IMPORTANT SAFETY INSTRUCTIONS

This manual contains important safety instructions that must be followed during the installation and maintenance of the equipment.

SAVE THESE INSTRUCTIONS!

Keep this document in a safe place near the inverter for easy access during installation, operation and maintenance.

THE INSTALLER MUST READ THIS DOCUMENT IN ITS ENTIRETY BEFORE INSTALLING THIS EQUIPMENT.

Operators are required to read this manual and scrupulously follow the instructions given in it, since ABB cannot be held responsible for damage caused to people and/or things, or the equipment, if the conditions described below are not observed.

The purpose of this document is to support the qualified technician, who has received training and/or has demonstrated skills and knowledge in construction, to install, operate and maintain the inverter. This manual covers only inverter, not any equipment (photovoltaic modules, external disconnects, etc) to which it is connected.

Warranty requirements are included in the Terms and Conditions of sale included with the inverter order.

NOTE: Any changes made to the product or to the installation conditions that hasn’t been approved by ABB will void the warranty.

All pictures and illustrations shown in this user manual are indicatives and must be intended as support for installation instruction only. Actual product may vary due to product enhancement. Specifications subject to change without notice. The latest version of this document is available on the ABB website.

The products are designed to be connected to and to communicate information and data via a network interface. It is the user’s sole responsibility to provide and continuously ensure a secure connection between the product and the user’s network or any other network (as the case may be). The user shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information. The data, examples and diagrams in this manual are included solely for the concept or product description and are not to be deemed as a statement of guaranteed properties. All persons responsible for applying the equipment addressed in this manual must satisfy themselves that each intended application is suitable and acceptable, including that any applicable safety or other operational requirements are complied with. In particular, any risks in applications where a system failure and/or product failure would create a risk for harm to property or persons (including but not limited to personal injuries or death) shall be the sole responsibility of the person or entity applying the equipment, and those so responsible are hereby requested to ensure that all measures are taken to exclude or mitigate such risks. This document has been carefully checked by ABB but deviations cannot be completely ruled out. In case any errors are detected, the reader is kindly requested to notify the manufacturer. Other than under explicit contractual commitments, in no event shall ABB be responsible or liable for any loss or damage resulting from the use of this manual or the application of the equipment.

This chapter contains the safety instructions which you must obey when you install and operate the inverter and perform maintenance operations on the inverter. Obey these safety instructions to prevent injury or death, or damage to the equipment.

The instructions provided in the manual do not replace the safety devices and technical data for installation and operation labels on the product, and they do not replace the safety regulations in force in the country of installation.

The operators must read and comply with the technical information and instruction provided in the manual and in the attached documentation.

ABB accepts no liability for failure to comply with the instructions for correct installation and cannot be held responsible for the upstream or downstream equipment.

Specific safety information are provided during installation, commissioning and maintenance operation instructions. Always follow the reading order of instruction exactly as described in this manual.
# Symbols and signs

In the manual and/or in some cases on the equipment, the danger or hazard zones are indicated with signs, labels, symbols or icons.

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Symbol" /></td>
<td>It is mandatory to consult the manual or original document, which must be available for future use and must not be damaged in any way.</td>
</tr>
<tr>
<td><img src="image" alt="Symbol" /></td>
<td><strong>General warning</strong> - Important safety information. Operations or situations in which staff must be very careful.</td>

Installation and maintenance safety

General safety information

Do not proceed with installation if the integrity of the equipment is compromised. Do not use the equipment if you find any operating anomalies.

Avoid temporary repairs. All repairs should be carried out using only genuine spare parts, which must be installed in accordance with their intended use.

The labels affixed on the equipment must strictly NOT be removed, damaged, defaced, hidden, etc.

Do not do work on the photovoltaic generator, or the inverter, or its input or output cables, when the inverter is connected to an electrical power system, or to the photovoltaic generator.

Before performing any maintenance operation on the inverter, follow these steps:

- Prepare the work: Do an on-site Risk Assessment or Job Hazard Analysis (Check for proper tools and PPE for the Job; Engage the person responsible for electrical equipment or system to review single-line, schematics, switching plans; Decide on the appropriate work methods and initiate the permit to work process).
- Clearly identify the work location and equipment.
- Disconnect all sources and Secure against reconnection by means of a ‘Lockout/Tagout procedure to ensure it cannot accidentally become live.
- Verify the absence of operating voltage (This must be by means of a proper test instrument).
- Complete the permit to work and “Walk the Permit’” (Now we have verified a ‘safe working area’ it is time to validate the ‘Permit to Work’ and “Walk the Permit”).

Refer to “Inverter total de-energization and safe access” chapter on this manual to know all detailed necessary steps to safely operate on the inverter.

Environmental conditions and risks

The device can be installed outdoors, but only in environmental conditions that do not prevent its regular operation. These conditions are listed in the technical data and in the installation chapter.

Do not open the front covers of the inverter when it is raining, or when sand or dust can blow into the unit. Water or sand in the inverter can cause damage in the unit. In the risk assessment prior any intervention on the equipment it is of paramount importance to evaluate the weather conditions. Any intervention on the inverter can be done only in case of dry environment. Don’t proceed in case of rain (even light) or high humidity.

The device is not designed to operate in environments that are particularly inflammable or explosive.

In the event of fire, use CO2 extinguishers and auto-extraction systems to extinguish the fire in closed environments.

The installer or maintenance technician must always pay attention to the work environment, ensuring that it is well-lit and there is enough room to ensure an escape route.
Electrical and thermal safety

**WARNING!** Obey these instructions to prevent injury or death, or damage to the equipment. If you are not a qualified electrician, do not perform any electrical installation or maintenance work.

Obey all installation safety standards. This can require, among other things, the use of personal protection equipment (PPE), such as arc-proof clothing, arc-proof masks, protective footwear, insulating and protective gloves, eye protection and hearing protection. High power inverter installations have high fault currents.

Before you operate on the inverter, isolate the AC line cables from the electrical power system with the AC disconnect switch of the power system transformer (downstream the inverter). Also, isolate the inverter from the photovoltaic generator with the DC disconnect switch of the generator or by other means (upstream the inverter). The internal AC disconnect switch (if present) do not isolate the AC output cables and terminals of the inverter from the electrical power system. The internal DC disconnect switches (if present) do not complete isolate the DC input cables or terminals from the DC voltage supplied by the photovoltaic generator. Refer to “Inverter total de-energization and safe access” chapter on this manual for further details.

Do not work on the communication and control signal cables when power is applied to the inverter or to the external control circuits.

Do not perform insulation or voltage withstand tests on the inverter.

ABB inverters must be earthed via the connection points marked with the protective earth symbol and using a cable with an appropriate conductor cross-section for the maximum ground fault current that the generating system might experience.

Do not switch-on the inverter with the front covers open, even during troubleshooting. The inverter front covers act as arc hazard protection. If a highly unlikely arc flash incident occurs when the inverter front covers are open, the arc-flash proof protection equipment might not provide sufficient protection for the operators.

When the device has just been switched off, it may have hot parts as a result of overheating of the heated surfaces (e.g.: transformers, accumulators, coils, etc.) so be careful where you touch.
Residual risks

Despite the warnings and safety systems, there are still some residual risks that cannot be eliminated. These risks are listed in the following table with some suggestions to prevent them.

Table of residual risks

<table>
<thead>
<tr>
<th>RISK ANALYSIS AND DESCRIPTION</th>
<th>SUGGESTED REMEDY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Noise pollution due to installation in unsuitable environments or where staff work permanently.</td>
<td>Reassess the environment or the place of installation.</td>
</tr>
<tr>
<td>Suitable local ventilation that does not cause overheating of the equipment and is sufficient not to create discomfort to people in the room.</td>
<td>Restore suitable ambient conditions and air the room.</td>
</tr>
<tr>
<td>External weather conditions, such as water seepage, low temperatures, high humidity, etc.</td>
<td>Maintain ambient conditions suitable for the system.</td>
</tr>
<tr>
<td>Overheating of surfaces at temperature (transformers, accumulators, coils, etc.) can cause burns. Also be careful not to block the cooling slits or systems of the equipment.</td>
<td>Use suitable protective equipment or wait for the parts to cool down before switching on the equipment.</td>
</tr>
<tr>
<td>Inadequate cleaning: compromises cooling and does not allow the safety labels to be read.</td>
<td>Clean the equipment, labels and work environment adequately.</td>
</tr>
<tr>
<td>Accumulation of electrostatic energy can generate hazardous discharges.</td>
<td>Ensure the devices have discharged their energy before working on them.</td>
</tr>
<tr>
<td>During installation, temporarily mounting the equipment or its components may be risky.</td>
<td>Be careful about and disallow access to the installation area.</td>
</tr>
</tbody>
</table>
Warranty and supply conditions

The warranty conditions (available on the official ABB website) are considered to be valid if the Customer adheres to the indications in this manual; any condition deviating from those described herein must be expressly agreed in the purchase order.

*ABB declares that the equipment complies with the provisions of law currently in force in the country of installation and has issued the corresponding declaration of conformity.*

Not included in the supply

*ABB accepts no liability for failure to comply with the instructions for correct installation and will not be held responsible for systems upstream or downstream of the equipment it has supplied.*

*It is absolutely forbidden to modify the equipment. Any modification, manipulation, or alteration not expressly agreed with the manufacturer, concerning either hardware or software, shall result in the immediate cancellation of the warranty.*

*The customer is fully responsible for any changes made to the system.*

Given the countless array of system configurations and installation environments possible, it is essential to check the following: adequate spaces, suitable for housing the equipment; airborne noise produced based on the environment; possible flammability conditions.

*ABB will NOT be held liable for defects or malfunctions arising from: improper use of the equipment; deterioration resulting from transportation or particular environmental conditions; performing maintenance incorrectly or not at all; tampering or unsafe repairs; use or installation by unqualified persons.*

*ABB is not responsible for any loss of the equipment, or part of it, which does not take place on the basis of the regulations and laws in force in the country of installation.*
Scope and target audience

Purpose and document structure

This operating and maintenance manual is a useful guide that will enable you to work safely and carry out the operations necessary for keeping the equipment in good working order.

If the equipment is used in a manner not specified in this manual, the protections and the certifications provided by the equipment may be impaired with the consequent loss of warranty.

The language in which the document was originally written is ENGLISH; therefore, in the event of inconsistencies or doubts please ask the manufacturer for the original document.

List of appendix documents

In addition to this user manual and maintenance you can consult (and download) the product documentation by visiting www.abbsolarinverters.com.

Part of the information given in this document is taken from the original supplier documents. This document contains only the information considered necessary for the use and routine maintenance of the equipment.

Operator and maintenance personnel skills/prerequisites

Personnel in charge of using and maintaining the equipment must be skilled for the described tasks and must reliably demonstrate their capacity to correctly interpret what is described in the manual.

For safety reasons, the installation must be performed by qualified installers and/or licensed electricians in accordance with the existing regulations in the country of installation and in accordance to all safety rules for performing electrical works. The installers must have demonstrated skills and knowledge of the inverter’s structure and operation.

Inverter operation and maintenance by a person who is NOT qualified, is intoxicated, or on narcotics, is strictly forbidden.

The customer has civil liability for the qualification and mental or physical state of the personnel who interact with the equipment. They must always use the personal protective equipment (PPE) required by the laws of the country of destination and whatever is provided by their employer.
Application area, general conditions

ABB shall not be liable for any damages whatsoever that may result from incorrect or careless operations.

You may not use the equipment for a use that does not conform to that provided for in the field of use. The equipment MUST NOT be used by inexperienced staff, or even experienced staff if carrying out operations on the equipment that fail to comply with the indications in this manual and enclosed documentation.

Intended or allowed use

This equipment is a inverter designed for:
- transforming a continuous electrical current (DC) supplied by a photovoltaic generator (PV)
- in an alternating electrical current (AC)
- suitable for feeding into the public distribution grid.

Limits in field of use

The inverter can be used only with photovoltaic modules which have ground isolated input poles.

Only a photovoltaic generator can be connected in the input of the inverter (do not connect batteries or other sources of power supply).

The inverter can be connected to the electricity grid only in countries for which it has been certified/approved.

The inverter cannot be connected to the DC side in parallel to other inverters.

The inverter may only be used in compliance with all its technical characteristics.

Improper or prohibited use

IT IS STRICTLY FORBIDDEN TO:

- Install the equipment in environments subject to particular conditions of flammability or in adverse or disallowed environmental conditions, (temperature and humidity).
- Use the equipment with safety devices which are faulty or disabled.
- Use the equipment or parts of the equipment by linking it to other machines or equipment, unless expressly provided for.
- Modify operating parameters that are not accessible to the operator and/or parts of the equipment to vary its performance or change its isolation.
- Clean with corrosive products that could corrode parts of the equipment or generate electrostatic charges.
- Use or install the appliance or parts of it without having read and understood the contents of the user and maintenance manual.
- Placing any heavy object, sit or stand up on the inverter.
- Heat or dry rags and clothing on the parts in temperature. In addition to being hazardous, doing so would compromise component ventilation and cooling.
General conditions

A description of the equipment characteristics is provided to identify its main components and specify the technical terminology used in the manual.

This chapter contains information about the models, details of the equipment, characteristics and technical data, overall dimensions and equipment identification.

*The customer/Installer takes full responsibility if, when reading this manual, the chronological order of its presentation provided is not observed. All information is provided considering occasional inclusion of information in previous chapters.*

In certain cases, there may be a need to separately document software functionality or attach supplementary documentation to this manual which is intended for more qualified professionals.
Identification of the equipment and manufacturer

The technical data provided in this manual does not substitute the data supplied on the labels affixed to the equipment.

The labels affixed to the equipment must NOT be removed, damaged, stained, hidden, etc., for any reason whatsoever.

The labels shown below have to be intended as example only.

The regulatory label contains the following information:
1. Manufacturer  3. Rating data
2. Model        4. Certification marks

Note: The labels are NOT to be hidden by foreign objects and parts (rags, boxes, equipment, etc.); they must be regularly cleaned and always kept in sight.
In addition to the label showing the inverter data, there are also additional identification labels for the power module (1) and the wiring box (2).

The labels display the following information:

- **Power module or wiring box model**
- **Power module or wiring box Part Number**
- **Power module/wiring box Serial Number**
  - YY = Year of manufacture
  - WW = Week of manufacture
  - SSSSSS = sequential number
- **Week/Year of manufacture**

The officially required information is located on the regulatory label. The identification label is an accessory label which shows the information necessary for the identification and characterisation of the inverter by ABB. In case you need to communicate with ABB about the inverter, the information from identification label are mandatory.

The labels are NOT to be hidden by foreign objects and parts (rags, boxes, equipment, etc.); they must be regularly cleaned and always kept in sight.

An additional Communication Identification label is applied on the wiring box (2). The label displays the following information:

- **WLAN board Serial Number**
- **WLAN board Part Number**
- **MAC address:**
  - To be used to obtain the SSID of the wireless access point created by the inverter: **ABB-XX-XX-XX-XX-XX-XX** (where “X” is a hex digit of the MAC address).
  - To be used to obtain the “Host Name”: **http://ABB-XX-XX-XX-XX-XX-XX.local** (where “X” is a hex digit of the MAC address).
  - MAC address it’s the only required information to register the inverter with Aurora Vision.
- **Wiring Box Serial Number**
- **Product Key:**
  To be used as wireless access point password, or to be used to access to the Web UI as username and password in case of lost credentials, and to commission inverter using ABB Installer for Solar Inverters.

The Communication Identification label is divided in two separate parts by a dashed line; take the bottom part and apply it on the plant documentation. (ABB recommend to create a plant map and apply the Communication Identification label on it).
The choice of the inverter model must be made by a qualified technician who knows about the installation conditions, the devices that will be installed outside the inverter and possible integration with an existing system.

