"Time Range Picker" Control element for changing the time of the displayed data sets. With [ ], all elements are provided that have implemented the interface ITimeSelector. By default, instances of the "Time Range Picker" visualization element are available.

"Legend" Control element for displaying a legend for the graphs. With [ ], all elements are provided that have implemented the interface ILegendDisplayer.

**Element property 'Center'**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ◀ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (◐) to other positions in the editor.

**Element property 'Absolute movement'**
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**"Movement"**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "X" | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
| "Y" | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |

**"Rotation"**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the "Center" point. This rotation point is shown as the ◀ symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

**"Interior rotation"**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| "Interior rotation" | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the ◀ symbol.  
Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |
You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Chapter 1.4.1.8.18 “Unit conversion” on page 298

The variables control the element behavior dynamically.

**Element property ‘State variables’**

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
"Animation duration"  Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  
  Example: `Menu.tContent with VAR tContent : INT := 500; END_VAR`

- Integer literal
  
  Example: `500`

Animatable properties

- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground"  Moves the visualization element to the foreground

- Variable (BOOL)
  
  Example: `bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR`

  TRUE: At runtime, the visualization element is displayed in the foreground.
  
  FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights"  Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:

- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

- Chapter 1.4.5.11.2 “Programming a Trend Visualization” on page 1312
- Object 'Trend Recording'

Visualization Element 'Legend'

Symbol:

Category: “Special Controls”
The element is used as a legend for another element (for example, a trend). The legend is assigned in the properties of the other element.

See also

- Chapter 1.4.5.11 “Displaying data curve with trend” on page 1309

### Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: LegendOfTrendA</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional</td>
<td></td>
</tr>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Type of element&quot;</th>
<th>&quot;Legend&quot;</th>
</tr>
</thead>
</table>

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

See also

- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>&quot;X&quot;</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>
You can also change the values by dragging the symbols (④) to other positions in the editor.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Orientation&quot;</td>
<td>Orientation of the element. The value is configured in the assigned element.</td>
</tr>
<tr>
<td></td>
<td>- &quot;Horizontal&quot;</td>
</tr>
<tr>
<td></td>
<td>- &quot;Vertical&quot;</td>
</tr>
<tr>
<td>&quot;Attached element instance&quot;</td>
<td>Example: Element_A</td>
</tr>
<tr>
<td>&quot;Show frame&quot;</td>
<td>①: The element is displayed with frames.</td>
</tr>
<tr>
<td>&quot;Number format&quot;</td>
<td>The format of the value in printf syntax (example: %d, %5.2f)</td>
</tr>
</tbody>
</table>

**Element Property 'Layout'**

Defines how many variables can be displayed at a maximum and is calculated from the row and column number.

<table>
<thead>
<tr>
<th>Property</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Max. number of rows&quot;</td>
<td>3</td>
</tr>
<tr>
<td>&quot;Max. number of columns&quot;</td>
<td>2</td>
</tr>
</tbody>
</table>

**Element Property 'Text properties'**

The property affects the text configured in the associated element.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Text format&quot;</td>
<td>&quot;Default&quot;: The text will be cut and displayed in only the part that fits into the visualization element.</td>
</tr>
<tr>
<td></td>
<td>&quot;Linebreak&quot;: The text will be wrapped in rows.</td>
</tr>
<tr>
<td></td>
<td>&quot;Ellipsis&quot;: The text is cut and ellipsis . . . are added to indicate that something is missing.</td>
</tr>
<tr>
<td>&quot;Font&quot;</td>
<td>Font of the text. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>&quot;Font color&quot;</td>
<td>Text color, for example Grey. The entries of the selection list are defined in the visualization style.</td>
</tr>
<tr>
<td>&quot;Transparency&quot;</td>
<td>Transparency value (255 to 0), which defines the transparency of the corresponding color. Example: 255: The color is opaque. 0: The color is fully transparent.</td>
</tr>
</tbody>
</table>

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Movement&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
</tr>
</tbody>
</table>
| “Y” | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| --- | --- |
| “Rotation” | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the + symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| “Interior rotation” | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the + symbol.  
Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Chapter 1.4.1.8.18 “Unit conversion” on page 298

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration” defines the duration (in milliseconds) in which the element runs an animation.
- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties:
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground” moves the visualization element to the foreground.
Variable (BOOL)
Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR
TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property ‘Access rights’

Requirement: User management is set up for the visualization.

“Access rights” opens the “Access rights” dialog. There you can edit the access privileges for the element.
Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- % Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745

Visualization Element ‘ActiveX’
Symbol:

Category: “Special Controls”
The element is used to link an existing ActiveX control in the visualization. You can configure the method calls and their parameters in the element properties of the “ActiveX” element.
**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td><strong>“Width”</strong></td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td><strong>“Height”</strong></td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (abilir) to other positions in the editor.

See also

- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th><strong>“X”</strong></th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Y”</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (abilitéts) to other positions in the editor.

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
### Movement

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
<th>Runtime</th>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X.</td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y.</td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
<tr>
<td><strong>Rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
<tr>
<td><strong>Scaling</strong></td>
<td>Variable (integer data type). Causes centric stretching.</td>
<td>PLC_PRG.iScaling.</td>
<td>The reference point is the “Center” property. The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
<td></td>
</tr>
<tr>
<td><strong>Interior rotation</strong></td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle2.</td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

---

*You can link the variables to a unit conversion.*

*The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.*

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>&quot;Invisible&quot;</th>
<th>Variable (BOOL). Toggles the visibility of the element. TRUE: The element is not visible at runtime.</th>
</tr>
</thead>
</table>

**The “Invisible” property is supported by the "Client Animation” functionality.**

**Element property 'Initial calls'**

These method calls are executed during initialization. They are executed in the first cycle only.

<table>
<thead>
<tr>
<th>&quot;Method calls &quot;</th>
<th>Button &quot;Create new&quot; Creates a subnode below “Methods” with parameters for the method call.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Methods&quot;</td>
<td>&quot;[&lt;number&gt;]&quot;</td>
</tr>
<tr>
<td></td>
<td>• &quot;Method&quot;: Name of the method</td>
</tr>
<tr>
<td></td>
<td>• &quot;Parameter&quot;: Parameter passed at the method call</td>
</tr>
<tr>
<td></td>
<td>• &quot;Result parameter&quot;: Optional variable for the return value of the method</td>
</tr>
</tbody>
</table>

**Element property 'Cyclic calls'**

These method calls are executed in every cycle. They are executed in the refresh rate of the visualization.

<table>
<thead>
<tr>
<th>&quot;Method calls &quot;</th>
<th>Button &quot;Create new&quot; Creates a subnode below “Methods” for a method call and its parameters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Methods&quot;</td>
<td>&quot;[&lt;number&gt;]&quot;</td>
</tr>
<tr>

- % Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745

Visualization Element 'Web Browser'

Symbol:

Category: “Special Controls”

The element shows a website, PDF file, or video that has a URL.
NOTICE!
The display options of the "Web Browser" element depend on the operating system and the display variant of the visualization.

Requirement: The software components of the web browser are available in the runtime and configured accordingly (example: videos to be shown on Linux).

- Chapter 1.4.5.21.6 “Displaying Web Contents” on page 2141

Element properties

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_59</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Web Browser&quot;</td>
</tr>
</tbody>
</table>

Element property 'Position'
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| "X" | X coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
|------|------------------------------------------------------|
| "Y" | Y coordinate of the upper left corner of the element  
Specified in pixels.  
Example: 10. |
| "Width" | Specified in pixels.  
Example: 150 |
| "Height" | Specified in pixels.  
Example: 30 |

You can also change the values by dragging the box symbols (_drag_ ) to other positions in the editor.

</table>

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

- Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745

Visualization Element ‘Busy Symbol, Cube’

Symbol:

Category: “Special Controls”

At runtime, this element indicates automatically that the runtime is busy or waiting for data.
Element properties

**“Element name”**

Example: Data_Transfer

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

**“Type of element”**

“Busy Symbol, Cube”

---

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>X coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
<td></td>
</tr>
<tr>
<td>Example: 10.</td>
<td></td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Y coordinate of the upper left corner of the element</td>
</tr>
<tr>
<td>Specified in pixels.</td>
<td></td>

<tr>
<td>Example: 150</td>
<td></td>
</tr>
<tr>
<td><strong>Height</strong></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td>Example: 30</td>
<td></td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (_drag_ to other positions in the editor.

See also

- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

---

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the _ postpone symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>X</strong></td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td><strong>Y</strong></td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (_rotate_) to other positions in the editor.

---

**Element property 'Absolute movement'**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.
**“Movement”**

| **“X”** | Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right. |
|---------|---------------------------------------------------------------------|
| **“Y”** | Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards. |
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the “Position  Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

See also
- Chapter 1.4.1.8.18 “Unit conversion” on page 298

**Element property 'State variables’**

The variables control the element behavior dynamically.
“Invisible” Variable (BOOL). Toggles the visibility of the element.

TRUE: The element is not visible at runtime.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

“Animation duration” Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  
  Example: 500

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground” Moves the visualization element to the foreground

Variable (BOOL)

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

TRUE: At runtime, the visualization element is displayed in the foreground.

FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property ‘Access rights’ Requirement: User management is set up for the visualization.

“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups : “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

<th>Variable (integer data type). Contains the line of the cursor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iRowCursor: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Column”</th>
<th>Variable (integer data type). Contains the column of the cursor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iColumnCursor: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Position”</th>
<th>Output variable (integer data type). Shows the absolute cursor position in the text.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iPosCursor: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Set cursor”</th>
<th>Variable (BOOL). Controls the setting of the cursor at a specific location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iSetCursor: INT;</td>
<td></td>
</tr>
<tr>
<td>TRUE: The cursor is moved. The new position is defined in the “Line” and “Column” properties.</td>
<td></td>
</tr>
<tr>
<td>FALSE: The “Line”, “Column”, and “Position” properties contain the actual values.</td>
<td></td>
</tr>
<tr>
<td>Note: The variable is used as the control variable for an input event triggered by a visualization user.</td>
<td></td>
</tr>
</tbody>
</table>

Table 364: Element property “Control variables --> Selection”

<table>
<thead>
<tr>
<th>“Start position”</th>
<th>Output variable (integer data type). Shows the absolute position for starting the text selection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iPosSelection: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“End position”</th>
<th>Output variable (integer data type). Shows the absolute position for ending the text selection.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iPosEndSelection: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Start line number”</th>
<th>Output variable (integer data type). Shows the line where the text selection begins</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iRowSelection: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Start column index”</th>
<th>Output variable (integer data type). Shows the column where the text selection begins</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iColumnSelection: INT;</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“End line number”</th>
<th>Output variable (integer data type). Shows the line where the text selection ends</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: iRowEndSelection: INT;</td>
<td></td>
</tr>
</tbody>
</table>
**“End column index”**
Output variable (integer data type). Shows the column where the text selection ends.
Example: \( iColumnEndSelection: \text{INT}; \)

**“Line to select”**
Variable (integer data type). Contains the line number that is selected.
Note: The selection is controlled by the variables in the “Trigger selection” property.

**“Set selection”**
Variable (BOOL). Controls the selection of a line.
Example: \( \text{bSetSelection}: \text{BOOL}; \)

  
  TRUE: The line from the “Line to select” property is selected and highlighted in the Text Editor.

  
  if the line is not in the current text segment of the Text Editor, then the text segment is moved to this line.

  
  Note: The variable is used as the control variable for an input event triggered by a visualization user. The control variable is not reset automatically. You are responsible for this to occur in the visualization.

---

**Table 365: Element property “Control variables --> Error handling”**

**“Variable for error code”**
Variable (integer data type). Contains the error code when an error occurs.
Example: \( iError: \text{INT}; \)

The error codes are declared in GVL_ErrorCodes in the VisuElemTextEditor library. To display the error text, the VisuFctTextEditorGetErrorText() function of the library must be called.

**“Variable for content changed”**
Variable (BOOL). Shows whether the contents have changed.
Example: \( \text{bIsContentEdited}: \text{BOOL}; \)

  
  TRUE: The contents of the Text Editor have changed.

**“Variable for access mode”**
Variable (BOOL). Controls the access privileges to the file.
Example: \( \text{bIsReadOnly}: \text{BOOL}; \)

  
  TRUE: A visualization user has read-only permission. At runtime, the file contents are highlighted in gray in the Text Editor.

  
  FALSE: A visualization user has read/write permission.

  
  Note: The variable overwrites the setting in the “Editor mode” property.

---

**“Maximum line length”**
Maximum number of characters per line

**“Editor mode”**

- “Read-only”: A visualization user has read-only permissions to the file. At runtime, the file contents are highlighted in gray in the text editor.
- “Read/write”: A visualization user has read-write permissions.

---

Element property 'New files'
“Encoding”
Character encoding of the new file:
- “ASCII”
- “Unicode (Little endian)”
- “Unicode (Big endian)”

“New line character sequence”
End of line character of the new file:
- “CR/LF”: Normal for Windows systems
- “LF”: Normal for UNIX systems

Please note: When a visualization user opens an existing file, the end-of-line character of the file is detected and used automatically.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

“Animation duration”
Defines the duration (in milliseconds) in which the element runs an animation
- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”
Moves the visualization element to the foreground

Variable (BOOL)

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property ‘Access rights’
Requirement: User management is set up for the visualization.

“Access rights”
Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- § Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745
Visualization Element 'Path3D'

Symbol:

Category: “Special Controls”

The "Path3D" visualization element graphically displays the curves of two independent records as a 3D path. It is specially designed for use with Motion Solution CNC in order to display the trajectory of a machine tool or a robot. The programmed path (path) and the path actually traveled (track) is displayed.

Although the visualization element is designed for use with Motion Solution CNC, it can also be used to display any other record. In this case the application has to provide the path data. The sample application 3D Path Generator, which is available in CODESYS Forge, shows how these data can be generated.

If the element is used together with SoftMotion CNC, then function blocks from the library SM3_CNC_Visu help to generate the data from the path and track. These function blocks are used by the sample project CNC_File_3DPath, which is stored in the installation directory of CODESYS.

- SMC_PathCopier
- SMC_PathCopierCompleteQueue
- SMC_PathCopierFile
- SMC_PositionTracker

A description of the function blocks can be found in the Library Manager in the library SM3_CNC_Visu.

The element does not work with the CODESYS HMI display variant.

See also

- CNC Example 6: Using Path3D with SoftMotion CNC
- Sample project in CODESYS Forge

**Element properties**

<table>
<thead>
<tr>
<th>&quot;Element name&quot;</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Type of element&quot;</td>
<td>&quot;Path3D&quot;</td>
</tr>
</tbody>
</table>

**Element property 'Position'**

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.
### Path description

<table>
<thead>
<tr>
<th>Path data (VisuStruct3DTrack)</th>
<th>Variable of the type VisuStruct3DTrack, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Path color</td>
<td>Color of the path drawn</td>
</tr>
<tr>
<td>Path line width</td>
<td>Path line width in pixels, e.g.: &quot;2&quot;</td>
</tr>
<tr>
<td>Style of boundary points</td>
<td>Display of the points between two successive objects in the path</td>
</tr>
<tr>
<td></td>
<td>- End points are not displayed</td>
</tr>
<tr>
<td></td>
<td>- End points are marked with a circle</td>
</tr>
<tr>
<td></td>
<td>- End points are marked with a plus</td>
</tr>
</tbody>
</table>

The track data are structured in exactly the same way as the path data: VisuStruct3DTrack

### Track description

<table>
<thead>
<tr>
<th>Track data (VisuStruct3DTrack)</th>
<th>Variable of the type VisuStruct3DTrack, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dt. A description of the structure can be found in the library manager in the library VisuElem3DPath.library.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Track color</td>
<td>Color of the track drawn</td>
</tr>
<tr>
<td>Track line width</td>
<td>Track line width in pixels, e.g.: &quot;2&quot;</td>
</tr>
</tbody>
</table>
Camera control  The camera position for the 3D mode is controlled with a reference to the external data structure. This structure allows the following operations:

- Shifting to the left/to the right/upwards/downwards
- Rotation around the X/Y/Z axis
- Resetting of the view at X/Y, Y/Z or Z/X level, so that the path and the track are completely visible.

| “Control data (VisuStruct3DControl)” | Variable of the type VisuStruct3DControl, which is declared in the IEC code. Example: PLC_PRG.pc.vs3dc.  
A description of the structure can be found in the library manager in the library VisuElem3DPath.  
The values can be set via the application itself or via the visualization element “ControlPanel”. The library VisuElem3DPath contains ready-to-use visualization frames that provide a possible user interface for these data. |
|——— | ——— |

Additional aspects

| “Coordinate system” | ☑: The coordinate system is displayed |
| “Grid” | ☑: Grid lines are displayed |
| “Grid color” | Color of the grid lines |

Highlighting  Individual parts of the path can be visually highlighted. This is typically used to mark the already processed part of a track with a different color. Each point in the path is given a unique ID, which in the case of a CNC editor is linked with the object ID on which the point lies. This ID ("highlight ID") can be specified via the application so that dynamic elements/parts of the track can be highlighted.

| Highlight mode | Select one of the following highlight modes:  
- Only the element whose ID corresponds to the value of the variable is highlighted.  
- All elements whose ID (linked with the object ID in the case of a CNC editor) is smaller than or equal to the value in Variable are highlighted. |
|——— | ——— |
| Variable | Project variable that specifies the ID of an element. Example: PLC_PRG.iVarElementID. This "highlight ID" is taken into account for the setting of the highlight mode. The variable must be set in the IEC application. |
| Highlight color | |

Element look

| “Frame line width” | Width of the frame around the element, in pixels, for example: "1" |
| “Frame line style” | Select one of these style types for the frame line:  
- Solid  
- Dashes  
- Dots  
- Dash Dot  
- Dash Dot Dot  
- Hollow |
“Transparent background”

- The background of the element is displayed transparently.
- The background of the element is displayed in the defined background color.

“Background color”

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

Variable (BOOL)

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

“Access rights”

Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:

- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also

- § Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745

Visualization Element 'Control Panel'

Symbol:
Category: “Special Controls”

This visualization element is used in connection with the “Path3D” visualization element. It is used for changing the position and orientation to the CNC path shown with “Path3D”.

See also
- **Chapter 1.4.5.19.5.42 “Visualization Element 'Path3D'” on page 2082**

## Element properties

| “Element name” | Optional.  
|----------------|--------------------------------------------------|
|                | Hint: Assign individual names for elements so that they are found faster in the element list. 
|                | Example: Camera_Path_1 |
| “Type of element” | “Frame” |
| “Clipping” | ☑: If you have set the “Scaling type” to “Fixed”, then only that part of the visualization is displayed that fits in the frame. |
| “Show frame” | Displays the frame  
| | • “No frame”: The displayed area of the frame does not have borders.  
| | • “Frame”: The displayed area of the frame has borders.  
| | • “No frame with offset”: The displayed area of the frame does not have a border and the displayed area of the referenced visualization is reduced inwards by one pixel as compared to the frame area. The resulting gap prevents the referenced visualization from touching any adjacent elements. |
| “Scaling type” | Describes how the frame reacts when the visualization is resized:  
| | • “Isotropic”: The frame retains its proportions. This allows the ratio of height to width to be preserved, even if the height and width of the visualization have been changed separately.  
| | • “Anisotropic”: The frame depends on the size of the visualization, so that height and width of the referenced visualization can be changed separately.  
| | • “Fixed”: The original size of the frame is retained, regardless of the visualization size. If you have also selected the “Clipping” option, then only the fitting part is displayed.  
| | • “Fixed and scrollable”: The referenced visualization is displayed without scaling. If the value is greater than the window area of the frame, then scrollbars are added to the frame. To set the position of the scroll bar with a variable, use the “Scroll position variable horizontal” or “Scroll position variable vertical” property. |
| “Deactivation of the background drawing” | ☑: To optimize the performance of the visualization, the non-animated elements of the frame element are drawn as a background bitmap. This could result in the elements not being displayed in the expected order.  
| | ☑: Deactivation of the background drawing. This can prevent the behavior described above. |

**Element property 'References'**

Contains the currently configured visualization references as a subnode
Clicking “Configure” opens the “Frame Configuration” dialog. This is used to manage the referenced visualizations.

Caution: Visualizations can be nested at any depth by means of Frame elements. In order to use the “Switch to any visualization” Frame selection type without any problems, a Frame must not contain more than 21 referenced visualizations. For more information, see also the description for the “Input configuration” of an element: Action “Switch Frame visualization”.

Visualizations that have a button also have this displayed as a subnode. Each interface variable is listed with the currently assigned transfer parameters.

Example:

```plaintext
vis_FormA
- iDataToDisplay_1: PLC_PRG.iVar1
- iDataToDisplay_2: PLC_PRG.iVar2
```

Hint: You can change the assignment of the variables to an interface variable here and edit the value field. Or click the “Configure” button instead.

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>X coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>“Y”</td>
<td>Y coordinate of the upper left corner of the element</td>
<td>10</td>
</tr>
<tr>
<td>“Width”</td>
<td>Specified in pixels.</td>
<td>150</td>
</tr>
<tr>
<td>“Height”</td>
<td>Specified in pixels.</td>
<td>30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ((DATA) to other positions in the editor.

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the 🔄 symbol. The point is used as the center for rotating and scaling.

See also

- Chapter 1.4.5.19.2.1 “Command 'Interface Editor’” on page 1719
- Chapter 1.4.5.15 “Creating a structured user interface” on page 1321
- "Input action ‘Switch Frame Visualization’” on page 1756
| **“X”** | X-coordinate of the point of rotation |
| **“Y”** | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols (φ) to other positions in the editor.

**Element property 'Colors'**

The properties contain fixed values for setting colors.

| **“Color”** | Color for the element in its normal state. Please note that the normal state is in effect if the expression in the “Color variables ➔ Toggle color” property is not defined or it has the value FALSE. |
| **“Alarm color”** | Color for the element in alarm state. Please note that the alarm state is in effect if the expression in the “Color variables ➔ Toggle color” property has the value TRUE. |
| **“Transparency”** | Value (0 to 255) for defining the transparency of the selected color. Example 255: The color is opaque. 0: The color is completely transparent. |
| **“Use gradient color”** | ☑: The element is displayed with a color gradient. |
| **“Gradient setting”** | The “Color gradient editor” dialog box opens. |
| **“Frame color”** | Example: “Black” |
| **“Fill color”** | Example: “Light gray” |

See also

- ☮ Chapter 1.4.5.19.3.5 “Dialog ‘Gradient Editor’” on page 1748
- ☮

**Element property 'Appearance’**

The properties contain fixed values for setting the look of the element.

| **“Line width”** | Value in pixels Example: 2 |
| **“Line style”** | Type of line representation |
| | “Solid” |
| | “Dashes” |
| | “Dots” |
| | “Dash Dot” |
| | “Dash Dot Dot” |
| | “not visible” |

You can assign variables in the “Appearance variables” property for controlling the appearance dynamically. The fixed values are defined here.
See also
- “Element property ‘Appearance variables’” on page 2095

**Element property ‘Texts’**

The properties contain character strings for labeling the element. The character string can also contain a placeholder with a format definition. In runtime mode, the placeholder is replaced by the current value in the specified format.

CODESYS accepts the specified texts automatically into the “GlobalTextList” text list. Therefore, these texts can be localized.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| **“Text”** | Character string (without single straight quotation marks) for the labeling the element. Add a line break by pressing the keyboard shortcut [Ctrl] + [Enter].  
Example: Accesses: %i  
The variable that contains the current value for the placeholder is specified in the property “Text variable” ➞ Text”. |
| **“Tooltip”** | Character string (without single straight quotation marks) that is displayed as the tooltip of an element.  
Example: Number of valid accesses.  
The variable that contains the current value for the placeholder is specified in the property “Text variable” ➞ Tooltip”. |

See also
- “Element property ‘Text variables’” on page 2091
- Chapter 1.4.5.3 “Designing a visualization with elements” on page 1254
- Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708

**Element property ‘Text properties’**

The properties contain fixed values for the text properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Horizontal alignment”</strong></td>
<td>Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Vertical alignment”</strong></td>
<td>Vertical alignment of the text within the element.</td>
</tr>
</tbody>
</table>
| **“Text format”** | Definition for displaying texts that are too long  
- “Default”: The long text is truncated.  
- “Line break”: The text is split into parts.  
- “Ellipsis”: The visible text ends with “...” indicating that it is not complete. |
| **“Font”** | Example: “Default”  
️: The “Font” dialog box opens.  
▼: Drop-down list with style fonts. |
| **“Font color”** | Example: “Black”  
️: The “Color” dialog box opens.  
▼: Drop-down list with style colors. |
| **“Transparency”** | Whole number (value range from 0 to 255). This determines the transparency of the respective color.  
Example: 255: The color is opaque.  
0: The color is completely transparent.  
Please note: If the color is a style color and already has a transparency value, then this property is write-protected. |
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>&quot;Movement&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td>Increase this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td>Increase this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Rotation&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Scaling&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (integer data type). Causes centric stretching.</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iScaling.</td>
</tr>
<tr>
<td>The reference point is the “Center” property.</td>
<td></td>
</tr>
<tr>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Interior rotation&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td></td>
</tr>
<tr>
<td>Example:</td>
<td>PLC_PRG.iAngle2.</td>
</tr>
<tr>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td></td>
</tr>
<tr>
<td>The rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td>Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

---

You can link the variables to a unit conversion.
The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also

- Chapter 1.4.1.8.18 “Unit conversion” on page 298

### Element property 'Relative movement'

The properties contains variables for moving the element. The reference point is the position of the element (“Position” property). The shape of the element can change.

<table>
<thead>
<tr>
<th>&quot;Movement top-left&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the left edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaX</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the top edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Movement bottom-right&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the right edge is moved horizontally. Incrementing the value moves the element to the right. Example: PLC_PRG.iDeltaWidth</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (integer data type). It contains the number (in pixels) that the bottom edge is moved vertically. Incrementing the value moves the element to the down. Example: PLC_PRG.iDeltaHeight</td>
</tr>
</tbody>
</table>

### Element property 'Text variables'

These properties are variables with contents that replace a format definition.

<table>
<thead>
<tr>
<th>&quot;Text variable&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccesses</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Text”. Note: If you specify a variable of type enumeration with text list support, then the name of the enumeration data type is added automatically in angle brackets after the variable name. Example: PLC_PRG.enVar &lt;enumeration name&gt;. Then the symbolic value of the enumeration component is printed instead of the numeric value when text is printed. Refer to the help page for the enumerations.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>&quot;Tooltip variable&quot;</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable (data type compliant with the format definition). It contains what is printed instead of the format definition. Example: PLC_PRG.iAccessesInTooltip</td>
<td></td>
</tr>
<tr>
<td>Note: The format definition is part of the text in the property “Texts ➔ Tooltip”.</td>
<td></td>
</tr>
</tbody>
</table>
Dynamic texts are variably indexed texts of a text list. At runtime, the text is displayed that is currently indexed in the variable.

### Dynamic texts

- **“Text list”**
  - Variable (string) or name of the text list as a fixed string in single straight quotation marks.
  - Example: 'Errorlist'
  - Description: Drop-down list with the dialogs available in the text lists.

- **“Text index”**
  - Text list ID. This refers to the desired output text.
  - As fixed string with the ID in single straight quotation marks.
    - Example: '1'
  - As a variable (STRING) for dynamically controlling the text output.
    - Example: `strTextID`
    - Sample assignment: `PLC_PRG.strTextID := '1';`

- **“Tooltip index”**
  - Text list ID. This refers to the desired output text.
  - As fixed string with the ID in single straight quotation marks.
    - Example: '2'
  - As a variable (STRING) for dynamically controlling the text output.
    - Example: `strToolTipID`
    - Sample assignment: `PLC_PRG.strToolTipID := '2';`

The variables allow for dynamic control of the text display.

See also

- `% Chapter 1.4.5.18.2 “Placeholders with Format Definition in the Output Text” on page 1708`
- `% “Element property ‘Texts’” on page 2089`
- `% Chapter 1.4.1.19.5.17 “Enumerations” on page 676`
| **“Font name”** | Variable (STRING). Includes the font of the text.  
Example: PLC_PRG.stFontVar := 'Arial';  
The selection of fonts corresponds to the default “Font” dialog. |
| **“Size”** | Variable (numeric data type). Contains the font size (in pixels or points). The applied unit is specified in brackets after the variable name.  
- <pt>: Points (default)  
  Example: PLC_PRG.iFontHeight <pt>  
  Code: iFontHeight : INT := 12;  
- <px>: Pixels  
  Example: PLC_PRG.iFontHeight <px>  
  Code: iFontHeight : INT := 19;  
If you click in the value field, a drop-down list opens on the right for setting the unit.  
Hint: The font size is specified in points (example: Arial 12). Use points when the variable font size should match a font, for example if a font is set in the property “Text property ➔ Font”. |
| **“Flags”** | Variable (DWORD). Contains the flags for displaying fonts.  
Flags:  
- 1: Italics  
- 2: Bold  
- 4: Underline  
- 8: Strikethrough  
Note: You can combine the font displays by adding the coding of the flags. For example, a bold and underlined text: PLC_PRG.dwFontType := 6; |
| **“Character set”** | Variable (DWORD). Contains a character set number for the font.  
The selection of character set numbers corresponds to the “Script” setting of the standard “Font” dialog. |
| **“Color”** | Variable (DWORD). Includes the color of the text.  
Example: PLC_PRG.dwColorFont := 16#FF000000; |
| **“Flags for text alignment”** | Variable (integer data type). Contains the coding for text alignment.  
Example: PLC_PRG.dwTextAlignment.  
Coding:  
- 0: Top left  
- 1: Horizontal center  
- 2: Right  
- 4: Vertical center  
- 8: Bottom  
Note: You can combine the text alignments by adding the coding of the flags. For example, a vertical and horizontal centered text: PLC_PRG.dwFontType := 5; |
Fixed values for displaying texts are set in “Text properties”.

See also
- “Element property ‘Text properties’” on page 2089

Element property ‘Color variables’
The Element property is used as an interface for project variables to dynamically control colors at runtime.

<table>
<thead>
<tr>
<th>“Toggle color”</th>
<th>The property controls the toggled color at runtime.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Value assignment:</td>
<td></td>
</tr>
<tr>
<td>● FALSE: The element is displayed with the color specified in the “Color” property.</td>
<td></td>
</tr>
<tr>
<td>● TRUE: The element is displayed with the color specified in the “Alarm color” property.</td>
<td></td>
</tr>
<tr>
<td>Assignment options:</td>
<td></td>
</tr>
</tbody>
</table>
| ● Placeholder for the user input variable  
  – “<toggle/tap variable>”  
  – “<NOT toggle/tap variable>”  |
| The color change is not controlled by its own variable, but by a user input variable.  |
| Note: Specify a variable for the mouse events “Tap” or “Toggle” in the input configuration of the element. Only then is the placeholder set. If you configure a variable in both “Toggle” and “Tap”, then the variable specified in “Tap” is used.  |
| Hint: Click the symbol to insert the placeholder “<toggle/tap variable>”. When you activate the “Inputconfiguration”, “Tap FALSE” property, then the “<NOT toggle/tap variable>” placeholder is displayed.  |
| ● Instance path of a project variable (BOOL)  
  Example: PLC_PRG.xColorIsToggeled  |
| Note: In the code, declare and implement the variable specified here. Its value assignment determines when the color changes.  |

<table>
<thead>
<tr>
<th>“Normal state” “Alarm state”</th>
<th>The properties listed below control the color depending on the state. The normal state is in effect if the variable in “Color variables”, “Toggle color” is not defined or it has the value FALSE. The alarm state is in effect if the variable in “Color variables”, “Toggle color” has the value TRUE.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Frame color”</th>
<th>Assignment options:</th>
</tr>
</thead>
</table>
| ● Variable (DWORD) for the frame color  
  Example: PLC_PRG.dwBorderColor  |
| ● Color literal  
  Example of green and opaque: 16#FF00FF00  |

<table>
<thead>
<tr>
<th>“Filling color”</th>
<th>Assignment options:</th>
</tr>
</thead>
</table>
| ● Variable (DWORD) for the fill color  
  Example: PLC_PRG.dwFillColor  |
| ● Color literal  
  Example of gray and opaque: 16#FF888888  |
The transparency part of the color value is evaluated only if the “Activate semi-transparent drawing” option of the visualization manager is selected.

Select the “Advanced” option in the toolbar of the properties view. Then all element properties are visible.

- “Chapter 1.4.5.8.3 “Animating a color display” on page 1295

Element property ‘Appearance variables’

The properties contain variables for controlling the appearance of the element dynamically.

| “Line width” | Variable (integer data type). Contains the line weight (in pixels).
|--------------|-------------------------------------------------------------------
|              | Note: The values 0 and 1 both result in a line weight of one pixel. If no line should be displayed, then the “Line style” property must be set to the option “Invisible”. |

<table>
<thead>
<tr>
<th>“Line style”</th>
<th>Variable (DWORD). Controls the line style.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Coding:</td>
</tr>
<tr>
<td></td>
<td>● 0: Solid line</td>
</tr>
<tr>
<td></td>
<td>● 1: Dashed line</td>
</tr>
<tr>
<td></td>
<td>● 2: Dotted line</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 3: Line type &quot;Dash Dot Dot&quot;</td>
</tr>
<tr>
<td></td>
<td>● 8: Invisible: The line is not drawn.</td>
</tr>
</tbody>
</table>

Fixed values can be set in the “Appearance” property. These values can be overwritten by dynamic variables at runtime.

See also
- “Element property ‘Appearance’” on page 2088

Element property ‘Switch frame variable’

The variable controls the switching of the referenced visualizations. This variable indexes one of the referenced frame visualizations and this is displayed in the frame. When the value of the variable changes, it switches to the recently indexed visualization.
"Variable"

- Variable (integer data type) that contains the index of the active visualization
  Example: PLC_PRG.uiIndexVisu
  Hint: The “Frame Configuration” dialog includes a list of referenced visualizations. The visualizations are automatically numerically indexed via the order in the list.
  Note: This variant of switching usually affects all connected display variants.
- Array element (integer data type) for index access via CURRENTCLIENTID
  Example: PLC_PRG.aIndexVisu[CURRENTCLIENTID]
  Note: This variant of switching applies to the current client only, and therefore only on one display variant. That is the display variant where the value change was triggered (for example, by means of user input).

See also
- § Chapter 1.4.5.19.2.9 “Command ‘Frame Selection’” on page 1727

Element property ‘State variables’

The variables control the element behavior dynamically.

"Invisible"

Variable (BOOL). Toggles the visibility of the element.
TRUE: The element is not visible at runtime.
Example: bIsVisible with VAR bIsVisible : BOOL := FALSE; END_VAR

"Deactivate inputs"

Variable (BOOL). Toggles the operability of the element.
TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
<table>
<thead>
<tr>
<th><strong>“Animation duration”</strong></th>
<th>Defines the duration (in milliseconds) in which the element runs an animation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>● Variable (integer value)</strong></td>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td><strong>● Integer literal</strong></td>
<td>Example: 500</td>
</tr>
</tbody>
</table>

Animatable properties
- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

<table>
<thead>
<tr>
<th><strong>“Move to foreground”</strong></th>
<th>Moves the visualization element to the foreground</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Variable (BOOL)</strong></td>
<td>Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
<tr>
<td><strong>TRUE</strong></td>
<td>At runtime, the visualization element is displayed in the foreground.</td>
</tr>
<tr>
<td><strong>FALSE</strong></td>
<td>At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.</td>
</tr>
</tbody>
</table>

**Element property 'Input configuration'**

The properties contain the configurations for the user input when using the mouse or keyboard.

A user input defines an event and one or more actions that are executed when an event occurs.

The “Configure” button opens the “Input Configuration” dialog. There you can create or edit user inputs. Configured user inputs are listed below the events. They each include the action that is triggered and the setting in short form.

**Example: “Execute ST Code”**: PLC_PRG.i_x := 0;

<table>
<thead>
<tr>
<th><strong>“OnDialogClosed”</strong></th>
<th>Input event: The user closes the dialog.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“OnMouseClicked”</strong></td>
<td>Input event: The user clicks the mouse button completely in the element area. The mouse button is clicked and released.</td>
</tr>
<tr>
<td><strong>“OnMouseDown”</strong></td>
<td>Input event: The user clicks down on the mouse button.</td>
</tr>
<tr>
<td><strong>“OnMouseEnter”</strong></td>
<td>Input event: The user drags the mouse pointer to the element.</td>
</tr>
<tr>
<td><strong>“OnMouseLeave”</strong></td>
<td>Input event: The user drags the mouse pointer away from the element.</td>
</tr>
<tr>
<td>Input event</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-------------</td>
</tr>
<tr>
<td>&quot;OnMouseMove&quot;</td>
<td>Input event: The user moves the mouse pointer over the element area.</td>
</tr>
</tbody>
</table>
| "OnMouseUp" | Input events:  
  - The user releases the mouse button within the element area. It is irrelevant whether the user has previously pressed the mouse button inside or outside the element area.  
  - The user presses the mouse button within the element area, leaves the element area, and then releases the mouse button.  
  
  Note: This CODESYS-specific triggering behavior guarantees that actions for key elements are completed. A key element starts an action for "OnMouseDown" and ends the action for "OnMouseUp".  
  
  Example: A visualization user presses the mouse button within the element area of the key element and then moves the cursor position so that it lies outside the element area. The action is ended anyway because "OnMouseUp" is triggered. |

| Tap | When a mouse click event occurs, the variable defined in "Variable" is described in the application. The coding depends on the "Tap FALSE" and "Tap on enter if captured" options. |
| Variable | Variable (BOOL) that is set on mouse click event.  
  
  Example: PLC_PRG.bIsTapped  
  
  TRUE: A mouse click event exists. It lasts as long as the user presses the mouse button over the element. It ends when the button is released.  
  
  FALSE: A mouse click event does not exist.  
  
  Requirement: The "Tap FALSE" option is not activated. |
| Tap FALSE | ☑: The mouse click event leads to a complementary value in "Variable".  
  
  TRUE: A mouse click event does not exist.  
  
  FALSE: While the mouse click event exists. |
| Tap on enter if captured | ☑: During user input, it is also taken into consideration whether the mouse pointer is dragged within the element area or not while the mouse button is pressed.  
  
  TRUE: While the mouse click event exists and the mouse pointer is moved over the element area.  
  
  FALSE: A mouse click event does not exist. Or the user moves the mouse pointer outside of the element area while the mouse button is pressed.  
  
  The value is TRUE again as soon as the user moves the pointer back to the element area. The mouse is then captured. |
| Toggle | With the onset of a mouse click event, the variable is set; when the mouse click event is completed, the variable is reset. |
| Variable | Variable (BOOL). Its value toggled when the mouse click event is ended. This is when the user releases the mouse button while the mouse pointer is over the element area.  
  
  If the user releases the mouse button while the mouse pointer is outside of the element area, then the mouse click event is not ended and the value is not toggled.  
  
  Hint: The user can cancel a started toggle input by dragging the mouse pointer out of the element area. |
<p>| Toggle on up if captured | ☑: The value toggles regardless of where the mouse pointer is when the mouse button is released. The mouse is then captured. |</p>
<table>
<thead>
<tr>
<th>“Hotkey”</th>
<th>Keyboard shortcut on the element for triggering specific input actions. When the keyboard shortcut event occurs, the input actions in the “Events” property are triggered. In this way, it is not the input action itself that leads to this input action, but the mouse input action.</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Key”</td>
<td>Key pressed for input action. Example: [T] Note: The following properties appear when a key is selected.</td>
</tr>
<tr>
<td>“Events”</td>
<td>● “None” ● “Mouse down”: Pressing the key triggers the input actions that are configured in the “OnMouseDown” property. ● “Mouse up”: Releasing the key triggers the input actions that are configured in the “OnMouseUp” property. ● “Mouse down/up”: Pressing and releasing the key triggers the input actions that are configured in the “OnMouseDown” property and the “OnMouseUp” property.</td>
</tr>
<tr>
<td>“Shift”</td>
<td>✔: Combination with the Shift key Example: [Shift]+[T].</td>
</tr>
<tr>
<td>“Control”</td>
<td>✔: Combination with the Ctrl key Example: [Ctrl]+[T].</td>
</tr>
<tr>
<td>“Alt”</td>
<td>✔: Combination with the Alt key Example: [Alt]+[T].</td>
</tr>
</tbody>
</table>

All keyboard shortcuts and their actions that are configured in the visualization are listed on the “Keyboard Configuration” tab.

Visualization Element ‘Date Range Picker’

Symbol:

Category: “Date/Time Controls”
The element provides the capability of selecting the date and time range of a saved data set. The element is used with the “Trend” visualization element.

Element properties
**Element name**

<table>
<thead>
<tr>
<th>Example: DateTrend1</th>
</tr>
</thead>
</table>

Optional

Hint: Assign individual names for elements so that they are found faster in the element list.

**Type of element**

"Date Range Picker"

---

### Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y coordinate of the upper left corner of the element</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Specified in pixels.</td>
</tr>
<tr>
<td></td>
<td>Example: 10.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Width”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 150</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols ( draggable) to other positions in the editor.

See also

- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

### Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>“X”</th>
<th>X-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Y”</th>
<th>Y-coordinate of the point of rotation</th>
</tr>
</thead>
</table>

You can also change the values by dragging the symbols ( draggable) to other positions in the editor.
**“Show frame”**
- The visualization element is drawn with a frame.

**“Resolution”**
- Resolution saved for the time stamp: “Millisecond” or “Microsecond”.

**“Attached element instance”**
- The element can be assigned to a “Trend” visualization element. As a result, the time range of the trend element can be changed. The available visual elements are selected with the help of the Input Assistant.

---

**Element property 'Tick mark labels'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Two-line labelling”</strong></td>
<td>- The time stamps are displayed in two lines. The date is displayed in the first line and the time is displayed in the second line.</td>
</tr>
<tr>
<td><strong>“Omit irrelevant information in time stamp”</strong></td>
<td>- The time stamp has a shorter form. For example, the date is displayed only for the first tick mark, and only the time for the following tick marks. The settings in “Internationalization (format strings)” are ignored for this setting.</td>
</tr>
<tr>
<td><strong>“Internationalization (format strings)”</strong></td>
<td>- Only active when the parameter “Omit irrelevant information in timestamps” is deactivated.</td>
</tr>
<tr>
<td><strong>“Date”</strong></td>
<td>- Definition of the date format. The default setting is taken from the Windows control panel.</td>
</tr>
<tr>
<td><strong>“Time”</strong></td>
<td>- Definition of the time format. The default setting is taken from the Windows control panel.</td>
</tr>
</tbody>
</table>

---

**Element property 'Text properties'**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Horizontal alignment”</strong></td>
<td>- Horizontal alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Vertical alignment”</strong></td>
<td>- Vertical alignment of the text within the element.</td>
</tr>
<tr>
<td><strong>“Font”</strong></td>
<td>- Example: “Default”</td>
</tr>
<tr>
<td></td>
<td>- The “Font” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style fonts.</td>
</tr>
<tr>
<td><strong>“Font color”</strong></td>
<td>- Example: “Black”</td>
</tr>
<tr>
<td></td>
<td>- The “Color” dialog box opens.</td>
</tr>
<tr>
<td></td>
<td>- ▼: Drop-down list with style colors.</td>
</tr>
<tr>
<td><strong>“Transparency”</strong></td>
<td>- Whole number (value range from 0 to 255). This determines the transparency of the respective color.</td>
</tr>
<tr>
<td></td>
<td>- Example: 255: The color is opaque.</td>
</tr>
<tr>
<td></td>
<td>- 0: The color is completely transparent.</td>
</tr>
<tr>
<td></td>
<td>- Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

---

**Element property 'Additional buttons'**
“Jump to the largest possible time stamp”:
- An additional button is displayed for jumping to the last time stamp.

“Jump to the smallest possible time stamp”:
- An additional button is displayed for jumping to the first time stamp.

“Zoom out”:
- An additional button is displayed for setting the current min./max. range to the maximum range. The selected range is left.

**Element property ‘Absolute movement’**

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

**“Movement”**

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
<td>PLC_PRG.iPos_X.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
<td>PLC_PRG.iPos_Y.</td>
</tr>
<tr>
<td></td>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
<tr>
<td>“Rotation”</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
<td>PLC_PRG.iAngle1.</td>
</tr>
<tr>
<td></td>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.</td>
<td></td>
</tr>
</tbody>
</table>

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- Chapter 1.4.1.8.18 “Unit conversion” on page 298

**Element property 'State variables'**

<table>
<thead>
<tr>
<th>&quot;Invisible&quot;</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TRUE: The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

**"Animation duration"**

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Defines the duration (in milliseconds) in which the element runs an animation</td>
</tr>
<tr>
<td>- Variable (integer value)</td>
</tr>
<tr>
<td>Example: Menu.tContent with VAR tContent : INT := 500; END_VAR</td>
</tr>
<tr>
<td>- Integer literal</td>
</tr>
<tr>
<td>Example: 500</td>
</tr>
</tbody>
</table>

Animatable properties

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

**"Move to foreground"**

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Moves the visualization element to the foreground</td>
</tr>
<tr>
<td>Variable (BOOL)</td>
</tr>
<tr>
<td>Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR</td>
</tr>
</tbody>
</table>

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.
“Access rights” Opens the “Access rights” dialog. There you can edit the access privileges for the element.

Status messages:
- “Not set. Full rights.”: Access rights for all user groups: “operable”
- “Rights are set: Limited rights”: Access is restricted for at least one group.

See also
- Chapter 1.4.5.19.3.1 “Dialog ‘Access Rights’” on page 1745

Visualization Element ‘Time Range Picker’

Symbol:

Category: “Date/Time Controls”

The element provides configurable buttons for setting the time range of a trend display to a defined time. In the process the end time of the previous display is left unchanged and the start time is adapted.

Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hint: Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td>Example: TimeRangeTemperature</td>
<td></td>
</tr>
</tbody>
</table>

| “Type of element” | “Time range picker” |

Element property ‘Position’ The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>

<td></td>
<td>Please note: If the color is a style color and already has a transparency value, then this property is write-protected.</td>
</tr>
</tbody>
</table>

**Property 'Times'** In “Times”, the buttons that the element provides at runtime are defined and configured in an array.
### “Provide "All" selection”
- Time Range Picker bar extended by "All" button. The diagram represents a time interval that covers all time stamps.

### “Times”
- Adds another button to the Time Range Picker bar and increases the array by one entry. An additional index is present in the property "Times ➔ Times ➔ [<new>]. “Time” is located under this index. The configuration of the button is to be entered there.

### “Times”
- Array of all buttons in the time selection bar. Index corresponds to the number of buttons.
- The associated button is removed from the Time Range Picker bar. The configuration entry is deleted from the “Times” property list.

### “[Index]”
- “Time”

- Time interval in standardized notation. Example: 3M for 3 months; 30m for 30 minutes. If a time interval is indicated in the field, then the button is labelled with it. If a user clicks on the button at runtime, the command is executed to switch the diagram to this time interval. The default is empty.

---

#### Element property 'Control variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Time”</td>
<td>Displays which time is currently selected. Variable (STRING) Example: PLC_PRG.strSelectedTime</td>
</tr>
<tr>
<td>“All selected”</td>
<td>Displays the state of the &quot;All&quot; button Variable (BOOL) Example: PLC_PRG.AllTimesAreSelected</td>
</tr>
</tbody>
</table>

#### Element property 'Absolute movement'

- The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“X”</td>
<td>Variable (numeric data type). Defines the X position (in pixels). Example: PLC_PRG.iPos_X. Increasing this value in runtime mode moves the element to the right.</td>
</tr>
<tr>
<td>“Y”</td>
<td>Variable (numeric data type). Defines the Y position (in pixels). Example: PLC_PRG.iPos_Y. Increasing this value in runtime mode moves the element downwards.</td>
</tr>
</tbody>
</table>
**“Rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle1.

The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.

**“Interior rotation”**
Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol. Note: If a static angle of rotation is specified in the “Position Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

**You can link the variables to a unit conversion.**

**The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.**

See also
- Chapter 1.4.1.8.18 “Unit conversion” on page 298

**Element property 'State variables'**

**“Invisible”**
Variable (BOOL). Toggles the visibility of the element.

**TRUE:** The element is not visible at runtime.

**The “Invisible” property is supported by the “Client Animation” functionality.**
These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.

Visualization Element ‘Date Picker’

Symbol:

Category: “Date/Time Controls”

The element is a calendar that displays the current date. A user can click a day to select a date, which is saved to a variable. In addition, it can customize the time interval that the calendar displays. Clicking the calendar header changes the year. Clicking the arrows in the calendar header changes the month.
Language-dependent texts of the element

The element contains language-dependent texts that are managed in the System text list. This deals with the names of the month and the days of the week written out completely or abbreviated. When the date picker is added to a visualization, CODESYS generates the text list automatically below the POU view. The IDs correspond to the standard text and therefore English terms. The text list makes it possible to translate these texts.

### Example

<table>
<thead>
<tr>
<th>“Height”</th>
<th>Specified in pixels. Example: 30</th>
</tr>
</thead>
</table>

You can also change the values by dragging the box symbols (черный) to other positions in the editor.

See also

- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

**Element property 'Center'**

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the symbol. The point is used as the center for rotating and scaling.
“X”  X-coordinate of the point of rotation

“Y”  Y-coordinate of the point of rotation

You can also change the values by dragging the symbols (⊕) to other positions in the editor.

“Variable”  Input variable (DATE). Contains the date that a user selects in the calendar.
Example: PLC_PRG.dtDueDate

“Design”  ● “From style”: All settings are preconfigured according to the style.
● “Explicit”: The “Design settings” property is available. You can customize the calendar here.

Design settings  Requirement: This property is visible only if the “Design” property is set to “Explicit”.
The values of the property can be predefined in the style. Then they are available in the drop-down list.

**Element property 'Display type'**
Element property 'Absolute movement'
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

| “Rows” | Number of month calendars per row (preset: 1) |
| “Columns” | Number of month calendars per column (preset: 1) |

“Movement”

| “X” | Variable (numeric data type). Defines the X position (in pixels). |
| Example: PLC_PRG.iPos_X. | Increasing this value in runtime mode moves the element to the right. |

| “Y” | Variable (numeric data type). Defines the Y position (in pixels). |
| Example: PLC_PRG.iPos_Y. | Increasing this value in runtime mode moves the element downwards. |

“Rotation”

| Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example: PLC_PRG.iAngle1. | The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol. |

| In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |

“Interior rotation”

| Variable (numeric data type). Defines the angle of rotation (in degrees). |
| Example: PLC_PRG.iAngle2. | In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise. |

| The rotation point is shown as the symbol. |

| Note: If a static angle of rotation is specified in the “Position ➔ Angle” property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.
The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the “Client Animation” functionality.

Element property 'State variables'

<table>
<thead>
<tr>
<th>Property</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
<th>TRUE: The element is not visible at runtime.</th>
<th>Example: <code>bIsVisible := TRUE; END_VAR</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>“Invisible”</td>
<td>Variable (BOOL). Toggles the operability of the element.</td>
<td>TRUE: User inputs do not have any effect in runtime more. The element is shown as deactivated.</td>
<td></td>
</tr>
</tbody>
</table>

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
"Animation duration" Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  Example: Menu.tContent with VAR tContent : INT := 500; END_VAR
- Integer literal
  Example: 500

Animatable properties

- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

"Move to foreground" Moves the visualization element to the foreground

Variable (BOOL)

Example: bIsInForeground with VAR bIsInForeground : BOOL := FALSE; END_VAR

TRUE: At runtime, the visualization element is displayed in the foreground.
FALSE: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Element property 'Access rights'

Requirement: User management is set up for the visualization.

"Access rights" Opens the "Access rights" dialog. There you can edit the access privileges for the element.

Status messages:

- "Not set. Full rights.": Access rights for all user groups: "operable"
- "Rights are set: Limited rights": Access is restricted for at least one group.

Visualization Element 'Analog Clock'

Symbol:

Category: “Date/Time Controls”

The element is a clock that displays the current time of day. The clock can also display a random time.
Element properties

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Example: GenElemInst_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Type of element”</td>
<td>“Analog Clock”</td>
</tr>
</tbody>
</table>

Element property 'Position'

The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

| “X” | X coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Y” | Y coordinate of the upper left corner of the element Specified in pixels. Example: 10. |
| “Width” | Specified in pixels. Example: 150 |
| “Height” | Specified in pixels. Example: 30 |

You can also change the values by dragging the box symbols (_drag) to other positions in the editor.

See also
- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

Element property 'Center'

The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ⦿ symbol. The point is used as the center for rotating and scaling.

| “X” | X-coordinate of the point of rotation |
| “Y” | Y-coordinate of the point of rotation |

You can also change the values by dragging the symbols ( HOWEVER) to other positions in the editor.

Element property 'Time Display'
"Use system time"  
- The system time of the PLC is displayed.

"Variable"  
- Variable (time data type TOD, TIME_OF_DAY). This receives the time of day that is not the system time.  
  Example: PLC_PRG.todTimeTokio  
  Requirement: The “Use system time” property is not activated.

See also  
- Chapter 1.4.1.19.5.5 “Data Type ‘TIME’” on page 649

"Design"  
- “From style”: All settings are preconfigured according to the style.  
- “Explicit”: The “Settings” property is available. Here you can customize the analog clock.

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

"Movement"  

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>Variable (numeric data type). Defines the X position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_X.</td>
<td></td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element to the right.</td>
<td></td>
</tr>
<tr>
<td>Y</td>
<td>Variable (numeric data type). Defines the Y position (in pixels).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iPos_Y.</td>
<td></td>
</tr>
<tr>
<td>Increasing this value in runtime mode moves the element downwards.</td>
<td></td>
</tr>
<tr>
<td>Rotation</td>
<td>Variable (numeric data type). Defines the angle of rotation (in degrees).</td>
</tr>
<tr>
<td>Example: PLC_PRG.iAngle1.</td>
<td></td>
</tr>
<tr>
<td>The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.</td>
<td></td>
</tr>
<tr>
<td>In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.</td>
<td></td>
</tr>
<tr>
<td>Scaling</td>
<td>Variable (integer data type). Causes centric stretching.</td>
</tr>
<tr>
<td>Example: PLC_PRG.iScaling.</td>
<td></td>
</tr>
<tr>
<td>The reference point is the “Center” property.</td>
<td></td>
</tr>
<tr>
<td>The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size.</td>
<td></td>
</tr>
</tbody>
</table>
"Interior rotation"  
Variable (numeric data type). Defines the angle of rotation (in degrees).

Example: PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

"Use REAL values"  
Note: Only available if the device supports the use of REAL coordinates.

☑ The properties of the absolute movement are interpreted as REAL values. The values are not rounded.

The option allows for the individual fine-tuning of drawing the element, for example for the visualization of a smoother rotation.

Hint: If a horizontal or vertical line is drawn blurry on a specific visualization platform, then this can be corrected by an offset of 0.5px in the direction of the line thickness.

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

| “Color” | Color of the center of the clock |

---

**Table 373: “Positioning”**

<table>
<thead>
<tr>
<th>“Usage of”</th>
<th>“Default style values”: Presetting of the style values</th>
</tr>
</thead>
</table>

| “Positioning” | Requirement: Visible when the “Usage or” property is set to “Individual settings”. |
“Numerics movement”  
Value (in pixels) for shifting the digits.  
Example: 80

“Line movement”  
Value (in pixels) for shifting the hour lines.  
Example: 100

“Hands scaling”  
Factor for scaling the length of the hour hand. You can customize the exact position of the hour hand relative to the background image.  
Example: 100

“Scaling type”  
Defines the scaling of the height and width of the element.  
- “Anisotropic”: The background image is scaled to the size of the element. The height and width are scaled independently of each other.  
- “Isotropic”: The background image is scaled to the size of the element, retaining its proportion. The proportion of height and width is fixed.

“Optimized drawing”  
☑: The background image is drawn one time. When the hour hand moves, only the affected part of the image is redrawn.  
☐: The background image is redrawn in cycles.  
Hint: Disable this option only for extreme exceptions.

Element property 'Absolute movement'  
The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

“Movement”

“X”  
Variable (numeric data type). Defines the X position (in pixels).  
Example: PLC_PRG.iPos_X.  
Increasing this value in runtime mode moves the element to the right.

