Portable NGC
Natural gas chromatograph
Measurement made easy
The Natural Gas Chromatograph (NGC) combines simplicity with low installation costs and unmatched performance, making it the ideal solution for natural gas custody transfer. The portable NGC is a natural gas chromatograph designed for installation in a vehicle, allowing it to be used for real-time analysis on any site that can be accessed by vehicle.

The NGC is powered, either from the vehicle’s 12 V DC system or from a 110 V AC inverter. Its low power operation allows to maintain continuous power on the unit, thus keeping it at operating temperature and assuring it is ready for immediate use on site.

From the spot analysis are calculated:
• Relative density
• Heating value
• VOS (velocity of sound)
• GPM (gallons of liquid per thousand cubic feet)
• Wobbe index
Introduction

This data can be used for flow computers, RTU’s, gas accounting systems, and SCADA systems for the energy, AGA3, 7, 8, and 10 calculations at the meter site. This data output can be a CSV file format so that analysis data systems can easily incorporate the information. The number of runs and the number of averages can be selected.

The averaged output can be formatted to be accepted by a 3rd party gas accounting software system, allowing automatic downloads of the analysis data. Analysis done on site is valuable because:

- Transportation of DOT regulated gas cylinders is avoided
- Time and cost of subsequent laboratory analysis
- Problems with sample handling
- Economic solution for gas quality measurement when the gas volumes are too low to justify on-line chromatography

Description

The truck is moved as close to the sample point as is practical. A flexible sample line is then uncoiled and attached to the probe in the flowing natural gas pipeline. If the dew point of the gas or the weather demands it, this flexible tubing must be heated. A sample of the gas is extracted from the probe in the line, purged through the flexible line and then transported to the analyzer. There it is processed for particle removal and phase integrity, injected onto the chromatographic columns where component separation occurs. These components are then quantified by peak integration and concentration is calculated. The other data of interest is then calculated from these concentrations.

The Portable NGC analyzes each sample utilizing established chromatographic techniques. The resulting information consists of mole percent values for the following:

- Air (N2 thru CO)
- C1
- CO2
- C2
- C3
- IC4
- NC4
- NeoC5
- IC5
- NC5
- C6+
- H2S optional

The NGC8206 measures a C6+ (back flushed) peak. Users may input the results of a comprehensive lab analysis that reflects the split or ratio of C6 through C10 components. This ratio can be used in subsequent analyses and energy calculations.

The NGC8209 measures a C9+ (back flushed) peak. Users may input the results of a comprehensive lab analysis that reflects the split or ratio of C9 through C12 components. This ratio can be used in subsequent analyses and energy calculations.

Calculated values include

- Relative density (specific gravity)
- Btu/CV (heating) value
- GPM (gallons of liquid)
### Standard features

**Modular design includes**
- Portable GC interface allows user analysis customization
- Modular software – application based plug in software modules
- Manifold module (internal tubing now replaced by manifold)
- Analysis sections contain stream selection solenoids, temperature and pressure regulation, 32 bit digital detector electronics, replaceable column / valve modules and a low power 32 bit digital controller, using Windows CE® (internal to GC unit)
- Microsoft® Windows® based man-machine interface software (PCCU)
- USB MMI port connectivity
- Ethernet connectivity
- Lithium battery-backed RAM
- Two remote serial digital communications ports; one local port
- Comprehensive diagnostics and wizards available to users
- Audit-quality historical data; date and time stamped
- Operational fault/warn alarms available
- Detectors - constant temperature, glass encapsulated thermister beads for rugged service and long life; will not burn out on loss of carrier
- 10 port valves have no moving metal parts in each analysis unit
- Low utility usage - low-power, low-carrier, no instrument air required
- On demand or scheduled automatic calibration and diagnostics

### Equipment

The equipment used for this analysis consists of the standard NGC8206 mounted in a powder-coated box. The equipment used for this analysis consists of the standard NGC8209 mounted in a black case. It is recommended that the unit be left in an operational mode while transporting.

All the valves, gauges, inlet ports, and PCCU32 (the laptop driven man-machine interface) connectors are bulkhead mounted on panel to provide the technician with ready access.
**Historical data**

The Portable NGC is designed to retain historical data. This data can be used for custody transfer needs, verify transmitter operation over time, and provide a limited data backup for communication link reliability.

In addition, various CSV file outputs are available to download the analysis data into spreadsheet based company specific data sheets, and outputs to 3rd party gas accounting packages.

The default¹ memory configuration provides the most recent 480 analysis cycles containing:

- Normalized components
- Un-normalized components
- Ideal Btu/CV
- Real Btu (wet and dry) / CV (superior and inferior)
- Relative density (specific gravity)
- Density
- GPM
- Wobbe index
- Alarms

Stream averages for the (default¹) 840 last hours, 35 last days and the most recent last month analyses. Operational Parameters for the (default²) last 480 cycles (Diagnostics Report):

- Selected peak times
- Selected peak areas
- Ideal Btu/CV
- Carrier regulator pressure
- Oven temperature
- Ambient temperature
- Sample pressure
- Detector noise values
- Detector balance values

Audit logs (default³)

- Last 480 alarms
- Last 480 events

Data retained by the Portable NGC can be collected via a remote communication link or by the laptop PC local operator interface PCCU 32.

---

**Available options**

- Sample and GC Rotometers
- 120/240 V AC / 24 V DC to 12 V DC power supply
- Modular Sample System for Non-pipeline quality natural gas and Sample transport lag-time needs: Type 4 w/ liquid shut-off
- Temperature Compensation Probes:
  - Fixed
  - Retractable
- Regulators, carrier and calibration blend
- Start up/calibration/validation gas sample (+2% Cal Blend)
- Export crating
- Tool kit
- Various maintenance kits
- On board digital ¼ VGA display with multiple screen access
- USB (Host and Client) and Ethernet ports
- SD memory cards
- Feed-Through heater
- Heat trace internal and external tubing

---

¹ Default
² The default memory configuration will provide for the data storage above. Users may reallocate the memory that is available.
