Safety instructions

Contents of this chapter

This chapter contains the safety instructions which you must obey when you install and operate the drive and do maintenance on the drive. If you ignore the safety instructions, injury, death or damage can occur.

Use of warnings and notes

Warnings tell you about conditions which can cause injury or death, or damage to the equipment. They also tell you how to prevent the danger. Notes draw attention to a particular condition or fact, or give information on a subject.

The manual uses these warning symbols:

<table>
<thead>
<tr>
<th>Warning Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Electricity warning</strong></td>
<td>tells about hazards from electricity which can cause injury or death, or damage to the equipment.</td>
</tr>
<tr>
<td><strong>General warning</strong></td>
<td>tells about conditions, other than those caused by electricity, which can cause injury or death, or damage to the equipment.</td>
</tr>
<tr>
<td><strong>Electrostatic sensitive devices warning</strong></td>
<td>tells you about the risk of electrostatic discharge which can cause damage to the equipment.</td>
</tr>
</tbody>
</table>
14 Safety instructions

General safety in installation, start-up and maintenance

These instructions are for all personnel that install the drive module and do maintenance work on it.

WARNING! Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

- Use protective gloves when working on the drive module.
- Handle the drive module carefully:
  - Use safety shoes with a metal toe cap to prevent foot injury.
  - Lift the drive module only by the lifting lugs.

- Make sure that the module does not topple over when you move it on the floor: Open the support legs by pressing each leg a little down (1, 2) and turning it aside. Whenever possible secure the module also with chains.
- Do not tilt the drive module (A). It is heavy and its center of gravity is high. The module overturns from a sideways tilt of 5 degrees. Do not leave the module unattended on a sloping floor.

- Do not use the module installation ramp with plinth heights which exceed the maximum height marked on the ramp. (The maximum plinth height is 50 mm [1.97 in] when the telescopic ramp is fully retracted and 150 mm [5.91 in] when the ramp is fully extended.)
- Attach the module installation ramp carefully.
To prevent the drive module from falling, attach its top lifting lugs with chains to the cabinet frame before you push the module into the cabinet and pull it from the cabinet. Work carefully preferably with help from another person as shown below. Keep a constant pressure with one foot on the base of the module to prevent the module from falling on its back.

Beware of hot surfaces. Some parts, such as heatsinks of power semiconductors, remain hot for a while after disconnection of the electrical supply.

Make sure that debris from borings and grindings does not enter the drive during the installation. Electrically conductive debris inside the drive may cause damage or malfunction.

Make sure that there is sufficient cooling.

Before you connect voltage to the drive, make sure that the cabinet doors are closed. Keep the doors closed during the operation. Obey the panel builder’s instructions.

Before you adjust the drive operation limits, make sure that the motor and all driven equipment can operate throughout the set operation limits.

Before you activate the automatic fault reset or automatic restart functions of the drive control program, make sure that no dangerous situations can occur. These functions reset the drive automatically and continue operation after a fault or supply break. If these functions are activated, the installation must be clearly marked as defined in IEC/EN 61800-5-1, subclause 6.5.3, for example, “THIS MACHINE STARTS AUTOMATICALLY”.

The maximum number of drive power-ups is five in ten minutes. Too frequent power-ups can damage the charging circuit of the DC capacitors.

Make sure that any safety circuits (for example, emergency stop and Safe torque off) are validated in start-up. See chapter Start-up for reference of the validation instructions.

Note:

- If you select an external source for start command and it is on, the drive will start immediately after fault reset unless you configure the drive for pulse start. See the firmware manual.
- When the control location is not set to Local, the stop key on the control panel will not stop the drive.
16 Safety Instructions

Electrical safety in installation, start-up and maintenance

Precautions before electrical work

These warnings are for all personnel that do work on the drive, motor cable or motor.

**WARNING!** Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrician, do not do installation or maintenance work. Go through these steps before you begin any installation or maintenance work.

1. Clearly identify the work location.
2. Disconnect all possible voltage sources.
   - Open the main disconnector of the drive.
   - Open the disconnector of the supply transformer as the main disconnector of the drive does not remove the voltage from the input busbars of the drive.
   - Make sure that reconnection is not possible. Lock the disconnectors to open position and attach a warning notice to them.
   - Disconnect any external power sources from the control circuits before you do work on the control cables.
   - After you disconnect the drive, always wait for 5 minutes to let the intermediate circuit capacitors discharge before you continue.
3. Protect any other energized parts in the work location against contact.
4. Take special precautions when close to bare conductors.
5. Measure that the installation is de-energized.
   - Use a multimeter with an impedance of at least 1 Mohm.
   - Make sure that the voltage between the drive module input power terminals (L1/U1, L2/V1, L3/W1) and the grounding (PE) busbar is close to 0 V.
   - If the drive module is equipped with UDC+ and UDC- terminals (option +H356), make sure that the voltage between the UDC+ and UDC- terminals and the grounding (PE) busbar is close to 0 V.
6. Install temporary grounding as required by the local regulations.
7. Ask for a permit to work from the person in control of the electrical installation work.
### Additional instructions and notes

**WARNING!** Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

- If you are not a qualified electrician, do not do installation or maintenance work.
- Do not install a drive with EMC filter option +E202 on an ungrounded power system or a high resistance-grounded (over 30 ohms) power system.
- Do not connect the drive to a voltage higher than what is on the type designation label. Overvoltage can cause the motor to rush to its maximum speed.
- We do not recommend that you secure the cabinet by arc welding. If you have to, obey the instructions in section *Arc welding* on page 50.
- Do not do insulation or voltage withstand tests on the drive or drive modules.

**Note:**
- The motor cable terminals of the drive are at a dangerous voltage when the input power is on, regardless of whether the motor is running or not.
- The DC bus terminals (UDC+, UDC-) are at a dangerous voltage.
- External wiring can supply dangerous voltages to the terminals of relay outputs (XRO1, XRO2 and XRO3).
- The Safe torque off function does not remove the voltage from the main and auxiliary circuits. The function is not effective against deliberate sabotage or misuse.

**WARNING!** Use a grounding wrist band when you handle the printed circuit boards. Do not touch the boards unnecessarily. The boards contain components sensitive to electrostatic discharge.

**WARNING!** Obey these instructions. If you ignore them, equipment malfunction and damage to the fiber optic cables can occur.

- Handle the fiber optic cables with care.
- When you unplug the cables, always hold the connector, not the cable itself.
- Do not touch the ends of the fibers with bare hands as the ends are extremely sensitive to dirt.
- Do not bend the fiber optic cables too tightly. The minimum allowed bend radius is 35 mm (1.4 in).
Grounding

These instructions are for all personnel who are responsible for the grounding of the drive.

**WARNING!** Obey these instructions. If you ignore them, injury or death, or equipment malfunction can occur, and electromagnetic interference can increase.

- If you are not a qualified electrician, do not do grounding work.
- Always ground the drive, the motor and adjoining equipment. This is necessary for the personnel safety. Proper grounding also reduces electromagnetic emission and interference.
- Make sure that the conductivity of the grounding conductors is sufficient. See section *Selecting the power cables* on page 55. Obey the local regulations.
- Connect the power cable shields to protective earth (PE) of the drive to make sure of personnel safety.
- Make a 360° grounding of the power and control cable shields at the cable entries to suppress electromagnetic disturbances.
- In a multiple-drive installation, connect each drive separately to the protective earth (PE) busbar of the switch board or the transformer.

**Note:**
- You can use power cable shields as grounding conductors only when their conductivity is sufficient.
- As the normal touch current of the drive is higher than 3.5 mA AC or 10 mA DC, you must use a fixed protective earth connection. See standard EN 61800-5-1, 4.3.5.5.2.
Additional instructions for permanent magnet motor drives

Safety in installation, start-up and maintenance

These are additional warnings concerning permanent magnet motor drives. The other safety instructions in this chapter are also valid.

WARNING! Obey these instructions. If you ignore them, injury or death and equipment malfunction can occur.

- Do not do work on the drive when the permanent magnet motor is rotating. A rotating permanent magnet motor energizes the drive including its input power terminals.

Before installation, start-up and maintenance work on the drive:
- Stop the motor.
- Disconnect the motor from the drive with a safety switch or by other means.
- If you cannot disconnect the motor, make sure that the motor cannot rotate during work. Make sure that no other system, like hydraulic crawling drives, can rotate the motor directly or through any mechanical connection like felt, nip, rope, etc.
- Measure that the installation is de-energized.
  - Use a multimeter with an impedance of at least 1 Mohm.
  - Make sure that the voltage between the drive output terminals (T1/U2, T2/V2, T3/W2) and the grounding (PE) busbar is close to 0 V.
  - Make sure that the voltage between the drive input power terminals (L1/U1, L2/V1, L3/W1) and the grounding (PE) busbar is close to 0 V.
  - Make sure that the voltage between the drive module UDC+ and UDC- terminals and the grounding (PE) busbar is close to 0 V.
- Install temporary grounding to the drive output terminals (T1/U2, T2/V2, T3/W2). Connect the output terminals together as well as to the PE.
- Make sure that the operator cannot run the motor over the rated speed. Motor overspeed causes overvoltage can damage or explode the capacitors in the intermediate circuit of the drive.
Safety Instructions
Introduction to the manual

Contents of this chapter
This chapter describes the intended audience and contents of the manual. It contains a flowchart of steps in checking the delivery, installing and commissioning the drive. The flowchart refers to chapters/sections in this manual and other manuals.

Target audience
This manual is intended for persons who
• plan the cabinet assembly of the drive module and install the module into a user-defined cabinet
• plan the electrical installation of the drive cabinet
• make instructions for the end user of the drive concerning the mechanical installation of the drive cabinet, connection of power and control cables to the cabinet-installed drive and maintenance of the drive.

Read the manual before working on the drive. You are expected to know the fundamentals of electricity, wiring, electrical components and electrical schematic symbols.

The manual is written for readers worldwide. Both SI and imperial units are shown.
Contents of the manual

This manual contains the instructions and information for the basic drive module configuration. The chapters of the manual are briefly described below.

Safety instructions gives safety instructions for the installation, commissioning, operation and maintenance of the drive module.

Introduction to the manual introduces the manual.

Operation principle and hardware description describes the drive module.

Guidelines for planning the cabinet installation guides in planning drive cabinets and installing the drive module into a user-defined cabinet. The chapter gives cabinet layout examples and free space requirements around the module for cooling.

Guidelines for planning the electrical installation instructs in the motor and cable selection, protections and cable routing.

Installation instructions gives the basic installation instructions that are common for the different installation procedures.

Installation example of drive module with IP20 shrouds (option +B051) describes the installation process of a standard drive module in a Rittal 600 mm wide cabinet.

Installation checklist contains lists for checking the mechanical and electrical installation of the drive.

Start-up refers to the start-up instructions of the cabinet-installed drive.

Fault tracing describes the LED indications and refers to the fault tracing instructions of the drive.

Maintenance contains maintenance instructions.

Technical data contains the technical specifications of the drive module, eg, the ratings, sizes and technical requirements, provisions for fulfilling the requirements for CE and other markings.

Dimension drawings contains dimension drawings of the drive module installed into a Rittal TS 8 cabinet.

Example circuit diagram shows an example circuit diagram for a cabinet-installed drive module.

Safe torque off function describes the Safe torque off function of the drive and gives instructions on its implementing.

du/dt filters describes how to select du/dt filters for the drive.

Step-by-step drawings for an installation example of drive module with options +B051 and +E208 in Rittal TS 8 600 mm wide cabinet shows how to install the drive module in a Rittal TS 8 cabinet.
Categorization by frame size and option code

The instructions, technical data and dimension drawings which concern only certain drive frame sizes are marked with the symbol of the frame size (R10 or R11). The frame size is marked on the type designation label.

The instructions and technical data which concern only certain optional selections are marked with option codes, e.g., +J410. The options included in the drive can be identified from the option codes visible on the type designation label. The option selections are listed in section Type designation key on page 34.

Introduction to the manual

Standard drive modules
- Install the additional components into the cabinet: for example, main disconnector, main contactor, main AC fuses, etc.
- Install the drive module into the cabinet.
- Connect the motor cables to the drive module terminals.
- Connect the DC connection cables (if any) to the drive module terminals.
- If the main disconnector is installed into the cabinet, connect it to the drive module terminals and the input power cabling to the disconnector.

Operation principle and hardware description

Contents of this chapter

This chapter describes the operating principle and construction of the drive module.

Product overview

The ACH580-04 is a drive module for controlling AC induction motors, synchronous reluctance motors and synchronous permanent magnet motors in open loop control.

The main circuit of the drive module is shown below.

1. AC choke
2. Rectifier. Converts alternating current and voltage to direct current and voltage.
3. DC link. DC circuit between rectifier and inverter
4. Inverter. Converts direct current and voltage to alternating current and voltage.
Layout

Standard drive module configuration

1. Lifting lugs
2. Fastening bracket
3. Input cable connection busbars (L1/U1, L2/V1, L3/W1)
4. Circuit board compartment
5. PE busbar
6. Output cable connection terminals (T1/U2, T2/V2, T3/W2) attached
7. Control cable duct
8. Main cooling fans
9. Pedestal
10. Upper front cover
11. Lower front cover
12. Control panel. Can also be mounted on the cabinet door as well with the door mounting platform kit.
13. Handle for pulling the drive module out of the cabinet
14. Retractable support legs
15. Base fastening screws behind the retractable support legs
16. Pedestal guide plate
17. Telescopic extraction and insertion ramp
Drive module configuration with option +B051

The drive module configuration with clear plastic shrouds (option +B051) mounted is shown below.

1 Upper front cover
2 Lower front cover
3 Clear plastic shrouds attached (option +B051)
4 Pedestal
5 Control panel

See the next page for the part descriptions.
### Operation principle and hardware description

1. Clear plastic shroud to be attached onto the drive module input power cabling (a). Lead-through shroud for side cabling (b). Option +B051.
2. Clear plastic shrouds to be attached onto the drive module output power cabling with option +B051.
3. Clear plastic shroud to be attached on top of the drive module (lead-through for top cabling) with option +B051.
4. Upper back clear plastic shroud with option +B051.
5. Lower back clear plastic shroud with option +B051.
6. Front clear plastic shroud with option +B051.
7. Input power cable connection terminals (option +H370).
8. Output power cable connection terminals.
9. Grounding terminal for output power cable shields.
10. Metallic shroud. With option +H370, the shroud includes a ground bar.
11. Control unit.
13. Telescopic extraction and insertion ramp.

---

**A** Drive module with clear plastic shrouds mounted (front view)
Control panel

1. ACH-AP-H hand-off-auto control panel (standard)
2. CDUM-01 blank control panel cover (no control panel) (option +J424)
3. ACH-AP-W hand-off-auto control panel with bluetooth interface (option +J429)
4. DPMP-03 control panel mounting platform

In the standard drive module configuration, the control panel is located on the internal control unit.

