Safety instructions

Contents of this chapter

This chapter contains the safety instructions which you must obey when you install, operate and do maintenance on the safety functions of a drive.

Use of warnings and notes

Warnings tell you about conditions which can cause injury or death, or damage to the equipment. They also tell you how to prevent the danger. Notes draw attention to a particular condition or fact, or give information on a subject.

The manual uses these warning symbols:

- **WARNING!**
  - Electricity warning tells about hazards from electricity which can cause injury or death, or damage to the equipment.

- **WARNING!**
  - General warning tells about conditions other than those caused by electricity, which can cause injury or death, or damage to the equipment.

- **WARNING!**
  - Electrostatic sensitive devices warning tells you about the risk of electrostatic discharge which can cause damage to the equipment.
Instructions for functional safety circuits

This manual does not contain the complete safety instructions of the drive. It only includes the instructions related to the scope of this manual.

Only a qualified electrical professional who has sufficient knowledge about functional, machine, and process safety is permitted to install, start up and maintain the safety circuit. All user-made changes are on the user's responsibility.

---

**WARNING!**
The safety function described in this manual does not isolate the main or auxiliary circuits from the power supply. Before you do work on the drive, or its main or auxiliary circuits, do the steps in section *Electrical safety precautions (page 9).*

---

**WARNING!**
(With permanent magnet or synchronous reluctance [SynRM] motors only)
In case of a multiple IGBT power semiconductor failure, the drive system can produce an alignment torque which maximally rotates the motor shaft by $180/p$ (with permanent magnet motors) or $180/2p$ (with synchronous reluctance [SynRM] motors) degrees regardless of the activation of the Safe torque off function. $p$ denotes the number of pole pairs.

---

**WARNING!**
Do the validation test of the safety function at the start-up and also after you make changes to the safety circuit.

---

**WARNING!**
Make sure that the functional safety of the machine is maintained in situations where the safety option does not provide protection, for example, during commissioning, system maintenance, fault tracing, or decommissioning.

---

**WARNING!**
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.
Electrical safety precautions

These electrical safety precautions are for all personnel who do work on the drive, motor cable or motor.

**WARNING!**
Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

If you are not a qualified electrical professional, do not do installation or maintenance work.

Do these steps before you begin any installation or maintenance work.

1. Clearly identify the work location and equipment.

2. Disconnect all possible voltage sources. Make sure that re-connection is not possible.
   Lock out and tag out.
   - Open the main disconnecting device of the drive.
   - Open the charging switch if present.
   - Open the disconnector of the supply transformer. (The main disconnecting device in the drive cabinet does not disconnect the voltage from the AC input power busbars of the drive cabinet.)
   - If the drive is equipped with a DC/DC converter unit (optional) or a DC feeder unit (optional): Open the DC switch-disconnector ([Q11], option +F286 or +F290) of the unit. Open the disconnecting device of the energy storage connected to the unit (outside the drive cabinet).
   - Open the auxiliary voltage switch-disconnector (if present), and all other possible disconnecting devices that isolate the drive from dangerous voltage sources.
   - In the liquid cooling unit (if present), open the switch-disconnector of the cooling pumps.
   - If you have a permanent magnet motor connected to the drive, disconnect the motor from the drive with a safety switch or by other means.
   - Disconnect all dangerous external voltages from the control circuits.
   - After you disconnect power from the drive, always wait 5 minutes to let the intermediate circuit capacitors discharge before you continue.