#### Input protection

- **Reverse polarity protection**: Yes, from current limited source
- **Input over voltage protection for each MPPT - varistor (-S / -S2 models)**: 2
- **Input over voltage protection for each MPPT - plug in modular surge arrester (-SX / -SX2 models)**: 2 (Type 2)
- **Photovoltaic array isolation control**: Yes, according to IEC 62109-2
- **Residual current monitoring device**: Yes, according to IEC 62109-2
- **DC switch rating for each MPPT**: 20 A/1500 V - 35 A/1250 V - 50 A/1000 V (2)
- **String current monitoring**: Input current monitoring per MPPT (12ch)
- **Arc fault protection**: Optional

#### Output

- **AC Connection to the grid**: Three phase 3W+PE (TN system)
- **Nominal AC Output Power (P<sub>pacr</sub>@cosφ=1)**: 175 000 W @ 40 °C
- **Maximum AC Output Power (P<sub>acmax</sub>@cosφ=1)**: 185 000 W @ 30 °C
- **Maximum apparent Output power (S<sub>max</sub>)**: 185 000 VA
- **Rated AC Output Voltage (Vacr)**: 800 V
- **Output voltage range (Vacmin...Vacmin)**: 552...960 V (3)
- **Maximum output current (I<sub>acmax</sub>)**: 134 A
- **Contribution to short-circuit current**: 140 A
- **Rated Output Frequency (fr)**: 50 Hz / 60 Hz
- **Output Frequency Range (f<sub>min</sub>...f<sub>max</sub>)**: 45...55 Hz / 55...65 Hz (3)
- **Nominal power factor and setting interval**: > 0.995, 0...1 inductive/capacitive with maximum S<sub>max</sub>
- **Total harmonic distortion of current**: <3%
- **Maximum AC Cable outer diameter / multi core**: 1 x 53 mm (1 x M63 cable gland)
- **Maximum AC Cable outer diameter / single core**: 3 x 32 mm (3 x M40 cable gland)

#### Busbar for lug connections with M10 bolts (included):

AC Connections Type

- Single core cable gland plate with 4 individual AC cable glands: 3 x M40: Ø 22...32mm, 1 x M32: Ø 18...25mm
- Multi core cable gland plate (optional) with 2 individual AC cable glands: 1 x M63: Ø 37...53mm, 1x M32 Ø 18...25mm

#### Output protection

- **Anti-islanding Protection**: According to local standard
- **Maximum external AC overcurrent protection**: 200 A
- **Output overvoltage protection - Varistor (-S / -S2 models)**: Yes
- **Output overvoltage protection - Modular surge arresters (-SX / -SX2 models)**: Type 2

### Communication

- Embedded communication interfaces: 1x RS485, 2x Ethernet (RJ45), WLAN (IEEE802.11 b/g/n @ 2.4 GHz)
- User Interface: 4 LEDs, Web User Interface, Mobile APP
- Communication protocol: Modbus RTU/TCP (Sunspec compliant)
- Commissioning tool: Web User Interface, Mobile APP
- Remote monitoring services: Aurora Vision® monitoring portal
- Advanced features: Embedded logging, direct telemetry data transferring to ABB cloud

### Environmental

- Ambient temperature range: -25°C...+60°C / -13°F...140°F with derating above 40°C / 104°F
- Storage temperature: -40°C...+85°C / -40°F...185°F
- Relative Humidity: 4…100 % with condensation
- Typical noise emission pressure: 65 dB(A) @ 1 m
- Maximum operating altitude without derating: 2000 m / 6560 ft
- Environmental pollution degree classification for external environments: 3
- Environmental class: Outdoor
- Climatic category according to IEC 60721-3-4: 4K4H

### Physical

- Environmental Protection Rating: IP 65 (IP54 for the cooling section)
- Cooling System: Forced air
- Dimensions (H x W x D): 867x1086x419 mm / 34.2”x42.7”x16.5” for -S, -SX model
- 867x1086x458 mm / 34.2”x42.7”x18.0” for -S2, SX2 model
- Weight: ~76 kg / 167.5 lbs for power module ; ~77 kg / 169.7 lbs for Wiring box
- Overall max ~153 kg / 337.2 lbs
- Assembly System: Mounting bracket support
- Overvoltage rating as per IEC 62109-1: II (DC input) III (AC output)

### Safety

- Safety class: I
- Insulation Level: Transformerless
- Marking: CE
- Safety, EMC and Radio Spectrum Standards:
  - IEC/EN 62109-1, IEC/EN 62109-2, EN 61000-6-2,
  - EN 61000-6-4, EN 61000-3-11, EN 61000-3-12,
  - EN 301 489-1, EN 301 489-17, EN 300 328, EN 62311
- Grid standard: CEI 0-16, UTE C 15 712-1, JORDAN IRR-DCC-MV, BDEW,
  (check the availability with your sales channel)
  - P.O. 12.3, DRRG D.4

### Accessories

- Assembly accessories: PVS-175 Installation Kit
- AC multicore cable gland plate (Supports M63 Ø 37…53mm + M32 Ø 18...25mm)
- DC Series Arc Fault Circuit Interrupter: Type I acc. to UL 1699B® with single-MPPT sensing capability
- DC link recharge circuit: Night time operation with restart capability
- Anti-PID®: Based on night time polarization of the array

---

1. In the event of a fault, limited by the external protection envisaged on the AC circuit
2. According to standard IEC60947.3 Table D.5
3. The AC voltage and frequency range may vary depending on specific country grid standard
4. Performance in line with the relevant requirements of the Draft IEC 63027 standard
5. Cannot operate simultaneously when installed in conjunction with the DC link recharge circuit
6. Hereby, Power-One Italy S.p.A. (A Member of the ABB Group) declares that the radio equipments (radio module combined with the inverter), to which this user manual refers, are in compliance with the Directive 2014/53/EU. The full text of the EU Declaration of Conformity is available at the following internet address: www.abb.com/solarinverters.

Note. Features not specifically mentioned in this data sheet are not included in the product
Tightening torques

To maintain the IP65 protection of the system and for optimal installation, the following tightening torques must be used:

**Efficiency (tolerances according to IEC 61683):**

- Max. Euro eff: 98.38
- CEC: 98.23
Power limitation (Power derating)

In order to allow inverter operation in safe thermal and electrical conditions, the unit automatically reduces the value of the power fed into the grid. Power limiting may occur due to:

- Adverse environmental conditions (thermal derating)
- Percentage of output power (value set by the user)
- Grid voltage over frequency (mode set by user)
- Grid overvoltage $U>10\text{min Der.}$ (enabling carried out by user)
- Anti-islanding
- Grid under voltage
- Input voltage values too high.
- High input current values.

Power reduction due to environmental conditions

The power reduction value and the inverter temperature at which it occurs depend on the ambient temperature and on many operating parameters.

Example: input voltage, grid voltage and power available from the photovoltaic field.

The inverter can therefore reduce the power during certain periods of the day according to the value of these parameters.

![Pacmax Vs Tamb @ 1150Vdc](chart.png)
Power reduction due to the input voltage

The reduction of the power supplied where the DC input voltage values are too high or too low is adjusted automatically.

![Graph showing output power vs input voltage at 30°C]

- Power reduction behaviour shown in the previous graph is guaranteed only in case of balanced input channels.
**P-Q Capability**

P-Q capability may be reduced to match the specific grid code requirements applicable in your country. The following represents the maximum P-Q capability of the unit under the specified operating conditions.

### Capability P-Q

![Capability P-Q Diagram](image)
Characteristics of a photovoltaic generator

A PV electric system consists of an assembly of photovoltaic modules that transform solar radiation into DC electrical energy and can be made up of:

- **Strings**: number of PV modules connected in series
- **Array**: group of strings connected in parallel

Strings and arrays

The string technology was developed to significantly reduce the installation costs of a photovoltaic system, mainly associated to wiring on the DC side of the inverter and subsequent distribution on the AC side. A photovoltaic module consists of many photovoltaic cells mounted on the same support.

- A string consists of a certain number of module connected in series.
- An array consists of two or more strings connected in parallel.

Large photovoltaic systems can include multiple arrays connected to one or more inverters. The greater the number of panels in each string, the lower the cost and the less complex the wiring connections of the system.
Description of the equipment

This equipment is a string inverter which converts the direct current of a photovoltaic generator into alternating current and feeds it into the public distribution grid.

Photovoltaic panels convert solar radiation into “DC” electrical energy (via a photovoltaic field, also called PV generator); in order to use it, it is transformed into “AC” alternate current. This conversion, known as inversion from DC to AC, is done in an efficient way by the ABB inverters, without using any rotary elements, rather only via static electronic systems.

In order to allow inverter operation in safe thermal and electrical conditions, the unit automatically reduces the value of the power fed into the grid under adverse environmental conditions or unsuitable input voltage values.

When connected in parallel with the grid, the alternating current from the inverter flows directly into the domestic or industrial distribution circuit, which is in turn connected to the public distribution grid.

This way the solar energy system compensates for the energy drawn from the utilities connected to the grid to which it is linked.

When the photovoltaic system is not generating sufficient energy, the power required to ensure proper operation of connected loads is taken from the public distribution grid. While if too much energy is produced, it is directly fed to the grid, thus becoming available to other users. According to national and local standards and regulations the produced energy can be sold to the grid or credited to the user against future consumption, thus granting a great saving of money.

Operating diagram (example)
**Mutual connection of multiple inverters**

If the photovoltaic system exceeds the capacity of a single inverter, it is possible to connect multiple inverters to the system, each of them in turn connected on the DC side to a separate section of the photovoltaic generator, and on the AC side to the distribution grid. Each string inverter will work independently of the others and its own photovoltaic module will supply the maximum power available to the grid.

**Notes on the system sizing**

*Decisions on how to structure a photovoltaic system depend on a series of factors and considerations, such as the type of panels, the space availability, the future location of the system, energy production goals over the long term, etc.*

A configuration program that can help to correctly size the photovoltaic system is available on the ABB website (http://stringsizer.abb.com).

When configuring DC input and during the installation it’s needed to follow one basic rule to avoid possible output power derating: All MPPTs shall be populated connecting at least one string. Considering to connect 20 strings, proceed connecting one string per MPPT and then connect the remaining strings in the selected MPPTs where you want to use 2 strings.
Functionality and components of the equipment

Highlights

- 12 independent MPPT
- Two box configuration, separate power module and wiring box
- Transformerless inverter
- Maximum efficiency up to 98.7%.
- Double stage topology for a wide input range
- Large set of specific grid codes available which can be selected directly in the field
- Wireless access to embedded user interfaces
- ABB Installer for Solar Inverters APP for commissioning of inverters
- Ethernet daisy chain enabled (supports both ethernet star/ring topology)
- One RS485 line acting as master or slave
- Modbus TPC/RTU Sunspec compliant
- Support to ABB accessories directly connected to the inverter via RS485
- Remote monitoring and firmware update via Aurora Vision® (logger free)

Improved commissioning and maintenance

ABB Installer for Solar Inverters APP
Improved multi inverter installation with ABB Installer for Solar Inverters APP by using Android mobile devices (the app for iOS mobile devices will be implemented soon).

Integrated Web User Interface
The inverter is equipped with an ethernet and wireless (IEEE802.11 b/g/n) board and with an Integrated Web User Interface that allow a full access to all main configuration and parameters of the inverter. It can be accessed by using from any ethernet or wireless capable device like laptop, tablet or smartphone via a common internet browser.

Remote firmware update function
The inverter firmware can be updated remotely using the Integrated Web User Interface dedicated section or via Aurora Vision® or via ABB Installer for Solar Inverters APP.
Aurora Vision Plant Management Platform

Integrated logging capability allows remote monitoring of the plant without the need of any additional external loggers.

Aurora Vision is a cloud based platform enabling remote monitoring and asset management of ABB devices in range of solar power application. Aurora Vision consists of three different products:

1. **Plant Portfolio Manager** is a full featured web based application used by solar power professionals to monitor and manage a portfolio of solar power plants using ABB inverters.

2. **Plant Viewer** is an easy to use web based serviced application used by non-solar power professionals (such as homeowners or small business owners) to monitor solar power plants they own.

3. **Plant Viewer for Mobile** is the mobile version of **Plant Viewer** enabling non-solar power professionals to remotely monitor their own PV plants by using smart phones, tablets and iPod Touch with IOS and Android operating systems.

4. **ABB Ability™ for solar plants - Energy Viewer** is an easy to use mobile application allowing solar plant owners to remotely monitor all the energy flows and the performance of their own pv plants, with and without an energy storage system installed.

All products previously mentioned work toghether to allow solar power professional and site owners to collaboratively manage solar power plants.

Please contact the ABB tecnichal support for getting your own Plant Portfolio Manager account (mainly for installers and plant administrators). Please get your Plant Viewer, Plant Viewer for Mobile or Energy Viewer by accessing the website www.auroravision.net and click on “Register with Plant Viewer” button (mainly for site owners).
**Configurable relays**

The inverter is equipped with two configurable switching relays, which can be used in different operating configurations that can be set using the web user interface. A typical example of application is closing the contact when an alarm is triggered.

**Remote switch-on/switch-off**

This command can be used to switch off/switch on the inverter via an external (remote) command using the Remote ON/OFF terminal block. This functionality must be enabled in the web user interface and when active, switching on the inverter, besides being dictated by the presence of normal parameters which allow the inverter to be connected to the grid, also depends on the external control for switching on/off.

**Reactive power feed into the grid**

The inverter is able to produce reactive power and can feed this power into the grid via the power factor setting. Power feeding modes vary according to the country of installation and the grid companies.

**Limiting the active power fed into the grid**

The inverter can limit the amount of active power fed into the grid by the inverter to the desired and adjustable value.

**Overvoltage surge arrester monitoring (-SX/SX2 models only)**

The inverter monitors the status of the overvoltage surge arresters, and generates a warning in the event of a fault (viewable via monitoring system, internal web user interface or Installer Mobile APP).

**Data transmission and control**

Embedded multi communication interfaces (WLAN, Ethernet, RS485) combined with a Sunspec compliant Modbus protocol (RTU/TCP) allow the inverter to be easily integrated with any third party monitoring and control systems that support the same Sunspec standard.

*The Modbus RTU/TCP register map is the same for all the communication interfaces (Ethernet, RS-485 and Wireless communication) of the inverter. Please refer to ABB solar official website or get access to Sunspec alliance website for getting the Modbus register map supported by the inverter.*
Communication connection diagrams

The communication connection diagrams shows how the integrated ethernet and wireless board allows the local or remote connection to the inverter.

Communication interface

The inverter provide the following integrated communication interfaces:

- Wi-Fi channel (IEEE 802.11 b/g/n@2.4GHz)
  The use is recommended to access wireless to embedded web server by using any WLAN standard device (PC, tablet, smartphone) for commissioning and parameter setting. Additionally there is second radio channel that can be used for connection to wireless router.

- 2x Ethernet ports (10/100BaseTx - RJ45 plugs)
  The ports are configured by default for enabling daisy chain connection of the inverters over the Ethernet bus.
  In order to improve the reliability of the communication with the inverters it is also allowed to create ring shape layout by using this Ethernet bus

- 1x RS485 ports (terminal block)
  The port enables daisy chain connection of the inverters over the serial line (slave mode). The port can either be used for connecting supported accessories (like weather station, meter...): in this case data from accessories will be logged and transferred to the cloud by inverter itself (master mode).

Ethernet bus connection

By default the 2 Ethernet ports of the inverters are already configured for enabling communication over daisy chain layout.

Once physically connected the inverters does not need specific settings: after the first turning on, the inverters automatically got all needed network parameters with or without the presence of DHCP server.
If an internet connection is available on site the inverters are automatically configured to transmit telemetry data to Aurora Vision Cloud without the need of installing any additional device (logging capability are already integrated into the inverter by default).

Aurora Vision Plant Management platform is the ABB cloud solution allowing customer to remotely monitor and manage its own solar plants. Please refer to http://new.abb.com/power-converters-inverters/solar or contact ABB technical support for further information on how getting an Aurora Vision account

With the inverters connected over Ethernet daisy chain and with an available internet connection it will be always possible, via Aurora Vision Cloud, to upgrade remotely the firmware of the inverters.
In order to improve the communication services and allow reaching of all the inverters in the chain also in presence of fault it is recommended to create a ring shape layout by connecting both the first and the last inverters of the chain to the local Ethernet switch (as shown in the picture).

Please refer to chapter 5 for further information about the installation.
Topographic diagram of the equipment

The diagram summarises the internal structure of the inverter.

The internal circuitry is with double stage conversion and therefore consists of:
- DC/DC input converter (booster)
- DC/AC output inverter

The DC-DC converter and the DC-AC inverter both work at a high switching frequency and are therefore small and relatively light related to output power.

The input converter is dedicated to multiple PV arrays with a maximum power point tracking (MPPT) function in order to maximize the energy harvesting from the photovoltaic generator.

This inverter version is of the type without transformer, that is without galvanic insulation between the input and the output. This allows ultimately an increase in conversion efficiency. The inverter is already equipped with all the protections necessary for safe operation and compliance with the norms, even without the insulation transformer.

The operation and the protection management of the inverter is controlled by two independent DSPs (Digital Signal Processors) and a central microprocessor.

A dedicate microprocessor is used for user communication interfaces.

The connection to the distribution grid is thus kept under control by two independent DSPs, in full compliance with the electric field norms both for power supply to the systems as well as security.

The operating system carries out the task of communicating with its components in order to carry out data analysis.

In doing all this, we guarantee optimal operation of the whole assembly and a high performance in all irradiation conditions and always ensuring full compliance with the relevant directives, standards and regulations.
**Safety devices**

**Anti-Islanding**

In the event of a local grid outage by the electricity company, or when the equipment is switched off for maintenance operations, the inverter must be physically disconnected to ensure the protection of the people working on the grid, in accordance with the relevant national laws and regulations. To prevent possible islanding, the inverter is equipped with an automatic safety disconnection system called “Anti-Islanding”.

The method used to ensure an active anti-islanding protection is: active frequency drift in combination with RoCoF techniques.

*Anti-islanding protection mechanisms are different depending on the grid standards, even if they all have the same purpose.*

**Ground fault of the photovoltaic panels**

Use this inverter with panels connected in "floating" mode, i.e. with no earth connections on the positive and negative terminals. An advanced ground fault protection circuit continuously monitors the ground connection and disconnects the inverter when a ground fault indicating the fault condition by means of the red "GFI" LED on the LED panel on the front side of wiring box.