“Y”  
Variable (numeric data type). Defines the Y position (in pixels).  
Example: PLC_PRG.iPos_Y.  
Increasing this value in runtime mode moves the element downwards.

“Rotation”  
Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right.
**"Interior rotation"**

Variable (numeric data type). Defines the angle of rotation (in degrees).

**Example:** PLC_PRG.iAngle2.

In runtime mode, the element rotates about the point of rotation specified in "Center" according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.

The rotation point is shown as the symbol.

Note: If a static angle of rotation is specified in the "Position ➔ Angle" property, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed.

---

You can link the variables to a unit conversion.

The “X”, “Y”, “Rotation”, and “Interior rotation” properties are supported by the "Client Animation" functionality.

See also

- Chapter 1.4.1.8.18 “Unit conversion” on page 298

**Element property 'State variables'**

The variables control the element behavior dynamically.

<table>
<thead>
<tr>
<th>“Invisible”</th>
<th>Variable (BOOL). Toggles the visibility of the element.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE:</td>
<td>The element is not visible at runtime.</td>
</tr>
</tbody>
</table>

The “Invisible” property is supported by the "Client Animation" functionality.

These properties are available only when you have selected the “Support client animations and overlay of native elements” option in the Visualization Manager.
“Animation duration”

Defines the duration (in milliseconds) in which the element runs an animation.

- **Variable (integer value)**
  
  **Example:** Menu.tContent with
  
  ```
  VAR tContent : INT := 500;
  END_VAR
  ```

- **Integer literal**
  
  Example: 500

**Animatable properties**

- “Absolute movement”, “Movement”, “X”, “Y”
- “Absolute movement”, “Rotation”
- “Absolute movement”, “Interior rotation”
- “Absolute movement”, “Exterior rotation”

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

“Move to foreground”

Moves the visualization element to the foreground

**Variable (BOOL)**

**Example:** bIsInForeground with

```
VAR bIsInForeground : BOOL := FALSE; END_VAR
```

**TRUE:** At runtime, the visualization element is displayed in the foreground.

**FALSE:** At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

Visualization Element ‘Date/Time Picker’

Symbol:

![Image](Image)

**Category:** “Date/Time Controls”

The element provides the capability of selecting the date and time. The value can be changed by means of the arrow keys on the keyboard. The date can be selected from a calendar.

**Element properties**

<table>
<thead>
<tr>
<th>“Element name”</th>
<th>Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Hint:</strong> Assign individual names for elements so that they are found faster in the element list.</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> StartDateAndTime</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Type of element”</th>
<th>“Date/Time Picker”</th>
</tr>
</thead>
</table>
**Element property 'Position'**
The position defines the location and size of the element in the visualization window. These are based on the Cartesian coordinate system. The origin is located at the upper left corner of the window. The positive horizontal x-axis runs to the right. The positive vertical y-axis runs downwards.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y coordinate of the upper left corner of the element Specified in pixels. Example: 10.</td>
</tr>
<tr>
<td>&quot;Width&quot;</td>
<td>Specified in pixels. Example: 150</td>
</tr>
<tr>
<td>&quot;Height&quot;</td>
<td>Specified in pixels. Example: 30</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the box symbols (⊤) to other positions in the editor.

See also
- Chapter 1.4.5.3.2 “Positioning the Element, Adapting Size and Layer” on page 1256

**Element property 'Center'**
The properties contain fixed values for the coordinates of the point of rotation. This point of rotation is shown as the ◆ symbol. The point is used as the center for rotating and scaling.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;X&quot;</td>
<td>X-coordinate of the point of rotation</td>
</tr>
<tr>
<td>&quot;Y&quot;</td>
<td>Y-coordinate of the point of rotation</td>
</tr>
</tbody>
</table>

You can also change the values by dragging the symbols (◆) to other positions in the editor.
### Variable

The value of the value of the variable is displayed and modified by means of the element.

The data type automatically determines the displayed value units:
- **TIME**: Day, hour, minute, and second (by default, milliseconds are not displayed)
- **DATE**: Year, month, and day
- **DT**: Year, month, day, hour, minute, and second
- **TOD**: Hour, minute, and second (by default, milliseconds are not displayed)
- **LTIME**: Day, hour, minute, and second (by default, milliseconds, microseconds, and nanoseconds are not displayed)

### Format string

The format can restrict the output to individual values.

Example for **LTIME**: Format: `HH:mm:ss.ms.us.ns` → displayed: 08:15:12.780.150.360

LTIME restricted: format: `HH:mm` → displayed: 08:15

Basically, all usual formats available for `%t` are also supported.

### Design date time picker

- **From style**: All settings are preconfigured according to the style.
- **Explicit**: The “Design settings” property is available. You can customize the calendar here.

### Design date picker

- **From style**: All settings are preconfigured according to the style.
- **Explicit**: The “Design settings” property is available. You can customize the calendar here.

### Positioning date picker

- **Dynamic**: The calendar is adapted and positioned automatically.
- **Manual**: The “Position settings” property is available. You can customize the calendar here.

### Element property 'Absolute movement'

The properties contain IEC variables for controlling the position of the element dynamically. The reference point is the upper left corner of the element. In runtime mode, the entire element is moved.

### Movement

- **X**
  - Variable (numeric data type). Defines the X position (in pixels).
  - **Example**: `PLC_PRG.iPos_X`
  - Increasing this value in runtime mode moves the element to the right.

- **Y**
  - Variable (numeric data type). Defines the Y position (in pixels).
  - **Example**: `PLC_PRG.iPos_Y`
  - Increasing this value in runtime mode moves the element downwards.
| **“Rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle1.  
The midpoint of the element rotates at the “Center” point. This rotation point is shown as the symbol.  
In runtime mode, the alignment of the element remains the same with respect to the coordinate system of the visualization. Increasing the value rotates the element to the right. |
| **“Scaling”** | Variable (integer data type). Causes centric stretching.  
Example: PLC_PRG.iScaling.  
The reference point is the “Center” property.  
The value 1 shrinks the element by a factor of 0.001. The value 1000 returns the element to its original size. |
| **“Interior rotation”** | Variable (numeric data type). Defines the angle of rotation (in degrees).  
Example: PLC_PRG.iAngle2.  
In runtime mode, the element rotates about the point of rotation specified in “Center” according to the value of the variable. In addition, the alignment of the element rotates according to the coordinate system of the visualization. Increasing the value in the code rotates clockwise.  
The rotation point is shown as the symbol.  
Note: If a static angle of rotation is specified in the property “Position ➔ Angle”, then the static angle of rotation is added to the variable angle of rotation (offset) when the visualization is executed. |

You can link the variables to a unit conversion.

The properties “X”, “Y”, “Rotation”, and “Interior rotation” are supported by the “Client Animation” functionality.

See also
- § Chapter 1.4.1.8.18 “Unit conversion” on page 298

Element property “State variables”

The variables control the element behavior dynamically.
### "Invisible"

Variable (BOOL). Toggles the visibility of the element.

**TRUE**: The element is not visible at runtime.

**Example**: `bIsVisible := FALSE;`  

### "Deactivate inputs"

Variable (BOOL). Toggles the operability of the element.

**TRUE**: User inputs do not have any effect in runtime more. The element is shown as deactivated.

---

**The “Invisible” property is supported by the "Client Animation“ functionality.**

---

These properties are available only when you have selected the “Support client animations and overlay of native elements“ option in the Visualization Manager.

### "Animation duration"

Defines the duration (in milliseconds) in which the element runs an animation

- Variable (integer value)
  **Example**: `tContent := 500;`  

- Integer literal
  **Example**: `500`

**Animatable properties**

- "Absolute movement", "Movement", "X", "Y"
- "Absolute movement", "Rotation"
- "Absolute movement", "Interior rotation"
- "Absolute movement", "Exterior rotation"

The animated movement is executed when at least one value of an animatable property has changed. The movement then executed is not jerky, but is smooth within the specified animation duration. The visualization element travels to the specified position while rotating dynamically. The transitions are smooth.

### "Move to foreground"

Moves the visualization element to the foreground

Variable (BOOL)

**Example**: `bIsInForeground := FALSE;`  

**TRUE**: At runtime, the visualization element is displayed in the foreground.

**FALSE**: At runtime, the visualization element is displayed in the layer where it was inserted in the visualization editor.

**Element property 'Access rights'**

Requirement: User management is set up for the visualization.

### "Access rights"

Opens the “Access rights“ dialog. There you can edit the access privileges for the element.

**Status messages**:

- "Not set. Full rights.“: Access rights for all user groups : “operable“
- "Rights are set: Limited rights“: Access is restricted for at least one group.
1.4.5.20 Reference, visualization style editor

1.4.5.20.1 Dialog 'Create a New Visualization Style'

Symbol: 🚧

Function: The dialog prompts you to specify data for a new created style file.

Call:
- In CODESYS:
  In the “Visualization Manager” object (tab “Settings”, group “Style Settings”):
  Clicking opens a drop-down list. Click “Create and Edit Derived Style”.
- In the visualization style editor:
  Menu bar: “File ➔ New Style”

<table>
<thead>
<tr>
<th>“Name”</th>
<th>Name of the new style.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: Style_CI</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Storage location”</th>
<th>Working directory for style editing</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>“Base style”</th>
<th>Style to base the new style on. The drop-down list includes all styles that are installed in the repository.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;none&gt;</td>
<td>The new style does not derive itself from an existing style.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>“Visualization profile”</th>
<th>The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Example: CODESYS V3.5 SP9</td>
<td></td>
</tr>
</tbody>
</table>

Click “OK” The new style is created and opened for editing in the visualization style editor. It already includes all required style entries and the localization in German (language column de).

1.4.5.20.2 Dialog 'Open Existing Style as a Copy'

Function: This dialog prompts you to specify data for copying a style file.

Call:
- In CODESYS:
  In the editor of the “Visualization Manager” object (tab “Settings”, group “Style Settings”, click for a drop-down list). Click “Copy and Edit Style”.
- In the visualization style editor:
  Menu bar: “File ➔ Open as Copy”
**“Style”**  Style to be copied.

*Example:* Basic Style, 3.5.9.0

*Note:* You can also select a style from the repository.

**“Destination”**  Working directory for style editing

**“OK”**  A copy of the style is created and opened for editing in the visualization style editor.

---

### 1.4.5.20.3 Editor ‘Visualization Style Editor’

**Symbol:** 🌐

**Function:** The editor is used for creating, deriving, editing, and localizing visualization styles. In addition, it makes it possible to check and install a style or a hierarchy of styles.

**Call:**

- In CODESYS:
  - In the “Visualization Manager” object (tab “Settings”, group “Style Settings”, click for a drop-down list). Click “Open Style Editor”.
  - Start menu > CODESYS installation folder > ‘CODESYS’ > ‘Visualization Style Editor’

**Menu ‘File’**

- **“New style”**  The “Create a New Visualization Style” dialog box opens.
- **“Open”**  The “Open Dialog” dialog box opens. This dialog prompts you to select a style file (format .visustyle.xml) to be opened and edited.
- **“Open as copy”**  The “Open Existing Style as Dialog” dialog box opens. This dialog prompts you to select a style that is copied, saved to the target location, and opened for editing.
- **“Close”**  Closes the style open in the editor.
- **“Save”**  Saves the changes of the open style.
- **“Save As”**  The “Select Visualization Style(s)” dialog box opens. This dialog prompts you to select a file to save the current settings.
- **“Save and Install”**  Saves the open visualization style and installs it to the visualization style repository.
- **“Recently opened files”**  Lists the files for selection that were last opened.
- **“Abort”**  Closes the visualization style editor.

---

### See also

- Chapter 1.4.5.20.1 “Dialog ‘Create a New Visualization Style’” on page 2127

---

**Menu ‘Styles’**  The commands affect the contents of the “Style Properties” tab.
<table>
<thead>
<tr>
<th><strong>“New Entry (as Child)“</strong></th>
<th>Creates another style entry as a child of the selected style property.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“New Entry (Afterwards)“</strong></td>
<td>Creates a new style entry in the list after the selected style property.</td>
</tr>
</tbody>
</table>
| **“Move Down“** | Moves the selected style entry down.  
Requirement: Sort order is flat. |
| **“Move Up“** | Moves the selected style entry up.  
Requirement: Sort order is flat. |
| **“Sort Order“** | Toggles between three sort orders:  
- Flat structure and alphabetical order  
- Flat structure and order according to the position of the entry in the XML style file  
  This position also determines the position of the property in CODESYS. The property appears, for example, in the “Properties“ view below the “Values“ column in the drop-down list for style properties.  
- Hierarchical structure of entries  
  Requirement: The names of the style properties contain at least one dash. |
| **“Check“** | The settings of the style properties are checked for consistency errors. This check is also performed when saving the style. |

**Menu 'Localization'**  
The commands affect the contents of the “Localization“ tab.

<table>
<thead>
<tr>
<th><strong>“Add Language“</strong></th>
<th>The dialog box “Add New Language“ opens. The dialog prompts you to specify data for creating a new language column.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Remove Selected Language“</strong></td>
<td>Removes the columns of the selected cell.</td>
</tr>
<tr>
<td><strong>“Rename Selected Language“</strong></td>
<td>The “Rename Language“ dialog box opens. The dialog is used for renaming the column that defines the selected cell and removes all previous translations.</td>
</tr>
</tbody>
</table>

**Table 374: Dialog box “Add New Language“**

| **“Name“** | Name of the new language as a language code according to ISO 639-1.  
Examples: de, en, es, it, fr, ja |
|-----------|---------------------------------------------------------------------|
| **“Copy from existing“** | All existing language columns are available for selection. The selected language is copied with all entered translations.  
“<do not copy text>“: The new language receives a blank translation column. |

**Tab 'General'**  
This tab contains the general metadata of the open style file and allows it to be edited.

**Table 375: “Identification“**

| **“Company“** | Example: Xy-z GmbH  
Tip: In the installed styles, CODESYS can filter by the company names specified here. |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>“Name“</strong></td>
<td>Example: Style_A</td>
</tr>
</tbody>
</table>
| **“Version“** | User-defined version number  
Example: 1.1.1.1 |
Table 376: “General Settings”

| Base style | Name and version of the style that the open style is based on. Tip: The derived style properties from the base style are highlighted in yellow in the “Style Properties” tab. |
| Partial style (usable only as base for other visualization styles) | [�]: The style is identified as incomplete. Therefore, it can be used for other styles as a base style only. Example: Style only with color definitions that derive this to many other styles. Note: CODESYS does not check for consistency errors of an incomplete style for itself. [ الثلاثة]: The style is identified as complete. |
| From | The “Select Base Style” dialog box opens. This dialog prompts you to select a style file that is saved to the file system (and not does not have to be installed). The file is used as a base style. |

Table 377: “Informational”

| Visualization profile | The profile is intended for informational purposes. For example, you find elements that are not preconfigured with special style entries, and information from the profile. In addition, CODESYS checks in the profile whether a required style is missing. |

Tab 'Style Properties'

This tab lists the names of the style properties with the associated values and makes it possible to edit it, even by means of the commands in the “Styles” menu. The style properties can be defined for colors, fonts, images, and any values. The style properties defined in a base style are derived and highlighted in yellow.

| Name | Name of the style property. If the name contains a dash, then the Visualization Style Editor can sort the style properties by the prefixed terms before the dash and display them in a hierarchy. A name can contain more than one dash. |
| Value | Value that is assigned to the style property. |
| Type | Data type of the style property; selected from a drop-down list. Note: This is possible and necessary only for specific style properties with a data type that is not implicitly defined. |
| Attribute | “hide”: The associated style property is not listed in the drop-down lists in CODESYS. |
| Used by | Visualization element that can be configured with this style property. Can be edited. |

Comment: Example: Special setting for Bar Display. Optional. Double-click a cell. An input field opens for editing. [Del] Removes the selected row.

Tab 'Localization'

This tab makes it possible to translate the names of the style properties into other languages.
<table>
<thead>
<tr>
<th>&quot;Name&quot;</th>
<th>Lists the name of the style properties as they are defined in the &quot;Style Properties&quot; tab.</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;&lt;language&gt;&quot;</td>
<td>Identification of the language name (as language code according to ISO 639-1) in which the style property name should be translated.</td>
</tr>
<tr>
<td>Double-click a cell.</td>
<td>An input field opens for editing.</td>
</tr>
</tbody>
</table>

1.4.5.21 Tutorial

Here you find instructions specific to different use cases.

This collection of instructions is expanded regularly.

1.4.5.21.1 CODESYS visualization - first steps

If you are not yet familiar with the CODESYS visualization, we recommend the application example. The example demonstrates the main features of visualization and provides insights into possible use cases.

1.4.5.21.2 Show instance names

For complex visualizations, it can be helpful if the instance names are displayed within the visualization. How to show instance names is described in the application example.

1.4.5.21.3 Visualizing a Refrigerator Controller

This tutorial demonstrates how to add visualizations to the project and link the elements of the visualization to the variables of the control program.

Preparation

This tutorial is based on the sample program RefrigeratorControl, which was created in the "Your First Program in CODESYS" chapter. The finished program can also be found in the installation directory of CODESYS, in the "Projects" subfolder.

See also

- Your First CODESYS Program

Creating the visualizations

The visualization consists of the following three visualization screens:

- Visualization: Control elements and display of the refrigerator
- Diagnosis: History of the set and actual temperature, parameter settings
- Live Visu: Animation with refrigerator

1. Select the "Application" object in the device tree.
2. Click "Project ➔ Add Object ➔ Visualization".
3. Specify Live_Visu as the name.
4. Create two more visualizations with the names Diagnosis and Visualization.
This screen consists of control and display elements that control the refrigerator.

1. Open the visualization in the editor.

2. Drag a "Rectangle" visualization element to the editor. Change the following properties:
   - "Texts ➔ Text": Actual temperature: %2.1f °C
   - "Text variables ➔ Text variable": Glob_Var.rTempActual

3. Drag a "Meter 180°" visualization element to the editor. Change the following properties:
   - "Value": Glob_Var.rTempActual
   - "Scale ➔ Scale end": 20
   - "Scale ➔ Main scale": 5
   - "Scale ➔ Subscale": 1

4. Drag a "Rectangle" visualization element to the editor. Change the following properties:
   - "Texts ➔ Text": Temperature presetting: %.1f °C
   - "Text variables ➔ Text variable": Glob_Var.rTempSet
5. Drag a “Potentiometer” visualization element to the editor.
Change the following properties
- “Variable”: Glob_Var.rTempSet
- “Background ➔ Background color”: “yellow”
- “Pointer ➔ Color”: “red”
- “Scale ➔ Subscale position”: “Outward”
- “Scale ➔ Scale start”: 3
- “Scale ➔ Scale end”: 13
- “Scale ➔ Subscale”: 1
- “Scale ➔ Main scale”: 1
- “Label ➔ Unit”: “°C”
- “Label ➔ Scale format (C syntax)”: %.0f
- “Label ➔ Max. text width of labels”: 21
- “Label ➔ Height of labels”: 15

6. Drag a “Label” visualization element to the editor.
Change the following properties
- “Texts ➔ Text”: Cooling compressor

7. Drag a “Lamp” visualization element to the editor. Position it behind the text Cooling compressor.
Change the following properties
- “Variable”: Glob_Var.bCompressor

8. Drag a “Label” visualization element to the editor.
Change the following properties
- “Texts ➔ Text”: Signal (beep)

9. Drag a “Lamp” visualization element to the editor. Position it behind the text “Signal (beep)”.
Change the following properties
- “Variable”: Glob_Var.bSignal
- “Background ➔ Image”: Red

10. Drag a “Rectangle” visualization element to the editor.
Change the following properties
- “Texts ➔ Text”: Door open

11. Drag a “Rocker Switch” visualization element to the editor.
Change the following properties
- “Variable”: Glob_Var.rDoorOpen

Structure of the visualization

Diagnosis

In this screen, you can monitor the temperature curve and optimize the parameters.
1. Open the visualization Diagnosis in the editor.
2. Drag a “Label” visualization element to the editor.
   Change the following properties
   - “Texts ➔ Text”: Refrigerator Diagnosis & Service Menu
   - “Text properties ➔ Font”: Arial, Standard, 18
3. Drag a “Trace” visualization element to the editor.
4. Click the Diagnosis_Trace1 value of the “Trace” property.
   ➔ The “Trace Configuration” dialog opens.
5. Select the “MainTask” in “Task”.
6. Click the “Add Variable” link.
   ➔ A variable is added to the trace. The variable settings are displayed in the dialog.
7. Select Glob_Var.bCompressor for the variable.
8. Add the Glob_Var.rTempSet and Glob_Var.rTempActual variables to the trace. For the other settings, you can use the default values.
9. Click “OK” to exit the dialog.
10. Drag a “Rectangle” visualization element to the editor. Position it on the right next to the trace element.
    Change the following properties
    - “Texts ➔ Text”: %s
    - “Text variables ➔ Text variable”: PLC_PRG.rHysteresis
11. Configure the “OnMouseDown” input configuration of the element. Click “Input configuration ➔ OnMouseDown ➔ Configure”.
    ➔ The “Input Configuration” dialog opens.
12. Assign the “Write Variable” command to the action. Accept the default values and click “OK”.
13. Drag a “Label” visualization element to the editor. Position it over the first rectangle.
    Change the following properties
    - “Texts ➔ Text”: Hysteresis Regulator
14. Adjust the size and position of both elements.
15. Select both of the “Rectangle” and “Label” elements and duplicate them by means of copy and paste.
16. Adjust the labels and variables of the copied elements.
   - “Text”: Compressor Efficiency, “Text variable”: Simulation.P_Cooling
   - “Text”: Time until Beep for DoorOpen, “Text variable”: Glob_Var.timDoorOpenThreshold
   - “Text”: Time until Beep for Compressor On, “Text variable”: Glob_Var.timAlarmThreshold

See also
- § Chapter 1.4.5.19.3.6 “Dialog 'Input Configuration'” on page 1749

Structure of the visualization 'Live Visu'
This screen includes the representation of a refrigerator. The refrigerator consists of several polygon type visualization elements. The doors of the refrigerator are drawn in both the closed and open states. Both doors consist of a group of single elements.

1. Open the Live_Visu visualization in the editor.
2. Select the “Polygon” visualization element in the “Visualization Toolbox” view.
3. Click several times in the editor to create a surface. Right-click to stop adding corner marks.

4. Move the corner marks to the required position so that the element (1) is formed.

![Image of corner marks and polygon]

5. Select the element.

Change the following properties:
- “Colors ⇒ Use gradient color”:
- “Appearance ⇒ Line style”: “Invisible”

6. Click the “Colors ⇒ Use gradient color” property.

7. Select the color “Gray” for “Color 1” in the “Gradient Editor” dialog.

![Image of gradient editor dialog]

8. Create all other elements with the “Polygon” visualization element.

9. Group the elements of the closed doors (2+3+4) and the open doors (5+6+7+8). To do this, press the [Shift] key and click “Visualization ⇒ Group” to select the elements.

10. Move the elements together so that the completed refrigerator is formed. Position the open doors precisely on the closed doors.

11. Select the "Open doors" group.

12. In the properties, double-click the input field “State variable ⇒ Invisible”.

14. Select the rDoorOpen variable in the “Variables” category (below “Application ⇒ Glob_Var”).

15. Negate the variable with NOT (→ NOT Glob_Var.rDoorOpen).

- If the rDoorOpen variable is FALSE (door is closed), then the element is invisible. Then the underlying doors are visible.

16. Copy the following elements from the Visualization screen:
- Potentiometer for setting the temperature
- Rectangle for displaying the set temperature
- Door open switch
- Cooling compressor lamp
- Signal (beep) lamp

17. Insert the elements from the clipboard to the Live_Visu visualization screen.
18. Reduce the elements and position them on the refrigerator.

When the visualization is complete, test it in simulation mode.

1. Click “Online ➔ Simulation”.
2. Click “Online ➔ Login”.
   ➔ A dialog opens and prompts you to create and download the application.
3. Click “Yes” to confirm the dialog.
4. Click “Debug ➔ Start”.
5. Open the visualization Live_Visu in the editor.
   ➔ The refrigerator is in online mode.
6. Open the doors with the switch and monitor the temperature and the alarms. Change the parameters in the screen Diagnosis and watch the reaction in the temperature curve.
1.4.5.21.4 Displaying Array Data in a Histogram

Setting element properties for the histogram

Requirements

- A project contains a visualization object and a program.
- A one-dimensional array is declared in the program (example: `histogram : ARRAY[1..10] OF INT;`).
- In the program, `histogram` data is assigned to the array (example: within the range from 0 to 50).

1. Double-click the “Visualization” object in the device tree.
2. In the “Visualization Toolbox” view, click “Measurement Controls” and drag the “Histogram” element to the visualization editor.
3. In the visualization editor, click the inserted “Histogram”.
   - The “Properties” view opens.
4. In the “Properties” view, double-click the “Value” input field in the “Data array” element property. Then click 
5. In the “Input Assistant” dialog in the “Variables” category of the “PLC (PRG)” program, select the array (example here: `histogram : ARRAY[1..10] OF INT;`) and click “OK”.
6. To display only part of the array as a histogram, activate the “Use subrange” option and specify the index values of the array in “Start index” and “End index” to define the subrange.
7. Select the “Display type” (example: “Bar”).
8. Specify a value between 1 and 100 (example: 30) for the “Relative bar width”.
9. Click the histogram in the visualization editor and change the size and position as desired.
   - The “Position” property changes its values accordingly.
10. Specify the values for the “Scale” element property. Select the values for “Scale start” and “Scale end” so that the array is displayed completely. For the example: “Scale start” 0, “Scale end” 50.
    - For the distance between values on the main scale, specify the value 10, for example, in “Main scale”.
11. In the “Label” element property, specify the “Unit” for the display values.
12. Click “Build ➔ Generate Code”.
13. If the project has been compiled without errors, then click “Online ➔ Login” and click “Debug ➔ Start” to start the application.

⇒ The histogram is displayed in the visualization as follows:

![Histogram](image)

Defining alarm colors for the histogram

☑ The visualization displays a histogram with bars all the same color (example: green). Now you want the bars with values less than 30, for example, to be displayed in another color (example: red).

1. Click the element property “Colors ➔ Alarm color”.
2. Specify the limiting value in “Alarm value” above or below which the bars should be displayed in another color.
3. Select “More” from the list box in “Alarm condition” if all values greater than the “Alarm value” should be displayed in another color. Otherwise, select “Less”.
4. Select an “Alarm color” (example: “Red”).
5. Click “Build ➔ Generate Code”.
6. If the project has been compiled without errors, then click “Online ➔ Login” and click “Debug ➔ Start” to start the application.

* In the example histogram, all bars with values greater than 30 are displayed in red.

### 1.4.5.21.5 Displaying Array Variables in Tables

A frequently required function of a user interface is the display of data arrays. CODESYS Visualization provides the element “Table” for this.

In the configuration of the element “Table”, enter an array variable in the property “Data array”. The array components are displayed in the rows and columns of the table.

Subsequent instructions describe an example of how an array of a structure is displayed in a table. As a preparation, create the `MYSTRUCT DUT` and the declarations in the `PLC_PRG` program.

```plaintext
TYPE MYSTRUCT :
  STRUCT
    iNo : INT;
    bOnStock : BOOL;
    strPartNumber : STRING;
  END_STRUCT
END_TYPE

PROGRAM PLC_PRG
VAR
  arrStruct : ARRAY[0..6] OF MYSTRUCT;
  iSelectedColumn : INT;
END_VAR
```
1. Drag the “Table” visualization element to the visualization editor.
2. Assign the array variable arrStruct to the “Data array” property.
   ⇒ The structure members are displayed as column headings and the array index as row headings.
3. Change the “Columns ⇒ Column ⇒ [0] ⇒ Column header” property to an informative heading (example: Number).
5. Assign a color to the “Selection ⇒ Selection color” property.
6. Define the “Selection ⇒ Selection type” property as Row selection.
7. In the “Selection ⇒ Variable for selected row” property, define the PLC_PRG.iSelectedColumn variable.
   ⇒ The following display results in online mode:

<table>
<thead>
<tr>
<th>Number</th>
<th>in Stock</th>
<th>Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>FALSE</td>
</tr>
<tr>
<td>3</td>
<td>0</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

1.4.5.21.6 Displaying Web Contents

Displaying websites in a visualization

☑ Requirement: A visualization open in a CODESYS project. The “Visualization Toolbox” and “Properties” views of the visualization are also open.

1. Drag the “Web Browser” element from “Special Controls” to the visualization editor.
2. Select the element in the editor.
   ⇒ In the “Properties” view, the element properties are listed for the “Web Browser” element.
3. In the “Position” property, specify the size (in pixels) for the “Width” and the “Height” (example: 600).
4. In “Control variables ⇒ URL”, specify the URL for the website (example: 'http://de.wikipedia.org'). You can also specify a variable here (STRING or WSTRING) where the URL is assigned in the project.
5. In “Control variables ⇒ Display”, specify a Boolean variable (example: bSetURL).
   ⇒ If the variable bSetURL has the value TRUE, then the website 'http://en.wikipedia.org' is displayed at runtime.
Configuring the buttons for forward and back navigation of the website

☐ Requirement: The “Web Browser” element of your visualization is configured as described above.

1. In a POU, declare both Boolean variables `bGoBack` and `bGoForward`.
2. In the visualization editor, click the “Web browser”.
3. For the property “Control variables ➔ Back”, select the variable `bGoBack` from the Input Assistant. For the property “Control variables ➔ Forward”, select the variable `bGoForward`.
4. In “General Controls”, add the “Button” element to your visualization two times.
5. Click a “Button” in the visualization editor and drag the “Button” to the required position (for example above the “Web Browser” element).
6. In the property “Texts ➔ Text”, specify the character “.”. In “Text properties ➔ Font”, select a font from the Input Assistant (example: Arial, Bold, 14).
7. Configure the property “Input configuration ➔ OnMouseClick” so that the variable `bGoForward` switches.
8. Configure the second button for back navigation in the same way as described in Steps 5 to 7.

⇒ If the variable `bSetURL` has the value TRUE, then the website 'http://de.wikipedia.org' is displayed with the forward and back buttons. When you click the buttons, navigation to the previous and next websites is successful.

- ☐ “Input action 'Toggle Variable'” on page 1758

1.4.5.21.7 Using Client Animation

The example shows a visualization with 3 screens. A menu controls the navigation of the screens. The menu is hidden until it moves into view by means of a hamburger button. During the movement, the transparency of the menu is changed. After the screen is selected, the menu moves back out of view. The animation is computed entirely on the target system. The CODESYS visualization only defines the target values (positions, transparency).

1. Preparation

1. Create a new standard project with the CODESYS Control Win V3 controller.
2. Add a “Visualization” object below the “Application”. Choose the name `Visu_Main`.
3. Open the Visualization Manager in the editor and select the “Support client animations and overlay of native elements” option.

2. Creating the PLC_PRG program

The program checks whether the menu button has been pressed. If the menu bar is not visible (position -300), then the position is moved to the visible area (0). If the menu bar is already visible (position 0), then the position is moved to the hidden area.
1. Open the “PLC_PRG” program in the editor.

2. Input the following code into the declaration editor:

```plaintext
PROGRAM PLC_PRG
VAR
    iSelection : INT;                  // to switch the
    xVisible: BOOL;                    // auxiliary variable to
    toggle the menu bar
    iMenuPos : INT := -300;            // position of the menu bar
    xToggle: BOOL;                     // button variable to
    toggle the menu bar
END_VAR
```

3. Input the following code into the implementation:

```plaintext
IF xToggle THEN
    xToggle := FALSE;
    IF xVisible THEN
        xVisible := FALSE;
        iMenuPos := -300;
    ELSE
        xVisible := TRUE;
        iMenuPos := 0;
    END_IF
END_IF
```

3. Creating the menu bar

The menu bar has 3 menu items. A visualization screen is displayed by clicking the corresponding menu item.

1. Insert a “Visu_Menu” visualization below the application.

2. Open the object properties. In the “Visualization” tab, set the “Visualization size” to a “Width” of 300 and a “Height” of 180.

3. Open the visualization in the editor.

4. Select the “Advanced” option in the “Properties” view.

5. In the upper left corner, add a button with a “Width” of 300 and a “Height” of 60.

6. Label the button as “Visu 1”. Set the font size to 24.

7. Open the “Input configuration ➤ OnMouseClick” property.

8. Select the “Execute ST code” action.

9. Input the following ST code:

```plaintext
PLC_PRG.iSelection := 0;
PLC_PRG.xToggle := TRUE;
```

10. Set the “Button state variable ➤ Digital variable” property to PLC_PRG.iSelection=0

11. Add two more buttons named "Visu 2" and "Visu 3".
12. Edit the button properties of "Visu2" (PLC_PRG.iSelection = 1) and "Visu3" (PLC_PRG.iSelection = 2).

Result:

4. Creating more visualization screens

1. Insert the "Visu1" visualization below the application.
2. Open the object properties. In the “Visualization” tab, set the “Visualization size” to a “Width” of 800 and a “Height” of 600.
3. Change the background color of the screen (for example, light gray).
4. Insert a “Label” object into the visualization screen and name the element (example: "Visu 1").
5. Insert two more visualizations "Visu2" and "Visu3" below the application. Edit the properties in the same way as for "Visu1".

5. Creating the main visualization screen

On this screen, you can see the menu bar and a button to show or hide the menu bar. The different visualization screens are navigated in a “Frame” visualization element.

1. Open the properties of the “Visu_Main” visualization. In the “Visualization” tab, set the “Visualization size” to a “Width” of 800 and a “Height” of 600.
2. Open the visualization in the editor.
3. Insert a “Frame” element into the visualization.
   - The “Frame Configuration” dialog opens.
4. Add the “Visu1” (Index 0), “Visu2” (Index 1), and “Visu3” (Index 2) visualizations.
5. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 800, and “Height” = 600.
6. Set the property value of “Switch frame variable ➔ Variable” to PLC_PRG.iSelection.
7. Insert a “Button” element into the visualization.
8. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 800, and “Height” = 600.
9. Set the property value of “Texts ➔ Text” to =.
10. Set the property value of “Text properties ➔ Font” to Arial; 36.
11. Open the “Input configuration ➔ OnMouseClick” property.
12. Select the “Execute ST code” action.
13. Input the following ST code:
   
   ```st
   PLC_PRG.xToggle := TRUE;
   ```
14. Set the property value of “Button state variable ➔ Digital variable” to
   PLC_PRG.xVisible.
15. Insert the “Visu_Menu” visualization element from the “Current Project” category into the
    visualization.
16. Set the property values of “Position” as follows: “X” = 0, “Y” = 0, “Width” = 300, and
    “Height” = 180.
17. Set the property value “Absolute movement ➔ Movement ➔ X” to PLC_PRG.iMenuPos.
18. Set the property value of “State variables ➔ Invisible” to not(PLC_PRG.xVisible).
19. Set the property value of “Animation duration” to 2000.

   ≫ Result:

See also

- Chapter 1.4.5.19.5.6 “Visualization Element ‘Frame’” on page 1856

6. Downloading the project to the controller and starting the WebVisu

1. Build the project and download it to the PLC.
2. Start the project.
3. In the browser, connect to the visualization (http://localhost:8080).
   ≫ The WebVisu connects to the controller and the visualization opens.
4. In the visualization, click the menu button.
   ≫ The menu moves into view.
5. Select a menu item.

⇒ The visualization screen is selected and the menu moves back out of view.

1.5 Libraries and solutions

1.5.1 Information on libraries

System libraries When upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically. Older library versions will be removed as coexistence of a new library version and an older library version is not possible. Check the available library version in the Library Manager.

Usually, when upgrading Automation Builder or an existing project, new AC500 V2 system libraries are installed automatically and older library versions are removed.

As an exception, for the CANopen device CM598-CN both library versions are available in the Library Manager due to compatibility reasons. However, coexistence of a new library version and an older library version is not possible. In order to avoid compile errors remove the older library version.

© Chapter 1.6.2.9 “Converting an AC500 V2 project to an AC500 V3 project” on page 2430

Customer libraries

Target change from AC500 V2 to AC500 V3

After a target change from AC500 V2 to AC500 V3 the customer libraries have to be converted manually using the Library Converter. For further information see © Chapter 1.6.6.1.3 “Later change-over of a target system” on page 3648.

Some Standard CODESYS libraries are automatically converted during the target change.

Documentation for libraries

- Description for the use of and information about selected libraries © Chapter 1.5 “Libraries and solutions” on page 2146.
- Reference for function blocks, functions, structures etc. © Chapter 1.10 “Reference, function blocks” on page 4292

1.5.2 Reference to CODESYS (V3)

Note that CODESYS V3 libraries are used.

For information on programming, see © Chapter 1.4.1.16.1 “Information for Library Developers” on page 449.

1.5.3 Library Manager functionality

The Library Manager contains descriptions of libraries and function blocks.

In the Automation Builder the Library Manager is located under the node “Application”.

© Chapter 1.6.2.9 “Converting an AC500 V2 project to an AC500 V3 project” on page 2430
The Library Manager offers a wide array of functionality for the user. Use cases and how to handle the function blocks of a certain library is described in application examples:

- **StringUtils library.**

1.5.3.1 Search function

In the Library Manager the search function allows you to quickly find any library or function.
To search for a library or function:

1. Select “Add Library”.

   The Add Library Window opens and a list of all available libraries is displayed.

   Libraries in folder “ABB - AC500” are created by ABB and tested in combination with Automation Builder.

   We recommend to use libraries of subfolder “Use Cases” for your project.

   Libraries in subfolder “Intern” are necessary for internal procedures.

   All 3S libraries distributed with Automation Builder are required by ABB libraries and have been tested in combination with AC500 and Automation Builder. Additional 3S libraries that are not distributed with Automation Builder can easily be added. There are no known major issues with using them, however, be aware that they are not tested by ABB.

2. Enter the name of the library or function you are searching for.

### 1.5.3.2 View embedded documentation of all libraries

In the Library Manager you can view embedded documentation of any ABB and 3S libraries. Precondition: Library must be available in Library Manager.
1. Select a library.
   ⇨ The contents of the library are shown.

2. From the contents select an object.
   ⇨ The corresponding documentation is opened.

1.5.3.3 Access version history

The Library Manager allows you to access the version history of ABB libraries.

The version history is not available for non ABB libraries.
To access the version history of an ABB library:

1. Select a library.
   ≫ The contents of the library are shown.

2. Select “history”.
   ≫ The version history is shown.

1.5.3.4 Add user defined libraries

If there are any unresolved library references, you can add user defined libraries.
To add libraries:
1. Right-click on a library.
2. Select “Add Library”.

The Add Library Window opens.

3. Choose the library you want to add.

1.5.3.5 Download missing libraries

The Library Manager allows you to automatically download missing 3S libraries from the project that are not available from the library repository.
To download missing libraries:

1. Select "Download missing libraries".
   ⇒ The 'Download missing libraries' window is opened.

2. Select which libraries you want to download.

### 1.5.4 ACS/DCS drives libraries

#### 1.5.4.1 Introduction

**1.5.4.1.1 Scope of the document**

The purpose of the system technology document is to give an overview and explain the overall concepts of the Drives library in V3. The library contains function blocks to establish communication, to control the ABB ACS / DCS drives from AC500 V3 PLCs.
### 1.5.4.1.2 Safety instructions and preconditions to use drives library

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the devices you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 in the online help in Automation Builder.
- Read the user information of the devices and functions you are using, see online help in Automation Builder.
- Installation and commissioning of the drive(s) is not part of this document nor the online help of Automation Builder. Installation and commissioning of the drive(s) must be done according to the related drives manuals and safety instructions.

The library package has been released for the software and firmware versions listed in the readme file of the package only.

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the Drives V3 Library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e.g. of example programs.

The user must follow all applicable safety instructions and the guidelines mentioned in the user documents of the ABB products.

Read the complete safety instructions for the AC500 before installation and commissioning.

---

**CAUTION!**

Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

---

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

---

### 1.5.4.1.3 Comparison of V2 and V3 drives library

The below table compares the FBs in the V2 library package and corresponding adapted FBs in the V3 library package.

The V2 package (PS553-Drives) has different library files for each protocol and the same is replaced with a single library in V3 (ABB_Drives_AC500).

1.5.4.1.4 Overview of the drives library for V3 PLC

This document will briefly explain about communication settings between PLCs with drives, how to control the drives from PLC using the control function blocks.

Each input and output of the function blocks are explained in the integrated documentation in the library.

This library is released for the following products:

- AC500 V3 CPU
- ABB Drives:
  - ACS380, ACS480, ACS580, ACH580, ACQ580, ACSM1, ACS880, DCS550, DCS800, DCS880. Other drives may still work, but are not tested.
  - To use the control blocks the Communication Profile must be “ABB Drives Profile” or “ABB Drives Profile enhanced”
- Fieldbus Adapters: FENA-01, FENA-11, FENA-21, FSCA-01, FCAN-01, FECA-01, RETA-01, RETA-02, RCAN-01, FPNO-21, FMBT-21. Fieldbus adapter support is dependent on the drive and for more details refer the corresponding drive manual.

Drives Library in V3 will support following protocols for the communication:

- Modbus TCP (onboard ETH1 and ETH2 ports)
- Modbus RTU (onboard COM1 port)
- PROFINET (using communication module CM579-PNIO)
- EtherCAT (using communication module CM579-ETHCAT)
- CANopen (onboard CAN port)

**Modbus TCP**

The following hardware components must be available:

- AC500 V3 PLC with ETH option. Configure onboard ETH1 or ETH2 for Modbus TCP.
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21 or FMBT-21
  - DCS550 and DCS800: RETA-01
- RJ45 Ethernet cable
ACS drives

Fig. 12: FB - Overview of Modbus TCP connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  - Use function block ‘DrvModbusTcp’. ⤷ Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181
- DrvModbusTcp
- Control function block in AC500 program:
  - Use function block ‘DrvControlModbusACS’. ⤷ Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177
- Scaling of the speed or torque (optional):
  - Use function block ‘DrvScaling’. ⤷ Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  - Use the function block ‘DrvModbusTcp’ with input EnhancedProfile = TRUE. ⤷ Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181
- DrvModbusTcp
- Control function block in AC500 program:
  - Use function block ‘DrvControlModbusACS’. ⤷ Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177
- Scaling of the speed or torque (optional): Use function block ‘DrvScaling’. ⤷ Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  
  Use the function block `DrvModbusRead`.  
  
  Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180

- **Write the values:**
  
  Use the function block `DrvModbusWrite`.  
  
  Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181

- **Read Write the values:**
  
  Use the function block `DrvModbusReadWrite23`.  
  
  Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201

**DCS drives**

![Diagram](image)

**Fig. 13: FB - Overview of Modbus TCP connection with DCS drives**

**DCS550 and DCS800 drives**

To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:
  
  Use function block “DrvModbusTcp”.  
  
  Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181

- “DrvModbusTcp”

- Control function block in AC500 program:
  
  Use function block “DrvControlModbusDCS”.  
  
  Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179

- Scaling of the speed or torque (optional):
  
  Use function block “DrvScaling”.  
  
  Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172
To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block “DrvModbusRead”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180}\)

- **Write the values:**
  Use the function block “DrvModbusWrite”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181}\)

- **Read write the values:**
  Use the function block “DrvModbusReadWrite23”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201}\)

**DCS80 drives**

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block “DrvModbusTcp”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181}\)
- “DrvModbusTcp”
- Control function block in AC500 program:
  Use function block “DrvControlModbusDCS”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179}\)
- Scaling of the speed or torque (optional):
  Use function block “DrvScaling”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172}\)

To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB drives enhanced
- Communication function block in AC500 program:
  Use the function block “DrvModbusTcp” with input EnhancedProfile = TRUE. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.8 “DrvModbusTcp” on page 2181}\)
- “DrvModbusTcp”
- Control function block in AC500 program:
  Use function block “DrvControlModbusDCS”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.5 “DrvControlModbusDCS” on page 2179}\)
- Scaling of the speed or torque (optional): Use function block “DrvScaling”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172}\)

To exchange more than above mentioned values use additionally the following blocks:

- **Read the values:**
  Use the function block “DrvModbusRead”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180}\)

- **Write the values:**
  Use the function block “DrvModbusWrite”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181}\)

- **Read Write the values:**
  Use the function block “DrvModbusReadWrite23”. \(\text{\textcopyright} \text{Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201}\)
Modbus RTU

The following hardware components must be available:

- AC500 V3 PLC. Configure onboard COM1 for the Modbus RTU communication.
- Drive with
  - ACS Drives and DCS880: Embedded fieldbus or FSCA-01
  - DCS550 and DCS800: Embedded fieldbus or RMBA-01
  - Twisted pair serial cable

ACS drives

Fig. 14: FB - Overview of Modbus RTU connection with ACS drives

To exchange only status word, actual speed, control word and speed reference:

- Communication profile in drive parameters: ABB Drives classic
- Communication function block in AC500 program:
  Use function block “DrvModbusRtu”. § Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188
- DrvModbusRtu
- Control function block in AC500 program:
  Use function block “DrvControlModbusACS”. § Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177
- Scaling of the speed or torque (optional):
  Use function block “DrvScaling”. § Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172
To exchange status word, actual value1 (speed), actual value2 (torque), control word, reference1 (speed), reference value2 (torque) and up to 12 more values read from drive and up to 12 more values write to the drive:

- Communication profile in drive parameters: ABB Drives enhanced
- Communication function block in AC500 program:
  Use the function block “DrvModbusRtu”. ¶ Chapter 1.5.4.2.3.1.9 “DrvModbusRtu” on page 2188
- “DrvModbusRtu”
- Control function block in AC500 program:
  Use function block “DrvControlModbusACS”. ¶ Chapter 1.5.4.2.3.1.4 “DrvControlModbusACS” on page 2177
- Scaling of the speed or torque (optional): Use function block “DrvScaling”. ¶ Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block “DrvModbusRead”. ¶ Chapter 1.5.4.2.3.1.6 “DrvModbusRead” on page 2180
- Write the values:
  Use the function block “DrvModbusWrite”. ¶ Chapter 1.5.4.2.3.1.7 “DrvModbusWrite” on page 2181
- Read Write the values:
  Use the function block “DrvModbusReadWrite23”. ¶ Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201

**DCS drives**

Fig. 15: FB - Overview of Modbus RTU connection with DCS drives
To exchange only status word, actual speed, control word and speed reference:

- Communication function block in AC500 program:
  Use function block “DrvModbusRtu”. \(\text{\textcopyright \hspace{1em} Chapter 1.5.4.2.3.1.9 "DrvModbusRtu" on page 2188}\)
  - “DrvModbusRtu”
- Control function block in AC500 program:
  Use function block “DrvControlModbusDCS”. \(\text{\textcopyright \hspace{1em} Chapter 1.5.4.2.3.1.5 "DrvControlModbusDCS" on page 2179}\)
- Scaling of the speed or torque (optional):
  Use function block “DrvScaling”. \(\text{\textcopyright \hspace{1em} Chapter 1.5.4.2.3.1.1 "DrvScaling" on page 2172}\)

To exchange more than above mentioned values use additionally the following blocks:

- Read the values:
  Use the function block “DrvModbusRead”. \(\text{\textcopyright \hspace{1em} Chapter 1.5.4.2.3.1.6 "DrvModbusRead" on page 2180}\)

- **Read Write the values:**
  Use the function block “DrvModbusReadWrite23”.  \(\triangleright\) Chapter 1.5.4.2.3.1.11 “DrvModbusReadWrite23” on page 2201

---

### PROFINET

The following hardware components must be available:

- **AC500 V3 PLC with CM579-PNIO (PROFINET Master communication module)**
- **Drive with fieldbus adapter module**
  - ACS Drives and DCS880: FENA-01 or FENA-11 or FENA-21
  - DCS550 and DCS800: RETA-02
- **RJ45 Ethernet cable**

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- **Drive → AC500:** Status word and actual value 1 (speed) and optional actual value 2 (torque).
- **AC500 → Drive:** Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- **Communication profile:** ABB Drives Profile
- **Control block:**
  - ACS Drives: Use function block ‘DrvControlACS’.  \(\triangleright\) Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2173.
  - DCS Drives: Use function block ‘DrvControlDCS’.  \(\triangleright\) Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2175.
- **Scaling of the speed or torque (optional):** Use function block ‘DrvScaling’.  \(\triangleright\) Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172.
- **PROFINET read function block.**  \(\triangleright\) Chapter 1.5.4.2.3.1.14 “DrvPNRead” on page 2205
- **PROFINET write function block.**  \(\triangleright\) Chapter 1.5.4.2.3.1.15 “DrvPnWrite” on page 2206

EtherCAT

The following hardware components must be available:

- AC500 V3 PLC with CM579-ETHCAT (EtherCAT Master communication module)
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FECA-01
  - DCS550 and DCS800: RECA-01
- RJ45 Ethernet cable

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block “DrvControlACS”.
  - DCS Drives: Use function block “DrvControlDCS”.
- Scaling of the speed or torque (optional): Use function block “DrvScaling”.

A direct Ethernet cable from CM579-ETHCAT to FECA-01 module is recommended, connection through switch is not recommended since it will slow down the connectivity. Also, the drives need to be connected in the same sequence as they are added in the Automation Builder when multiple drives are connected.
ACS drives

The following hardware components must be available:
- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Drive with fieldbus adapter module
  - ACS Drives and DCS880: FCAN-01
  - DCS550 and DCS800: RCAN-01
- CANopen communication cable with 120 Ω resistor.
The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.

- Drive → AC500: Status word and actual value 1 (speed) and optional actual value 2 (torque).
- AC500 → Drive: Control word and reference value 1 (speed) and optional reference value 2 (torque).

The following function blocks can be configured in the AC500 program.

- Communication profile: ABB Drives Profile
- Control block:
  - ACS Drives: Use function block “DrvControlACS”. See Chapter 1.5.4.2.3.1.2 “DrvControlACS” on page 2173
  - DCS Drives: Use function block “DrvControlDCS”. See Chapter 1.5.4.2.3.1.3 “DrvControlDCS” on page 2175
- Scaling of the speed or torque (optional): Use function block “DrvScaling”. See Chapter 1.5.4.2.3.1.1 “DrvScaling” on page 2172

Fig. 21: FB - Overview of CANopen connection with DCS drives

CANopen with CAN CiA402 Profile for generic Drives

The following hardware components must be available:
- AC500 V3 PLC. Configure onboard CAN port for CANopen communication.
- Any drive with CAN fieldbus adapter module and CAN CiA402 profile.
- CANopen communication cable with 120 Ω resistor.

The following values should be mapped in the fieldbus configuration of the drive and the configuration of AC500. These settings must be done in the Automation Builder hardware configuration.
- Drive → AC500: Status word and actual speed.
- AC500 → Drive: Control word and reference speed.

The following function blocks can be configured in the AC500 program.
- Communication profile: CANopen device profile CiA402
- Control block: Use function block “DrvControlCANCiA402”. See Chapter 1.5.4.2.3.1.13 “DrvControlCANCiA402” on page 2204
General drives with CAN CiA402 interface

*Drive configuration tool and fieldbus adapter module support is dependent on the drive used, for the compatible tool details refer to the drive manual.*

### 1.5.4.2.3 Description of the library

This chapter briefly explains the functions, function blocks, structures, enumerations and visualization present in the library.
Fig. 23: FB - Overview of the Drives Library
Function blocks

DrvScaling

Fig. 24: DrvScaling

DrvScaling function block is used to scale the speed or torque reference to the drive based on the maximum values defined.

Function block “DrvScaling” can be used to scale the variables from fieldbus equivalent values to values used in the program. Fieldbus variables are given in fieldbus equivalent values as INT values. With the scaling a conversion from INT (fieldbus) to REAL (program) and vice versa is performed. Reference1 and Actual Value1 (speed) are mostly given in the range of -20000 ... +20000. Reference2 and Actual Value2 (torque) are mostly given in the range of 0 ... +10000.
This function block can be used to control ACS drives with ABB drives profile using direct input of status word (SW) from drive via any supported fieldbus communication like PROFINET, EtherCAT, CANopen.

Control word (CW) will be built by the function block according to the ABB drives profile state machine. Output CW has to be send to the drive via any fieldbus communication supported. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

</tbody>
</table>
This function block can be used to control ACS drives with ABB Drives profile or ABB Drives enhanced profile using Modbus communication block like DrvModbusTcp or DrvModbusRtu. Status Word (SW) is read from drive through Modbus communication block using "DriveData" interface. See Chapter 1.5.4.2.3.3 “Structure: DrvDataType” on page 2207.
Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.

The function block should be used for ACS drives using ABB drive (Classic/Enhanced) profile for Modbus protocol only. The data transfer to the ACS drive is realized via the “IN_OUT” variable DriveData, which must be connected to “DrvModbusTcp” or “DrvModbusRtu” function block.
This function block can be used to control DCS drives with ABB Drives profile using Modbus communication block like “DrvModbusTcp” or “DrvModbusRtu”.

Status Word (SW) is read from drive through Modbus communication block using DriveData interface. 

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.
The function block should be used for DCS drives using ABB drive profile for Modbus protocol only. The data transfer to the DCS drive is realized via the “IN_OUT” variable DriveData, which must be connected to “DrvModbusTcp” or “DrvModbusRtu” function block.

### DrvModbusRead

The function block 'DrvModbusRead' reads one or more parameters / values of the drive. The number of data to be read is specified at the input 'Nvar'. The first parameter number is specified at the input 'PrmNum'. All parameters must be accessible from consecutive Modbus registers in the drive. The values of the parameters are stored in the PLC memory area, defined at the input 'Data'.

The values in the PLC memory area are updated when the read job was performed without error. This is indicated by JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Enable is set from TRUE to FALSE.

As long as the Enable = TRUE a new read job is requested automatically one cycle after the further read job was terminated. The Modbus job is started from the Communication Block which is connected to the same 'DriveData' variable. It uses the Modbus function code 03 (read n words). The drive (Modbus device) from which the parameter is read is specified at this Communication Block. The Communication Blocks are available from the library e.g. DrvModbusTcp or DrvModbusRtu.

The function block is activated (Enable = TRUE) or deactivated (Enable = FALSE) via input Enable. If the block is active, the current values are available at the outputs. To start a new read job the input Enable must be set to TRUE. If the input values are valid, a request to perform a Modbus job is send to the Communication Block via the 'DriveData' variable. If at least 1 input is invalid, no job is generated, and the error is displayed at the outputs Error and ErrorID instead.
**DrvModbusWrite**

Function block 'DrvModbusWrite' writes 'n' parameters to the drive. The number of parameters to be written must be available in the PLC memory area, defined at the input Data. The write job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

To start a new write job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the Communication Block which is connected to the same DriveData variable. It uses the Modbus function code 16 (write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

*Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set. Please see drive manuals for the parameter details.*

**DrvModbusTcp**

Function block DrvModbusTcp controls the Modbus TCP communication to ACS/DCS drives and provides the basic values (CW, Ref1, Ref2, SW, Act1, Act2) which are used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.
The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable. These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.

If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters.

Using the input NvarRead the function block can be configured to read between 0 and 12 parameters from the drive. All read data is then written to the array at the ReadValue output array. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.
Modbus register address in drive | Mapping configuration in drive | Written in AC500 | Condition at function block
--- | --- | --- | ---
ACS380, ACS480, ACS580, ACH580, ACHQ580, ACS880, ACM1 | DCS550, DCS800 | DCS880 |
Communication module | FENA-01/11/21 | RETA-01 | FENA-01/11/21
FMBT-21 |
400051 | Status Word (SW) | Status Word (SW) | Status Word (SW) | DriveData.wStatusWord | Enable = TRUE
400052 | Actual Value 1 | Actual Value 1 | Actual Value 1 | DriveData.iActualValue1 | Enable = TRUE
400053 | Actual Value 2 | Actual Value 2 | Actual Value 2 | DriveData.iActualValue2 | Enable = TRUE
400054 | FBA Data IN 1 | FBA Data IN 1 | FBA Data IN 1 | ReadValues[1] | Enable = TRUE NVarRead >= 1
400055 | FBA Data IN 2 | FBA Data IN 2 | FBA Data IN 2 | ReadValues[2] | Enable = TRUE NVarRead >= 2
... | ... | ... | ... | ...
400064 | FBA Data IN 11 | FBA Data IN 11 | FBA Data IN 11 | ReadValues[11] | Enable = TRUE NVarRead >= 11
400065 | FBA Data IN 12 | FBA Data IN 12 | FBA Data IN 12 | ReadValues[12] | Enable = TRUE NVarRead >= 12

If 32-bit parameters are mapped to DATA IN,
- The following field in DATA IN must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.
  (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from ReadValues fields must be recombined in the program.

