TZIDC-200
Digital Positioner

Introduction
The TZIDC-200 has an integral mount design, features a modular structure and offers an outstanding price-performance ratio. Fully automatic determination of the control parameters and adaptation to the final control element allow for considerable time savings as well as optimum control behavior.

Additional Information
Additional documentation on TZIDC-200 is available for download free of charge at www.abb.com/positioners. Alternatively simply scan this code:

1 Safety

General information and instructions
These instructions are an important part of the product and must be retained for future reference.
Installation, commissioning, and maintenance of the product may only be performed by trained specialist personnel who have been authorized by the plant operator accordingly. The specialist personnel must have read and understood the manual and must comply with its instructions.
For additional information or if specific problems occur that are not discussed in these instructions, contact the manufacturer.
The content of these instructions is neither part of nor an amendment to any previous or existing agreement, promise or legal relationship.
Modifications and repairs to the product may only be performed if expressly permitted by these instructions.
Information and symbols on the product must be observed. These may not be removed and must be fully legible at all times. The operating company must strictly observe the applicable national regulations relating to the installation, function testing, repair and maintenance of electrical products.

Warnings
The warnings in these instructions are structured as follows:

⚠️ DANGER
The signal word ‘DANGER’ indicates an imminent danger. Failure to observe this information will result in death or severe injury.

⚠️ WARNING
The signal word ‘WARNING’ indicates an imminent danger. Failure to observe this information may result in death or severe injury.

⚠️ CAUTION
The signal word ‘CAUTION’ indicates an imminent danger. Failure to observe this information may result in minor or moderate injury.

 NOTICE
The signal word ‘NOTICE’ indicates possible material damage.

Note
‘Note’ indicates useful or important information about the product.
1 Safety

Intended use
Positioning of pneumatically controlled actuators; designed for mounting on linear and rotary actuators.
The device is designed for use exclusively within the stated values on the name plate and in the data sheet.
• The maximum operating temperature must not be exceeded.
• The maximum ambient temperature must not be exceeded.
• The housing's rating must be observed during operation.

Improper use
The following are considered to be instances of improper use of the device:
• For use as a climbing aid, for example for mounting purposes.
• For use as a bracket for external loads, for example as a support for piping, etc.
• Material application, for example by painting over the housing, name plate or welding/soldering on parts.
• Material removal, for example by spot drilling the housing.

Notes on data safety
This product is designed to be connected to and to communicate information and data via a network interface.
It is operator's sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be).
Operator shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information.
ABB Automation Products GmbH and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.

Warranty provisions
Using the device in a manner that does not fall within the scope of its intended use, disregarding this manual, using underqualified personnel, or making unauthorized alterations releases the manufacturer from liability for any resulting damage. This renders the manufacturer's warranty null and void.

2 Use in potentially explosive atmospheres

General requirements
- The ABB positioner has been approved only for appropriate and intended use in standard industrial atmospheres. Any breach of this rule leads to a cancellation of warranty and manufacturer’s responsibility!
- Make sure that only devices which comply with the types of protection relevant to the applicable zones and categories are installed.
- All electric equipment has to be suited for the respective intended use.
- In potentially explosive atmospheres, assembly may be conducted only in compliance with locally applicable installation regulations. The following conditions have to be observed (incomplete):
  - Assembly and maintenance may only be conducted if there is no explosion hazard in the area and you have a hot work permit.
  - The TZIDC-200 may be operated in a fully mounted and intact housing only.

Commissioning, Installation
The ABB positioner has to be mounted in a major system. Depending on the degrees of IP-protection, an interval for cleaning the equipment (dust settlement) has to be defined. Strict care has to be taken that only devices which comply with the types of protection relevant to the applicable zones and categories is installed. When installing the device, the locally applicable installation regulations, such as EN 60079-14, must be observed.

Other important facts to be observed:
- The electric circuits of the positioner must be put into operation in all zones by persons qualified in accordance with TRBS 1203. The details on the type label are mandatory for doing this.
- The device has been designed in accordance with IP 65 (optionally IP 66) and must be protected accordingly against adverse ambient conditions.
- The EC Type Examination Certificate has to be taken into account, including any special conditions defined therein.
- The device may only be used in accordance with its intended use.
- The device may only be connected when de-energized.
- The potential equalization of the system must be established in accordance with installation regulations applicable in the respective country (VDE 0100, part 540, IEC 364-5-54).
- Circulating currents must not be guided through the housing!
- Make sure that the housing is properly installed and that its IP rating has not been compromised.

