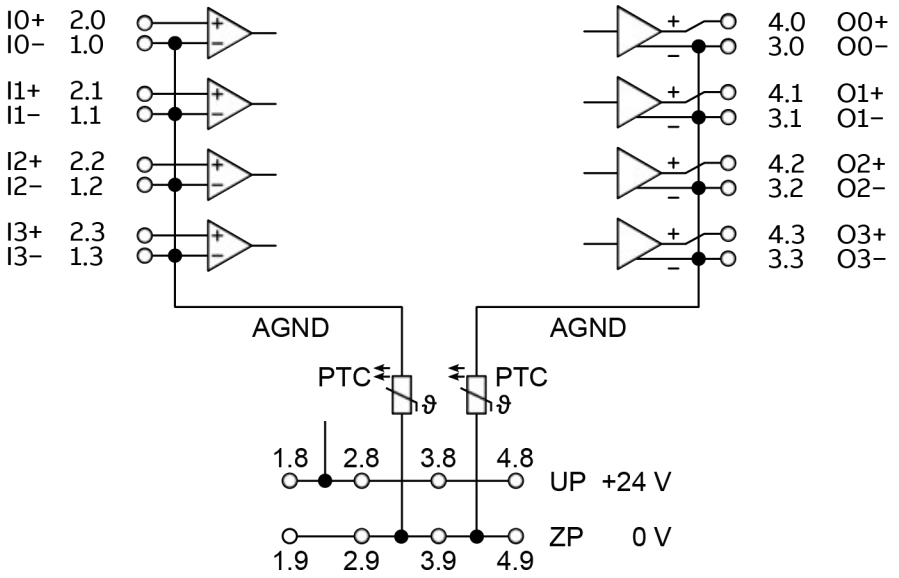


Fig. 150: 4 analog inputs and 4 analog outputs, individually configurable ↬ *Chapter 1.6.3.6.2.2.5.2 “Functionality” on page 2928*

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

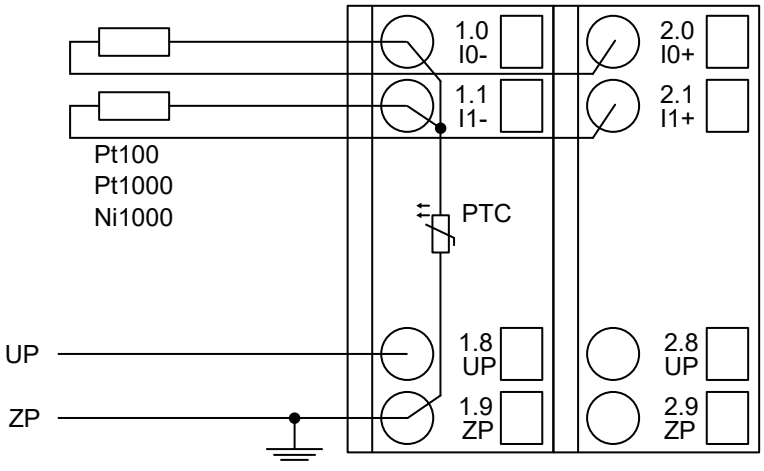

Fig. 151: Connection example

Pt100	-50 °C...+70 °C	2-wire configuration, one channel used
Pt100	-50 °C...+400 °C	2-wire configuration, one channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, one channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, one channel used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

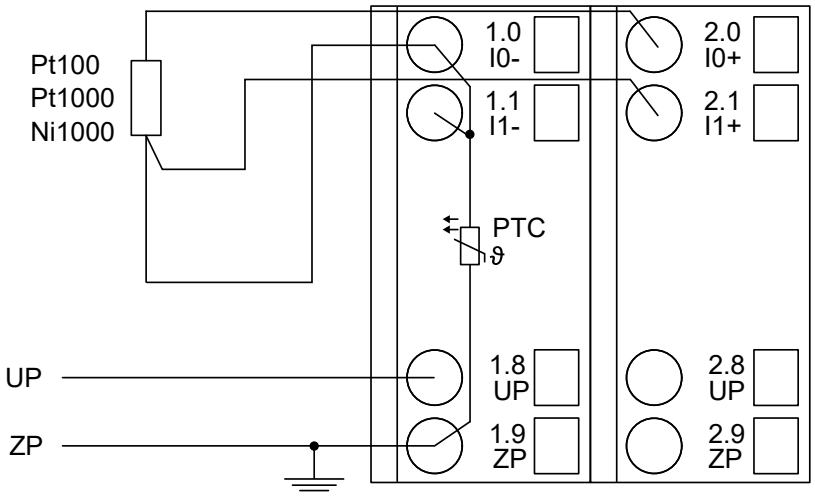

Fig. 152: Connection example

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Pt100	-50 °C...+70 °C	3-wire configuration, two channels used
Pt100	-50 °C...+400 °C	3-wire configuration, two channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, two channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, two channels used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

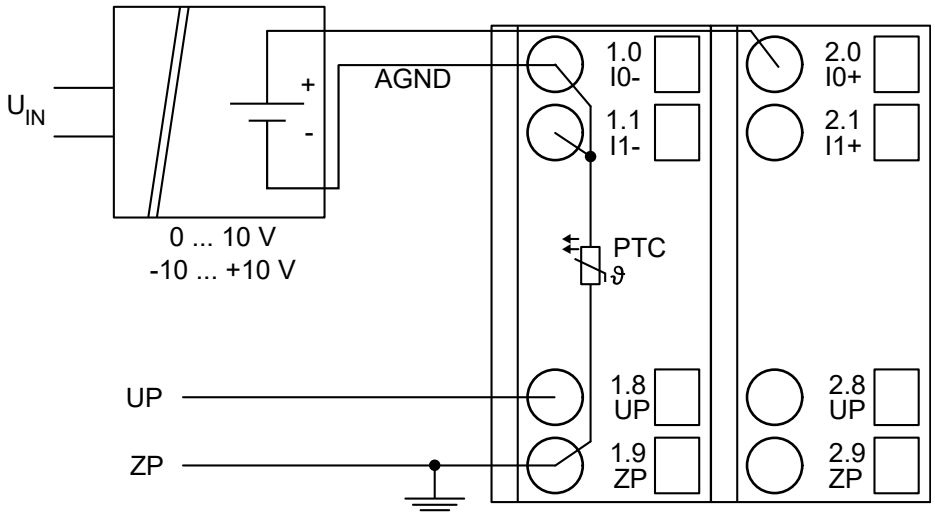

Fig. 153: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 ↳ *Chapter 1.6.3.6.2.2.5.6 "Parameterization" on page 2938* and for AX522 ↳ *Chapter 1.6.3.6.2.2.6.6 "Parameterization" on page 2963*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

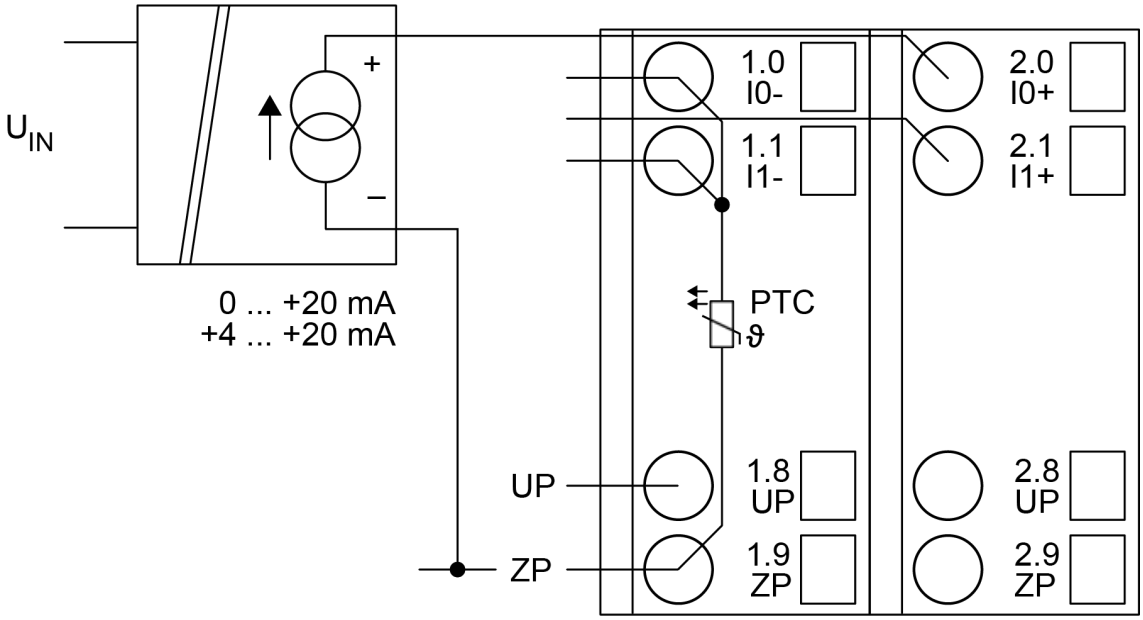

Fig. 154: Connection example

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

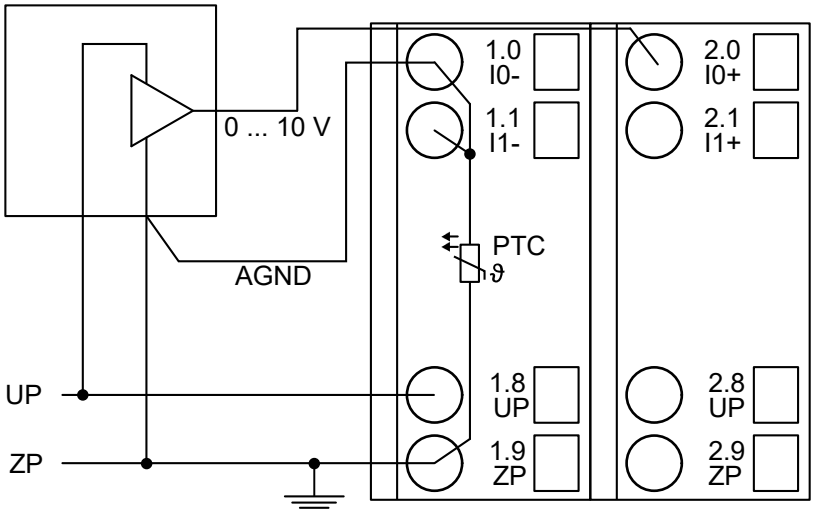

Fig. 155: Connection example

CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V *)	1 channel used

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

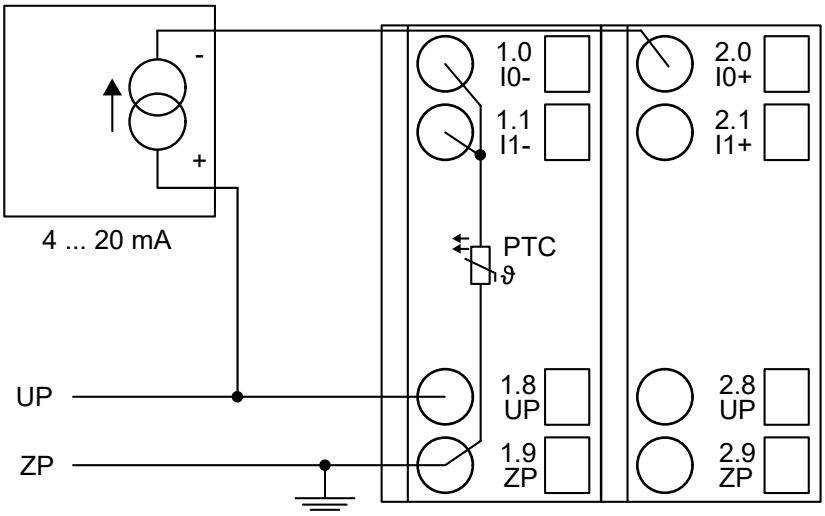

Fig. 156: Connection example

Current	4 mA...20 mA	1 channel used

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

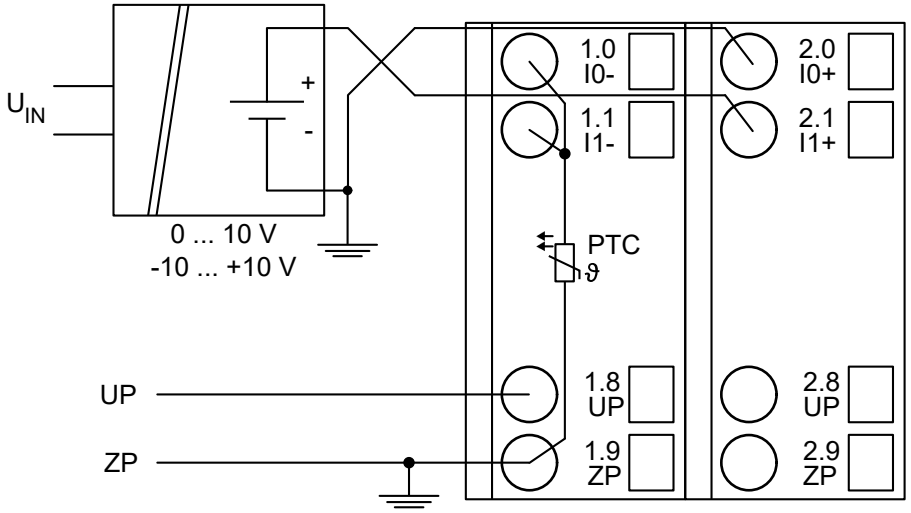

Fig. 157: Connection example

The negative pole of the sensor must be grounded next to the sensor.

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

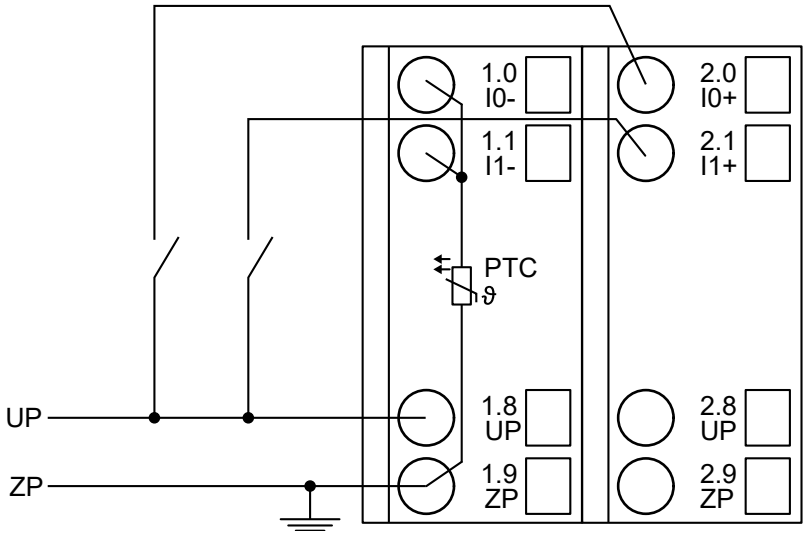

Fig. 158: Connection example

Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

Connection of analog output loads (Voltage, current)

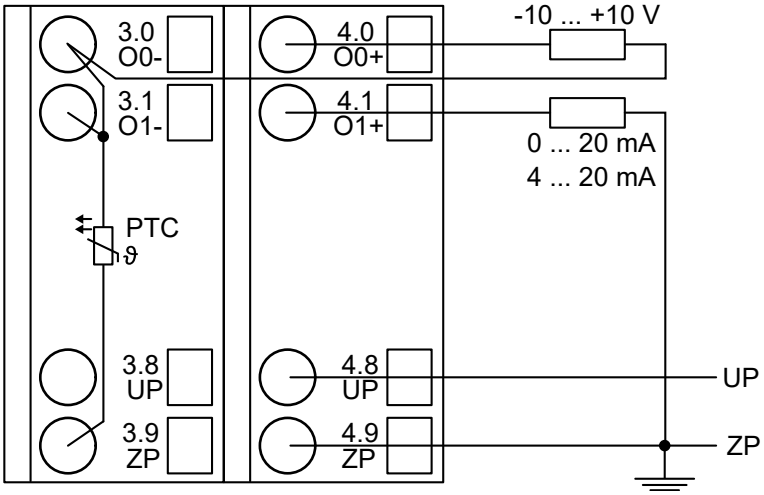

Fig. 159: Connection example

Voltage	-10 V...+10 V	Load max. ±10 mA	1 channel used
Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

Unused analog outputs can be left open-circuited.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	0
Counter input data (words)	4
Counter output data (words)	4

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

4	14	1...10	3	4...7	8...15	7	Analog value under-flow at an analog output	Check output value
	11 / 12	ADR	1...10					

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Inputs I0...I3	Analog input	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
	Outputs O0...O3	Analog output	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
	UP	Process voltage 24 V DC via terminal	Green	Process voltage is missing	Process voltage OK	--
	CH-ERR2	Channel error, error messages in groups (analog inputs or outputs combined into the groups 2 and 4)	Red	No error or process voltage is missing	Severe error within the corresponding group	Error on one channel of the group
	CH-ERR4		Red			
	CH-ERR *)	Module error	Red	--	Internal error	--
	*) Both LEDs (CH-ERR2 and CH-ERR4) light up together					

Measuring ranges

Input ranges of voltage, current and digital input

The represented resolution corresponds to 16 bits.

Range	0...10 V	-10...+10 V	0...20 mA	4...20 mA	Digital input	Digital value

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation	0.15 A + output loads
Inrush current from UP (at power up)		0.020 A^2s

Parameter	Value
Max. length of analog cables, conductor cross section > 0.14 mm²	100 m
Weight	300 g
Mounting position	Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter	Value	
Number of channels per module	4	
Distribution of channels into groups	1 group of 4 channels	
Connections of the channels I0- to I3-	Terminals 1.0 to 1.3	
Connections of the channels I0+ to I3+	Terminals 2.0 to 2.3	
Input type	Bipolar (not with current or Pt100/Pt1000/Ni1000)	
Galvanic isolation	Against internal supply and other modules	
Configurability	0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)	
Channel input resistance	Voltage: > 100 kΩ Current: ca. 330 Ω	
Time constant of the input filter	Voltage: 100 µs Current: 100 µs	
Indication of the input signals	One LED per channel	
Conversion cycle	2 ms (for 8 inputs + 8 outputs), with Pt/Ni... 1 s	
Resolution	Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between input signal and hex code	See tables *Chapter 1.6.3.6.2.2.5.9.1 “Input ranges of voltage, current and digital input” on page 2945*	

Parameter	Value
Unused voltage inputs	Are configured as "unused"
Unused current inputs	Have a low resistance, can be left open-circuited
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels I0+ to I3+		Terminals 2.0 to 2.3
Reference potential for the inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)
Input signal delay		Typ. 8 ms, configurable from 0.1 to 32 ms
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 4.3 mA
	Input voltage +30 V	< 9 mA
Input resistance		ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		4, all channels for voltage and current
Distribution of channels into groups		1 group of 4 channels
	Channels O0-...O3-	Terminals 3.0...3.3
	Channels O0+...O3+	Terminals 4.0...4.3
Output type		Bipolar with voltage, unipolar with current
Galvanic isolation		Against internal supply and other modules
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually), current outputs only channels 0...3
Output resistance (load), as current output		0 Ω...500 Ω
Output loadability, as voltage output		Max. ±10 mA
Indication of the output signals		One LED per channel
Resolution		12 bits (+ sign)

Parameter	Value	
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between output signal and hex code	See table *Chapter 1.6.3.6.2.2.5.9.3 "Output ranges voltage and current" on page 2946*	
Unused outputs	Can be left open-circuited	

Ordering Data

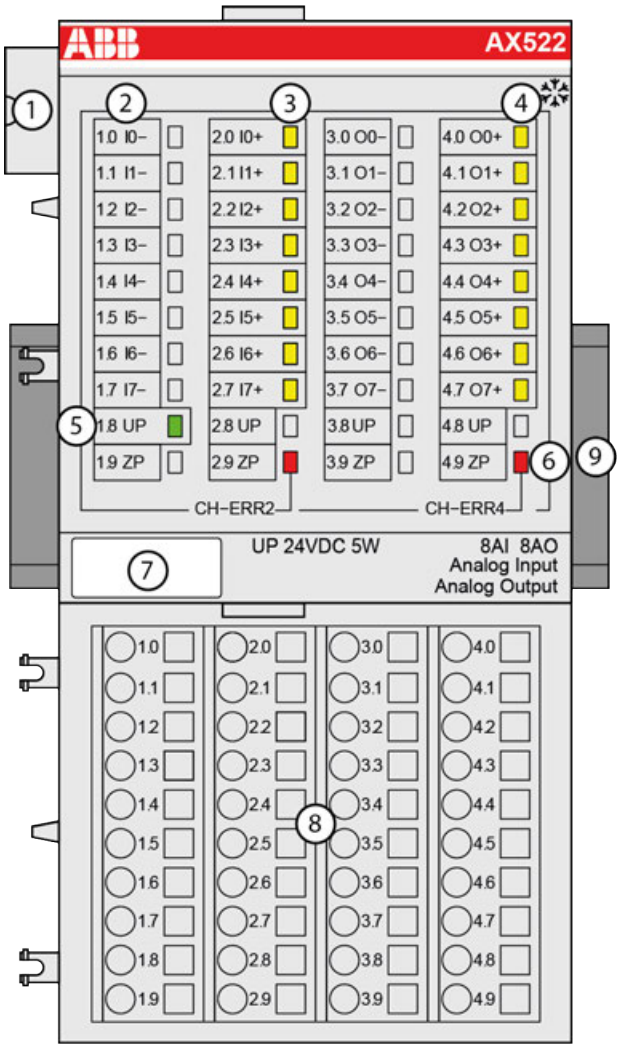
AX522 - Analog input/output module

- 8 configurable analog inputs (I0 to I7) in 1 group (1.0...2.7)
  Resolution 12 bits plus sign
- 8 configurable analog outputs (O0 to O7) in 1 group (3.0...4.7)
  Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the analog inputs (I0 - I7)
4 8 yellow LEDs to display the signal states at the analog outputs (O0 - O7)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

8 analog inputs (I0...I7), individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA

- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs (O4...O7), individually configurable for

- Unused (default setting)
- -10 V...+10 V

Parameter		**Value**
Resolution of the analog channels		
	Voltage -10 V...+10 V	12 bits plus sign
	Voltage 0 V...10 V	12 bits
	Current 0 mA...20 mA, 4 mA...20 mA	12 bits
	Temperature	0.1 °C
LED displays		19 LEDs for signals and error messages
Internal power supply		Via the I/O bus interface (I/O bus)
External power supply		Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit		TU515 or TU516 ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The modules are plugged on an I/O terminal unit ↳ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ↳ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9,3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC

Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	I0- to I7-	Negative poles of the 8 analog inputs
2.0 to 2.7	I0+ to I7+	Positive poles of the 8 analog inputs
3.0 to 3.7	O0- to O7-	Negative poles of the 8 analog outputs
4.0 to 4.7	O0+ to O7+	Positive poles of the 8 analog outputs

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the I/O module.

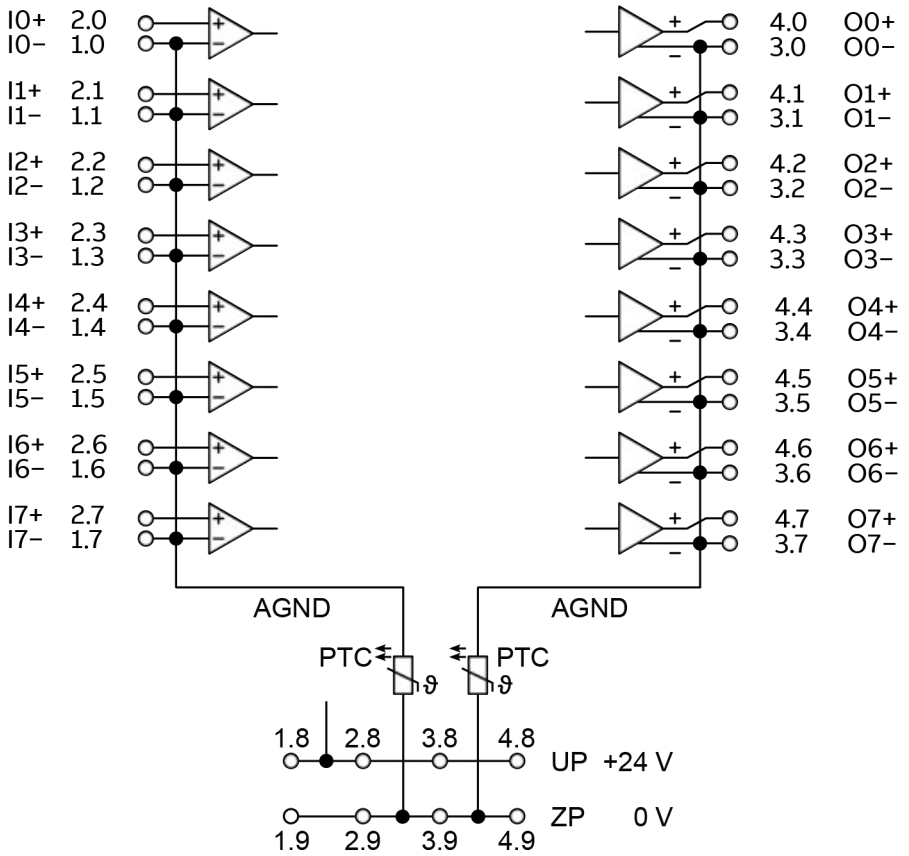


Fig. 160: 8 analog inputs and 8 analog outputs, individually configurable ↳ *Chapter 1.6.3.6.2.2.6.2 “Functionality” on page 2951*

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

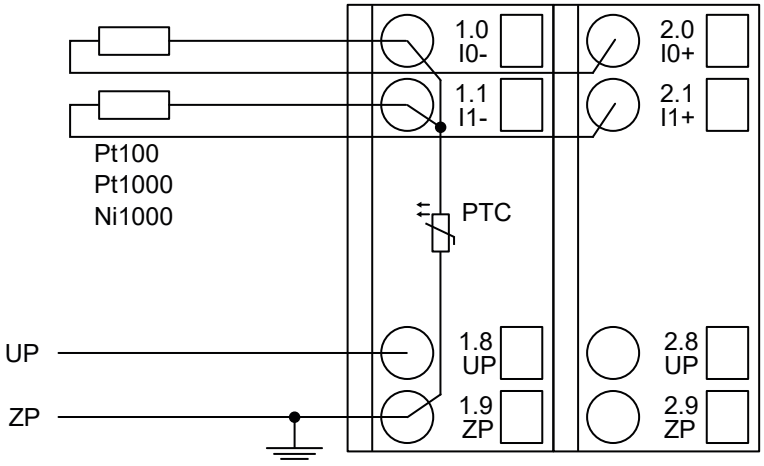

Fig. 161: Connection example

Pt100	-50 °C...+70 °C	2-wire configuration, one channel used
Pt100	-50 °C...+400 °C	2-wire configuration, one channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, one channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, one channel used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

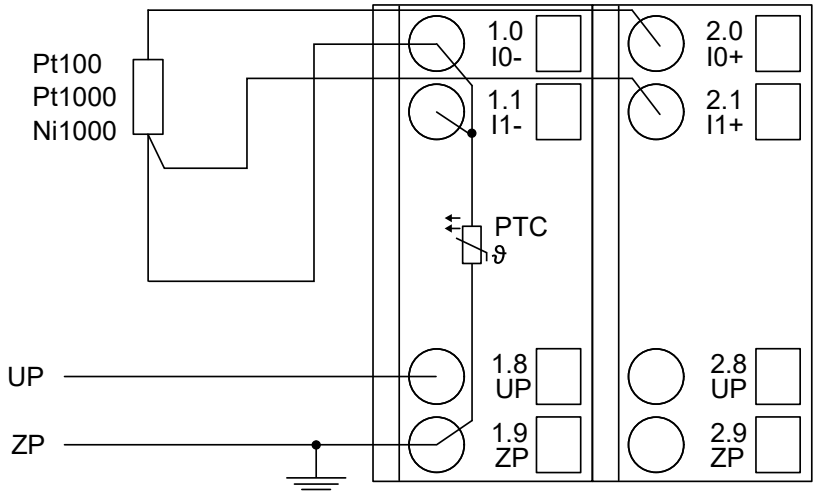

Fig. 162: Connection example

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Pt100	-50 °C...+70 °C	3-wire configuration, two channels used
Pt100	-50 °C...+400 °C	3-wire configuration, two channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, two channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, two channels used

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

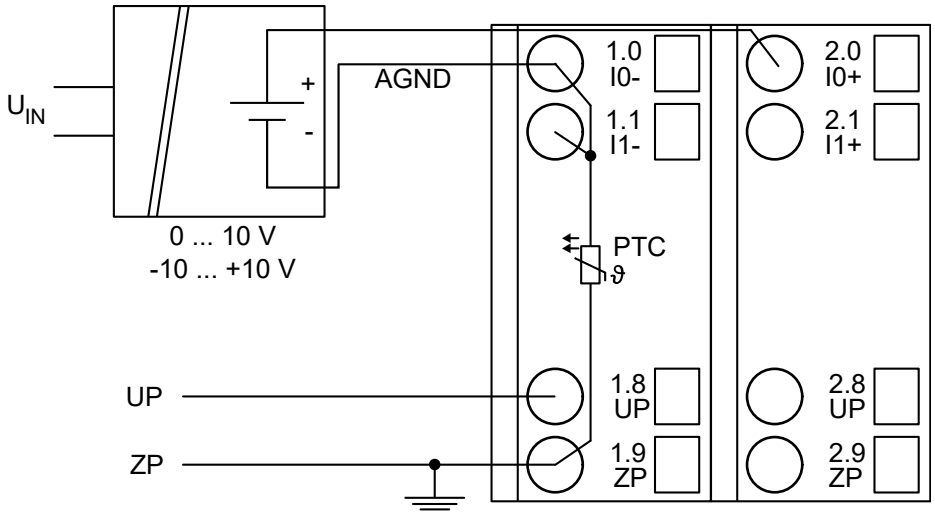

Fig. 163: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 ↳ *Chapter 1.6.3.6.2.2.5.6 “Parameterization” on page 2938* and for AX522 ↳ *Chapter 1.6.3.6.2.2.6.6 “Parameterization” on page 2963*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

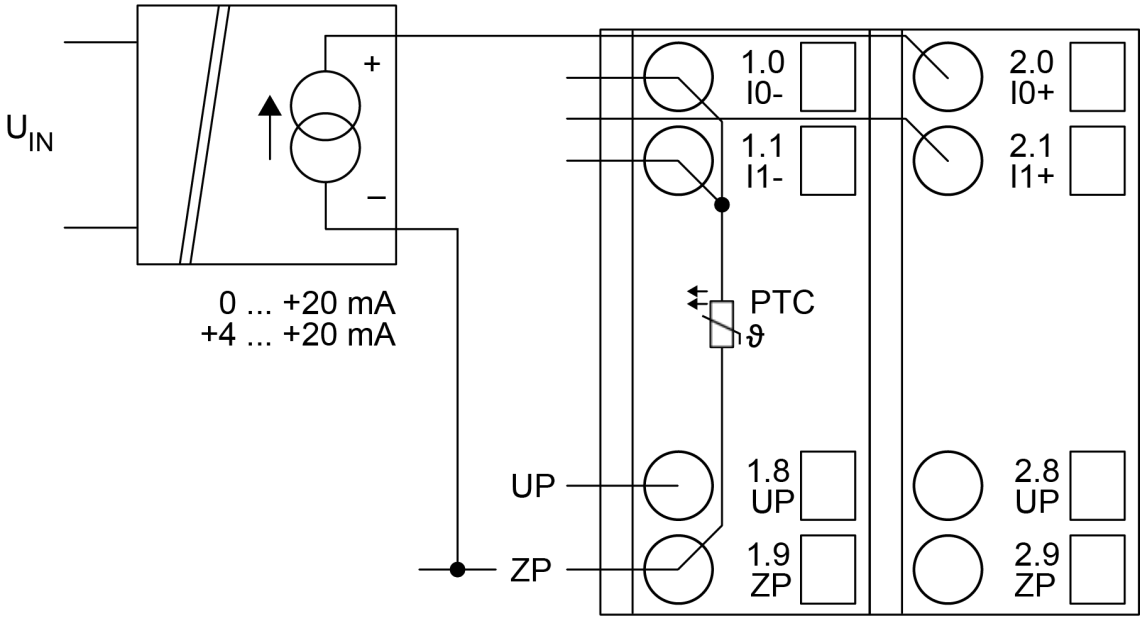

Fig. 164: Connection example

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

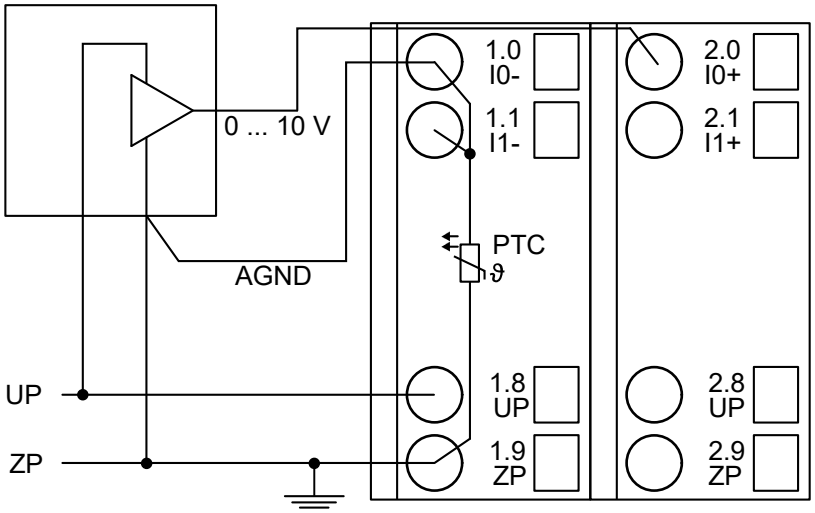

Fig. 165: Connection example

CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V *)	1 channel used

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

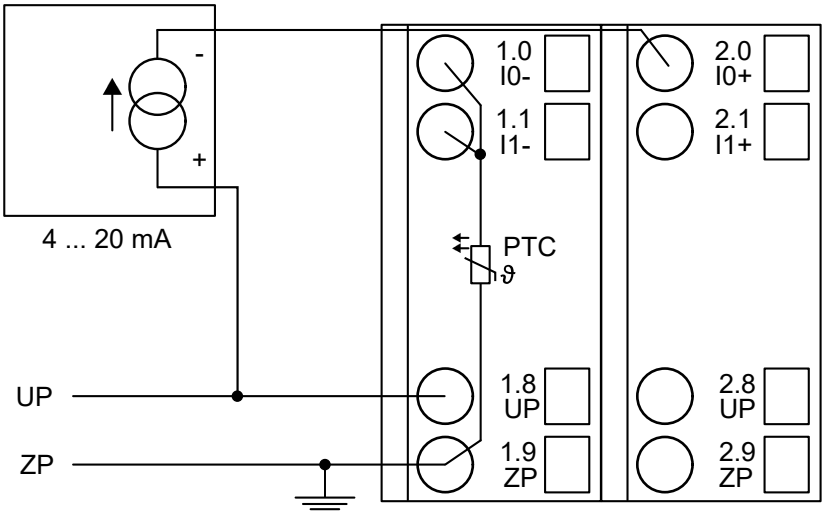

Fig. 166: Connection example

Current	4 mA...20 mA	1 channel used

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

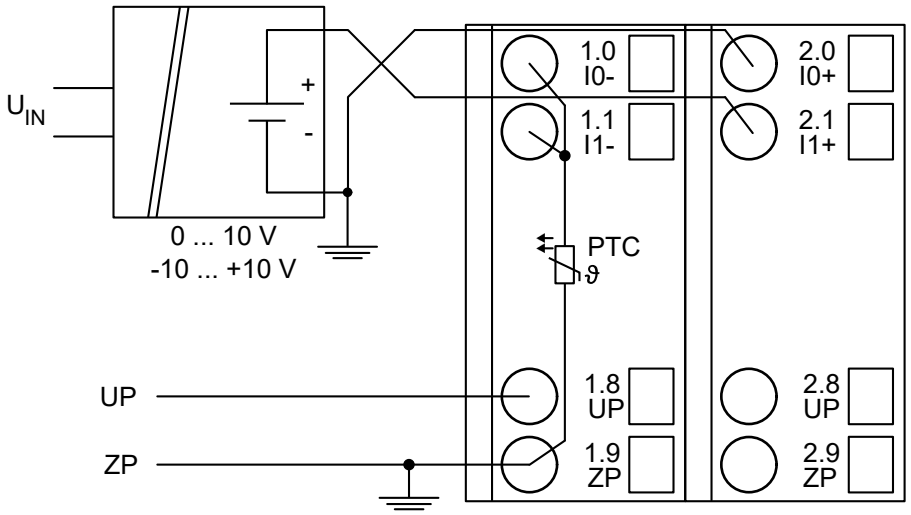

Fig. 167: Connection example

The negative pole of the sensor must be grounded next to the sensor.

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

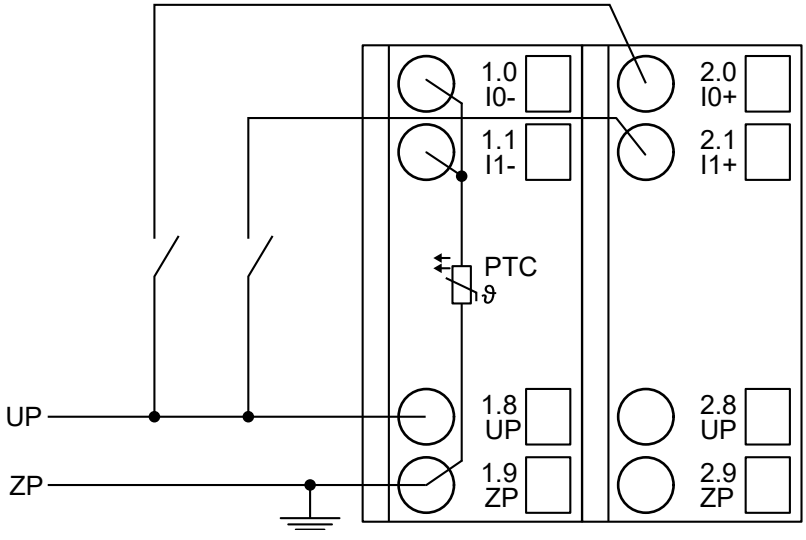

Fig. 168: Connection example

Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

Connection of analog output loads (Voltage, current)

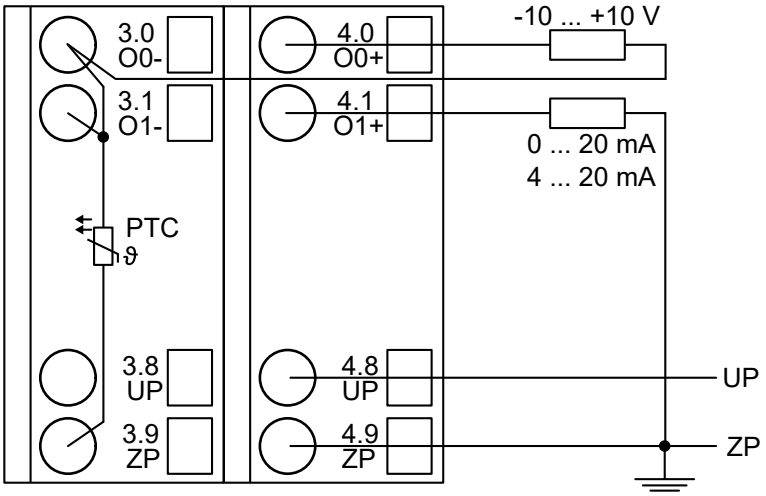

Fig. 169: Connection example

Voltage	-10 V...+10 V	Load max. ±10 mA	1 channel used
Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

Unused analog outputs can be left open-circuited.

Internal data exchange

Digital inputs (bytes)	0
Digital outputs (bytes)	0
Counter input data (words)	8
Counter output data (words)	8

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module slot address: Y = 1...7

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

LED		State	Color	LED = OFF	LED = ON	LED flashes
	Inputs I0...I7	Analog input	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
	Outputs O0...O7	Analog output	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
	UP	Process voltage 24 V DC via terminal	Green	Process voltage is missing	Process voltage OK	--
	CH-ERR2	Channel error, error messages in groups (analog inputs or outputs combined into the groups 2 and 4)	Red	No error or process voltage is missing	Severe error within the corresponding group	Error on one channel of the group
	CH-ERR4		Red			
	CH-ERR *)	Module error	Red	--	Internal error	--
	*) Both LEDs (CH-ERR2 and CH-ERR4) light up together

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for +24 V (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 V (ZP)
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
	Rated protection fuse on UP	10 A fast
	Galvanic isolation	Yes, per module
Current consumption		
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	Ca. 2 mA
	From UP at normal operation	0.15 A + output loads
Inrush current from UP (at power up)		0.020 A^2s

Parameter	Value
Max. length of analog cables, conductor cross section > 0.14 mm²	100 m
Weight	300 g
Mounting position	Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the analog inputs

Parameter	Value	
Number of channels per module	8	
Distribution of channels into groups	1 group of 8 channels	
Connections of the channels I0- to I7-	Terminals 1.0 to 1.7	
Connections of the channels I0+ to I7+	Terminals 2.0 to 2.3	
Input type	Bipolar (not with current or Pt100/Pt1000/Ni1000)	
Galvanic isolation	Against internal supply and other modules	
Configurability	0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)	
Channel input resistance	Voltage: > 100 kΩ Current: ca. 330 Ω	
Time constant of the input filter	Voltage: 100 µs current: 100 µs	
Indication of the input signals	One LED per channel	
Conversion cycle	2 ms (for 8 inputs + 8 outputs), with Pt/Ni... 1 s	
Resolution	Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Unused voltage inputs	Are configured as "unused"	

Parameter	Value
Unused current inputs	Have a low resistance, can be left open-circuited
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital Inputs

Parameter		Value
Number of channels per module		Max. 8
Distribution of channels into groups		1 group of 8 channels
Connections of the channels I0+ to I7+		Terminals 2.0 to 2.7
Reference potential for the inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)
Input signal delay		Typ. 8 ms, configurable from 0.1 to 32 ms
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 4.3 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		8, all channels for voltage, the first 4 channels also for current
Distribution of channels into groups		1 group of 8 channels
	Channels O0-...O7-	Terminals 3.0...3.7
	Channels O0+...O7+	Terminals 4.0...4.7
Output type		Bipolar with voltage, unipolar with current
Galvanic isolation		Against internal supply and other modules
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually), current outputs only channels 0...3
Output resistance (load), as current output		0 Ω...500 Ω
Output loadability, as voltage output		Max. ±10 mA
Indication of the output signals		One LED per channel
Resolution		12 bits (+ sign)

Parameter	Value	
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms	
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ.	±0.5 % of full scale at 25 °C
	Max.	±1 % of full scale (all ranges) at 0 °C...60 °C or EMC disturbance
Relationship between output signal and hex code	See table, *Chapter 1.6.3.6.2.2.6.9.3 "Output ranges voltage and current" on page 2971*	
Unused outputs	Can be left open-circuited

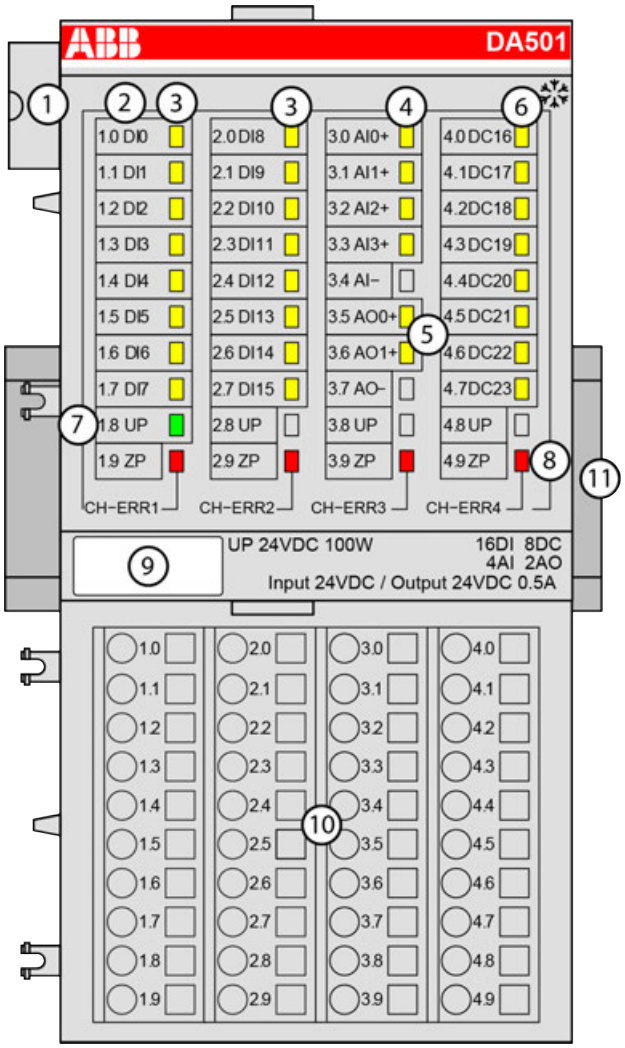
S500

DA501 - Digital/Analog input/output module

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  Resolution 12 bits plus sign
- Fast counter

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states of the digital inputs DI0 to DI15
4 4 yellow LEDs to display the signal states of the analog inputs AI0 to AI3
5 2 yellow LEDs to display the signal states of the analog outputs AO0 to AO1
6 8 yellow LEDs to display the signal state of the configurable digital inputs/outputs DC16 to DC23
7 1 green LED to display the state of the process supply voltage UP
8 4 red LEDs to display errors
9 Label
10 Terminal unit
11 DIN rail
❄ Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.

- 4 analog inputs, voltage, current and RTD.
  Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  Resolution 12 bits plus sign
- Fast counter

Parameter	Value
Fast Counter	Integrated, many configurable operating modes
Power supply	From the process supply voltage UP
LED displays	For system displays, signal states, errors and power supply
Internal supply voltage	Via the I/O bus interface (I/O bus)
External supply voltage	Via terminals UP and ZP (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU515 or TU516 ↬ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↬ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 ↬ *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*.

The assignment of the terminals:

Terminal	Signal	Description
1.0	DI0	Signal of the digital input DI0
1.1	DI1	Signal of the digital input DI1
1.2	DI2	Signal of the digital input DI2
1.3	DI3	Signal of the digital input DI3
1.4	DI4	Signal of the digital input DI4
1.5	DI5	Signal of the digital input DI5
1.6	DI6	Signal of the digital input DI6
1.7	DI7	Signal of the digital input DI7
1.8	UP	Process voltage UP (24 V DC)
1.9	ZP	Process voltage ZP (0 V DC)
2.0	DI8	Signal of the digital input DI8
2.1	DI9	Signal of the digital input DI9
2.2	DI10	Signal of the digital input DI10

Terminal	Signal	Description
2.3	DI11	Signal of the digital input DI11
2.4	DI12	Signal of the digital input DI12
2.5	DI13	Signal of the digital input DI13
2.6	DI14	Signal of the digital input DI14
2.7	DI15	Signal of the digital input DI15
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	AI0+	Positive pole of analog input signal 0
3.1	AI1+	Positive pole of analog input signal 1
3.2	AI2+	Positive pole of analog input signal 2
3.3	AI3+	Positive pole of analog input signal 3
3.4	AI-	Negative pole of analog input signals 0 to 3
3.5	AO0+	Positive pole of analog output signal 0
3.6	AO1+	Positive pole of analog output signal 1
3.7	AO-	Negative pole of analog output signals 0 and 1
3.8	UP	Process voltage UP (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)
4.0	C16	Signal of the configurable digital input/ output C16
4.1	C17	Signal of the configurable digital input/ output C17
4.2	C18	Signal of the configurable digital input/ output C18
4.3	C19	Signal of the configurable digital input/ output C19
4.4	C20	Signal of the configurable digital input/ output C20
4.5	C21	Signal of the configurable digital input/ output C21
4.6	C22	Signal of the configurable digital input/ output C22
4.7	C23	Signal of the configurable digital input/ output C23
4.8	UP	Process voltage UP (24 V DC)
4.9	ZP	Process voltage ZP (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA501.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove or replace a module.

CAUTION!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

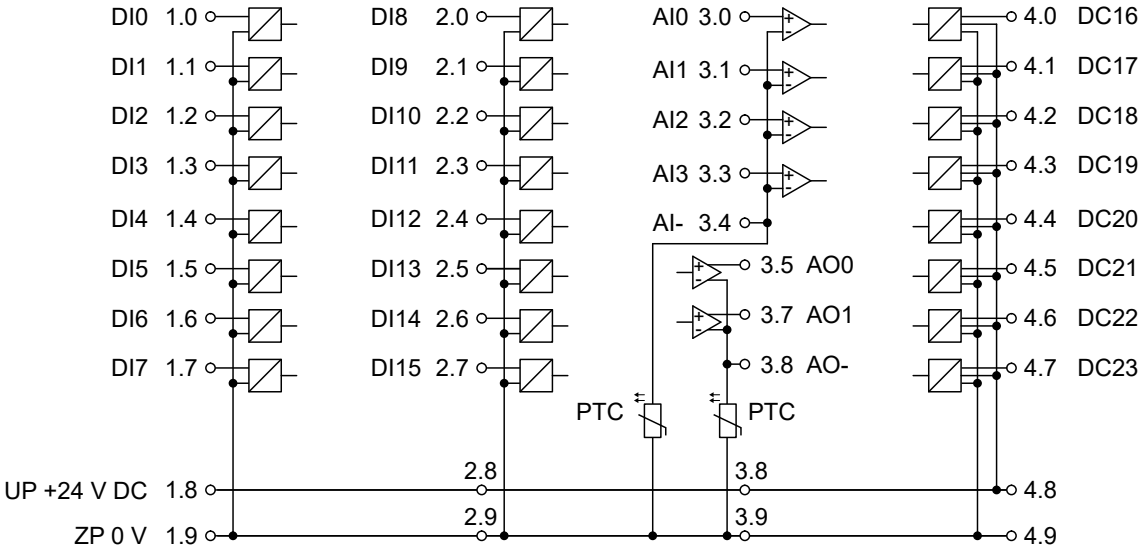


Fig. 170: Terminal assignment of the module

The module provides several diagnosis functions *Chapter 1.6.3.6.3.1.1.7 “Diagnosis” on page 2996*.

Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI15 in the same way.

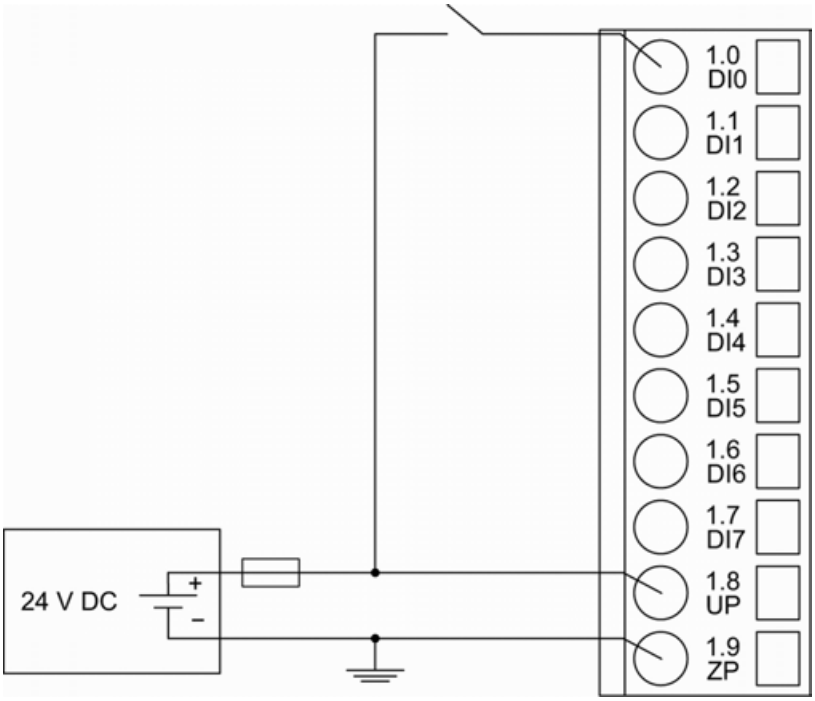

Fig. 171: Connection of the module

The meaning of the LEDs is described in the Displays *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999* chapter.

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.

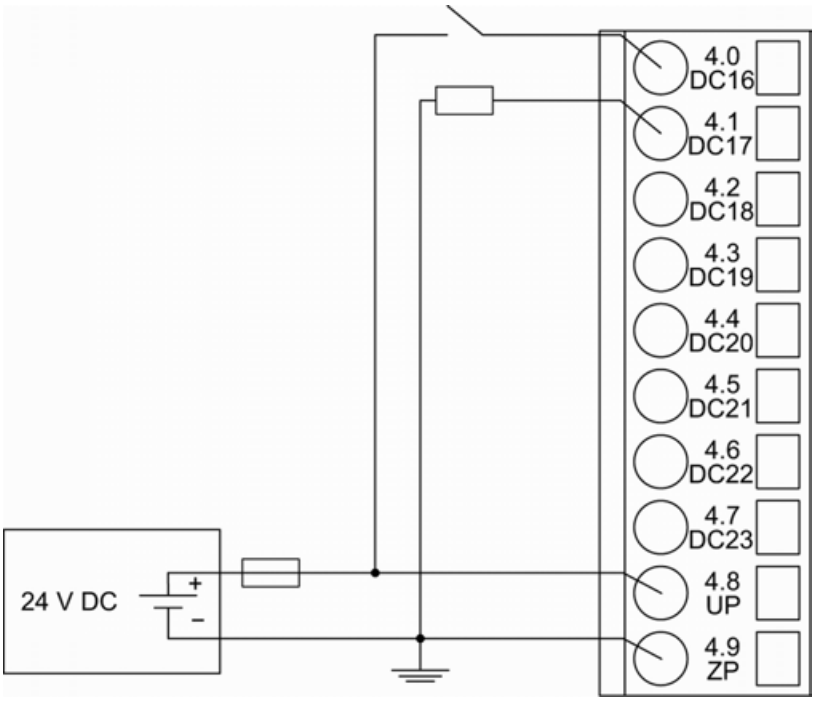

Fig. 172: Connection of configurable digital inputs/outputs to the module

CAUTION!

Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DA501.

If the inputs are used as fast counter inputs, connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

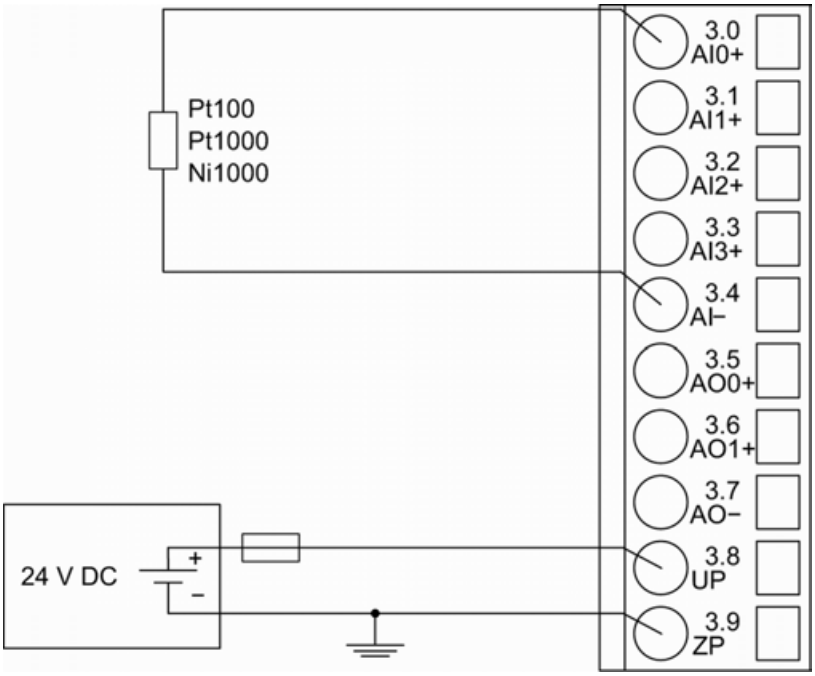

Fig. 173: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Pt100	-50 °C...+400 °C	2-wire configuration, 1 channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, 1 channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, 1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

0

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

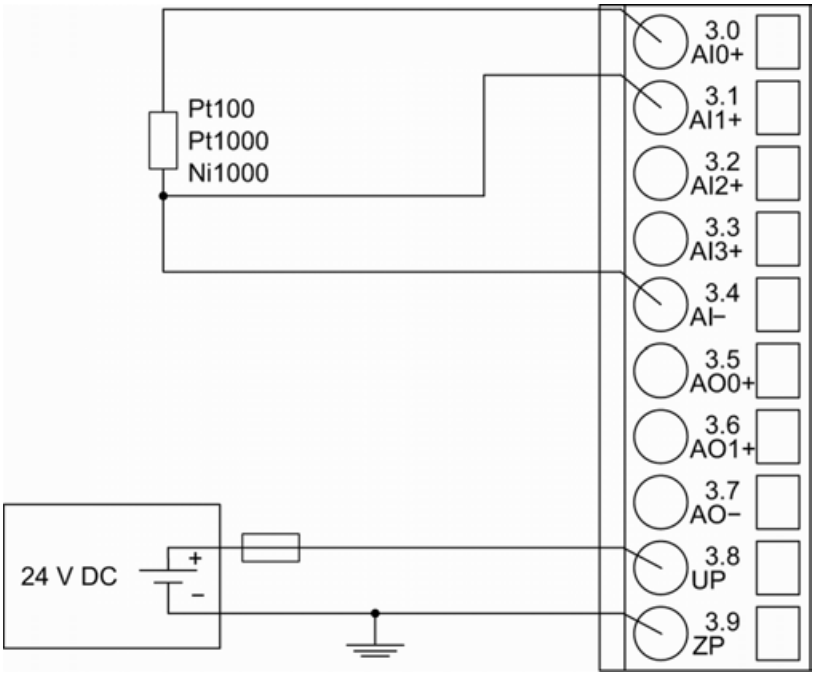

Fig. 174: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Pt100	-50 °C...+400 °C	3-wire configuration, 2 channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, 2 channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, 2 channels used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.1.7 “Diagnosis” on page 2996*.

0

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

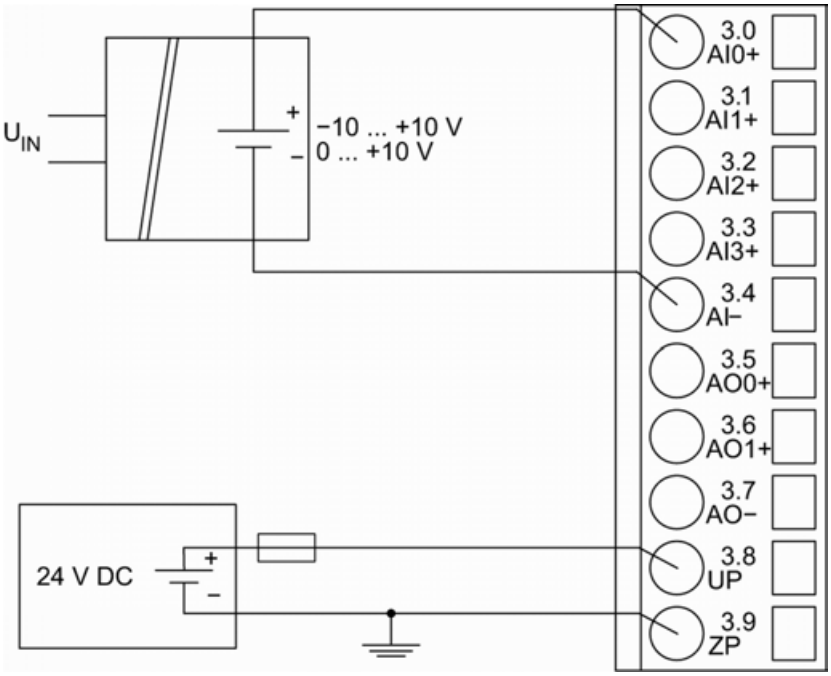

Fig. 175: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

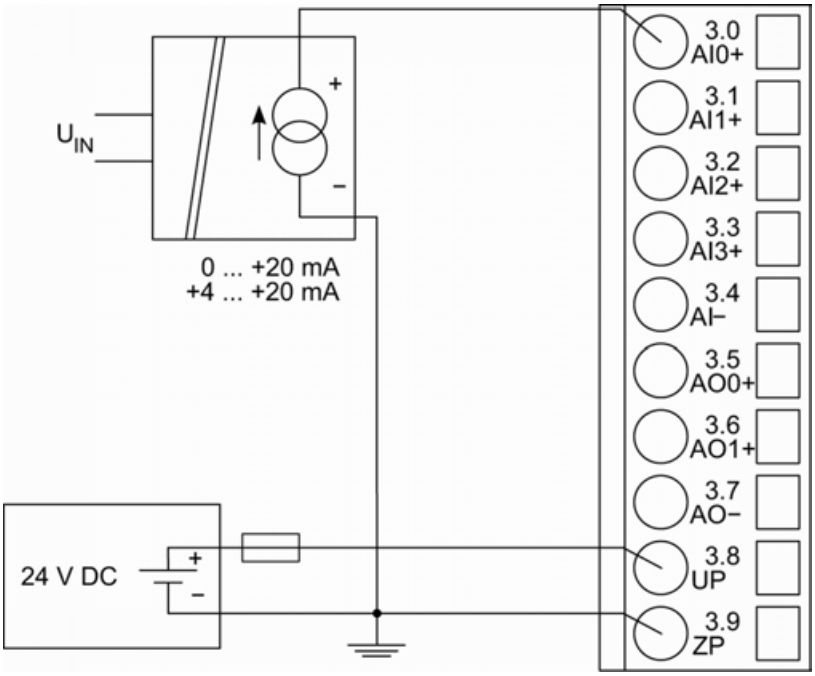

Fig. 176: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

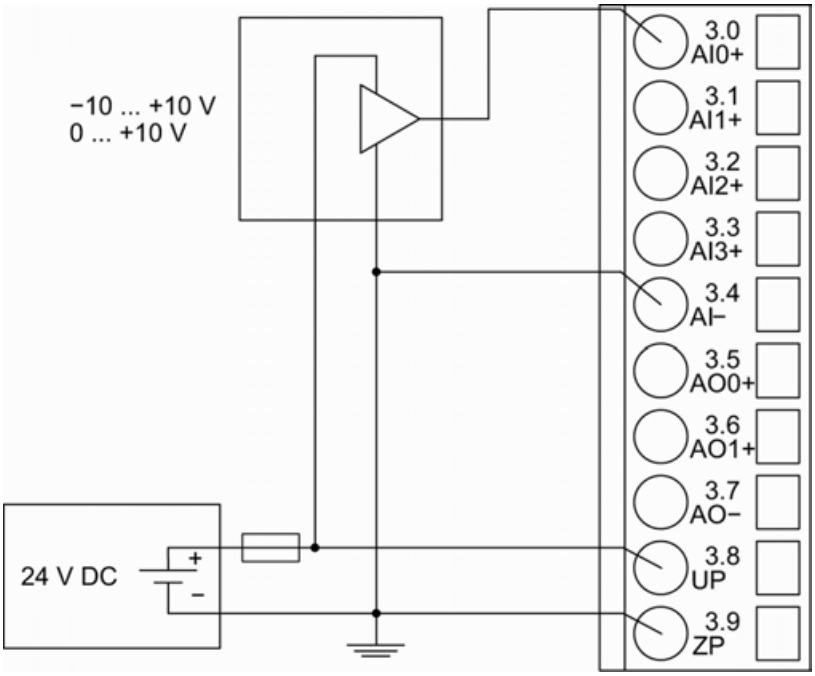

Fig. 177: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ↳ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

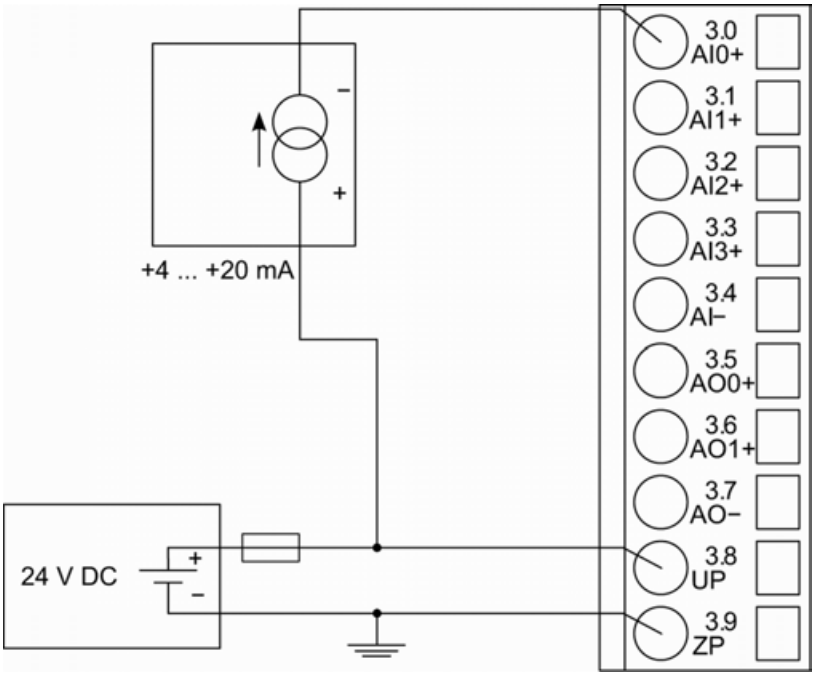

Fig. 178: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 "Parameterization" on page 2992*:

Current	4 mA...20 mA	1 channel used

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ↳ *Chapter 1.6.3.6.3.1.1.8 "State LEDs" on page 2999*.

CAUTION!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

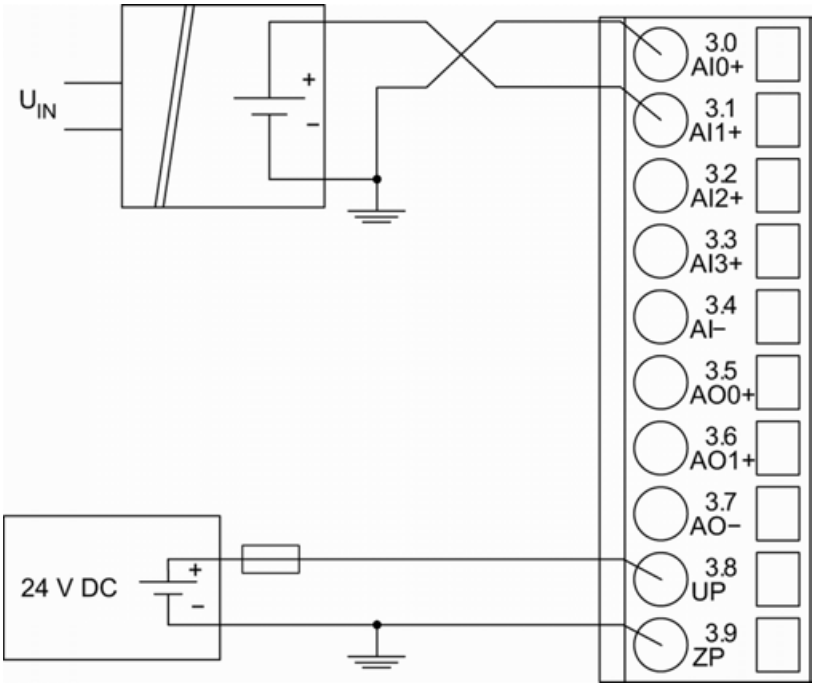

Fig. 179: Connection of active-type analog sensors (voltage) to differential analog inputs

The following measuring ranges can be configured *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

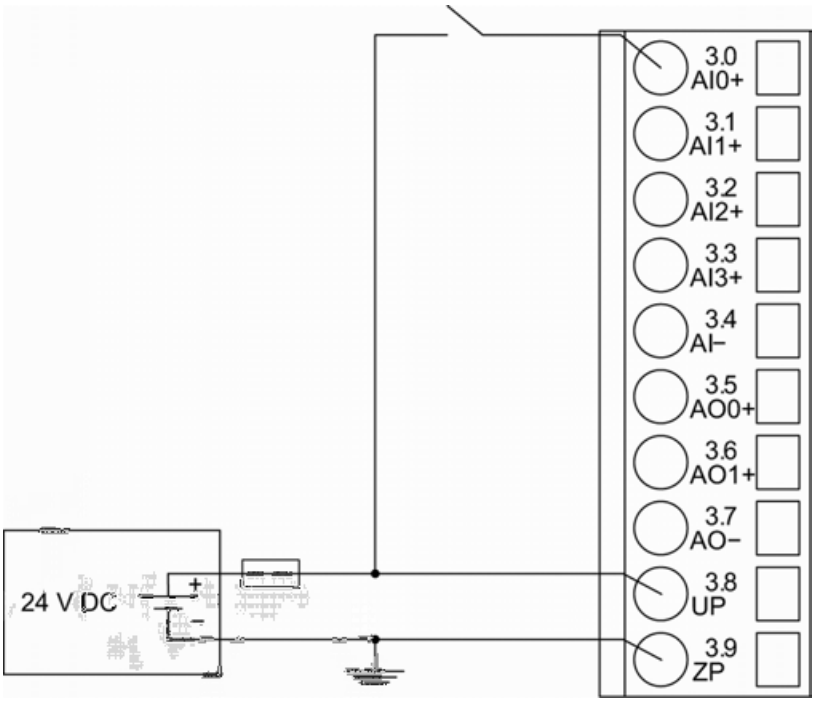

Fig. 180: Use of analog inputs as digital inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

Digital input	24 V	1 channel used

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ↳ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

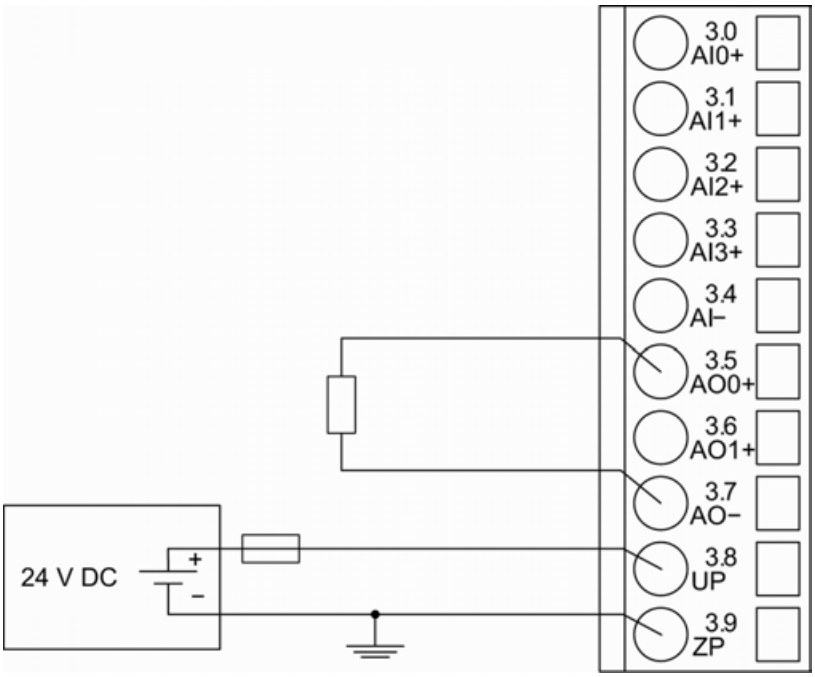

Fig. 181: Connection of analog output loads (voltage)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992* :

Voltage	-10 V...+10 V	Load ±10 mA max.	1 channel used

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ↳ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

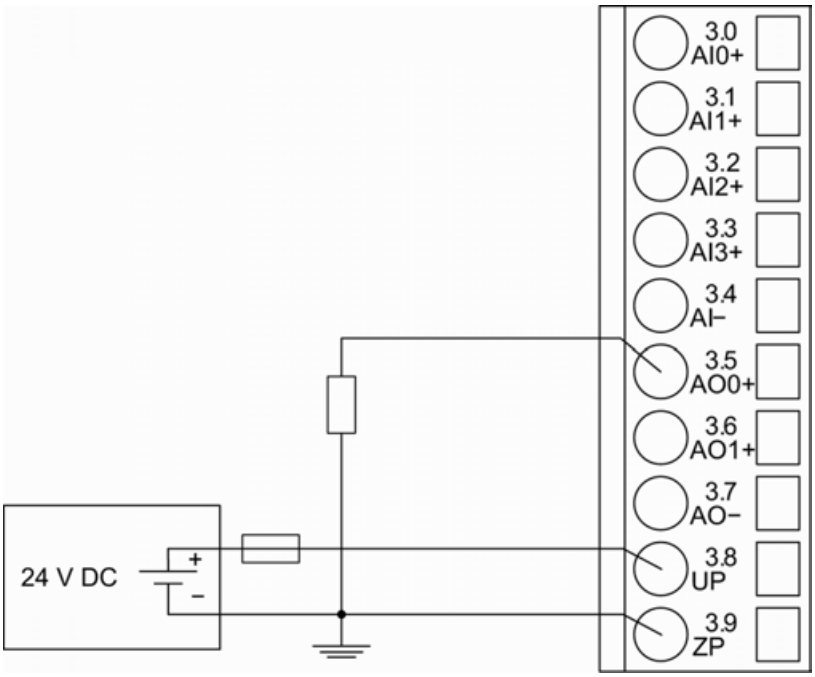

Fig. 182: Connection of analog output loads (current)

The following measuring ranges can be configured ↬ *Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992*:

0

Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ↬ *Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999*.

Unused analog outputs can be left open-circuited.

Internal data exchange

	Without the fast counter	**With the fast counter (only with AC500)**
Digital inputs (bytes)	3	5
Digital outputs (bytes)	1	3
Analog inputs (words)	4	4
Digital outputs (words)	2	2
Counter input data (words)	0	4
Counter output data (words)	0	8

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

Name	Value	Internal value	Internal value, type	Default	EDS Slot / Index
Module ID [1])	Internal	1810	WORD	1810	0x0Y01
Ignore module see table [2])	Internal	Yes No	BYTE	No	not for FBP

Intended behavior of output channel when the control system stops	Required setting of the module parameter "Behavior of outputs in case of a communication error"	Required setting of the channel parameter "Substitute value"
Output OFF	Off	0
Last value infinite	Last value	0
Last value for 5 s and then turn off	Last value 5 sec	0
Last value for 10 s and then turn off	Last value 10 sec	0
Substitute value infinite	Substitute value	Depending on configuration
Substitute value for 5 s and then turn off	Substitute value 5 sec	Depending on configuration
Substitute value for 10 s and then turn off	Substitute value 10 sec	Depending on configuration

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

	11 / 12	ADR	1...10					

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = communication interface module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO, 4 = DC); COM1/ COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = module itself" is output.
[5])	Ch = 22...29 indicates the digital inputs/outputs DC16...DC23
[6])	Ch = 16...19 indicates the analog inputs AI0...AI3
[7])	Ch = 20...21 indicates the analog outputs AO0...AO1

State LEDs

LED		State	Color	LED = OFF	LED = ON	LED flashes
	DI0 to DI15	Digital input	Yellow	Input is OFF	Input is ON [1])	--
	DC16 to DC23	Digital input/ output	Yellow	Input/output is OFF	Input/output is ON [1])	--
	AI0 to AI3	Analog input	Yellow	Input is OFF	Input is ON [2])	--
	AO0 to AO1	Analog output	Yellow	Output is OFF	Output is ON [2])	--
	UP	Process supply voltage 24 V DC via terminal	Green	Process supply voltage is missing	Process supply voltage OK	--
	CH-ERR1	Channel error, error messages in groups (digital inputs/ outputs combined into the groups 1, 2, 3, 4)	Red	No error or process supply voltage is missing	Severe error within the corresponding group	Severe error within the corresponding group (e.g. short circuit at an output)
	CH-ERR2		Red			
	CH-ERR3		Red			
	CH-ERR4		Red			
	CH-ERR [3])	Module error	Red	--	Internal error	--
	[1]) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.					
	[2]) Brightness depends on the value of the analog signal					
	[3]) All of the LEDs CH-ERR1 to CH-ERR4 light up together					

Measuring ranges

Input ranges voltage, current and digital input

Range	0...10 V	-10...+10 V	0...20 mA	4...20 mA	Digital input
Overflow	> 11.7589	> 11.7589	> 23.5178	> 22.8142

Technical data

Technical data of the module

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC ↬ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		**Value**
Process supply voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for UP (+24 V DC) and 1.9, 2.9, 3.9 and 4.9 for ZP (0 V DC)
	Protection against reverse voltage	yes
	Rated protection fuse at UP	10 A fast
	Rated value	24 V DC
	Max. ripple	5 %
Current consumption		
	From UP	0.07 A + max. 0.5 A per output
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	ca. 2 mA
	Inrush current from UP (at power-up)	0.04 A^2s
Galvanic isolation		Yes, per module
Max. power dissipation within the module		6 W (outputs unloaded)
Weight (without terminal unit)		ca. 125 g
Mounting position		Horizontal mounting or vertical with derating (output load reduced to 50 % at 40 °C)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		16
Distribution of the channels into groups		2 groups of 8 channels
Terminals of the channels DI0 to DI7		Terminals 1.0 to 1.7
Terminals of the channels DI8 to DI15		Terminals 2.0 to 2.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input indicator		LED is part of the input circuitry
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the configurable digital inputs/outputs

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		8 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group for 8 channels
If the channels are used as inputs		
	Channels DC16...DC23	Terminals 4.0...4.7
If the channels are used as outputs		
	Channels DC16...DC23	Terminals 4.0...4.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)

Parameter	Value
Monitoring point of input/output indicator	LED is part of the input circuitry
Galvanic isolation	Yes, per module

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC16 to DC23		Terminals 4.0 to 4.7
Reference potential for all inputs		Terminals 1.9...4.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	shielded	1000 m
	unshielded	600 m

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DC16 to DC23	Terminals 4.0 to 4.7

Parameter	Value
Reference potential for all outputs	Terminals 1.9...4.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage	For all outputs terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the supply voltage, signal name UP)
Output voltage for signal 1	UP (-0.8 V)
Output delay (0->1 or 1->0)	On request
Output current	
rated value per channel	500 mA at UP = 24 V
max. value (all channels together)	4 A
Leakage current with signal 0	< 0.5 mA
Fuse for UP	10 A fast
Demagnetization with inductive DC load	Via internal varistors (see figure below this table)
Output switching frequency	
With resistive load	On request
With inductive loads	Max. 0.5 Hz
With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof	Yes
Overload message (I > 0.7 A)	Yes, after ca. 100 ms
Output current limitation	Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals	Yes (software-controlled supervision)
Max. cable length	
Shielded	1000 m
Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

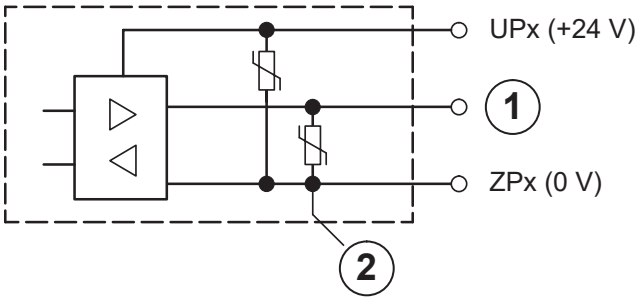

Fig. 183: Digital input/output (circuit diagram)

1 Digital input/output
2 For demagnetization when inductive loads are turned off

Technical data of the fast counter

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

Parameter	Value
Used inputs	DC16 / DC17
Used outputs	DC18
Counting frequency	Max. 50 kHz

↳ *Chapter 1.6.5.1.12 “Fast counters” on page 3570*

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 3.0 to 3.3
Reference potential for AI0+ to AI3+		Terminal 3.4 (AI-) for voltage and RTD measurement Terminal 1.9, 2.9, 3.9 and 4.9 for current measurement
Input type		
	Unipolar	Voltage 0 V...10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10 V...+10 V
Configurability		0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/Ni... 1 s
Resolution		Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C

Parameter	Value
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 % For XC version below 0 °C and above 60 °C: on request
Relationship between input signal and hex code	↳ *Chapter 1.6.3.6.3.1.1.9.1 “Input ranges voltage, current and digital input” on page 2999* ↳ *Chapter 1.6.3.6.3.1.1.9.2 “Input ranges resistance temperature detector” on page 3000*
Unused inputs	Are configured as "unused" (default value)
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels AI0+ to AI3+		Terminals 3.0 to 3.3
Reference potential for the inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 3.7 mA
	Input voltage +30 V	< 9 mA
Input resistance		ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		2
Distribution of channels into groups		1 group for 2 channels
Connection of the channels AO0+...AO1+		Terminals 3.5 and 3.6
Reference potential for AO0+ to AO1+		Terminal 3.7 (AO-) for voltage output Terminals 1.9, 2.9, 3.9 and 4.9 for current output
Output type		
	Unipolar	Current

Parameter	Value
Bipolar	Voltage
Galvanic isolation	Against internal supply and other modules
Configurability	-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually)
Output resistance (load) as current output	0 Ω...500 Ω
Output loadability as voltage output	±10 mA max.
Indication of the output signals	1 LED per channel (brightness depends on the value of the analog signal)
Resolution	12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code	*Chapter 1.6.3.6.3.1.1.9.3 “Output ranges voltage and current” on page 3002*
Unused outputs	Are configured as "unused" (default value) and can be left open-circuited

Internal data exchange

	Without the fast counter	With the fast counter (only with AC500)
Digital inputs (bytes)	3	5
Digital outputs (bytes)	1	3
Analog inputs (words)	4	4
Analog outputs (words)	2	2
Counter input data (words)	0	4
Counter output data (words)	0	8

Ordering data

Part no.	Description	Product life cycle phase *)

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication iInterface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

Parameter	Value
Fast counter	Integrated, many configurable operating modes
Power supply	From the process supply voltage UP
LED displays	For system displays, signal states, errors and power supply
Internal supply voltage	Via the I/O bus interface (I/O bus)
External supply voltage	Via terminals UP and ZP (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU515 or TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 *Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553*.