**Overvoltage surge arresters (-SX/SX2 models only)**

As an additional protection to prevent damage caused by the discharges from lightning and electrostatic induction phenomena, the wiring box is equipped with DC overvoltage surge arresters and with AC overvoltage surge arresters.

**Other safeguards**

The inverter is equipped with additional protective devices to ensure safe operation in any circumstance. These protections include:
- Constant monitoring of the grid voltage to ensure that voltage and frequency values remain within operating limits;
- Internal temperature control to automatically limit the power if necessary to prevent overheating of the unit (derating).

*The numerous control systems determine a redundant structure to ensure absolutely safe operations.*
General conditions

Some recommendations apply only to large size product or multiple small size product packaging.

Transport and handling

Transport of the equipment, especially by road, must be carried out with means for protecting the components (in particular, the electronic components) from violent shocks, humidity, vibration, etc.

During handling, do not make any sudden or fast movements that can create dangerous swinging.

Lifting

ABB usually stores and protects individual components by suitable means to make their transport and subsequent handling easier, but as a rule, it is necessary to utilize the experience of specialized staff in change of loading and unloading the components.

The ropes and equipment used for lifting must be suitable for bearing the weight of the equipment.

Do not lift several units or parts of the equipment at the same time, unless otherwise indicated.

Unpacking and checking

Packaging elements (cardboard, cellophane, staples, adhesive tape, straps, etc.) may cause cuts and/or injuries if not handled with care. They should be removed with the proper equipment.

The components of the packaging must be disposed on in accordance with the regulations in force in the country of installation.

When you open an equipment package, check that the equipment is undamaged and make sure all the components are present. If you find any defects or damage, stop unpacking and consult the carrier, and also promptly inform ABB Service.
Storage

DO NOT store the equipment (also valid for spare parts units) in a location exposed to severe weather conditions (e.g. rain, snow or a high level of humidity). Always comply with storage temperature indicated in “Characteristics and technical data” chapter in this manual.

If the package with the power module part is stored correctly, it can withstand a maximum load of 2 stacked units (power module+wiring box+bracket).

DO NOT stack with equipment or products other than those indicated. Accessory components are in separate packages and can be piled separately.

Weight of the modules of the equipment

Types of lifting

Risk of injury due to the heavy weight of the equipment!

The power module and the wiring box must be lifted using the 4 handles or alternatively using suitable lifting equipment.

In case of manual lifting the number of required operators necessary to lift the equipment must be in accordance to local regulations relating lifting limits per operator.

The handles must be mounted into the designated holes located on the enclosures; if lifting with ropes, M8 eyebolts must be mounted in the same holes.

Handling and installation operations shall be performed only by using the special tools and accessories provided with “PVS-175 Installation Kit” that have to be ordered separately. The use of these equipment are mandatory to safely install the inverter. Refer to “Kit of recommended spare parts” chapter for further information.

DO NOT grab the equipment from the rear flange!
Risk of injury due to cutting surfaces and risk of equipment damage. Always use proper lifting equipment!
It is required to use one of the following lifting methods to move the equipment during installation or maintenance phases:

<table>
<thead>
<tr>
<th>Manual lifting (handles)</th>
<th>Ropes lifting (eyebolts)</th>
</tr>
</thead>
</table>

Always consider the center of gravity of the enclosures while lifting.

<table>
<thead>
<tr>
<th>Center of gravity (wiring box)</th>
<th>Center of gravity (power module)</th>
</tr>
</thead>
</table>
In case of manual lifting it’s suggested to use a support plan (e.g. a table) to place the equipment during the lifting operation, to allow the change of hands position.
List of components supplied

The following list shows the supplied components required to correctly install and connect the inverter.

**General conditions**

The device is intended to be installed in a suitable plant for its use and its purpose. All the installation instruction described in this chapter must be followed considering the plant structure where the device is intended to be installed. Its performance therefore depends on the correctness of the installation.

The installation operations must be carried out by qualified personnel and it is mandatory to adhere to the indications provided in this manual, the diagrams and the enclosed documentation, paying attention to follow the installation sequence exactly as described in this manual.

Staff authorised to carry out the installation must be specialised and experienced in this job. They must also have received suitable training on equipment of this type.

The installation must be performed by qualified installers and/or licensed electricians in accordance with the existing regulations in the country of installation.

Handling and installation operations shall be performed only by using the special tools and accessories provided with “PVS-175 Installation Kit” that have to be ordered separately. The use of these equipment are mandatory to safely install the inverter. Refer to “Kit of recommended spare parts” chapter for further information.

The inverter panels/covers can be removed from authorized service personnel only. (the users is not authorized to remove inverter panels/covers).

Connection of the photovoltaic system to an electric installation connected to the distribution grid must be approved by the electricity provider.

The installation must be carried out with the equipment disconnected from any voltage sources. Refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.

**Important note:** It is important to remark the presence of auxiliary power supply connected to the AC grid. The inverter is supplied either by DC and AC power, so that the internal voltages are present even in case the DC switches are open.

When the photovoltaic panels are exposed to sunlight they provide continuous DC voltage to the inverter.
Installation site and position

Please refer to the warranty terms and conditions to evaluate any possible warranty exclusions due to improper installation.

General recommendation on installation position

• Consult the technical data to check the required environmental conditions (protection rating, temperature, humidity, altitude, etc.).
• Installation of the unit in a location exposed to direct sunlight NOT acceptable. (Add awning in case of direct sunlight installation).
• Final installation of the device must not compromise access to any disconnection devices that may be located externally.
• Do not install in small closed rooms where air cannot circulate freely.
• Always ensure that the flow of air around the inverter is not blocked so as to prevent overheating.
• Do not install near flammable substances (minimum distance 3 m).
• Do not install on wood walls or other flammable supports.
• Install on a wall or strong structure suitable to bear the weight.
• Do not install in rooms where people live or where the prolonged presence of people or animals is expected, because of the high noise that the inverter produces during operation. The level of the sound emission is heavily influenced by where the appliance is installed (for example: the type of surface around the inverter, the general properties of the room, etc.) and the quality of the electricity supply.

Tilting admittance

• The installation can be carried out with a maximum inclination as indicated in the figures below.
Distances

- Hardware and software maintenance on device entails removing the front cover. Check that the correct installation safety distances are observed in order to allow routine check and maintenance operations.

- Provide sufficient working space in front of the inverter that allows to open the front covers and to make connections on the wiring box.

(*) Recommended minimum free space to operate with the inverter

- Install at a height which takes into consideration the weight of the appliance and in a position which is suitable for servicing, unless suitable means are provided to carry out the operation.

- If possible, install at eye-level so that the status LEDs can be seen easily.

- Respect the minimum distances from objects around the inverter that could prevent the inverter installation and restrict or block the air flow.

Do not install any object (e.g. AC or DC cables) that could be damaged by overheating from outgoing hot air flow from top and side fan sections ($\Delta T=+15^\circ\text{C}$ compared to ambient temperature). In case of this kind of installation needs, please evaluate the installation of a proper air deflector. Always respect the minimum distances required.

The minimum clearance distances depends from multiple factors:

- **Ventilation flow on the top side of the inverter.** The upper (A) minimum required free space must be 25 cm.
- **Possible flooding or damage during grass cutting.** It changes the bottom (B) required free space: If the inverter is installed in a place where there are risks of flooding or there is need to cut the grass growing underneath the unit, the bottom (B) minimum recommended free space is **50 cm**; otherwise in case the inverter is installed in a place where there’s no risks of flooding or grass cutting convenience, the bottom (B) minimum required free space can be reduced to **15 cm**.

- **Cables bending radius.** Sides (C) minimum required free space may depend from cable type (cable dimension, bending radius, etc.): this evaluation must be done by the installer during the plant design phase (refer to “Cable routing” chapter for more information). In any case minimum required free space for proper ventilation of the unit (near side fans) cannot be under **15 cm on the right side** and **30 cm on the left side**.

> In case of manual installation (using handles 04) consider a free side space to lift the inverter of **60 cm minimum**.

> In case of installation with lifting equipments (eyebolts and ropes) the side distances (C) could be reduced at the minimum required but a subsequent manual lifting it will no longer be possible: in this case the lifting equipments must remain available on the field for any subsequent operation.

**Installation of multiple units**
- When installing multiple units position the inverters side by side paying attention to keep the minimum clearance distances (measured from the outer edge of the inverter) for each inverter specified in the following graph.

![Graph showing minimum clearance distances for multiple inverters.](image)

- The installation of two inverters positioned back to back is also permitted on a structure which must be composed of a 2 or 3 frame supports (refer to “Mounting with a support bracket” chapter). In this case the minimum recommended distance between the units in order to avoid the use of an air deflector is **30 cm**.
Wireless signal environmental checks

The inverter can be commissioned and monitored using the wireless communication channel. The WLAN board of the inverter uses radio waves to transmit and receive data, it is therefore important to assess this factor in order to have optimal installation.

• Walls in reinforced concrete and surfaces covered with metal (doors, shutters, etc.) might significantly reduce the reach of the device which even in optimal conditions, is approximately 40 metres in free space.

• It is therefore recommended that before installing the inverter, the strength of the wireless signal is checked, using a mobile device (smartphone, tablet or notebook) and connecting to the wireless router from a position which is close to the intended installation position of the inverter.

The radio signal level between the inverter and the wireless router can be improved in a number of ways:

1. Find a new position for the router considering the different types of materials which the radio signal will have to pass through:

<table>
<thead>
<tr>
<th>Material</th>
<th>Relative signal reduction</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open field</td>
<td>0% (strength of approximately 40 metres)</td>
</tr>
<tr>
<td>Wood / Glass</td>
<td>From 0 to 10%</td>
</tr>
<tr>
<td>Stone / Plywood</td>
<td>From 10 to 40%</td>
</tr>
<tr>
<td>Reinforced concrete</td>
<td>From 60 to 90%</td>
</tr>
<tr>
<td>Metal</td>
<td>Up to 100%</td>
</tr>
</tbody>
</table>

The quality of the RF signal can be assessed during the installation stage where the signal is displayed in dBm.

2. Install a wireless signal repeater and place it in an area between the inverter and the router, trying to make sure that the most critical obstacles are avoided.
**Installations above 2000 metres**

On account of the rarefaction of the air (at high altitudes), particular conditions may occur that should be considered when choosing the place of installation:

- Less efficient cooling and therefore a greater likelihood of the device going into derating because of high internal temperatures.
- Reduction in the dielectric resistance of the air which, in the presence of high operating voltages (DC input), can create electric arcs (electrical discharges) that may damage the device.

As the altitude increases, the failure rate of some electronic components increases exponentially because of cosmic radiation.

All installations at altitudes exceeding 2000 metres are not recommended on the basis of the criticalities indicated above.

**Installations with a high level of humidity**

Never open the inverter in the case of rain, snow or a level of humidity >95%.
Always carefully seal all unused openings.

Even though the device is equipped with an anti-condensation valve, air with extremely high levels of humidity can lead to the creation of condensation inside the inverter.
As the inverter is almost completely insulated from the outside, condensation can also form after installation in certain weather conditions.
Installations of IP65 protection covers for wiring box openings (long term installation)

Never leave the power module or the wiring box disassembled on the field. In case it is necessary to install the wiring box only, an IP65 protection covers for wiring box openings (long term installation) kit is available as accessory options.

To install the protection covers, place them over the wiring box openings and fix them using the 8 x M5 screws provided with the accessory kit.

Some wiring box parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary steps to safely operate on the inverter.
Mounting with a support bracket

Bracket 3 assembly

- Assembly the two side bracket pieces together with the central bracket, by sliding it as shown in the picture and paying attention to the orientation of the pieces (refer to arrow and “UP” markings on the brackets): side brackets arrow have to be turned downwards, central bracket have to be turned upwards.

- Slide the central bracket in order to match the two holes with the centering pins of the side brackets.
• Use the two M8 screws with flat and spring washers (supplied) to fix the pieces of the bracket together.

• Position the bracket perfectly level on the support and use it as drilling template.

Consider the overall dimensions of the power module and the wiring box.
• It is the installer’s responsibility to choose an appropriate number and distribution of attachment points. The choice must be based on the type of support (wall, frame or other support), the type of anchors to be used, and their ability to support 4 times the inverter’s weight (4x153Kg=612Kg for all models).

• Attach the bracket to the support with at least 6 attachment screws (shown in RED) or at least 6 frame fixing bracket for frame mounting (shown in BLUE). Depending on the type of anchor chosen, drill the required holes to mount the bracket. The pictures shown the recommended minimum fixing point depending to the type of support.

In case of use of “frame fixing brackets” (see side picture as example) it will be possible to fix the bracket to the frame structure without drill any additional holes.

• Fix the bracket to the support.
Assembly the Inverter to the bracket

Handling and installation operations shall be performed only by using the special tools and accessories provided with “PVS-175 Installation Kit” that have to be ordered separately. The use of these equipment are mandatory to safely install the inverter. Refer to “Kit of recommended spare parts” chapter for further information.

• Lift the wiring box up to the bracket using the handles or the M8 eyebolts.

Risk of injury due to the heavy weight of the equipment. Always consider the center of gravity of the enclosures while lifting.

• Insert the heads of the two rear attachment pins (placed on the rear part of the wiring box) into the two slots on the bracket. Check that the pins has been correctly inserted in the slots as shown in the picture before releasing the wiring box.

• Remove the handles or eye bolts.

• Insert the two gasket protective covers sliding the positioning pins (shown in red in the picture) into the proper bracket holes. If the mounting is correct the gasket protective cover will have a locked position.
• Lift the power module ① up to the bracket ③ and over the wiring box ②, using the handles ④ or the M8 eyebolts.

![Image showing the power module being lifted]

Risk of injury due to the heavy weight of the equipment. Always consider the center of gravity of the enclosures while lifting.

• Insert the heads of two rear attachment pins ⑪ (placed on the rear part of the power module ①) into the slots ⑫ on the bracket ③.

• Remove the previously installed gasket protective covers from the inverter by sliding it pulling from the handles.

![Image showing the gasket protective covers being removed]
• Fasten all of the four side closures (latches) 16 as shown in the pictures.

Risk of injury due to the high strength of latches 16. Use the proper protection gloves.
Opening the Wiring box cover

• Using the key tool provided with the installation kit content in the wiring box package, open the three cover quarter cam locks following the proper ways as shown in the related silkscreens on the Wiring box cover.

• (only for -S2, -SX2 version) Set the wiring box AC disconnect switch to OFF position; otherwise it will not be possible to open the Wiring box cover.

• Open the Wiring box cover and use the cover support brackets to lock the cover in open position.

Pay attention to properly secure the cover support brackets in order to avoid falling of the cover!
Final fastening operations

In order to reach the two junction screws and complete the power module and wiring box mating, the DC surge arrester plate have to be opened as follow:

• Remove the DC cable duct from the DC surge arrester plate.

• Remove the three M5 screws from the DC surge arrester plate.
• Rotate the DC surge arrester plate 21 as shown in the picture below.

• Tighten the two hexagonal junction screws 20 with a tightening torque of 12 Nm.
• Close the DC surge arrester plate 21 using the three M5 screws previously removed with a tightening torque of 3 Nm.

• Insert the DC cable duct 22 previously removed to the DC surge arrester plate 21.

• Tighten the two side screws (supplied) with a tightening torque of 5 Nm, to avoid the tilting of the bottom part of the inverter.

• Close the Wiring box cover 07.
Opening the power module cover

• Using the key tool provided with the installation kit content in the wiring box package, open the three cover quarter cam locks following the proper ways as shown in the related silkscreens on the power module cover.

• Open the power module cover.
Connection of the AC interface cables

The AC interface cable lugs (RST phases, PE and MID BULK) are situated into his cable housing on the top side of wiring box.

• Fix the R, S and T phases and MID BULK cable lugs to the respective AC interface connection point situated on the internal bottom side of power module, paying attention to the correspondence of the phases with the labels, using the M6 bolts (for phases) and the M5 bolt (for MID BULK) supplied in the power module installation kit.

In case of a wrong phase sequence the inverter will not connect to the grid and it will provide an error state.

The cable lugs must be installed with a tightening torque of 5 Nm for phases (M6 bolts) and 3 Nm for MID-BULK (M5 bolts).
• Fix the protective earth cable lug 31 to the protection earth connection point 36 situated on the internal bottom side of power module 31, using the washers and bolt supplied in the power module installation kit, as shown in the following picture:

The cable lug must be installed with a tightening torque of 3 Nm.

Any failure of the inverter when it is not connected to earth through the appropriate connection point is not covered by the warranty.
Connection of the interface signal connectors

The interface signal connectors (male) are situated into right side of Power module and they are composed by 8 connectors.

• Connect all the interface signal connectors (male) with the related interface signal connectors (female) located on the top side of wiring box (push the connector until you hear a locking “click”). All connectors have a different pin-out in order to avoid any connection error.
Connection of the DC interface cables

The DC interface cables are situated into the left side of the Power module and they are divided into two groups.