Function block DATA IN has to be configured in drive in the following groups see also FENA-x1 manual.

<table>
<thead>
<tr>
<th>Drive</th>
<th>Parameter Group</th>

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information then job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.
If 32-bit parameters are mapped to DATA OUT,:

- The next/following field in DATA OUT must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive. (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from WriteValues fields must be recombined in the program.

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

### Diagnosis

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information the job is aborted with an error.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModTcpMast job. The ModMastErrorIDLast will keep this Error ID until a new rising edge of the Enable is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusTcp".

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

**DrvModbusRtu**

Function block DrvModbusRtu controls the Modbus RTU communication to ACS/DCS drives and is used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

**Reading status information from drives**

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

With input NvarRead the function block can be configured to read in the same job between 0 ... 24 data more from the drive. These additional data are written to the array at the 'ReadValues' output. These data must be configured in the drive and are only accessible if the embedded Modbus is used.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
<table>
<thead>
<tr>
<th>Modbus register address in drive</th>
<th>Mapping configuration in drive</th>

</tbody>
</table>

400004 Status Word (SW) Status Word (SW) Status Word (SW) 58.104 = 4 DriveData.wStatusWord Enable = TRUE

400005 Actual Value 1 Actual Value 1 Actual Value 1 58.105 = 5 DriveData.iActValue1 Enable = TRUE

400006 Actual Value 2 Actual Value 2 Actual Value 2 58.106 = 6 DriveData.iActValue2 Enable = TRUE

400007 - - 58.107 DATA I/O 7 ReadValues[1] Enable = TRUE

... ... ... ... ... ... ... ...

400014 - - 58.114 DATA I/O 14 ReadValues[8] Enable = TRUE

... ... ... ... ... ... ... ...

400024 - - 58.124 DATA I/O 24 ReadValues[18] Enable = TRUE

More details on the limits for the data read and write is explained in Chapter 1.5.4.2.4 “Limits for the data read and write between AC500 and drives” on page 2208. The value is dependent on the Drive used.

**Writing control word and reference value to drives**

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
### ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

The ABB Drives Profile Enhanced communication profile provides register mapped access to the Control, Status, Reference and Actual Values of the ABB Drives Profile Enhanced. The mapping of the registers has been enhanced to allow additional writing of up to 12 control and reading of up to 12 additional status parameters in a single Modbus job.

#### Reading status information from drives

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters in the same job.

Using the input NvarRead the function block can be configured to read between 1 and 12 more parameters from the drive. All read data is then written to the array at the ReadValues output. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

**Writing control word and reference value to drives**

The function block checks if there are changes in any of the following values since last write job:
- Control Word (wControlWord),
- Reference Value 1 (iRefValue1),
- Reference Value 2 (iRefValue2) on the DriveData variable,
- values in the input array WriteValues – WriteValues[1..NVarWrite].

If there is a change a write job is requested to send the 3 control values and the values in WriteValues array (WriteValues[1..NVarWrite]) to the ACS/DCS drive starting at Modbus register 400001. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
Modbus register address in drive | Mapping configuration in drive | Written from AC500 | Condition at function block
--- | --- | --- | ---
ACS380, ACS480, ACS580, ACS880, ACH580, ACQ580, ACS880, ACSM1 DCS880 | DCS550, DCS800 | DCS880 |

Communication module | FSCA-01 | RMBA-01 | FSCA-01 |

400002 | Reference Value 1 | Reference Value 1 | Reference Value 1 | DriveData.iRefValue1 | Enable = TRUE |

400003 | Reference Value 2 | Reference Value 2 | Reference Value 2 | DriveData.iRefValue2 | Enable = TRUE |

400004 | FBA Data OUT 1 | FBA Data OUT 1 | FBA Data OUT 1 | WriteValues[1] | Enable = TRUE NVarWrite >= 1 |

400005 | FBA Data OUT 2 | FBA Data OUT 2 | FBA Data OUT 2 | WriteValues[2] | Enable = TRUE NVarWrite >= 2 |

400015 | FBA Data OUT 12 | FBA Data OUT 12 | FBA Data OUT 12 | WriteValues[12] | Enable = TRUE NVarWrite >= 12 |

Reconnection pause
When one or more drives in the Modbus RTU lines are offline, all the other drives have to wait for the TimeOut to elapse until a line token is assigned to next drive. Reconnection pause input helps in skipping the drives which are offline from the next Modbus job and execute Modbus job operations only for the drives which are online.

“ReconnectPause” is time in seconds before next retry to connect after a timeout was detected. Timeout is detected with ModMastErrorIDLast = 16#120 (ERR_TIMEOUT).

This feature can be used with the DrvModbusRtu function block in both ABB Drives Profile and ABB Drives Enhanced Profile. User must configure the reconnect pause input value using the input variable “ReconnectPause”.

For the generic RTU block ModRtuToken (part of AC500_ModbusRtu library), also the value for the reconnect pause must be configured at input variable “ReconnectPause”.

Diagnosis
The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.
However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance. These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTU”.

- **iWriteErrCnt**: number of errors in write jobs since Enable = TRUE.
- **wLastWriteErno**: holds the error number of the last executed write job.
- **iReadErrCnt**: number of errors in read jobs since Enable = TRUE.
- **wLastReadErno**: holds the error number of the last executed read job.
- **iReadWriteErrCnt**: number of errors in read write jobs since Enable = TRUE.
- **wLastReadWriteErno**: holds the error number of the last executed read write job.

---

*If several drives are used, for each drive a communication function block such as DrvModbusRtu must be programmed. Also, every other generic Modbus server device on the same Modbus RTU line must be programmed with its own ModRtuToken function block. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive/device, so only one drive/device at a time is communicating with the PLC.*

*ModRtuToken function block and ModRtuTokenType structure are part of AC500_ModbusRtu library. Kindly refer the same.*

---

*If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.*

---

*If a Modbus RTU job tries to access a register in the drive which has no valid mapping information then the job is aborted with an error.*

*Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.*

*Modbus RTU using Embedded Fieldbus:*

*When embedded fieldbus is used for the Modbus RTU communication, user can read maximum of 24 parameters (based on the limitation in drive) from the DATA I/O parameters in the embedded fieldbus parameter group. These parameters can only be used for reading operation and cannot be configured to write data.*

Function block DrvModbusRtuBroadcast is a communication block which sends the broadcast messages via the Modbus RTU communication to all ACS/DCS drives and other Modbus devices connected to the same Modbus RTU line (physical line). The function block can be used with all drives with either ABB Drives Profile or ABB Drives Enhanced Profile but not a mix of both profiles.

As the broadcast job will be received by all devices on the same physical Modbus line it's highly recommended to use this block only in case there are no other Modbus devices connected to this line and all drives use the same profile.

This function block does not perform any Modbus read operation, hence it does not read any values such as status word, actual value 1 and actual value 2 etc., from any of the drive.

This function block should not be used along with 'DrvModbusRead' and 'DrvModbusReadWrite23' function blocks. They will be ignored showing an error. This function block should be only used independently or in combination with 'DrvModbusWrite' function block for broadcasting write operation.

A successful broadcast message for writing control word, reference values and additional mapped parameters (only in case of Enhanced Profile) is indicated by JobDone = TRUE and ModMastErrorAct = FALSE. A next broadcast job for writing these values can once again started with a fresh rising edge at 'SendCtrlValues' input.

Apart from sending control values and up to 12 additional values from WriteValues array (only in case of ABB Drives Enhanced Profile) a normal Modbus write function block “DrvModbusWrite” can be used to send broadcast write messages to specific address on all drives connected to the Modbus RTU line. The requests to process broadcast write Modbus jobs is transferred via the DriveData structure at the InOut variable DriveData which can be connected to multiple instances of write function block 'DrvModbusWrite'.

After each successful broadcast write job a fixed pause of 250 ms is implemented before any other Modbus job within the same line will be started.

### ABB drives classic profile

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

#### Writing control word and reference value to drives

A rising edge from FALSE to TRUE at input 'SendCtrlValues' starts sending broadcast message with Control Word and Reference Values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) are taken from DriveData variable for sending broadcast message.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
<table>
<thead>
<tr>
<th>Modbus register address in drive</th>

</tr>
</tbody>
</table>

### ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile. With the ABB Drives Profile Enhanced profile, along with 3 control values Control Word, Reference Value 1, Reference Value 2, up to 12 additional values can be sent as broadcast message in a single Modbus job.

### Writing control word and reference values to drives

A rising edge from FALSE to TRUE at input ‘SendCtrlValues’ starts sending broadcast message with Control Word and reference values to all the drives starting at Modbus register 400001. Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) from DriveData along with values in the input array WriteValues – WriteValues[1..NvarWrite] are taken for sending broadcast message.

For the additional 12 values the configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus broadcast write job and the needed mapping in the drive as well as the area where the data is taken from the AC500.

## Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects an actual error occurred in Modbus job. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTUBroadcast”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.

---

**For all drives, which are connected to same Modbus RTU line, one instance of broadcast block DrvModbusRtuBroadcast is enough and it must be connected to same LineToken of DrvModbusRtu function blocks which are used for communication between PLC and each drive on Modbus RTU line. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive / device, so only one drive / device at a time is communicating with the PLC.**
All the drives should be configured either in Classic Profile or Enhanced Profile and accordingly the function block DrvModbusRtuBroadcast should be parameterized. Mix of profile with few drives in Classic and few drives in Enhanced should not be used when using DrvModbusRtuBroadcast block, if using such configuration along with DrvModbusRtuBroadcast may lead to incorrect operation.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

The Modbus RTU broadcast job is sent to all devices on the same physical Modbus RTU line.

Therefore, if other Modbus devices than ACS / DCS drives are connected to the same line using the ModRtuToken communication block it’s highly recommended not to use the DrvModbusRtuBroadcast function block.

This might only be used, if the user is aware about the behavior of the connected devices if they receive the Modbus broadcast job.

If a Modbus RTU broadcast job is sent to access a register in the drive which has no valid mapping information then Modbus broadcast job is not aborted but will just send out the broadcast message without any error in the function block. This broadcast message is ignored by drives which have no valid mapping information.

Therefore, the drive parameters in FBA DATA OUT have to be configured according to the used 'NvarWrite' input number respectively.

---

- Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.
- ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter “PARAMETER SAVE” must be set.
  Please see also drive manuals which parameter must be set.
  For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880
  – Par 96.07 = 1
  For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
The function block 'DrvModbusReadWrite23' reads and writes one or more parameters of the drive via DriveData connected to Modbus TCP / Modbus RTU communication blocks with Modbus function code FCT = 23. This function block internally calls DrvModbusWrite to execute ReadWrite job with FCT = 23, used along with the internal structure for Fct23, DrvModFct23Type.

The number of parameters to be read is specified at the input 'NvarRead'. The first address for read operation is specified at the input 'PrmNumRead'. The values of the data are stored in the PLC memory area, defined at the input 'DataRead'.

The number of parameters to be written is specified at the input 'NvarWrite'. The first address for write operation is specified at the input 'PrmNumWrite'. The values of the data that should be written must be stored in the PLC memory area, defined at the input 'DataWrite'.

To start a new ReadWrite job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the communication block DrvModbusTcp or DrvModbusRtu which is connected to the same DriveData variable. It uses the Modbus function code 23 (Read and write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

The values in the PLC memory area are updated when the ReadWrite job was performed without error. The ReadWrite job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

After termination of this job, even if it was not successful, a next ReadWrite job can once again only be started with a rising edge at 'Execute' input.

Drive parameters are only saved temporarily, if changed via fieldbus.
To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
For ACM1, DCS800 and DCS550 – Par 16.06 = 1

UsedControlWord  WORD
```
The function block “DrvControlModbusEng” is designed for user specific control of the drive by setting the control word (CW) by the user itself in the program. Therefore, the user should have a detailed knowledge of the ABB drives profile handling. The reference and actual values must be given in fieldbus equivalent, e.g. range -20000 ... +20000.

Inputs “RefValue1”, “RefValue2” and the generated control word are written to the “DriveData” variable which transfers these values to a communication function block, e.g. “DrvModbusRtu”, “DrvModbusTcp” or “DrvModbusRtuBroadcast” communication function block writes to the drive. In the same way “ActValue1”, “ActValue2” and the status word are transferred from the communication function block to the “DrvControlModbusEng” block, where they are written to the outputs.

The control word can be generated in 2 ways. First way is to set the single bits of the control word separately at the inputs “Off1”, “Off2” ... “ControlWordB15” while the input “UseControlWord” = FALSE.

Second way is to set the input “UseControlWord” = TRUE and write the control word as a whole word directly to the input control word. The generated control word is written to the “DriveData” variable and for diagnosis purpose also available at output “UsedControlWord”.

The input and output names of the bits in control word and status word reflect the functions used with ABB Drive Profile. So the block should be used with ABB Drives Profil setting in the drive.

The function block does not execute any functionality except data transfer to and from the “DriveData” variable. There is no special drive parameter setting necessary to use this block.

The programmer using this block should have a detailed understanding of how to set the control word according to the status word and the description of the used drive.

For standard speed and torque control application it is recommended to use the “DrvControlModbusACS” instead.
The function block “DrvControlCANCiA402” is used for the control of ABB ACS Drive or non-ABB drives from AC500 using CANCiA402 Profile. The CANopen CiA402 function block and visualization from the library can also be used for the 3rd party drives which comply to the CANopen CiA402 Profile.
**DrvPNRead**

Function block “DrvPnRead” reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be read is specified at the input Nvar. Parameters to read from the drive are specified at the Data input. “DrvPbPnPrmDpv1DataType” structure must be declared to a variable and connected to Data input using ADR. This structure contains the group, index, which must be given to the variable. Read parameter type and values are stored in the same variable.

“DrvPdPrmDpv1DataType” structure has the following array elements:

- “abyPrmGroup”: Array of 37 WORD for specifying parameter group.
- “abyPrmIndex”: Array of 37 WORD for specifying parameter index.
- “abyPrmType”: Array of 37 DRV_PDRIVE_PRM_TYPE. READ parameter data type will be available here. For details refer to DRV_PDRIVE_PRM_TYPE. If a type is set here at the start, it can be compared with the type read from the drive if the compare input is TRUE.
- “adwPrmValue”: Array of 37 DWORD. Read parameter value will be available here. If a value is set at the start, it can be compared with the value read from the drive if the compare input is TRUE.

**Read errors:**

If the drive rejects to read a specific parameter, it returns the error code DRV_ERROR_PRM (16#44) in the corresponding abyPrmType element and a more specific error value in the corresponding adwPrmValue element.

The number of elements with errors from the drive are given at the output “NumPrmErrors”. The output “PrmErrCmpValues” gives an array, which contains the more specific error values in the elements (index). This can be used to quickly identify the erroneous elements.

**Compare input:**

As the “DrvPnWrite” function block does not return an error in case a parameter in the drive could not be written correctly it is recommended to verify the writing. This can be done with the call of this function block “DrvPnRead” if the same parameters, types and values are connected to the DATA input (use the same struct as for the writing), and the input “Compare” is set to TRUE.

Then the types and values of the connected struct are copied at the rising edge of execute inputs and compared with the returned types and values from the drive.

In case of a difference this is set into the corresponding element of the output array “PrmErrCmpValues” with the possible three error codes DRV_CMP_DIFF_TYPE, DRV_CMP_DIFF_VALUE or DRV_CMP_DIFF_TYPE_AND_VALUE.

**Mode input:**

- Mode = 16#00 => Read direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the “Data.awPrmGroup” and “Data.awPrmIndex” array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#01 => Read direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the “Data.awPrmGroup” and “Data.awPrmIndex” array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#1x => to be used to access “PROFIDrive” parameters with Attribute = 16#10 (Value) and Number of Elements = x.
● Mode = 16#2x => to be used to access “PROFIDrive” parameters with Attribute = 16#20 (Description) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
● Mode = 16#3x => to be used to access PROFIDrive parameters with Attribute = 16#30 (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)

For “PROFIDrive” parameters using Mode = 16#1x, 16#2x or 16#3x the Number of Elements = x is used for all the parameters in the Data array.

### DrvPnWrite

Function block “DrvPnRead” reads maximum 37 parameters from the drive in a single DPV1 query. The number of parameters to be written is specified at the input Nvar.

Another limit while using the “DrvPnWrite” function block is, it can process only up to 240-byte data in one request or 37 drive parameters whichever is lower. If the write data length is more than 240 bytes, the function block generates an error code WRITE_PACKAGE_SIZE_TOO_LONG 16#0004. At the output “PackageSize” the precalculated size of the request is shown.

Parameters to write to the drive are specified at the data input. “DrvPdPrmDpv1DataType” structure must be declared to a variable and connected to data input using ADR.

“DrvPdPrmDpv1DataType” structure has the following array elements:

- “abyPrmGroup”: Array of 37 WORD for specifying parameter group.
- “abyPrmIndex”: Array of 37 WORD for specifying parameter index.
- “abyPrmType”: Array of 37 DRV_PDRIVE_PRM_TYPE for specifying parameter type, refer the respective drives manual for parameter data type and enter the respective enumeration. For details about enumeration refer DRV_PDRIVE_PRM_TYPE in the library.
- “adwPrmValue”: Array of 37 DWORD for specifying parameter value that should be written.

The values in the structure area are updated when the write job was performed without error. This is indicated by Done=TRUE.

### Mode input:

- Mode = 16#00 => Write direct variables and parameters via an Fxxx module, e.g. FENA-21 or FPNO-21. Group and Index have to be used as in the “Data.awPrmGroup” and “Data.awPrmIndex” array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#01 => Write direct variables and parameters via an Rxxx module, e.g. RETA-21 for ACS800 or DCS500. Group and Index have to be used as in the “Data.awPrmGroup” and “Data.awPrmIndex” array. (Number of Elements in the PN Data block is set to 16#01)
- Mode = 16#1x => to be used to access “PROFIDrive” parameters with Attribute = 16#10 (Value) and Number of Elements = x.
- Mode = 16#2x => to be used to access “PROFIDrive” parameters with Attribute = 16#20 (Description) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)
- Mode = 16#3x => to be used to access PROFIDrive parameters with Attribute = 16#30 (Text) and Number of Elements = x. (Not supported with Fxxx or Rxxx modules)

For “PROFIDrive” parameters using Mode = 16#1x, 16#2x or 16#3x the Number of Elements = x is used for ALL the parameters in the Data array.
Function: DrvModPara32Bit

Creates the Modbus address for 32-bit parameters of the ACSxxx drives.

To access 32-bit parameters in ACSxxx drives using Modbus a special address calculation must be performed.

This block calculates the 6-digit address out of the 5-digit address used for 16-bit parameters.

Input is the 5-digit address: GGii, where GG = parameter group and ii = the index.

E.g. Par 12.02 ➔ address = 1202.

Output is the calculated address for 32-bit parameters according to the following rule:

```
DrvModPara32Bit = 20000 + (200 * GG) + (2 * ii) e.g. Par. 14.54 ➔ output = 22908
```

This output can be connected directly to the input "PrmNum" of one of the blocks DrvModbusRead or DrvModbusWrite or inputs “PrmNumRead” and “PrmNumWrite” of the block DrvModbusReadWrite23.

Structure: DrvDataType

Structure DrvDataType is used for the DriveData variable to exchange the data for one drive.

Besides the element “sName” all variables should not be written by the user directly. They are read and written within the function blocks. The DrvDataType contains some more internal, invisible variables which are used for internal functionality and not meant for user access.

The following table shows the visible variables of DrvDataType.

<table>
<thead>
<tr>

1.5.4.2.4 Limits for the data read and write between AC500 and drives

The below table defines the limits for the reading of data from the drive and limits for writing data to drives from AC500 with cyclic data exchange.

If fieldbus adapter Plug (FBA) is used, then parameter group FBA DATA IN (e.g. 52) and group FBA DATA OUT (e.g. 53) is accessed in the drive. For the embedded fieldbus (EFB) parameters are used in EFB group (e.g. 58).

According to the table below, limits are defined for the variables 'NVarRead', 'NVarWrite' in DrvModbusRtu and DrvModbusTcp blocks.

1.5.5 BACnet-BC

1.5.5.1 Introduction to BACnet

BACnet is a standardized data communication protocol for Building Automation and Control networks as defined in the ANSI/ASHRAE standard 135 and ISO 16484-5.

The advantage is interoperability between devices of different vendors.

The BACnet protocol defines services to allow communication between devices. Examples include 'Who is', 'I am', 'Who has' and 'I have' for device and object search and identification, “Read Property” and “Write Property” for the exchange of data, up to more complex services for alarm and event management, scheduling and trending.

The BACnet protocol defines a number of object types on which the services operate. Each object is characterized by its properties.

The BACnet objects are combined in a BACnet device. A BACnet device represents the functionality of a physical device.

More background information and introduction can be found here:

http://www.bacnet.org
http://www.bacnet.org/Bibliography

1.5.5.2 AC500 and BACnet

A BACnet device can be described by its “BACnet Interoperability Building Blocks” (BIBB)s, which are needed to establish services. They are grouped in different areas:

- “Data Sharing” (DS)
- “Alarm and Event Management” (AE)
- “Scheduling” (SCHED)
- “Trending” (T)
- “Device and Network Management” (DM)

“Data Sharing” for example contains two BIBBs which are needed for the “Service Read Property”:

- Client side: DS-RP-A (Data Sharing - Read Property - A)
- Server side: DS-RP-B (Data Sharing - Read Property - B)

The BACnet standard defines profiles by the minimum required BIBBs, see table below. “BACnet Simple Sensor” (B-SS) is the simplest one, only containing one BIBB. More complex devices contain more BIBBs (from right to left).
The AC500 V2 supports BIBBs qualifying it as “BACnet Application Specific Controller” (B-ASC), by installing the BACnet B-ASC library.

AC500 V3 supports many more BIBBs qualifying it as “BACnet Building Controller” (B-BC), which contains a server (all BIBBs ending with -B) and a client (all BIBBs ending with -A). In fact, the AC500 contains some more BIBBs. All BIBBs under B-BC in the table above, plus:

- DS-COV-A, -B (Change of Value-A, -B)
- DS-COV-A, -B (Change of Value of Properties-A, -B)
- AE-N-E-B (Alarm and Event-Notification External-B)
- AE-ASUM-B (Alarm and Event-Alarm Summary-B)
- SCHED-I-B (Scheduling-Internal-B)
- T-VMT-E-B (Viewing and Modifying Trends External-B)
- DM-TS-B (Time Synchronization-B)
- DM-UTC-B (UTC Time Synchronization-B)
- DM-MTS-A (Manual Time Synchronization-A)
- DM-LM-B (List Manipulation-B)
- DM-OCD-B (Object Creation and Deletion-B)
- NM-BBMDC-B (BBMD Configuration-B)

... A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Direction: Help/Project examples/Examples.

The figure below shows a typical application for an AC500 V3, acting as B-BC.
A drive with several actuators and sensors is acting as B-ASC, for example providing a temperature value as “Analog Input” (AI) object on the MS/TP network.

AC500 B-BC as client can read this temperature value, perform some processing (scaling, limit check) and on the server side provide the processed value as “Analog Value” (AV) object and as “Trend” object on the IP network. Higher level clients like BACnet Operator Workstation (B-OWS) can access the processed objects “Analog Value” and “Trend” for supervision.

The following chapters describe the possible applications and how to configure an AC500 V3 as B-BC.

1.5.5.3 AC500 V3 as BACnet Building Controller (B-BC)

The BACnet integration into CODESYS implements the ANSI/ASHRAE standard 135-2012 (ISO 16484-5) protocol revision 14 and is based on the AMEV AS-A and AS-B standards. Integration allows access to the properties of BACnet objects and the configuration parameters of a BACnet device by means of an IEC application. You can program a dynamic BACnet configuration and have access to the BACnet functions in the BACnet network by reading and writing BACnet object properties.

1.5.5.3.1 Supported BACnet networks

BACnet can run on different local area network types. The AC500 B-BC supports the following ones:

- MS/TP (Master Slave / Token Passing), based on serial RS-485
- BACnet IP, based on Ethernet / UDP / IP
Different networks can be combined to one common “BACnet internetwork”. The figure above shows an example of some BACnet devices in one “BACnet internetwork”. Each device has a device ID (10 to 15) which must be unique on application level. Services on application level (e.g. read or write request) are working with these device IDs and need no addressing information of the lower levels.

The example “BACnet internetwork” consists of different BACnet networks:

- **BACnet MS/TP network** connecting device 10, 11 and 12
- **BACnet IP network (UDP port 47808)**, consisting of one IP subnets with IP range 192.168.0.x, connecting device 12, 13 and 14
- **BACnet IP network (UDP port 47809)**, consisting of one IP subnet with IP range 192.168.2.x, connecting device 14 and 15

Addressing in a BACnet network is done through datalinks which must have a unique BACnet MAC address (which is different to an Ethernet MAC address).

- In a MS/TP network the BACnet MAC address is just one octet (1, 2, 3 in the example).
- In an IP network the BACnet MAC address is the combination of the IP address and the UDP port number (for example 192.168.0.130.47808 for device 13). The following 16 UDP ports are reserved for BACnet: BAC0 (=47808 decimal) to BACF.

To form a common “BACnet internetwork” the single BACnet networks must be combined by BACnet routers. AC500 can act as a BACnet router between BACnet MS/TP and IP networks (device 12 in the figure above) or between two different BACnet IP networks (device 14).

Two IP subnets using the same UDP ports can be combined to one BACnet IP network with an internet router.

The problem is that internet routers block local broadcast messages, which are required for BACnet communication. This can be solved by “Broadcast Management Devices” (BBDM). AC500 V3 can be configured as BBDM. In the figure above the devices 12 and 14 should be configured as BBDM in order to enable the BACnet communication across the internet router.

An alternative is to configure AC500 V3 as foreign BACnet device if an IP subnet contains no BBDM device to pass broadcast messages over internet routers.

Configuring the AC500 as BBDM or foreign device is described in Chapter 1.5.5.3.4.4 “Configuration of datalinks” on page 2220.
1.5.5.3.2 Supported objects and properties

Communication with BACnet is done through objects and properties.

The AC500 B-BC server of the figure below is represented as a BACnet device object with “ID 12”. The device contains more objects like the Analog Input object, representing the input of a temperature measurement device. An object contains several properties, like “ID, Description, Present Value, Unit” etc.

Further possible objects of an AC500 B-BC are:

- “Binary Input” for example from connected to a switch
- “Analog / Binary Output” for actuators
- “Analog / Binary Values” for local variables
- “Calendar”
- “Schedule”
- “Trend Log”
- ...

A list with all details can be found in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/.

In the figure below, a simple “Service Read Property” is shown. The service is executed in two steps:

1. The client initiates a confirmed request “Read Property”, asking for the present value of the “Analog Input” of object with “ID 1010”.
2. The server answers with an acknowledge, sending the present value which is 21.89°C in the example.

A list of all supported BIBBs and services of AC500 V3 is given in the Automation Builder pdf document ABB-B-BC-PICS-AC500_V3.pdf. Help/Project examples/Examples.

Fig. 25: BACnet objects, properties, services and BIBBs
1.5.5.3.4 BACnet configuration in Automation Builder

To act as a BACnet server or client, the AC500 must be configured accordingly. The figure below shows the basic configuration of a BACnet server (left) and a BACnet server with client functionality (right). It is also possible to have server and client functionality in parallel.

Following objects need to be created:

1. **“BACnet Server”** root object. This is the root object for the server functionality, as well as for the client functionality. It is mandatory, even if only client functionality is required. See Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object” on page 2214

2. BACnet server objects, for example “BACnet Analog Input” Temperature. The properties of the objects must be controlled (written or read) by the PLC logic. See Chapter 1.5.5.3.4.2 “Adding BACnet server objects” on page 2216

3. BACnet client objects, represented by a different symbol. For example, “BACnet Client Read Property”. The functionality of the client objects must be programmed in the PLC logic. Inserting the client objects below the server is optional. It is also possible to instantiate the objects only in a PLC logic. See Chapter 1.5.5.3.4.3 “Adding BACnet client functionality” on page 2217

4. Datalink for the physical layer. This object links the physical interface (Ethernet IP or serial MS/TP) to the “BACnet Server” object. In the example above the IP address of ETH1 is automatically retrieved by inserting the “BACnet IP datalink” below the ETH1 port. See “Configuration of an IP datalink” on page 2221. For MS/TP refer to “Configuration of an MS/TP datalink” on page 2220.

**Configuration of BACnet server root object**

1. Create an empty project with an AC500 V3 CPU type and call it for example “Device_12”.

2. Insert a “BACnet Server” object below the interfaces object in the device tree.
3. Set the device `InstanceNumber` in the “BACnet Parameters” of the “BACnet Server”, e.g. to 12 and the `InstanceName` to `Device_12` (according to Fig. 25 BACnet objects, properties, services and BIBBs).

4. Add a datalink, IP or MS/TP. In the example an IP datalink is inserted below ETH1. Default parameters are sufficient if only one datalink is used.

   “Configuration of an IP datalink” on page 2221

5. Build the project, download to the PLC and set it to [RUN]. The status of the “BACnet Server” should be green (running). If not, please ensure that you have installed the runtime license BACnet Protocol B-BC Runtime, verifiable by right-click on the PLC node and select [Show license information] from the runtime licensing menu. The project is scanned for required licenses. If you are logged in to a PLC, then the licenses available on the PLC are displayed. A missing required license is highlighted.

   Chapter 1.6.6.2.2.2 “PLC runtime licensing” on page 3665
6. Start any BACnet client to find the server, for example Inneasoft BACnet Explorer.

Adding BACnet server objects

Goal is to publish an analog value as BACnet server object. This example is according to Fig. 25 BACnet objects, properties, services and BIBBs, left part containing a temperature value.

1. Configure a “BACnet Server” root object according to Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object” on page 2214.

2. Add a “BACnet Analog Input” object below the “BACnet Server”.

3. Rename it to Temperature, adjust the parameters: InstanceNumber: 1010, Description: Temperature, Units: UNIT_DEGREES_C.
4. The present value of the objects Temperature needs to be fed with the value from the real temperature device. Alternatively, a simple PLC program can simulate this value.

5. Download the program and observe the temperature value in the BACnet client.

Adding BACnet client functionality

Goal is to configure a second AC500 controller as BACnet client which reads an analog value from a server. This example is according to Fig. 25 BACnet objects, properties, services and BIBBs, right part.

1. Add a new controller and configure a “BACnet Server” root object according to Chapter 1.5.5.3.4.1 “Configuration of BACnet server root object ” on page 2214.

2. Set InstanceNumber to 14 and InstanceName to Device 14.
3. In addition to BACnet objects, BACnet clients can also be inserted as devices under a “BACnet Server”. Add a “BACnet Client Read Property” below the “BACnet Server” node.

4. The created object “BACnet Client Read Property” generates a function block instance which can be used to program the client read functionality. The figure below shows a simple example.

In line 1-5 of the code part the function block is called with the following parameter:

- Device ID of the server to read from (12) % Chapter 1.5.5.3.2 “Supported objects and properties ” on page 2213
- Object ID of the object to read from (1010 for the “Analog Input”)
- Object type (“Analog Input”)
- Property to read (“present value”)
- triggerRead to start the read operation

When the user (or another program part) sets the variable triggerRead from FALSE to TRUE the edge triggered function block BACnet_Client_Read_Property starts operation and sends the read request to the server device. After receiving the reply from the Server, the output .xDone gets TRUE (line 8) and the temperature value can be read from the output .result (line 14).
5. Download this program to another AC500 V3 controller, which is in the same IP network as the server. Set it to run and read the temperature value by setting `triggerRead` to `TRUE`. In online mode the read temperature value can be observed in line 14.

**Alternative configuration**

Unlike BACnet objects, a BACnet client does not require a complex (static) configuration, thus a client function block can be used without creating a BACnet client as device.

There is no BACnet_Client_Read_Property object created below the “BACnet Server”. Instead a function block BACnet_Client_Read_Property must be declared in the PRG (line 6 in the declaration) and initially "connected" to its “BACnet Server” in IEC-code via RegisterToServer(), and thus get activated (line 2 in the code) \(\text{Chapter 1.10 “Reference, function blocks” on page 4292.}\)
Configuration of datalinks

For communication with other BACnet devices AC500 provides two different possibilities: MS/TP and IP.

For a non-routing device one MS/TP or IP datalink must be configured.

If more than one datalink is configured, routing between the datalinks is automatically enabled.

Configuration of an MS/TP datalink

- Add the “BACnet MS/TP COM” object below the COM port.

In fact the empty COM port is replaced by the “BACnet MS/TP COM”. By that the COM port is configured as RS-485 with fixed settings for MS/TP: No parity, 8 data bits, 1 stop bits.

- Below the “BACnet MS/TP COM” port object an “BACnet MS/TP datalink” is inserted automatically which can be configured according to the requirements.
● **NetworkNumber**: Use the default value 1 if no routing is required. For routing, use a unique network number in one controller.

● **ConnectionType**: Use the default value *Master* if no routing is required. For routing, use "*Master – answering always postponed*".

● **Baudrate**: Can be set according to requirements in the range of from 9600 to 38400 bits/s, higher values (57600 and 115200 bits/s) are not recommended.

● **DatalayerAddress**: This is the MAC address as described in Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2211. The MAC address must be unique in the MS/TP network.

● For all other parameters the default values are recommended for typical applications.

---

### Configuration of an IP datalink

- Add a “BACnet_IP_datalink” object below the Ethernet port ETH1 or ETH2.

---

- **NetworkNumber**: Use the default value if no routing is required. For routing, use a unique network number in one controller.

- **UDPport**: Use the default value (47808 decimal) in the normal case. Range is possible from BAC0 (= 47808 decimal) to BACF. UDPport + IP address form the MAC address of the IP datalink as described in Chapter 1.5.5.3.1 “Supported BACnet networks” on page 2211. The IP address cannot be specified here. It is automatically taken from the parent Ethernet node (ETH1 or ETH2); its IP address is set in the communication settings of the CPU node, “Device_14” in the example.

- **ForeignDevice** and **BBMD**: Special configuration is only needed if an internet router is located between two BACnet devices.

  - AC500 can be configured as ForeignDevice or BBMD, but not the combination of both. An example for BBDM can be found in the example folder.

---

### Configuration of Routing

Routing enables the combination of different BACnet networks to one common “BACnet internetwork”.

- BACnet devices from different BACnet networks can communicate with each other.

  - If more than one datalink is configured in one CPU, routing between the different networks is automatically enabled. It must only be ensured that the network number is unique in one controller.

  - For MS/TP the **ConnectionType** must be set to “*Master – answering always postponed*”. An example for routing can be found in the example folder.

---

### Time synchonisation

The BACnet clients expect to receive the local time. Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in the near future. In the meantime, it is recommended to store the local time (green color in the following figure) in the AC500 as a workaround.
Using this workaround, the following time sync mechanisms can be used:

- Set local time from Automation Builder Tab "PLC Shell":
  Set the time by the command "time hh:mm:ss".

- Read the local time from the Automation Builder Tab "Statistics":
  "Current PLC Date and time" shows the PLC time as local time without conversion, if the tab "Show PLC time in UTC" is enabled.

For storing the local time in AC500, do not use the button [Set PLC to PC Time] (Tab "Statistics"), since this is always converting from local time to UTC time.
• BACnet clients can read local or UTC time, both requests will deliver the same (local) time information, since the timezone is 0.
• If an SNTP time sync is required (for example with a Meinberg clock), UTC times are exchanged. For conversion of UTC to local time in AC500 a proprietary STNP client must be programmed.
   Please contact the PLC support for more information.

1.5.5.3.5 Package content

The BACnet package PS5607-BACnet-BC can be installed with the Installation Manager and contains the following components:

- BACnet runtime component, part of AC500 firmware.
- Automation Builder package: CODESYS BACnet
  - BACnet plug-in component
  - Device descriptions for “BACnet Server”, BACnet objects, BACnet client and datalinks

  ◊ Chapter 1.5.5.3.5.1 “BACnet libraries” on page 2223

BACnet libraries

The IEC library CmpBACnet represents the integration of the BACnet stack into a CODESYS IEC environment and provides the BACnet data types as well as the BACstack methods.

The sole use of the IEC library CmpBACnet (without the BACnet and BACnetDefaultImpl libraries) would result in complex and lengthy IEC application code.

The BACnet library simplifies BACnet application development considerably as compared to the sole use of CmpBACnet, especially in the following areas:

- Starting and stopping the BACnet stack
- Using BACnet server objects and their properties
- Triggering asynchronous requests (mainly client service requests) and processing the request transaction
- Processing of callbacks from the BACnet stack (see IBACnetEventConsumer) and distributing the callbacks to multiple receivers in the application

Furthermore, the BACnet library provides a plug-in mechanism (BACnetServerPlugin) for extending certain aspects of the BACnet library. BACnetServerPlugin is the basis for the BACnetDefaultImpl library.

The BACnetDefaultImpl library is used for the additional simplification of BACnet application development. The BACnet standard ASHRAE 135 leaves some aspects of the practical use of BACnet open. The most notable examples include the following:

- Persistence of server objects
- Storage and persistence of Trend Log, Trend Log Multiple, and Event Log entries
- Update of the date/time information of the device object
The IEC library BACnet is intended as a layer over the IEC library CmpBACnet. However, the layer does not hide the library because this would require the BACnet library to have "facade" functions for CmpBACnet functions. These facade functions would result in larger application code and increased runtime requirements. This is difficult for the PLC to accept. For this reason, it is necessary to know when elements from the BACnet library or CmpBACnet library are to be used.

General rules:

- **Starting and stopping the BACnet stack**
  - Always use `BACnetServer.StartBACnetStack` and `BACnetServer.StopBACnetStack` or `AutoStart`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetServerInit`.

- **Using BACnet server objects and their properties**
  - Always use the specified function blocks in IEC-lib-BACnet, such as `BACnetAnalogValue`. Never directly use the corresponding functions of the BACnet library, such as `CmpBACnet.BACnetStorePropertyInstance`.

- **Triggering of asynchronous requests**
  - Always use the specified client function blocks of the BACnet library, such as `BACnetClientReadProperty`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetReadProperty`. All functions of the CmpBACnet library that require a BACnetAsyncTransactionToken belong to this category and should never be used directly.

- **Processing of callbacks from the BACnet stack and distributing the callbacks to multiple receivers in the application**
  - Always use `IBACnetEventConsumer` and `BACnetServer.RegisterHook/UnregisterHook/RegisterCallback/UnregisterCallback`. Never directly use the corresponding functions of the CmpBACnet library, such as `CmpBACnet.BACnetSetHook` or `CmpBACnet.BACnetSetCallback`.

When is it appropriate and safe to directly call the functions of the CmpBACnet library?

Basically, it is only necessary to call functions of CmpBACnet directly when a corresponding functionality is not provided in the BACnet library. Check the BACnet library first before trying to use CmpBACnet directly. It is possible to use blocking functions in CmpBACnet, such as `BACnet*CbCompletion`, `BACnetIam(Ex)`, or `BACnetIHave(Ex)`, `BACnetUnconf*`.

Most often, you will use `BACnet*CbCompletion` to implement your specific `IBACnetEventConsumer`, `BACnetEventCallbacks`. But first check whether or not the `BACnetDefaultImpl` library already contains an appropriate standard implementation.

Application examples

- **AC500_V3_BACnet_B-BC_Example_ABxxx.project** including simple read and write operations between client and server.
  - Use case 1: AC500 as BACnet client, read and write (with priority)
  - Use case 2: AC500 as "BACnet Server", publish the analog value
- **AC500_V3_BACnet_B-BC_Example_Routing_ABxxx.project**
- **Examples from 3S**, including
  - Read and write operations with more options, notification class, calendar, scheduler, etc.
  - Device discovery
  - BBMD
  - Persistence
  - Logging
  - Routing
1.5.6 CAA library guidelines

Function block descriptions for the CAA library can be found in the Library Manager. The guidelines for the CAA libraries correspond to the general guidelines for library development. For a detailed description see help chapter Guidelines for Library Development.

With the help of the CAA library, different use cases for dealing with AC500 PLCs can be programmed. A possible example is the use of the so-called CSV read function, with which information from CSV or other formatted DAT files can be read into Structured Text. This use case is described in the application example.

Another application example describes the file handling in order to write, read and append files.

1.5.7 Datalogging library

1.5.7.1 Overview

The Datalogging function block library (PS5609-Log) contains five function blocks for the purpose of advanced time-stamped data logging for different use cases.

In the most challenging use case it also can be called buffering: The AC500 application program generates data which are normally transmitted to a telecontrol system for storage and further processing or displaying to the end user. Typically, these may be remote applications like water- or oil-pumping or electrification stations or solar power plants. The connection between these remote stations with an AC500 and a central SCADA/telecontrol station is not always stable or only sporadically connected. Sporadically connected can be by intention, e.g. to save communication costs or open ports/connections to be used with a control station only in a limited way.

- Then the Datalogging function blocks buffer or store data in case of a broken or intentionally interrupted connection between AC500 and the telecontrol system.

Fig. 26: Overview

1 AC500 application (remote substation)
2 Telecontrol (control station)

- The Datalogging library can be also used as an event recorder. In this special mode data is continuously recorded in a ring buffer which can be read out after a certain event x (e.g. outage) in order to analyze the values especially before but also after the event x.

OR

- Data can be logged only and on command transferred to the ftp area to be analyzed offline or taken out via the memory card.

The following figure gives an overview of the described interaction of the data logging function blocks. There is always an input function block (“LogInput”) needed which transfers the input data into data sets with timestamp for use by the datalogger (“LogHandling”). An output function block (LogOutput) receives the current or retrieved data from the datalogger in case of communication or further processing. The input function blocks “Logxx_Input”, the function block
"LogHandling" and the output function blocks "Logxx_Output" communicate via SRAM FIFOin and FIFOOut areas in the memory. The SRAM FIFOin is power-fail-safe intermediate buffer and help in decoupling time wise and speeding up the necessary write/read operations on the logging file structures significantly. These read/write operations on the files are done in blocks of Data sets, enabling a comparably fast interaction with the otherwise slow file system.

**Fig. 27: Overview function blocks**

Each Datalogging application requires the main function block “LogHandling”, one of the input function blocks to provide data to be logged and one output function block to retrieve the data and send the data to telecontrol (scada).

As input and output function blocks two different types exist:

- For logging data of an interrupted IEC60870 communication, the function blocks “Logiec60870_Input” and “Logiec60870_Output” are provided. The IEC60870 Datalogging function blocks support the IEC data types and work internally with the standard AC500 IEC60870 library. The IEC Datalogger output function block does not need special handling or control/inputs.

- For other types of general data "LogGeneric_Input" and "LogGeneric_Output" are provided. The generic Datalogging function blocks support an even larger variety of data types. The generic output function block needs to be hand-shake with for each data set, in order to retrieve the data from the Datalogging files. Therefore the generic function blocks can also be used to integrate the data logging into any other protocol, e.g. Modbus.

The function block “LogHandling” ensures that also several consecutive and fast interruptions can be handled without losing data. While the log file is replayed, arriving new data is stored in the SRAM FIFOin and added to the Datalogging files (File FIFO) if the SRAM FIFOin becomes full (during that short time the log file replay is paused). Nevertheless any data send to a control station via a communication is always with the oldest data first (FIFO = "First In First Out").

As it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols by the AC500 hardware/firmware), the data rate at which data should be logged in case of a communication break has to be calculated and limited.

As an improvement a ping mechanism should be implemented in the substation. This was done in the example program for the IEC logger. With this ping the interruption is already detected after 1-2 seconds (can be configured in the example program - the configurable "SecureReadTime" must be considered in this context. This ensures that the time delay - before a loss of connection is detected and is compensated).
As the SRAM FIFO has to store data during this time its size limits the data rate. The SRAM FIFO size is 160 Data sets. If data rate is too high, FIFO will overflow. The maximum data rate is depending on the CPU type, storage media (memory card / flash disk) and cycle time configured, must be determined by try and error.

The data rates for storing only without this detection can be much higher and depends on the CPU and memory type chosen. The data is always logged in directly readable csv format ☞ Chapter 1.5.7.1.5 “CSV file formats” on page 2232. Depending on the input function block and data type, the log file contains only one or up to 32 data variables per timestamped data set. The Datalogging files can be configured (up to 65k Data sets per file, up to 999 consecutive log files, name format).

1.5.7.1.1 Operating modes

This chapter describes the different operating modes of the Datalogging and their behavior.

- Mode 0/1: Buffer and disposal in chronologic order
  - Mode 0: Limited storage (keeps oldest, but stops if full)
  - Mode 1: Endless (ring buffer) operation modes (deletes oldest)
- Mode 2: Buffer and disposal via FTP, Log file(s) copied to ftp server area for further use
- Mode 3: Events Recorder, logs data before and after an event.

Mode 0/1: Buffer and disposal in chronologic order

Fig. 28: Overview Mode 0/1

Mode 0/1 is for buffering the values from the AC500 application in case of a broken or intentionally interrupted connection between AC500 and telecontrol. In the normal state 1 the values are directly sent from the FIFOin (input values from application) to FIFOout (telecontrol connection). As soon as the connection is interrupted, the Datalogger changes to working state 2. The values are sent to the file FIFO instead. When the file FIFO is full, the Datalogging is stopped (Mode 0) or the oldest data will be overwritten (Mode 1 = ringbuffer). When the connection is established again and the “ReleaseHistory” pin is triggered, the datalogger changes to working state 3. It cares for disposal of the values in chronological order. The buffered values are
written to FIFOout (working state 3a). This may take some time during which new values are coming from the application and stored into FIFOin. Before the FIFOin overflows the datalogger switches to working state 3b and buffers the new values. After that it can continue with working state 3a. Only if the File FIFO is empty (all files deleted) the datalogger changes back to normal state 1.

The advantage of Mode 0/1 is that all values (directly and buffered) are sent to telecontrol in strictly chronological order which is expected by most control stations (SCADA systems/historians).

If a historical value is sent to the SCADA after a current value has already been sent, the historical value is normally rejected by the SCADA.

As it takes up to 30 seconds before a communication break is detected (e.g. with TCP/IP protocols by the AC500 hardware/firmware), the data rate at which data should be logged in case of a communication break has to be calculated and limited. It therefore makes sense to use PING to detect a possible interruption in the connection. This enables an earlier detection of the connectionless state.

Mode 2: Buffer and disposal via FTP

---

**Fig. 29: Overview Mode 2**

Mode 2 is also used for buffering the values from AC500 application in case of a broken connection between AC500 and telecontrol. State 1 and state 2 are similar to Mode 0/1. The difference is the disposal. When the connection is established again the Datalogger changes directly back to state 1 and the input values in FIFOin are directly sent to FIFOout (telecontrol connection). The buffered values in File FIFO are internally moved from disk 1 to disk 2 which can then be accessed or used by FTP (client or server). This move action can also be triggered by the command “MoveFile”, or when file 1 is full. The advantage of Mode 2 is the immediate availability of the latest and all current values after an outage.
Mode 3: Events recorder

Mode 3 is used to record data values around an event, before and after the event X, e.g. outage of a part of the plant. The values are continuously recorded into the File FIFO file system independent of the connection status to telecontrol. If the File FIFO is full the oldest values are overwritten (ring buffer). Thus the file FIFO always contains the values from the past period n, which is depending on the number of values per second and on the size of the File FIFO. When a certain event x occurs, the command "MoveFile" can be given directly or after the period m. With the command "MoveFile" the values in File FIFO are internally moved from disk1 to disk 2 and can be read out by an FTP action (client or server) when required.

Fig. 30: Overview Mode 3

The buffered values represent the time before the event (n-m) and after the event (m).

The advantage of Mode 3 is that the values from the time period before the event (n-m) and after the event (m) are recorded and can help to reconstruct the cause and effect of the event.

**Logging capacity:**

- Data set: 1 data set always has 400 byte
- FIFOin: Has a maximum capacity of 161 data sets (a 400 byte = 64400 byte)
- FIFOout: Has a maximum capacity of 161 data sets (a 400 byte = 64400 byte)
- File: 1 file stores up to 65535 data records, which are copied block by block from the FIFOin in case of a communication lost
- A maximum of 999 files can be saved.

In purely mathematical terms, that would be 999 files * 65535 Data sets * 400 byte / Data set = 26,187,786,000 bytes = 26 GB
Since neither the flash disk nor the usable memory card have such a capacity, the user has to find a sensible compromise. The flash disk as a storage medium is fail-safe, i.e. in the event of a sudden power failure, data in the possibly currently open file is reconstructed when the power is restored. This is not the case with a memory card. There the file is destroyed. It is therefore advantageous if such a variant is operated with a power supply that keeps the PLC alive for at least a few seconds after the supply voltage failure (see “Input ExternalPower” on the “LogHandling” function block).

**Time synchronization:**
Currently the AC500 V3 does not distinguish between UTC time and local time and its time zone is set to 0. This will be improved in near future. In the meantime, it is recommended to store the local time in the AC500 as a workaround.

> Chapter 1.5.5.3.4.5 “Time syncronisation” on page 2221

### 1.5.7.1.3 File names

File names are renamed according to storing time with an accuracy of 100 ms. The files are renamed from “filename.csv” to a file name with timestamp and with or without file extension, according to input “Disk2Extension” is applicable only in Mode 2.

<table>
<thead>
<tr>
<th>File name with timestamp</th>
<th>02281448.593 = February 28th, 2:48pm (14:48), 59s, 300ms</th>

<tbody>
<tr>
<td>File name with timestamp and file extension</td>
<td>02281448.csv = February 28th, 2:48pm (14:48)</td>
</tr>
</tbody>
</table>

### 1.5.7.1.4 Preconditions

- The Datalogging library supports CPU PM5650 or higher.
- The Datalogging library does not support CPUs of the AC500-eCo series.

**CAUTION!**

Failure in Processing of the function blocks.
- The function blocks LOGxxxxxx_Input, LogHandling and LOGxxxxxx_Output must be put in the same task.

CPU firmware must be V 3.4.0 or higher.

Use memory card from ABB with sufficient free space, at least 1.5 x file size as configured (file size is depending on input “MaxNumDatasetFile” from “LogHandling” function block).

Maximum number of files (input of “LogHandling”) is limited to 999. ABB memory card is formatted with FAT by default.

1.5.8 High Availability Modbus TCP

1.5.8.1 HA-Modbus TCP - System technology

1.5.8.1.1 The AC500 High Availability system

The AC500 High Availability system is designed for the demand of automation systems that require a higher availability, which is realized by redundant devices and communications. The redundancy concept reduces the risk of losing production due to failure of parts of the automation system and thereby minimizes scheduled idle times.

For instance, control can be taken over by the secondary station automatically if the primary station fails.

AC500 High Availability system implements redundancy based on standard AC500 PLCs:

- PLC
- Field communication
- SCADA communication

General differences in high availability / redundancy systems are in which way and how fast the switchover between redundancies happens.

- Cold standby: A replacement system is there but not up and running - Process has (to allow) to completely stop for switchover – e.g. outputs may go to zero.
- Warm standby: Both CPU may be running (= warm) but e.g. communication need to be started/stopped for switch-over - Process needs to tolerate longer freeze times e.g. on outputs - e.g. several seconds.
- AC500 High Availability systems are "hot-standby":
  - Redundant CPUs and all communications are always up and running (hot)
  - Continuous failure detection in both CPU’s and mutual exchange of status
  - Continuous synchronization of critical/historical data from primary to secondary
  - Automatic switch-over in very short time in case of any failure in primary CPU
**PLC冗余**：两台PLC（A和B）并行运行并计算和读取。

一个为“primary”（活动），意味着也在向现场设备写入数据。

另一个为“secondary”（备份），也在计算但只读取来自现场设备的数据，并接收来自primary的同步数据。

- 同步数据是关键内部变量，例如历史内容，将从primary传输到secondary CPU，使secondary总是具有最新的数据，并能立即接管。

  自动同步的是特殊HA库函数块的历史数据（如计数器、定时器、积分控制器等），其他事件和诊断数据可以通过同步块同步。

  同步连接还传输一个“lifecom1”信号（双向），包含每个CPU的诊断数据，以便两台CPU都了解对方的状态。如果secondary CPU接收不到“lifecom1”信号，它假设primary CPU已失效，并接管primary状态。

- 用于primary status的独立连接“lifecom2”将通过与数据同步/lifecom1不同的物理通信路径来区分同步连接失败和“other PLC”失败。

  “lifecom2”应该通过不同的物理通信路径传输，例如Field或SCADA网络。

- 现场I/O连接通过以太网协议ModbusTCP - 连接CI52x设备（参见第1.6.3.7.4.1“CI521-MODTCP”或第1.6.3.7.4.2“CI522-MODTCP”）。

对于现场或SCADA网络的高可用性/冗余性，已经验证的以太网冗余机制被使用。在AC500中，这至少实现为两个外部、管理的交换机，这有一个优点，即可以使用任何更快的冗余机制/协议来使用AC500 HA。
For the I/O communication with CI52x modules two variants exist (see online help: PLC Automation with V2 CPUs ➔ PLC integration ➔ Device specifications ➔ Communication interface modules (S500) ➔ Modbus XY)

For smaller systems, the CI52x modules can be directly daisy chained (as in previous figure above) if MRP (Media Redundancy Protocol) or DLR (Device Level Ring) is used. CI52x are not actively participating in ring recovery however, a special FW allows fast ring detection and very short freeze times. Larger systems with e.g. many IO and clusters typically anyway connect to the network via a dedicated managed switch.

SCADA connection is redundant by nature of the two Ethernet ports and can be extended with further redundancy level as well by managed switches. SCADA itself can also switch the primary PLC to ensure communication to the active PLC in case of a simple connection and a connection failure. If the redundancy mechanism of the OPC DA server is not used, SCADA level itself must be able to handle and differentiate primary and secondary PLC and IP addresses based on the HA-status bits. For CP600 a script exists to do the same for Modbus or AC500 communication protocol.

In most PLC applications the critical components to fail are, beneath PLC, typically the power supply or communication components such as wires or switches. Therefore a SPOF (Single Point Of Failure) has to be avoided by adding redundant devices or redundancy functions wherever a failure likelihood is high and failures are not tolerable.

HA core functionality typically can tolerate only a single failure in the different levels. Then, a repair of the failed part is highly advised to achieve and ensure redundancy again. As shown in the above figure, the I/O-network cabling already provides a second independent redundancy layer e.g. for cable failure by its redundancy mechanism (e.g. ring), which can keep up communication without switching the PLCs: There a second failure in the PLC level could be tolerated as long as both connecting, managed switched still work, but it is highly advised to repair immediately anyway.

The AC500 High Availability system itself only takes care of the first fault. For example, in case of a second fault the primary PLC remains primary PLC until the second fault occurs. This results in no further switchovers (manual switchovers included).

Due to the efficient data sync mechanism, which allows data sync over normal and shared ethernet networks, with a well-planned communication network, the PLCs can operate geographically separated (by many 10³ kilometers). So even in catastrophic events with full mechanical destruction still one PLC will be available to control the process or infrastructure.

The secondary PLC or single CI52x modules can be exchanged in a running system without interruption of the primary PLC or the process. (Check document in “Examples” directory of Automation Builder if HA package was installed.)

Libraries

In order to achieve high availability, the CODESYS application must be enhanced with HA function blocks, from the HA-Modbus TCP library and the CI52x library. If the bulk data manager tool (BDM) is used for configuring the System and I/O modules - this is done automatically for the basic initial configuration step by code creation resulting in a prepared user specific “template” application (see below).

- HA-Modbus TCP library contains HA control and HA utility function blocks
  - HA control function blocks manage the core HA functionality by collecting diagnosis and switching if necessary.
  - HA utility function blocks provide standard functions in the application program with internal sync for integral data e.g. timers, counters, PI control.
- CI52x library contains a function block to configure and communicate to the communication interface modules and ensures that only the primary PLC writes to the outputs. The inputs are read by both PLCs.
- For both PLCs the same application must be used/downloaded.
Bulk data manager tool (BDM)

For configuration of the CI52x Modbus TCPs, a separate Bulk Data Manager tool (BDM) is provided. Especially in larger systems usage of BDM is recommended to comfortably engineer HA and create CI52x related configuration and variable data in one place:

- Configuration and parameters of the used I/O modules
- Program code creation for variable naming, configuration, communication and all basic HA functionality

The BDM tool can serve SCADA programming and documentation as well in an efficient manner.

1.5.8.1.2 Hardware, requirements and options overview

Two same type AC500 PLCs are required as central hardware components. Each PLC is equipped with at least two Ethernet ports at a processor module or at a communication module. The two PLCs, called PLC A and PLC B, are linked by Ethernet to exchange and synchronize information (Sync). Connections to the AC500 peripheral field devices (I/O) are performed via Ethernet as well.

For further information on which CPU type and library to be used refer to Table 379 “Overview of AC500 HA systems and options” on page 2238.

The following table gives an overview of the different High Availability variants possible with AC500.

The figures are indicative, depend on chosen architectures, system size, network and CPU/CM modules used.

1) Number of CI52x recommendation based on performance or max. number of sockets (CPU and CM modules).

For more details of Modbus clients supported in AC500 V3 PLCs refer to "Chapter 1.6.1.3.3 "Limitation of connections per protocol" on page 2392.

2) Limited by CPU performance, number of CM574 modules number of CS31 clients and process data limits.

3) Depends on system size and CPU type.
4) For details on certain S500-eCo modules not supported, see the Automation Builder release notes, Appendix 1.

5) CM597 not available for V3 CPUs.

6) Based on HA bits switchover, depending on failure case: Chapter 1.5.8.1.3.2 "Use case descriptions" on page 2245 and Chapter 1.5.8.1.5.2 "Task configuration recommendations for HA system" on page 2258.

7) Field network: If CI52x are used with their 2 ports as part of a ring: In the moment of a network switchover single telegrams may be destroyed: - for V2 ETH onboard: Standard TCP delays repeats by 500 ms - for V3 CPUs onboard or V2 CPU using CM597: A special HA-FW ensures fast repeats of typ. ~50ms (settable).

CPU choice, system size and performance indications

The diagrams below indicate the example choices of AC500 CPU's (horizontal axes) based on the number of communication interface CI-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).

Further details can be found in Chapter 1.5.8.1.5.2 "Task configuration recommendations for HA system" on page 2258. The values in below graphs base on the assumption to use max. 50-60% as CPU loading by the bare fast IO communication and HA functionality. So the application load would come on top and cycle times (especially HA, Modbus) need to be relaxed (made higher) compared to below indication.

![Graph showing application cycle time vs. number of communication interface CI-remote I/O clusters](image)

Fig. 37: Indication of AC500 CPU's performance (horizontal axes) based on the number of communication interface CI-remote I/O clusters (Communication Interface modules; numbers see legend) used in a system and resulting application cycle times (vertical axes).
Example: If you need a system supporting min. 25 CI at application cycle time around 120 ms, suitable options based on above graph would be V2 PLCs - PM592 or PM595 and V3 PLCs – PM5650 or PM5670. The main parameter in the application cycle determination is the amount of overall Sync data, which is assumed 160 bytes per CI for the smaller systems, up to 250 bytes per CI for the larger ones. Sync data of the project of in total more than ~1200 byte necessitates several HA cycles to transfer within one application cycle.

The V2 or V3 PLCs types, also differ in available interfaces, protocols supported and memory size.

CI521-MODTCP or CI522-MODTCP can be used as peripheral devices which communicate via the Modbus TCP protocol with the PLCs. The HA-Modbus TCP library supports currently up to 120 CI52x, depending on the CPU type as listed in Further information on page 2238. Each CI52x supports up to a maximum of 10 S500-I/O modules. Nevertheless the standard Modbus TCP communication of the HA library transfers only 120 words per cycle: Therefore please check if for your module configuration matches: In case of many analog IO modules with high-density - like 16 channel AI523/AO523 or modules with fast counters - this limit might be surpassed by roughly 5-6 such modules (to help calculate exactly, there is an Excel sheet provided in the HA “Examples” subfolder of Automation Builder once installed).

For more details of Modbus clients supported in AC500 V3 PLCs refer to Chapter 1.6.1.3.3 “Limitation of connections per protocol” on page 2392.

Local I/O on a CPU can signal / interact for diagnosis or service with / from this CPU. This local I/O is not redundant and won’t be available to communicate to in case of a CPU failure.
Hardware connections

**Fig. 38: AC500 HA and SCADA connection**

SCADA/ Engineering connection is done using ETH ports of both PLCs and one or several managed Ethernet switches depending on the redundancy requirements in the Ethernet levels.

- **HA communication between PLC A and PLC B** must be done via two physical connections between PLC A and PLC B in order to distinguish a “sync link” failure from another PLC failure:
  - Sync (including “lifecom1”) over Ethernet
  - “Lifecom2” over Ethernet (Modbus TCP): Can be combined with Field or SCADA network or a separate Ethernet network over CAN (only possible with AC500 V3 CPU)

- Field devices (CI52x modules) will be connected via Ethernet switches, forming a redundant network (if requested). For details on network configuration see Chapter 1.5.8.1.5.3 “Field I/O network topologies” on page 2260.

The following table shows possible combinations of connections for different CPU types. There must be at least two physical connections. The availability can be increased with a third physical connection, e.g. CM597 for AC500 V2 CPUs or CAN for AC500 V3 CPUs.
1 ETH1 (orange)
2 ETH2 (green)
3 CAN (blue, applicable only in V3)
11 CM597 communication module at slot1 (grey)

The blue box indicates the example which is used in the next chapters.

The numbers in the figure above define the slot on which the connection is made. Last line # of physical connections define how many physical interfaces are used or connected between the PLCs.

It is also possible to realize an HA system without a communication interface CI module see chapter %Chapter 1.5.8.1.6.1.1 “Configuration without communication interface modules to establish redundancy” on page 2264.

**Hardware Example**

HA hardware configuration based on V3 PLC to explain the minimal recommended Ethernet port configuration.

- The Sync connection is performed via SCADA network, the
- “lifecom2” is performed via field network (or the other way around).

The following figure represents the connection example with the details from the highlighted box (see previous figure).
1.5.8.1.3  Functionality

Failures and use cases

The AC500 High Availability system performs a switch-over whenever the primary PLC is powered off, crashed or stopped or if the primary PLC loses fieldbus communication (cut of ETH or defect MRP switch) while the secondary PLC still has connection.

In the following the different use cases and reaction times are outlined.
**Fig. 40: HA use cases – failures, assuming PLC A is primary and “lifecom2” over field network**

The below use case table with reaction and diagnosis messages are based on the setup where Sync is via SCADA network, “lifecom2” over field network and PLC A is primary.

*) Diagnosis description, see function block description.

---

**Reaction**

Switchover to secondary PLC. The communication interface modules are updated by the new primary PLC.

**Comment**

CI52x outputs are frozen during switchover period.

**Diagnosis message on function block**

Primary PLC is powered off.
Secondary PLC: control block output Runtime Error = 16#001E and xHaModPrimary = TRUE
Case 1 b): Primary PLC is stopped

Reaction: Switchover to secondary PLC. The communication interface modules are updated by the new primary PLC.

Comment: CI52x outputs are frozen during switchover period.

Diagnosis message on function block:
Primary PLC is stopped.
Secondary PLC: control block output Runtime Error = 16#0016 and xHaModPrimary = TRUE

If "lifecom2" is lost and the PLC is in STOP mode RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

Case 2 a): Secondary PLC is powered off or crashes

[Diagrams showing the network setup and connection issues]
### Case 2 b): Secondary PLC stop

<table>

<td>Ci52x outputs will be frozen during switchover</td>
</tr>
</tbody>
</table>
| Diagnosis message on function block | Primary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = FALSE  
Secondary PLC: control block output Runtime Error = 16#0000 and xHaModPrimary = TRUE |

A manual switchover can be triggered from both PLCs. For each trigger a switchover from primary PLC to secondary PLC will take place.

1.5.8.1.4 How to get and install the AC500 High Availability system package

The PS5601- High Availability Modbus library package can be installed from the Automation Builder Installation Manager by selecting the component.
Fig. 41: Automation Builder Installation Manager

The following components are installed:

- Libraries
  - AC500 V2 libraries: C:\Program Files (x86)\Common Files\CAA-Targets\ABB_AC500\AC500_V12\library\PS5601-HA-MTCP
    - CI52x_AC500_Vxx.lib, HAModbus_AC500_Vxx.lib.
  - AC500 V3 libraries available in library repository: ABB_CI52x_AC500.compiled-library, ABB_HaModbus_AC500.compiled-library

- Online help: HA-CS31, HA Modbus V2 function block description
- Automation Builder Example folder: C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP
  - AC500_V2: Examples for AC500 V2 including documentation
  - AC500_V3: Examples for AC500 V3 including documentation
  - BulkDataManager: Bulk Data Manager (BDM) tool which helps efficient engineering in larger projects. This requires a separate installation. Further information can be found in the document: C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation.
  - HA-Modbus TCP System Technology.pdf (this document)

1.5.8.1.5 System structure

This chapter explains the detailed structure of the HA system in CODESYS. A HA-Modbus TCP system is characterized by two AC500 PLCs with the following features:

- Identical programs (application with additional HA and Modbus function blocks) that are loaded to both PLCs.
- Communication interface modules CI52x-MODTCP that are connected via Modbus TCP.
- Synchronization of both PLCs (sync/lifecom1 and lifecom2 logical connections).

Programming

Each PLC contains at least three main tasks/programs:

- HA program
- Application program
- Modbus program
The programs in one PLC communicate via internal structures of the libraries and dedicated internal memory areas for HA-Sync array and the Modbus CI52x memory(ies) CiModDataxx.

**Fig. 42: Principle structure of the HA system and recommended tasks: HA, Modbus, Application**

**Modbus program**

The function block CIModCI52x (V3) / CI_MOD_CI52x (V2) reads the input values from the CI52x modules and stores them in the structure CiModDataxx. If the CPU is primary it also writes the outputs to the CI52x modules. The Function block also parametrizes the CI Module as configured in e.g. Bulk data manager tool during the first startup or when a CI module is exchanged.
Normally the HA-Modbus TCP library takes care of communication monitoring. Nevertheless if communication is cut completely, the CI52x communication interfaces and its I/O modules have to react on their own to achieve a bumpless or desired behavior: The following parameters for the CI52x communication interfaces and I/O modules need to be considered:

- **CI52x: parameter “Timeout” for Bus supervision:**
  Allows to detect errors from communication interface side as well and take action to ensure a fail-safe behavior if communication is cut. It can be set in 10 ms steps. If set to 0 no bus supervision is active. Proposed value: 50 = 500 ms = default in Bulk data manager; this value should be increased, e.g. to value 65 if AC500 V2 CPU ports are used for field communication to take care of the larger TCP retransmit time.

- **“Behaviour Outputs” at “Timeout for Bus supervision”**
  This fail-safe parameter has to be consciously set: separate settings are possible for each module (and communication interface): “off”, “last” or “substitute”: 5 s, 10 s, ∞ s.

**Remarks:**

1) The parameters “Behaviour Outputs at comm. Error” is only analyzed if the Failsafe-mode is [ON].

2) Both are CI52x parameters set e.g. via Bulk data manager tool in the program.

**Application program**

- At the start of the application task the InputRefresh program has to be called. It copies data from Modbus via the structure CiModDataxx to the user variables, which were defined in BDM as signals. For further information refer to BDM documentation, chapter 7 which is available in the path: C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation.
- Only the main application programs should be in this task and use these variables for the user defined functions. E.g here the user programs and logic should be called and use the HA libraries utility blocks (which sync their historic data automatically) and HA_MOD_DATA_SYNC blocks for further user data which should be synchronized.
- Data of utility blocks and HA_MOD_DATA_SYNC blocks are copied to the HA Sync array of the primary CPU (which is sent to the secondary CPU by the HA program).
- OutputRefresh program is called as a last step. It copies data from the user variables via structure CiModDataxx to Modbus.

**Example of a utility function block (with integrated sync data)**

Consider the on-delay timer HA_MOD_TON (V2)/ HaModTon (V3).

![Diagram](image)

Fig. 43: HaModTon utility function block with internal synchronization

Both PLCs require the same function block called in the program. Under normal operating conditions the elapsed time ET and output Q of the timer is synchronized internally from primary to the secondary CPU. ET and Q data are available and can be attached to local or global variables in the program as per application requirements. If PLC A shuts down due to a fault, the primary status switches over to PLC B.
In the event of a switchover, the moment PLC B becomes the primary, the timer on this PLC will keep running. Until the time of PLC A failure, the timer on PLC B was synchronized. This is most important in cases when one CPU was not in run or off and needs to “catch up” such integral or historic system values (timers, counters, operator settings, …). The actual process remains then unaffected by the switchover.

**HA program**

HA_MOD_CONTROL has two functions:
- Exchange status data (lifecom1 and lifecom2) and switch from secondary to primary PLC (or vice versa) based on the status according to the use cases described in Chapter 1.5.8.1.3.1 “Failures and use cases” on page 2243.
- Send sync “HA SYNC” array from primary to secondary PLC to ensure that the secondary PLC is always in hot-stand-by and can take over immediately. UDP protocol is used for data synchronization between the CPUs.

**Data synchronization via UDP**

This chapter explains how the data synchronization happens between primary and secondary PLC via UDP.

All prepared sync data is synchronized with the secondary PLC. Typically only integral values (timers, counters, PID, …) or settings which might have been received have to be synchronized. For example for fast start-up cases when a secondary CPU was restarted, as both PLCs are running and calculating closely in parallel and based on the same input values, synchronization will make the secondary start with current value instead of default value. For details on how to configure or use the data sync function block refer example projects.

Following steps are performed:
- HA SYNC array is transferred via UDP to the secondary CPU. This includes the exchange of lifecom1 status between primary and secondary CPU.
- In the HA program the HA_MOD_CONTROL function block collects all diagnosis, sync and lifecom2 data from the field and/or the other PLC. Whether a switchover is necessary is decided based on a simple decision matrix.
- Lifecom2 is exchanged between CPUs over Modbus TCP every cycle.
- One task per program, see figure above.
- Status of the inputs connected to CI52x decentralized I/O stations is transferred to both PLCs simultaneously in every PLC cycle. They are received by the CI52x function block.
- At the end of the program, the generated output values are sent, by transferring from the primary PLC respective buffers to the CI52x-MODTCP module(s) via CI52x function block and Modbus TCP. The secondary PLC is prepared to send but stays “silent” (not sending output values).

One ETH frame copies approx. 1412 data bytes. The number of ETH frames needed to synchronize HA Sync Array completely depends on the number of data sync bytes. Global variable iNoOfEthFrames gives the user this information, which should be used to calculate the cycle time for the application task.

Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258

Up to max. 60 kB of Sync data can be synchronized.

Synchronization between the primary and the secondary PLC happens over a few cycles of HA task time depending on the total sync data bytes configured in the system. Lifecom1 is also exchanged between the primary and the secondary PLC. The primary PLC sends lifecom1 to the secondary PLC along with sync data. Backwards the secondary PLC sends lifecom1 to the primary PLC every cycle.

The following figures shows an example for V2 PLC. When in the project the sync data is equal to 4 iNoOfEthFrames then it takes 4 HA cycles to synchronize the data between the PLCs.
When sync data in the project is equal to 6 $i_{NoOfEthFrames}$ then it takes 6 HA cycles to synchronize the data between the PLCs.
Task configuration recommendations for HA system

For a balanced performance of the HA system consider the following recommendations in your project task configuration:

General

- Use the real time priorities for all HA related tasks. The HA program/ task should be called at highest priority as it is responsible for the core HA functionality and should be the fastest task.
- The Modbus task contains the Modbus communication function blocks at lower priority and (depending on CPU performance) also a faster cycle time to ensure sufficient update rates on Modbus without over-loading the CPU with communication.
- The application program parts should be called in the application task with even lower priority and a larger cycle time than above tasks.
- Configuration to improve standard Modbus TCP for a fast switch over between PLCs.
- AC500 V2
  - CM597ETH_SET_TCP_RTO function block from CM597_ETH_AC500_V28.lib needs to be called inside HA task. User needs to call this function block for each CM597 module connected. For recommended values see example description.
- AC500 V3
  - RTO retransmission time function block “EthSetRtoMin” for the ETH port where fieldbus communication is configured. By default, minimum retransmission time configured is 15 ms.
Task Priority PM57x, PM58x, PM59x PM595-4ETH V3 PLCs

<table>
<thead>
<tr>
<th>Task</th>
<th>Priority</th>
<th>PM57x, PM58x, PM59x</th>
<th>PM595-4ETH</th>
<th>V3 PLCs</th>
</tr>
</thead>
<tbody>
<tr>
<td>HA</td>
<td>10 (high)</td>
<td>4 ms or higher</td>
<td>2 ms or higher</td>
<td>4 ms or higher</td>
</tr>
<tr>
<td>Modbus</td>
<td>11 (medium)</td>
<td>Maximum of (HA cycle time * 2), (3 ms + round up (#CI/2))</td>
<td>Maximum of (HA cycle time * 2), (3 ms + round up (#CI/2))</td>
<td>Maximum of (HA cycle time * 2), (3 ms + round up (#CI/2))</td>
</tr>
<tr>
<td>Application</td>
<td>12 (low)</td>
<td>Maximum of (Modbus cycle time * 2), (iNoOfEthFrames * HA cycle time)</td>
<td>(iNoOfEthFrames * HA cycle time)</td>
<td>Maximum of (Modbus cycle time * 2), (iNoOfEthFrames * HA cycle time * 2)</td>
</tr>
</tbody>
</table>

### Procedure for task configuration

1. Choose suitable CPU type according to chapter CPU choice, system size, performance indications.
2. Configure task priorities according to the table.
3. Set HA task to minimum according to above table.
4. Calculate Modbus cycle time according formulas in the table, based on HA cycle and number of CI modules “#CI”.
5. Calculate Application cycle time according to formulas in the table, based on Modbus cycle time and variable iNoOfEthFrames, which is defined in the global variables of HA-Modbus TCP library.
6. Measure PLC and CPU load during trial operation.
7. Following timeout values has to be defined in the user project according to the relation defined.

A new **V3 CPU configuration option** is introduced from Automation Builder 2.4.1 and onwards which allows to change the priority for Ethernet communication in PLCs.

**Set this configuration in the device tree of the CPU in Automation Builder double click on PLC “CPU_Parameters Parameters Communication Schema” Select “Onboard Ethernet”**.

The above parameter should be set to “Onboard” Ethernet for HA systems and it will consequently increase the loading due to the higher priority.

PLC Load < 50 % and CPU load < 70 % should be considered as guidelines here instead, while setting the task times while setting the task times.

PLC Load < 50 % or CPU load higher than 60 % then increase HA cycle time (e.g. to 8 ms / 12 ms / 24 ms, …) and go to step 4, repeat the steps until loading is within defined range.

### Timeout variables (see definitions in box below table)

<table>
<thead>
<tr>
<th>Timeout variables</th>
<th>HA in V2</th>
<th>HA in V3</th>
</tr>
</thead>
<tbody>
<tr>
<td>timClf52xTimeOut</td>
<td>1 * Modbus Task time</td>
<td>50 ms or Modbus Task time, whichever is higher</td>
</tr>
<tr>
<td>timHaModSyncTimeOut</td>
<td>1 * HA Task time</td>
<td>2 * HA Task time</td>
</tr>
<tr>
<td>timResponseTimeout</td>
<td>Not applicable</td>
<td>50 ms or (2 * Modbus Task time), whichever is higher</td>
</tr>
<tr>
<td>timCanTimeOut</td>
<td>Not applicable</td>
<td>100 ms or (2 * Application Task time) whichever is higher</td>
</tr>
</tbody>
</table>
8. Add additional applications and SCADA communication: Check PLC and CPU load again vs. your requirements.

In the HA Modbus system different timeouts must be configured for the fine operation of the system as described above in the task configuration for V2 and V3 PLCs. These different timeouts meaning, and relation is explained below:

**timHaModSyncTimeOut:**
Time limit to check if the new sync data is received or not in the secondary PLC. If this timeout is not defined properly, Sync lost error/ “lifecom1” lost error will be generated.

**timCanTimeOut:**
Time used for the check whether “lifecom2” is received when configured via CAN. This value is applicable only in AC500 V3. Lifecom2 via CAN won’t be stable between the PLCs and runtime error “lifecom2 lost” will be flickering if not the right value is configured.

**timCI52xTimeOut:**
Time limit to check whether new data is received in the Modbus field modules. It is also used to check whether “lifecom2” is received when configured via Modbus TCP. If ’timCI52xTimeOut’ is not defined as described, “lifecom2” error / communication interface diagnosis error will not be generated as expected.

**timResponseTimeOut:**
Timeout value to check whether CPU has lost the communication interface modules connected in the network. If this value is not defined as described, communication interface module lost detection will not be indicated properly.

---

**Field I/O network topologies**

Modbus TCP communication between PLC and communication interface modules CI521-MODTCP or CI522-MODTCP can be done using different network topologies. In the following subchapters different simple combinations with their pros and cons are explained.

If a CI52x module of a daisy chain is powered off, next following modules will lose connection/ data provided there is no redundancy in the Ethernet network (e.g. ring and managed switch).

---

**Simple ring topology (smaller systems)**

In a simple configuration, CI52x modules can be part of a ring if MRP (or DLR) protocol is used in the managed switches. Then the CI52x are connected from one to another device ("daisy chained") through e.g. two network switches. The redundancy protocol detects a closed ring and opens one port of a managed switch to avoid the ring. The user has to configure the necessary ring configurations and enable the ring manager for the used ring ports in one switch.

It is recommended that time interval between ETH cable disconnection and re-connection should be greater than 2-3 seconds.
Standard network topology (large systems)

In the standard redundant network, which is often done by third party dedicated telecommunication companies, managed switches are used for every connection point to this network. It's the network's (and operator's) responsibility to repair any failure fast enough so that no influence on the HA system or its outputs occur.

The network can use other fast redundancy algorithms, also having other than ring structures, if redundancy links are activated fast enough.
Parallel network topology (using PRP)

Each CI52x module and PLCs as single ended devices are connected by PRP switches to both networks. Here the failure of the switch which connects the primary CPU will also lead to a switchover.
Redundancy switchover timing should match the settings in the program and communication interface modules for time-out and freeze periods. The networks for larger systems are often seen as a separate entity and done by a separate company. Make sure to have the redundancy status information of the network at least in SCADA, to repair in time. If the I/O field network responsibility is with the automation/PLC part, the redundancy status should be also monitored by the PLC. A warning to initiate repair may be created from the managed switches in the I/O field network.

- Alarm output(s) wired (e.g. to a CI52x input and related settings of the switch(es)).
- Settings of the switch(es) to send (e.g. SNMP traps, which can be received in PLC (AC500 SNMP library)).
- Use of “automation switches” which can also communicate their status directly via Modbus.

It is also possible to connect switches in ring combination with CI modules connected to them in daisy chain. User needs to do the relevant setting based on type of switch and protocol (Ex: MRP, RSTP).

If RSTP ring configuration is used in the system, ring reconfiguration time is slower than other ring protocols. During this reconfiguration, connection to the CI modules will be lost.

HA Modbus system without communication interface modules in the network

It is also possible to have a HA Modbus system without connecting any field devices, CI521-MODTCP / CI522-MODTCP in the network. This system can be used for establishing a redundant PLC system with data synchronization between two AC500 controllers, either without field IO or with user integration of other protocols to field-IO or “intelligent” IO: CPUs as field devices.
Secondary will be on hot standby with primary PLC, during a power off/stop of the primary PLC. Secondary will take over the control and continue the process. Any user integrated field-IO or CPUs can establish communication mapped with the primary bit: parallel reading but prevent parallel writing.

HA without CI modules can be also used during commissioning to check the data sync, OPC and SCADA related communications without any field devices configured. The user has to set the global variable ‘xNoCiBus’ to TRUE defined in the HA_GLOBAL_VARIABLES. This variable has to be set to TRUE in both PLCs. Note: It is not advised to update this variable during runtime.

**Fig. 47: Simple SCADA connection**

### 1.5.8.1.6 Getting started

Quick start list and guidelines

![Engineering workflow using Automation Builder](image)

**Fig. 48: Engineering workflow using Automation Builder**

Simple steps to engineer the HA Modbus system is explained in the following chapters.

**Configuration without communication interface modules to establish redundancy**

Configuration of the HA system without communication interface modules to establish redundancy is done by the following steps (for details see the example documentations):
1. Install the hardware Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237.

2. Select the CPUs based on the requirements Chapter 1.5.8.1.2.1 “CPU choice, system size and performance indications” on page 2239.

3. Install Automation Builder including the latest libraries Chapter 1.5.8.1.4 “How to get and install the AC500 High Availability system package” on page 2252.

4. Create a new project in Automation Builder for the chosen CPUs.

5. Configure the required Modbus and UDP configuration in the Automation Builder device tree of the CPU.

6. For UDP in AC500 V2 PLC, configure “UDP_no_AC31_header” and set the port number to value “3000”.

7. Assign the IP addresses in ≥ 2 different Ethernet networks:
   - SCADA network: SCADA, connected PLC A and PLC B
   - Field network: connected CI52x module(s)

8. Configure the mandatory HA_MOD_CONTROL function block for the HA task “HA program” on page 2256.

9. Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event “stop”.

10. Add optional HA utility function blocks or function block HA_MOD_DATASYNC.
11. Make the global variable xNoCiBus = TRUE to run the system without communication interface module configured in the system. Refer to Chapter 1.5.8.1.5.3.4 “HA Modbus system without communication interface modules in the network” on page 2263.

![Image]

12. Add the task configuration Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258.

13. Activate the runtime license if it is a V3 PLC to enable HA system. Refer to Chapter 1.6.6.2.2.2 “PLC runtime licensing” on page 3665.

14. Compile and download to both PLCs (simplified in V3 via integrated download manager).

15. Create a boot project, restart the complete system and RUN.

16. Operation: Test use cases (e.g. by putting the primary PLC to STOP mode and observe the switchover). For different use cases and behavior refer to .

17. Runtime error and diagnosis function block can be used to monitor the system . For details refer to chapter Diagnosis Chapter 1.5.8.1.8 “Diagnosis” on page 2269.

Configuration with communication interface modules and redundancy

For medium or large HA systems the configuration with communication interface modules and redundancy is done by the following steps. For details see the example documentations:

1. Install the hardware Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237.

2. Select the CPUs based on the requirements Chapter 1.5.8.1.2.1 “CPU choice, system size and performance indications” on page 2239.

3. Install Automation Builder including the latest libraries Chapter 1.5.8.1.2 “Hardware, requirements and options overview” on page 2237.

4. Install the Bulk Data Manager tool (BDM) Chapter 1.5.8.1.4 “How to get and install the AC500 High Availability system package” on page 2252.

5. Create a new project in Automation Builder for the chosen CPUs.
6. Configure the required Modbus and UDP configuration in the Automation Builder device tree of the CPU. UDP settings are only required in AC500 V2 PLCs.

7. For UDP in AC500 V2 PLC, configure “UDP_no_AC31_header” and define the port number as ‘3000’.

8. In AC500 V2 PLCs for each CM597-ETH communication module added the “Send timeout” value has to be changed to 600 ms for the Modbus TCP server.
9. Assign the IP addresses in ≥ 2 different Ethernet networks:
   ● SCADA network: SCADA, connected PLC A and PLC B.
   ● Field network: connected CI52x module(s).
10. Configure a network switch in the field network (if managed/redundant) based on network redundancy required & Chapter 1.5.8.1.5.3 “Field I/O network topologies” on page 2260.
11. Run BDM tool to configure CI52x network.
12. Export the files. Refer for details in the document: C:\Users\Public\Documents\AutomationBuilder\Examples\PS5601-HA-MTCP\BulkDataManager\Documentation.
13. Import the Bulk data export files to the Automation Builder project.
15. For the system with V3 PLCs, set the Communication Schema to “Onboard Ethernet” “CPU-Parameters Parameters” for better performance.
16. Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event “stop”.
17. Add optional HA utility function blocks or function block HA_MOD_DATASYNC.
18. Add the task configuration & Chapter 1.5.8.1.5.2 “Task configuration recommendations for HA system” on page 2258.
19. Activate the runtime license if it is a V3 PLC to enable HA system. Refer to Chapter 1.5.8.1.2.2 “PLC runtime licensing” on page 3665.

20. Compile and download to both PLCs (simplified in V3 via integrated download manager).

21. Create a boot project, restart the complete system and RUN.

22. Operation: Test use cases (e.g. by putting the primary PLC to STOP mode and observe the switchover).

23. For different use cases and behavior refer to Chapter 1.5.8.1.3.1 “Failures and use cases” on page 2243.

24. Runtime error and diagnosis function block can be used to monitor the system. For details refer to Chapter 1.5.8.1.8 “Diagnosis” on page 2269.

1.5.8.1.7 HA-Modbus TCP Limits

HA-Modbus TCP is supported as of Automation Builder 2.0 or higher and the corresponding AC500 CPUs mentioned previously. AC500 V3 PLC is currently not supporting external ETH communication modules. Therefore, onboard ETH1, ETH2 (and eventually CAN) ports are to be used for communication.

3000 sync instances can be used: Either 3000 HA_MOD_DATA_SYNC function block instances alone or together 3000 instances of HA_MOD_DATA_SYNC including + HA utility function block can be used. If more than 3000 instances are configured user can see the error at xHaModDataErr = True and wHaModDataErNo = 16#2022 in HA_GLOBAL_VARIABLES.

The maximum length of sync data at an instance of HA_MOD_DATA_SYNC function block would be 1412 bytes. The maximum size of sync data which can be synced between PLCA and PLCB in total can be max. 60 000 bytes.

The HA-Modbus TCP system takes care of the first fault only. This fault must be visualized by the programmer and overall system (e.g. HMI, SCADA) to the operator, to plan and repair as soon as possible as redundancy might be lost. If more than one error occurs, system may not react to second or following faults.

SCADA/ HMI has to be configured/programmed to:

- Only read data from the primary PLC.
- Parameters and control data should be always written to both PLCs or has to be synchronized via the function block.

This is given automatically when using OPC DA, where the CODESYS OPC Server does this switching for the connected clients according to the primary status. For CP600 HMI a script is available to switch likewise (connected via the internal AC500 protocol or Modbus). Zenon as a SCADA also uses the AC500 protocol to automatically switchover.

1.5.8.1.8 Diagnosis

This chapter explains the diagnosis information available to the user in the HA Modbus library and Ci52x library. Diagnosis information is available at the outputs of HA control function block, HA Diagnosis function block and at the Ci52x function block.

Depending on the use case defined in Chapter 1.5.8.1.3 “Functionality” on page 2243 different diagnosis information can be accessed.
Primary CPU currently can read-out the diagnosis information (CI52x function block outputs) from communication interface module only once, hence secondary PLC will not be able to read the diagnosis information from the CI52x module.

So if any change happens in CI52x diagnosis it is not reflected in the secondary CPU.

This can lead to different diagnosis information of CI52x module in the primary and the secondary CPU. Hence it is recommended to customers that diagnosis information should be handled in the application (e.g. SCADA).

Diagnosis in HA-Modbus TCP library

In the HA Modbus library diagnosis information is available at the control block and diagnosis block.

Output System Configuration

This output at the HA control block gives the information of system configuration. Each bit of the word represents a different configuration.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Sync is configured via CAN</td>
</tr>
<tr>
<td>1</td>
<td>Sync is configured via UDP</td>
</tr>
<tr>
<td>2</td>
<td>Lifecom2 is configured via CAN</td>
</tr>
<tr>
<td>3</td>
<td>Lifecom2 is configured via UDP</td>
</tr>
<tr>
<td>4</td>
<td>Lifecom2 is configured via Modbus TCP</td>
</tr>
<tr>
<td>5</td>
<td>Initialization for Ethernet configuration</td>
</tr>
</tbody>
</table>

Output System Configuration error

This output at the HA control block gives the details of error in the configuration. Each bit of the word represents different configuration errors. It is valid only when Error = TRUE.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Communication interface module is not configured properly</td>
</tr>
<tr>
<td>1</td>
<td>1&lt; SyncSlot &gt;3. Invalid value at input sync slot</td>
</tr>
<tr>
<td>2</td>
<td>1&lt;SecSlot&gt;3. Invalid value at input second slot</td>
</tr>
<tr>
<td>3</td>
<td>Value at IpAdrCpuASync is invalid</td>
</tr>
<tr>
<td>4</td>
<td>Value at IpAdrCpuBSync is invalid</td>
</tr>
<tr>
<td>5</td>
<td>Value at IpAdrCpuALifecom2 is invalid</td>
</tr>
<tr>
<td>6</td>
<td>Value at IpAdrCpuBLifecom2 is invalid</td>
</tr>
<tr>
<td>7</td>
<td>IpAdrCpuASync = IpAdrCpuBSync or IpAdrCpuALifecom2 = IpAdrCpuBLifecom2</td>
</tr>
<tr>
<td></td>
<td>The IP addresses assigned at sync or lifecom2 inputs are wrong</td>
</tr>
</tbody>
</table>

Output Runtime error

This output at the HA control block gives the details of the error during run time of the system. Each bit of the word represents different runtime errors. It will not set Error = FALSE.
## Bit Description

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Communication interface modules are lost</td>
</tr>
<tr>
<td>1</td>
<td>Other CPU is not active</td>
</tr>
<tr>
<td>2</td>
<td>Lifecom1 is lost (part of sync)</td>
</tr>
<tr>
<td>3</td>
<td>Lifecom2 is lost. This error will not be TRUE if the PLC is in STOP status. This is because Modbus is still responding even when PLC is in STOP</td>
</tr>
<tr>
<td>4</td>
<td>Synchronization is lost</td>
</tr>
<tr>
<td>5</td>
<td>Error in synchronization</td>
</tr>
<tr>
<td>6</td>
<td>Ethernet status error</td>
</tr>
<tr>

<tr>
<td>10</td>
<td>fbGetOwnIP function block has error</td>
</tr>
</tbody>
</table>

## Diagnosis function block

Outputs at the HA Diagnosis function block, HaModDiag (V3) / HA_MOD_DIAG (V2) provides the following diagnosis information of the HA system.

<table>
<thead>
<tr>
<th>Output</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CpuAPrimary / CPUA_PRIMARY</td>
<td>TRUE indicates CPU A is primary</td>
</tr>
<tr>
<td>CpuBPrimary / CPUB_PRIMARY</td>
<td>TRUE indicates CPU B is primary</td>
</tr>
<tr>
<td>CpuARun / CPUA_RUN</td>
<td>TRUE means CPU A is in RUN mode</td>
</tr>
<tr>
<td>CpuBRun / CPUB_RUN</td>
<td>TRUE means CPU B is in RUN mode</td>
</tr>
<tr>
<td>CpuACi52xBusActive / CPUA_CI52x_BUS_ACTIVE</td>
<td>Modbus TCP CI52x bus active on CPU A</td>
</tr>
<tr>
<td>CpuBCi52xBusActive / CPUB_CI52x_BUS_ACTIVE</td>
<td>Modbus TCP CI52x bus active on CPU B</td>
</tr>
<tr>
<td>CpuACi52xCfg / CPUA_CI52x_CFG</td>
<td>Total number of CI52x configured on CPU A</td>
</tr>
<tr>
<td>CpuBCi52xCfg / CPUB_CI52x_CFG</td>
<td>Total number of CI52x configured on CPU B</td>
</tr>
<tr>
<td>CpuACi52xAct / CPUA_CI52x_ACT</td>
<td>Total number of CI52x active on CPU A line</td>
</tr>
<tr>
<td>CpuBCi52xAct / CPUB_CI52x_ACT</td>
<td>Total number of CI2x active on CPU B line</td>
</tr>
<tr>
<td>SyncInstances / SYNC_INSTANCES</td>
<td>Number of data sync and utility blocks initialized in the system</td>
</tr>
<tr>
<td>SyncDataChecksum / SYNC_DATA_SUM</td>
<td>Checksum of all address pointer blocks in bytes, indicates total number of bytes getting synchronized.</td>
</tr>
</tbody>
</table>
### Output Description

**StHACpuStatus / stHA_CPU_STATUS**

HA own CPU status. It will show the status details of logged in CPU for the following parameters:

- HA1: CPU A is primary
- HA2: CPU B is primary
- bit_CI52x_BUS_active: CI52x bus with one or more communication interface modules active
- bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost
- RUN: Run status of CI52x
- cnt: Count of data sync communication, indicates data sync between CPUs is okay.

**StHAotherCpuStatus / stHA_OTHER_CPU_STATUS**

HA other CPU status. It will show the status details of other CPU for the following parameters:

- HA1: CPU A is primary
- HA2: CPU B is primary
- bit_CI52x_BUS_active: CI52x bus with one or more communication interface modules active
- bit_CI52x_BUS_err: CI52x bus one or more communication interface modules powered off / connection lost
- RUN: Run status of CI52x
- byETH_ACT_CI52x_Count: CI52x alive identification count.

### Other diagnosis variables

Apart from the errors / diagnosis information available in the control and diagnosis block, few other variables can be monitored too.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wHA_ER_NO_SYNC_LINK</td>
<td>16#7487</td>
<td>No sync link between the PLCs</td>
</tr>
<tr>
<td>HA_MOD_INVALID_LENGTH</td>
<td>16#2017</td>
<td>Invalid length at the input of the data sync block</td>
</tr>
<tr>
<td>HA_MOD_ERO_NO_TBL_OVERFLOW</td>
<td>16#2022</td>
<td>HA data reference table is full</td>
</tr>
<tr>
<td>xHaModDataErr</td>
<td>TRUE</td>
<td>IF TRUE – HA data sync is in error state</td>
</tr>
<tr>
<td>wHaModDataErNo</td>
<td></td>
<td>HA data sync error code</td>
</tr>
<tr>
<td>xHaModErr</td>
<td>TRUE</td>
<td>HA system is in error state</td>
</tr>
<tr>
<td>dwHaModServerAlive</td>
<td></td>
<td>Life counter incremented by OPC DA server</td>
</tr>
</tbody>
</table>
Diagnosis in CI52x library

In addition to the diagnosis information in the HA Modbus library, additional diagnosis information for each communication interface module can be obtained from the CI52x library.

System Configuration error

This output at the CI52x function block gives the details of the configuration error in the CI52x module. Each bit of the byte represents different configuration errors:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reserved</td>
</tr>
<tr>
<td>1</td>
<td>Wrong ETH port is configured at input Config ETH</td>
</tr>
<tr>
<td>2</td>
<td>Wrong IP address is configured for communication interface module</td>
</tr>
</tbody>
</table>

Runtime error

RuntimeError (v3) / RUNTIME_ERROR (v2) of the function block CiModCI52x (v3) / CI_MOD_CI52x (v2). Runtime error is a combination of error bits that are described in the following:

<table>
<thead>
<tr>
<th>Runtime Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit 0</td>
<td>Indicates communication error i.e., when CPU is not able to get any response from CI52x module. This error will get reset when communication is reestablished.</td>
</tr>
<tr>
<td>Bit 1</td>
<td>Indicates parameter state is not equal to 2 (PARA_STATE_PARA_DONE). If not true, then system gives I/O bus error. System resets this error when parameter state is equal to 2.</td>
</tr>
<tr>
<td>Bit 2</td>
<td>Indicates the cluster error 1) in the system, if there is an error in the diagnosis buffer. ACK input is needed to reset this error.</td>
</tr>
<tr>
<td>Bit 3</td>
<td>Indicates the hardware configuration error, mismatch between configuration and actual hardware detected. System automatically resets this error when the hardware matches.</td>
</tr>
<tr>
<td>S-ERR</td>
<td>Indicates that there is some issue with channel configuration in the cluster 1). It is not linked with Runtime Error. User can read DiagBuffer (v3) / DIAG_BUFFER (v2) from CIModDiag (v3) / CI_MOD_DIAG (v2) function block to get more information. This error does not get reset using ACK. It will only reset when all channel errors are removed.</td>
</tr>
</tbody>
</table>

1) “Cluster” means a combination of one communication interface module and several I/O modules attached to it.

Runtime error in different scenarios:
<table>
<thead>
<tr>
<th>Error</th>
<th>Run-time error</th>
<th>PLC A: Primary</th>
<th>PLC B: Secondary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wrong IP address configured</td>
<td>16#1</td>
<td>TRUE FALSE FALSE FALSE TRUE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Wrong slot address configured</td>
<td>16#0</td>
<td>FALSE FALSE FALSE FALSE FALSE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Communication cable disconnected</td>
<td>16#2</td>
<td>TRUE TRUE FALSE FALSE TRUE TRUE FALSE FALSE</td>
<td>TRUE TRUE FALSE FALSE</td>
</tr>
<tr>
<td>Wrong I/O module plugged in the CI module</td>
<td>16#B</td>
<td>BLINK TRUE FALSE TRUE BLINK TRUE TRUE FALSE</td>
<td>TRUE TRUE FALSE TRUE</td>
</tr>
<tr>
<td>Wrong hotswap I/O module plugged at the start</td>
<td>16#B</td>
<td>BLINK TRUE FALSE TRUE BLINK TRUE TRUE FALSE</td>
<td>TRUE TRUE FALSE TRUE</td>
</tr>
<tr>
<td>Wrong hotswap I/O module swapped online</td>
<td>16#4</td>
<td>FALSE FALSE TRUE FALSE FALSE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Configured I/O module not connected at start</td>
<td>16#B</td>
<td>BLINK TRUE FALSE TRUE BLINK TRUE TRUE FALSE</td>
<td>TRUE TRUE FALSE TRUE</td>
</tr>
<tr>
<td>Configured hotswap I/O module not connected at start</td>
<td>16#B</td>
<td>BLINK TRUE FALSE TRUE BLINK TRUE TRUE FALSE</td>
<td>TRUE TRUE FALSE TRUE</td>
</tr>
<tr>
<td>I/O module powered off in CI module</td>
<td>16#4</td>
<td>FALSE FALSE TRUE FALSE FALSE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Hotswap I/O module powered off in CI module</td>
<td>16#4</td>
<td>FALSE FALSE TRUE FALSE FALSE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Remove hotswap I/O module when online</td>
<td>16#4</td>
<td>FALSE FALSE TRUE FALSE FALSE FALSE FALSE FALSE</td>
<td>TRUE FALSE FALSE FALSE</td>
</tr>
<tr>
<td>Error</td>
<td>Run-time error</td>
<td>PLC A: Primary</td>
<td>PLC B: Secondary</td>
</tr>
<tr>
<td>-------</td>
<td>----------------</td>
<td>----------------</td>
<td>------------------</td>
</tr>
<tr>
<td>CI module is powered off</td>
<td>16#2</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>Mismatch in Channel configuration and wiring</td>
<td>16#0</td>
<td>FALSE</td>
<td>FALSE</td>
</tr>
<tr>
<td>Regular I/O module mounted on hotswap terminal unit</td>
<td>16#0</td>
<td>FALSE</td>
<td>FALSE</td>
</tr>
<tr>
<td>During an error stage if HA system changeover is initiated</td>
<td>16#0</td>
<td>FALSE</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

1) Slot input in the block can be ignored. Similar to ETH input of the ModMast blocks.
2) Error generated only in the primary PLC, to reset ACK input to be used.
4) No runtime error in function block. Module generates S-Err.
5) Runtimer Error bit2 gets reset when the PLC is switched over and error won’t be available in any of the PLC regardless of its Primary status.
### Table 381: Function block CiModDiag (V3) and CI_MOD_DIAG (V2)

<table>

### 1.5.8.1.9 Library overview

#### Documentation

CODESYS V3 libraries are described in the Library Manager as an integrated documentation. Refer to the documentation section within the Library Manager.

The following function blocks are contained in the libraries:
1.5.9 Motion Solution Wizard

Preconditions for the use of the “Motion Solution Wizard”

To be able to use the Motion Solution Wizard and the detailed information pdf, the following software packages must be installed:

- “Motion Control (PS561)”
- “Servo Drives”
1. Select “Tools” and “Installation Manager” to open it.
2. Select “Modify”.
3. Mark the mentioned software packages.
4. Click the “Continuous” button.
   ⇒ The various packages are downloaded and installed.

In the installation process, some operations must be confirmed.

Further detailed information about the “Motion Solution Wizard” and the “CAM editor” which are both basing on the “Motion control library” according PLCopen can be found in “AC500_V3_Motion Control_Wizard&Cam_Editor_Quick_Start_Guide_3ADR010899.pdf”:
   C:\Users\Public\Documents\AutomationBuilder\Examples\PS5611-Motion\Or via the Automation Builder: “Help ➔ Project examples ➔ PS5611-Motion”
   ▼ Chapter 1.4.1.8.23.1 “Basic Motion” on page 317

Currently the “Motion Solution Wizard” supported only the ABB EtherCAT servo drives (E180/E190).
1.5.9.1 Create new project

Select “File” ➔ “New Project”.

After successful download and installation of the missing software packages, the “Motion Solution Project” icon is showed in the “Templates”.

1. Select the “Motion Solution Project” icon.
2. Enter a project name.
3. Specify the storage location for the new project.
4. Click the [OK] button.

⇒ A new project is created and can be configured.

1.5.9.2 Select PLC

The Motion Solution Wizard can only be executed in an EtherCAT environment.
1. Select the desired PLC device.
2. Click the [Add PLC] button.
   - Along with the PLC added, Motion Solution Wizard and CM579-EtherCAT module also get added (Slot 1).

### 1.5.9.3 Select servo drive (motion axis)

After creating the hardware tree, Automation Builder will now pop up “Add Motion Drive” window. Here it shows all the installed EtherCAT supported ABB Servo drives.

Each servo drive added under the EtherCAT master will be counted as a motion axis in Automation Builder.
1. Delete the check mark of “Close the dialog after each transaction” (Red rectangle in the figure above).

⇒ Now several axes can be selected one after the other without closing the window.

2. Click on the motion drive you want to install.

3. Click “Add motion drive”.

⇒ In the “Devices” tree, the selected axis is displayed.

4. For more axes repeat the procedure.

⇒ The selected axes are displayed in the “Devices” tree.

5. Click the [Close] button if the required axes have been selected.

### 1.5.9.4 Configure servo drive (motion axis)

Users need to configure each axis separately as per the application requirement by opening the motion axis object which is added under the servo drive.

1. Double-click on the axis you want to configure.

⇒ The “Settings” and the “Mapping” tab are shown.

2. Now select the desired settings.

*Depending on the selected axis type, the view and selection of setting options may change.*
All settings related to the application and axis specific will be done here and needs to be carefully updated for each axis. Based on the inputs provided here, wizard will compile and generated the code.

The following “Settings” are available:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis type</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Modulo (rotary)</td>
<td>By selecting the Modulo (rotary) the axis will be configured as a roll-over axis and the desired modulo range can be configured later.</td>
<td></td>
</tr>
<tr>
<td>Finite (rotary)</td>
<td>Default</td>
<td>The axis will be configured as a roll-over axis where in modulo range it is non editable by the user and calculated based on the “Unit” selection, “Inc_Per_R, U_Per_Rev_Nominator and U_Per_Rev_Denominator setting”.</td>
</tr>
<tr>
<td>Linear (rotary screw)</td>
<td>Rotary motor with linear movements (linear axis).</td>
<td></td>
</tr>
<tr>
<td>Linear (linear motor)</td>
<td>Configure if the axis is a linear motor.</td>
<td></td>
</tr>
<tr>
<td>Virtual axis</td>
<td>This option is an additional check which user can do along with the axis type selection to make the configured axis type (physically configured) as virtual axis.</td>
<td></td>
</tr>
<tr>
<td>Units</td>
<td>Supported units are: Pulse, mm, µm, nm, degree inch and revolution. For “Modulo (rotary)” axis the units mm, µm, nm, and inch might lead to inaccuracy.</td>
<td></td>
</tr>
</tbody>
</table>
| Feedback device scaling       | Forc
<p>| Encoder increments per motor revolution (1) | 131072 pulses / revolution | User can update this parameter with the actual encoder increments per motor revolution. Not available with an “Axis type” “Linear”. |
| Application gearing           | Based on the actual application requirement, here user can check / uncheck the “Application has gearing” check box. Here user can also update the required tool travel distance per motor revolution. Not available with an “Axis type” “Linear”. |
| Units per revolution scaling  | (without gearbox)       | When the user unchecks the check box, user can update the “Tool travel distance per motor revolution” as per the application requirement. Not available with an “Axis type” “Linear”. |
| Tool travel distance per motor revolution (2) | 131072 pulses / revolution | Number of pulses (pulse) = (1) * Travel distance (in user defined units) (2) |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Units per revolution scaling (with gearbox)</td>
<td></td>

1.5.9.5 Open Motion Solution Wizard editor page and generate application

Once all the settings have been made, double-click to switch to the “Motion Solution Wizard” icon in the “Devices” tree.

All existing axes are listed here with their status. In the screenshot above “Not generated”.

1. Set a check mark for the axes that are to be generated under the column “Generate”.
2. Click the button “Generate application”.
   ⇧ The application code/s will now be generated.
3. Confirm the “Generation successful” window by clicking the [OK] button.

1.5.9.6 Check generated application

A new folder has been created in the “Application” - “MotionSolution_Generated”. In this folder are the folders of the generated axis with the global variables and function block calls. The added axes are mapped in the “Devices” tree under “Extension_Bus”.

PLC Automation with V3 CPUs
Libraries and solutions > Motion Solution Wizard
These application codes can now be copied as required and integrated into your own PLC programming.

1.5.9.7 Optional: Add and configure virtual axis for simulation without real axis

Some of the applications need virtual axis to be configured to fulfill the application requirement.

1. Right click on the “Motion Solution Wizard”.
   ➤ A new window opens.

2. Click “Add object”.
   ➤ A new window opens.
3. Mark the “Virtual Axis” object.
4. Click the [Add object] button and the [Close] button.

A virtual axis was created.

After adding the virtual axis, user can find the same under “Motion Solution Wizard” object in Automation Builder. User can double-click on the added virtual axis object to get the settings page and configure it as per the requirement. Settings here is similar to the motion axis.

1.5.10 Motion control library

Safety instructions

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the drives you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 or chapter "Chapter 1.6.2.4 "Regulations" on page 2406 in the online help.
- Read the Important user Information. See chapter "Chapter 1.6.2.1 "Safety instructions" on page 2395 in the online help.

1.5.10.1 Preconditions for the use of the libraries

The user has to read the following instructions and documents before using the libraries:

The library package has been released for the software and firmware versions listed in the readme file of Automation Builder only (see “Help ➔ Automation Builder Release Notes”). In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product, software or firmware versions. The error-free operation of the HA library with other devices, software or firmware versions should be possible but cannot be guaranteed and may need adaptations e. g. of example programs.

The first version of Motion Control Library Package PS5611-Motion has been released with Automation Builder 2.4.0. Thereafter the package is updated with several changes. For details on all changes please refer PS5611-Motion release note area from Automation Builder release notes.
The Motion control package contains follows libraries:

<table>
<thead>
<tr>
<th>Library</th>
<th>Automation Builder</th>
<th>PLC firmware</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB_MotionControl_AC500</td>
<td>AB 2.4.0 or higher</td>
<td>AC500 V3 firmware version 3.3.1 or higher</td>
</tr>
<tr>
<td>ABB_Ecat_CiaA402_AC500</td>
<td></td>
<td>AC500-eCo V3 firmware version 3.4.0 or higher</td>
</tr>
<tr>
<td>ABB_MathFunctions_AC500</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ABB_MotionControlIEco_AC500</td>
<td>AB 2.5.0 or higher</td>
<td>AC500 V3 firmware version 3.5.0 or higher</td>
</tr>
<tr>
<td>ABB_MotionControlLoad_AC500</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The PS5611-Motion libraries have been tested with the following product / firmware / software versions:

- AC500 V3 PLC firmware 3.3.1 or higher
- AC500-eCo V3 (PTO & PWM) firmware 3.4.0 or higher
- CM579-ETHCAT EtherCAT Communication Module firmware 4.4.3.21 or higher
- ABB e190 Drive
- CD522 module

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product / software / firmware versions. The error-free operation of the PS5611 - Motion with other devices / software / firmware versions should be possible but can not be guaranteed and may need adaptations e. g. of example programs.

**CAUTION!**

Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The function blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

There are limits on the minimum EtherCAT cycle time, user can configure in each PLC type.

**Table 382: Details on the limits on the minimum EtherCAT cycle time**

<table>
<thead>
<tr>
<th>PLC type</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
</tr>
</thead>
<tbody>
<tr>
<td>Min. EtherCAT master cycle time</td>
<td>2 ms</td>
<td>1 ms</td>
<td>0.5 ms</td>
</tr>
</tbody>
</table>

Other than the above limits, there is also limits on configuring the number of synchronized axis in each PLC type. This limits is based on the EtherCAT master cycle time configured under EtherCAT master.

**Limits on number of synchronized axis**
Table 383: Details on the limits for each PLC type

<table>
<thead>
<tr>
<th>PLC type</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of synchronized axis in 1 ms</td>
<td>4</td>
<td>16</td>
<td>32</td>
</tr>
<tr>
<td>Number of synchronized axis in 2 ms</td>
<td>8</td>
<td>32</td>
<td>64</td>
</tr>
<tr>
<td>Number of synchronized axis in 4 ms</td>
<td>8</td>
<td>32</td>
<td>64</td>
</tr>
</tbody>
</table>

“Number of axis” is counted in Automation Builder is based on the number of Kernel function block instance declared in the IEC application. In this way, it is made sure all real and virtual axis are counted.

User can increase the EtherCAT cycle time to accommodate more “Number of axis” in the same PLC type.

User can use the [Statistics] tab from Automation Builder to see how many axis are supported for the particular PLC type and for the EtherCAT master cycle time configured. Once the axis is configured user need to update the [Statistics] tab by “Generate Code” to get the updated information.

Automation Builder allows an additional axis than what is mentioned in the above table to support one virtual axis additionally.

Please remove any Kernel function block instance which is declared but not used in the application to get the correct number of axis calculated by Automation Builder under the [Statistics] tab.

1.5.10.2 Overview

The PS5611-Motion is a Motion Control library for AC500 V3 CPUs, to create Motion Control applications based on function blocks according to the standard of PLCopen Motion Control. These function blocks can be used for PLC-based Motion Control and cover a wide range of possible Motion Control functionalities. Starting from single axis movements to master-follower axes to perform electronic gearing and CAM functions.

This documentation contains the following chapters:

- **Overview**
  In the subsequent chapters general information are provided for a better understanding of Motion Control with AC500 PLC and PS5611-Motion. There is also a tabular overview of the available PLCopen function blocks and their compatibility with PLC-based Motion Control and the provided drive-based Motion Control axis implementations.

- **PLCopen**
  The principle of the PLCopen Motion Control standard is explained as well as how PLCopen function blocks can be used to create PLC Motion Control application programs.

- **PLC-based Motion Control**
  This chapter explains how PLC-based Motion Control with AC500 can be realized and how it can be used in combination with the available PLCopen function blocks.

- **PLC-based Motion Control Fluid Power Extension or Load Control**
  This chapter explains how the PLCopen part 6 Fluid Power - extension also called “Load Control” can be used to practically realize also a form of Torque control (or -profiling) and how it can be used in combination with the available PLCopen function blocks and switch between Torque/Load control and position control.
1.5.10.2.1 PLC-based motion control

With PS5611-Motion the application program and the profile generator are realized in the PLC. The implementation of the profile generator is based on a set of function blocks which are named Central Motion Control (CMC).

The profile generator of many possible axes is centrally placed inside the AC500 PLC. Therefore multiaxis motion functionalities become easily available and can be accessed by PLCopen function blocks. As a result, Motion Control functionalities are almost drive independent.

Available motion control functionalities:
- Simple axis Movements
- Electronic Gearin
- Electronic CAMs
- Position Profiles
- Velocity Profiles
- Acceleration Profiles
- Load control (Torque profiling)

Then the output is a position reference signal which the drive will follow. A new position reference value will be calculated with every cycle of the PLC and has to be transferred to the drive, which demands real time capabilities to the PLC and to the communication channel. A real time fieldbus like EtherCAT is needed. The feedback of the actual position can be used for supervision purposes during operation and is needed to adjust the value of the position reference before the drive will be enabled.

**AC500 as Motion Controller (Central Motion Control)**

![System structure of PLC-based Motion Control with AC500 PLC and PS5611-Motion](image)

With PLC-based Motion Control it is also possible to include the position control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory.
With PLC-based Motion Control it is also possible to include the load control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory and to close the load control loop, feedback of the actual load/torque is mandatory.
1.5.10.2.2 Overview of PLCopen function blocks

The following tables give an overview of the defined function blocks, divided into administrative (not driving motion) and motion related sets. They give an overview which function block could be used for the different possible configurations.

These function blocks are part of the ABB_MotionControl_AC500 and ABB_MotionControl-Load_AC500 library.

If there are restrictions concerning a certain drive ("XXX") which lead to a different or limited behavior compared to the standard the respective chapter is supplemented with an additional paragraph "Notes for XXX".

The "KERNEL" function blocks are available in different variants.

The "CMC_Basic_Kernel" and "CMC_Load_Motion_Kernel" function block is designed to be used in standard V3 PLCs, and can either work with drives connected to a fieldbus or IOs.

The "OBIO_PTOMotionKernel" or "OBIO_PWMMotionKernel" function blocks (part of AC500_MotionControlEco) are solely to be used in AC500-eCo V3 CPUs and to make use of the integrated stepper-IO along with PLCopen function blocks. It connects automatically to the internal IOs.

For details of the limitations of PTO and PWM outputs in eCo V3 PLCs, refer to Automation Builder help file.

#### 1.5.10.2.3 Overview of libraries

- Add the following libraries for the listed applications.
- In some cases by adding a library, there will be other libraries added automatically.

<table>
<thead>
<tr>
<th>Application</th>
<th>Library to be added manually</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLC-based motion control</td>
<td>ABB_MotionControl_AC500.-compiled-library</td>
</tr>
<tr>
<td></td>
<td>ABB_MathFunctions_AC500.-compiled-library</td>
</tr>
<tr>
<td>PLC-based motion control, optional for EtherCAT</td>
<td>ABB_Ecat_CiA402_AC500.-library</td>
</tr>
<tr>
<td>Motion control with eCo V3 (OBIO_PTO_MotionKernel &amp; OBIO_PWMMotionKernel)</td>
<td>ABB_MotionControlEco_AC500.compiled library</td>
</tr>
<tr>
<td>PLC-based motion control - Fluid Power Extensions</td>
<td>ABB_MotionControlLoad_AC500.compiled library</td>
</tr>
</tbody>
</table>

The features of the function blocks provided with PS5611-Motion can be used from the PLC program according to PLCopen standard. Different drives and different Motion Control realizations could be used and can be combined with each other as well as different fieldbuses. ABB_Ecat_CiA402_AC500.library is editable and can be adapted based on the drive configuration and drive type.
1.5.10.2.4 Overview of data types

The following data types are used for the Motion Control library. The data types are defined in the library file ABB_MotionControl_AC500 compiled-library. The corresponding elements can be used for the function blocks inputs.

### 1.5.10.2.5 Naming of function blocks and data structures

**PLCopen**

All function blocks and data types named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation. They may have additional inputs but according to PLCopen rules.
All function blocks and data types named MCA_xxx are implemented corresponding to PLCopen rules with adaptations specific to AC500. They are AC500 specific extensions to the PLCopen library.

**PLC-based motion control**

All function blocks named CMC_xxx belong to the implementation of PLC-based motion control. 
All data types named CMC_xxx belong to the implementation of PLC-based motion control. 
All data types named AXIS_xxx exist according to PLCopen definition. The content is ABB specific and not documented. 
All function blocks named zCMC_xxx belong to the implementation of PLC-based motion control. These are not documented and not intended for customer use. 
All function blocks and data types named MC_xxx are implemented according PLCopen definition and follow the PLCopen documentation. 
All function blocks and data types named OBIO_xxx in the ABB_MotionControlEco_AC500 library are intended for use with AC500-eCo V3 PLCs only. 
All function blocks named xxx_APP are not write protected and may be modified for adaptations. Editable library is available in the example folder.

Editable library is available in the example folder.

**1.5.10.3 PLCopen**

Based on application requirements and project specifications engineers are required to use or select a wide range of Motion Control hardware. In the past this required unique software to be created for each application even though the functions are the same. PLCopen motion standard provide a way to have standard application libraries that are reusable for multiple hardware platforms. This lowers development, maintenance and support costs while eliminating confusion. In addition, engineering becomes easier, training costs decrease, and the software is reusable across platforms. Effectively, this standardization is done by defining libraries of reusable components. In this way the programming is less hardware dependent, the reusability of the application software increased, the cost involved in training and support reduced, and the application becomes scalable across different control solutions. Due to the data hiding and encapsulation, it is usable on different architectures, for instance ranging from centralized to distributed or integrated to networked control. It is not specifically designed for one application, but will serve as a basic layer for ongoing definitions in different areas. As such it is open to existing and future technologies.

ABB is a member of the PLCopen organization. More Information about PLCopen can be read on the [PLCopen website](https://plcopen.org).

![PLCopen Motion Control logo](image)

*Fig. 53: PLCopen Motion Control logo*
Function blocks according to PLCopen are designed for controlling axes via the language elements consistent with those defined in the IEC 61131-3 standard. It was decided by the task force that it would not be practical to encapsulate all the aspects of one axis into only one function block. The retained solution is to provide a set of command-oriented function blocks that have a reference to the axis, e.g. the abstract data type Axis, which offers flexibility, ease of use and reusability.

Implementations based on IEC 61131-3 (for instance via function blocks and SFC) will be focused towards the interface (look-and-feel/proxy) of the function blocks. This specification does not define the internal operation of the function blocks.

PLCopen Motion Control function blocks can be used in any IEC 61131-3 programming language. The following picture shows an example of a function block used in Function Block Diagram (FBD) language.

![Function Block Diagram](image)

**Fig. 54: Command for absolute positioning according to PLCopen standard**

Application programs which use the manufacturer independent function blocks according to PLCopen will lead to the following advantages:

- Reusable software structure for different platforms.
- Programming based on function blocks.
- Function blocks can be used in any IEC 61131-3 language.

All function blocks which are defined by PLCopen will have the following qualities independently to the manufacturer of the motion control system:

- Same inputs/outputs
- Same functional behavior
- Same name

The following parts of the PLCopen motion control definition are completely or partly included in this product:

- Part 1: Function blocks for motion control
- Part 2: Extensions
- Part 3: User Guidelines
- Part 4: Homing Procedures
- Part 6: Function blocks for motion control – Fluid Power Extensions

### 1.5.10.3.1 Programming guidelines

This chapter explains some rules on the usage of the libraries and the structure Axis_Ref.

- In general, the kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.
- If Axis_Ref is used as input on a user defined function block or program or function, always use it as VAR_IN_OUT and never use it as VAR_INPUT or VAR_OUTPUT. The reason is that this would
  - Break the consistency and destroy data.
  - Consume a lot of computing power by copying data.
● Any instance of a function block should be called only once per cycle and in only one specific task. If the instance is used in several tasks, it has to be checked that it is not called several times. Because this could corrupt the handshake from function block to Axis_Ref to CMC_Basic_Kernel and vice versa.

● Some PLCopen function blocks are only allowed to be called within the same task as the CMC_Basic_Kernel function block. This is mentioned in the function block descriptions.

● If PLCopen function blocks are called from a different task, the cycle time should be at least 2 times the cycle time for CMC_Basic_Kernel function block.

**Axis data type Axis_Ref**

The Axis_Ref is a structure that contains information on the corresponding axis. It is used as a VAR_IN_OUT in all Motion Control function blocks defined in this document. The content of this structure is implementation dependent and can ultimately be empty. If there are elements in this structure, the supplier shall support the access to them, but this is outside of the scope of this document. The refresh rate of this structure is also implementation dependent. According to IEC 61131-3 it is allowed to switch the Axis_Ref for an active function block, for instance from Axis1 to Axis2. However, the behavior of this can vary across different platforms, and is not encouraged to do.

**Axis_Ref data type declaration:**