3. Protect any other energized parts in the work location against contact.

4. Take special precautions when close to bare conductors.

5. Measure that the installation is de-energized. Use a quality voltage tester. If the measurement requires removal or disassembly of shrouding or other cabinet structures, obey the local laws and regulations applicable to live working (including – but not limited to – electric shock and arc protection).
   - Before and after measuring the installation, verify the operation of the voltage tester on a known voltage source.
   - Make sure that the voltage between the drive input power terminals (L1, L2, L3) and the grounding (PE) busbar is zero.
   - Make sure that the voltage between the drive output terminals (T1/U, T2/V, T3/W) and the grounding (PE) busbar is zero.
Important! Repeat the measurement also with the DC voltage setting of the tester. Measure between each phase and ground. There is a risk of dangerous DC voltage charging due to leakage capacitances of the motor circuit. This voltage can remain charged for a long time after the drive power-off. The measurement discharges the voltage.

- Make sure that the voltage between the drive DC terminals (UDC+ and UDC-) and the grounding (PE) terminal is zero. In cabinet-built drives, measure between the drive DC busbars (+ and -) and the grounding (PE) busbar.

**WARNING!**
The busbars inside the cabinet of liquid-cooled drives are partially coated. Measurements made through the coating are potentially unreliable, so only measure at uncoated portions. Note that the coating does not constitute a safe or touch-proof insulation.

6. Install temporary grounding as required by the local regulations.

7. Ask for a permit to work from the person in control of the electrical installation work.
Introduction to the manual

Contents of this chapter
This chapter describes the manual in short and gives some general information for the reader. This chapter also contains a quick reference guide for implementing a safety system.

Applicability
This manual is applicable to ACS880 air-cooled and liquid-cooled multidrives which have the option: Prevention of unexpected start-up (option +Q957).

This manual shows the default design of the safety circuit ordered with option code +Q957. The actual design can be different from the default design because of customer-defined modifications. Always refer to the documentation delivered with the drive.

Target audience
This manual is intended for people who install, commission, use and service the safety function. Read the manual before working on the unit. You are expected to know the fundamentals of electricity, wiring, electrical components, electrical schematic symbols, and functional safety.

Exclusion of liability
ABB is not responsible for the implementation, verification and validation of the overall safety system. It is the responsibility of the system integrator (or other party) who is responsible for the overall system and system safety.

The system integrator (or other responsible party) must make sure that the entire implementation complies with the instructions in this manual, all relevant standards, directives and local electrical code, and that the system is tested, verified and validated correctly.

Option description

Contents of this chapter
This chapter describes the option +Q957, prevention of unexpected start-up, and its settings.

Overview
A drive with option +Q957 uses a safety relay to implement the Prevention of unexpected start-up (POUS) safety function. ABB installs the safety relay to the drive at the factory.

The user must install and connect an operating switch and an indication lamp (optional) on site. These are not included in the delivery. The user can install the operating switch on, for example, a control desk. Refer to the machine-specific C-type standards on whether the indication lamp is required.

When the user sets the operating switch to the open position, the POUS function activates the Safe torque off (STO) function in the inverter units. The Safe torque off function disables the control voltage of the power semiconductors of the inverter unit output stage. This prevents the inverter units from generating the torque required to rotate the motors. With the POUS function, the user can do short-time operations (like cleaning) or maintenance work on the non-electrical parts of the machinery without switching off and disconnecting the inverter units.

Note: The situations in which you can use the POUS function must always be based on a risk assessment. Refer to IEC 60204-1:2016.

Note: Drives with the Emergency stop, stop category 1 function (option +Q952 or +Q964): If the user activates the POUS function during the emergency stop deceleration ramp, it overrides the emergency stop function. This activates the drive STO function immediately and the motor coasts to a stop. For more information on the emergency stop function, refer to the applicable emergency stop option user’s manual.

For a detailed description of the inverter unit STO function, refer to the inverter unit hardware manual.
The design principles of the option +Q957 comply with EN ISO 14118. The STO function complies with IEC/EN 61800-5-2. For a complete list of related standards and European directives, refer to section Related standards and directives (page 36).

**Operation principle**

The figure shows a simplified operation principle. For a more detailed description, refer to the circuit diagrams delivered with the drive.

---

The dashed line in the figure shows a user-defined installation.