Notes for operation
- The positioner must be integrated in the local potential equalization system.
- Only either intrinsically safe or non-intrinsically safe circuits may be connected. A combination is not permitted.
- If the positioner is operated with non-intrinsically safe circuits, later use for the intrinsic safety type of protection is not permitted.

Use, operation
The TZIDC-200 is approved for proper and intended use only. In case of non-compliance, the warranty and manufacturer’s liability do no longer apply!
- Only those auxiliary components which fulfill all the requirements of European and national standards may be used in potentially explosive atmospheres.
- The ambient conditions specified in the operating instruction must be strictly followed.
- The TZIDC-200 is approved for proper and intended use in standard industrial atmospheres only. Where aggressive substances are present in the air, the manufacturer has to be consulted.
... 2 Use in potentially explosive atmospheres

Maintenance, repair

Definition of terms according to IEC 60079-17:

Maintenance
Defines a combination of actions performed to maintain or restore the condition of an item such that the item meets the requirements of the relevant specification and performs its required functions.

Analyzer module without electronics module (power supply):
Defines an action which involves careful inspection of an item (either without disassembly or with partial disassembly, as required) supplemented by measurements, aimed at achieving a reliable conclusion regarding the condition of the item.

Visual inspection
Defines an inspection which identifies defects which are visible to the naked eye, such as missing screws, without the use of access equipment and tools.

Close inspection
Defines an inspection which encompasses the aspects covered by a visual inspection and in addition, identifies defects such as loose screws, which can only be detected with the use of access equipment (e.g. steps) and tools.

Detailed inspection
Defines an inspection which encompasses the aspects covered by a close inspection and in addition, identifies defects, such as loose connections, which can only be detected by opening the housing and / or by using tools and test devices, as needed.

- Maintenance and exchange work may be conducted by qualified specialists only, i.e., qualified personnel in accordance with TRBS 1203 or similar.
- Only those auxiliary components which fulfill all the requirements of European and national guidelines and regulations may be used in potentially explosive atmospheres.
- Maintenance works that require disassembly of the system may only be performed in non-hazardous areas. If that is not possible, however, the usual precautions have to be ensured according to local regulations.
- Components may only be replaced by original spare parts which are therefore approved for use in potentially explosive atmospheres.
- The device must be regularly cleaned when used in potentially explosive atmospheres. The intervals must be defined by the operator in compliance with the ambient conditions present at the operating location.
- After all maintenance and repair work has been completed, any barriers and plates removed for that purpose must be put back in their original place.
- The flameproof joints differ from the tables of IEC 60079-1 and may be repaired by the manufacturer only.

Product identification

Depending on the type of explosion protection, Ex-marking is attached to the positioner on the left, next to the main name plate. This indicates the level of explosion protection and the device's relevant Ex certificate.

Marking (name plate)

DMT 02 ATEX E 029X

Figure 1: Marking

NOTICE

A legible marking showing the type of protection required for the intended area of application must be affixed to the device before it is put into operation for the first time.

Preconditions for safe operation of the positioner

⚠️ DANGER

Risk of explosion due to hot parts
Hot parts inside the device pose an explosion hazard.
• Never open the device immediately after switch-off.
• A waiting time of at least four minutes should be observed before opening the device.

NOTICE

Damage to components
If the sealing surface is damaged, ‘Ex d’ explosion protection is no longer guaranteed.
• Handle the housing cover carefully.
• Place the housing cover on a smooth and clean surface only!

When using in hazardous areas, observe the following points:
• Observe the specification and special conditions applicable for the device in accordance with the relevant valid certificate.
• Manipulation of the device in any form by the user is not permitted. Only the manufacturer or an explosion protection specialist may modify the device.
• The IP 65 / NEMA 4x IP rating is only achieved if the splash guard is screwed in place. Operating the unit without splash guard cap is prohibited.
• The device may only be operated using instrument air that is free from oil, water and dust. The use of flammable gas, oxygen, or oxygen-enriched gas is not permitted.

Cable gland

Limited temperature range of the M20 × 1.5 plastic cable gland for explosion protection variants.
The permissible ambient temperature range of the cable gland is -20 to 80 °C (−4 to 176 °F). When using the cable gland, make sure that the ambient temperature is within this range. The cable gland must be installed in the housing with a tightening torque of 3.8 Nm. When installing the connection of the cable gland and cable, check for tightness to ensure that the required IP rating is met.