• Wrap the DC interface cables with the two cable sheathing supplied in the power module installation kit.
• Pass the DC interface cables (33) into the wiring box using the dedicated opening for DC cables (30) as shown in the picture.

• Close the power module cover (16) and open the wiring box cover (17).
• Remove the cable sheathing from the DC interface cables (33) and the DC cable duct (22) from the DC surge arrester plate (21).
• Connect all DC interface cables to the related DC interface faston connectors located in the DC surge arrester plate. The two cable groups are marked with a identification label “B1” and “B2” that correspond to the DSP board number label (“B1” and “B2”). Each single cable are marked with a label corresponding to related DC interface faston connectors on the DSP boards (E.g. “TB1”, “TB3”...).
Routing the cable to the inverter

The cable routing have to be done in order to avoid water dripping to the AC panel cable glands 11 12, DC input quick fit connectors 18 or to signal cable glands 13.

Especially when coming from the top, the cables must be routed in order to create a loop: in this way the water that flows on the cables will be drained.

The AC and DC conductors must be anchored or supported in order to prevent loading and mechanical stress on the cable glands and quick fit connectors causing potential damage on the AC and the DC plates.

The side pictures are showing some example of incorrect and proper cable routing.

In case of the AC cable glands 11 was accidentally removed during the cable routing phase, it will needed to assure the correct tightness of the lock nut of the cable gland to the inverter chassis with a tightening torque of 8.0 Nm (for each cable gland).
Grid output connection (AC side)

The inverter must be connected to a three-phase TN system with the center of the star connected to ground. To connect the inverter to the grid is necessary to use a three-wire connection (3 phases) without neutral cable. **In any case, the inverter's earth connection is mandatory.**

Depending of the type of the AC panel it's possible to use single conductors cables or a multipolar cable:
- Single-core configuration have 3xM40 cable glands for the “R”, “S”, “T” phases and a M32 cable gland for the grounding cable.
- Multi-core configuration (optional) have a M63 cable gland for the “R”, “S”, “T” phases and a M32 cable gland for the grounding cable.

The connections can also be made with the wiring box detached from the power module which can be connected later for commissioning.

When working with the wiring box detached, (pay particular attention to outdoor installations) always protect the top of wiring box with proper IP65 protection covers (optional accessory content in the “PVS-175 Installation KIT”, to be ordered separately) on the housing. Refer to the dedicated chapter “Installation of IP65 protection covers for wiring box openings (long term installation)” for further information about the installation procedures.

Characteristics and sizing of the protective grounding cable

ABB inverters must be earthed via the connection points marked with the protective earth symbol and using a cable with an appropriate conductor cross-section for the maximum ground fault current that the generating system might experience. **According to IEC 62109-1:** If the external Protective earthing conductor cross-section area is S/2, where S is the cross-section of the phase conductor, no further calculation are needed to demonstrate that the cross-section is enough to sustain the fault current. Otherwise the protective earthing conductor cross-section shall be determined by calculation according to IEC 60364-5-54 or have to fulfill the requirement of local standard.

Any failure of the inverter when it is not connected to earth through the appropriate connection point is not covered by the warranty.

The ground connection can be made through the Protective earth point (int.), Protective earth point (ext.) or both (this is required by regulations in force in certain countries of installation).

The sizing of the ground cable depend on the choice of the protective earth point (internal or external) where it will be connected:

<table>

Cable lug dimensioning

For M10 Stud:
- a = 10.5 mm (min)
- b = 40 mm (max)

For M8 Bolt:
- a = 8.4 mm (min) - 8.5 mm (max)
- b = all dimension accepted
Characteristics and sizing of the AC cable

The cross-section of the AC line conductor cables must be sized in order to prevent unwanted disconnections of the inverter from the grid due to high impedance of the line that connects the inverter to the power supply; If the impedance is too high it causes an increase in the AC voltage which, on reaching the limit set by the standards in the country of installation, causes the inverter to switch off.

The minimum required cross sectional area for the phases conductors is 50 mm².

The AC cables must be connected to the AC connection busbar using a cable lug (not supplied) of a suitable size for installation on the M10 threaded studs used for securing the cable. The AC output cable lugs must meet the following dimensions: a = 10.5 mm (min) b = 40 mm (max)

Load protection switch (AC disconnect switch)

To protect the AC connection line of the inverter, an overcurrent protection device with the following features must be installed (these are the characteristic of a load protection switch referred to a single inverter installation):

<table>
<thead>
<tr>
<th>PVS-175-TL</th>

(*) please consider thermal and other derating when selecting the current rating of the protection equipment for your application.
Selection of differential protection downstream of the inverter

All ABB string inverters commercialized in Europe are equipped with a device for protection against ground faults in accordance with the safety standard IEC 62109-2, please refer to sections 4.8.2 and 4.8.3 of the Standard. In particular, ABB inverters are equipped with a redundancy on the reading of the ground leakage current sensitive to all components of both direct and alternating current. Measurement of the ground leakage current is carried out at the same time and independently by 2 different processors: it is sufficient for one of the two to detect an anomaly to trip the protection, with consequent disconnection from the grid and stopping of the conversion process.

There is an absolute threshold of 1.6 A for the overall leakage current AC+DC with protection tripping time at a max. of 300 msec. Furthermore, there are other three tripping levels with limit set respectively at 30 mA, 60 mA and 150 mA to cover the “rapid” changes in fault current induced by accidental contact with leaking live parts. The max. tripping times are progressively shortened as the speed of change in the fault current increases and, starting from the 300 msec/max for the 30 mA change, they are reduced respectively to 150 msec and 40 msec for 60 mA and 150 mA changes.

For protection of the AC line, on the basis of the information above with regard to the differential protection integrated in ABB inverters, it is not necessary to install a type B ground fault switch.

In case of installation of a residual current protection, the device shall meet the following characteristics in order to prevent nuisance tripping due to capacitive leakage current of photovoltaic modules:

<table>
<thead>
<tr>
<th>PVS-175-TL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
</tr>
<tr>
<td>Sensitivity</td>
</tr>
</tbody>
</table>

In accordance with article 712.413.1.1.1.2 of Section 712 of IEC Standard 64-8/7, we hereby declare that, because of their construction, ABB inverters do not inject ground fault direct currents.

In the case of systems which consist of several inverters connected to a single switch with differential protection it is recommended that a device is installed which allows the adjustment of the tripping value and the tripping time.
AC output cables connection

Before carrying out any operation, check that any external AC switch downstream to the inverter (grid side) are in OFF position and check for voltage absence on the AC conductors!

Routing of the AC cables inside the inverter must be carried out from the right side of the inverter.

Depending of the version of the AC panel installed on the inverter it will be necessary to route the AC output and ground cables into different ways:

- **Single-core configuration (default):** 3xM40 cable glands for the “R”, “S”, “T” phases and a M32 cable gland for the grounding cable.
  In this configuration the AC output and ground cables must be inserted into the proper cable glands, trying to follow a logical order based on the position of the internal connections:
  - R = Phase R (indicated with a label near the AC connection busbar)
  - S = Phase S (indicated with a label near the AC connection busbar)
  - T = Phase T (indicated with a label near the AC connection busbar)

  The ground connection can be made using the Protective earth point (int.) or Protective earth point (ext.) or both (this is required by regulations in force in certain countries of installation).

- **Multi-core configuration (optional):** one M63 cable gland for the “R”, “S”, “T” phases and a M32 cable gland for the grounding cable.
  This version of the AC panel can be ordered separately. Refer to “Kit of recommended spare parts” chapter for further information.

Follow the procedure below to route all the cables:
- Open the wiring box front cover.
- Remove the AC protective shield by removing the M5 screw and nut.
Depending on the ground connection method (internal \(\textcircled{28}\) or external \(\textcircled{10}\)) follow the procedures described below:

**Internal ground connection**
- Pass the protective earth cable through the proper cable gland \(\textcircled{28}\) on the AC panel.
- Fix the protective earth cable lug to the protection earth connection point (int.) \(\textcircled{28}\) using the washers and bolt pre-installed on the M10 stud, as shown in the following diagram:

1 = cable lug  
2 = flat washer  
3 = spring washer  
4 = M10 nut

Depending on the version of the AC panel installed on the inverter it will be necessary to use a different protection earth connection point in order to avoid mechanical stress due to cable bending: in case of Single-core AC panel use the horizontal connection point \(A\), otherwise in case of Multi-core AC panel it will be necessary to use the oblique connection point \(B\).

The cable lug must be installed with a tightening torque of 21Nm.

**External ground connection**
- Fix the protective earth cable lug to the protection earth connection point (ext.) \(\textcircled{10}\) (this is the same thread for handles) using the washers and M8 bolt provided in the wiring box installation kit, as shown in the following diagram:

1 = cable lug  
2 = flat washer  
3 = spring washer  
4 = M8 bolt

The cable lug must be installed with a tightening torque of 15.2 Nm.

Before connecting the inverter to AC or DC sources use a suitable multimeter to test the conductivity of the earth connections between the protection earth connection point (ext.) \(\textcircled{10}\) and a handles thread \(\textcircled{04}\) on the housing of power module \(\textcircled{01}\).
• Pass the AC cables through the cable glands \textcircled{11} on the AC panel. The length of phase cables on the internal side of wiring box need to be about 300 mm (cable lug included).

• Fix the R, S and T cable lugs to the AC connection busbars \textcircled{27}, paying attention to the correspondence of the phases with the labels, using the washers and the M10 nuts pre-installed on the busbar as shown in the following diagram:

\[
\begin{align*}
1 &= \text{cable lug} \\ 
2 &= \text{flat washer} \\ 
3 &= \text{spring washer} \\ 
4 &= \text{M10 nut}
\end{align*}
\]

In case of a wrong phase sequence the inverter will not connect to the grid and it will provide an error state.

The cable lugs must be installed with a tightening torque of 25Nm.

• Re-install the AC protective shield \textcircled{23} by using the M5 screw and the M5 nut previously removed with a tightening torque of 3 Nm.

• Check the tightness of the AC cable glands \textcircled{11} (5 Nm for single core AC cable gland M40 / 18 Nm for multi core AC cable gland M63) and, if used, protective earth cable gland \textcircled{12} (5 Nm for PE cable gland M32) at the end of the installation.

In case of the AC cable glands \textcircled{11} was accidentally removed during the cable routing phase, it will needed to assure the correct tightness of the lock nut of the cable gland to the inverter chassis with a tightening torque of 8.0 Nm (for each cable gland).
Operations preliminary to the connection of the PV generator

In order to safely perform the preliminary operations before the connection to the PV generator, the connection of the ground protection cable (21) to the wiring box (22) is mandatory.

Checking of leakage to ground of the photovoltaic generator

Measure the voltage present between positive and negative pole of each string with respect to ground.

If a voltage is measured between an input pole and ground, it may be that there is a low insulation resistance of the photovoltaic generator and the installer will have to carry out a check to solve the problem.

Do not connect the strings if a leakage to ground has been detected, as the inverter might not connect to the grid.

Refer to “Verification of ground leakage” chapter on this manual to know how to verify the leakage to ground of the photovoltaic generator.

Checking of string voltage

Measure the voltage present between positive and negative pole of each string using suitable equipment (1500V rated voltmeter).

If the open circuit voltage of the string is near the maximum value accepted by the inverter, consider that low ambient temperatures cause an increase in the string voltage (different according to the photovoltaic module used). In this case it is necessary to carry out a check of the sizing of the system and/or a check on the connections of the modules of the system (e.g.: number of modules in series higher than the design number).

Input voltages higher than the maximum absolute value accepted by the inverter (see technical data table) may damage the equipment.

Checking the correct polarity of the strings

These activity is allowed ONLY with the appropriate PPE for carrying out this check (overall resistant to electric arc, dielectric helmet with visor, insulating gloves class 0, Protective over-glove in leather EN420 – EN388, Safety shoes).

Before connecting any input strings to the DC input quick fit connectors panel (18) the string polarity of each string have to be checked using suitable equipment (1500V rated voltmeter).

The reverse polarity can cause severe damage and electric arc hazards! In case of reverse input strings do not disconnect them while under load and do not turn the DC disconnect switches (13) to OFF position. Wait until input current are below 0.5A (when solar irradiance declines at night) and turn the DC disconnect switches (13) to OFF position, disconnect the DC input quick fit connectors (18) and correct the wrong polarity of the string.
Input connection to PV generator (DC side)

After having carried out preliminary checks and therefore having verified that there are no problems in the photovoltaic system, you may connect the inputs to the inverter.

Comply with the maximum input current relating to the quick-fit connectors as indicated in the technical data.

Polarity inversion can cause serious damage. Check polarity before connecting each string!

When the photovoltaic panels are exposed to sunlight they provide continuous DC voltage to the inverter. To avoid risks of electrical shock, all wiring operations must be carried out with the DC disconnect switches (internal and external to the inverter) and AC disconnect switches (internal or external to the inverter) OFF.

Caution! The inverters referred to in this document are TRANSFORMERLESS. This type requires the use of insulated photovoltaic panels (IEC61730 Class A Rating) and the need to keep the photovoltaic generator floating with respect to ground: no terminal of the generator must be connected to ground.

For the string connections it is necessary to use the quick fit connectors located on the left side of the wiring box.

The models of the counterpart for quick fit connectors to be used to connect the input strings are shown in the table below:

</tbody>
</table>

According to IEC 62548 (Photovoltaic (PV) arrays – Design requirements), connectors mated together in a PV system shall be of the same type from the same manufacturer, i.e. a plug from one manufacturer and a socket from another manufacturer or vice versa shall not be used to make a connection.

Using mating parts of different type or brand than those specified above could cause serious damage to the unit and will lead to the invalidation of the warranty.

The input connectors are divided into 12 MPPTs (one MPPTs for each input channel) consisting of 2 pairs of quick fit connectors. Each DC disconnect switches is related to a group of four MPPTs.
Connect all the strings required by the system, always checking the seal of the connectors.

Make sure to connect at least one string per MPPTs to prevent unbalancing between input channels.

If any string inputs is not required check that protective caps are installed to the relative unused connectors. This is necessary for the inverter seal and to avoid any damage to the unused connectors which may be used at a later time.

The connections can also be made with the wiring box detached from the power module that can be connected later for commissioning. When working with the wiring box detached, pay particular attention to:

- presence of ground connection
- The top of wiring box must always be protected in outdoor installations with proper IP65 protection covers (optional accessory content in "PVS-175 Installation Kit", to be ordered separately). Refer to the dedicated chapter “Installation of IP65 protection covers for wiring box openings (long term installation)” for further information about the installation procedures.
Installation procedure for quick-fit connectors

The model of connectors installed on your inverter must be matched by the same model of the respective corresponding parts to be used (check the corresponding part on the manufacturer's website or with ABB).

Using mating parts that are not compliant with the quick fit connector models on the inverter could cause serious damage to the unit and lead to invalidation of the warranty.

CAUTION: To avoid damage to the equipment, when crimping cables to the connectors, pay particular attention to polarity.

Complete assembly instructions and specification of quick-fit connectors could be find on manufacturer website.

Input cables must meet the connector requirements (cable diameter, conductor cross section) and depends from connector models as shown in the table below:

<table>

- Strip the cable over a length of 6.0 to 7.5mm using suitable equipment.

- Crimp the terminal to the conductor using the designated pliers.
- Insert the crimped terminal contact into the insulator body of the connector, until you hear the click indicating that the terminal is engaged inside the connector.

- Firmly tighten the cable gland using the relevant tool to finish the operation.

4.0 Nm with 4mm² cable section
3.5 Nm with 6mm² cable section
3.5 Nm with 10mm² cable section
Quick fit connector disconnection

CAUTION: Risk of electric shock! Do not disconnect PV connectors while under load! Refer to "Inverter total de-energization and safe access" chapter on this manual to know all the necessary steps to safely disconnect the connectors!

In order to disconnect the PV connectors it is necessary to use the disconnection tool provided with the “PVS-175 Installation Kit”.

- Insert the pins of disconnection tool in the coupled PV connectors as shown in the pictures.

- Separate the two parts of PV connectors.

(*): The RS-485 connector (RJ45) (ABB Service only) and the signal R1 on the Remote ON/OFF terminal block are used to bring the signals on the external RS-485 Service connector.
Connections to the communication and control board

The communication and control signals could be connected to the communication and control board inside the wiring box. On the right side of the wiring box, there are two PG16 and two PG21 cable glands that can be used to reach the terminals / connectors on the communication and control board.

The PG16 cable gland accepts a single cable from 10 mm to 14 mm diameter. The PG21 cable gland accepts a single cable from 13 mm to 18 mm diameter.

As an alternative, the standard gasket of the PG21 cable glands can be replaced with the two-hole gasket (supplied in the wiring box installation kit).

The two-hole gasket accepts two separate cables with a diameter of 6mm for PG21 gasket.

If a hole is not used, it is necessary to install a plug (supplied plastic cylinder) to ensure the inverter’s sealing.