The assignment of the terminals:

Terminal	Signal	Description
1.0	DO0	Signal of the digital output DO0
1.1	DO1	Signal of the digital output DO1
1.2	DO2	Signal of the digital output DO2
1.3	DO3	Signal of the digital output DO3
1.4	DO4	Signal of the digital output DO4
1.5	DO5	Signal of the digital output DO5
1.6	DO6	Signal of the digital output DO6
1.7	DO7	Signal of the digital output DO7
1.8	UP	Process voltage UP (24 V DC)
1.9	ZP	Process voltage ZP (0 V DC)
2.0	DO8	Signal of the digital output DO8
2.1	DO9	Signal of the digital output DO9

Terminal	Signal	Description
2.2	DO10	Signal of the digital output DO10
2.3	DO11	Signal of the digital output DO11
2.4	DO12	Signal of the digital output DO12
2.5	DO13	Signal of the digital output DO13
2.6	DO14	Signal of the digital output DO14
2.7	DO15	Signal of the digital output DO15
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	AI0+	Positive pole of analog input signal 0
3.1	AI1+	Positive pole of analog input signal 1
3.2	AI2+	Positive pole of analog input signal 2
3.3	AI3+	Positive pole of analog input signal 3
3.4	AI-	Negative pole of analog input signals 0 to 3
3.5	AO0+	Positive pole of analog output signal 0
3.6	AO1+	Positive pole of analog output signal 1
3.7	AO-	Negative pole of analog output signals 0 and 1
3.8	UP	Process voltage UP (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)
4.0	DC16	Signal of the configurable digital input/output DC16
4.1	DC17	Signal of the configurable digital input/output DC17
4.2	DC18	Signal of the configurable digital input/output DC18
4.3	DC19	Signal of the configurable digital input/output DC19
4.4	DC20	Signal of the configurable digital input/output DC20
4.5	DC21	Signal of the configurable digital input/output DC21
4.6	DC22	Signal of the configurable digital input/output DC22
4.7	DC23	Signal of the configurable digital input/output DC23
4.8	UP	Process voltage UP (24 V DC)
4.9	ZP	Process voltage ZP (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569*.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!

Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove or replace a module.

CAUTION!

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

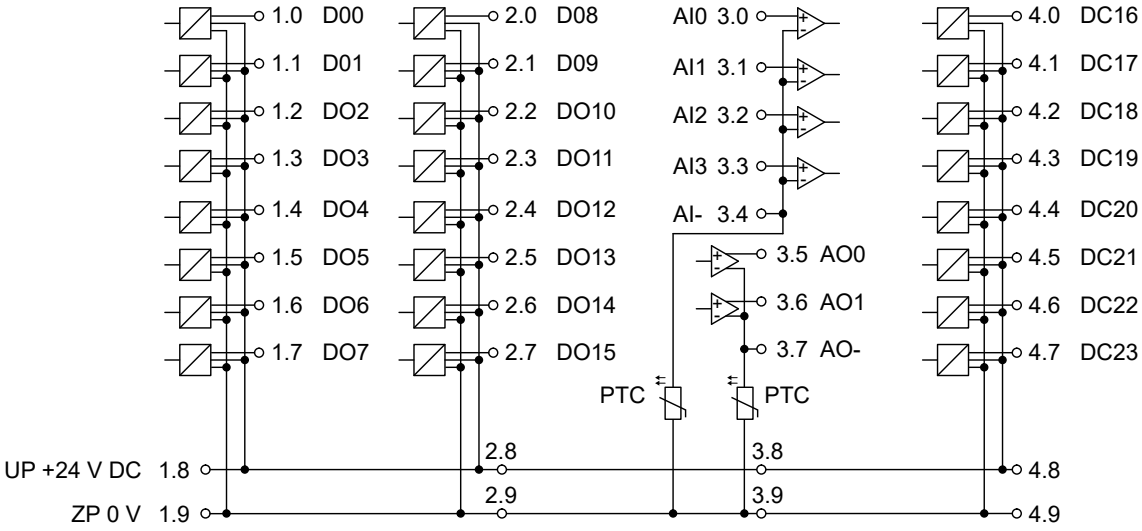

Fig. 184: Terminal assignment of the module

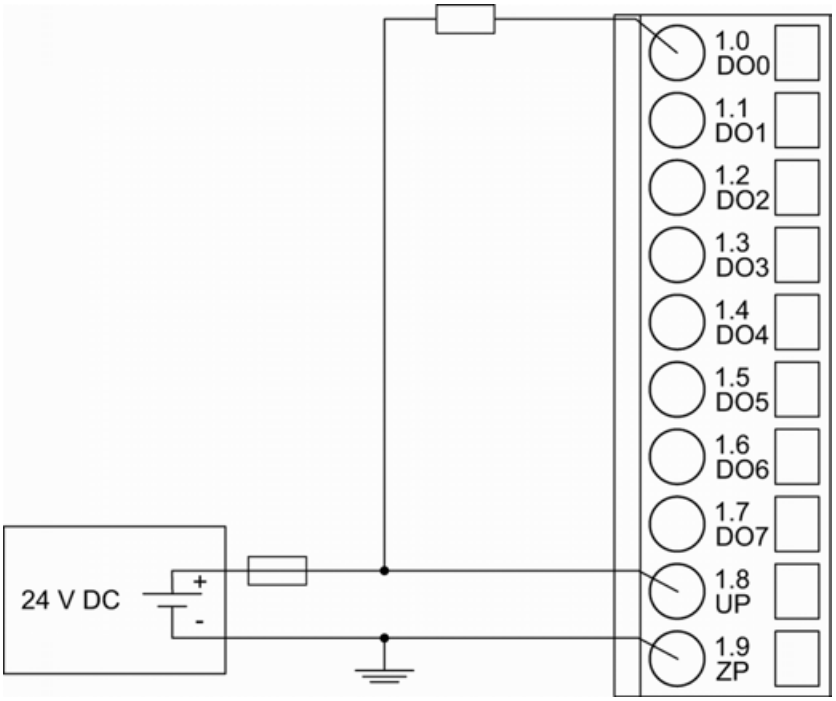
The module provides several diagnosis functions *Chapter 1.6.3.6.3.1.2.7 “Diagnosis” on page 3030*.

Connection of the digital outputs

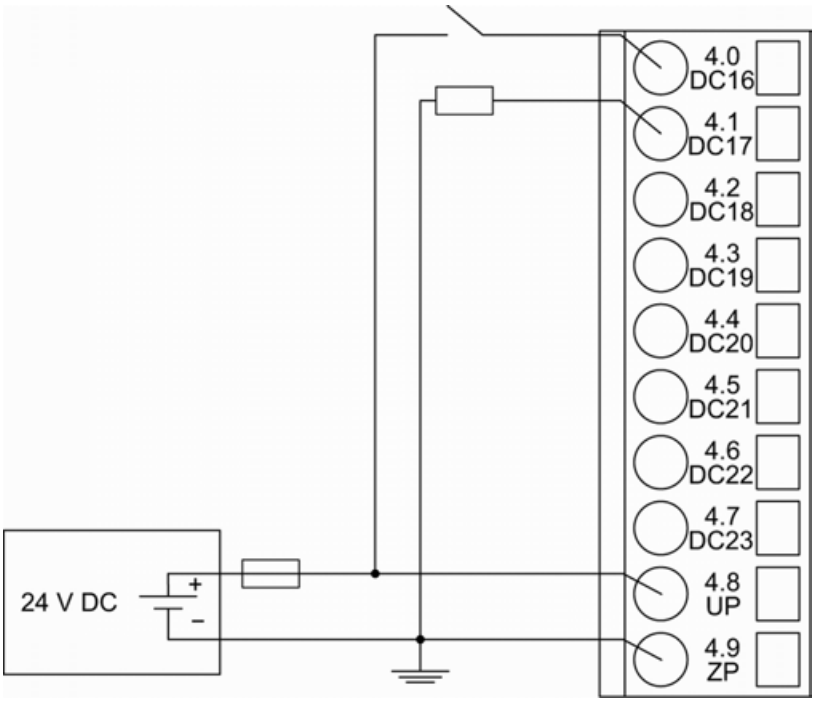
The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 to DO15 in the same way.



For a description of the meaning of the LEDs, please refer to the Displays chapter *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.



NOTICE!

Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DA502.

Connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of tthe meaning of the LEDs, please refer to the Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033* chapter.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

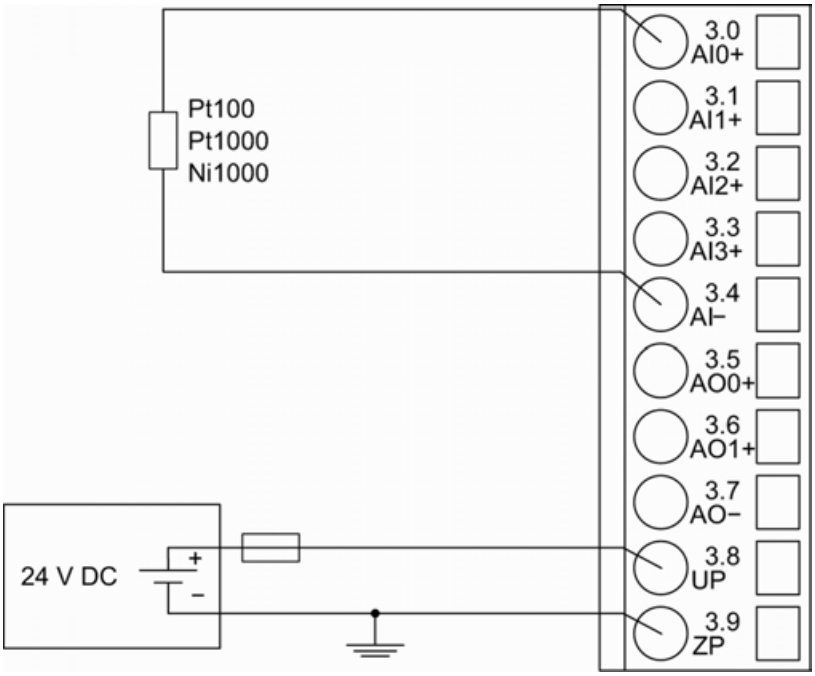


Fig. 185: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Pt100	-50 °C...+400 °C	2-wire configuration, 1 channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, 1 channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

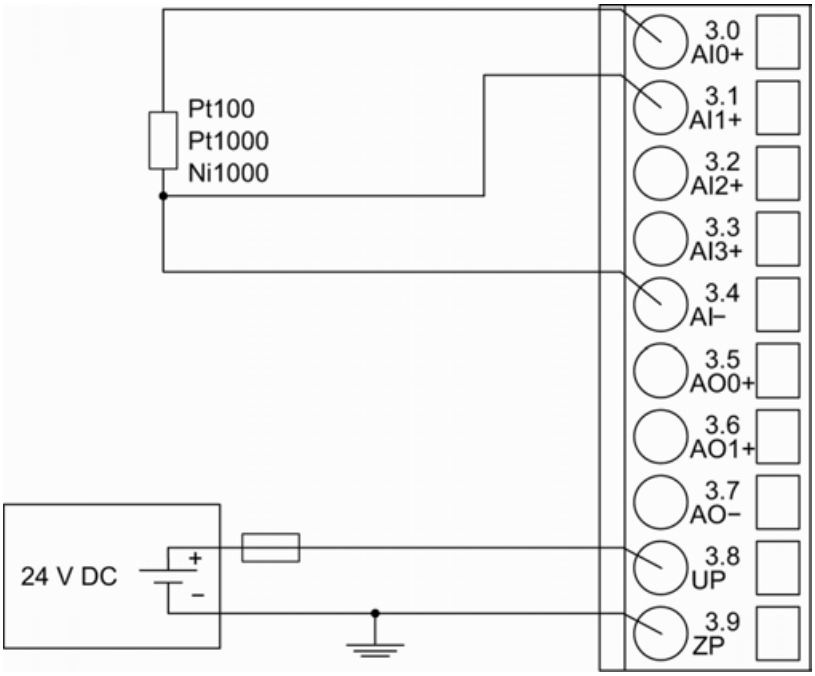

Fig. 186: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Pt100	-50 °C...+400 °C	3-wire configuration, 2 channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, 2 channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, 2 channels used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

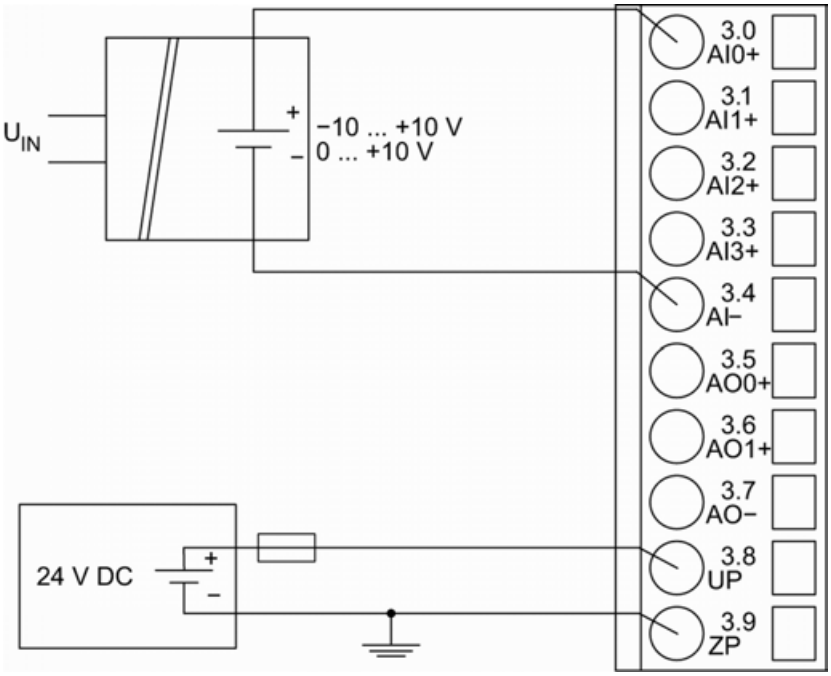

Fig. 187: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

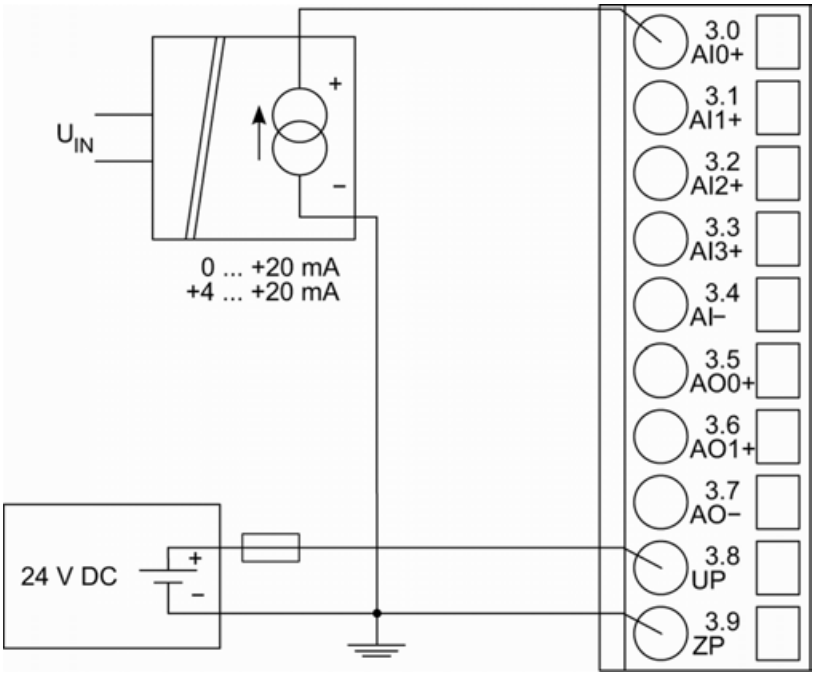

Fig. 188: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

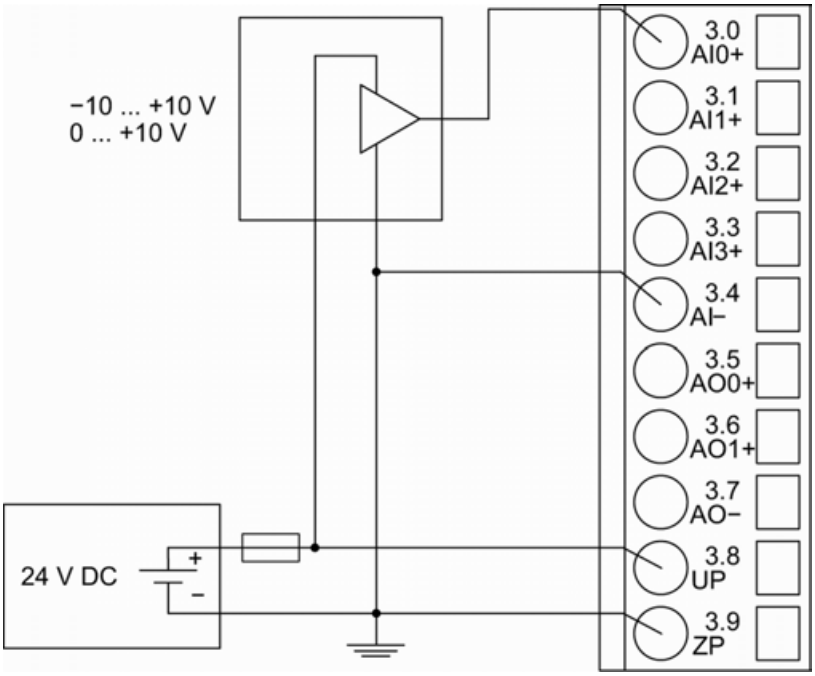

Fig. 189: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured ↬ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↬ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↬ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

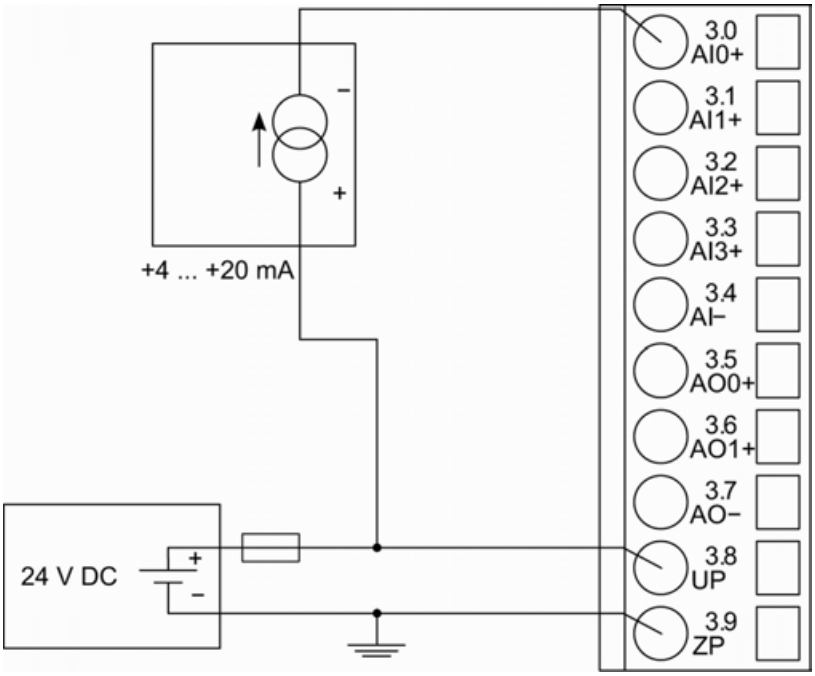

Fig. 190: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Current	4 mA...20 mA	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

NOTICE!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

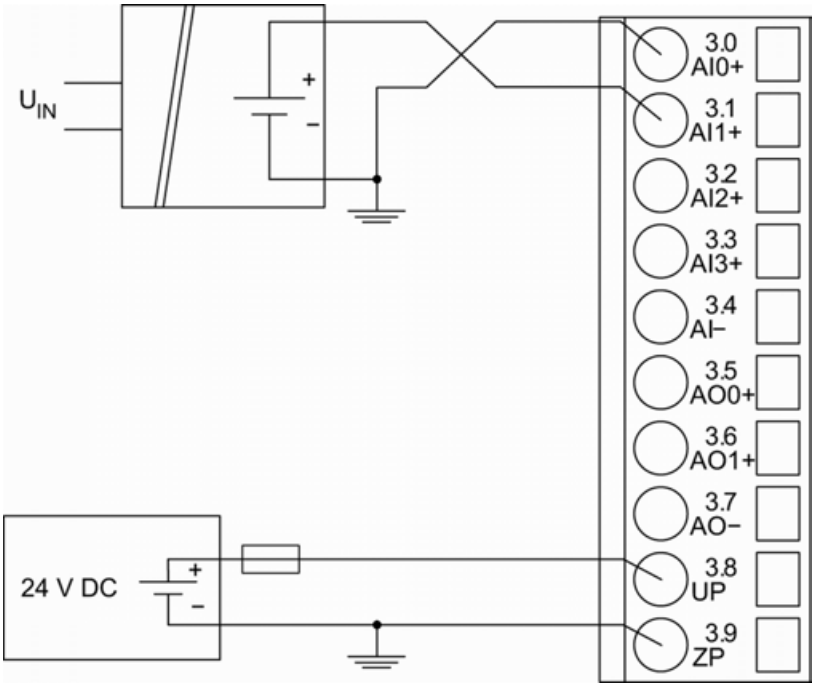

Fig. 191: Connection of active-type analog sensors (voltage) to differential analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

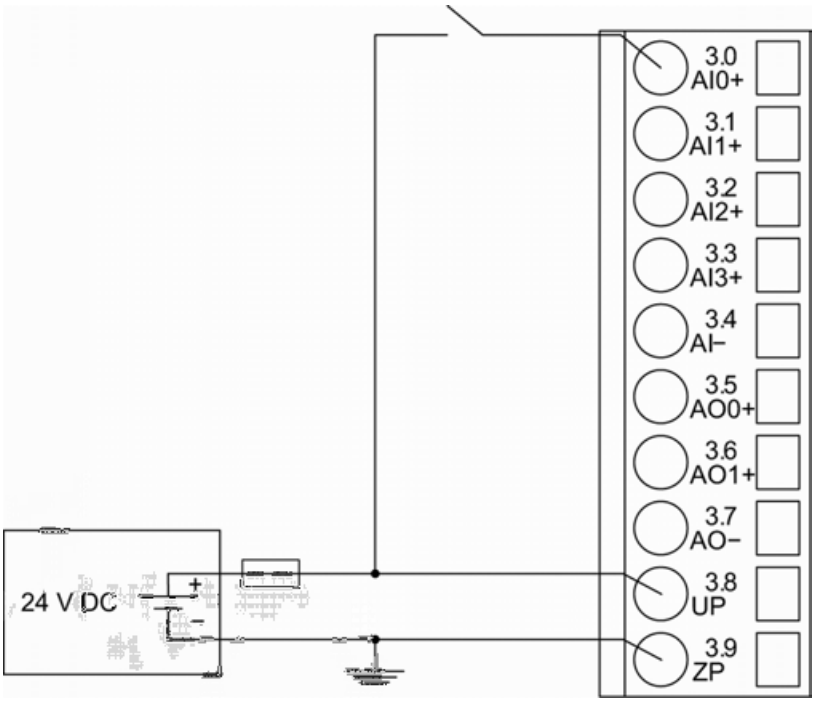

Fig. 192: Use of analog inputs as digital inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033* :

Digital input	24 V	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

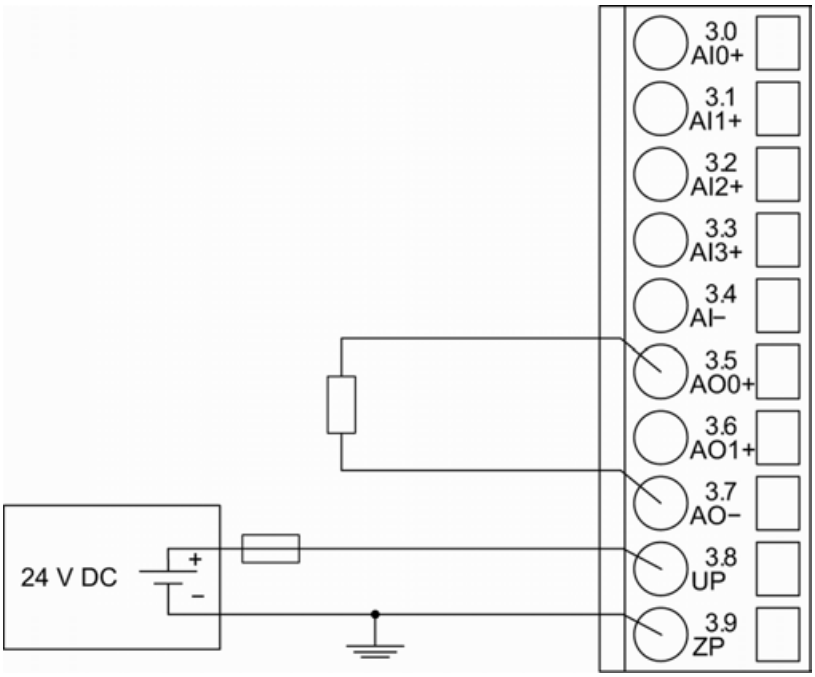

Fig. 193: Connection of analog output loads (voltage)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Voltage	-10 V...+10 V	Load ±10 mA max.	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

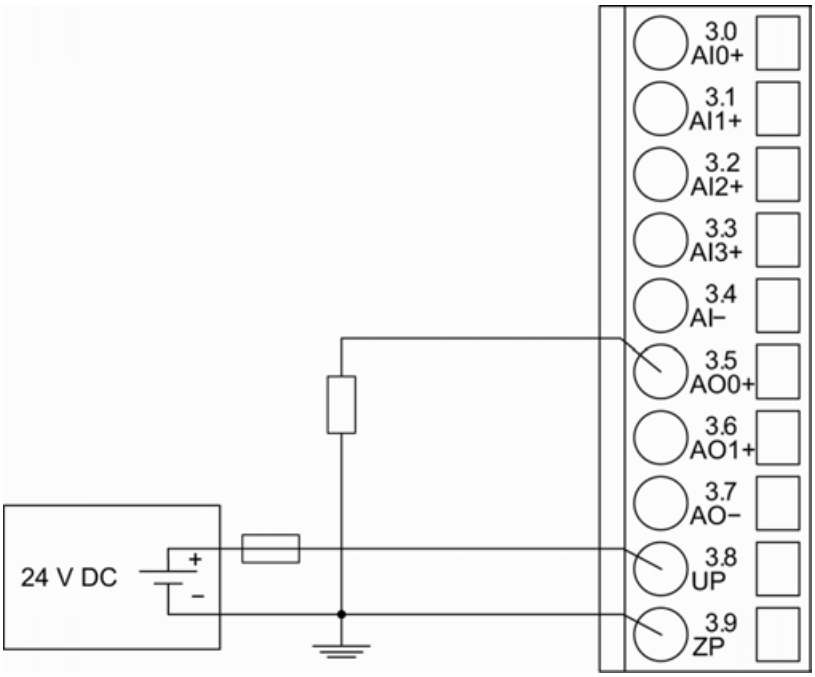

Fig. 194: Connection of analog output loads (current)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026* ↳ *Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033*:

Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ↳ *Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033*.

Unused analog outputs can be left open-circuited.

Internal data exchange

	Without the fast counter	**With the fast counter (only with AC500)**
Digital inputs (bytes)	1	1
Digital outputs (bytes)	3	3
Analog inputs (words)	4	4
Analog outputs (words)	2	2
Counter input data (words)	0	5
Counter output data (words)	0	9

I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

Firmware version	Configuration
Firmware version > V2.0.0	The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module: Module slot address: Y = 1...10

Last value for 5 s and then turn off	Last value 5 s	0
Last value for 10 s and then turn off	Last value 10 s	0
Substitute value infinite	Substitute value	Depending on configuration
Substitute value for 5 s and then turn off	Substitute value 5 s	Depending on configuration
Substitute value for 10 s and then turn off	Substitute value 10 s	Depending on configuration

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

	[1])	**[2])**	**[3])**	**[4])**				
4	14	1...10	3	20...21 [7])	7	Analog value underflow at an analog output		Check output value
	11 / 12	ADR	1...10					

Remarks:

[1])	In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
[2])	With "Device" the following allocation applies: 31 = module itself, 1...10 = communication interface module 1...10, ADR = hardware address (e.g. of the DC551)
[3])	With "Module" the following allocation applies depending on the master: Module error: I/O bus: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10
[4])	In case of module errors, with channel "31 = module itself" is output.
[5])	Ch = 22...29 indicate the digital inputs/outputs DC16...DC23
[6])	Ch = 16...19 indicates the analog inputs AI0...AI3
[7])	Ch = 20...21 indicates the analog outputs AO0...AO1

State LEDs

LED		State	Color	LED = OFF	LED = ON	LED flashes
	DO0 to DO15	Digital output	Yellow	Output is OFF	Output is ON	--
	DC16 to DC23	Digital input/ output	Yellow	Input/output is OFF	Input/output is ON [1])	--
	AI0 to AI3	Analog input	Yellow	Input is OFF	Input is ON [2])	--
	AO0 to AO1	Analog output	Yellow	Output is OFF	Output is ON [2])	--
	UP	Process supply voltage 24 V DC via terminal	Green	Process supply voltage is missing	Process supply voltage OK	--
	CH-ERR1	Channel error, error messages in groups (digital inputs/ outputs combined into the groups 1, 2, 3, 4)	Red	No error or process supply voltage is missing	Severe error within the corresponding group	Severe error within the corresponding group (e.g. short circuit at an output)
	CH-ERR2		Red			
	CH-ERR3		Red			
	CH-ERR4		Red			
	CH-ERR [3])	Module error	Red	--	Internal error	--
	[1]) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.					
	[2]) Brightness depends on the value of the analog signal					
	[3]) All of the LEDs CH-ERR1 to CH-ERR4 light up together					

Measuring ranges

Input ranges voltage, current and digital input

Range	0...10 V	-10...+10 V	0...20 mA	4...20 mA	Digital input	Digital value	
						Decimal	Hex.
Overflow	> 11.7589	> 11.7589	> 23.5178	> 22.8142		32767	7FFF

Technical data

Technical data of the module

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter		Value
Process supply voltage		
	Connections	Terminals 1.8, 2.8, 3.8 and 4.8 for UP (+24 V DC) and 1.9, 2.9, 3.9 and 4.9 for ZP (0 V)
	Protection against reverse voltage	yes
	Rated protection fuse at UP	10 A fast
	Rated value	24 V DC
	Max. ripple	5 %
Current consumption		
	From UP	0.07 A + max. 0.5 A per output
	From 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module	ca. 2 mA
	Inrush current from UP (at power-up)	0.04 A^2s
Galvanic isolation		Yes, per module
Max. power dissipation within the module		6 W (outputs unloaded)
Weight (without terminal unit)		ca. 125 g
Mounting position		Horizontal mounting or vertical with derating (output load reduced to 50% at 40 °C)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital outputs

Parameter		Value
Number of channels per module		16 outputs (with transistors)
Distribution of the channels into groups		1 group of 16 channels
Connection of the channels		
	DO0 to DO7	Terminals 1.0 to 1.7
	DO8 to DO15	Terminals 2.0 to 2.7

Parameter		Value
Indication of the output signals		1 yellow LED per channel, the LED is ON if the output signal is high (signal 1)
Monitoring point of output indicator		LED is controlled by process CPU
Reference potential for all outputs		Terminals 1.9, 2.9, 3.9 and 4.9 (negative pole of the process supply voltage, signal name ZP)
Common power supply voltage		For all outputs: terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the process supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value, per channel	500 mA at UP = 24 V
	Maximum value (channels O0 to O15)	4 A
Leakage current with signal 0		< 0.5 mA
Rated protection fuse on UP		10 A fast
Demagnetization when inductive loads are switched off		With varistors integrated in the module (see figure below)
Switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	Max. 11 Hz with max. 5 W
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the configurable digital inputs/outputs

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		8 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group for 8 channels
If the channels are used as inputs		
	Channels DC16...DC23	Terminals 4.0...4.7
If the channels are used as outputs		
	Channels DC16...DC23	Terminals 4.0...4.7

Parameter	Value
Indication of the input/output signals	1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Monitoring point of input/output indicator	LED is part of the input circuitry
Galvanic isolation	Yes, per module

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC16 to DC23		Terminals 4.0 to 4.7
Reference potential for all inputs		Terminals 1.9...4.9 (Negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Monitoring point of input/output indicator		LED is part of the input circuitry
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC16 to DC23		Terminals 4.0 to 4.7
Reference potential for all outputs		Terminals 1.9...4.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the supply voltage, signal name UP)
Output voltage for signal 1		UP (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	rated value per channel	500 mA at UP = 24 V
	max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
Fuse for UP		10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

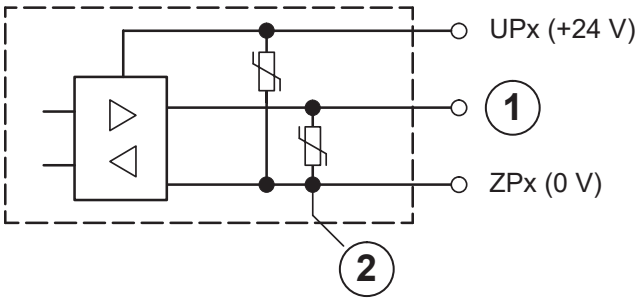

Fig. 195: Digital input/output (circuit diagram)

1 Digital input/output
2 For demagnetization when inductive loads are turned off

Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a CS31 bus module.

Parameter	Value
Counting frequency	Max. 50 kHz

Chapter 1.6.5.1.12 “Fast counters” on page 3570

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 3.0 to 3.3
Reference potential for AI0+ to AI3+		Terminal 3.4 (AI-) for voltage and RTD measurement Terminal 1.9, 2.9, 3.9 and 4.9 for current measurement
Input type		
	Unipolar	Voltage 0 V...10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10 V...+10 V
Configurability		0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s
Resolution		Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ. 0.5 %, max. 1 % For XC version below 0 °C and above 60 °C: on request

Parameter	Value
Relationship between input signal and hex code	↳ *Chapter 1.6.3.6.3.1.2.9.1 “Input ranges voltage, current and digital input” on page 3033* ↳ *Chapter 1.6.3.6.3.1.2.9.2 “Input ranges resistance temperature detector” on page 3034*
Unused inputs	Are configured as "unused" (default value)
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels AI0+ to AI3+		Terminals 3.0 to 3.3
Reference potential for the inputs		Terminals 1.9, 2.9, 3.9 and 4.9 (ZP)
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 3.7 mA
	Input voltage +30 V	< 9 mA
Input resistance		ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		2
Distribution of channels into groups		1 group for 2 channels
Connection of the channels AO0+...AO1+		Terminals 3.5 and 3.6
Reference potential for AO0+ to AO1+		Terminal 3.7 (AO-) for voltage output Terminals 1.9, 2.9, 3.9 and 4.9 for current output
Output type		
	Unipolar	Current
	Bipolar	Voltage
Galvanic isolation		Against internal supply and other modules

Parameter	Value
Configurability	-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually)
Output resistance (load), as current output	0 Ω...500 Ω
Output loadability, as voltage output	±10 mA max.
Indication of the output signals	1 LED per channel (brightness depends on the value of the analog signal)
Resolution	12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code	↬ *Chapter 1.6.3.6.3.1.2.9.3 “Output ranges voltage and current” on page 3035*
Unused outputs	Are configured as "unused" (default value) and can be left open-circuited

Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 250 800 R0001	DA502, digital/analog input/output module, 16 DO, 8 DC, 4 AI, 2 AO	Active
1SAP 450 800 R0001	DA502-XC, digital/analog input/output module, 16 DO, 8 DC, 4 AI, 2 AO, XC version	Active

**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

1.6.3.7 Communication interface modules (S500)

Hot swap

System requirements for hot swapping of I/O modules:

- *Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-**H**.*
- *I/O modules as of index F0.*

The following I/O bus masters support hot swapping of attached I/O modules:

- *Communication interface modules CI5xx as of index F0.*
- *Processor modules PM56xx-2ETH with firmware version as of V3.2.0.*

NOTICE!

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping

- *Digital outputs are not under load.*
- *Input/output voltages above safety extra low voltage/ protective extra low voltages (SELV/PELV) are switched off.*
- *Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.*

Hot swap

Further information about hot swap: ↬ Chapter 1.6.5.1.8 “Hot swap” on page 3523.

1.6.3.7.1 Compatibility of communication modules and communication interface modules

Table 536: Modbus TCP

Communication module	Communication interface module	I/O expansion module S500	I/O expansion module S500-eCo	I/O expansion module S500-S	Applications

1.6.3.7.2 CANopen

Comparison CI581 and CI582

CI581/CI582:
Technical data

Parameter	Value
Interface	CAN
Protocol	CANopen
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the CANopen Node ID for configuration purposes (00h to FFh)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Transmission rates	10 / 20 / 50 / 125 / 250 / 500 / 800 kbit/s 1 Mbit/s Auto transmission rate detection is supported
Bus connection	Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block

Parameter		Value
Processor		Hilscher NETX 100
Expandability		CI58x can only be used on onboard CAN interface and without any I/O expansion module *Table 538 “CANopen” on page 3044*.
State display		Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus
Adjusting elements		2 rotary switches for generation of the node address
Ambient temperature		System data AC500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* System data AC500 XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*
Current consumption		UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output
Weight (without terminal unit)		Ca. 125 g
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	CANopen interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 2.8 and 3.8 for +24 V (UP) Terminal 4.8 for +24 V (UP3) Terminals 2.9, 3.9 and 4.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Setting of the CANopen Node ID identifier		With 2 rotary switches at the front side of the module
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V
Required terminal unit		TU509, TU510, TU517 or TU518 *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559*

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

The difference of those devices can be found in their input and output characteristics.

CI581-CN: Input/ Output characteristics

Parameter	Value
Inputs and outputs	8 digital inputs (24 V DC; delay time configurable via software) 8 digital transistor outputs (24 V DC, 0.5 A max.) 4 analog inputs, configurable as: ● -10 V...+10 V ● 0 V...+10 V ● -10 V...+10 V (differential voltage) ● 0 mA...20 mA ● 4 mA...20 mA ● Pt100 , Pt1000, Ni1000 (for each 2-wire and 3-wire) ● 24 V digital input function 2 analog outputs, configurable as: ● -10 V...+10 V ● 0 mA...20 mA ● 4 mA...20 mA
Resolution of the analog channels	12 bits
Fast counter	Integrated, configurable operating modes

CI582-CN: Input/ Output characteristics

Parameter	Value
Inputs and outputs	8 digital inputs (24 V DC) 8 digital transistor outputs (24 V DC, 0.5 A max.) 8 configurable digital inputs/outputs (24 V DC, 0.5 A max.)

CI581-CN

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max

9 Label
10 2 rotary switches for setting the CANopen Node ID
11 10 terminals to connect the CANopen bus signals
12 Terminal unit
13 DIN rail
❄ Sign for XC version

Intended purpose

The CANopen communication interface module CI581-CN is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0...2.3)
- 2 analog outputs (2.5...2.6)
- 8 digital inputs 24 V DC in 1 group (3.0...3.7)
- 8 digital outputs 24 V DC in 1 group (4.0...4.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter		Value
Interface		CAN
Protocol		CANopen
Power supply		From the process supply voltage UP
Supply of the electronic circuitry of the I/O modules attached		Through the I/O bus interface (I/O bus)
Rotary switches		For setting the CANopen Node ID for configuration purposes (00h to FFh)
LED displays		For system displays, signal states, errors and power supply
External supply voltage		Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Transmission rates		10 / 20 / 50 / 125 / 250 / 500 / 800 kbit/s 1 Mbit/s Auto transmission rate detection is supported
Bus connection		Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block
Processor		Hilscher NETX 100
Expandability		CI58x can only be used on onboard CAN interface and without any I/O expansion module ↳ *Table 538 “CANopen” on page 3044*.
State display		Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus
Adjusting elements		2 rotary switches for generation of the node address
Ambient temperature		System data AC500 ↳ *Chapter 1.6.4.6.1 “System data AC500” on page 3398* System data AC500 XC ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*
Current consumption		UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output
Weight (without terminal unit)		Ca. 125 g
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	CANopen interface against the rest of the module
	Inrush current from UP (at power up)	On request

Parameter		Value
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 2.8 and 3.8 for +24 V (UP) Terminal 4.8 for +24 V (UP3) Terminals 2.9, 3.9 and 4.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Setting of the CANopen Node ID identifier		With 2 rotary switches at the front side of the module
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V
Required terminal unit		TU509, TU510, TU517 or TU518 *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559*

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

CI581-CN: Input/ Output characteristics

Parameter	Value
Inputs and outputs	8 digital inputs (24 V DC; delay time configurable via software) 8 digital transistor outputs (24 V DC, 0.5 A max.) 4 analog inputs, configurable as: ● -10 V...+10 V ● 0 V...+10 V ● -10 V...+10 V (differential voltage) ● 0 mA...20 mA ● 4 mA...20 mA ● Pt100 , Pt1000, Ni1000 (for each 2-wire and 3-wire) ● 24 V digital input function 2 analog outputs, configurable as: ● -10 V...+10 V ● 0 mA...20 mA ● 4 mA...20 mA
Resolution of the analog channels	12 bits
Fast counter	Integrated, configurable operating modes

Connections

The CANopen communication interface module is plugged on the I/O terminal units TU517 ↳ *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559* or TU518 ↳ *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559* and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC

Terminal 4.8: process supply voltage UP3 = +24 V DC

Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to the digital outputs!

Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This ist not the intended use.

CAUTION!

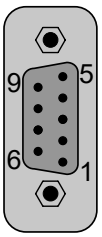
Risk of malfunctions by unintended use!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7 and DC0..DC7.

Possibilities of connection

Mounting on terminal units TU509 or TU510

The assignment of the 9-pin female D-sub for the CANopen signals



1	---	Reserved
2	CAN-	Inverted signal of the CAN bus
3	CAN_GND	Ground potential of the CAN bus
4	---	Reserved
5	---	Reserved
6	---	Reserved
7	CAN+	Non-inverted signal of the CAN bus
8	---	Reserved
9	---	Reserved
Shield	Cable shield	Functional earth

Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

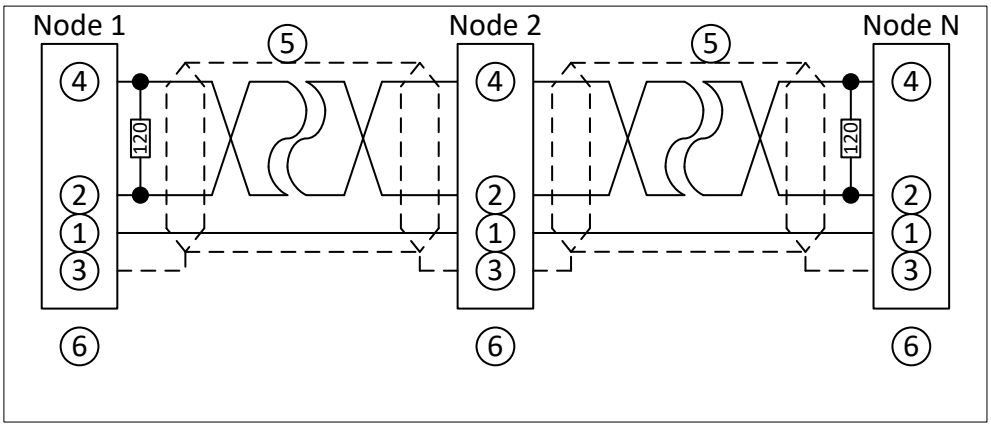


Fig. 196: CANopen interface, bus terminating resistors connected to the line ends

1	CAN_GND
2	CAN_L

The grounding of the shield should take place at the switchgear. Please refer to Chapter 1.6.4.6.1 “System data AC500” on page 3398.

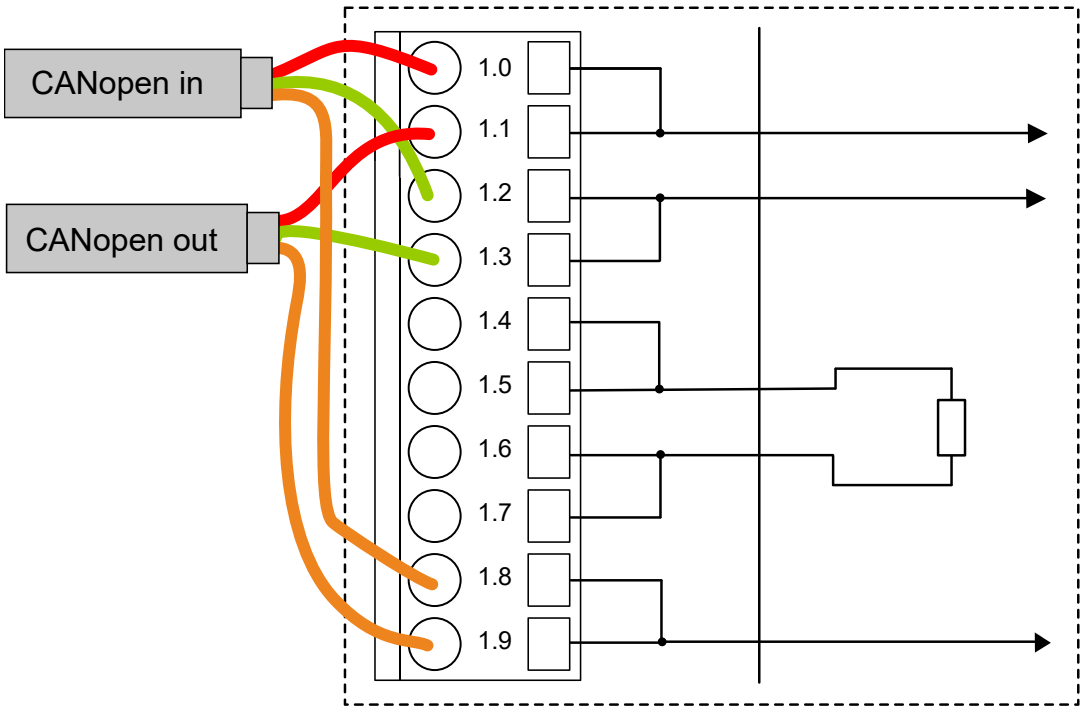
Mounting on terminal units TU517 or TU518

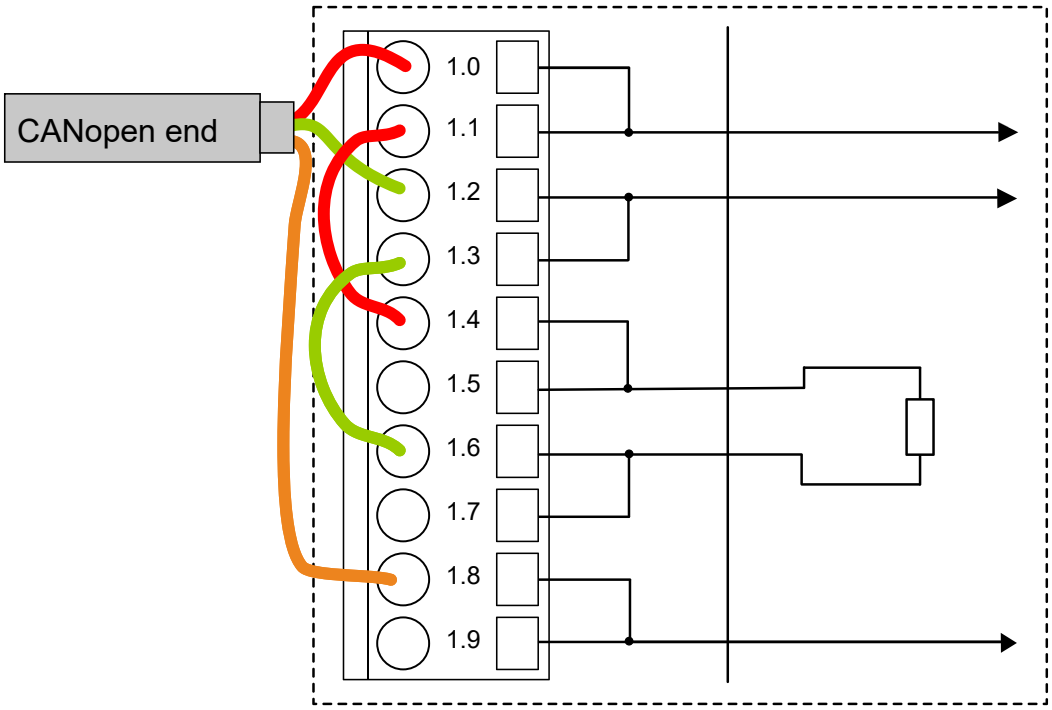
Table 540: Assignment of the terminals

Terminal	Signal	Description
1.0	CAN+	Non-inverted signal of the CAN bus
1.1	CAN+	Non-inverted signal of the CAN bus
1.2	CAN-	Inverted signal of the CAN bus
1.3	CAN-	Inverted signal of the CAN bus
1.4	Term+	CAN bus termination for CAN+ (for bus termination, Term+ must be connected with CAN+)
1.5	Term+	CAN bus termination for CAN+ (connecting alternative for terminal 1.4)
1.6	Term-	CAN bus termination for CAN- (for bus termination, Term- must be connected with CAN-)
1.7	Term-	CAN bus termination for CAN- (connecting alternative for terminal 1.6)
1.8	CAN-GND	Ground potential of the CAN bus
1.9	CAN-GND	Ground potential of the CAN bus

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:





In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the switchgear cabinet. Please refer to the AC500 System-Data Chapter 1.6.4.6.1 “System data AC500” on page 3398.

Table 541: Assignment of the other terminals

Terminal	Signal	Description
2.0	AI0+	Positive pole of analog input signal 0
2.1	AI1+	Positive pole of analog input signal 1
2.2	AI2+	Positive pole of analog input signal 2
2.3	AI3+	Positive pole of analog input signal 3
2.4	AI-	Negative pole of analog input signals 0 to 3
2.5	AO0+	Positive pole of analog output signal 0
2.6	AO1+	Positive pole of analog output signal 1
2.7	AI-	Negative pole of analog output signals 0 and 1
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DI0	Signal of the digital input DI0
3.1	DI1	Signal of the digital input DI1
3.2	DI2	Signal of the digital input DI2
3.3	DI3	Signal of the digital input DI3

Terminal	Signal	Description
3.4	DI4	Signal of the digital input DI4
3.5	DI5	Signal of the digital input DI5
3.6	DI6	Signal of the digital input DI6
3.7	DI7	Signal of the digital input DI7
3.8	UP	Process voltage UP (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)
4.0	DO0	Signal of the digital output DO0
4.1	DO1	Signal of the digital output DO1
4.2	DO2	Signal of the digital output DO2
4.3	DO3	Signal of the digital output DO3
4.4	DO4	Signal of the digital output DO4
4.5	DO5	Signal of the digital output DO5
4.6	DO6	Signal of the digital output DO6
4.7	DO7	Signal of the digital output DO7
4.8	UP3	Process voltage UP3 (24 V DC)
4.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

Connection of CANopen communication interface module CI581-CN:

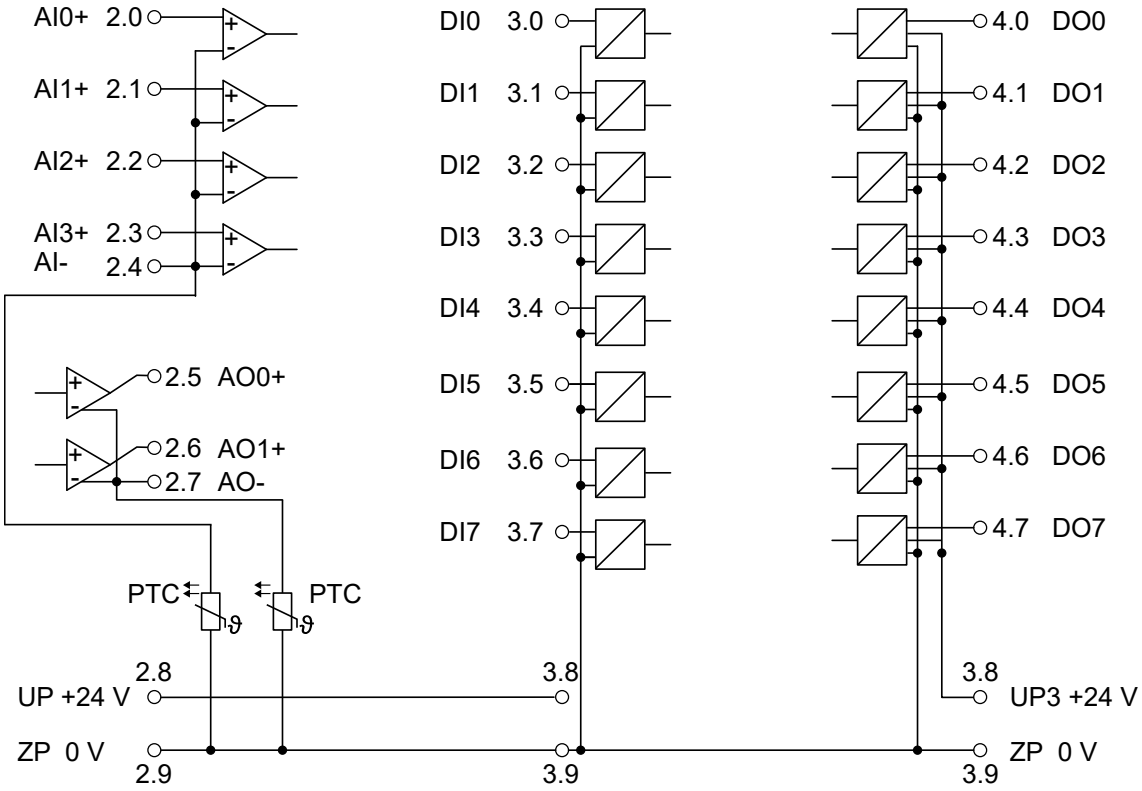


Fig. 198: Connection of the communication interface module CI581-CN

The module provides several diagnosis functions ↳ *Chapter 1.6.3.7.2.2.8 “Diagnosis” on page 3072*.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

The meaning of the LEDs is described in the section for the state LEDs ↳ *Chapter 1.6.3.7.2.2.9 “State LEDs” on page 3075*.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

Bit Rate (speed)	Bus Length
1 Mbit/s	40 m
800 kbit/s	50 m
500 kbit/s	100 m
250 kbit/s	250 m
125 kbit/s	500 m
50 kbit/s	1000 m

Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.

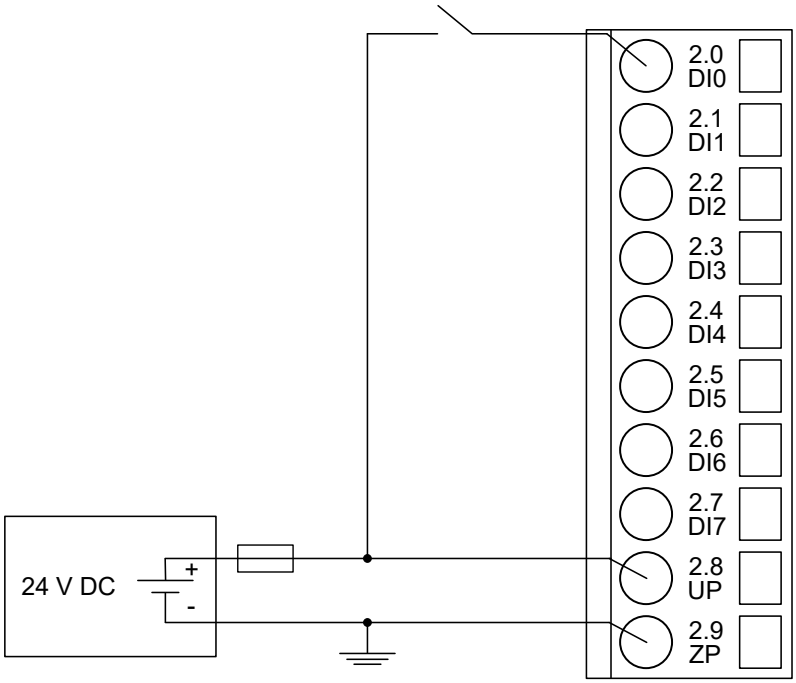

Fig. 199: Connection of the digital inputs to the module CI581-CN

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.

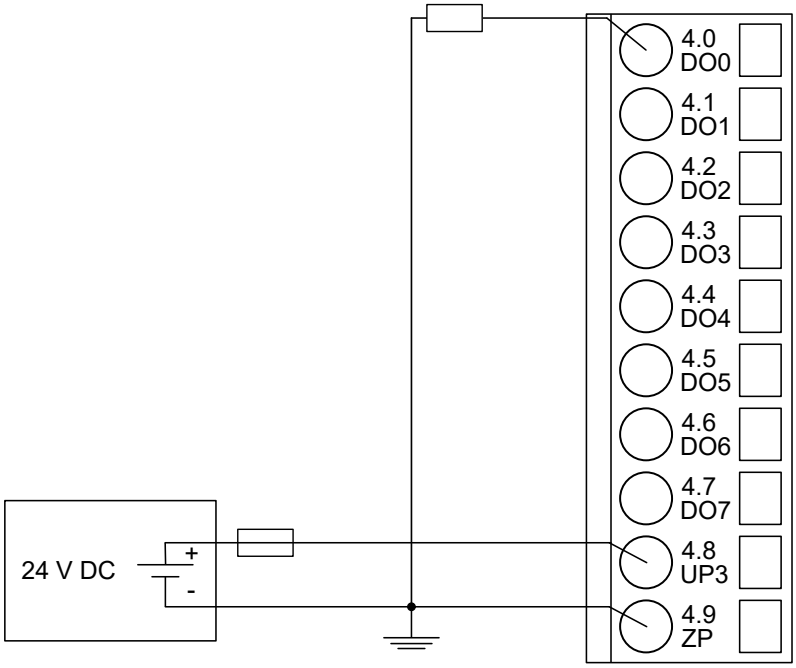

Fig. 200: Connection of configurable digital inputs/outputs to the module CI581-CN

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

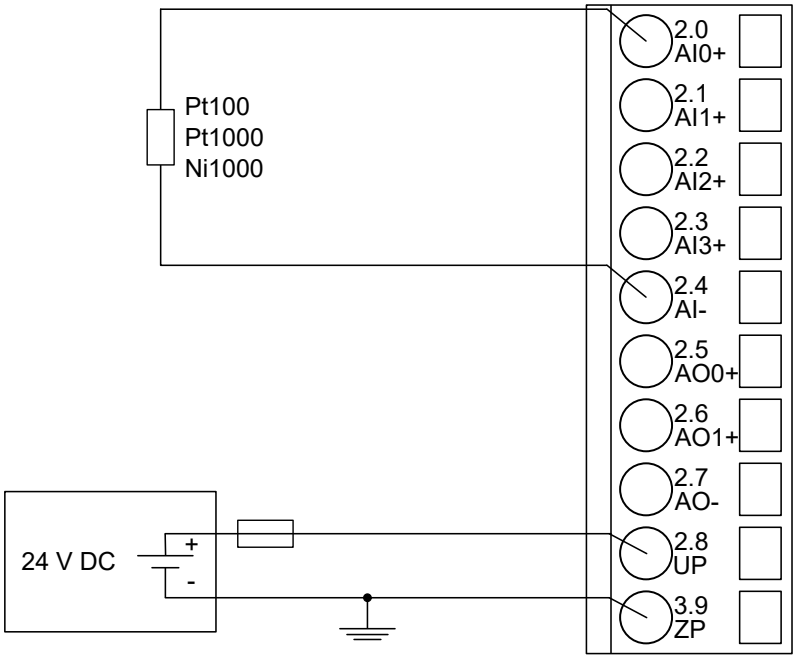

Fig. 201: Connection of resistance thermometers in 2-wire configuration to the analog inputs

Pt100	2-wire configuration, 1 channel used
Pt1000	2-wire configuration, 1 channel used
Ni1000	2-wire configuration, 1 channel used

For the measuring ranges that can be configured, please refer to sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

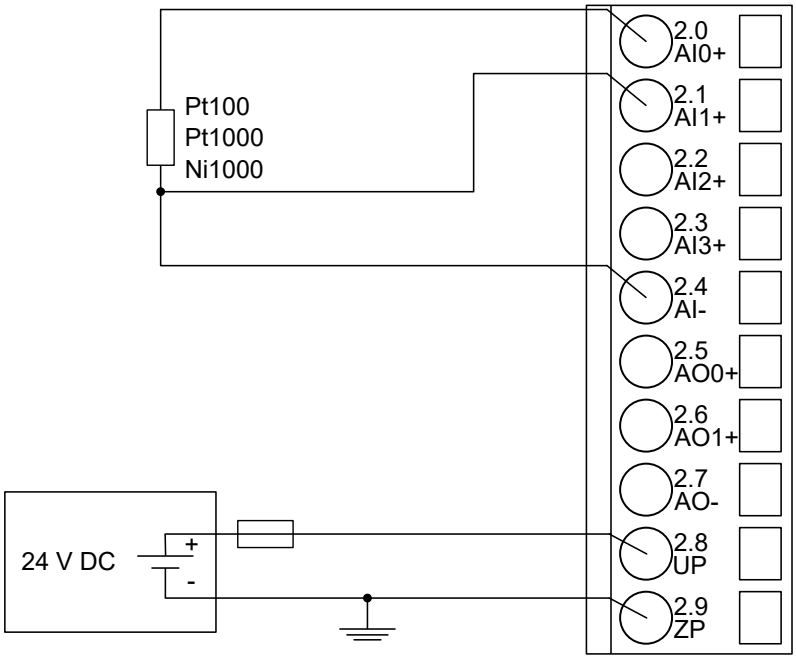

Fig. 202: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Pt100	3-wire configuration, 2 channels used
Pt1000	3-wire configuration, 2 channels used
Ni1000	3-wire configuration, 2 channels used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

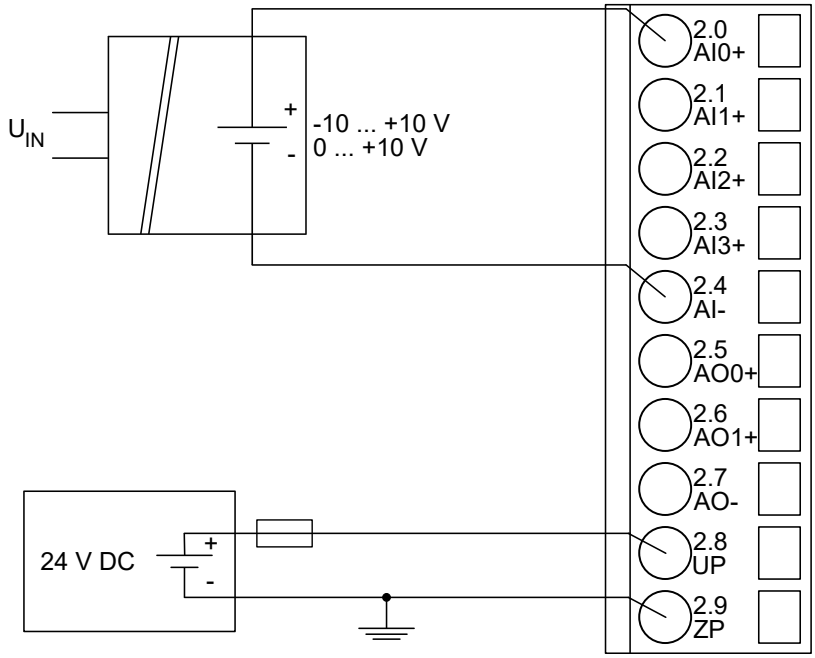

Fig. 203: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

To avoid error messages, configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

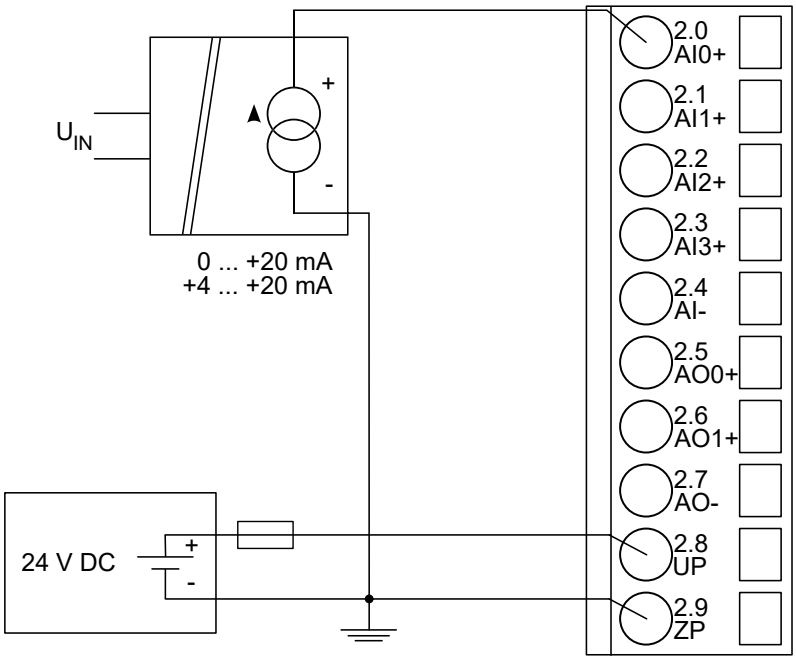

Fig. 204: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

Current	0...20 mA	1 channel used
Current	4...20 mA	1 channel used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

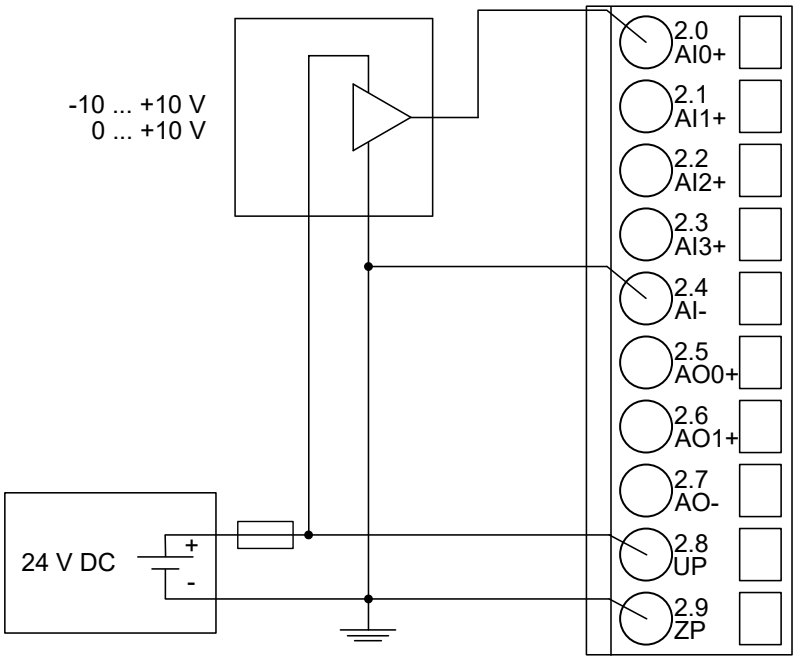

Fig. 205: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

NOTICE!

Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

For the measuring ranges that can be configured, plese refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

To avoid error messages, configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

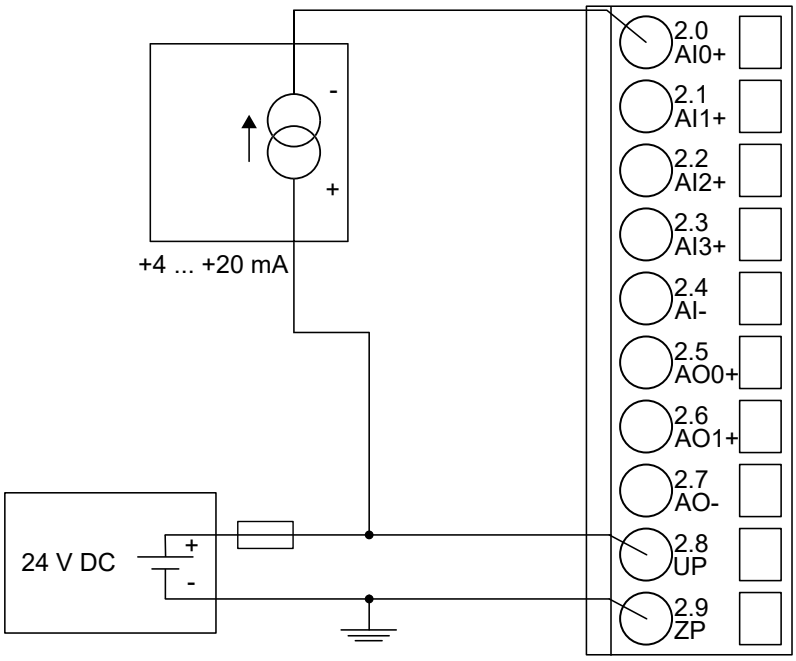

Fig. 206: Connection of passive-type analog sensors (current) to the analog inputs

Current	4...20 mA	1 channel used

CAUTION!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

NOTICE!

Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

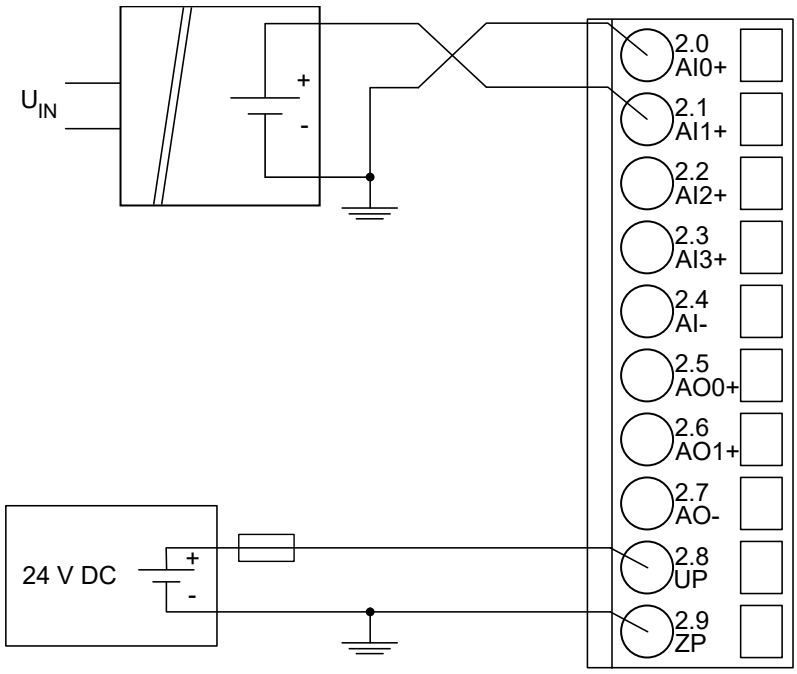

Fig. 207: Connection of active-type analog sensors (voltage) to differential analog inputs

Voltage	0...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↳ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↳ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

To avoid error messages, configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

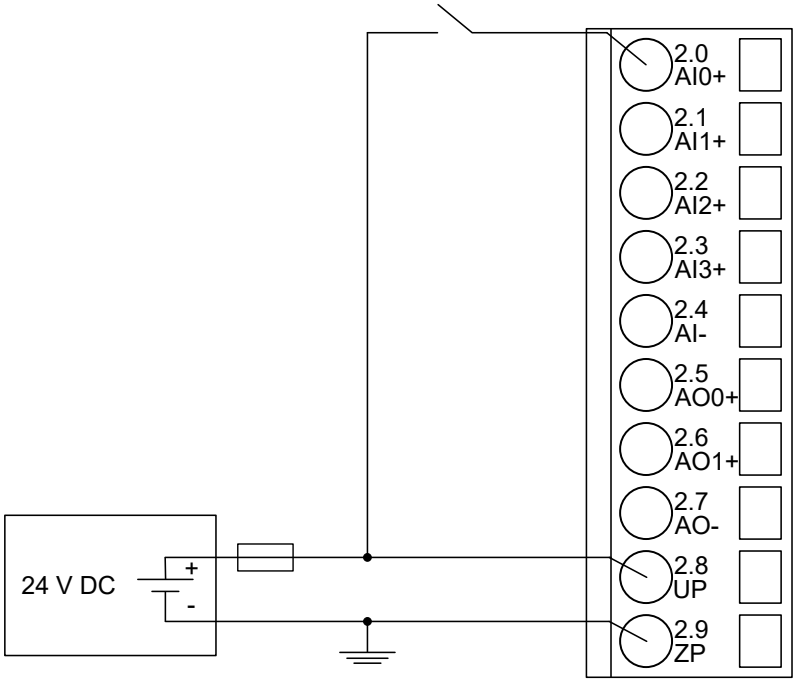

Fig. 208: Use of analog inputs as digital inputs

Digital input	24 V	1 channel used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges ↬ *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization ↬ *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

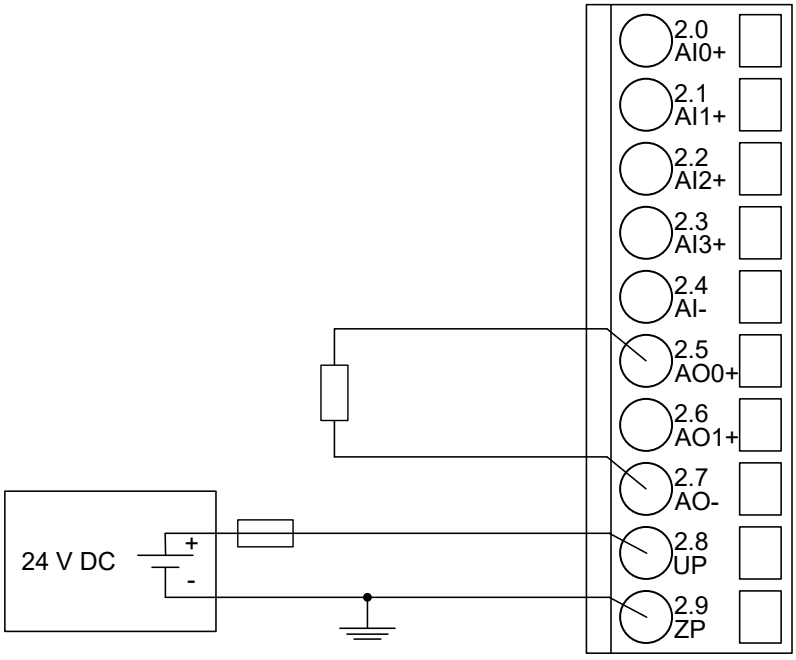

Fig. 209: Connection of analog output loads (voltage)

Voltage	-10 V...+10 V	Load ± 10 mA max.	1 channel used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

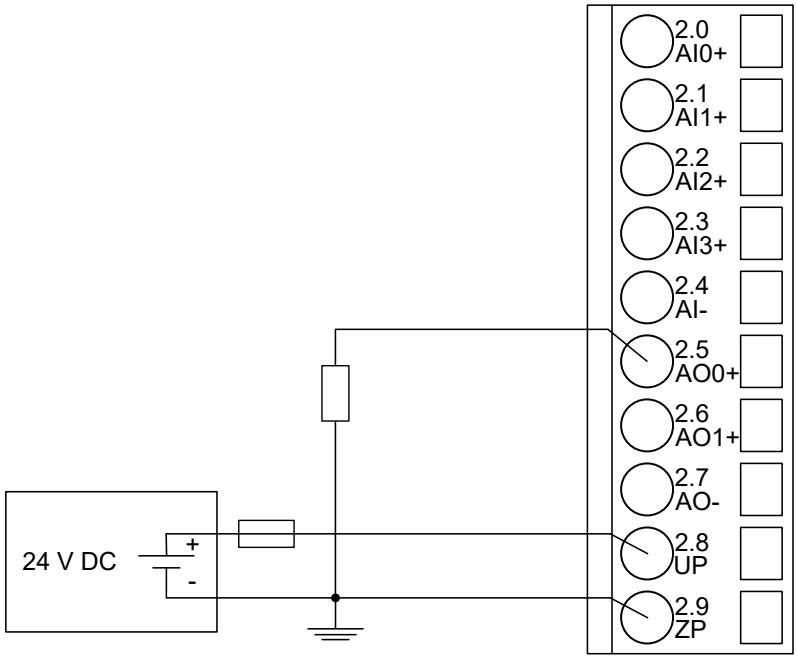

Fig. 210: Connection of analog output loads (current)

Current	0...20 mA	Load 0...500 Ω	1 channel used
Current	4...20 mA	Load 0...500 Ω	1 channel used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges *Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077* and Parameterization *Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067*.

Unused analog outputs can be left open-circuited.

Internal data exchange

Parameter	Value
Digital inputs (bytes)	3
Digital outputs (bytes)	3
Analog inputs (words)	4
Analog outputs (words)	2
Counter input data (words)	4
Counter output data (words)	8

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen communication interface module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmision rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	0x1C84	WORD	0x1C84
Parameter length	Internal	54	BYTE	54
Error LED / Failsafe function (table error LED / Failsafe function ↳ *Further information on page 3067*)	On	0	BYTE	0
	Off by E4	1		
	Off by E3	2		
	On + failsafe	16		
	Off by E4 + failsafe	17		
	Off by E3 + failsafe	18		
Reserved	0	0	ARRAY of 24 BYTES

Input 3, Channel configuration	Operation modes of analog inputs	Operation modes of analog inputs	BYTE	0
Input 3, Check channel	Settings channel monitoring	Settings channel monitoring	BYTE	0

Table 543: Channel configuration - Operating modes of the analog inputs

Internal Value	Operating Modes (individually configurable)
0 (default)	Not used
1	0...10 V
2	Digital input
3	0...20 mA
4	4...20 mA
5	-10 V...+10 V
8	2-wire Pt100 -50...+400 °C
9	3-wire Pt100 -50...+400 °C *)
10	0...10 V (voltage diff.) *)
11	-10 V...+10 V (voltage diff.) *)
14	2-wire Pt100 -50...+70 °C
15	3-wire Pt100 -50...+70 °C *)
16	2-wire Pt1000 -50...+400 °C
17	3-wire Pt1000 -50...+400 °C *)
18	2-wire Ni1000 -50...+150 °C
19	3-wire Ni1000 -50...+150 °C *)
*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).	