</tr>
</tbody>
</table>

**Special conditions**

- Before final installation, the operator needs to decide on the use of the device, either
  A) as a device with ‘Ex i’ intrinsically safe type of protection or
  B) as a device with ‘Ex d’ type of protection
  and permanently mark the selected type of use on the name plate. Specific conditions of the surrounding environment, such as chemical corrosion, must be taken into account when affixing the permanent mark. Only the manufacturer must change the selected type of use following a re-examination
- Medium strength adhesive must be used to secure the cable entries and line entries and stop them from twisting and self-loosening
- In the case of high torsional forces, the bearing sleeves must be replaced due to wear on the shaft for the position pickoff (significant control deviation).
- If the positioner is operated at an ambient temperature above 60 °C (140 °F) or below -20 °C (-4 °F), make sure to use cable entries and lines suited for an operating temperature corresponding to the maximum ambient temperature increased by 10 K or corresponding to the minimum ambient temperature, respectively.
- The dimensions of the flameproof joint of this equipment partly exceed the minimum values required by EN 60079-1:2014 or IEC 60079-1:2014 or partly down-scale the maximum values required therein. All inquiries relating to dimensions must be directed to the manufacturer
- Screws that comply with the minimum requirements of the A2-70, A2-80 or 10.12 quality grades must be used to close the flameproof enclosure.

</tr>
</tbody>
</table>

**Special conditions**

- Devices must only be connected to circuits in zone 2 if they are suitable for operation in zone 2 potentially explosive atmospheres and for the conditions prevailing at the installation location (manufacturer’s declaration or certificate from an inspection authority).
- For the ‘Limit monitor with proximity switches’ circuit, measures outside of the device must be implemented to prevent the rated voltage from being up-scaled by more than 40% due to transient disturbances.
- It is only permissible to connect, disconnect, and switch live circuits during installation or maintenance, or for the purpose of carrying out repairs. Note: It is considered very unlikely that a potentially hazardous atmosphere would be present in zone 2 at the same time that installation or maintenance or repair work was being carried out.
- Only non-flammable gases must be used for pneumatic power supply.
- Only suited cable entries must be used that meet the requirements of EN 60079-15.

3 Design and function

Schematic diagram

Note
With optional extensions, either the ‘Limit monitor with proximity switches’ \( \text{11} \) or the ‘Limit monitor with 24 V-microswitches’ \( \text{12} \) can be used. In both cases though, the mechanical position indication \( \text{10} \) must be installed.

Principle of operation
The TZIDC-200 is an electronically configurable positioner with communication capabilities designed for mounting on pneumatic linear or rotary actuators.
Fully automatic determination of the control parameters and adaptation to the positioner allow for considerable time savings as well as optimum control behavior.

5 Transport and storage

Inspection
Check the devices immediately after unpacking for possible damage that may have occurred from improper transport. Details of any damage that has occurred in transit must be recorded on the transport documents. All claims for damages must be submitted to the shipper without delay and before installation.

Transporting the device
Observe the following instructions:
- Do not expose the device to humidity during transport. Pack the device accordingly.
- Pack the device so that it is protected against vibrations during transport, for example, by using air-cushioned packing.

Storing the device
Bear the following points in mind when storing devices:
- Store the device in its original packaging in a dry and dust-free location. The device is also protected by a desiccant in the packaging.
- The storage temperature should be between –40 to 85 °C (–40 to 185 °F).
- Avoid storing the device in permanent direct sunlight.
- In principle, the devices may be stored for an unlimited period. However, the warranty conditions stipulated in the order confirmation of the supplier apply.

Ambient conditions
The ambient conditions for the transport and storage of the device correspond to the ambient conditions for operation of the device.
Adhere to the device data sheet!

Returning devices
For the return of devices, follow the instructions in Repair on page 40.

6 Installation

Safety instructions

⚠️ CAUTION
Risk of injury due to incorrect parameter values!
Incorrect parameter values can cause the valve to move unexpectedly. This can lead to process failures and result in injuries.
- Before recommissioning a positioner that was previously in use at another location, always reset the device to its factory settings.
- Never start automatic adjustment before restoring the factory settings!

Note
Before assembly, check whether the positioner meets the control and safety requirements for the installation location (actuator or final control element).
Refer to the Specification in the data sheet.

Only qualified specialists who have been trained for these tasks are authorized to mount and adjust the unit, and to make the electrical connection.
When carrying out any work on the device, always observe the local accident prevention regulations and the regulations concerning the construction of technical installations.
Mechanical mounting

General

Operating range for linear actuators:
The operating range for linear actuators is ±45° symmetrically to the longitudinal axis. The usable span within the operating range is at least 25° (recommended figure 40°). The usable span does not necessarily need to run symmetrically to the longitudinal axis.