Please ensure that all unused cable glands are properly sealed by the IP65 plastic cap (pre-installed on cable glands).
To connect the signal and communication wirings, the communication and control board have to be extracted by removing the two M5 screws, as shown in the picture below:

After the connections has been made, re-insert the communication and control board in the own board tray and fasten the two M5 screws previously removed.

Check the tightness of the signal cable glands (5 Nm PG16 cable gland / 7.5 Nm PG21 cable gland) at the end of wiring operations.
Ethernet connection

The ethernet connection allows a direct data transfer to the ABB server for monitoring purpose. When the inverter will be powered on, network parameters are automatically set and the inverter start the transmission of telemetry data to the Aurora Vision® CLOUD platform.

The connection of the ethernet communication cable must be made on the specific connectors 44 and 45 located on the Communication and control board 26 inside the wiring box 02. If the inverters of the plant need to be connected in daisy chain or ring configuration use both connectors.

The cable should be compliant to the following specification:
- Cable type: Patch or Cross type, 100BaseTx, CAT5e (or higher). For outdoor application and/or in presence of strong electromagnetic sources it is advisable to use shielded cables with metallic shielded RJ-45 plug.
- UV-resistant if used outdoors
- The maximum length that can reach these cables is 100 meters, and it is always advisable not to let them pass by the power cords to avoid interference with data transmission.
- Maximum inverters number connected over one single daisy chain is 40.

For outdoor application and/or in presence of adverse weather/strong electromagnetic events it is advisable to use additional overvoltage protective devices.

Connection of ethernet cable is made trought the two RJ45 connectors 44 and 45.

The two RJ45 connectors LAN1 and LAN2 are equivalent to each other and can be used for the input or for the output of the line connecting multiple inverters in a daisy-chain.
Three topologies of ethernet connection to the router are available:

Ring configuration

The ring configuration is the preferred method to connect multiple units in order to allow reaching inverters also in case of single unit failures. In case inverters are connected to the networking switch with a ring topology is recommended to enable SPT protocol on the switch (Spanning Tree Protocol SPT (IEEE 802.1D) is enabled by default on inverters).

Daisy chain configuration

Star configuration

On each configuration the maximum length of the cable must be 100m between inverter – inverter and inverter – switch.

For further information on the Ethernet connection refer to the Local Area Network standard IEEE802.3

Please refer to Aurora Vision documents available on ABB website for further information how to get an Aurora Vision account for remotely monitoring and managing the installed solar assets.

No initial setup is required to start data transmission to Aurora Vision. Internet connection is required to use all the Aurora Vision remote functionalities.
Serial communication connection (RS485 - Slave mode)

Please note that automatic settings of network parameters at turning on, embedded logging capability, automatic logger-free transferring of data to Aurora Vision Cloud and remote firmware update are provided over TCP/IP (Ethernet and/or Wi-fi) bus only.

The use of the inverters over the RS485 line is recommended in case of monitoring and controlling by using third party RS485 control systems.

By default the RS485 port is set as Slave mode. In case the port was set as “Master mode” it must configured through the integrated Web User Interface (refer to chapter “Web User Interface”) to use the RS485 as a serial communication line.

RS485 line supports Modbus/RTU SUNSPEC compliant Modbus protocol.

Connection of the R485 communication line conductors is made using the terminal block connectors (485+, 485-, RTN and SHIELD).
For long distance connections is necessary to use a shielded twisted pair cable with characteristic impedance of $Z_0=120$ Ohm like the one shown on the following table:

<table>
<thead>
<tr>
<th>Signal</th>
<th>Symbol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positive data</td>
<td>485+</td>
</tr>
<tr>
<td>Negative data</td>
<td>485-</td>
</tr>
<tr>
<td>Reference</td>
<td>RTN</td>
</tr>
<tr>
<td>Shield</td>
<td>SHIELD</td>
</tr>
</tbody>
</table>

**Shield continuity must be provided along the communication line and must be grounded in a single point.**

The RS485 line can be used to set up a line of communication which, when connected to a monitoring device, enables the operation of the photovoltaic system to be kept under control. Depending on the device used monitoring can be local or remote.

*It is the installer’s responsibility to evaluate the use of an additional overvoltage protective devices on the communication line.*

*For information on installation, compatibility and use of monitoring system, please refer to the specific documentation on the accessory components.*
Connect all the units of the RS485 chain in accordance with the daisy-chain model observing the correspondence between the signals, and activate the termination resistance of the communication line in the final element of the chain by switching the 40 switch in the ON position.

The communication line must also be terminated on the first element of the chain which normally corresponds to the monitoring device.

It is recommended not to exceed a length of 1000m for the communication line. The maximum number of inverters that can be connected to the same RS485 line is 62. In case of longer communication line and/or in case of a large number of connected inverters to the same line it could be necessary to add a RS485 amplifier to guarantee the performance of the communication line.

When connecting a single inverter to the monitoring system, activate the communication line resistance terminal by setting the switch 40 (to the ON position).

Set a different RS485 address on each inverter in the chain. No inverter can have “Auto” as an address. An address can be freely chosen between 2 and 63.

The setting of the address on the inverter is done through the integrated Web User Interface (refer to chapter “Web User Interface”).

When an RS-485 connection is being used, if one or more inverters are added to the system at a later time, it is necessary to remember to reset to OFF the switch of the termination resistance being used (1) or (2) on the inverter which previously was the last in the system.

Each inverter is shipped with the RS485 address pre-set to two (2) and with the resistance terminal setting Switch 40 in the OFF position.
RS485 RJ45 external connector for ABB Service operation

The inverter has an second RS485 communication lines (that could be access using the external RJ45 connector 14) working as Slave to be used by ABB Service personnel only.

This communication port has is configured for communicating over proprietary communication protocol called “Aurora”.
Serial communication connection (RS485 - Master mode)

The RS485 port can either be used for connecting supported accessories (like weather station): in this case data from accessories will be logged and transferred to the cloud by inverter itself (master mode). This allow to use the inverter as logger also for ABB accessories.

To know how to connect the accessories to the RS485 terminal block refer to accessory product manual or contact ABB customer support.

When the RS485 port is configured as Master, the switch of the termination resistance have to be set to “ON” position.

When an accessory is connected to the RS485 port it must be added and configured into the “Monitored device” list on the integrated Web User Interface (refer to chapter “Web User Interface”).
Remote control connection

The connection and disconnection of the inverter to and from the grid can be controlled through an external control. The function must be enabled in the relevant menu of the Web User Interface. If the remote control function is disabled, the switching on of the inverter is dictated by the presence of the normal parameters which allow the inverter to connect to the grid.

If the remote control function is operating, besides being dictated by the presence of the normal parameters that allow the inverter to connect to the grid, the switching on of the inverter also depends on the status of the R1 and R2 terminals compared to the RTN terminal present on the connector of the communication and control board.

When one of the R1 or R2 signals is brought to the same potential as the RTN signal (i.e. by making a short circuit between the two terminals of the connector), this causes the inverter to disconnect from the grid.

The connections of these controls have to be made between the R1 and the R2 inputs compared to the common RTN signal.

Since this is a digital input, there are no requirements to be observed as regards cable cross-section (it only needs to comply with the sizing requirement for passing cables through the cable glands and the terminal connector).

The external switch used for Remote ON/OFF should be rated for DC low voltage, low current application (the minimum switching current capability should be 1mA or lower).

Demand Response Mode 0 (AS/NZS 4777.2)

Where requested by the AS/NZS 4777.2 standard, it’s possible to use the Remote terminal block for the Demand Response Mode 0 (DRM0) functionality. The function could be activated by setting the DRM0 activation switch to “ON” position.

The terminal to be used to connect the inverter to the distribution grid are R2 and RTN.

In case of the DRM0 function is activated without the proper wiring of the Remote terminal block, the inverter will no longer be able to connect to the grid. For further information regarding the DRM0 function refer to the AS/NZS 4777 standard.
Configurable Relay connection (ALARM and AUX)

The inverter is equipped with 2 multifunction relays with configurable activation. It can be connected with normally open contact (being connected between the N.O. terminal and the common contact C) and with normally closed contact (being connected between the N.C. terminal and the common contact C). Different types of devices (light, sound, etc.) can be connected to the relay, provided they comply with the following requirements:

**Alternating current**
- Maximum Voltage: 160 V AC  
- Maximum Current: 6 A

**Direct current**
- Maximum Voltage: 30 V DC  
- Maximum Current: 3 A

**Cable requirements**
- External diameter: 6 mm
- Conductor cross-section: from 28 to 16 AWG

This contact can be used in different operating configurations that can be selected by accessing the relevant section in the web user Interface “SETTINGS > Digital Outputs”.

![Diagram of the inverter's relay connection](image)
General conditions

One of the first rules for preventing damage to the equipment and to the operator is to have a thorough knowledge of the instruments. We, therefore, advise that you carefully read this manual. If you are not sure about any information in this manual, please ask ABB Service for more detailed information.

Do not use the equipment if:
- you do not have suitable qualifications to work on this equipment or similar products;
- you are unable to understand how it works;
- you are not sure what will happen when the buttons or switches are operated;
- you notice any operating anomalies;
- there are doubts or contradictions between your experience, the manual and/or other operators.

ABB cannot be held responsible for damage to the equipment or the operator if it is the result of lack of knowledge, insufficient qualifications or lack of training.
Description of the LED function

The LEDs on the inverter are described below.

- **POWER**
  Indicates that the inverter is functioning correctly. When the unit is commissioned, while the grid is checked, this LED blinks. If a valid grid voltage is detected, the LED remains continuously lit, as long as there is sufficient sunlight to activate the unit. Otherwise, the LED will continue to blink until the sunlight is sufficient for activation.

- **ALARM**
  Indicates that the inverter has detected an anomaly. This type of problem is highlighted in the Web User Interface and ABB Installer for Solar Inverters APP.

- **GFI**
  The “GFI” (ground fault) LED indicates that the inverter has detected a ground fault in the DC side photovoltaic generator. When this fault is detected, the inverter immediately disconnects from the grid.

- **WLAN/LAN**
  Indicates the status of the Wireless or ETHERNET communication lines.

The LEDs, in various multiple available combinations, can signal multiple conditions other than the original single condition; see the various descriptions explained in the “Power, Alarm, GFI LEDs behaviour” and “WLAN/LAN LED behaviour” chapters on this manual.
User interface

1. ABB Installer for Solar Inverters
   • Mobile APP improving multiple inverter commissioning and system settings with ABB Installer for Solar Inverters APP.
   • Compatible with Android devices.
   • Updating of the inverter firmware.

2. Embedded Web User Interface
   • Accessible via Wi-Fi by using any WLAN enabled standard device (PC, smartphone, tabled,…)
   • Enables single inverter commissioning and parameters settings.
   • Updating the inverter firmware.

3. Aurora Vision Plant Management Platform
   Additional to any local user interfaces the inverter comes with capability enabling remote monitoring and managing via Aurora Vision Plant Management Platform cloud. Aurora Vision offert includes:
   • Plant Portfolio Manager: web portal for solar professional.
   • Plant Viewer: single web page for casual user.
   • Plant Viewer for Mobile: mobile application for plant monitoring.
   • ABB Ability™ for solar plants - Energy Viewer: mobile application for plant monitoring.
   • Kiosk view: single HTML5 page for public visualization of plant data.
   • API: web based tool for enabling the sharing of the data with a third party data.

Measurement tolerance

The data supplied by the inverter may differ from measurements taken by certified measuring instruments (e.g. output meters, multimeters and grid analysers); since the inverter is not a measuring instrument it has wider tolerances for the measurements it makes.

The tolerances are generally:
±5% for real-time measurements with output power below 20%
±3% for real-time measurements with output power above 20%
±4% for all statistical data.
General conditions

Before checking the operation of the equipment, it is necessary to have a thorough knowledge of the Instruments chapter 6 and the functions that have been enabled in the installation process.

The equipment operates automatically without the aid of an operator; the operating state should be controlled through the equipment’s instrumentation.

The interpretation or variation of some data is reserved exclusively for specialized and qualified staff.

The input voltage must not exceed the maximum values shown in the technical data, section 2 in order to avoid damaging the equipment. Consult the technical data for further details.

During operation, check that the environmental and storage conditions are correct (see installation chapter 5). Make sure that environmental and storage conditions have not changed over time and that the equipment is not exposed to adverse weather conditions.
Commissioning

Do not place objects of any kind on the inverter during operation! Do not touch the heat sink while the inverter is operating! Some parts may be very hot and could cause burns.

Before proceeding with commissioning, make sure you have carried out all the checks and verifications indicated in the section on preliminary checks.

This inverter can be powered both with AC or DC sources. In case of DC source is used, make sure that irradiation is stable and adequate for the inverter commissioning procedure to be completed.

At the first activation of the inverter the firmware version could synchronize between power module and wiring box. During this phase the LEDs “Power” “Alarm” and “GFI” blinks together every 1 second. This process is absolutely normal and must be completed without interruption. A switch-off of the system during this process could cause serious damage to the inverter.

Commissioning could be carried out in two different ways:

• **Via ABB Installer for Solar Inverters APP**
  Recommended mobile APP for commissioning a single inverter as well as a multi-inverter solar plant.

• **Via Web UI (access point wireless network)**
  Integrated Web User Interface enabling setting parameters and performing commissioning of a single inverter (multi inverter support is not provided).
  Recommended as alternative method for performing single inverter commissioning.
Commissioning via ABB Installer for Solar Inverters mobile APP

ABB Installer for Solar Inverters APP is the new advanced ABB mobile APP which simplifies the commissioning of large scale solar plants thanks to the capability to set parameters of multiple inverters simultaneously.

Even in case of single inverter installation it can be considered the most suitable tool to be used.

ABB Installer for Solar Inverters APP is available for Android mobile devices with an Android version of 6.0.1 or greater (for iOS mobile devices will be implemented soon) and could be downloaded and installed from Play Store.

The requirements to complete the procedures are listed below:
- ABB Installer for Solar Inverters APP installed on mobile device.
- Enabled installer account for ABB Installer for Solar Inverters APP
  The account could be created in the mobile app directly following the dedicated wizard procedure.
- Manual claiming of the inverters to be commissioned.

The claiming process consist of indicating which inverters are to be commissioned

Claiming process can be performed by taking pictures of the QR codes of single inverter units (printed on the Communication identification label) (recommended); manual insertion of the MAC address and related product keys of all the inverters that shall be commissioned; scanning and selecting of SSIDs associated to the Wi-Fi networks generated by each inverter to commission.

This inverter can be powered both with AC or DC sources. In case of DC source is used, make sure that irradiation is stable and adequate for the inverter commissioning procedure to be completed.

• Close the DC disconnect switches to supply the inverter with input voltage from the photovoltaic generator or close the AC switch downstream of the inverter (and AC disconnect switch for the -S2, -SX2 wiring box version) to supply the inverter with AC grid voltage. In the pre-commissioning phase the “Alarm” LED keeps quickly flashing, “Power” and “GFI” LEDs are OFF.

• Perform the installation wizard steps enabling the transferring the settings to all the claimed inverters.

For more details about the procedure for commissioning with the ABB Installer for Solar Inverters APP refer to dedicated documentation on the ABB solar website.

For any other specific settings of parameters of single inverters please refer to “Description of the Web User Interface” chapter.
After the commissioning via ABB Installer for Solar Inverters APP is completed, the inverter changes the behaviour of the “Power” and “Alarm” LEDs, in relation of the input voltage value:

<table>
<thead>
<tr>
<th>Input voltage</th>
<th>LED Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vin &lt; Vstart</td>
<td>Power = Flashing Alarm = OFF</td>
<td>The input voltage is not sufficient to enable connection to the grid.</td>
</tr>
<tr>
<td>Vin &gt; Vstart</td>
<td>Power = Flashing Alarm = ON</td>
<td>The input voltage is sufficient to enable connection to the grid: the inverter waits for the grid voltage to be present to make the connection to the grid.</td>
</tr>
</tbody>
</table>

- Depending of the supply source used to complete the installation wizard steps, close the disconnect switch of missing voltage sources: In case of missing AC source close the AC switch downstream of the inverter (and AC disconnect switch for the -S2, -SX2 wiring box version); In case of missing DC source close the DC disconnect switches.

- When the input voltage is sufficient to allow the connection to the grid, the inverter will check the grid voltage, measure the isolation resistance of the photovoltaic field with respect to ground and performs other auto-diagnostic checks. During the preliminary checks on the parallel connection with the grid, the “Power” LED keeps flashing, the “Alarm” and “GFI” LEDs are OFF. The inverter will ONLY connect to the grid if all parameters fall within the ranges foreseen by current regulations.

- If the outcome of the preliminary checks to grid synchronization are positive, the inverter connects and starts to export power to the grid. The “Power” LED remains fixed on while the “Alarm” and “GFI” LEDs are OFF.

To address any problems that may occur during the initial stages of operation of the system and to ensure the inverter remains fully functional, you are advised to check for any firmware updates in the dedicated section of web user interface or in the download area of the website www.abb.com/solarinverters or at https://registration.abbsolarinverters.com (instructions for registering on the website and updating the firmware are given in this manual).
Commissioning Via Web UI - Wireless connection

**CONNECTION TO THE INVERTER - WIRELESS**

Commissioning could be carried out via wireless connection to the inverter's Web User Interface. Initial setup of the system must therefore be carried out via a tablet, notebook or smartphone with a wireless connection.