```
TYPE Axis_Ref : STRUCT
(Content is implementation dependent)
END_STRUCT
```

**Example:**

```
TYPE Axis_Ref : STRUCT
AxisNo: UINT; AxisName: STRING (255);
…….
END_STRUCT
```

**1.5.10.3.2 The single axis state diagram**

The following diagram normatively defines the behavior of the axis at a high level when multiple motion control function blocks are simultaneously activated. This combination of motion profiles is useful in building a more complicated profile or to handle exceptions within a program. (In real implementations there may be additional states at a lower level defined). The basic rule is that motion commands are always taken sequentially, even if the PLC had the capability of real parallel processing. These commands act on the axis' state diagram.

The axis is always in one of the defined states (see diagram below). Any motion command that causes a transition changes the state of the axis and, as a consequence, modifies the way the current motion is computed. The single axis state diagram is an abstraction layer of what the real state of the axis is, comparable to the image of the I/O points within a cyclic (PLC) program. A change of state is reflected immediately when issuing the corresponding motion command.

The response time of immediately is system dependent, coupled to the state of the axis, or an abstraction layer in the software.
The diagram is focused on a single axis. The multiple axis function blocks, MC_CamIn, MC_GearIn and MC_Phasing, can be looked at, from a single axis state diagram point of view, as multiple single-axes all in specific states. For instance, the CAM-master can be in the state Continuous Motion. The corresponding slave is in the state Synchronized Motion. Connecting a slave axis to a master axis has no influence on the master axis.

The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the function blocks. The axis feedback is operational. If the MC_Power function block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.

Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating function block controls an axis, while the MC_Power function block with Enable=FALSE is called, the motion generating function block is aborted (CommandAborted).

The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the function blocks. The axis feedback is operational. If the MC_Power function block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.

Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating function block controls an axis, while the MC_Power function block with Enable=FALSE is called, the motion generating function block is aborted (CommandAborted).

The intention of the state ErrorStop is that the axis goes to a stop, if possible. There are no further inputs from function blocks accepted until a reset has been done from the ErrorStop state.

The transition Error refers to errors from the axis and axis control, and not from the function block instances. These axis errors may also be reflected in the output of the function blocks instances errors.

Issuing MC_Home in any other state than StandStill will go to ErrorStop, even if MC_Home is issued from the state Homing itself.

Function blocks which are not listed in the single axis state diagram do not affect the state of the axis, meaning that whenever they are called the state does not change. They are:

MC_ReadStatus; MC_ReadAxisError; MC_ReadParameter; MC_ReadBoolParameter;
MC_WriteParameter; MC_WriteBoolParameter; MC_ReadActualPosition and MC_CamTableSelect.

Calling the function block MC_Stop in state StandStill changes the state to Stopping and back to Standstill when Execute = FALSE. The state Stopping is kept as long as the input Execute is TRUE. The output Done is set when the stop ramp is finished.
1. In this state ErrorStop or Stopping, all function blocks can be called, although they will not be executed, except MC_Reset and Error – they will generate the transition to StandStill or ErrorStop respectively.

2. Power.Enable = TRUE and there is an error in the Axis.

3. Power.Enable = TRUE and there is no error in the Axis.

1.5.10.3.3 Visualizations

For usage with the PLCopen Library, a set of visualization objects is defined. These visualizations use the placeholder concept, which means that they could be used in an actual visualization several times and be instantiated by replacing the “placeholder” with an effective data-structure.

Two types of visualizations exist:

- As placeholder, an instance of Axis_Ref should be used. These are named: MC_VISU_Axis_name. Here the name could be state machine or its actual.
- As placeholder, an instance of the respective PLCopen function block should be used. These visualizations are named MC_VISU_FB_name where "name" could be MoveAbsolute or MoveVelocity, so the complete element is named MC_VISU_FB_MoveAbsolute or MC_VISU_FB_MoveVelocity.

The background colour and the colour for the title of each element could be changed. The colours are defined in some global predefined variables in MC_VISU_COLOR_INFORMATION. By changing these values, different colours will be used.

**MC_VISU_COLOR_INFORMATION (GVL)**

<table>
<thead>
<tr>
<th>In/Out</th>
<th>Name</th>
<th>Type</th>
<th>Initial</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MC_VISU_BACKGROUND_COLOR</td>
<td>DWORD</td>
<td>16#FF0000</td>
<td>Color combination for the background color</td>
</tr>
<tr>
<td></td>
<td>MC_VISU_TITLE_COLOR</td>
<td>DWORD</td>
<td>16#FFFFFF</td>
<td>Color combination for the title</td>
</tr>
</tbody>
</table>

Below, some existing visualizations are shown.

**MC_VISU_Axis_StateMachine** This shows the state machine of the axis according to PLCopen definition. The active state is shown green except the ErrorStop which is shown red. Usually, it starts with Disabled. When no remote connection to the drive is available, it will switch to ErrorStop immediately.

The placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

**MC_VISU_Axis_actual** This object shows some actual values.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.
This object shows the error information connected to the PLCopen function blocks. This is NOT a drive error. If no error occurs in the execution of a function block, just the name is shown. If an error occurred, it shows the name of the function block as well as the error number and a short description. In the example below, the MC_Power function block recognized that no fieldbus connection to the drive was available.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

**1.5.10.3.4 Error codes**

Besides the diagnosis information of the drive which is described in the respective drive documentation, there are a number of error codes directly related to the function blocks. These error codes are displayed at the output “ErrorID” of the function block.

<table>

<td>ErrorID WARNING_MOTION_DIRECTION</td>
<td>Either positive or negative direction blocked by MC_Power</td>
</tr>
</tbody>
</table>
1.5.10.3.5 Error handling

All access to the drive/motion control is via function blocks. Internally these function blocks provide basic error checking on the input data. Exactly how this is done is implementation dependent. For instance, if MaxVelocity is set to 6000, and the Velocity input to a function block is set to 10,000, a basic error report is generated. In the case where an intelligent drive is coupled via a network to the system, the MaxVelocity parameter is probably stored on the drive. The function block must take care of the errors generated by the drive internally. With another implementation, the MaxVelocity value could be stored locally. In this case the function block will generate the error locally.

Both centralized and decentralized error handling methods are possible when using the motion control function blocks.

Centralized error handling is used to simplify programming of the function block. Error reaction is the same independent of the instance in which the error has occurred.

Decentralized error handling gives the possibility of different reactions depending on the function block in which an error occurred.
Fig. 57: function blocks with decentralized error handling

### 1.5.10.3.6 PLCopen parameter

Additional parameters are available by ReadParameter and WriteParameter function blocks.

> Following function blocks can be used for the read and write operation. Functionality of these blocks and its variables are explained in the integrated documentation

- `MC_ReadParameter`
- `MC_WriteParameter`
- `MC_ReadBoolParameter`
- `MC_WriteBoolParameter`

1.5.10.3.8 General restrictions

Restrictions for the available function blocks

- As buffered mode, MC_Aborting is realized as a default. This does NOT mean that the axis stops when another movement is started while an ongoing movement is still active. It means instead that the new movement will take control immediately and change the velocity to its own velocity by using its own acceleration or deceleration.

- The buffered mode MC_Buffered could be reached with using the axis state StandStill as enable signal for the Execute of the next block.

- From the Extended Inputs and Outputs at the function blocks, the following are not realized:
  - BufferedMode: The realization just supports the MC_Aborting mode.
  - The following Outputs at ReadStatus are not supported: ConstantVelocity, Accelerating and Decelerating.
  - TorqueLimit for Homing function blocks.

```

MC_Aborting Mode

The diagram shows the behavior with BufferMode MC_Aborting, which is the only available BufferMode. When the second Block is activated, it will take control and will continue on its own velocity. The velocity is changed by using the acceleration value from the second function block. The movement will not be stopped in between. The first function block shows CommandAborted when the second function block is activated.

MC_Buffered

A behavior according to BufferMode MC_Buffered could be reached by using the Done output from the first function block to enable the Execute of the second function block.

1.5.10.3.9 Behavior of the function block inputs and outputs

General rules

<table>
<thead>
<tr>
<th>Table 393: General rules</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output exclusivity</strong></td>
</tr>
<tr>
<td>The outputs Busy, Done, Error, and CommandAborted are mutually exclusive: Only one of them can be TRUE on one function block. If Execute is TRUE, one of these outputs has to be TRUE. Only one of the outputs Active, Error, Done and CommandAborted is set at the same time.</td>
</tr>
<tr>
<td><strong>Output status</strong></td>
</tr>
<tr>
<td>The outputs Done, InGear, InSync, InVelocity, Error, ErrorID and CommandAborted are reset with the falling edge of Execute. However, the falling edge of Execute does not stop or even influence the execution of the actual function block. It must be guaranteed that the corresponding outputs are set for at least one cycle if the situation occurs, even if execute was reset before the function block completed. If an instance of a function block receives a new execute before it has finished (as a series of commands on the same instance), the function block will not return any feedback, like Done or CommandAborted, for the previous action.</td>
</tr>
<tr>
<td><strong>Input parameters</strong></td>
</tr>
<tr>
<td>The parameters are used with the rising edge of the execute input. To modify any parameter, it is necessary to change the input parameter(s) and to trigger the motion again.</td>
</tr>
<tr>
<td><strong>Missing input parameters</strong></td>
</tr>
<tr>
<td>According to IEC 61131-3, if any parameter of a function block input is missing (open) then the value from the previous invocation of this instance will be used. In the first invocation the initial value is applied.</td>
</tr>
<tr>
<td><strong>Position versus distance</strong></td>
</tr>
<tr>
<td>Position is a value defined within a coordinate system. Distance is a relative measure related to technical units. Distance is the difference between two positions.</td>
</tr>
<tr>
<td><strong>Sign rules</strong></td>
</tr>
<tr>
<td>Velocity, Acceleration, Deceleration and Jerk are always positive values. Position and Distance can be both positive and negative.</td>
</tr>
<tr>
<td><strong>Error Handling Behavior</strong></td>
</tr>
<tr>
<td>All function blocks have two outputs, which deal with errors that can occur while executing that function block. These outputs are defined as follow: Error Rising edge of Error informs that an error occurred during the execution of the function block. ErrorID: Error number</td>
</tr>
</tbody>
</table>

Position versus distance

Position is a value defined within a coordinate system. Distance is a relative measure related to technical units. Distance is the difference between two positions.
The outputs Done, InVelocity, InGear, and InSync mean successful completion so these signals are logically exclusive to Error.

Types of errors:
- Function blocks (e.g. parameters out of range, state machine violation attempted),
- Communication,
- Drive Instance errors do not always result in an axis error (bringing the axis to StandStill). The error outputs of the relevant function block are reset with falling edge of Execute.

<table>
<thead>
<tr>
<th>Function block naming</th>
<th>In case of multiple libraries within one system (to support multiple drive/ motion control systems), the function block naming may be changed to MC_FunctionBlockName_SupplierID.</th>
</tr>
</thead>
</table>

**Behavior of Done output**
The outputs Done, InGear, InSync... are set when the commanded action has been completed successfully. With multiple function blocks working on the same axis in a sequence, the following applies:

When one movement on an axis is interrupted with another movement on the same axis without having reached the final goal, Done of the first function block will not be set.

**Behavior of CommandAborted output**
CommandAborted is set, when a commanded motion is interrupted by another motion command. The reset-behavior of CommandAborted is like that of Done. When CommandAborted occurs, the other output-signals such as InVelocity are reset.

**Inputs exceeding application limits**
If a function block is commanded with parameters which result in a violation of application limits, the instance of the function block generates an error. The consequences of this error for the axis are application specific and thus should be handled by the application program.

**Behavior of Busy output**
Every function block can have an output Busy, reflecting that the function block is not finished. Busy is SET at the rising edge of Execute and RESET when one of the outputs Done, Aborted, or Error is set. It is recommended that this function block should be kept in the active loop of the application program for at least as long as Busy is true, because the outputs may still change. For one axis, several function blocks might be busy, but only one can be active at a time.

Exceptions are MC_SuperImposed and MC_Phasing, where more than one function block related to one axis can be active.

**Output Active**
The output Active is required on buffered function blocks. This output is set at the moment the function block takes control of the motion of the according axis. For un-buffered mode the outputs Active and Busy can have the same value.

**Enable and Valid/Status**
The input Enable is coupled to output Valid. Enable is level sensitive, and Valid shows that a valid set of outputs is available at the function block. The output Valid is TRUE as long as an output value of Valid is available and the input Enable is TRUE. The relevant output value can be refreshed as long as the input Enable is TRUE. If there is a function block error, the output is not Valid (Valid set to FALSE). When the error condition disappears, the values will reappear and output Valid will be set again.
Why is the command input edge sensitive?

The input Execute for the different function blocks described in this document always triggers the function with its rising edge. The reason for this is that with edge triggered Execute new input values may be commanded during execution of a previous command. The advantage of this method is a precise management of the instant a motion command is performed. Combining different function blocks is then easier in both centralized and decentralized models of axis management. The output Done can be used to trigger the next part of the movement. The example given below is intended to explain the behavior of the function block execution.

The following figure illustrates the sequence of three function blocks First, Second and Third controlling the same axis. These three function blocks could be for instance various absolute or relative move commands. When First is completed the motion its rising output First.Done triggers Second.Execute. The output Second.Done AND In13 triggers the Third.Execute.
The input ContinuousUpdate

Like described in the previous chapter, the input Execute triggers a new movement. With a rising edge of this input the values of the other function block inputs are defining the movement. Until version 1.1 of PLCopen there was the general rule that a later change in these input parameters does not affect the ongoing motion.

Nevertheless, there are numerous application examples, where a continuous change of the parameters is needed. The user could retrigger the input Execute of the function block, but this complicated the application.

Therefore, the input ContinuousUpdate has been introduced. It is an extended input to all applicable function blocks. If it is TRUE, when the function block is triggered (rising Execute), it will - as long as it stays TRUE – make the function block use the current values of the input variables and apply it to the ongoing movement. This does not influence the general behavior of the function block nor does it impact the single axis state diagram. In other words it only influences the ongoing movement and its impact ends as soon as the function block is no longer Busy or the input ContinuousUpdate is set to FALSE.
If ContinuousUpdate is FALSE with the rising edge of the input Execute, a change in the input parameters is ignored during the whole movement and the original behavior of previous versions is applicable. The ContinuousUpdate is not a retriggering of the input Execute of the function block. A retriggering of a function block which was previously aborted, stopped, or completed, would regain control on the axis and modify its single axis state diagram. Opposite to this, the ContinuousUpdate only effects an ongoing movement. Also, a ContinuousUpdate of relative inputs (e.g. Distance in MC_MoveRelative) always refers to the initial condition (at rising edge of Execute).

### Example

- **MC_MoveContinuousRelative** is started at Position 0 with Distance 100, Velocity 10 and ContinuousUpdate set TRUE. Execute is Set and so the movement is started to position 100.
- While the movement is executed (let the drive be at position 50), the input Distance is changed to 130, Velocity 20.
- The axis will accelerate (to the new Velocity 20) and stop at Position 130 and set the output Done and does not accept any new values.

### 1.5.10.3.10 Unit of length

The only specification for physical quantities is made on the unit of length (noted as \([u]\)) that is to be coherent with its derivatives i.e. (velocity \([u/s]\); acceleration \([u/s^2]\); jerk \([u/s^3]\)). Nevertheless, the unit \([u]\) is not specified (manufacturer dependent). Only its relations with others are specified.

### 1.5.10.3.11 Aborting versus buffered modes

Some of the function blocks have an input called BufferMode. With this input, the function block can either work in a Non-buffered mode (default behavior) or in a Buffered mode. The difference between those modes is when they should start their action:

- A command in a non-buffered mode acts immediately, even if this interrupts another motion,
- A command in a buffered mode waits till the current function block sets its output Done (or InPosition, InVelocity...).
- The library just supports the mode "aborting" (MCAborting)

The following examples describe the different behavior of these modes:
Example 1:

</tbody>
</table>
Fig. 62: Timing diagram for example above with function block 2 interrupting function block 1 (McAborting Mode)
If an on-going motion is aborted by another movement, it can occur that the braking distance is not sufficient due to deceleration limits.

In rotary axis, a modulo can be added. A modulo axis could go to the earliest repetition of the absolute position specified, in cases where the axis should not change direction and reverse to attain the target position.

In linear systems, the resulting overshoot can be resolved by reversing, as each position is unique and therefore there is no need to add a modulo to reach the correct position.
1.5.10.3.12 PLCopen examples

Example: A function block instance controls different motions of an axis

The following figure shows an example where the function block (MC_MoveVelocity) is used to control AxisX with three different values of Velocity. In a Sequential Function Chart (SFC) the velocity 10, 20, and 0 is assigned to V. To trigger the input Execute with a rising edge the variable E is stepwise set and reset.

Fig. 63: Single function block with SFC

The following timing diagram explains how it works:
The second InVelocity is set for only one cycle because the Execute has gone low before the ActualVelocity equals CommandedVelocity.
Different instances related to the same axis can control the motions on an axis. Each instance will then be responsible for one part of the global profile.

Example: Different function blocks instances control the motions of an axis

Fig. 65: Cascaded function blocks

The timing diagram:
Fig. 66: Cascaded function blocks timing diagram

A corresponding solution written in LD looks like:

Fig. 67: Cascaded function blocks with LD
1.5.10.4 PLC-based motion control

1.5.10.4.1 PLC-based motion control architecture

With PS5611-Motion different motion control system structures are possible. Independent of the system structure a typical motion control application consists of the following system elements:

- An application program which contains PLCopen function blocks that defines the general application behavior and logics.
- A profile generator which generates a position profile based on the dynamic specifications of the application program to guide the axis to the desired positions.
- A position control loop which outputs a speed reference signal to minimize the following error.

To achieve the best system structure for an application these components can be separated into different devices. Each type of structure has its own kind of interface and type of signals which need to be transferred between the interacting devices.

All shown motion control system structures (Central motion control with or without position control loop) can be combined together in the same application program for a motion control project.

With the function blocks of motion library a motion control profiler can be used inside the PLC. As shown in the following figure it is needed to provide the actual position of the drive. The output can be either a position or a velocity reference signal. The used output signal will then be used to move the axis in the desired way.

There are 2 possibilities to send a reference value to the drive:

- When the position control loop is closed by the PLC by a CMC_Basic_Kernel function block, the output Speed_Reference should be connected to the drive. The value of Speed_Reference can be scaled with the axis parameters Max_Rpm and Ref_Max.
- When the position control loop is closed by the drive, the output Position_Reference should be connected to the drive. The unit for the output Position_Reference is incremented as well as the input Drive_ActualPosition.
In general the programming of a machine consists of two layers as shown in the figure above. In the application layer function blocks according to PLCopen motion control are used to program the application sequences with all necessary types of movements and administrational commands. Due to the standard PLCopen motion control this can be reused in any other machine programs that used PLCopen function blocks.

The axis implementation layer is responsible for the execution of the commands from the application layer and can be programmed for each axis in a different way depending on the used hardware components.

Table 394: Needed function blocks for an application with PLC-based Motion Control

</tr>
<tr>
<td></td>
<td>Motion Control function blocks according to PLCopen</td>
</tr>
</tbody>
</table>

For a central motion axis implementation the use of the function blocks CMC_Basic_Kernel and CMC_Axis_Control_Parameter are mandatory.

The library design is independent from any bus architecture or any specific drive features.
In case the velocity reference value is used from the kernel function block the position control loop is closed inside the drive. In this case, it is necessary to adjust the related parameters from the parameters function block. When the position reference will be used the position control loop is closed inside the drive. In this case, the internal control loop is just used to monitor the position and velocity.

When the position reference is used for the drive the following aspects have to be taken care of:
- It is necessary to use a real time fieldbus, like EtherCAT.
- The PLC cycle has to be synchronized to the fieldbus cycle.
- The task calculation times may not exceed the used cycle time.

The drive’s status should be managed by a specialized function block that supports the used type of drive as shown in the figure above. The kernel function block is the main function block which is needed to operate an axis with PLC-based Motion Control. It must be used with the parameter function block which is the interface to input parameters which are used to setup the axis.

The drive has to be accessed outside the CMC_Basic_Kernel function block. Actual values and reference values might be transferred by a synchronized fieldbus or by I/Os. The function block CMC_Basic_Kernel has to be called every cycle and at least once before any function block MC or MCA is activated.

The following figure shows an example with an axis simulation. The main data signals are drawn in bold lines. Here, the drive will receive a speed reference signal which means that the position control loop is closed inside the PLC by the Central Motion function blocks. The time behavior of the simulated drive can be set by the parameter T1 at the axis simulation function block. If the time constant is to slow and the axis parameter Control_Time is too short the simulation axis will run into instability – like a real drive. Sample values: # Chapter 1.5.10.4.2.3 "How to use the axis simulation" on page 2337
A different option to create a virtual or simulated axis is to engage the Enable_Virtual input at CMC_Basic_Kernel. This virtual axis will follow the speed reference without additional delay, whereas the CMC_Axis_Simu creates a first order delay.

The following figure shows an example with a CiA402 drive on an EtherCAT network. The main data signals are drawn in bold lines. Here, the drive will receive a position reference signal which means that the position control loop is closed inside the drive.
In the example the main signals are to be transferred via EtherCAT network. The drive control function block for the Microflex e190 can be found in the ABB_Ecat_CiA402_AC500.library.

If using the eCo V3 PLCs, use the OBIO_PTOMotionKernel function block (separate library ABB_MotionControlEco_AC500.library) instead of CMC_Basic_Kernel for the PTO functionality.

In the eCo V3 PLC, if PWM is used in the configuration, use the kernel function block OBIO_PWMMotionKernel function block instead of CMC_Basic_Kernel function block.

**Kernel function block**

**Kernel Arithmetic**

The “KERNEL” function blocks are available in two variants.

The OBIO_PTOMotionKernel / OBIO_PWMMotionKernel function blocks are solely to be used in eCo V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs. Use the PTO or PWM specific kernel block based on your configuration ⇒ Chapter 1.6.3.3.1.7.2 “Functionality” on page 2451.

The CMC_Basic_Kernel block is designed to be used in any V3 PLCs and can either work with drives connected to a fieldbus or IOs.

How does the parameter for jerk influence the axis movements

The diagram shows the result with different jerk values and the same velocity and acceleration. The time needed for acceleration with jerk=0 is:

\[ \text{Time}_1 = \frac{\text{velocity}}{\text{acceleration}} = \frac{20}{100} \text{s} = 0.2 \text{s} \]

The additional time with jerk=500 will be:

\[ \text{Time}_2 = \frac{\text{acceleration}}{\text{jerk}} = \frac{500}{100} \text{s} = 5 \text{s} \]

So the total time is:

\[ \text{Time} = \text{Time}_1 + \text{Time}_2 = 0.2 \text{s} + 5 \text{s} = 5.2 \text{s} \]

In the last example with jerk=100, the velocity and acceleration values are not reached.

1.5.10.4.2 Basic functionalities

How to connect a drive

The connection to a drive must be done with the inputs and outputs of the function block CMC_Basic_Kernel. All inputs and outputs of the kernel function block with the prefix “Drive_” are intended to be used with a drive, but in some cases not all of them are needed. In all cases the input Drive_ActualPosition has to be connected with the actual position of the axis. This value can be received by an I/O module of the PLC or via a fieldbus.

Depending on which device closes the position control loop either the output Speed_Reference or Position_Reference output has to be used. The value of Speed_Reference can be connected to an analog output module or be transferred via a fieldbus. The value of Position_Reference should be exclusively sent via a real-time fieldbus like EtherCAT.
In the example the position control loop will be closed by the PLC, therefore the input Drive_ActualPosition and the output Speed_Reference are to be used.

In combination with the I/O module CD522 and the corresponding function block CD522Encoder32Bit the position of the encoder can be used. For the effective resolution of the encoder parameter Inc_Per_R of the parameter function block has to be used.

The output Speed_Reference can be written directly to the global variable of an output channel of an analog module but can also be transferred via a fieldbus. The scaling of this output value can be done with the parameters Ref_Max and Max_Rpm of the function block CMC_Axis_Control_Parameter_Real.

The scaling of the Speed_Reference value can be set with the inputs Ref_Max and Max_Rpm of the parameter function block.

In order to finish a homing sequence which is done by the function block MC_StepRefPulse the outputs Drive_Set_Ref and Drive_Set_Position from the kernel function block have to be connected with the inputs EN_RPI and START_VALUE of the CD552 I/O module function block. Also the output RdyRpi of the CD552 I/O module function block has to be connected with Drive_Ref_Ok from the kernel function block.

To enable and disable the drive Drive_Release could be connected to a binary output to activate the drive. Drive_InOperation could be connected to a binary input to get the information that Drive_Release was successful.
In the example the position control loop will be closed by the drive, therefore the input Drive_ActualPosition and the output Position_Reference are to be used. The inputs referring to the position control loop of the parameter function block do not have to be set.

For the effective resolution of the motor’s encoder parameter Inc_Per_R of the parameter function block has to be adjusted.

Example 2:
Servo Drive -
Microflex e190
via EtherCAT in continuous positioning mode (csp)

To enable and disable the drive Drive_Release and Drive_Inoperation have to be connected to the control function block ECAT_CiA402_Control_App of the library ABB_Ecat_CiA402_AC500.library, which controls the status and control word of the drive.

All function blocks from this library are not password protected and free to be changed in order to be adapted for different drives. The library and the function blocks are marked with the ending _APP.

How to enable and disable a drive

In order to enable a drive the function block MC_Power has to be used within the applica-
tional layer. The kernel function block will then, if possible, output a rising edge on the output Drive_Release which can be connected to the drive-control function block which performs the needed actions on the drives control word to enable the drive. As soon the drive states enabled, this signal can be connected to the input Drive_In_Operation of the kernel function block. The axis state according to the single axis state diagram of PLCopen will then switch from Disabled to Standstill.

MC_Power_inst.enable
Axis State
Kernel_inst.DRIVE/gallery? decent
Kernel_inst.DRIVE/gallery? decent

Application Layer
Axis Implementation Layer
Drive will be enabled

Fig. 70: Enabling sequence of a drive
As long as the drive is in state Disabled or ErrorStop the input Drive_Actual_Position will be copied to the output Position_Reference of the kernel function block. The output Speed_Reference will be zero.

When the axis is in operation, which means it is not in state Disabled or ErrorStop, then the output Position_Reference will be calculated by the kernel function block and the position control loop will be closed, which outputs non zero value for the output Speed_Reference in case of a following error. The input Actual_Position should then follow the position reference. The difference of both values is the following error and will be supervised by the kernel function block.

In case of drive problem, Drive_InOperation should be reset. The function block will open the position control loop and Speed_Reference will be set to zero.

For the most drives the status is control by the drives control word whereas the drives status word represents its actual status. In order to enable the drive it might be necessary to pass through several drives states according a defined scheme which depends on the used drive. Therefore the library ABB_Ecat_CiA402_AC500.library is added to PS5611-Motion package which contains function blocks to operate with different drives on an EtherCAT network. There is also the PS5605-DRIVES library package which can be used to control the state of other ABB drives and other protocols.

**How to use the axis simulation**

It is possible to use a simulated axis instead of a real drive.

The axis simulation can be used in the following use cases:

- When the real drive is not available the simulation can be used to test all available motion functionalities to verify the application program.
- The simulation can be used to create a virtual master axis and synchronize other axes to it.

The simulation is realized by the function block CMC_Axis_Simu or input Enable_Virtual = TRUE can be used at the KERNEL-block.

Homing will be possible if the limit-switches (data type CMC_Axis_IO) are simulated also. This is not done by CMC_Axis_Simu but could be realized in the PLC program.

![Diagram](image)

**Fig. 71: Example for Simulation**

The drive velocity is simulated by PT1-Characteristic. The input T1 gives the time constant for this PT1 as multiple of the cycle time. All other properties are simulated according to the CMC_Axis_Control_Parameter.
The value of the time behavior from the axis simulation function block set by the input \( T1 \) has to be at least four times smaller than the value of the axis parameter \( Control\_Time \) from the parameter function block. If \( Enable\_Virtual = TRUE \) is used, no delay will be applied to the simulated drive speed, and it will not be possible to test the position-control loop, but it will be fine to be used as virtual axis.

How to perform a homing

The homing of an axis is a procedure which consists of up to two phases. For each phase there are different function blocks available. The available function blocks are according to PLCopen and belong to the application layer.

Table 395: Overview of the available homing function blocks

<table>
<thead>
<tr>
<th>Phase 1</th>
<th>Phase 2/Finish Homing</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC_StepAbsSwitch</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepDirect</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepLimitSwitch</td>
<td>X</td>
</tr>
<tr>
<td>MC_StepRefPulse</td>
<td>X</td>
</tr>
</tbody>
</table>

In order to create a complete homing sequence one function block of each phase can be used.

First phase

The used function blocks will change the axis state to Homing and will move the axis to approach installed limit switches or a dedicated absolute switch in the desired directions. No manipulation of a position value will be done in this phase. The use of function blocks of this phase is optional for a homing.

The signals of the installed limit switches have to be written to a variable of the data type CMC_Axis_IO.

Second phase

Function blocks from this phase will also change the axis state to Homing if this has not already happen and will finish the homing. Therefore a new position will be set to the axis. The axis state will then switch back to Standstill.

The use of a function block of the second phase is mandatory for a homing.

In general with AC500 PLC-based Motion Control there are two position values: One position value will represent the encoder counts of a drive or the CD522 module which is connected to the input Drive_ActualPosition of the kernel function block. The other position is a user defined scaled unit which is used for PLCopen function blocks.

There are different ways to finish the homing by manipulate and adjust a position value. Which value should be manipulated depends on the used drive or module and its capabilities. See the following types A, B and C.

Type A

The user defined position unit will be changed only. The function block MC_StepDirect must be used here. This type of homing is less complex than the other types but also less precise.
Fig. 72: Homing Type A

The Drive or the CD522 module will change its own position value, the encoder counts.

Fig. 73: Homing Type B

The process will be started by the execution of the function block MC_StepRefPulse. The axis will start to move. The output Drive_Set_Ref of the kernel function block will then set the drive to sense for a digital signal. At the same time the kernel function block outputs a preset value which will replace the actual encoder count value at the moment the digital signal occurs. This signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In the same cycle when the new position value is set there also has to be a boolean signal stating a new position value at the input Drive_Ref_Ok of the kernel function block. The user defined position value will then be shifted accordingly.
Example of type B for phase 2: Chapter 1.5.10.4.2.1 “How to connect a drive” on page 2334

**Type C**

The encoder count position value will not be changed but involves registration capabilities of a drive or the CD522 module.

![Diagram](image.png)

**Fig. 74: Homing Type C**

The process will be started by the execution of the function block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_Cia402_AC500.library).

The axis will start to move.

The output Drive_Set_Ref of the kernel function block will then command the drive or the CD522 module to activate the Touch Probe functionality. This will configure the drive to latch a position at the moment a digital signal occurs. The digital signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In combination with the latched position value there is a boolean signal which states that a new latch value has been received. In case of the module CD522 this encoder count position value has to be converted from encoder counts to equivalent user scaled units by the use of the function “CMC_Get_Units_From_Inc” (ABB_MotionControl_AC500.library) before it can be connected to the function block ECAT_HomingOnTouchProbe_APP.

To manage the Touch Probe objects of a drive within the CiA402 profile (e.g. Microflex e190) the function block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_Cia402_AC500.library) can be used. This will also cover the conversion from encoder counts to user scaled units.

At the end of the process the function block ECAT_HomingOnTouchProbe_APP will manipulate the user scaled position value according to the latched position from the drive and the users settings.

For further information see: [AN00220-001 - AC500 and MicroFlex e190 - EtherCAT Homing Methods](#)
How to Use a CAM curve

The CAM functionality is only available in combination with the kernel function block CMC_Basic_Kernel.

From Automation Builder 2.5.0 onwards user can make use of inbuild Cam Configurator to generate Cam Table. For more details on how to use Cam Configurator please refer Automation Builder Help file.

It is recommended to use the CAM Editor from Automation Builder for those who are new to Cam table or to get the structure of the Cam Table. User can create the complete CAM Table using Cam Editor or can make a copy of CAM Table (IEC Code) and adapt it directly in the IEC code if needed.

Details on the CAM Table structure and different parameters to be considered while creating the CAM is described below.

General usage
The usage of a CAM function is based on the following elements:

- CAM table defined with the data type MC_PProfile.
- An instance of the function block MC_CamTableSelect
- An instance of the function block MCA_Cam_Extra (optional)
- An instance of function block MC_CamIn
- An instance of function block MC_CamOut

The following steps are necessary to use a CAM table

1. Declare a CAM table as an array of the data type MC_PProfile in the program.
2. Write data to this array.
3. Use the address of the CAM table at the input CamTable of the function block MC_CamTableSelect.
4. Execute the function block MC_CamTableSelect to process the data of the CAM table with the function block's input parameters
5. Additionally you can execute the function block MCA_Cam_Extra for optional parameters after the processing of the function block MC_CamTableSelect.
6. Execute the function block MC_CamIn to start the slave axis movement according to the CAM table data and parameters.
   ➔ The axis will operate in the axis state Synchronized Motion.
7. To leave the axis state you can execute the function block MC_CamOut.
   ➔ The axis state will switch to state Continuous Motion and maintains its last velocity as long as there is no other command.
8. You can also use any other motion command interrupt the Synchronized Motion.

CAM table
CAM data is done with one table (two dimensional – describing master and slave positions together).

The data of the elements (array of data type MC_PProfile) can either be assigned within the declaration or can be assigned during run time before the execution of the function block MC_CamTableSelect.

It can be filled with data in the following ways:

- To use a predefined variable list.
- To calculate the values within the program (before using the MC_CamTableSelect).
- To send values by any communication access to the PLC.

In order to use the new data it is necessary to execute the function block MC_CamTableSelect again. In case the CAM table is executed the function block MC_CamTableSelect may not be executed.
Elements of the data type MC_PProfile: Chapter 1.5.10.2.4 “Overview of data types” on page 2297

The inputs MasterSyncPosition and MasterSyncDistance of the function block MC_CamIn can be used to define a distance to synchronize the slave axis onto the CAM table during the start. In case master axis moves with negative velocity the parameter MasterSyncDistance can be negative. The MasterSyncPosition should always be within the range of the CAM table master position.

MasterSyncDistance = 0 will deactivate the synchronization. In this case the slave axis should be moved on the CAM curve before MC_CamIn is executed, otherwise a following error can occur.

![Fig. 75: CAM profile figure](image)

The master position in the CAM table must be strictly monotonic rising.

The length of a CAM table is just restricted by the memory size of the PLC. When long tables are used, it is recommended to call CamTableSelect in a task with lower priority as it will need a considerable computing time.

It is possible to hold several CamTables as a pool and to switch from one to another. This has to be done at matching positions as no means for synchronization are available.

The offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

The parameters at MC_CamTableSelect, MC_CamIn and function and MCA_Cam_Extra also modify the behavior:

<td>Start synchronization at master axis position=MasterSyncPosition-MasterStartDistance+MasterOffset, meet the CamTable at master axis position=MasterSyncPosition. In case of MasterAbsolute=FALSE: start at &quot;actualPosition+MasterSyncPosition-MasterStartDistance&quot;, meet the CamTable at &quot;actualPosition+MasterSyncPosition&quot;!!! It is just possible to use the &quot;sync&quot; mechanism when the axis is in StandStill on start.</td>
</tr>
<tr>
<td>MasterStartDistance</td>
<td>LREAL</td>
<td>0</td>
<td>A negative value will create a reverse synchronization mode, which means the master should move in negative direction to synchronize. It is independent from the ReverseBit which indicates how to end the movement.</td>
</tr>
</tbody>
</table>

These 2 parameters are "extras" to be written with the MCA_Cam_Extra function. When the parameters are used, the MCA_Cam_Extra has to be called after the MC_CamTableSelect.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Type</th>
<th>Default value</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Periodic</td>
<td>BOOL</td>
<td>TRUE for master &quot;Modulo&quot;, FALSE for master linear axis</td>
<td>CamTable will not reach &quot;EndOfProfile&quot; but will be repeated periodically. When the master is a linear axis, it has to move forward and backward within the CamTable position range, but even when it leaves this position range, the CamTable will stay active.</td>
</tr>
<tr>
<td>Reverse</td>
<td>BOOL</td>
<td>FALSE</td>
<td>Just necessary when a CamTable is NOT &quot;periodic&quot; and will run in reverse direction (master with negative velocity) Reverse=FALSE, the CamTable is ready when the master leaves the position range in positive direction, e.g. when it moves from 359° to 0° on a rollover axes Reverse=TRUE, the CamTable is ready when the master leaves the position range in negative direction.</td>
</tr>
</tbody>
</table>
In the example, the slave will run from 0 to 2000 while the master runs from 0 to 1000. The slave will start and end with velocity 0, no matter which velocity the master has during start. The slave will reach the maximum velocity when it is at position 1000 and the master is at position 500.
How to use an external axis

To use multiaxis PLCopen function blocks with an externally sensed axis as master axis the following structure can be used for the axis implementation:

Axis Implementation Layer

![Diagram showing structure synchronization to an external axis](image)

**Fig. 76: Structure synchronization to an external axis**

The use of a feed forward filter function block is needed if the slave axis has to follow the position of the external axis. In this case there will be a time delay between sensing the position of the external axis and moving the follower axis along the sensed position. The filter function block will then add a certain distance to the external axis’ position depending of its speed.

The filter function block MATH_LINEAR_REGRESSION from the library ABB_MathFunctions_AC500.library can be used here.
Fig. 77: Filter function block to feed forward an externally sensed position

For an axis which is following the external axis, the value “mcActualValue” (from MC_Source enumeration) for the input “MasterValueSource” for multi-axis PLCopen function blocks has to be used.

When the filter function block MATH_LINEAR_REGRESSION is used to process an actual position, 2 different purposes are fulfilled:

- A jitter or noise can be compensated
- It is possible to calculate a forecast-position to compensate for a delay in position measurement

---

*Process the actual position or any other master axis always before the slave axis.*
*Otherwise, an additional one cycle-delay is introduced.*

The MATH_LINEAR_REGRESSION function block calculates the progress for a variable which is captured in equidistant periods of time and is assumed to follow a linear curve. It uses the Gauss “least squares” -algorithm to do so. The line is calculated in a way that the sum of squares for the distances from the measured points to the assumed straight line is minimized.

A noise or jitter influence of the value is compensated and a predictive value for the variable with an adjustable forecast horizon can be calculated.

Linear equation:

\[
\text{line}[i] = \text{gradient} \times i + \text{offset}
\]

Sum of squares:

\[
\text{sum} = \sum_{i=1}^{\text{history}} (x[i] - \text{line}[i])^2
\]

The gradient and offset for the line are calculated in a way that “sum” is minimized. Then these 2 values are used to calculate the forecast value:

\[
\text{NEXT}\_\text{VALUE} := \text{gradient} \times \text{FORECAST} + \text{offset}
\]

FORECAST=0 would mean: value right now, no future or past considered.

When the ACTUAL value is a modulo value, for example a single turn encoder or a rollover axis, this has to be considered in the calculation. The 2 input values POSITIVE\_LIMIT and NEGATIVE\_LIMIT can be used to configure this. They define the upper and lower limit for ACTUAL. Also, the NEXT\_BINARY will as a result be limited to these borders.
How to use an encoder/drive with <> 32-bit position overrun

The incremental position as actual position at the function block CMC_Basic_Kernel is usually assumed as position with a 32-bit position overrun. As well as it is the reference position which is sent to the drive.

Any modulo-axis configuration should be done inside the PLC.

Some drives are requested to correct their positions themselves for a non-linear axis which should constantly run into the same direction.

In this case, the drive has to be configured as a modulo-axis and the function block CMC_Basic_Kernel needs some additional function blocks to create the 32-bit value Chapter 1.5.10.4.3.4 “Roll-Over axis” on page 2357.

Fig. 79: Kernel

The function block CMC_Modulo2Binary will convert any position with any Modulo_Range to a 32-bit binary position.

The actual_position is assumed to run between 0 to Modulo_Range.

The actual_position should not change > 1/4 Modulo_Range between two scan cycles.

The function block CMC_Modulo2Binary will convert the 32-bit binary position reference from CMC_Basic_Kernel to a position reference which runs from 0 to Modulo_Range.
How to do position correction “on the fly”

Sometimes it is required to have a position correction “on the fly”. For example, it can happen that a position is wrong due to mechanical slip and that a switch which is passed by during the movement is used to capture a position value.

In other cases, it is required to synchronize the position to a print mark, so an actual_position has to be corrected, but not the movement of the printed material.

For both applications, the function block MCA_SetPositionContinuous can be used. It will use ramps and a limited velocity for the correction, so it will be tolerable to execute it during an ongoing movement and while the axis is activated in a multi-axis movement.

![MCA_SetPositionContinuous](image)

The block can be used in any axis state except ERRORSTOP and HOMING.

Two different operation modes are possible:

1. SuperImp=FALSE
   - The actual_position will be modified.
   - The block will not cause any movement.
   - If a PLCopen block in DISCRETE_MOTION (positioning) is active during the execution, this block will not reach Done as the actual_position is modified.
   - If a slave axis is coupled to an axis while MCA_SetPositionContinuous is executed (with SuperImp=FALSE) it will follow.
   - This mode is possible while the axis is in state DISABLED.

2. SuperImp=TRUE
   - The actual_position will stay constant.
   - A mechanical movement is executed (without changing the axis state machine).
   - A slave axis will not follow.
   - This behavior is similar to a superimposed movement.
   - It is not possible when the axis is in state DISABLED.

The block can just be aborted by another MCA_SetPositionContinuous.

How to limit the movement

It is possible to limit the movement by position (software limit switches) and by velocity. By default, no software limit switches are activated in PS5611-Motion. It is possible to activate them by accessing some PLCopen parameter.

The functionality described below is just available with linear axes.
<table>

</tr>
</tbody>
</table>
The following different behavior is possible:

- No limitation at all (default)
- Limit position with ERRORSTOP:
  - Limit position between SWLimitNeg to SWLimitPos, axis to state ERRORSTOP in case the position range is left.
- Limit velocity and acceleration:
  - Limit velocity to paraMaxVelocityAppl and acceleration/deceleration to paraMaxDecelerationAppl, create WARNING_VELOCITY, not state changes for axis, abort movement is optional when MaxPositionGap is reached due to limitation.
- Limit Position with ramp-down:
  - In addition, it is possible to limit the position between SWLimit2DecNeg and SWLimit2DecPos. paraMaxDecelerationAppl is used to ramp down.

When activated with EnableLimitPos or EnableLimitNeg, the reaction will be as follows:

- When the control position reaches the respective limit switch, the axis will go to state ERRORSTOP, and Drive_Release will be switched off. The actual_position might be behind, depending on the following error. It is assumed that a drive or application specific braking is performed. The axis will be stopped behind the limit.
- The axis could be switched on again by MC_Power. A movement in the opposite direction will be possible.
- The functionality of EnableLimitPos and EnableLimitNeg is unchanged.

You can use the limitation of movement to achieve a soft or adjustable braking in advance before reaching the software limit switch. The limitation is activated by three Boolean parameter and will calculate a position distance to the limit switch, which depends on the actual velocity and given deceleration ramp. “paraMaxDecelerationAppl” is used for deceleration. It will decelerate the axis by the given deceleration ramp when the calculated position is reached and stop at the software limit switch. The original behavior is not modified, so if also these software limit-switches are activated, the axis might be set to state ERRORSTOP.

\[
T = \frac{\text{velocity}}{\text{deceleration}} \quad \text{(time to stop)}
\]

\[
S = \frac{1}{2} \ \text{velocity}^2 T \quad \text{(distance to stop)}
\]
There are 2 different modes:

- **EnableLimitAbort = TRUE**
  Any ongoing motion will be aborted immediately (when the distance to stop is reached, as shown in the above diagram), a warning is shown
  The axis will be decelerated to reach the software limit switch.

- **EnableLimitAbort =FALSE, EnableLimitDecelerate=TRUE**
  A warning is shown and the velocity is reduced, with respect to the given deceleration and position limit.
  The ongoing motion is not aborted. If it was just a “tight fit”, e.g. in a master slave movement and the direction is turned soon enough, it might be possible to continue the movement.
  As the ongoing movement is not interrupted, an activated movement might not be completed, for example a MC_MoveAbsolute will never reach its target position. A warning is shown at function block CMC_Basic_Kernel.

When **EnableLimitPos = TRUE or EnableLimitNeg = TRUE**, and the values for SWLimitPos or SWLimitNeg are set, the axis will be set to state ERRORSTOP when these position limits are reached.

In addition, the function block will allow to limit the velocity. With **EnableLimitVelocity = TRUE**, it will monitor the velocity demand from the position reference and limit the position reference, so the given velocity limit will not be exceeded. A warning will be shown. The velocity used for limitation is MaxVelocityAppl.

---

**The velocity limitation can be used to prevent short-term velocity peeks. The limited position will be caught up later, whenever possible. This can result in not-expected behavior. The WARNING issued by CMC_Basic_Kernel can be checked and used to stop a movement. The movement will be aborted automatically when the position is by MaxPositionGap behind.**

- For a single axis movement, the commanded velocity is limited at the beginning. No position gap will occur.
- In a multi-axis movement, the slave axis follows a master. This can result in a position gap. A velocity peek from the master axis can be reduced by using the limitation. If the master is too fast because of the value for MaxPositionGap, the movement will be aborted.

When **EnableLimit2Decelerate or EnableLimitAbort** are used, the velocity is limited to MaxVelocitySystem with **EnableLimitVelocity = FALSE**. The function modifies the position reference. This modified position reference is used to control the drive. Whenever the limitation interferes the kernel will show a warning or an error. The warning or error message will disappear when the situation is cleared.

</tr>
</tbody>
</table>

The active PLCopen function block is aborted as soon as the warning is issued. With EnableLimitPos = TRUE or EnableLimitNeg = TRUE: When the Position limit is reached, the axis is set to mode ERRORSTOP.
### 1.10.4.3 Axis parameters

The parameters for axis configuration and adjustment are set by the function blocks `CMC_Axis_Control_Parameter`.

Depending on the version of the kernel function block the corresponding version of the parameters function block has to be used. The instance will then be connected to the kernel function block by its instance name.

#### Example

In the example the control structure is a simple position control loop with just proportional gain. When the application does not require minimized position following error it should be used this way as it is simple to adjust, robust and requires minimal performance. The proportional gain is then adjusted by `Control_Time`. Just change values at `CMC_Axis_Control_Parameter` when the position control loop is open (Drive_Release=FALSE, the axis state is Disabled). The values are sending to the control loop with a positive edge at "Enable". The `CMC_Basic_Kernel` function block needs to be already enabled.

#### Supervision

**Pos_Lag_Percentage**

This parameter configures the position window for the supervision of the following error. The default value is 150[\%]. A value of 0[\%] will deactivate the supervision function.

The size of the position window depends on the setting of the parameters `Control_Time` and `Max_Rpm` ⇋ "Control_Time" on page 2354.

Position Window [Increments] = (Inc_Per_R) * (Max_Rpm/60) * (Control_Time/1000)
Position Window [Units] = \( \left( \frac{U_{\text{Per Rev Nominator}}}{U_{\text{Per Rev Denominator}}} \right) \times \frac{\text{Max Rpm}}{60} \times \frac{\text{Control Time}}{1000} \)

<table>
<thead>
<tr>
<th>Example</th>
<th>Position Window [Increments] = ( (10000) \times \frac{6000}{60} \times \frac{50}{1000} ) = 50000 [Increments]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Position Window [Units] = ( \frac{1}{1} \times \frac{6000}{60} \times \frac{50}{1000} ) = 5 [Units]</td>
</tr>
</tbody>
</table>

A value of 100% will result in a position window which corresponds to the expected following error with the giving Control Time at Max Rpm. Therefore it is recommended to use values higher than 100[\%]. In case the parameter FF_Percentage is used smaller values can be used.

If the supervised position window is exceeded the axis state will change to ERRORSTOP.

