Further information
Safety instructions

Contents of this chapter
This chapter contains the safety instructions which you must obey when you install, operate and do maintenance on the safety functions of a drive.

Use of warnings and notes
Warnings tell you about conditions which can cause injury or death, or damage to the equipment. They also tell you how to prevent the danger. Notes draw attention to a particular condition or fact, or give information on a subject.

The manual uses these warning symbols:

---

**WARNING!**
Electricity warning tells about hazards from electricity which can cause injury or death, or damage to the equipment.

---

**WARNING!**
General warning tells about conditions, other than those caused by electricity, which can cause injury or death, or damage to the equipment.

---

**WARNING!**
Electrostatic sensitive devices warning tells you about the risk of electrostatic discharge which can cause damage to the equipment.
Instructions for functional safety circuits

This manual does not contain the complete safety instructions of the drive. It only includes the instructions related to the scope of this manual.

Only a qualified electrical professional who has sufficient knowledge about functional, machine, and process safety is permitted to install, start up and maintain the safety circuit. All user-made changes are on the user’s responsibility.

**WARNING!**
The safety function described in this manual does not isolate the main or auxiliary circuits from the power supply. Before you do work on the drive, or its main or auxiliary circuits, do the steps in section *Electrical safety precautions (page 9).*

**WARNING!**
Do the validation test of the safety function at the start-up and also after you make changes to the safety circuit.

**WARNING!**
Make sure that the functional safety of the machine is maintained in situations where the safety option does not provide protection, for example, during commissioning, system maintenance, fault tracing, or decommissioning.

**WARNING!**
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation or maintenance work.
**Electrical safety precautions**

These electrical safety precautions are for all personnel who do work on the drive, motor cable or motor.

---

**WARNING!**

Obey these instructions. If you ignore them, injury or death, or damage to the equipment can occur.

- If you are not a qualified electrical professional, do not do installation or maintenance work.
- Go through these steps before you begin any installation or maintenance work.

---

1. Clearly identify the work location and equipment.

2. Disconnect all possible voltage sources. Make sure that re-connection is not possible. Lock out and tag out.
   - Open the main disconnecting device of the drive.
   - Open the charging switch if present.
   - Open the disconnector of the supply transformer. (The main disconnecting device in the drive cabinet does not disconnect the voltage from the AC input power busbars of the drive cabinet.)
   - Open the auxiliary voltage switch-disconnector (if present), and all other possible disconnecting devices that isolate the drive from dangerous voltage sources.
   - In the liquid cooling unit (if present), open the switch-disconnector of the cooling pumps.
   - If you have a permanent magnet motor connected to the drive, disconnect the motor from the drive with a safety switch or by other means.
   - Disconnect all dangerous external voltages from the control circuits.
   - After you disconnect power from the drive, always wait 5 minutes to let the intermediate circuit capacitors discharge before you continue.

3. Protect any other energized parts in the work location against contact.

4. Take special precautions when close to bare conductors.
5. Measure that the installation is de-energized. If the measurement requires removal or disassembly of shrouding or other cabinet structures, obey the local laws and regulations applicable to live working (including – but not limited to – electric shock and arc protection).

- Before and after measuring the installation, verify the operation of the voltage tester on a known voltage source.
- Make sure that the voltage between the drive input power terminals (L1, L2, L3) and the grounding (PE) busbar is zero.
- Make sure that the voltage between the drive output terminals (T1/U, T2/V, T3/W) and the grounding (PE) busbar is zero.
- Make sure that the voltage between the drive DC terminals (UDC+ and UDC-) and the grounding (PE) terminal is zero. In cabinet-built drives, measure between the drive DC busbars (+ and -) and the grounding (PE) busbar.

**WARNING!**
The busbars inside the cabinet of liquid-cooled drives are partially coated. Measurements made through the coating are potentially unreliable, so only measure at uncoated portions. Note that the coating does not constitute a safe or touch-proof insulation.

6. Install temporary grounding as required by the local regulations.

7. Ask the person in control of the electrical installation work for a permit to work.
Introduction to the manual

Contents of this chapter

This chapter describes the manual in short and gives some general information for the reader. This chapter also contains a quick reference guide for implementing a safety system.

Applicability

This manual is applicable to ACS880-07CLC drives which have the option: Emergency stop, stop category 0 with main contactor/breaker, with safety relays (option +Q951).

This manual shows the default design of the safety circuit ordered with option code +Q951. The actual design can be different from the default design because of customer-defined modifications. Always refer to the documentation delivered with the drive.