Table 544: Channel monitoring

Internal Value	Check Channel
0 (default)	Plausib(ility), cut wire, short circuit
3	Not used

Channel parameters for the analog outputs (2x)

Name	Value	Internal value	Internal value, type	Default
Output 0, Channel configuration	Operation modes of analog outputs	Operation modes of analog outputs	BYTE	0
Output 0, Check channel	Channel monitoring	Channel monitoring	BYTE	0
Output 0, Substitute value	Substitute value	Substitute value	WORD	0
Output 1, Channel configuration	Operation modes of analog outputs	Operation modes of analog outputs	BYTE	0
Output 1, Check channel	Channel monitoring	Channel monitoring	BYTE	0
Output 1, Substitute value	Substitute value	Substitute value	WORD	0

Table 545: Channel configuration - Operating modes of the analog outputs

Internal value	Operating Modes (individually configurable)
0 (default)	Not used
128	-10 V...+10 V
129	0...20 mA
130	4...20 mA

Table 546: Channel monitoring

Internal value	Check channel
0	Plausib(ility), cut wire, short circuit
3	None

Table 547: Substitute value

Intended Behavior of Output Channel when the Control System Stops	Required Setting of the Module Parameter "Behavior of Outputs in Case of a Communication Error"	Required Setting of the Channel Parameter "Substitute value"
Output OFF	Off	0
Last value infinite	Last value	0
Last value for 5 s and then turn off	Last value 5 sec	0
Last value for 10 s and then turn off	Last value 10 sec	0
Substitute value infinite	Substitute value	Depending on configuration

Intended Behavior of Output Channel when the Control System Stops	Required Setting of the Module Parameter "Behavior of Outputs in Case of a Communication Error"	Required Setting of the Channel Parameter "Substitute value"
Substitute value for 5 s and then turn off	Substitute value 5 sec	Depending on configuration
Substitute value for 10 s and then turn off	Substitute value 10 sec	Depending on configuration

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.1 ms 1 ms 8 ms 32 ms	0 1 2 3	BYTE	0.1 ms 0x00
Detect short circuit at outputs	Off On	0 1	BYTE	On 0x01
Behavior digital outputs at communcation error [1])	Off Last value Last value 5 sec Last value 10 sec Substitute value Substitute value 5 sec Substitute value 10 sec	0 1 6 11 2 7 12	BYTE	Off 0x00
Substitute value at output	0 ... 255	00h ... FFh	BYTE	0 0x00
Detect voltage overflow at outputs [2])	Off On	0 1	BYTE	Off 0x00

[1]) The parameter Behavior digital outputs at communcation error is only analyzed if the failsafe mode is ON.

[2]) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected ↳ *Chapter 1.6.3.7.2.2.3 “Connections” on page 3050*. In this case, the start-up is disabled as long as the external voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

Diagnosis

Byte Number	Description	Possible Values
1	Diagnosis byte, slot number	31 = CI581-CN (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O module ... 10 = 10th connected S500 I/O module
2	Diagnosis byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to bit 5, coded error description
5	Diagnosis byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

4	-	31	3	0..1	7	Analog value underflow at an analog output	Check output value

Remarks:

[1])	In AC500, the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module;14 = I/O bus; 31 = module itself The identifier is not contained in the CI541-DP diagnosis block.
[2])	With "Device" the following allocation applies: 31 = module itself; 1..10 = decentralized communication interface module
[3])	With "Module" the following allocation applies: 31 = module itself Channel error: module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears if external voltages at one or more terminals DO0..DO7 cause other digital outputs to be fed by that voltage (voltage feedback, description in 'Connections' ↯ *Chapter 1.6.3.7.2.2.3 “Connections” on page 3050*). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
[5])	The voltage on digital outputs DO0..DO7 has overrun the process supply voltage UP3 (description in 'Connections' ↯ *Chapter 1.6.3.7.2.2.3 “Connections” on page 3050*). Diagnosis message appears for the whole module.
[6])	This message appears if the output of a channel DO0..DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.
[7])	Short circuit: After a short circuit has been detected, the output is deactivated for 100ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The state LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with I/O controller	Start-up / preparing communication
	Yellow	---	---	---

LED	Color	OFF	ON	Flashing
CN-RUN	Green	---	Device configured, CANopen bus in OPERATIONAL state and cyclic data exchange running	Flashing: CANopen bus in PRE-OPERATIONAL state and slave is being configured Single flash: CANopen bus in STOPPED state. Flickering: Autodetect is active
CN-ERR	Red	No system error	CANopen Bus is OFF	Flashing: Configuration error Single flash: error counter overflow due to too many error frames Double flash: A node-guard or a heartbeat event occurred Flickering: Autodetect is active
S-ERR	Red	No error	Internal error	--
I/O bus	Green	No decentralized I/O modules connected or communication error	Decentralized I/O modules connected and operational	---

States of the 27 process LEDs:

LED	Color	OFF	ON	Flashing
AI0 to AI3	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
AO0 to AO1	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
DI0 to DI7	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO0 toDO7	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--

LED	Color	OFF	ON	Flashing
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Measuring ranges

Input ranges voltage, current and digital input

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DI0 to DI7	Terminals 3.0 to 3.7
Reference potential for all inputs	Terminals 2.9 ... 4.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals	1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)	Type 1
Input delay (0->1 or 1->0)	Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage	24 V DC
Signal 0	-3 V...+5 V
Undefined signal	> +5 V...< +15 V
Signal 1	+15 V...+30 V
Ripple with signal 0	Within -3 V...+5 V
Ripple with signal 1	Within +15 V...+30 V
Input current per channel	
Input voltage +24 V	Typ. 5 mA
Input voltage +5 V	> 1 mA

Parameter	Value
Input voltage +15 V	> 2 mA
Input voltage +30 V	< 8 mA
Max. cable length	
Shielded	1000 m
Unshielded	600 m

Technical data of the digital outputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DO0 to DO7	Terminals 4.0 to 4.7
Reference potential for all outputs	Terminals 2.9 ... 4.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage	For all outputs terminal 4.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1	UP3 (-0.8 V)
Output delay (0->1 or 1->0)	On request
Output current	
Rated value per channel	500 mA at UP3 = 24 V
Max. value (all channels together)	4 A
Leakage current with signal 0	< 0.5 mA
Fuse for UP3	10 A fast
Demagnetization with inductive DC load	Via internal varistors (see figure below this table)
Output switching frequency	
With resistive load	On request
With inductive loads	Max. 0.5 Hz
With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof	Yes
Overload message (I > 0.7 A)	Yes, after ca. 100 ms
Output current limitation	Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals	Yes (software-controlled supervision)
Max. cable length	
Shielded	1000 m
Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

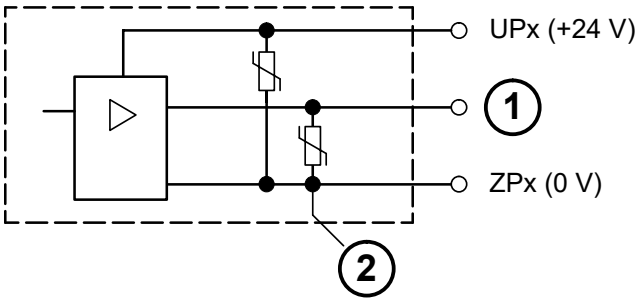

Fig. 211: Digital input/output (circuit diagram)

1	Digital output
2	Varistors for demagnetization when inductive loads are turned off

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 2.0 to2.3
Reference potential for AI0+ to AI3+		Terminal 2.4 (AI-) for voltage and RTD measurement Terminal 2.9, 3.9 and 4.9 for current measurement
Input type		
	Unipolar	Voltage 0...10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10...+10 V
Galvanic isolation		Against CANopen Bus
Configurability		0...10 V, -10...+10 V, 0/4...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s
Resolution		Range 0...10 V: 12 bits Range -10...+10 V: 12 bits + sign Range 0...20 mA: 12 bits Range 4...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C

Parameter	Value
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code	Tables Input Ranges Voltage, Current ↳ *Chapter 1.6.3.7.2.2.10.1 “Input ranges voltage, current and digital input” on page 3077* and Digital Input and IInput range resistance temperature detector ↳ *Chapter 1.6.3.7.2.2.10.2 “Input ranges resistance temperature detector” on page 3077*
Unused inputs	Are configured as "unused" (default value)
Overvoltage protection	Yes

Technical data of the analog inputs if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels AI0+ to AI3+		Terminals 2.0 to 2.3
Reference potential for the inputs		Terminals 2.9, 3.9 and 4.9 (ZP)
Indication of the input signals		1 LED per channel
Input signal voltage		24 VDC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V...+15 V
	Signal 1	+15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 3.7 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		2
Distribution of channels into groups		1 group for 2 channels
Connection of the channels AO0+...AO1+		Terminals 1.5...1.6
Reference potential for AO0+ to AO1+		Terminal 2.7 (AO-) for voltage output Terminal 2.9, 3.9 and 4.9 for current output
Output type		
	Unipolar	Current

Parameter		Value
	Bipolar	Voltage
Galvanic isolation		Against internal supply and other modules
Configurability		-10...+10 V, 0...20 mA, 4...20 mA (each output can be configured individually)
Output resistance (load), as current output		0...500 Ω
Output loadability, as voltage output		±10 mA max.
Indication of the output signals		1 LED per channel (brightness depends on the value of the analog signal)
Resolution		12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance)		Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code		See *Chapter 1.6.3.7.2.2.10.3 “Output ranges voltage and current” on page 3078*
Unused outputs		Are configured as "unused" (default value) and can be left open-circuited

Technical data of the fast counter

Parameter	Value
Used inputs	Terminal 3.0 (DI0), 3.1 (DI1)
Used outputs	Terminal 4.0 (DO0)
Counting frequency	Depending on operation mode: Mode 1 - 6: max. 200 kHz Mode 7: max. 50 kHz Mode 9: max. 35 kHz Mode 10: max. 20 kHz
Detailed description	Fast Counter *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*
Operating modes	Operating modes *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*

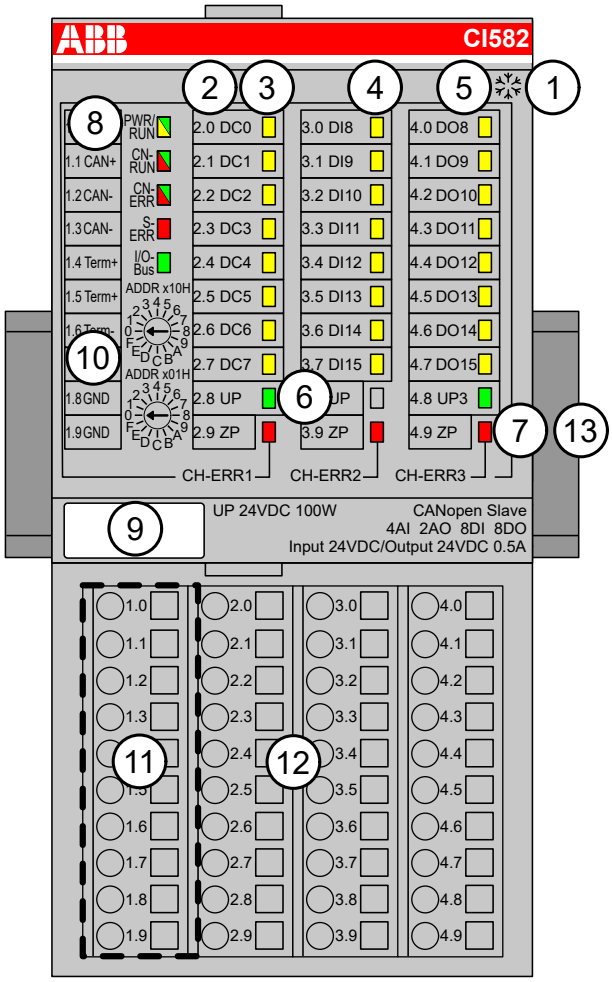
Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 228 100 R0001	CI581-CN, CANopen communication interface module with 8 DI, 8 DO, 4 AI and 2 AO	Active
1SAP 428 100 R0001	CI581-CN-XC, CANopen communication interface module with 8 DI, 8 DO, 4 AI and 2 AO, XC version	Active

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

CI582-CN

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states of the configurable digital inputs/outputs (DC0 - DC7)
4 8 yellow LEDs to display the signal states of the digital inputs (DI8 - DI15)
5 8 yellow LEDs to display the signal states of the digital outputs (DO8 - DO15)
6 2 green LEDs to display the supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 System LEDs: PWR/RUN, CN-RUN, CN-ERR, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the CANopen node ID

11 10 terminals to connect the CANopen bus signals
12 Terminal unit
13 DIN rail
❄ Sign for XC version

Intended purpose

The CANopen communication interface module CI582-CN is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Interface	CAN
Protocol	CANopen
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the CANopen Node ID for configuration purposes (00h to FFh)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Transmission rates	10 / 20 / 50 / 125 / 250 / 500 / 800 kbit/s 1 Mbit/s Auto transmission rate detection is supported
Bus connection	Depending on used terminal unit TU510: 9-pin D-sub connector TU518: 10-pin terminal block
Processor	Hilscher NETX 100
Expandability	CI58x can only be used on onboard CAN interface and without any I/O expansion module ↳ *Table 538 “CANopen” on page 3044*.
State display	Module state: PWR/RUN, CN-RUN, CN-ERR, E-ERR, I/O bus
Adjusting elements	2 rotary switches for generation of the node address

Parameter		Value
Ambient temperature		System data AC500 ↳ *Chapter 1.6.4.6.1 "System data AC500" on page 3398* System data AC500 XC ↳ *Chapter 1.6.4.7.1 "System data AC500-XC" on page 3450*
Current consumption		UP: 0.2 A UP3: 0.06 A + 0.5 A max. per output
Weight (without terminal unit)		Ca. 125 g
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	CANopen interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 2.8 and 3.8 for +24 V (UP) Terminal 4.8 for +24 V (UP3) Terminals 2.9, 3.9 and 4.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Setting of the CANopen Node ID identifier		With 2 rotary switches at the front side of the module
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V
Required terminal unit		TU509, TU510, TU517 or TU518 ↳ *Chapter 1.6.3.5.3 "TU517 and TU518 for communication interface modules" on page 2559*

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

CI582-CN: Input/ Output characteristics

Parameter	Value
Inputs and outputs	8 digital inputs (24 V DC) 8 digital transistor outputs (24 V DC, 0.5 A max.) 8 configurable digital inputs/outputs (24 V DC, 0.5 A max.)

Connections

The CANopen communication interface module is plugged on the I/O terminal units TU517 ↬ *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559* or TU518 ↬ *Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559* and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC

Terminal 4.8: process supply voltage UP3 = +24 V DC

Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

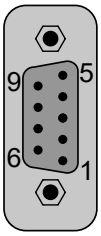
For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↬ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Possibilities of connection

Mounting on terminal units TU509 or TU510

The assignment of the 9-pin female D-sub for the CANopen signals



1	---	Reserved
2	CAN-	Inverted signal of the CAN bus
3	CAN_GND	Ground potential of the CAN bus
4	---	Reserved
5	---	Reserved
6	---	Reserved
7	CAN+	Non-inverted signal of the CAN bus
8	---	Reserved

	9	---	Reserved
	Shield	Cable shield	Functional earth

Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

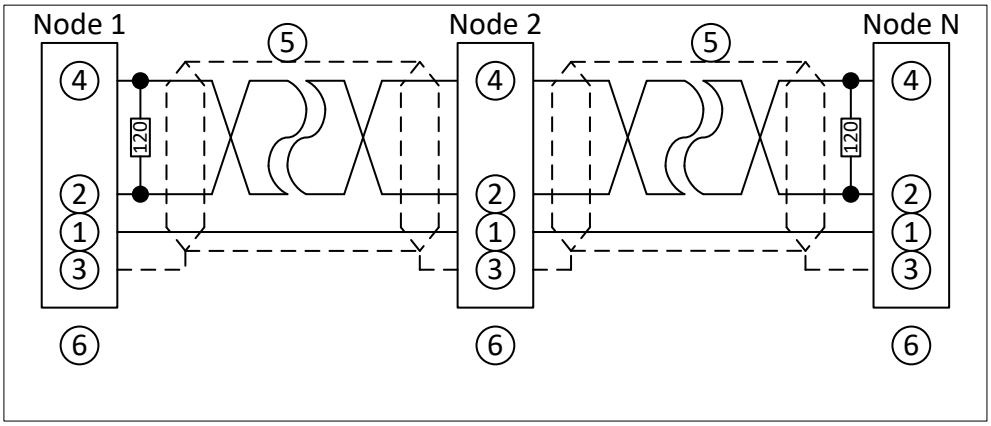


Fig. 212: CANopen interface, bus terminating resistors connected to the line ends

1	CAN_GND
2	CAN_L
3	Shield
4	CAN_H
5	Data line, shielded twisted pair
6	COMBICON connection, CANopen interface

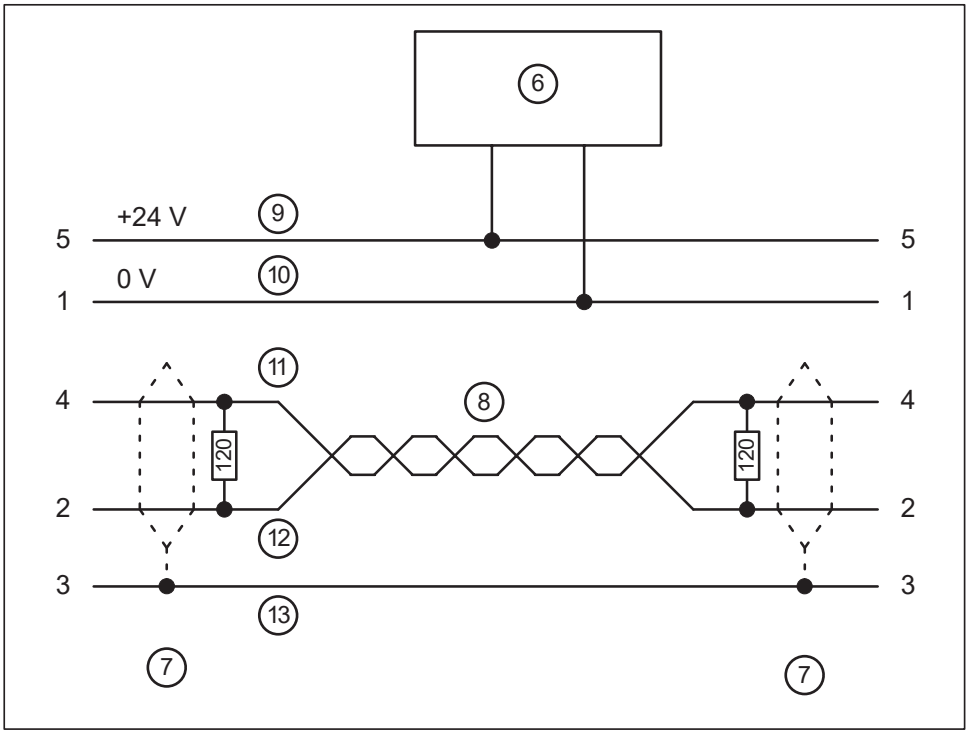

Fig. 213: DeviceNet interface, bus terminating resistors connected to the line ends

6	DeviceNet power supply
7	COMBICON connection, DeviceNet interface
8	Data lines, twisted pair cables
9	red
10	black
11	white
12	blue
13	bare

The grounding of the shield should take place at the switchgear. Please refer to ↳ *Chapter 1.6.4.6.1 “System data AC500” on page 3398.*

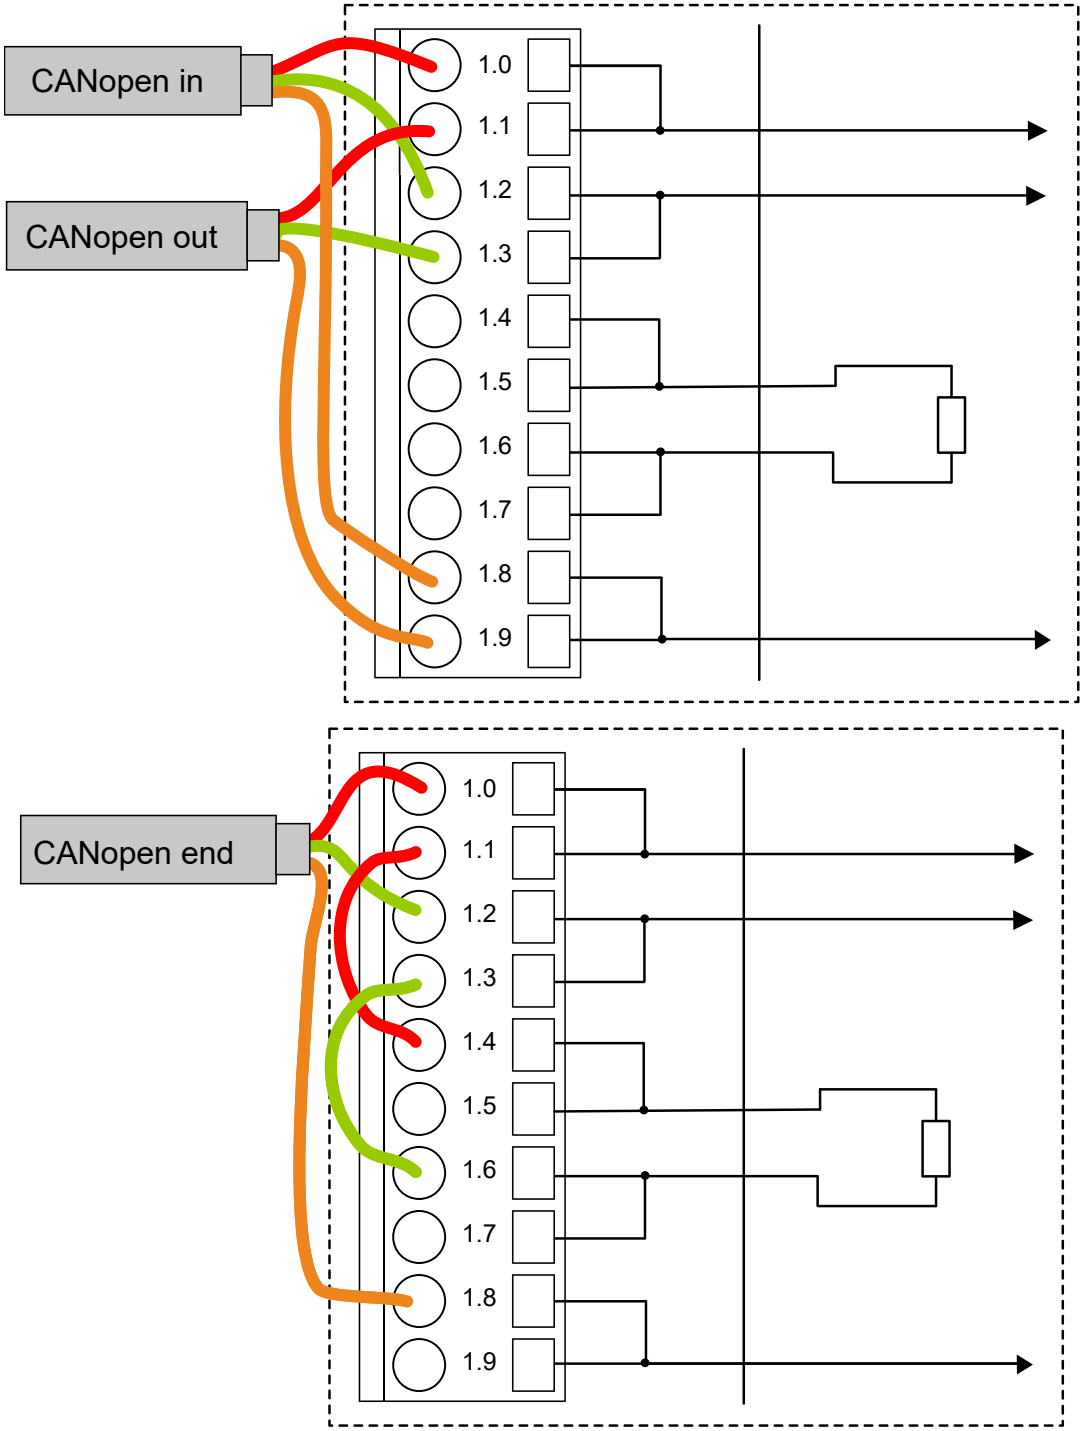
Mounting on terminal units TU517 or TU518

Table 548: Assignment of the terminals

Terminal	Signal	Description
1.0	CAN+	Non-inverted signal of the CAN bus
1.1	CAN+	Non-inverted signal of the CAN bus
1.2	CAN-	Inverted signal of the CAN bus
1.3	CAN-	Inverted signal of the CAN bus
1.4	Term+	CAN bus termination for CAN+ (for bus termination, Term+ must be connected with CAN+)
1.5	Term+	CAN bus termination for CAN+ (connecting alternative for terminal 1.4)
1.6	Term-	CAN bus termination for CAN- (for bus termination, Term- must be connected with CAN-)
1.7	Term-	CAN bus termination for CAN- (connecting alternative for terminal 1.6)
1.8	CAN-GND	Ground potential of the CAN bus
1.9	CAN-GND	Ground potential of the CAN bus

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:



In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the switchgear cabinet. Please refer to the AC500 System-Data ↳ Chapter 1.6.4.6.1 “System data AC500” on page 3398.

Table 549: Assignment of the other terminals

Terminal	Signal	Description
2.0	DC0	Signal of the configurable digital input/output DC0
2.1	DC1	Signal of the configurable digital input/output DC1
2.2	DC2	Signal of the configurable digital input/output DC2
2.3	DC3	Signal of the configurable digital input/output DC3
2.4	DC4	Signal of the configurable digital input/output DC4
2.5	DC5	Signal of the configurable digital input/output DC5
2.6	DC6	Signal of the configurable digital input/output DC6
2.7	DC7	Signal of the configurable digital input/output DC7
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DI8	Signal of the digital input DI8
3.1	DI9	Signal of the digital input DI9
3.2	DI10	Signal of the digital input DI10
3.3	DI11	Signal of the digital input DI11
3.4	DI12	Signal of the digital input DI12
3.5	DI13	Signal of the digital input DI13
3.6	DI14	Signal of the digital input DI14
3.7	DI15	Signal of the digital input DI15
3.8	UP	Process voltage UP (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)
4.0	DO8	Signal of the digital output DO8
4.1	DO9	Signal of the digital output DO9
4.2	DO10	Signal of the digital output DO10
4.3	DO11	Signal of the digital output DO11
4.4	DO12	Signal of the digital output DO12
4.5	DO13	Signal of the digital output DO13
4.6	DO14	Signal of the digital output DO14
4.7	DO15	Signal of the digital output DO15
4.8	UP3	Process voltage UP3 (24 V DC)
4.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Connection of CANopen communication interface module CI582-CN:

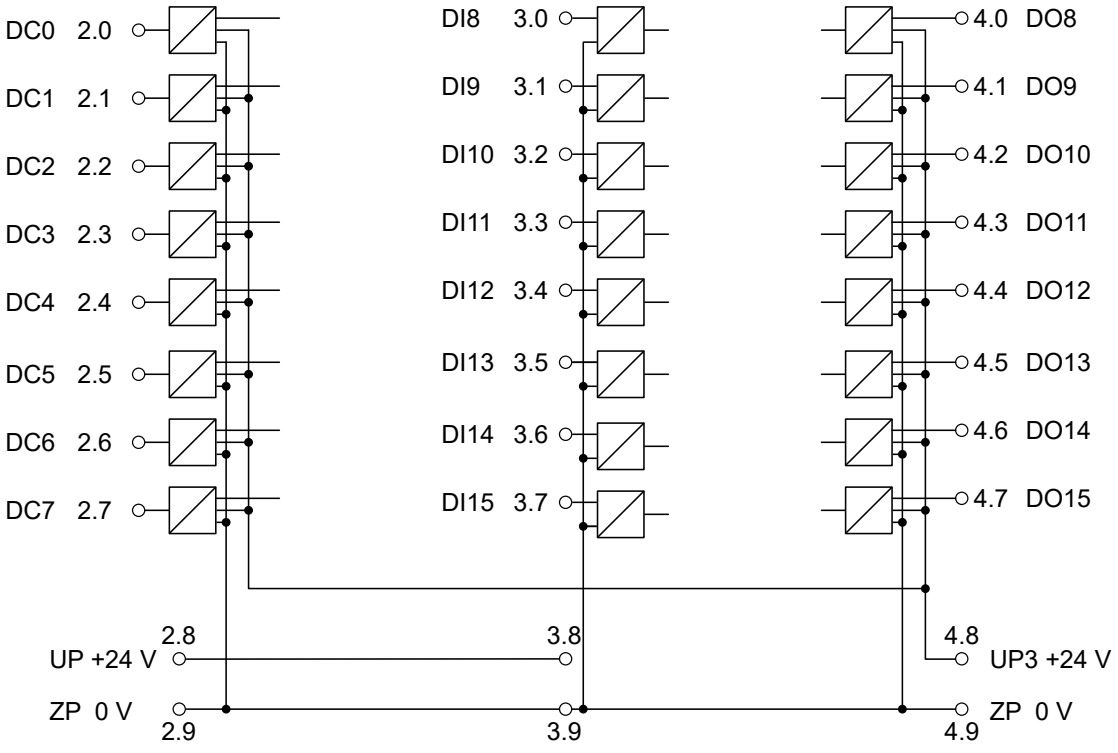


Fig. 214: Connection of the communication interface module CI582-CN

For a description of the meaning of the LEDs, please refer to the section for the state LEDs ↳ *Chapter 1.6.3.7.2.3.9 “State LEDs” on page 3101*.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length

Bit Rate (speed)	Bus Length
1 Mbit/s	40 m
800 kbit/s	50 m
500 kbit/s	100 m
250 kbit/s	250 m
125 kbit/s	500 m
50 kbit/s	1000 m

Connection of the digital inputs

The following figure shows the connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.

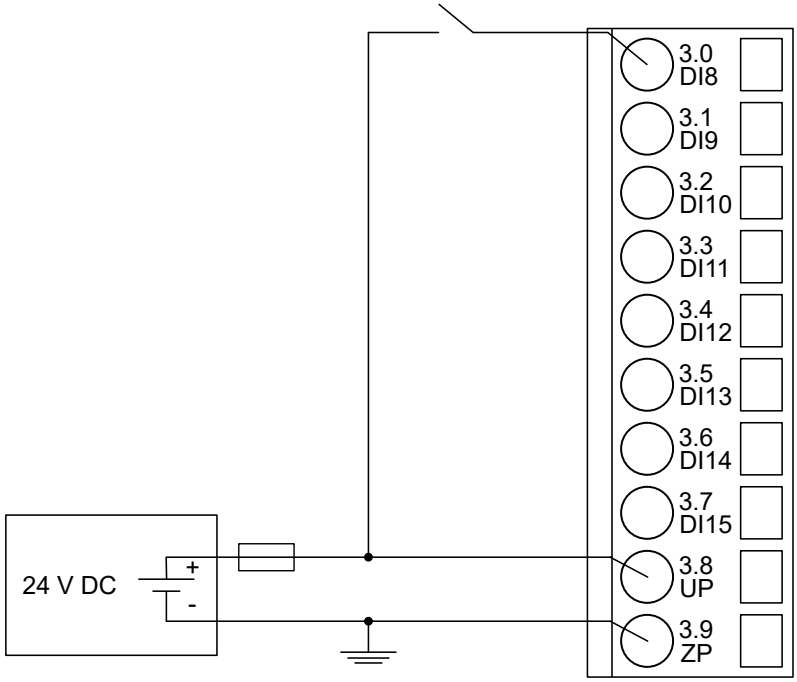

Fig. 215: Connection of the digital inputs to the module CI582-CN

Connection of the digital outputs

The following figure shows the connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.

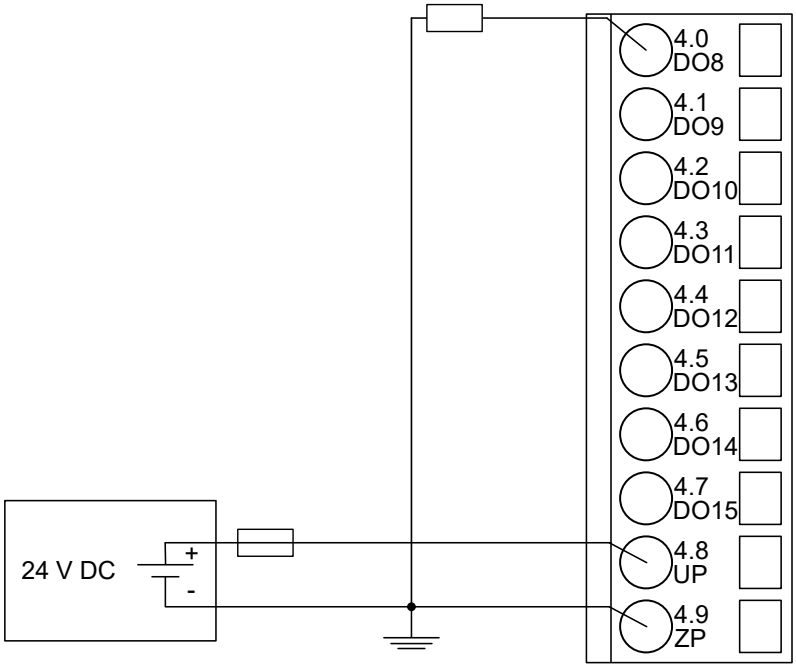

Fig. 216: Connection of configurable digital inputs/outputs to the module CI582-CN

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

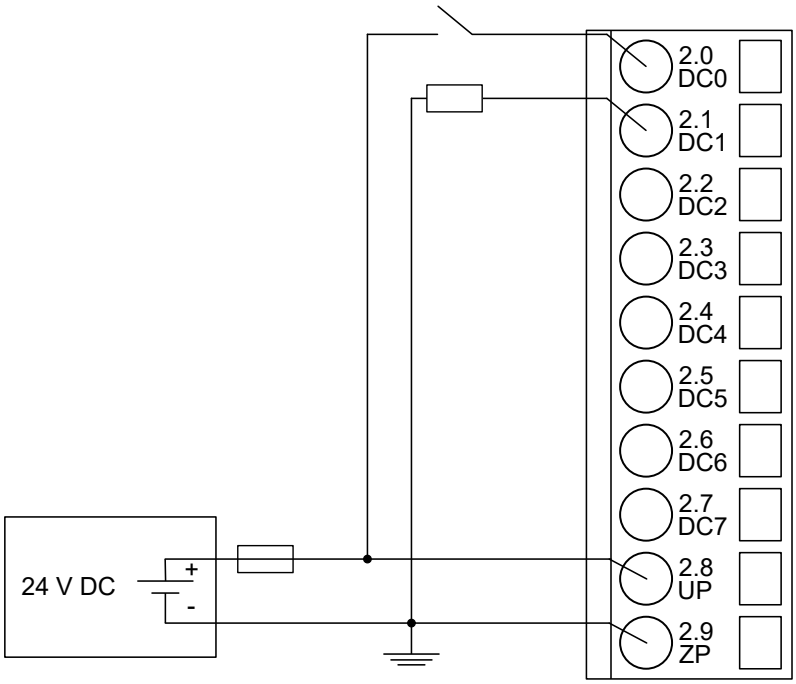

Fig. 217: Connection of configurable digital inputs/outputs to the module CI582-CN

Internal data exchange

Parameter	Value
Digital inputs (bytes)	5
Digital outputs (bytes)	5
Counter input data (words)	4
Counter output data (words)	8

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen communication interface module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmision rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	0x1C89	WORD	0x1C89
Parameter length	Internal	38	BYTE	38
Error LED / failsafe function table error LED / failsafe function ↳ *Table 550 “Error LED / Failsafe function” on page 3096*)	On	0	BYTE	0
	Off by E4	1		
	Off by E3	2		
	On + failsafe	16		
	Off by E4 + failsafe	17		
	Off by E3 + failsafe	18		
Reserved	0	0	ARRAY of 24 BYTES	
Check supply	On	0	BYTE	
	Off	1		1

Name	Value	Internal value	Internal value, type	Default
Fast counter	0	0	BYTE	0
	:	:		
	10 [2])	10		

[1]) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

[2]) For a description of the counter operating modes, please refer to the 'Fast Counter' section *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*.

Table 550: Error LED / Failsafe function

Setting	Description
On	Error LED (S-ERR) lights up at errors of all error classes, failsafe mode off
Off by E4	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, failsafe mode off
Off by E3	Error LED (S-ERR) lights up at errors of error classes E1 and E2, failsafe mode off
On + Failsafe	Error LED (S-ERR) lights up at errors of all error classes, failsafe mode on *)
Off by E4 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, failsafe mode on *)
Off by E3 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1 and E2, failsafe mode on *)
*) The parameter Behavior DO at comm. error is only analyzed if the failsafe mode is ON.	

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.1 ms	0	BYTE	0.1 ms
	1 ms	1		0x00
	8 ms	2		
	32 ms	3		
Detect short circuit at outputs	Off	0	BYTE	On
	On	1		0x01
Behavior DO at comm. error [1])	Off	0	BYTE	Off
	Last value	1		0x00
	Last value 5 sec	6		
	Last value 10 sec	11		
	Substitute value	2		
	Substitute value 5 sec	7		
	Substitute value 10 sec	12		

Name	Value	Internal value	Internal value, type	Default
Substitute value at output	0 ... 65535	0000h ... FFFFh	WORD	0 0x0000
Preventive voltage feedback monitoring for DC0..DC7 [2])	Off On	0 1	BYTE	Off 0x00
Detect voltage overflow at outputs [3])	Off On	0 1	BYTE	Off 0x00

Remarks:

[1])	The parameter Behavior DO at comm. error is applied to DC and DO channels and only analyzed if the failsafe mode is ON.
[2])	The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
[3])	The error state "voltage overflow at outputs" appears if external voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see 'Connections' ↳ *Chapter 1.6.3.7.2.3.3 “Connections” on page 3087*). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters to "OFF". This parameter should only be disabled in exceptional cases as voltage overflow may produce reverse voltage.

Diagnosis

Byte Number	Description	Possible Values
1	Diagnosis byte, slot number	31 = CI582-CN (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O module ... 10 = 10th connected S500 I/O module
2	Diagnosis byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master

Byte Number	Description	Possible Values
4	Diagnosis byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to Bit 5, coded error description
5	Diagnosis byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

[1])	In AC500, the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module;14 = I/O bus; 31 = module itself The identifier is not contained in the CI542-DP diagnosis block.
[2])	With "Device" the following allocation applies: 31 = module itself, 1..10 = expansion module
[3])	With "Module" the following allocation applies depending on the master: Module error: 31 = module itself Channel error: module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears if external voltages at one or more terminals DC0..DC7 or DO0..DO7 cause other digital outputs to be supplied by that voltage (voltage feedback, see 'Connections' ↳ *Chapter 1.6.3.7.2.3.3 “Connections” on page 3087*). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

[5])	The voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see 'Connections' *Chapter 1.6.3.7.2.3.3 “Connections” on page 3087*). A diagnosis message appears for the whole module.
[6])	This message appears if the output of a channel DC0..DC7 or DO0..DO7 should be switched on while an external voltage is connected. In this case the start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.
[7])	Short circuit: After a short circuit has been detected, the output is deactivated for 100ms. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with I/O controller	Start-up / preparing communication
	Yellow	---	---	---
CN-RUN	Green	---	Device configured, CANopen bus in OPERATIONAL state and cyclic data exchange running	Flashing: CANopen bus in PRE-OPERATIONAL state and slave is being configured Single flash: CANopen bus in STOPPED state. Flickering: Autodetect is active
CN-ERR	Red	No system error	CANopen Bus is OFF	Flashing: Configuration error Single flash: error counter overflow due to too many error frames Double flash: A node-guard or a heartbeat event occurred Flickering: Autodetect is active

LED	Color	OFF	ON	Flashing
S-ERR	Red	No error	Internal error	--
I/O bus	Green	No decentralized I/O modules connected or communication error	Decentralized I/O modules connected and operational	---

States of the 29 process LEDs

LED	Color	OFF	ON	Flashing
DC0 to DC7	Yellow	Input/output is OFF	Input/output is ON	--
DI8 to DI15	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO8 to DO15	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Technical data

The system data of AC500 and S500 ↳ *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DI0 to DI7	Terminals 3.0 to 3.7
Reference potential for all inputs	Terminals 2.9 ... 4.9 (negative pole of the supply voltage, signal name ZP)

Parameter	Value
Indication of the input signals	1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)	Type 1
Input delay (0->1 or 1->0)	Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage	24 V DC
Signal 0	-3 V...+5 V
Undefined signal	> +5 V...< +15 V
Signal 1	+15 V...+30 V
Ripple with signal 0	Within -3 V...+5 V
Ripple with signal 1	Within +15 V...+30 V
Input current per channel	
Input voltage +24 V	Typ. 5 mA
Input voltage +5 V	> 1 mA
Input voltage +15 V	> 2 mA
Input voltage +30 V	< 8 mA
Max. cable length	
Shielded	1000 m
Unshielded	600 m

Technical data of the digital outputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DO0 to DO7	Terminals 4.0 to 4.7
Reference potential for all outputs	Terminals 2.9 ... 4.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage	For all outputs terminal 4.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1	UP3 (-0.8 V)
Output delay (0->1 or 1->0)	On request
Output current	
Rated value per channel	500 mA at UP3 = 24 V
Max. value (all channels together)	4 A
Leakage current with signal 0	< 0.5 mA
Fuse for UP3	10 A fast
Demagnetization with inductive DC load	Via internal varistors (see figure below this table)
Output switching frequency	
With resistive load	On request
With inductive loads	Max. 0.5 Hz

Parameter	Value
With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof	Yes
Overload message (I > 0.7 A)	Yes, after ca. 100 ms
Output current limitation	Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals	Yes (software-controlled supervision)
Max. cable length	
Shielded	1000 m
Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

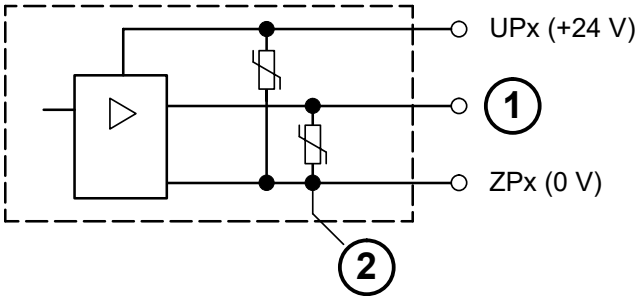

Fig. 218: Digital input/output (circuit diagram)

1	Digital output
2	Varistors for demagnetization when inductive loads are turned off

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter	Value
Number of channels per module	8 inputs/outputs (with transistors)
Distribution of the channels into groups	1 group for 8 channels
If the channels are used as inputs	
Channels DC0...DC07	Terminals 2.0...2.7
If the channels are used as outputs	
Channels DC0...DC07	Terminals 2.0...2.7
Indication of the input/output signals	1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation	From the CANopen network

Technical data of the digital inputs/outputs if used as inputs

Please refer to the Technical Data of the Digital Inputs *Chapter 1.6.3.7.2.3.10 “Technical data” on page 3102*. Deviation:

Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Please refer to the Technical Data of the Digital Outputs *Chapter 1.6.3.7.2.3.10 “Technical data” on page 3102*. Deviation:

Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

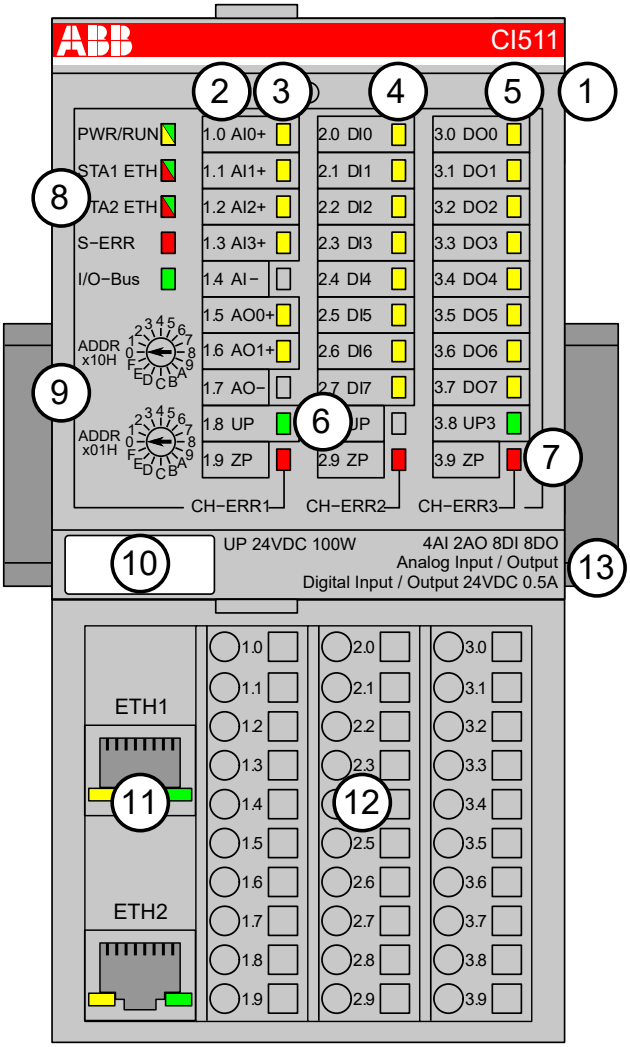
1.6.3.7.3 EtherCAT

CI511-ETHCAT

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *) (see also Extended Cam Switch Library)
- Module-wise galvanically isolated - Expandability with up to 10 S500 I/O Modules *)

*) Applicable for device index C0 and above.



1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 - AI3, AO0 - AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 - DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 - DO7)
6 2 green LEDs to display the supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, NET, DC, S-ERR, I/O-Bus
9 2 rotary switches (reserved for future extensions)
10 Label
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail

Intended purpose

The EtherCAT communication interface module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)

- 8 digital outputs 24 V DC in 1 group (3.0...3.7)
- Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Functionality

Parameter	Value
Interface	Ethernet
Protocol	EtherCAT
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	Not used; reserved for future extensions
Analog inputs	4 (configurable via software)
Analog outputs	2 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU507 or TU508 ↬ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet communication interface module CI511-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↬ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

Terminal	Signal	Description
1.0 to 1.3	AI0 to AI3	Positive pole of the 4 analog inputs
1.4	AI-	Negative pole of the analog inputs
1.5 to 1.6	AO0 to AO1	Positive pole of the 2 analog outputs
1.7	AO-	Negative pole of the analog outputs
2.0 to 2.7	DI0 to DI7	8 digital inputs
3.0 to 3.7	DO0 to DO7	8 digital outputs

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

CAUTION!

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

CAUTION!

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the connection of the Ethernet communication interface module CI511-ETHCAT.

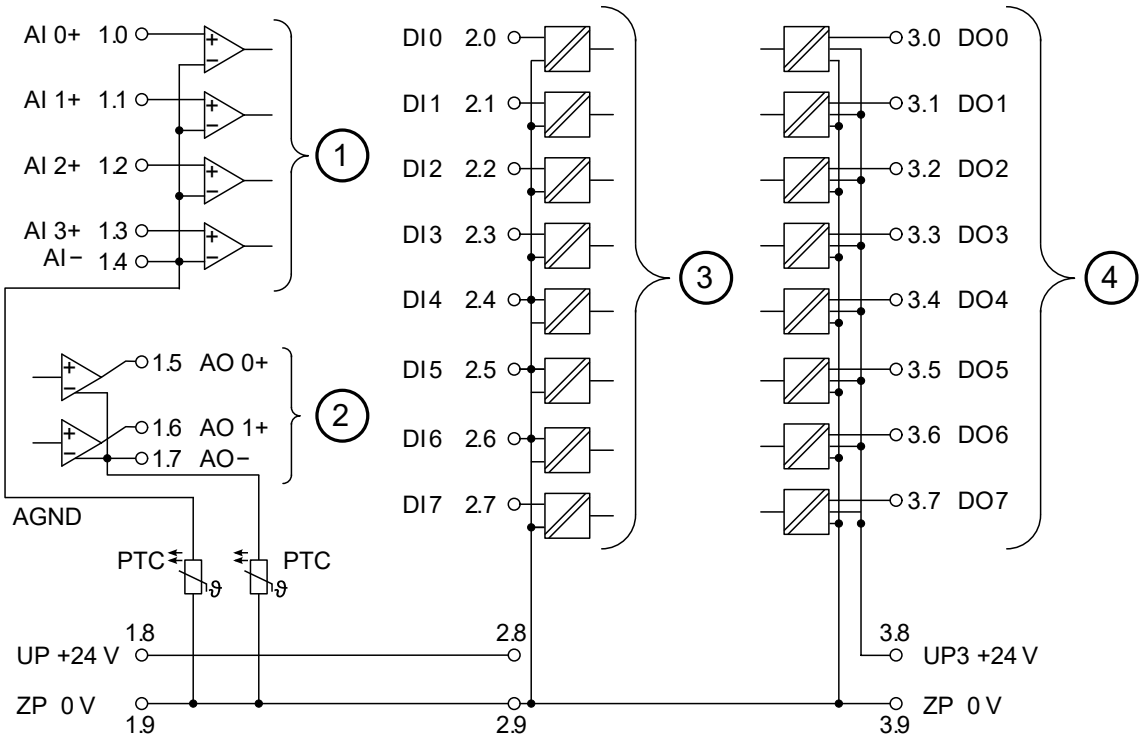


Fig. 220: Connection of the communication interface module CI511-ETHCAT

1 4 analog inputs, configurable for 0...10 V, -10...+10 V, 0/4...20 mA, Pt100/Pt1000, Ni1000 and digital signals
2 2 analog outputs, configurable for -10...+10 V, 0/4...20 mA
3 8 digital inputs 24 V DC
4 8 digital outputs 24 V DC, 0.5 A max.

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active

The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active

Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

NOTICE!

Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

CAUTION!

The process supply voltage must be included within the grounding concept of the plant (e. g. grounding of the negative pole).

The module provide several diagnosis functions *Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 3127*.

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

The function of the LEDs is described in the section State LEDs *Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 3127*.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration.

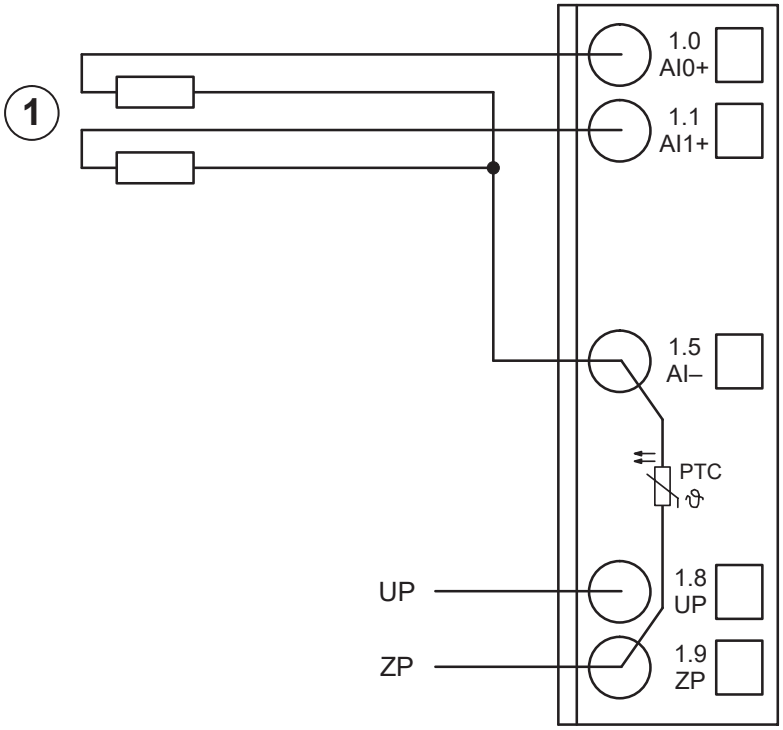

Fig. 221: Connection of resistance thermometers in 2-wire configuration

1 Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel

Pt100	-50 °C...+400 °C	2-wire configuration, 1 channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, 1 channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, 1 channel used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration.

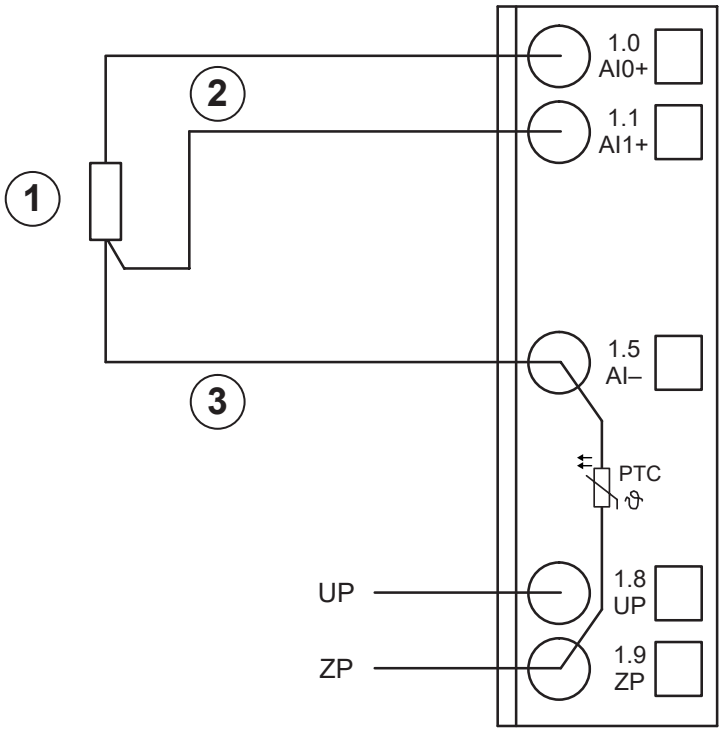

Fig. 222: Connection of resistance thermometers in 3-wire configuration

1 Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2 Twisted pair within the cable
3 Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary, to have all the involved conductors in the same cable. All the conductors must have the same cross section.

Pt100	-50 °C...+400 °C	3-wire configuration, 2 channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, 2 channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, 2 channels used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply

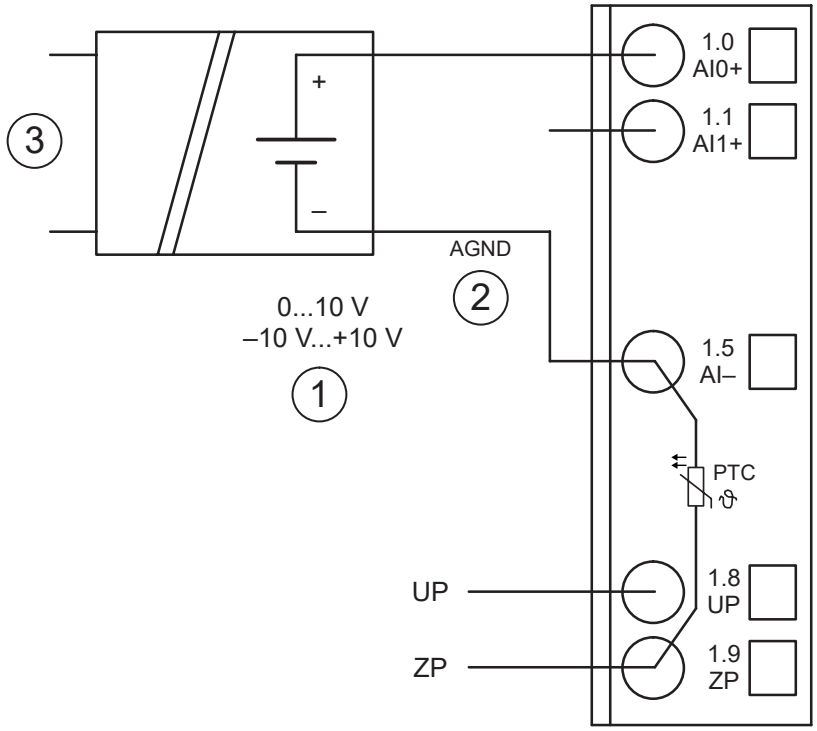

Fig. 223: Connection of active-type analog sensors (voltage) with galvanically isolated power supply

1 1 analog sensor requires 1 channel
2 By connecting to AI-, the galvanically isolated voltage source of the sensor is referred to ZP
3 Galvanically isolated power supply for the analog sensor

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply.

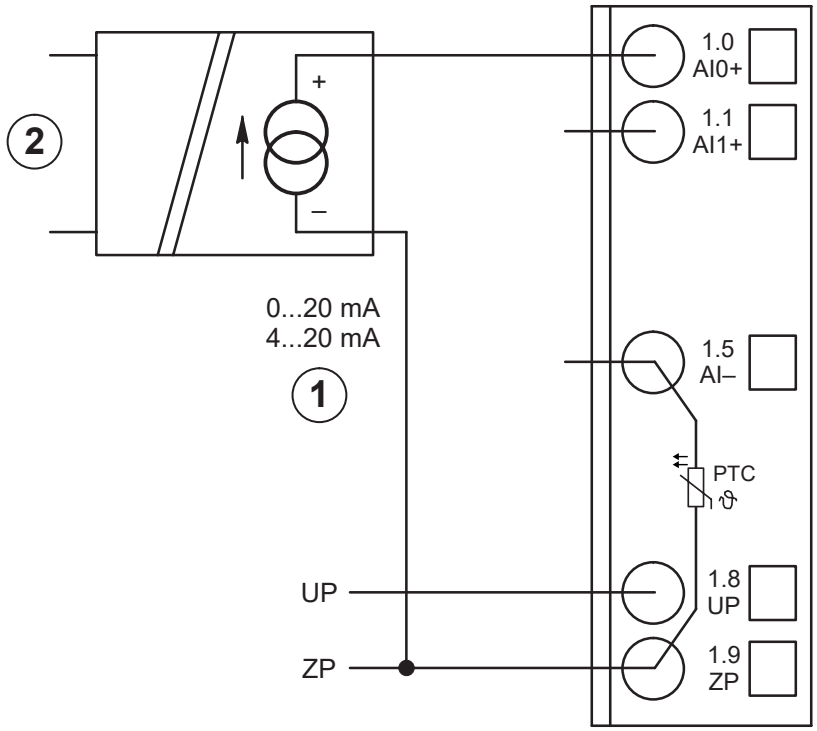

Fig. 224: Connection of active-type analog sensors (current) with galvanically isolated power supply

1 1 analog sensor requires 1 channel
2 Galvanically isolated power supply for the analog sensor

Current	0...20 mA	1 channel used
Current	4...20 mA	1 channel used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

The following figure shows the connection of active-type sensors (voltage) with no galvanically isolated power supply.

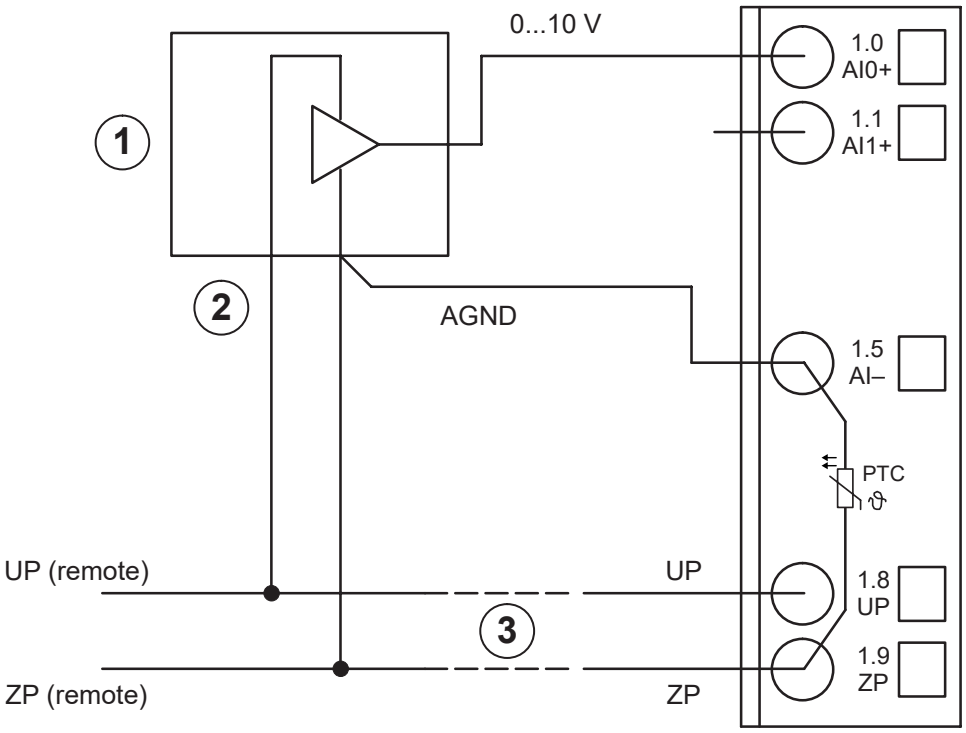

Fig. 225: Connection of active-type sensors (voltage) with no galvanically isolated power supply

1 1 analog sensor requires 1 channel
2 Power supply not galvanically isolated
3 The connection between the negative pole of the sensor and ZP has to be performed
4 Long cable

NOTICE!

Risk of faulty measurements!

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).

Make sure that the potential difference never exceeds ± 1 V.

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V *)	1 channel used

*) if the sensor can provide this signal range

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

The following figure shows the connection of passive-type analog sensors (current).

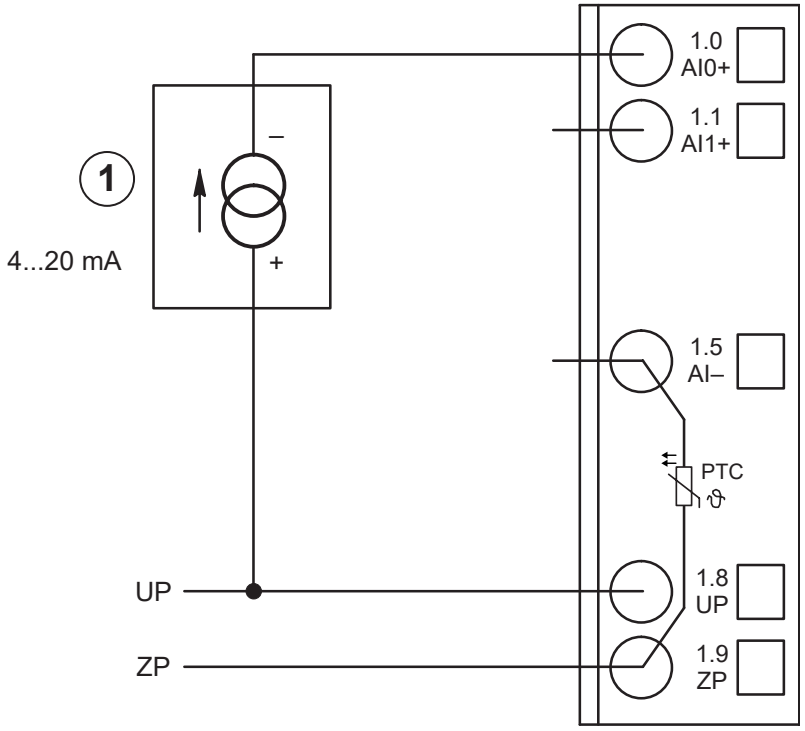

Fig. 226: Connection of passive-type analog sensors (current)

1 1 analog sensor requires 1 channel

Current	4...20 mA	1 channel used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10-volt zener diode (in parallel to I+ and I-). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

Important: The ground potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs

The following figure shows the connection of active-type analog sensors (voltage) to differential inputs.

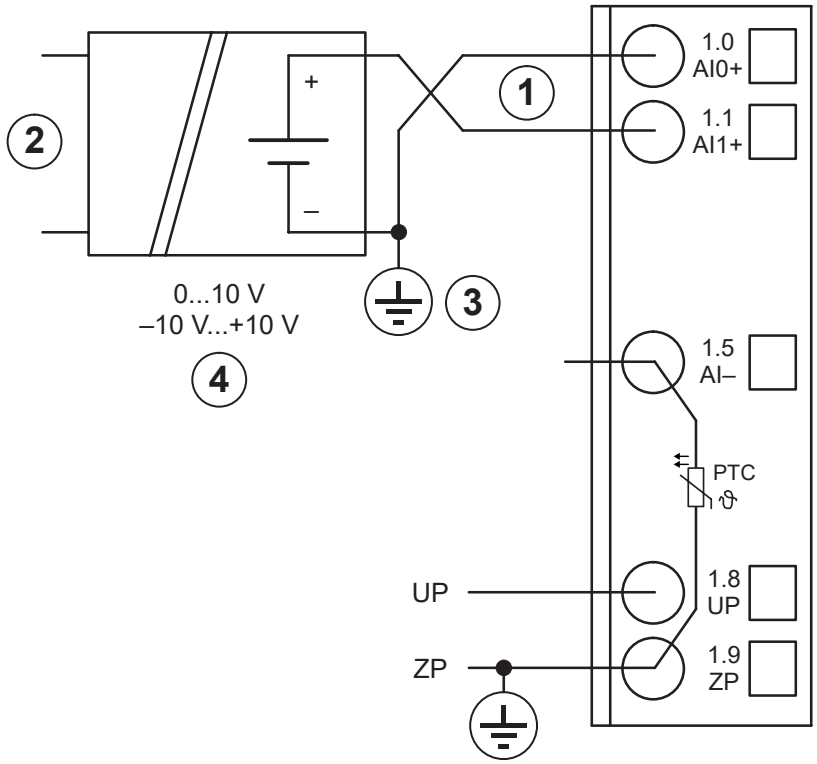

Fig. 227: Connection of active-type analog sensors (voltage) to differential inputs

1 1 analog sensor requires 2 channels
2 Galvanically isolated power supply for the analog sensor
3 Grounding at the sensor
4 0 V...10 V / -10 V...+10 V connected to differential inputs

Voltage	0 V...10 V	with differential inputs, 2 channels used
Voltage	-10 V...+10 V	with differential inputs, 2 channels used

The measuring ranges are described in the section Measuring Ranges *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital input. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the use of analog inputs as digital inputs.

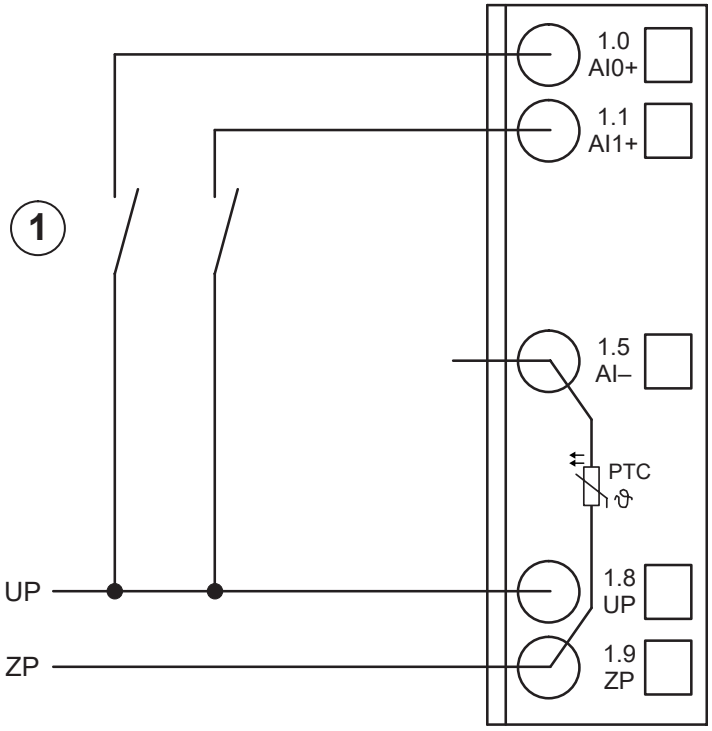

Fig. 228: Use of analog inputs as digital inputs

1 1 digital signal requires 1 channel

Digital input	24 V	1 channel used

The measuring ranges are described in the section Measuring Ranges ↳ *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* ↳ *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

Connection of analog output loads (Voltage, current)

The following figure shows the connection of analog output loads (voltage, current).

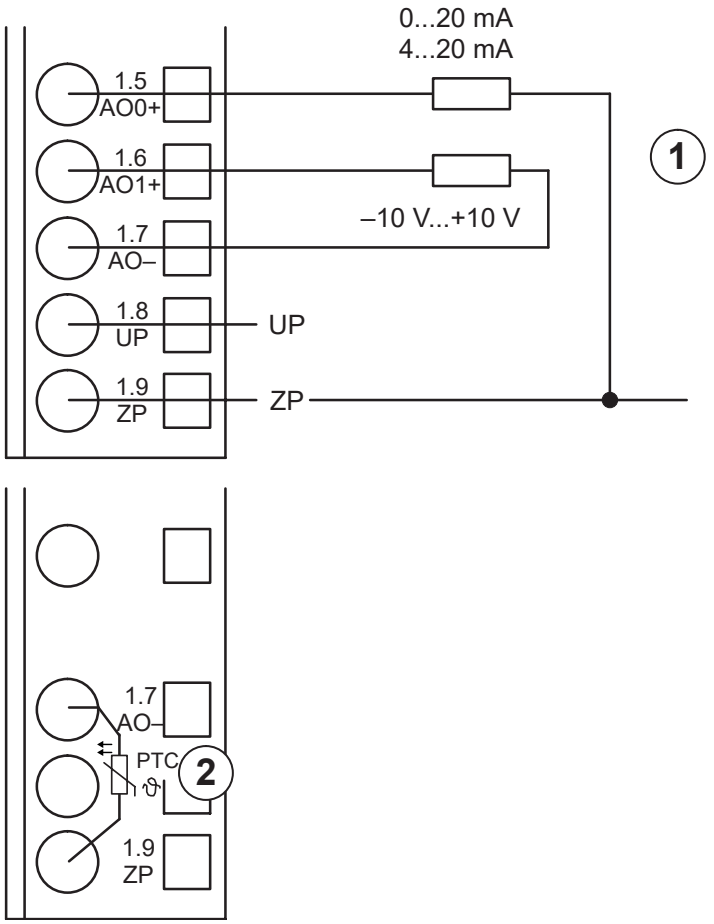

Fig. 229: Connection of analog output loads (voltage, current)

1 1 analog load requires 1 channel

Voltage	-10 V...+10 V	Load ±10 mA max.	1 channel used

Current	4...20 mA	Load 0...500 Ω	1 channel used

The measuring ranges are described in the section Measuring Ranges ↳ *Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121* ↳ *Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130*.

Unused analog outputs can be left open-circuited.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet
Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

Internal data exchange

Parameter	Value
Digital inputs (bytes)	1
Digital outputs (bytes)	1
Analog inputs (words)	4
Analog outputs (words)	2

Addressing

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.

I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself.

The analog I/O channels are configured via software.

Parameterization

*) The parameters behaviourAOatCommunicationFault and behaviourDOatCommunicationFault are only analyzed if the Failsafe-mode is ON.

Group parameters of the cam switch

Name	Value	Internal value	Internal value, type	Default
numOfUsed-Cams [1])	0 ... 32 128...160	0 ... 32 218...160	WORD	0
resolution [2])	0 ... 2 -1	0 ... 2 -1	DWORD	36000
zeroShift [3])	0 ... 2 -1	0 ... 2 -1	DWORD	0
EncoderBitReso-lution [4])	8 ... 32	8 ... 32	WORD	18
Reserve	-	-	WORD	-

[1]) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

Parameter setting for numOfUsed-Cams	Number of cams used	Interrupt cycle time	Behavior if DC information is lost
0	0	50 µs	Module changes to "safe-operational" state; the outputs are activated trough the user program
1...8	1...8	80 µs	
9...16	9...16	100 µs	
17...32	17...32	200 µs	
128	0	50 µs	Module keeps in "operational" state; the outputs are activated trough the user program
129...136	1...8	80 µs	Module keeps in "operational" state; the cam switch outputs are activated according to an interpolated timing information
137...144	9...16	100 µs	
145...170	17...32	200 µs	

[2]) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

[3]) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

[4]) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

Channel parameters for the cam switch (max. 32x)

14	2-wire Pt100 -50...+70 °C
15	3-wire Pt100 -50...+70 °C *)

Internal value	Operating modes of the analog inputs, individually configurable
16	2-wire Pt1000 -50...+400 °C
17	3-wire Pt1000 -50...+400 °C *)
18	2-wire Ni1000 -50...+150 °C
19	3-wire Ni1000 -50...+150 °C *)
	*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

Table 552: Channel monitoring [2])

Internal Value	Check channel
0	Plausib(ility), cut wire, short circuit
3	not used

Channel parameters for the analog outputs (2x)

Name	Value	Internal value	Internal value, type	Default
Output 0, channel configuration	see [3])	see [3])	BYTE	0
Output 0, check channel	see [4])	see [4])	BYTE	0
Output 0, substitute value	see [5])	see [5])	WORD	0

Substitute value at output	0 ... 255	00h ... FFh	BYTE	0 0x0000

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module;14 = I/O bus; 31 = Module itself The identifier is not contained in the CI511-ETHCAT diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself or ADR = Hardware address (e. g. of the DC551)

[3])	With "Module" the following allocation applies dependent of the master: 31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)
[4])	Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.
[5])	Diagnosis message appears per channel. The message occurs if the output channel is not active.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 556: States of the 5 system LEDs

LED	Color	Off	On	Flashing	1x Flash	2x Flash
PWR/RUN	Green	Error in the internal supply voltage or process voltage missing	Internal supply voltage OK	Module is not configured	--	--
	Yellow	--	--	--	--	--
NET	Green	Init	Operational	Pre-operational	Safe-operational	--
	Red	No error	PDI Watchdog Timeout	Invalid Configuration	Unsolicited State Change	Application time out
DC *)	Green	Distributed Clock not active	Distributed Clock active	--	--	--
	Red	--	--	--	--	--
S-ERR	Red	No error	Internal error	--	--	--
I/O-Bus	Green	No communication interface modules connected or communication error	---	---	--	--
ETH1	Green	No EtherCAT connection	Link OK No data transfer	Link OK Data transfer OK	--	--
	Yellow	--	--	--	--	--

LED	Color	Off	On	Flashing	1x Flash	2x Flash
ETH2	Green	No EtherCAT connection	Link OK No data transfer	Link OK Data transfer OK	--	--
	Yellow	--	--	--	--	--

*) The state of this LED is only significant if the cam switch functionality is enabled

Table 557: States of the 27 process LEDs

LED	Color	OFF	ON	Flashing
AI0 to AI3	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
AO0 to AO1	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
DI0 to DI7	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO0 toDO7	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Measuring ranges

Technical data

The system data of AC500 and S500 ↬ *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC ↬ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Bus connection	2 x RJ45
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)

Parameter	Value
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Expandability (S500 I/O modules)	Up to 10 S500 I/O modules (Index C0 and above), not available (Index below C0)
Indicators	5 LEDs for state indication
Adjusting elements	2 rotary switches (used for future topology extensions)
Quantity of input/output data	CI512-ETHCAT: 10 bytes input and 14 bytes output CI511-ETHCAT: 18 bytes input and 18 bytes output
Limit of data for input and output	144 byte
Acyclic services	SDO (1500 bytes max.) Emergency ECAT_SLV_DIAG
Protective functions (according to CODESYS)	Protected against: ● short circuit ● reverse supply ● overvoltage ● reverse polarity Galvanic isolation to network

Technical data of the module

Parameter		Value
Process supply voltage UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of analog inputs		4
Number of analog outputs		2

Parameter	Value
Reference potential for all digital inputs and outputs	Negative pole of the supply voltage, signal name ZP
Diagnosis	See Diagnosis and Displays *Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 3127*
Operation and error displays	32 LEDs (totally)
Weight (without terminal unit)	ca. 125 g
Mounting position	Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DI0 to DI7		Terminals 2.0 to 2.7
Reference potential for all inputs		Terminals 1.9...3.9 (Negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA

Parameter		Value
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DO0 to DO7		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (Negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

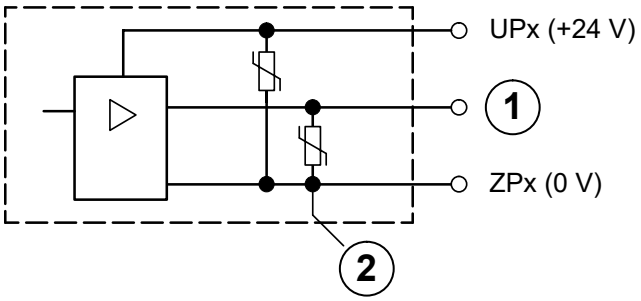

Fig. 230: Digital input/output (circuit diagram)

1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 1.0 to 1.3
Reference potential for AI0+ to AI3+		Terminal 1.4 (AI-) for voltage and RTD measurement Terminals 1.9, 2.9 and 3.9 for current measurement
Input type		
	Unipolar	Voltage 0 V...10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10 V...+10 V
Galvanic isolation		Against Ethernet network
Configurability		0 V...10 V, -10 V...+10 V, 0/4 mA...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s
Resolution		Range 0...10 V: 12 bits Range -10...+10 V: 12 bits + sign Range 0...20 mA: 12 bits Range 4...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ. 0.5 %, max. 1 %

Parameter	Value
Relationship between input signal and hex code	Tables Input Ranges Voltage, Current and Digital Input ↳ *Chapter 1.6.3.7.3.1.10.1 "Input ranges voltage, current and digital input" on page 3130* and Input range resistance temperature detector ↳ *Chapter 1.6.3.7.3.1.10.2 "Input ranges resistance temperature detector" on page 3131*
Unused inputs	Are configured as "unused" (default value)
Overvoltage protection	Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels AI0+ to AI3+		Terminals 1.0 to 1.3
Reference potential for the inputs		Terminals 1.9, 2.9 and 3.9 (ZP)
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V ... +13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 3.7 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		2
Distribution of channels into groups		1 group for 2 channels
Connection of the channels AO0+...AO1+		Terminals 1.5...1.6
Reference potential for AO0+ to AO1+		Terminal 1.7 (AO-) for voltage outputTerminals 1.9, 2.9 and 3.9 (ZP) for current output
Output type		
	Unipolar	Current
	Bipolar	Voltage
Galvanic isolation		Against Ethernet network
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually)

Parameter	Value
Output resistance (load), as current output	0 ... 500 Ω
Output loadability, as voltage output	± 10 mA max.
Indication of the output signals	1 LED per channel (brightness depends on the value of the analog signal)
Resolution	12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance)	Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code	Table Output Ranges Voltage and Current ↯ *Chapter 1.6.3.7.3.1.10.3 “Output ranges voltage and current” on page 3132*
Unused outputs	Are configured as unused (default value) and can be left open-circuited

Ordering data

Part no.	Description	Product life cycle phase *)

Intended purpose

The EtherCAT communication interface module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)
- Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

Functionality

Parameter	Value
Interface	Ethernet
Protocol	EtherCAT
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	Not used; reserved for future extensions
Configurable digital inputs/outputs	8 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU507 or TU508 *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet communication interface module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

Terminals	Signal	Description
1.0 to 1.7	DC0 to DC7	8 digital inputs/outputs (configurable via software)
2.0 to 2.7	DI0 to DI7	8 digital inputs (delay time configurable via software)
3.0 to 3.7	DO0 to DO7	8 digital outputs

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figures show the connection of the Ethernet communication interface module CI512-ETHCAT.

