   Embedded ATS: Grey vs Black trip units
Over the last years, service continuity in low voltage electrical installations has played an increasingly leading role. In actual fact, this requirement is a fundamental characteristic if economically and functionally efficient installations have to be created.

A system able to switch the supply from the main line to an emergency line reduces problems caused by faulty conditions in the public network to the minimum. These operations, commonly known as “automatic switching”, comprise sequences that automatically control the installation components (the circuit-breakers play a fundamental role) without interventions from the operator.

To guarantee that power is supplied to the loads, a fundamental requirement in an installation is to have a redundancy in supply sources type N+1, usually consisting of a transformer and emergency generator (or, as an alternative, a second transformer).

**Installations with an automatic switching system:**
- Maximize the service continuity of any processes
- Provide a power supply with high quality voltage if the main network is out of service
- Manage microgrid connection and disconnection from the main grid
- Reduce the effects caused by network faults on parts of the installation (voltage reduction leads to loss of stability in the rotating Machines, a higher voltage drop, faults in the equipment, etc.)
- Achieve a good compromise amongst reliability, simplicity and cost-effectiveness
- Provide the maintenance staff and managing system with a power source able to supply the installation or part of it when the transformer is being serviced.

**The ATS solution**

The Embedded ATS is a high-performances energy automation system, easy to install and program. In a world where digital communication is the predominant agent responsible for improved efficiencies and performances in industrial and power applications, ABB is moving to re-invent how digital systems are embedded.
The Embedded ATS system exploits the full capabilities of SACE Emax 2 circuit-breakers and Ekip Connect 3 commissioning tool to deliver compact and reliable solutions.

The All-In-One innovation improves efficiency in any electrical plants. SACE Emax 2 circuit breakers offer the highest short circuit performances in the most compact size and integrate in one single device both protection functions and automatic transfer switching logics. Ekip Connect 3 permits to exploit the full potential of the Ekip trip units. Thanks to this tool, the user can manage power, acquire and analyze electrical values, test protection, maintenance and diagnostic functions.

Where are you going to use the Embedded ATS function? And why?

Where can ATS be applied?

Automatic Transfer Switch systems are common in all applications where service continuity is essential and there are multi power sources. The main applications are:

- Oil & Gas
- Operating theatres and primary hospital services
- Emergency power supplies for civil building, hotels and airports
- Data banks and telecommunication systems
- Power supply of industrial line for continuous processes

Another case is when ATS is used in applications where a portion of grid with local generation (called microgrid) can be disconnected from the main network.

---

The benefits

Ready-to-go solution

If you have ever programmed a power automation switchboard, you know that it requires PLC programming skills and electrical knowledge. Moreover, every custom-engineered system demands individual effort and personal responsibility. If settings need to be modified, the engineer may have to re-open the project, which has associated time and money costs. ABB Embedded ATS cuts this long story by offering a general template, already tested and ready-to-go, that can be easily customized. The user can modify basic settings via an intuitive graphical interface. When all the parameters have been properly set, a simple tool allows to upload the template to the devices. And that’s it, the system is up and running.

If settings need to be modified another time, just connect your laptop and implement the changes required through the same easy graphical interface.
General introduction

Simplify the connections

The idea for the Embedded ATS solution emerged considering the complexity of the traditional solutions for power ATS. In the past, whether you were using a PLC or an external protection unit, you would have needed complex, hard-wired cabling between the protection devices, the operating devices (switch disconnectors) and the PLC, as well as the CTs (current transformers) and VTs (voltage transformers). See picture below.

The introduction of the IEC 61850 communication standard for substation automation systems simplified things considerably by defining how devices should report their status and generally transfer data.
This communication is physically achieved via an Ethernet cable or similar. However, even with an architecture based on IEC 61850, many external devices are still needed to manage the complexity of the system.

Select the ABB Embedded ATS solution to master this complexity by harnessing the power of intelligent SACE circuit-breakers together with Ekip Connect 3 software commissioning tool.

With Emax 2 you can integrate measures, protections and communication between the devices and to the network. See picture below.
General introduction

Emax 2 compactness

Thanks to the All-In-One innovation, SACE Emax 2 is the most compact air circuit-breaker in the market by offering a lot of functionalities:
  • Breaker
  • Human-Machine Interface
  • Advanced protection functions
  • Measurement (including the transformers)
  • Interlocking communication (horizontal) between devices
  • Communication to the supervision system (SCADA)
  • Communication to a cloud energy monitoring platform

The Embedded ATS solution is as compact as the Emax 2 is. Nothing needs to be added.
Top-rate reliability

Now, let’s think to a complex switchboard, with many different devices connected. What to do if one element is damaged or one cable is disconnected? See Fig. A.