Operating range of rotary actuators:
The usable span is 90°, which must be entirely within the measuring range, but does not necessarily need to run symmetrically to the longitudinal axis.

Note
During installation make sure that the actuator travel or rotation angle for position feedback is implemented correctly.

Arrow 1 on the device feedback shaft (position feedback point) must move between the arrow marks 2.

Figure 4: Operating range

Figure 5: Measuring and operating ranges of the positioner
... 6 Installation

... Mechanical mounting

Mounting on linear actuators

For mounting on a linear actuator in accordance with DIN / IEC 534 (lateral mounting as per NAMUR), the following attachment kit is available:

1. Screw
2. Washer
3. Mounting bracket
4. Lever with follower pin (for mechanical stroke 10 to 35 mm [0.39 to 1.38 in] or 20 to 100 mm [0.79 to 3.94 in])
5. Washers
6. Screws
7. U-bolt
8. Washers
9. Nuts
10. Screws
11. Spring washers
12. Clamp plates
13. Follower guide

Figure 6: Components of attachment kit

Figure 7: Attaching a follower guide to the actuator

1. Tighten the screws so that they are hand-tight.
2. Attach the follower guide 1 and clamp plates 2 with screws 4 and spring washers 3 to the actuator stem.

Figure 3: Assemble the lever (unless pre-assembled)

1. Insert spring 8 on bolt with follower pin 9.
2. Slip the plastic washer 7 onto the bolt and compress the spring with it.
3. Insert the bolt with compressed spring into the oblong hole in the lever 6 and fasten it in the desired position using the plain washer 5 and nut 4 at the lever. The scale on the lever indicates the link point for the stroke range.
4. Place the washer 2 on the screw 1. Insert the screw in the lever and lock with the nut 3.
1. Attach the lever 6 to the feedback shaft 5 of the positioner (can only be mounted in one position due to the cut shape of the feedback shaft).
2. Using the arrow marks 4, check whether the lever moves within the operating range (between the arrows).
3. Hand-tighten the screw 7 on the lever.
4. Hold the prepared positioner (with the mount bracket 1 still loose) on the actuator so that the follower pin for the lever enters the follower guide to determine which tap holes on the positioner must be used for the mount bracket.
5. Secure the mount bracket 1 with screws 2 and washers 3 using the relevant tap holes on the positioner housing. Tighten the screws as evenly as possible to ensure subsequent linearity. Align the mount bracket in the oblong hole to ensure that the operating range is symmetrical (lever moves between the arrow marks 4).

**Figure 4: Mounting lever and bracket on the positioner**

**Figure 5: Mounting on a cast iron yoke**

1. Attach the mount bracket 2 with screw 4 and washer 3 to the cast iron yoke 1.

or

**Figure 6: Mounting on a columnar yoke**

1. Hold the mount bracket 3 in the proper position on the columnar yoke 2.
2. Insert the U-bolts 1 from the inside of the columnar yoke 2 through the holes of the mount bracket.
3. Add the washers 4 and nuts 5.
4. Tighten the nuts so that they are hand-tight.

**Note**

Adjust the height of the positioner on the cast iron yoke or columnar yoke until the lever is horizontal (based on a visual check) at half stroke of the valve.
... 6 Installation

... Mechanical mounting

The scale on the lever indicates the link points for the various stroke ranges of the valve.
Move the bolt with the follower pin in the oblong hole of the lever to adjust the stroke range of the valve to the working range for the position sensor.
Moving the link point inwards increases the rotation angle of the position sensor. Moving the link point outwards reduces the rotation angle of the position sensor.
Adjust the actuator stroke to make use of as large an angle of rotation as possible (symmetrical around the center position) on the position sensor.

Recommended range for linear actuators: -30° to 30°; minimum range: 25°

Note
After mounting, check whether the positioner is operating within the measuring range.