Target audience

This manual is intended for people who install, commission, use and service the safety function. Read the manual before working on the unit. You are expected to know the fundamentals of electricity, wiring, electrical components, electrical schematic symbols, and functional safety.

Exclusion of liability

ABB is not responsible for the implementation, verification and validation of the overall safety system. It is the responsibility of the system integrator (or other party) who is responsible for the overall system and system safety.

The system integrator (or other responsible party) must make sure that the entire implementation complies with the instructions in this manual, all relevant standards, directives and local electrical code, and that the system is tested, verified and validated correctly.

Option description

Contents of this chapter
This chapter describes the +Q951 emergency stop option and its settings.

Overview
Option +Q951 corresponds to an uncontrolled stop in accordance with stop category 0 (IEC/EN 60204-1). When the user gives the emergency stop command, the drive opens the main contactor/breaker, which disconnects the input power from the drive. The motor coasts to a stop.

The drive main circuit is de-energized while the emergency stop is active and the main contactor/breaker is open, but the auxiliary circuit stays energized. Note that activating the emergency stop function does not isolate the drive or motor from dangerous voltages.

The design principles of the option +Q951 comply with EN ISO 13850.

For a list of related standards and European directives, see section Related standards and directives (page 37).

Operation principle
The figure shows a simplified operation principle. The user is responsible for the installation of the main contactor/breaker and its control and monitoring circuits. Also, the implementation
of the charging circuit can be different than shown in the figure. For a detailed description, refer to the circuit diagrams delivered with the drive.

- - - The dashed line in the figure shows a user-defined installation.

**Step** | **Operation**
---|---
<p>| Initial status: The drive is in operation and the motor is running. |
| 1 | The user pushes the emergency stop button [S61]. This activates the emergency stop function. The emergency stop safety relay [A640] de-energizes XSTO inputs IN1 and IN2 of the inverter control unit [A41]. This activates the inverter unit Safe torque off function. The emergency stop safety relay [A640] de-energizes the DIIL input on the supply control unit [A51]. This gives the emergency stop command to the supply unit. The emergency stop safety relay [A640] de-energizes the safety relay [K640]. The safety relay [K640] opens the main contactor/breaker [Qx], which disconnects the input power from the supply unit [T01]. The charging contactor [Q4] is opened, if the emergency stop is activated during charging. |</p>

| 5    | Normal operation resumes after the user:  
|      | • releases the emergency stop button [S61] to the normal (up) position  
|      | • pushes the emergency stop reset button [S62] for 0.1 … 3 seconds  
|      | • resets the faults from the drive (if the drive tripped on a fault)  
|      | • makes sure that the drive receives the start signal (depends on the configuration, see the firmware manual). |

**Fault reaction function**

**Definition:** A safety function requires a “fault reaction function” that tries to initiate a safe state if it detects a failure in the safety system.

The fault reaction function of the emergency stop safety relay trips the system, if it detects a failure in the safety circuit (for example, short circuit between signals, open circuit, or redundancy fault).

If a fault is detected, the fault reaction function:

• activates the emergency stop command  
• activates the drive STO function  
• opens the main contactor/breaker  
• keeps the safe state activated and the emergency stop reset button indicator light on until the fault is repaired and the safety function is reset.

**Note:** Resetting the safety function is not possible, if the reset circuit in the emergency stop safety relay is open.

**Hardware settings**

The hardware settings for the safety function are set at the factory.

The emergency stop safety relay [A640] is set to the manual reset mode at the factory. Do not change this setting.

For more information, see the circuit diagrams delivered with the drive.
Electrical installation

Contents of this chapter
This chapter describes the wiring of the safety option done at the factory and contains guidelines for making user connections.

Wiring

WARNING!
Obey the safety instructions of the drive. If you ignore them, injury or death, or damage to the equipment can occur. If you are not a qualified electrical professional, do not do installation or maintenance work.

One emergency stop button is installed on the cabinet door and connected to the emergency stop safety relay [A640] at the factory. There are double contacts in the emergency stop button and double wiring (two-channel connection) between the button and the emergency stop safety relay. The emergency stop safety relay [A640] detects cross faults and faults across one contact from the emergency stop button.

The drive does not have a factory-installed main contactor/breaker. You must install one and connect its control circuit and status monitoring circuit to the drive. Refer to the drive hardware manual and the circuit diagrams delivered with the drive.

Note: The safety system and all user-made connections are on the user’s responsibility.
Parameter settings

Contents of this chapter

This chapter contains the parameter settings related to the safety function.