Emax 2 compactness does not preclude top-rate reliability. All the Ekip protection trip units ensure high reliability by using an electronic circuit that periodically checks the continuity of the internal connections (trip coil, rating plug and current sensors). In the event of a malfunction, the LEDs indicate the corresponding - removable - alarm to enable the fault to be rapidly identified and rectified. See Fig. B.

How it works

ABB Embedded ATS solution is based on four main elements:
- Ekip trip units that enable logic operations
- Ekip Link
- Ekip Synchrocheck (only in case of closed transition systems)
- Ekip Connect 3 tool

The Ekip Touch/Hi-Touch trip units (also in Generator Protection versions) have the capability of managing complex Boolean logic, rather like a PLC. Moreover, every physical, electrical and digital condition of the breaker is digitally mapped.

This means that you have at your disposal thousands of parameters and statuses that can be shared with other devices and used to monitor the entire system. You can use this capability to automate the response of the system according to any circuit breaker status or events. This is the essence of what the Embedded ATS does.

Let’s show an example. Here you can see a very simple logic:

The basic elements are the input statuses (No Alarms, Circuit Breaker Open, Close Command), the Boolean AND operator and the output, which is active when all the input conditions are satisfied (AND function).

In other words, the circuit-breaker will close when it is open, with no alarms shown, and after the close command is sent. This type of logic - and the more complex ones - is exactly what the Embedded ATS can do.
---

**Ekip Link**

The computing power and logic capability of one circuit-breaker (as described above) can be extrapolated to realize a fast and powerful network of interconnected breakers that are able to exchange information each other.

This approach introduces a multiplier in terms of overall system capability that delivers unparalleled performance. Ekip Link is the ABB tool that lets this peer-to-peer communication happen.

Ekip Link enables Emax 2 circuit breakers to perform various tasks:
- Connect to the Ekip Control Panel
- Create logical selectivity
- Be part of a power controller system
- Enable horizontal communication between circuit-breakers

The horizontal communication between Emax 2 circuit-breakers eliminates the need for a supervising device or master and makes data exchange - concerning, for example, status and protection interlocks between circuit breakers - direct and fast.¹

¹ Another prominent method of horizontal communication is by the GOOSE messages described in the IEC 61850 standard.
How it works

Ekip Synchrocheck
(for closed transition only)

A closed transition occurs when a load is switched from one power source to another and for a short, transitional time the two power sources both supply the load, in a parallel fashion. If you want to set up what is called a closed transition ATS, then you need to install an Ekip Synchrocheck module. Conducting a closed transition is a delicate operation and many parameters must be checked and be within certain limits, before the power sources can be paralleled.

The Ekip Synchrocheck module available for SACE Emax 2 circuit-breakers is the accessory required to check that all the conditions for the transfer procedure are satisfied.

Fulfilling ANSI 25 protection, this module compares the angles, phases and frequencies of two voltages: one on the circuit breaker internal voltage plugs and the other on the line to be compared.

When the results of the comparison match predetermined set ranges, a confirmation is generated by analog and digital contacts.

However, this is not the only function performed by the Ekip Synchrocheck. The module can also act as a dead busbar detector by automatically switching from one application to the other one.

Imagine you can take all the digital information it provides and use them inside the Logic system. That’s how we are able to meet the challenge of the most complex ATS systems.
Ekip Connect 3 tool

How does ABB allow to implement the Embedded ATS function in the easiest possible way?

The Ekip Connect 3 software opens the door to the Ekip electronic trip units so their functionality can be fully exploited, in an easy-to-use manner.

This commissioning tool has been created to facilitate and speed up the management of all the functions available. A simple and smart user interface and a thoughtful design of the programming processes make network configuration a breeze.

In addition, it offers measurement visualization, a freely configurable dashboard and various tools to manage information, signals, statuses and documents associated with your devices.

Inside Ekip Connect 3, the ATS software tool is a one-step wizard that allows to:
- Manage ATS projects, including the ability to save, load and share projects
- Set up projects quickly, with an intuitive interface
- Upload projects to the Ekip trip units

In this way, ABB offers a solution that is:
- Engineering-free
- Error-free
- Fast
How to order and use it

How to use it

Once you order the Embedded ATS function, you will receive a USB key containing the license that unlocks your ATS system.