DPMP-03 door mounting platform is also available with option +J410 in the Chinese market. In other market regions, DPMP-03 kit is included in the standard delivery. DPMP-03 allows you to mount the control panel on the cabinet door.

For the use of the control panel, see the firmware manual or ACS-AP-X assistant control panels user’s manual (3AUA0000085685 [English]).
Overview of power and control connections

The diagram shows the power connections and control interfaces of the drive module.

1. Option slot 1 for optional fieldbus adapter modules
2. Option slot 2 for optional I/O extension modules
3. Panel port
4. I/O terminal blocks. See section Control connection terminals below and section Default I/O connection diagram (ABB standard macro) on page 84.
5. Control panel (see page 90)
6. Sine filter (optional, see page 173)
Control connection terminals

The layout of the control connection terminals on the drive module control are shown below.

### Type designation label

The type designation label includes a rating, markings, a type designation and a serial number, which allow individual recognition of each drive module. The type designation label is located on the front cover. An example label is shown below.

![Type designation label example](image)

1. Type designation, see section on page 40.
2. Manufacturer’s address
3. Ratings, see sections [Ratings](#) on page 115, [Electrical power network specification](#) on page 120 and [Motor connection data](#) on page 120.
4. Valid markings
5. Frame size
6. Cooling method
7. Degree of protection, enclosure type
8. Short-circuit withstand strength, see section [Electrical power network specification](#) on page 120.
9. Serial number. The first digit of the serial number refers to the manufacturing plant. The next four digits refer to the unit’s manufacturing year and week, respectively. The remaining digits complete the serial number so that there are no two units with the same number.

### Type designation key

The type designation contains information on the specifications and configuration of the drive module. The first digits from left express the basic configuration. The optional selections are given thereafter, separated by plus signs, eg, +J410. The main selections are described below. Not all selections are available for all types. For more information, refer to ACH580-04 [Ordering Information](3AXD10000580721), available on request.

### Construction, pedestal and cabling
- B051 IP20 shrouds for cabling area
- H370 Full-size input power cable connection terminals and PE busbar

### Control panel and mounting platform
- J400 Hand-Off-Auto control panel (standard) ACH-AP-H
- 0J400 No control panel. **Note:** You need at least one loose control panel to be able to commission the drive.
- J424 Blank control panel cover (no control panel) CDUM-01
- J429 Assistant control panel with Bluetooth interface ACH-AP-W

### Fieldbus adapter modules
- K451 FDNA-01 DeviceNet™ fieldbus adapter module
- K452 LonWorks
- K454 FPBA-01 PROFIBUS DP fieldbus adapter module
- K457 FCAN-01 CANopen fieldbus adapter module
- K458 FSQA-01 Modbus/RTU adapter module
- K462 FCNA-01 ControlNet fieldbus adapter module
- K465 BACnet/IP (2-port)
- K469 FECA-01 EtherCAT™ fieldbus adapter module
- K470 FEPL-02 Ethernet POWERLINK fieldbus adapter module
- K473 FENA-11 Ethernet/IP™, Modbus/TCP and PROFINET I/O fieldbus adapter module
- K475 2-port Ethernet (Ethernet/IP, Modbus/TCP, PROFINET)

### I/O extension and feedback interface modules
- L501 CMOD-01 external 24 V DC/AC and digital I/O extension module (two relay outputs and one digital output)
- L512 CHDI-01 115/230 V digital input module (six digital inputs and two relay outputs)
- L523 CMOD-02 external 24 V and isolated PTC interface

### Specialities
- P931 Extended warranty 36 extends the total warranty to 36 months from delivery.
- P932 Extended warranty 60 extends the total warranty to 60 months from delivery.

### Paper manuals. **Note:** The delivered manual set can include manuals in English if the translation is not available.
- R700 English
- R701 German
- R702 Italian
- R703 Dutch
- R704 Danish
- R705 Swedish
- R706 Finnish
- R707 French
- R708 Spanish
- R709 Portuguese (in Brazilian Portuguese)
- R711 Russian
- R712 Chinese
- R714 Turkish
Operation principle and hardware description
Guidelines for planning the cabinet installation

Contents of this chapter
This chapter guides in planning drive cabinets and installing the drive module into a user-defined cabinet. The chapter gives cabinet layout examples and free space requirements around the module for cooling. These guidelines are essential for the safe and trouble-free use of the drive system.

Limitation of liability
You must always plan and make the installation according to applicable local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches the local laws and/or other regulations.

Installation positions of the drive module
You can put the drive module in the bookshelf position in a cabinet.

Basic requirements for the cabinet
Use a cabinet which
• has a frame sturdy enough to carry the weight of the drive components, control circuitry and other equipment installed in it
• protects the user and drive module against contact and meets the requirements for dust and humidity
• has sufficient air inlet and outlet gratings that allow free flow of cooling air through the cabinet. This is critical for proper cooling of the drive module.
Planning the layout of the cabinet

Plan a spacious layout to ensure easy installation and maintenance. Sufficient cooling air flow, obligatory clearances, cables and cable support structures all require space.

Place the control board(s) away from:
• main circuit components such as contactors, switches and power cables
• hot parts (heat sink, air outlet of the drive module).

Layout example, door closed

This diagram shows a cabinet layout example with the input power cable lead-through from top and the motor cable lead-through from bottom.

1a*) Air inlet for the drive module
1b) Air inlet for the other equipment. An extra fan is not necessary if an extra air baffle is used on the cabinet roof (see page 39).
1c*) Air inlet for circuit boards and DC and output busbars
2a*) Air outlet with an extra exhaust fan for the drive module
2b*) Air outlet for the other equipment
2c*) Air outlet for the drive module and other equipment on the cabinet roof. An exhaust fan if needed. We recommend this alternative instead of 2a.
3 Drive control panel with DPMP-03 mounting platform (option +J410). The control panel is connected to the drive module control unit inside the cabinet.
4 Contactor control switch and emergency stop switch (connected to the contactor control circuit inside the cabinet)
5 Operating handle of the disconnector
6 Rubber grommets for degree of protection
7 Roof air flow viewed from top

Note: The sizes of the air inlet and outlet gratings are critical for proper cooling of the drive module. For losses and cooling data requirements, see page 119.
Guidelines for planning the cabinet installation  39

- Layout example, door open (standard drive module configuration)

1 Supporting frame of the cabinet
2 Vertical (2a, 2b) and horizontal (2c, 2d) air baffles that separate the cool and hot areas (leak-proof lead-throughs). See also page 45.
2e Optional air baffle that is needed when there is no fan on the lower part of the cabinet door (see 1b on page 38)
3 Cabinet grounding busbar (PE)
4 Input power cable including the protective ground conductor (PE) of the drive
5 Disconnector and fuses
6 Contactor
7 Drive module
8 Motor cable including the protective ground conductor of the drive module
9 Drive module control unit. **Note**: With the internal control unit, the upper door air inlet is critical for proper cooling of the control board.
10 External control cables
11 Grounding screws
12 Alternative to grounding screws (11)
13 Air flow to the roof
14 Air flow through the drive module
15 Air flow through circuit boards and to DC output busbars

**Note 1**: The power cable shields can also be grounded to the drive module grounding terminals.

**Note 2**: See also section *Required free space*, page 49.
Layout example, door open (option +B051)

This diagram shows a layout example for drive modules with IP20 shrouds (option +B051).

1. Supporting frame of the cabinet
2a. Vertical (2a) and horizontal (2b) air baffles that separate the cool and hot areas (leak-proof lead-throughs). See also page 45.
2b. Optional air baffle that is needed when there is no fan on the lower part of the cabinet door (see 1b on page on 38)
3. Cabinet grounding busbar (PE)
4. Input power cable including the protective ground conductor (PE) of the drive
5. Disconnector and fuses
6. Contactor
7. Drive module
8. Motor cable including the protective ground conductor of the drive module
9. Drive module control unit. Note: With an internal control unit, the upper door air inlet is critical for proper cooling of the control board.
10. External control cables
11. Grounding screws
12. Air flow to the roof
13. Air flow through the drive module
14. Air flow through circuit boards and to DC output busbars
Arranging the grounding inside the cabinet

Arrange the grounding of the drive module by leaving the contact surfaces of the fastening points unpainted (bare metal-to-metal contact). The module frame will be grounded to the PE busbar of the cabinet via the fastening surfaces, screws and the cabinet frame. Alternatively, use a separate grounding conductor between the PE terminal of the drive module and the PE busbar of the cabinet.

Ground also the other components in the cabinet according to the principle above.

Selecting the busbar material and preparation of the joints

Note the following when you use busbars:

• Tin-plated copper is recommended but aluminum can also be used.
• The oxide layer from aluminum busbar joints must be removed and suitable anti-oxidant joint compound applied.

Tightening torques

Apply the following torques to grade 8.8 screws (with or without joint compound) that tighten electric contacts.

<table>
<thead>
<tr>
<th>Screw size</th>
<th>Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>M5</td>
<td>3.5 N·m (2.6 lbf·ft)</td>

<td>70 N·m (52 lbf·ft)</td>
</tr>
<tr>
<td>M16</td>
<td>180 N·m (133 lbf·ft)</td>
</tr>
</tbody>
</table>

Planning the fastening of the cabinet

Note the following when you plan the fastening of the cabinet:

• Fasten the cabinet to the floor from the front and to the floor or wall from the back.
• Always fasten the drive module from its fastening points to the cabinet. For details, see the module installation instructions.

**WARNING!** Do not fasten the cabinet by electric welding. ABB does not assume any liability for damages caused by electric welding as the welding circuit can damage electronic circuits in the cabinet. See section *Arc welding* on page 50.
Planning the cabinet placement on a cable channel

Note the following when you plan to place the cabinet on a cable channel:

• The cabinet structure must be sturdy enough. If the whole cabinet base is not supported from below, the cabinet weight will lie on the sections that the floor carries.

• Equip the cabinet with a sealed bottom plate and cable lead-throughs to ensure the degree of protection and to prevent the cooling air flow from the cable channel into the cabinet.

Note for option +B051: When the bottom grille and clear plastic shrouds around the motor cables are installed, the degree of protection of the drive module from bottom side is IP20.

Planning the electromagnetic compatibility (EMC) of the cabinet

Note the following when you plan the electromagnetic compatibility of the cabinet:

• Generally, the fewer and smaller the holes in the cabinet, the better the interference attenuation. The maximum recommended diameter of a hole in galvanic metal contact in the covering cabinet structure is 100 mm (3.94 in). Pay special attention to the cooling air inlet and outlet gratings.

• The best galvanic connection between the steel panels is achieved by welding them together as no holes are necessary. If welding is not possible, we recommend to leave the seams between the panels unpainted and equipped with special conductive EMC strips to provide adequate galvanic connection. Usually, reliable strips are made of flexible silicon mass covered with a metal mesh. The non-tightened touch-contact of the metal surfaces is not sufficient, so a conductive gasket between the surfaces is required. The maximum recommended distance between assembly screws is 100 mm (3.94 in).

• Construct sufficient high-frequency grounding network in the cabinet to avoid voltage differences and forming of high-impedance radiator structures. A good high-frequency grounding is made with short flat copper braids for low inductance. One-point high-frequency grounding cannot be used due to the long distances inside the cabinet.

• 360° high frequency grounding of the cable shields at the cable lead-throughs improves the EMC shielding of the cabinet.
• We recommend 360° high frequency grounding of the motor cable shields at their entries. The grounding can be implemented by a knitted wire mesh screening as shown below.

1. Cable
2. Cable tie
3. Strain relief
4. Bare cable shield
5. Knitted wire mesh
6. Cabinet lead-through plate

• We recommend 360° high frequency grounding of the control cable shields at their entries. The shields can be grounded by means of conductive shielding cushions pressed against the cable shield from both directions as shown below.

1. Tightening screw
2. EMI conductive cushion
3. Strain relief
4. Grommet
5. Lead-through plate
Planning the cooling

Note the following guidelines when you plan the cooling of the cabinet:

- Ventilate the installation site sufficiently so that the cooling air flow and ambient temperature requirements of the drive module are met, see pages 119 and 123. The internal cooling fan of the drive module rotates at a constant speed thus blowing constant air flow through the module. Whether the same amount of air must be replaced all the time in the facility depends on how much heat must be removed.

- Leave enough free space around the components to ensure sufficient cooling. Observe the minimum clearances given for each component. For the required free space around the drive module, see page 49.

- Also ventilate the heat dissipated by cables and other additional equipment.

- Make sure that the air inlets and outlets are large enough to allow sufficient air flow in and out of the cabinet. This is critical for proper cooling of the drive module.

- Equip the air inlets and outlets with gratings that
  - guide the air flow
  - protect against contact
  - prevent water splashes from entering the cabinet.

- The drawing below shows two typical cabinet cooling solutions. The air inlet is at the bottom of the cabinet, while the outlet is at the top, either on the upper part of the door or on the roof. We recommend that the air outlet is on the cabinet roof. Use an extra exhaust fan if the air outlet is on the cabinet door.
• The internal cooling fans of the drive modules and reactors/chokes are usually sufficient to keep the component temperatures low enough in IP22 cabinets.
• In IP54 cabinets, thick filter mats are used to prevent water splashes from entering the cabinet. This requires the installation of additional cooling equipment, such as a hot air exhaust fan.

**Preventing the recirculation of hot air**

Prevent hot air circulation outside the cabinet by leading the out coming hot air away from the area where the inlet air to the cabinet is taken. Possible solutions are listed below:

- gratings that guide air flow at the air inlet and outlet
- air inlet and outlet at different sides of the cabinet
- cool air inlet in the lower part of the front door, and an extra exhaust fan on the roof of the cabinet.

Prevent hot air circulation inside the cabinet with, for example, leak-proof air baffles. No gaskets are usually required.
Guidelines for planning the cabinet installation

- **Standard drive module configuration**

  This diagram shows air baffle positions inside an example cabinet. For the descriptions, see the next page.
1a  Air flow to the drive module, max. 40 °C (104 °F)  
1b  Air inlet to the drive module circuit boards and DC output busbars  
2a  Vertical air baffle that separates the cool and hot areas in the cabinet  
2b  Vertical air baffle  
2c  Upper horizontal air baffle. For vertical location, see page 136.  
2d  Lower horizontal air baffle  
2e  Optional air baffle that is needed when there is no fan on the lower part of the cabinet door (see ‘1b on page 38).  
3  Drive module  
4  Disconnector and fuses  
5  Contactor  
6  Drive module control unit  
7  Air flow out
Drive module with option +B051

This diagram shows air baffle positions inside an example cabinet.

Required free space

Free space around the drive module is needed for ensuring that sufficient cooling air flows through the module and the module cools correctly.

- **Free space at the top of the drive module**

The required free space at the top of the drive module is shown below.

![Diagram of drive module](image)

- **Free space around the drive module**

20 mm (0.79 in.) free space around the drive module is required from the cabinet back panel and front door. No free space for cooling is required on the left- and right-hand sides of the module.

