Overview of this specification

About this Product Specification

This product specification describes the RobotStudio 2019.1 product. RobotStudio helps you program, configure, and commission ABB robots. You can use the product offline with virtual robots, and online with real robots.

Users

This document is intended for:

- Industrial Engineers
- Purchasing Agents

1 Introduction

Overview

There is increasing competitive pressure on the industrial market. Higher efficiency in production is required to reduce cost and to increase quality. Allowing robot programming to add time to the manufacturing start of new products is unacceptable today as is shutting down ongoing production to program new or modified parts. Taking the risk of manufacturing tooling and fixtures without first verifying reach and accessibility is no longer an option. The modern production site verifies the manufacturability of new parts during the design phase. When programming your robots offline, programming can take place in parallel with the system build. By programming the system at the same time as it is manufactured, production can start earlier, reducing time-to-market. Offline programming reduces system risk by visualizing and confirming solutions and layouts before the actual robot is installed and generates higher part quality through the creation of more accurate paths.

RobotStudio is an engineering tool for configuration and programming of ABB robots, both real robots on the shop floor and virtual robots in a PC. To achieve true offline programming, RobotStudio utilizes ABB VirtualRobot™ Technology.
## 2 Features of RobotStudio

### 2.1 Basic and Premium Functionality

#### Overview
The features of RobotStudio are split into Basic and Premium functionality. The Basic functionality can be used free of charge whereas the Premium functionality requires a paid subscription.

#### Basic
The Basic functionality includes the necessary features to start up an ABB IRC5 industrial robot on the shop floor, and to do simple text-based programming. The same functionality is also available for virtual robot controllers running on a PC. The Basic functionality also includes the ability to open existing stations and Pack&Go files, run a simulation and watch the result in the graphical 3D view. In addition, you can import the ABB range of industrial robots, run them on the virtual robot controller and jog them around. The Go Offline feature will let you create a virtual replica of your connected real robot controller system.

**Note**
You need to have the RobotWare option PC Interface on your real controller system to allow your RobotStudio PC to connect to the real robot through the LAN. The option is not required for Service port connections.

#### Premium [1100-1]
The Premium functionality includes productivity features for efficient commissioning and programming. Tabular editing of RAPID data, and a comparison tool for viewing program differences are examples of Premium functionality. Program debugging is enabled by the RAPID Watch window, RAPID breakpoints, and the Signal Analyzer. Using the ScreenMaker, you can create custom user screens for the FlexPendant. In addition, offline programming, simulation and 3D functions are all part of the Premium package.

2.2 General Features

Microsoft Office Fluent User Interface

RobotStudio has adopted the Microsoft Office Fluent User Interface. The Office Fluent UI is also used in Microsoft Office. As in Office, the features of RobotStudio are designed in a workflow-oriented way.

Developer Tools

With add-ins, RobotStudio can be extended and customized to suit your specific needs. Add-ins are developed using the RobotStudio SDK. With the SDK it is also possible to develop custom SmartComponents which exceed the functionality provided by RobotStudio's base components.

To create custom PC applications for communication with a real or virtual robot, ABB offers the PC SDK. Users who want to customize the FlexPendant can use ScreenMaker, a Premium feature of RobotStudio.
2 Features of RobotStudio

2.3 Features for both real and virtual robot controllers

ScreenMaker

ScreenMaker is a tool in RobotStudio for developing custom screens. It is used to create customized FlexPendant GUIs without the need to learn the Visual Studio development environment and .NET programming.

RAPID Editor

The integrated RAPID editor enables you to view and edit programs loaded into a controller, both real and virtual. The editor is useful for editing all robot tasks other than robot motion. With the RAPID editor you can edit the RAPID code of the program modules and system modules. Each module you open appears in an editor window of its own, where you can add or edit RAPID code.

The RAPID editor’s features include:

- Syntax and error highlighting
- Find and Replace operations
- Tooltips for information on symbols, arguments, function calls and so on.
- Automatic insertion of arguments
- Context-sensitive help for RAPID code
- Line numbers for the RAPID code lines
- Editing RAPID modules in controller memory and in files

RAPID Data Editor

The RAPID Data Editor allows you to edit RAPID data in a table that you can view and edit.