Position of actuator bolt
The actuator bolt for moving the potentiometer lever can be mounted permanently on the lever itself or on the valve stem.
Depending on the mounting method, when the valve moves the actuator bolt performs either a circular or a linear movement with reference to the center of rotation of the potentiometer lever. Select the chosen bolt position in the HMI menu in order to ensure optimum linearization. The default setting is actuator bolt on lever.
Mounting on rotary actuator

For mounting on part-turn actuators in accordance with VDI / VDE 3845, the following attachment kit is available:

- Adapter 1 with spring 5
- four M6 screws each 4, spring washers 3 and washers 2 to fasten the attachment bracket 6 to the positioner
- four M5 screws 7, Spring washers 8 and washers 9 to fasten the attachment bracket to the actuator

Required tools:
- Wrench, size 8 / 10
- Allen key, size 3

Figure 11: Components of attachment kit

Figure 12: Mounting the adapter on the positioner

1. Determine the mounting position (parallel to actuator or at 90° angle)
2. Calculate the rotational direction of the actuator (right or left).
3. Move the part-turn actuator into the home position.
4. Pre-adjust feedback shaft.

To ensure the positioner will operate within the operating range (see chapter General on page 15), the mounting position as well as the home position and direction of rotation of the actuator must be taken into account when determining the adapter position on the feedback shaft 1. For this purpose, the feedback shaft can be adjusted manually so that the adapter 3 can be attached in the correct position.

5. Place the adapter in the proper position on the feedback shaft and fasten with threaded pins 2. One of the threaded pins must be locked in place on the flat side of the feedback shaft.
... 6 Installation

**Attachment bracket**

Figure 13: Screwing the attachment bracket onto the positioner

![Diagram of positioner installation](image)

**Figure 14: Screwing the positioner onto the actuator**

**Electrical connections**

⚠️ **WARNING**

**Risk of injury due to live parts!**
When the housing is open, contact protection is not provided and EMC protection is limited.

- Before opening the housing, switch off the power supply.

The electrical connection may only be established by authorized specialist personnel.

Notices on electrical connection in this instruction must be observed; otherwise, electric safety and the IP-rating may be adversely affected.

Safe isolation of electric circuits which are dangerous if touched is only guaranteed when the connected devices fulfill the requirements of EN 61140 (basic requirements for secure separation).

To ensure safe isolation, install supply lines so that they are separate from electrical circuits which are dangerous if touched, or implement additional isolation measures for them.

**Note**

After mounting, check whether the operating range of the actuator matches the measuring range of the positioner, see chapter **General** on page 15.

2 Blind plug
3 Terminals for option modules
4 Terminal attachment kit for digital feedback
5 Terminals for basic unit

Figure 16: Connection to device (example)
... 6 Installation

... Electrical connections

2 tap holes ½-14 NPT or M20 × 1.5 are provided on the left side of the housing for cable entry in the housing. One of the tap holes is fitted with a cable gland, while the other tap hole has a blind plug.

Note
The connecting terminals are delivered closed and must be unscrewed before inserting the wire.

1. Strip the wires to approximately 6 mm (0.24 in).
2. Connect the wires to the connecting terminals in line with the connection diagram.

Pneumatic connections

**Note**
The positioner must only be supplied with instrument air that is free of oil, water, and dust.
The purity and oil content must meet the requirements of Class 3 according to DIN/ISO 8573-1.

---

**NOTICE**

**Damage to components!**
Contamination on the air pipe and positioner can damage components.
Dust, splinters, and any other particles of dirt must be blown off the pipe before it is connected.

---

**NOTICE**

**Damage to components!**
Pressure above 6 bar (90 psi) can damage the positioner or actuator.
Provisions must be made, e.g. by using a pressure reducer, to make sure that the pressure does not rise above 6 bar (90 psi), even in the event of a fault.

* 5.5 bar (80 psi) (marine version)

---

**Information on double acting actuators with spring-return mechanism**
On double-acting actuators with spring-return mechanism, a pressure that significantly exceeds the supply air pressure value can be generated during operation by the springs in the chamber opposite the springs.
This may damage the positioner or adversely affect control of the actuator.
In order to ensure that this behavior cannot occur, it is recommended to install a pressure compensation valve between the springless chamber and the supply air for these types of applications. It enables the increased pressure to be transferred back to the air inlet line.
The opening pressure of the check valve should be < 250 mbar (< 3.6 psi).

---

** (marine version)

Join the pipe connections according to the designation, observing the following points:
- All pneumatic piping connections are located on the right-hand side of the positioner. G¼ or ¼ 18 NPT tap holes are provided for the pneumatic connections. The positioner is labeled according to the tap holes available.
- We recommend that you use a pipe with dimensions of 12 × 1.75 mm.
- The supply air pressure required to apply the actuating force must be adjusted in line with the output pressure in the actuator. The operating range of the positioner is between 1.4 to 6 bar (20 to 90 psi)***.

Commissioning

Note

The electrical power supply and supply air pressure data indicated on the name plate must be complied with during commissioning.