The module can be installed in a cabinet with the following dimensions:
- width 500 mm (19.68 in.)
- depth 600 mm (23.62 in.)
- height 2000 mm (78.74 in.).

Other installation positions

Contact your local ABB representative for more information.

- **Drive module on its back**

If you install the drive module on its back, make sure that the hot cooling air that flows upwards from the module does not cause danger.
Planning the placement of the control panel

Note the following alternatives when you plan the placement of the control panel:
- As standard, the control panel is integrated on the control unit inside the drive module.
- The control panel can be mounted onto the cabinet door using a control panel mounting platform (option +J410). For instructions, see DPMP-02/03 control panel mounting platform kit installation guide (3AUA0000136205 [English]).

Planning the use of cubicle heaters

Use a cubicle heater if there is a risk of condensation in the cabinet. Although the primary function of the heater is to keep the air dry, it may also be required for heating at low temperatures.

Arc welding

Fastening the cabinet by arc welding is not allowed due to risk of electrical component failure. However, if the arc welding is the only mounting option, remove the module from the cabinet before welding.
Guidelines for planning the electrical installation

Contents of this chapter
This chapter contains the instructions that you must obey when you select the motor, cables, protections, cable routing and way of operation for the drive system.

Limitation of liability
The installation must always be designed and made according to applicable local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches the local laws and/or other regulations. Furthermore, if the recommendations given by ABB are not obeyed, the drive can experience problems that the warranty does not cover.
Selecting the supply disconnecting device

Install a hand-operated input disconnecting device between the AC power source and the drive. The disconnecting device must be of a type that can be locked to the open position for installation and maintenance work.

**European Union**

To meet the European Union Directives, according to standard EN 60204-1, *Safety of Machinery*, the disconnecting device must be one of the following types:

- switch-disconnector of utilization category AC-23B (EN 60947-3)
- disconnector that has an auxiliary contact that in all cases causes switching devices to break the load circuit before the opening of the main contacts of the disconnector (EN 60947-3)
- circuit breaker suitable for isolation in accordance with EN 60947-2.

**Other regions**

The disconnecting device must conform to the applicable safety regulations.

Selecting the main contactor

If a main contactor is used, its utilization category (number of operations under load) must be AC-1 according to IEC 60947-4, *Low-voltage switchgear and controlgear*. Select the contactor according to the nominal voltage and current of the drive.

Examining the compatibility of the motor and drive

Use an AC induction motor, synchronous reluctance motor or synchronous permanent magnet motor with the drive. Several induction motors can be connected at a time.

Select the motor size and drive type from the rating tables in chapter *Technical data* on basis of the AC line voltage and motor load.

Make sure that the motor withstands the maximum peak voltage in the motor terminals, see the *Requirements table* on page 53. For basics of protecting the motor insulation and bearings in drive systems, refer to section *Protecting the motor insulation and bearings* below.

**Note:**

- Consult the motor manufacturer before you use a motor which nominal voltage differs from the AC line voltage connected to the drive input.
- The voltage peaks at the motor terminals are relative to the supply voltage of the drive, not the drive output voltage.

**Protecting the motor insulation and bearings**

The drive uses modern IGBT inverter technology. Regardless of frequency, the drive output has pulses of approximately the drive DC bus voltage with a very short rise time. Up to twice bus voltage can be at the motor terminals, depending on the attenuation and reflection properties of the motor cable and the terminals. The increased voltage can cause additional stress on the motor and motor cable insulation.

Modern variable speed drives with their fast rising voltage pulses and high switching frequencies can generate current pulses that flow through the motor bearings. This can gradually erode the bearing races and rolling elements.
Optional \( \text{d}u/\text{d}t \) filters protect motor insulation system and reduce bearing currents. Optional common mode filters mainly reduce bearing currents. Insulated N-end (non-drive end) bearings protect the motor bearings.

### Requirements table

The following table shows how to select the motor insulation system and when optional ABB \( \text{d}u/\text{d}t \) filters, insulated N-end (non-drive end) motor bearings and ABB common mode filters are required. Failure of the motor to fulfill the following requirements or improper installation may shorten motor life or damage the motor bearings and voids the warranty.

</tr>
</tbody>
</table>
Additional data for calculating the rise time and the peak line-to-line voltage

The diagrams below show the relative peak line-to-line voltage and rate of change of voltage as a function of the motor cable length with and without a du/dt filter in use.

To calculate the actual peak voltage for a certain cable length read the relative $\dot{U}_{LL}/U_N$ value from the appropriate diagram and multiply it by the nominal supply voltage ($U_N$).

To calculate the actual voltage rise time for a certain cable length read the relative values $\dot{U}_{LL}/U_N$ and $(du/dt)/U_N$ from the appropriate diagram. Multiply the values by the nominal supply voltage ($U_N$) and substitute into equation $t = 0.8 \cdot \dot{U}_{LL}/(du/dt)$.

<table>
<thead>
<tr>
<th>Drive with du/dt filter</th>
<th>Drive without du/dt filter</th>
</tr>
</thead>
<tbody>
<tr>
<td>$t$ (Motor cable length)</td>
<td>$\dot{U}_{LL}/U_N$ (Relative peak line-to-line voltage)</td>
</tr>
<tr>
<td>$du/dt/U_N$ (Relative du/dt value)</td>
<td>$\dot{U}_{LL}/U_N$</td>
</tr>
</tbody>
</table>

Note: $\dot{U}_{LL}$ and $du/dt$ values are approximately 20% higher with resistor braking.

Additional note for common mode filters

Common mode filters are available as plus code option +E208.

Selecting the power cables

- **General rules**

  Select the input power and motor cables according to local regulations:
  - Select a cable capable of carrying the drive nominal current. See section Ratings (page 115) for the rated currents.
  - Select a cable rated for at least 70 °C (158 °F) maximum permissible temperature of conductor in continuous use. For US, see Selecting the control cables, page 59.
  - The inductance and impedance of the PE conductor/cable (grounding wire) must be rated according to permissible touch voltage appearing under fault conditions (so that the fault point voltage will not rise excessively when a ground fault occurs).
  - 600 V AC cable is accepted for up to 500 V AC.

Use symmetrical shielded motor cables (see page 58). Ground motor cable shields 360° at both ends. Keep the motor cable and its PE pigtail (twisted shield) as short as possible to reduce high-frequency electromagnetic emissions.
Note: When continuous metal conduit is employed, shielded cable is not required. The conduit must have bonding at both ends.

A four-conductor system is allowed for input cabling, but shielded symmetrical cable is recommended.

Compared to a four-conductor system, the use of symmetrical shielded cable reduces electromagnetic emission of the whole drive system as well as the stress on motor insulation, bearing currents and wear.

- **Sufficient conductivity of the protective conductor**

The protective conductor must always have an adequate conductivity.

Unless local wiring regulations state otherwise, the cross-sectional area of the protective conductor must meet the conditions that require automatic disconnection of the supply required in 411.3.2. of IEC 60364-4-41:2005 and be capable of withstanding the prospective fault current during the disconnection time of the protective device.

The cross-sectional area of the protective conductor can either be selected from the table below or calculated according to 543.1 of IEC 60364-5-54.

This table shows the minimum cross-sectional area related to the phase conductor size according to IEC 61800-5-1 when the phase conductor and the protective conductor are made of the same metal. If this is not so, the cross-sectional area of the protective earthing conductor shall be determined in a manner which produces a conductance equivalent to that which results from the application of this table.

<table>
<thead>

1) The cable sizing is based on max. 9 cables laid on a cable ladder side by side, three ladder type trays one on top of the other, ambient temperature 30 °C (86 °F) PVC insulation, surface temperature 70 °C (158 °F) (EN 60204-1 and IEC 60364-5-52). For other conditions, dimension the cables according to local safety regulations, appropriate input voltage and the load current of the drive.
Alternative power cable types

The recommended and not allowed power cable types to be used with the drive are presented below.

**Recommended power cable types**

| Symmetrical shielded cable with three phase conductors and a concentric PE conductor as shield. The shield must meet the requirements of IEC 61800-5-1, see section *Motor cable shield* on page 58. Check with local / state / country electrical codes for allowance. |
| Symmetrical shielded cable with three phase conductors and a concentric PE conductor as shield. A separate PE conductor is required if the shield does not meet the requirements of IEC 61800-5-1, see section *Motor cable shield* on page 58. |
| Symmetrical shielded cable with three phase conductors and symmetrically constructed PE conductor, and a shield. The PE conductor must meet the requirements of IEC 61800-5-1, see section *Motor cable shield* on page 58. |

**Power cable types for restricted use**

| PE ⚫ ⬤ ⬤ | A four-conductor system (three phase conductors and a protective conductor on a cable tray) is not allowed for motor cabling (allowed for input cabling). |

**Not allowed power cable types**

| PE ⚰ ⬤ ⬤ | Symmetrical shielded cable with individual shields for each phase conductor is not allowed on any cable size for input and motor cabling. |

**Motor cable shield**

If the motor cable shield is used as the sole protective earth conductor of the motor, make sure that the conductivity of the shield is sufficient. See subsection *General rules* on page 55, or IEC 61800-5-1. To effectively suppress radiated and conducted radio-frequency emissions, the cable shield conductivity must be at least 1/10 of the phase conductor conductivity. The requirements are easily met with a copper or aluminum shield. The minimum requirement of the motor cable shield of the drive is shown below. It consists of a concentric layer of copper wires with an open helix of copper tape or copper wire. The better and tighter the shield, the lower the emission level and bearing currents.
Guidelines for planning the electrical installation

59

Selecting the control cables

- **Shielding**

  All control cables must be shielded.

  Use a double-shielded twisted pair cable for analog signals. We recommend this type of cable for the pulse encoder signals also. Employ one individually shielded pair for each signal. Do not use common return for different analog signals.

  A double-shielded cable (figure a below) is the best alternative for low-voltage digital signals but single-shielded (b) twisted pair cable is also acceptable.

- **Signals in separate cables**

  Run analog and digital signals in separate, shielded cables. Never mix 24 V DC and 115/230 V AC signals in the same cable.

- **Signals allowed to be run in the same cable**

  Relay-controlled signals, providing their voltage does not exceed 48 V, can be run in the same cables as digital input signals. The relay-controlled signals should be run as twisted pairs.

- **Relay cable type**

  The cable type with braided metallic screen (for example ÖLFLEX by LAPPKABEL, Germany) has been tested and approved by ABB.

- **Control panel cable length and type**

  In remote use, the cable connecting the control panel to the drive must not exceed three meters (10 ft). Cable type: shielded CAT 5e or better Ethernet patch cable with RJ-45 ends.
Routing the cables

Route the motor cable away from other cable routes. Motor cables of several drives can be run in parallel when installed next to each other. The motor cable, input power cable and control cables should be installed on separate trays. Avoid long parallel runs of motor cables with other cables in order to decrease electromagnetic interference caused by the rapid changes in the drive output voltage.

Where control cables must cross power cables, make sure they are arranged at an angle as near to 90 degrees as possible. Do not install extra cables through the drive.

The cable trays must have good electrical bonding to each other and to the grounding electrodes. Aluminum tray systems can be used to improve local equalizing of potential

A diagram of the cable routing is shown below.

Separate control cable ducts

Lead 24 V and 230 V (120 V) control cables in separate ducts unless the 24 V cable is insulated for 230 V (120 V) or insulated with an insulation sleeving for 230 V (120 V).
Continuous motor cable shield or enclosure for equipment in the motor cable

To minimize the emission level when safety switches, contactors, connection boxes or similar equipment are installed on the motor cable between the drive and the motor:

- European Union: Install the equipment in a metal enclosure with 360 degree grounding for the shields of both the incoming and outgoing cable, or connect the shields of the cables otherwise together.
- US: Install the equipment in a metal enclosure in a way that the conduit or motor cable shielding runs consistently without breaks from the drive to the motor.

Implementing thermal overload and short-circuit protection

Protecting the drive and input power cable in short-circuits

Protect the drive with fuses (a) and the input cable with fuses (b) as shown below:

Size the fuses or the circuit breaker at the distribution board according to local regulations for the input cable protection. Select the fuses for the drive according to the instructions given in chapter Technical data. The fuses for the drive protection will restrict drive damage and prevent damage to adjoining equipment in case of a short-circuit inside the drive.

Note 1: If the fuses for the drive protection are placed at the distribution board and the input cable is dimensioned according to the nominal input current of the drive given in the rating table on page 115, the fuses will protect also the input cable in short-circuit situations, restrict drive damage and prevent damage to adjoining equipment in case of a short-circuit inside the drive. No separate fuses for the input cable protection are needed.

Note 2: Circuit breakers must not be used without fuses. For more information, contact ABB.

Protecting the motor and motor cable in short-circuits

The drive protects the motor cable and motor in a short-circuit situation when the motor cable is dimensioned according to the nominal current of the drive. No additional protection devices are needed.
Guidelines for planning the electrical installation

Protecting the drive and the input power and motor cables against thermal overload

The drive protects itself and the input and motor cables against thermal overload when the cables are dimensioned according to the nominal current of the drive. No additional thermal protection devices are needed.

**WARNING!** If the drive is connected to multiple motors, use a separate circuit breaker or fuses for protecting each motor cable and motor against overload. The drive overload protection is tuned for the total motor load. It may not trip due to an overload in one motor circuit only.

Protecting the motor against thermal overload

According to regulations, the motor must be protected against thermal overload and the current must be switched off when overload is detected. The drive includes a motor thermal protection function that protects the motor and switches off the current when necessary. Depending on a drive parameter value, the function either monitors a calculated temperature value (based on a motor thermal model) or an actual temperature indication given by motor temperature sensors. The user can tune the thermal model further by feeding in additional motor and load data.

The most common temperature sensors are:
- motor sizes IEC 180…225: thermal switch, eg, Klixon
- motor sizes IEC 200…250 and larger: PTC or Pt100.

See the firmware manual for more information on the motor thermal protection, and the connection and use of the temperature sensors.

Protecting the drive against ground faults

The drive is equipped with an internal ground fault protective function to protect the drive against ground faults in the motor and motor cable in TN (grounded) networks. This is not a personal safety or a fire protection feature. The ground fault protective function can be disabled with a parameter, refer to the firmware manual.

Measures for protection in case of direct or indirect contact, such as separation from the environment by double or reinforced insulation or isolation from the supply system by a transformer, can be applied.

Residual current device compatibility

The drive is suitable to be used with residual current devices of Type B.

**Note:** The EMC filter of the drive includes capacitors connected between the main circuit and the frame. These capacitors and long motor cables increase the ground leakage current and can cause fault current circuit breakers to function.
Implementing the Emergency stop function

For safety reasons, install the emergency stop devices at each operator control station and at other operating stations where emergency stop may be needed. You can implement the emergency stop function using the Safe torque off function of the drive module (see chapter Safe torque off function on page 139). Design the emergency stop according to relevant standards.

