Introduction to the manual

Contents of this chapter
This chapter describes the manual in short and gives some general information for the reader. The chapter also contains a quick reference for implementing a safety system.

Applicability
The manual applies to ACS580-07, ACH580-07 and ACQ580-07 drives which have the option: Emergency stop, stop category 0 with STO, with safety relays (option+Q963). In this emergency stop option, the main contactor/circuit breaker of the drive is not opened.

Safety instructions
Only a qualified electrician who has appropriate knowledge on functional/machine/process safety is allowed to install, start up and maintain the safety circuit.

⚠️ WARNING! This safety function does not disconnect the voltage of the main and auxiliary circuits from the drive. Never work on the electrical parts of the drive or the motor before you have also disconnected the drive system from the electric supply, from rotating permanent magnet motors and from rotating motors equipped with sine filters, and made sure by measuring that there is no dangerous voltage present.

⚠️ WARNING! After you have made additions to the drive safety circuit or modified it, changed circuit boards inside the drive, always test the operation of the safety circuit according to its acceptance test procedure. The change can affect unexpectedly. All customer-made changes are on the customer’s responsibility.
WARNING! Read and obey all safety instructions given for the drive in its hardware manual. If you ignore them, injury or death, or damage to the equipment can occur.

This manual does not repeat the complete safety instructions of the drive but it only includes the instructions related to the scope of this manual.

Target audience

The manual is intended for people who install, start up, use and service the safety option of the drive. Read the manual before working on the drive. You are expected to know the fundamentals of electricity, wiring, electrical components, electrical schematic symbols, and functional safety.

Contents

The chapters of this manual are briefly described below.

*Introduction to the manual* (this chapter) introduces this manual.

*Option description and instructions* describes the safety option and instructs how to wire, start up, test, validate, use and maintain it. The chapter also contains the safety data.

Exclusion of liability
ABB is not responsible for the implementation, verification and validation of the overall safety system. It is the responsibility of the system integrator (or other party) who is responsible for the overall system and system safety.

The system integrator (or other responsible party) must make sure that the entire implementation complies with all relevant standards, directives and local electrical code, and that the system is tested, verified and validated correctly.

Contents this chapter

This chapter describes the +Q963 emergency stop option and instructs how to wire, start up, test, validate, use and maintain it. The safety data is also given.

Description

The option +Q963 corresponds to an uncontrolled stop in accordance with stop category 0 (EN/IEC 60204-1). The option activates the Safe torque off (STO) function which disables the control voltage of the power semiconductors of the drive output stage. This prevents the drive from generating the torque required to rotate the motor(s). The motor(s) coasts to a stop. The main contactor/breaker of the drive is not opened.

For a detailed description of the Safe torque off function, see the hardware manual.

The design principles of the option +Q963 comply with EN ISO13850.

For a complete list of related standards and European directives, see section Related standards and directives on page 23.
Initial status: The drive is in operation and the motor is running.

|      | • releases the emergency stop button [S61] to normal (up) position  
|      | • resets the emergency stop circuit with the emergency stop reset button [S62]  
|      | • resets the drive (if the STO indication parameter 31.22 has been set so that a fault is generated)  
|      | • makes sure that the drive has received the start signal (depends on the configuration, see the firmware manual). |
Fault reaction function

Definition: A safety function requires a ‘fault reaction function’ that attempts to initiate a safe state if the safety function's diagnostics detect a fault within the hardware/software that performs the safety function.

The fault reaction function of the emergency stop safety relay [A61] trips if it detects a failure (short circuit between signals, open circuits, redundancy fault when the emergency stop button is pushed) in the safety circuit. The fault reaction function shifts the drive immediately into safe state by activating the Safe torque off (STO) function, switching on the drive emergency stop command, and keeping it on until the detected fault has been repaired. The indication lamp of the reset button is on until the fault has been repaired.

The emergency stop reset circuit must be open when the user releases the emergency stop button. The emergency stop safety relay [A61] detects if the reset circuit is closed and the relay does not close.

The STO function has its own internal fault diagnostics and fault reaction function.

Parameter settings

The drive parameter setting in the drive control program:

- parameter 31.22 STO indication run/stop is set to value Warning/Warning (recommended).

For more information, see the firmware manual.

Hardware settings

The emergency stop safety relay [A16] is set to the manual reset mode at the factory.