**A41**  Inverter control unit

**A65**  POUS safety relay

**P**  POUS indicator lamp (user-defined)

**S**  POUS switch (user-defined)

</tr>
<tr>
<td>4</td>
<td>The user cannot start the motor while STO is active.</td>
</tr>
</tbody>
</table>
| 5 | Normal operation continues after the user:  
   • sets the POUS switch [S] to the closed position  
   • resets the inverter units, if they are configured to generate a fault when STO is activated  
   • makes sure that the drive receives the start signal (depends on the configuration, see the firmware manual). |

**Fault reaction function**

**Definition:** A safety function requires a “fault reaction function” that tries to initiate a safe state if it detects a failure in the safety system.

The fault reaction function of the POUS safety relay trips the system, if it detects a failure in the safety circuit (for example, short circuit between signals, open circuit, or redundancy fault).

If a fault is detected, the fault reaction function:

• activates the POUS request  
• activates the drive STO function  
• keeps the safe state activated and the POUS indication lamp on until the fault is repaired and the safety function is reset.

The STO function has its own internal fault diagnostics and fault reaction function.

**Hardware settings**

The hardware settings for the safety function are set at the factory.

The settings in the POUS safety relay [A65] are:

• Cross fault detection is set to *With*  
• Start mode is set to *Automatic*.

**Note:** If the cross fault detection is set to *Without*, the fault diagnostics of the wiring decreases.

For more information, refer to the circuit diagrams delivered with the drive.
Electrical installation

Contents of this chapter

This chapter describes the wiring of the safety option done at the factory and contains guidelines for making user connections.

Wiring

**WARNING!**
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation, commissioning or maintenance work.

The operating switch and the indication lamp for the POUS function are not factory-installed. The user must install and connect them to the inverter units on site.

There must be double contacts in the POUS switch [S] and double wiring (redundant two-channel connection) between the button and the POUS safety relay [A65]. The safety relay detects cross faults and faults across one contact from the POUS switch.

Connect the POUS switch to the applicable terminals inside the drive cabinet. For the POUS indication lamp [P], ABB recommends an LED indication lamp. Refer to the circuit diagrams delivered with the drive.

Obey the rules below:

1. Use only double-contact switches. ABB recommends approved and lockable switches.
2. Connect the switch with two conductors (two-channel connection). Keep the channels separate.

**Note:** If you use only one channel in a two-channel implementation, or if the channels are connected together, the cross fault detection of the POUS relay detects a redundancy fault and activates the fault reaction function.

**Note:** The safety circuit design can be different when modified according to the customer's safety requirements. Refer to the circuit diagrams delivered with the drive.
3. Use shielded, twisted pair cables. ABB recommends double-shielded cable and gold-plated contacts in the POUS switch.

4. Make sure that the sum resistance for one channel (loop resistance) is not more than 70 ohms.

5. Obey the general control cable installation instructions given in the inverter unit hardware manual.
Parameter settings

Contents of this chapter

This chapter gives the parameter settings related to the safety function.

Inverter unit parameter settings

The table that follows gives the parameters related to the safety function in the ACS880 primary control program. The parameters are set at the factory.

<table>
<thead>
<tr>
<th>No.</th>
<th>Name</th>
<th>Default value 1)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31.22</td>
<td>STO indication run/stop</td>
<td>Warning/Warning</td>
<td>Selects which indications are given when the Safe torque off (STO) function is activated. Warning/Warning is the recommended setting.</td>
</tr>
</tbody>
</table>

1) Value set by ABB at the factory for the default design.
Use of the safety function

Contents of this chapter
This chapter describes the use of the safety function with factory default settings.

Activating the safety function
Activate the POUS function only when the motors are stopped.
Activation procedure:
1. Set the POUS switch [S] to the open position.
   When POUS is activated, the following indications are shown:
   • the inverter unit control program has the indication Safe torque off active
   • the POUS indication lamp is on (if installed).
   