*This inverter can be powered both with AC or DC sources. In case of DC source is used, make sure that irradiation is stable and adequate for the inverter commissioning procedure to be completed.*

- Close the DC disconnect switches to supply the inverter with input voltage from the photovoltaic generator or close the AC switch downstream of the inverter (and AC disconnect switch for the -S2, -SX2 wiring box version) to supply the inverter with AC grid voltage. In the pre-commissioning phase the “Alarm” LED keeps quickly flashing, “Power” and “GFI” LEDs are OFF.

- Once powered, the inverter will automatically create a wireless network (approx. 60 seconds after switching-on).

- Enable the wireless connection on the device which is being used for the board setup (tablet, smartphone or PC) and connect it to the Access Point created by the inverter system: the name of the wireless network created by the system that the connection should be established with, will be: **ABB-XX-XX-XX-XX-XX-XX** where “X” is a hex digit of the wireless MAC address (MAC address can be found on the “Communication Identification Label” placed on the side of the inverter).

The screens shown below pertain to a tablet with the Android operating system. Screens on other devices or operating systems may differ.

- When required enter the PRODUCT KEY (printed on the “Communication Identification label” and applied during the commissioning phase to the plant documentation) as access point password.

  Note that it’s required to digit also the dash “-” characters of the Product Key in the password field.

In case of need, product key can be recovered by Aurora Vision Cloud of by calling ABB technical support.
COMMISSIONING PROCEDURE - WIRELESS CONNECTED

• Open an internet browser (recommended browser: Chrome versions from v.55, Firefox versions from v.50) and enter the preset IP address 192.168.117.1 to access the Web User Interface. Web User interface has easy commissioning wizard to commission the inverter.

The language of the wizard could be changed by clicking on the upper status bar

The required information during the procedure are:

STEP 1 - Administrator/User login credentials

- **Set the Administrator account user and password** (minimum 8 character for password):
  Administrator account can open and view the contents of photovoltaic site. Additionally, they can make changes to inverter settings.
  User and password are CASE SENSITIVE.

- **Set the User account user and (optional) password** (minimum 8 character for password):
  User account can only read data. It cannot make any changes.
  User and password are CASE SENSITIVE.
STEP 2 (Optional) - Wireless network connection.

As described on chapter 2 the recommended way to get all the installed inverters to communicate to the internet and Aurora Vision Cloud is creating a wired Ethernet daisy chain bus. Anyway, in case of a few inverters installation in suitable environment, it is also possible to connect each inverter of the plant to a Wi-Fi router without using any cable.

The AP is still available and the user can connect to the inverter.

In this scenario the Router gives IPs according to its own rules.

Inverter is reachable by IP.

Domain name can be used only if the Router permits multicast.

During the installation wizard of the single inverter, the installer will be asked to connect the inverter to a Wi-Fi router. By selecting connection to Wi-Fi router the inverter will turn on a second Wi-Fi radio channel in order to enable connection to the Wi-Fi router. By selecting “Skip this step” button the other radio channel will be kept off.

Two Wi-Fi radio channels enables simultaneous wireless connection; one static IP address connection between inverter and installer devices and one between inverter and switch/router.

Whatever option is used to connect the inverter to the router (Ethernet cable or Wi-Fi) it will be always possible to access to the embedded web server also by connecting its own device to the same switch/router, and reaching the inverter (via second radio channel in case of Wi-Fi connection with the router) by using the assigned IP address or inverter’s host name.

The IP address assigned to the inverter may vary or may be unknown. Please contact the IT administrator for getting the assigned IP address.

Differently from the assigned IP address, the «Host Name» of the inverter is does not change over time.

In order to use the «Host Name» as an alternative to the assigned IP address, for accessing to the inverters web server from the router the Domain Name System (DNS) service shall be available and activated.

The Host Name associated to each ABB inverter is structured as indicated below:

```
ABB-lognormal LOCAL
```

where:

logger ID stands for the MAC address indicated on the “Communication identification label” applied on the inverter.
The parameters related to the customer wireless network (set on the router) that must be known and set during this step are:

- **IP Settings**: DHCP or Static.
  If you select the DHCP function (default setup) the router will automatically assign a dynamic IP address to the inverter whenever it tries to connect to the user network.
  With Static, the user can assign a fixed IP address to the system. The data which has to be entered in order for IP static address assigning to take place will appear. Complete the additional fields at the bottom of the screen (all the fields are mandatory with the exception of the secondary DNS server).

- **Available networks (SSID)**:
  Identify and select your own (customer) wireless network from all those shown in the SSID field (you can carry out a new search of the networks that can be detected with the Update button). Once the network has been selected, confirm.

- **Password**: Wireless network password.
  Enter the password for the destination network (if necessary) and start the connection attempt (it will take a few seconds).

Click on “Connect” button to connect the inverter to the home wireless network.

A message will ask for confirmation. Click “Next” to connect the inverter to the customer wireless network.
Once the inverter is connected to the customer wireless network, a new message will confirm that the connection is acquired.

The message provides the IP Address assigned by the home wireless network router to the inverter that can be used each time you want to access the Web User Interface, with the inverter connected to the home wireless network. Take note of it.

Click on “Next” button to proceed to the next stage of the configuration wizard.

The IP address assigned may vary for reasons connected to the wireless home router setup (for example, a very brief DHCP lease time). If verification of the address is required, it is usually possible to obtain the client list (and the corresponding IP addresses) from the wireless router administration panel.

If the inverter loses the connection with the home wireless network (and therefore, loses the internet connection), it will once again enable its own access point.

The most common causes of losing connectivity might be: different wireless network password, faulty or unreachable router, replacement of router (different SSID) without the necessary setting updates.
Set the Date, Time and Time zone (The inverter will propose these fields when available).

When it's not possible for the inverter to detect the time protocol, these fields have to be manually entered.

Click on "Next" button to proceed to the next stage of the configuration wizard.
STEP 4 - Inverter country standard and Input configuration

- **Country standard: selection of grid standard:**
  Set the grid standard of the country in which the inverter is installed.

After the grid standard is set you have 24 hours to make any changes to the grid standard value; 24 hours later the Country Standard sub-menu will be locked, and the remaining time shall be reset in order to have the 24 hours of unlocked operation available again to select a new grid standard (follow the procedure “Resetting the remaining time for grid standard variation” described in the relevant section).

- **Input mode:**
  Only Independent configuration are available.

Confirm the settings by clicking “END” and the inverter will reboot.

A notification will confirm that the wizard is completed.
After the wizard procedure is completed, the inverter changes the behaviour of the “Power” and “Alarm” LEDs, in relation of the input voltage value:

<table>
<thead>
<tr>
<th>Input voltage</th>
<th>LED Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\text{Vin} &lt; \text{Vstart}$</td>
<td>Power = Flashing, Alarm = OFF</td>
<td>The input voltage is not sufficient to enable connection to the grid.</td>
</tr>
<tr>
<td>$\text{Vin} &gt; \text{Vstart}$</td>
<td>Power = Flashing, Alarm = ON</td>
<td>The input voltage is sufficient to enable connection to the grid; the inverter waits for the grid voltage to be present to make the connection to the grid.</td>
</tr>
</tbody>
</table>

- Depending of the supply source used to complete the installation wizard steps, close the disconnect switch of missing voltage sources: In case of missing AC source close the AC switch downstream of the inverter (and AC disconnect switch for the -S2, -SX2 wiring box version); In case of missing DC source close the DC disconnect switches.

- When the input voltage is sufficient to allow the connection to the grid, the inverter will check the grid voltage, measure the isolation resistance of the photovoltaic field with respect to ground and performs other auto-diagnostic checks. During the preliminary checks on the parallel connection with the grid, the “Power” LED keeps flashing, the “Alarm” and “GFI” LEDs are OFF. The inverter will ONLY connect to the grid if all parameters fall within the ranges foreseen by current regulations.

- If the outcome of the preliminary checks to grid synchronization are positive, the inverter connects and starts to export power to the grid. The “Power” LED remains fixed on while the “Alarm” and “GFI” LEDs are OFF.

To address any problems that may occur during the initial stages of operation of the system and to ensure the inverter remains fully functional, you are advised to check for any firmware updates in the dedicated section of web user interface or in the download area of the website www.abb.com/solarinverters or at https://registration.abb.com (instructions for registering on the website and updating the firmware are given in this manual).
**Power, Alarm, GFI LEDs behaviour**

The following table shows all the possible activation combinations of “Power” “Alarm” and “GFI” LEDs on the LED panel according to the operating status of the inverter.

All possible LED activation combinations are shown in the following table. In particular, each LED could behave in one of the following ways:
- ○ = LED on
- ✗ = LED flashing slow (2 seconds on / 2 seconds off)
- ⬇️ = LED flashing fast (0.2 seconds on / 0.2 seconds off)
- ✗️ = LED off
- ✗️️ = Any one of the conditions described above

<table>
<thead>
<tr>
<th>LED status</th>
<th>Operating state</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
Description of the Web User Interface

The inverter is equipped with an advanced integrated Web User Interface that allow a full access to all configuration and commissioning parameters from any electronic device (laptop, tablet and smartphone).

Access to the Web User Interface

To access to the Web User Interface is required to connect a device equipped with wireless connection (such as tablet, laptop or smartphone).

Depending on the connection method chosen during the inverter commissioning phase (“Station Mode” or “AP Mode”) it’s required to follow one of the two procedures described below:

Connection to the inverter in “Station Mode”

- Enable the wireless connection on the device (tablet, smartphone or laptop) and connect it to the same wireless network to which the inverter is connected.

- Open an internet browser (recommended browser: Chrome versions from v.55, Firefox versions from v.50) and enter the links (corresponding to the IP Address assigned by the router to the inverter, or the “Host Name”) provided during the commissioning phase to access the login page.

In order to use the “Host Name” as an alternative to the dynamic IP address, the Wi-Fi router to which the board is connected (when operating in “Station Mode”) must provide the Domain Name System (DNS) service (contact the network administrator for further information regarding the presence or absence of the DNS service in the Wi-Fi router or how to enable it). In this way, even if the IP address assigned to the inverter should change over time, (dynamic IP), it will always be possible to use the same “Host Name” which will remain unchanged over time.

The IP address assigned may vary for reasons connected to the wireless home router setup (for example, a very brief DHCP lease time). If verification of the address is required, it is usually possible to obtain the client list (and the corresponding IP addresses) from the wireless router administration panel.

If the “Host Name” was lost, it could be obtained writing this url:

`http://ABB-XX-XX-XX-XX-XX-XX.local`

replacing the “X” with the hex digits of the MAC address of the inverter (it can be found on the “Communication Identification label” placed on the side of the inverter or applied during the commissioning phase to the plant documentation).
Connection to the inverter in “AP Mode”

- Enable the wireless connection on the device which is being used for the board setup (tablet, smartphone or PC) and connect it to the Access Point created by the inverter system: the name of the wireless network created by the system that the connection should be established with, will be:

ABB-XX-XX-XX-XX-XX

where “X” is a hex digit of the MAC address (MAC address can be found on the “Communication Identification label” placed on the side of the inverter or applied during the commissioning phase to the plant documentation).

- When required digit the PRODUCT KEY (printed on the “Communication Identification label” and applied during the commissioning phase to the plant documentation) as access point password.

Note that it’s required to digit also the dash “-” characters of the Product Key in the password field.

In case of need, product key can be recovered by Aurora Vision Cloud or by calling ABB technical support.

- Open an internet browser (recommended browser: Chrome versions from v.55, Firefox versions from v.50) and enter the pre-set IP address 192.168.117.1 to access the login page.
Login page

After you have connected the device to the inverter and you access to the login page, login with the username and password created during the commissioning phase.

User and password are CASE SENSITIVE.

If the Password is lost click on “Forgot your password?” to obtain the access to the Web User Interface (and it will be possible to change the password) by entering the PRODUCT KEY (printed on the “Communication Identification label” and applied during the commissioning phase to the plant documentation).

The language of the Web User Interface could be changed in any moment by clicking on the right status bar:
The Web User Interface is divided in six main sections, available on the left sidebar:

**MAIN**: Main section of Web User Interface dedicated to viewing the summary information related to the status and the production information of the inverter and photovoltaic plant.

**SETTINGS**: Section dedicated to AC and DC line parameters configurations.

**INVERTER LOG**: Section dedicated to viewing Alarms and Warnings event log.

**USER**: Section dedicated to User management.

**CONNECTIVITY**: Section dedicated to inverter communication settings and configurations.

**SERVICE TOOLS**: Section dedicated to main service tools configurations.

**INFORMATION**: Section dedicated for general information about the embedded Web User Interface.

The following screenshots are related from a laptop visualization, may differ from smartphone or tablet visualization.
**MAIN section**

In the **MAIN** section it’s possible to access the following sub-menus:

- Dashboard
- Status Summary

**Dashboard**

In the **Dashboard** sub-menu you can view the main information related the status and the production information of the inverter and photovoltaic plant and alarm/warning active events.

**Status Summary**

In the **Status Summary** sub-menu you can view the detailed information related the status and the production information of the system.
**SETTINGS section**

In the **SETTINGS** section it’s possible to access the following sub-menus:

- **INVERTER PARAMETERS:**
  - AC output Rating (Only visible with Admin Plus privileges)
  - AC Settings (Only visible with Admin Plus privileges)
  - Active Power Control (Only visible with Admin Plus privileges)
  - DC Settings
  - Digital Inputs
  - Frequency Control: P(f) (Only visible with Admin Plus privileges)
  - Ramp Control (Only visible with Admin Plus privileges)
  - Reactive Power Control (Only visible with Admin Plus privileges)

- **DIGITAL OUTPUTS**

**INVERTER PARAMETERS:**

**AC output Rating (Only visible and editable with Admin Plus privileges)**

In the **AC output Rating** sub-menu you can config the output power limitation by changing the Maximum AC output power and the maximum apparent output power parameters.

*Do not change these parameters if not requested by the grid operator.*

**AC Settings (Only visible and editable with Admin Plus privileges)**

In the **AC Settings** sub-menu you can setup the parameter related to the Output AC side:

*Changing the above-mentioned parameters may prevent disconnection from the grid if the new values exceed those given in the standards of the country of installation. If these parameters are changed to values outside the standard range, an interface protection must be installed external to the inverter in accordance with the requirements of the country of installation.*

1. **Grid Connection**
   By editing these settings it’s possible to change the grid connection thresholds parameters to which the inverter have to connect to the grid.

2. **Grid Protections + VRT/FRT**
   By editing these settings it’s possible to enable/disable and change the grid protection intervention thresholds parameters. In addition it is possible to change voltage ride thorough (HVRT, LVRT) and frequency ride thorough (HFRT, LFRT) settings.
**Active Power Control (Only visible and editable with Admin Plus privileges)**

In the Active Power Control sub-menu you can configure settings related to the active power derating parameters using the following parameter groups:

1. **Active Power Curtailment**
2. **CEI Average VGrid Derating**
3. **Volt/Watt settings: P(V)**

*Do not change these parameters if not requested by the grid operator.*

**DC Settings**

In the DC Settings sub-menu you can set the parameter related to the Input DC side:

1. **Multiple Max Scan Enable**
   - This setting allows you to enable/disables the scan for identifying the maximum power point of the system.

2. **Multiple Max Scan Period - Value**
   - This setting allows you to set the time between scans. Remember that the shorter the scan interval, the greater the loss of production, due to the fact that energy is transferred to the grid during the scan but not at the maximum power point. Each scan takes roughly 2 seconds.

3. **UV Protection Time - Value**
   - This section of the menu allows you to set the time for which the inverter stays connected to the grid after the input voltage has dropped below the Under Voltage limit (set at 70% of Vstart). (60 seconds is the default setting).

4.-15. **VStart 1...12 New Value**
   - These parameters are used to set the Vstart activation voltage for the related input channel. This voltage imposes a minimum input voltage on the inverter above which connection to the grid will be attempted.

*Change the activation voltage only if really necessary and to set it to the correct value: the photovoltaic generator sizing tool available on the ABB website will indicate whether Vstart needs to be changed and what value have to be set.*

**Digital Inputs**

In the Digital Inputs sub-menu you can disable or enable the Remote ON/OFF functionality related to the “Remote” terminal block 🛠️.
**Frequency Control: P(f) (Only visible and editable with Admin Plus privileges)**

In the Frequency Control: P(f) sub-menu you can configure settings related to the active power derating as a function of grid frequency.

*Do not change these parameters if not requested by the grid operator.*

**Ramp Control (Only visible and editable with Admin Plus privileges)**

In the Ramp Control sub-menu you can configure the parameter related to the active power ramp up at the start-up and after a grid fault event.