RAPID Path Editor

The paths of a real robot can be viewed and edited graphically without the need of a virtual robot controller or running a simulation. You can load a workpiece to see the path in relation to the part geometry. By enabling the tool visualization, you can clearly see the target orientation. The property window allows you to tune multiple robtargets in a single operation.

RAPID Debugging

RobotStudio supports RAPID Debugging. Breakpoints can be set and the RAPID program can be stepped through when pinpointing the possible cause of a fault. These breakpoints are listed in a separate window which provides the overview and quick access, double-click on any item in the list to access the corresponding code.

RAPID Call Stack

Use the RAPID Call Stack window, to view the function or procedure calls that are currently on the stack. This is useful while debugging a robot program for understanding the sequence of routine calls that led to the current location of the program pointer.

Continues on next page
The RAPID Call Stack window displays the name of each routine and additional information, such as module name and line number.

**Adjust Robtargets**

The Premium feature Adjust Robtargets allows programs that has been programmed with the wrong TCP (tooldata) or work object (wobjdata) to be corrected. The joint angles of the robot will remain the same.

**Event Log**

You can view and save the Event Log of the controller from RobotStudio.

**I/O Viewer**

You can view and set input and output signals from the I/O System.

**System Builder**

With the System Builder, you can create, build, modify and copy RobotWare 5 systems to run on virtual and real controllers. These systems can be converted to boot media and downloaded to a real controller.

**Installation Manager**

Installation Manager is the tool for building, installing and modifying RobotWare 6 systems on an IRC5 controller. It can be used for both virtual and real systems.

**Configuration Editor**

From the Configuration Editor you view and edit the system parameters of a specific topic in a controller. You can also load pre-defined configuration files to the controller and save current configuration to file.

**Safety Controller Configuration**

Configuration of parameters for the safety functions SafeMove and Electronic Positioning Switches (EPS) can be done using the configuration tools Visual SafeMove and EPS Wizard, respectively.

**Backup and Restore**

Controller data can be backed up and restored from RobotStudio.

**Transfer**

The transfer function allows easy transfer of offline-created RAPID programs to the real robot on the shop floor. This means that you can transfer data from a virtual robot controller (which is offline) to a real controller (which is online). As part of the transfer function you can also compare the RAPID data present in the virtual robot controller with that present in the real controller and then select which data to transfer.

You can also use the transfer function to transfer data from a virtual robot controller to another virtual robot controller.
2 Features of RobotStudio

2.3 Features for both real and virtual robot controllers

Continued

**RAPID Watch Window**

You can view and edit the RAPID data of the variables in the RAPID Watch window, both during program execution and when the controller is stopped. However, you can only view, but not edit, I/O signals in the RAPID Watch window.

**Signal Analyzer**

The Signal Analyzer functionality helps in displaying and analyzing signals from a robot controller. Using the Signal Analyzer, you can optimize the robot program. Signals to be analyzed are defined in the Signal Setup tool for viewing and analyzing the Signal Analyzer. The tool allows robot performance tuning and signal debugging. In addition to I/O signals of the station and the robot controller and the controller EventLog, motion signals such as TCP position, speed, acceleration and motor power can be recorded, analyzed and exported to Microsoft Excel.
2.4 Features for real controllers

FlexPendant Viewer
The FlexPendant Viewer takes a snapshot of the FlexPendant of the connected physical robot controller and displays it in RobotStudio. The Viewer is updated at a user-defined interval.

Online Monitor
The Online Monitor can be described as a virtual web camera that monitors the connected robot and visualizes its movements. The graphical view that shows the robot model is updated with the true robot position every second. If the robot is in a singular position or at a joint limit you will get an indication in the view.

File Transfer
You can transfer the files and folders between the PC and a controller through the File Transfer window.

User Authorization
The data, functionality, and commands of a controller are protected by the User Authorization System (UAS). The UAS defines the access rights for the individual users of the robot controller and can be configured from RobotStudio.

Controller and System Properties
The properties of a connected controller and its system can be viewed using the Controller and System Properties tool. The name, date and time of the controller can also be viewed and modified.

Device Browser
The Device Browser displays the properties and trends of the hardware and software devices in a robot controller.