Note: Pressing the stop key  on the control panel of the drive does not generate an emergency stop of the motor or separate the drive from dangerous potential.

Implementing the Safe torque off function

See chapter Safe torque off function on page 139.

Implementing the Power loss ride-through function

Implement the power-loss ride-through function as follows:

- Check that the power-loss ride-through function of the drive is enabled with parameter 30.31 Undervoltage control.
- Set parameter 21.01 Vector start mode to Automatic (in vector mode) or parameter 21.19 Scalar start mode to Automatic (in scalar mode) to make flying start (starting into a rotating motor) possible. If the installation is equipped with a main contactor, prevent its tripping at the input power break. For example, use a time delay relay (hold) in the contactor control circuit.

WARNING! Make sure that the flying restart of the motor will not cause any danger. If you are in doubt, do not implement the Power-loss ride-through function.

Using power factor compensation capacitors with the drive

Power factor compensation is not needed with AC drives. However, if a drive is to be connected in a system with compensation capacitors installed, contact ABB for instructions.

Implementing a safety switch between the drive and the motor

We recommended that you install a safety switch between the permanent magnet motor and the drive output. The switch is needed to isolate the motor during any maintenance work on the drive.
Using a contactor between the drive and the motor

Implementing the control of the output contactor depends on how you select the drive to operate. See also section Implementing a bypass connection on page 64.

When you have selected to use
• vector control mode and motor ramp stop,
open the contactor as follows:
  1. Give a stop command to the drive.
  2. Wait until the drive decelerates the motor to zero speed.
  3. Open the contactor.

When you have selected to use
• vector control mode and motor coast stop; or scalar control mode,
open the contactor as follows:
  1. Give a stop command to the drive.
  2. Open the contactor.

WARNING! When the vector control mode is in use, never open the output contactor while the drive controls the motor. The vector control operates extremely fast, much faster than it takes for the contactor to open its contacts. When the contactor starts opening while the drive controls the motor, the vector control will try to maintain the load current by immediately increasing the drive output voltage to the maximum. This will damage, or even burn the contactor completely.

Implementing a bypass connection

If bypassing is required, employ mechanically or electrically interlocked contactors between the motor and the drive and between the motor and the power line. Make sure with interlocking that the contactors cannot be closed simultaneously. The installation must be clearly marked as defined in IEC/EN 61800-5-1, subclause 6.5.3, for example, “THIS MACHINE STARTS AUTOMATICALLY.”

WARNING! Never connect the drive output to the electrical power network. The connection may damage the drive.
Example bypass connection

An example bypass connection is shown below.

Switching the motor power supply from drive to direct-on-line

1. Stop the drive and the motor with the drive control panel (drive in the local control mode) or the external stop signal (drive in the remote control mode).
2. Open the main contactor of the drive with S11.
3. Switch the motor power supply from the drive to direct-on-line with S40.
4. Wait for 10 seconds to allow the motor magnetization to die away.
5. Start the motor with S41.

</tr>
<tr>
<td>S42</td>
<td>Stop when motor is connected direct-on-line</td>
</tr>
</tbody>
</table>
Switching the motor power supply from direct-on-line to drive

1. Stop the motor with S42.
2. Switch the motor power supply from direct-on-line to the drive with S40.
3. Close the main contactor of the drive with switch S11 (-> turn to position ST for two seconds and leave to position 1).
4. Start the drive and the motor with the drive control panel (drive in the local control mode) or the external start signal (drive in the remote control mode).

Protecting the contacts of relay outputs

Inductive loads (relays, contactors, motors) cause voltage transients when switched off. The relay contacts on the drive control unit are protected with varistors (250 V) against overvoltage peaks. In spite of this, it is highly recommended that inductive loads are equipped with noise attenuating circuits (varistors, RC filters [AC] or diodes [DC]) in order to minimize the EMC emission at switch-off. If not suppressed, the disturbances may connect capacitively or inductively to other conductors in the control cable and form a risk of malfunction in other parts of the system.

Install the protective component as close to the inductive load as possible. Do not install protective components at the relay outputs.

1) Relay outputs; 2) Varistor; 3) RC filter; 4) diode
Guidelines for planning the electrical installation

Connecting a motor temperature sensor to the drive I/O

**WARNING!** IEC 60664 requires double or reinforced insulation between live parts and the surface of accessible parts of electrical equipment which are either non-conductive or conductive but not connected to the protective earth.

To fulfill this requirement, you can connect a thermistor (and other similar components) to the inputs of the drive:

- If there is double or reinforced insulation between the thermistor and live parts of the motor or
- If circuits connected to all digital and analog inputs of the drive are protected against contact and insulated with basic insulation (the same voltage level as the drive main circuit) from other low voltage circuits.

Another way is to use an optional thermistor protection module or an external thermistor relay. The insulation of the relay must be rated for the same voltage level as the main circuit of the drive. For connection to the relay, see the firmware manual. For connection to the thermistor protection module, see its manual.

See page 137.
Installation instructions

Contents of this chapter
This chapter contains the general installation instructions for the drive module. The chapter refers to the installation example chapters which contain instructions that depend on the selected drive configuration.

Safety

WARNING! If you are not a qualified electrician do not do the installation work described in this chapter. Obey the instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

Checking the installation site
The material below the drive must be non-flammable and strong enough to carry the weight of the drive.

See section Ambient conditions on page 123 for the allowed ambient conditions and section Losses, cooling data and noise on page 119 for the required cooling air.
Moving and unpacking the unit

WARNING! Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

Move the transport package by pallet truck to the installation site.

Unpack the package as follows (see the package drawing on page 71):
- Cut the bands (A).
- Unpack the additional boxes (B).
- Remove the outer sheathing by lifting it (C).
- Remove the sheathing by lifting it (D).
- Remove the pedestal guide plate (not included with options +0H354 and +0P919) as shown below.

Checking the delivery

Check that all items listed in section *Moving and unpacking the unit* are present.

Check that there are no signs of damage. Before attempting installation and operation, check the information on the type designation label of the drive to verify that the unit is of the correct type.

Installing the motor cable at the motor end

Ground the motor cable shield 360 degrees at the lead-through of the motor terminal box.
Checking the insulation of the assembly

- **Drive**
  
  Do not make any voltage tolerance or insulation resistance tests on any part of the drive as testing can damage the drive. Every drive has been tested for insulation between the main circuit and the chassis at the factory. Also, there are voltage-limiting circuits inside the drive which cut down the testing voltage automatically.

- **Input cable**
  
  Check the insulation of the input cable according to local regulations before connecting it to the drive.

- **Motor and motor cable**
  
  Check the insulation of the motor and motor cable as follows:
  
  1. Check that the motor cable is disconnected from the drive output terminals T1/U2, T2/V2 and T3/W2.
  2. Measure the insulation resistance between each phase conductor and the Protective Earth conductor using a measuring voltage of 1000 V DC. The insulation resistance of an ABB motor must exceed 100 Mohm (reference value at 25 °C or 77 °F). For the insulation resistance of other motors, consult the manufacturer’s instructions. **Note:** Moisture inside the motor casing will reduce the insulation resistance. If you suspect moisture, dry the motor and repeat the measurement.

**Installation alternatives**

For an installation example of how to install the standard drive module into a Rittal cabinet, see chapter **Installation example of drive module with IP20 shrouds (option +B051)**. You can install the drive module into a cabinet using different procedures depending on the drive configuration. Obey the general power and control cable installation instructions that we give in this chapter and see the installation example of your drive configuration in the following chapters.

- **Standard drive module configuration and option +B051**
  
  For an installation example on how to install the drive module into a Rittal TS 8 cabinet, see chapter **Installation example of drive module with IP20 shrouds (option +B051)** on page 91. See also ACS580-04 drive modules (200 to 560 kW, 300 to 700 hp) quick installation guide (3AXD50000015469 [English]).

- **Optional input power cable connection terminals and ground busbar assembly (+H370)**
  
  Connect the input power cable connection terminals as shown in chapter **Step-by-step drawings for an installation example of drive module with options +B051 and +E208 in Rittal TS 8 600 mm wide cabinet** on page 179.
Install the metallic shroud with ground bar as shown below.

- **Drive module without output cable connection terminals (option +0H371)**

  The power cables can be connected directly to the drive module input and output terminals with cable lugs or by busbars.

- **Drive module without pedestal (option +0H354)**

  The drive module without pedestal can be mounted on a wall or a cabinet with four screws through the fastening holes at the top and bottom of the module.

  Make sure that the cabinet mounting plate and frame are strong enough to carry the weight of the drive module. See section *Dimensions, weights and free space requirements* on page 119.
Attaching the drive module to a mounting plate or wall

Use the support bracket if you attach the drive module directly to a mounting plate or wall. The support bracket prevents the drive module screws from chafing against the plate.

Alternatives for grounding the drive module

You can ground the drive module from its top back to the cabinet frame with these alternatives:

1. from the grounding hole
2. to a Rittal punched section with the fastening bracket.
Installing the bottom grille (for IP20 degree protection)

For option +B051: If IP20 degree of protection is needed from the bottom side, install the bottom grille as shown below.

Insert lifting hooks to the drive module lifting eyes and lift the module to the installation place.
Connecting the power cables

- Connection diagram

1. For alternatives, see section Selecting the supply disconnecting device on page 52. In the installing example of this chapter, the disconnecting device is not in the same cubicle with the drive module.

2. If a shielded cable is used (not required but recommended) and the conductivity of the shield is < 50% of the conductivity of the phase conductor, use a separate PE cable (2a) or a cable with a grounding conductor (2b).

3. We recommend 360-degree grounding at the cabinet entry if a shielded cable is used. Ground the other end of the input cable shield or PE conductor at the distribution board.

4. We recommend 360-degree grounding at the cabinet entry, see page 42.
80 Installation instructions

5 Use a separate grounding cable if the conductivity of the cable shield is < 50% of the conductivity of the phase conductor and there is no symmetrically constructed grounding conductor in the cable (see page 59).
6 Common mode filter (optional, see page 53)
7 d/dt filter (optional, see page 173)
8 EMC filter (option +E210)
9 The drive module frame must be connected to the cabinet frame. See section Arranging the grounding inside the cabinet on page 41 and Alternatives for grounding the drive module on page 77.

Note:
If there is a symmetrically constructed grounding conductor in the motor cable in addition to the conductive shield, connect the grounding conductor to the grounding terminal at the drive and motor ends. Do not use an asymmetrically constructed motor cable. Connecting its fourth conductor at the motor end increases bearing currents and causes extra wear.

Power cable connection procedure

WARNING! Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

WARNING! Apply grease to stripped aluminum conductors before attaching them to non-coated aluminum cable lugs. Obey the grease manufacturer’s instructions. Aluminum-aluminum contact can cause oxidation in the contact surfaces.

1. Run the motor cables from the motor to the cabinet. We recommend to ground the cable shields 360° at the lead-through plate.

1 Cable
2 Cable tie
3 Strain relief
4 Bare cable shield
5 Knitted wire mesh
6 Cabinet lead-through plate
2. Twist the cable shields of the motor cables into bundles and connect them and any separate ground conductors or cables to the grounding terminal of the drive module.

3. Connect the phase conductors of the motor cables to terminals T1/U2, T2/V2 and T3/W2 of the drive module. For the tightening torques, see page 119.

4. Make sure that all power is disconnected and reconnection is not possible. Use proper safe disconnect procedures according to local codes.

5. Run the input cables from the supply source to the cabinet. If shielded cable is used: we recommend to ground the cable shields 360° at the lead-through plate.

6. If shielded cable is used: twist the cable shields of the input cables into bundles and connect them and any separate ground conductors or cables to the drive module grounding terminal.

7. Connect the phase conductors of the input cables to terminals L1/U1, L2/V1 and L3/W1 of the drive module. For the tightening torques, see page 119.

**DC connection**

The UDC+ and UDC– terminals are intended for common DC configurations of a number of drives, allowing regenerative energy from one drive to be utilized by the other drives in the motoring mode. For more information, contact your local ABB representative.
82  Installation instructions

Connecting the control cables

1. Remove the middle front cover of the drive module.

2. Attach the option modules if not attached already. See section Installing option modules on page 89.

3. Lead the control cables inside the drive cabinet.

4. Ground the outer control cable shields 360 degrees at the cabinet lead-through plate (recommendation).

5. Route the control cables along the control cable duct from bottom or top to the control unit.
6. Ground the shields of the control cables at the clamp plate. The shields should be continuous as close to the terminals of the control unit as possible. Only remove the outer jacket of the cable at the cable clamp so that the clamp presses on the bare shield. The shield (especially in case of multiple shields) can also be terminated with a lug and fastened with a screw at the clamp plate. Leave the other end of the shield unconnected or ground it indirectly via a few nanofarads high-frequency capacitor, eg, 3.3 nF / 630 V. The shield can also be grounded directly at both ends if they are in the same ground line with no significant voltage drop between the end points. Tighten the screws to secure the connection.

7. Connect the conductors to the appropriate detachable terminals of the control unit. See section Default I/O connection diagram (ABB standard macro) on page 84 for the default I/O connections of the ABB standard macro. For other macros, see the firmware manual. Use shrink tubing or insulating tape to contain any stray strands. Tighten the screws to secure the connection.

Note: Keep any signal wire pairs twisted as close to the terminals as possible. Twisting the wire with its return wire reduces disturbances caused by inductive coupling.
Installation instructions

**Default I/O connection diagram (ABB standard macro)**

Default control connections for the HVAC are shown below.

See the notes on the next page.

Total load capacity of the Auxiliary voltage output +24V (X2:10) is 6.0 W (250 mA / 24 V DC).

Terminal sizes: 0.14...2.5 mm² (all terminals)

Tightening torques: 0.5...0.6 N·m (0.4 lbf·ft)
Installation Instructions

Notes:
1. Current [0(4)...20 mA, $R_{in} = 100$ ohm] or voltage [0(2)...10 V, $R_{in} > 200$ kohm]. Change of setting requires changing the corresponding parameter.
2. Total load capacity of the Auxiliary voltage output +24V (X2:10) is 6.0 W (250 mA / 24 V) minus the power taken by the option modules installed on the board.
3. In scalar control: See Menu - Primary settings - Drive - Constant frequencies or parameter group 28 Frequency reference chain.
   In vector control: See Menu - Primary setting - Drive - Constant speeds or parameter group 22 Speed reference selection.
4. Connected with jumpers at the factory.
5. Use shielded twisted-pair cables for digital signals.
   Ground the outer shield of the cable 360 degrees at the cabinet entry.

Further information on the usage of the connectors and switches is given in the sections below.

PNP configuration for digital inputs (X2 & X3))

Internal and external +24 V power supply connections for PNP configuration are shown in the figure below.

WARNING! Do not connect the +24 V AC cable to the control board ground when the control board is powered using an external 24 V AC supply.
NPN configuration for digital inputs (X2 & X3)

Internal and external +24 V power supply connections for NPN configuration are shown in the figure below.