**V_Check_Time**

After the configured time the drive’s actual velocity has to be at least 50 % of the commanded velocity. This function can also be used in case the Position Reference is transferred to the drive.

A value of 0 will deactivate this supervision function.

If the supervised velocity window is exceeded the axis state will change to ERRORSTOP.

**Position control loop**

![Diagram of Position Control Loop](image)

*Fig. 81: Basic structure of position control loop*

**Control_Time**

The default value is 100 which leads to a proportional gain of 10.

*In case the value of Control Time is too short the position control loop will run into instability.*

*In case the position control loop is not used this parameter must not be set to 0.*
Fig. 82: Control Time and static following error in case the feed forward of velocity and the integrational part of the position control loop is not used.

The static following error depends on the axis velocity and can be calculated easily: Control Time multiplied by the axis velocity (\( p_{\text{error}} = v \times CT \)).

In general it should be aimed to reach a high position control loop gain with a short Control Time to achieve a small following error. As the reaction times take account in the possible Control Time of the complete system (parameters of the drive control loop, PLC cycle time as well as the communication fieldbus) should be considered.

As a basic rule the Control Time should be at least four times longer than the reaction time between the output of the Speed Reference and the input of actual position.

When the time Ts and Tt is measured, a control_time of 4 * (Ts + Tt) will result in an aperiodic damping of the position control loop. It is important to measure the values from inside the PLC (e.g. Trace) to have the complete reaction times included. Practical values for Control_Time might be from 50 - 500ms. The PLC cycle time as well as bus cycle times and mechanical reaction will influence the value.

**FF_Percentage**

The default value is 0.

In case a velocity feedforward has to be configured a value of up to 80 is recommended. For larger values than 80 the parameter Horizon needs to be used as the resulted position will overshoot otherwise.

A value of 100 adds a velocity to the Speed Reference output which corresponds exactly to the ongoing Position Reference value.

**Integral_Part**

The integral part of the position control loop can be used to eliminate a permanent positioning error, e.g. in case of hanging loads.

The time value can be regarded as the time the integrator needs to sum up the input value to reach the same value for its output.
In case the Integral Part Time is too short the position control loop will run into instability.

**Horizon**

A communication delay of the Speed Reference value to the drive system can cause an overshoot during positioning caused by the velocity feedforward gain.

This function will compensate this communication delay to prevent an overshoot by time shifting the signals Velocity Feed Forward and Position Reference relatively to each other.

The value of Horizon can be approximately assumed to be the time delay of the communication delay.

The delay time might be caused by the cycle time of the control loop and by any delay in sending the speed reference, delay in the drive to build up the torque and delay to receive the actual position. To overcome this delay, a Horizon > 0 might be used. The feed forward reference will be created in advance, while the proportional gain is applied to the original motion profile. The delay is then compensated.

This function should not be used if the feed forward parameter FF_Percentage is 0.

A value of 0 will deactivate this function, which is the default value.

While this function is used, it will increase the needed PLC calculation time for this axis.

*Fig. 83: Result with Horizon=0*
PLC cycle time

Cycle This parameter represents the cycle time in which the kernel function block of the axis is called. If the configured cycle time is not correct the resulting acceleration and speed of an axis will not be correct also.

In case the task execution of the axis is synchronized to a fieldbus (e.g. EtherCAT) the cycle time of the fieldbus has to be used.

Roll-Over axis

If the Position Reference value is used, the drive must be able to perform a position over-run after 32 bit. If the drive’s position over-run is different, it can be adapted with the function blocks CMC_Binary2Modulo and CMC_Modulo2Binary from the library ABB_MotionControl_AC500.library. Incompatibility can cause an axis to trip after hours of operation.

The possible position following error has to be smaller than ½ Modulo_Range. Make sure that the modulo range is large enough.

Position following error = (100 - FF_Percentage) * Max_Rpm * Inc_Per_R * Control_Time/6000000. This is the maximum value at constant velocity.

En_Modulo With this parameter the axis can be configured as a roll-over axis.

Modulo_Range The modulo range will be defined in drive position counts (DINT). It will result that the scaled unit position which is used by the PLCopen function blocks will stay within the defined range.

Example

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>20000</td>
</tr>
<tr>
<td>Inc_Per_Rev</td>
<td>10000</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>360 (e.g. degree)</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
</tr>
</tbody>
</table>

The scaled unit's position will cover the range from 0 to 720 (degrees).

In some cases it is not suitable to set the modulo range of an application with the DINT value of the parameter Modulo_Range only. In such cases the parameters 2001 Modulo_Nominator and 2002 Modulo_Denominator can be used to scale the parameter Modulo_Range to a more precise value.
These parameters can be used to modify the Modulo_Range in a way that fractions of an increment could be used for 1 modulo (=rollover) distance:

- **Default**: Modulo_Nominator=1 and Modulo_Denominator=1: the actual position for an axis is limited between 0 and Modulo_Range increments.
- **Limitations**: Modulo_Range*Modulo_Nominator < 2147483647. Otherwise: default values will be used.
- When modifying these parameters, the position control loop should be opened.

**Example**

```plaintext
En_Modulo         = TRUE
Modulo_Range      = 1024
Modulo_Nominator  = 10
Modulo_Denominator= 3
Inc_Per_R         = 1024
U_Per_Rev_Nominator= 80*5*3
U_Per_Rev_Denominator= 10
```

5mm each tooth

80 teeth

Gearbox 3:10 ratio

Motor / Encoder 1024 counts per revolution

Result of parameters Modulo_Range, Modulo_Nominator and Modulo_Denominator: The modulo range will cover one revolution of the toothed-belt wheel.

Result of parameters U_Per_Rev_Nominator and U_Per_Rev_Denominator: One scaled unit corresponds to one mm of the tooth belt.

**Example: Gearbox 10.1**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option1</th>
<th>Option2</th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>10240</td>
<td>10240</td>
</tr>
<tr>
<td>Modulo_Nominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Modulo_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Inc_Per_R</td>
<td>1024</td>
<td>10240</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>36</td>
<td>360</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Max_Rpm</td>
<td>3000</td>
<td>300</td>
</tr>
</tbody>
</table>

The two options above describe exactly the same configuration. The Modulo_Range is equivalent to 10 motor revolutions and is 10240 increments. For the position, 1u means 1° and the resolution is 360°/10240-inc = 0.035°/Inc = 1°/28.44 Inc.
The two options above describe exactly the same configuration. The gearbox is 10:3, so the Modulo_Range is equivalent to \(1024 \times 10/3 = 3413 + 1/3\) increments. For the first option, the resulting modulo range is calculated \(1024 \times 10/3\), for option 2, it is \(10240 \times 1/3\). For the position, 1u means 1° and the resolution is \(108°/1024\text{inc} = 0,105°/\text{Inc} = 1°/9.481\text{ Inc}.

---

**Example: Gearbox 10.3**

<table>
<thead>

<td>3000</td>
<td>300</td>
</tr>
</tbody>
</table>

---

**Scaling of the unit of length**

**Inc_Per_R**
With this parameter the number of the drive position counts each revolution of the motor (DINT) have to be entered.

**U_Per_Rev_Denominator & U_Per_Rev_Nominator**
With these two parameters the number of units which correspond to one revolution of the motor have to be entered.

The units of length can be scaled to values like: mm, inch, degree, ...

All dynamic parameters of the PLCopen function blocks like velocity, acceleration and jerk are based on seconds. Velocity [units/s], acceleration [units/s²], jerk [units/s³]

**Example 1**

\[
\begin{align*}
\text{Inc\_Per\_Rev} & = 10000 \\
\text{U\_Per\_Rev\_Nominator} & = 360 \\
\text{U\_Per\_Rev\_Denominator} & = 1
\end{align*}
\]

This will scale one unit to one degrees of the motor shaft. Correspondingly a velocity [units/s] of 360 will turn the motor shaft one revolution per second.

**Example 2**

In the example one unit will be scaled to one millimeter of the conveyor.

5 mm each tooth

80 teeth

1:5 ratio

1024 counts per revolution

**Fig. 85: Scaling units**

How many units will pass after one revolution of the motor? \((80 \times 5\text{mm}) / 5 = 80\)

\[
\begin{align*}
\text{Inc\_Per\_Rev} & = 1024 \\
\text{U\_Per\_Rev\_Nominator} & = 80 \\
\text{U\_Per\_Rev\_Denominator} & = 1
\end{align*}
\]
Example 3

In the example one unit will be scaled to one millimeter of the conveyor.

![Diagram of Motor/Encoder, Gearbox, and Scaling Units]

How many units will pass after one revolution of the motor? \((80 \times 5 \text{ mm}) / 32 = 12.5 = 125 / 10\)

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>1024</td>
<td>125</td>
<td>10</td>
</tr>
</tbody>
</table>

Scaling of the speed reference output

These two parameters are used to scale Speed Reference output of the kernel FB in order to reach the intended velocity by the output value and to limit the highest possible output value.

**Ref_Max**

Highest possible output value of the Speed Reference output. The Speed Reference value that corresponds to the parameter Max_Rpm should be used.

**Max_Rpm**

Maximum speed of the motor in revolutions per minute.

**Example**

- Analog Drive: 1000 rpm at 2 Volts, 3200 rpm at 6.4 Volts (max.)
- Analog output module: 10 Volts output at digital value 27648
- \(\text{Ref}_\text{Max} = 17695 = (27648 / 10) \times 6.4\)
- Max_Rpm = 3200

Access and modify parameters

> All modifications will be effective immediately. There is no extra plausibility check and values are not checked for limitations.

Use this functionality with care.

Some parameters are collected inside a structure in Axis_Ref, and can be accessed and modified immediately. They are the same parameters as used with function blocks MC_WriteParameter and MC_ReadParameter. \(\text{Section 1.5.10.3.6 “PLCopen parameter” on page 2308.}\)

The differences are:

- Only available with CMC_Basic_Kernel
- The parameter values are LREAL instead of DINT and can be used with decimals.
- The parameters will be effective immediately.
- There is no check for consistency or limits.
- The parameters for position control can be checked and modified by accessing the structure Axis_Parameter.CMC_Pos_Control in addition.
### Parameter for position control

<table>

**Possible to use different gain for forward/backward movement, possible improvement for hydraulic axis or vertical movement**

See parameter KP/KP_BACK and KF/KF_BACK.

**Limitation for velocity and acceleration and deceleration**

From library version 3.1 on, these values are not limited to the 16-bit range of values (32767). The limit for velocity is calculated by the values given at CMC_Axis_Control_Parameter and the acceleration is limited such that this velocity can not be reached faster than 1 cycle.
1.5.10.4.4 Programming guidelines

To achieve the best results for Motion Control the actual position has to be transferred in best possible quality (with minimal jitter) to the PLC. The position feedback is expected to be in increments as the data type is a DINT.

The kernel function block (CMC_Basic_Kernel or OBIO_PTOMotionKernel or OBIO_PWMMotionKernel) has to be called every cycle and its task requires a fixed cycle time.

A variable of type Axis_Ref is used to connect to the PLCopen function blocks and their kernel function block.

The function block CMC_Axis_Control_Parameter has to be used for the axis configuration. Chapter 1.5.10.4.3 “Axis parameters” on page 2353

The signal of the limits switches and the absolute switch should be connected to the elements of the data type CMC_Axis_IO. The signal of the absolute switch must be TRUE in case the axis hits the sensor. The signal of a corresponding limit switch has to be true when the axis leaves the area surrounded by the limit switches. If needed the signal has to be inverted before it is connected to the elements of the data type.

Task configuration

The kernel function block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. Always make sure Kernel function block is called at the highest priority task and other applications must be at a lower priority task.

In order to save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real-time task with the axis implementation as shown in the figure below.

Optional: Unsynchronized Task Execution

Synchronized Task Execution

All PLCopen function blocks which must be called in the same task than the kernel function block:

- MC_CombineAxes
- MCA_MoveByExternalReference

In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following figures show an example for EtherCAT:

Fig. 87: Task of axis layer
1.5.10.4.5 Visualization

The structure of the position control loop is also as visualization element CMC_Visu_FB_Basic_Kernel included in ABB_MotionControl_AC500.library. As placeholder, an instance of CMC_Basic_Kernel has to be used. The visualization shows all numbers as they are really used inside the block, the adjustment for different resolution or cycle times is already included.

1.5.10.4.6 ABB specific data structures

Not all data structures are defined by PLCopen. Some specific structures are described in the following chapter. In addition to the data in these arrays, the movement is modified by offset and scaling values at the respective function block. These offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.
**PositionProfile**

The data type MC_PProfile is used for CamTable. An array has to be defined and provided at MC_CamTableSelect. Several CamTables could be defined and the axis could change between them on the fly. There is no routine of smooth movement from one table to the next so the user has to take care just to switch on appropriate positions. Details are described in the documentation included with the library.

```
ARRAY[1..3] OF MC_PProfile :=
  (Master_position:= 0 , interpolation_point := 0 , Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
  (Master_position:= 50 , interpolation_point := 25 , Velocity_ratio:= 0 , Acceleration_ratio:= 0 ),
  (Master_position:= 100 , interpolation_point := 100 , Velocity_ratio:= 0 , Acceleration_ratio:= 0 );
```

**Declaration example CAM_table**

**PositionTimeProfile**

This structure is used for time based profiles, e.g. MC_PositionProfile:

**Interpolation types for profiles**

The curves defined by an array of MC_PProfile hold master position points and according slave positions. When the master position is between 2 points, the according position for the slave is interpolated. Different types of interpolation are possible. The type is defined in MC_ABB_iTypes_Enum. The master could be a real axis or some virtual axis which could be created by just writing values for position and velocity to the Axis_Master variable as shown in the example. The same interpolation types could be used on MC_TProfile.

<table>
<thead>
<tr>
<th>Interpolation Types</th>

</tbody>
</table>
### Interpolation Types

<table>
<thead>
<tr>
<th>Interpolation Types</th>
<th>Results in</th>
<th>Requires</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCA_SPLINE_COMPLETE</td>
<td>Cubic spline interpolation without jerk, start and end of profile with velocity=0.</td>
<td>profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point</td>
</tr>
<tr>
<td>MCA_POLY3</td>
<td>Polynomial interpolation with linear velocity between interpolation points.</td>
<td>profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio</td>
</tr>
<tr>
<td>MCA_POLY5</td>
<td>Polynomial interpolation with linear acceleration between interpolation points.</td>
<td>profile.MC_PProfile_Array[x].master_position, profile.MC_PProfile_Array[x].interpolation_point, profile.MC_PProfile_Array[x].velocity_ratio, profile.MC_PProfile_Array[x].acceleration_ratio</td>
</tr>
</tbody>
</table>

The interpolations allow to run on smooth curves without the need to define a large number of points. The following chapter shows the results with different interpolation modes for a sinus-curve with 10 interpolation points. The following table gives the mean deviation.

<table>
<thead>
<tr>
<th>Interpolation Type</th>
<th>Mean deviation [ppm]</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCA_LINEAR</td>
<td>19686 = 1.9%</td>
</tr>
<tr>
<td>MCA_SPLINE_NATURAL</td>
<td>151 = 0.0151%</td>
</tr>
<tr>
<td>MCA_SPLINE_COMPLETE</td>
<td>25510 = 2.5%</td>
</tr>
<tr>
<td>MCA_POLY3</td>
<td>131 = 0.0131%</td>
</tr>
<tr>
<td>MCA_POLY5</td>
<td>0.37</td>
</tr>
</tbody>
</table>

The original curve is represented by y_sinus for position and v_sinus for velocity. The diagrams show the result which is achieved by different interpolation types.

**MCA_LINEAR**
Fig. 89: Results from linear interpolation

The velocity is constant between the interpolation points.

MCA_POLY3

Fig. 90: Results from polynomial interpolation

The result looks almost identical to the original curve. The mean deviation shows that MCA_POLY3, MCA_POLY5 and MCA_SPLINE_NATURAL produce results which follow the original curve really good and are almost identical. The spline interpolation produces a jerk-free curve without the need of providing velocity values and acceleration values in advance.
In the beginning and the end, the curve does not follow the original curve. The reason is that it starts with velocity 0 and produces a jerk free result.

So the favoured result has to be considered in advance to choose the right interpolation method. With these different methods it is not necessary to provide a large number of interpolation points to get good results and smooth acceleration and deceleration ramps.

1.5.10.4.7 PLC-based motion control — Load control / fluid power extensions

The ABB_MotionControlLoad_AC500 library is an extension to ABB_MotionControl_AC500 library based on PLCopen part 6 called “fluid power” and basically can be used to implement load control as a simple form of torque profiling. It can be used together with all other motion control package libraries. The same structure and general rules are applied and all the above chapters in this document is relevant for ABB_MotionControlLoad_AC500 library as well. It is recommended to read through all the above chapters before start using the function blocks from this library. A difference is that the position control loop has to be closed inside the PLC as it is to be synchronized with the load control loop which is also realized. The implementation of Load function blocks is based on the PLCopen part 6 – Fluid power.

Overview of the defined extended function blocks:

<table>
<thead>
<tr>
<th>Administrative</th>
<th>Motion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single axis</td>
<td>Multiple axis</td>
</tr>
<tr>
<td>MC_LimitLoad</td>
<td>-</td>
</tr>
<tr>
<td>MC_LimitMotion</td>
<td>-</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>
As per PLCopen MC_TorqueControl is a part 1 function block, however due to its implementation as a wrapper for the load control and limit load blocks this is added to ABB_MotionControlLoad_AC500 library.

The following state diagram is based on the version as defined in ‘Part 1 – Function Blocks for Motion Control’, Version 2.0.

This specification adds three load function blocks to the state diagram:
- MC_LoadControl
- MC_LoadSuperImposed
- MC_LoadProfile

MC_TorqueControl function block also follows the same state diagram.

Function blocks not listed in the state diagram do not affect the state diagram, meaning that whenever they are called the state does not change.

The state diagram shows synchronized motion because the position-axis follows the load, and the state is related to the position axis.

Note 1: From any state. An error in the axis occurred.
Note 2: From any state. MC_Power.Enable = FALSE and there is no error in the axis
Note 3: MC_Reset and MC_Power.Status = FALSE
Note 5: MC_Power.Enable = TRUE and MC_Power.Status = TRUE
Note 6: MC_Stop.Done = TRUE and MC_Stop.Execute = FALSE

Kernel function block - Fluid power

The basic block is the CMC_Load_Motion_Kernel. It has to be called every cycle and at least once before any MC... block is activated. It is used to combine the position and velocity functionality from CMC_Basic_Kernel with the load control functionality which is utilized by the MC_Load... blocks.
The reference which is used by the CMC_Load_Motion_Kernel is equivalent with the Speed_Reference at CMC_Basic_Kernel, as long as no LOAD-functionality is activated. The documentation from CMC_Basic_Kernel applies to the identical inputs and outputs. Some inputs and outputs are added to serve the load control functionality.

The Load_Ref is used instead of Axis_Ref for the MC_Loadxxx blocks. When the CMC_Load_Motion_Kernel is used, Load_Ref replaces Axis_Ref and user can use all PLCopen-Blocks.

The actuator (drive) has to be accessed outside the CMC_Load_Motion_Kernel block. Actual values and reference values might be transferred by a synchronised bus or by I/Os.

- All inputs and outputs of the function block which are named “DRIVE_xxxx” should be used to connect to the actuator (drive). It does not matter whether this connection is done by fieldbus or by conventional I/Os.
  - The Axis-structure is used to connect to the PLCopen blocks
- The Load_Axis structure is used to connect the fluid-power PLCopen blocks
The control_parameter-structure is used for configuration of control loop.

The IO-structure gives a connection to limit- or reference switches.

When the function block will take control (close loop) the output “Drive_Release” is set. The PLC-Program should then start the actuator (actuator (drive)) and set “Drive_InOperation = TRUE” when successful. In case of actuator (actuator (drive)) problem, “Drive_InOperation” should be reset. The function block will then open the position control loop and Speed_Reference will be 0.

The homing is done with PLCopen-blocks. As the interface to the actual position is outside the CompactMotion, the bit “Drive_Set_Ref” is set when the state is reached to evaluate the zero-track. When the zero-track was found, Drive_ActualPosition has to be set to “Drive_Set_Position”, this has to be indicated by “Drive_Ref_Ok”.

The output “Drive Reference” should be send to the actuator (drive). This value is scaled with Max_Rpm and Max_Reference which means: when “Drive_Reference” equals Max_Reference, the motor is expected to run with Max_Rpm.

Load control

The function block holds a position control loop and a load control loop. The load control loop is a PIDT1-Block. Both control loops are alternately activated, depending if a MC_Load...block or a MC_Move... block is active. There is a bumbless transition realized between the different control loops.

The PIDT1 controller has a proportional, integral and derivative part. The integral and derivative part can be switched off by using a time value = 0.

Transfer function

\[ F(s) = K_P \cdot \frac{1}{s \cdot T_N} + \frac{1}{1 + (s \cdot T)} \]

Control algorithm: Simple rectangle rule:

\[ Y = \frac{1}{100} \cdot \left( VD(Tz-1) + \frac{1}{1+(Tz1 \cdot Tz)} \right) \]

Where:

- Y(z-1): The integral portion from the previous program cycle
- X(z-1): Control system difference from the previous program cycle

All 3 parts of the control loop are added up. The integral or derivative part could be disabled by setting the respective time constant to 0, so the following structures are possible:

- P
- PDT1
- PI
- PIDT1

The Load_MaxRef and Load_MinRef values will limit the controllers output Y and also apply to the controller’s internal integral part. I.e the integral part can only hold values between the high and low limits. If the manipulated variable Y reaches one of the two limits, the controller’s integral part is no longer changed. This prevents the integral part from holding meaningless values and, in certain circumstances, not returning to the operating range for a long time. This behavior of a controller is also referred to as a “special anti-reset windup measure”.
**MC LimitLoad**

In the diagram below, an example is explained. SFC is used here to distinguish between a movement where the MC_LimitLoad functionality has become ‘Active’ or not. In Step 2 there is a movement like ‘MoveAbsolute’, which is limited by the MC_LimitLoad functionality. If the absolute position is reached without MC_LimitLoad becoming active, the transition via ‘done’ to step 3 is applicable. However, if the MC_LimitLoad becomes ‘Active’, the transition to the ‘Halt’ step is applicable, issuing a MC_Halt.

![Fig. 92: MC_LimitLoad used in SFC](image)

**MC LimitMotion e.g. force fitting**

The function block is intended to be used in conjunction with a MC_LoadControl or MC_TorqueControl having primary control on the axis. The MC_LimitMotion should be enabled by the ‘Active’ output of the MC_LoadControl / MC_TorqueControl. If motion values on the axis exceed the given limit, appropriate measures are taken to keep to these limits, implying that the load/torque will not follow the programmed trajectory but depend on the external load conditions. However, the ‘Active’ output of the MC_LoadControl/MC_TorqueControl will stay TRUE in this case, following the modified PLCopen definition “The ‘Active’ output indicates, that the FB has control on the set-value generation of the axis”. This is despite the fact, that physically only the load-conditions or the movement of an axis can be controlled. With actual motion states below programmed limits, the programmed load/torque trajectory will proceed. Enabling the limiter block with activation of the MC_LoadControl/MC_TorqueControl ensures that limits are only supervised when the MC_LoadControl/MC_TorqueControl takes control on the axis for the first time. Disabling the limiter block with de-activation of the MC_LoadControl/MC_TorqueControl ensures that limits are no more supervised when the MC_LoadControl/MC_TorqueControl loses control on the axis by ‘CommandAborted’ or ‘Error’.
**Possible Application:** Actuator: hydraulic cylinder with fluid pressure sensor actuates the press of plastic injection molding machine in a continuous load operation.

**Request:** Prior to MC_LoadSuperImposed call, a MC_LoadControl block is ‘Active’ with a command of 7,500 kPa to press melted plastic into the mold. Once the MC_LoadControl ‘InLoad’ condition is achieved a superimposed pressure of 5,000 kPa is added several times to cause a hammering effect to relieve stresses in the plastic.

**Result:** the MC_LoadControl pressure command of 7,500 kPa is superimposed with a discrete pressure command of 5,000 kPa. Once the ‘LoadSuperImposed’ command is active the system pressure rises to 12,500 kPa.

When the superimposed pressure command has been achieved the MC_LoadSuperImposed block is done and the original command given by the MC_LoadControl resumes the original pressure command. The MC_LoadSuperImposed block is executed several times without affecting the original pressure command given by the MC_LoadControl block.
The example (below) opposite signs for ‘Direction’ & ‘Torque’ are used (e. g. Retention or brake control). (In the function block: +Direction –Torque). It is like an unwinding application with torque on the material, and a break in the material. When the material breaks, as shown in the middle of the figure this causes a drop in the real Torque value (in absolute terms): The velocity will decrease, limited by the fastest “deceleration” limit specified by the ‘Deceleration’ VAR_INPUT down to zero velocity (with no tension there is a risk of having shock breakings, so we have to limit to the fastest). In this case the torque setpoint might not be achieved.

In an unwinding application (derived from this brake control) material tension is the target, not motor torque. The instantaneous diameter of the roll should be taken into account to transform the “User tension setpoint”. Also, additional inertia compensation by modification of the torque setpoint for acceleration / deceleration is common from instantaneous weight data (weight is commonly estimated from diameter). Additionally, in unwinding applications, in the case of loose material (same condition as material break), a negative slow velocity reference is usually applied to “rewind” the loose material. In this case, this must be provided by external programming.

1.5.10.4.8 Appendix

List of all PLCopen and ABB specific function blocks in PS552-MC (for V2 PLC) and PS5611-Motion (for V3)

1.5.12 PLCopen libraries

1.5.12.1 Common function block state machine

Most of the V3 function blocks follow the behavior model and style as recommended by PLC Open.

- Clear separation between “Edge triggered FBs” (“Execute”) or “Level triggered FBs” (“Enable”)
- Binary status outputs: “Done”, “Busy”, “Error” (exclusive)
- Standardized state machine
- CamelCase naming for function block and all inputs and outputs
Example: Edge_Triggered_Function_Block_EthOwnIP according to PLCopen

Currently the following “function block state machines” are used:

- **“Edge Triggered”** (Input “Execute”), for example EthOwnIP
- **“Level Controlled”** (Input “Enable”)
- **“Level Controlled Continuous”** (Input “Enable”, no “Done” output, for example PID)

In contrast to AC500 V2 POUs, either “Done” or “Error” is set, not both outputs at the same time in case of an error.

The state machines are explained in the following chapters.

1.5.12.1.1  **Edge triggered (AbbETrig)**

After a rising edge at the input “Execute” the state goes from “Dormant” to “Busy”. In the first cycle all inputs are sampled and stored.

When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”.

The states “Done” or “Error” are stable for minimum one cycle and as long as “Execute” is “TRUE”. With a falling edge of “Execute”, the state goes via Reset to “Dormant”.
Description of standard inputs and outputs:

- **“Execute”**
  A rising edge starts the operation, the output “Busy” goes to “TRUE”. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After “Done = TRUE” or “Error = TRUE” and “Execute = FALSE” all outputs will be reset.

- **“Busy”**
  Operation is running (while outputs “Done” and “Error” are “FALSE”)

- **“Done”**
  Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”

- **“Error”**
  Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”. The output “ErrorID” gives more details about the error.

### 1.5.12.1.2 Level controlled (AbbLCon)

![State diagram](image)

After a rising edge at the input “Enable” the state goes “Dormant” to “Busy”. All inputs are sampled and considered continuously. When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”. The states “Done” or “Error” are stable for minimum one cycle and as long as “Enable is TRUE”. With a falling edge of “Enable”, the state goes via Reset to “Dormant”.

The Busy state can be aborted from outside by setting the “Enable” input to “FALSE”. After Aborting is done the state goes back to “Dormant”.

Description of standard inputs and outputs:

- **“Enable”**
  A rising edge (“Enable = TRUE”) starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously. A falling edge (“Enable = FALSE”) aborts the operation.
  During Aborting the Busy is still “TRUE”. Afterward all outputs are reset.

- **“Busy”**
  Operation is running (while outputs “Done” and “Error” are “FALSE”)
● “Done”  
Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”).  
This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.

● “Error”  
Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”).  
This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.  
The output “ErrorID” gives more details about the error.

Level controlled continuous (AbbLConC)
This state machine is a special case of “Level Controlled”. Only difference is that this function block type is never done, for example a PID which never stops.  
Therefore these function blocks have no “Done” output.

Description of standard inputs and outputs:

● “Enable”  
A rising edge (“Enable = TRUE”) starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously.  
A falling edge (“Enable = FALSE”) aborts the operation.  
During Aborting the “Busy” is still “TRUE”. Afterward all outputs are reset.

● “Busy”  
Operation is running (while output “Error is FALSE”)

● “Error”  
Operation is stopped with error (while output “Busy is FALSE”).  
This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.  
The output “ErrorID” gives more details about the error.

1.5.12.1.3 Error_ID
Each library contains an enumeration “ERROR_ID”, which is valid for this library but not across all libraries.

![Image of Error_ID enumeration]

Only the following errors are unique:

● 16#5FFF FATAL_ERROR from state machine
● 16#4000 errors are used for input errors, same scheme like in V2:
4000hex...4FFFFhex - Block Input Error

The error 4xxxhex is used in case of detected Function Block input parameter errors. The error is structured as follows:

- 4 = Function Block identifier
- XX = Error class
- X = Error type

<table>
<thead>
<tr>

HEX
1.5.12.1.4 Compatibility with V2 function blocks

In order to ensure compatibility with V2 applications a lot of ABB function blocks are delivered together with a compatible version in classic style:

Names in CAPITAL letters, input “EN” and outputs “DONE”, “ERR” and “ERNO”:

The classic blocks internally use the PLCopen style function blocks. The inputs and outputs are mapped in the following way:

1.6 PLC integration (hardware)

1.6.1 Product overview and comparison

1.6.1.1 Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:

<table>
<thead>
<tr>
<th>Terminal base compatibility</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5610</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5620</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5640</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5660</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.

Table 398: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<table>
<thead>
<tr>
<th>Processor module</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600-2ETH</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>

<td>4 slots</td>
<td>4 slots</td>
</tr>
<tr>
<td>TB5660-2ETH</td>
<td>-</td>
<td>-</td>
<td>6 slots</td>
<td>6 slots</td>
</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index $\geq C0$.

---

**Supported devices**

The AC500 V3 terminal bases can be equipped with the following supported devices:

*Table 399: Comparison: TB56xx*

### 1.6.1.3.1 Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:
### Protocol Port

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig ¹)</td>
<td>UDP 24576</td>
</tr>
<tr>
<td>Online access with driver 3S UDP BlkDrvUdp (with scan)</td>

</tr>
<tr>
<td>Online access with driver 3S Tcp/IP BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
</tr>
<tr>
<td>OPC UA server ²)</td>
<td>TCP 4840</td>
</tr>
</tbody>
</table>

Remarks:

¹): The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.

²): The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

All other ports are closed by default.

### 1.6.1.3.2 Overview of protocols, sockets and ports

For changing the default addresses or the description of the function keys see:

☞ Chapter 1.6.6.2.2.4.2 “Configuration of the IP settings with the IP configuration tool” on page 3675

☞ Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491.
1.6.1.3.5 Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC’s.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:
- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

Online access can be established from:
- Automation Builder command ‘Login’ ⇒ Chapter 1.4.1.20.3.6.2 “Command ‘Login’” on page 1028
- CODESYS OPC DA server
- Panel CP600 series

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   ⇒ One socket on port 11740 (listen).

2. Login from Automation Builder via driver “BlkDrvTcp”.
   ⇒ 2 sockets on port 11740 (1x online, 1x listen)

3. Additional login out of OPC server with the same driver.
   ⇒ 3 sockets on port 11740 (2x online, 1x listen)

4. Additional connect CP600 via driver “BlkDrvTcp”.
   ⇒ 4 sockets on port 11740 (3x online, 1x listen)

1.6.2 PLC introduction

1.6.2.1 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

PLC specific safety notices

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.
NOTICE!
Avoidance of electrostatic charging
PLC devices and equipment are sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:
- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!
PLC damage due to operation conditions
Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!
PLC damage due to wrong enclosures
Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction
Do not use cleaning agent for cleaning the device.
Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!
Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!
PLC damage due to missing grounding
- Ensure to earth the devices.
- The grounding (switch cabinet grounding, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the ground before the device is subjected to any power. The grounding may be removed only if it is certain that no more power is being supplied to the control system.
In the description for the devices (operating manual or AC500 system description), reference is made at several points to grounding, galvanic isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the grounding via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the grounding (in this respect, see also VBG 4 and the relevant VDE regulations).

**CAUTION!**

Do not obstruct the ventilation for cooling!
The ventilation slots on the upper and lower side of the devices must not be covered.

**CAUTION!**

Run signal and power wiring separately!
Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

**WARNING!**

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

**WARNING!**

Splaying of strands can cause hazards!
During wiring of terminals with stranded conductors, splaying of strands shall be avoided.
- Ferrules can be used to prevent splaying.

**WARNING!**

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
Information on batteries

CAUTION!
Use only ABB approved lithium battery modules!
At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!
Risk of explosion!
Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.
Protect them from heat and fire and store them in a dry place.
Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations
Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

Environment and enclosure information

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2,000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as “open type” equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.6.2.2 Cyber security

Cyber security disclaimer
This product is designed to be connected to and to communicate information and data via a network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.
Although ABB provides functionality testing on the products and updates that we release, you should institute your own testing program for any product updates or other major system updates (to include but not limited to code changes, configuration file changes, third party software updates or patches, hardware exchanges, etc.) to ensure that the security measures that you have implemented have not been compromised and system functionality in your environment is as expected. This also applies to the operating system. Security measures (such as but not limited to the installation of latest patches, installation of firewalls, application of authentication measures, installation of anti-virus programs, etc.) are in your responsibility. You have to be aware that operating systems provide a considerable number of open ports that should be monitored carefully for any threats.

It has to be considered that online connections to any devices are not secured. It is your responsibility to assure that connections are established to the correct device (and e.g. not to an unknown device pretending to be a known device type). Furthermore you have to take care that confidential data exchanged with the PLC is either compiled or encrypted.

Security related deployment guidelines for industrial automation

Signed firmware updates

The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

Open ports and services

As part of the ABB security concept the AC500 V3 PLC comes with minimal services opened by default. Only the services needed for initial setup and programming are open before any user application is downloaded. Chapter 1.6.1.3 "Ethernet protocols and ports for AC500 V3 products" on page 2389.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

Secure communication

Whenever possible, use an encrypted communication between AC500 V3 devices and third party devices, such as HMI devices. This is necessary to protect passwords and other data.

Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

Frequently asked questions

For more information around cyber security please see our FAQ.

1.6.2.2.1 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor’s recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:
- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks

Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

Only used services/ports should be enabled (e.g. to enable the functionality of an FTPS server).

References: CODESYS Security Whitepaper

Security zones

IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewalls. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.

Cooperate network
Available for all employees

Company intranet
Available to local employees

Automation system
Available to operators and process engineers only

Fig. 93: Security zones

Fig. 93 shows three security zones, but the number of zones does not have to be as many or as few as three. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.
High-security zones should be kept small and independent. They need to be physically pro-
tected, i.e. physical access to computers, network equipment and network cables must be 
limited by physical means to authorized persons only. A high-security zone should obviously not 
depend on resources in a less secure zone for its security. Therefore, it should form its own 
domain that is administered from the inside, and not depend on, e.g., a domain controller in a 
less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compro-
mised resource that is inside the trusted zone, or by an outside user or resource that succeeds 
to penetrate the secure interconnection. Trust therefore depends also upon the types of meas-
ures taken to detect and prevent compromise of resources and violation of the security policy.

References: Security for Industrial Automation and Control Systems

1.6.2.2 Secure operation

The controller must be located in a protected environment in order to avoid accidental or 
tended access to the controller or the application.

A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras 
or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers 
  and field devices via standard communication protocols (fieldbus systems) using appro-
  riate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional 
  measures, such as encryption. Open physical or data access to fieldbus systems and their 
  components is a serious security risk.
- Physically protect all equipment, i.e., ensure that physical access to computers, network 
  equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized 
  persons
- When connecting a trusted network zone to outer networks, make sure that all connections 
  are through properly configured secure interconnections only, such as a firewall or a system 
  of firewalls, which is configured for “deny by default”, i.e., blocks everything except traffic 
  that is explicitly needed to fulfill operational requirements.
- Allow only authorized users to log on to the system, and enforce strong passwords that are 
  changed regularly.
- Continuously maintain the definitions of authorized users, user groups, and access rights, 
  to properly reflect the current authorities and responsibilities of all individuals at all times. 
  Users should not have more privileges than they need to do their job.
- Do not use the system for e-mail, instant messaging, or internet browsing. Use separate 
  computers and networks for these functions if they are needed.
- Do not allow installation of any unauthorized software in the system.
- Restrict temporary connection of portable computers, USB memory sticks and other remov-
  able data carriers. Computers that can be physically accessed by regular users should have 
  ports for removable data carriers disabled.
- If portable computers need to be connected, e.g., for service or maintenance purposes, they 
  should be carefully scanned for viruses immediately before connection.
- All CDs, DVDs, USB memory sticks and other removable data carriers, and files with 
  software or software updates, should also be checked for viruses before being introduced 
  into the trusted zone.
- Continuously monitor the system for intrusion attempts.
- Define and maintain plans for incident response, including how to recover from potential disasters.
- Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.

A protected local control cabinet could look like in figure 94, page 2402. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.

**Fig. 94: Isolated automation system**

Servers and workplaces that are not directly involved in the control and monitoring of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.
Fig. 95: Plant information network connected to an automation system

For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.
1.6.2.2.3 Hardening

System hardening means to eliminate as many security risks as possible. Hardening your system is an important step to protect your personal data and information. This process intends to eliminate attacks by patching vulnerabilities and turning off inessential services. Hardening a system involves several steps to form layers of protection.

Commissioning phase
- Protect the hardware from unauthorized access
- Be sure the hardware is based on a secure environment
- Disable unused software and services (network ports)
- Install firewalls
- Disallow file sharing among programs
- Install virus and spyware protection

Fig. 96: Automation system and IS network
- Use containers or virtual machines
- Create strong passwords by applying a strong password policy
- Create and keep backups
- Use encryption when possible
- Disable weak encryption algorithms
- Separate data and programs
- Enable and use disk quotas
- Strong logical access control
- Adjust default settings, especially passwords

**Verification phase**
- Verification of antivirus - Check antivirus is active and updated
- Verification of the identification - Check that test and unauthorized accounts are removed
- Verification of intrusion detection systems - Check malicious traffic is blocked
- Verification of audit logging - Check audit log is enabled
- You can use the checklist out of the [cyber security white paper](#)

**Operation phase**
- Keep software up-to-date, especially by applying security patches
- Keep antivirus up and running
- Keep antivirus definitions up-to-date
- Delete unused user accounts
- Lock an active session whenever it is unattended, e.g., lock the screen of the PC or of the control panel (HMI)

**Decommissioning phase**
- Delete all credentials stored in the device like certificates and user data  "Decommissioning" on page 3351.

**References:** [Hardening in Wikipedia (2021)](#)

### 1.6.2.4 Open Ports and Services

Overview of minimum cyber security requirements for open ports and services settings.

### 1.6.2.3 License and third party information

Information on Automation Builder licensing and Third Party software can be found in the "About" window of the Automation Builder Installation Manager.

*Further information on licensing.*
1.6.2.4 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

- DIN VDE 0100: "Regulations for the Setting up of Power Installations"
- DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
- DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

- DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
- DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

- DIN VDE 0110 Part 1 ↔ IEC 664
- DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
- DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

- Automation technology sector
- Dealing with dangerous voltages
- Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.6.2.5 Definitions: PLC system start-up

Cold start

The AC500-eCo V3 does not use a battery for buffering the operand areas specified below, hence the "cold start" mode does not exist in this product.

- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see Chapter 1.4.1.20.3.6.10 “Command 'Reset Cold’” on page 1038).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.
Warm start
- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see Chapter 1.4.1.20.3.6.11 “Command 'Reset Warm'” on page 1038).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

RUN -> STOP
- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (AC500 PLC display "run", AC500-eCo PLC "RUN LED" is ON).
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP", AC500-eCo "RUN LED" changes from ON to OFF.

START -> STOP
- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The AC500 PLC display changes from "run" to "StoP".

Reset
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for ≥ 5 s in STOP mode.

Reset (cold)
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)
- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program!).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN
- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (AC500 PLC display "StoP", AC500-eCo "RUN LED" is ON). "RUN LED" is OFF of the toggle switch of an AC500-eCo CPU.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo "RUN LED" changes from OFF to ON.

STOP -> START
- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The AC500 PLC display changes from "StoP" to "run", AC500-eCo PLC "RUN LED" changes from OFF to ON.
Download

- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change

- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
- Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command "Online/Create boot project" cannot be initiated until re-organization is completed.
- Online Change is not possible after:
  - changes in the PLC configuration
  - changes in the task configuration
  - changes in the library management
  - changed compile-specific settings (segment sizes)
  - performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering

- Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected for AC500 CPU and the buffering will take place in FLASH with AC500-eCo V3 CPU. The following data can be buffered completely or in parts:
  - Data in the addressable flag area (%M area)
  - RETAIN variable
  - PERSISTENT variable (number is limited, no structured variables)
  - PERSISTENT area (%R area)
- In order to buffer particular data, the data must be excluded from the initialization process (see chapter 1.6.5.1.1 "Handling of remanent variables for AC500 V3 products" on page 3456).

### 1.6.2.7 PLC system description

#### 1.6.2.7.1 AC500 product family

**AC500 programmable logic controllers (PLCs)**

The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide solutions for small, middle and high-end applications. Our AC500 platform offers different performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

**Features of AC500 PLCs**

- Scalable and consistently expandable system
- Different performance classes of processor modules (CPUs) available
- Several field busses available
- Parallel connection to several field busses which can be combined arbitrarily

The AC500 product family consists of the product groups:
- **AC500 (standard):**
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- **AC500-eCo:**
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- **AC500-S:**
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- **AC500-XC:**
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

### Extensions in the product name

AC500 devices support different protocols and technologies (e.g. Ethernet, PROFIBUS etc.) in variable number. AC500 devices with onboard interfaces for support of a certain protocol or technology can be identified easily by the extension in the product name of the AC500 device. For example the AC500 Communication Module PM592-DP provides onboard support for PROFIBUS DP, the AC500 processor module PM595-4ETH provides onboard support for four provided Ethernet interfaces.

Further extensions in AC500 device names:

- -ETH: Ethernet
- -ARC: ARCNET
- -DP: PROFIBUS DP
- -CAN: CAN/CANopen
- -ETHCAT: EtherCAT
- -PNIO: PROFINET
- -RCOM: RCOM/RCOM+
- -RS: Serial interface

### 1.6.2.7.2 AC500/S500 system structure

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the CPU with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

Example of an AC500 PLC system:
1 Plug-in communication module
2 Processor module
3 Plug-in I/O module
4 Plug-in function module (AC500-eCo)
   - Plug-in communication module (AC500-S), not displayed
   - Plug-in I/O module (AC500-S), not displayed

Centralized I/O extension

Fig. 97: S500 I/O modules directly connected to a processor module
1.6.2.7.3  AC500/S500: Short description hardware

Processor modules

AC500 processor modules contains the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the system program to command the PLC for operation.

Its functions include:

- To receive user program and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax error in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user program in the memory one by one and execute it after interpretation
- To update the state of related flag bits and output shadow register contents according to execution results and realize output control by means of output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.

There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.

If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).
AC500 communication modules are required for

- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.
The I/O modules are the input / output unit which connects the PLC with the industrial production site. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to realize the control purpose.

External input equipment and output equipment need various signal levels while the information processed by the CPU in the PLC only can be the standard level. In order to realize such conversion, the I/O interface generally shall perform optical isolation and filtering to improve interference immunity of the PLC. In addition, the I/O interface generally can indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interface for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC have the number of input / output signals taken as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system is insufficient in the I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.

The modules can be simply plugged onto a terminal unit for a centralized I/O extension or for a decentralized I/O extension via communication interface modules.

**Function modules**

Function modules extend the PLC system to perform special task control. Those modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus.

It is connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC.

**Communication interface modules**

Communication interface modules enable a decentralized I/O station. It contains embedded digital I/Os and a fieldbus interface.

Communication interface modules act as I/O slave devices within a master-slave-arrangement.
Terminal bases

On a terminal base the processor module and the communication modules are plugged.

For AC500-eCo processor modules and special AC500 (Standard) processor modules the terminal base cannot be removed.

Terminal units

On a terminal unit the I/O modules are plugged.

Terminal units enable simple prewiring without electronics and are available for 24 V DC and 230 V AC, optionally for spring or screw-type terminals.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. The following memory types can be distinguished:

- **Volatile memory:**
  All saved data will be lost after power failure of the memory but the memory can provide high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- **Nonvolatile memory:**
  All saved data will not be lost after power failure of the memory, but the memory is subject to low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, memory card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to get protected from power failure. The programs are exported to the volatile memory under operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access in the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains existing state by using built-in supercapacitors or backup batteries in case of power failure. The memory area for data saving in case of power failure is called the data retention area.
Power supply

The PLC is equipped with a switch power supply for internal circuit. Compared with ordinary power supply, the PLC power supply has the higher stability and interference immunity. A number of PLC products provide 24 V DC stabilized voltage supply to meet external sensors.

1.6.2.7.4 Short description software

Configuration and programming of all AC500 control systems (CPUs) is done by using Automation Builder software.

Features:
- Standardized programming according to IEC 61131-3 - five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), free graphical function chart (CFC), debugging functions for program test
- Application programming in C/C++
- Online diagnosis
- Debugging functions for the program test: Single step, Single cycle, Breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting

IEC 61131-3 commands can be simulated without a PLC being connected, including the relevant malfunctions. After the program test, the application can be downloaded to the control system.

Timing diagrams for process variables and storage of data in a ring buffer with event trigger.
### Recipe management and watch lists
Values of selected variables are displayed. Pre-defined values can be assigned to variables which can then be downloaded to the control system all at once ("Write recipe"). Actual values from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe"). These functions are also helpful, for example, for setting and entering control parameters.

### Visualization
Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

### Programming
Serial or via Ethernet networks.

### Engineering interface
Provides access from the programming system to an external project database in which the program source code of one or several automation projects is managed. Optionally, a version control system, such as Visual Source Safe, can be used in order to ensure data consistency of the program code for several different users and projects.

### 1.6.2.7.5 CP600 control panels (HMI)
ABB control panels offer a wide range of features and functionalities for maximum operability. The panels are distinguished by their robustness and easy usability, providing all the relevant information from production plants and machines at a single touch.

![CP600 control panel](image)

HMI - human control and operation of machines and processes.

Individual solutions for each application - this enables an operator at any time to have an overview on a profitable production and intervene manually if necessary.

Control panels with TFT graphical display and touch screen.

Available in various resolutions.

### 1.6.2.8 AC500-S
The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the [AC500-S safety user manual](#) is only available on our website.
The AC500-S safety PLC includes the following safety-relevant hardware components.

- SM560-S / SM560-S-FD-1 / SM560-S-FD-4
- DI581-S
- DX581-S
- AI581-S
- TU582-S

1.6.2.9 Converting an AC500 V2 project to an AC500 V3 project

A project that has been configured for an AC500 V2 PLC can be converted to a project for an AC500 V3 PLC.

Essentially, the conversion is done in Automation Builder, however, some additional actions have to be executed manually. The complete procedure is described in the application example "Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3."

1.6.3 Device specifications

1.6.3.1 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- Status LEDs:
  Indicates the availability of devices/components such as communication modules, communication interface modules or function modules. Functionality and diagnosis of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- I/O LEDs:
  Displays the status of the inputs and outputs.

- LED display:
  Available for some processor modules. It can be used for simple configurations and for reading out diagnosis information.
  \(\text{Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486} \)
  \(\text{Chapter 1.7.1.2 “Diagnosis in CPU display” on page 4013} \)

- Function keys and switches:
  Allows to change the current operating modes/status manually \(\text{Chapter 1.6.5.1.6.5 “Description of the function keys” on page 3491} \).

1.6.3.2 Terminal bases (AC500 standard)

AC500-eCo V3 processor modules do not have a separate terminal base

1.6.3.2.1 TB56xx for AC500 V3 products

- TB5600-2ETH: 1 processor module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5610-2ETH: 1 processor module, 1 communication module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5620-2ETH: 1 processor module, 2 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5640-2ETH: 1 processor module, 4 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5660-2ETH: 1 processor module, 6 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- XC version for use in extreme ambient conditions available

Terminal bases TB56xx-2ETH can only be used with processor modules PM56xx-2ETH.

</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

\(^1\) PM567x must have an index \(\geq\) C0.

The following figure shows the TB5620-2ETH as example.

1. I/O bus (10-pin, female) to connect the I/O terminal units
2. One available slot for the processor module
3. Slots for communication modules
4. Interface for CAN (5-pin terminal block, removable)
5. Power supply (5-pin terminal block, removable)
6 Serial interface COM1 (9-pin terminal block, removable)  
7 RJ45 female connector for Ethernet connection  
8 Holes for screw mounting

**XC version**  
**XC** = eXtreme Conditions

---

**Extreme conditions**  
Terminal bases for use in extreme ambient conditions have no ☉ sign for XC version.  
The figure 3 in the Part no. 1SAP3... (label) identifies the XC version.

---

**Short description**

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.  
Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.  
The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

**Table 408: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)**

| TB5660-2ETH      | -      | -      | 6 slots | 6 slots | 1\)

**Remarks:**  
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.  
1) PM567x must have an index \( \geq C0 \).

---

**NOTICE!**  
Risk of malfunctions!  
Unused slots for communication modules are not protected against accidental physical contact.  
- Unused slots for communication modules must be covered with dummy communication modules to achieve IP20 rating ☉ Chapter 1.6.3.8.2.5 “TA524 - Dummy communication module” on page 3328.  
- I/O bus connectors must not be touched during operation.
Connections

I/O bus

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added (see description for I/O bus in the system assembly chapter Chapter 1.6.4.4.1 “Serial I/O bus” on page 3338).

Power supply

The supply voltage of 24 V DC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals, when the ambient temperature never exceeds 60 °C.

</tr>
</tbody>
</table>

NOTICE!

Risk of damaging the processor module and terminal base!

Exceeding the maximum voltage could lead to unrecoverable damage to the system.

The system might be destroyed.

NOTICE!

Risk of malfunction!

To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s.

NOTICE!

Risk of damaging the terminal base and power supply!

Short circuits might damage the terminal base and power supply.

Make sure that the four clamps L+ and M (two of each) are not wrongly connected (e.g. +/- of power supply is connected to both L+/L+ or both M/M).
Serial interface COM1

The serial interface COM1 is connected to a removable 9-pin terminal block.

From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).

---

**NOTICE!**

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

---

For further information on connection and wiring please refer to [Ethernet interface](#).

---

**Ethernet interface**

This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.

**TB56xx-2ETH** for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces.

The two Ethernet interfaces can be configured as independent interfaces or with switch functionality.

In case of two independent interfaces they must be configured to different subnets.

For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.

<td>Not connected</td>
</tr>
</tbody>
</table>

**NOTICE!**

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

## Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>
<td>50 m</td>
</tr>
<tr>
<td>500 kbit/s</td>
<td>100 m</td>
</tr>
<tr>
<td>250 kbit/s</td>
<td>250 m</td>
</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

## Types of bus cables

Only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. See § Chapter 1.6.4.6.4.6 “CANopen field bus” on page 3422.

## Bus terminating resistors

Both ends of the CAN bus have to be terminated with a 120 Ω (≥ 1/4 W, ≤ 5 %) bus terminating resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L). See § Chapter 1.6.4.6.4.6 “CANopen field bus” on page 3422.

## Technical data

The system data of AC500 and S500 are applicable to the standard version. § Chapter 1.6.4.6.1 “System data AC500” on page 3398

The system data of AC500-XC are applicable to the XC version. § Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.
<table>
<thead>

1.6.3.3 Processor modules

The AC500 product family consists of the product groups:

- **AC500 (standard):**
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- **AC500-eCo:**
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- **AC500-S:**
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- **AC500-XC:**
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. See Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

1.6.3.3.1 AC500-eCo

Fig. 99: Example: PM5072-T-2ETH

1. Micro memory card slot
2. 5 LEDs to display the states of the processor module (Power, Error, Run, MC, MOD1)
3. RUN button
4. RJ45 female connector for Ethernet1 connection
5. RJ45 female connector for Ethernet2 connection (available for PM5072-T-2ETH(W))
6. 3-pin terminal block for power supply 24 V DC
7. 2 holes for screw mounting
8. Option board slot cover for option board slot (the number of available slots varies according to the CPU type)
9. Cable fixing
The processor module is shown with pluggable terminal blocks. These terminal blocks must be ordered separately.

The cable fixing accessory on the top of the housing is optional. Please use TA5301-CFA cable fixing accessory to provide strain relief. It can also be used for AC500-eCo I/O modules.

The PM50x2 processor modules are supplied with option board slot covers as standard. There are various TA51xx option boards for the processor modules that can be ordered separately. Which and how many option boards can be plugged, depends on the respective processor module.

Short description

The processor modules PM50xx series are the central units of AC500-eCo V3 PLC. Their main characteristics are:

- Power supply 24 V DC
- I/O bus (not for PM5012-x-ETH)
- Real-time clock (PM5012-x-ETH needs additional RTC option board)
- Option board slots for extension on the CPU (1 for PM5012-x-ETH, 2 for PM5032-x-ETH, 3 for PM5052-x-ETH and PM5072-T-2ETH)
- 6 digital inputs (PM5012-x-ETH), 12 digital inputs (PM5032-x-ETH, PM5052-x-ETH, PM5072-T-2ETH)
- 4 transistor outputs (PM5012-T-ETH), 8 transistor outputs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH)
- 4 relay outputs (PM5012-R-ETH), 6 relay outputs (PM5032-R-ETH, PM5052-R-ETH)
- 2 configurable digital inputs/outputs (not for PM5012-x-ETH)

The various processor module variants differ in the following characteristics:

- Type of the digital outputs (transistor or relays)
- Ethernet interface one or two independent interfaces

All processor module variants include a micro memory card slot.

Details and technical data are provided in the technical data section "Technical data" on page 2472.

### Connections and interfaces

#### I/O bus

The I/O bus is not available for PM5012-T-ETH and PM5012-R-ETH. I/O channel extension using option board slot only.

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules for PM5032-x-ETH (but with a limit of 128 Bytes input/128 Bytes output variables) and 10 I/O modules for PM5052-x-ETH and PM5072-T-2ETH can be added.
Depending on the processor module variants, an additional option board can be connected to the option board slot to extend the feature of the processor module. 

**Chapter 1.6.2.6.2.1.1 “Option boards for AC500-eCo V3 processor modules” on page 2410.**

### Serial interface
RS-232 communication interface is available by using option board:
- TA5141-RS232I (isolated)  
  ⊗ Chapter 1.6.3.3.1.2.6 “TA5141-RS232I - Option board for COMx serial communication” on page 2502

RS-485 communication interface is available by using option boards:
- TA5142-RS485I (isolated)  
  ⊗ Chapter 1.6.3.3.1.2.7 “TA5142-RS485I - Option board for COMx serial communication” on page 2504
- TA5142-RS485 (non isolated)  
  ⊗ Chapter 1.6.3.3.1.2.8 “TA5142-RS485 - Option board for COMx serial communication” on page 2510

### Ethernet interface
The Ethernet interface is carried out via a RJ45 jack.

**Table 412: Pin assignment of the Ethernet interface**

### Power supply
The processor modules PM50x2 can be connected to the 24 V DC supply voltage via a removable 3-pin spring terminal block or a 3-pin screw terminal block.

**Table 413: Removable terminal block for the supply voltage 24 V DC**

<table>
<thead>
<tr>
<th>3-pin spring terminal block</th>

### Faulty wiring on power supply terminals

**CAUTION!**
Risk of damaging the AC500-eCo V3 processor module and the connected modules!

Voltages > 30 V DC might damage the processor module and the connected modules.

Make sure that the supply voltage never exceeds 30 V DC.