Go Offline
This feature creates a new RobotStudio station with a virtual robot similar to the connected real robot. This enables a robot technician to work Offline, when it is not possible or convenient to continue working on a real robot.

Jobs
The Jobs feature allows you to perform certain actions on a large population of robot controllers. A Job is defined by a Device list and an Action. The Action will be carried out for all controllers in the Device list. Examples of Actions are Backup, Update UAS, Save assessment data and SetTime.
2 Features of RobotStudio

2.5 Features for virtual robot controllers

VirtualRobot Technology
VirtualRobot Technology enables robot systems to run on a PC using the same software that drives the real robots. It is possible to run several robots at the same time on your PC.

TrueMove™ Path Visualization
The IRC5 controller features TrueMove that implies minimal deviation from the programmed path. TrueMove ensures that the motion path followed is the same irrespective of the speed. It also obviates the need for path tuning when speed parameters are adjusted online.

When creating robot programs offline, RobotStudio takes advantage of TrueMove and it directly displays the resulting path that the robot will follow in the graphics viewer. The TrueMove Path Visualization applies to linear and circular move instructions.

Smart Components
Smart Components offers a way of creating simulations by adding behavior to the simulated objects. It brings life to the graphical component libraries by the addition of so-called Base Smart Components for basic motion, signal logic, arithmetic, parametric modeling, sensors and so on.

Virtual Time
RobotStudio uses virtual time to synchronize the virtual robots of the station with each other and the surrounding equipment during simulation in the virtual environment. To save valuable engineering time, the simulation time can be accelerated to run as fast as the PC hardware permits.

Collision Detection
By selecting the objects concerned, RobotStudio will monitor and indicate whether they will collide when a robot program is executed. The Collision Detection computation makes use of multiple CPU cores available and uses the SSE (Streaming SIMD Extensions) instruction set for best performance.

Mechanism Modeler
With the Mechanism Modeler, you can model your own tracks, tools or grippers for use in RobotStudio simulations.

RAPID Synchronization
You can work with your existing RAPID program from the real robot on the shop floor by loading it to a virtual robot in RobotStudio and synchronizing it to the station to allow it to be viewed and modified in the graphical view. When programming is completed you can generate RAPID code by synchronizing it back to the virtual robot. The resulting RAPID program can be saved to file and loaded to the real robot.

Continues on next page
Virtual FlexPendant
This is a graphical representation of the real FlexPendant, powered by the VirtualRobot.

AutoReach
AutoReach analyzes reachability and lets you move the robot or the work piece around until all positions are reachable. This allows you to verify and optimize the work cell layout.

Document Manager
The Document Manager allows you to search and browse RobotStudio documents like libraries and geometries. You can add your own galleries to the RobotStudio user interface showing the content of your folders of interest. Files and folders related to your RobotStudio project can be linked or embedded in the station and packaged into the Pack and Go file.

FlexPendant Operator Window
The FlexPendant Operator Window is available in RobotStudio. It will display in Offline mode the same output as displayed on the Virtual FlexPendant Operator Window.

AutoConfiguration
The AutoConfiguration feature helps you to automatically define the robot configuration (confdata) for a complete path.

AutoPath
By using a CAD-model of the part to be processed it is possible to automatically generate the robot positions needed to follow a curve or edge of the geometry.

Continues on next page
2 Features of RobotStudio

2.5 Features for virtual robot controllers

Continued

MultiMove
From the infinite number of possible solutions to splitting a job between several robots in a MultiMove system, RobotStudio can generate a path for each robot that results in the shortest combined joint motion, taking restrictions such as joint limits or tool orientation constraints into consideration.

Working Envelope
In RobotStudio, you can visualize the working envelope for a robot in the graphical view.

Instruction templates
The instruction templates enable RobotStudio to recognize and program any RAPID instruction. RobotStudio comes with predefined templates for the most common RAPID instructions and you also have the possibilities to create and share templates for your own custom processes and instructions.

Station Viewer
RobotStudio can create a 3D interactive movie packaged in a standalone executable for showing and sharing a RobotStudio simulation to others that do not have RobotStudio installed. During replay, the speed can be adjusted to run faster or slower than real-time. A slider can be used to jump directly to the simulation highlights.