**WARNING!** Do not connect the +24 V AC cable to the control board ground when the control board is powered using an external 24 V AC supply.

Connection for obtaining 0…10 V from analog output 2 (AO2)

To obtain 0…10 V from analog output AO2, connect a 500 ohm resistor (or two 1 kohm resistors in parallel) between the analog output 2 AO2 and analog common ground AGND. Examples are shown in the figure below.
Connection examples of two-wire and three-wire sensors to analog input (AI2)

Note: The maximum capability of the auxiliary voltage output (24 V DC [250 mA]) must not be exceeded.

An example of a two-wire sensor/transmitter supplied by the drive auxiliary voltage output is shown below. Set the input signal to 4...20 mA, not 0...20 mA.

![Two-wire sensor example](image)

An example of a three-wire sensor/transmitter supplied by the drive auxiliary voltage output is shown below. The sensor is supplied through its current output and the drive feeds the supply voltage (+24 V DC). Thus the output signal must be 4...20 mA, not 0...20 mA.

![Three-wire sensor example](image)

**DI6 as frequency input**

If DI6 is used as a frequency input, see the firmware manual for how to set parameters accordingly.

**DI6 as PTC input**

If DI6 is used as a PTC input, see firmware manual for how to set parameters accordingly. The wiring and the PTC sensor need to be double isolated. Otherwise the CMOD-02 I/O extension module must be used.
Ai1 and Ai2 as Pt100, Pt1000, Ni1000, KTY83 and KTY84 sensor inputs

One, two or three Pt100 sensors; one, two or three Pt1000 sensors; or one Ni1000, KTY83 or KTY84 sensor for motor temperature measurement can be connected between an analog input and output as shown below. Leave the other end of the shield unconnected or ground it indirectly via a few nanofarads high-frequency capacitor, for example, 3.3 nF / 630 V. The shield can also be grounded directly at both ends if they are in the same ground line with no significant voltage drop between the end points.

---

**WARNING!** As the inputs pictured above are not insulated according to IEC 60664, the connection of the motor temperature sensor requires double or reinforced insulation between motor live parts and the sensor. If the assembly does not fulfill the requirement, the I/O board terminals must be protected against contact and must not be connected to other equipment or the temperature sensor must be isolated from the I/O terminals.

---

**Safe torque off (X4)**

For the drive to start, both connections (+24 V DC to IN1 and +24 V DC to IN2) must be closed. By default, the terminal block has jumpers to close the circuit.

Remove the jumpers before connecting an external Safe torque off circuitry to the drive. See also chapter **Safe torque off function** on page 139.

**Note:** Only 24 V DC can be used for STO. Only PNP input configuration can be used.

---

**Connecting a control panel**

With door mounting kit (option +J410), connect the control panel to the control unit as shown in **DPMP-02/03 mounting platform for control panels Installation guide** (3AUA0000136205 [English]).

**Note 1:** When a PC is connected to the control panel, the control panel keypad is disabled. In this case, the control panel acts as a USB-RS485 adapter.
Installing option modules

Disconnect the drive from the power line. Lock the main disconnecting device and ensure by measuring that there is no voltage.

- Option slot 2 (I/O extension modules)
  1. Put the module carefully into its position on the control unit.
  2. Tighten the mounting screw.
  3. Tighten the grounding screw (CHASSIS). **Note:** The screw grounds the module. It is necessary for fulfilling the EMC requirements and for proper operation of the module.

- Option slot 1 (fieldbus adapter modules)
  1. Put the module carefully into its position on the control unit.
  2. Tighten the mounting screw (CHASSIS). **Note:** The screw tightens the connections and grounds the module. It is necessary for fulfilling the EMC requirements and for proper operation of the module.

- Wiring the optional modules

  See the appropriate optional module manual for specific installation and wiring instructions.
Connecting a PC

WARNING! Do not connect the PC directly to the control panel connector of the control unit as this can cause damage.

To be able to connect a PC to the drive, you need an assistant control panel (ACS-AP-x or ACH-AP-H). It is also possible to use CCA-01 configuration adapter.

To connect a PC to the control panel with a USB data cable (USB Type A <-> USB Type Mini-B):

1. Lift the USB connector cover on the control panel from bottom upwards.
2. Insert the USB cable Mini-B plug in the control panel USB connector.
3. Insert the USB cable A-plug in the USB connector of the PC (a). -> The panel displays: USB connected (b).

Note: When a PC is connected to the control panel, the control panel keypad is disabled. In this case, the control panel acts as a USB-RS485 adapter.

For information on using the Drive composer PC tool, see Drive composer PC tool user's manual (3AUA0000094606 [English]).
Installation example of drive module with IP20 shrouds (option +B051)

Contents of this chapter

In this chapter, the drive module with IP20 shrouds (option +B051) is installed in a 600 mm wide Rittal TS 8 cabinet in a bookshelf way of mounting. The module is placed in an upright position on the cabinet bottom with its front facing the cabinet door.

Limitation of liability

Always obey the general rules given in this chapter and local laws and regulations. ABB does not assume any liability whatsoever for any installation which breaches local laws and/or other regulations.

Safety

WARNING! If you are not a qualified electrician do not do the installation work described in this chapter. Obey the instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.
Installation example of drive module with IP20 shrouds (option +B051)

**Required parts**

**Drive module standard parts**
- Drive module
- Fastening bracket
- Pedestal guide plate
- Telescopic extraction and insertion ramp
- Fastening screws and insulators in a plastic bag
- External control unit

**Rittal parts**

## Installing the drive module into a cabinet

See appendix [Step-by-step drawings for an installation example of drive module with options +B051 and +E208 in Rittal TS 8 600 mm wide cabinet](#) on page 175 and ACS580-04 quick installation guide (3AXD5000001546 [English]).

- Install the punched section to the back of the cabinet frame.
- Install the support rails and pedestal guide plate to the cabinet bottom frame.
- Install the telescopic insertion ramp to the pedestal guide plate.
- Remove the sheeting from the clear plastic shrouds from both sides.
- Install the top metallic shroud to the drive module.
- Install the back shrouds to the drive module.
- To prevent the drive module from falling, attach its lifting lugs with chains to the cabinet frame.
- Push the drive module carefully into the cabinet along the telescopic insertion ramp.
- Remove the ramp.
- Fasten the drive module to the pedestal guide plate.
- Fasten the drive module from top to the punched section at the cabinet back. **Note:** The fastening bracket grounds the drive module to the cabinet frame.
- Install the air baffles. See section *Preventing the recirculation of hot air* on page 45.

</tr>
</tbody>
</table>
Installing the roof and door

Install the air inlet gratings to the cabinet door and the spacers on top of the cabinet as shown below.

1 Door
2 Install these gratings as close to each other as possible. Remove the filter mats.
Installation example of drive module with IP20 shrouds (option +B051)

Miscellaneous

- **Input power cable lead-through from top**
  
  If you run the input cables from top to the drive module, drill the lead-through holes to the top clear plastic shroud.

- **Attaching the drive module to a mounting plate**
  
  Use the assembly support if you attach the drive module directly to the cabinet back plate. The support prevents the drive module screws from chafing the plate.

- **IP20 shrouds**
  
  You can order IP20 shrouds for frame R10 with code 3AXD50000024563 and for R11 with 3AXD50000024564.
# Installation checklist

## Contents of this chapter

This chapter contains a list for checking the mechanical and electrical installation of the drive module.

## Installation checklist

Go through the checklist below together with another person.

⚠️ ⚠️ **WARNING!** Obey the safety instructions in chapter *Safety instructions*. If you ignore them, injury or death, or damage to the equipment can occur.

<tr>
<td>• Cables are connected to terminals tight enough by pulling the cable.</td>
<td></td>
</tr>
<tr>
<td>• Cable termination on terminals chaining is done correctly.</td>
<td></td>
</tr>
<tr>
<td>• Bare conductors are not too far outside the terminal causing an insufficient clearance or loss of shielding against contact.</td>
<td></td>
</tr>
<tr>
<td>• The control unit is wired properly to the drive module.</td>
<td></td>
</tr>
<tr>
<td>• The control panel cable is connected properly.</td>
<td></td>
</tr>
<tr>
<td>Cables are not lying against sharp edges or bare live parts. Bending radius of fiber optic cables is at least 3.5 cm (1.38 in.).</td>
<td></td>
</tr>
<tr>
<td>The type, markings, insulation plates and cross connections of terminal blocks are correct.</td>
<td></td>
</tr>
<tr>
<td><strong>Grounding and protection</strong></td>
<td></td>
</tr>
<tr>
<td>The grounding colors, cross-section and grounding points of modules and other equipment match the circuit diagrams. No long routes for pigtails.</td>
<td></td>
</tr>
<tr>
<td>Connections of PE cables and busbars are tight enough. Pull the cable to test that it does not loosen. No long routes for pigtails.</td>
<td></td>
</tr>
<tr>
<td>Doors equipped with electrical equipment are grounded. No long grounding routes. From EMC standpoint best result is achieved with a flat copper braid.</td>
<td></td>
</tr>
<tr>
<td>Fans that can be touched are shrouded.</td>
<td></td>
</tr>
<tr>
<td>Live parts inside the doors are protected against direct contact to at least IP2x.</td>
<td></td>
</tr>
<tr>
<td><strong>Labels</strong></td>
<td></td>
</tr>
<tr>
<td>The type designation labels and warning and instruction stickers are made according to the local regulations and placed correctly.</td>
<td></td>
</tr>
<tr>
<td><strong>Switches and doors</strong></td>
<td></td>
</tr>
<tr>
<td>Mechanical switches, main disconnecting switch and cabinet doors function properly.</td>
<td></td>
</tr>
</tbody>
</table>
The drive cabinet has been attached to floor and also from top to the wall or roof.

The ambient operating conditions meet the specifications given in chapter [Technical data].

The cooling air will flow freely in and out of the drive cabinet, and air recirculation inside the cabinet will not be possible (air baffle plates are in place).

If the drive module has been stored over one year, the electrolytic DC capacitors in the DC link of the drive have been reformed. See page 111.

There is an adequately sized protective ground conductor between the drive and the switchboard.

There is an adequately sized protective ground conductor between the motor and the drive.

All protective ground conductors have been connected to the appropriate terminals and the terminals have been tightened. (Pull the conductors to check.)

The enclosures of the equipment in the cabinet have proper galvanic connection to the cabinet protective earth (ground) busbar; the connection surfaces at the fastening points are bare (unpainted) and the connections are tight, or separate grounding conductors have been installed.

The supply voltage matches the nominal input voltage of the drive. Check the type designation label.

Appropriate AC fuses and a main disconnector have been installed.

The motor cable has been connected to the appropriate terminals, the phase order is right, and the terminals have been tightened. (Pull the conductors to check.)

The motor cable has been routed away from other cables.

No power factor compensation capacitors have been connected to the motor cable.

The control cables (if any) have been connected to the appropriate terminals, and the terminals have been tightened. (Pull the conductors to check.)

If a drive bypass connection is used, the direct-on-line contactor of the motor and the drive output contactor are either mechanically or electrically interlocked, i.e., cannot be closed simultaneously.

There are no tools, foreign objects or dust from drilling inside the drive module.

All shrouds and cover of the motor connection box are in place. Cabinet doors have been closed.

The motor and the driven equipment are ready for start.

---

Start-up

Contents of this chapter
This chapter describes the start-up procedure of the drive.

Start-up procedure

1. Only qualified electricians are allowed to start-up the drive.
2. Make sure that the installation of the drive module has been checked according to the checklist in chapter Installation checklist, and that the motor and driven equipment are ready for start.
3. Perform the start-up tasks instructed by the cabinet-installer of the drive module.
4. Switch the power on, setup the drive control program, and perform the first start of the drive and motor. See the ACH580-04 quick installation (3AXD50000048686 [English]) or ACH580 firmware manual (3AXD50000027537 [English]). If you need more information on the use of the control panel, see ACS-AP-x Assistant control panels user’s manual (3AUA0000085685 [English]).

For drive modules in which the Safe torque off function is in use: Test and validate the operation of the Safe torque off function. See section Start-up including acceptance test on page 147.
Fault tracing

Contents of this chapter
This chapter describes the fault tracing possibilities of the drive.

Warning and fault messages
See the firmware manual for the descriptions, causes and remedies of the control program warning and fault messages.
Maintenance

Contents of this chapter
This chapter contains maintenance instructions of the drive module.

Maintenance intervals
The table below shows the maintenance tasks which can be done by the end user. The complete maintenance schedule is available on the Internet (www.abb.com/driveservices). For more information, consult your local ABB Service representative (www.abb.com/searchchannels).

The maintenance and component replacement intervals are based on the assumption that the equipment is operated within the specified ratings and ambient conditions. ABB recommends annual drive inspections to ensure the highest reliability and optimum performance.

Note: Long term operation near the specified maximum ratings or ambient conditions may require shorter maintenance intervals for certain components. Consult your local ABB Service representative for additional maintenance recommendations.

Cabinet

Cleaning the interior of the cabinet

**WARNING!** Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

**WARNING!** Use a vacuum cleaner with antistatic hose and nozzle. Using a normal vacuum cleaner creates static discharges which can damage circuit boards.

1. Stop the drive and do the steps in section Precautions before electrical work on page 16 before you start the work.
2. Make sure that the drive is disconnected from the power line and all other precautions described under Grounding on page 18 have been taken into consideration.
3. When necessary, clean the interior of the cabinet with a soft brush and a vacuum cleaner.
Heatsink

The module heatsink fins pick up dust from the cooling air. The drive runs into overtemperature warnings and faults if the heatsink is not clean.

Cleaning the interior of the heatsink

WARNING! Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

WARNING! Use a vacuum cleaner with antistatic hose and nozzle. Using a normal vacuum cleaner creates static discharges which can damage circuit boards.

1. Stop the drive and do the steps in section Precautions before electrical work on page 16 before you start the work.
2. Make sure that the drive is disconnected from the power line and all other precautions described under Grounding on page 18 have been taken into consideration.
3. Undo the fastening screws of the handle plate of the drive module.
4. Remove the handle plate.
5. Vacuum the interior of the heatsink from the opening.
6. Blow clean compressed air (not humid or oily) upwards from the opening and, at the same time, vacuum from the top of the drive module.
Fans

The actual lifespan depends on the running time of the fan, ambient temperature and dust concentration. See the firmware manual for the actual signal which indicates the running time of the cooling fan. For resetting the running time signal after a fan replacement, please contact ABB.

Replacement fans are available from ABB. Do not use other than ABB specified spare parts.

Replacing the circuit board compartment cooling fan

WARNING! Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

1. Stop the drive and do the steps in section Precautions before electrical work on page 16 before you start the work.
2. Remove the drive module out of the cabinet. See section Replacing the drive module on page 110.
3. Undo the fastening screw of the fan enclosure.
4. Unplug the power supply cable of the fan.
5. Install the new fan in reverse order to the above.
Replacing the main cooling fans

**WARNING!** Obey the safety instructions in chapter Safety instructions. If you ignore them, injury or death, or damage to the equipment can occur.

