

Laser Level Transmitters. Controls for sustainability in the mining industry.

The ABB family of laser level transmitters, LM200 and LM80, provide the solution to safety and process control concerns in the mining industry. The LM200's focused, near infrared laser beam can effectively reach the bottom of the narrow ore pass, providing continuous level measurement to ensure production efficiency and safety. The LM80 provides a unique and reliable level measurement solution for a variety of mining level measurement applications such as crusher level control, inventory measurement in silos, bins and detection of plugged chutes.