Screen Recorder
Simulations can be recorded by the Screen Recorder. The Recorder may create movies in virtual time, independent of your simulation hardware. Movies recorded in this mode are replayed in real time, which will show the true robot performance. Your favourite codec can be used to record movies in the AVI format. On Windows 7, both the Windows Media Video (WMV) format and the compressed format H.264 (MP4) are supported.

Markups
A markup is a text box displayed in the 3D graphics. It can be used to highlight areas of interest. Markups become part of the Station Viewer.

View Points
A Viewpoint stores the location and direction of the virtual camera in the 3D environment. Viewpoints can be used to store points of interests in a station and to create camera movements during simulation.

Linked Geometry
The Linked Geometry feature allows the user to load geometry from a shared repository and let RobotStudio remember the source location. If the source file is updated, you can order an update of the RobotStudio station whereby the new version of the geometry file will be loaded to replace the old one.

Continues on next page
2.5 Features for virtual robot controllers

Transparent Textures

Textures can be added to your station parts to enhance the realism even further. Transparent textures can be used to simplify fence modeling, for example.

I/O Simulator

The I/O Simulator displays the current state of input and output signals during program execution. It also allows the user to change their values.

Lights, Shadows and Materials

The DirectX 11 based 3D graphics engine in RobotStudio enables the user to customize the light setup by adding and tuning the light sources available: ambient light, infinite light, spotlight and point light. The shadows cast by the objects in combination with the built-in material library gives a realistic touch to the visualization of your result.

Tags

Tags feature provides a way to structure your station content such as robots, parts, paths, targets and other 3D objects. You can control the visibility of the tagged objects by hiding or showing them independent of objects with a different tag.

Conveyor Tracking

RobotStudio supports programming and simulation of robot systems that are equipped with the RobotWare option Conveyor Tracking. In Conveyor Tracking, the robot Tool Center Point (TCP) will automatically follow a work object that is defined on the moving conveyor. One or more robots can be combined with one or more moving conveyors.

Continues on next page
Virtual Reality Meeting

In a Virtual Reality Meeting, several participants can share the same virtual room from multiple locations. You can see avatars of each other, talk, draw, and make annotations in a live RobotStudio simulation. Virtual Reality provides an accurate perception of dimensions, ergonomics, and accessibility for cleaning and servicing of equipment. The VR Meeting function helps in design reviews and to correct errors at an early stage. This results in significantly shorter installation and start-up phase.

Virtual Reality Lead-Through Programming

Virtual Reality allows robot programs to be created in an intuitive way by guiding the robot through the process and simultaneously recording the motion. Lead-through programming efficiently lowers the threshold and allows non-robot experts to do the motion programming as hands-on lead-through programming is not possible in reality due to various limitations such as safety, availability of equipment, work environment, and ergonomics. VR Lead-through programming guarantees Reachability since the robot manipulator itself is used to teach the path.
2.6 Robot and Equipment Library

This release includes the following robot models:

**Standard Robots**
- IRB 120
- IRB 140
- IRB 260
- IRB 340
- IRB 360
- IRB 460
- IRB 660
- IRB 760
- IRB 910SC
- IRB 1200
- IRB 1400 and IRB 1410
- IRB 1520ID
- IRB 1600, IRB 1600ID and IRB 1660ID
- IRB 2400 and IRB 2400L
- IRB 2600 and IRB 2600ID
- IRB 4400, IRB 4400L, and IRB 4400S
- IRB 4450S
- IRB 4600
- IRB 6400RF
- IRB 6600 and IRB 6600ID
- IRB 6620 and IRB 6620LX
- IRB 6640 and IRB 6640ID
- IRB 6650, IRB 6650S and IRB 6650ID
- IRB 6660
- IRB 6700
- IRB 7600
- IRB 8700
- IRB 14000

**Paint Robots**
- IRB 52
- IRB 540-12 standard arm
- IRB 580-12 short and standard arm
- IRB 5300
- IRB 5320
- IRB 5350
- IRB 5400-12 standard arm
2 Features of RobotStudio

2.6 Robot and Equipment Library

Continued

- IRB 5400-13 standard arm
- IRB 5400-14 standard arm
- IRB 5400-22 process arm
- IRB 5400-23 process arm
- IRB 5400-24 process arm
- IRB 5500 slim and process arm, A and B