CAUTION

Risk of injury due to incorrect parameter values!

Incorrect parameter values can cause the valve to move unexpectedly. This can lead to process failures and result in injuries.

- Before recommissioning a positioner that was previously in use at another location, always reset the device to its factory settings.
- Never start automatic adjustment before restoring the factory settings!

Note

Please observe the information in Operation on page 30 to operate the device!

Commissioning the positioner:

1. Open the pneumatic power supply.
2. Power-up the electric power supply and feed in the setpoint signal 4 to 20 mA.
3. Checking mechanical mounting:
   - Press and hold MODE; in addition, press ‡ or § until operating mode 1.3 (manual adjustment in the measuring range) is displayed. Release MODE.
   - Press ‡ or § to move the actuator into the mechanical end position; check the end positions; rotational angle is displayed in degrees; for high-speed mode, press ‡ or § simultaneously.

Recommended rotational angle range

<table>
<thead>
<tr>
<th>Linear actuators</th>
<th>−28 to 28°</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotary actuators</td>
<td>−57 to 57°</td>
</tr>
<tr>
<td>Minimum angle</td>
<td>25°</td>
</tr>
</tbody>
</table>

4. Perform standard automatic adjustment in accordance with Standard automatic adjustment on page 27.

Commissioning of the positioner is now complete, and the device is ready for operation.
Operating modes
Selection from the operating level
1. Press and hold down MODE.
2. Also press and release ⦿ rapidly as often as required. The selected operating mode is displayed.
3. Release MODE.
The position is displayed in % or as a rotation angle.

<table>
<thead>

</tr>
</tbody>
</table>

* Since self-optimization in operating mode 1.0 is subject to several factors during control operation with adaptation, incorrect adjustments could appear over an extended period.
** Positioning not active.
*** For high-speed mode, press ⦿ and ⦿ simultaneously.

Standard automatic adjustment

Note
Standard Auto Adjust does not always result in optimum control conditions.

Standard automatic adjustment for linear actuators*
1. MODE Press and hold until ADJ_LIN is displayed.
2. MODE Press and hold until the countdown ends.
3. Release MODE; this starts Autoadjust.

Standard automatic adjustment for rotary actuators*
1. ENTER Press and hold until ADJ_ROT is displayed.
2. ENTER Press and hold until the countdown ends.
3. Release ENTER; this starts Autoadjust.

If Autoadjust is successful, the parameters will be stored automatically and the positioner will revert to operating mode 1.1.

If an error occurs during Autoadjust, the process will be terminated with an error message.

Perform the following steps if an error occurs:
1. Press and hold down operating button ⦿ or ⦿ for approximately three seconds.
The unit will switch to the operating level, mode 1.3 (manual adjustment within the measuring range).
2. Check mechanical mounting in accordance with Mechanical mounting on page 15 and repeat the standard automatic adjustment.

* The zero position is determined automatically and saved during standard automatic adjustment, counter-clockwise (CTCLOCKW) for linear actuators and clockwise (CLOCKW) for rotary actuators.
### 7 Commissioning

#### Sample parameters

‘Change the zero position of the LCD display from clockwise (CLOCKW) to counter-clockwise limit stop (CTCLOCKW)’

Initial situation: the positioner is in bus operation on the operating level.

1. Switching to the configuration level:
   - Press and hold down ⌈ and ⌈ simultaneously,
   - additionally quickly press and release ENTER,
   - Wait for the countdown to go from 3 to 0,
   - Release ⌈ and ⌈.
   The following is now shown in the display:

   ![Display Image]

2. Switching to parameter group 3.:
   - Press and hold down MODE and ENTER simultaneously,
   - additionally quickly press and release ⌈ 2×,
   The following is now shown in the display:

   ![Display Image]

3. Selecting parameter 3.2:
   - Press and hold down MODE,
   - additionally quickly press and release ⌈ 2×,
   The following is now shown in the display:

   ![Display Image]

   — Release MODE.

4. Changing parameter settings:
   - Quickly press and release ⌈ to select CTCLOCKW.

5. Switching to parameter 3.3 (Return to operating level) and saving the new settings:
   - Press and hold down MODE,
   - additionally quickly press and release ⌈ 2×,
   The following is now shown in the display:

   ![Display Image]

   - Release MODE,
   - Quickly press and release ⌈ to select NV_SAVE,
   - Press ENTER and hold down until the countdown goes from 3 to 0.

The new parameter setting is saved and the positioner automatically returns to the operating level. It continues in the operating mode that was active prior to the configuration level being called up.