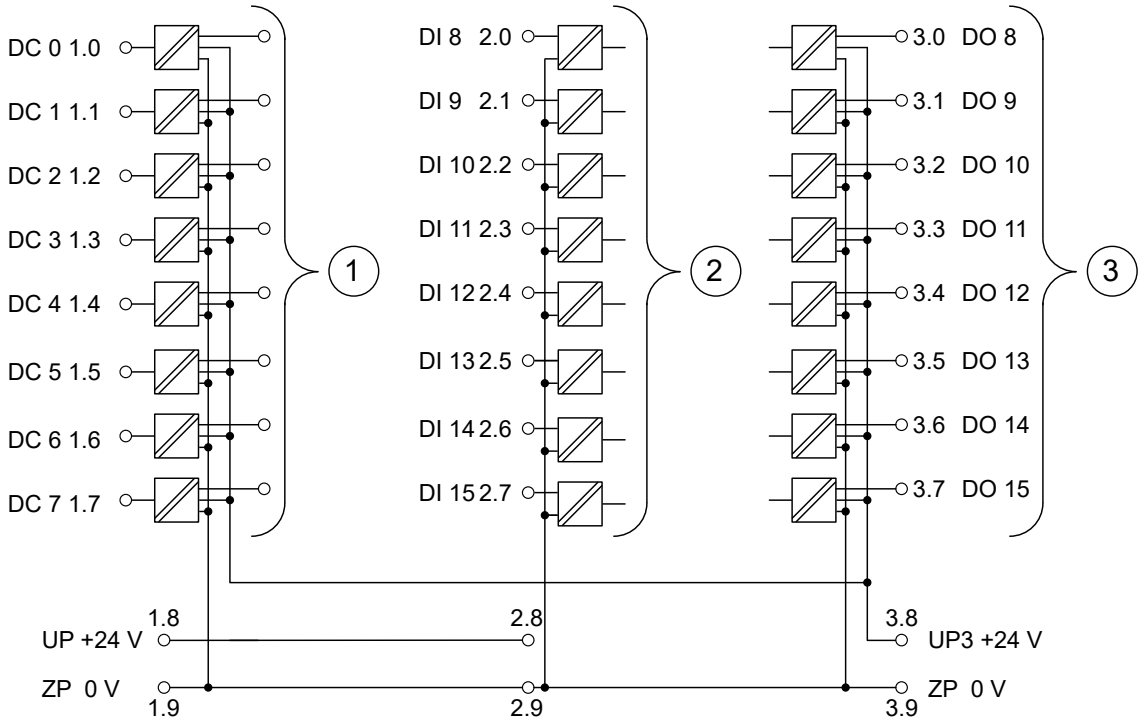

Fig. 231: Connection of the communication interface module CI512-ETHCAT

1 8 digital configurable inputs/outputs 24 V DC
2 8 digital inputs 24 V DC
3 8 digital outputs 24 V DC

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active

The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active

Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

CAUTION!
The process supply voltage must be included within the grounding concept of the plant (e. g. grounding of the negative pole).

The module provides several diagnosis functions *Chapter 1.6.3.7.3.2.9 “Diagnosis” on page 3147*.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet
Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

Internal data exchange

Parameter	Value
Digital inputs (bytes)	1
Digital outputs (bytes)	1
Configurable digital inputs/outputs (bytes)	1 + 1

Addressing

The Ethernet communication interface module CI512-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.

I/O configuration

> *In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.*

The CI512-ETHCAT does not store configuration data itself.

The analog I/O channels are configured via software.

Parameterization

Module parameter

Name	Value	Internal value	Internal value, type	Default
Module ID	Internal	49435	WORD	49435
Parameter length	Internal	10	BYTE	10
Error LED / Fail-safe function [1])	On Off by E4 Off by E3 On + failsafe Off by E4 + failsafe Off by E3 + failsafe	0 1 3 16 17 19	BYTE	0
Check Supply	Off On	0 1	BYTE	1

Table 558: Error LED / Failsafe function [1])

Setting	Description
On	Error LED lights up at errors of all error classes, Failsafe mode off
Off by E4	Error LED lights up at errors of error classes E1, E2 and E3, Failsafe mode off
Off by E3	Error LED lights up at errors of error classes E1 and E2 auf, Failsafe mode off
On + failsafe	Error LED lights up at errors of all error classes, Failsafe mode on *)
Off by E4 + failsafe	Error LED lights up at errors of error classes E1, E2 and E3, Failsafe mode on *)
Off by E3 + failsafe	Error LED lights up at errors of error classes E1 and E2, Failsafe mode on *)

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.

Group parameters of the cam switch

Name	Value	Internal value	Internal value, type	Default
numOfUsed-Cams [1])	0 ... 32 128...160	0 ... 32 218...160	WORD	0
resolution [2])	0 ... 2 -1	0 ... 2 -1	DWORD	36000
zeroShift [3])	0 ... 2 -1	0 ... 2 -1	DWORD	0
EncoderBitReso-lution [4])	8 ... 32	8 ... 32	WORD	18
Reserve	-	-	WORD	-

Remarks:

[1]) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

Parameter setting for numOfUsed-Cams	Number of cams used	Interrupt cycle time	Behavior if DC information is lost
0	0	50 µs	Module changes to "safe-operational" state; the outputs are activated trough the user program
1...8	1...8	80 µs	
9...16	9...16	100 µs	
17...32	17...32	200 µs	
128	0	50 µs	Module keeps in "operational" state; the outputs are activated trough the user program
129...136	1...8	80 µs	Module keeps in "operational" state; the cam switch outputs are activated according to an interpolated timing information
137...144	9...16	100 µs	
145...170	17...32	200 µs	

[2]) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

[3]) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

[4]) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

Channel parameters for the cam switch (max. 32x)

Name	Value	Internal value	Internal value, type	Default
camToTrack0 [1])	Digital Output 0 ... 15, none	0 ... 15, FF	BYTE	FF
:	:	:	:	:
camToTrack31	Digital Output 0 ... 15, none	0 ... 15, FF	BYTE	FF

[1]) The value of the parameter camToTrack# defines which DO (digital output) is assigned to the track. camToTrack0 = 3 for example means that track 0 is assigned to the digital output 3. If the value FFh is set to a track, no digital output is assigned to it.

Name	Value	Referred FB from extended Cam Switch Library [2])	Internal value	Internal value, type	Default
cam-Type[0] [1]) ...	Common	MCX_CamSwitchSimple_c	0	BYTE	0
	Pulsed	MCX_CamSwitchSimple_dc			
	Timed	MCX_PulseSwitch_dc	1		
	Comfort	MCX_CamSwitchTimed_dc	2		
	Cam shift	MCX_CamSwitchComfort_dc	3		
	Binary shift	MCX_CamShift_dc	4		
	Multiturn cam	MCX_BinaryShift_dc	5		
	Time timed	MCX_CamSwitchMulti_dc	6		
	Reference	MCX_SwitchTimeTimed_dc	7		
	Multiturn timed	MCX_BinaryReference_dc	8		
		MCX_CamSwitchMulti-Timed_dc	9		

[1]) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.

[2]) camType parameters and the Extended Camswitch Library are only available for CI511-ETHCAT and CI512-ETHCAT with device index C0 and above.

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.01 ms	0	BYTE	0.01 ms
	1 ms	1		0x00
	8 ms	2		
	32 ms	3		
Detect short circuit at outputs	Off	0	BYTE	On
	On	1		0x01

Name	Value	Internal value	Internal value, type	Default
Behaviour DO at comm. error *)	Off Last value Last value 5 sec Last value 10 sec Substitute value Substitute value 5 sec Substitute value 10 sec	0 1 6 11 2 7 12	BYTE	Off 0x00
Substitute values DO	0 ... 65535	0000h ... FFFFh	WORD	0 0x0000
*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.				

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself The identifier is not contained in the CI512-ETHCAT diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself or ADR = Hardware address (e. g. of the DC551)
[3])	With "Module" the following allocation applies dependent of the master: 31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)
[4])	Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.
[5]	Diagnosis message appears per channel. The message occurs if the output channel is not active.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 559: States of the 5 system LEDs

LED	Color	Off	On	Flashing	1x flash	2x flash
PWR/RUN	Green	Error in the internal supply voltage or process voltage missing	Internal supply voltage OK	Module is not config-ured	--	--
	Yellow	--	--	--	--	--
NET	Green	Init	Operational	Pre-opera-tional	Safe-opera-tional	--
	Red	No error	PDI Watchdog Timeout	Invalid Con-figuration	Unsolicited State Change	Application time out
DC *)	Green	Distributed Clock not active	Distributed Clock active	--	--	--
	Red	--	--	--	--	--

ETH2	Green	No EtherCAT connection	Link OK No data transfer	Link OK Data transfer OK	--	--
	Yellow	--	--	--	--	--
*) The state of this LED is only significant if the camswitch functionality is enabled						

Table 560: States of the 29 process LEDs

LED	Color	OFF	ON	Flashing
DC0 to DC7	Yellow	Input/Output is OFF	Input/Output is ON	--
DI8 to DI15	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO8 to DO15	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Parameter	Value
Bus connection	2 x RJ45
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Expandability (S500 I/O modules)	Up to 10 S500 I/O modules (Index C0 and above), not available (Index below C0)
Indicators	5 LEDs for state indication
Adjusting elements	2 rotary switches (used for future topology extensions)
Quantity of input/output data	CI512-ETHCAT: 10 bytes input and 14 bytes output CI511-ETHCAT: 18 bytes input and 18 bytes output
Limit of data for input and output	144 byte

Parameter	Value
Acyclic services	SDO (1500 bytes max.) Emergency ECAT_SLV_DIAG
Protective functions (according to CODESYS)	Protected against: ● short circuit ● reverse supply ● overvoltage ● reverse polarity Galvanic isolation to network

Technical data of the module

Parameter		Value
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.15 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of configurable digital inputs/outputs		8
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Diagnosis		See Diagnosis and Displays *Chapter 1.6.3.7.3.2.9 “Diagnosis” on page 3147*
Operation and error displays		34 LEDs (totally)
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DI0 to DI7		Terminals 2.0 to 2.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DO0 to DO7		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

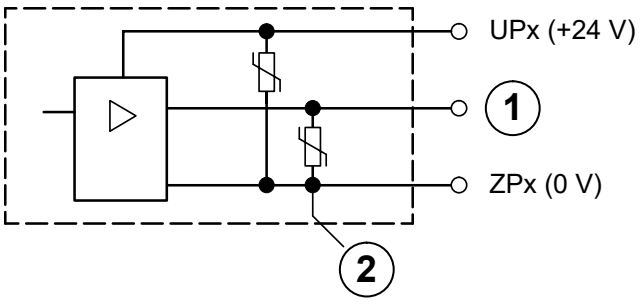

Fig. 232: Digital input/output (circuit diagram)

1 Digital Output

Figure:

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		8 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group for 8 channels
If the channels are used as inputs		
	Channels DC0...DC07	Terminals 1.0...1.7
If the channels are used as outputs		
	Channels DC0...DC07	Terminals 1.0...1.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation		From the Ethernet network

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC0 to DC7		Terminals 1.0 to 1.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V *)
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V *)
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC0 to DC7		Terminals 1.0 to 1.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

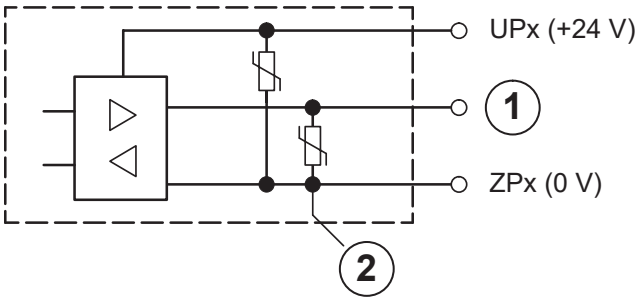

Fig. 233: Digital input/output (circuit diagram)

1 Digital input/output

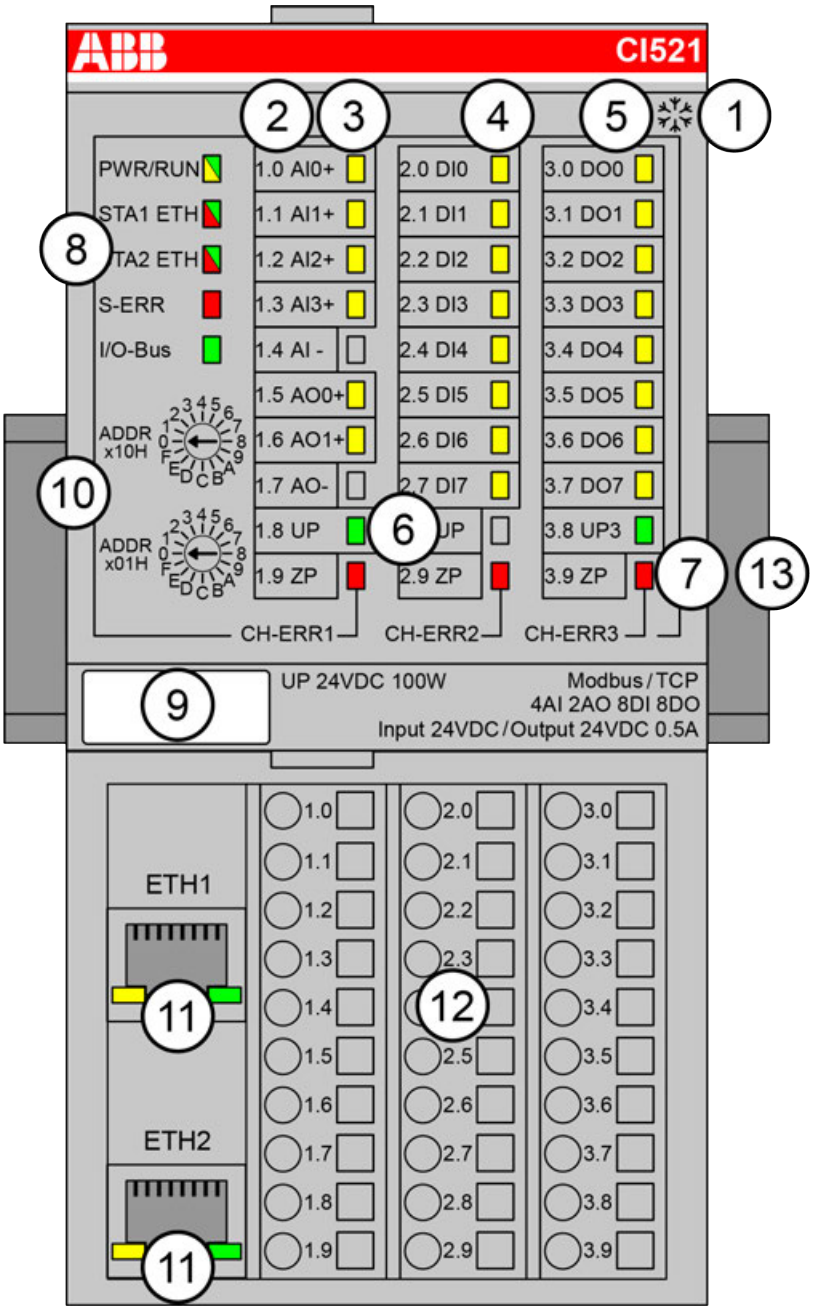
**) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.*

1.6.3.7.4 Modbus

CI521-MODTCP

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 - AI3, AO0 - AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 - DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 - DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the IP address
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit
12 Terminal unit
13 DIN rail
❄ Sign for XC version

Intended purpose

The Modbus TCP communication interface module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Parameter	Value
Interface	Ethernet
Protocol	Modbus TCP
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	for setting the last BYTE of the IP (00h to FFh)
Analog inputs	4 (configurable via software)
Analog outputs	2 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Required terminal unit	TU507 or TU508 ↬ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet communication interface module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH ↬ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ↬ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

S500 I/O module type	First index with firmware version above 1.9
AI523	D0
AI523-XC	D0
AI531	A3
AI531-XC	A0
AO523	D0
AO523-XC	D0
AX521	D0
AX521-XC	D0
AX522	D0
AX522-XC	D0
CD522	A2
CD522-XC	A0
DA501	A2
DA501-XC	A0
DA502	A1
DA502-XC	A1
DC522	D0
DC522-XC	D0
DC523	D0

S500 I/O module type	First index with firmware version above 1.9
DC523-XC	D0
DC532	D0
DC532-XC	D0
DI524	D0
DI524-XC	D0
DO524	A2
DO524-XC	A2
DX522	D0
DX522-XC	D0
DX531	D0
AC522	D0
PD501	D0

Do not connect any voltages externally to digital outputs!

Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This ist not intended usage.

CAUTION!

Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0..DO7.

The assignment of the other terminals:

Terminal	Signal	Description
1.0	AI0+	Positive pole of analog input signal 0
1.1	AI1+	Positive pole of analog input signal 1
1.2	AI2+	Positive pole of analog input signal 2
1.3	AI3+	Positive pole of analog input signal 3
1.4	AI-	Negative pole of analog input signals 0 to 3
1.5	AO0+	Positive pole of analog output signal 0
1.6	AO1+	Positive pole of analog output signal 1
1.7	AI-	Negative pole of analog output signals 0 and 1
1.8	UP	Process voltage UP (24 V DC)
1.9	ZP	Process voltage ZP (0 V DC)
2.0	DI0	Signal of the digital input DI0
2.1	DI1	Signal of the digital input DI1
2.2	DI2	Signal of the digital input DI2
2.3	DI3	Signal of the digital input DI3
2.4	DI4	Signal of the digital input DI4

Terminal	Signal	Description
2.5	DI5	Signal of the digital input DI5
2.6	DI6	Signal of the digital input DI6
2.7	DI7	Signal of the digital input DI7
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DO0	Signal of the digital output DO0
3.1	DO1	Signal of the digital output DO1
3.2	DO2	Signal of the digital output DO2
3.3	DO3	Signal of the digital output DO3
3.4	DO4	Signal of the digital output DO4
3.5	DO5	Signal of the digital output DO5
3.6	DO6	Signal of the digital output DO6
3.7	DO7	Signal of the digital output DO7
3.8	UP3	Process voltage UP3 (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the connection of the Ethernet communication interface module CI521-MODTCP.

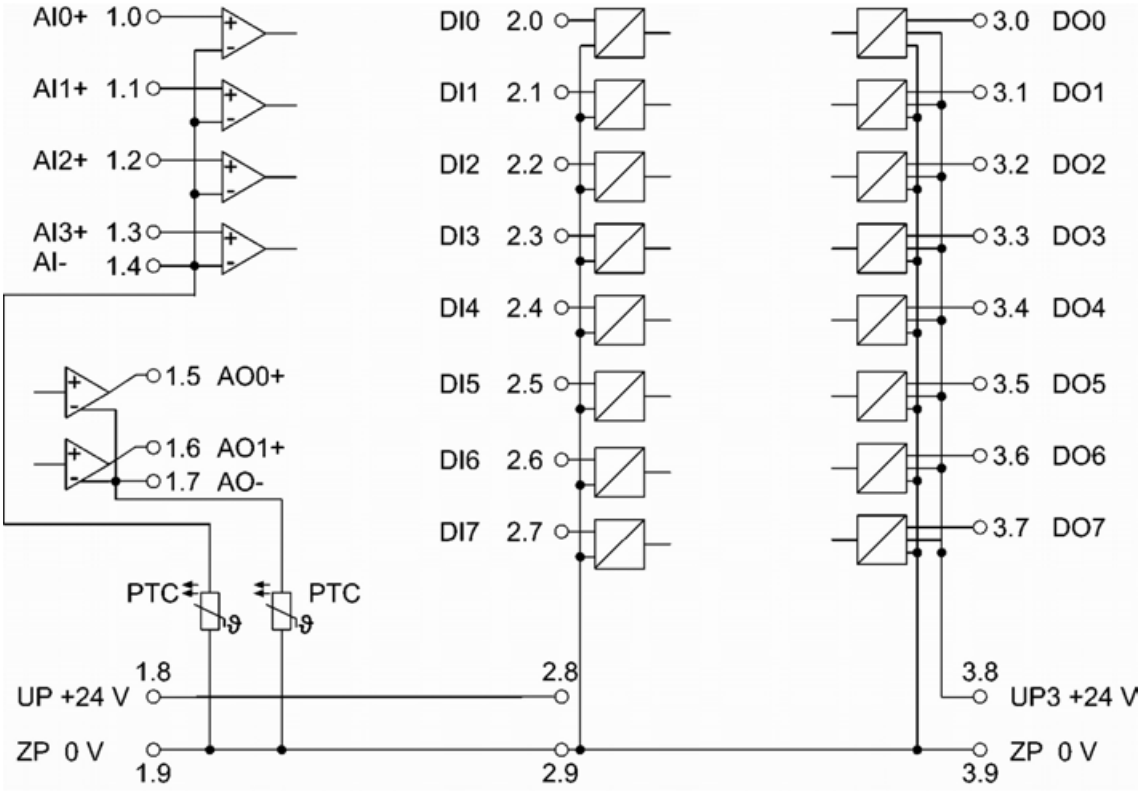


Fig. 234: Connection of the communication interface module CI521-MODTCP

Further information is provided in the System Technology chapter *Chapter 1.6.5.3.1 “Modbus communication interface module” on page 3603*.

Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.

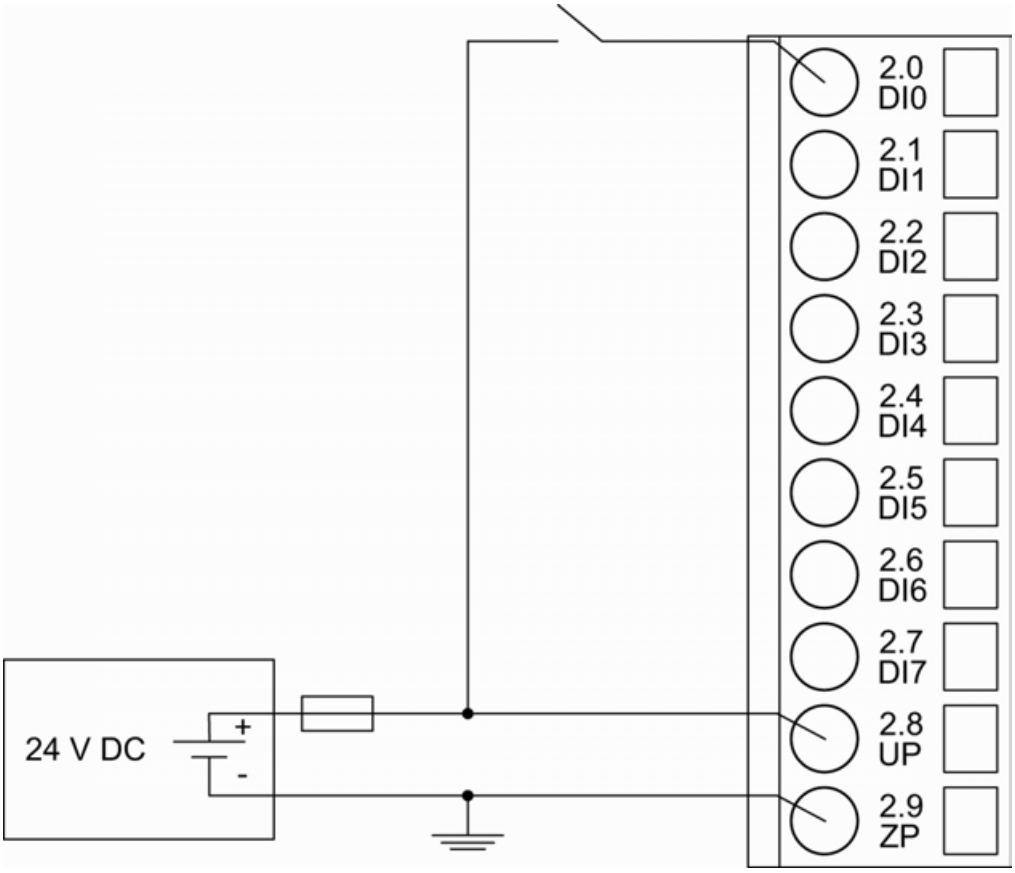

Fig. 235: Connection of the digital inputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.4.1.8.2 “State LEDs” on page 3187*.

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.

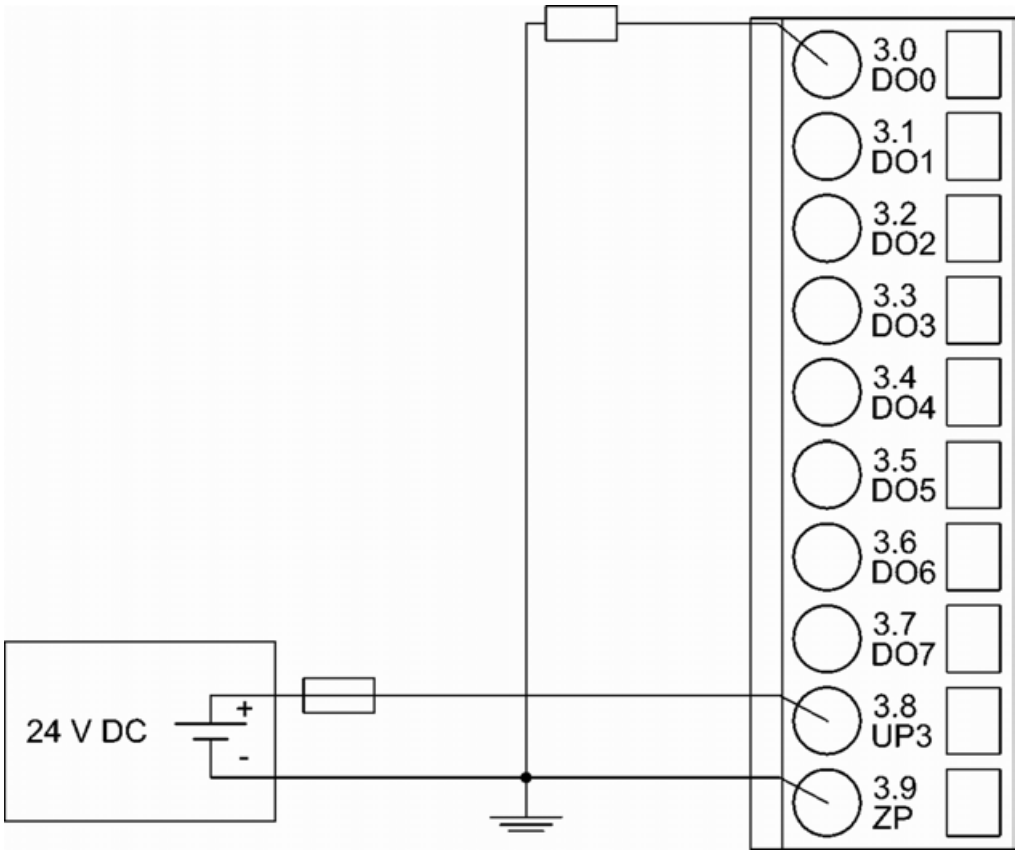

Fig. 236: Connection of configurable digital inputs/outputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.4.1.8.2 “State LEDs” on page 3187*.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

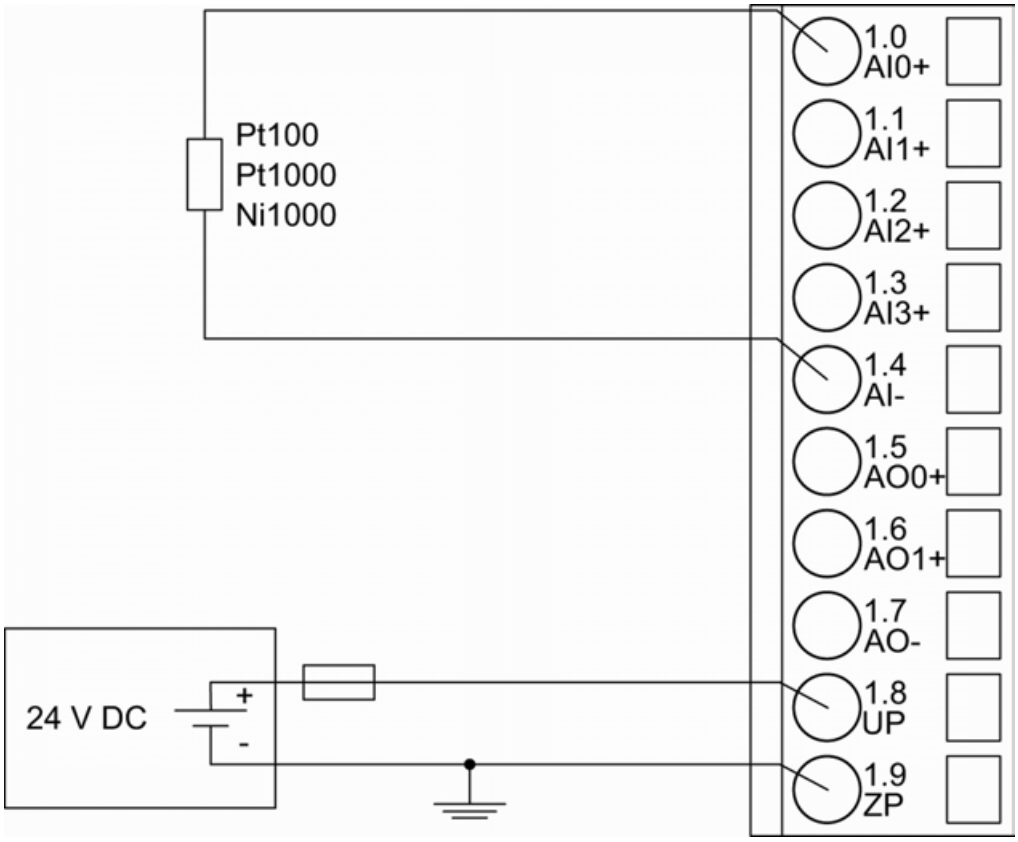

Fig. 237: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Pt100	-50 °C...+70 °C	2-wire configuration, 1 channel used
Pt100	-50 °C...+400 °C	2-wire configuration, 1 channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, 1 channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, 1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

The module CI521-MODTCP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

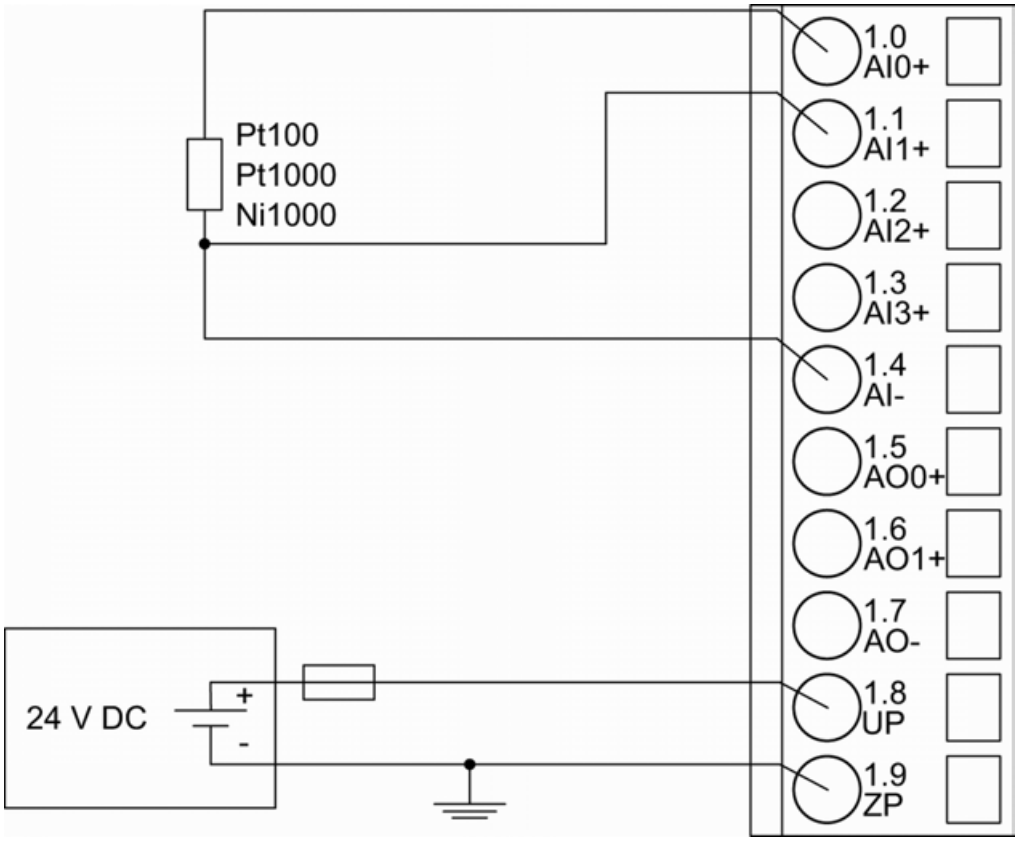

Fig. 238: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Pt100	-50 °C...+70 °C	3-wire configuration, 2 channels used
Pt100	-50 °C...+400 °C	3-wire configuration, 2 channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, 2 channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, 2 channels used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

The module CI521-MODTCP performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

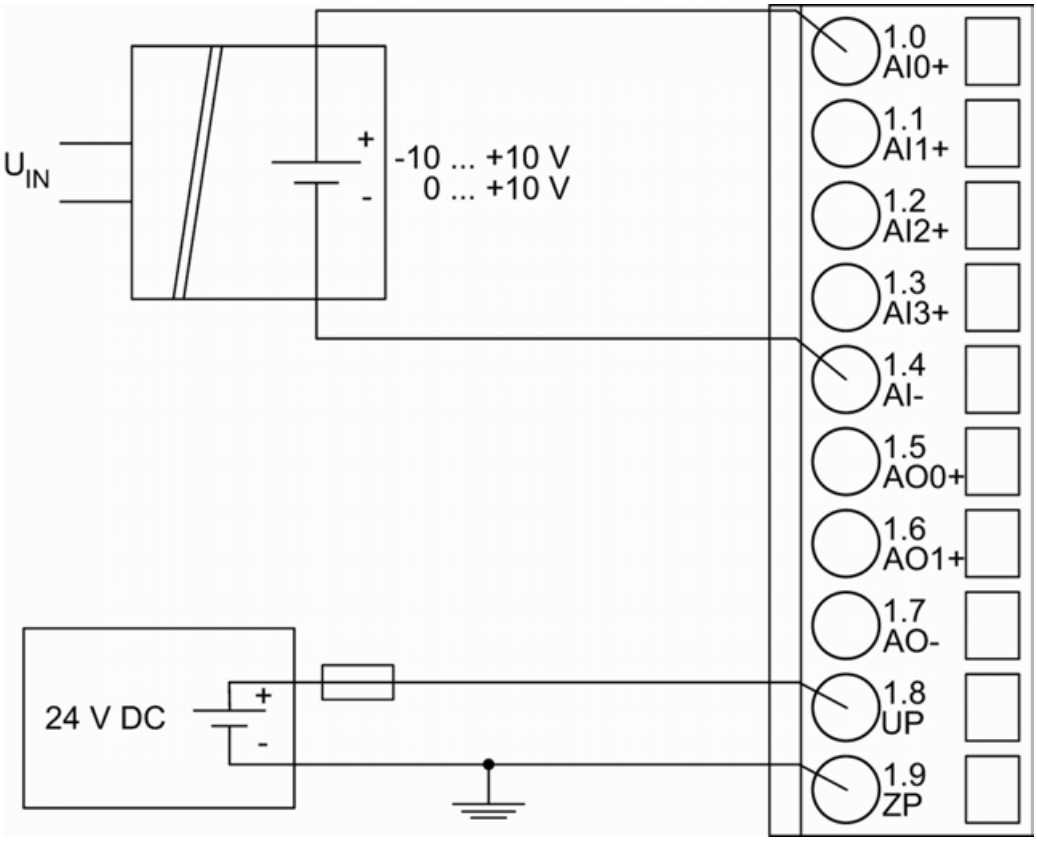

Fig. 239: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

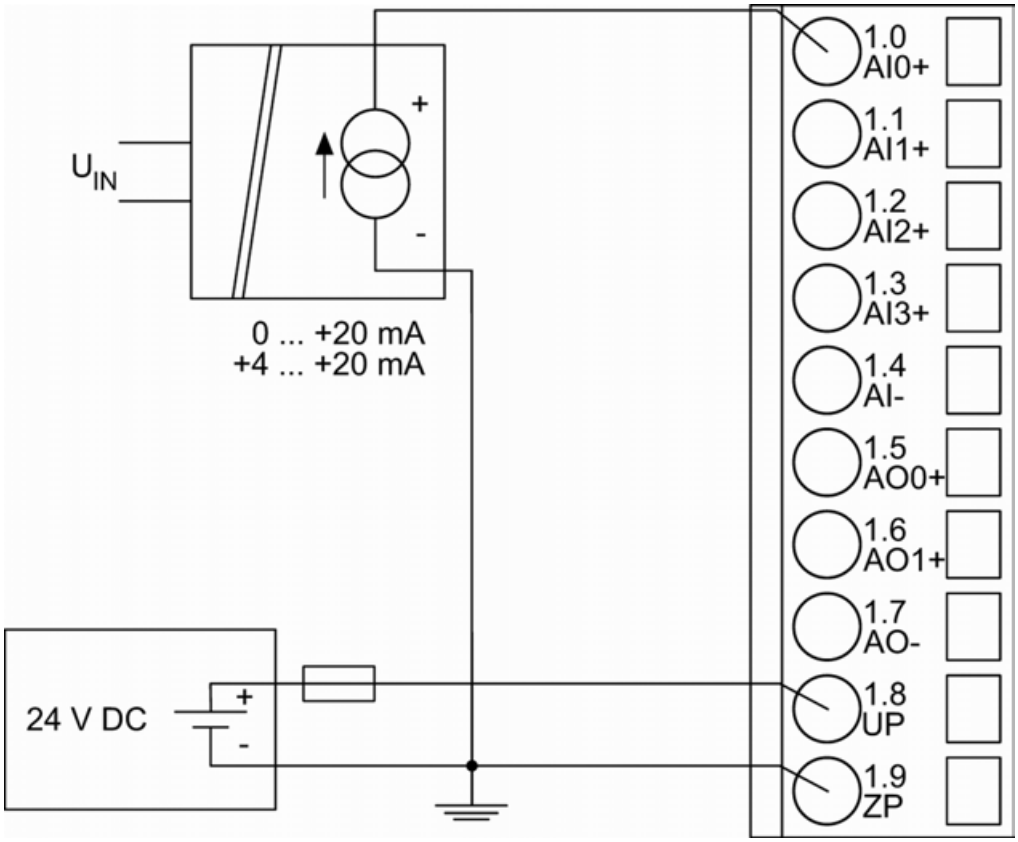

Fig. 240: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Current	0...20 mA	1 channel used
Current	4...20 mA	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

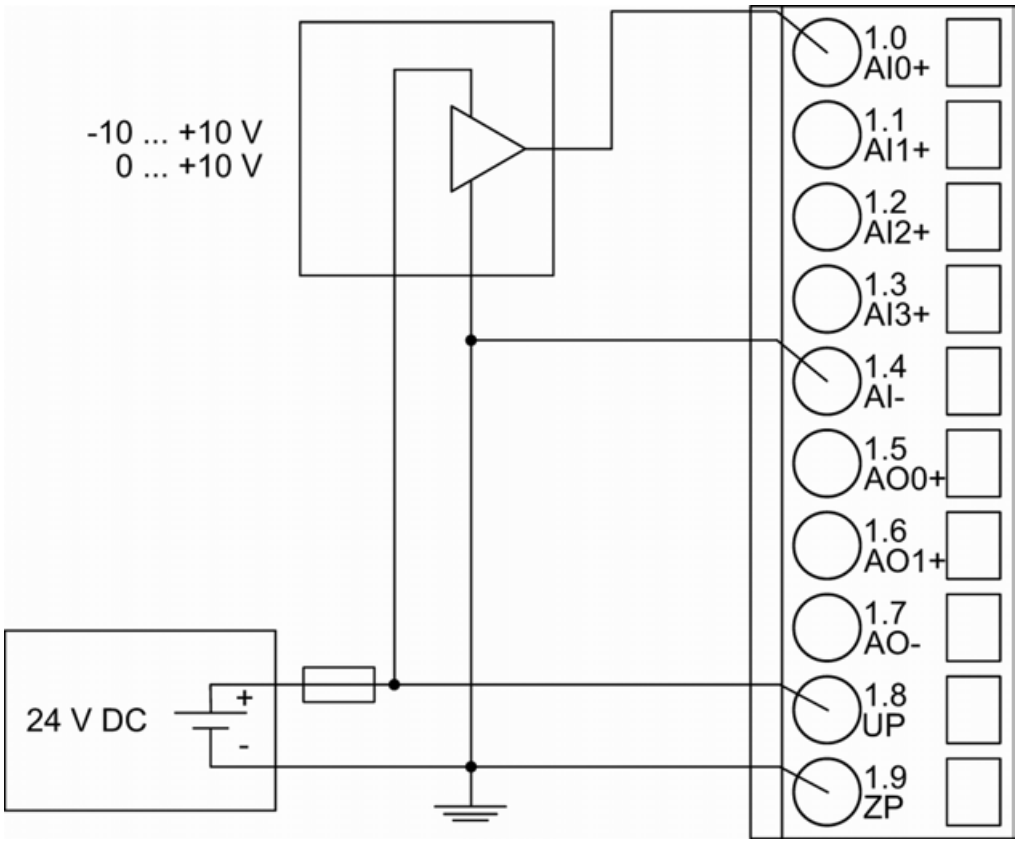

Fig. 241: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ± 1 V).

Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*.

Voltage	0...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

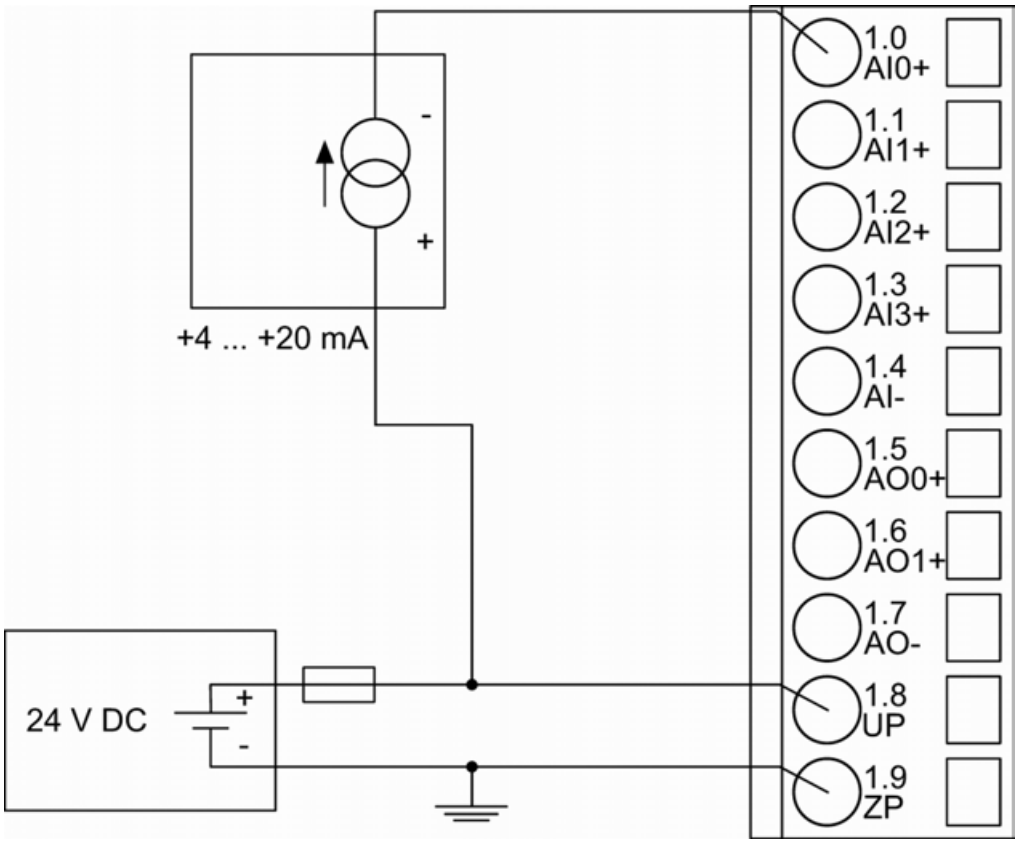

Fig. 242: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured ↬ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↬ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Current	4...20 mA	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↬ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

CAUTION!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

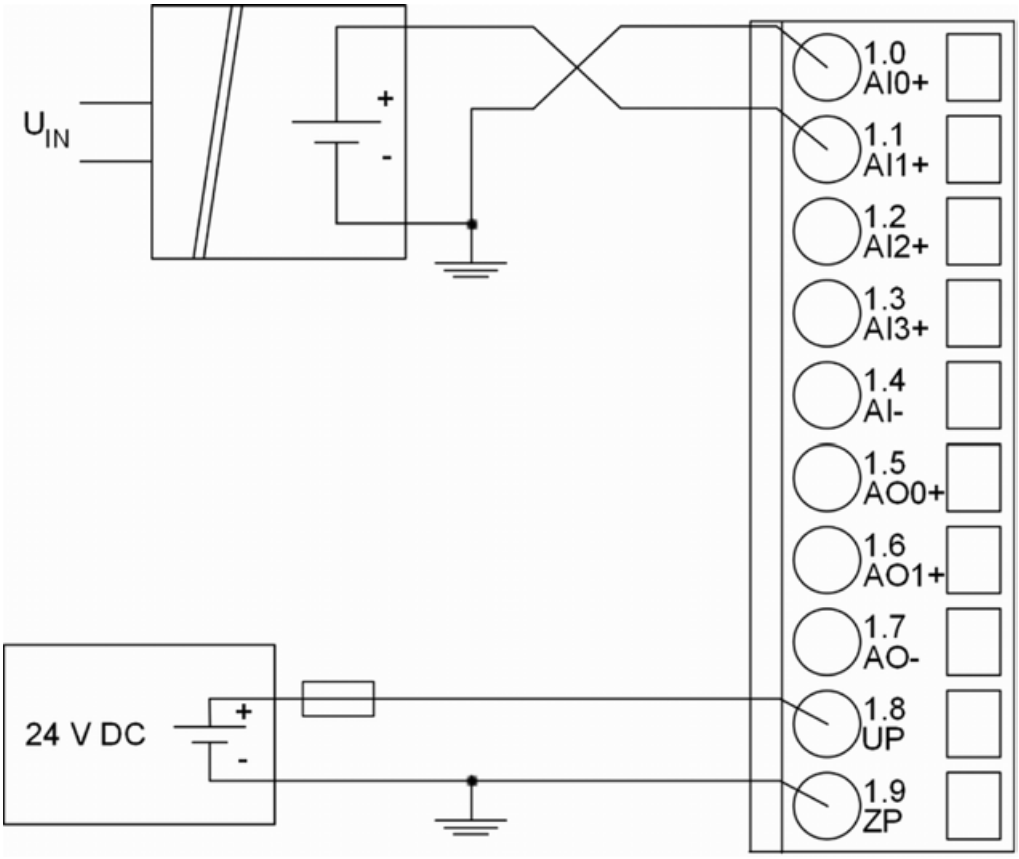

Fig. 243: Connection of active-type analog sensors (voltage) to differential analog inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Voltage	0...10 V	With differential inputs, 2 channels used
Voltage	-10 V...+10 V	With differential inputs, 2 channels used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs ↳ *Chapter 1.6.3.7.4.1.10.5 “Technical data of the analog inputs if used as digital inputs” on page 3194*. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

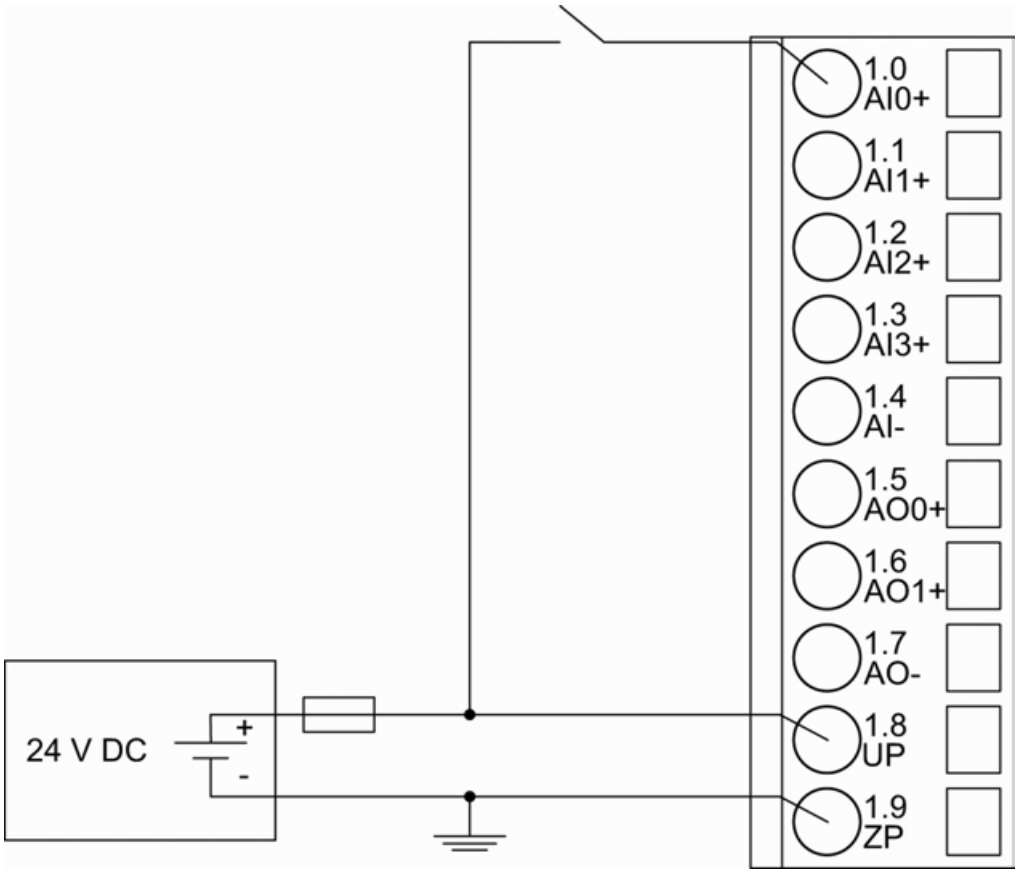

Fig. 244: Use of analog inputs as digital inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188* :

Digital input	24 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

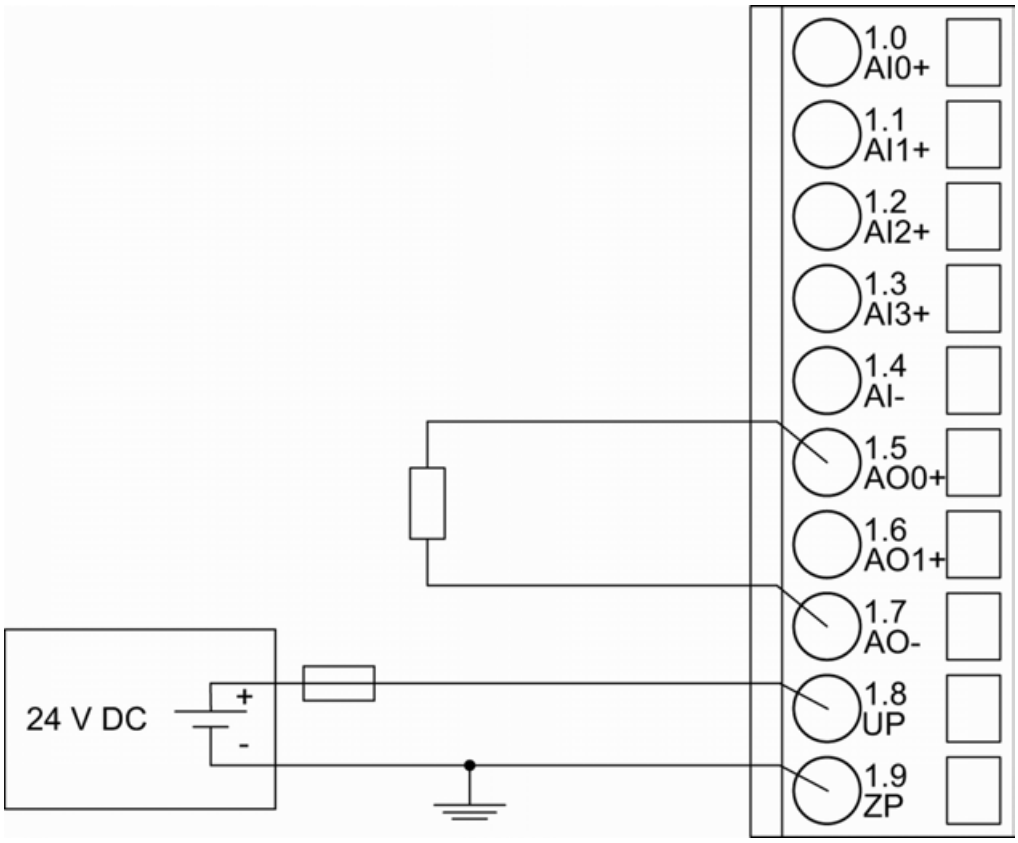

Fig. 245: Connection of analog output loads (voltage)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*

Voltage	-10 V...+10 V	Load ±10 mA max.	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

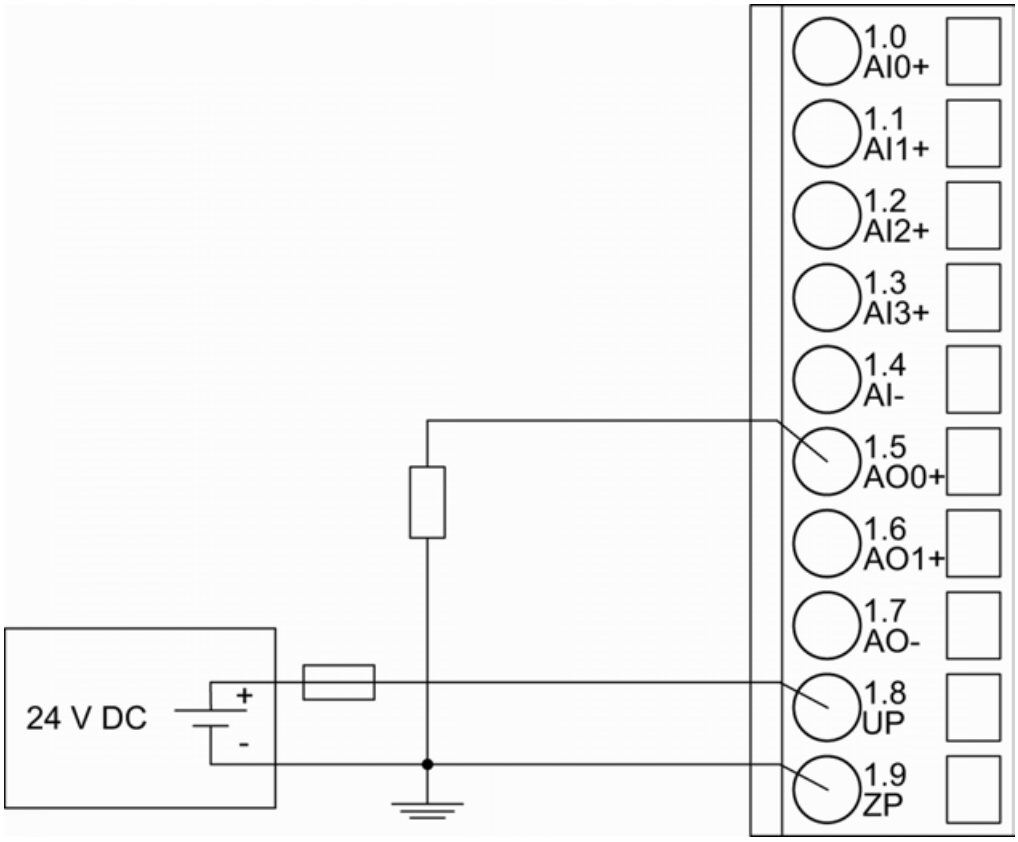

Fig. 246: Connection of analog output loads (current)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176* and ↳ *Chapter 1.6.3.7.4.1.9 “Measuring ranges” on page 3188*:

Current	0...20 mA	Load 0...500 Ω	1 channel used
Current	4...20 mA	Load 0...500 Ω	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*.

Unused analog outputs can be left open-circuited.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected

Interface	PIN	Signal	Description
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet *Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.*

Internal data exchange

Parameter	Value
Digital inputs (bytes)	3
Digital outputs (bytes)	3
Analog inputs (words)	4
Analog outputs (words)	2
Counter input data (words)	4
Counter output data (words)	8

Addressing

The module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

The IP address of the CI521-MODTCP Module can be set with the "ABB IP Configuration Tool". *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675*

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

I/O configuration

The CI521-MODTCP stores configuration parameters (IP address configuration, module parameters).

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization *Chapter 1.6.3.7.4.1.7 “Parameterization” on page 3176*.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	7400	WORD	7000

Master IP for Write restriction [4])	No master IP Master IP	0,0,0,0 W,X,y,z	ARRAY[0..3] OF BYTE	0,0,0,0

Name	Value	Internal value	Internal value, type	Default
Timeout for Bus supervision	No supervision 10 ms timeout 20 ms timeout	0 1 2	BYTE	No supervision
IO Mapping Structure [3])	Fixed Mapping Dynamic Mapping	0 1	BYTE	0
Reserved	Internal	0	ARRAY[0..2] OF BYTE	0,0,0
Check supply	off on	0 1	BYTE	1
Fast counter	0 : 10 [3])	0 : 10	BYTE	0

[1]) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission.

[2]) Counter operating modes, see description of the *Chapter 1.6.5.1.12 “Fast counters” on page 3570*.

[3]) Fixed Mapping means each module has its own Modbus registers for data transfer independent of the IO bus constellation. For details see *Chapter 1.6.5.3.1.2 “Modbus TCP registers” on page 3604*.

Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.

[4]) If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

Table 561: Error LED / Failsafe function

Setting	Description
On	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode off
Off by E4	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode off
Off by E3	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode off
On +Failsafe	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode on *)
Off by E4 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode on *)
Off by E3 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode on *)
*) The parameters Behaviour AO at comm. error and Behaviour DO at comm. error are only analyzed if the Failsafe-mode is ON.	

Group parameters for the analog part

Name	Value	Internal value	Internal value, type	Default

Internal value	Check channel
0	Plausib(ility), cut wire, short circuit
3	None

Table 566: Substitute value

Intended behavior of output channel when the control system stops	Required setting of the module parameter "Behaviour of outputs in case of a communication error"	Required setting of the channel parameter "Substitute value"
Output OFF	Off	0
Last value infinite	Last value	0
Last value for 5 s and then turn off	Last value 5 sec	0
Last value for 10 s and then turn off	Last value 10 sec	0
Substitute value infinite	Substitute value	Depending on configuration

Intended behavior of output channel when the control system stops	Required setting of the module parameter "Behaviour of outputs in case of a communication error"	Required setting of the channel parameter "Substitute value"
Substitute value for 5 s and then turn off	Substitute value 5 sec	Depending on configuration
Substitute value for 10 s and then turn off	Substitute value 10 sec	Depending on configuration

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.1 ms 1 ms 8 ms 32 ms	0 1 2 3	BYTE	0.1 ms 0x00
Detect short circuit at outputs	Off On	0 1	BYTE	On 0x01
Behaviour DO at comm. error [1])	Off Last value Last value 5 sec Last value 10 sec Substitute value Substitute value 5 sec Substitute value 10 sec	0 1 6 11 2 7 12	BYTE	Off 0x00
Substitute value at output	0 ... 255	00h ... FFh	BYTE	0 0x0000
Detect voltage overflow at outputs [2])	Off On	0 1	BYTE	On 0x01

[1]) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.

[2]) The state "externally voltage detected" appears, if the output of a channel DC0..DC7 should be switched on while an externally voltage is connected ↳ *Chapter 1.6.3.7.4.1.3 “Connections” on page 3158*. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

Diagnosis and state LEDs

Structure of the diagnosis block

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI521-MODTCP (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O Module ... 10 = 10th connected S500 I/O Module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version ≥ 3.2.6 is required.

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module;14 = I/O bus; 31 = Module itself The identifier is not contained in the CI521-MODTCP diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself; 1..10 = Expansion module
[3])	With "Module" the following allocation applies: 31 = Module itself Module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage ↳ *Chapter 1.6.3.7.4.1.3 “Connections” on page 3158*. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
[5])	The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3 ↳ *Chapter 1.6.3.7.4.1.3 “Connections” on page 3158*. Diag-nosis message appears for the whole module.
[6])	This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.
[7])	Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.

[8])	In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.
[9])	Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 567: States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with IO Controller	Start-up / preparing communication
	Yellow	---	---	---
STA1 ETH (System LED "BF")	Green	---	Device configured, cyclic data exchange running	Device configured, acyclic data exchange running
	Red	---	Communication error (timeout) appeared	IP address error
STA2 ETH (System LED "SF")	Green	Device has valid parameters	Device is running parameterization sequenze	Device has no parameters
	Red	---	---	Device has invalid parameters
S-ERR	Red	No error	Internal error	--
I/O-Bus	Green	No expansion modules connected or communication error	Expansion modules connected and operational	---
ETH1	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams
ETH2	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams

Table 568: States of the 27 process LEDs

LED	Color	OFF	ON	Flashing
AI0 to AI3	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
AO0 to AO1	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
DI0 to DI7	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO0 toDO7	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Measuring ranges

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Technical data of the module

Parameter		Value
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output

Parameter		Value
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of analog inputs		4
Number of analog outputs		2
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Ethernet		10/100 base-TX, internal switch, 2 x RJ45 socket
Setting of the IP address		With ABB IP config tool and 2 rotary switches at the front side of the module
Diagnose		See Diagnosis and Displays ↬ *Chapter 1.6.3.7.4.1.8 “Diagnosis and state LEDs” on page 3182*
Operation and error displays		32 LEDs (totally)
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Extended ambient temperature (XC version)		> 60 °C on request
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DI0 to DI7	Terminals 2.0 to 2.7
Reference potential for all inputs	Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals	1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)	Type 1
Input delay (0->1 or 1->0)	Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage	24 V DC

Parameter		Value
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DO0 to DO7		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload

Parameter		Value
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

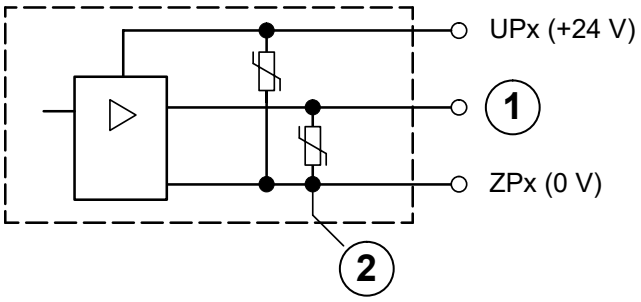

Fig. 247: Digital input/output (circuit diagram)

1 Digital Output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 1.0 to1.3
Reference potential for AI0+ to AI3+		Terminal 1.4 (AI-) for voltage and RTD measurement Terminal 1.9, 2.9 and 3.9 for current measurement
Input type		
	Unipolar	Voltage 0 ... 10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10 ... +10 V
Galvanic isolation		Against Ethernet network
Configurability		0...10 V, -10...+10 V, 0/4...20 mA, Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s

Parameter	Value
Resolution	Range 0...10 V: 12 bits Range -10...+10 V: 12 bits + sign Range 0...20 mA: 12 bits Range 4...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range	Typ. 0.5 %, max. 1 %

Intended purpose

Modbus TCP communication interface module CI522-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

Interface	Ethernet
Protocol	Modbus TCP
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	for setting the last BYTE of the IP ADDRESS (00h to FFh)
Configurable digital inputs/outputs	8 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Required terminal unit	TU507 or TU508 ↳ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet bus module CI522-MODTCP is plugged on the I/O terminal unit TU507-ETH ↳ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549* or TU508-ETH ↳ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ↳ *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter ↳ *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

S500 I/O module type	First index with firmware version above 1.9
AI523	D0
AI523-XC	D0
AI531	A3
AI531-XC	A0
AO523	D0
AO523-XC	D0
AX521	D0
AX521-XC	D0
AX522	D0
AX522-XC	D0
CD522	A2
CD522-XC	A0
DA501	A2

DC522-XC	D0
DC523	D0
DC523-XC	D0
DC532	D0
DC532-XC	D0
DI524	D0

S500 I/O module type	First index with firmware version above 1.9
DI524-XC	D0
DO524	A2
DO524-XC	A2
DX522	D0
DX522-XC	D0
DX531	D0
AC522	D0
PD501	D0

Do not connect any voltages externally to digital outputs!

This ist not intended usage.

Reason: Externally voltages at one or more terminals DC0...DC7 or DO8...DO15 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0..DI7.

CAUTION!

Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO8...DO15 and DC0...DC7.

The assignment of the other terminals:

Terminal	Signal	Description
1.0	DC0	Signal of the configurable digital input/output DC0
1.1	DC1	Signal of the configurable digital input/output DC1
1.2	DC2	Signal of the configurable digital input/output DC2
1.3	DC3	Signal of the configurable digital input/output DC3
1.4	DC4	Signal of the configurable digital input/output DC4
1.5	DC5	Signal of the configurable digital input/output DC5
1.6	DC6	Signal of the configurable digital input/output DC6
1.7	DC7	Signal of the configurable digital input/output DC7
1.8	UP	Process voltage UP (24 V DC)
1.9	ZP	Process voltage ZP (0 V DC)

Terminal	Signal	Description
2.0	DI8	Signal of the digital input DI8
2.1	DI9	Signal of the digital input DI9
2.2	DI10	Signal of the digital input DI10
2.3	DI11	Signal of the digital input DI11
2.4	DI12	Signal of the digital input DI12
2.5	DI13	Signal of the digital input DI13
2.6	DI14	Signal of the digital input DI14
2.7	DI15	Signal of the digital input DI15
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DO8	Signal of the digital output DO8
3.1	DO9	Signal of the digital output DO9
3.2	DO10	Signal of the digital output DO10
3.3	DO11	Signal of the digital output DO11
3.4	DO12	Signal of the digital output DO12
3.5	DO13	Signal of the digital output DO13
3.6	DO14	Signal of the digital output DO14
3.7	DO15	Signal of the digital output DO15
3.8	UP3	Process voltage UP3 (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the Ethernet bus module CI522-MODTCP.

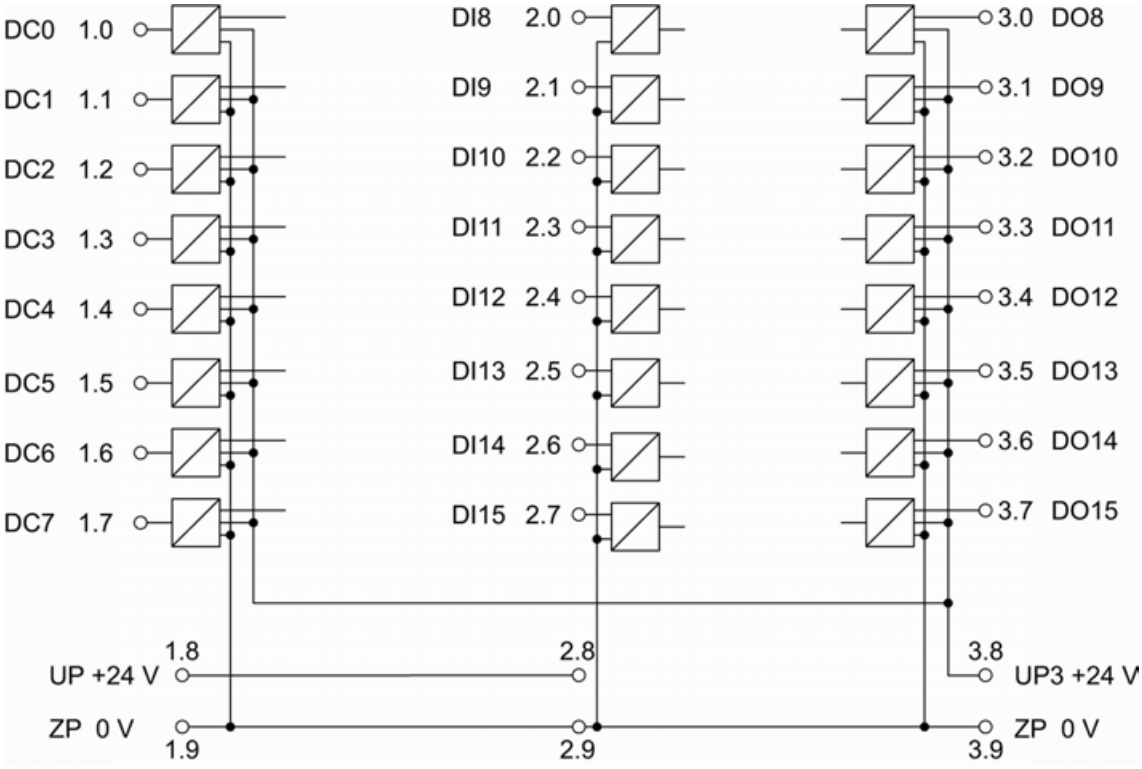

Fig. 248: Connection of the communication interface module CI522-MODTCP

Further information is provided in the System Technology chapter *Chapter 1.6.5.3.1 “Modbus communication interface module” on page 3603*.

Connection of the digital inputs

The following figure shows the connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.

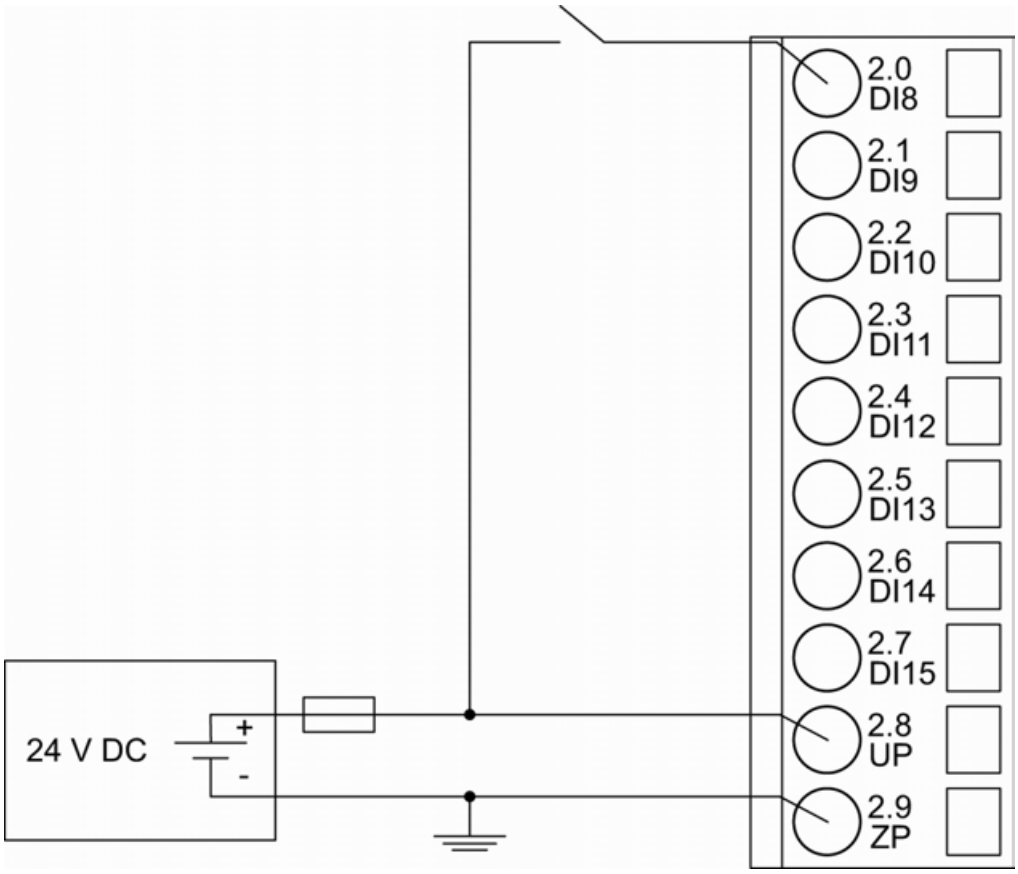

Fig. 249: Connection of the digital inputs to the module CI522-MODTCP

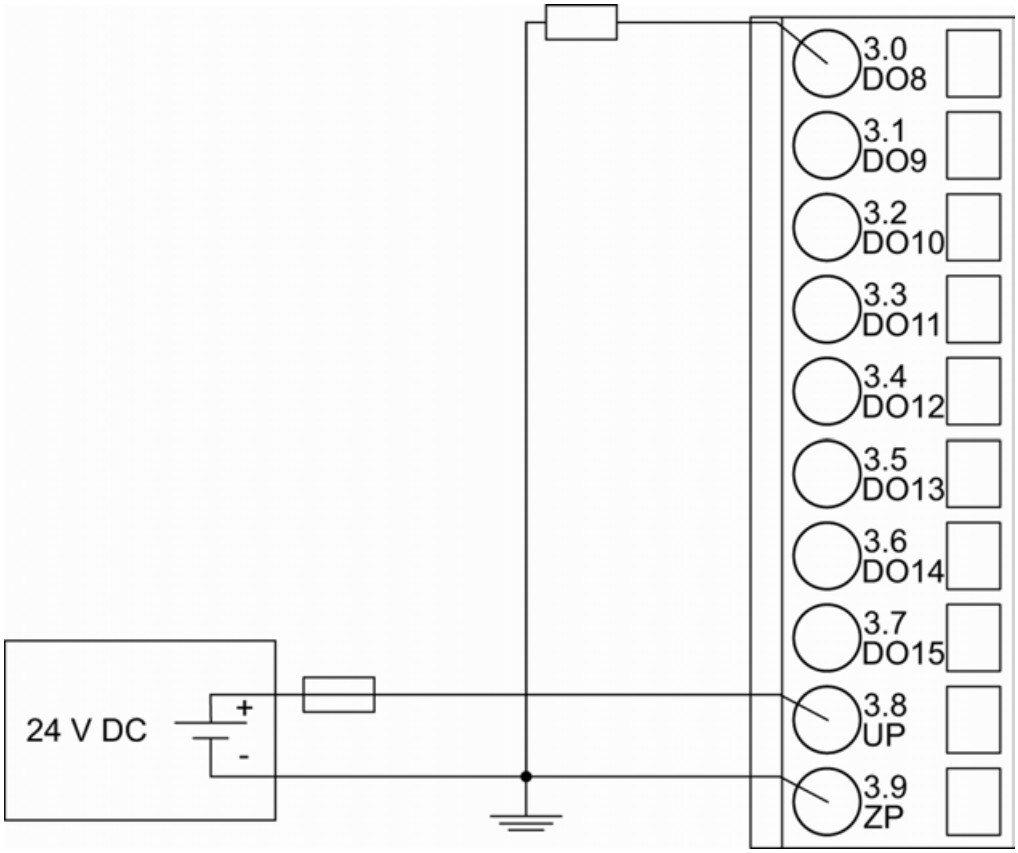
The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.4.2.8.1 “State LEDs” on page 3214*.

Connection of the digital outputs

The following figure shows the connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.

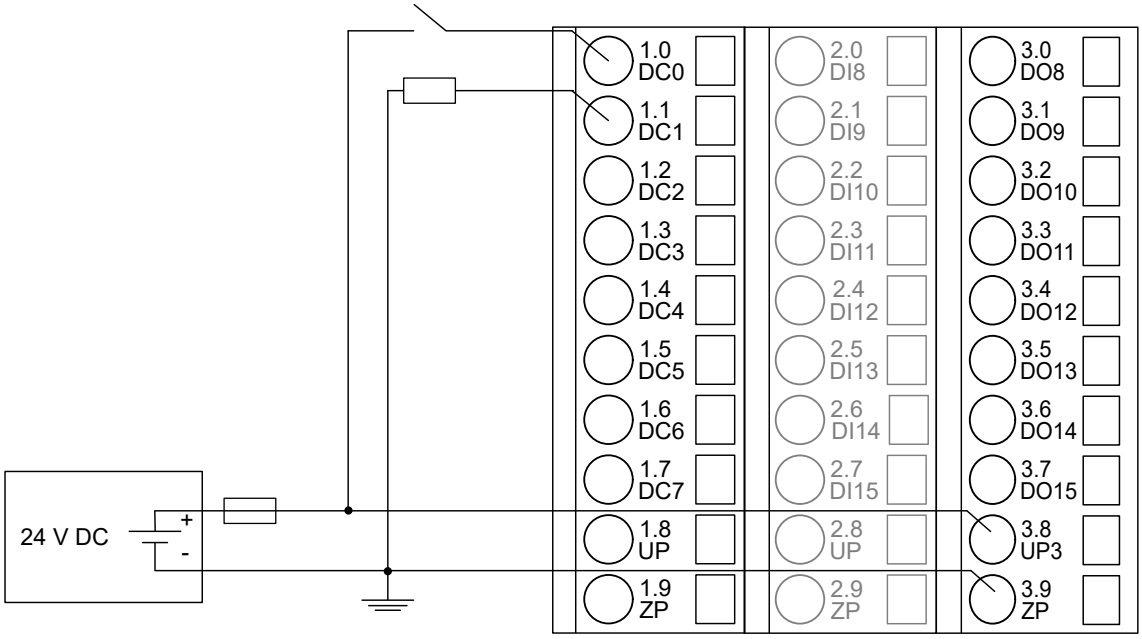


The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.4.2.8.1 “State LEDs” on page 3214*.

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!
If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device *Chapter 1.6.3.7.4.2.3 “Connections” on page 3198*.



The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.4.2.8.1 “State LEDs” on page 3214*.

Assignment of the Ethernet ports

The terminal unit for the Communication Interface Module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet *Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.*

Internal data exchange

Digital inputs (bytes)	5
Digital outputs (bytes)	5
Counter input data (words)	4
Counter output data (words)	8

Addressing

The IP address of the CI5221-MODTCP Module can be set with the “ABB IP Configuration Tool”. *Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675*.

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

The module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI522-MODTCP stores configuration parameters (IP address configuration, module parameters).

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization *Chapter 1.6.3.7.4.2.7 “Parameterization” on page 3206*.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	7405	WORD	7405
Ignore Module	Internal	0	BYTE	0

IO Mapping Structure [3])	Fixed Mapping Dynamic Mapping	0 1	BYTE	0
Reserved	Internal	0	ARRAY[0..2] OF BYTE	0,0,0
Check supply	off on	0 1	BYTE	1
Fast counter	0 : 10 [2])	0 : 10	BYTE	0

Remarks:

[1])	With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.
[2])	Counter operating modes *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*

[3])	Fixed Mapping means each module has its own Modbus registers for data transfer independent of the I/O bus constellation description. For details see *Chapter 1.6.5.3.1.2 “Modbus TCP registers” on page 3604*. Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.
[4])	If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules. If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

Table 569: Table Error LED / Failsafe function

Setting	Description
On	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode off
Off by E4	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode off

Preventive voltage feedback monitoring for DC0..DC7 [2])	Off On	0 1	BYTE	Off 0x00
Detect voltage overflow at outputs [3])	Off On	0 1	BYTE	Off 0x00

Remarks:

[1])	The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.
[2])	The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
[3])	The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3 ↳ *Chapter 1.6.3.7.4.2.3 “Connections” on page 3198* (see description in section). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

Diagnosis

Structure of the Diagnosis Block

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI502-PNIO (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O Module ... 10 = 10th connected S500 I/O Module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error
6	Reserved	0

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

For diagnosis firmware version ≥ 3.2.6 is required.