Note

New models and revisions of models (robots and positioners) are continuously published on www.abb.com/robotics as they become available.
3 PowerPacs and Options

3.1 Introduction

Overview

A PowerPac is an optional addition to RobotStudio for certain application specific tasks.
Overview

ArcWelding PowerPac is a geometry based off-line programming tool for generating arc welding programs. The programmer defines weld locations on the CAD geometries and the system creates robot positions in relation to that geometry, including approach and departure positions. ArcWelding PowerPac complements the basic RobotStudio functionality of generating programs from geometry. The programmer can create welding and process templates and then define weld locations on CAD geometries. This results in a complete program including approach and departure positions, as well as searching instructions for tactile sensors.
Overview

RobotStudio Machine Tending PowerPac is an add-in that provides a platform for creation and modification of machine tending robot cells in a 3D virtual environment. The basic concept is that the basic programming and configuration of machine tending cells are done through graphical user interfaces. For more advanced features, the users have the possibility to use standard RAPID programming. Programming is typically done in a sequence of steps, where it is easy to go back and forth between the steps. First one defines parts, grippers and stations used in the machine tending cell. The software provides templates and examples with in-built logic available. Second, the user interactively defines cycles and movements between stations. Third, the user defines the automatic and safe HomeRun strategy. And finally, the program can be simulated, validated and optimized before deployment to the ABB robot controller. Throughout the programming and configuration, the user has the possibility to configure the user interfaces that are used on the ABB controller device.

The main features are described below.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define parts</td>
<td>Define and configure parts being produced in the cell. Create part or use CAD drawing. Connect program, part and gripper to confirm combination.</td>
</tr>
<tr>
<td>Define grippers</td>
<td>Define and configure the grippers used by the robot. Select from gripper libraries and templates, or create your own gripper. Set up signal interface.</td>
</tr>
<tr>
<td>Define stations</td>
<td>Define and configure stations in the cell. Select station type and template programs or create your own. Set up signal interface.</td>
</tr>
<tr>
<td>Define movements between stations</td>
<td>Interactively create robot movement between stations. Grid system support defining movements between stations.</td>
</tr>
<tr>
<td>Define HomeRun strategy</td>
<td>Define strategy to automatically and safe move the robot to home position if problems occur. Graphical representation of robot movement.</td>
</tr>
</tbody>
</table>

Continues on next page
Define different production cycles; start-up, production, empty, etc. Interactively define logic for each cycle.

Simulation of complete machine tending cycles. Validation of robot reach and prevent collisions. Optimization of movements to shorten cycle time.

Deploy the generated robot program to the robot controller. Automatically generate project documentation.

### Related product – RobotWare Machine Tending
RobotWare Machine Tending is a controller software for deployment and operation of ABB robots that must be used together with RobotStudio Machine Tending PP. RobotWare Machine Tending software provides a programming framework supporting the offline programming. It also contains a customizable graphical user interface via ABB’s FlexPendant control device.
3.4 Machining PowerPac [1110-1]

Overview

For an imported CAD model, the Machining PowerPac can guide a user to create targets and paths from surfaces and edges. Pre-defined path generation patterns are provided. Process settings such as tool width, overlap rate, and machining angles can be defined.
3 PowerPacs and Options

3.5 Painting PowerPac [1112-1]

Overview

Painting PowerPac demonstrates the ability of ABB robotics in painting applications. With Painting PowerPac you can simulate and run a paint cell with multiple robots, including conveyor tracking. You reduce the risk by confirming layouts and solutions before the robots are installed. Paint strokes are easy to create and edit. Paint instructions are automatically created and robot positions for acceleration and deceleration distances calculated automatically. Painting PowerPac comes with CAD models of IRC5P paint robots and ABB’s applicators included.
The Palletizing PowerPac is a software for palletizing applications. It is based on the proven palletizing solution of PickMaster 5 and PickWare. Palletizing PowerPac enables users to get a quick valid solution without having to write any code.