For more information, see the circuit diagrams delivered with the drive.
Wiring

One emergency stop button and one reset button are installed on the cabinet door and wired to the drive at the factory. There are double contacts in the emergency stop button and double wiring (two-channel connection) between the button and the emergency stop safety relay [A61]. The safety relay detects cross faults and faults across one contact from the emergency stop button. This function must be used in a redundant manner, that is, the emergency stop button must be connected to both terminals with a separate contact.

If needed, install additional emergency stop buttons on site and wire them to the appropriate terminal block inside the drive cabinet. See the circuit diagrams delivered with the drive. Follow the rules below:

1. Use only double-contact buttons approved for the emergency stop circuits.

2. Connect the emergency stop buttons with two conductors (two-channel connection).
   **Note:** Keep the channels separate. If you use only one channel, or if the first and second channels are connected together (for example, in a chain), the cross fault detection of the emergency stop safety relay trips and activates the emergency stop command of the drive as it detects a redundancy fault.

3. Use shielded, twisted pair cable. We recommend a double-shielded cable and gold-plated contacts in the emergency stop button.

4. Ensure that the sum resistance for one channel (loop resistance) does not exceed 70 Ohm.

5. Obey the general control cable installation instructions given in the drive hardware manual.

You can also install additional reset buttons and indication lamps for the emergency stop circuit on site. We recommend gold-plated contacts in the reset button. Wire the buttons to the appropriate terminal block inside the drive cabinet. See the circuit diagrams delivered with the drive. Follow the rules below:

1. Sum resistance of the external reset circuit may not exceed 70 Ohm.

2. Obey the general control cable installation instructions given in the drive hardware manual.
# Start-up and acceptance test

You need the Drive composer PC tool or a control panel to perform the start-up and acceptance test.

Initial status: Make sure that the drive is ready for use, that is, you have done the tasks of the drive start-up procedure. See the hardware manual.

## Checks and settings with no voltage connected

If any connections of emergency stop circuit have been done on site (such as wiring of additional emergency stop buttons, connection of shipping splits of large drives, etc.), check the connections against the appropriate circuit diagrams.

Check that the hardware settings relevant to the safety function are set as defined in section Hardware settings on page 13.

## Settings with voltage connected

Check that the parameters relevant to the safety function are set as defined in section Parameter settings on page 13.

## Acceptance test

Ensure that the motor can be run and stopped freely during the test.

Start the drive and ensure that the motor is running. If possible, use a motor speed close to the maximum speed of the application.

Push the emergency stop button [S61].

Ensure that the drive stops the motor by coasting and displays a related warning. See section Emergency stop indications on page 16.

Ensure that the emergency stop indication lamp [P62] switches on.

Ensure that you cannot start the drive and motor from any control location: Ensure that the motor does not start even if you switch the start signal off and on or push the start key of the panel.

Turn the emergency stop button [S61] until it releases and returns to the up position.

Push the emergency stop reset button [S62]. Ensure that the emergency stop indication lamp [P62] switches off.

Switch off the drive start signal.

If a fault message is generated, reset the drive. See section Parameter settings on page 13.

Restart the drive and motor and check that they operate normally.

Repeat the test from each operating location (every emergency stop button and reset button).

Fill in and sign the acceptance test report which verifies that the safety function is safe and accepted to operation.
Use of the safety function

- Activating
  1. Push the emergency stop button [S61]. The emergency stop activates and the button locks in “ON” (open) position.

- Resetting
  1. Turn the emergency stop button [S61] until it releases.
  3. Reset the drive if necessary.
  4. Make sure that the drive has received the start signal (depends on the configuration, see the firmware manual).
  5. You can now restart the drive.

Note: You have to reset the emergency stop circuit with the reset button [S62] also after you have powered up the drive.

Emergency stop indications

When the emergency stop is on:
- the drive control program has the warning Safe torque off active,
- the emergency stop reset button [S62] on cabinet door is illuminated (indication lamp [P62]).
Fault tracing

The emergency stop safety relay [A61] type is Phoenix Contact PSR-MC34. For more information, see the data sheet of the relay (www.phoenixcontact.com).

This table describes the status LEDs of the relay.

For more fault tracing possibilities, see the hardware and firmware manuals of the drive.
Maintenance

After the operation of the circuit is tested at start-up, it does not need any scheduled maintenance during its specified lifetime.

In addition to proof testing, it is a good practice to check the operation of the function when other maintenance routines of the machinery are carried out.

If you change any wiring or component after the start up, or restore parameters to their default values:

- Use only ABB approved spare parts.
- Register the change to the change log for the safety circuit.
- Test the safety function again after the change. Follow the rules given in section Start-up and acceptance test on page 15.
- Document the tests and store the report into the logbook of the machine.