### State LEDs and operating elements

**RUN/STOP button**
The processor modules, PM50xx series, have a RUN/STOP button. By pressing the RUN/STOP button, the processor modules switch between RUN mode and STOP mode. By long-pressing RUN/STOP button during the processor module power on phase, the processor module will be in MOD1.

**State LEDs**
The processor modules PM50xx indicate their states of operation via 5 LEDs located on the upper left side of the processor module.

</tr>
</tbody>
</table>

PLC Automation with V3 CPUs
PLC integration (hardware) > Device specifications
The AC500-eCo V3 processor module also provides 2 LEDs below the state LEDs which can be used by user and driven by an application. The LEDs can be used into a project and controlled using special function blocks which are contained in the PM AC500 library. The POU is PmLedSet located in folder LED control.

The processor module provides up to 10 LEDs (PM5012-x-ETH), 20 LEDs (PM5032-R-ETH, PM5052-R-ETH), or 22 LEDs (PM5032-T-ETH, PM5052-T-ETH, PM5072-T-2ETH) to display the states of the inputs and outputs.

### Diagnosis

The AC500 processor module can display various errors according to the error classes. The following error classes are possible. The reaction of the processor module is different for each type of error.

<table>
<thead>
<tr>
<th>Error class</th>
<th>Type</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>E1</td>
<td>Fatal error</td>
<td>A safe function of the operating system is no longer guaranteed.</td>
<td>Checksum error in the system Flash or RAM error</td>
</tr>
<tr>
<td>E2</td>
<td>Severe error</td>
<td>The operating system is functioning without problems, but the error-free processing of the user program is no longer guaranteed.</td>
<td>Checksum error in the user Flash, independent of the task duration</td>
</tr>
<tr>
<td>E3</td>
<td>Light error</td>
<td>It depends on the application if the user program should be stopped by the operating system or not. The user should determine which reaction is necessary.</td>
<td>Flash could not be programmed, I/O module has failed</td>
</tr>
<tr>
<td>E4</td>
<td>Warning</td>
<td>Error in the periphery (e.g. I/O) which may show an impact in the future. The user should determine which reaction is necessary.</td>
<td>Short-circuit at an I/O module, the battery is run down or not inserted</td>
</tr>
</tbody>
</table>

*) The behaviour if the ERR-LED lights up at error classes E3 or E4 is configurable.

Occurred errors can be displayed with the commands diagshow all in the PLC-Browser of Automation Builder software.

---

### Onboard I/Os

The AC500-eCo V3 processor modules have onboard I/Os which provide several functionalities. According to the CPU type, the number or the functionality of the onboard I/Os can be different.

**Connections**

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**NOTICE!**
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.
NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

When replacing a processor module, it is recommended to mark each wire connected to the onboard I/O terminal block before disconnecting it. This should make sure that the wires can be reconnected in the same order.

The connection is carried out by using removable 12-pin and 13-pin terminal blocks.

</table>
The following block diagram shows the internal structure of the onboard I/Os.
Connection of the digital inputs

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

Risk of malfunctions in the plant!

A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital inputs to the PM50x2 processor modules:
Connection of the digital transistor outputs (PM50xx-T-ETH only)

![Diagram of digital transistor outputs]

Fig. 100: Connection of digital transistor outputs and configurable digital inputs/outputs

- C12 used as configurable digital input
- C13 used as configurable digital transistor output

**CAUTION!**

Risk of damaging the processor module!

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

Connection of the digital relay outputs (PM50xx-R-ETH only)

The following figures show the connection of the digital relay outputs to the processor modules:
**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**CAUTION!**
Risk of damaging the processor module!
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be fed from the same phase.
- Use an external fuse to protect the outputs.

Fig. 101: Connection of digital relay outputs and configurable digital inputs/outputs

C12 used as configurable digital input
C13 used as configurable digital transistor output
I/O configuration

The configuration data of the onboard I/Os is stored in the processor modules PM50x2. See PLC configuration: Chapter 1.6.6.2.5 “Configure the onboard I/O channel” on page 3700

Parameterization

For information about parameterization, refer to the description for onboard I/Os for processor modules PM50x2. See PLC configuration: “PM5012-x-ETH Basic CPU” on page 3702 and “PM5032-x-ETH, PM5052-x-ETH Standard CPU” on page 3703

Diagnosis

No diagnosis is generated for the onboard I/O.

There is only an error message if the configuration does not work. A log entry is generated. The Automation Builder already prevents faulty values from being entered in the configuration. If the configuration does not work, there is a system error, if e.g. faulty software or wrong versions are installed. Otherwise there are error messages from the blocks for the individual functions.

### Technical data of the fast counter inputs

For AC500 devices the function "fast counter" is available in S500 I/O modules as of firmware version V1.3.

For AC500-eCo V3 devices the function "fast counter" is available in onboard I/Os of PM50xx.

The AC500-eCo V3 processor modules with onboard I/Os provide some special functionality on the digital inputs or digital outputs. Fast counter, encoder inputs, interrupt inputs or PWM/PTO outputs are available depending on the device used.

The fast counter functionality can be activated within the onboard I/O configuration.

The fast counter can work in pulse/direction mode or A/B track counter mode.

The pulse/direction counter detects the rising edge of the counter input. It will increase or decrease the count value (depending on the direction input) at every rising edge.

The A/B track counter is used to count the signal from an encoder.

The counter can count with quad phases. In the following the behavior of the A/B track counter is described.
Further information:
Operating modes of the fast counter: 
Chapter 1.6.6.2.13.9.1.2 “Operating modes” on page 3781
Configuration of the fast counter: 
Chapter 1.6.6.2.7.2 “Fast counters in the onboard I/Os” on page 3710

For 2 PTO 200 kHz *) Pulse/Direction or CC/Ccw modes as pair of outputs
DO4 ... DO7 as 4 PTO 100 kHz Pulse outputs / Direction using fast output 5kHz DO0...DO3

*) If the load is less than 100 mA it is strongly recommended to connect an additional load resistor (240 Ω/5 W or 270 Ω/5 W) to the output to improve the pulse signal.

### Channels for transistor version

| Channels for transistor version | 4 (5 kHz standard and PWM) | 8 (incl. 4 fast outputs for standard or 4 PWM/2 PTO (100 kHz/200 kHz), 4 standard outputs (5 kHz)) |

### Channels digital input/output configurable

(valid for both PLC version relais or transistor)

| Channels digital input/output configurable | - | 2 Relay version: The DC channels can be used as 1 PTO/2 PWM (100 kHz) or standard digital inputs/outputs |

Transistor version: The DC channels can only be used as standard digital inputs/outputs

| Channels for relay version | 4 | 6 | - |

### Rated voltage transistor

| Rated voltage transistor | 24 V DC |

### Nominal current per transistor channel

| Nominal current per transistor channel | 0.5 A resistive |

### Channels for relay version

| Channels for relay version | 4 | 6 | - |

### Rated voltage relay

| Rated voltage relay | 100 V AC...240 V AC or 24 V DC |

### Nominal current per relay channel

| Nominal current per relay channel | 2 A resistive |

### Analog inputs

| Analog inputs | Optional |

### Analog outputs

| Analog outputs | Optional |

### Number of option board slots

| Number of option board slots | 1 | 2 | 3 | 3 |

### Usage of option board

| Usage of option board | Each slot can be used for all type of existing option boards, same option board for serial interface or digital/analog I/O extension can be used on several slot per CPU. Note: RTC option board is only for PM5012 possible. |

| KNX address switch | No | TA5130-KNXPB only on 1 slot |

### Real-time clock (RTC)

| Real-time clock (RTC) | TA5131-RTC | No |

### Serial interface

| Serial interface | TA5141-RS232I, TA5142-RS485/TA5142-RS485I |

### Digital in/out channels

| Digital in/out channels | TA5101-4DI, TA5105-4DOT, TA5110-2DI2DOT |

### Analog in/out channels

| Analog in/out channels | TA5120-2AI-UI, TA5122-2AI-TC, TA5123-2AI-RTD, TA5126-2AO-UI |

### Max. number of I/O modules on I/O bus

<p>| Max. number of I/O modules on I/O bus | 0 | 10 |</p>

**Option boards**

**TA5101-4DI - Option board for digital I/O extension**

- 4 digital inputs 24 V DC (I0 to I3) in 1 group
- Module-wise galvanically isolated
1 4 yellow LEDs to display the signal states of the inputs I0 to I3
2 Allocation of signal name
3 5-pin terminal block for input signals

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

**Intended purpose**
The device is used as an optional I/O extension module for AC500-eCo V3 CPUs (PM50x2).
The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via internal CPU connection</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>

**Connections**

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the system assembly chapter.*

The connection is carried out by using a removable 5-pin terminal block. For more information, please refer to the chapter terminal blocks for AC500-eCo V3 system. The terminal blocks are included in the module’s scope of delivery and additional terminal blocks as spare parts can be ordered separately.

The following block diagram shows the internal construction of the digital inputs:
Table 429: Assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Input signal I2</td>
</tr>
<tr>
<td>5</td>
<td>I3</td>
<td>Input signal I3</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5101-4DI.

An external power supply connection is not needed.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.
NOTICE!
Risk of malfunctions in the plant!
A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the option board for digital I/O extension TA5101-4DI:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The module provides several diagnosis functions, see Diagnosis “Diagnosis” on page 2482.
The meaning of the LEDs is described in the section State LEDs “State LEDs” on page 2482.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.
1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

</table>

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5105-4DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

### NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

---

The following figure shows the connection of the option board for digital I/O extension TA5105-4DOT:
NOTICE!
Risk of malfunctions in the plant!
Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available.
This must be considered in the application planning.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis “Diagnosis” on page 2488.
The meaning of the LEDs is described in the section State LEDs “State LEDs” on page 2488.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.
1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

<tr>
<td>7</td>
<td>ZP</td>
<td>Process supply voltage ZP 0 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the connection to CPU. Thus, the current consumption from 24 V DC power supply at the terminals L+ and M of the CPU module increases by 10 mA per TA5110-2DI2DOT.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**  
**Risk of damaging the PLC modules!**  
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with "NC"). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**  
**Risk of malfunctions in the plant!**  
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection for inputs of the option board for digital I/O extension TA5110-2DI2DOT:

<table>
<thead>
<tr>
<th>Sink inputs of TA5110-2DI2DOT</th>
<th>Source inputs of TA5110-2DI2DOT</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Sink inputs diagram]</td>
<td>![Source inputs diagram]</td>
</tr>
</tbody>
</table>

The following figure shows the connection for outputs of the option board for digital I/O extension TA5110-2DI2DOT:

![Output connections diagram]

**NOTICE!**  
**Risk of malfunctions in the plant!**  
Only if L+/M of the CPU is available and the outputs are already configured in the AB program, the outputs will switch on as soon as the UP/ZP is available. This must be considered in the application planning.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external fuse for the outputs.

The module provides several diagnosis functions, see Diagnosis & “Diagnosis” on page 2494.
The meaning of the LEDs is described in the section State LEDs & “State LEDs” on page 2495.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from
the CPU module during power-up of the system.
Hence, replacing optional modules is possible without any re-parameterization via software.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.

Diagnosis

If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.
1. In the device tree, double-click the desired option board.
2. Select the “Diagnosis” tab to view the diagnosis messages of the desired option board.

### TA5130-KNXPB - Option board KNX adress push button

![TA5130-KNXPB option board](image)

1  State LED  
2  Allocation of signal name  
3  Connector

For more information about TA5130-KNXPB, please refer to the Automation Builder online help.
Intended purpose

This option board is only intended to be used with PM5072-T-2ETH(W).
This option board can only be used once on one slot at a time!
The option board is not supported by other AC500-eCo V3 PLCs.

Functionality

Information can be found in the chapter system technology: see Chapter 1.6.5.1.9 “KNX IP integration” on page 3527

Information about the integration of the PLC in KNX can be found here: “AC500-eCo V3 via TA5130-KNXPB“ on page 3540

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

1. In the device tree, double-click the desired option board.
2. Select the “TA51xx Parameters” tab to edit the parameterization of the desired option board.

TA5131-RTC - Option board for real-time clock

1 TA5131-RTC option board

Intended purpose

This option board is only for the basic CPUs PM5012-T-ETH and PM5012-R-ETH.
All other AC500-eCo V3 CPUs have the real-time clock already integrated.

Information can be found in the chapter system technology: see § Chapter 1.6.5.1.4 “Real-time clock and battery” on page 3478

Functionality

Information can be found in the chapter system technology: see § Chapter 1.6.5.1.4 “Real-time clock and battery” on page 3478

TA5141-RS232I - Option board for COMx serial communication

1. 2 LEDs for communication state display (TxD and RxD)
2. Allocation of signal name
3. 5-pin terminal block for communication interface

**Intended purpose**
Option board for COMx serial communication TA5141-RS232I is equipped with 1 RS-232 serial interface with handshake.

**Connections**

### Serial interfaces

**NOTICE!**

Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

**TA5142-RS485I - Option board for COMx serial communication**

1. 2 LEDs for communication state display (TxD and RxD)
2. 2 LEDs for termination state display
3. Allocation of signal name
4. 5-pin terminal block for communication interface
Intended purpose
Option board for COMx serial communication TA5142-RS485(I) is equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.

Bus terminations are built-in and configurable.

Connections

Serial interfaces

NOTICE!
Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!
If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

### Bus termination

The line ends of the bus segment must be equipped with bus terminating resistors. These resistors are integrated in the module TA5142-RS485I. The pull-up and pull-down settings must also be made on the circuit board of the module.

1. Termination resistance settings
2. Pull-up and pull-down settings

---

**TA5142-RS485 - Option board for COMx serial communication**

1. 2 LEDs for communication state display (TxD and RxD)
2. 2 LEDs for termination state display
3. Allocation of signal name
4. 5-pin terminal block for communication interface

**Intended purpose**

Option board for COMx serial communication TA5142-RS485(I) is equipped with 1 RS-485 (2-wire half-duplex) serial interface which can be used for communication via Modbus RTU or CAA SerialCom.

Bus terminations are built-in and configurable.
Connections

Serial interfaces

NOTICE!
Damage to the serial communication interface by using 5-pin terminal block of the TA5101-4DI!

If the 5-pin terminal block of the TA5101-4DI option board is plugged into a option board for COMx serial communication TA5141-RS232I, TA5142-RS485I or TA5142-RS485, the communication interface will be damaged by the 24 V.

Please do not confuse the 5-pin terminal block of the TA5101-4DI with the 5-pin terminal block for serial communication interface of TA5141-RS232I, TA5142-RS485I or TA5142-RS485.

### 1.6.3.3.2 AC500 (standard)

**PM56xx-2ETH for AC500 V3 products**

Processor modules with onboard interfaces:

- PM5630-2ETH: processor module, memory 8 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5650-2ETH: processor module, memory 80 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5670-2ETH: processor module, memory 160 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- PM5675-2ETH: processor module, 160 MB, 8 GB flash disk, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- XC version for use in extreme ambient conditions available
Short description

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.
### Table 446: Comparison: TB56xx

</tbody>
</table>

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1). *Chapter 1.6.3.2.1.3 “Technical data” on page 2437*

All other V3 processor modules can operate multiple communication modules via their communication module interface.

The communication modules are mounted on the left side of the processor module on the same terminal base.

On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.

Each processor module can be used as:
- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 V DC.
WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

Connections

All terminals for connection are available on the terminal base. For information on connection and available interfaces see the descriptions for

- Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430.

Processor modules PM56xx-2ETH can only be used with TB56xx-2ETH terminal bases.

Table 447: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

¹) PM567x must have an index ≥ C0.

Storage elements
Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. Chapter 1.6.5.1.4.2 “AC500 battery” on page 3479
The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery Chapter 1.6.3.8.2.4 “TA521 - Battery” on page 3324.

**Memory card**  AC500 processor modules are supplied without memory card. It must be ordered separately. The memory card can be used
● to read and write user files
● to download a user program
● for firmware updates

Detailed information can be found in the system technology chapter. Chapter 1.6.5.1.2 “System processing” on page 3463

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards.

Only genuine MC502 memory cards are supported.

For more information on the technical data, handling instructions and the insertion/replacement of the memory card, please refer to the chapter memory card MC502. Chapter 1.6.3.8.2.1 “MC502 - Memory card” on page 3311

**LEDs, display and function keys on the front panel**
Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding is described in the system technology section Chapter 1.6.5.1.6 “LEDs, display and function keys on the front panel” on page 3486.

Technical data

The system data of AC500 and S500 are applicable to the standard version. Chapter 1.6.4.6.1 “System data AC500” on page 3398

The system data of AC500-XC are applicable to the XC version. Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

| 1SAP 180 100 R0001 | MC502, memory card |
AC500 communication modules are required for

- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.

A separate voltage source is not required.
WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- Chapter 1.6.3.2.1 “TB56xx for AC500 V3 products” on page 2430

There are no restrictions concerning which communication modules can be arranged for a processor module.

Within the AC500 control system, the communication modules can be used as
- bus master or
- slave.

It depends on the
- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:
- CMxyz-ETH: Ethernet
- CMxyz-DP: PROFIBUS
- CMxyz-PNIO: PROFINET
- CMxyz-ETHCAT: EtherCAT
- CMxyz-CN: CANopen
- CMxyz-RCOM: RCOM/RCOM+ protocol (and 2 serial interfaces)
- CMxyz-RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Purpose

Communication module CM598-CN enables communication over the CANopen field bus. For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN. Support of CANopen protocol is in preparation.
Connections

Field bus interface

<table>
<thead>
<tr>
<th>Interface socket</th>
<th>5-pin COMBICON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission standard</td>
<td>ISO 11898, potential-free</td>
</tr>
<tr>
<td>Transmission protocol</td>
<td>CANopen (CAN), 1 Mbaud max.</td>
</tr>
<tr>
<td>Transfer rate (transmission rate)</td>
<td>10 kbit/s, 20 kbit/s, 50 kbit/s, 100 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s,</td>
</tr>
</tbody>
</table>

The CANopen connector has the following pin assignment:

<table>
<thead>
<tr>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>PIN</th>
<th>Signal Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CAN_GND CAN reference potential</td>
</tr>
<tr>
<td>2</td>
<td>CAN_L Bus line, receive/transmit line, LOW</td>
</tr>
<tr>
<td>3</td>
<td>CAN_SHLD Shield of the bus line</td>
</tr>
<tr>
<td>4</td>
<td>CAN_H Bus line, receive/transmit line, HIGH</td>
</tr>
<tr>
<td>5</td>
<td>NC Not connected</td>
</tr>
</tbody>
</table>

**NOTICE!**

Unused connector!

Make sure that the terminal block is always connected to the terminal base or communication module, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>
<td>50 m</td>
</tr>
<tr>
<td>500 kbit/s</td>
<td>100 m</td>
</tr>
<tr>
<td>250 kbit/s</td>
<td>250 m</td>
</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:
<table>
<thead>
<tr>
<th>Length of segment [m]</th>
<th>Bus cable (shielded, twisted pair)</th>

**Bus terminating resistors**

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

1.6.3.4.4 EtherCAT
CM579-ETHCAT - EtherCAT master

Intended purpose
Communication module CM579-ETHCAT is for EtherCAT communication. The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

Connections
Field bus interfaces
The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.

1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

In corrosive environment, please protect unused connectors using the TA535 accessory.

Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.
State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

1.6.3.4.5 PROFINET

CM579-PNIO - PROFINET IO RT controller

- PROFINET IO controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available
The communication module is for PROFINET RT communication. The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved on a non-volatile Flash EPROM memory.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

1.6.3.5 Terminal units (AC500 standard)

**Hot swap**

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

**Hot swap**

Further information about hot swap: Chapter 1.6.5.1.8 “Hot swap” on page 3523.

1.6.3.5.1 TU507-ETH and TU508-ETH for Ethernet communication interface modules

- TU507-ETH, Ethernet terminal unit, 24 V DC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 V DC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 V DC, spring terminals, XC version
1 I/O bus (10 pins, female) to connect the first terminal unit
2a Plug (2x 25 pins) to connect the inserted Ethernet communication interface module
2b Plug (3x 19 pins) to connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 2 RJ45 interfaces with indication LEDs for connection with the Ethernet network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.

The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e.g. CI501-PNIO).
Extreme conditions

Terminal units for use in extreme ambient conditions have no sign for XC version.
The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

**Terminals**

<table>
<thead>

<td></td>
</tr>
<tr>
<td>1.8</td>
<td></td>
</tr>
<tr>
<td>1.9</td>
<td></td>
</tr>
</tbody>
</table>

For information about wiring specifications see the description of the terminal units Chapter 1.6.4.6.4.3 “Terminals at the terminal unit” on page 3417.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

For information about mechanical dimensions, please refer to the Mechanical dimensions S500 chapter Chapter 1.6.4.6.2.3 “Mechanical dimensions S500” on page 3406.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage \(UP = +24\) V DC

Terminal 3.8: Process supply voltage \(UP3 = +24\) V DC

Terminals 1.9, 2.9 and 3.9: Process supply voltage \(ZP = 0\) V

The assignment of the other terminals is dependent on the inserted communication interface module.
Notice!
Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.
Protect unused connectors and slots with TA535 protective caps for XC devices. % Chapter 1.6.3.8.3.4 “TA535 - Protective caps for XC devices” on page 3333

Technical data

The system data of AC500 and S500 % Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC % Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

- TU542, I/O terminal unit, 24 V DC, spring terminals
- TU542-XC, I/O terminal unit, 24 V DC, spring terminals, XC version
- TU542-H, I/O terminal unit, hot swap, 24 V DC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 V DC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.
1 I/O bus (10 pins, male) to connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2 I/O bus (10 pins, female) to connect other terminal units
3a Plug (2 x 25 pins) to connect the inserted I/O modules
3b Plug (2 x 19 pins) to connect the inserted I/O modules
4 With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
5 Holes for screw mounting
6 40 terminals for signals and process supply voltage
7 DIN rail
8 White border signifies hot swap capability of the terminal unit

**Hot swap**

⚠️ **WARNING!**

**Risk of explosion or fire in hazardous environments during hot swapping!**

Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/
    protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits
    engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed
or inserted during operation.

H = Hot swap

Hot swap
System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the
  appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

Hot swap is not supported by AC500-eCo V3 CPU!
The index of the module is in the right corner of the label.

NOTICE!
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

<table>

7 DIN rail
8 White border signifies hot swap capability of the terminal unit

The input/output modules (I/O modules) plug into the I/O terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115-230 V AC inputs and/or 230 V AC relay outputs.

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
**WARNING!**

**Electric shock due to negligent behavior during hot swapping!**

To avoid electric shock

- make sure the following conditions apply:
  - Digital outputs are not under load.
  - Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  - Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  - Never touch exposed contacts (dangerous voltages).
  - Stay away from electrical contacts to avoid arc discharge.
  - Do not operate a mechanical installation improperly.

**NOTICE!**

**Risk of damage to I/O modules!**

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**Hot swap is not supported by AC500-eCo V3 CPU!**
The index of the module is in the right corner of the label.

NOTICE!
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage \( UP = +24 \text{ V DC} \)
- Terminals 1.9 to 4.9: process supply voltage \( ZP = 0 \text{ V} \)

The assignment of the other terminals depends on the inserted communication interface module (see the description of the respective module used).

The supply voltage of 24 V DC for the module's circuitry comes from the I/O expansion bus (I/O bus).

**Technical data**

The system data of AC500 and S500 \( \subseteq \) Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC \( \subseteq \) Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
1.6.3.6 I/O modules

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

**Hot swap**

Further information about hot swap: Chapter 1.6.5.1.8 "Hot swap" on page 3523.

1.6.3.6.1 Digital I/O modules

S500-eCo

DC561 - Digital input/output module

- 16 configurable digital inputs/outputs 24 V DC,
- Connection via Interfast
- Module-wise galvanically isolated
Intended purpose

The digital I/O module DC561 can be connected to the following devices via the I/O bus connector:

- S500 communication interface modules (e.g. CI501-PNIO, CI541-DP, CI581-CN)
- AC500 CPUs
- other AC500 I/O modules

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

The module contains 16 digital channels in 1 group, each channel can be used as a digital 24 V DC input or 24 V DC output.
The inputs/outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs/outputs.

Functionality

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter % Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is established out by using the 20-pin Interfast connector. For further information, refer to the Interfast documentation.

The assignment of the terminals:

</tbody>
</table>

The arrow located next to the Interfast connector marks terminal 1.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

If DC561 with index A0 is used, the process supply voltage must stem from the same source as the power supply voltage of the CPU. The index consists of 1 letter, followed by 1 digit, and can be found on the type plate of the module next to the type designator "DC561".
The module provides several diagnosis functions \( \text{\textcopyright} \) Chapter 1.6.3.6.1.1.6 "Diagnosis" on page 2574.

The meaning of the LEDs is described in the section State LEDs \( \text{\textcopyright} \) Chapter 1.6.3.6.1.1.7 "State LEDs" on page 2574.

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

\[ \text{If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.} \]

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

<tr>
<th>Part no.</th>
<th>Description</th>
<th>Product life cycle phase *)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1TNE 968 902 R2001</td>
<td>DC561, digital input/output module, 16 configurable inputs/outputs, transistor output, interfast connector</td>
<td>Classic</td>
</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DC562 - Digital input/output module**

- 16 configurable digital inputs/outputs in 1 group, 24 V DC
- Module-wise galvanically isolated
The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs/outputs are group-wise galvanically isolated from each other. All other circuitry of the module is galvanically isolated from the inputs/outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.
### Functionality

<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 V DC)</td>
</tr>
</tbody>
</table>

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter "AC500-eCo" on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
### Table 468: Assignment of the terminals:

<td>ZP</td>
<td>Process voltage ZP 0 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DC652.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

The following figure shows the connection of the digital input/output module DC562:

In this connection example, the inputs/outputs C0...C7 are connected as inputs and the inputs/outputs C8...C15 are connected as outputs.

The module provides several diagnosis functions \( \text{Chapter 1.6.3.6.1.1.2.6 “Diagnosis” on page 2584.} \)

The meaning of the LEDs is described in the section State LEDs \( \text{Chapter 1.6.3.6.1.1.2.7 “State LEDs” on page 2584.} \)
I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
</tbody>
</table>

1) In AC500 the following interface identifier applies:

14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.

The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:

31 = Module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:

- Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
- Channel error: I/O bus or PNIO = module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
DI561 - Digital input module

- 8 digital inputs 24 V DC / 24 V AC (I0 to I7) in 1 group
- Module-wise galvanically isolated

1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI561.

An external power supply connection is not needed.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

Risk of malfunctions in the plant!

- A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital input module DI561:
The module provides several diagnosis functions “Chapter 1.6.3.6.1.1.3.6 “Diagnosis” on page 2592.”

The meaning of the LEDs is described in the section “State LEDs “Chapter 1.6.3.6.1.1.3.7 “State LEDs” on page 2593.”

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

<table>
<thead>
<tr>
<th>LED</th>
<th>State</th>
<th>Color</th>
<th>LED = OFF</th>
<th>LED = ON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inputs I0...I7</td>
<td>Digital</td>
<td>Yellow</td>
<td>Input is OFF</td>
<td>Input is ON</td>
</tr>
</tbody>
</table>

In the undefined signal range, the state LED for the inputs can be ON although the input state detected by the module is OFF.

Technical data

The System Data of AC500-eCo apply to Chapter 1.6.4.5.1 “System data AC500-eCo V3” on page 3352.

Only additional details are therefore documented below.

<table>

</table>
1 I/O bus  
2 16 yellow LEDs to display the signal states of the inputs I0 to I15  
3 Terminal number  
4 Allocation of signal name  
5 Terminal block for input signals (9-pin)  
6 Terminal block for input signals (11-pin)  
7 2 holes for wall-mounting with screws  
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

</tbody>
</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter % Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

```
    C0..7 1
     |   |

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI562.

An external power supply connection is not needed.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \( \text{Chapter 1.6.3.6.1.4.6 "Diagnosis" on page 2600.} \)

The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the connection of the digital input module DI562:
The meaning of the LEDs is described in section State LEDs in Chapter 1.6.3.6.1.4.7 “State LEDs” on page 2600.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

### State LEDs

20 | --- | Reserved

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI571.

An external power supply connection is not needed.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**WARNING!**
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the digital input module DI571:
NOTICE!

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions "Chapter 1.6.3.6.1.1.5.7 “Diagnosis” on page 2609."

The meaning of the LEDs is described in the section State LEDs "Chapter 1.6.3.6.1.1.5.8 “State LEDs” on page 2609."
Internal data exchange

**Module error**

| 3 | 14 | 1...10 | 31 | 31 | 19 | Checksum error in the I/O module | Replace I/O module |
| 11 / 12 ADR | 1...10 |

| 3 | 14 | 1...10 | 31 | 31 | 43 | Internal error in the module | Replace I/O module |
| 11 / 12 ADR | 1...10 |

| 3 | 14 | 1...10 | 31 | 31 | 9 | Overflow diagnosis buffer | Restart |
| 11 / 12 ADR | 1...10 |

| 3 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 ADR | 1...10 |

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e. g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### DI572 - Digital input module
- 16 digital inputs 100-240 V AC (I0 to I15) in 2 groups
- Module-wise galvanically isolated
1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 to I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*
### Functionality

</tr>
</tbody>
</table>

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter % Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DI572.

An external power supply connection is not needed.

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.
NOTICE!
Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions ⇧ Chapter 1.6.3.6.1.1.6.6 “Diagnosis” on page 2618.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1...10 = decentralized communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

**DO561 - Digital output module**

- 8 digital outputs 24 V DC (O0 to O7) in 1 group
- Module-wise galvanically isolated
1  I/O bus
2  8 yellow LEDs to display the signal states of the outputs O0 to O7
3  Terminal number
4  Allocation of signal name
5  Terminal block for output signals (11-pin)
6  2 holes for wall-mounting with screws
7  DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

```

</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

---

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the digital output module DO561:
**NOTICE!**
**Risk of malfunctions in the plant!**
The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

**NOTICE!**
**Risk of damaging the I/O module!**
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis & Chapter 1.6.3.6.1.1.7.6 “Diagnosis” on page 2625).
The meaning of the LEDs is described in the section State LEDs & Chapter 1.6.3.6.1.1.7.7 “State LEDs” on page 2626.

**I/O configuration**
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

DO562 - Digital output module

- 16 digital outputs 24 V DC (O0 to O15) in 1 group
- Module-wise galvanically isolated

1. I/O bus
2. 16 yellow LEDs to display the signal states of the outputs O0 to O15
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (9-pin)
6. Terminal block for output signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
Table 473: Assignment of the terminals:

</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

### WARNING!
**Removal/Insertion under power**
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

- Make sure that all voltage sources (supply and process voltage) are switched off before you
  - connect or disconnect any signal or terminal block
  - remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

- Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!
**Risk of damaging the PLC modules!**
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 μs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis “Chapter 1.6.3.6.1.1.8.6 “Diagnosis” on page 2635).
The meaning of the LEDs is described in the section Status LEDs “Chapter 1.6.3.6.1.1.8.7 “State LEDs” on page 2635.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation depends on the master:
   Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DO571 - Digital output module

- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100-240 V AC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise galvanically isolated
1. I/O bus
2. 8 yellow LEDs to display the signal states of the outputs O0 to O7
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (11-pin)
6. 2 holes for wall-mounting with screws
7. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

<tr>
<td>20</td>
<td>L+</td>
<td>Process voltage L+ +24 V DC</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZN of the CPU/communication interface module increases by 5 mA per DO571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/communication interface module and the DO571 must have a common power supply.

---

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

---

**WARNING!**

For screw terminals only: Danger of death by electric shock!

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

---

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..3 and R4..7) does not exceed 8 A.

Never connect total currents > 8 A per group.

If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:

*Fig. 105: Connection of 24 V DC actuators*
**NOTICE!**

**Risk of damaging the I/O module!**

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

---

**Fig. 106: Connection of 24 V AC or 100-240 V AC actuators**

**Fig. 107: Power supply - the negative connection is realized via the I/O bus**
The L+ connection of the DO571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

The module provides several diagnosis functions (see Diagnosis Chapter 1.6.3.6.1.1.9.6 “Diagnosis” on page 2645).

The meaning of the LEDs is described in the section Status LEDs Chapter 1.6.3.6.1.1.9.7 “State LEDs” on page 2646.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

#### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module
   1...10, ADR = Hardware address (e.g. of the DC551-CS31)
3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1..10 = expansion 1..10

4) In case of module errors, with channel "31 = Module itself" is output.

### DO572 - Digital output module
- 8 digital triac outputs (O0 to O7) in 8 groups
- 240 V AC
- Module-wise galvanically isolated
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

</table>
The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DO572. An external power supply connection is not needed.

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the module:

![Diagram of PLC module connections](image)
NOTICE!
Risk of damaging the PLC modules!
The PLC modules will be irreparably damaged if a voltage > 240 V is connected.
Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions (see chapter Diagnosis \(\Rightarrow\) Chapter 1.6.3.6.1.1.10.6 “Diagnosis” on page 2655).
The meaning of the LEDs is described in the section State LEDs \(\Rightarrow\) Chapter 1.6.3.6.1.1.10.7 “State LEDs” on page 2656.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Module error

| 3 | 14 | 1...10 | 31 | 31 | 19 | Checksum error in the I/O module | Replace I/O module |
| 11 / 12 | ADR | 1...10 |
| 3 | 14 | 1...10 | 31 | 31 | 43 | Internal error in the module | Replace I/O module |
| 11 / 12 | ADR | 1...10 |
| 3 | 14 | 1...10 | 31 | 31 | 9 | Overflow diagnosis buffer | Restart |
| 11 / 12 | ADR | 1...10 |
| 4 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 | ADR | 1...10 |

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DO573 - Digital output module

- 16 digital normally open relay outputs 24 V DC or 100-240 V AC (NO0 to NO15) in 2 groups, 2 A max.
- Group-wise galvanically isolated

1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are group-wise galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the outputs.

\[
\text{The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.}
\]

Functionality

Connections

\[
\text{For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter \& Chapter 1.6.4.5 “AC500-eCo” on page 3352.}
\]

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
Table 476: Assignment of the terminals:

</tbody>
</table>
Terminal | Signal | Description
--- | --- | ---
15 | NO13 | Normally-open contact of the output NO13
16 | NO14 | Normally-open contact of the output NO14
17 | NO15 | Normally-open contact of the output NO15
18 | R8..15 | Output common for signals NO8 to NO15
19 | L+ | Process voltage L+ (24 V DC)
20 | M | Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DO573.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/communication interface module.

**WARNING!**
**Risk of death by electric shock!**
Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:

**WARNING!**
**For screw terminals only: Danger of death by electric shock!**
The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

**WARNING!**
**Removal/Insertion under power**
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0..7 and R8..15) does not exceed 10 A.
Never connect total currents > 10 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The following figure shows the connection of the module:
Fig. 108: Connection of 24 V DC actuators
Fig. 109: Connection of 100-240 V AC actuators

The module provides several diagnosis functions (see section Diagnosis ⇨ Chapter 1.6.3.6.1.1.11.6 “Diagnosis” on page 2666).

The meaning of the LEDs is described in the section State LEDs ⇨ Chapter 1.6.3.6.1.1.10.7 “State LEDs” on page 2656.
The L+ connection of the DO573 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500 the following interface identifier applies:
   - I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = Module itself, 1...10 = decentralized communication interface module 1...10,
   - ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DX561 - Digital input/output module

- 8 digital inputs 24 V DC (I0 to I7) in 1 group
- 8 digital transistor outputs 24 V DC (O0 to O7) in 1 group
- Group-wise galvanically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs O0 to O7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

**Functionality**

<table>

</tr>
</tbody>
</table>

**Connections**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
### Table 477: Assignment of the terminals:

```
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 V DC) and ZP (0 V DC) terminals.

### WARNING!
#### Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

### NOTICE!
#### Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

### NOTICE!
#### Risk of malfunctions in the plant!

A ground fault, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.
The following figure shows the connection of the inputs to the digital input/output module DX561:

**Fig. 111: Connection of inputs - sink inputs**

The following figure shows the connection of the outputs to the module:

**Fig. 112: Connection of inputs - source inputs**
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see chapter Diagnosis Chapter 1.6.3.6.1.12.6 “Diagnosis” on page 2678).
The meaning of the LEDs is described in the Displays section Chapter 1.6.3.6.1.12.7 “State LEDs” on page 2679 chapter.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or communication interface module) during power-up of
the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

DX571 - Digital input/output module

- 8 digital inputs 24 V DC / 24 V AC (I0 to I7) in 1 group
- 8 digital normally open relay outputs 24 V DC / 24 V AC or 100-240 V AC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise galvanically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs NO0 to NO7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs and outputs are group-wise galvanically isolated from each other.

All other circuitry of the module is galvanically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

### Functionality

<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminal L+ (process voltage 24 V DC). The negative pole is provided by the I/O bus.</td>
</tr>
</tbody>
</table>

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter % Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
Table 478: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per DX571.

The external power supply connection is carried out via the L+ (+24 V DC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/communication interface module and the DX571 must have a common power supply.

---

### WARNING!

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

### NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules can be damaged by overload.
Make sure that the total current of each output common terminal (R0..3 and R4..7) does not exceed 8 A.
Never connect total currents > 8 A per group.
If the group fuse protection is not sufficient, then individual fuse protection of the outputs should be used.

The module provides several diagnosis functions (see Diagnosis “Chapter 1.6.3.6.1.1.13.6 "Diagnosis" on page 2691).
The digital inputs can be used as source inputs or as sink inputs.

NOTICE!
Risk of malfunctions in the plant!
A ground fault, e.g. caused by a damaged cable insulation, can bridge switches accidentally.
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figures show the connection of the inputs to the digital input/output module DX571:

Fig. 114: Connection of inputs - sink inputs
Fig. 115: Connection of inputs - source inputs

The following figures show the connection of the outputs to the module:

Fig. 116: Connection of 24 V DC actuators
The L+ connection of the DX571 and the 24 V supply of the CPU/communication interface module must be connected to the same 24 V power supply.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

For screw-type terminals only:
WARNING!
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section Chapter 1.6.3.6.1.13.7 “State LEDs” on page 2692.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = Module itself,
1...10 = decentralized communication interface module 1...10,
ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

State LEDs

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
S500
DC522 - Digital input/output module

- 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Digital configurable input/output unit.

- 2 sensor supply voltages 24 V DC, 0.5 A, with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 V DC (C0 to C15) in 1 group (2.0...2.7 and 4.0...4.7), each of which can be used
  - as an input,
  - as a transistor output with short-circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</table>

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

### Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process voltage ZP = 0 V DC
1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Switchgear cabinet earth

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.3</td>
<td>+24 V</td>
<td>4 x sensor power supply sources (loadable with 0.5 A in total)</td>
</tr>
<tr>
<td>1.4 to 1.7</td>
<td>0 V</td>
<td>0 V (reference potential)</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>C0 to C7</td>
<td>8 digital inputs/outputs</td>
</tr>
<tr>
<td>3.0 to 3.3</td>
<td>+24 V</td>
<td>4 x sensor power supply sources (loadable with 0.5 A in total)</td>
</tr>
<tr>
<td>3.4 to 3.7</td>
<td>0 V</td>
<td>0 V (reference potential)</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C8 to C15</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>
CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "I/O modules" on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC522.
Connect a 470 Ω / 1 W resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions "S500 I/O modules diagnosis" on page 4065.
### Internal data exchange

<table>

<td>8</td>
</tr>
</tbody>
</table>

### I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

### Parameterization

**Firmware version**

<table>
<thead>
<tr>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) With CS31 and addresses smaller than 70 and FBP, the value is increased by 1
2) Not with FBP
3) For a description of the counter operating modes, please refer to the 'Fast Counter' section page 277 on page 2776
4) With FBP or CS31 without the parameter Fast Counter

GSD file:

```plaintext
Ext_User_Prm_Data.Len = 9
Ext_User_Prm_Data.Const(0) = 0x04, 0xc5, 0x06, \n                           0x01, 0x02, 0x01, 0x00, 0x00, 0x00;
```

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
**Technical data**

The system data of AC500 and S500 \(\$Chapter\ 1.6.4.6.1\ “System\ data\ AC500”\ on\ page\ 3398\) are applicable to the standard version.

The system data of AC500-XC \(\$Chapter\ 1.6.4.7.1\ “System\ data\ AC500-XC”\ on\ page\ 3450\) are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

24 V DC with short-circuit and overload protection

Loadability  
Terminals 1.0...1.3, in total max. 0.5 A  
Terminals 3.0...3.3, in total max. 0.5 A

Weight (without terminal unit)  
Ca. 125 g

Mounting position  
Horizontal  
Or vertical with derating (output load reduced to 50 % at 40 °C per group)

Cooling  
The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

### NOTICE!

**Attention:**  
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the configurable digital inputs/outputs**

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

<table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DC523 - Digital input/output module

- 24 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Digital configurable input/output unit.

- 1 sensor supply voltage 24 V DC, 0.5 A, with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 V DC (C0 to C23) in 1 group (2.0...2.7, 3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

NOTICE!

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

### Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module.
Terminals 1.8 to 4.8: process voltage UP = +24 V DC
Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>

</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C16 to C23</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

---

**CAUTION!**

The process supply voltage must be included in the grounding concept (e.g., grounding of the negative pole).

---

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

---

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "I/O modules" on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

**NOTICE!**

**Risk of influences to the connected sensors!**

Some sensors may be influenced by the deactivated module outputs of DC523.

Connect a 470 Ω / 1 W resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.
The modules provide several diagnosis functions \( \triangleright \) Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065.

### I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

> If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

The system data of AC500 and S500 \(\approx\) Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC \(\approx\) Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**NOTICE!**

**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

*Multiple overloads*

*No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.*

**Technical data of the configurable digital inputs/outputs**

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DC532 - Digital input/output module

- 16 digital inputs 24 V DC, 16 configurable digital inputs/outputs
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the digital inputs (I0 - I15)
4 16 yellow LEDs to display the signal states at the digital inputs/outputs (C16 - C31)
5 1 green LED to display the state of the process supply voltage UP
6 4 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
*:* Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Digital configurable input / output unit.

- 16 digital inputs 24 V DC in 2 groups (1.0...1.7 and 2.0...2.7)
- 16 digital configurable inputs/outputs 24 V DC (C16 to C31) in 1 group (3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The device is plugged on a terminal unit % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter % Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.
Connections

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC
Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 switchgear cabinet earth

The assignment of the other terminals:

</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C24 to C31</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

**CAUTION!**

The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DC532.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter © Chapter 1.6.3.6 “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
NOTICE!
Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DC532. Connect a 470 Ω / 1 W resistor in series to inputs C24/C25 if using them as fast counter inputs to avoid any influences.

The module provides several diagnosis functions. See Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065.

Internal data exchange

</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>

### NOTICE!

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DI524 - Digital input module

- 32 digital inputs 24 V DC in 4 groups (1.0...1.7, 2.0...2.7, 3.0...3.7 and 4.0...4.7)
- Fast counter
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1  I/O bus

2  Allocation between terminal number and signal name
32 yellow LEDs to display the signal states at the digital inputs (I0 - I31)
1 green LED to display the state of the process supply voltage UP
4 red LEDs to display errors
Label
Terminal unit
DIN rail
\*\*: Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g., wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast counter</td>
<td>Integrated, many configurable operating modes (only with AC500)</td>
</tr>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via the I/O bus interface (I/O bus)</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 V DC)</td>

<tr>
<td>Required terminal units</td>
<td>TU515 or TU516 * Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553</td>
</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit \* Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 \* Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter \* Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC
Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

Table 479: Assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>I0 to I7</td>

<td>8 digital inputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>I24 to I31</td>
<td>8 digital inputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "Chapter 1.6.3.6 "I/O modules" on page 2569. The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
1 I/O bus
2 switchgear cabinet earth

CAUTION!
The process supply voltage must be included in the grounding concept (e.g.
grounding of the negative pole).

The module provides several diagnosis functions ⇐ Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DO524 - Digital output module

- 32 digital outputs 24 V DC / 0.5 A in 4 groups (1.0...4.7) with short circuit and overload protection
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 32 yellow LEDs to display the signal states at the digital outputs (O0 - O31)
4 1 green LED to display the state of the process supply voltage UP
5 4 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels.
### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via the I/O bus interface (I/O bus)</td>

<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 V DC)</td>
</tr>
<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516  Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit  Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526  Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

#### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter  Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>O0 to O7</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>O8 to O15</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>3.0 to 3.7</td>
<td>O16 to O23</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O24 to O31</td>
<td>8 digital outputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO524.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:

The module provides several diagnosis functions “S500 I/O modules diagnosis” on page 4065.

</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

**NOTICE!**

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tr>
</tbody>
</table>

The output module is plugged on the terminal unit TU542. Properly position the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 \( \$ \) *Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329*).

Connections

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter \( \$ \) *Chapter 1.6.4.6 “AC500 (Standard)” on page 3398*.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 2.8 and 1.9 to 2.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

<table>
<thead>
<tr>
<th>Terminals 1.8 to 2.8:</th>
<th>Process voltage UP = +24 V DC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminals 1.9 to 2.9:</td>
<td>Process voltage ZP = 0 V</td>
</tr>
<tr>
<td>Terminal 3.8:</td>
<td>Process voltage UP3 = +24 V DC</td>
</tr>
<tr>
<td>Terminal 3.9:</td>
<td>Process voltage ZP3 = 0 V</td>
</tr>
<tr>
<td>Terminal 4.8:</td>
<td>Process voltage UP4 = +24 V DC</td>
</tr>
<tr>
<td>Terminal 4.9:</td>
<td>Process voltage ZP4 = 0 V</td>
</tr>
</tbody>
</table>

<table>
<thead>

<th>Terminals 3.0, 3.1, 3.4, 3.5</th>
<th>O0 to O3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminals 4.0, 4.1, 4.4, 4.5</td>
<td>O4 to O7</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DO526.

The external power supply connection is carried out via the UP, UP3, UP4 (+24 V DC) and the ZP, ZP3, ZP4 (0 V DC) terminals.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:
1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input; Connected with ZP (load) -> Output
3 Switchgear cabinet earth

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

The module provides several diagnosis functions ⇩ Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

- If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions ≥ 1.2.3.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### NOTICE!

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply and continuous overvoltage up to 30 V DC.

No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

**DX522 - Digital input/output module**

- 8 digital inputs 24 V DC, module-wise galvanically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4 8 yellow LEDs to display the signal states at the digital relay outputs (R0 - R7)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
\[
\text{Sign for XC version}
\]

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input/output unit.
- 8 digital inputs 24 V DC in 1 group (1.0...1.7)
- 8 digital relay outputs with one change-over contact each (R0...R7). All output channels are galvanically isolated from each other.
- Fast counter
The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>

<td>TU531 or TU532 © Chapter 1.6.3.5.4 &quot;TU531 and TU532 for I/O modules&quot; on page 2562</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit © Chapter 1.6.3.5.4 "TU531 and TU532 for I/O modules" on page 2562. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 © Chapter 1.6.3.8.2.6 "TA526 - Wall mounting accessory" on page 3329).

### Connections

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module. Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

*For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter © Chapter 1.6.4.6 "AC500 (Standard)" on page 3398.*

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units. The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V DC
Table 480: Assignment of the other terminals:

<table>
<thead>
<tr>

</tr>
<tr>
<td>4.7</td>
<td>NC 7</td>
<td>Normally-closed contact of the eighth relay output</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter © Chapter 1.6.3.6 "I/O modules" on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions (see Diagnosis and State LEDs © Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065).

The following figure shows the connection of the digital input/output module DX522.
Fig. 120: Connection of the module

1  I/O bus
2  Switchgear cabinet earth

**NOTICE!**
- If the relay outputs have to switch inductive DC loads, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive AC loads, spark suppressors are required.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).
**NOTICE!**

**Risk of damaging the PLC module!**

The following has to be considered when connecting input and output voltages to the module:

- All 230 V AC feeds must be single-phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 8 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

---

**NOTICE!**

**Risk of damaging the PLC module!**

There is no internal short-circuit or overload protection for the relay outputs.

Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

---

**Internal data exchange**

### Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a
- FBP interface module
- CS31 bus module
- CANopen communication interface module

### Parameter | Value
--- | ---
Output switching capacity (XC version above 60 °C) | On request
Lifetime (cycles) | Mechanical: 300 000; Under load: 300 000 (24 V DC at 2 A), 200 000 (120 V AC at 2 A), 100 000 (230 V AC at 3 A)
Spark suppression with inductive AC load | Must be performed externally according to driven load specifications
Demagnetization with inductive DC load | A free-wheeling diode must be circuited in parallel to the inductive load
Switching frequency | With resistive load: Max. 10 Hz
| With inductive load: Max. 2 Hz
| With lamp load: On request
Max. cable length | Shielded: 1000 m
| Unshielded: 600 m

### Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a
- FBP interface module
- CS31 bus module
- CANopen communication interface module

### Parameter | Value
--- | ---
Used inputs | I0 / I1
Used outputs | None
Counting frequency | 50 kHz max.
Detailed description | See Chapter 1.6.5.1.12 “Fast counters” on page 3570

</tbody>
</table>
*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

DX531 - Digital input/output module

- 8 digital inputs 120/230 V AC
- 4 relay outputs with one change-over contacts each
- Module-wise galvanically isolated

1. I/O bus
2. Allocation between terminal number and signal name
3. 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4. 4 yellow LEDs to display the signal states at the digital relay outputs (R0 - R3)
5. 1 green LED to display the state of the process supply voltage UP
6. 2 red LEDs to display errors
7. Label
8. Terminal unit
9. DIN rail

* Sign for XC version
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Digital configurable input / output unit.
- 8 digital inputs 120/230 V AC in 1 group (2.0...2.3 and 3.0...3.3)
- 4 digital relay outputs with one change-over contact each (R0...R3). All output channels are galvanically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 V DC.

All available inputs/outputs are galvanically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>
<tr>

<td>TU531 or TU532. Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit. Chapter 1.6.3.5.4 “TU531 and TU532 for I/O modules” on page 2562. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526. Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

Connections

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.6.4.6 "AC500 (Standard)" on page 3398.

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 V DC

The assignment of the other terminals:

</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DX531. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter 

Chapter 1.6.3.6 "I/O modules" on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the connection of the module:

![Connection diagram](image)

1 I/O bus
2 Switchgear cabinet earth

NOTICE!
- If the relay outputs have to switch inductive **DC loads**, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive **AC loads**, spark suppressors are required.
**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

**NOTICE!**
Risk of damaging the PLC module!
The following has to be considered when connecting input and output voltages to the module:
- All 230 V AC feeds must be single phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 V AC and 3-phase loads are not allowed.
- The 4 change-over contacts of the relays are galvanically isolated from channel to channel. This allows to connect loads of 24 V DC and 230 V AC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
- All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 V AC max., not for 400 V AC, not even between two input terminals.
- All neutral conductor connections must be common to the same supply system, since the terminals 4.0 to 4.3 are interconnected within the module. Otherwise, accidental energization could occur.

**NOTICE!**
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

The module provides several diagnosis functions (see chapter Diagnosis and State LEDs in Chapter 1.7.3.3 “S500 I/O modules diagnosis” on page 4065).

### Internal data exchange

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>1</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>1</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>0</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
</tr>
</tbody>
</table>

### I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

### Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Fast counter

More information can be found in the Automation Builder chapter, "Fast counters in AC500 devices".

☞ Chapter 1.6.5.1.12 “Fast counters” on page 3570

### 1.6.3.6.2 Analog I/O modules

**S500-eCo**

**AI561 - Analog input module**

- 4 configurable analog inputs (I0 to I3) in 1 group
- Resolution: 11 bits plus sign or 12 bits
1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.

All other circuitry of the module is not galvanically isolated from the inputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.
Functionality

4 analog inputs, individually configurable for
- Not used (default setting)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 10 mA per A1561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

**NOTICE!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ⇐ Chapter 1.6.3.6.2.1.1.6 “Diagnosis” on page 2783.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.
CAUTION!
Risk of damaging the analog input!
The 250 Ω input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the connection of analog sensors (voltage) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

Connection of active-type analog sensors (voltage)
Connection of passive-type analog sensors (voltage)

The following figures are an example of the connection of analog sensors (current) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

Connection of active-type analog sensors (current)
Connection of passive-type analog sensors (current)

The meaning of the LEDs is described in the Displays section Chapter 1.6.3.6.2.1.1.7 “State LEDs” on page 2784.

I/O configuration

The analog input module AI561 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)
3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1..10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### AI562 - Analog input module

- 2 configurable analog resistance temperature detector (RTD) inputs (I0 and I1) in 1 group
- Resolution: 15 bits plus sign
1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.
All other circuitry of the module is galvanically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.*
Functionality

2 analog RTD-inputs, individually configurable for
- Not used (default)
- Pt100, -50 °C...+400 °C, 2-wire
- Pt100, -50 °C...+400 °C, 3-wire
- Pt1000, -50 °C...+400 °C, 2-wire
- Pt1000, -50 °C...+400 °C, 3-wire
- Ni1000, -50 °C...+150 °C, 2-wire
- Ni1000, -50 °C...+150 °C, 3-wire
- Ni100, -50 °C...+150 °C, 2-wire
- Analog input resistance 0 Ω...150 Ω
- Analog input resistance 0 Ω...300 Ω

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter “AC500-eCo” on page 3352.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

<table>
<thead>

<td>ZP</td>
<td>Process voltage ZP (0 V DC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 5 mA per A1562.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
Notice!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

Notice!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \(\checkmark\) Chapter 1.6.3.6.2.1.2.6 “Diagnosis” on page 2793.

The following figures show the connection of RTDs to the inputs of the analog input module AI562.

With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.

The meaning of the LEDs is described in the Displays section \(\checkmark\) Chapter 1.6.3.6.2.1.2.7 “State LEDs” on page 2794.

I/O configuration
The analog input module AI562 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

**Diagnosis**

- **AN000...063**
- **AC500 display**
- **← Display in**
- **PS501 PLC Browser**
- **PNIO diagnosis block**
- **Check input value**
- **Check input value or terminal**
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

### Parameter | Value
--- | ---
Galvanic isolation | Against internal power supply and other modules
Input ranges | Pt100, Pt1000, Ni100, Ni1000
150 Ω, 300 Ω
Indication of the input signals | No
Module update time | All channels: < 1 s
Channel input resistance | > 100 kΩ
Input filter attenuation | -3 dB at 3.6 kHz
Conversion error of the analog values caused by non-linearity, adjustment error at factory and resolution within the normal range | Typ. Depending on RTD max. ±0.6 % of full scale (guaranteed for 3-wires connection only) at 25 °C
Max. ±2 % of full scale (guaranteed for 3-wires connection only) at 0 °C...60 °C or EMC disturbances
Measuring range | % Chapter 1.6.3.6.2.1.2.8 “Measuring ranges” on page 2794
Analog to digital conversion time | Typ. 140 ms per channel
Unused inputs | Can be left open and should be configured as "unused"
Input data length | 4 bytes
Power dissipation inside the sensor (max.) | 1 mW
Suppression of interference | On request
Maximum input voltage | 30 V DC (sense), 5 V DC (source)
Basic error (resistance) | 0.1 % of full-scale
Repeatability | 0.05 % of full-scale
Overvoltage protection | Yes, up to 30 V DC
Wire loop resistance | < 20 Ω
Max. cable length (conductor cross section > 0.14 mm²) | Unshielded wire 10 m
Shielded wire 100 m

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AI563 - Analog input module

- 4 configurable thermocouple (TC) / -80 mV...+80 mV inputs (I0 to I3) in 1 group
- Resolution: 15 bits plus sign

1  I/O bus
2  1 green LED to display power supply, 1 red LED to display error
3  Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are group-wise galvanically isolated from each other.
The other electronic circuitry of the module is galvanically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

Functionality

4 analog TC inputs, individually configurable for
- Not used (default)
- Voltage -80 mV ... + 80 mV
- Thermocouple J-type -210 °C...+1200 °C
- Thermocouple K-type -270 °C...+1372 °C
- Thermocouple R-type -50 °C...+1768 °C
- Thermocouple S-type -50 °C...+1768 °C
- Thermocouple T-type -270 °C...+400 °C
- Thermocouple E-type -270 °C...+1000 °C
- Thermocouple N-type -270 °C...+1300 °C

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter % Chapter 1.6.4.5 “AC500-eCo” on page 3352.
After powering up the system, input channels, which are configured will have undefined values /diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET communication interface module, the firmware version of PROFINET communication interface module must be 1.2 or above.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:

```
I0+  1
I0-  2
I1+  3
I1-  4

<td>ZP</td>
<td>Process voltage ZP (0 V DC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

---

### NOTICE!

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

---

### NOTICE!

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.
**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \( \text{Chapter 1.6.3.6.2.1.3.6 “Diagnosis” on page 2804.} \)

The following figure shows the connection of thermocouples to the inputs of the module:

The meaning of the LEDs is described in Displays \( \text{Chapter 1.6.3.6.2.1.3.7 "State LEDs” on page 2805 chapter.} \)
I/O configuration
The analog input module AI563 does not store configuration data itself.