The Palletizing PowerPac supports all ABB palletizing robots and three types of ABB grippers. Users can test different pallet patterns, grippers and feeders using plug-and-play components. With the easy-to-use Check Reachability, Preview, and Simulation functions, users can get a thorough estimation of the cell throughput before actually investing in real production.
3.7 Cutting PowerPac [1120-1]

Overview

RobotStudio Cutting PowerPac is an add-in tool to generate cutting programs based on CAD models. Using this tool you can generate 2D instructions for shape cutting, based on geometry features. The tool provides predefined cutting instructions for holes, slots, rectangles, hexagons and CAD shapes. The tool also supports free-form path generation from geometry edges (that is, free-form cutting instructions) which are typically used for trimming edges.

The Cutting PowerPac contains features that can be used for process analysis and optimization. A cutting program can be analyzed to improve cutting performance. The simulation tool indicates improvement points, where you can change tool parameters to keep the cutting speed constant. You can also optimize the relation between the laser’s power and the speed of the cutting head, thereby improving the quality of cutting and also optimizing the performance.
3.8 Picking PowerPac [1121-1]

Overview

The Picking PowerPac is a RobotStudio add-in, extending RobotStudio with picking functionality, which enables you to do offline programming and simulation of PickMaster 3 controlled picking lines. Included features and functions are one to one with the picking software PickMaster 3, which has been the market leader picking software for over 10 years. Picking PowerPac greatly simplifies line creation and programming with an intuitive step-by-step setup procedure. A line setup can be simulated and improved until optimum efficiency has been reached. Product flows can be setup and fluctuated to verify different production scenarios. Eventually, the programming can be downloaded and reused into a real PickMaster 3 application.
3 PowerPacs and Options

3.9 Dispensing PowerPac [1252-1]

3.9 Dispensing PowerPac [1252-1]

Overview

Dispensing PowerPac is a RobotStudio Add-in that provides tailored functionality for programming of dispensing applications. It builds on the RobotWare Add-in Integrated Dispensing Function Package (IDFP). Dispensing PowerPac is a geometry based offline programming tool for defining cell layouts, creating the programs, and for running simulations.

The PowerPac contains a 3D component library of dispensing equipments that can be used when creating the cell layout. The path view gives an overview of each path and related process instructions. By testing the path using the virtual robot controller, you can fine tune the path and verify cycle time. This program can be loaded into the real robot controller.

Main Features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Import Library</td>
<td>Supports auto and manual import of libraries for station layout.</td>
</tr>
<tr>
<td>Beaddata Setting</td>
<td>Independent window to organize bead data.</td>
</tr>
<tr>
<td>Parameter Table</td>
<td>Interconnects and synchronizes system parameters between station and controller</td>
</tr>
<tr>
<td>Bead Path Generator</td>
<td>Creates precise bead paths easily for complex geometric models.</td>
</tr>
<tr>
<td>Bead Path Visualizer and Editor</td>
<td>For visualizing and editing complex bead path.</td>
</tr>
<tr>
<td>3D Bead Path Configurator</td>
<td>For configuring 3D beads with precision.</td>
</tr>
<tr>
<td>Plug-in Tutorial</td>
<td>Includes online help and tutorials with interactive instructions.</td>
</tr>
</tbody>
</table>

3.10 CAD Import options

Overview

RobotStudio can optionally import and export data in major CAD formats. The native 3D format of RobotStudio is ACIS (.sat) and the current version is 2019 1.0. Support for additional CAD formats are provided as options.
3 PowerPacs and Options

3.10.1 CAD Converter IGES [1101-1]

3.10.1 CAD Converter IGES [1101-1]

**Reader**

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGES</td>
<td>.igs, .iges</td>
<td>up to 5.3</td>
</tr>
</tbody>
</table>

**Writer**

This option enables export of the following formats and their versions from RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>IGES</td>
<td>.igs, .iges</td>
<td>5.3</td>
</tr>
</tbody>
</table>
### 3.10.2 CAD Converter STEP [1102-1]

**Reader**

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEP</td>
<td>.stp, .step</td>
<td>AP203, AP214, AP242</td>
</tr>
</tbody>
</table>

**Writer**

This option enables export of the following formats and their versions from RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>STEP</td>
<td>.stp, .step</td>
<td>AP214</td>
</tr>
</tbody>
</table>
3.10.3 CAD Converter VDAFS [1103-1]