**Step 1:** Open Ekip Connect 3

**Step 2:** Perform a scan of the network to find the available devices

**Step 3:** Enter the Tools section and follow the contextual help to configure your ATS system

**Step 4:** Once configured, use the lower right buttons to save the project or transfer the project to the interested circuit-breakers

It is possible to transfer the ATS project to multiple devices only in case of connection to a Modbus TCP network. Otherwise, the transfer has to be performed one single device per time using Ekip T&P or Ekip Programming. In case of single transfer, one by one, the user has to repeat the scan of the devices each time. After the scan, click again on the Tools section. The project will stay open and on hold, waiting for the next transfer command to send.

Once transferred, the project is permanently associated to the selected circuit-breakers.

To break an association, please contact ABB.

To transfer a project to the circuit-breakers, perform a Scan of the network clicking on the “Scan” section on the left column and following the procedure. After the scan the available circuit-breakers will appear on the list of the ATS commissioning tool.

A progress bar will be displayed and a confirmation message will appear once operations are completed.

---

How to buy the license

Order the USB key containing the unlocking license.

Every license unlocks the whole system. You can swap the role of each authorized circuit breaker any time if you have the USB key inserted (eg. Main 1 become bus-tie and vice-versa).

You can also change every setting with the USB key inserted.

You cannot substitute a breaker associated to the ATS system with a breaker not associated (eg, the Main 1 breaker needs to be changed in the switchboard, the new breaker cannot be associated automatically).

Contact ABB to break an association or substitute a device into the system.
Annex A

Main-Tie-Main Closed Transition

Scope
This specification describes the operating philosophy of the ATS Main-Tie-Main Closed transition system with SACE Emax 2 circuit-breakers. The system is a Main-Tie-Main. The two electrical power sources are transformers.

Modes of operation and controls
Four modes of operation and control are foreseen and described in this document:

- Local control (manual)
- Remote control
- Automatic transfer switch (ATS)
- Manual transfer switch (MTS)

One of the operation modes is selected by means of one of the following switches:

- S1: ATS/MTS mode switch selector
- S2: A-C-B CBs selection for CB trip in MTS mode
  - A = CB-A
  - C = CB-C
  - B = CB-B
- S3: Push-button for starting manual transfer mode
- S4: Emergency latching push-button to exclude the automatic logic
- S43: Local/remote-IPCS selector (one per each circuit-breaker, it can be wired by the customer following the connection schemes in the Emax 2 installation manual)

Main switchgear working philosophy

The main switchgear configuration (see fig.2) under normal operating condition is “TT”:

- Incomer lines from transformer (CB-A and CB-B): Close condition
- Bus-tie (CB-C): Open condition

The circuit breakers shall be manually controlled locally (switchgear) or remotely (IPCS). ATS “break-before-make” and MTS “make-before-break” systems are provided.

The local/remote mode selection shall be done using the selector switch S43 located in each incomer or bus tie cubicle.

Legend

R, S, T, N: Three phases + neutral
MEAS: Measurement module
SYNCH: Ekip Synchrocheck
Feeder A/B: Power sources (transformer or generator)comer or bus tie cubicle.

Note:
ABB provide the internal voltage plug connected as standard to the bottom terminals. To obtain the breaker with the voltage plugs connected to the top terminals, please use the specific extra ordering code.
**S43 - Local control**

When the local/remote selector S43 is set to “Local” at each corresponding CB, opening and closing operations are permitted by using the ON or OFF push-buttons provided with every CB (see fig. 3). The control is manual.

The selector excludes any automatic logic (ATS or MTS) or IPCS remote operations. In practice, the local/remote selector S43 activates the Emax 2 Ekip actuator or the YC/YO direct control.

See the scheme 1 for details. The system permits the closing of every circuit breaker, if done manually.

No Interlock are provided in Manual operations.

---

**S43 - Remote control**

CB-A / CB-B / CB-C (incomers and bus tie) IPCS controls are allowed with switch S43 in the Remote position.

The CBs can be controlled by the IPCS via the defined communication protocol. In remote mode, the CB status can also be controlled by Ekip Connect.

If the Emergency latching push-button S6 is pushed, it is possible to open or close any circuit breaker.