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module;14 = I/O bus; 31 = Module itself The identifier is not contained in the CI502-PNIO diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module
[3])	With "Module" the following allocation applies dependent of the master: Module error: 31 = Module itself Channel error: Module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO8...DO15 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' ↳ *Chapter 1.6.3.7.4.2.3 "Connections" on page 3198*. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
[5])	The voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3 ↳ *Chapter 1.6.3.7.4.2.3 "Connections" on page 3198*. Diagnosis message appears for the whole module.
[6])	This message appears, if the output of a channel DC0...DC7 or DO8...DO15 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.
[7])	Short circuit: After a detected short circuit, the output is deactivated for 2000ms. Then a new start up will be executed. This diagnosis message appears per channel.
[8])	In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.
[9])	Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 570: States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with I/O Controller	Start-up / preparing communication
	Yellow	---	---	---

LED	Color	OFF	ON	Flashing
STA1 ETH (System LED "BF")	Green	---	Device configured, cyclic data exchange running	Device configured, acyclic data exchange running
	Red	---	Communication error (timeout) appeared	IP address error
STA2 ETH (System LED "SF")	Green	Device has valid parameters	Device is running parameterization sequenze	Device has no parameters
	Red	---	---	Device has invalid parameters
S-ERR	Red	No error	Internal error	--
I/O-Bus	Green	No expansion modules connected or communication error	Expansion modules connected and operational	---
ETH1	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams
ETH2	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams

Table 571: States of the 29 process LEDs

LED	Color	OFF	ON	Flashing
DC0 to DC7	Yellow	Input/Output is OFF	Input/Output is ON	--
DI8 to DI15	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO8 to DO15	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Technical data of the module

Parameter		Value
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.15 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of configurable digital inputs/outputs		8
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Ethernet		10/100 base-TX, internal switch, 2 x RJ45 socket
Setting of the I/O device identifier		With 2 rotary switches at the front side of the module
Diagnosis		See Diagnosis and Displays *Chapter 1.6.3.7.4.2.8 “Diagnosis” on page 3209*
Operation and error displays		34 LEDs (totally)
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40°C per group)
Extended ambient temperature (XC version)		> 60 °C on request
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the digital inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DI8 to DI15		Terminals 2.0 to 2.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DO8 to DO15		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

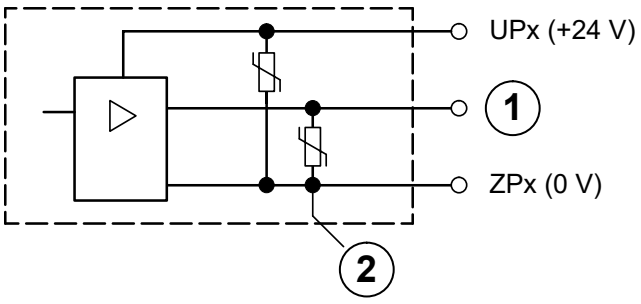

Fig. 250: Digital input/output (circuit diagram)

1 Digital Output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		8 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group for 8 channels
If the channels are used as inputs		
	Channels DC0...DC7	Terminals 1.0...1.7
If the channels are used as outputs		
	Channels DC0...DC7	Terminals 1.0...1.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation		From the Ethernet network

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC0 to DC7		Terminals 1.0 to 1.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V *)
	Undefined Signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V *)
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC0 to DC7		Terminals 1.0 to 1.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0,8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

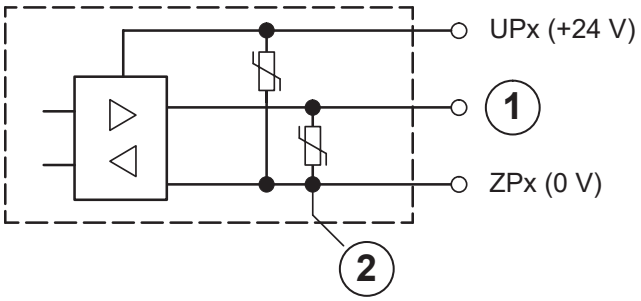

Fig. 251: Digital input/output (circuit diagram)

1 Digital input/output
2 For demagnetization when inductive loads are turned off

Technical data of the fast counter

Parameter	Value
Used inputs	Terminal 2.0 (DI8),Terminal 2.1 (DI9)
Used outputs	Terminal 3.0 (DO8)
Counting frequency	Depending on operation mode: Mode 1- 6: max. 200 kHz Mode 7: max. 50 kHz Mode 9: max. 35 kHz Mode 10: max. 20 kHz
Detailed description	See *Chapter 1.6.5.1.12 "Fast counters" on page 3570*

1.6.3.7.5 PROFINET

Comparison of the CI5xx-PNIO modules

The PROFINET IO devices combine the advantages of decentralized I/O modules with the reaction time of AC500 mounted central I/O modules. The devices for PROFINET provide the extension -PNIO in the device name.

The communication module CM579-PNIO acts as I/O controller in a PROFINET network. It is connected to the processor module via an internal communication bus. Depending on the terminal base, several communication modules can be used for one processor module.

The communication interface modules CI5xx-PNIO act as I/O devices in a PROFINET network.

Additionally the communication module CM589-PNIO(-4) can be used to setup a AC500 PLC to act as I/O module in a PROFINET network.

The difference of the CI5xx-PNIO devices can be found in their input and output characteristics ↳ *Chapter 1.6.3.7.5.1.1.1 “Characteristics of CI50x-PNIO” on page 3222*.

PROFINET IO devices CI50x-PNIO

Characteristics of CI50x-PNIO

Parameter	Value
Bus connection	2 x RJ45
Switch	Integrated
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Expandability	Max. 10 S500 I/O modules
Adjusting elements	2 rotary switches for generation of an explicit name
Supported protocols	RTC - real time cyclic protocol, class 1 *) RTA - real time acyclic protocol DCP - discovery and configuration protocol CL-RPC - connectionless remote procedure Call LLDP - link layer discovery protocol MRP - MRP Client
Acyclic services	PNIO read / write sequence (max. 1024 bytes per telegram) Process-Alarm service
Supported alarm types	Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm
Min. bus cycle	1 ms
Conformance class	CC A
Protective functions (according to IEC 61131-3)	Protected against: ● short circuit ● reverse supply ● overvoltage ● reverse polarity Galvanic isolation from the rest of the module

*) Priorization with the aid of VLAN-ID including priority level

Input/Output characteristics of CI501-PNIO

The PROFINET communication interface module CI501-PNIO is used as decentralized I/O module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3), configurable as:
  - -10 ... +10 V
  - 0 ... +10 V
  - -10 ... +10 V (differential voltage)
  - 0 ... 20 mA
  - 4 ... 20 mA
  - Pt100 , Pt1000, Ni1000 (for each 2-wire and 3-wire)
  - 24 V digital input function
- 2 analog outputs (1.5...1.6), configurable as:
  - -10 ... +10 V
  - 0 ... 20 mA
  - 4 ... 20 mA
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital transistor outputs 24 V DC (0.5 A max.) in 1 group (3.0...3.7)
- Resolution of the analog channels: 12 bits

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Input/Output characteristics of CI502-PNIO

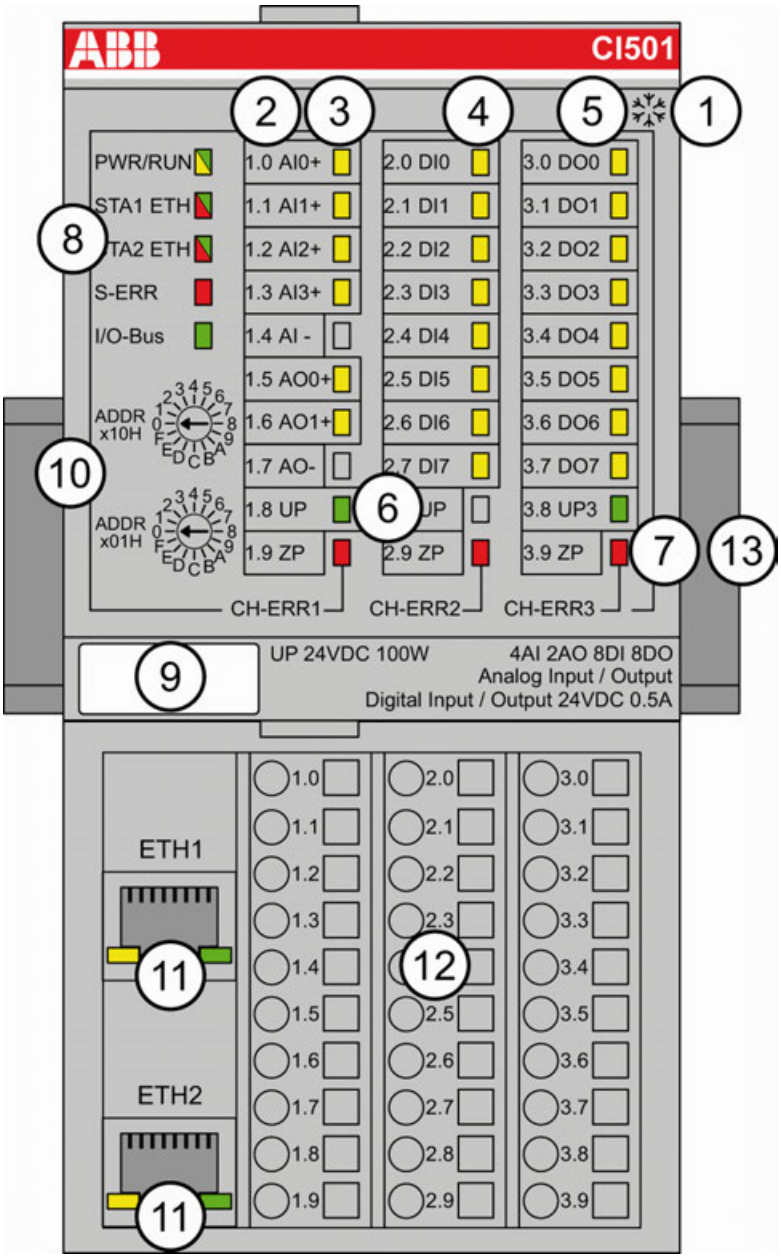
- 8 digital inputs 24 V DC
- 8 digital transistor outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- XC version for usage in extreme ambient conditions available

Technical data of the serial interfaces of CI504-PNIO

Parameter	Value
Number of serial interfaces	3
Connectors for serial interfaces	X11 for COM1 X12 for COM2 X13 for COM3
Supported physical layers	RS-232 RS-422 RS-485
Supported protocols	ASCII
Transmission rate	Configurable from 300 bit/s to 115.200 bit/s

CI501-PNIO

- 4 analog inputs, 2 analog outputs, 8 digital inputs, 8 digital outputs
- Resolution 12 bits plus sign
- Module-wise galvanically isolated
- Fast counter
- XC version for usage in extreme ambient conditions available



1 I/O bus
2 Allocation between terminal number and signal name
3 6 yellow LEDs to display the signal states of the analog inputs/outputs (AI0 - AI3, AO0 - AO1)
4 8 yellow LEDs to display the signal states of the digital inputs (DI0 - DI7)
5 8 yellow LEDs to display the signal states of the digital outputs (DO0 - DO7)
6 2 green LEDs to display the process supply voltage UP and UP3
7 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8 5 system LEDs: PWR/RUN, STA1 ETH, STA2 ETH, S-ERR, I/O-Bus
9 Label
10 2 rotary switches for setting the I/O device identifier
11 Ethernet interfaces (ETH1, ETH2) on the terminal unit

12 Terminal unit
13 DIN rail
❄ Sign for XC version

Intended purpose

The PROFINET communication interface modules CI501-PNIO and CI502-PNIO are used as communication interface modules in PROFINET networks. The network connection is performed by Ethernet cables which are inserted in the RJ45 connectors in the terminal unit. An Ethernet switch in the communication interface module allows daisy chaining of the network.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

The communication interface module contains 22 I/O channels with the following properties:

- 4 configurable analog inputs (2-wire / single-ended) or 2 configurable analog inputs (3-wire / differential) (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC, 0.5 A max. in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the PROFINET network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Parameter	Value
Interface	Ethernet
Protocol	PROFINET IO RT
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the I/O device identifier for configuration purposes (00h to FFh)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU507 or TU508 ↬ *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet communication interface module CI501-PNIO is plugged on the I/O terminal unit TU507-ETH or TU508-ETH *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!

Reason: External voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is unintended usage.

CAUTION!

Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0...DO7.

The assignment of the other terminals:

Terminal	Signal	Description
1.0	AI0+	Positive pole of analog input signal 0
1.1	AI1+	Positive pole of analog input signal 1
1.2	AI2+	Positive pole of analog input signal 2
1.3	AI3+	Positive pole of analog input signal 3
1.4	AI-	Negative pole of analog input signals 0 to 3
1.5	AO0+	Positive pole of analog output signal 0
1.6	AO1+	Positive pole of analog output signal 1
1.7	AI-	Negative pole of analog output signals 0 and 1
1.8	UP	Process voltage UP (24 V DC)

Terminal	Signal	Description
1.9	ZP	Process voltage ZP (0 V DC)
2.0	DI0	Signal of the digital input DI0
2.1	DI1	Signal of the digital input DI1
2.2	DI2	Signal of the digital input DI2
2.3	DI3	Signal of the digital input DI3
2.4	DI4	Signal of the digital input DI4
2.5	DI5	Signal of the digital input DI5
2.6	DI6	Signal of the digital input DI6
2.7	DI7	Signal of the digital input DI7
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DO0	Signal of the digital output DO0
3.1	DO1	Signal of the digital output DO1
3.2	DO2	Signal of the digital output DO2
3.3	DO3	Signal of the digital output DO3
3.4	DO4	Signal of the digital output DO4
3.5	DO5	Signal of the digital output DO5
3.6	DO6	Signal of the digital output DO6
3.7	DO7	Signal of the digital output DO7
3.8	UP3	Process voltage UP3 (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

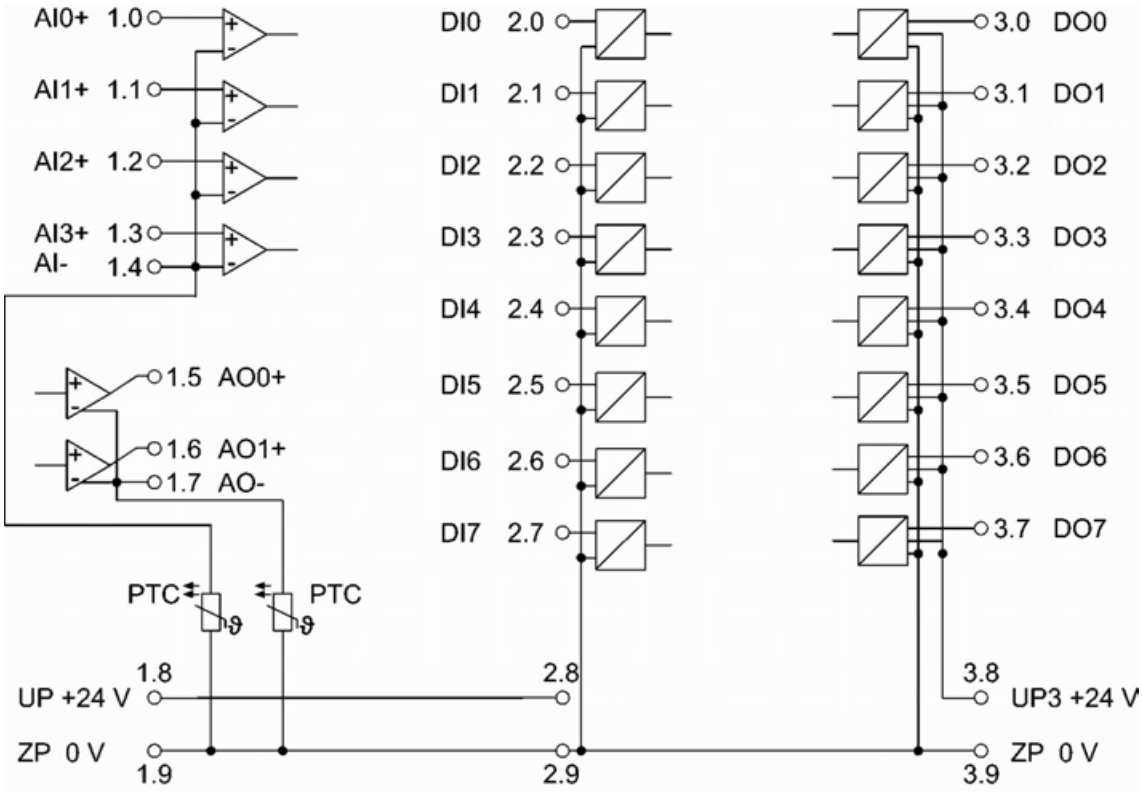
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

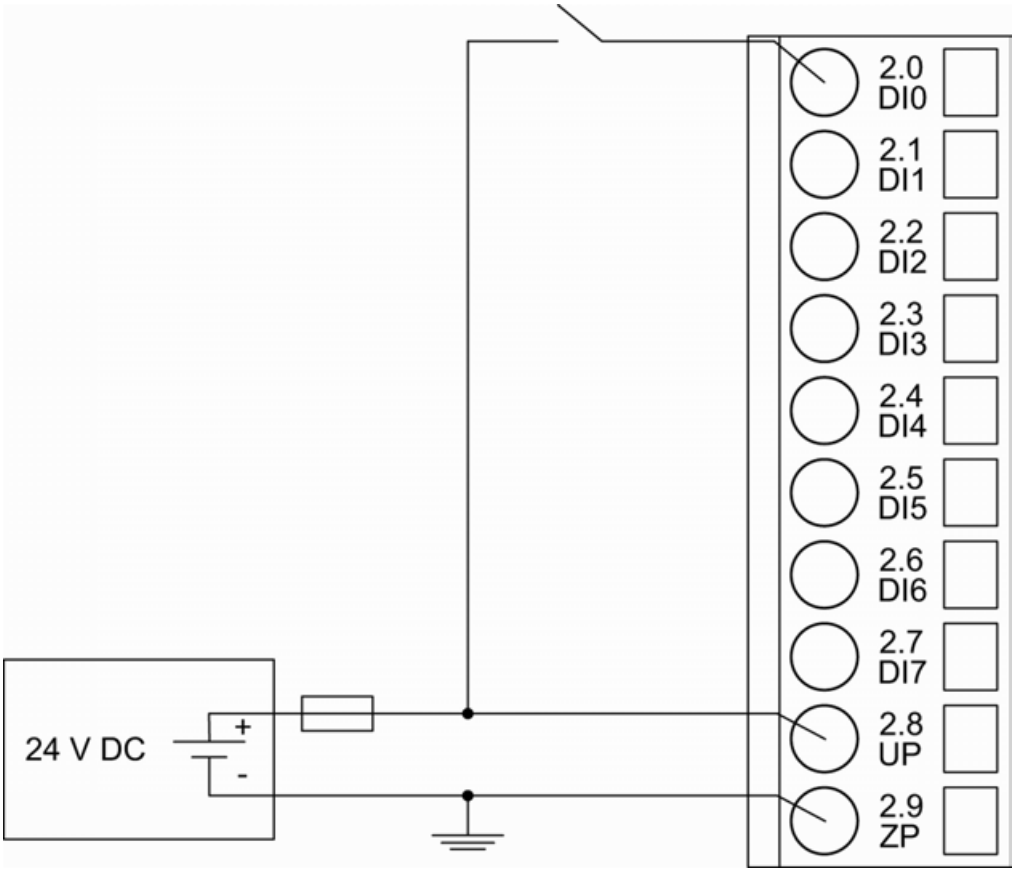
The following figures show the connection of the Ethernet bus module CI501-PNIO.



Further information is provided in the System Technology chapter *Chapter 1.6.5.3.2 “PROFINET communication interface module” on page 3629*.

Connection of the digital inputs

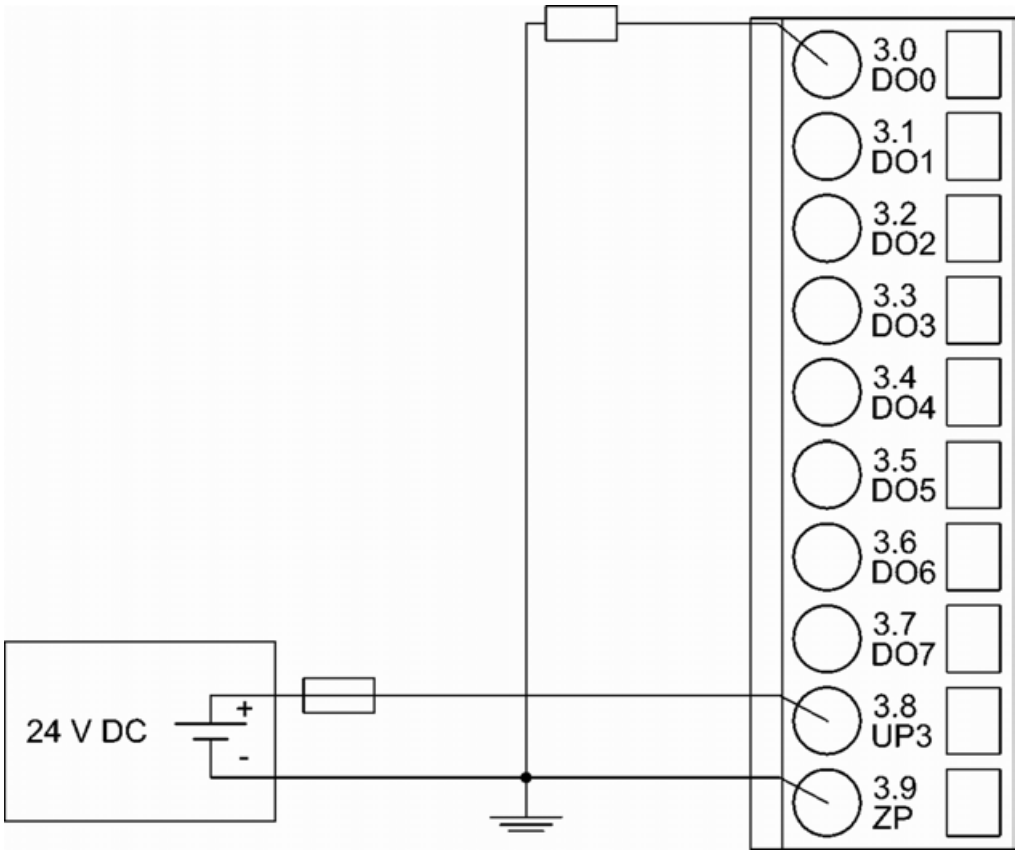
The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.



The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.5.2.8.2 “State LEDs” on page 3253*.

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.

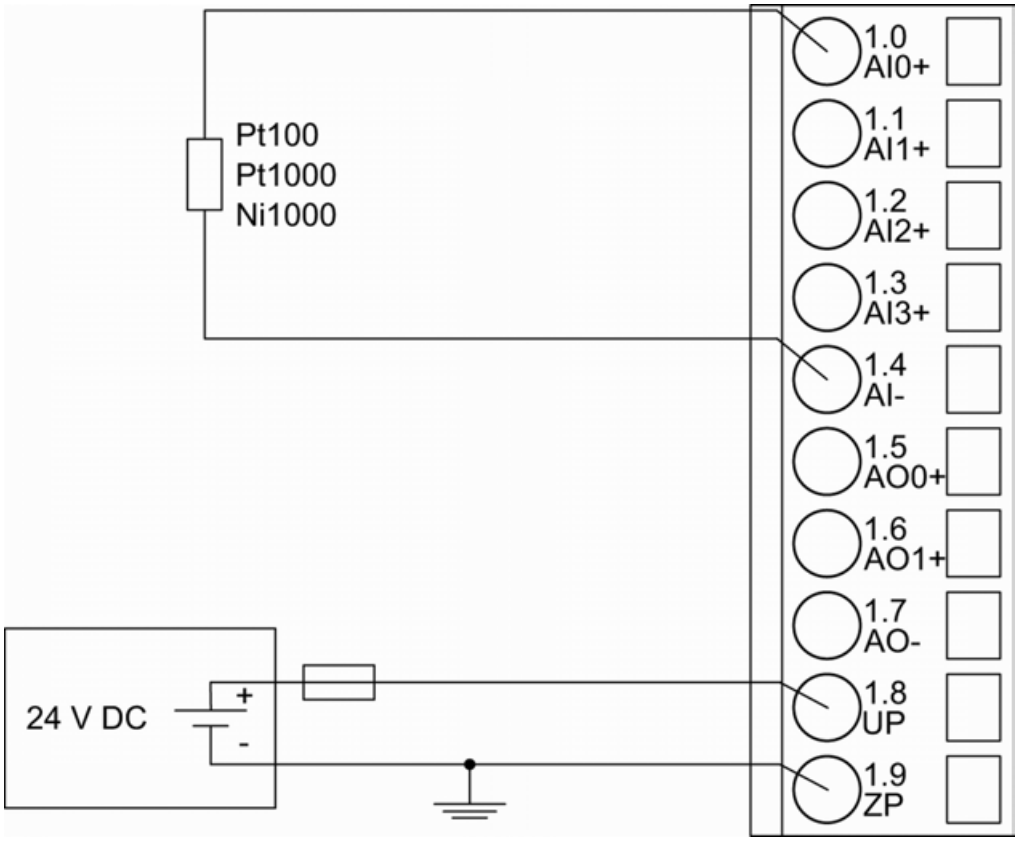


The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.5.2.8.2 “State LEDs” on page 3253*.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.



The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Pt100	-50 °C...+400 °C	2-wire configuration, 1 channel used
Pt1000	-50 °C...+400 °C	2-wire configuration, 1 channel used
Ni1000	-50 °C...+150 °C	2-wire configuration, 1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

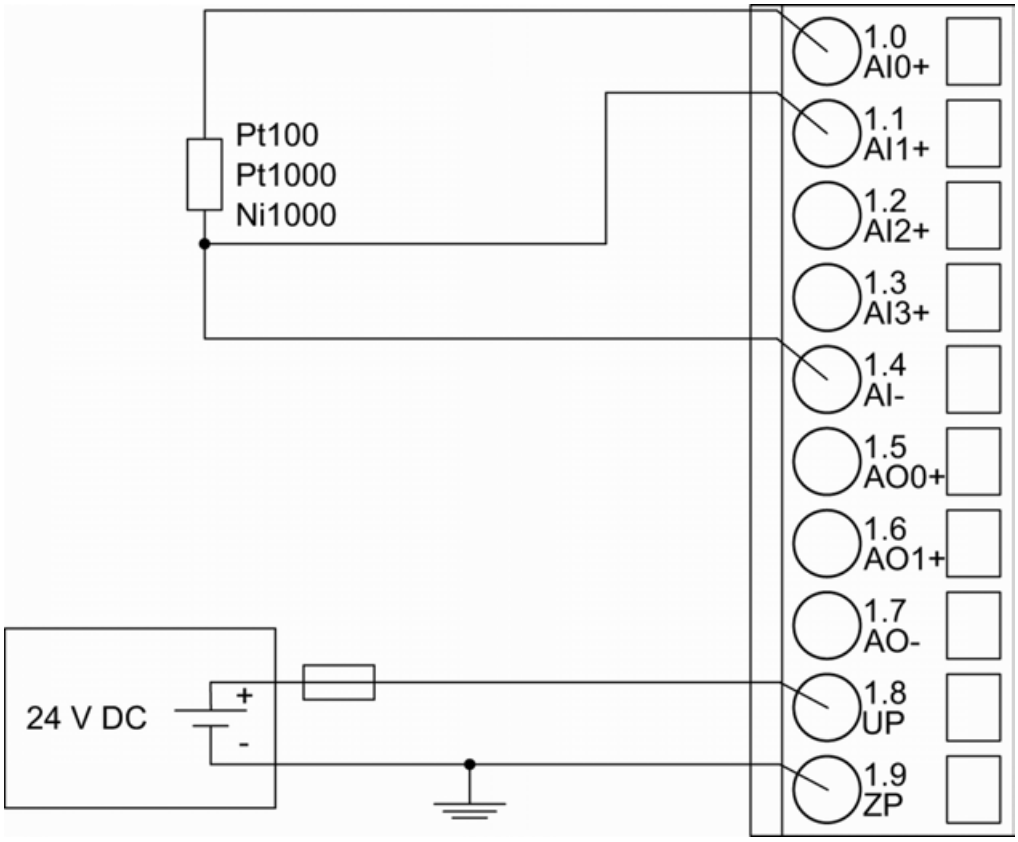
The module CI501-PNIO performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.



With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Pt100	-50 °C...+70 °C	3-wire configuration, 2 channels used
Pt100	-50 °C...+400 °C	3-wire configuration, 2 channels used
Pt1000	-50 °C...+400 °C	3-wire configuration, 2 channels used
Ni1000	-50 °C...+150 °C	3-wire configuration, 2 channels used

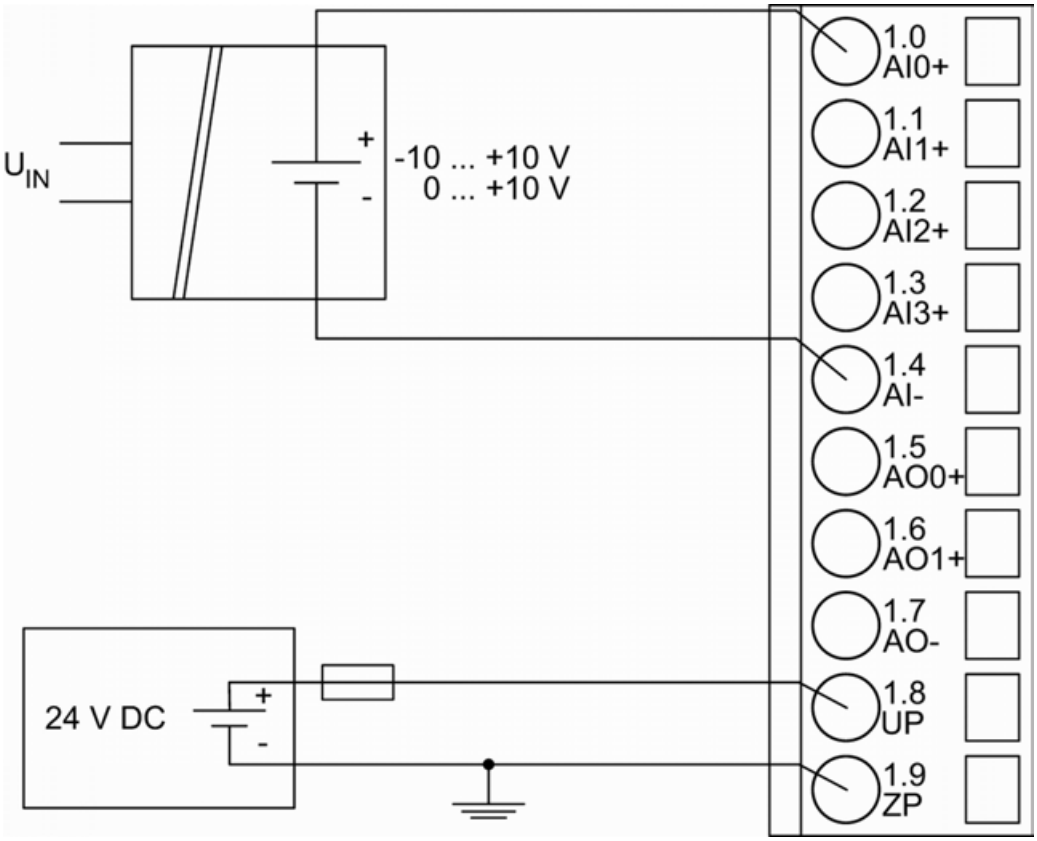
The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

The module CI501-PNIO performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.



The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

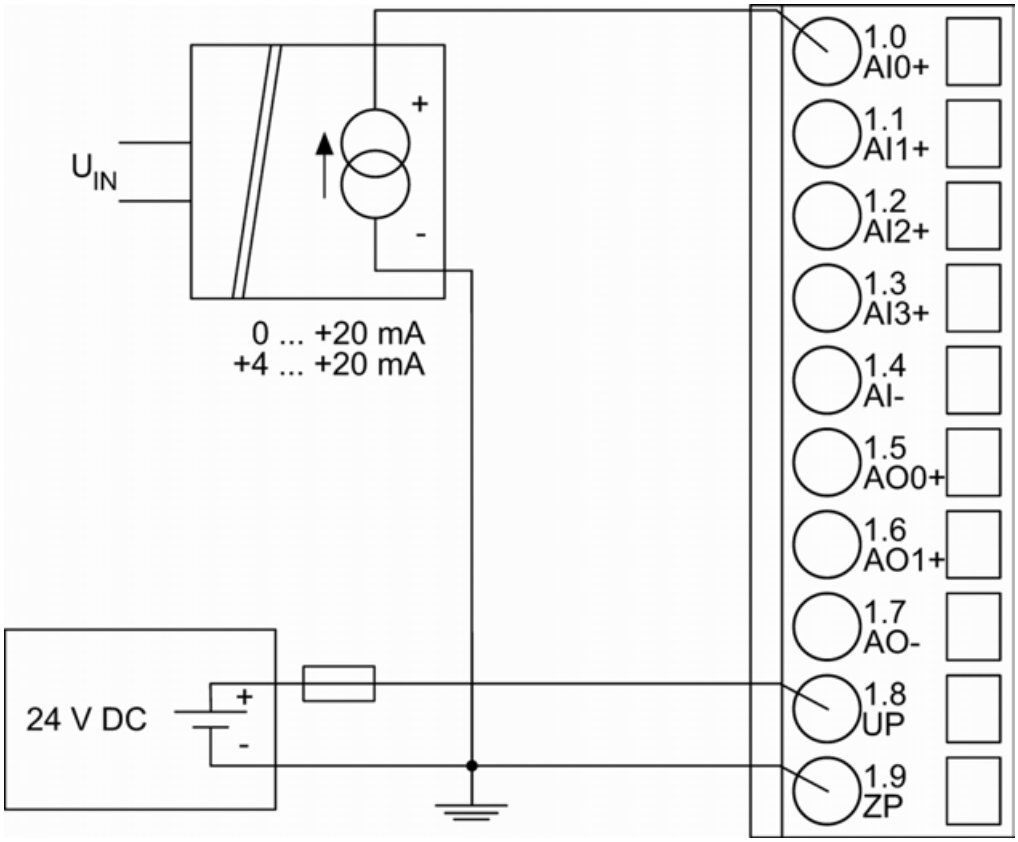
Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.



The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Current	0 mA...20 mA	1 channel used
Current	4 mA...20 mA	1 channel used

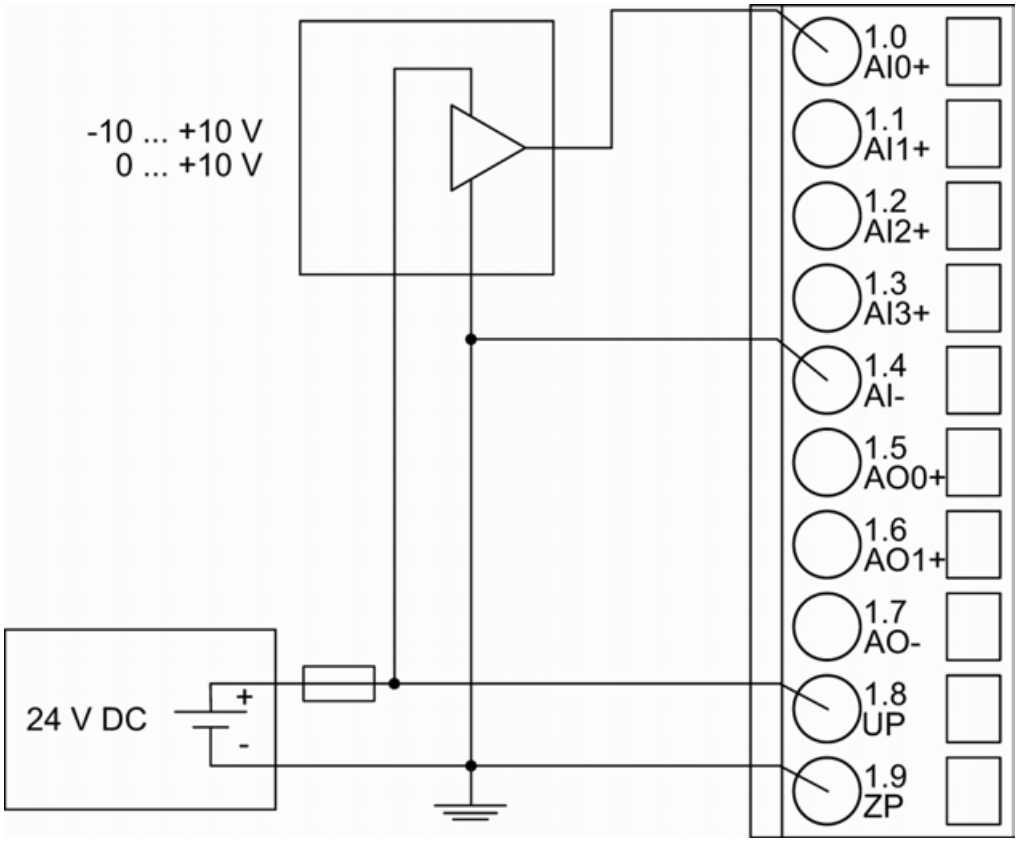
The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.



CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V (also not with long cable lengths).

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242*:

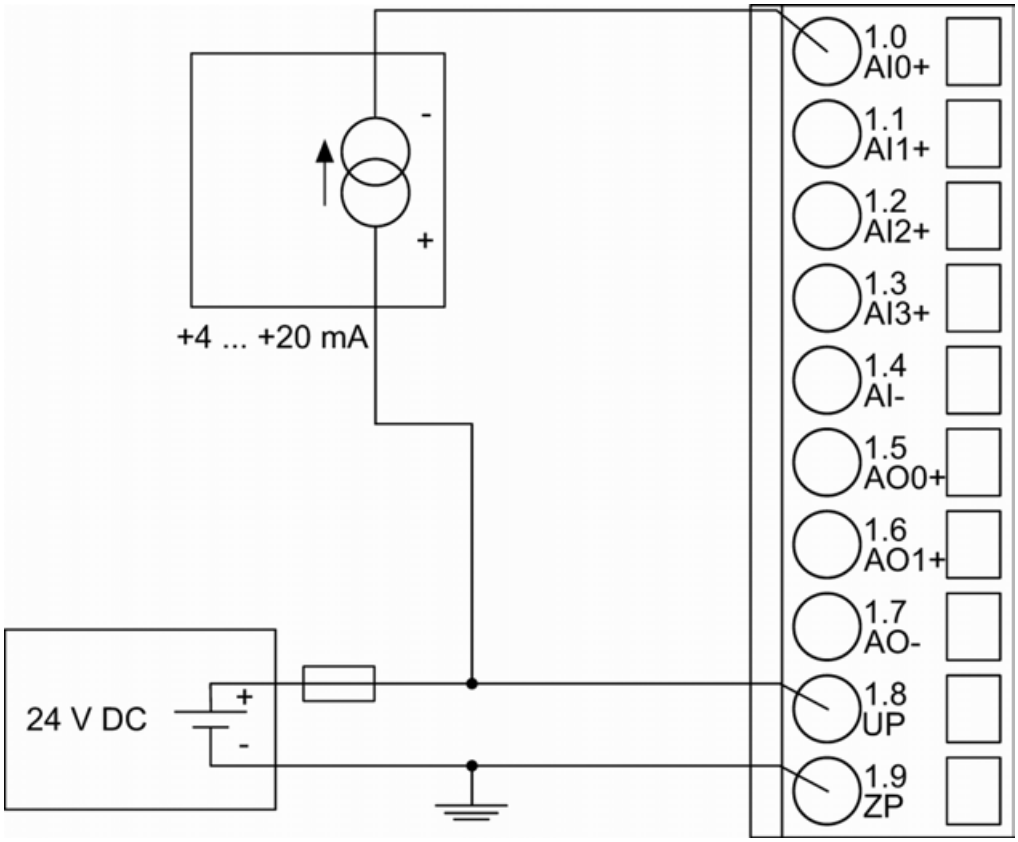
Voltage	0 V...10 V	1 channel used
Voltage	-10 V...+10 V	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.



The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Current	4 mA...20 mA	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

CAUTION!

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

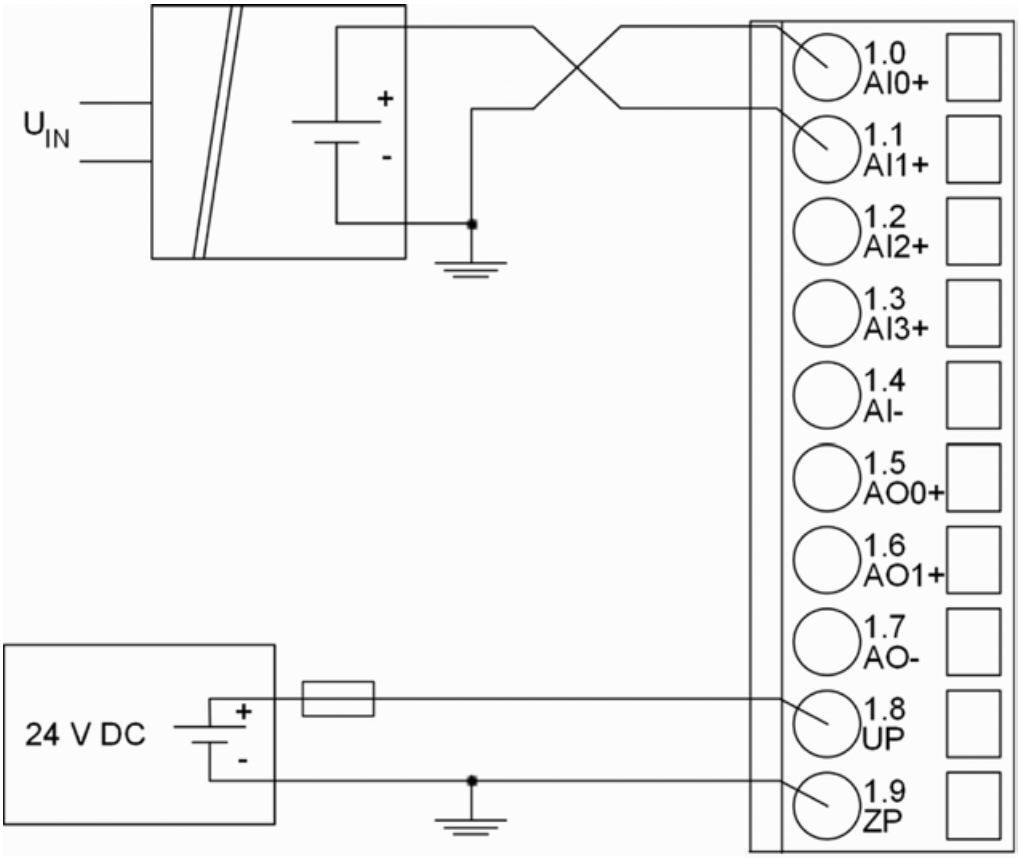
CAUTION!

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.



The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Voltage	0 V...10 V	With differential inputs, 2 channels used
Voltage	-10 V...+10 V	With differential inputs, 2 channels used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

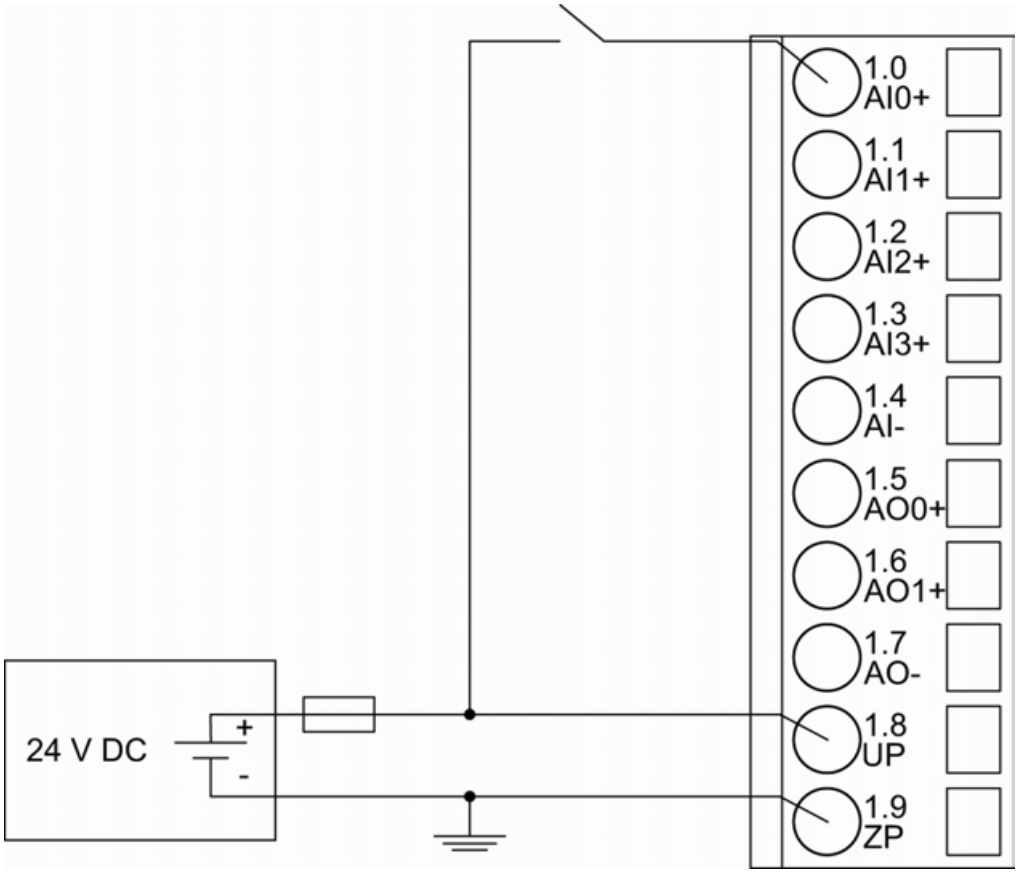


Fig. 252: Use of analog inputs as digital inputs

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255* :

Digital input	24 V	1 channel used
Effect of incorrect input terminal connection		Wrong or no signal detected, no damage up to 35 V

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

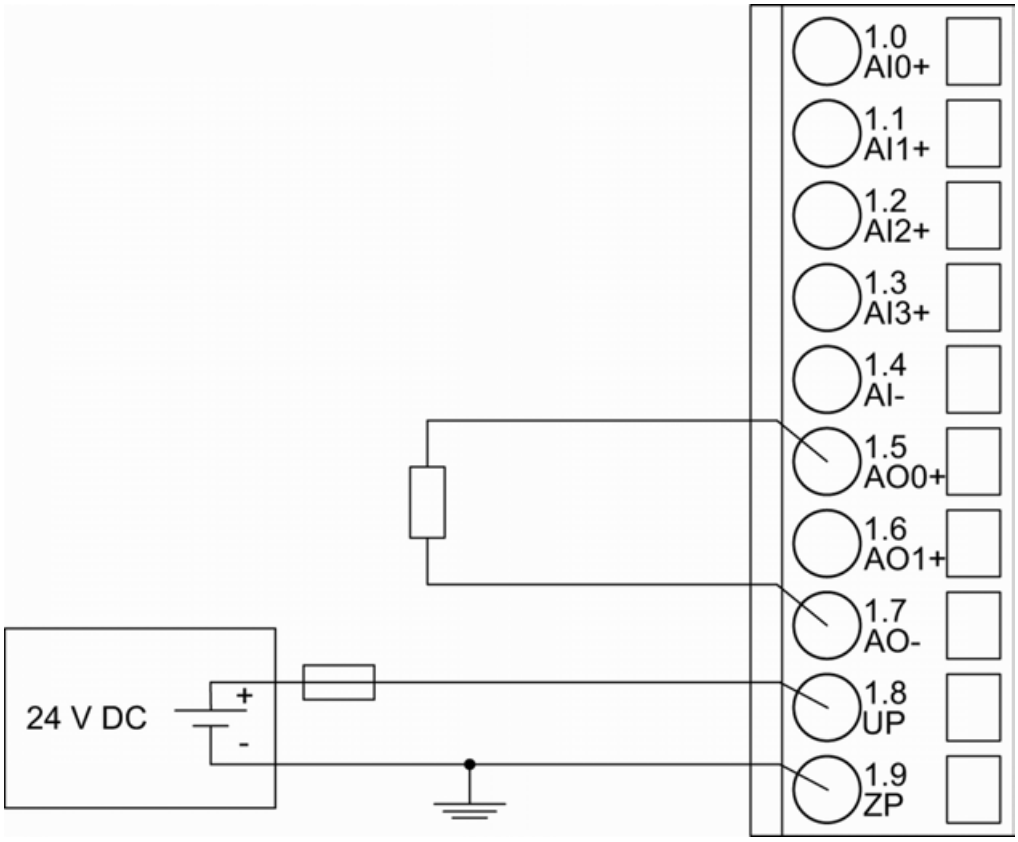

Fig. 253: Connection of analog output loads (voltage)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*

Voltage	-10 V...+10 V	Load ±10 mA max.	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.

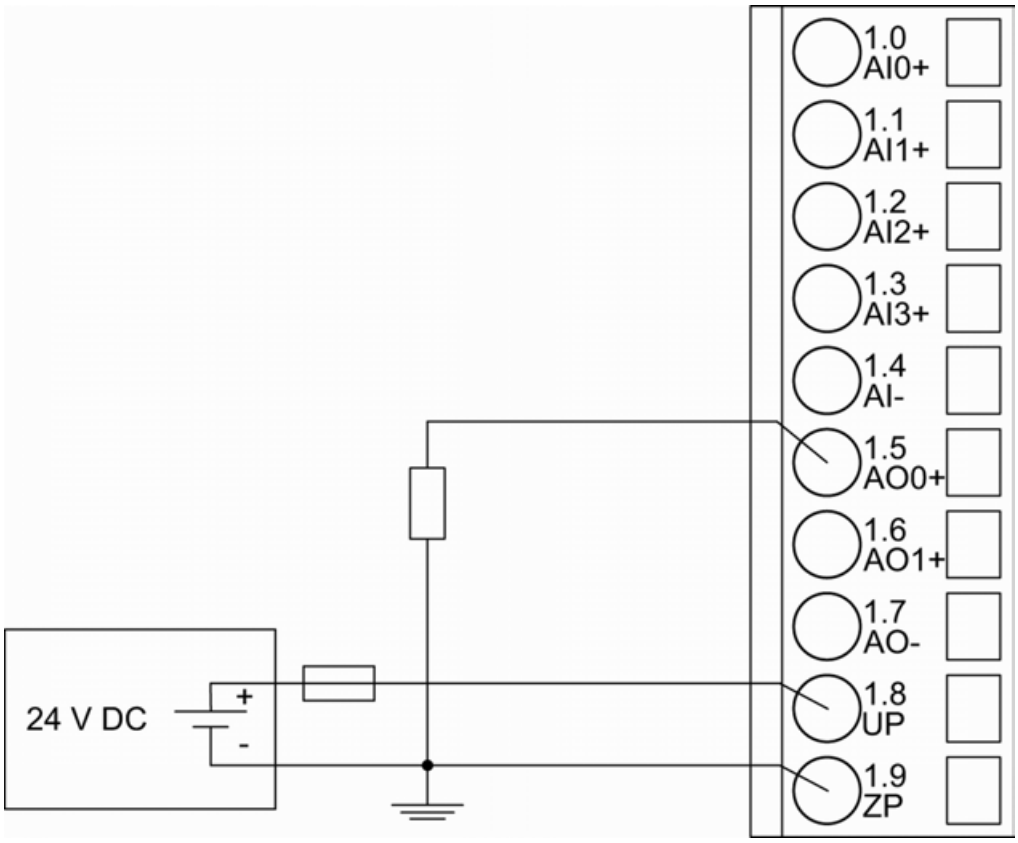

Fig. 254: Connection of analog output loads (current)

The following measuring ranges can be configured ↳ *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242* ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*:

Current	0 mA...20 mA	Load 0 Ω...500 Ω	1 channel used
Current	4 mA...20 mA	Load 0 Ω...500 Ω	1 channel used

The function of the LEDs is described under Diagnosis and displays / Displays ↳ *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*.

Unused analog outputs can be left open-circuited.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected

Interface	PIN	Signal	Description
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet *Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.*

Internal data exchange

Parameter	Value
Digital inputs (bytes)	3
Digital outputs (bytes)	3
Analog inputs (words)	4
Analog outputs (words)	2
Counter input data (words)	4
Counter output data (words)	8

Addressing

The module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI501-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization *Chapter 1.6.3.7.5.2.7 “Parameterization” on page 3242*.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	7000	WORD	7000
Parameter length	Internal	25	BYTE	25
Error LED / Failsafe function see table Error LED / Failsafe function *Table 572 "Error LED / Failsafe function" on page 3243*	On	0	BYTE	0
	Off by E4	1		
	Off by E3	3		
	On + failsafe	16		
	Off by E4 + failsafe	17		
	Off by E3 + failsafe	19		
Process cycle time [2])	1 ms process cycle time	1	BYTE	1 ms
	2 ms process cycle time	2		
	3 ms process cycle time	3		
	4 ms process cycle time	4		
	5 ms process cycle time	5		
	6 ms process cycle time	6		
	7 ms process cycle time	7		
	8 ms process cycle time	8		
	9 ms process cycle time	9		
	10 ms process cycle time	10		
	11 ms process cycle time	11		
	12 ms process cycle time	12		
	13 ms process cycle time	13		
	14 ms process cycle time	14		
	15 ms process cycle time	15		
	16 ms process cycle time	16		
Check supply	off	0	BYTE	1
	on	1		

Name	Value	Internal value	Internal value, type	Default
Input delay	8 ms	8 ms	BYTE	8 ms
Fast counter	0 : 10 [3])	0 : 10	BYTE	0
Detect short circuit at outputs	On	1	BYTE	On
Behavior digital outputs at comm. error	Off	0	BYTE	Off
Substitute value digital outputs	0	0..255	BYTE	0
Overvoltage behavior on output	Off	0	BYTE	Off
Behavior analog outputs atcomm. error	Off	0	BYTE	Off
I/O-Bus reset	Off	0	BYTE	Off
	On	1	BYTE	Off

Remarks:

[1])	With a faulty ID, the modules reports a "parameter error" and does not perform cyclic process data transmission.
[2])	As for device index C0 the parameter is no longer evaluated.
[3])	Counter operating modes, see description of the Fast counter ↬ *Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776*.

Table 572: Error LED / Failsafe function

Setting	Description
On	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode off
Off by E4	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode off
Off by E3	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode off
On +Failsafe	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode on *)
Off by E4 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode on *)
Off by E3 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode on *)
*) The parameters Behaviour AO at comm. error and Behaviour DO at comm. error are only analyzed if the Failsafe-mode is ON.	

IO-BUS reset after PROFINET reconnection

IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET CI modules in relation to connected I/O modules (both safety and non-safety I/O modules).

- IO-BUS reset after PROFINET reconnection = *"On"* resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.

  Note that if the parameter is set to *"On"* then:
  - The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to *"0"* values during the re-connection and re-parameterization time and after that go to new output values.
  - Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.
- IO-BUS reset after PROFINET reconnection = *"Off"* will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.

  Note that if the parameter is set to *"Off"* then:
  - The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from fail-safe values to *"0"* values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
  - Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

Group parameters for the analog part

Name	Value	Internal value	Internal value, type	Default
Analog data format	Standard	0	BYTE	0
	Reserved	255		
Behaviour AO at comm. error *)	Off	0	BYTE	0

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.1 ms 1 ms 8 ms 32 ms	0 1 2 3	BYTE	0.1 ms 0x00
Detect short circuit at outputs	Off On	0 1	BYTE	On 0x01

Name	Value	Internal value	Internal value, type	Default
Behaviour DO at comm. error [1])	Off Last value Last value 5 sec Last value 10 sec Substitute value Substitute value 5 sec Substitute value 10 sec	0 1 6 11 2 7 12	BYTE	Off 0x00
Substitute value at output	0...255	00h...FFh	BYTE	0 0x0000
Detect voltage overflow at outputs [2])	Off On	0 1	BYTE	On 0x01
[1]) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON. [2]) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected ↯ *Chapter 1.6.3.7.5.2.3 “Connections” on page 3226*. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".				

Diagnosis and state LEDs

Structure of the diagnosis block via PNIO_DEV_ALARM function block

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI501-PNIO (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O module ... 10 = 10th connected S500 I/O module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master

Byte Number	Description	Possible Values
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the communication module;14 = I/O bus; 31 = Module itself The identifier is not contained in the CI501-PNIO diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself; 1...10 = Expansion module
[3])	With "Module" the following allocation applies: 31 = Module itself Module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage ↳ *Chapter 1.6.3.7.5.2.3 "Connections" on page 3226*. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
[5])	The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3 ↳ *Chapter 1.6.3.7.5.2.3 "Connections" on page 3226*. Diagnosis message appears for the whole module.
[6])	This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.
[7])	Short circuit: After a detected short circuit, the output is deactivated for 100 ms. Then a new start up will be executed. This diagnosis message appears per channel.
[8])	In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.
[9])	Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 578: States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with I/O Controller	Start-up / preparing communication
	Yellow	---	---	---
STA1 ETH (System LED "BF")	Green	---	Device configured, cyclic data exchange running	---

LED	Color	OFF	ON	Flashing
	Red	---	---	Device is not configured
STA2 ETH (System LED "SF")	Green	---	---	Got identification request from I/O controller
	Red	No system error	System error (collective error)	---
S-ERR	Red	No error	Internal error	--
I/O-Bus	Green	No expansion modules connected or communication error	Expansion modules connected and operational	---
ETH1	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams
ETH2	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams

Table 579: States of the 27 process LEDs

LED	Color	OFF	ON	Flashing
AI0 to AI3	Yellow	Input is OFF	Input is ON (brightness depends on the value of the analog signal)	--
AO0 to AO1	Yellow	Output is OFF	Output is ON (brightness depends on the value of the analog signal)	--
DI0 to DI7	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO0 to DO7	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Technical data of the module

Parameter		Value
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.2 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of analog inputs		4
Number of analog outputs		2
Input data length		2 bytes
Output data length		2 bytes
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Setting of the I/O device identifier		With 2 rotary switches at the front side of the module
Diagnose		See Diagnosis and Displays *Chapter 1.6.3.7.5.2.8 “Diagnosis and state LEDs” on page 3248*
Operation and error displays		32 LEDs (totally)
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)

Parameter	Value
Extended ambient temperature (XC version)	>60 °C on request
Cooling	The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Parameter	Value
Bus connection	2 x RJ45
Switch	Integrated
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Expandability	Max. 10 S500 I/O modules
Adjusting elements	2 rotary switches for generation of an explicit name
Supported protocols	RTC - real time cyclic protocol, class 1 *) RTA - real time acyclic protocol DCP - discovery and configuration protocol CL-RPC - connectionless remote procedure Call LLDP - link layer discovery protocol MRP - MRP Client
Acyclic services	PNIO read / write sequence (max. 1024 bytes per telegram) Process-Alarm service
Supported alarm types	Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm
Min. bus cycle	1 ms

Parameter	Value
Conformance class	CC A
Protective functions (according to IEC 61131-3)	Protected against: ● short circuit ● reverse supply ● overvoltage ● reverse polarity Galvanic isolation from the rest of the module

*) Priorization with the aid of VLAN-ID including priority level

Technical data of the digital inputs

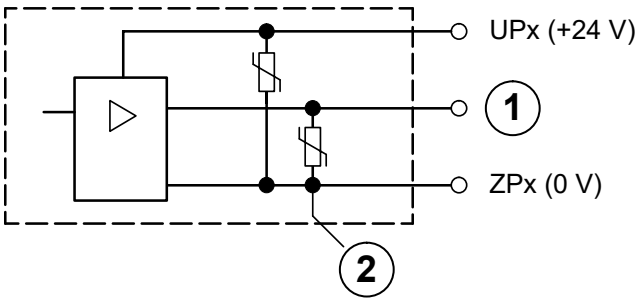
Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DI0 to DI7		Terminals 2.0 to 2.7
Reference potential for all inputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	0-Signal	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	1-Signal	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels

Parameter		Value
Terminals of the channels DO0 to DO7		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.



1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the analog inputs

Parameter		Value
Number of channels per module		4
Distribution of channels into groups		1 group with 4 channels
Connection if channels AI0+ to AI3+		Terminals 1.0 to1.3
Reference potential for AI0+ to AI3+		Terminal 1.4 (AI-) for voltage and RTD measurement Terminal 1.9, 2.9 and 3.9 for current measurement
Input type		
	Unipolar	Voltage 0 V... 10 V, current or Pt100/Pt1000/ Ni1000
	Bipolar	Voltage -10 V... +10 V
Galvanic isolation		Against Ethernet network
Configurability		0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA Pt100/1000, Ni1000 (each input can be configured individually)
Channel input resistance		Voltage: > 100 kΩ Current: ca. 330 Ω
Time constant of the input filter		Voltage: 100 µs Current: 100 µs
Indication of the input signals		1 LED per channel (brightness depends on the value of the analog signal)
Conversion cycle		1 ms (for 4 inputs + 2 outputs); with RTDs Pt/ Ni... 1 s
Resolution		Range 0 V...10 V: 12 bits Range -10 V...+10 V: 12 bits + sign Range 0 mA...20 mA: 12 bits Range 4 mA...20 mA: 12 bits Range RTD (Pt100, PT1000, Ni1000): 0.1 °C
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ. 0.5 %, max. 1 %
Relationship between input signal and hex code		Tables Input ranges voltage, current and digital input and Input range resistance temperature detector ↳ *Chapter 1.6.3.7.5.2.9.1 “Input ranges voltage, current and digital input” on page 3255*
Unused inputs		Are configured as "unused" (default value)
Overvoltage protection		Yes

Technical data of the analog inputs, if used as digital inputs

Parameter		Value
Number of channels per module		Max. 4
Distribution of channels into groups		1 group of 4 channels
Connections of the channels AI0+ to AI3+		Terminals 1.0 to 1.3
Reference potential for the inputs		Terminals 1.9, 2.9 and 3.9 (ZP)
Indication of the input signals		1 LED per channel
Input signal voltage		24 V DC
	Signal 0	-30 V...+5 V
	Undefined signal	+5 V ... +13 V
	Signal 1	+13 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 7 mA
	Input voltage +5 V	Typ. 1.4 mA
	Input voltage +15 V	Typ. 3.7 mA
	Input voltage +30 V	< 9 mA
Input resistance		Ca. 3.5 kΩ

Technical data of the analog outputs

Parameter		Value
Number of channels per module		2
Distribution of channels into groups		1 group for 2 channels
Connection of the channels AO0+...AO1+		Terminals 1.5...1.6
Reference potential for AO0+ to AO1+		Terminal 1.7 (AO-) for voltage output terminal 1.9, 2.9 and 3.9 for current output
Output type		
	Unipolar	Current
	Bipolar	Voltage
Galvanic isolation		Against internal supply and other modules
Configurability		-10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA (each output can be configured individually)
Output resistance (load), as current output		0 Ω...500 Ω
Output loadability, as voltage output		±10 mA max.
Indication of the output signals		1 LED per channel (brightness depends on the value of the analog signal)
Resolution		12 bits (+ sign)
Settling time for full range change (resistive load, output signal within specified tolerance)		Typ. 5 ms
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range		Typ. 0.5 %, max. 1 %

Intended purpose

The PROFINET communication interface module CI502-PNIO is used as communication interface module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

The CI502 communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs
- 8 digital inputs: 24 V DC
- 8 digital outputs: 24 V DC, 0.5 A max.

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Parameter	Value
Interface	Ethernet
Protocol	PROFINET IO RT
Power supply	From the process supply voltage UP
Supply of the electronic circuitry of the I/O expansion modules attached	Through the I/O bus interface (I/O bus)
Rotary switches	For setting the IO device identifier for configuration purposes (00h to FFh)
Configurable digital inputs/outputs	8 (configurable via software)
Digital inputs	8 (24 V DC; delay time configurable via software)
Digital outputs	8 (24 V DC, 0.5 A max.)
LED displays	For system displays, signal states, errors and power supply
External supply voltage	Via terminals ZP, UP and UP3 (process supply voltage 24 V DC)
Effect of incorrect input terminal connection	Wrong or no signal detected, no damage up to 35 V
Required terminal unit	TU507-ETH or TU508-ETH *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*

Connections

The Ethernet communication interface module CI502-PNIO is plugged on the I/O terminal unit TU507-ETH *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549* or TU508-ETH *Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549*. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.*

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC

Terminal 3.8: Process supply voltage UP3 = +24 V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V.

The assignment of the other terminals:

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!

This ist not intended usage.

Reason: Externally voltages at one or more terminals DC0..DC7 or DO0..DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0..DI7.

CAUTION!

Risk of malfunction by unintended usage!

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0...DO7 and DC0...DC7.

The assignment of the other terminals:

Terminal	Signal	Description
1.0	DC0	Signal of the configurable digital input/output DC0
1.1	DC1	Signal of the configurable digital input/output DC1
1.2	DC2	Signal of the configurable digital input/output DC2
1.3	DC3	Signal of the configurable digital input/output DC3
1.4	DC4	Signal of the configurable digital input/output DC4
1.5	DC5	Signal of the configurable digital input/output DC5
1.6	DC6	Signal of the configurable digital input/output DC6
1.7	DC7	Signal of the configurable digital input/output DC7
1.8	UP	Process voltage UP (24 V DC)
1.9	ZP	Process voltage ZP (0 V DC)

Terminal	Signal	Description
2.0	DI8	Signal of the digital input DI8
2.1	DI9	Signal of the digital input DI9
2.2	DI10	Signal of the digital input DI10
2.3	DI11	Signal of the digital input DI11
2.4	DI12	Signal of the digital input DI12
2.5	DI13	Signal of the digital input DI13
2.6	DI14	Signal of the digital input DI14
2.7	DI15	Signal of the digital input DI15
2.8	UP	Process voltage UP (24 V DC)
2.9	ZP	Process voltage ZP (0 V DC)
3.0	DO8	Signal of the digital output DO8
3.1	DO9	Signal of the digital output DO9
3.2	DO10	Signal of the digital output DO10
3.3	DO11	Signal of the digital output DO11
3.4	DO12	Signal of the digital output DO12
3.5	DO13	Signal of the digital output DO13
3.6	DO14	Signal of the digital output DO14
3.7	DO15	Signal of the digital output DO15
3.8	UP3	Process voltage UP3 (24 V DC)
3.9	ZP	Process voltage ZP (0 V DC)

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

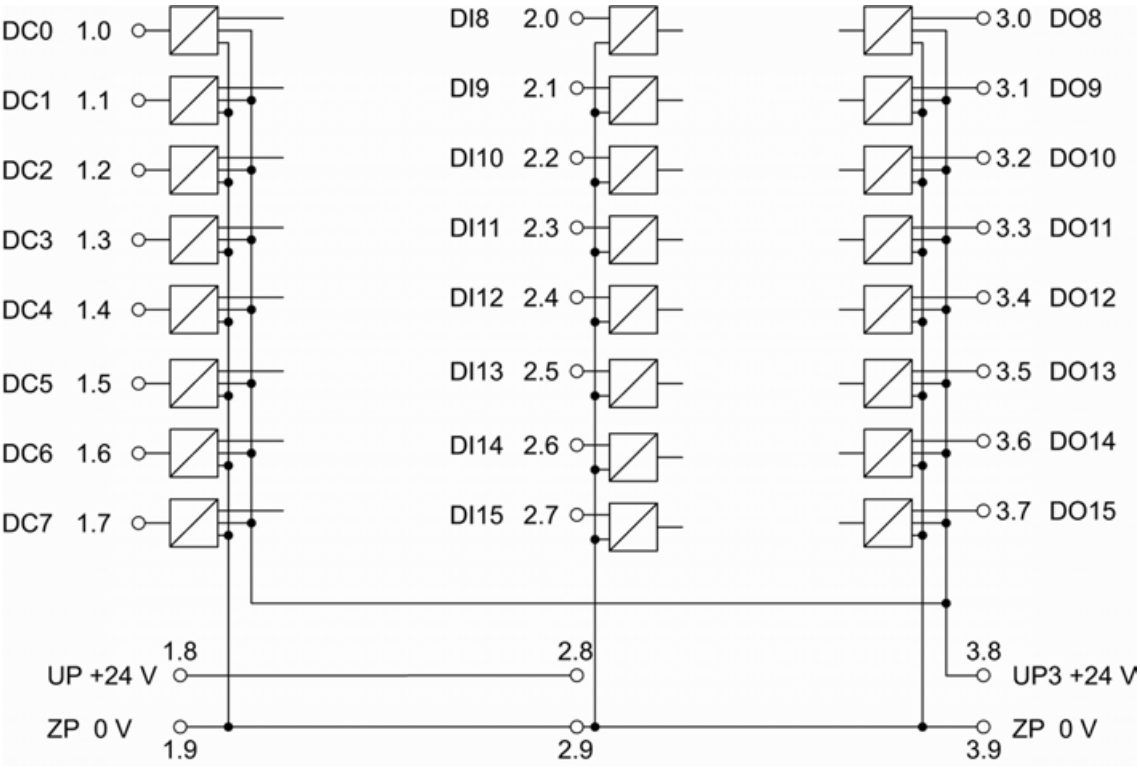
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

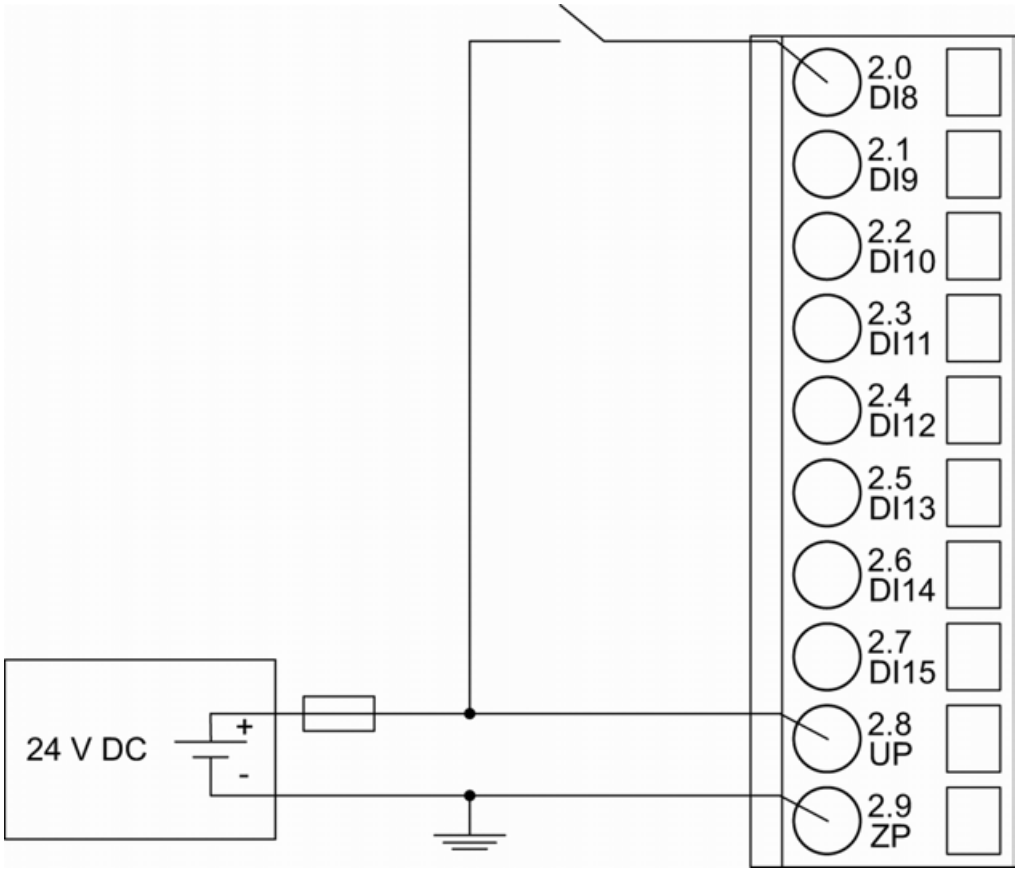
The following figure shows the connection of the Ethernet communication interface module CI502-PNIO.



Further information is provided in the System Technology chapter PROFINET *Chapter 1.6.5.3.2 “PROFINET communication interface module” on page 3629*.

Connection of the Digital inputs

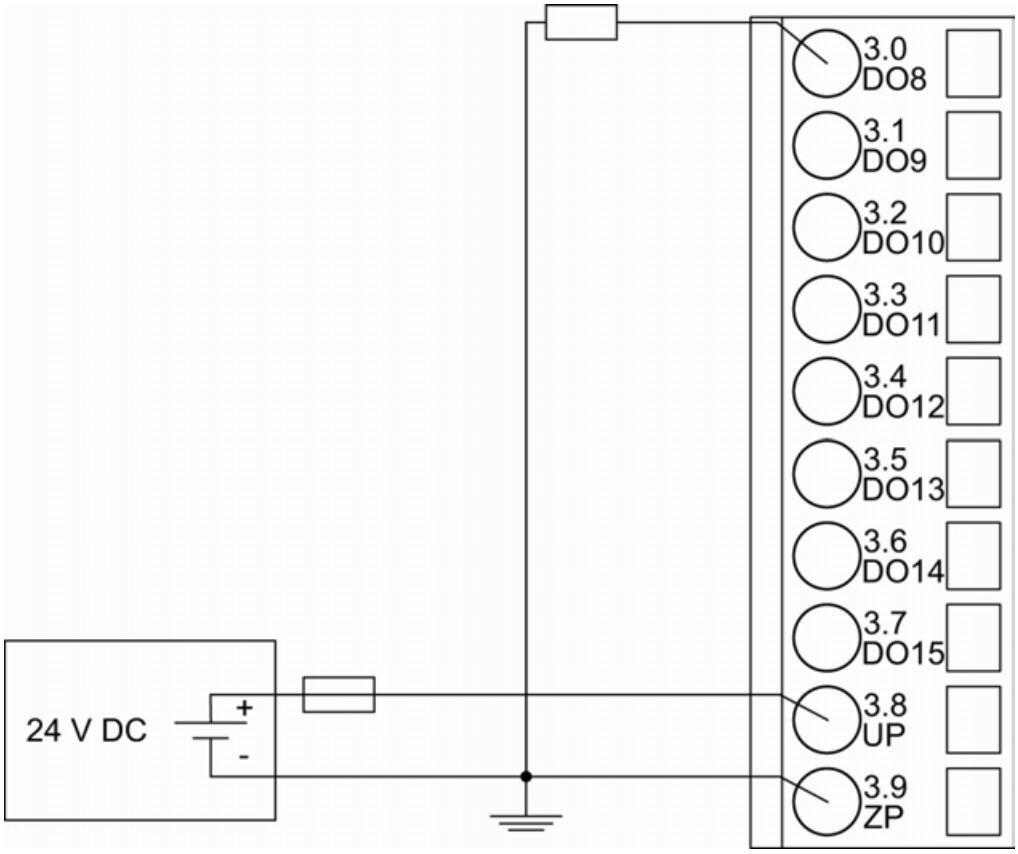
The following figure shows the connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.



The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3280*.

Connection of the Digital outputs

The following figure shows the connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.

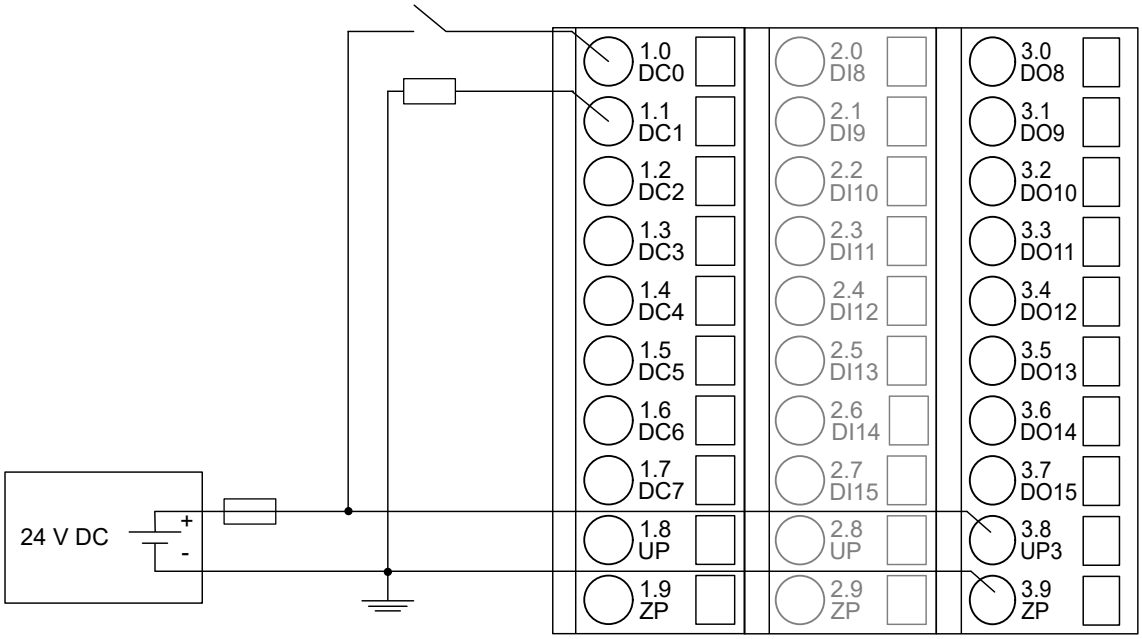


The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3280*.

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!
If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device *Chapter 1.6.3.7.5.3.3 “Connections” on page 3265*.



The meaning of the LEDs is described in Displays *Chapter 1.6.3.7.5.3.8.1 “State LEDs” on page 3280*.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Pin assignment

Interface	PIN	Signal	Description
	1	TxD+	Transmit data +
	2	TxD-	Transmit data -
	3	RxD+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	RxD-	Receive data -
	7	NC	Not connected
	8	NC	Not connected
	Shield	Cable shield	Functional earth

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet *Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.*

Internal data exchange

Parameter	Value
Digital inputs (bytes)	5
Digital outputs (bytes)	5
Counter input data (words)	4
Counter output data (words)	8

Addressing

The module reads the position of the rotary switches only during power-up, i. e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI502-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization *Chapter 1.6.3.7.5.3.7 “Parameterization” on page 3272*.

Parameterization

Parameters of the module

Name	Value	Internal value	Internal value, type	Default
Module ID [1])	Internal	7005	WORD	7005
Parameter length	Internal	8	BYTE	8

Name	Value	Internal value	Internal value, type	Default
Error LED / Failsafe function (Table Error LED / Failsafe function *Further information on page 3272*)	On	0	BYTE	0
	Off by E4	1		
	Off by E3	3		
	On + failsafe	16		
	Off by E4 + failsafe	17		
	Off by E3 + failsafe	19		
Process cycle time	1 ms process cycle time	1	BYTE	1 ms

	9 ms process cycle time	9		
	10 ms process cycle time	10		
	11 ms process cycle time	11		
	12 ms process cycle time	12		
	13 ms process cycle time	13		
	14 ms process cycle time	14		
	15 ms process cycle time	15		
	16 ms process cycle time	16		
Check supply	Off On	0 1	BYTE	1
Fast counter	0 : 10 [2])	0 : 10	BYTE	0
I/O-Bus reset	Off	0	BYTE	Off

Name	Value	Internal value	Internal value, type	Default
	On	1	BYTE	Off
[1]) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.				
[2]) Counter operating modes *Chapter 1.6.3.6.1.2.9 "Fast counter" on page 2776*				

Table 580: Table Error LED / Failsafe function

Setting	Description
On	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode off
Off by E4	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode off
Off by E3	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode off
On + Failsafe	Error LED (S-ERR) lights up at errors of all error classes, Failsafe-mode on *)
Off by E4 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1, E2 and E3, Failsafe-mode on *)
Off by E3 + Failsafe	Error LED (S-ERR) lights up at errors of error classes E1 and E2, Failsafe-mode on *)
*) The parameter Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.	