**Reader**

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>VDA-FS</td>
<td>.vda</td>
<td>1.0 – 2.0</td>
</tr>
</tbody>
</table>

**Writer**

This option enables export of the following formats and their versions from RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>VDA-FS</td>
<td>.vda</td>
<td>2.0</td>
</tr>
</tbody>
</table>
### 3.10.4 CAD Converter CATIA

#### Reader
This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>3DXML</td>
<td>.3DXML</td>
<td>4.0 – 4.3</td>
</tr>
<tr>
<td>CATIA V5</td>
<td>.CATPart, .CATProduct, .CGR</td>
<td>V5 R8 to V5–6 R2019</td>
</tr>
<tr>
<td>CATIA V6</td>
<td>.CATPart, .CATProduct, .CGR, CATDr</td>
<td>Exported from up to V6 R2019x</td>
</tr>
<tr>
<td>CATIA V4</td>
<td>.model, .exp, .session</td>
<td>4.1.9 – 4.2.4</td>
</tr>
</tbody>
</table>

**Note**

3DEXPERIENCE (CATIA V6) does not natively use the file system, so it does not have any file format of its own. 3DEXPERIENCE (CATIA V6) users must export their database objects as CATIA V5 CATParts, CATProducts, cgr, or 3DXML, which can then be imported into RobotStudio.

#### Writer
This option enables export of the following formats and their versions from RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>CATIA V5</td>
<td>.CATPart</td>
<td>V5 R15 – V5–6 R2019</td>
</tr>
<tr>
<td>CATIA V4</td>
<td>.model</td>
<td>4.1.9</td>
</tr>
</tbody>
</table>
3 PowerPacs and Options

3.10.5 CAD Converter Inventor [1106-1]

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File Extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inventor</td>
<td>.ipt</td>
<td>V6 – V2019</td>
</tr>
<tr>
<td></td>
<td>.iam</td>
<td>V11 – V2019</td>
</tr>
</tbody>
</table>
3.10.6 CAD Converter Creo [1107-1]

Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pro/E/Creo</td>
<td>.prt, .prt.<em>, .asm, .asm.</em></td>
<td>16 – Creo 5.0</td>
</tr>
</tbody>
</table>
3.10.7 CAD Converter DXF/DWG [1122-1]

Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>DXF/DWG</td>
<td>.dxf, .dwg</td>
<td>2.5 - 2019</td>
</tr>
</tbody>
</table>
3.10.8 CAD Converter JT [1123-1]

Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>JT</td>
<td>.jt</td>
<td>8.x, 9.x, 10 and 10.2</td>
</tr>
</tbody>
</table>
Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>NX</td>
<td>.prt</td>
<td>NX 1 – NX 12.0.0</td>
</tr>
</tbody>
</table>
3.10.10 CAD Converter Parasolid [1127-1]

Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parasolid</td>
<td>.x_t, .xmt_txt, .x_b, .xmt_bin</td>
<td>9.0.x – 31.0.x</td>
</tr>
</tbody>
</table>
3 PowerPacs and Options

3.10.11 CAD Converter Solid Edge [1128-1]

3.10.11 CAD Converter Solid Edge [1128-1]

Reader

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid Edge</td>
<td>.par, .asm, .psm</td>
<td>V18 – ST11</td>
</tr>
</tbody>
</table>
3.10.12 CAD Converter SolidWorks [1129-1]

This option enables import of the following formats and their versions into RobotStudio.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>SolidWorks</td>
<td>.sldprt, .sldasm</td>
<td>2003 – 2019</td>
</tr>
</tbody>
</table>
3.11 Other 3D Formats

**Reader**

The following formats and their versions can be imported into RobotStudio Premium without any additional option.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACIS</td>
<td>.sat</td>
<td>R1 – 2019 1.0</td>
</tr>
<tr>
<td>3DStudio</td>
<td>.3ds</td>
<td></td>
</tr>
<tr>
<td>COLLADA</td>
<td>.dae</td>
<td>1.4.1</td>
</tr>
<tr>
<td>OBJ</td>
<td>.obj</td>
<td></td>
</tr>
<tr>
<td>STL</td>
<td>.stl</td>
<td>ASCII</td>
</tr>
<tr>
<td>VRML</td>
<td>.wrl</td>
<td>2</td>
</tr>
<tr>
<td>LDraw</td>
<td>.ldr, .ldraw, .mpd</td>
<td>1.0.2</td>
</tr>
</tbody>
</table>

**Writer**

The following formats and their versions can be exported from RobotStudio Premium without any additional option.