1. Stop the drive and do the steps in section Precautions before electrical work on page 16 before you start the work.
2. Remove the drive module out of the cabinet. See section Replacing the drive module on page 110.
3. Open the support legs of the pedestal.
4. Undo the two screws that fasten the fan assembly plate.
5. Tilt the fan assembly plate down.
6. Disconnect the power supply wires of the fans.
7. Remove the fan assembly from the drive module.
8. Undo the fastening screws of the fan(s) and remove the fan(s) from the assembly plate.
9. Install the new fan(s) in reverse order to the above.
Replacing the drive module

**WARNING!** Obey the safety instructions in chapter *Safety instructions*. If you ignore them, injury or death, or damage to the equipment can occur.

- Handle the drive module carefully:
  - Use safety shoes with a metal toe cap to prevent foot injury.
  - Lift the drive module only by the lifting lugs.
  - Make sure that the module does not topple over when you move it on the floor:
    Open the support legs by pressing each leg a little down (1, 2) and turning it aside. Whenever possible secure the module also with chains.
  - Do not tilt the drive module (A). It is heavy and its center of gravity is high. The module overturns from a sideways tilt of 5 degrees. Do not leave the module unattended on a sloping floor.

1. Stop the drive and do the steps in section *Precautions before electrical work* on page 16 before you start the work.
2. Make sure that all other precautions described under *Grounding* on page 18 have been taken into consideration.
3. For option +B051, remove the clear plastic shrouds on the power cables and parts in front of the drive module.
4. Disconnect the power cables.
5. Disconnect the external control cables from the drive module.
6. Remove the screws that attach the drive module to the cabinet at the top and behind the front support legs.
7. Attach the extraction ramp to the cabinet base with two screws.
8. To prevent the drive module from falling, attach its top lifting lugs with chains with chains to the cabinet frame.
9. Pull the drive module carefully out of the cabinet preferably with help from another person.
10. Install the new module in reverse order to the above.
Capacitors

The drive intermediate circuit employs several electrolytic capacitors. Their lifespan depends on the operating time of the drive, loading and ambient temperature. The lifespan of the capacitor can be prolonged by lowering the ambient temperature.

It is not possible to predict a capacitor failure. The capacitor failure is usually followed by damage to the unit and an input cable fuse failure, or a fault trip. Contact ABB if a capacitor failure is suspected. Replacements are available from ABB. Do not use other than ABB specified spare parts.

- Reforming the capacitors

If the drive module has been stored for a year or more, reform the capacitors. See page 33 for information on finding out the manufacturing date. For the reforming instructions, see Converter modules with electrolytic DC capacitors in the DC link, capacitor reforming instructions (3BFE64059629 [English]).
Control panel

- **Cleaning the control panel**
  
  Use a soft damp cloth to clean the control panel. Avoid harsh cleaners which could scratch the display window.

- **Replacing the battery in the assistant control panel**
  
  A battery is only used in assistant control panels that have the clock function. The battery keeps the clock operating in memory during power interruptions.
  
  The expected life for the battery is greater than ten years.
  
  **Note:** The battery is NOT required for any control panel or drive functions, except the clock.

  1. Remove the control panel from the drive.
     
     Press the retaining clip at the top (1a) and pull it forward from the top edge (1b).

  2. To remove the battery, use a coin to rotate the battery cover on the back of the control panel.

  3. Replace the battery with type CR2032. Dispose the old battery according to local disposal rules or applicable laws.
4. To reinstall the control panel, put the bottom of the container in position (4a), press the retaining clip at the top (4b) and push the control panel in at the top edge (4c).

For the use of the control panel, see the firmware manual and ACS-AP-X assistant control panels user’s manual (3AU0000085685 [English]).
Technical data

Contents of this chapter
This chapter contains the technical specifications of the drive, for example, the ratings, sizes and technical requirements, provisions for fulfilling the requirements for CE and other markings.

Ratings
The ratings of the drive modules with 50 & 60 Hz supply are given below.

IEC ratings

</table>

**Note:** To achieve the rated motor power given in the table, the rated current of the drive must be higher than or equal to the rated motor current. The power ratings apply to most IEC 34 motors at the nominal voltage of the drive. We recommend to select the drive, motor and gear combination for the required motion profile with the DriveSize dimensioning tool available from ABB.

**NEMA and NEC RATINGS**

<table>
<thead>
<tr>
<th>Drive type</th>
<th>Frame size</th>
<th>Input current</th>
<th>Nominal use</th>
<th>Light-duty use</th>
<th>Heavy-duty use</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td></td>
<td>A</td>
<td>A</td>
<td>A</td>
<td>hp</td>
<td>hp</td>
</tr>
</tbody>
</table>

**Note:** The final derating factor is a multiplication of all applicable derating factors.
**Ambient temperature derating**

In the temperature range +40…55 °C (+104…131 °F), the rated output current is derated by 1% for every added 1 °C (1.8 °F) as follows. Calculate the output current by multiplying the current given in the rating table by the derating factor.

![Derating factor chart](chart)

**Altitude derating**

At altitudes from 1000 to 4000 m (3300 to 13123 ft) above sea level, the derating is 1% for every 100 m (328 ft). For a more accurate derating, use the DriveSize PC tool.

**Deratings for special settings in the drive control program**

Switching frequencies other than 1.5 kHz can require output current derating. If you change the minimum switching frequency with parameter 97.02 Minimum switching frequency, calculate the derated output current by multiplying the current given in the rating table by the derating factor given in the table below.

<table>
<thead>
<tr>
<th>Frame size</th>
<th>Derating factor</th>
<th>1 kHz</th>
<th>2 kHz</th>
<th>4 kHz</th>
<th>8 kHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>R10</td>

<td></td>
</tr>
<tr>
<td>R11</td>
<td>1</td>
<td>0.92</td>
<td>0.78</td>
<td>0.58</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Changing the value of parameter 97.01 Switching frequency reference does not require derating.

For more information, contact local ABB.
Fuses (IEC)

aR fuses for protection against short-circuit in the input power cable or drive are listed below.

Note 1: See also Implementing thermal overload and short-circuit protection on page 61.

Note 2: In multicable installations, install only one fuse per phase (not one fuse per conductor).

Note 3: Fuses with higher current rating than the recommended ones must not be used. Fuses with lower current rating can be used.

Note 4: Fuses from other manufacturers can be used if they meet the ratings and the melting curve of the fuse does not exceed the melting curve of the fuse mentioned in the table.

Fuses (UL)

UL fuses for branch circuit protection per NEC are listed below. Check that the operating time of the fuse is below 0.1 seconds. The operating time depends on the fuse type, supply network impedance and the cross-sectional area, material and length of the supply cable. The fuses must be of the "non-time delay" type. Obey local regulations.

---

### Ultrarapid (aR) fuses

Terminal and lead-through data for the power cables

The maximum accepted cable size is $4 \times (3 \times 240) \text{ mm}^2$ or $4 \times (3 \times 500 \text{ AWG})$. Screw size for connecting busbars to the drive module input and output busbars: M12, tightening torque 50...75 N·m.

- Drive modules without output cable connection terminals (+OH371) and with a common mode filter (+E208)

It is possible to use the maximum cable size ($4 \times [3 \times 240] \text{ mm}^2$ or $4 \times [3 \times 500 \text{ AWG}]$) only with special cable lugs and additional insulation. For more information, contact your local ABB representative.

Terminal data for the control cables

See page 84.
Electrical power network specification

Voltage \((U_1)\)

ACS580-04-xxxx-4 drive modules: 380...480 V AC 3-phase \(\pm 10\%\). This is indicated in the type designation label as typical input voltage levels 3~400/480 V AC.

Network type

TN (grounded) and IT (ungrounded) systems

Rated conditional short-circuit current \(I_{cc}\) (IEC 61800-5-1)

Maximum allowable prospective short-circuit current is 65 kA when protected by the fuses given in the fuse table.

Short-circuit current protection (UL 508A)

The drive is suitable for use on a circuit capable of delivering not more than 150,000 rms symmetrical amperes at 600 V maximum when by the fuses given in the fuse table.

Frequency

48 to 63 Hz, maximum rate of change 17%/s

Imbalance

Max. \(\pm 3\%\) of nominal phase to phase input voltage

Fundamental power factor \((\cos \phi _1)\)

0.98 (at nominal load)

Motor connection data

Motor types

Asynchronous AC induction motors, synchronous reluctance motors and synchronous permanent magnet motors

Voltage \((U_2)\)

0 to \(U_1\), 3-phase symmetrical. This is indicated in the type designation label as typical output voltage level 3~\(U_1\),

Frequency

0...500 Hz

Frequency resolution

0.01 Hz

Current

See section Ratings

Frequency

0...500 Hz. For drives with \(du/dt\) filter: 200 Hz

Switching frequency

= nominal switching frequency. Minimum switching frequency 1.5 kHz, 2 kHz, 4 kHz, 8 kHz (depends on the parameter settings)

Maximum recommended motor cable length

<table>
<thead>
<tr>
<th>Vector control</th>
<th>Scalar control</th>
</tr>
</thead>
<tbody>
<tr>
<td>300 m (984 ft)</td>
<td>300 m (984 ft)</td>

Control unit (CCU-24) connection data

External power supply Term. 40, 41

Maximum power: 36 W, 1.50 A at 24 V AC/DC \(\pm 10\%\) as standard

Terminal size: 0.14...2.5 mm²

+24 V DC output (Term. 10)

Total load capacity of this output is 8.0 W (250 mA / 24 V) minus the power taken by the option modules installed on the board.

Terminal size: 0.14...2.5 mm²
## Technical data

**Digital inputs DI1...DI6 (Term. 13...18)**
- **Input type**: NPN/PNP
- **Terminal size**: 0.14...2.5 mm$^2$
- **DI1...DI5 (Term. 13...17)**
  - 12/24 V DC logic levels: "0" < 4 V, "1" > 8 V
  - $R_{in}$: 3 kohm
  - Hardware filtering: 0.04 ms, digital filtering: 2 ms sampling
- **DI6 (Term. 17)**
  - Can be used as a digital or frequency input.
  - 12/24 V DC logic levels: "0" < 3 V, "1" > 8 V
  - $R_{in}$: 3 kohm
  - Max. frequency 16 kHz
  - Symmetrical signal (duty cycle D = 0.50)
- **Note**: DI6 is not supported in the NPN configuration.

**Relay outputs RO1...RO3 (Term. 19...27)**
- **250 V AC / 30 V DC, 2 A**
- **Terminal size**: 0.14...2.5 mm$^2$
- **See section Isolation areas on page 122.**

**Analog inputs AI1 and AI2 (Term. 2 and 5)**
- **Current/voltage input mode selected with a parameter**
  - Current input: 0(4)...20 mA, $R_{in}$: 100 ohm
  - Voltage input: 0(2)...10 V, $R_{in}$: > 200 kohm
- **Terminal size**: 0.14...2.5 mm$^2$
- **Inaccuracy**: typical ±1%, max. ±1.5% of full scale

**Analog outputs AO1 and AO2 (Term. 7 and 8)**
- **Current/voltage output mode for AO1 selected with a parameter**
  - Current output: 0...20 mA, $R_{load}$: < 500 ohm
  - Voltage output: 0...10 V, $R_{load}$: > 100 kohm (AO1 only)
- **Terminal size**: 0.14...2.5 mm$^2$
- **Inaccuracy**: ±1% of full scale (in voltage and current modes)

**Reference voltage output for analog inputs +10V DC (Term. 4)**
- **Max. 20 mA output**
- **Inaccuracy**: ±1%

**Safe torque off (STO) inputs IN1 and IN2 (Term. 37 and 38)**
- **24 V DC logic levels: "0" < 5 V, "1" > 13 V**
- **$R_{in}$**: 2.47 kohm
- **Terminal size**: 0.14...2.5 mm$^2$
- **STO cable**
  - Maximum cable length 300 m (984 ft) between activation switch (K) and drive control board, see section Wiring examples on page 143 and Safety data on page 150.

**Control panel - drive connection**
- **EIA-485, male RJ-45 connector, max. cable length 100 m**

**Control panel - PC connection**
- **USB Type Mini-B, max. cable length 2 m**
Isolation areas

Reinforced insulation (IEC/EN 61800-5-1:2016)
Functional insulation (IEC/EN 61800-5-1:2016)

The terminals on the control board fulfill the Protective Extra Low Voltage (PELV) requirements (EN 50178): There is reinforced insulation between the user terminals which only accept ELV voltages and terminals that accept higher voltages (relay outputs).

Note: There is functional insulation also between the individual relay outputs.
Note: There is reinforced insulation on the power unit.

Control panel type

+J400 ACH-AP-H Hand-Off-Auto control panel (standard)
+J424 CDUM-01 Blank control panel cover
+J429 ACS-AP-W Assistant control panel with Bluetooth interface

Efficiency

Approximately 98% at nominal power level

Degree of protection

IP00. With option +B051: IP20
## Ambient conditions

Environmental limits for the drive are given below. The drive is to be used in a heated, indoor, controlled environment.

Materials

Drive enclosure
- PC/ABS 2.5 mm, color NCS 1502-Y (RAL 9002 / PMS 420 C)
- hot-dip zinc coated steel sheet 1.5 to 2.5 mm, thickness of coating 100 micrometers, color NCS 1502-Y

Package
Plywood and cardboard, bands PP.

Disposal
The main parts of the drive can be recycled to preserve natural resources and energy. Product parts and materials should be dismantled and separated.
Generally all metals, such as steel, aluminum, copper and its alloys, and precious metals can be recycled as material. Plastics, rubber, cardboard and other packaging material can be used in energy recovery. Printed circuit boards and DC capacitors (C1-1 to C1-x) need selective treatment according to IEC 62635 guidelines. To aid recycling, plastic parts are marked with an appropriate identification code.
Contact your local ABB distributor for further information on environmental aspects and recycling instructions for professional recyclers. End of life treatment must follow international and local regulations.

Applicable standards
- EN 61800-5-1:2016 Adjustable speed electrical power drive systems. Part 5-1: Safety requirements – electrical, thermal and energy

CE marking
A CE mark is attached to the drive to verify that the unit follows the provisions of the European Low Voltage, EMC, and RoHS Directives. The CE marking also verifies that the drive, in regard to its safety functions (such as Safe torque off), conforms with the Machinery Directive as a safety component.

 Compliance with the European Low Voltage Directive
The compliance with the European Low Voltage Directive has been verified according to standards EN 60204-1 and EN 61800-5-1.
Compliance with the European EMC Directive
The EMC Directive defines the requirements for immunity and emissions of electrical equipment used within the European Union. The EMC product standard (EN 61800-3:2004) covers requirements stated for drives. See section Compliance with EN 61800-3:2004 below.

Compliance with the European RoHS Directive
The RoHS Directive defines the restriction of the use of certain hazardous substances in electrical and electronic equipment.