   Note: The POUS indication is not SIL/PL-rated.

   If configured with parameter 31.22 STO indication run/stop, an indication for Safe torque off is shown when the inverter unit STO is activated.

Resetting the safety function

WARNING!
Make sure that the drive does not start accidentally. This can occur with the automatic reset method of the safety function, if a level-triggered start command and the start enable signal are on at the same time.

1. Set the POUS switch [S] to the closed position.
2. If necessary, reset faults from the inverter units.
24 Use of the safety function

A manual reset is not necessary after you deactivate the POUS function. ABB sets the POUS safety relay [A65] to the automatic reset mode at the factory.
Start-up and validation test

Contents of this chapter
This chapter describes the start-up, validation test procedure, and validation of the safety function.

Validation of the safety functions
You must do a validation test to make sure that the safety function operates correctly and according to the safety requirements.

- Competence
The person who does the validation test of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6. This person must document and sign the test procedures and report.

- Validation procedure
You must do the validation test using the checklist given in this manual and the validation test plan of the complete safety system:
  - at the initial start-up of the safety function
  - after changes related to the safety function (wiring, components, safety function-related parameter settings, etc.)
  - after changes related to the power unit or its circuit boards
  - after maintenance work related to the safety function
  - at the proof test of the safety function.
The validation test must include at least the following steps:

- you must have a validation test plan
- you must test all commissioned functions for correct operation, from each operation location
- you must document all validation tests
- you must sign and store the validation test report for further reference.

## Validation test reports

You must store the signed validation test reports in the logbook of the machine. The report must include, as required by the referred standards:

- a description of the safety application (including a figure)
- a description and revisions of safety components that are used in the safety application
- a list of all safety functions that are used in the safety application
- a list of all safety-related parameters and their values
- documentation of start-up activities, references to failure reports and resolution of failures
- the test results for each safety function, checksums, date of the tests, and confirmation by the test personnel.

You must store any new validation test reports done due to changes or maintenance in the logbook of the machine.

### Start-up and validation test

You must use the Drive Composer PC tool or a control panel to do the start-up and validation test.

| Action |  
|--------|---
| **WARNING!** Obey the safety instructions. If you ignore them, injury or death, or damage to the equipment can occur. | ☑

#### Initial status

Make sure that the drive is ready for use, that is, you have done the tasks of the drive start-up procedure. Refer to the hardware manuals.

Make sure that the STO function is configured and validated. Refer to the inverter unit hardware manual.

#### Checks and settings with no voltage connected

Stop the drive and do the steps in section *Electrical safety precautions (page 9)* before you start the work.

After you connect the POUS switch and indication lamp to the drive, do a check of the connections against the applicable circuit diagrams. Do the check also if you made other connections to the safety circuit on site (for example, connected shipping splits of large drives).

Make sure that the POUS request is not on (the POUS switch is in the closed position).
### Action

**Inverter units with parallel R8i inverter modules:**
Make sure that the XSTO.OUT output on the inverter control unit [A41] is chained to the STO inputs of all inverter modules.

Make sure that the hardware settings of the safety function are set as defined in this manual.

### Settings with voltage connected

Close the cabinet doors and power up the drive. Refer to the hardware manual.

Make sure that the parameter settings related to the safety functions are correct. Refer to chapter *Parameter settings*.

### Validation test

ABB recommends that you monitor at least these signals with the Drive Composer PC tool:

- 01.01 Motor speed used (rpm)
- 01.02 Motor speed estimated (rpm)
- 01.07 Motor current (A)
- 01.10 Motor torque (%)
- 06.18 Start inhibit status word
- 23.01 Speed ref ramp input (rpm)
- 23.02 Speed ref ramp output (rpm)
- 90.01 Motor speed for control (rpm)
- When using an encoder, also: 90.10 Encoder 1 speed (rpm)

Make sure that it is safe to start, run and stop the motors during the test.