*Do not change these parameters if not requested by the grid operator.*

**Reactive Power Control (Only visible and editable with Admin Plus privileges)**

In the Reactive Power Control sub-menu you can configure settings related to the reactive power parameters using the following parameters groups:

1. Cosphi Set
2. Q Set
3. Volt/VAr Settings: Q(V)
4. Watt/Cosphi Settings: Cosphi(P)

*Do not change these parameters if not requested by the grid operator.*
**DIGITAL OUTPUTS:**

In the **Digital Outputs** menu it’s possible to set the activation status of the two configurable relays related to “ALARM” and “AUX” terminal block ④ (refer to “Configurable Relay connection (ALARM and AUX)” chapter to know how to connect to these terminal block and to configure customised alarm conditions.

This contact can be used, for example, to activate a siren or a visual alarm, control the disconnect device of an external transformer, or control an external device.

Relay switching can be set in different modes using the setting icon ⑤:

With “Output active filter” you can select the list of events for which the relays switch.

The available operating mode are:

1. **Production**
   The relay is activated (status: switched) whenever the inverter connects to the grid; as soon as the inverter is disconnected from the grid (for whatever reason that caused disconnection), the relay is in its resting position.

2. **Alarm ALL - no-latch**
   The relay is activated (status: switched) whenever an error (code Exxx) or warnings related to grid parameters out of range (Warning – codes W003, W004, W005, W006, W007) are present on the inverter. The alarm contact returns to its resting position when the alarm signal ends, i.e. before the inverter checks the grid parameters after the alarm state. This is because grid control state is not an alarm state but a state of normal operation.

**Alarms for which the relay is activated**

<table>

</tbody>
</table>

*In the presence of W003, W004, W005, W006, W007 signalling, the alarm contact switches to then reset itself at the end of the alarm signal. This means that during the absence of grid voltage (display message “Missing Grid”) the alarm contact remains in its resting position.*
3. Alarm Configurable - no-latch

The relay is activated (status: switched) whenever an error (code Exxx) or a warning (code Wxxx) is among those selected from the list in the dedicated submenu Alarm Config. The contact returns to its resting position when the alarm signal ends, i.e. before the inverter checks the grid after the alarm state. This is because grid control state is not an alarm state but a state of normal operation.

</table>

For the configurable relay operating mode “Alarm Conf.”, the following considerations are valid:

**If the alarm condition is persistent, the alarm contact cyclically switches from its resting state to its activated state.**

In the presence of W002 signalling (Input UV – input voltage below the limit of operation), the alarm contact switches to then reset itself at the end of the alarm signal. This means that during the reduced input voltage (display message “Waiting Sun”) the alarm contact remains in its resting position.

In the presence of W003, W004, W005, W006, W007 signalling, the alarm contact switches to then reset itself at the end of the alarm signal.

This means that during the absence of grid voltage (display message “Missing Grid”) the alarm contact remains in its resting position.

4. Crepuscular

The relay is activated (status: switched) as soon as the inverter input voltage exceeds the activation voltage set.

The relay is in its rest position when the input voltage drops below 70% of the activation voltage set.

This mode is useful for disconnecting any output transformers that could have unnecessary consumption during the night.
5. Alarm ALL - latch

The relay is activated (status: switched) whenever an error (code Exxx) or a warning (code Wxxx) is present (see the table below). The contact returns to its resting position when the inverter returns to its normal operating state and reconnects to the grid.

<table>
<thead>
<tr>

If the alarm condition is persistent, the relay will remain activated (status: switched)
**INVERTER LOG Section**

In the **INVERTER LOG** Section it’s possible to view the Alarm and Warning events list that it can be custom filtered by type or by entering a matching word.

Clicking on any event to view its details.
USER section

In the USER section it’s possible to logout from Web User Interface and return to the login page, or to access the following sub-menus:
• Edit Email and Password
• Admin Plus
• User Management

Edit Email and Password

In the Edit Email and Password sub-menu you can change the e-mail and password related to the user which is used to login to the Web User Interface:

Admin Plus

By accessing to the Admin Plus sub-menu you can obtain the “Admin Plus” user privileges which allow you to:
- View and edit the AC Settings, Reactive Power Control, Ramp Control, Active Power Control and Frequency Control: P(f) sub-menus on SETTINGS section.
- Change the grid standard of the inverter, after 24 hours while the inverter is operating so the Country Standard sub-menu on SERVICE TOOLS section is locked).
- Access the “Reset Manufacturing” sub-menu on SERVICE TOOLS section.

To access on the Web User Interface with the “Admin Plus” user privileges it’s required to enter a security token that can be obtained by registering on the website https://registration.abbsolarinverters.com. Refer to the dedicated section on this topic in the manual.

User Management

By accessing to the User Management sub-menu it’s possible to edit all the users already created and create new users (both with admin or User privileges).
CONNECTIVITY section

In the CONNECTIVITY section it's possible to access the following sub-menus:
• LAN
• WLAN
• RS485
• Debug Settings
• Modbus

LAN

In the LAN sub-menu it's possible to view the status and change the daisy chain configuration of the two ethernet ports 🌐🌐 of the inverter.

- **Daisy chain configuration: DHCP or Static:**
  By selecting the DHCP function (default setup) the router will automatically assign a dynamic IP address to the inverter whenever it tries to connect to the user network.
  With Static, the user can assign a fixed IP address to the system. The data which has to be entered in order for IP static address assigning to take place will appear. Complete the additional fields at the bottom of the screen (all the fields are mandatory with the exception of the secondary DNS server).
WLAN

In the WLAN sub-menu it’s possible to view the status of the two wireless channels of the inverter, and to disconnect the channel 2.

- Channel 1: “Access Point mode”: Only local communication is enabled in this mode; In particular, the WLAN acts like an «access point» generating a wireless network to which the user can connect locally, configure the inverter / photovoltaic system, using the direct access to the embedded Web User Interface.

![Wireless connection - “ACCESS POINT MODE” COMMUNICATION](image)

- Channel 2 “Station Mode”: In this operating mode is possible to connect the inverter to a Wi-Fi router; in this condition remote monitoring is enabled accessing to Aurora Vision® CLOUD platform.

![Wireless connection](image)
In case of connection to channel 2 ("Station Mode"), it will be required to enter the wireless network parameters (set on the router) and follow the subsequent procedure:

- **IP Selection Mode:** DHCP or Static:
  By selecting the DHCP function (default setup) the router will automatically assign a dynamic IP address to the inverter whenever it tries to connect to the user network.
  
  With Static, the user can assign a fixed IP address to the system. The data which has to be entered in order for IP static address assigning to take place will appear. Complete the additional fields at the bottom of the screen (all the fields are mandatory with the exception of the secondary DNS server).

- **SSID (name of wireless network):**
  Identify and select your own (home) wireless network from all those shown in the SSID field (you can carry out a new search of the networks that can be detected with the Update button). Once the network has been selected, confirm.

- **Password (wireless network password):**
  Enter the password for the destination network (if necessary) and start the connection attempt (it will take a few seconds).

Click on "Connect"
Once the inverter is associated with a wireless network, the user must switch the tablet/smartphone/PC to the same wireless network which the inverter is connected.

**Please do not close this page and switch Wireless network**
In order to proceed, you should connect to the following Wireless Network without closing this page:

**HOME_Network**

The operation could take 5 minutes

Once the tablet/smartphone/PC device is switched to the local wireless network a new message will confirm that the connection is acquired.

**Connection acquired**
The inverter is connected to the network

**HOME_Network**

The device is available at the following addresses:
- IP Address: 192.168.1.23

Please take note of them.

Click the “Next” button to complete the setup of “Station Mode”

In order to use the “Host Name” as an alternative to the dynamic IP address, the Wi-Fi router to which the board is connected (when operating in “Station Mode”) must provide the Domain Name System (DNS) service (contact the network administrator for further information regarding the presence or absence of the DNS service in the Wi-Fi router or how to enable it). In this way, even if the IP address assigned to the inverter should change over time, (dynamic IP), it will always be possible to use the same “Host Name” which will remain unchanged over time.

The IP address assigned may vary for reasons connected to the wireless home router setup (for example, a very brief DHCP lease time). If verification of the address is required, it is usually possible to obtain the client list (and the corresponding IP addresses) from the wireless router administration panel.
**RS485**

In the RS485 sub-menu it’s possible to adjust the settings relating to the RS485_main communication port (refer to the “Serial communication connection” chapter for info about where this port is located). In particular it is possible to set:

- **RS485 Node address**: It allows you to set the address (any value from 2 to 63 is allowed).

- **RS485 Baud Rate**: It allows you to set the Baud Rate (accepted values are: 2400/4800/9600/19200/34800/57600/115200).

- **RS485 Parity Mode**: It allows you to set the Parity bit (please select among No Parity, Even Parity, Odd Parity).

- **RS485 Protocol Type**: It allows you to set the communication protocol to be used for the RS485 line when the port is set as SLAVE or to enable the port itself to work in MASTER mode (refer to the “Serial communication connection” chapter for further info on SLAVE and MASTER operating mode allowed). In particular it is possible to select among the following value:
  - **“Modbus SunSpec Server”**: SunSpec(*) complaint Modbus RTU communication protocol enabling monitoring and controlling of the inverter by ABB as well as third party systems (SLAVE operating mode).
  
  - **“Device Acquisition”**: Enables polling and logging of data from ABB supported accessories directly connected with the RS485 port like VSN800 Weather Station, digital environmental sensors, meters (MASTER operating mode).

(*) Please refer to official SunSpec Alliance documentation (www.sunspec.org) for details on SunSpec communication protocol.

**Debug Settings**

In the Debug Settings sub-menu it’s possible to enable or disable the Debugging access for ABB Service purposes.
Modbus

In the Modbus sub-menu it's possible to enable and set parameters related to external monitoring and control systems over ethernet/wireless channels (“TCP/IP” section) or over RS485 communication line (“RTU” section).

TCP/IP

In the TCP / IP (WLAN / LAN) section there are different settings based on the type of external device connected to the inverter.

• If the inverter acts as CLIENT and the external device as SERVER:
  - click the “Edit” button and select the type of external device
  - According to the device, select the communication protocol
  - click the [+] button and the added device is displayed
  - change the SLAVE ID / NAME / IP ADDRESS / DEVICE settings and save them.

• If the inverter acts as a SERVER, set the port communication protocol only (Communication protocol server)
RTU
Select one of the following Operating Modes: Modbus SunSpec, Device Acquisition.

- **Modbus SunSpec Server**: Select “Edit RS485”, Select Protocol Type as “Modbus SunSpec Server”. Configure Node Address, Baud Rate, Parity. Please note that this will delete the previous configuration.
- **Device Acquisition**: Select “Edit RS485”. Select Protocol Type as “Device Acquisition”. Configure Baud Rate, Parity. Please note that this will delete the previous configuration.

- Click “Edit” button
- Select device type in the “Add device” field. It’s possible to choose between “Generic SunSpec Device” and “ABB B23/24 Power Meter”, then click the [+] button to add the new device.
- Change the SLAVE ID / “NAME” if necessary and save
SERVICE TOOLS section

In the SERVICE TOOLS section it’s possible to access the following sub-menus:
• Firmware Update
• Connectivity Check
• Country Standard
• Date/Time
• Reset Manufacturing (Only visible with Admin Plus privileges)

Firmware Update

By accessing to the Firmware Update sub-menu you can upgrade the firmware of the inverter and his components selecting a Remote firmware Update or a Local firmware Update.

This inverter can be powered both with AC or DC sources. In case of DC source only is used, Perform the update during good irradiation conditions (avoid the dawn and dusk hours). An interruption of updating process could damage the inverter!

• Remote firmware Update:
  - In remote mode, the firmware will update automatically, searching the last available firmware on ABB servers, by clicking the “CHECK” button.
  - At the end of the verification process the available release will be notified on the bottom part of the section
  - Click on “UPDATE” button to start with the updating process.

• Overnight update mode:
By selecting this mode, the firmware will be automatically updated during the night. In this way it’s possible to avoid energy harvesting interruption due to update process.
• **Local firmware Update:**

By updating in local mode, the firmware have to be selected and uploaded from local folder of the devices used to access to the web server.

The latest firmware version is available from the download area of the website [www.abb.com/solarinverters](http://www.abb.com/solarinverters) or from [https://registration.abbsolarinverters.com](https://registration.abbsolarinverters.com)

- Click on “FW SELECT” and select the firmware package previously downloaded.

- Click on “UPDATE” button to start with the updating process.

**Connectivity Check**

In the **Connectivity Check** sub-menu it’s possible to carry out connectivity tests of the wireless network connection, ethernet connection, connection to Aurora Vision and firmware upgrade servers. At the end of the test it will be reported the detail of the results.
Country Standard

By accessing to the Country Standard sub-menu you can modify the grid standard within 24 hours while the inverter is operating.

After the grid standard is set you have 24 hours to make any changes to the grid standard value; 24 hours later the Country Standard sub-menu will be locked, and any subsequent changes can only be made accessing with Admin Plus privileges. Refer to the dedicated section on this topic in the manual to know how to unlock the Country Standard sub-menu.
**Date and Time**

In the **Date and Time** sub-menu it's possible to set the date, time and time zone.

The inverter will propose these fields when the time protocol is available. When it's not possible for the inverter to detect the time protocol, these fields have to be manually entered.

![Date and Time](image)

- Network Time Protocol server has been detected and it will be used to keep the system clock synchronized.

- **Date**: Feb 22, 2017

- **Time**: 4:52 PM

- **Time Zone**: Europe/Berlin GMT+01:00

- **SAVE**
Reset Manufacturing (Only visible and editable with Admin Plus privileges)

In the Reset Manufacturing sub-menu it’s possible to factory reset the settings related to country standard and related to communication parameters:

- **Reset Country Std and Restore Default**: Reset country standard and restore communication parameters to default. The inverter connectivity will be reboot after the operation.

- **Reset Country Standard**: Reset ONLY country standard. The inverter connectivity will be reboot after the operation.

- **Reset to Default**: Reset ONLY communication parameters (not country standard). The inverter connectivity will be reboot after the operation.

- **Connectivity Reboot**: Reboot of the inverter connectivity.
INFORMATION Section

In the INFORMATION Section it's possible to view the general information about the embedded Web User Interface.

it's possible to access the following sub-menus:
• Product Info
• Privacy Policy
• Provider Information/Impressum
• Acknowledgments
• Release Notes
General conditions

Routine and periodic maintenance operations must only be carried out by specialized staff with knowledge of how to perform these tasks.

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary steps to safely operate on the inverter.

For cleaning, DO NOT use rags made of filamentary material or corrosive products that may corrode the equipment or generate electrostatic charges. Avoid temporary repairs. All repairs should be carried out using only genuine spare parts. The maintenance technician is to promptly report any anomalies.

DO NOT allow the equipment to be used if problems of any kind are found.

Always use personal protective equipment (PPE) provided by the employer and comply with local safety regulations.
Inverter total de-energization and safe access

The purpose of this chapter is to provide instructions for de-energize the PVS-175-TL inverters in order to allow access to active parts inside the inverter. The procedure describes the steps to perform a total isolation and thus includes operations on devices that are located outside the inverter. The total isolation approach consider the disconnection of the inverter from any possible voltage source to which the inverter may be connected. In the procedure the test of residual voltage potentially present inside the inverter is included. This procedure is intended exclusively to be used by skilled or trained persons in accordance with safety standards EN 50110-1 and EN 50110-2 (CENELEC/CEN) or equivalent standards. Furthermore, only these skilled or trained persons are permitted to carry out the procedure.

Operator and maintenance personnel skills/prerequisites

Personnel in charge of using and maintaining the equipment must be skilled for the described tasks and must reliably demonstrate their capacity to correctly interpret what is described in the manual.

For safety reasons, the installation must be performed by qualified installers and/or licensed electricians in accordance with the existing regulations in the country of installation and in accordance of all safety rules for performing electrical works. The installers must have demonstrated skills and knowledge of the inverter’s structure and operation.

Inverter operation and maintenance by a person who is NOT qualified, is intoxicated, or on narcotics, is strictly forbidden.

The customer has civil liability for the qualification and mental or physical state of the personnel who interact with the equipment. They must always use the personal protective equipment (PPE) required by the laws of the country of destination and whatever is provided by their employer.

The following job requirements and qualifications are required to operate on the inverter:

- Compliance with all legal standard in force in the installation country to perform the electrical work described on this procedure.
**Clothing and protection of personnel**

The following Personal Protective Equipment (PPE) are required to perform any intervention on the inverter:

- Dielectric helmet EN397 – EN50365 (1000Vac-1500Vdc) with visor EN166 grade 8.
- Insulating composite gloves class 0 EN60903 (1000Vac-1500Vdc) resistant to electric arc class 2 (7kA) EN61482-1-2 in combination with protective overglove in leather EN420 – EN388.
- Work overall UNI EN 11612 A B1 C1 resistant to electric arc class 2 (7kA 1s.) CEI EN 61482-1-2.
- Safety shoes.