Compliance with the European Machinery Directive
The drive is an electronic product which is covered by the European Low Voltage Directive. However, the drive includes the Safe torque off function and can be equipped with other safety functions for machinery which, as safety components, are in the scope of the Machinery Directive. These functions of the drive comply with European harmonized standards such as EN 61800-5-2.

Compliance with EN 61800-3:2004

Definitions
EMC stands for Electromagnetic Compatibility. It is the ability of electrical/electronic equipment to operate without problems within an electromagnetic environment. Likewise, the equipment must not disturb or interfere with any other product or system within its locality.

First environment includes establishments connected to a low-voltage network which supplies buildings used for domestic purposes.

Second environment includes establishments connected to a network not supplying domestic premises.

Drive of category C2: drive of rated voltage less than 1000 V and intended to be installed and started up only by a professional when used in the first environment.

Note: A professional is a person or organization having necessary skills in installing and/or starting up power drive systems, including their EMC aspects.

Drive of category C3: drive of rated voltage less than 1000 V and intended for use in the second environment and not intended for use in the first environment.

Drive of category C4: drive of rated voltage equal to or above 1000 V, or rated current equal to or above 400 A, or intended for use in complex systems in the second environment.
## Category C3

The drive complies with the standard with the following provisions:

1. The drive is equipped with EMC filter (option +E210) and common mode filter (option+E208).
2. The motor and control cables are selected as specified in the hardware manual.
3. The drive is installed according to the instructions given in the hardware manual.
4. Maximum motor cable length is 100 meters.
5. The value of parameter 97.01 Switching frequency reference must be set to 2 kHz.

**WARNING!** A drive of category C3 is not intended to be used on a low-voltage public network which supplies domestic premises. Radio frequency interference is expected if the drive is used on such a network.

## Category C4

If the provisions under **Category C3** cannot be met, the requirements of the standard can be met as follows:

1. It is ensured that no excessive emission is propagated to neighboring low-voltage networks. In some cases, the inherent suppression in transformers and cables is sufficient. If in doubt, the supply transformer with static screening between the primary and secondary windings can be used.
2. An EMC plan for preventing disturbances is drawn up for the installation. A template is available from the local ABB representative.
3. The motor and control cables are selected as specified in the hardware manual.
4. The drive is installed according to the instructions given in the hardware manual.

**WARNING!** A drive of category C4 is not intended to be used on a low-voltage public network which supplies domestic premises. Radio frequency interference is expected if the drive is used on such a network.
UL marking

The drive modules are cULus Listed.

• Make sure that the drive type designation label includes the cULus Listed marking.

• **CAUTION - Risk of electric shock.** After disconnecting the input power, always wait for 5 minutes to let the intermediate circuit capacitors discharge before you start working on the drive, motor or motor cable.

• The drive must be installed in clean air according to the enclosure classification. Cooling air must be clean, free from corrosive materials and electrically conductive dust. (IP55) UL Type 12 enclosure. This enclosure provides protection from airborne dust and light sprays or splashing water from all directions.

• The maximum surrounding air temperature is 40 °C (104 °F) at rated current. The current is derated for 40 to 55 °C (104 to 131 °F).

• The drive is suitable for use in a circuit capable of delivering not more than 100,000 rms symmetrical amperes, 600 V maximum when protected by the UL fuses given in the table on page 118. The ampere rating is based on tests done according to the appropriate UL standard.

• The cables located within the motor circuit must be rated for at least 75 °C (167 °F) in UL-compliant installations.

• Integral solid state short circuit protection does not provide branch circuit protection. The input cable must be protected with fuses. Suitable IEC fuses are listed on page 118 and UL classified fuses on page 118. These fuses provide branch circuit protection in accordance with the National Electrical Code (NEC) and Canadian Electrical Code. For installation in the United States, also obey any other applicable local codes. For installation in Canada, also obey any applicable provincial codes.

  **Note:** Circuit breakers must not be used without fuses in the USA. Contact your local representative for suitable circuit breakers.

• The drive provides motor overload protection. For the adjustments, see the firmware manual.

• For drive overvoltage category, see page 122. For pollution degree, see page 123.

China RoHS marking

The People’s Republic of China Electronic Industry Standard (SJ/T 11364-2014) specifies the marking requirements for hazardous substances in electronic and electrical products. The green mark is attached to the drive to verify that it does not contain toxic and hazardous substances or elements above the maximum concentration values, and that it is an environmentally-friendly product which can be recycled and reused.

RCM marking

RCM marking is required in Australia and New Zealand. An RCM mark is attached to the drive modules to verify compliance with the relevant standard (IEC 61800-3:2004), mandated by the Trans-Tasman Electromagnetic Compatibility Scheme.

For fulfilling the requirements of the standard, see section **Compliance with EN 61800-3:2004** on page 125.
**WE EE marking**

The drive is marked with the wheelie bin symbol. It indicates that at the end of life the drive should enter the recycling system at an appropriate collection point and not placed in the normal waste stream. See section *Disposal* on page 124.

**EAC (Eurasian Conformity) marking**

The drive has EAC certification. EAC marking is required in Russia, Belarus and Kazakhstan.

**Cybersecurity disclaimer**

This product is designed to be connected to and to communicate information and data via a network interface. It is Customer's sole responsibility to provide and continuously ensure a secure connection between the product and Customer network or any other network (as the case may be). Customer shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

**Disclaimer**

The manufacturer shall have no obligation with respect to any product which (i) has been improperly repaired or altered; (ii) has been subjected to misuse, negligence or accident; (iii) has been used in a manner contrary to the manufacturer's instructions; or (iv) has failed as a result of ordinary wear and tear.
Dimension drawings

Contents of this chapter
This chapter contains dimension drawings of the drive modules.
R10 standard configuration
R10 with options +E208+0H354+H356+0H370+0H371
R10 with option +B051
R11 standard configuration
R11 with options +E208+0H354+H356+0H370+0H371
R11 with option +B051
Air baffles for the drive module with option +B051

This drawing shows the dimensions of the hole in the air baffle around the drive module with option +B051. The drawing also shows the correct vertical location area of the air baffle as measured from the top grill.
Example circuit diagram

Contents of this chapter
This chapter shows an example circuit diagram for a cabinet-installed drive module.
Example circuit diagram

This diagram is an example for the main wiring of a drive cabinet. Note that the diagram includes components which are not included in a basic delivery (* plus code options, ** other options, *** to be acquired by the customer).
Safe torque off function

Contents of this chapter

This chapter describes the Safe torque off (STO) function of the drive and gives instructions for its use.

Description

The Safe torque off function can be used, for example, to construct safety or supervision circuits that stop the inverter in case of danger (such as an emergency stop circuit). Another possible application is a prevention of unexpected start-up switch that enables short-time maintenance operations like cleaning or work on non-electrical parts of the machinery without switching off the power supply to the inverter.

When activated, the Safe torque off function disables the control voltage of the power semiconductors of the drive output stage (A, see diagram below), thus preventing the drive from generating the torque required to rotate the motor. If the motor is running when Safe torque off is activated, it coasts to a stop.

The Safe torque off function has a redundant architecture, that is, both channels must be used in the safety function implementation. The safety data given in this manual is calculated for redundant use, and does not apply if both channels are not used.

The Safe torque off function of the drive complies with these standards:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEC 61326-3-1:2008</td>
<td>Electrical equipment for measurement, control and laboratory use – EMC requirements – Part 3-1: Immunity requirements for safety-related systems and for equipment intended to perform safety-related functions (functional safety) – General industrial applications</td>
</tr>
</tbody>
</table>
Safe torque off function

The function also corresponds to Prevention of unexpected start-up as specified by EN 1037:1995 + A1:2008 and Uncontrolled stop (stop category 0) as specified in EN/IEC 60204-1.

Compliance with the European Machinery Directive

See section Compliance with the European Machinery Directive on page 125. See Electrical planning instructions for ACS880 multidrive cabinets and modules (3AU0000102324 [English]).

Wiring

The following diagrams present examples of Safe torque off wiring for
- a single drive (page 141)
- multiple drives (page 145)
- multiple drives when an external 24 V DC power supply is used (page 146).

For information on the specifications of the STO input, see section Default I/O connection diagram (ABB standard macro) on page 84.

For drives with option +L537, see CPTC-02 ATEX-certified thermistor protection module, Ex II (2) GD (+L537+Q971) user's manual (3AXD50000030058 [English]).

Activation switch

In the wiring diagrams below, the activation switch has the designation [K]. This represents a component such as a manually operated switch, an emergency stop push button switch, or the contacts of a safety relay or safety PLC.
- In case a manually operated activation switch is used, the switch must be of a type that can be locked out to the open position.
- The contacts of the switch or relay must open/close within 200 ms of each other.
- An CPTC-02 thermistor protection module can also be used. For more information, see section CPTC-02 ATEX-certified thermistor protection module, (external 24 V AC/DC and isolated PTC interface) on page 172.
- **Cable types and lengths**
  - Double-shielded twisted-pair cable is recommended.
  - Maximum cable lengths:
    - 300 m (1000 ft) between activation switch [K] and drive control unit
    - 60 m (200 ft) between multiple drives
    - 60 m (200 ft) between external power supply and first drive.
  
  **Note:** The voltage at the INx terminals of each control unit must be at least 17 V DC to be interpreted as “1”.

- **Grounding of protective shields**
  - Ground the shield in the cabling between the activation switch and the control unit at the control unit.
  - Ground the shield in the cabling between two control units at one control unit only.

- **Single drive (internal power supply)**
### Single drive (external +24 V DC power supply)

- **Control unit**
  - OUT1
  - OUT2
  - SGND
  - IN1
  - IN2

- **Drive**
  - T1/U, T2/V, T3/W
  - UDC+
  - UDC–

- **Control logic**
  - +24 V DC
  - -K

### Dual-channel connection

- **Drive**
  - +24 V
  - OUT1
  - SGND

- **Control unit**
  - IN1

- **Control logic**
  - +24 V
  - -K
  - UDC+
  - A
  - T1/U, T2/V, T3/W
### Single-channel connection

![Diagram of single-channel connection](image)

**Notes:**
- Both STO inputs (IN1, IN2) must be connected to the activation switch. Otherwise, no SIL/PL classification is given.
- Pay special attention to avoiding any potential failure modes for the wiring. For example, use shielded cable. For measures for fault exclusion of wiring, see eg. EN ISO 13849-2:2012, table D.4.

### Wiring examples

An example of a Safe torque off wiring with internal +24 V DC power supply is shown below.

![Diagram of wiring examples](image)
An example of a Safe torque off wiring with external +24 V DC power supply is shown below.
Multiple drives (internal power supply)
Multiple drives (external power supply)
Operation principle

1. The Safe torque off activates (the activation switch is opened, or safety relay contacts open).
2. STO inputs on the drive control unit de-energize.
3. The control unit cuts off the control voltage from the drive IGBTs.
4. The control program generates an indication as defined by parameter 31.22 – see ACH560 firmware manual (3AXD50000027537[English]).
5. Motor coasts to a stop (if running). The drive cannot restart while the activation switch or safety relay contacts are open. After the contacts close, a new start command is required to start the drive.

Start-up including acceptance test

To ensure the safe operation of a safety function, validation is required. The final assembler of the machine must validate the function by performing an acceptance test.

The acceptance test must be performed
- at initial start-up of the safety function
- after any changes related to the safety function (circuit boards, wiring, components, settings, etc.)
- after any maintenance work related to the safety function.

Competence

The acceptance test of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6. The test procedures and report must be documented and signed by this person.

Acceptance test reports

Signed acceptance test reports must be stored in the logbook of the machine. The report shall include documentation of start-up activities and test results, references to failure reports and resolution of failures. Any new acceptance tests performed due to changes or maintenance shall be logged into the logbook.

Acceptance test procedure

After wiring the Safe torque off function, validate its operation as follows.

<table>

Safe torque off function

1. Open the activation switch, or activate the safety functionality that is wired to the STO connection.

2. STO inputs on the drive control unit de-energize, and the drive control unit cuts off the control voltage from the drive IGBTs.

3. The control program generates an indication as defined by parameter 31.22 – see ACH580 firmware manual (3AXD50000027537 [English]).

4. Motor coasts to a stop (if running). The drive will not restart while the activation switch or safety relay contacts are open.

5. Deactivate the STO by closing the activation switch, or resetting the safety functionality that is wired to the STO connection.

6. Reset any faults before restarting.

---

<table>
<thead>
<tr>
<th>Action</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Test the operation of the STO function when the motor is stopped.</td>
<td></td>
</tr>
<tr>
<td>• Give a stop command for the drive (if running) and wait until the motor shaft is at a standstill.</td>
<td></td>
</tr>
<tr>
<td>Make sure that the drive operates as follows:</td>
<td></td>
</tr>
<tr>
<td>• Open the STO circuit. The drive generates an indication if one is defined for ‘stopped’ state in parameter 31.22 (see the firmware manual).</td>
<td></td>
</tr>
<tr>
<td>• Give a start command to verify that the STO function blocks the drive operations. The motor should not start.</td>
<td></td>
</tr>
<tr>
<td>• Close the STO circuit.</td>
<td></td>
</tr>
<tr>
<td>• Reset any active faults. Restart the drive and check that the motor runs normally.</td>
<td></td>
</tr>
</tbody>
</table>

Test the operation of the STO function when the motor is running.

• Start the drive and ensure the motor is running.
• Open the STO circuit. The motor should stop. The drive generates an indication if one is defined for ‘running’ state in parameter 31.22 (see the firmware manual).
• Reset any active faults and try to start the drive.
• Ensure that the motor stays at a standstill and the drive operates as described above in testing the operation when the motor is stopped.
• Close the STO circuit.
• Reset any active faults. Restart the drive and check that the motor runs normally.

Test the operation of the failure detection of the inverter. The motor can be stopped or running.

• Open the 1st channel of the STO circuit (wire coming to IN1). If the motor was running, it should coast to a stop. The inverter generates a FA81 Safe Torque Off 1 loss fault indication (see the firmware manual).
• Give a start command to verify that the STO function blocks the inverter’s operation. The motor should not start.
• Close the STO circuit.
• Reset any active faults. Restart the inverter and check that the motor runs normally.
• Open the 2nd channel of the STO circuit (wire coming to IN2). If the motor was running, it should coast to a stop. The inverter generates a FA82 Safe Torque Off 2 loss fault indication (see the firmware manual).
• Give a start command to verify that the STO function blocks the inverter’s operation. The motor should not start.
• Close the STO circuit.
• Reset any active faults. Restart the inverter and check that the motor runs normally.

Document and sign the acceptance test report which verifies that the safety function is safe and accepted for operation.

---

Use

1. Open the activation switch, or activate the safety functionality that is wired to the STO connection.

2. STO inputs on the drive control unit de-energize, and the drive control unit cuts off the control voltage from the drive IGBTs.

3. The control program generates an indication as defined by parameter 31.22 – see ACH580 firmware manual (3AXD50000027537 [English]).