Start the drive and make sure that the motors are running. Then stop the motors.

Make sure that the motors are stopped.

Activate the POUS function: set the POUS switch to the open position.

Make sure that the correct warnings and indications are shown.

If there is more than one POUS group in the system, make sure that only the correct inverter units indicate POUS.

Make sure that the POUS indication is activated. For example, if you installed a POUS indication lamp, make sure that it comes on.

If there is more than one POUS group in the system, make sure that only the correct inverter units indicate POUS.

Make sure that the inverter unit generates none of these faults:
- STO hardware failure (5090)
- Safe torque off 1 loss (FA81)
- Safe torque off 2 loss (FA82)

If the inverter unit generates these faults, refer to the fault tracing instructions in this manual.

Make sure that you cannot start the inverter units or motors from any control location. Make sure that the inverter units or motors do not start when you switch the start signal off and on, or push the start key of the panel when the panel is in local control mode.

Deactivate the POUS function: set the POUS switch to the closed position.

**Note**: If the POUS function is in the automatic reset mode, the drive can restart automatically when you deactivate the POUS function.

Make sure that the POUS indication lamp goes off and the related warning is no longer shown.

Restart the inverter units and motors. Make sure that they operate normally.

Do the validation test for each POUS group.
### 28 Start-up and validation test

Fault tracing

Contents of this chapter
This chapter provides general diagnostics and troubleshooting tips.

Fault tracing
This table gives the indications of the DOLD LG 5925 relay:

<table>
<thead>
<tr>
<th>LED</th>
<th>LED is on</th>
<th>LED is off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Netz</td>
<td>Power supply is connected.</td>
<td>Power supply is not connected, or there is an external error.</td>
</tr>
<tr>
<td>K1</td>
<td>Relay K1 is energized.</td>
<td>There is an external error.</td>
</tr>
<tr>
<td>K2</td>
<td>Relay K2 is energized.</td>
<td>There is an external error.</td>
</tr>
</tbody>
</table>

For more information, see the data sheet of the relay (www.dold.com).

Use a multimeter to measure the STO circuit connections, if the inverter unit generates one or more of these faults:

- STO hardware failure (5090)
- Safe torque off 1 loss (FA81)
- Safe torque off 2 loss (FA82)

Refer to the circuit diagrams delivered with the drive.

For more fault tracing possibilities, refer to the hardware and firmware manuals of the drive.

Reporting problems and failures related to safety functions
Contact ABB.
Maintenance

Contents of this chapter
This chapter contains information for the maintenance and decommissioning of the safety function.

Safety circuit maintenance
After the safety function is validated, it must be maintained by periodic proof testing.
If you change the wiring or a component after the start-up, replace a power unit or its circuit boards, or restore parameters to their factory default values:
• Use only ABB-approved spare parts.
• Register the change to the change log for the safety circuit.
• If parameters were restored to the factory default values: Set the parameters related to the safety function.
• Do the validation test of the safety function.
• Document the tests and store the report into the logbook of the machine.

Proof test interval
Proof tests are used to detect failures in the safety function. To do a proof test, use the validation test procedure given in this manual.
Periodic proof testing of the safety function is necessary to maintain the required SIL/PL-level.
In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 2 or 5 years (high or low demand as defined in IEC 61508, IEC/EN 62061 and EN ISO 13849-1). Regardless of the mode of operation, it is a good practice to do the proof test for the safety function at least
once a year. It is also a good practice to include the proof test for the safety function in the routine maintenance program of the machinery.

The person responsible for the design of the complete safety system should also note the Recommendation of Use CNB/M/11.050 published by the European co-ordination of Notified Bodies for Machinery concerning dual-channel safety-related systems with electromechanical outputs:

- When the safety integrity requirement for the safety function is SIL 3 or PLe (cat. 3 or 4), the proof test for the function must be done at least every month.
- When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PLa (cat. 3), the proof test for the function must be done at least every 12 months.