IO-BUS reset after PROFINET reconnection

IO-BUS reset after PROFINET reconnection controls the behavior of PROFINET CI modules in relation to connected I/O modules (both safety and non-safety I/O modules).

- IO-BUS reset after PROFINET reconnection = *"On"* resets and, thus, re-parameterizes all attached I/O modules. All internal I/O modules states are reset, including the related diagnosis information.

  Note that if the parameter is set to *"On"* then:
  - The bumpless re-start of non-safety I/O modules will not be supported. It means, for example, that non-safety output channels will go from fail-safe values to *"0"* values during the re-connection and re-parameterization time and after that go to new output values.
  - Safety I/O modules will be re-parameterized and re-started as newly started modules, which may not require their PROFIsafe reintegration, depending on safety CPU state, in the safety application.
- IO-BUS reset after PROFINET reconnection = *"Off"* will not reset all attached I/O modules. It will re-parameterize I/O modules only if parameter change is detected during the reconnection. All internal I/O modules states are not reset, including the related diagnosis information.

  Note that if the parameter is set to *"Off"* then:
  - The bumpless re-start of non-safety I/O modules is supported (if no parameters are changed). It means, for example, that non-safety output channels will not go from fail-safe values to *"0"* values during the re-connection and re-parameterization time, but directly from fail-safe values to new output values.
  - Safety I/O modules will not be re-parameterized (if no parameters are changed). Thus, they may continue their operation, which may require their PROFIsafe reintegration in the safety application on the safety CPU, e.g., if PROFIsafe watchdog time for this safety I/O module has expired. Any reintegration of such safety I/O modules will be not only application specific but also PROFIsafe specific and depend on the safety I/O handling in the safety application.

Group parameters for the digital part

Name	Value	Internal value	Internal value, type	Default
Input delay	0.1 ms 1 ms 8 ms 32 ms	0 1 2 3	BYTE	0.1 ms 0x00
Detect short circuit at outputs	Off On	0 1	BYTE	On 0x01
Behaviour DO at comm. error [1])	Off Last value Last value 5 sec Last value 10 sec Substitute value Substitute value 5 sec Substitute value 10 sec	0 1 6 11 2 7 12	BYTE	Off 0x00
Substitute value at output	0...65535	0000h...FFFFh	WORD	0 0x0000
Preventive voltage feedback monitoring for DC0..DC7 [2])	Off On	0 1	BYTE	Off 0x00
Detect voltage overflow at outputs [3])	Off On	0 1	BYTE	Off 0x00

Remarks:

[1])	The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.
[2])	The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
[3])	The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3 ↯ *Chapter 1.6.3.7.5.3.3 “Connections” on page 3265* (see description in section). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

Diagnosis

Structure of the Diagnosis Block via PNIO_DEV_ALARM function block.

Byte Number	Description	Possible Values
1	Diagnosis Byte, slot number	31 = CI502-PNIO (e. g. error at integrated 8 DI / 8 DO) 1 = 1st connected S500 I/O module ... 10 = 10th connected S500 I/O module
2	Diagnosis Byte, module number	According to the I/O bus specification passed on by modules to the fieldbus master
3	Diagnosis Byte, channel	According to the I/O bus specification passed on by modules to the fieldbus master
4	Diagnosis Byte, error code	According to the I/O bus specification Bit 7 and bit 6, coded error class 0 = E1 1 = E2 2 = E3 3 = E4 Bit 0 to bit 5, coded error description
5	Diagnosis Byte, flags	According to the I/O bus specification Bit 7: 1 = coming error Bit 6: 1 = leaving error

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Channel error digital							
4	-	31	2	8...15	46	Externally voltage detected at digital output DO0..DO7 [6])	Check terminals
4	-	31	4	0...7	46	Externally voltage detected at digital output DC0..DC7 [6])	Check terminals
4	-	31	4	0...7	47	Short circuit at digital output DC0..DC7[7])	Check terminals
4	-	31	2	8...15	47	Short circuit at digital output DO0..DO7[7])	Check terminals

Remarks:

[1])	In AC500 the following interface identifier applies: "-" = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the Communication Module;14 = I/O-Bus; 31 = Module itself The identifier is not contained in the CI502-PNIO diagnosis block.
[2])	With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module
[3])	With "Module" the following allocation applies dependent of the master: Module error: 31 = Module itself Channel error: Module type (1 = AI, 2 = DO, 3 = AO)
[4])	This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO0...DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in 'Connections' *Chapter 1.6.3.7.5.3.3 "Connections" on page 3265*. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
[5])	The voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3 *Chapter 1.6.3.7.5.3.3 "Connections" on page 3265*. Diagnosis message appears for the whole module.
[6])	This message appears, if the output of a channel DC0...DC7 or DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.
[7])	Short circuit: After a detected short circuit, the output is deactivated for 2000 ms. Then a new start up will be executed. This diagnosis message appears per channel.
[8])	In case of an I/O module doesn't support hot swapping, do not perform any hot swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.
[9])	Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Table 581: States of the 5 system LEDs

LED	Color	OFF	ON	Flashing
PWR/RUN	Green	Process supply voltage missing	Internal supply voltage OK, module ready for communication with IO Controller	Start-up / preparing communication
	Yellow	---	---	---
STA1 ETH (System-LED "BF")	Green	---	Device configured, cyclic data exchange running	---

LED	Color	OFF	ON	Flashing
	Red	---	---	Device is not configured
STA2 ETH (System LED "SF")	Green	---	---	Got identification request from I/O controller
	Red	No system error	System error (collective error)	---
S-ERR	Red	No error	Internal error	--
I/O-Bus	Green	No expansion modules connected or communication error	Expansion modules connected and operational	---
ETH1	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams
ETH2	Green	No connection at Ethernet interface	Connected to Ethernet interface	---
	Yellow	---	Device is transmitting telegrams	Device is transmitting telegrams

Table 582: States of the 29 process LEDs

LED	Color	OFF	ON	Flashing
DC0 to DC7	Yellow	Input/Output is OFF	Input/Output is ON	--
DI8 to DI15	Yellow	Input is OFF	Input is ON (the input voltage is even displayed if the supply voltage is OFF)	--
DO8 to DO15	Yellow	Output is OFF	Output is ON	--
UP	Green	Process supply voltage missing	Process supply voltage OK and initialization finished	--
UP3	Green	Process supply voltage missing	Process supply voltage OK	--
CH-ERR1 to CH-ERR3	Red	No error or process supply voltage missing	Internal error	Error on one channel of the corresponding group

Technical data

The system data of AC500 and S500 *Chapter 1.6.4.6.1 “System data AC500” on page 3398* are applicable to the standard version.

The system data of AC500-XC *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450* are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

Technical data of the module

Parameter		Value
Process supply voltages UP/UP3		
	Rated value	24 V DC (for inputs and outputs)
	Max. load for the terminals	10 A
	Protection against reversed voltage	Yes
	Rated protection fuse on UP/UP3	10 A fast
	Galvanic isolation	Ethernet interface against the rest of the module
	Inrush current from UP (at power up)	On request
	Current consumption via UP (normal operation)	0.15 A
	Current consumption via UP3	0.06 A + 0.5 A max. per output
	Connections	Terminals 1.8 and 2.8 for +24 V (UP) Terminal 3.8 for +24 V (UP3) Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
Max. power dissipation within the module		6 W
Number of digital inputs		8
Number of digital outputs		8
Number of configurable digital inputs/outputs		8
Input data length		12 bytes
Output data length		20 bytes
Reference potential for all digital inputs and outputs		Negative pole of the supply voltage, signal name ZP
Setting of the I/O device identifier		With 2 rotary switches at the front side of the module
Diagnosis		See Diagnosis and Displays *Chapter 1.6.3.7.5.3.8 “Diagnosis” on page 3275*
Operation and error displays		34 LEDs (totally)
Weight (without terminal unit)		Ca. 125 g
Mounting position		Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Extended ambient temperature (XC version)		> 60 °C on request
Cooling		The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Parameter	Value
Bus connection	2 x RJ45
Switch	Integrated
Technology	Hilscher NETX 100
Transfer rate	10/100 Mbit/s (full-duplex)
Transfer method	According to Ethernet II, IEEE 802.3
Ethernet	100 base-TX, internal switch, 2x RJ45 socket
Expandability	Max. 10 S500 I/O modules
Adjusting elements	2 rotary switches for generation of an explicit name
Supported protocols	RTC - real time cyclic protocol, class 1 *) RTA - real time acyclic protocol DCP - discovery and configuration protocol CL-RPC - connectionless remote procedure Call LLDP - link layer discovery protocol MRP - MRP Client
Acyclic services	PNIO read / write sequence (max. 1024 bytes per telegram) Process-Alarm service
Supported alarm types	Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm
Min. bus cycle	1 ms
Conformance class	CC A
Protective functions (according to IEC 61131-3)	Protected against: ● short circuit ● reverse supply ● overvoltage ● reverse polarity Galvanic isolation from the rest of the module

*) Priorization with the aid of VLAN-ID including priority level

Technical data of the digital inputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DI0 to DI7	Terminals 2.0 to 2.7

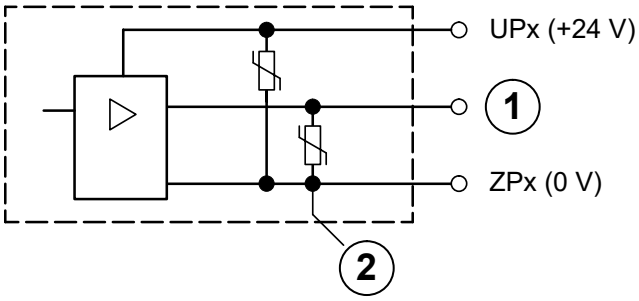
Parameter		Value
Reference potential for all inputs		Terminals 1.9...3.9 (Negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

Technical data of the digital outputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DO0 to DO7		Terminals 3.0 to 3.7
Reference potential for all outputs		Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage		For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1		UP3 (-0.8 V)
Output delay (0->1 or 1->0)		On request
Output current		
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request

Parameter		Value
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.



1 Digital output
2 Varistors for demagnetization when inductive loads are turned off

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter		Value
Number of channels per module		8 inputs/outputs (with transistors)
Distribution of the channels into groups		1 group for 8 channels
If the channels are used as inputs		
	Channels DC0...DC07	Terminals 1.0...1.7
If the channels are used as outputs		
	Channels DC0...DC07	Terminals 1.0...1.7
Indication of the input/output signals		1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation		From the Ethernet network

Technical data of the digital inputs/outputs if used as inputs

Parameter		Value
Number of channels per module		8
Distribution of the channels into groups		1 group of 8 channels
Terminals of the channels DC0 to DC7		Terminals 1.0 to 1.7
Reference potential for all inputs		Terminals 1.9...3.9 (Negative pole of the supply voltage, signal name ZP)
Indication of the input signals		1 yellow LED per channel, the LED is ON when the input signal is high (signal 1)
Input type (according EN 61131-2)		Type 1
Input delay (0->1 or 1->0)		Typ. 0.1 ms, configurable from 0.1...32 ms
Input signal voltage		24 V DC
	Signal 0	-3 V...+5 V
	Undefined Signal	> +5 V...< +15 V
	Signal 1	+15 V...+30 V
Ripple with signal 0		Within -3 V...+5 V
Ripple with signal 1		Within +15 V...+30 V
Input current per channel		
	Input voltage +24 V	Typ. 5 mA
	Input voltage +5 V	> 1 mA
	Input voltage +15 V	> 2 mA
	Input voltage +30 V	< 8 mA
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

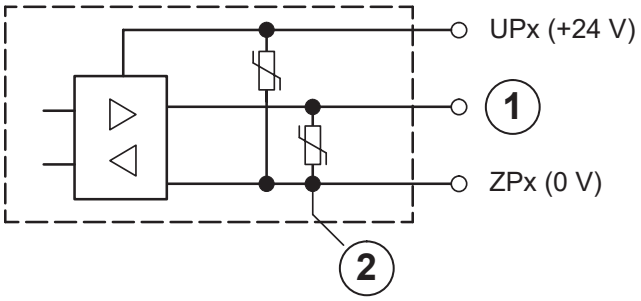
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Technical data of the digital inputs/outputs if used as outputs

Parameter	Value
Number of channels per module	8
Distribution of the channels into groups	1 group of 8 channels
Terminals of the channels DC0 to DC7	Terminals 1.0 to 1.7
Reference potential for all outputs	Terminals 1.9...3.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage	For all outputs terminal 3.8 (positive pole of the supply voltage, signal name UP3)
Output voltage for signal 1	UP3 (-0.8 V)
Output delay (0->1 or 1->0)	On request
Output current	

Parameter		Value
	Rated value per channel	500 mA at UP3 = 24 V
	Max. value (all channels together)	4 A
Leakage current with signal 0		< 0.5 mA
	Fuse for UP3	10 A fast
Demagnetization with inductive DC load		Via internal varistors (see figure below this table)
Output switching frequency		
	With resistive load	On request
	With inductive loads	Max. 0.5 Hz
	With lamp loads	11 Hz max. at 5 W max.
Short-circuit-proof / overload proof		Yes
Overload message (I > 0.7 A)		Yes, after ca. 100 ms
Output current limitation		Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals		Yes (software-controlled supervision)
Max. cable length		
	Shielded	1000 m
	Unshielded	600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.



1 Digital input/output
2 For demagnetization when inductive loads are turned off

Technical data of the fast counter

Parameter	Value
Used inputs	Terminal 2.0 (DI8),Terminal 2.1 (DI9)
Used outputs	Terminal 3.0 (DO8)
Counting frequency	Depending on operation mode: Mode 1- 6: max. 200 kHz Mode 7: max. 50 kHz Mode 9: max. 35 kHz Mode 10: max. 20 kHz

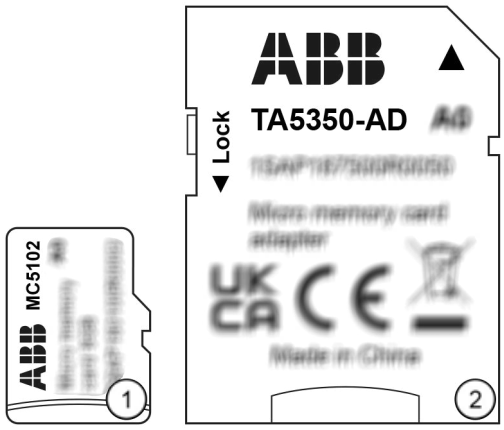
1.6.3.8 Accessories

1.6.3.8.1 AC500-eCo

MC5102 - Micro memory card with micro memory card adapter

- Solid state flash memory storage



1 Micro memory card
2 TA5350-AD micro memory card adapter

The MC5102 micro memory card has no write protect switch.

The TA5350-AD micro memory card adapter has a write protect switch.

In the position "LOCK", the inserted micro memory card can only be read.

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

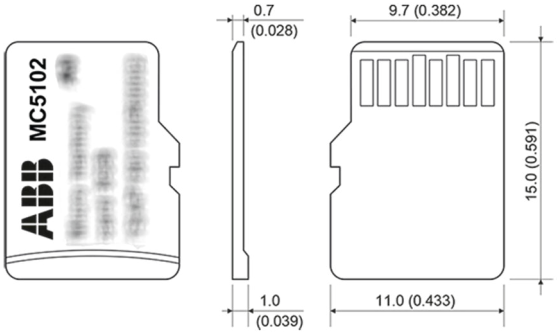
The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

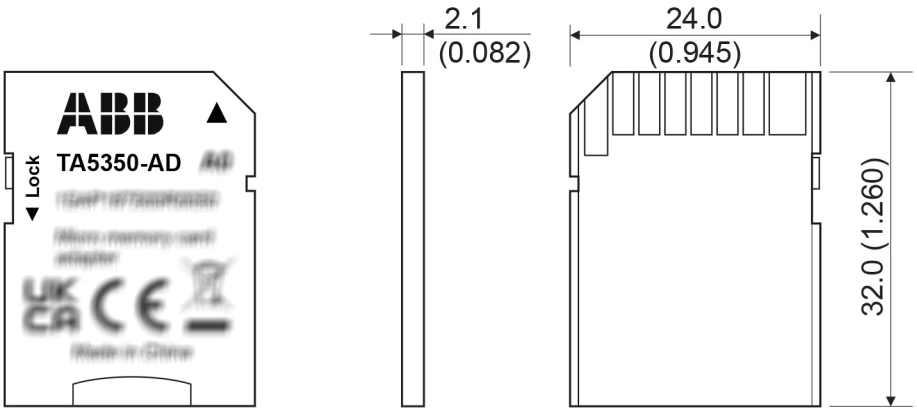
Dimensions

Micro memory card



The dimensions are in mm and in brackets in inch.

Micro memory card adapter



The dimensions are in mm and in brackets in inch.

Insert the micro memory card

AC500 V3

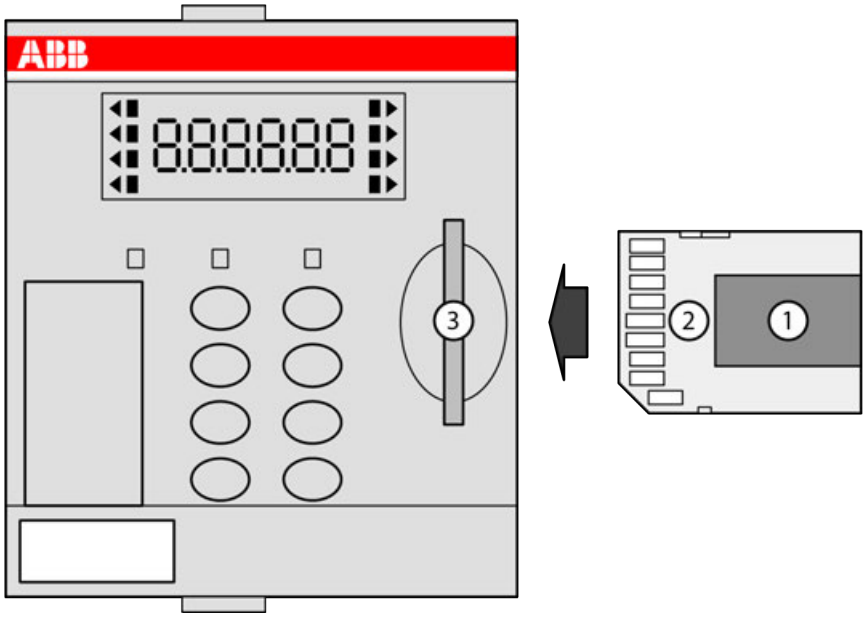


Fig. 255: Insert micro memory card into PM56xx

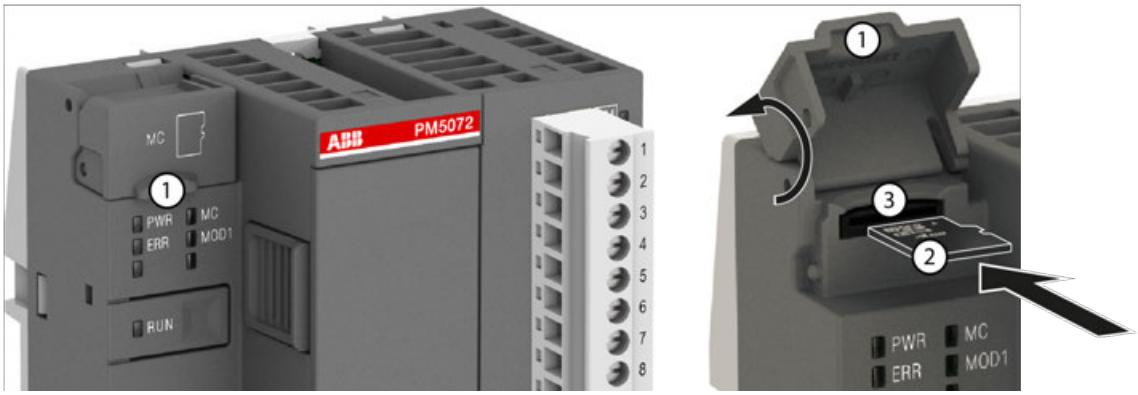
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

Remove the micro memory card

NOTICE!

Removal of the micro memory card

Do not remove the micro memory card when it is working!

AC500 V3: Remove the micro memory card with micro memory card adapter only when no black square (■) is shown next to MC in the display.

AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

AC500 V3

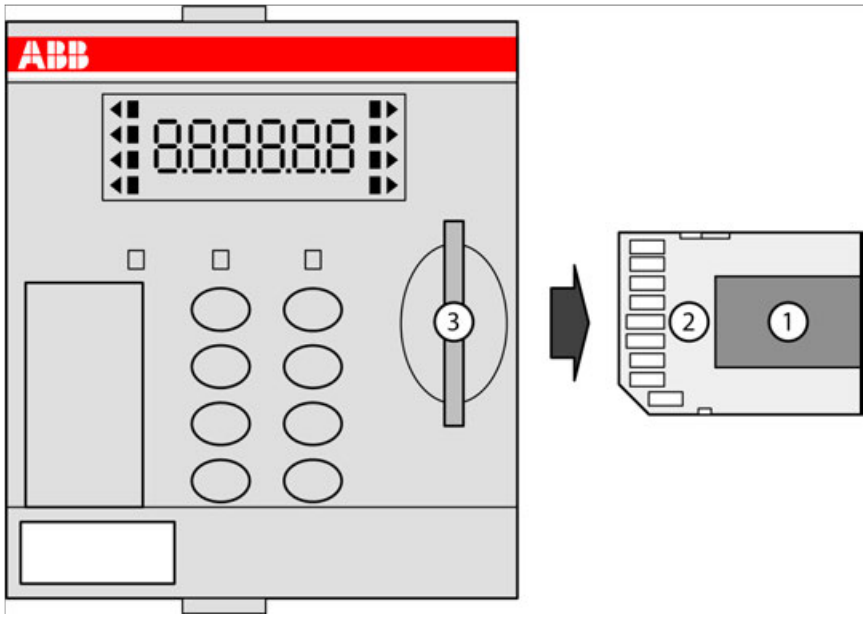


Fig. 256: Remove micro memory card from PM56xx

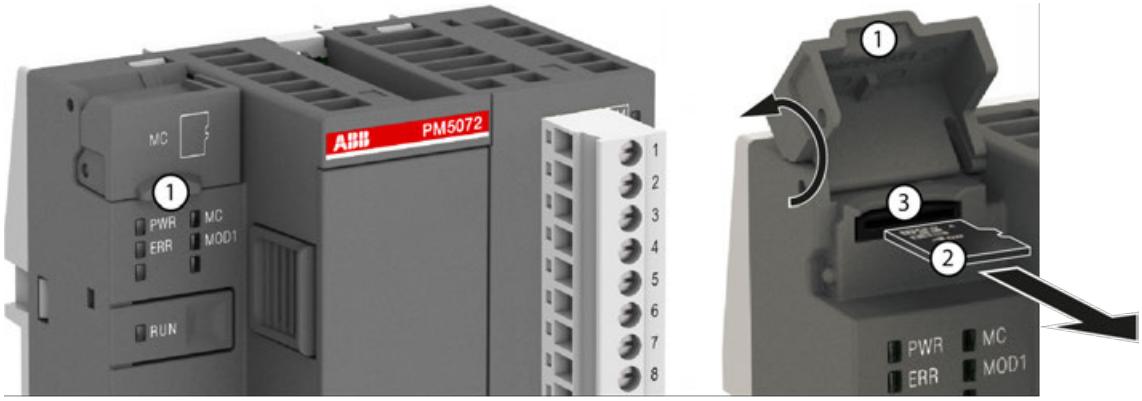
1 Micro memory card
2 Micro memory card adapter
3 Memory card slot

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.
2. By this, the micro memory card adapter is unlocked and can be removed.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

Technical data

Parameter	Value
Memory capacity	8 GB
Total bytes written (TBW)	On request

Parameter		Value
Data retention		
	at beginning	10 years at 40 °C
	when number of write processes has been 90 % of lifetime of each cell	1 year at 40 °C
Write protect switch		
	Micro memory card	No
	Micro memory card adapter	Yes
Weight		0.25 g
Dimensions		15 mm x 11 mm x 0.7 mm

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the micro memory card in AC500 PLCs is provided in the chapter ↳ *Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3999*.

TA52xx(-x) - Terminal block sets

Intended purpose

Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules PM50x2.

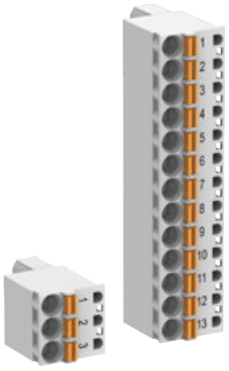
For option boards there are different removable terminal blocks in spring version.

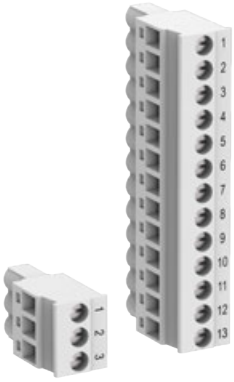
For the AC500-eCo V3 **Basic CPUs** a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

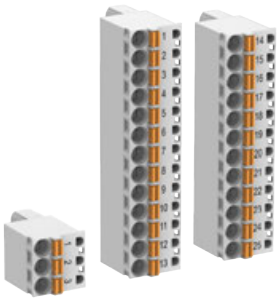
For the AC500-eCo V3 **Standard CPUs** and **Pro CPUs** a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw and a spring variant available.

Basic CPU		**Standard and Pro CPUs**	
Spring type **TA5211-TSPF-B**	**Screw type** **TA5211-TSCL-B**	**Spring type** **TA5212-TSPF**	**Screw type** **TA5212-TSCL**
			

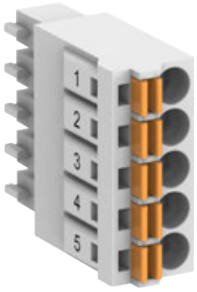


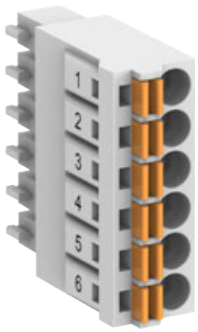


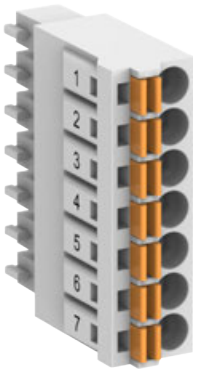


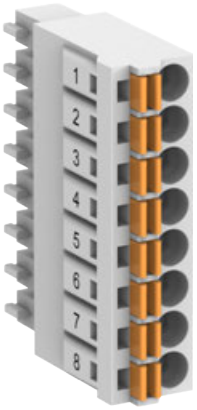
Various removable spring-type terminal blocks are available for option boards.

The following spare parts are available (depending on the number of pins).

Spring type			
TA5220-SPF5	**TA5220-SPF6**	**TA5220-SPF7**	**TA5220-SPF8**
			








CAUTION!

Risk of injury and damaging the product!

Improper installation and maintenance may result in injury and can damage the product!

- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

CAUTION!

Risk of injury and damaging the processor module when using unapproved terminal blocks!

Only use terminal blocks approved by ABB to avoid injury and damage to the processor module.

Terminal block set for PM50x2

Processor modules PM50x2 CPU are not delivered with terminal blocks.

Screw type terminal block set:

- *TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH*
- *TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W)*

Spring type terminal block set:

- *TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH*

TA5300-CVR - Option board slot cover

Intended purpose

TA5300-CVR option board slot covers for PM50xx processor modules are necessary to protect not used option board slots.

CAUTION!

Risk of injury and damaging the product!

Always plug in the option board slot cover when the option board is not inserted.

If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).

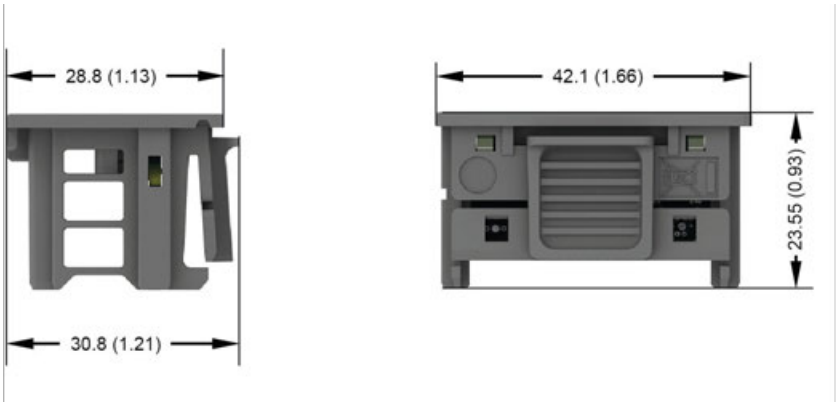
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

The AC500-eCo V3 processor modules are delivered with option board slot cover(s).

The option board slot cover has to be removed before inserting an option board.

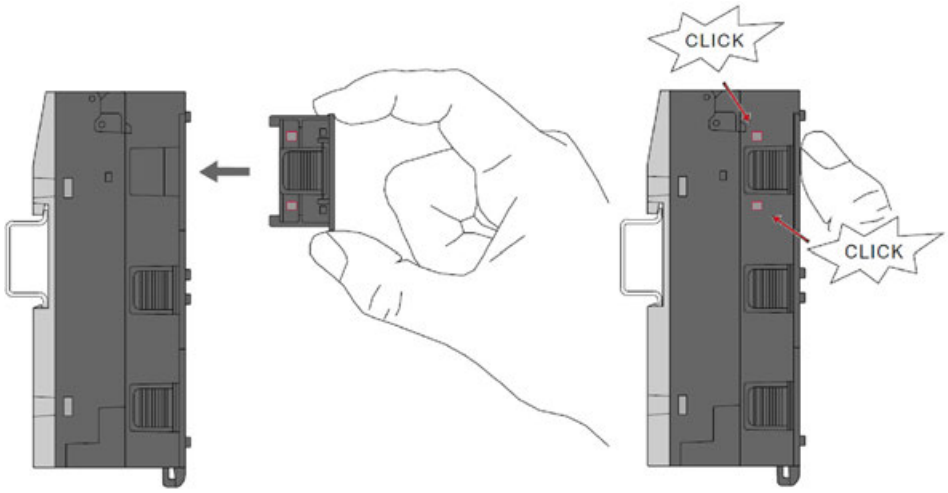
The TA5300-CVR option board slot covers are available as spare parts.

Dimensions



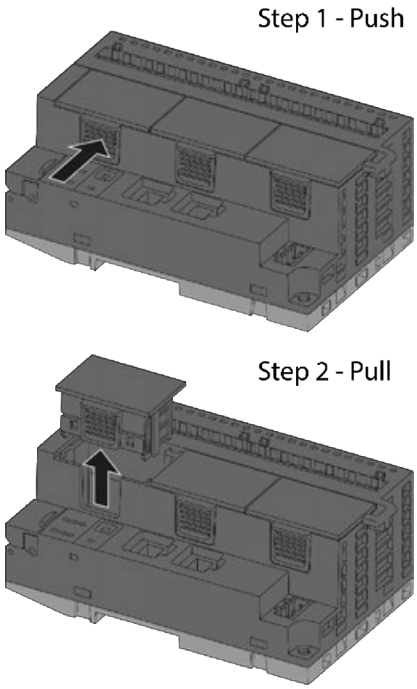
The dimensions are in mm and in brackets in inch.

Inserting of the option board slot cover



1. Press on the option board slot cover to insert it in the not used option board slot of the processor module PM50xx.
2. The option board slot cover must click into the not used option board slot.

Removing of the option board slot cover



1. Press the side of the inserted option board slot cover.
2. At the same time, pull the option board slot cover out of the option board slot of the processor module PM50xx.

Technical data

The system data of AC500-eCo V3 apply *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter	Value
Weight	47 g

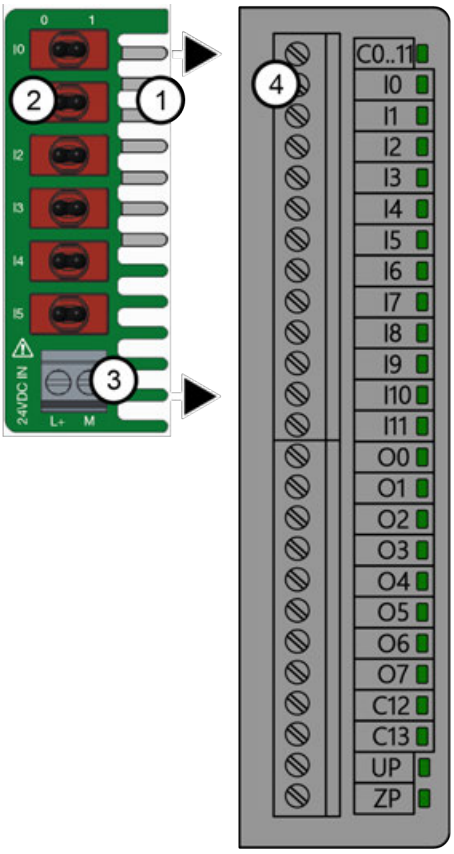
TA5400-SIM - Input simulator

- TA5400-SIM input simulator for 6 digital inputs 24 V DC
- For usage with AC500-eCo V3 processor modules



1 Contacts for connecting the input simulator to the terminal block for I/O connectors
2 6 switches for the digital inputs DI0 ... DI5 (0 means opened switch, 1 means closed switch)
3 Screw terminal block for power supply
4 Screw terminal block(s) for I/O connectors

Intended purpose

TA5400-SIM

The TA5400-SIM input simulator is only intended for testing and training purposes for AC500-eCo V3 processor modules PM50x2.

Continuous operation in a productive system is not permitted.

The TA5400-SIM input simulator may only be used with screw-type terminal blocks.

The TA5400-SIM input simulator must not be used with spring-type terminal blocks.

Environmental conditions for testing and training purposes

In order not to impair the functionality of the product, avoid any kind of disturbing environmental influences:

- *mechanical disturbances*
- *climatic influences*

Make sure that the parameters are within the normal range:

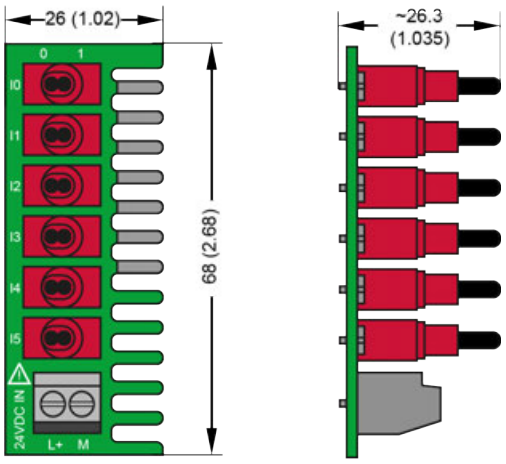
- *temperature*
- *air pressure*
- *humidity*
- *altitude*

The TA5400-SIM input simulator can simulate 6 digital 24 V DC input signals to the digital inputs I0...I5 of onboard I/Os.

With the TA5400-SIM input simulator, the digital 24 V DC inputs I0...I5 can be turned OFF and ON separately:

- If the lever of the switch is on the right side (1), the input is ON.
- If the lever of the switch is on the left side (0), the input is OFF.

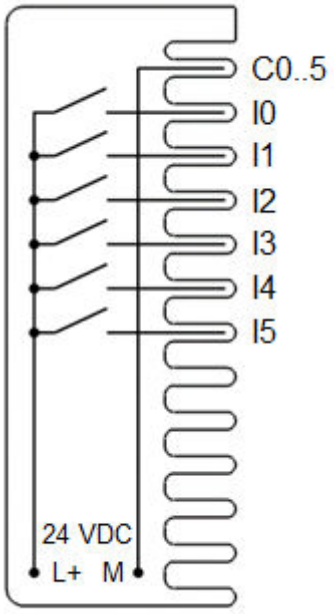
Dimensions



The dimensions are in mm and in brackets in inch.

Electrical diagram

The diagram below shows the connection of the TA5400-SIM input simulator.



NOTICE!

Risk of damage to the TA5400-SIM input simulator!

Do not remove the terminal block while the TA5400-SIM input simulator is connected.

Do not apply mechanical forces to the input simulator when it is connected to the terminal block.

In both cases the input simulator could be damaged.

Assembly

Insertion of the input simulator

1. Make sure that the power supply of the processor module is turned off.

CAUTION!

Risk of damaging the PLC modules!

The PLC modules can be damaged by overvoltages and short circuits.

Make sure, that all voltage sources (supply and process voltage) are switched off before you start working on the system.

Never connect voltages > 24 V DC to the terminal block of the TA5400-SIM input simulator.

CAUTION!

Risk of damaging the input simulator and/or PLC modules!

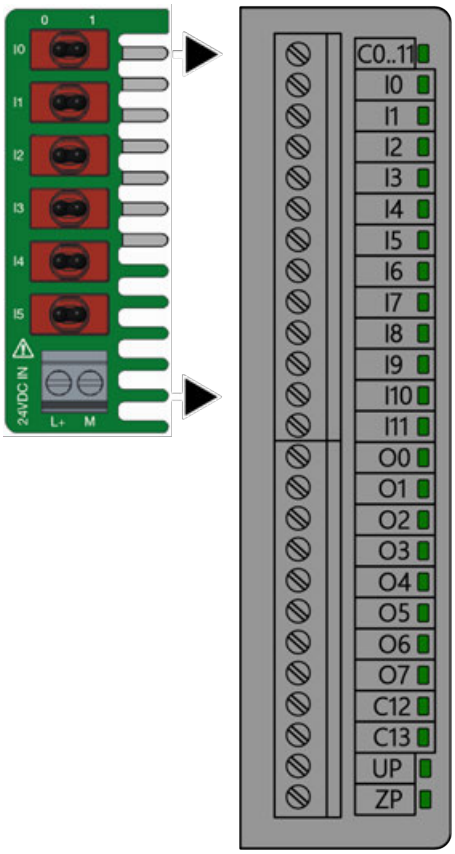
The TA5400-SIM input simulator may only be used with AC500-eCo V3 processor modules PM50x2.

Never use the input simulator with other devices.

The input simulator may only be used with screw-type terminal blocks.

The input simulator is only intended for testing and training purposes. Never use it within productive sytems.

2. Make sure that all clamps of the onboard I/Os are totally open.
3. Insert the TA5400-SIM input simulator into the screw terminal block as shown in the figure.



4. Tighten all screws of the onboard I/O clamps.
5. Make sure all switches are in OFF state (0).
6. Connect 24 V DC to the power supply of the TA5400-SIM (L+ and M). Tighten the screws.
7. Connect the processor module power supply wires (24 V DC). See PM50xx ↳ *"Pin assignment" on page 3371*.

Disassembly

Removal of the input simulator

1. Make sure that the power supply of the processor module is turned off.

> **CAUTION!**
> **Risk of damaging the PLC modules!**
> The PLC modules can be damaged by overvoltages and short circuits.
> Make sure that all voltage sources (supply and process voltage) are switched off before you start working on the system.

2. Disconnect the TA5400-SIM power supply wires (24 V DC) with a flat-blade screwdriver from the terminal block for power supply (L+ and M).
3. Loosen all screws of the onboard I/Os.
4. Remove the input simulator by pulling it to the left side.

Technical data

The system data of AC500-eCo V3 apply ↳ *Chapter 1.6.4.5.1 "System data AC500-eCo V3" on page 3352*

Only additional details are therefore documented below.

Table 588: Technical data of the module

Parameter		Value
Process supply voltage		
	Connections	Terminal (L+) for +24 V DC and terminal (M) for 0 V DC
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
Galvanic isolation		Yes (on processor module PM50xx)
Isolated Groups		1 (6 channels per group)
Weight		18 g
Mounting position		Horizontal or vertical

Table 589: Technical data of the inputs

Parameter	Value
Number of channels per module	6 digital input channels (+24 V DC)
Distribution of the channels into groups	1 (6 channels per group)
Connections of channels I0 to I5	Terminals 2...7
Reference potential for the channels I0 to I5	Terminal 1 (negative pole of the process supply voltage, signal name C0...5)
Input current per active channel (at input voltage +24 V DC) The current is given through the used processor module.	Typ. 5 mA
Inrush current per active channel The current is given through the used processor module.	Typ. 5 mA

1.6.3.8.2 AC500 (standard)

MC502 - Memory card

- Solid state flash memory storage

1 MC502 memory card

The memory card has a write protect switch.

In the position "LOCK", the memory card can only be read.

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

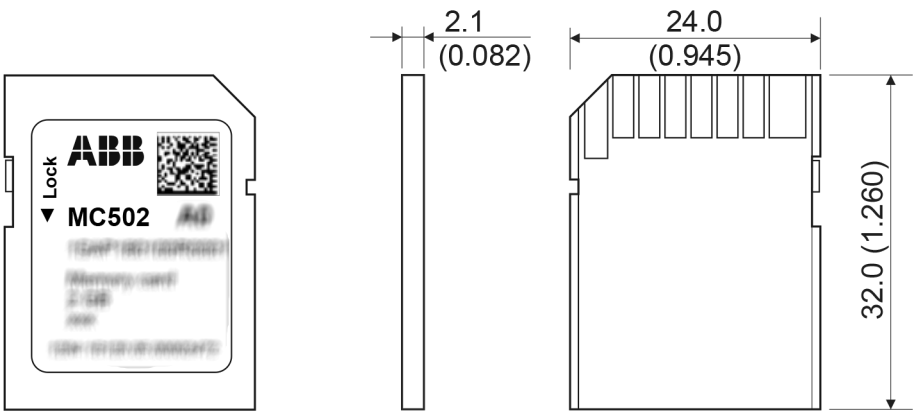
Processor modules are supplied without (micro) memory card. It must be ordered separately.

The memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The memory card is intended for long-term use in standard and XC application.

The memory card can be read/written on a PC with a SDHC compatible memory card reader.

Dimensions



The dimensions are in mm and in brackets in inch.

Insert the memory card

AC500 V3

1. Unpack the memory card.
2. Insert the memory card into the memory card slot of the processor module until locked.

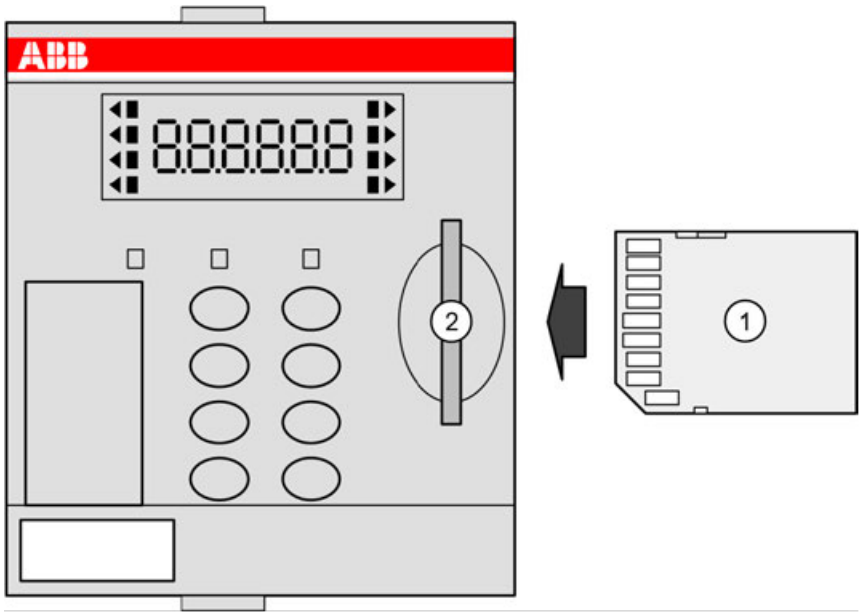


Fig. 257: Insert memory card into PM56xx

1 Memory card
2 Memory card slot

Remove the memory card

AC500 V3

NOTICE!

Removal of the memory card

Do not remove the memory card when it is working!

Remove the memory card only when no black square (■) is shown next to MC in the display.

Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

1. To remove the memory card, push on the memory card until it moves forward.
2. By this, the memory card is unlocked and can be removed.

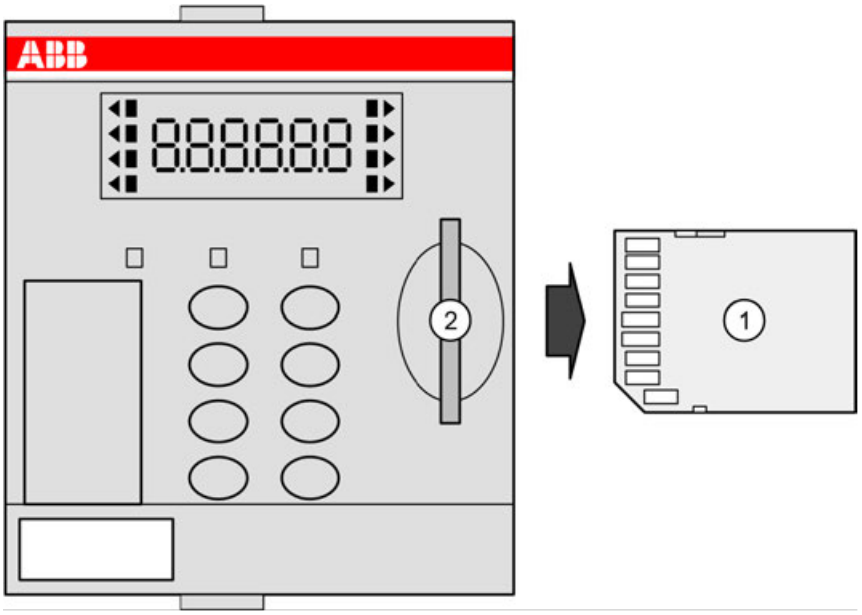

Fig. 258: Remove memory card from PM56xx

1 Memory card
2 Memory card slot

Technical data

Parameter		Value
Memory capacity		2 GB
Total bytes written (TBW)		On request
Data retention		
	at beginning	10 years at 40 °C
	when number of write processes has been 90 % of lifetime of each cell	1 year at 40 °C
Write protect switch		Yes, at the edge of the memory card
Weight		2 g
Dimensions		24 mm x 32 mm x 2.1 mm

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the memory card in AC500 PLCs is provided in the chapter
↳ *Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3999*.

Ordering data

MC5141	x	x	x	x	x	-

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

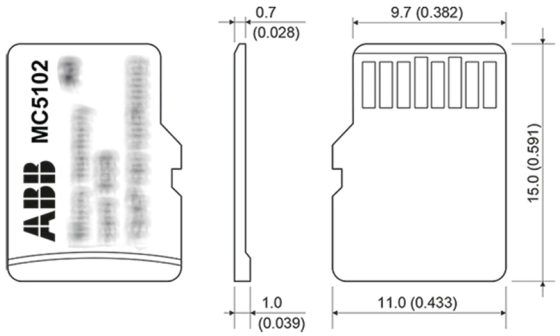
The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

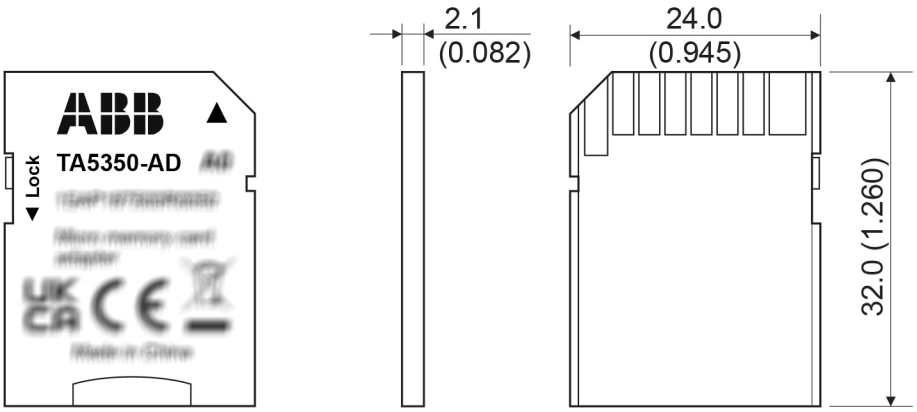
Dimensions

Micro memory card



The dimensions are in mm and in brackets in inch.

Micro memory card adapter



The dimensions are in mm and in brackets in inch.

Insert the micro memory card

AC500 V3

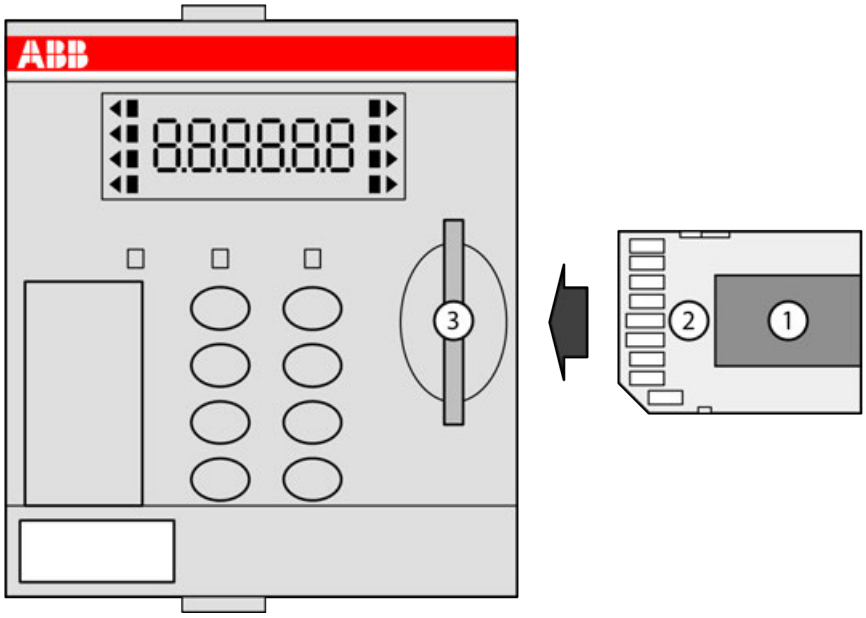


Fig. 259: Insert micro memory card into PM56xx

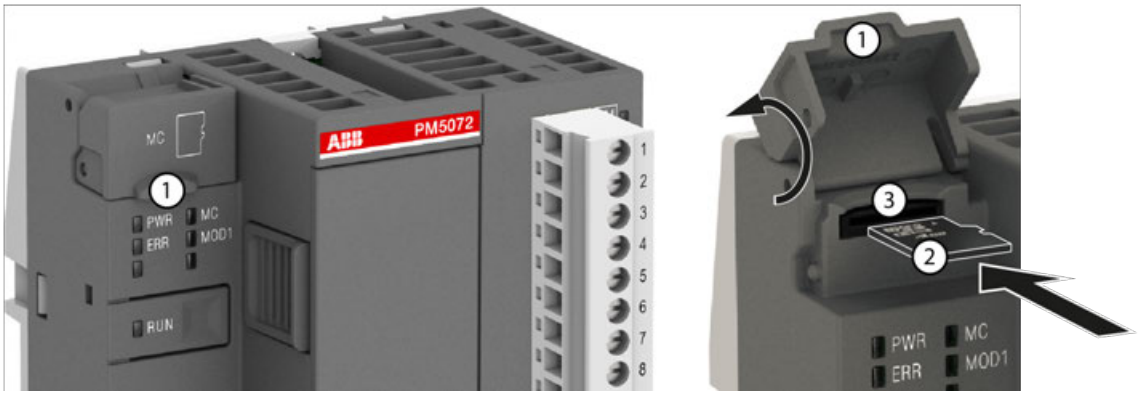
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

Remove the micro memory card

NOTICE!

Removal of the micro memory card

Do not remove the micro memory card when it is working!

AC500 V3: Remove the micro memory card with micro memory card adapter only when no black square (■) is shown next to MC in the display.

AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

AC500 V3

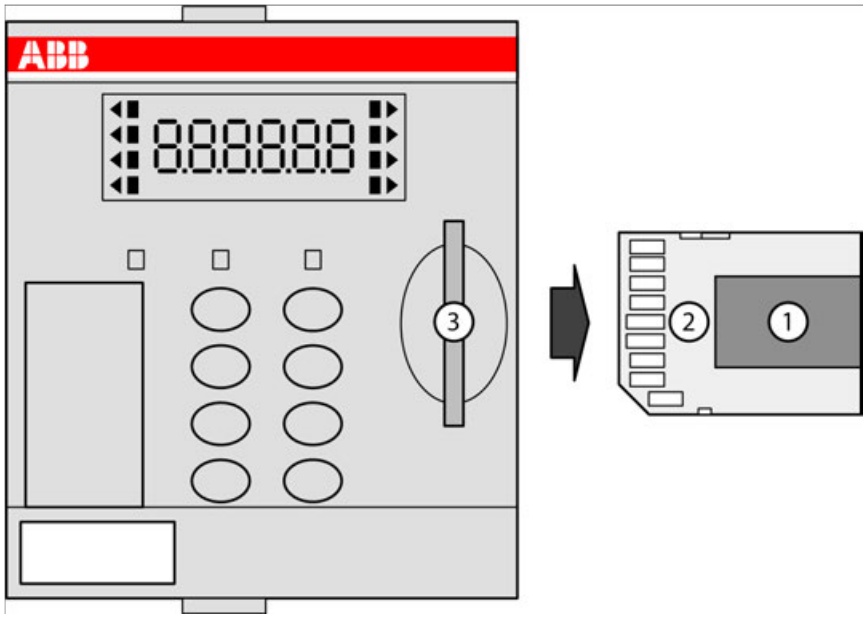


Fig. 260: Remove micro memory card from PM56xx

1 Micro memory card
2 Micro memory card adapter

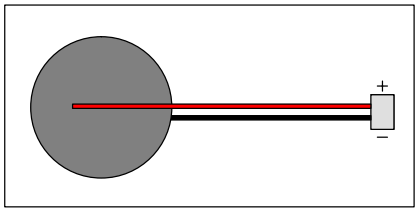
TA521 - Battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable



Purpose

The TA521 battery is the only applicable battery for the AC500 processor modules *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2516*. It cannot be recharged.

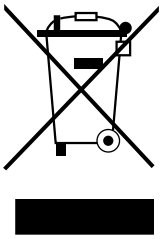
The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.



Battery lifetime

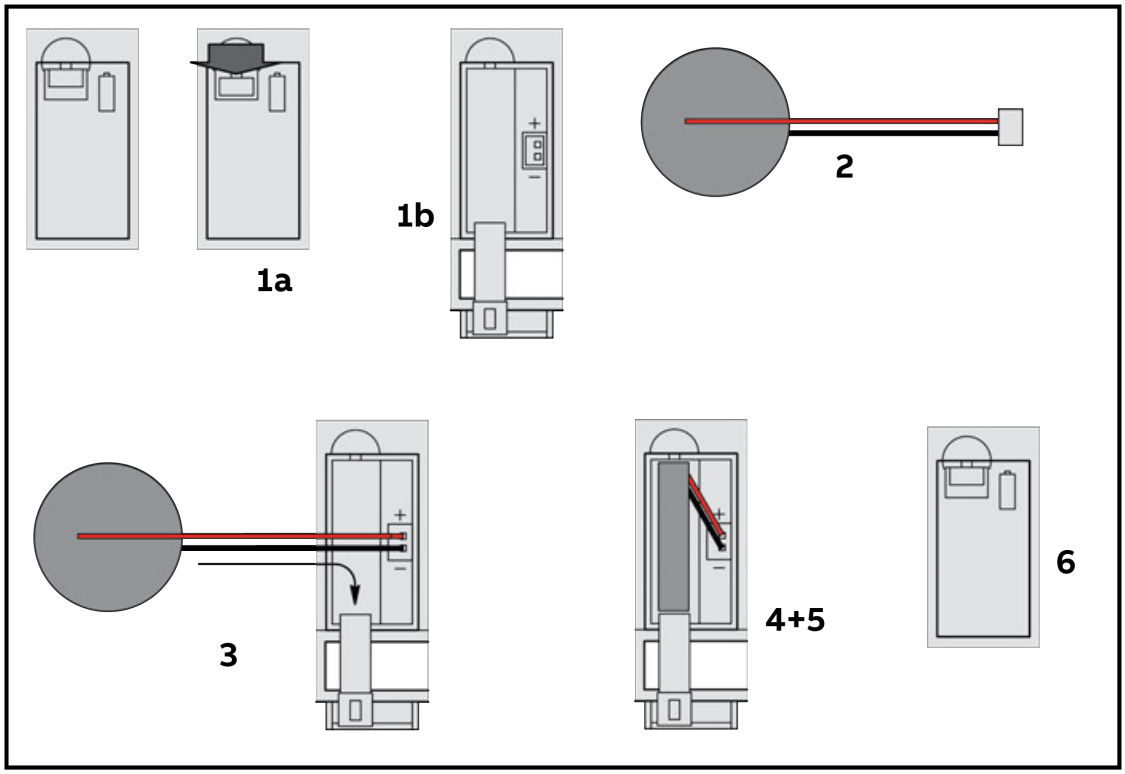
The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

Insertion

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

WARNING!
Risk of fire or explosion!
Use of incorrect Battery may cause fire or explosion.



1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = positive pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front view of the processor module and cannot be removed.
2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Technical data

Parameter	Value
Nominal voltage	3 V
Nominal capacity	560 mAh
Temperature range (index below C0)	Operating: 0 °C...+60 °C Storage: -20 °C...+60 °C Transport: -20 °C...+60 °C
Temperature range (index C0 and above)	Operating: -40 °C...+70 °C Storage: -40 °C...+85 °C Transport: -40 °C...+85 °C
Battery lifetime	Typ. 3 years at 25 °C
Self-discharge	2 % per year at 25 °C 5 % per year at 40 °C 20 % per year at 60 °C
Protection against reverse polarity	Yes, by mechanical coding of the plug.

1.6.4 System assembly, construction and connection

1.6.4.1 Introduction

This chapter provides information on assembly, construction and connection of control systems of the product family AC500.

The AC500 product family consists of the sub-families:

- AC500 (standard): standard PLC that offers a wide range of performance levels and scalability.
- AC500-eCo: cost-effective PLC that offers total inter-operability with the core AC500 range.
- AC500-S: PLC for special safety requirements in all functional safety applications.

AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. Those devices operate mainly identical to the appropriate AC500 product family, however, can be operated under extreme conditions ↳ *Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450*.

AC500 product family is characterized by functional modularity, i.e. the devices of all AC500 sub-families can be combined flexible.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section. Details that are only valid for a specific AC500 sub-family are described in separate sections.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section *Chapter 1.6.4.4 “Overall information (valid for complete AC500 product family)” on page 3338*. Details that are only valid for a specific AC500 sub-family are described in separate sections.

Consider the safety instructions

In the description, special attention must be paid to designs using galvanic isolation, grounding and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family Chapter 1.6.4.3 “Safety instructions” on page 3335.

1.6.4.2 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0113 Part 1 & Part 200: "Working & Process Machinery"
- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.6.4.3 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

PLC specific safety notices

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!

PLC damage due to operation conditions

Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction

Do not use cleaning agent for cleaning the device.

Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!

Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!

PLC damage due to missing grounding

– Ensure to earth the devices.
– The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.

In the description for the devices (operating manual or AC500 system description), reference is made at several points to grounding, galvanic isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the grounding via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the grounding (in this respect, see also VBG 4 and the relevant VDE regulations).

CAUTION!

Do not obstruct the ventilation for cooling!

The ventilation slots on the upper and lower side of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!

Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

WARNING!

Splaying of strands can cause hazards!

During wiring of terminals with stranded conductors, splaying of strands shall be avoided.

– Ferrules can be used to prevent splaying.

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Information on batteries

CAUTION!

Use only ABB approved lithium battery modules!

At the end of the battery's lifetime, always replace it only with a genuine battery module.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations

Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

Environment and enclosure information

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2.000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

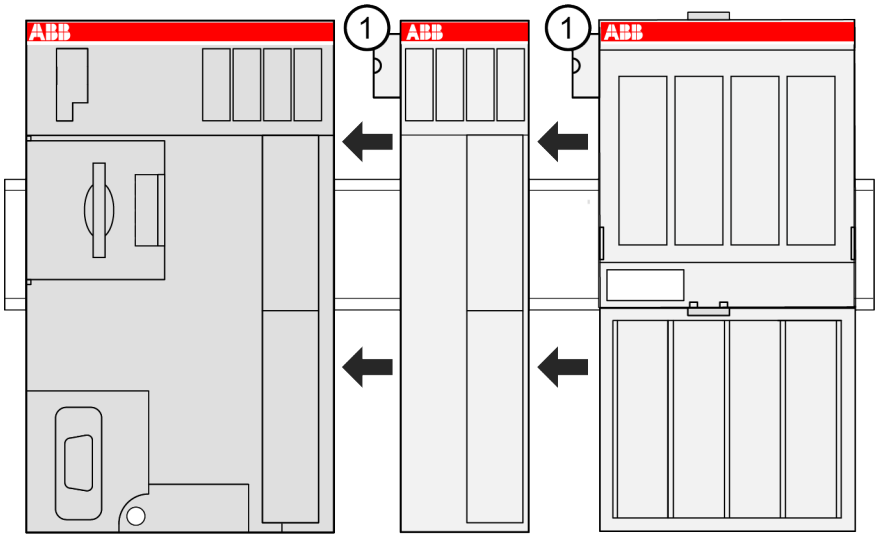
Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.4.4 Overall information (valid for complete AC500 product family)

1.6.4.4.1 Serial I/O bus

The synchronized serial I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

Up to 10 I/O terminal units (for 1 I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules.



1 I/O bus connection

The connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 V DC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals

NOTICE!

The I/O bus is not designed for plugging and unplugging modules while in operation. If a module is plugged or replaced while the bus is in operation, the following consequences are possible

- reset of the station or of the CPU
- system lockup
- damage of the module

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

With its fast data transmission, the I/O bus obtains very low reaction times. Depending on the device and on the version of firmware and Automation Builder, the following numbers of I/O devices can be connected to the I/O bus.

Device	Version Automation Builder	Version firmware	Max. number of I/O devices
CANopen bus modules CI581-CN and CI582-CN	As of V2.1.0	All	0
PROFINET bus modules CI501-PNIO and CI502-PNIO	As of V2.1.0	all	10
EtherCAT communication interface module CI511-ETHCAT and CI512-ETHCAT	As of V2.1.0	As of V2.0.x	10

Table 590: General data

Parameter	Value
Supply voltage, signal level	3.3 V DC ± 10 %
Max. supply current	On request
Type of the data interface	Synchronized serial data exchange

Parameter	Value
Bus data transmission speed	1.8 Mb/s
Minimum bus cycle time	500 µs [1])
Galvanic isolation	I/O bus is galvanic connected to CPU and communication interface logic ciruits. Galvanic isolation of I/O bus is I/O module specific. See each module specification for details.
Protection against electrostatic discharge (ESD)	TB5xx, TB56xx: with protection diodes, no ESD discharge allowed on the port.
Max. bus length	1 m
[1]) Minimum bus cycle time: This value is valid for all module combinations (from 1 to 10 I/O modules)	

Table 591: Wiring (bus connection)

Parameter	Value
Bus connection	Left-side and right-side connection from module to module via a 10-pole HE plug (male at the left side, female at the right side)
Mechanical connection	Established by the terminal units
Max. bus length	1 m

1.6.4.4.2 Mechanical encoding

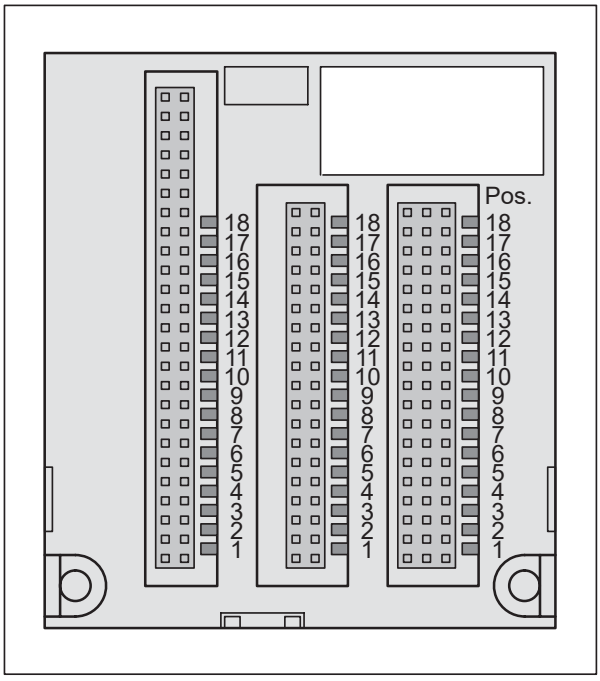


Fig. 263: Possible positions for mechanical encoding (1 to 18)

NOTICE!
Terminal units and terminal bases have a mechanical coding which prevents modules (from) being inserted into the wrong places for cases that might result in dangerous parasitic voltages or if modules could be destroyed.

The coding either makes it impossible to insert the module to the wrong place or blocks its electrical function (outputs are not activated).

The following figures show the possible encodings.

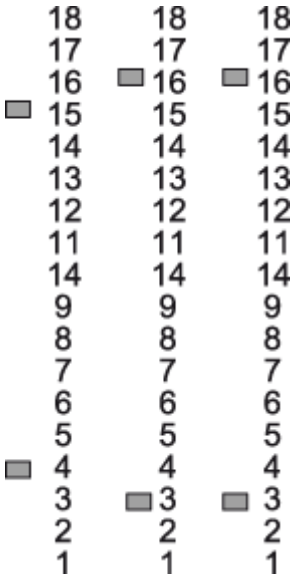

Fig. 264: Encoding for processor modules with Ethernet interface

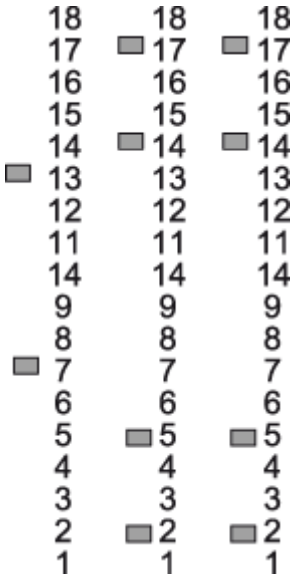

Fig. 265: Encoding for real-time Ethernet modules

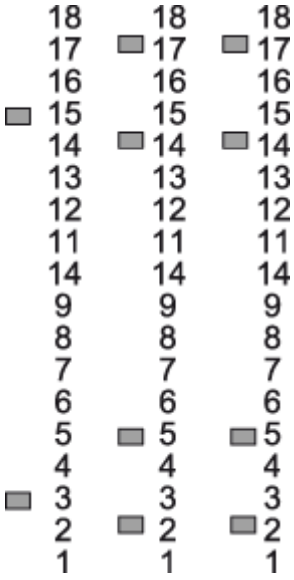

Fig. 266: Encoding for communication interface modules

Fig. 267: Encoding for I/O modules (24 VDC)

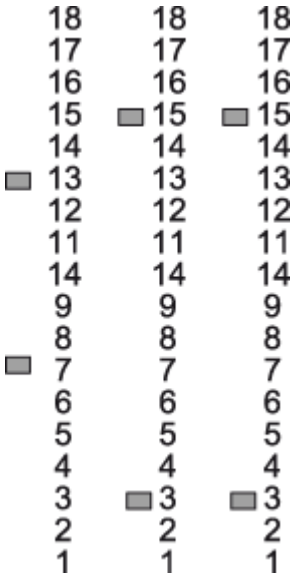

Fig. 268: Encoding for communication interface modules with PROFINET interface

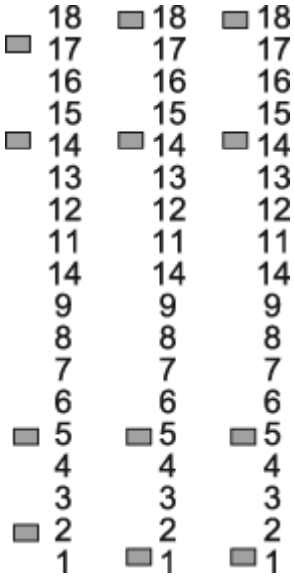

Fig. 269: Encoding for I/O modules (120 VAC / 230 VAC)

Fig. 270: Encoding for positioning modules

1.6.4.4.3 Earthing concept (Block diagrams)

NOTICE!

PLC damage due to missing grounding

- Ensure to earth the devices.
- The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.

1.6.4.4.4 EMC-conforming assembly and construction

General principles

General considerations

Electric and electronical devices have to work correctly on site. This is also valid when electro-magnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.

Advant Controller components have a very high noise immunity.

When the wiring and grounding instructions are met, an error-free operation is given.

High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.

There are three important principles to be especially considered:

- *Keep all connections as short as possible (in particular the grounding conductors)*
- *Use large conductor cross sections (in particular for the grounding conductors)*
- *Create low-impedance, i.e. good and large-sized contacts (in particular for the grounding conductors)*

Pay attention to the following:

- *Use vibration-resistant connections*
- *Clean metallic contact areas*
- *Use solid plug and screw-type connections*
- *Use earth cable shields with clips on a well-grounded metallic surface*
- *Do not use aluminium parts*
- *Do not use sheath wires*
- *Do not use toothed lock washers under screw connections*

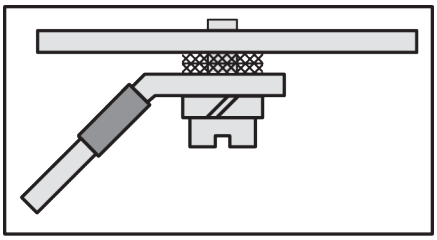

Fig. 271: Assembly: wrong

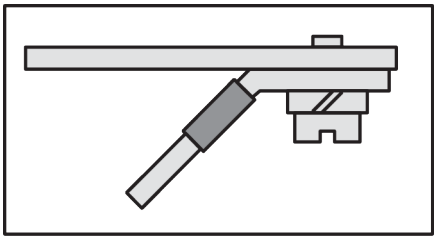

Fig. 272: Assembly: correct

Make a connection between the DIN rails and PE (Protective Earth). For this, use an grounding wire with a minimum conductor cross section of 10 mm^2.

The wire is connected to the DIN rail with an M6 screw.

A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behavior significantly, as the disturbances can be discharged more effective.

Cable routing

- Route cables meeting the standards.
- Sort the cables into cable groups:
  - Power current cables
  - Power supply cables
  - Signal cables
  - Data cables

- Rout signal cables and data cables separately from the power cables.
  – Separate cable ducts or cable bundles.
  – The distance should be 20 cm or greater.
- Lay signal and data cables close to earthed surfaces.

Cable shields

- Use only shielded data cables. The shield should be grounded at both ends.
  A cable shield only grounded at one end can only protect from capacitively coupled interference and low-frequency disturbances (50 Hz hum).
- Avoid parasitic currents flowing through the cable shields.
  This can be done by installing current-carrying equipotential bondings.
- Use only cables with braided shields.
  Foil shields are not robust enough, cannot be contacted well and have poor HF properties.
- Use only metallic or [metal]-plated plugs for shielded data cables.
- Use only shielded cables for analog signals.
  For small signals ground the shield only at one end.
- Ground the cable shield directly with a clip when entering the switchgear cabinet.
  Do not cut the shield until the cable reaches the module connected.

The connection between the PE bar and the shield bar must have a low impedance.

Switchgear cabinet

According to DNV GL mounting in a seperate metall cabinet is required for:

- *SM560-S-FD-1*
- *CI521-MODTCP*
- *CI522-MODTCP*

Connections The connections between the switchgear cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

Grounding Ground the switchgear cabinet doors with short and highly flexible conductors.

Illumination Only use filament lamps (bulbs) or fluorescent tubes with interference suppression.

For supplying the PC Use the mains socket which is located inside the switchgear cabinet.

↳ *Chapter 1.6.4.6.2.1 “Switchgear cabinet assembly” on page 3403*

Reference potential

- Provide a uniform reference potential in the entire installation and ground all electrical appliances if possible.
- Route your grounding conductors in a star configuration so that no ground loops can occur.

Equipotential bonding

The Installation of equipotential bondings are necessary if there are present or expected potential differences between parts of your application.

- *The impedance of equipotential bonding must be equal or lower than 10 % of the shield impedance of the shielded signal cables between the same points.*
- *The conductor cross section of a equipotential bonding must be 16 mm² to withstand the maximum possible compensating current.*
- *Equipotential bondings and shielded signal cables should be laid close to each other.*
- *Equipotential bondings must be connected to PE with low impedance.*

1.6.4.4.5 Power consumption of an entire station

The power consumption of a complete station consists of the sum of all individual consumptions.

- Consumers over terminals L+ and M on the AC500 terminal base/AC500-eCo CPU:
  - CPU itself
  - I/O modules attached on the I/O bus
  - Communication modules attached (AC500 terminal base)
- Consumers over the process supply voltage terminals ZP and UP of the AC500 terminal units / the L+/M or UP/ZP terminals of the AC500-eCo I/O modules:
  - Digital I/O modules
  - Analog I/O modules

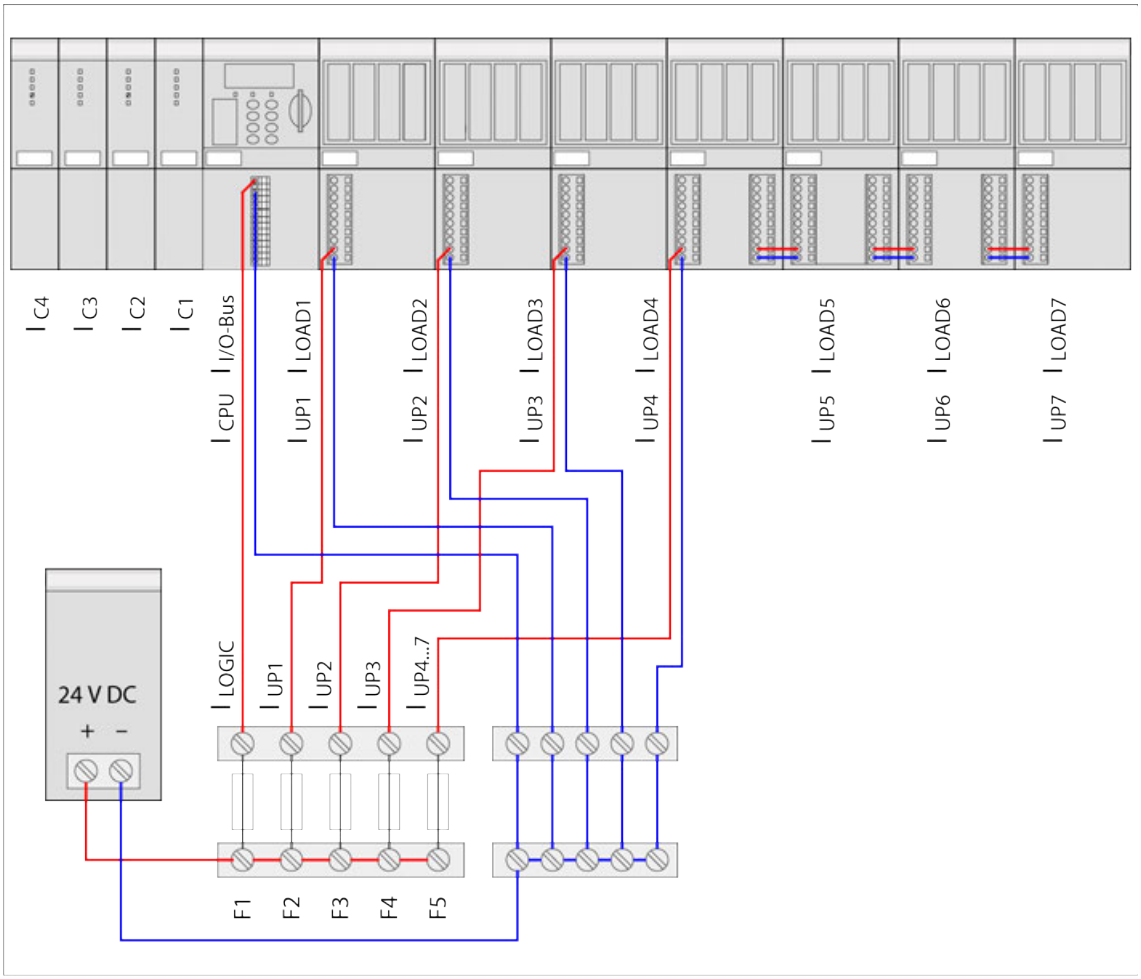
The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.

Calculation of the total current consumption

Example

In the example, the AC500 control system consists of the following devices:

- AC500 CPU with Ethernet interface
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units



Because of the high total current consumption of the digital I/O modules (from UP = 24 V DC), the supply is divided up into several electric circuits fused separately.

The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A.

The total current can be calculated as follows:

$I_{Total} = I_{LOGIC} + I_{UP}$

with the assumptions

$I_{LOGIC} = I_{CPU} + I_{I/O\ bus} + I_{C1} + I_{C2} + I_{C3} + I_{C4}$ (CPU + communication modules + I/O bus)

$I_{I/O\ bus}$ = Number of expansion modules × Current consumption through the I/O bus per module

and

$I_{UP} = I_{UP1} + I_{LOAD1} + I_{UP2} + I_{LOAD2} + I_{UP3} + I_{LOAD3} + I_{UP4} + I_{LOAD4} + I_{UP5} + I_{LOAD5} + I_{UP6} + I_{LOAD6} + I_{UP7} + I_{LOAD7}$

If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

	I_{CPU} *)	I_{Cx} *)	$I_{I/O\ bus}$ *)	I_{UPx} *)	I_{LOADx} *)
CPU / communication module part					
CPU	0.110 A	-	-	-	-
C1	-	0.050 A	-	-	-
C2	-	0.085 A	-	-	-
C3	-	0.050 A	-	-	-
C4	-	0.050 A	-	-	-
I/O module part					
Analog1	-	-	0.002 A	0.150 A	-
Analog2	-	-	0.002 A	0.150 A	0.160 A
Analog3	-	-	0.002 A	0.100 A	0.080 A
Analog4	-	-	0.002 A	0.100 A	0.080 A
Digital1	-	-	0.002 A	0.050 A	8.000 A
Digital2	-	-	0.002 A	0.050 A	8.000 A
Digital3	-	-	0.002 A	0.050 A	8.000 A
Σ columns	0.110 A	0.235 A	0.014 A	0.650 A	24.320 A
	$\Sigma\ I_{LOGIC} \approx 0.4$ A			$\Sigma\ I_{UP} \approx 25$ A	
	$I_{Total} \approx 25.4$ A				
*) All values in this column are exemplary values					

Dimensioning of the fuses

To be able to select the fuses for the station correctly, both the current consumption and the inrush currents (melting integral for the series-connected fuse) must be taken into consideration.

Fuse	for	Σ of the melting integrals in A^2s	$I_{Logic\ A}$	$I_{UPx\ A}$	Recommended fuse	
					Type	Value
F1	CPU logic	1.000	≈ 0.4	-	Quick	10 A
F2	Module Digital1	0.005	-	8.050	Quick	10 A
F3	Module Digital2	0.008	-	8.050	Quick	10 A
F4	Module Digital3	0.007	-	8.050	Quick	10 A
F5	Modules Analog1 + Analog2 + Analog3 + Analog4	0.130	-	0.820	Quick	10 A

1.6.4.4.6 Decommissioning

Secure decommissioning of a functional CPU

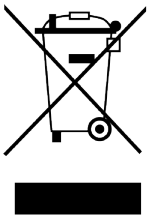
1. Delete the runtime licenses ↳ *Chapter 1.6.6.2.2.2.4 “Returning a license” on page 3671*.
2. Delete certificates available on the CPU ↳ *Chapter 1.8.2.4.1 “View 'Security Screen' - 'Devices'” on page 4125*.
3. Delete applications ↳ *Chapter 1.4.1.20.3.6.12 “Command 'Reset Origin'” on page 1039* ↳ *Chapter 1.4.1.20.3.6.13 “Command 'Reset Origin Device'” on page 1040*.
4. Delete applications from memory card, if available ↳ *Chapter 1.4.1.14 “Copying files to/ from PLC” on page 441*.
5. If available, remove memory card and battery from CPU.
6. Delete all user accounts and user data ↳ *“Tab 'User'” on page 996*.
7. Demount and dispose the hardware modules ↳ *Chapter 1.6.4.5.3 “Mounting and demounting” on page 3360* ↳ *Chapter 1.6.4.6.3 “Mounting and demounting” on page 3408* ↳ *Chapter 1.6.4.4.7 “Recycling” on page 3352*.