4. Motor coasts to a stop (if running). The drive will not restart while the activation switch or safety relay contacts are open.

5. Deactivate the STO by closing the activation switch, or resetting the safety functionality that is wired to the STO connection.

6. Reset any faults before restarting.
WARNING! The Safe torque off function does not disconnect the voltage of the main and auxiliary circuits from the drive. Therefore maintenance work on electrical parts of the drive or the motor can only be carried out after isolating the drive from the main supply.

WARNING! (With permanent magnet or synchronous reluctance [SynRM] motors only) In case of a multiple IGBT power semiconductor failure, the drive system can produce an alignment torque which maximally rotates the motor shaft by $180/p$ (with permanent magnet motors) or $180/2p$ (with synchronous reluctance [SynRM] motors) degrees regardless of the activation of the Safe torque off function. $p$ denotes the number of pole pairs.

Notes:
• If a running drive is stopped by using the Safe torque off function, the drive will cut off the motor supply voltage and the motor will coast to a stop. If this causes danger or is not otherwise acceptable, stop the inverter and machinery using the appropriate stop mode before activating the Safe torque off function.
• The Safe torque off function overrides all other functions of the drive.
• The Safe torque off function is ineffective against deliberate sabotage or misuse.
• The Safe torque off function has been designed to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. The assembler of the machine must inform the final user about the residual risks.

Maintenance
After the operation of the circuit is validated at start-up, the STO function shall be maintained by periodic proof testing. In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 5 or 2 years; see section Safety data (page 150). It is assumed that all dangerous failures of the STO circuit are detected by the proof test. To perform the proof test, do the Acceptance test procedure (page 147).

Note: See also the Recommendation of Use CNB/M/11.050 (published by the European co-ordination of Notified Bodies) concerning dual-channel safety-related systems with electromechanical outputs:
• When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be performed at least every month.
• When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be performed at least every 12 months.

The STO function of the drive does not contain any electromechanical components. In addition to proof testing, it is a good practice to check the operation of the function when other maintenance procedures are carried out on the machinery.

Include the Safe torque off operation test described above in the routine maintenance program of the machinery that the drive runs.

If any wiring or component change is needed after start-up, or the parameters are restored, follow the test given in section Acceptance test procedure on page 147.

Use only ABB approved spare parts.

Record all maintenance and proof test activities in the machine logbook.
Safe torque off function

Compentence

The maintenance and proof test activities of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6.

Fault tracing

The indications given during the normal operation of the Safe torque off function are selected by drive parameter 31.22.

The diagnostics of the Safe torque off function cross-compare the status of the two STO channels. In case the channels are not in the same state, a fault reaction function is performed and the inverter trips on an "STO hardware failure" fault. An attempt to use the STO in a non-redundant manner, for example activating only one channel, will trigger the same reaction.

See the drive firmware manual for the indications generated by the drive, and for details on directing fault and warning indications to an output on the control unit for external diagnostics.

Any failures of the Safe torque off function must be reported to ABB.

Safety data

Preliminary safety data for the Safe torque off function is given below.

Note: The safety data is calculated for redundant use, and does not apply if both STO channels are not used.

<table>
<thead>
<tr>
<th>Frame size</th>
<th>SIL/SILCL</th>
<th>SC</th>

</tbody>
</table>

* According to Table E1 EN/ISO 13849-1

- The following temperature profile is used in safety value calculations:
  - 670 on/off cycles per year with \( \Delta T = 71.66 \) °C
  - 1340 on/off cycles per year with \( \Delta T = 61.66 \) °C
  - 30 on/off cycles per year with \( \Delta T = 10.0 \) °C
  - 32 °C board temperature at 2.0% of time
  - 60 °C board temperature at 1.5% of time
  - 85 °C board temperature at 2.3% of time

- The safety data is calculated for redundant use, and does not apply if both channels are not used.
- The STO is a type A safety component as defined in IEC 61508-2.
- Relevant failure modes:
  - The STO trips spuriously (safe failure)
  - The STO does not activate when requested

A fault exclusion on the failure mode “short circuit on printed circuit board” has been made (EN 13849-2, table D.5). The analysis is based on an assumption that one failure occurs at one time. No accumulated failures have been analyzed.
- STO reaction time (shortest detectable break): 1 ms
- STO response time: 2 ms (typical), 5 ms (maximum)
- Fault detection time: Channels in different states for longer than 200 ms
- Fault reaction time: Fault detection time + 10 ms
- STO fault indication (parameter 31.22) delay: < 500 ms
- STO warning indication (parameter 31.22) delay: < 1000 ms

Optional I/O extension modules

Contents of this chapter
This chapter describes how to install and start up the optional CHDI-01, CMOD-01 and CMOD-02 I/O extension modules. The chapter also contains their diagnostics and technical data.

CHDI-01 115/230 V digital input extension module

- Safety instructions

WARNING! Obey the safety instructions for the drive. If you ignore the safety instructions, injury or death can occur.

- Hardware description

Product overview
The CHDI-01 115/230 V digital input extension module expands the inputs of the drive control unit. It has six high voltage inputs and two relay outputs.
Layout

Necessary tools and instructions

- Screwdriver and a set of suitable bits.

Unpacking and checking the delivery

1. Open the option package.
2. Make sure that the package contains:
   - CHDI-01 high voltage digital extension module
   - mounting screw.
3. Make sure that there are no signs of damage.

Installing the module

See chapter Installing option modules on page 89.

Electrical installation

Warnings

WARNING! Obey the instructions in chapter Safety instructions on page 13. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrician, do not do electrical work.

Make sure that the drive is disconnected from the input power during installation. If the drive is already connected to the input power, wait for 5 minutes after disconnecting the input power.

Necessary tools and instructions

- Screwdriver and a set of suitable bits
- Cabling tools

Terminal designations

For more detailed information on the connectors, see section Technical data on page 164.

General cabling instructions

Obey the instructions given in chapter Guidelines for planning the electrical installation on page 51.

Wiring

Connect the external control cables to the applicable module terminals. Ground the outer shield of the cables 360 degrees under a grounding clamp next to the control unit.
Start-up

Setting the parameters

1. Power up the drive.
2. If no warning is shown,
   • make sure that the value of both parameter 15.02 Detected extension module and parameter 15.01 Extension module type is CHDI-01.
   If warning A7AB Extension I/O configuration failure is shown,
   • make sure that the value of parameter 15.02 Detected extension module is CHDI-01.
   • set parameter 15.01 Extension module type to CHDI-01.
   You can now see the parameters of the extension module in parameter group 15 I/O extension module.
3. Set the parameters of the extension module to applicable values.
   Parameter setting example for relay output
   This example shows how to make relay output RO4 of the extension module indicate the reverse direction of rotation of the motor with a one-second delay.

**Technical data**

**Dimension drawing:**

The dimensions are in millimeters and [inches].

**Installation:** Into an option slot on the drive control unit

**Degree of protection:** IP20

**Ambient conditions:** See the drive technical data.

**Package:** Cardboard
Isolation areas:

- Relay outputs (50…52, 53…55):
  - Wire size max. 1.5 mm²
  - Minimum contact rating: 12 V / 10 mA
  - Maximum contact rating: 250 V AC / 30 V DC / 2 A
  - Maximum breaking capacity: 1500 VA

- 115/230 V inputs (70…78):
  - Wire size max. 1.5 mm²
  - Input voltage: 115 to 230 V AC ±10%
  - Maximum current leakage in digital off state: 2 mA
CMOD-01 multifunction extension module (external 24 V AC/DC and digital I/O)

Safety instructions

**WARNING!** Obey the safety instructions for the drive. If you ignore the safety instructions, injury or death can occur.

Hardware description

Product overview

The CMOD-01 multifunction extension module (external 24 V AC/DC and digital I/O) expands the outputs of the drive control unit. It has two relay outputs and one transistor output, which can function as a digital or frequency output.

In addition, the extension module has an external power supply interface, which can be used to power up the drive control unit in case the drive power supply fails. If you do not need the back-up power supply, you do not have to connect it because the module is powered from the drive control unit by default.

**WARNING!** Do not connect the +24 V AC cable to the control unit ground when the control unit is powered using an external 24 V AC supply.
**Optional I/O extension modules**

### Mechanical installation

#### Necessary tools and instructions
- Screwdriver and a set of suitable bits.

#### Unpacking and checking the delivery
1. Open the option package.
2. Make sure that the package contains:
   - CMOD-01 multifunction extension module
   - mounting screw.
3. Make sure that there are no signs of damage.

### Installing the module

See chapter **Installing option modules** on page 89.
## Electrical installation

### Warnings

**WARNING!** Obey the instructions in chapter *Safety instructions* on page 13. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrician, do not do electrical work.

Make sure that the drive is disconnected from the input power during installation. If the drive is already connected to the input power, wait for 5 minutes after disconnecting the input power.

### Necessary tools and instructions

- Screwdriver and a set of suitable bits
- Cabling tools

### Terminal designations

For more detailed information on the connectors, see section *Technical data* on page 164.

**WARNING!** Do not connect the +24 V AC cable to the control unit ground when the control unit is powered using an external 24 V AC supply.
## Start-up

**Setting the parameters**

1. Power up the drive.

2. If no warning is shown,
   - make sure that the value of both parameter 15.02 Detected extension module and parameter 15.01 Extension module type is CMOD-01.
   
   If warning A7AB Extension I/O configuration failure is shown,
   - make sure that the value of parameter 15.02 Detected extension module is CMOD-01.
   - set parameter 15.01 Extension module type to CMOD-01.
   
   You can now see the parameters of the extension module in parameter group 15 I/O extension module.

3. Set the parameters of the extension module to applicable values.
   
   Examples are given below.

### Parameter setting example for relay output

This example shows how to make relay output RO4 of the extension module indicate the reverse direction of rotation of the motor with a one-second delay.

Relay outputs (50...52, 53...55):
- Wire size max. 1.5 mm²
- Minimum contact rating: 12 V / 10 mA
- Maximum contact rating: 250 V AC / 30 V DC / 2 A
- Maximum breaking capacity: 1500 VA

Transistor output (42...44):
- Wire size max. 1.5 mm²
- Type: Transistor output PNP
- Maximum load: 4 kohm
- Maximum switching voltage: 30 V DC
- Maximum switching current: 100 mA / 30 V DC, short-circuit protected
- Frequency: 10 Hz ... 16 kHz
- Resolution: 1 Hz
- Inaccuracy: 0.2%

External power supply (40...41):
- Wire size max. 1.5 mm²
- 24 V AC / V DC ±10% (GND, user potential)
- Maximum current consumption: 25 W, 1.04 A at 24 V DC
CMOD-02 multifunction extension module
(external 24 V AC/DC and isolated PTC interface)

Safety instructions

WARNING! Obey the safety instructions for the drive. If you ignore the safety instructions, injury or death can occur.

Hardware description

Product overview
The CMOD-02 multifunction extension module (external 24 V AC/DC and isolated PTC interface) has a motor thermistor connection for supervising the motor temperature and one relay output, which indicates the thermistor status. To trip the drive, the user must connect this overtemperature indication back to the drive, for example, to its Safe torque off input.

In addition, the extension module has an external power supply interface, which can be used to power up the drive control unit in case the drive power supply fails. If you do not need the back-up power supply, you do not have to connect it because the module is powered from the drive control unit by default.

There is reinforced insulation between the motor thermistor connection, the relay output and the drive control unit interface. Thus, you can connect a motor thermistor to the drive through the extension module.

WARNING! Do not connect the +24 V AC cable to the control unit ground when the control unit is powered using an external 24 V AC supply.
### Mechanical installation

**Necessary tools and instructions**
- Screwdriver and a set of suitable bits

**Unpacking and checking the delivery**
1. Open the option package.
2. Make sure that the package contains:
   - CMOD-02 multifunction extension module
   - mounting screw
3. Make sure that there are no signs of damage.

**Installing the module**
See chapter *Installing option modules* on page 89.
Electrical installation

Warnings

WARNING! Obey the instructions in chapter Safety instructions on page 13. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrician, do not do electrical work.

Make sure that the drive is disconnected from the input power during installation. If the drive is already connected to the input power, wait for 5 minutes after disconnecting the input power.

Necessary tools and instructions

- Screwdriver and a set of suitable bits
- Cabling tools

Terminal designations

For more detailed information on the connectors, see section Technical data on page 170.

Motor thermistor connection

General cabling instructions

Obey the instructions given in chapter Guidelines for planning the electrical installation on page 51.

Wiring

Connect the external control cables to the applicable module terminals. Ground the outer shield of the cables 360 degrees under a grounding clamp next to the control unit.
Motor thermistor connection example

1) One or 3...6 PTC thermistors connected in series.
The PTC input is reinforced/double insulated. If the motor part of the PTC sensor and wiring are reinforced/double insulated, voltages on the PTC wiring are within SELV limits. If the motor PTC circuit is not reinforced/double insulated (i.e., it is basic insulated), it is mandatory to use reinforced/double insulated wiring between the motor PTC and CMOD-02 PTC terminal.

Relay output connection example

Power supply connection example

1) External power supply, 24 V AC/DC

**WARNING!** Do not connect the +24 V AC cable to the control unit ground when the control unit is powered using an external 24 V AC supply.

### Start-up

**Setting the parameters**

1. Power up the drive.
2. If no warning is shown,
   - make sure that the value of both parameter 15.02 Detected extension module and parameter 15.01 Extension module type is CMOD-02.
If warning A7AB Extension I/O configuration failure is shown,
- make sure that the value of parameter 15.02 Detected extension module is CMOD-02
- set parameter 15.01 Extension module type to CMOD-02.
You can now see the parameters of the extension module in parameter group 15 I/O extension module.

## Diagnostics

### Faults and warning messages
Warning A7AB Extension I/O configuration failure.

### LEDs
The extension module has one diagnostic LED.

## Technical data

### Dimension drawing:
The dimensions are in millimeters and [inches].

**Installation:** Into an option slot on the drive control unit

**Degree of protection:** IP20
Ambient conditions: See the drive technical data.

Package: Cardboard

Isolation areas:

Motor thermistor connection (60...61):
- Wire size max. 1.5 mm²
- Supported standards: DIN 44081 and DIN 44082
- Number of PTC thermistor relays: 1 or 3...6 in series
- Triggering threshold: 3.6 kohm
- Recovery threshold: 1.6 kohm
- PTC terminal voltage: \( \leq 5.0 \text{ V} \)
- PTC terminal current: \(< 1 \text{ mA}\)
- Short-circuit detection: \(< 50 \text{ ohm}\)

Relay output (62...63):
- Wire size max. 1.5 mm²
- Maximum contact rating: 250 V AC / 30 V DC / 5 A
- Maximum breaking capacity: 1000 VA

External power supply (40...41):
- Wire size max. 1.5 mm²
- 24 V AC / V DC ±10% (GND, user potential)
- Maximum current consumption: 25 W, 1.04 A at 24 V DC