<table>
<thead>
<tr>
<th>Format</th>
<th>File extension</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACIS</td>
<td>.sat</td>
<td>R1 – 2019 1.0</td>
</tr>
<tr>
<td>COLLADA</td>
<td>.dae</td>
<td>1.4.1</td>
</tr>
<tr>
<td>OBJ</td>
<td>.obj</td>
<td></td>
</tr>
<tr>
<td>VRML</td>
<td>.wrl</td>
<td>2</td>
</tr>
<tr>
<td>DirectX</td>
<td>.x</td>
<td></td>
</tr>
<tr>
<td>FBX</td>
<td>.fbx</td>
<td>7.5</td>
</tr>
</tbody>
</table>
4 Pricing and Licensing

Pricing

RobotStudio is available at a low annual fee. Customers can thus, without a high up-front investment, equip all their users with RobotStudio.

Licensing

RobotStudio is licensed to customers for use on a particular PC for a particular time period. It is protected from unauthorized use though its Activation procedure.

Activation

When you sign up for a RobotStudio subscription, you receive an Activation Key which unlocks the premium functionality of RobotStudio on one PC for the duration of the subscription period.
5 System Requirements

Software Requirements

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microsoft Windows 7 SP1</td>
<td>64-bit edition</td>
</tr>
<tr>
<td>Microsoft Windows 10 Anniversary Edition or later</td>
<td>64-bit edition</td>
</tr>
</tbody>
</table>

**Note**

The Windows Firewall will try to block features necessary to run RobotStudio. Make sure to unblock these features when asked (Industrial Robot Discovery Server, RobotStudio StudioAppFramework module, Virtual RobotController (all published by ABB)). The blocking state of a certain program can be viewed and changed at Start/Control Panel/ Windows Firewall.

For more information on Windows Firewall, visit [www.microsoft.com](http://www.microsoft.com).

Hardware Requirements

High-performance desktop or laptop workstation, with the following requirements:

<table>
<thead>
<tr>
<th>Part</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU</td>
<td>2.0GHz or faster processor, multiple cores recommended</td>
</tr>
<tr>
<td>Memory</td>
<td>8 GB minimum. 16 GB or more if working with large CAD models.</td>
</tr>
<tr>
<td>Disk</td>
<td>10+ GB free space, solid state drive (SSD) recommended.</td>
</tr>
<tr>
<td>Graphics card</td>
<td>High-performance, DirectX 11 compatible, gaming graphics card from any of the leading vendors. For the Advanced lightning mode Direct3D feature level 10_1 or higher is required.</td>
</tr>
<tr>
<td>Display settings</td>
<td>1920 x 1080 pixels or higher resolution is recommended.</td>
</tr>
<tr>
<td>dots per inch (dpi)</td>
<td>Only Normal size supported for Integrated Vision.</td>
</tr>
<tr>
<td>Mouse</td>
<td>Three-button mouse.</td>
</tr>
<tr>
<td>3D Mouse [optional]</td>
<td>Any 3D mouse from 3DConnexion. See <a href="http://www.3dconnexion.com">http://www.3dconnexion.com</a>.</td>
</tr>
</tbody>
</table>

RobotStudio supports RobotWare 6.09 down to RobotWare 5.07 including subrevisions. See RobotStudio Release Notes for any compatibility limitations.

The RobotWare option PC Interface is required to connect RobotStudio or a PC SDK application to a real IRC5 robot controller over Ethernet. This option is not required while connecting to the service port of the IRC5 controller.

The RobotWare option FlexPendant Interface is required to run a ScreenMaker application, or a FlexPendant SDK application on a real IRC5 robot controller.
6 Supported Languages

RobotStudio supports the following languages:

- English
- French
- German
- Italian
- Spanish
- Japanese
- Chinese (simplified)
- Czech