Parameterization
The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
</tbody>
</table>

**Remarks:**
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

</tbody>
</table>

Measuring ranges

AI563 needs typ. 6 to 8 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During this time, the accuracy of the measurement values is not within specification. After that, valid measurement values are provided by the module. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms, a re-initialization is performed by AI563.

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.
Make sure that the analog signal at the connection terminals is always within the signal range.
When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AO561 - Analog output module

- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bit

1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e. g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The outputs are not galvanically isolated from each other.

The other electronic circuitry of the module is not galvanically isolated from the outputs or from the I/O bus.
The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.

**Functionality**

2 analog outputs, individually configurable for
- Not used (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<table>
<thead>

</tr>
</tbody>
</table>

**Connections**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3352.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog outputs:
The assignment of the terminals:

<table>

<td>M</td>
<td>Process voltage M (0 V DC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AO561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/communication interface module.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \( \text{Chapter 1.6.3.6.2.1.4.6 “Diagnosis” on page 2815.} \)
The following figures show the connection of analog actuators to the analog output module AO561.

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.
I/O configuration

The analog output module AO561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNI0 diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNI0: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNI0 = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

AX561 - Analog input/output module
- 4 configurable analog inputs (I0 to I3) in 1 group
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bits

1  I/O bus
2  1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The inputs are not galvanically isolated from each other.
The outputs are not galvanically isolated from each other.
All other circuitry of the module is not galvanically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA communication interface modules.

**Functionality**

4 analog inputs, individually configurable for
- Not used (default)
- -2.5 V...+2.5 V
- -5 V...+ 5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

2 analog outputs, individually configurable for
- Not used (default)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<table>

</tr>
</tbody>
</table>
**Parameter** | **Value**
--- | ---
Internal supply | Via I/O bus
External supply | Via the terminals L+ (process voltage 24 V DC) and M (0 V DC); the M terminal is connected to the M terminal of the CPU via the I/O bus

**Connections**

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter Chapter 1.6.4.5 “AC500-eCo” on page 3352.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs and outputs:
The assignment of the terminals:

<table>
<thead>
<tr>

</tr>
<tr>
<td>14</td>
<td>O0I+</td>
<td>Current output of channel 0</td>
</tr>
</tbody>
</table>
Terminal | Signal | Description
---|---|---
15 | O1U+ | Voltage output of channel 1
16 | O1I+ | Current output of channel 1
17 | O01- | Negative pole of channels O0 and O1
18 | SG | Shield grounding
19 | L+ | Process voltage L+ (24 V DC)
20 | M | Process voltage M (0 V DC)

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals UP/L+ and ZP/M of the CPU/communication interface module increases by 5 mA per AX561.

The external power supply connection is carried out via the L+ (+24 V DC) and the M (0 V DC) terminals. The M terminal is interconnected to the M/ZP terminal of the CPU/communication interface module.

---

**NOTICE!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

---

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.
The module provides several diagnosis functions \(\varepsilon\) Chapter 1.6.3.6.2.1.5.6 “Diagnosis” on page 2827.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.

![Diagram of AI0](image)

**CAUTION!**

**Risk of damaging the analog input!**

The 250 Ω input resistor can be damaged by overcurrent. Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the connection of analog sensors (voltage) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

![Connection of Analog Sensors (Voltage)](image)

The following figures are an example of the connection of analog sensors (current) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

![Connection of Analog Sensors (Current)](image)
The following figures are an example of the connection of analog actuators to the analog input/output module AX561.

Connection of analog voltage actuators

Connection of analog current actuators

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behavior and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter "Chapter 1.6.3.6.2.1.5.7 "State LEDs" on page 2828.

I/O configuration

The I/O module does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself, 1…10 = expansion module 1…10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1…10 = expansion 1…10
   - Channel error: I/O bus or PNIO = module type (1 = AI, 3 = AO); COM1/COM2: 1…10 = expansion 1…10

4) In case of module errors, with channel "31 = Module itself" is output.

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

## S500

**AC522 - Analog input/output module**

- 8 configurable analog inputs/outputs in one group (2.0...2.7 and 3.0...3.7)
- Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the analog inputs/outputs (C0 - C7)
4 1 green LED to display the state of the process supply voltage UP
5 1 red LED to display errors
6 Label
7 Terminal unit
8 DIN rail
9 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

The configuration is performed by software. The modules are supplied with a process voltage of 24 V DC.

The inputs and outputs are galvanically isolated from all other circuitry of the module.
Functionality

8 analog inputs (I0...I7), individually configurable for
- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for
- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs (O4...O7), individually configurable for
- Unused (default setting)
- -10 V...+10 V

</table>
Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter © Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The modules are plugged on an I/O terminal unit  © Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 © Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>

<td>Unused</td>
</tr>
</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.
For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module. The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the I/O module.
1 4 analog I/O channels
as inputs for 0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/Pt1000/Ni1000
digital signals
as outputs for -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA
2 4 analog I/O channels
as inputs for 0 V...10 V, -10 V...+10 V, 0 mA...20 mA, 4 mA...20 mA, Pt100/Pt1000/Ni1000
digital signals
as outputs for -10 V...+10 V

The process voltage must be included in the grounding concept of the control system (e.g. grounding the negative pole).

By installing equipotential bonding conductors between the different parts of the system, it must be made ensured that the potential difference between ZP and AGND never exceeds 1 V.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.
Pt100 -50 °C...+70 °C 2-wire configuration, one channel used
Pt100 -50 °C...+400 °C 2-wire configuration, one channel used
Pt1000 -50 °C...+400 °C 2-wire configuration, one channel used
Ni1000 -50 °C...+150 °C 2-wire configuration, one channel used

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g., the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g., C1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>3-wire configuration, two channels used</td>

</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

By connecting to AGND the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

2022/01/21
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Measurement Type</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>1</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

![Connection diagram]

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

*If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.*

<table>
<thead>
<tr>
<th>Measurement Type</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V...10 V</td>
<td>1</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as “unused”.
Connection of passive-type analog sensors (Current)

| Current | 4 mA...20 mA | 1 channel used |

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
The negative pole of the sensor must be grounded next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
Digital input 24 V 1 channel used

Effect of incorrect input terminal connection
Wrong or no signal detected, no damage up to 35 V

Connection of analog output loads (Voltage, current)

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current 0</td>
<td>0 mA...20 mA</td>
<td>0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current 4</td>
<td>4 mA...20 mA</td>
<td>0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA). Unused analog outputs can be left open-circuited.
Internal data exchange

<table>
<thead>
<tr>
<th>Analog inputs (words)</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analog outputs (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. The 8 configurable analog channels are defined as inputs or outputs by the configuration, i.e. each of the configurable channels can used as input or output (or re-readable output in case of voltage input/output).

When a channel is used as input, the corresponding output must be configured unused.

When a channel is used as output, the corresponding input must be configured unused.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)
3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### AI523 - Analog input module

- 16 configurable analog inputs (I0 to I15) in 2 groups (1.0...2.7 and 3.0...4.7)
- Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog inputs (I0 - I15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail

**Sign for XC version**

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

**Functionality**

16 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

### Parameter | Value
--- | ---
Resolution of the analog channels | 12 bits plus sign
Voltage -10 V... +10 V | 12 bits
Voltage 0 V...10 V | 12 bits
Current 0 mA...20 mA, 4 mA...20 mA | 12 bits
Temperature | 0.1 °C
LED displays | 19 LEDs for signals and error messages
Internal power supply | Via the I/O bus interface (I/O bus)
External power supply | Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit | TU515 or TU516 [Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553]

**Connections**

The modules are plugged on an I/O terminal unit [Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553]. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 [Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329]).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.6.4.6 “AC500 (Standard)” on page 3398].

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 V DC
- Terminals 1.9 to 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

</table>

**CAUTION!**
The negative poles of the analog inputs are galvanically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also galvanically connected to each other to form an "Analog Ground" signal.

**CAUTION!**
There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

**CAUTION!**
Because of their common reference potential, analog current inputs cannot be circulated in series, neither within the module nor with channels of other modules.

*For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power
Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "Chapter 1.6.3.6 "I/O modules" on page 2569. The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.

– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the connection of the module:
Fig. 122: 16 analog inputs in two groups, individually configurable © Chapter 1.6.3.6.2.2.2.2 “Functionality” on page 2859

**CAUTION!**

By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**

The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

The modules provide several diagnosis functions © Chapter 1.6.3.6.2.2.2.7 “Diagnosis” on page 2874.
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the 8 analog channels.

![Connection example diagram]

*Fig. 123: Connection example*

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100 -50 °C...+70 °C</td>
<td>2-wire configuration, one channel used</td>

<td>2-wire configuration, one channel used</td>
</tr>
<tr>
<td>Ni1000 -50 °C...+150 °C</td>
<td>2-wire configuration, one channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, the return line is necessary only once. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ꟲ Chapter 1.6.3.6.2.2.2.6 “Parameterization” on page 2871

<table>

</tr>
</tbody>
</table>

The function of the LEDs is described under Displays:

- **Chapter 1.6.3.6.2.2.7 “Diagnosis” on page 2874**

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

![Connection Diagram]

0 ... 10 V

Fig. 126: Connection example

Fig. 127: Connection example
CAUTION!
The potential difference between AGND and ZP at the module must not be greater than 1 V, not even in case of long lines.

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

The function of the LEDs is described under Displays

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

Fig. 128: Connection example

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The function of the LEDs is described under Displays.
CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 volt Zener diode (in parallel to I+ and I-). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

CAUTION!
The ground potential at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

**Fig. 129: Connection example**

The negative pole of the sensor must be grounded next to the sensor.
The following measuring ranges can be configured:  

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

![Connection example](Fig. 130: Connection example)

The following operating mode can be configured:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Displays.

**Internal data exchange**

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>16</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
</tr>
</tbody>
</table>
I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

![Note]

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1..10 = expansion module 1..10, ADR = hardware address
   (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1..10 = expansion 1..10
   Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1..10 = expansion 1..10

4) In case of module errors, with channel "31 = Module itself" is output.

**State LEDs**

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

AI531 - Analog input module

- 8 configurable analog inputs (I0 to I7) in 2 groups (1.0...1.7 and 2.0...2.7 as well as 3.0...3.7 and 4.0...4.7)
  Resolution 15 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

1 I/O bus
2 Allocation between terminal number and signal names
3 4 yellow LEDs to display the states at the inputs I0 to I3
4 4 yellow LEDs to display the states at the inputs I4 to I7
5 1 green LED to display the process supply voltage UP
6 2 red LEDs to display errors (CH-ERR2 and CH-ERR4)
7 Label
8 Terminal unit
9 DIN rail
*: Sign for XC version
Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

8 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...5 V, 0 V...10 V
- -50 mV...+50 mV, -500 mV...+500 mV
- -1 V...+1 V, -5 V...+5 V, -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- -20 mA...20 mA
- Pt100, -50 °C...+70 °C or 400 °C (2-, 3- and 4-wire)
- Pt1000, -50 °C...+400 °C (2-, 3- and 4-wire)
- NTC thermistor, -50 °C...+100 °C (2-, 3- and 4-wire)
- Cu50 (1.426): -50 °C...+200 °C (2-, 3- and 4-wire)
- Cu50 (1.428): -200 °C...+200 °C (2-, 3- and 4-wire)
- 0 Ω...50 kΩ
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

</table>

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.
The modules are plugged on an I/O terminal unit Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8, 4.8, 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V

The assignment of the other terminals:

</tr>
</tbody>
</table>

CAUTION!
Analog sensors must be galvanically isolated against the ground. In order to avoid inaccuracy with the measuring results, the analog sensors should also be isolated against the power supply.

The "IxB" clamps (x=0..7) of the analog inputs are galvanically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix- may accept a potential difference up to ±20 V DC with regard to the common reference potential IxB (AGND, ZP). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.
For the open-circuit detection (cut wire), each positive analog input channel \( I_x^+ \) is pulled up to "plus" by a high-resistance resistor and each negative analog input channel \( I_x^- \) is pulled down to "minus" by a resistor. If cut wire occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AI531.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.
Fig. 131: 8 analog inputs in two groups, individually configurable

**CAUTION!**
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

**CAUTION!**
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

The module provides several diagnosis functions

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays

The module linearizes the resistance thermometer characteristics. In order to keep measuring errors as small as possible, it is necessary by all means, to have all the involved conductors in the same cable.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistors in 2-wire configuration

For evaluating resistors, a constant current must flow through them to build the necessary voltage drop. For this, the module AI531 provides a constant current source which is multiplexed over the 4 analog channels.
The following measuring ranges can be configured: 

<table>
<thead>
<tr>
<th>Resistor</th>
<th>50 kΩ</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays: 

Chapter 1.6.3.6.2.3.6 “Parameterization” on page 2899.

In order to avoid error messages from unused analog input channels, it is useful to configure them as “unused”.

**Connection of a resistance measuring bridge with internal supply**

When resistance measuring bridges are connected, the short-circuit-proof voltage output (internal supply) at pin I0A (or I2A, I4A, I6A) must be used. This supply voltage is activated as soon as "Voltage Measurement" is configured for the relevant channel.
All voltage measuring ranges can be configured in Chapter 1.6.3.6.2.3.6 “Parameterization” on page 2899.

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

**Connection of a resistance measuring bridge with external supply**

With the connection of a resistance measuring bridge with external supply, the supply voltage is provided separately.
All voltage measuring ranges can be configured in Chapter 1.6.3.6.2.3.6 “Parameterization” on page 2899.

The calculation of the resistor deviation must be performed via the bridge voltage by the PLC user program.

</tbody>
</table>
For a description of the function of the LEDs, please refer to Diagnosis and displays / displays \(\text{Chapter 1.6.3.6.2.3.7 “Diagnosis” on page 2902.}\)

The module linearizes the thermocouple characteristics. It supports the following possibilities of temperature compensation and handling with cold junctions:

**Internal compensation**

An internal temperature sensor which is located next to the terminal unit is used to detect the temperature of the cold junction. So the compensating cables must be connected directly to the terminal unit, where the cold junction is located.

The setting "Internal compensation (default)" for the parameter "Compensation channel" should be selected.

To get more precise temperature measurements, the use of an external compensation method is recommended.

**External compensation with temperature input**

The temperature for the cold junction can be determined externally.

A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred to the module via the output data word to all required channels. The possible temperature range is from -25 °C to +60 °C and is monitored by the AI531.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with compensation box**

A compensation box balances the temperature difference between the cold junction and the reference temperature by generating a bridge voltage. The reference temperature is transferred via the output data word.

The compensation box must fit to the type of thermocouple and is located at the end of the compensating cables, where the cold junction is located. The cabling to the AI531 can be carried out with normal cables. The operating manual of the compensation box also has to be considered.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with flanking channel**

A flanking channel of the same input group can be used for compensation, e.g. for channel 3, the channels 0, 1 and 2 can be selected as reference channels. The type of sensor for the reference channel can be selected in the parameters for the flanking channel. For example, a RTD sensor which is located next to the thermocouple terminal can be used as reference point for other channels.

The setting "Channel x" for the parameter "Compensation channel" should be selected. Refer to Channel configuration \(\text{Chapter 1.6.3.6.2.3.6 “Parameterization” on page 2899 for possible settings.}\)

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Internal data exchange

<p>| | |</p>

</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

This means that replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500, the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2. The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies: 31 = module itself, 1...10 expansion module 1...10, ADR = hardware address (e.g. of the DC551).

3) With "Module" the following allocation applies dependent of the master: Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

---

### State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

States of the LEDs (see also section Diagnosis LEDs in the S500 system data):

Technical data

The system data of AC500 and S500 ð Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC ð Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

</tr>
</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### AO523 - Analog output module
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog outputs (O0 - O15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9: Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

**Functionality**

- 16 analog outputs in two groups:
  - 8 channels configurable for voltage or current output (O0...O3 / O8...O11)
  - 8 channels for voltage output (O4...O7 / O12...O15)

  Resolution 12 bits plus sign
Parameter | Value
--- | ---
Resolution of the analog channels | 
Voltage -10 V...+10 V | 12 bits plus sign
Current 0 mA...20 mA, 4 mA...20 mA | 12 bits
LED displays | 19 LEDs for signals and error messages
Internal power supply | Through the I/O bus interface (I/O bus)
External power supply | Via the terminals ZP and UP (process voltage 24 V DC)
Required terminal unit | TU515 or TU516

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter "Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The modules are plugged on an I/O terminal unit “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 “TA526 - Wall mounting accessory” on page 3329).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 V DC
Terminals 1.9 to 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>O0- to O7-</td>
<td>Negative poles of the first 8 analog outputs</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>O0+ to O7+</td>
<td>Positive poles of the first 8 analog outputs</td>
</tr>
<tr>
<td>3.0 to 3.7</td>
<td>O8- to O15-</td>

</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O8+ to O15+</td>
<td>Positive poles of the following 8 analog outputs</td>
</tr>
</tbody>
</table>

For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per AO523.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

---

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter (Chapter 1.6.3.6 “I/O modules” on page 2569).

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

---

The following figure shows the connection of the module:
CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

The modules provide several diagnosis functions  Chapter 1.6.3.6.2.2.4.7 “Diagnosis” on page 2922.
Connection of analog output loads (Voltage, current)

Fig. 149: Connection example

The following measuring ranges can be configured (Chapter 1.6.3.6.2.4.6 “Parameterization” on page 2918):

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 and 8...11 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

The function of the LEDs is described under Displays.

Unused analog outputs can be left open-circuited.

Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>

<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>0</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>16</td>
</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.
Parameterization

The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.
AX521 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group (1.0...2.3)
  Resolution 12 bits plus sign
- 4 configurable analog outputs (O0 to O3) in 1 group (3.0...4.3)
  Resolution 12 bits plus sign
- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.
Functionality

AX521 4 analog inputs (I0...I3), individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter § Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.
The modules are plugged on an I/O terminal unit Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an “Analog Ground” signal for the module.

The negative poles of the analog outputs are connected to each other to form an “Analog Ground” signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuitied in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/post communication interface module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

---

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter *Chapter 1.6.3.6 “I/O modules” on page 2569.*

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

**Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.**

**Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.**

---

The following figure shows the connection of the I/O module.
Fig. 150: 4 analog inputs and 4 analog outputs, individually configurable

Chapter 1.6.3.6.2.2.5.2 “Functionality” on page 2928

CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e. g. grounding of the negative pole).

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

Fig. 151: Connection example
<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire, one channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire, one channel used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.

![Connection example diagram](image)

*Fig. 152: Connection example*

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
Pt100  -50 °C...+70 °C  3-wire configuration, two channels used
Pt100  -50 °C...+400 °C  3-wire configuration, two channels used
Pt1000 -50 °C...+400 °C  3-wire configuration, two channels used
Ni1000 -50 °C...+150 °C  3-wire configuration, two channels used

The I/O module performs a linearization of the resistance characteristic.
In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

![Connection Diagram](image)

**Fig. 153: Connection example**

By connecting the sensor’s negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 "Parameterization" on page 2938 and for AX522 "Parameterization" on page 2963:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
### Connection of active-type analog sensors (Current) with galvanically isolated power supply

![Connection Diagram](image)

**Fig. 154: Connection example**

<table>
<thead>
<tr>
<th>Current</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 mA...20 mA</td>
<td>1 channel</td>
<td></td>
</tr>
<tr>
<td>4 mA...20 mA</td>
<td>1 channel</td>
<td></td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.

### Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

![Connection Diagram](image)

**Fig. 155: Connection example**

**CAUTION!**

The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).
If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

![Connection diagram]

Fig. 156: Connection example

| Current       | 4 mA...20 mA          | 1 channel used |

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to \( I^+ \) and \( I^- \)). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).
The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.

---

**Fig. 157: Connection example**

The negative pole of the sensor must be grounded next to the sensor.

**Summary table**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
**Fig. 158: Connection example**

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>

**Connection of analog output loads (Voltage, current)**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address
   (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/C0M2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/C0M2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

## Technical data

The system data of AC500 and S500 "Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC "Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

9 DIN rail
z  Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

**Functionality**

8 analog inputs (I0...I7), individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs (O0...O3), individually configurable for
- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs (O4...O7), individually configurable for
- Unused (default setting)
- -10 V...+10 V

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter `Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The modules are plugged on an I/O terminal unit `Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 `Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).
The connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:
- Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 V DC
- Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V DC

The assignment of the other terminals:

<table>
<thead>
<tr>

</tbody>
</table>

The negative poles of the analog inputs are connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per I/O module.
The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.

**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter [Chapter 1.6.3.6 “I/O modules” on page 2569](#).

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.**

**Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.**

The following figure shows the connection of the I/O module.
CAUTION!
By installing equipotential bonding conductors between the different parts of the system, it must be ensured that the potential difference between ZP and AGND never can exceed 1 V.

CAUTION!
The process supply voltage must be included in the grounding concept (e.g. grounding of the negative pole).

Connection of resistance thermometers in 2-wire configuration
When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.
The I/O module performs a linearization of the resistance characteristic. In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

### Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the galvanically isolated voltage source of the sensor is referred to ZP.
The following measuring ranges can be configured for AX521 (Chapter 1.6.3.6.2.2.5.6 “Parameterization” on page 2938) and for AX522 (Chapter 1.6.3.6.2.2.6.6 “Parameterization” on page 2963):

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V...10 V</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply

![Connection diagram](image)

**Fig. 164: Connection example**

<table>
<thead>
<tr>
<th>Current</th>
<th>Range</th>
<th>Channels Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Unused input channels can be left open-circuited, because they are of low resistance.
Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply

**Fig. 165: Connection example**

![Connection diagram](image)

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

*If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.*

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

![Connection Diagram]

Fig. 166: Connection example

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
The negative pole of the sensor must be grounded next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.
### Digital input

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>

### Connection of analog output loads (Voltage, current)

![Connection example](image)

**Fig. 169: Connection example**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA). Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>8</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

</tbody>
</table>

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

### Technical data

The system data of AC500 and S500 in Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC in Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

<table>

</tbody>
</table>
**Parameter** | **Value**
--- | ---
Max. length of analog cables, conductor cross section > 0.14 mm² | 100 m
Weight | 300 g
Mounting position | Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

**NOTICE!**

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

---

### 1.6.3.6.3 Digital/Analog I/O modules

**S500**

**DA501 - Digital/Analog input/output module**

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  - Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  - Resolution 12 bits plus sign
- Fast counter

- Module-wise galvanically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states of the digital inputs DI0 to DI15
4 4 yellow LEDs to display the signal states of the analog inputs AI0 to AI3
5 2 yellow LEDs to display the signal states of the analog outputs AO0 to AO1
6 8 yellow LEDs to display the signal state of the configurable digital inputs/outputs DC16 to DC23
7 1 green LED to display the state of the process supply voltage UP
8 4 red LEDs to display errors
9 Label
10 Terminal unit
11 DIN rail
\*\* Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 communication interface modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs.

Functionality

- 16 digital inputs 24 V DC
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  Resolution 12 bits plus sign
- Fast counter

Connections

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter % Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The connection is carried out by using the 40 terminals of the terminal unit TU515/TU516 % Chapter 1.6.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2553.

The assignment of the terminals:

</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA501.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
WARNING!
Removal/Insertion under power

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ***). Reserved terminals may carry internal voltages.

NOTICE!
Risk of damaging the PLC modules!

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

CAUTION!
Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.
Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI15 in the same way.

Fig. 171: Connection of the module

The meaning of the LEDs is described in the Displays \(\textit{Chapter 1.6.3.6.3.1.1.8 "State LEDs" on page 2999} \).
Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.

Fig. 172: Connection of configurable digital inputs/outputs to the module

CAUTION!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DA501.
If the inputs are used as fast counter inputs, connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 173: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured \(\text{Chapter 1.6.3.6.3.1.1.6 "Parameterization" on page 2992}:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays \(\text{Chapter 1.6.3.6.3.1.1.8 "State LEDs" on page 2999}.

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured "Chapter 1.6.3.6.3.1.1.6 "Parameterization” on page 2992:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays "Chapter 1.6.3.6.3.1.1.7 "Diagnosis” on page 2996.

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 175: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input Al0. Proceed with the analog inputs Al1 to Al3 in the same way.
Fig. 176: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured in Chapter 1.6.3.6.3.1.6 “Parameterization” on page 2992:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays in Chapter 1.6.3.6.3.1.8 “State LEDs” on page 2999.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 177: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

**CAUTION!**

Risk of faulty measurements!

The negative pole at the sensors must not have too big a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured (Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992):

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter (Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999).

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 178: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured ★ Chapter 1.6.3.6.3.1.1.6 “Parameterization” on page 2992:

| Current | 4 mA...20 mA | 1 channel used |

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter ★ Chapter 1.6.3.6.3.1.1.8 “State LEDs” on page 2999.

**CAUTION!**

Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

---

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

**Fig. 179: Connection of active-type analog sensors (voltage) to differential analog inputs**

The following measuring ranges can be configured "Parameterization" on page 2992:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>

</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

<td>Error LED lights up at errors of error classes E1 and E2, Failsafe mode on *)</td>
</tr>
</tbody>
</table>

Remarks:

1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission

2) Not for FBP

3) With FBP or CS31 without the parameter "Fast Counter"

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

4) For counter operating modes, please refer to the description of the fast counter  Chapter 1.6.3.6.1.2.9 “Fast counter” on page 2776

5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe-mode is ON.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

### Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

</tbody>
</table>
**Remarks:**

1) In AC500, the following interface identifier applies:
   - 14 = I/O bus,  11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself,
   - 1...10 = communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation depending on the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicates the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1

</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) Brightness depends on the value of the analog signal

3) All of the LEDs CH-ERR1 to CH-ERR4 light up together

### Technical data

#### Technical data of the module

The system data of AC500 and S500 © Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.
The system data of AC500-XC \(\Downarrow\) Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version. Only additional details are therefore documented below. The technical data are also applicable to the XC version.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

### Technical data of the digital inputs/outputs if used as outputs

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of channels per module</td>

<td>Terminals of the channels DC16 to DC23</td>
<td>Terminals 4.0 to 4.7</td>
</tr>
</tbody>
</table>
**Parameter** | **Value**
---|---
Reference potential for all outputs | Terminals 1.9...4.9 (negative pole of the supply voltage, signal name ZP)
Common power supply voltage | For all outputs terminals 1.8, 2.8, 3.8 and 4.8 (positive pole of the supply voltage, signal name UP)
Output voltage for signal 1 | UP (-0.8 V)
Output delay (0->1 or 1->0) | On request
Output current |  
  - rated value per channel: 500 mA at UP = 24 V  
  - max. value (all channels together): 4 A
Leakage current with signal 0 | < 0.5 mA
Fuse for UP | 10 A fast
Demagnetization with inductive DC load | Via internal varistors (see figure below this table)
Output switching frequency |  
  - With resistive load: On request  
  - With inductive loads: Max. 0.5 Hz  
  - With lamp loads: 11 Hz max. at 5 W max.
Short-circuit-proof / overload-proof | Yes
Overload message (I > 0.7 A) | Yes, after ca. 100 ms
Output current limitation | Yes, automatic reactivation after short circuit/overload
Resistance to feedback against 24 V signals | Yes (software-controlled supervision)
Max. cable length |  
  - Shielded: 1000 m  
  - Unshielded: 600 m

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

![Fig. 183: Digital input/output (circuit diagram)](image)

1. Digital input/output
2. For demagnetization when inductive loads are turned off
Technical data of the fast counter

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a communication interface module or a CPU). Thus, the current consumption from 24 V DC power supply at the terminals L+/UP and M/ZP of the CPU/communication interface module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 V DC) and the ZP (0 V DC) terminals.
**WARNING!**

**Removal/Insertion under power**

Removal or insertion under power is only permissible under conditions described in Hot Swap chapter "Chapter 1.6.3.6 “I/O modules” on page 2569.

The devices are not designed for removal or insertion under power when Hot Swap conditions do not apply. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove or replace a module.

---

**CAUTION!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.
The module provides several diagnosis functions ° Chapter 1.6.3.6.3.1.2.7 “Diagnosis” on page 3030.

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 to DO15 in the same way.

For a description of the meaning of the LEDs, please refer to the Displays chapter ° Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

Connection of the configurable digital inputs/outputs

The following figure shows the connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.
NOTICE!

Risk of influences to the connected sensors!

Some sensors may be influenced by the deactivated module outputs of DA502. Connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of the meaning of the LEDs, please refer to the Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033 chapter.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 185: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured, as Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026 and Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033:

<table>
<thead>
<tr>
<th>thermocouple</th>
<th>temperature range</th>
<th>configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire config. 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire config. 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire config. 1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays, as Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as “unused”.

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
Fig. 186: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measurement Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire config. 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire config. 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire config. 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 187: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured: Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026 Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 188: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

The following measuring ranges can be configured: Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026, Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

**CAUTION!**
Risk of faulty measurements!

The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured ⇩ Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026 ⇩ Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays ⇩ Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input Al0. Proceed with the analog inputs Al1 to Al3 in the same way.
The following measuring ranges can be configured: *Chapter 1.6.3.6.1.2.6 “Parameterization” on page 3026* *Chapter 1.6.3.6.1.2.9 “Measuring ranges” on page 3033*:

| Current | 4 mA...20 mA | 1 channel used |

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays *Chapter 1.6.3.6.1.2.8 “State LEDs” on page 3033*.

**NOTICE!**

**Risk of overloading the analog input!**

- If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).
- Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

Fig. 191: Connection of active-type analog sensors (voltage) to differential analog inputs

The following measuring ranges can be configured "Parameterization" on page 3026 "Measuring ranges" on page 3033:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays "State LEDs” on page 3033.

To avoid error messages from unused analog input channels, configure them as "unused".

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 192: Use of analog inputs as digital inputs

The following measuring ranges can be configured "Parameterization" on page 3026 "Measuring ranges" on page 3033:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.6.3.6.3.1.2.8 "State LEDs" on page 3033.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
Fig. 193: Connection of analog output loads (voltage)

The following measuring ranges can be configured \( \text{Chapter 1.6.3.6.3.1.2.6 "Parameterization" on page 3026} \) Chapter 1.6.3.6.3.1.2.9 "Measuring ranges" on page 3033:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load ±10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \( \text{Chapter 1.6.3.6.3.1.2.8 "State LEDs" on page 3033.} \)

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured \(^5\) Chapter 1.6.3.6.3.1.2.6 “Parameterization” on page 3026 \(^6\) Chapter 1.6.3.6.3.1.2.9 “Measuring ranges” on page 3033:

<table>
<thead>
<tr>
<th>Current</th>
<th>Load 0 Ω...500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 mA...20 mA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4 mA...20 mA</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays \(^7\) Chapter 1.6.3.6.3.1.2.8 “State LEDs” on page 3033.

Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the fast counter</th>
<th>With the fast counter (only with AC500)</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>9</td>
</tr>
</tbody>
</table>

### I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or communication interface module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Parameterization</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

</tbody>
</table>

#### Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus,  11 = COM1 (e.g. CS31 bus), 12 = COM2.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicate the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1

</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) Brightness depends on the value of the analog signal

3) All of the LEDs CH-ERR1 to CH-ERR4 light up together

### Measuring ranges

### Technical data

#### Technical data of the module

The system data of AC500 and S500 can be found in Chapter 1.6.4.6.1 “System data AC500” on page 3398 and are applicable to the standard version.

The system data of AC500-XC can be found in Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 and are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.
### Technical Data of the Digital Outputs

<table>
<thead>

</tr>
</tbody>
</table>

---

### NOTICE!

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC. **Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.
### Technical data of the configurable digital inputs/outputs

Each of the configurable digital I/O channels can be defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of channels per module</td>

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

1.6.3.7 Communication interface modules (S500)

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules.

Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

**Hot swap**

Further information about hot swap: ¶ Chapter 1.6.5.1.8 “Hot swap” on page 3523.

CI581-CN

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
**Intended purpose**

The CANopen communication interface module CI581-CN is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0...2.3)
- 2 analog outputs (2.5...2.6)
- 8 digital inputs 24 V DC in 1 group (3.0...3.7)
- 8 digital outputs 24 V DC in 1 group (4.0...4.7)
The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**Functionality**

### Connections

The CANopen communication interface module is plugged on the I/O terminal units TU517 or TU518 on page 2559 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
Terminal 4.8: process supply voltage UP3 = +24 V DC
Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

---

**For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter on page 3398.**

---

**With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.**
Do not connect any voltages externally to the digital outputs!

Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This is not the intended use.

CAUTION!
Risk of malfunctions by unintended use!
If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7 and DC0..DC7.

Possibilities of connection
Mounting on terminal units TU509 or TU510

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

Bus terminating resistors

Fig. 196: CANopen interface, bus terminating resistors connected to the line ends
The grounding of the shield should take place at the switchgear. Please refer to Chapter 1.6.4.6.1 “System data AC500” on page 3398.

</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:
In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the switchgear cabinet. Please refer to the AC500 System-Data Chapter 1.6.4.6.1 “System data AC500” on page 3398.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

Connection of CANopen communication interface module CI581-CN:

![Connection Diagram]

Fig. 198: Connection of the communication interface module CI581-CN

The module provides several diagnosis functions Chapter 1.6.3.7.2.2.8 “Diagnosis” on page 3072.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077 and Parameterization Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067.

The meaning of the LEDs is described in the section for the state LEDs Chapter 1.6.3.7.2.2.9 “State LEDs” on page 3075.

**Bus length**

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.
<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>

Connection of the digital inputs

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.

![Connection diagram](image)

Fig. 199: Connection of the digital inputs to the module CI581-CN

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
### Pt100
- 2-wire configuration, 1 channel used

### Pt1000
- 2-wire configuration, 1 channel used

### Ni1000
- 2-wire configuration, 1 channel used

For the measuring ranges that can be configured, please refer to sections Measuring Ranges (Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077) and Parameterization (Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067).

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

---

### Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

![Connection Diagram](image)

**Fig. 202: Connection of resistance thermometers in 3-wire configuration to the analog inputs**

With 3-wire configuration, 2 adjacent analog channels belong together (e.g., the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g., I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.
Pt100 3-wire configuration, 2 channels used
Pt1000 3-wire configuration, 2 channels used
Ni1000 3-wire configuration, 2 channels used

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077 and Parameterization Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067.

The module Ci581-CN performs a linearization of the resistance characteristic.
To avoid error messages, configure unused analog input channels as “unused”.

Connection of active-type analog sensors (Voltage) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection diagram](image)

Fig. 203: Connection of active-type analog sensors (voltage) with galvanically isolated power supply to the analog inputs

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077 and Parameterization Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067.

To avoid error messages, configure unused analog input channels as “unused”.

Connection of active-type analog sensors (Current) with galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 204: Connection of active-type analog sensors (current) with galvanically isolated power supply to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>0...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>1 channel used</td>

</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077 and Parameterization Chapter 1.6.3.7.2.7 “Parameterization” on page 3067.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no galvanically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 205: Connection of active-type sensors (voltage) with no galvanically isolated power supply to the analog inputs

**NOTICE!**

**Risk of faulty measurements!**

The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges & Chapter 1.6.3.7.2.2.10 "Measuring ranges" on page 3077 and Parameterization & Chapter 1.6.3.7.2.2.7 "Parameterization" on page 3067.

To avoid error messages, configure unused analog input channels as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 206: Connection of passive-type analog sensors (current) to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**
Risk of overloading the analog input!
If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely grounded) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
NOTICE!
Risk of faulty measurements!
The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Chapter 1.6.3.7.2.2.10 “Measuring ranges” on page 3077 and Parameterization "Chapter 1.6.3.7.2.2.7 “Parameterization” on page 3067. To avoid error messages, configure unused analog input channels as "unused".

Use of analog inputs as digital inputs
Several (or all) analog inputs can be configured as digital inputs. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 208: Use of analog inputs as digital inputs

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

---

The CANopen communication interface module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch’s value.

---

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</tbody>
</table>

1) The parameter Behavior digital outputs at communcation error is only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected © Chapter 1.6.3.7.2.2.3 “Connections” on page 3050. In this case, the start-up is disabled as long as the external voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
## Diagnosis

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
</table>
| 1           | Diagnosis byte, slot number        | 31 = CI581-CN (e.g. error at integrated 8 DI / 8 DO)  
1 = 1st connected S500 I/O module  
...  
10 = 10th connected S500 I/O module |
| 2           | Diagnosis byte, module number      | According to the I/O bus specification passed on by modules to the fieldbus master |
| 3           | Diagnosis byte, channel            | According to the I/O bus specification passed on by modules to the fieldbus master |
| 4           | Diagnosis byte, error code         | According to the I/O bus specification  
Bit 7 and bit 6, coded error class  
0 = E1  
1 = E2  
2 = E3  
3 = E4  
Bit 0 to bit 5, coded error description |
| 5           | Diagnosis byte, flags              | According to the I/O bus specification  
Bit 7: 1 = coming error  
Bit 6: 1 = leaving error |

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

| 4 | - | 31 | 3 | 0..1 | 7  | Analog value underflow at an analog output | Check output value |

Remarks:
In AC500, the following interface identifier applies:

```
"-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
```

The identifier is not contained in the CI541-DP diagnosis block.

With "Device" the following allocation applies: 31 = module itself; 1..10 = decentralized communication interface module

With "Module" the following allocation applies:

31 = module itself

Channel error: module type (1 = AI, 2 = DO, 3 = AO)

This message appears if external voltages at one or more terminals DO0..DO7 cause other digital outputs to be fed by that voltage (voltage feedback, description in 'Connections' % Chapter 1.6.3.7.2.2.3 “Connections” on page 3050). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0..DO7 has overrun the process supply voltage UP3 (description in 'Connections' % Chapter 1.6.3.7.2.2.3 “Connections” on page 3050). Diagnosis message appears for the whole module.

This message appears if the output of a channel DO0..DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

---

### State LEDs

The state LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Technical data**

The system data of AC500 and S500 ⊗ Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC ⊗ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

---

**Multiple overloads**

*No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.*

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

CI582-CN

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise galvanically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1. I/O bus
2. Allocation between terminal number and signal name
3. 8 yellow LEDs to display the signal states of the configurable digital inputs/outputs (DC0 - DC7)
4. 8 yellow LEDs to display the signal states of the digital inputs (DI8 - DI15)
5. 8 yellow LEDs to display the signal states of the digital outputs (DO8 - DO15)
6. 2 green LEDs to display the supply voltage UP and UP3
7. 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8. 5 System LEDs: PWR/RUN, CN-RUN, CN-ERR, S-ERR, I/O-Bus
9. Label
10. 2 rotary switches for setting the CANopen node ID
Intended purpose

The CANopen communication interface module CI582-CN is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</tr>
<tr>
<td></td>
<td>8 configurable digital inputs/outputs (24 V DC, 0.5 A max.)</td>
</tr>
</tbody>
</table>

### Connections

The CANopen communication interface module is plugged on the I/O terminal units TU517
See Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559 or TU518
See Chapter 1.6.3.5.3 “TU517 and TU518 for communication interface modules” on page 2559 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:
- Terminals 2.8 and 3.8: process supply voltage UP = +24 V DC
- Terminal 4.8: process supply voltage UP3 = +24 V DC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

---

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter See Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

### Possibilities of connection

### Bus terminating resistors

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

</tr>
<tr>
<td>1.9</td>
<td>CAN-GND</td>
<td>Ground potential of the CAN bus</td>
</tr>
</tbody>
</table>

At the line ends of a bus segment, terminating resistors must be connected. If TU517 or TU518 is used, the bus terminating resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external terminating resistors are required, see figure below).

The following figures show the different connection options for the CANopen communication interface module:
In the case of TU517/TU518, the terminating resistors are not located inside the TU but inside the communication interface module CI581-CN. Hence, when removing the device from the TU, the bus terminating resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The grounding of the shield should take place at the switchgear cabinet. Please refer to the AC500 System-Data Chapter 1.6.4.6.1 “System data AC500” on page 3398.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Connection of CANopen communication interface module CI582-CN:

![Connection diagram](attachment:connection_diagram.png)

**Fig. 214: Connection of the communication interface module CI582-CN**

For a description of the meaning of the LEDs, please refer to the section for the state LEDs ⇨ Chapter 1.6.3.7.2.3.9 “State LEDs” on page 3101.
**Bus length**

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

> The CANopen communication interface module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

> The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch’s value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

<td>BYTE</td>
<td>Off</td>
</tr>
<tr>
<td>outputs</td>
<td>On</td>
<td>1</td>
<td></td>
<td>0x00</td>
</tr>
</tbody>
</table>

Remarks:

1) The parameter Behavior DO at comm. error is applied to DC and DO channels and only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears if external voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see 'Connections' Chapter 1.6.3.7.2.3.3 "Connections" on page 3087). The according diagnosis message "Voltage overflow on outputs" can be disabled by setting the parameters to "OFF". This parameter should only be disabled in exceptional cases as voltage overflow may produce reverse voltage.

### Diagnosis

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis byte, slot number</td>
<td>31 = CI582-CN (e. g. error at integrated 8 DI / 8 DO)</td>
</tr>
<tr>

### Remarks:

1) In AC500, the following interface identifier applies:
   
   "-" = Diagnosis via bus-specific function blocks; 0 … 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
   
   The identifier is not contained in the CI542-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = module itself, 1..10 = expansion module

3) With "Module" the following allocation applies depending on the master:
   Module error: 31 = module itself
   Channel error: module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears if external voltages at one or more terminals DC0..DC7 or DO0..DO7 cause other digital outputs to be supplied by that voltage (voltage feedback, see ‘Connections’ § Chapter 1.6.3.7.2.3.3 "Connections" on page 3087). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.
The voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see ‘Connections’ Chapter 1.6.3.7.2.3.3 “Connections” on page 3087). A diagnosis message appears for the whole module.

This message appears if the output of a channel DC0..DC7 or DO0..DO7 should be switched on while an external voltage is connected. In this case the start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

### State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

#### States of the 5 system LEDs

### Technical data

The system data of AC500 and S500 \( \text{Chapter 1.6.4.6.1 "System data AC500" on page 3398} \) are applicable to the standard version.

The system data of AC500-XC \( \text{Chapter 1.6.4.7.1 "System data AC500-XC" on page 3450} \) are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Fig. 218: Digital input/output (circuit diagram)**

| 1 | Digital output |
| 2 | Varistors for demagnetization when inductive loads are turned off |

**Technical data of the configurable digital inputs/outputs**

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

Parameter | Value
---|---
Number of channels per module | 8 inputs/outputs (with transistors)
Distribution of the channels into groups | 1 group for 8 channels
If the channels are used as inputs | Channels DC0...DC07
| Terminals 2.0...2.7
If the channels are used as outputs | Channels DC0...DC07
| Terminals 2.0...2.7
Indication of the input/output signals | 1 yellow LED per channel, the LED is ON when the input/output signal is high (signal 1)
Galvanic isolation | From the CANopen network
Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *) (see also Extended Cam Switch Library)
- Module-wise galvanically isolated - Expandability with up to 10 S500 I/O Modules *)

*) Applicable for device index C0 and above.
Intended purpose

The EtherCAT communication interface module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
● 8 digital outputs 24 V DC in 1 group (3.0...3.7)
● Cam switch functionality

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

</table>

### Connections

The Ethernet communication interface module CI511-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter \(\text{\&} \) Chapter 1.6.4.6 "AC500 (Standard)" on page 3398.

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage \(\text{UP} = +24 \text{ V DC}\)
Terminal 3.8: Process supply voltage \(\text{UP3} = +24 \text{ V DC}\)
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

**WARNING!**
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**CAUTION!**

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the ground potential or the supply voltage.

**CAUTION!**

Because of their common reference potential, analog current inputs cannot be circuitted in series, neither within the module nor with channels of other modules.
For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Analog signals are always laid in shielded cables. The cable shields are grounded at both ends of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the connection of the Ethernet communication interface module CI511-ETHCAT.

**Fig. 220: Connection of the communication interface module CI511-ETHCAT**

1. 4 analog inputs, configurable for 0...10 V, -10...+10 V, 0/4...20 mA, Pt100/Pt1000, Ni1000 and digital signals
2. 2 analog outputs, configurable for -10...+10 V, 0/4...20 mA
3. 8 digital inputs 24 V DC
4. 8 digital outputs 24 V DC, 0.5 A max.

In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.
2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.
**NOTICE!**
Risk of faulty measurements!
The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

**CAUTION!**
The process supply voltage must be included within the grounding concept of the plant (e.g. grounding of the negative pole).

The module provide several diagnosis functions “Diagnosis” on page 3127.
The measuring ranges are described in the section Measuring Ranges “Parameterization” on page 3121 “Measuring ranges” on page 3130.
The function of the LEDs is described in the section State LEDs “Diagnosis” on page 3127.

**Connection of resistance thermometers in 2-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration.

![Fig. 221: Connection of resistance thermometers in 2-wire configuration](image)

1 Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel
### Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration.

![Connection of resistance thermometers in 3-wire configuration](image)

**Fig. 222: Connection of resistance thermometers in 3-wire configuration**

1. Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2. Twisted pair within the cable
3. Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).
The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>

</tr>
</tbody>
</table>

The measuring ranges are described in the section Measuring Ranges "Parameterization" on page 3121 and Chapter 1.6.3.7.3.1.10 "Measuring ranges" on page 3130.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

### Connection of active-type analog sensors (Voltage) with galvanically isolated power supply

The following figure shows the connection of active-type analog sensors (voltage) with galvanically isolated power supply.

![Connection diagram](image)

Fig. 223: Connection of active-type analog sensors (voltage) with galvanically isolated power supply

1. 1 analog sensor requires 1 channel
2. By connecting to AI-, the galvanically isolated voltage source of the sensor is referred to ZP
3. Galvanically isolated power supply for the analog sensor
Voltage | 0...10 V | 1 channel used
---|---|---
Voltage | -10 V...+10 V | 1 channel used

The measuring ranges are described in the section Measuring Ranges “Parameterization” on page 3121 “Measuring ranges” on page 3130.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Connection of active-type analog sensors (Current) with galvanically isolated power supply**

The following figure shows the connection of active-type analog sensors (current) with galvanically isolated power supply.

![Connection diagram](image)

*Fig. 224: Connection of active-type analog sensors (current) with galvanically isolated power supply*

1. 1 analog sensor requires 1 channel
2. Galvanically isolated power supply for the analog sensor

| Current | 0...20 mA | 1 channel used |
---|---|---|
| Current | 4...20 mA | 1 channel used |

The measuring ranges are described in the section Measuring Ranges “Parameterization” on page 3121 “Measuring ranges” on page 3130.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) with no galvanically isolated power supply**

The following figure shows the connection of active-type sensors (voltage) with no galvanically isolated power supply.
Fig. 225: Connection of active-type sensors (voltage) with no galvanically isolated power supply

1. Analog sensor requires 1 channel
2. Power supply not galvanically isolated
3. The connection between the negative pole of the sensor and ZP has to be performed
4. Long cable

**NOTICE!**

Risk of faulty measurements!
- The negative pole/ground potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range).
- Make sure that the potential difference never exceeds ± 1 V.

<table>

<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

The measuring ranges are described in the section Measuring Ranges © Chapter 1.6.3.7.3.1.7 "Parameterization" on page 3121 © Chapter 1.6.3.7.3.1.10 "Measuring ranges" on page 3130.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of passive-type analog sensors (Current)

The following figure shows the connection of passive-type analog sensors (current).
**Fig. 226: Connection of passive-type analog sensors (current)**

1. 1 analog sensor requires 1 channel

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The measuring ranges are described in the section Measuring Ranges "Parameterization" on page 3121 and Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3116 "Measuring ranges” on page 3130.

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10-volt zener diode (in parallel to I+ and I-). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely grounded).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid ground loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
Important: The ground potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

The following figure shows the connection of active-type analog sensors (voltage) to differential inputs.

![Connection diagram](image)

**Fig. 227: Connection of active-type analog sensors (voltage) to differential inputs**

1. 1 analog sensor requires 2 channels

</table>

The measuring ranges are described in the section Measuring Ranges Chapter 1.6.3.7.3.1.7 “Parameterization” on page 3121 Chapter 1.6.3.7.3.1.10 “Measuring ranges” on page 3130.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital input. The inputs are not galvanically isolated against the other analog channels.

The following figure shows the use of analog inputs as digital inputs.
1. Use of analog inputs as digital inputs

### Addressing

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself. The analog I/O channels are configured via software.

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

¹) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.

²) camType parameters and the Extended Camswitch Library are only available for CI511-ETHCAT and CI512-ETHCAT with device index C0 and above.

</tbody>
</table>

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.
Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

#### Remarks:

1) In AC500 the following interface identifier applies:

- "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

   The identifier is not contained in the CI511-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:

   31 = Module itself or ADR = Hardware address (e. g. of the DC551)
With "Module" the following allocation applies dependent of the master:

31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

Diagnosis message appears per channel. The message occurs if the output channel is not active.

### State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 @ Chapter 1.6.4.6.1 “System data AC500” on page 3398 are applicable to the standard version.

The system data of AC500-XC @ Chapter 1.6.4.7.1 “System data AC500-XC” on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.

The technical data are also applicable to the XC version.

### Parameter Value

- **Process supply voltage UP/UP3**
- **Rated value** 24 V DC (for inputs and outputs)
- **Max. load for the terminals** 10 A
- **Protection against reversed voltage** Yes
- **Rated protection fuse on UP/UP3** 10 A fast
- **Galvanic isolation** Ethernet interface against the rest of the module
- **Inrush current from UP (at power up)** On request
- **Current consumption via UP (normal operation)** 0.2 A
- **Current consumption via UP3** 0.06 A + 0.5 A max. per output
- **Connections** Terminals 1.8 and 2.8 for +24 V (UP)
  - Terminal 3.8 for +24 V (UP3)
  - Terminals 1.9, 2.9 and 3.9 for 0 V (ZP)
- **Max. power dissipation within the module** 6 W
- **Number of digital inputs** 8
- **Number of digital outputs** 8
- **Number of analog inputs** 4
- **Number of analog outputs** 2
Parameter | Value
--- | ---
Reference potential for all digital inputs and outputs | Negative pole of the supply voltage, signal name ZP
Diagnosis | See Diagnosis and Displays ‘Chapter 1.6.3.7.3.1.8 “Diagnosis” on page 3127"
Operation and error displays | 32 LEDs (totally)
Weight (without terminal unit) | ca. 125 g
Mounting position | Horizontal
Or vertical with derating (output load reduced to 50 % at 40 °C per group)
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

**NOTICE!**
**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

**Multiple overloads**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the digital inputs**

</tbody>
</table>

*) Modules in lifecycle Classic are available from stock but not recommended for planning and commissioning of new installations.

### CI512-ETHCAT

- 8 digital inputs 24 V DC
- 8 digital outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Cam switch functionality (see also Extended Cam Switch Library)
- Extended Cam switch functionality *)
  (see also Extended Cam Switch Library)
- Module-wise galvanically isolated
- Expandability with up to 10 S500 I/O modules *)

*) Applicable for device index C0 and above.
Intended purpose

The EtherCAT communication interface module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)
- Cam switch functionality
The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

</tr>
</tbody>
</table>

### Connections

The Ethernet communication interface module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly chapter ∘ Chapter 1.6.4.5 “AC500-eCo” on page 3352.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
- Terminal 3.8: Process supply voltage UP3 = +24 V DC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V
With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figures show the connection of the Ethernet communication interface module CI512-ETHCAT.
In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.
2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

CAUTION!
The process supply voltage must be included within the grounding concept of the plant (e.g. grounding of the negative pole).

The module provides several diagnosis functions in Chapter 1.6.3.7.3.2.9 “Diagnosis” on page 3147.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.
Pin assignment

</tbody>
</table>

In corrosive environment, please protect unused connectors using the TA535 accessory.
Not supplied with this device.

For further information regarding wiring and cable types see chapter Ethernet Chapter 1.6.4.6.4.7 “Ethernet connection details” on page 3424.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):
At the EtherCAT slaves (communication interface modules), the ETH1-connect- nector is IN and the ETH2-connector is OUT.
At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

Addressing

The Ethernet communication interface module CI512-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI512-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

Remarks:

¹) The parameter numOfUsedCams defines the interrupt cycle time (Therefore, it takes effect to the accuracy of the track) and the behavior of the module if the DC information is lost.

<table>

</tbody>
</table>

²) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

³) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

⁴) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.
Channel parameters for the cam switch (max. 32x)

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Internal value</th>
<th>Internal value, type</th>

<tr>
<td>camToTrack31</td>
<td>Digital Output 0 ... 15, none</td>
<td>0 ... 15, FF</td>
<td>BYTE</td>
<td>FF</td>
</tr>
</tbody>
</table>

1) The value of the parameter camToTrack# defines which DO (digital output) is assigned to the track. camToTrack0 = 3 for example means that track 0 is assigned to the digital output 3. If the value FFh is set to a track, no digital output is assigned to it.

1) camType additionally to camToTrack identifies the type of each cam switch and enables the use of a specific function block from the Extended Cam Switch Library.

2) camType parameters and the Extended Camswitch Library are only available for CI511-ETHCAT and CI512-ETHCAT with device index C0 and above.

### Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules perform reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

**Channel error digital**

| 4     | -         | 31     | 2      | 0..15   | 46               | Voltage feedback on deactivated digital output | Check terminals |
|       |           |        |        |         |                  | ⁵) | |
| 4     | -         | 31     | 4      | 0..7    | 47               | Short circuit at digital output | Check terminals |
| 4     | -         | 31     | 2      | 8..15   | 47               | Short circuit at digital output | Check terminals |

Remarks:

1) In AC500 the following interface identifier applies:
   "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
   The identifier is not contained in the CI512-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:
   31 = Module itself or ADR = Hardware address (e. g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

4) Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

5) Diagnosis message appears per channel. The message occurs if the output channel is not active.
State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

The system data of AC500 and S500 "System data AC500" on page 3398 are applicable to the standard version.

The system data of AC500-XC "System data AC500-XC" on page 3450 are applicable to the XC version.

Only additional details are therefore documented below.
The technical data are also applicable to the XC version.

</tbody>
</table>
NOTICE!
Attention:
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 V DC.

Multiple overloads
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Figure:
Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

13 DIN rail  
**Sign for XC version**
Intended purpose

The Modbus TCP communication interface module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The communication interface module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are galvanically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

</table>

Connections

The Ethernet communication interface module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH % Chapter 1.6.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2549. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.6.3.8.2.6 “TA526 - Wall mounting accessory” on page 3329).

The connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.6.4.6 “AC500 (Standard)” on page 3398.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 V DC
Terminal 3.8: Process supply voltage UP3 = +24 V DC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

---

**Do not connect any voltages externally to digital outputs!**

**Reason:** Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

---

**CAUTION!**

**Risk of malfunction by unintended usage!**

If the function cut-off of the digital outputs is to be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7.

---

**WARNING!**

**Removal/Insertion under power**
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations on the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
Generally, analog signals must be laid in shielded cables. The cable shields must be grounded at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the connection of the Ethernet communication interface module CI521-MODTCP.

![Connection diagram of CI521-MODTCP](image)

**Fig. 234: Connection of the communication interface module CI521-MODTCP**

Further information is provided in the System Technology chapter Chapter 1.6.5.3.1 “Modbus communication interface module” on page 3603.

**Connection of the digital inputs**

The following figure shows the connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.
Fig. 235: Connection of the digital inputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays Chapter 1.6.3.7.4.1.8.2 “State LEDs” on page 3187.

Connection of the digital outputs

The following figure shows the connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
Connection of resistance thermometers in 2-wire configuration to the analog inputs
