## Relion® BIO-Testers

Healthy binary inputs and outputs (BIOs) prevent incorrect operation, ensure optimal personnel safety, minimize the risk of damages to equipment, maximize process uptime, and save time and money. ABB's Relion® BIO-Tester range makes testing BIOs can be fast and easy, throughout the entire relay life cycle.

**Relion® BIO-Testers are intended for testing the binary inputs and outputs of ABB's Relion® protection relays. These easy-to-use compact testers can be used for simulation during the design of the application configuration, including troubleshooting, as well as for routine maintenance and testing.**

**Relion® BIO-Testers – an easy, fast and safe choice**  
Binary inputs and outputs (BIOs) play an important role in the overall operation of protection relays, for example in various control and interlocking schemes, and by generating alarm and trip signals to the circuit breaker. Ensuring the health of the BIOs through simulation and testing is advisable to prevent incorrect operation of a control scheme, which may pose a safety risk to personnel, damage equipment and result in process or revenue loss.

BIOs can be tested already at the primary design stage to ensure the correctness of the logic and during periodic maintenance. Relion® BIO-Testers have been specifically developed to facilitate the testing of both the configuration and the operation of inputs and outputs. Where using a digital ohmmeter is laborious, the BIO testers make the simulation and testing fast, safe and easy.