Secure decommissioning of a not functional CPU

▷ If you can not access the data stored in the CPU, e.g., because the CPU is not functional any more, then physically destroy the device.

⇨ This ensures that the credentials that are stored in the device, can not be misused.

1.6.4.4.7 Recycling



Disposal and recycling information

This symbol on the product (and on its packaging) is in accordance with the European Union's Waste Electrical and Electronic Equipment (WEEE) Directive.

The symbol indicates that this product must be recycled/disposed of separately from other household waste.

It is the end user's responsibility to dispose of this product by taking it to a designated WEEE collection facility for the proper collection and recycling of the waste equipment.

The separate collection and recycling of waste equipment will help to conserve natural resources and protect human health and the environment.

For more information about recycling, please contact your local environmental office, an electrical/electronic waste disposal company or the store where you purchased the product.

Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Power supply units

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

WARNING!

Improper installation can lead to death by touching hazardous voltages!

To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

Electromagnetic compatibility

Electromagnetic Compatibility		
Device suitable for:		
	Industrial applications	Yes
	Domestic applications	Yes
Immunity against electrostatic discharge (ESD):		According to IEC 61000-4-2, zone B, criterion B
	Electrostatic voltage in case of air discharge	8 kV
	Electrostatic voltage in case of contact discharge	6 kV
	ESD with communication connectors	In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
Immunity against the influence of radiated (CW radiated):		According to IEC 61000-4-3, zone B, criterion A
	Test field strength	10 V/m
Immunity against transient interference voltages (burst):		According to IEC 61000-4-4, zone B, criterion B
	Supply voltage units (DC)	2 kV
	Digital inputs/outputs (24 V DC)	1 kV

Electromagnetic Compatibility		
	Digital inputs/outputs (100 V AC...240 V AC)	Relay 2 kV
	Ethernet	1 kV
	Serial interfaces	1 kV
Immunity against the influence of line-conducted interferences (CW conducted):		According to IEC 61000-4-6, zone B, criterion A
Test voltage		10 V pass A
High energy surges		According to IEC 61000-4-5, zone B, criterion B
	Power supply DC	1 kV CM / 0.5 kV DM [1])
	DC I/O supply	1 kV CM / 0.5 kV DM [1])
	Ethernet	1 kV CM [1])
	Serial interfaces	1 kV CM [1])
	AC I/O unshielded	2 kV CM, 1 kV DM [1])
	I/O analog, I/O DC unshielded	1 kV CM [1])
Radiation (radio disturbance)		According to IEC 55011, group 1, class A

[1]) CM = Common Mode, DM = Differential Mode

Mechanical data

Parameter	**Value**
Mounting	Horizontal
Degree of protection	EN61131-2: IP20 with all option boards or option board slot covers attached (and all terminal screws are tightened)
Housing	Classification V0 according to UL 94
Vibration resistance acc. to EN 61131-2	all three axes (DIN rail mounting) 5 Hz...8.2 Hz: ±7.5 mm peak 8.2 Hz...150 Hz: 2 g peak
Shock test	All three axes 15 g, 11 ms, half-sinusoidal
Mounting of the modules:	
DIN rail according to DIN EN 50022	35 mm, depth 7.5 mm or 15 mm
Mounting with screws	M3
Fastening torque	1.2 Nm

Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

1.6.4.5.2 Mechanical dimensions

Switchgear cabinet assembly (indoor use)

> *Information on EMC-conforming assembly and construction is provided within the overall functions section ↳ Chapter 1.6.4.4.4 “EMC-conforming assembly and construction” on page 3345.*

PLC enclosure

To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.

It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

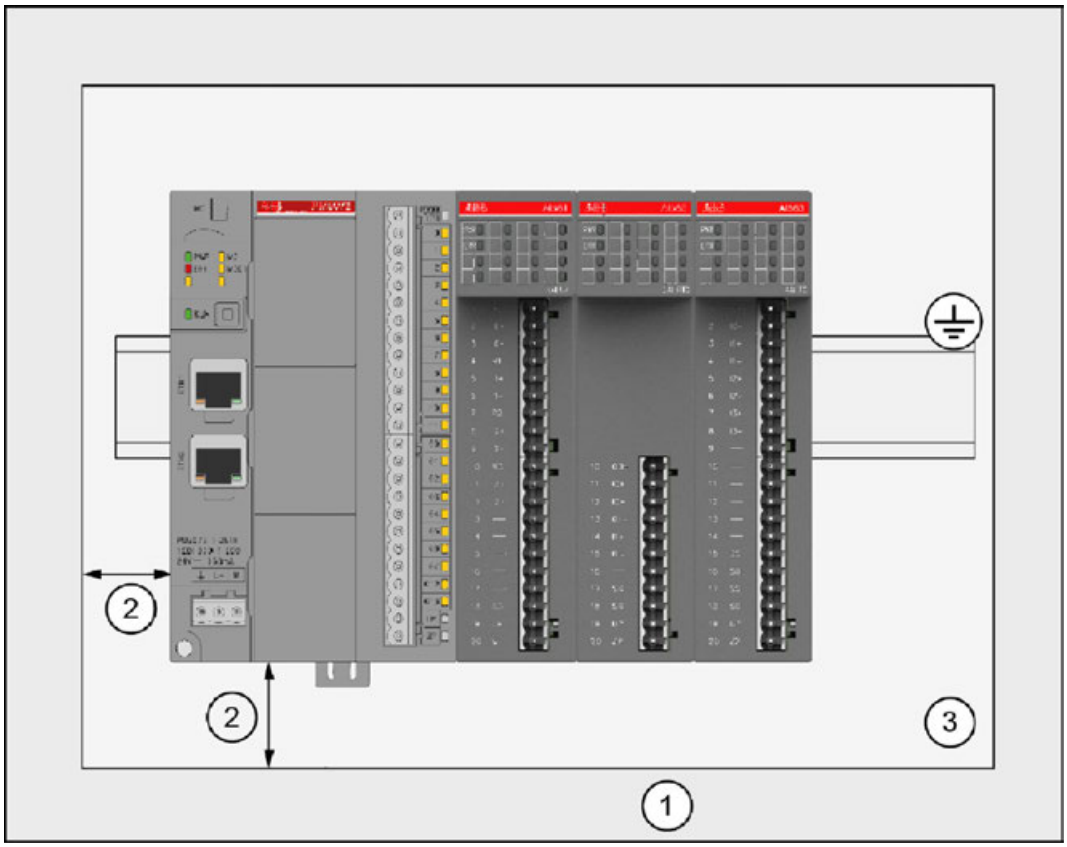

Fig. 274: Installation of AC500-eCo V3 CPU/S500 modules in a switchgear cabinet

1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, grounded

NOTICE!

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating.

When vertically mounted, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

With high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

1.6.4.5.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting and demounting of the AC500-eCo V3 CPUs

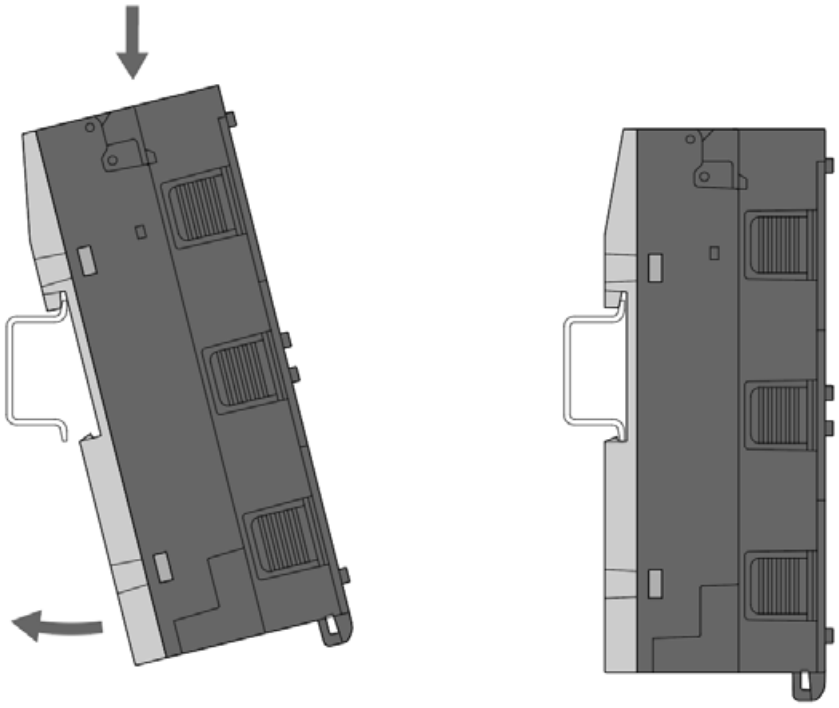
Mounting a processor module on a DIN rail

NOTICE!

Risk of function faults!

The processor module is grounded via DIN rail.

The DIN rail must be included into the earthing conception of the plant.

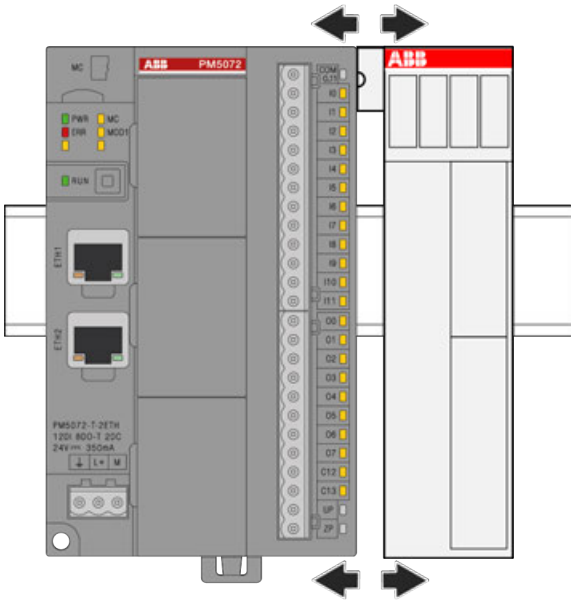


Mount the processor module at the top of the DIN rail, then snap it in below.

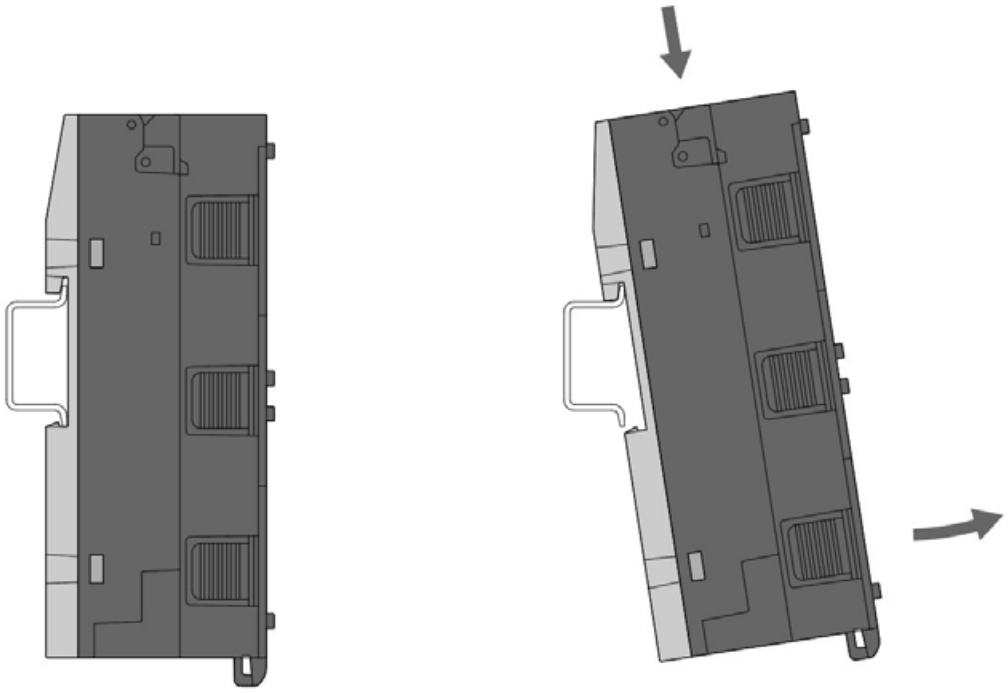
See hardware description of PM50xx ↳ Chapter 1.6.3.3.1.1 “PM50xx” on page 2440 for connection.

Demounting a processor module mounted on a DIN rail

1. Remove I/O modules if connected.



2. While pressing down processor module pull it away from DIN rail.

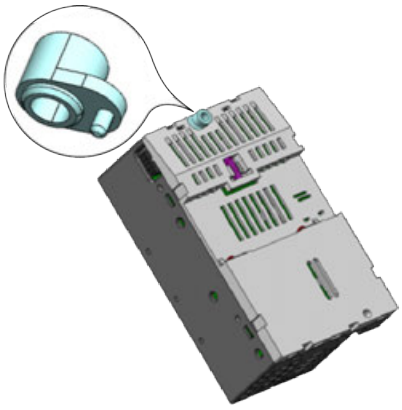


Mounting a processor module on a metal plate

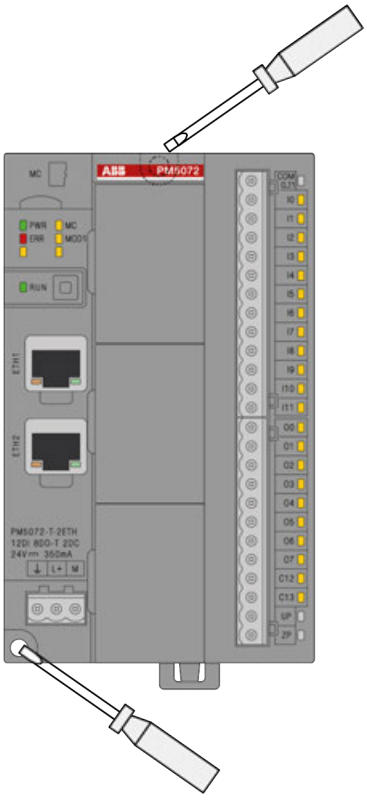
NOTICE!
Risk of function faults!
Missing electrical contact by isolating screws or washers!
Use metal screws on the metal plate.
The metal plate must be included into the earthing concept of the plant.
Do NOT use insulating washers!

One TA543 wall mounting accessory ⇳ Chapter 1.6.4.5.5.5 “TA543 - Screw mounting accessory” on page 3396 is needed per processor module.

1. Snap in the TA543 at the back side of the processor module.



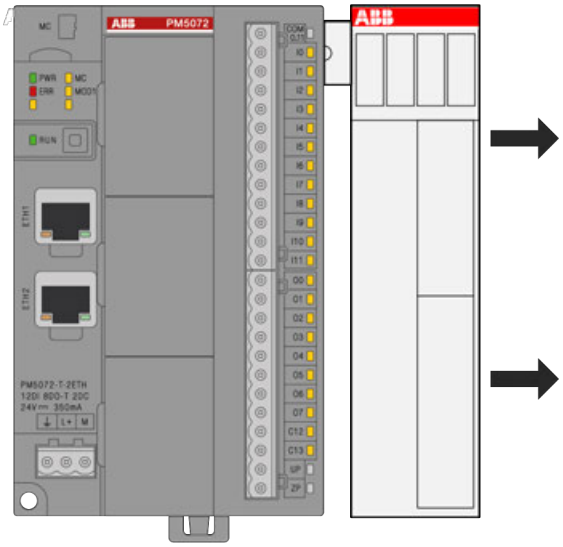
2. Fasten the processor module with two screws (max. diameter: 4 mm) to the metal plate.



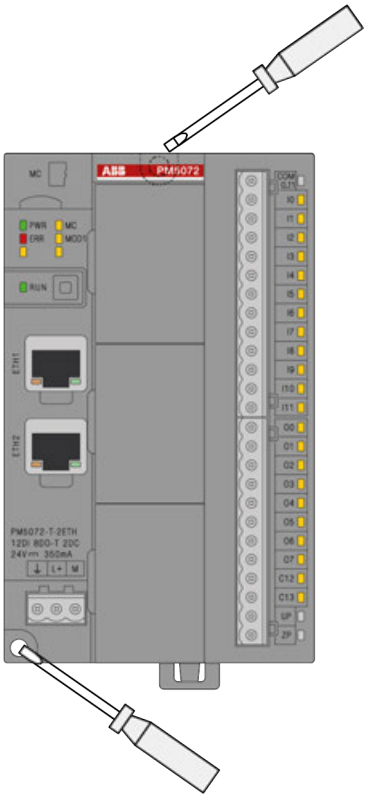
> *See hardware description of PM50xx ↳ Chapter 1.6.3.3.1.1 “PM50xx” on page 2440 for connection.*

Demounting a processor module mounted on a metal plate

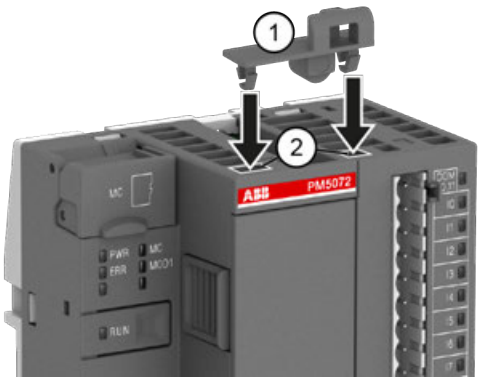
1. Remove I/O modules if connected.



2. Remove the 2 screws.



Mounting of TA5301-CFA



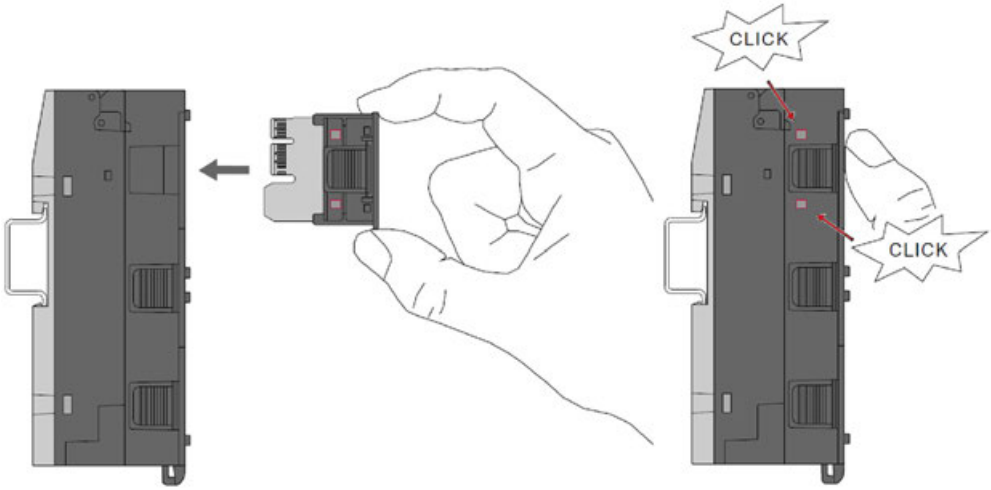
1 TA5301-CFA cable fixing accessory
2 2 openings on the PM50x2 processor module

▷ Insert the TA5301-CFA cable fixing accessory into the two openings on the PM50x2 processor module marked white in the figure.

Mounting and demounting option boards

Inserting the option board

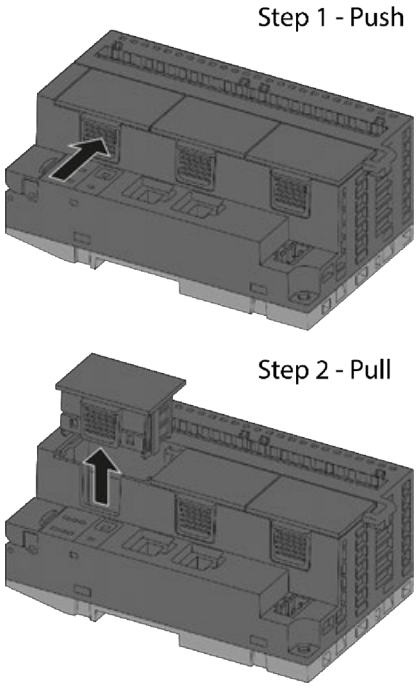
After mounting the PM50x2 processor module on the DIN rail, mount the option board.



▷ Press the option board TA51xx (or TA5300-CVR) into the slot of the processor module PM50x2 until it locks in place.

The option board must click into the slot of the processor module.

Removing the option board



1. Push the option board on the side to release the lock.
2. At the same time, pull the option board out of the slot.

CAUTION!
Risk of injury and damaging the product!
Always plug in the option board slot cover when the option board is not inserted.

If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).

Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

Mounting and demounting of S500-eCo I/O modules

S500-eCo I/O modules can be mounted either on a DIN rail or with screws on a metal plate.

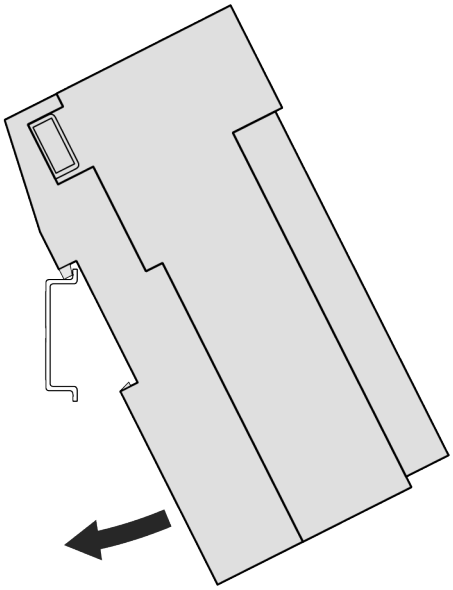
Mounting I/O modules on a DIN rail

NOTICE!
Risk of function faults!
The S500-eCo I/O modules are grounded via the DIN rail.

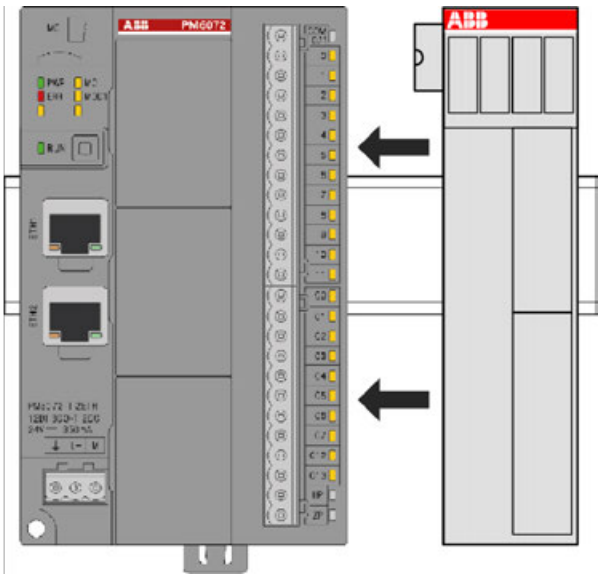
The DIN rail must be included into the earthing concept of the plant.

Use only metal screws.

1. Mount I/O module at the top of the DIN rail, then snap it in below.

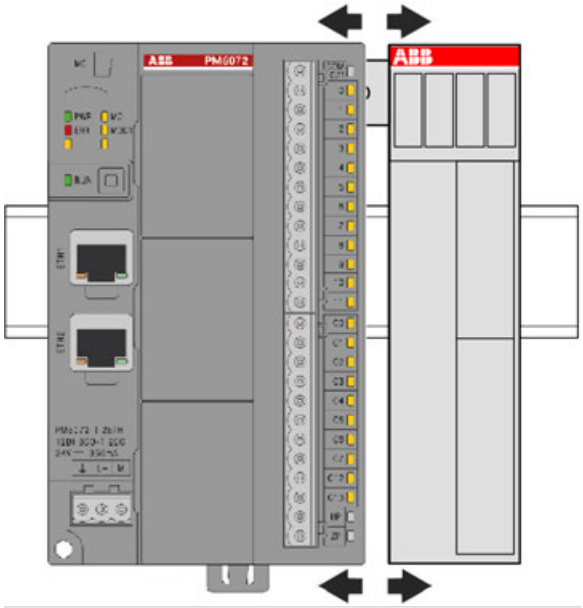


2. Attach I/O module by hand to an other module. The serial I/O bus is connected automatically.

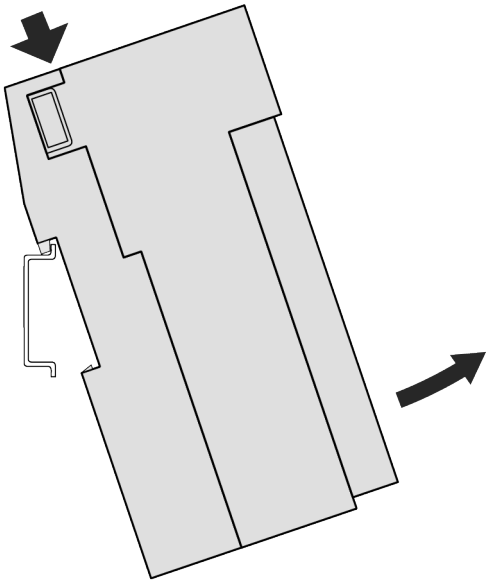


Demounting I/O modules mounted on a DIN rail

1. Remove I/O module by hand if connected.



2. While pressing down I/O module pull it away from DIN rail.



Mounting I/O modules on a metal plate

NOTICE!
Risk of function faults!
Missing electrical contact by isolating screws or washers!

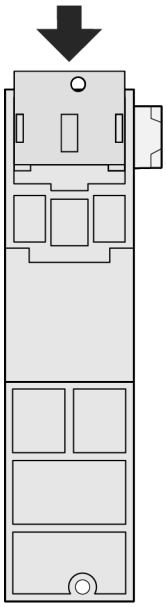
Use metal screws on the metal plate.

The metal plate must be included into the earthing concept of the plant.

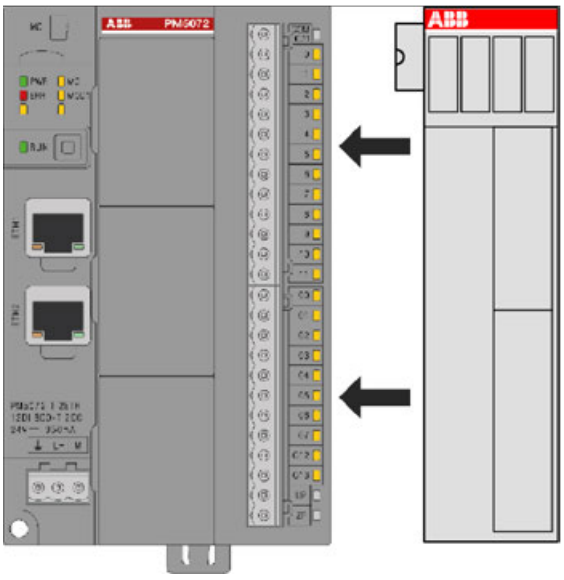
Do NOT use insulating washers!

> *One TA566 wall mounting accessory ↳ Chapter 1.6.4.5.5.6 “ TA566 - Wall mounting accessory” on page 3397 is needed per S500-eCo I/O module.*

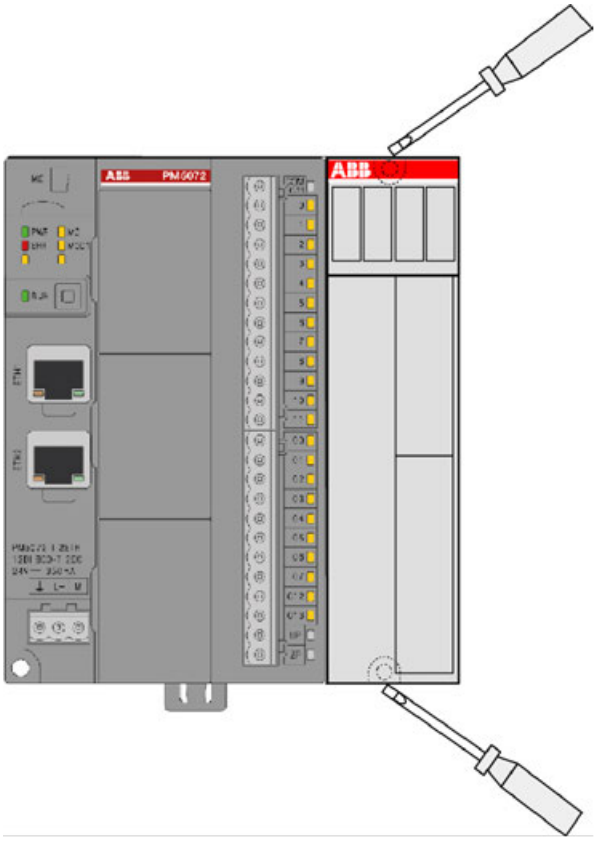
1. Snap in the TA566 at the back side of the I/O module.



2. Attach the I/O module by hand to an other module. The serial I/O bus is connected automatically.

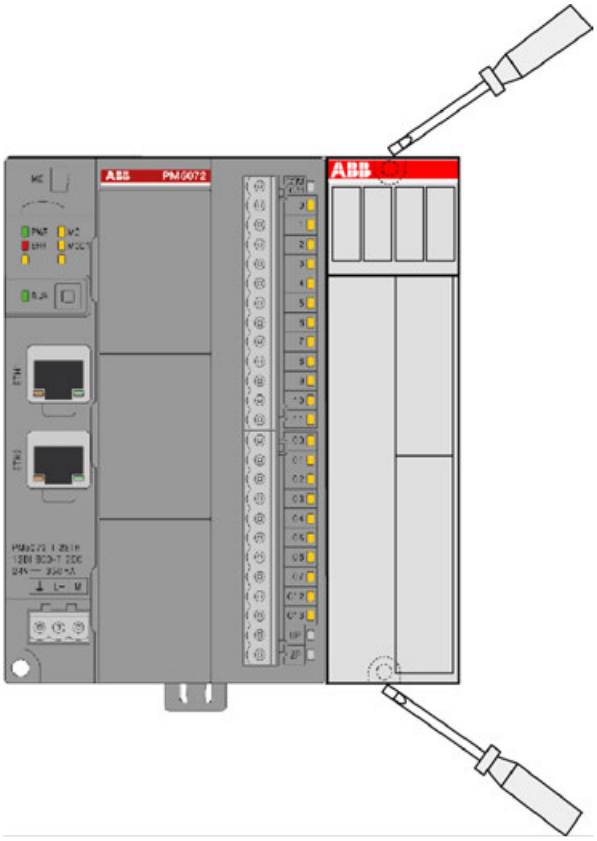


3. Fasten the I/O module with two screws (max. diameter: 4 mm) to the metal plate.

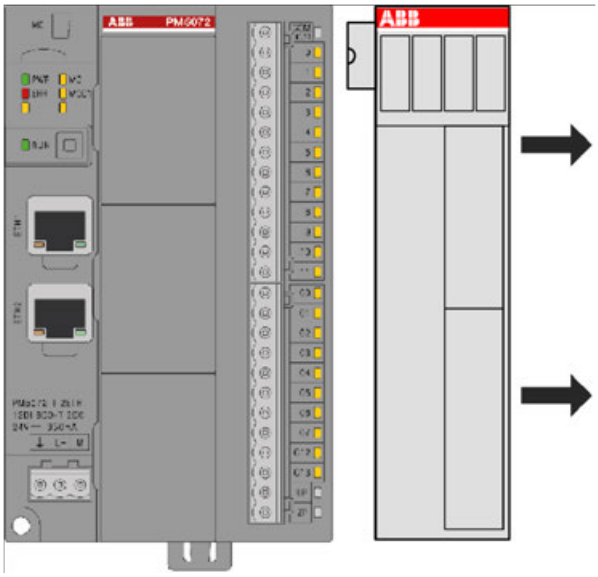


Demounting I/O modules mounted on a metal plate

1. Remove the 2 screws.



2. Remove the I/O module from the connected module by hand.



1.6.4.5.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device specification of the appropriate device.

Power supply

The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

Table 593: Removable terminal block for the supply voltage 24 V DC

3-pin spring terminal block	3-pin screw terminal block
	

The terminal block is available as a set for AC500-eCo V3 processor modules.

Basic CPU (PM5012)		**Standard CPUs (PM5032, PM5052) and Pro CPUs (PM5072)**	
Spring type	**Screw type**	**Spring type**	**Screw type**
TA5211-TSPF-B	TA5211-TSCL-B	TA5212-TSPF	TA5212-TSCL

Further information on the terminal blocks concerning power supply and onboard inputs/outputs are provided under pluggable connectors for screw and spring connection *Chapter 1.6.4.5.5.2 “TA52xx(-x) - Terminal block sets” on page 3379*.

Pin assignment

Pin Assignment	Pin	Label	Function	Description
 Terminal block inserted	1	⏚	FE	Functional earth
	2	L+	+24 V DC	Positive pin of the power supply voltage
	3	M	0 V	Negative pin of the power supply voltage

Faulty wiring on power supply terminals

CAUTION!

Risk of damaging the AC500-eCo V3 processor module and the connected modules!

Voltages > 30 V DC might damage the processor module and the connected modules.

Make sure that the supply voltage never exceeds 30 V DC.

Processor module interfaces

I/O bus

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128 Bytes input/ 128 Bytes output variables) and 10 I/O modules for PM5052-x-ETH and PM5072-T-2ETH can be added.

Option board slot interface

Depending on the processor module variants, an additional option board can be connected to the option board slot to extend the feature of the processor module ↬ *Chapter 1.6.2.6.2.1.1 “Option boards for AC500-eCo V3 processor modules” on page 2410* .

Serial interface

RS-232 communication interface is available by using option board:

- TA5141-RS232I (isolated)
  ↬ *Chapter 1.6.3.3.1.2.6 “TA5141-RS232I - Option board for COMx serial communication” on page 2502*

RS-485 communication interface is available by using option boards:

- TA5142-RS485I (isolated)
  ↬ *Chapter 1.6.3.3.1.2.7 “TA5142-RS485I - Option board for COMx serial communication” on page 2504*
- TA5142-RS485 (non isolated)
  ↬ *Chapter 1.6.3.3.1.2.8 “TA5142-RS485 - Option board for COMx serial communication” on page 2510*

Ethernet

Ethernet is also used for Modbus TCP connection.

Ethernet interface

The Ethernet interface is carried out via a RJ45 jack. The pin assignment of the Ethernet interface:

Interface	Pin	Description	
	1	Tx+	Transmit Data +
	2	Tx-	Transmit Data -
	3	Rx+	Receive data +
	4	NC	Not connected
	5	NC	Not connected
	6	Rx-	Receive data -
	7	NC	Not connected

Interface	Pin	Description	
	8	NC	Not connected
	Shield	Cable shield	Functional earth

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

Technical data

Table 594: Description of the Modbus protocol

Parameter	Value
Supported standard	See *Serial interface* ↳ *Chapter 1.6.6.2.14.1 "Configuring Modbus RTU on serial interface" on page 3793*
Number of connection points	1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol	Modbus
Operating mode	Client/server
Address	Server only
Data transmission control	CRC16
Data transmission speed	From 9,600 bits/s to 115,200 bits/s (see *Serial interface* ↳ *Chapter 1.6.6.2.14.1 "Configuring Modbus RTU on serial interface" on page 3793*)
Encoding	1 start bit 8 data bits 1 or 2 stop bits 1 parity bit (see *Serial interface* ↳ *Chapter 1.6.6.2.14.1 "Configuring Modbus RTU on serial interface" on page 3793*)
Max. cable length for RS-485 on serial interface option board used on the CPU.	1.200 m at 19.200 baud

Bus topology

Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.

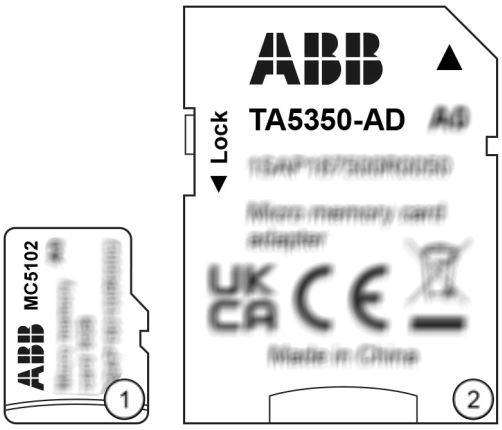
For further information on Modbus see chapter ↳ *Chapter 1.6.5.1.10 "Communication with Modbus RTU" on page 3542*.

1.6.4.5.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

MC5102 - Micro memory card with micro memory card adapter

- Solid state flash memory storage



1 Micro memory card
2 TA5350-AD micro memory card adapter

> *The MC5102 micro memory card has no write protect switch.*
> *The TA5350-AD micro memory card adapter has a write protect switch.*
> *In the position "LOCK", the inserted micro memory card can only be read.*

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

> *The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.*

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

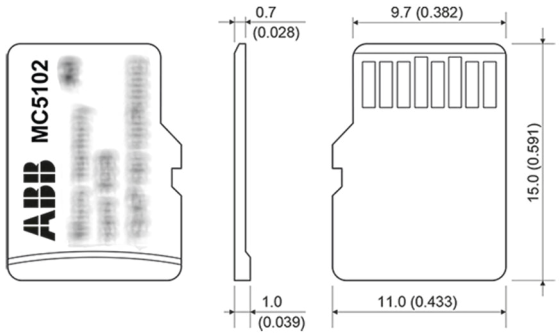
The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

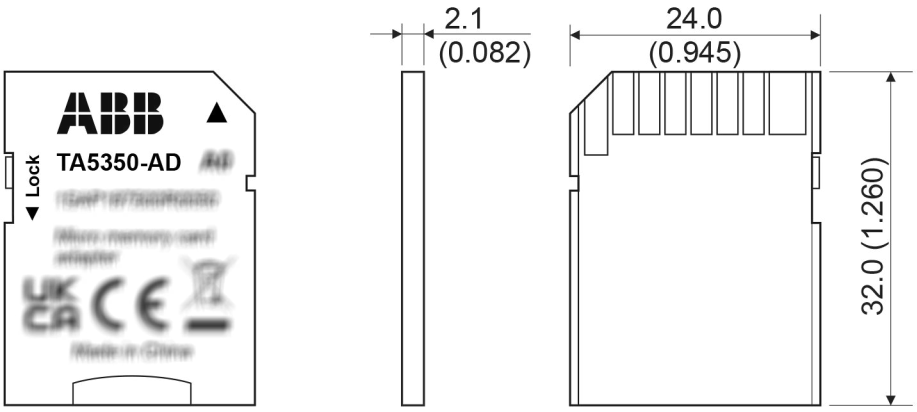
Dimensions

Micro memory card



The dimensions are in mm and in brackets in inch.

Micro memory card adapter



The dimensions are in mm and in brackets in inch.

Insert the micro memory card

AC500 V3

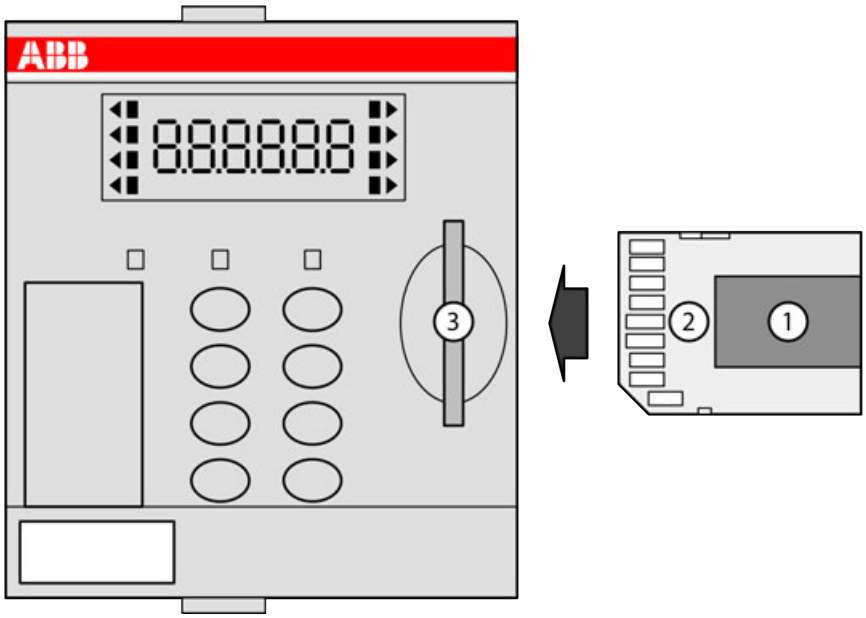


Fig. 277: Insert micro memory card into PM56xx

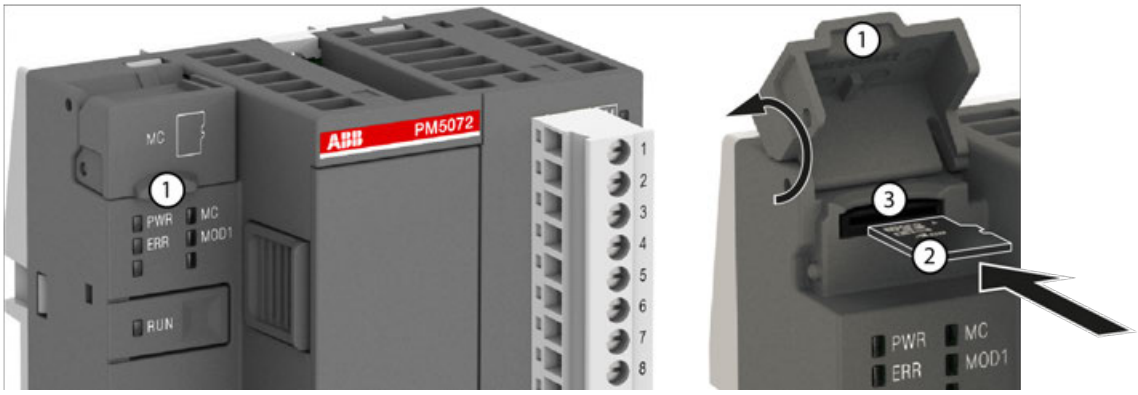
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

Remove the micro memory card

NOTICE!

Removal of the micro memory card

Do not remove the micro memory card when it is working!

AC500 V3: Remove the micro memory card with micro memory card adapter only when no black square (■) is shown next to MC in the display.

AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

AC500 V3

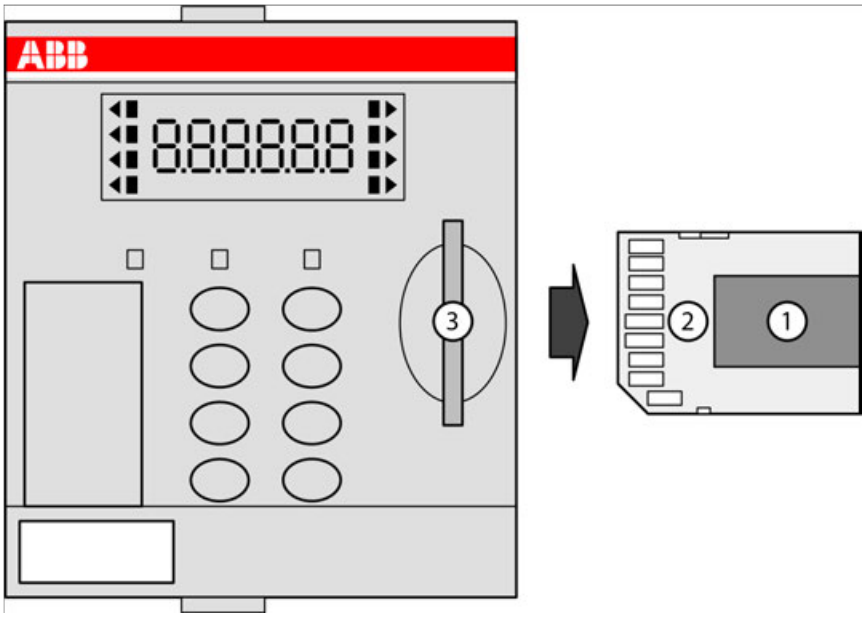


Fig. 278: Remove micro memory card from PM56xx

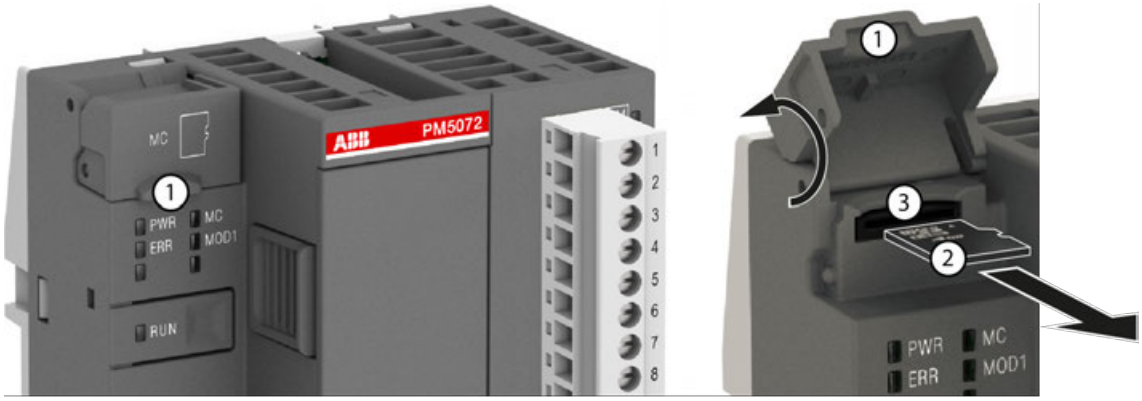
1 Micro memory card
2 Micro memory card adapter
3 Memory card slot

1. To remove the micro memory card adapter with the integrated micro memory card, push on the micro memory card adapter until it moves forward.
2. By this, the micro memory card adapter is unlocked and can be removed.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Micro memory card can be removed from the micro memory card slot by gripping and pulling with two fingers.
3. Close the micro memory card slot cover by turning it downwards.

Technical data

Parameter		Value
Memory capacity		8 GB
Total bytes written (TBW)		On request
Data retention		
	at beginning	10 years at 40 °C
	when number of write processes has been 90 % of lifetime of each cell	1 year at 40 °C
Write protect switch		
	Micro memory card	No
	Micro memory card adapter	Yes
Weight		0.25 g
Dimensions		15 mm x 11 mm x 0.7 mm

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the micro memory card in AC500 PLCs is provided in the chapter ↳ *Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3999*.

Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 180 100 R0002	MC5102, micro memory card with TA5350-AD micro memory card adapter	Active

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

TA52xx(-x) - Terminal block sets

Intended purpose

Removable terminal blocks are used for power supply and for I/O connectors on AC500-eCo V3 processor modules PM50x2.

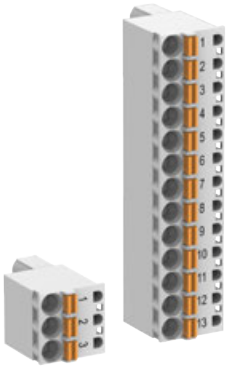
For option boards there are different removable terminal blocks in spring version.

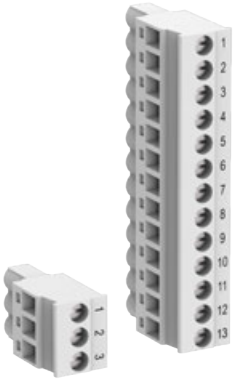
For the AC500-eCo V3 **Basic CPUs** a 3-pin terminal block for power supply and a 13-pin terminal block for I/O connectors are used.

For the AC500-eCo V3 **Standard CPUs** and **Pro CPUs** a 3-pin terminal block for power supply, a 13-pin terminal block and a 12-pin terminal block for I/O connectors are used.

For all CPUs there is a screw and a spring variant available.

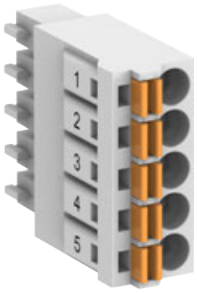
Basic CPU		Standard and Pro CPUs	
Spring type TA5211-TSPF-B	Screw type TA5211-TSCL-B	Spring type TA5212-TSPF	Screw type TA5212-TSCL
			

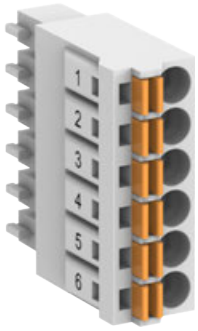


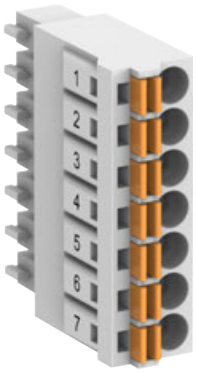


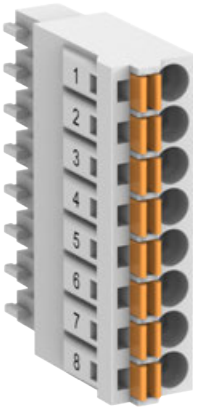
Various removable spring-type terminal blocks are available for option boards.

The following spare parts are available (depending on the number of pins).

Spring type			
TA5220-SPF5	**TA5220-SPF6**	**TA5220-SPF7**	**TA5220-SPF8**
			








CAUTION!

Risk of injury and damaging the product!

Improper installation and maintenance may result in injury and can damage the product!

- Installation and maintenance have to be performed according to the technical rules, codes and relevant standards, e.g. EN 60204-1.
- Read product documentation carefully before wiring. Improper wiring or wrong terminal block from other devices can damage the product!
- Only by qualified personnel.

CAUTION!

Risk of injury and damaging the processor module when using unapproved terminal blocks!

Only use terminal blocks approved by ABB to avoid injury and damage to the processor module.

Terminal block set for PM50x2

Processor modules PM50x2 CPU are not delivered with terminal blocks.

Screw type terminal block set:

- *TA5211-TSCL-B (1SAP187400R0001) for PM5012-x-ETH*
- *TA5212-TSCL (1SAP187400R0004) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W)*

Spring type terminal block set:

- *TA5211-TSPF-B (1SAP187400R0002) for PM5012-x-ETH*
- *TA5212-TSPF (1SAP187400R0005) for PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH(W)*

TA5300-CVR - Option board slot cover

Intended purpose

TA5300-CVR option board slot covers for PM50xx processor modules are necessary to protect not used option board slots.

CAUTION!

Risk of injury and damaging the product!

Always plug in the option board slot cover when the option board is not inserted.

If the option board slot cover is lost, please order the replacement TA5300-CVR (1SAP187500R0001).

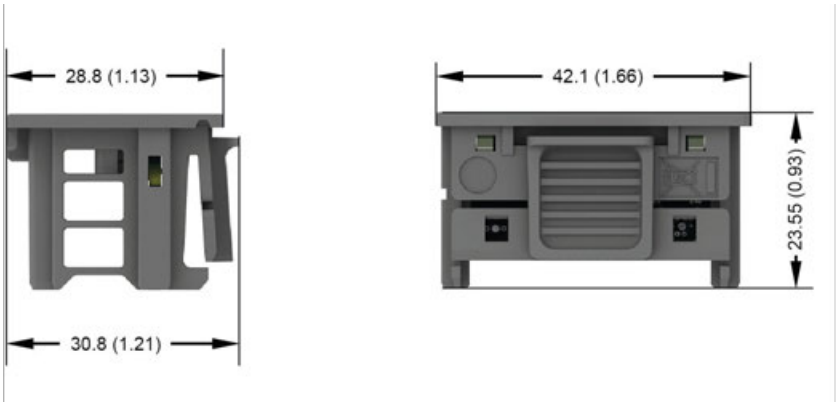
Never power up the CPU with uncovered option board slot, otherwise it may cause serious injury and/or damage the product.

The AC500-eCo V3 processor modules are delivered with option board slot cover(s).

The option board slot cover has to be removed before inserting an option board.

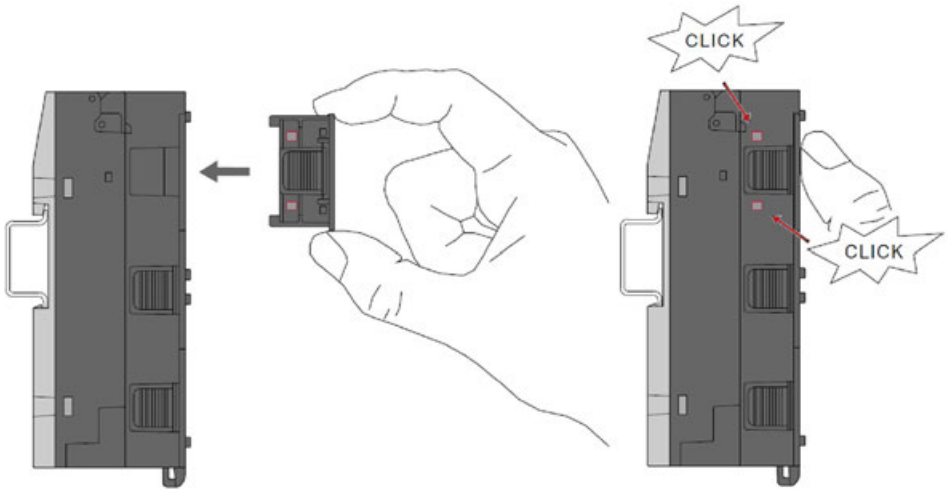
The TA5300-CVR option board slot covers are available as spare parts.

Dimensions



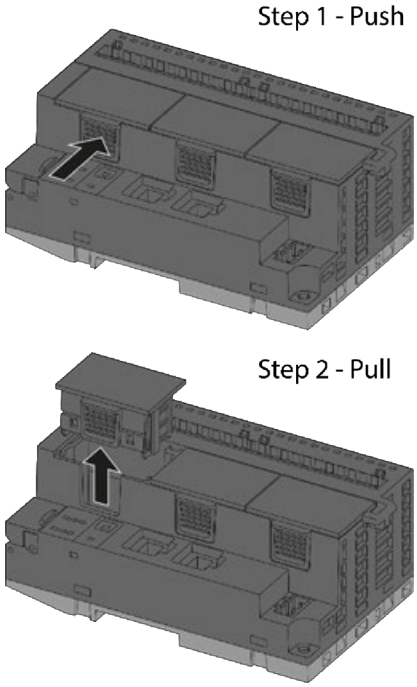
The dimensions are in mm and in brackets in inch.

Inserting of the option board slot cover



1. Press on the option board slot cover to insert it in the not used option board slot of the processor module PM50xx.
2. The option board slot cover must click into the not used option board slot.

Removing of the option board slot cover



1. Press the side of the inserted option board slot cover.
2. At the same time, pull the option board slot cover out of the option board slot of the processor module PM50xx.

Technical data

The system data of AC500-eCo V3 apply ↳ *Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352*

Only additional details are therefore documented below.

Parameter	Value
Weight	47 g
Dimensions	42.1 mm x 30.8 mm x 23.55

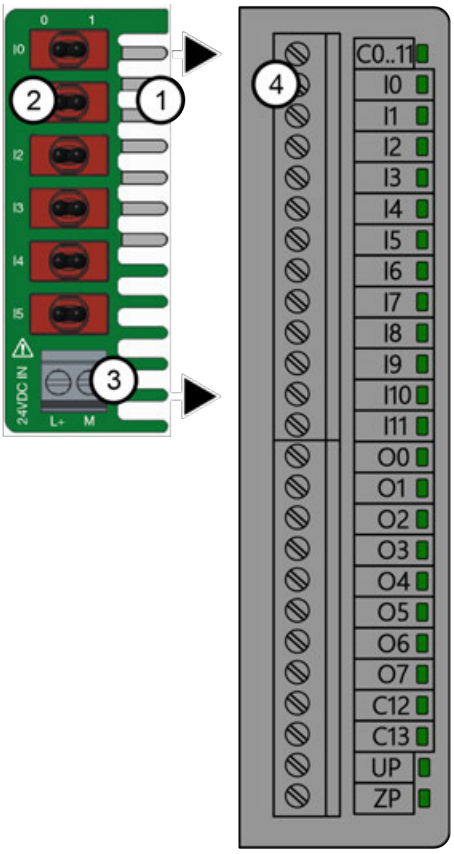
TA5400-SIM - Input simulator

- TA5400-SIM input simulator for 6 digital inputs 24 V DC
- For usage with AC500-eCo V3 processor modules



1 Contacts for connecting the input simulator to the terminal block for I/O connectors
2 6 switches for the digital inputs DI0 ... DI5 (0 means opened switch, 1 means closed switch)
3 Screw terminal block for power supply
4 Screw terminal block(s) for I/O connectors

Intended purpose

TA5400-SIM

The TA5400-SIM input simulator is only intended for testing and training purposes for AC500-eCo V3 processor modules PM50x2.

Continuous operation in a productive system is not permitted.

The TA5400-SIM input simulator may only be used with screw-type terminal blocks.

The TA5400-SIM input simulator must not be used with spring-type terminal blocks.

Environmental conditions for testing and training purposes

In order not to impair the functionality of the product, avoid any kind of disturbing environmental influences:

- *mechanical disturbances*
- *climatic influences*

Make sure that the parameters are within the normal range:

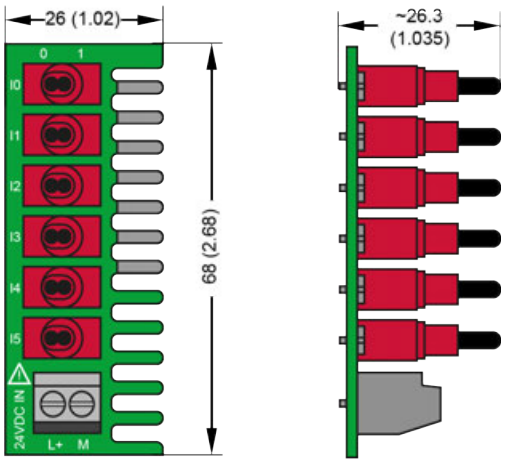
- *temperature*
- *air pressure*
- *humidity*
- *altitude*

The TA5400-SIM input simulator can simulate 6 digital 24 V DC input signals to the digital inputs I0...I5 of onboard I/Os.

With the TA5400-SIM input simulator, the digital 24 V DC inputs I0...I5 can be turned OFF and ON separately:

- If the lever of the switch is on the right side (1), the input is ON.
- If the lever of the switch is on the left side (0), the input is OFF.

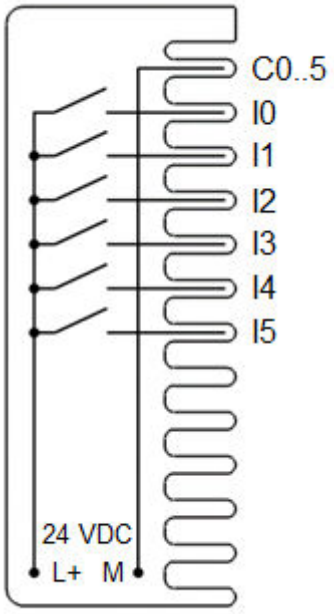
Dimensions



The dimensions are in mm and in brackets in inch.

Electrical diagram

The diagram below shows the connection of the TA5400-SIM input simulator.



NOTICE!

Risk of damage to the TA5400-SIM input simulator!

Do not remove the terminal block while the TA5400-SIM input simulator is connected.

Do not apply mechanical forces to the input simulator when it is connected to the terminal block.

In both cases the input simulator could be damaged.

Assembly

Insertion of the input simulator

1. Make sure that the power supply of the processor module is turned off.

CAUTION!

Risk of damaging the PLC modules!

The PLC modules can be damaged by overvoltages and short circuits.

Make sure, that all voltage sources (supply and process voltage) are switched off before you start working on the system.

Never connect voltages > 24 V DC to the terminal block of the TA5400-SIM input simulator.

CAUTION!

Risk of damaging the input simulator and/or PLC modules!

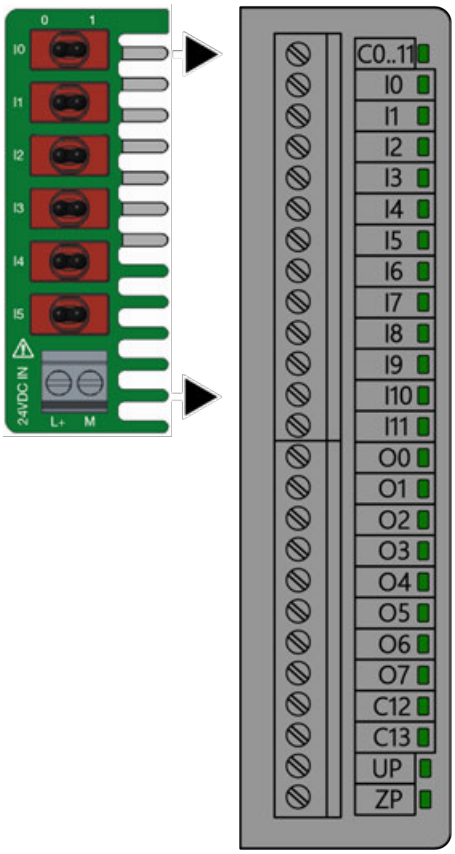
The TA5400-SIM input simulator may only be used with AC500-eCo V3 processor modules PM50x2.

Never use the input simulator with other devices.

The input simulator may only be used with screw-type terminal blocks.

The input simulator is only intended for testing and training purposes. Never use it within productive sytems.

2. Make sure that all clamps of the onboard I/Os are totally open.
3. Insert the TA5400-SIM input simulator into the screw terminal block as shown in the figure.



4. Tighten all screws of the onboard I/O clamps.
5. Make sure all switches are in OFF state (0).
6. Connect 24 V DC to the power supply of the TA5400-SIM (L+ and M). Tighten the screws.
7. Connect the processor module power supply wires (24 V DC). See PM50xx ↳ *"Pin assignment" on page 3371*.

Disassembly

Removal of the input simulator

1. Make sure that the power supply of the processor module is turned off.

> **CAUTION!**
> **Risk of damaging the PLC modules!**
> The PLC modules can be damaged by overvoltages and short circuits.
> Make sure that all voltage sources (supply and process voltage) are switched off before you start working on the system.

2. Disconnect the TA5400-SIM power supply wires (24 V DC) with a flat-blade screwdriver from the terminal block for power supply (L+ and M).
3. Loosen all screws of the onboard I/Os.
4. Remove the input simulator by pulling it to the left side.

Technical data

The system data of AC500-eCo V3 apply ↳ *Chapter 1.6.4.5.1 "System data AC500-eCo V3" on page 3352*

Only additional details are therefore documented below.

Table 600: Technical data of the module

Parameter		Value
Process supply voltage		
	Connections	Terminal (L+) for +24 V DC and terminal (M) for 0 V DC
	Rated value	24 V DC
	Max. ripple	5 %
	Protection against reversed voltage	Yes
Galvanic isolation		Yes (on processor module PM50xx)
Isolated Groups		1 (6 channels per group)
Weight		18 g
Mounting position		Horizontal or vertical

Table 601: Technical data of the inputs

Parameter	Value
Number of channels per module	6 digital input channels (+24 V DC)
Distribution of the channels into groups	1 (6 channels per group)
Connections of channels I0 to I5	Terminals 2...7
Reference potential for the channels I0 to I5	Terminal 1 (negative pole of the process supply voltage, signal name C0...5)
Input current per active channel (at input voltage +24 V DC) The current is given through the used processor module.	Typ. 5 mA
Inrush current per active channel The current is given through the used processor module.	Typ. 5 mA

1.6.4.6 AC500 (Standard)

1.6.4.6.1 System data AC500

Environmental conditions

Table 602: Process and supply voltages

Parameter		Value
24 V DC		
	Voltage	24 V (-15 %, +20 %)
	Protection against reverse polarity	Yes
120 V AC		
	Voltage	120 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
230 V AC		
	Voltage	230 V AC (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
120 V AC...240 V AC wide-range supply		
	Voltage	120 V...240 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
Allowed interruptions of power supply, according to EN 61131-2		
	DC supply	Interruption < 10 ms, time between 2 interruptions > 1 s, PS2
	AC supply	Interruption < 0.5 periods, time between 2 interruptions > 1 s

NOTICE!

Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system might be destroyed.

NOTICE!
Improper voltage level or frequency range which cause damage of AC inputs:
– AC voltage above 264 V
– Frenquency below 47 Hz or above 62.4 Hz

NOTICE!
Improper connection leads cause overtemperature on terminals.
PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

Parameter		Value
Temperature		
	Operating	0 °C...+60 °C: Horizontal mounting of modules. 0 °C...+40 °C: Vertical mounting of modules. Output load reduced to 50 % per group.
	Storage	-40 °C...+70 °C
	Transport	-40 °C...+70 °C
Humidity		Max. 95 %, without condensation
Air pressure		
	Operating	> 800 hPa / < 2000 m
	Storage	> 660 hPa / < 3500 m
Ingress protection		IP20

Creepage distances and clearances

The creepage distances and clearances meet the requirements of the overvoltage category II, pollution degree 2.

Insulation test voltages, routine test

According to EN 61131-2

Parameter	Value	
230 V circuits against other circuitry	2500 V	1.2/50 µs
120 V circuits against other circuitry	1500 V	1.2/50 µs
120 V...240 V circuits against other circuitry	2500 V	1.2/50 µs
24 V circuits (supply, 24 V inputs/outputs, analog inputs/outputs), if they are galvanically isolated against other circuitry	500 V	1.2/50 µs

Parameter	Value	
COM interfaces, galvanically isolated	500 V	1.2/50 µs
Ethernet	500 V	1.2/50 µs
230 V circuits against other circuitry	1350 V	AC 2 s
120 V circuits against other circuitry	820 V	AC 2 s
120 V...240 V circuits against other circuitry	1350 V	AC 2 s
24 V circuits (supply, 24 V inputs/outputs, analog inputs/outputs), if they are galvanically isolated against other circuitry	350 V	AC 2 s
COM interfaces, galvanically isolated	350 V	AC 2 s
	Not applicable	Not applicable
Ethernet	350 V	AC 2 s

According to IEC 61010-2-201

The content of the following table is only valid for PM56xx and TB56xx.

Table 603: Insulation, test voltages and continuous voltages

	Insulation	Test Voltage	Continuous Voltage
COM interfaces, galvanically isolated	1.1 mm	1216 V DC (60 s) 1500 V (1.2/50µs)	75 V
CAN interface, galvanically isolated	1.1 mm	1216 V DC (60 s) 1500 V (1.2/50µs)	75 V
Ethernet	1.1 mm	1500 V rms (50-60 Hz, 60 s) 2400 V (1.2/50µs)	On request

Power supply units

For the supply of the modules, power supply units according to SELV or PELV specifications must be used.

Safety Extra Low Voltage (SELV) and Protective Extra Low Voltage (PELV)

To ensure electrical safety of AC500/AC500-eCo extra low voltage circuits, 24 V DC supply, communication interfaces, I/O circuits, and all connected devices must be powered from sources meeting requirements of SELV, PELV, class 2, limited voltage or limited power according to applicable standards.

WARNING!

Improper installation can lead to death by touching hazardous voltages!

To avoid personal injury, safe separation, double or reinforced insulation and separation of the primary and secondary circuit must be observed and implemented during installation.

- Only use power converters for safety extra-low voltages (SELV) with safe galvanic separation of the primary and secondary circuit.
- Safe separation means that the primary circuit of mains transformers must be separated from the secondary circuit by double or reinforced insulation. The protective extra-low voltage (PELV) offers protection against electric shock.

Electromagnetic compatibility

Table 604: Range of use

Parameter	Value
Industrial applications	Yes
Domestic applications	No

Table 605: Immunity against electrostatic discharge (ESD), according to IEC 61000-4-2, zone B, criterion B

Parameter	Value
Electrostatic voltage in case of air discharge	8 kV
Electrostatic voltage in case of contact discharge	4 kV, in a closed switchgear cabinet 6 kV [1])
ESD with communication connectors	In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
ESD with connectors of terminal bases	The connectors between the Terminal Bases and processor modules or Communication Modules must not be touched during operation. The same is valid for the I/O bus with all modules involved.

[1]) High requirement for shipping classes are achieved with additional specific measures (see specific documentation).

Table 606: Immunity against the influence of radiated (CW radiated), according to IEC 61000-4-3, zone B, criterion A

Parameter	Value
Test field strength	10 V/m

Table 607: Immunity against fast transient interference voltages (burst), according to IEC 61000-4-4, zone B, criterion B

Parameter	Value
Supply voltage units (DC)	2 kV
Supply voltage units (AC)	2 kV
Digital inputs/outputs (24 V DC)	1 kV
Digital inputs/outputs (120 V AC...240 V AC)	2 kV
Analog inputs/outputs	1 kV
CS31 bus	1 kV
Serial RS-485 interfaces (COM)	1 kV
Serial RS-232 interfaces (COM, not for PM55x and PM56x)	1 kV
Ethernet	1 kV
I/O supply (DC-out)	1 kV

Table 608: Immunity against the influence of line-conducted interferences (CW conducted), according to IEC 61000-4-6, zone B, criterion A

Parameter		Value
Test voltage		3V zone B, 10 V is also met.
High energy surges		According to IEC 61000-4-5, zone B, criterion B
	Power supply DC	1 kV CM / 0.5 kV DM [2])
	DC I/O supply	0.5 kV CM / 0.5 kV DM [2])
	Communication Lines, shielded	1 kV CM [2])
	AC I/O unshielded [3])	2 kV CM / 1 kV DM [2])
	I/O analog, I/O DC unshielded [3])	1 kV CM / 0.5 kV DM [2])
Radiation (radio disturbance)		According to IEC 55011, group 1, class A

[2]) CM = Common Mode, DM = Differential Mode

[3]) When DC I/O inputs are used with AC voltage, external filters limiting high energy surges to 1 kV CM / 0.5 DM are required to meet requirements according IEC 61131-2.

Mechanical data

Parameter	Value
Mounting	Horizontal
Degree of protection	IP 20
Housing	Classification V-2 according to UL 94

Parameter	Value
Vibration resistance acc. to EN 61131-2	all three axes 2 Hz...8.4 Hz, continuous 3.5 mm 8.4 Hz...150 Hz, continuous 1 g (higher values on request)
Shock test	All three axes 15 g, 11 ms, half-sinusoidal
Mounting of the modules:	
DIN rail according to DIN EN 50022	35 mm, depth 7.5 mm or 15 mm
Mounting with screws	Screws with a diameter of 4 mm
Fastening torque	1.2 Nm

Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

1.6.4.6.2 Mechanical dimensions

Switchgear cabinet assembly

Information on EMC-conforming assembly and construction is provided within the overall functions section ↳ Chapter 1.6.4.4.4 “EMC-conforming assembly and construction” on page 3345.

PLC enclosure

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

To protect PLCs against:

- unauthorized access,
- dusting and pollution,
- moisture and wetness and
- mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:

- enclosure walls
- wireways
- adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and galvanic isolation.

It is recommended to mount the modules on an grounded mounting plate, or an grounded DIN rail, independent of the mounting location.

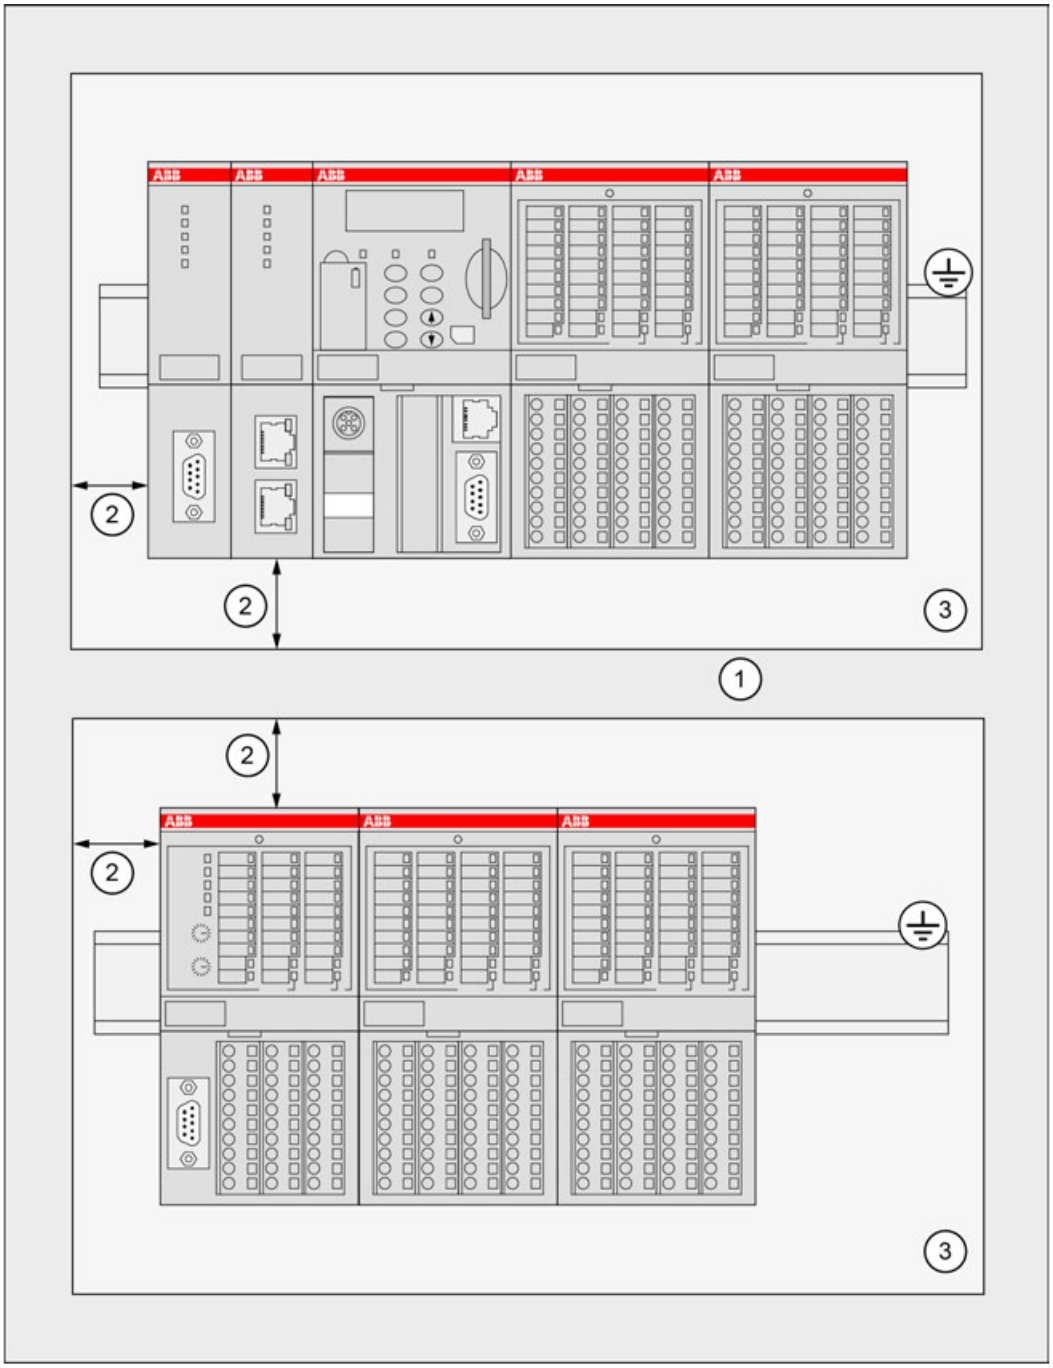

Fig. 279: Installation of AC500/S500 modules in a switchgear cabinet

1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, grounded

NOTICE!

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating (see *Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3398*).