Inverter unit parameter settings

Use of the safety function

Contents of this chapter

This chapter describes the use of the safety function with factory default settings.

Activating the safety function

Activation procedure:

1. Push the emergency stop button [S61]. The emergency stop is activated and the button locks in the “ON” (open) position.
   When the emergency stop is active, the following indications are shown:
   • the inverter unit control program has the warning Emergency stop active
   • the supply unit control program has the warning Emergency stop active
   • the emergency stop reset button indicator light [S62] on the cabinet door is on.

If configured with parameter 31.22 STO indication run/stop, an indication for Safe torque off is shown when the drive STO is activated.

Resetting the safety function

WARNING!
Make sure that the drive does not start accidentally. This can occur after the reset of the safety function, if a level-triggered start command and the start enable signal are on at the same time.

1. Turn the emergency stop button [S61] until it releases.
2. Push the emergency stop reset button [S62] on the cabinet door for 0.1 … 3 seconds. The emergency stop reset button indicator light [S62] goes off, and the emergency stop is deactivated.
24 Use of the safety function

3. If necessary, reset faults from the drive.
4. If necessary, close the main contactor/breaker.
5. Make sure that the drive receives the start signal.
6. You can now restart the drive.

For more information, see the hardware and firmware manuals.

**Note:** You must also reset the emergency stop safety relay [A640] with the emergency stop reset button [S62] each time after you energize the relay. If you do not reset the relay, you cannot close the main contactor/breaker.
Start-up and validation test

Contents of this chapter
This chapter describes the start-up, validation test procedure, and validation of the safety function.

Validation of the safety functions
You must do a validation test to make sure that the safety function operates correctly and according to the safety requirements.

- Competence
The person who does the validation test of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6. This person must document and sign the test procedures and report.

- Validation procedure
You must do the validation test using the checklist given in this manual and the validation test plan of the complete safety system:
  - at the initial start-up of the safety function
  - after changes related to the safety function (wiring, components, safety function-related parameter settings, etc.)
  - after maintenance work related to the safety function
  - at the proof test of the safety function.

The validation test must include at least the following steps:
  - you must have a validation test plan
  - you must test all commissioned functions for proper operation, from each operation location
• you must document all validation tests
• you must sign and store the validation test report for further reference.

### Validation test reports

You must store the signed validation test reports in the logbook of the machine. The report must include, as required by the referred standards:

- a description of the safety application (including a figure)
- a description and revisions of safety components that are used in the safety application
- a list of all safety functions that are used in the safety application
- a list of all safety-related parameters and their values
- documentation of start-up activities, references to failure reports and resolution of failures
- the test results for each safety function, checksums, date of the tests, and confirmation by the test personnel.

You must store any new validation test reports done due to changes or maintenance in the logbook of the machine.

### Start-up and validation test

You must use the Drive composer PC tool or a control panel to do the start-up and validation test.

**Initial status**

Make sure that the drive is ready for use, that is, you have done the tasks of the drive start-up procedure. See the hardware manual.

Make sure that the STO function is configured and validated. See the hardware manual.

**Checks and settings with no voltage connected**

Stop the drive and do the steps in section Electrical safety precautions (page 9) before you start the work.

If you have done any connections for the emergency stop circuit on site (such as wiring of additional emergency stop buttons, connection of shipping splits of large drives, etc.), check the connections against the applicable circuit diagrams.

**Inverter units with parallel R8i inverter modules:**

Make sure that the XSTO.OUT output on the inverter control unit [A41] is chained to the STO inputs of all inverter modules.

Make sure that the hardware settings of the safety function are set as defined in this manual.

**Settings with voltage connected**

Close the cabinet doors and power up the drive. See the hardware manual.

Make sure that the parameter settings related to the safety functions are correct. See chapter Parameter settings.

For more information, see the data sheet of the relay (www.phoenixcontact.com).

Use a multimeter to measure the STO circuit connections, if the drive generates one or more of these faults:
- STO hardware failure (5090)
- Safe torque off 1 loss (FA81)
- Safe torque off 2 loss (FA82)

Refer to the circuit diagrams delivered with the drive.

For more fault tracing possibilities, see the hardware and firmware manuals of the drive.

**Reporting problems and failures related to safety functions**

Contact ABB.
Contents of this chapter
This chapter contains information for the maintenance and decommissioning of the safety function.