It is not possible to start an MTS sequence in remote mode.
Annex A

S1 - Automatic Transfer Switch (ATS)
The ATS logic works as follows.
Starting from a TT configuration (CB-A and CB-B closed, CB-C open):
- In case of undervoltage (ANSI27) [set point] or Ekip Signalling 4K Digital Input 1, 2 or 3 activated on one line (A or B), the relevant CB opens within the set time [set point].
- After the pre–set time and checking for Ready to Close status, checking for dead busbar (under 10 percent of Un), checking that no electric protection element caused the line to open, checking that the other line is available and healthy (over 90 percent of Un), -CB-C closes.

The ATS shall operate under the following conditions:
- ATS Emergency latching push–button S4 not pressed
- Bus–tie open and RTC
- Other bus bar voltage level > 90 percent of Un

The automatic changeover shall be locked in case of:
- Any protection Trip or alarm (The protections activation and settings must be carried out by the customer)
- Emergency push–button pressed

After a current protection trip of any circuit–breakers, the ATS logic is locked. The lock shall be removed by resetting the circuit–breaker locally or remotely.

When the “ATS Logic Disabled” normally closed pushbutton is pressed:
- The ATS logic is deactivated
  - The line breakers CB-A and CB-B can open for ANSI27
  - The bus–tie breaker CB-C does NOT close after the opening by ANSI27 of one line
- The MTS logic is deactivated

When the “ATS Logic Disabled” normally closed pushbutton is reset after being pressed:
- If no events occurred (ANSI27 or digital input) the ATS system is restored and ready to operate
- If one line breaker opened for ANSI27 while the pushbutton was pressed:
  - If the line voltage is still absent, the ATS system starts the bus–tie closing procedure after the preset time.
  - If the line voltage is back over 90 percent of Un, the system keeps the previous status (line breaker open, bus tie open) and the operator shall manually restore the desired condition.

Starting from an L configuration (CB-A and CB-C closed, CB-B open / CB-B and CB-C closed, CB-A open)
- In the case of undervoltage (ANSI27) on the healthy line, the relevant breaker and the bus–tie open. The system shall be manually restored.
- In the case of return of voltage (over 90 percent of Un) on the previously faulty line, the system is locked. The operator shall activate the MTS operating mode to change the status of the system.

If the ATS system is working properly, the CB-A 4K Output 1 is lit. You can connect the output to a switchboard signalling system or you can communicate the contact status to the IPCS.
S1 - Manual Transfer Switch (MTS)

MTS mode can:
- Restore the normal operating condition (TT) without loss of supply after an ATS operation
- Transfer the load from one transformer to another without loss of supply
- Change the system configuration from TT to L without loss of supply

The ANSI25 Syncrocheck function prevents the paralleling of out-of-synch sources.

The “A-C-B” selector S2 has three positions. Each position acts as follow:
- Position A : CB-C or CB-B will close and CB-A will open;
- Position C: CB-A or CB-B will close and CB-C will open;
- Position B: CB-A or CB-C will close and CB-B will open;

The manual transfer shall be locked in case of:
- Emergency push-button S4 pressed
- The two power sources are out of sync as stated by ANSI25

Compatibility
The Embedded ATS tool is compatible with all the Emax 2 electronic trip units starting from version v02.20.08 of the Ekip Mainboard firmware.

To check the firmware version of your device you can:
1) Use the “Information” section of Ekip Connect 3, Nominal Data field
2) Press the “i” button on the front of the trip unit until the page “Protection Unit” appears.

Notes
Between the external contacts of the circuit-breaker and the inputs of the Ekip Synchrocheck module, an insulation transformer must be always installed (see the technical details in the table below).

Main-Gen Open Transition

Scope
This specification describes the operating philosophy of the ATS Main-Gen Open transition system with SACE Emax 2 circuit-breakers. The device monitors the voltage of the main line and generator line and reacts to the following faults:

- Maximum and minimum voltage
- Maximum and minimum frequency

• Modes of operation and controls
There are three modes of operation available:

Application Limits

- Un = Up to 1150 V
- AUX = 24-240 V
- In = 100-6300 A
- Frequency = 50-60 Hz
- Three-phase with or without neutral
Application Description

1. Auto mode
In case of main line failure, the system starts up the emergency generator and, as soon as power on the generator side is available, the system starts the automatic switching procedure according to TS and TCE times.

When the voltage on the main line comes back, two different behaviors can take place:

1) If the system is set to “Automatic switching without inverse procedure”, the system locks in the current configuration (CB1 OPEN, CB2 CLOSED, generator running)
2) If the system is set to “Automatic switching with inverse procedure”, the system will go back to the original configuration (CB1 CLOSED and CB2 OPEN) with a “Break-Before-Make” switching, according to the set times. Once the transition is completed, the generator switches off.