When vertically mounted, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

With high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

Mechanical dimensions AC500

Dimensions: terminal bases

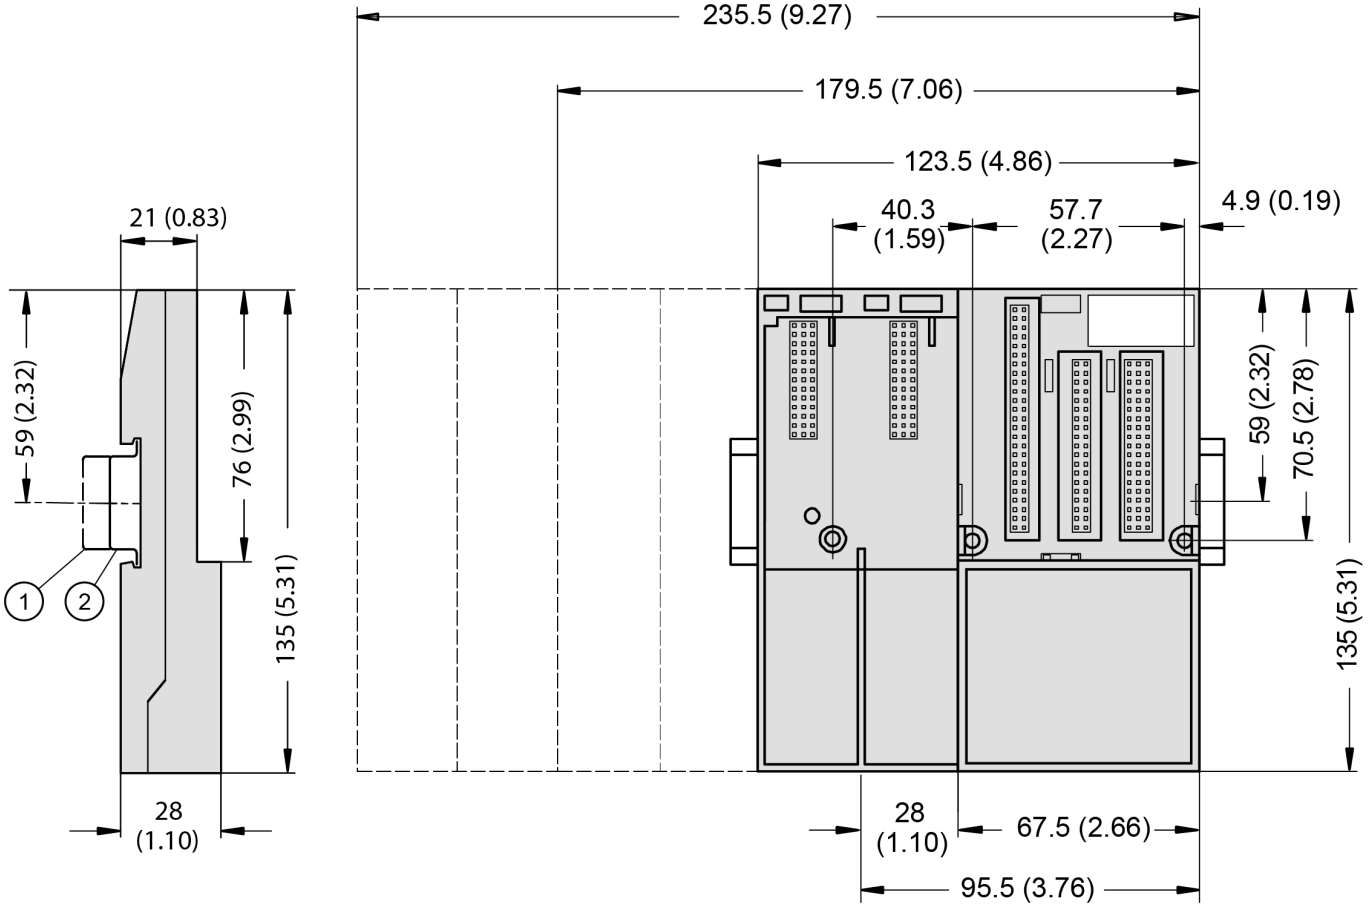

Fig. 280: Terminal bases, side view and front view

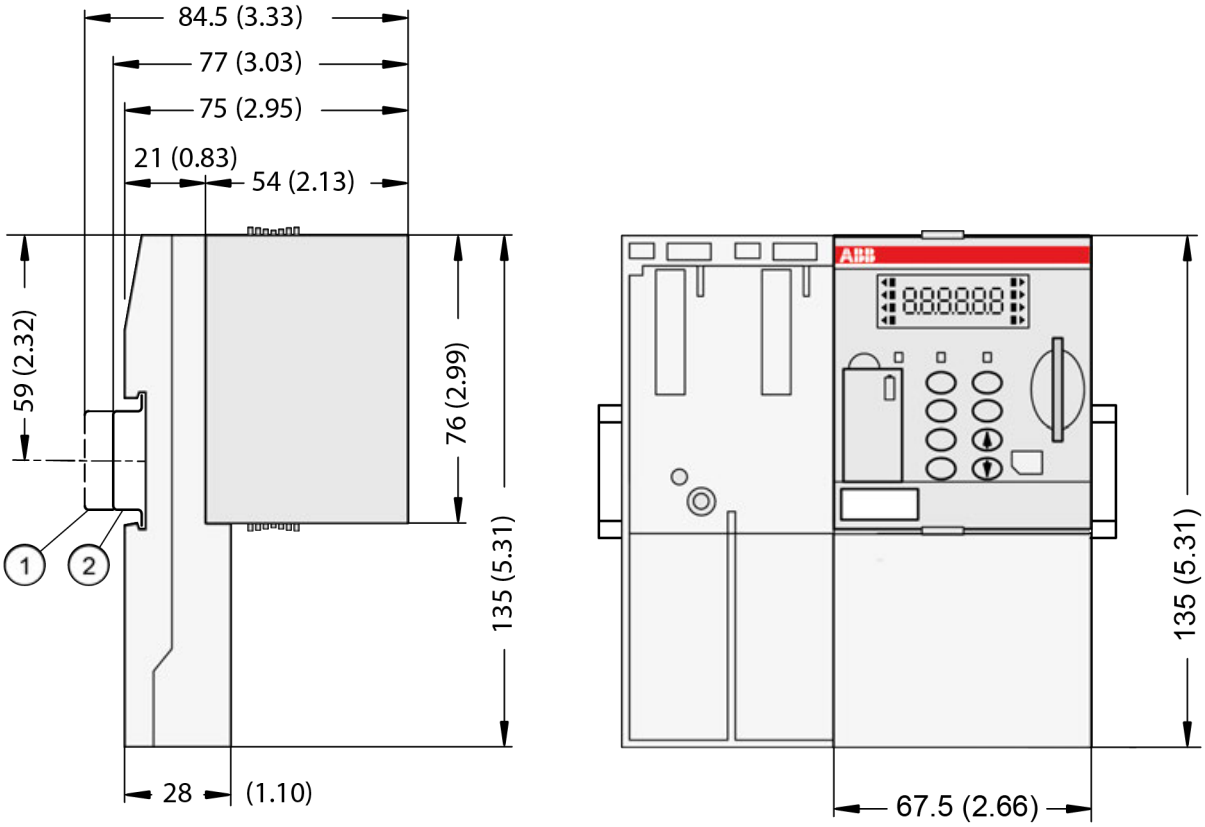

Fig. 281: Terminal bases with processor modules, side view and front view

Mechanical dimensions S500

Dimensions:
Terminal units

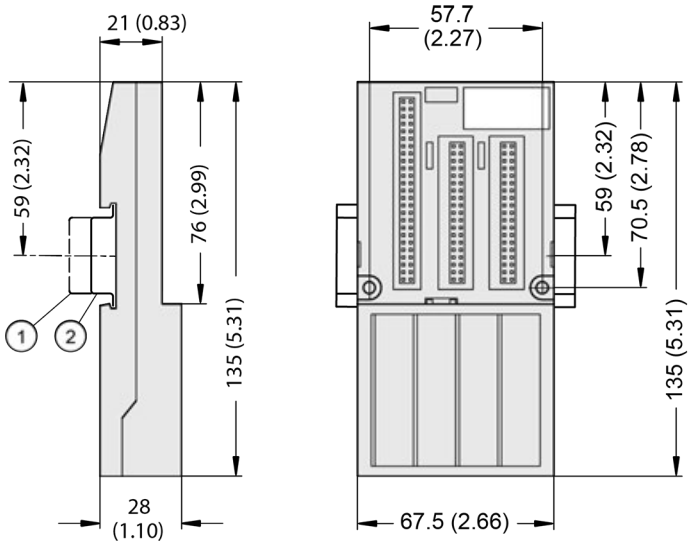

Fig. 282: Terminal units, side view and front view

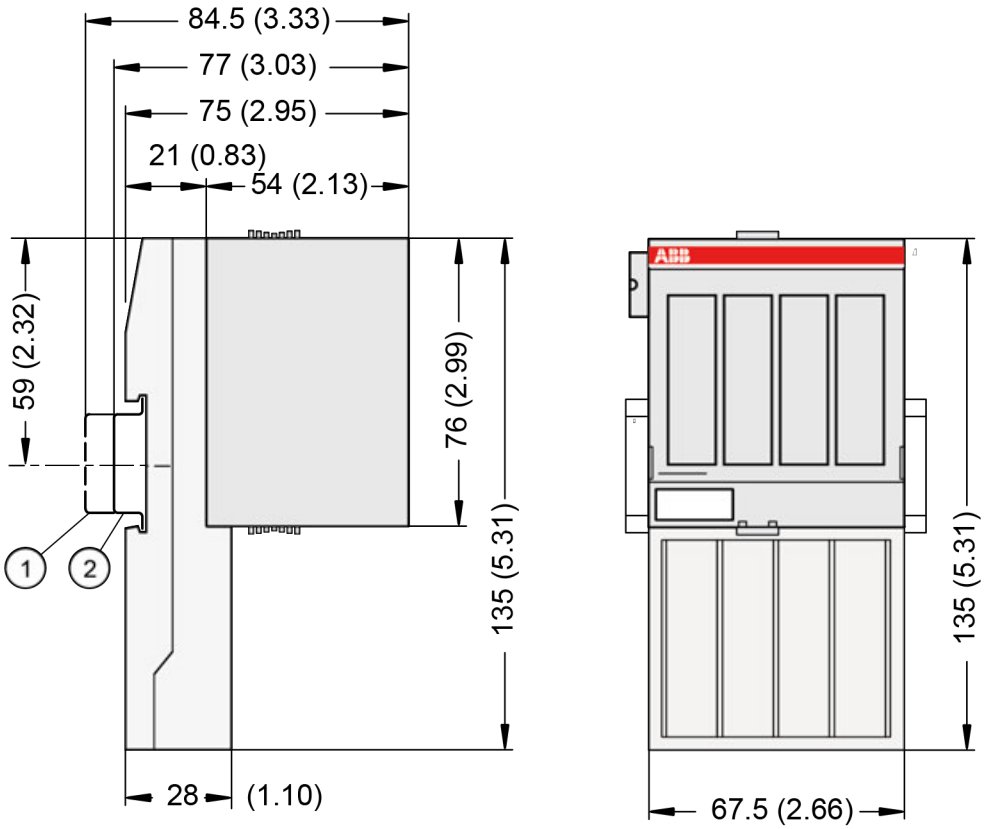

Fig. 283: Terminal units and S500 modules, side view and front view

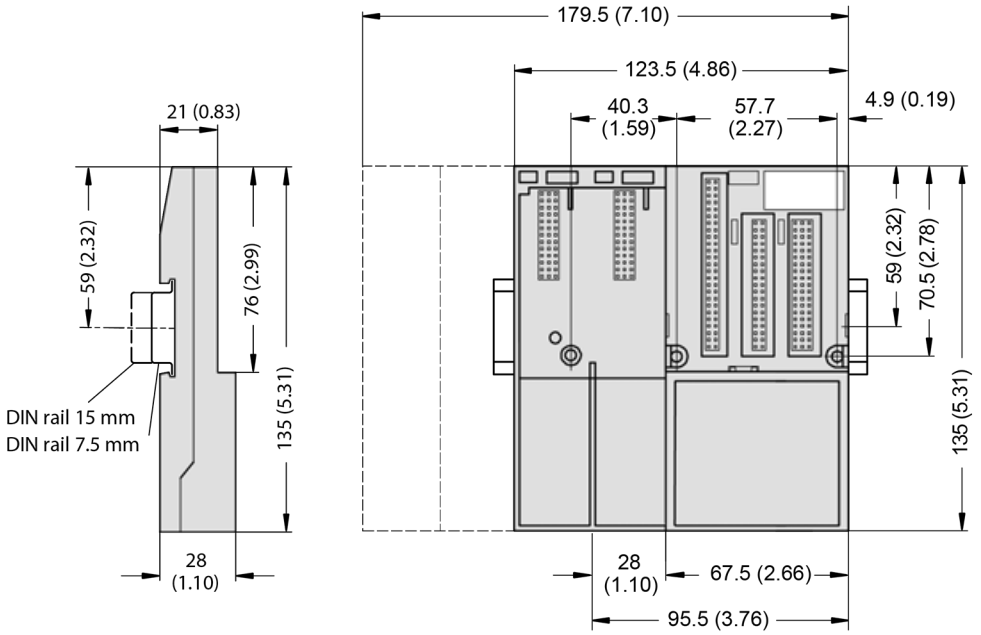

Fig. 284: Terminal base (for comparison)

All dimensions are in mm (in.). Hole spacing tolerance: ±0.4 mm (0.016 in.)

1.6.4.6.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

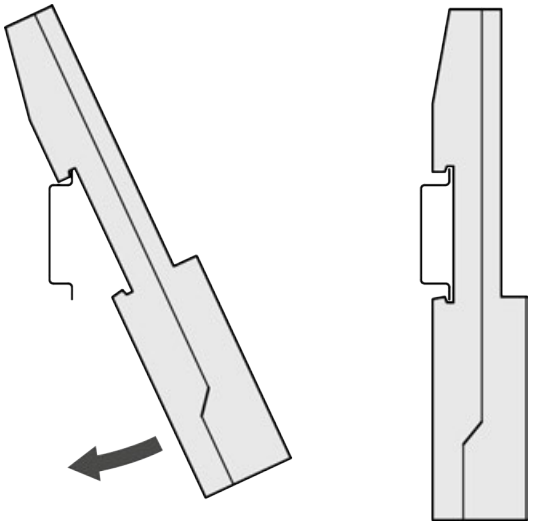
During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting/Demounting terminal bases and function module terminal bases

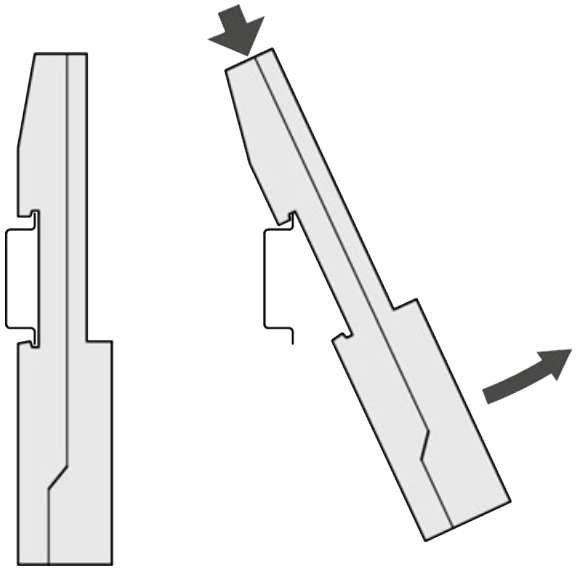
Demounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal base/function module terminal base:



⇨ The terminal base is put on the DIN rail above and then snapped-in below.

3. The demounting is carried out in a reversed order.



Mounting with screws

If the terminal base should be mounted with screws, wall mounting accessories TA526 ↳ *Chapter 1.6.4.6.5.5 “TA526 - Wall mounting accessory” on page 3445* must be inserted at the rear side first. These plastic parts prevent bending of the terminal base while screwing on. TB560x and TB561x need one TA526, TB562x, TB564x and TB566x need two TA526.

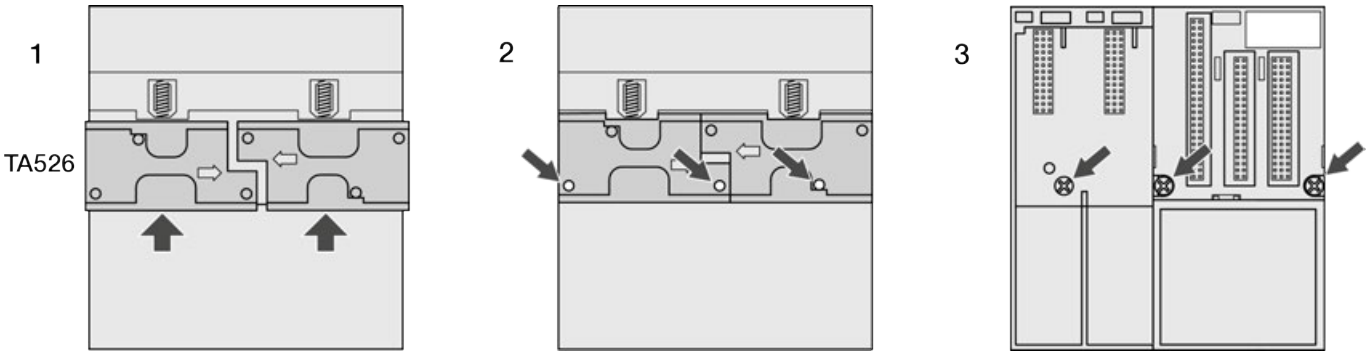


Fig. 285: Terminal bases, Fastening with screws

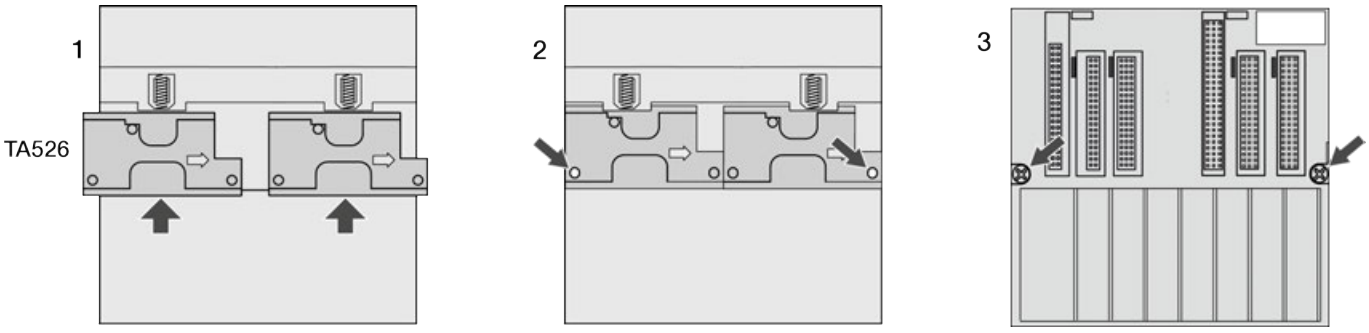

Fig. 286: Function module terminal bases, Fastening with screws

By wall mounting, the terminal base is grounded through the screws. It is necessary that

- *the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)*
- *the mounting plate is grounded*
- *the screws have a good electrical contact to the mounting plate*

Practical tip

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

> *If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.*

7. Repeat the steps for all remaining modules.

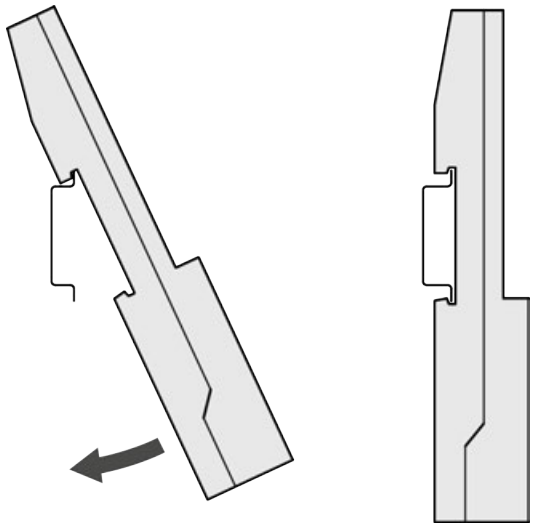
Mounting/Demounting the terminal unit

Mounting on DIN rail

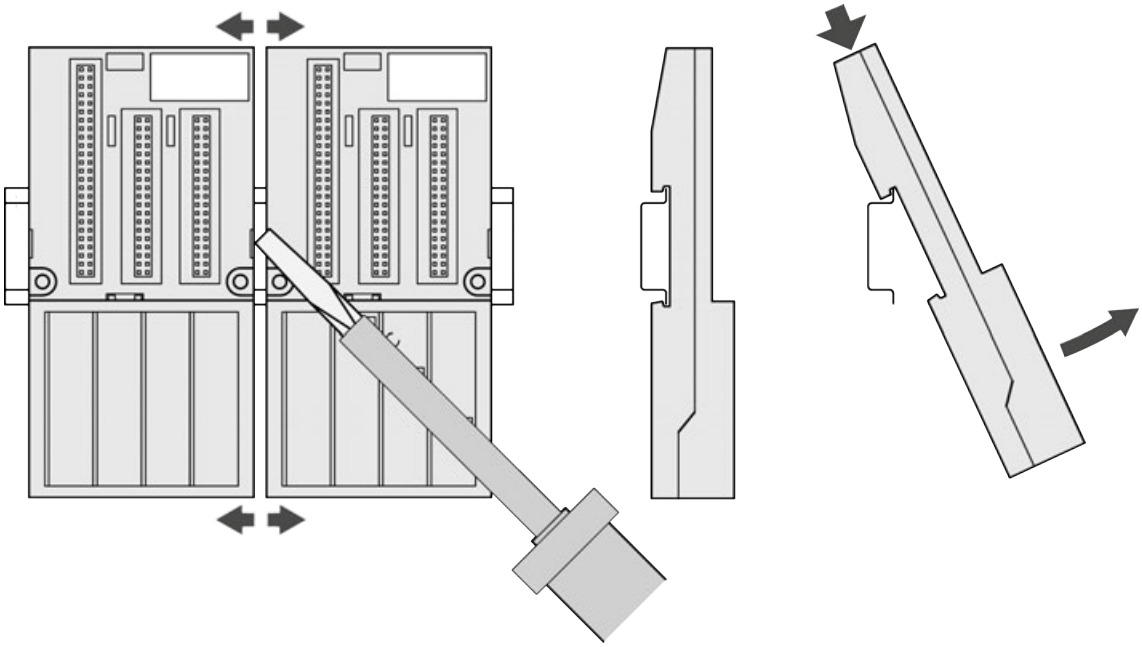
1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the terminal unit.

   The terminal unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the terminal unit to the left until it fully locks into place creating a solid mechanical and connection.

> *When attaching the devices, make sure the bus connectors are securely locked together to ensure proper connection. Max. 10 terminal units can be attached.*



3. Demounting: A screwdriver is inserted in the indicated place to separate the terminal units.



Mounting with screws

If the terminal unit should be mounted with screws, wall mounting accessories TA526 ↳ *Chapter 1.6.4.6.5.5 “TA526 - Wall mounting accessory” on page 3445* must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on.

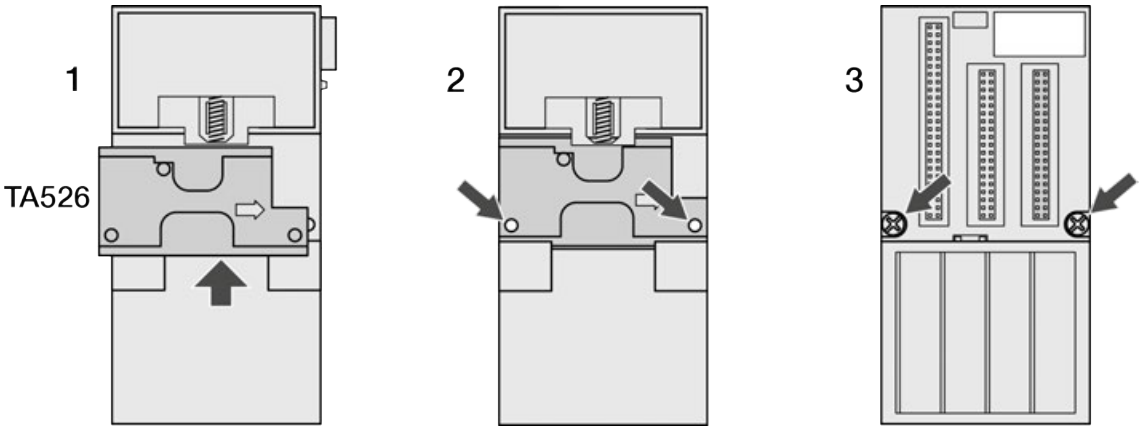


Fig. 287: Fastening with screws

By wall mounting, the terminal unit is grounded through the screws. It is necessary that

- *the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)*
- *the mounting plate is grounded*
- *the screws have a good electrical contact to the mounting plate*

Practical tip

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one terminal base and two terminal units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.

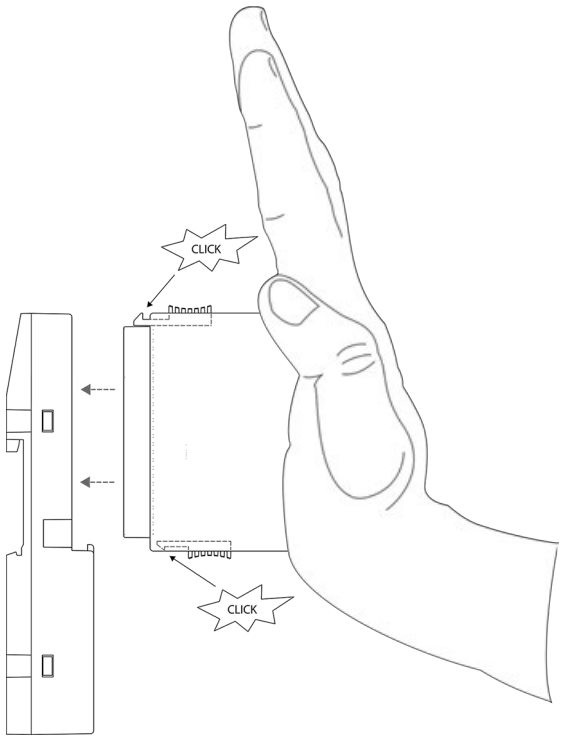
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

> *If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.*

7. Repeat the steps for all remaining modules.

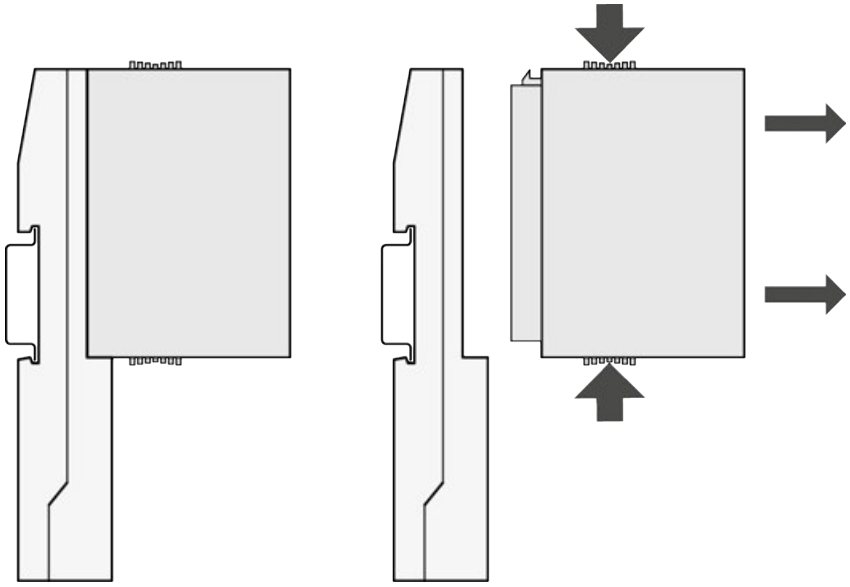
Mounting processor modules PM57x, PM58x, PM59x and PM56xx

1. After mounting the Terminal Base on the DIN rail, mount the processor module.



2. Press the processor module into the Terminal Base until it locks in place.

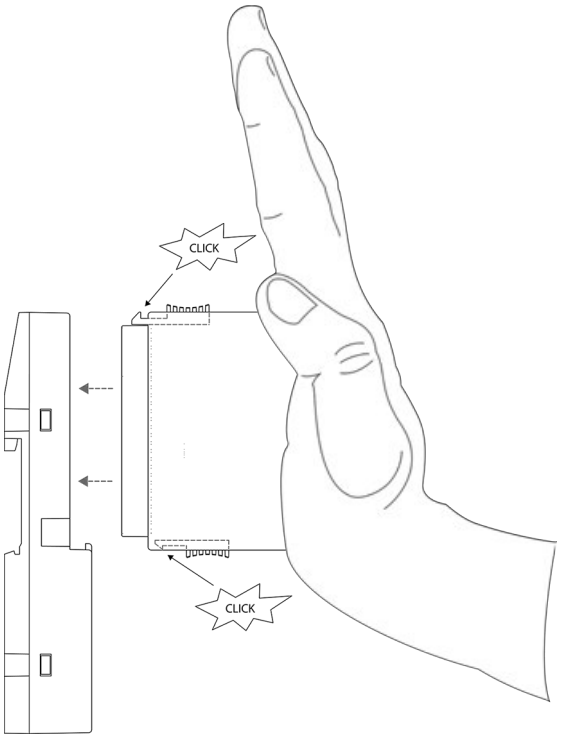
3. The demounting is carried out in a reversed order. Press above and below, then remove the processor module.



Mounting/Demounting the I/O modules

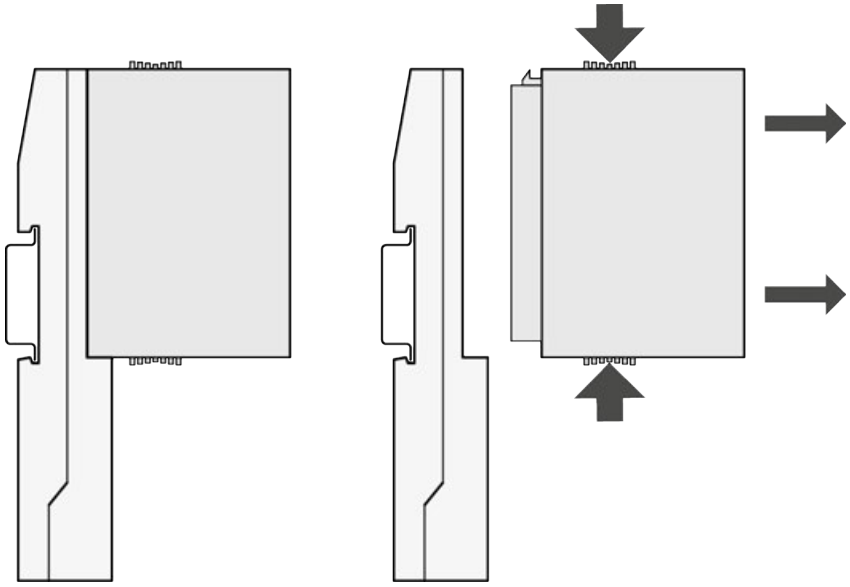
After mounting the terminal unit, mount the I/O modules.

1. Press the I/O module into the terminal unit until it locks in place.



2. The demounting is carried out in a reversed order.

   Press above and below, then remove the module.



Mounting/Demounting the communication modules

Communication modules are mounted on the left side of the processor module on the same terminal base. The connection is established automatically when mounting the communication module.

NOTICE!

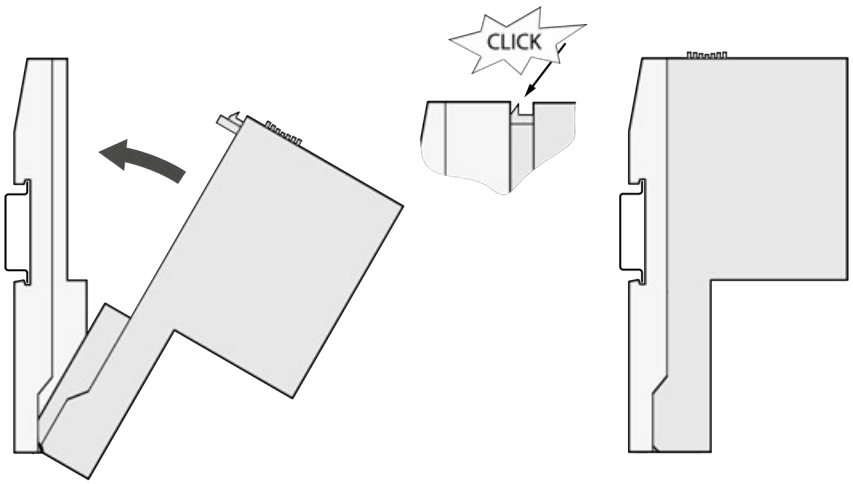
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the terminal base, mount the communication modules.

1. First insert the bottom nose of the communication module into the dedicated holes of the terminal base. Then, rotate the communication module on the dedicated terminal base slot until it is locked in place.



⇨

NOTICE!

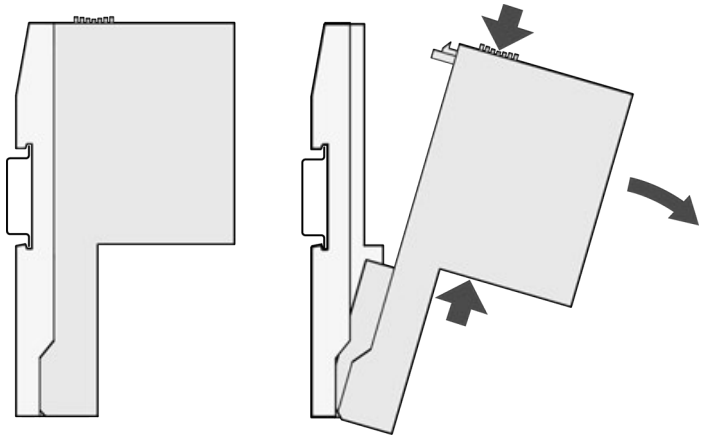
Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

– Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ↬ *Chapter 1.6.4.6.5.6 “TA524 - Dummy communication module” on page 3446*.
– I/O bus connectors must not be touched during operation.

2. The demounting is carried out in a reversed order.

   Press above and below, then rotate the communication module and remove it.



Mounting/Demounting the accessories

Additional components such as batteries, cables, etc. are required for commissioning the PLC system. Information on assembly, replacement or basic use of the orderable components can be found in the description of the respective accessory.

↬ *Chapter 1.6.4.6.5 “Handling of accessories” on page 3428*

Hardware details can be found in the device specifications of the accessory.

↬ *Chapter 1.6.3.8 “Accessories” on page 3288*

1.6.4.6.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device description of the appropriate device.

NOTICE!

Attention:

The devices should be installed by experts who are trained in wiring electronic devices. In case of bad wiring, the following problems could occur:

- On the terminal base, the terminals L+ and M are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the terminal base itself might be destroyed.
- The terminal bases and all electronic modules and terminal units are protected against reverse polarity.
- All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

NOTICE!

Attention:

Due to possible loss of communcation, the communication cables should be fixed with cable duct or bracket or clamp during application.

Power supply

AC500 system power supply

As soon as the power supply of the processor module (CPU) is higher than the minimum Process and supply voltage (see *Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3398*), the power supply detection is activated and the processor module is started. Power supply of processor module and I/O modules should be powered on the same time, otherwise the processor module will not switch to run after startup.

When during operation the power supply is going down lower than the minimum Process and supply voltage (see *Chapter 1.6.4.6.1.1 “Environmental conditions” on page 3398*) for more than 10 ms, the processor module is switched to safety mode (display shows “AC500”). A restart of the processor module only occurs by switching the power supply off and on again.

If an I/O module is disconnected during normal operation from power supply while processor module is still powered, the processor module will continue its normal operation on all other powered peripherals (I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of I/O Module power supply it will continue normal operation and inputs and outputs were updated.

Logic Controller Supply: AC500 logic controller power supply is provided through terminals L+ / M.

Process Power Supply: S500 process power supply is provided through terminals UP / ZP.

Logic Controller Supply is galvanic isolated from Process Power Supply.

As system power supply for AC500/S500, the ABB CP power supply series can be used.

Power supply for processor modules

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm^2 conductor) via these terminals.

Pin assignment

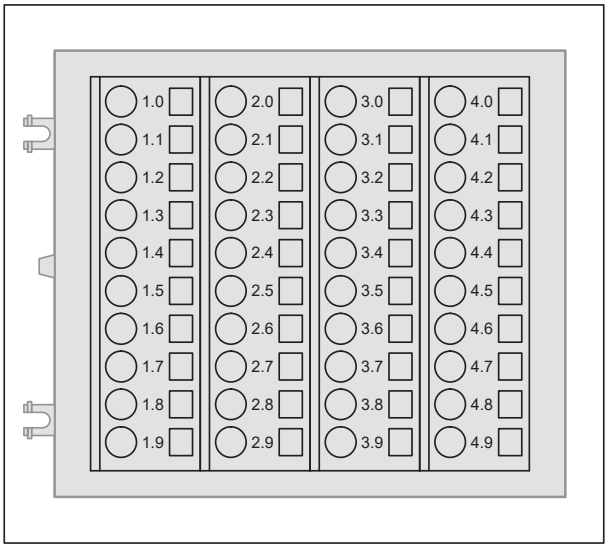
Pin Assignment		Label	Function	Description
 Terminal block removed	 Terminal block inserted	L+	+24 V DC	Positive pin of the power supply voltage
		L+	+24 V DC	Positive pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		M	0 V	Negative pin of the power supply voltage
		⏚	FE	Functional earth

Terminals for power supply and the COM1 interface

Terminal type: Spring terminal

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 1.5 mm^2
1	Flexible	0.08 mm^2 to 1.5 mm^2
1 with wire-end ferrule (without plastic sleeve)	Flexible	0.25 mm^2 to 1.5 mm^2
1 with wire-end ferrule (with plastic sleeve)	Flexible	0.25 mm^2 to 0.5 mm^2
1 (TWIN wire end ferrule)	Flexible	0.5 mm^2

Terminals at the terminal unit



Terminal type: Screw-type terminal

Front terminal, conductor connection vertically with respect to the printed circuit board.

Parameter	Value

1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule	Flexible	0.25 mm^2 to 1.5 mm^2
2	Solid	Not intended
2	Flexible	Not intended
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.25 mm^2 or 2 x 0.5 mm^2 or 2 x 0.75 mm^2, with square cross-section of the wire-end ferrule also 2 x 1.0 mm^2

Terminal units with product index ≥ C0 e. g. 1SAP 212 200 R0001 C0

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule without plastic sleeve	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule with plastic sleeve	Flexible	0.14 mm^2 to 1.5 mm^2
2	Solid	0.08 mm^2 to 1.5 mm^2
2	Flexible	0.08 mm^2 to 1.5 mm^2
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.5 mm^2 to 2 x 1.0 mm^2
2 with separate wire-end ferrule without plastic sleeve	Flexible	0.08 mm^2 to 0.75 mm^2

Terminal type: Spring terminal

Front terminal, conductor connection vertically with respect to the printed circuit board.

Parameter	Value
Type	Front terminal
Degree of protection	IP 20
Stripped conductor end	9 mm, min. 8 mm
Needed tool	Slotted screwdriver
Dimensions	2.5 x 0.4 to 3.5 x 0.5 mm, screwdriver must be at least 15 mm free of insulation at the tip

Number of cores per terminal	Conductor type	Cross section
1	Solid	0.08 mm^2 to 2.5 mm^2
1	Flexible	0.08 mm^2 to 2.5 mm^2
1 with wire-end ferrule	Flexible	0.25 mm^2 to 1.5 mm^2
2	Solid	Not intended
2	Flexible	Not intended
2 with TWIN wire end ferrule (length 10 mm) with plastic sleeve	Flexible	2 x 0.25 mm^2 or 2 x 0.5 mm^2 or 2 x 0.75 mm^2, with square cross-section of the wire-end ferrule also 2 x 1.0 mm^2

Connection of wires at the spring terminals

Connection

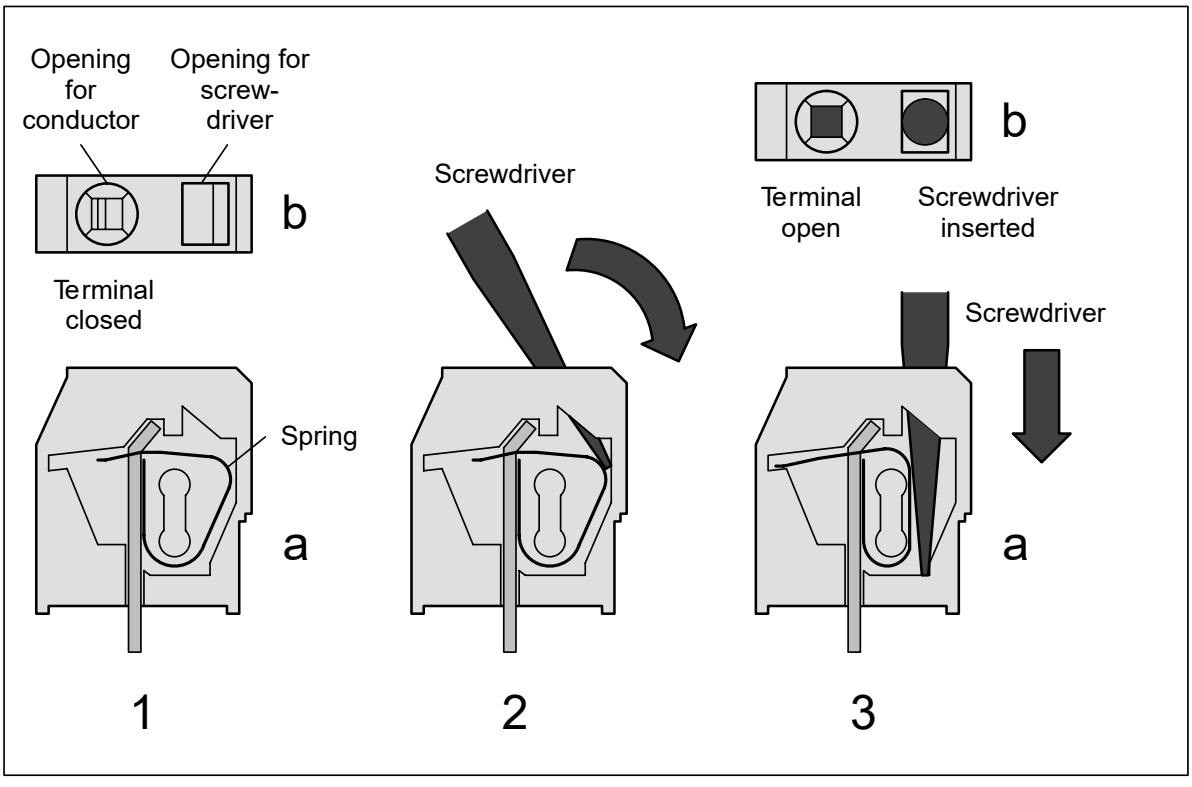

Fig. 288: Connect the wire to the spring terminal (steps 1 to 3)

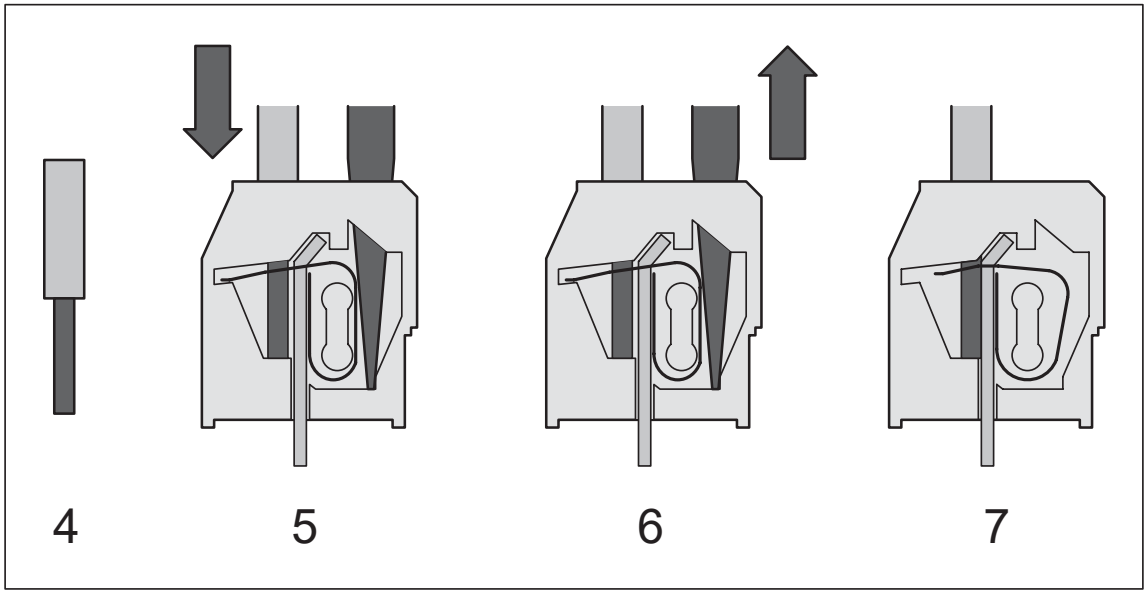

Fig. 289: Connect the wire to the spring terminal (steps 4 to 7)

1. Side view (open terminal drawn for illustration)
2. The top view shows the openings for wire and screwdriver
3. Insert screwdriver (2.5 x 0.4 to 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
4. While erecting the screwdriver, insert it until the stop (requires a little strength)
5. Screwdriver inserted - terminal open
6. Strip the wire for 7 mm (and put on wire-end ferrule)
7. Insert wire into the open terminal
8. Done

Disconnection

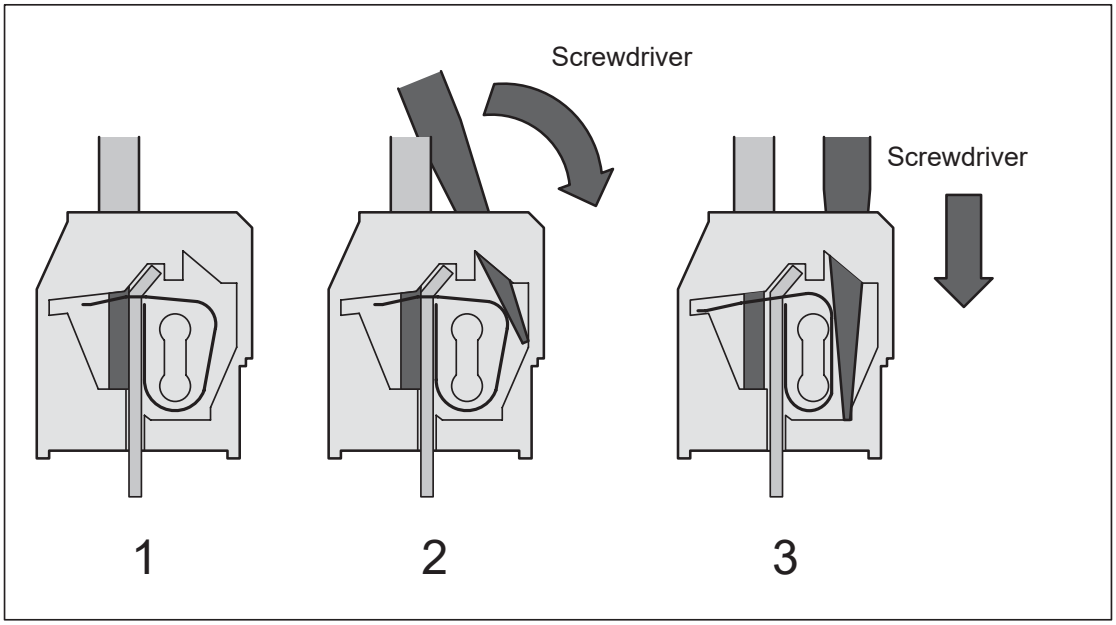

Fig. 290: Disconnect wire from the spring terminal (steps 1 to 3)

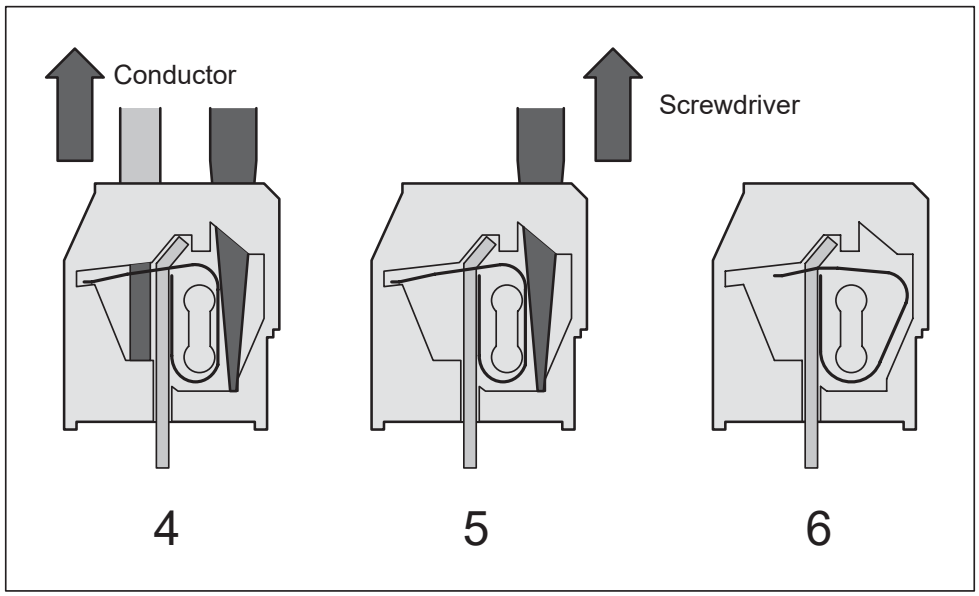

Fig. 291: Disconnect wire from the spring terminal (steps 4 to 6)

1. Terminal with wire connected
2. Insert screwdriver (2.5 x 0.4 to 3.5 x 0.5 mm) at an angle, screwdriver must be at least 15 mm free of insulation at the tip
3. While erecting the screwdriver, insert it until the stop (requires a little strength) - terminal is now open
4. Remove wire from the open terminal
5. Done

Terminals for CANopen/DeviceNet communication modules

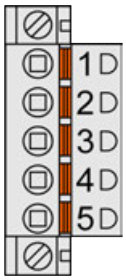

Fig. 292: Combicon, 5-pole, female, removable plug with spring terminals

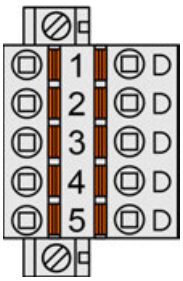

Fig. 293: Combicon, 5-pole, female, removable plug with spring terminals

Terminal type: Spring terminal

Number of cores per terminal	Conductor type	Cross section	Stripped conductor end
1	solid	0.2 mm^2 to 2.5 mm^2	10 mm
1	flexible	0.2 mm^2 to 2.5 mm^2	10 mm
1 with wire-end ferrule (without plastic sleeve)	flexible	0.25 mm^2 to 2.5 mm^2	10 mm
1 with wire-end ferrule (with plastic sleeve)	flexible	0.25 mm^2 to 2.5 mm^2	10 mm

CANopen field bus

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

Length of segment [m]	Bus cable (shielded, twisted pair)			Max. transmission rate [kbit/s]
	Conductor cross section [mm^2]	Line resistance [Ω/km]	Wave impedance [Ω]	
0...40	0.25...0.34 / AWG23, AWG22	70	120	1000 at 40 m
40...300	0.34...0.60 / AWG22, AWG20	< 60	120	< 500 at 100 m
300...600	0.50...0.60 / AWG20	< 40	120	< 100 at 500 m
600...1000	0.75...0.80 / AWG18	< 26	120	< 50 at 1000 m

NOTICE!

Risk of telegram and data errors!

The use of wrong cable type and quality could lead to limitations in cable length, causing telegram and data errors.

NOTICE!

Risk of damaging the terminating resistor!

A bus-line short-circuit to the 24 V DC power supply can cause damage by exceeding the power rating of the terminating resistor.

NOTICE!

Risk of telegram and data errors!

Miss- or unterminated data lines can cause reflections on the bus, leading to telegram and data errors. For maximum cable length and transmission rate, the bus must always be terminated on both ends with the characteristic impedance of the cable type.

NOTICE!

Verification of termination (Make sure the power supply on all CAN nodes is turned off)!

To verify the termination, the DC resistance between CAN_H and CAN_L can be measured. The value should be between 50 Ω and 70 Ω.

Check for correct resistor values, short circuits and correct number of terminating resistors, if the measurement is showing deviations.

Installation hint

Ensure that the termination and FE connection will not be removed when removing CAN modules from the bus.

Branches are not allowed in a CAN network. Stubs should be avoided or kept as short as possible (< 0.3 m).

When connecting the cable take care to use one dedicated twisted pair for the CAN signals (CAN_L and CAN_H) and another free wire for CAN_GND. CAN_GND must be connected as reference, to avoid common mode problems causing telegram errors.

Keep the CAN bus wiring away from electrical disturbance and close to earth potential to minimize interference.

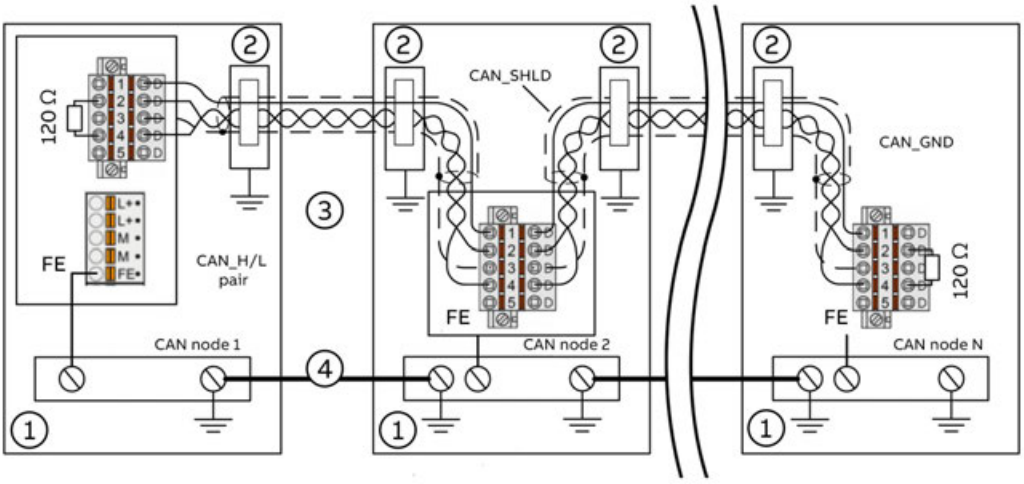

Fig. 294: CAN bus, connection and wiring

	8	NU	Not used
	Shield	Cable shield	Functional earth

See supported protocols and used Ethernet ports: *Chapter 1.6.5.1.7.1.2 “Ethernet protocols and ports for AC500 V3 products” on page 3515*.

See communication via Modbus TCP/IP: *Chapter 1.6.5.1.11 “Communication with Modbus TCP/IP” on page 3558*.

See communication via Modbus RTU: *Chapter 1.6.5.1.10 “Communication with Modbus RTU” on page 3542*.

Wiring

Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

The following table shows the specified properties of the respective cable types per 100 m.

Table 609: Specified cable properties:

Parameter	10Base-T [10 MHz]	100Base-TX [100 MHz]
Attenuation [dB / 100m]	10.7	23.2
NEXT [dB / 100m]	23	24
ACR [dB / 100m]	N/A	4
Return loss [dB / 100m]	18	10
Wave impedance [Ohms]	100	100
Category	3 or higher	5
Class	C or higher	D or higher

TP cable

The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

Table 610: Color coding of TP cables:

Pairs	EIA/TIA 568 Version 1		EIA/TIA 568 Version 2		DIN 47100		IEC 189.2	
Pair 1	white/ blue	blue	green	red	white	brown	white	blue
Pair 2	white/ orange	orange	black	yellow	green	yellow	white	orange

Pairs	EIA/TIA 568 Version 1		EIA/TIA 568 Version 2		DIN 47100		IEC 189.2	
Pair 3	white/ green	green	blue	orange	grey	pink	white	green
Pair 4	white/ brown	brown	brown	slate	blue	red	white	brown

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.

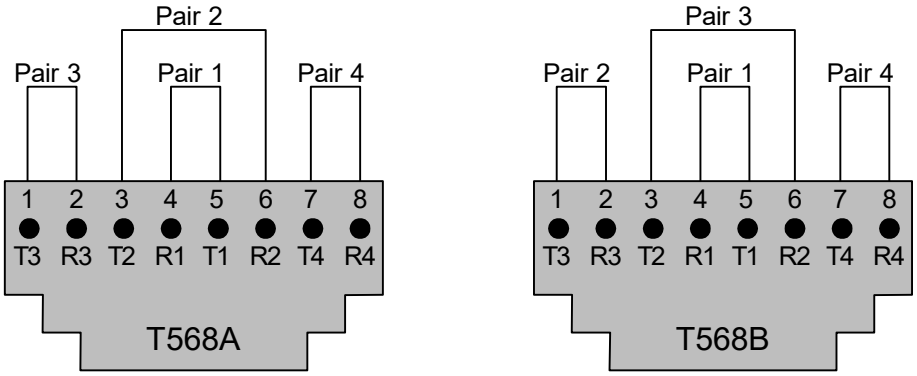

Fig. 295: Pin assignment of RJ45 sockets

Cable types

Crossover cable

> ***Particular use***
> *Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase "Classic".*

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.

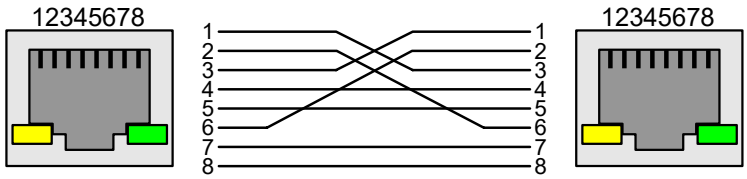

Fig. 296: Wiring of a crossover cable

Straight-through cable

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

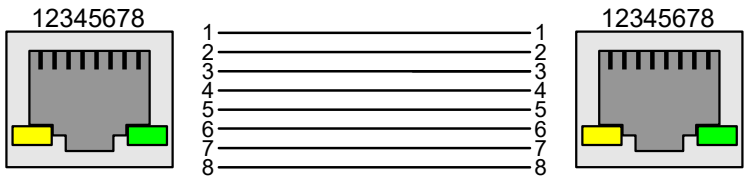

Fig. 297: Wiring of a straight-through cable

CAUTION!
Risk of communication faults!
When using inappropriate cables, malfunctions in communication may occur.

Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 processor modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the function block COM_MOD_MAST.

Technical data

The Modbus operating mode and the interface parameters are set in the ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*.

Table 611: Description of the Modbus protocol

Parameter	Value
Supported standard	See ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*
Number of connection points	1 client Max. 1 server with RS-232 interface Max. 31 servers with RS-485
Protocol	Modbus
Operating mode	Client/server
Address	Server only
Data transmission control	CRC16
Data transmission speed	From 9,600 bits/s to 115,200 bits/s ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*
Encoding	1 start bit 8 data bits 1 or 2 stop bits 1 parity bit ↳ *Chapter 1.6.6.2.14.1 “Configuring Modbus RTU on serial interface” on page 3793*)
Max. cable length for RS-485 on COM1 for AC500 CPU	1.200 m at 19.200 baud

Bus topology Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol.

For further information on Modbus see chapter *Chapter 1.6.5.1.10 “Communication with Modbus RTU” on page 3542*.

1.6.4.6.5 Handling of accessories

This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

MC502 - Memory card

- Solid state flash memory storage

1 MC502 memory card

The memory card has a write protect switch.

In the position "LOCK", the memory card can only be read.

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

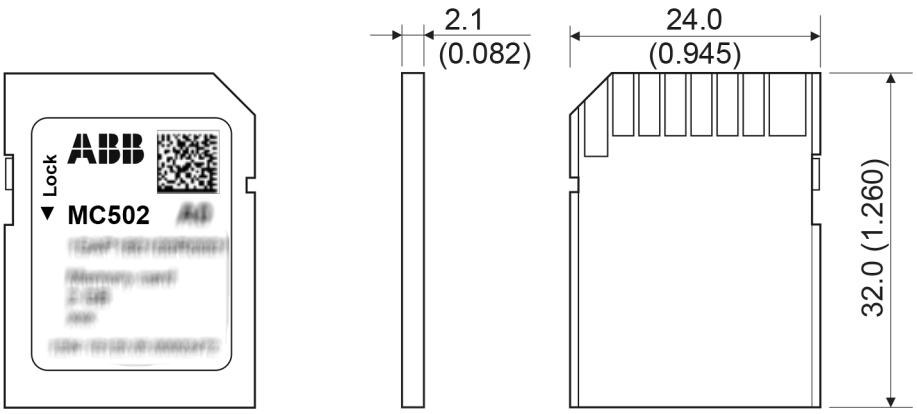
Processor modules are supplied without (micro) memory card. It must be ordered separately.

The memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The memory card is intended for long-term use in standard and XC application.

The memory card can be read/written on a PC with a SDHC compatible memory card reader.

Dimensions



The dimensions are in mm and in brackets in inch.

Insert the memory card

AC500 V3

1. Unpack the memory card.
2. Insert the memory card into the memory card slot of the processor module until locked.

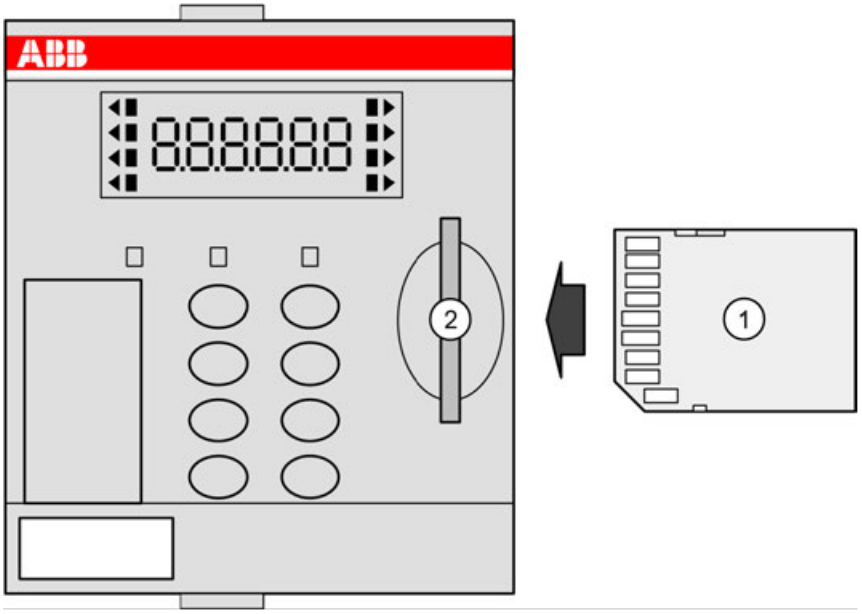


Fig. 298: Insert memory card into PM56xx

1 Memory card
2 Memory card slot

Remove the memory card

AC500 V3

NOTICE!

Removal of the memory card

Do not remove the memory card when it is working!

Remove the memory card only when no black square (■) is shown next to MC in the display.

Otherwise the memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

1. To remove the memory card, push on the memory card until it moves forward.
2. By this, the memory card is unlocked and can be removed.

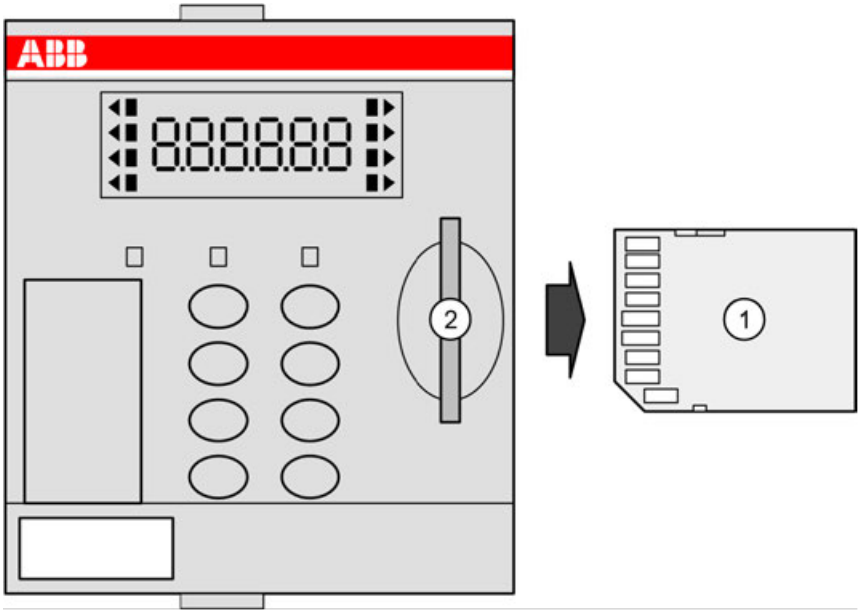

Fig. 299: Remove memory card from PM56xx

1 Memory card
2 Memory card slot

Technical data

Parameter		Value
Memory capacity		2 GB
Total bytes written (TBW)		On request
Data retention		
	at beginning	10 years at 40 °C
	when number of write processes has been 90 % of lifetime of each cell	1 year at 40 °C
Write protect switch		Yes, at the edge of the memory card
Weight		2 g
Dimensions		24 mm x 32 mm x 2.1 mm

It is not possible to use 100 % of a device's memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the memory card in AC500 PLCs is provided in the chapter
Chapter 1.6.7.2 “Memory card in AC500 V3” on page 3999.

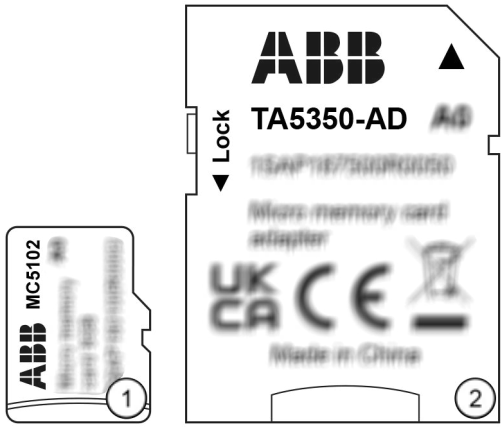
Ordering data

Part no.	Description	Product life cycle phase *)
1SAP 180 100 R0001	MC502, memory card	Classic

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

MC5102 - Micro memory card with micro memory card adapter

- Solid state flash memory storage



1 Micro memory card
2 TA5350-AD micro memory card adapter

The MC5102 micro memory card has no write protect switch.

The TA5350-AD micro memory card adapter has a write protect switch.

In the position "LOCK", the inserted micro memory card can only be read.

Memory card type	AC500 V2	AC500-XC V2	AC500-eCo V2 [3])	AC500 V3	AC500-XC V3	AC500-eCo V3
MC502	x	x	x	x	x	-
MC5141	x	x	x	x	x	-
MC5102 **with** TA5350-AD micro memory card adapter	x [1])	x [1]) [2])	x [1])	x	x [2])	-
MC5102 **without** TA5350-AD micro memory card adapter	-	-	-	-	-	x

[1]) As of firmware 2.5.x

[2]) Temporary use of MC5102 is possible under normal environmental conditions, but MC5141 should be preferred.

[3]) A memory card can only be inserted when a MC503 memory card adapter is installed in the processor module.

The use of other micro memory cards is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

Purpose

Processor modules can be operated with and without (micro) memory card.

Processor modules are supplied without (micro) memory card. It must be ordered separately.

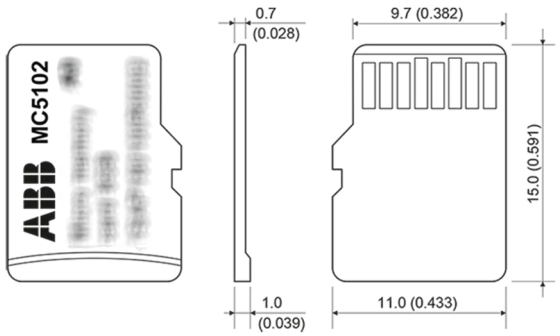
The micro memory card is used to store or backup application data and/or application programs or project source codes as well as to update the internal CPU firmware.

The micro memory card can only be used temporarily in standard and XC applications.

The memory card can be read/written on a PC with a SDHC compatible memory card reader when using TA5350-AD micro memory card adapter.

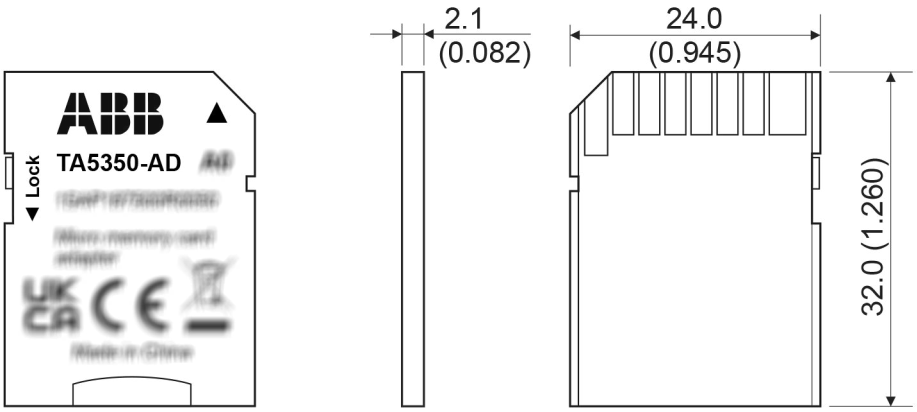
Dimensions

Micro memory card



The dimensions are in mm and in brackets in inch.

Micro memory card adapter



The dimensions are in mm and in brackets in inch.

Insert the micro memory card

AC500 V3

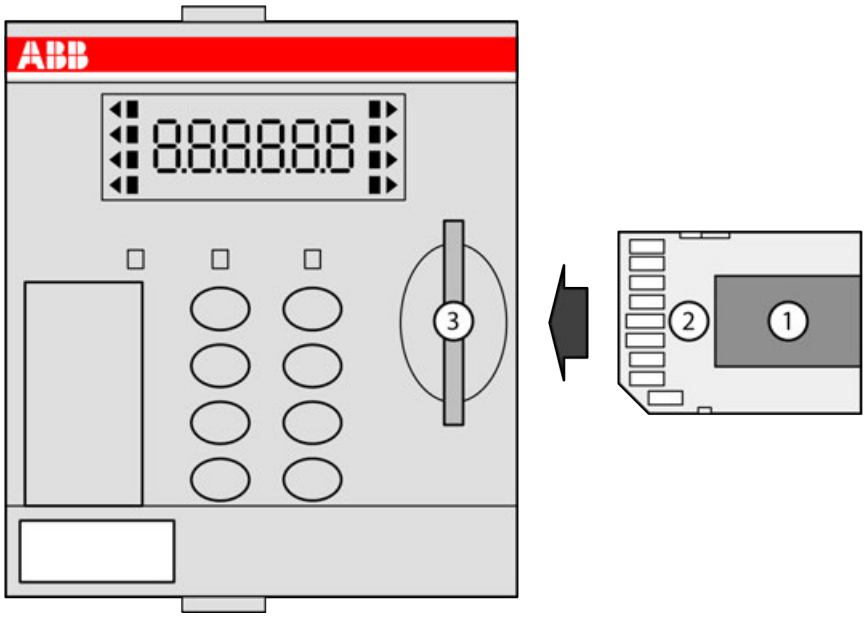


Fig. 300: Insert micro memory card into PM56xx

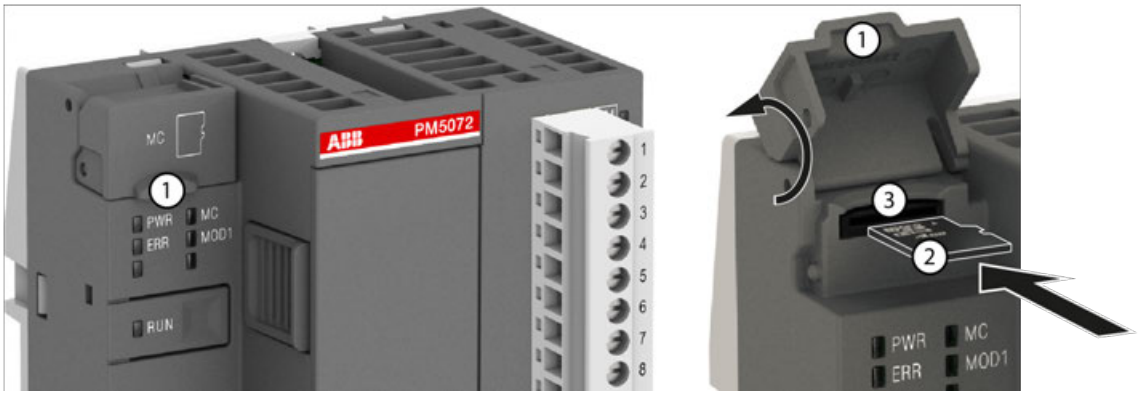
1 Micro memory card
2 TA5350-AD micro memory card adapter
3 Memory card slot

1. Unpack the micro memory card and insert it into the supplied micro memory card adapter.
2. Insert the micro memory card adapter with integrated micro memory card into the memory card slot of the processor module until locked.

AC500-eCo V3



1 Micro memory card slot cover
2 Micro memory card
3 Micro memory card slot

1. Open the micro memory card slot cover by turning it upwards.
2. Carefully insert the micro memory card into the micro memory card slot as far as it will go. Observe orientation of card.
3. Close the micro memory card slot cover by turning it downwards.

Remove the micro memory card

NOTICE!

Removal of the micro memory card

Do not remove the micro memory card when it is working!

AC500 V3: Remove the micro memory card with micro memory card adapter only when no black square (■) is shown next to MC in the display.

AC500-eCo V3: Remove the micro memory card only when the MC LED is not blinking.

Otherwise the micro memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

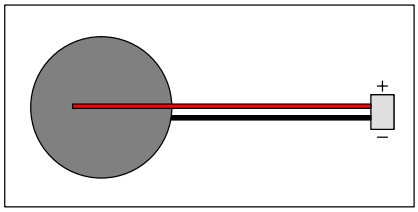
TA521 - Battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable



Purpose

The TA521 battery is the only applicable battery for the AC500 processor modules *Chapter 1.6.3.3.2.1 “PM56xx-2ETH for AC500 V3 products” on page 2516*. It cannot be recharged.

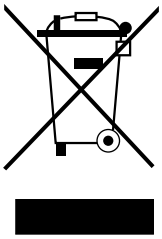
The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. *Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479*

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.



Battery lifetime

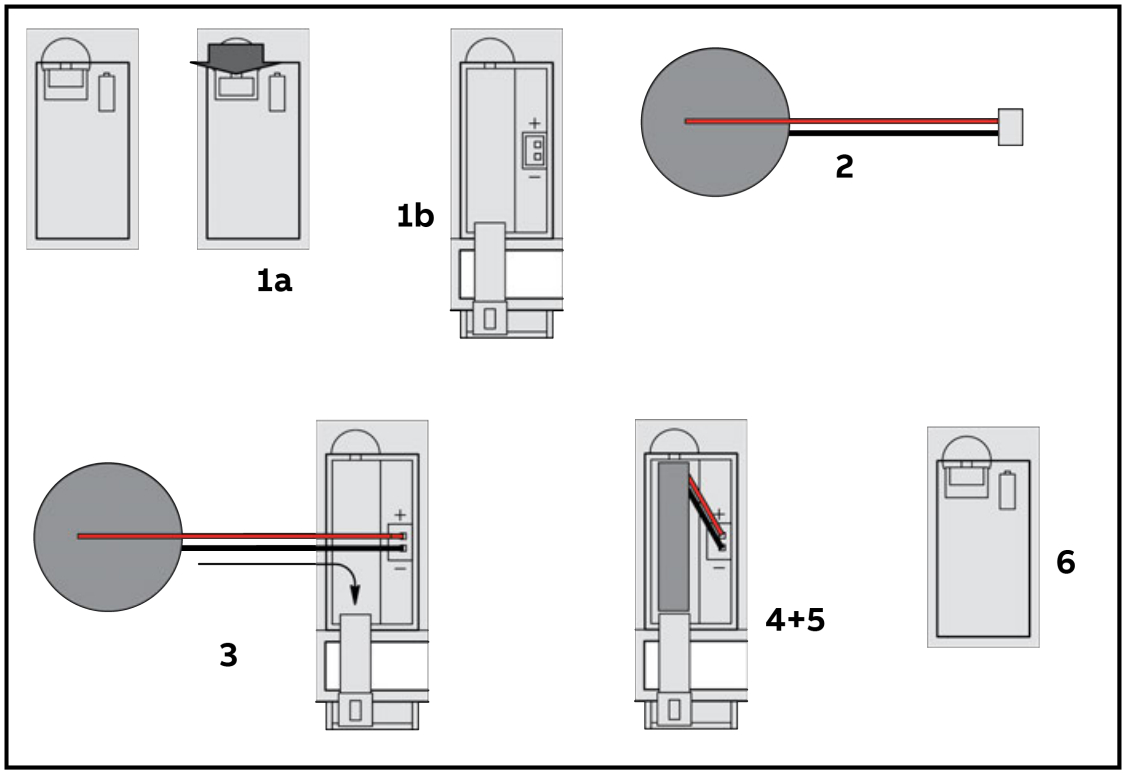
The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

Insertion

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

WARNING!
Risk of fire or explosion!
Use of incorrect Battery may cause fire or explosion.



1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = positive pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement of the battery

To ensure propper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front view of the processor module and cannot be removed.
2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Protect them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Technical data

Parameter	Value
Nominal voltage	3 V
Nominal capacity	560 mAh
Temperature range (index below C0)	Operating: 0 °C...+60 °C Storage: -20 °C...+60 °C Transport: -20 °C...+60 °C
Temperature range (index C0 and above)	Operating: -40 °C...+70 °C Storage: -40 °C...+85 °C Transport: -40 °C...+85 °C
Battery lifetime	Typ. 3 years at 25 °C
Self-discharge	2 % per year at 25 °C 5 % per year at 40 °C 20 % per year at 60 °C
Protection against reverse polarity	Yes, by mechanical coding of the plug.
Insulation	The battery is completely insulated.
Connection	Red = positive pole = above at plug, black = negative pole,
Weight	7 g
Dimensions	Diameter of the button cell: 24.5 mm Thickness of the button cell: 5 mm

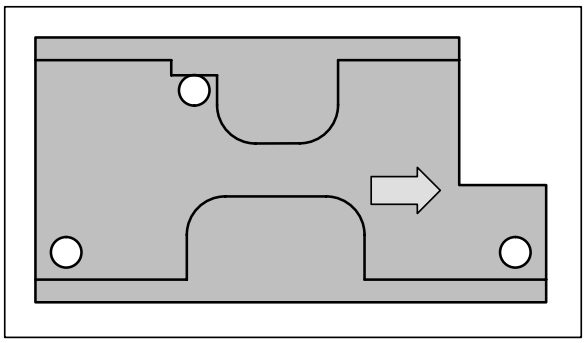
TA526 - Wall mounting accessory



Purpose

If a terminal base TB5xx or a terminal unit TU5xx should be mounted with screws, the wall mounting accessories TA526 must be inserted at the rear side first. This plastic parts prevent bending of terminal bases and terminal units while screwing up.

Handling instructions

Handling of the wall mounting accessory is described in detail in the section *Mounting and disassembling the terminal unit* *“Mounting with screws” on page 3411* and *Mounting/Disassembling Terminal Bases and Function Module Terminal Bases* *“Mounting with screws” on page 3409*.

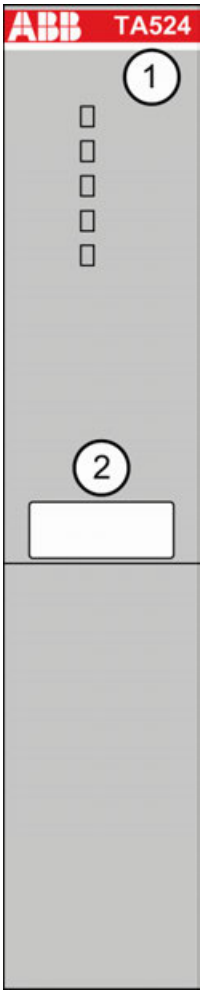
TA524 - Dummy communication module



1 Type
2 Label

Purpose

TA524 is used to cover an unused communication module slot of a terminal base ↳ *Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430*. It protects the terminal base from dust and inadvertent touch.

Handling instructions

TA524 is mounted in the same way as a common communication module ↳ *Chapter 1.6.4.6.3.5 “Mounting/Demounting the communication modules” on page 3414*.

Technical data

Parameter	Value
Weight	50 g
Dimensions	135 mm x 28 mm x 62 mm

CP-E - Economic range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

- Wide-range input voltage
- Mounting on DIN rail
- High efficiency of up to 90 %
- Low power dissipation and low heating
- Wide ambient temperature range from -40 °C...+70 °C
- No-load-proof, overload-proof, continuous short-circuit-proof
- Power factor correction (depending on the type)
- Approved in accordance with all relevant international standards

Table 612: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]
1SVR427030R0000	CP-E 24/0.75	100-240 V AC or 120-370 V DC	24 V DC, 0.75 A	-	22.5
1SVR427031R0000	CP-E 24/1.25	100-240 V AC or 90-375 V DC	24 V DC, 1.25 A	-	40.5
1SVR427032R0000	CP-E 24/2.5	100-240 V AC or 90-375 V DC	24 V DC, 2.5 A	-	40.5
1SVR427034R0000	CP-E 24/5.0	115/230 V AC auto select or 210-370 V DC	24 V DC, 5 A	-	63.2
1SVR427035R0000	CP-E 24/10.0	115/230 V AC auto select or 210-370 V DC	24 V DC, 10 A	-	83
1SVR427036R0000	CP-E 24/20.0	115-230 V AC or 120-370 V DC	24 V DC, 20 A	-	175

CP-C.1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB's high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combinded with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

Table 613: Ordering data

Order No.	Type	Input	Output	Overload capacity	Module width [mm]
1SVR360563R1001	CP-C.1 24/5.0	110-240 V AC or 90-300 V DC	24 V DC, 5 A	+50 %	40

1SVR360763R1001	CP-C.1 24/20.0	110-240 V AC or 90-300 V DC	24 V DC, 20 A	+30 %	82

1.6.4.7 AC500-XC

1.6.4.7.1 System data AC500-XC

Assembly, construction and connection of devices of the variant AC500-XC is identical to AC500 (standard) ↬ Chapter 1.6.4.6 “AC500 (Standard)” on page 3398. The following description provides information on general technical data of AC500-XC system.

Environmental conditions

Table 614: Process and supply voltages

Parameter		Value
24 V DC		
	Voltage	24 V (-15 %, +20 %)
	Protection against reverse polarity	Yes
120 V AC...240 V AC wide-range supply		
	Voltage	120...240 V (-15 %, +10 %)
	Frequency	50/60 Hz (-6 %, +4 %)
Allowed interruptions of power supply		
	DC supply	Interruption < 10 ms, time between 2 interruptions > 1 s, PS2

NOTICE!
Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system might be destroyed.

NOTICE!
For the supply of the modules, power supply units according to PELV or SELV specifications must be used.