Safety circuit maintenance
After the safety function is validated, it must be maintained by:

• periodic proof testing
• replacing the main contactor/breaker before the end of its specified lifetime.

See the contactor/breaker data sheet or manual.

If you change the wiring or a component after the start-up, or restore parameters to their factory default values:

• Use only ABB-approved spare parts.
• Register the change to the change log for the safety circuit.
• If parameters were restored to the factory default values: Set the parameters related to the safety function.
• Do the validation test of the safety function.
• Document the tests and store the report into the logbook of the machine.

Proof test interval
Proof tests are used to detect failures in the safety function. To do a proof test, use the validation test procedure given in this manual.

Periodic proof testing of the safety function is necessary to maintain the required SIL/PL-level. In high demand mode of operation, the maximum proof test interval is 20 years. In low
demand mode of operation, the maximum proof test interval is 1 year (high or low demand as defined in IEC 61508, IEC/EN 62061 and EN ISO 13849-1). Regardless of the mode of operation, it is a good practice to do the proof test for the safety function at least once a year. It is also a good practice to include the proof test for the safety function in the routine maintenance program of the machinery.

The person responsible for the design of the complete safety system should also note the Recommendation of Use CNB/M/11.050 published by the European co-ordination of Notified Bodies for Machinery concerning dual-channel safety-related systems with electromechanical outputs:

- When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be done at least every month.
- When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be done at least every 12 months.

This is a recommendation and depends on the required (not achieved) SIL/PL. For example, contactors, breakers, safety relays, contactor relays, emergency stop buttons, switches, etc. are typically safety devices which have electromechanical outputs. The STO circuit of the drive does not have electromechanical outputs.

**Functional safety components**

The mission time of functional safety components is 20 years which equals the time during which failure rates of electronic components remain constant. This applies to the components of the standard Safe torque off circuit as well as any modules, relays and, typically, any other components that are part of functional safety circuits.

The expiry of mission time terminates the certification and SIL/PL classification of the safety function. The following options exist:

- Renewal of the whole drive and all optional functional safety module(s) and components.
- Renewal of the components in the safety function circuit. In practice, this is economical only with larger drives that have replaceable circuit boards and other components such as relays.

Note that some of the components may already have been renewed earlier, restarting their mission time. The remaining mission time of the whole circuit is however determined by its oldest component.

Contact your local ABB service representative for more information.

**Competence**

The person who does the maintenance and proof test activities of the safety function must be a competent person with expertise and knowledge of the safety function and functional safety, as required by IEC 61508-1 clause 6.

**Residual risk**

The safety functions are used to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. Thus, the warnings for the residual risks must be given to the operators.
Intentional misuse
The safety circuit is not designed to protect a machine against intentional misuse.

Decommissioning
When you decommission an emergency stop circuit or a drive, make sure that the functional safety of the machine is maintained by other means until the decommissioning is completed.
Technical data

Contents of this chapter

This chapter lists the safety data, describes the ambient conditions and gives a list of standards related to the product.

Safety data

- Safety data values

The safety data is valid for the default design of the safety circuit described in this manual. If the final design is different from the default and the customer has ordered safety data calculations (option +P947), ABB calculates new safety data and delivers it separately to the customer.

The safety data calculations are based on the following assumptions on the operation of the main contactor/breaker [Qx]:

- It is switched at low load current (normal use, ~0%, AC-1).
- It is used for the emergency stop once a month.
- It is used for the ordinary on and off once a day.

1) Contactors installed by the user will have an effect on the safety data.

2) PFH values according to EN ISO 13849.

3) In low demand mode, DC of electromechanical devices is considered as 0%, and therefore no overall DC value is claimed in low demand mode.

4) See also the Recommendation of Use CNB/M/11.050 published by the European coordination of Notified Bodies for lower T1 requirement.

5) T1 ≥ 20 a stands for high demand use. T1 = 1 a is used with low demand mode of operation.

6) With internal charging circuit and charging contactor.

**Note:** If T1 > 1 a is needed in low demand mode of operation, SIL 1 / PL c levels shall be used and PFD calculated separately.

Operation delays

Emergency stop total delay: less than 250 ms.

Ambient conditions

For the environmental limits for the safety functions and the drive, refer to the drive hardware manual.

Compliance with the European Machinery Directive

The drive is an electronic product which is covered by the European Low Voltage Directive. However, the drive internal safety function of this manual is in the scope of the Machinery Directive as a safety component. This function complies with European harmonized standards such as IEC/EN 61800-5-2. The declaration of conformity is delivered with the drive.