Proof test interval

After the operation of the safety function is validated at start-up, the safety function must be maintained by periodic proof testing. In high demand mode of operation, the maximum proof test interval is 20 years. In low demand mode of operation, the maximum proof test interval is 5 or 2 years (high or low demand as defined in IEC 61508, EN/IEC 62061 and EN ISO 13849-1). Regardless of the mode of operation, it is a good practice to check the operation of the safety function at least once a year. Do the test as described in section Start-up and acceptance test on page 15.

The person responsible for the design of the complete safety function should also note the Recommendation of Use CNB/M/11.050 published by the European co-ordination of Notified Bodies for Machinery concerning dual-channel safety-related systems with electromechanical outputs:

- When the safety integrity requirement for the safety function is SIL 3 or PL e (cat. 3 or 4), the proof test for the function must be performed at least every month.
- When the safety integrity requirement for the safety function is SIL 2 (HFT = 1) or PL d (cat. 3), the proof test for the function must be performed at least every 12 months.

This is a recommendation and depends on the required (not achieved) SIL/PL. For example, safety relays, contactor relays, emergency stop buttons, switches etc. are typically safety devices which contain electromechanical outputs. The STO circuit of the drive does not contain any electromechanical components.

Competence

The maintenance and proof test activities of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6.

Residual risk

The safety functions are used to reduce the recognized hazardous conditions. In spite of this, it is not always possible to eliminate all potential hazards. Therefore the warnings for the residual risks must be given to the operators.
Intentional misuse
The safety circuit is not designed to protect a machine against intentional misuse.

Decommissioning
When you decommission an emergency stop circuit or a drive, make sure that the safety of the machine is maintained until the decommissioning is complete.
Safety data

The safety data given below is valid for the default design of the safety circuit presented in this manual. In case the final design differs from the default, ABB calculates new safety data and delivers it separately to the customer.

Safety data values

The safety data calculations are based on the assumption that the emergency stop is used once a month.

1) DC for low demand mode is 90% (determined by the DC of the worst component in the subsystem).
2) T1 = 20a is used with high demand mode of operation. T1 = 2a or 5a is used with low demand mode of operation.

See also section Proof test interval on page 18.

Safety component types

Safety component types as defined in IEC 61508-2:
- emergency stop button: type A
- emergency stop safety relay: type A
- drive STO circuit: type A.

Safety block diagram

The components that are included in the safety data calculations are shown in the safety block diagram below.

Relevant failure modes

Internal failures of safety relays, the emergency stop button and STO. These failures are included in the PFH value of the function.
Fault exclusions
Fault exclusions (not considered in the calculations):
• any short and open circuits in the cables of the safety circuit
• any short and open circuits in the cabinet terminal blocks of the safety circuits.

Operation delays
Emergency stop total delay: less than 250 ms
General rules, notes and definitions

Validation of the safety functions
You must do an acceptance test (validation) to validate the correct operation of safety functions.

Validation procedure
You must do the acceptance test using the checklist given in section Start-up and acceptance test on page 15:

• at initial start-up of the safety function
• after any changes related to the safety function (wiring, components, safety function related parameter settings etc.)
• after any maintenance action related to the safety function.

The acceptance test must include at least the following steps:

• you must have an acceptance test plan
• you must test all commissioned functions for proper operation, from each operation location
• you must document all acceptance tests.

Acceptance test reports
You must store the signed acceptance test reports in the logbook of the machine. The report must include, as required by the referred standards:

• a description of the safety application (including a figure)
• a description and revisions of safety components that are used in the safety application
• a list of all safety functions that are used in the safety application
• a list of all safety related parameters and their values
• documentation of start-up activities, references to failure reports and resolution of failures
• the test results for each safety function, checksums, date of the tests and confirmation by the test personnel.

You must store any new acceptance test reports performed due to changes or maintenance in the logbook of the machine.

Competence
The acceptance test of the safety function must be carried out by a competent person with adequate expertise and knowledge of the safety function as well as functional safety, as required by IEC 61508-1 clause 6. The test procedures and report must be documented and signed by this person.
## Ambient conditions

For the environmental limits for the safety functions and the drive, refer to the hardware manual.

## Compliance with the European Machinery Directive

The drive is an electronic product which is covered by the European Low Voltage Directive. However, the drive internal safety function of this manual (option +Q963) is in the scope of the Machinery Directive as a safety component. This function complies with European harmonized standards such as EN/IEC 61800-5-2. The declaration of conformity is delivered with the drive.