This is a recommendation and depends on the required (not achieved) SIL/PL. For example, contactors, breakers, safety relays, contactor relays, emergency stop buttons, switches, etc. are typically safety devices which have electromechanical outputs. The STO circuit of the inverter unit does not have electromechanical outputs.

**Functional safety components**

The mission time of functional safety components is 20 years which equals the time during which failure rates of electronic components remain constant. This applies to the components of the standard Safe torque off circuit as well as any modules, relays and, typically, any other components that are part of functional safety circuits.

The expiry of mission time terminates the certification and SIL/PL classification of the safety function. The following options exist:

- Renewal of the whole drive and all optional functional safety module(s) and components.
- Renewal of the components in the safety function circuit. In practice, this is economical only with larger drives that have replaceable circuit boards and other components such as relays.

Note that some of the components may already have been renewed earlier, restarting their mission time. The remaining mission time of the whole circuit is however determined by its oldest component.

Contact your local ABB service representative for more information.

**Competence**

The person who does the maintenance and proof test activities of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6.

**Residual risk**

The safety functions are used to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. Thus, the warnings for the residual risks must be given to the operators.

**Intentional misuse**

The safety circuit is not designed to protect a machine against intentional misuse.
Decommissioning

When you decommission a POUS group or an inverter unit, make sure that the functional safety of the machine is maintained by other means until the decommissioning is completed.
Technical data

Contents of this chapter
This chapter gives the safety data, ambient conditions, and list of standards related to the product.

Safety data

- **Safety data values**
  Each multidrives delivery is unique. If the customer has ordered safety data calculations (option +P947), ABB calculates the safety data and delivers it separately to the customer.

- **Safety component types**
  Safety component types as defined in IEC 61508-2:
  - POUS safety relay: type A
  - inverter unit STO circuit:
    - air-cooled R1i…R7i inverter modules: type A
    - air-cooled R8i inverter modules: type B
    - liquid-cooled R7i…R8i inverter modules: type B.

- **Safety block diagrams**
  Each multidrives delivery is unique. If included in the customer order, ABB defines the safety block diagram for the safety function and delivers the diagram separately to the customer.
Relevant failure modes

Relevant failure modes are:

- internal failures of safety relays and STO. These failures are included in the failure rate value of the function.

Fault exclusions

Fault exclusions (not considered in the calculations):

- short and open circuits in the cables of the safety circuit
- short and open circuits in the cabinet terminal blocks of the safety circuits.

Operation delays

Total delay for the POUS function: (less than) 100 ms.

Ambient conditions

For the environmental limits for the safety functions and the drive, refer to the inverter unit hardware manual.

Compliance with the European Machinery Directive

The drive is an electronic product which is covered by the European Low Voltage Directive. However, the drive internal safety function of this manual is in the scope of the Machinery Directive as a safety component. This function complies with European harmonized standards such as IEC/EN 61800-5-2. The declaration of conformity is delivered with the drive.

Compliance with the Supply of Machinery (Safety) Regulations (UK)

The drive is an electronic product which is covered by the Electrical Equipment (Safety) Regulations. However, the drive internal safety function of this manual is in the scope of the Supply of Machinery (Safety) Regulations as a safety component. This function complies with designated standards such as EN 61800-5-2. The declaration of conformity is delivered with the drive.
Further information

Product and service inquiries
Address any inquiries about the product to your local ABB representative, quoting the type designation and serial number of the unit in question. A listing of ABB sales, support and service contacts can be found by navigating to www.abb.com/searchchannels.

Product training
For information on ABB product training, navigate to new.abb.com/service/training.

Providing feedback on ABB manuals
Your comments on our manuals are welcome. Navigate to new.abb.com/drives/manuals-feedback-form.

Document library on the Internet
You can find manuals and other product documents in PDF format on the Internet at www.abb.com/drives/documents.