#### Setting the option modules

**Setting the mechanical position indication**

1. Loosen the screws for the housing cover and remove it.
2. Rotate the position indicator on the shaft to the desired position.
3. Attach the housing cover and screw it onto the housing.
   - Tighten the screws so that they are hand-tight.
4. Attach the symbol label to mark the minimum and maximum valve positions on the housing cover.

**Note**

The labels are located on the inside of the housing cover.
Setting the mechanical limit switch with proximity switches

1. Loosen the screws for the housing cover and remove it.

! CAUTION
Risk of injury!
The device includes slot sensors with sharp edges.
• Adjust the metal tags using a screwdriver only!

2. Set the upper and lower switching points for binary feedback as follows:
   • Select the ‘Manual Adjustment’ operating mode and move the final control element by hand into the lower switching position.
   • Using a screwdriver, adjust the metal tag of proximity switch 1 (lower contact) on the axis until contact is made, i.e., just before it is inserted in the proximity switch. The slot sensor enters proximity switch 1 when the feedback shaft is rotated clockwise (as viewed from the front).
   • Move the final control element by hand into the upper switching position.
   • Using a screwdriver, adjust the metal tag of proximity switch 2 (upper contact) on the axis until contact is made, i.e., just before it is inserted in the proximity switch. The slot sensor enters proximity switch 2 when the feedback shaft is rotated counter-clockwise (as viewed from the front).

3. Attach the housing cover and screw it onto the housing.
4. Tighten the screws so that they are hand-tight.

Setting the mechanical limit switch with 24 V microswitches

1. Loosen the screws for the housing cover and remove it.
2. Select the ‘Manual Adjustment’ operating mode and move the final control element by hand into the desired switching position for contact 1.
3. Set maximum contact (1, lower washer).
   Fasten the upper washer with the special adjustment retainer and rotate the lower washer manually.
4. Select the ‘Manual Adjustment’ operating mode and move the final control element by hand into the desired switching position for contact 2.
5. Set minimum contact (2, upper washer);
   Fasten the lower washer with the special adjustment retainer and rotate the upper washer manually.
6. Connect the microswitch.
7. Attach the housing cover and screw it on to the housing.
8. Tighten the screws so that they are hand-tight.
8 Operation

Safety instructions

⚠️ CAUTION
Risk of injury due to incorrect parameter values!
Incorrect parameter values can cause the valve to move unexpectedly. This can lead to process failures and result in injuries.
- Before recommissioning a positioner that was previously in use at another location, always reset the device to its factory settings.
- Never start automatic adjustment before restoring the factory settings!

If there is a chance that safe operation is no longer possible, take the device out of operation and secure it against unintended startup.

Parameterization of the device
The LCD display features operating buttons which enable the device to be operated with the housing cover open.

Menu navigation

Value display with unit
This 7-segment display with four digits indicates parameter values or parameter reference numbers. For values, the physical unit (°C, %, mA) is also displayed.

Designator display
This 14-segment display with eight digits indicates the designators of the parameters with their status, of the parameter groups, and of the operating modes.

Description of symbols

<table>

| ENTER          | • Acknowledge message  
                 | • Start an action  
                 | • Save in the non-volatile memory |
| MODE           | • Choose operating mode (operating level)  
                 | • Select parameter group or parameter (configuration level) |
| ▲              | UP direction button                                                   |
| ◇              | DOWN direction button                                                 |
| Press and hold all four buttons for 5 s | Reset                                                             |

### Menu levels

The positioner has two operating levels.

**Operating level**

On the operating level the positioner operates in one of four possible operating modes (two for automatic control and two for manual mode). Parameters cannot be changed or saved on this level.

**Configuration level**

On this level most of the parameters of the positioner can be changed locally. The PC is required to change the limit values for the movement counter, the travel counter, and the user-defined characteristic curve.

On the configuration level the active operating mode is deactivated. The I/P module is in neutral position. The control operation is inactive.

### NOTICE

**Property damage**

During external configuration via a PC, the positioner no longer responds to the set point current. This may lead to process failures.

- Before any external parameterization, always move the actuator to the safety position and activate manual adjustment.
8 Operation

10 Maintenance

The positioner does not require any maintenance if it is used as intended under normal operating conditions.

Note

Manipulation by users shall immediately render the warranty for the device invalid.

To ensure fault-free operation, it is essential that the device is supplied with instrument air that is free of oil, water, and dust.

11 Repair

Repair and maintenance activities may only be performed by authorized customer service personnel.

When replacing or repairing individual components, use original spare parts.