2. Manual mode
In manual mode, the system can be manually configured running under transformer or under generator.

</tbody>
</table>

Time Diagrams

Application time diagram

Special cases:
- If LN1 returns to normal and it is stabilized before LN2 is normal the sequence interrupts and the generator must be turned off
- If LN1 returns to normal and it is stabilized during TCE, the sequence is completed
- If LN1 disappears during TBS, the sequence interrupts
- If LN1 disappears during TCN, the switchboard starts TS running in order to re-enter on LN2
System settings
The system settings can be adjusted through the Ekip Connect 3 commissioning tool.

Mechanical Interlock
We strongly recommend to install a mechanical interlock between the breakers. Please refer to the Ekip Connect 3 catalogue to order the right interlock.

Compatibility
The Embedded ATS Main-Gen Open Transition is compatible with the following firmware versions.

<table>
<thead>
<tr>
<th>Description</th>
<th>Ordering Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mainboard</td>
<td>02.22.37</td>
</tr>
<tr>
<td>Ekip Touch</td>
<td>02.22.34</td>
</tr>
<tr>
<td>Link</td>
<td>02.40</td>
</tr>
</tbody>
</table>

To check the firmware version you can do one of the following:
1) Use the "Information" section of Ekip Connect 3, Nominal Data field
2) Press the "i" button on the front of the trip unit until the page "Protection Unit" appears

Annex B

Breakers configuration
The Embedded ATS Main-Gen Open Transition is available for all the SACE Emax 2 frames, fixed or withdrawable, 3 poles or 4 poles.

Each breaker must be equipped with the following listed accessories.
Ekip Signalling 2K
The Ekip Signalling 2K is a signalling accessory module equipped with:
- Two digital inputs and two contacts for output signals
- A power status LED and four signalling LEDs (one LED for every input/output).

On each circuit-breaker, a maximum of two (for E1.2) or three (for E2.2-E4.2-E6.2) Ekip Signalling 2K modules can be installed: one 2K-1, one 2K-2, and one 2K-3 (in case of E2.2-E4.2-E6.2 circuit breakers).

These modules only differ in naming and wiring diagrams. The technical characteristics and manner of installation are in common.

The Ekip Signalling 2K modules always require the presence of an Ekip Supply module in the first slot of the circuit-breaker terminal box.

### Electrical characteristics

<table>
<thead>
<tr>
<th>Component</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output contacts</td>
<td>• Maximum switching power: 1250 VA&lt;br&gt;• Maximum switching voltage: 150 V DC / 250 V&lt;br&gt;• Breaking power: 2 A @ 30 V DC, 0.8 A @ 50 V DC, 0.2 A @ 150 V DC, 4A @ 250 V AC&lt;br&gt;• Dielectric strength between open contacts: 1000 V AC (1 minute @ 50 Hz)&lt;br&gt;• Dielectric strength between each contact and coil: 1000 V AC (1 minute @ 50 Hz)</td>
</tr>
</tbody>
</table>

### ATS System Outputs

</tr>
</tbody>
</table>
Electrical diagrams

The Ekip Supply module must be continuously fed, also during the transfer phase.
You can order a low voltage Ekip Supply (24-48V), or any voltage which fits, and supply it from the engine starting battery.

Alternatively, an isolated secondary circuit (UPS) must be provided.

Notes
For external wiring, AWG 22-16 cables with a maximum external diameter of 1.4 mm must be used.
For further information, please refer to the document 1SDM000091R0001.
Annex C

Embedded ATS: Grey vs Black trip units

With the introduction of the new electronics, SACE Emax 2 circuit-breakers are provided with the new Black trip units.

Classic grey platform

New black Platform

The Embedded ATS function is suitable for both the old (Grey) and new (Black) trip units. However, an ATS license must be associated to circuit-breakers with the same type of electronics. No mixes are allowed between Grey and Black Platforms within the same ATS project.

The Embedded ATS characteristics remain the same. The only differences concern product configuration and accessories, as shown in the following tables.

Main-Tie-Main Closed Transition

</tbody>
</table>

\(\dagger\) in case of Ekip G trip units, no SW packages are needed.

The ordering codes for ATS licenses are the same, with no distinctions between Grey and Black trip units:

- 1SDA082886R1 for ATS Main-Tie-Main Closed Transition
- 1SDA082889R1 for ATS Main-Gen Open Transition

For further details, please refer to the Emax 2 technical catalogue.