Returning devices

Use the original packaging or a secure transport container of an appropriate type if you need to return the device for repair or recalibration purposes.

Fill out the return form (see Return form on page 41) and include this with the device.

In accordance with the EU Directive governing hazardous materials, the owner of hazardous waste is responsible for its disposal or must observe the following regulations for shipping purposes:

- All devices delivered to ABB must be free from any hazardous materials (acids, alkalis, solvents, etc.).

Please contact Customer Center Service acc. to page 4 for nearest service location.

12 Recycling and disposal

Note

Products that are marked with the adjacent symbol may **not** be disposed of as unsorted municipal waste (domestic waste).

They should be disposed of through separate collection of electric and electronic devices.

This product and its packaging are manufactured from materials that can be recycled by specialist recycling companies.

Bear the following points in mind when disposing of them:

- As of 8/15/2018, this product will be under the open scope of the WEEE Directive 2012/19/EU and relevant national laws (for example, ElektroG - Electrical Equipment Act - in Germany).
- The product must be supplied to a specialist recycling company. Do not use municipal waste collection points. These may be used for privately used products only in accordance with WEEE Directive 2012/19/EU.
- If there is no possibility to dispose of the old equipment properly, our Service can take care of its pick-up and disposal for a fee.

13 Additional documents

Note

All documentation, declarations of conformity and certificates are available in ABB’s download area.

14 Appendix

Return form

Statement on the contamination of devices and components

Repair and/or maintenance work will only be performed on devices and components if a statement form has been completed and submitted. Otherwise, the device/component returned may be rejected. This statement form may only be completed and signed by authorized specialist personnel employed by the operator.

Customer details:
Company:
Address:
Contact person: Telephone:
Fax: Email:

Device details:
Type: Serial no.:
Reason for the return/description of the defect:

Was this device used in conjunction with substances which pose a threat or risk to health?
☐ Yes ☐ No
If yes, which type of contamination (please place an X next to the applicable items):
☐ biological ☐ corrosive / irritating ☐ combustible (highly / extremely combustible)
☐ toxic ☐ explosive ☐ other toxic substances
☐ radioactive

Which substances have come into contact with the device?
1.
2.
3.

We hereby state that the devices/components shipped have been cleaned and are free from any dangerous or poisonous substances.

Control Equipment

Entity Parameters:

Input: 12

Terminals

Vmax = 30 Vdc
Li = 0 uH
Pi = 1 W

Imax = 1.04 mA

Notes
1. Vdc or Vi < Vmax, Isc or It < Imax, Ca > Ci+Cable, La >= Li + Lcable, Po << Pi
2. Dust-tight conduit seal must be used when installed in Class I and Class II environments.
3. Control equipment connected to barrier must not use or generate more than 250 Vrms or Vdc
4. Installation should be in accordance with ANSI/ISA R8.1.6 "Installation of Intrinsically Safe System for Hazardous (Classified) Locations" and the National Electrical Code (ANSI/NFPA 70).
5. The configuration of associated apparatus must be FMRC Approved/CSA Approved as required.
6. Associated apparatus manufacturers installation drawing must be followed when installing this equipment.
7. When connecting conduit to the enclosure use conduit hubs that have the same environmental rating as the enclosure.
8. No revision to drawing without prior FMRC Approval/CSA Approval.
9. OUTPUT CURRENT MUST BE LIMITED BY A RESISTOR SUCH THAT THE OUTPUT VOLTAGE CURRENT PLOT IS A STRAIGHT LINE DRAWN BETWEEN OPEN CIRCUIT VOLTAGE AND SHORT CIRCUIT CURRENT.
10. Tampering and replacement with non-factory components may adversely affect the safe use of the system. Substitution of components may impair suitability for hazardous locations.
11. FOR FM DIV 2 USE: Do not connect or disconnect unless the power was switched off or the area is known to be non-hazardous.
12. Local communication interface I/Os shall not be used in hazardous locations.
13. To maintain intrinsic safety, wiring associated with each channel must be run in separate cable shields connected to intrinsically safe (associated apparatus) ground.
14. Preventing electrostatic charging

Due to the possibility of impermissible electrostatic charging of the housing occurring, the effects of high-voltage sources on the equipment must be prevented. Electrostatic charging can also occur if the device is wiped with a dry cloth or if large amounts of dust flow around the device in dusty environments. To prevent charging of this type from occurring, the device may only be cleaned using a damp cloth. Dust flowing round the device should be prevented by installing a flow restrictor or partition.