**Safety equipment and tools**

The following equipment and tools are required to perform any intervention on the inverter:

- Disconnect tool for DC side (PV) connectors (provided with PVS-175 Installation KIT).
- Voltage detector (EN 61243-2) capable of 3kVdc and up to 1kVac.
- DC current clamp.
- Safety tags “work in progress, do not operate”.
- Padlocks.
Inverter total de-energization and safe access procedure

Start

Prepare for the work and identify the worklocation and equipment
- Coordinate the activities with plant manager
- PPE Check
- Equipment check

Stop of the inverter

Check the absence of dangerous voltage on inverter chassis respect ground

Wear PPE

MAIN AC DISCONNECT – PLANT SIDE
- Open the external main AC switch
- Apply LOTO on the external main AC switch

DC SIDE DISCONNECT – PLANT SIDE
- Open the external DC switches (if present)
- Apply LOTO on external DC switches

MAIN AC DISCONNECT – INVERTER
- Open the internal main AC switch (if present)
- Apply LOTO on the internal main AC switch

DC SIDE DISCONNECT – INVERTER
- Open the internal DC switches
- Apply LOTO on internal DC switches

REMOVE DC CABLES

CAPACITOR DISCHARGE
Wait for the time mentioned in the regulatory label

Perform the voltage absence verification test
DC side – WBOX
AC side – WBOX
AC Cap - WBOX
BULK CAPS – PWRMOD

Fill-in the check-list in appendix A
Issue the work permit and “walk the permit”
When the device has just been switched off, it may have hot parts as a result of overheating of the heated surfaces (e.g.: transformers, accumulators, coils, etc.) so be careful where you touch.

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, follow this procedure for safely isolate the inverter.

**Important note**: It is important to remark the presence of auxiliary power supply connected to the AC grid. The inverter is supplied either by DC and AC power, so that the internal voltages are present even in case the DC switches are open.

1. **Preliminary checks**
   - Weather conditions: In the risk assessment prior the intervention it is of paramount importance to evaluate the weather conditions. This procedure can be applied only in case of dry environment. Don’t proceed in case of rain (even light) or high humidity.
   - PPE Check: Verify the integrity of the PPE that is going to be used to perform the operations.
   - Equipment check:
     - Check the voltage tester is working correctly:
       - Perform an integrity check of the instrument in general; examine the test terminals, its integrity and make sure they are properly fixed; make sure the batteries level is enough high (don’t use the instrument in case the message “LOW BATTERY” is present) or replace them.
       - Perform test of the instrument using an energized AC socket and a DC voltage source (example: battery in the service car) with known voltage level; in case the instrument is provided with a self-test feature, follow the instructions provided in the instrument manual to carry out the self-test.
     - Check the DC current probe is properly working, make sure to perform the “ZERO-OFFSET” procedure and to select DC measurement range.

2. Wear the appropriate PPE for carrying out the operations (overall resistant to electric arc, dielectric helmet with visor, insulating gloves). All the following activities (till the completion of the procedure) must be performed wearing the PPE.
3. Stop the inverter operation:
The inverter have an external RJ45 connector on which a RS485 service-related communication line and REMOTE OFF signal is provided.

- Prepare an RJ45 cable with the PIN 1 and PIN 7 bond toghether and properly isolated.

The pin-out of the connector is the following:

<table>
<thead>
<tr>
<th>Pin No.</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Remote OFF</td>
</tr>
<tr>
<td>7</td>
<td>GND</td>
</tr>
<tr>
<td>1, 2, 4, 6, 8</td>
<td>not used</td>
</tr>
<tr>
<td>3, 5</td>
<td>RS485 for ABB Service operation</td>
</tr>
</tbody>
</table>
• Connect the modified RJ45 cable to the external RJ45 connector to perform a soft shut-down of the inverter. The connection of the cable will cause the interruption of the operation of the inverter, i.e. it stops the IGBT switching, interrupts the injection of current into the grid and opens the AC contactor.

⚠️ The REMOTE OFF function doesn't cause the disconnection of power sources from the inverter.

⚠️ Make sure to keep the jumper fitted in the RJ45 connector to ensure the inverter in OFF condition. Make sure to remove the cable from the connector prior to restart the inverter.

4. **Check the absence of dangerous voltages on inverter enclosure respect ground:**

• Check the absence of dangerous voltage on the inverter chassis. The measurement point are between inverter chassis not-painted part (both power module and wiring box - samples point circled in red) and the Protective earth point (ext.) outside the inverter.
5. Operations on External AC switches

The diagram below represents a possible arrangement of the PV plant. Depending on the design choices made by the developer of the plant, some of the devices could not be present. Identify the external AC switch(es) in the plant with the support of the plant manager.

- Open the external AC disconnect switch or the main external AC disconnect switch (blue in below picture) outside the inverter (IEC 60364-7-712.536.2.2). In case none of the LV AC switches are present, the MV switch must be opened.
- Affix designated lock preventing operation onto any external AC disconnect device, affixing designated tags (LOTO procedure).

Identification of the external switch may require the cooperation of the plant manager and it must be included in the switching plan defined during the preparation of the work.

- Check on the status LEDs the shutdown command has been carried out (Missing Grid status):
  - **Power** LED (Green): Flashing
  - **Alarm** LED (Yellow): ON (solid)
  - **GFI** LED (Red): OFF
  - **WLAN/LAN** LED (Blue): Depends by the communication status.
6. Operations on External DC switches (if present)

**Note:** In case of absence of External DC disconnect device skip this step.

The diagram below represents a possible arrangement of the PV plant. Depending on the design choices made by the developer of the plant some of the devices could not be present. Identify the external DC switch(es) in the plant with the support of the plant manager.

- Open the external DC disconnect switch (blue in below picture) outside the inverter (IEC 60364-7-712.536.2.2)
- Affix designated lock preventing operation onto any external DC disconnect device, affixing designated tags (LOTO procedure).

**Identification of the external switch may require the cooperation of the plant manager and it must be included in the switching plan defined during the preparation of the work.**

- Check on the status LEDs  the shutdown command has been carried out (Missing DC voltage status): **All LEDs OFF**.

**The time needed for the complete shut-down of the LEDs depends by the input voltage of the inverter. The complete shut-down of the LEDs may require some minutes.**
7. Operations on internal AC disconnect Switch (if present)

**Note:** This operation can be done only in case of wiring box -SX2 or -S2 model. The wiring box -SX or -S model doesn't include the AC switch.

- Open the main AC disconnect switch (shown in blue in the picture below).

- Affix designated lock preventing operation onto AC disconnect switch, affixing designated tags (LOTO procedure).
8. Operations on Internal DC disconnect switches

- Open all the internal DC switches (1, 2 and 3, blue in the below picture).

- Affix designated lock preventing operation onto all DC disconnect switches, affixing designated tags (LOTO procedure).

- Check on the status LEDs the shutdown command has been carried out (Missing DC voltage status): All LEDs OFF.

⚠️ The time needed for the complete shut-down of the LEDs depends by the input voltage of the inverter. The complete shut-down of the LEDs may require some minutes.
The below picture represents the expected status of the switches in the plant after the switching operations have been completed.
9. Remove the DC quick fit connectors 18 from wiring box 19

- Using the current clamp check the absence of current on DC side, measurement each positive and negative DC input string cables (check the correct setting of the current sensor).

- Remove all quick fit DC connectors 18 (PV Connectors) from the wiring box 19, using the dedicated disconnect tool. To avoid mechanical interferences, use a cable tie to collect the disconnected cables.

It is highly recommended to put labels on the cables in order to easily reconnect them to the correct connectors once completed the service activities.

10. Discharge of the capacitor

- Wait the internal capacitors to be discharged. The discharge time of the stored energy is indicated on the regulatory label.
11. Voltage absence test on DC side (wiring box)

Before to approach the below operations all the steps from 1 to 9 included must be successfully completed.

- Access to the wiring box by opening the front wiring box cover.
- Visually inspect the components to identify the presence of any overheating, signs of electric arcs, failure of the insulating devices, loosen connections or cables not connected.
- Test the absence of voltage on the DC inputs using the voltage detector: the voltage absence test on DC side inside the wiring box must be carried out on the DC surge arrester boards, shown in the picture below.

The layout of the DC surge arrester boards is provided below, with reference of the points where the input DC voltage absence test must be performed. The points are represented by the faston where the cables (coming from DC switches) are connected.
For each one of the input channels, the measurement must be performed between: positive to ground, negative to ground, positive to negative.

<table>

12. Voltage absence test on AC side (wiring box)

- Visually inspect the components to identify the presence of any overheating, signs of electric arcs, failure of the insulating devices, loosen connections or cables not connected.
- Using a Philip screwdriver, unscrew the blocking screw B on the AC protective shield 23.
- Open the sliding cover A and block it in open position using the blocking screw B. The opening of the sliding cover will open the 6 holes that make accessible the VAT points on the AC connection busbar 27.
• Perform VAT by inserting the voltage detector in the holes. With reference to below picture, the right holes are designated for the insertion of the voltage detector (red arrows) while the left holes (in blue) are designated as visually inspection holes, to make sure the electrodes of the voltage detector are touching the main AC screws on the AC connection busbar.

14. Voltage absence test on bulk capacitors (Power Module)

Before to approach the below operations all the steps from 1 to 12 included must be successfully completed.

- Access to the power module box ① by opening the power module front cover ③.
- Visually inspect the components to identify the presence of any overheating, signs of electric arcs, failure of the insulating devices, loosen connections or cables not connected.
- Check the absence of voltage on the DC input filter boards using the voltage detector. The voltage absence test on bulk capacitors inside the power module ① must be carried out on the DC input filter boards, through the holes provided in the protective metal shield mounted inside the power module, as shown in the below pictures. The red holes allow to reach the +BULK while the blue holes allow to reach the –BULK. Holes are enough big to visually inspect during the VAT operations.
The layout of the DC input filter board is provided below, with reference of the points where the input DC voltage absence test must be performed.

Measuring between the all points refer to table below.

<table>
<thead>
<tr>
<th>Check sequence</th>
<th>First point</th>
<th>Second point</th>

<td>-BULK</td>
</tr>
</tbody>
</table>
15. Voltage absence test on mid bulk point (Power Module)

- Check the absence of voltage on the mid bulk using the voltage detector. The voltage absence test on mid bulk must be carried out inside the power module between the measure points shown below.

| Check sequence:                              |
| Positive to ground (PE)                      |
| First point | Second point |
| MID BULK    | PE           |
16. Check list to be filled prior the access to the inverter

- Purpose of the checklist is to verify that all the operations mentioned in the procedure have been carried out. The checklist below must be attached to the intervention report.

<table>
<thead>

**OPERATIONS AT PLANT LEVEL [*]**

| Operations in External AC switch |               |
| Operations in External DC Switch (If present) |               |

**OPERATIONS AT INVERTER LEVEL**

| Operations on internal AC switch (if present) |               |
| Operations on internal DC switches |               |
| Remove the DC quick fit connectors from wiring box |               |
| Wait the discharge of the internal capacitor |               |

**VOLTAGE ABSENCE TEST**

| Voltage absence check on DC side (wiring box) |               |
| Voltage absence check on AC Side (wiring box) |               |
| Voltage absence check on AC Capacitor (wiring box) |               |
| Voltage absence check on bulk capacitors (power module) |               |
| Voltage absence check on mid bulk point (power module) |               |

**ISSUE WORK PERMIT**

| Issue work permit and “Walk the permit” – Check list filling |               |

== ONLY if all checks are POSITIVE (✓) the ACCESS IS ALLOWED =

[*]: Identification of the external switch may require the cooperation of the plant manager and it must be included in the switching plan defined during the preparation of the work.
Routine maintenance

To preserve long term proper operation of the inverter, you are advised to perform the routine maintenance operations listed in this chapter.

Maintenance operations shall be performed only by qualified personnel or ABB personnel (under a servicing contract). The maintenance schedule may vary depending on the environmental conditions of the installation.

Table: routine maintenance

<table>
<thead>
<tr>
<th>Table: routine maintenance</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Annual visual inspections</strong></td>
</tr>
<tr>
<td>• Check that the inverter is operating properly, without any alarm signals.</td>
</tr>
<tr>
<td>• Ensure all labels and safety symbols are visible.</td>
</tr>
<tr>
<td>• Check the integrity of the cables, connectors and cable glands outside the inverter.</td>
</tr>
<tr>
<td>• Check that the environmental conditions have not changed dramatically from those on installation.</td>
</tr>
<tr>
<td>• Check there are no obstacles (animals, insects, leaves or anything which could reduce the heat exchanging capacity of the heat sink) at the top, at the bottom and on the external arrays of cooling fan.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Annual operations</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Check the tightening of the cable glands and the screw terminal blocks.</td>
</tr>
<tr>
<td>• Check the front covers is secured.</td>
</tr>
<tr>
<td>• If there is no monitoring system, check the record of alarms and errors using the indications provided in the manual in order to check recent notification of recent malfunctions.</td>
</tr>
<tr>
<td>• For the models with AC disconnect switch, it is recommended that once a year the disconnect switch is operated a number of times (at least 10) to keep the contacts clean and prevent oxidation. This operation must be carried out in periods with low input power or at night.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Annual cleaning</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Clean the equipment; verify, in particular, clean the side and top arrays of the cooling fan assembly and the heat sink.</td>
</tr>
</tbody>
</table>

For a complete maintenance procedure ask for “Preventive Maintenance -Life Cycle” to ABB customer service.
Recommended replacement intervals of components

To preserve long term proper operation of the inverter it’s advisable to follow the recommended replacement schedule specified below:

<table>
<thead>
<tr>
<th>Component</th>
<th>3</th>
<th>6</th>
<th>9</th>
<th>12</th>
<th>15</th>
<th>18</th>
<th>21</th>
<th>24</th>
</tr>
</thead>
<tbody>
<tr>
<td>External Fan section</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Internal Fan section</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td>R</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The replacement schedule may vary depending on the environmental conditions of the installation (e.g. high dust presence environment).

Refer to dedicated chapters on this manual to know how to replace each listed component.
Replacing fan section (external)

The following operation must be carried out wearing the appropriate insulating composite gloves class 0 EN60903 (1000Vac-1500Vdc) resistant to electric arc class 2 (7kA) EN61482-1-2 in combination with protective overglove in leather EN420 – EN388.

When replacing the external fan sections it’s strictly recommended to clean the fins of internal heatsink using compressed air (blowing air from top and the side to the rear of the inverter).

Procedure for replacing the side fan sections:

1. Open the DC disconnect switches [19].
2. Open any AC disconnect switch downstream of the inverter or the AC disconnect switch [18] (only on -S2 or -SX2 model).
3. Wait the internal capacitors to be discharged (the discharge time of the stored energy is indicated on the regulatory label), and check that fans are completely stopped.
4. Remove the 2 screws (STEP A).
5. Tilt the fan section as shown in the picture (STEP B).
6. Pull out the fan section (STEP C).
7. Disconnect the 2 fan connectors (STEP D).
8. Take the new fan section and connect the 2 fan connectors. During this phase pay attention to connect the fan to the correspondent cable; on each fan cable coming from the power module and on each fan are applied labels that indicates the fans number (from FAN1 to FAN5).
7. Place the new fan section in the reverse way of previous steps.
8. Screw the 2 fastening screws.
Procedure for replacing the top fan sections:

1. Open the DC disconnect switches (19).
2. Open any AC disconnect switch downstream of the inverter or the AC disconnect switch (9) (only on -S2 or -SX2 model).

   Do not open the front wiring box cover (7) nor the front power module cover (6).

3. Wait the internal capacitors to be discharged (the discharge time of the stored energy is indicated on the regulatory label), and check that fans are completely stopped.
4. Remove the 2 screws (STEP A).
5. Tilt the fan section as shown in the picture (STEP B).
6. Pull out the fan section (STEP C).
7. Disconnect the 2 fan connectors (STEP D).
8. Take the new fan section and connect the 2 fan connectors. During this phase pay attention to connect the fan to the correspondent cable; on each fan cable coming from the power module and on each fan are applied labels that indicates the fans number (from FAN1 to FAN5).
9. Place the new fan section in the reverse way of previous steps.
10. Screw the 2 fastening screws.
Replacing fan section (internal)

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.

Procedure for replacing one of the two fan sections:
1. Perform the “Inverter total de-energization and safe access” procedure before operate on the inverter.
2. Open the front wiring box cover.

Do not open the power module cover during the replacement operation.

3. Remove the 2 screws (STEP A).
4. Pull out the fan section (STEP B).

Pay special attention to don’t damage the cables situated in front of fans during the replacement operation.

5. Place the new fan section in the reverse way of previous steps.
Replacing the DC surge arrester cartridge (-SX/SX2 models only)

The following operation must be carried out wearing the appropriate insulating composite gloves class 0 EN60903 (1000Vac-1500Vdc) resistant to electric arc class 2 (7kA) EN61482-1-2 in combination with protective overglove in leather EN420 – EN388 and using a Voltage detector (EN 61243-2) capable of 3kVdc and up to 1kVac.

Replacing the DC surge arrester cartridges may be necessary in the following circumstances:

1. “Alarm” LED flashing, “Power” LED steady ON.
2. Presence of “W018” Error in Inverter Log section of web user interface.
3. The inspection window of DC surge arrester cartridge is RED.

The DC surge arrester cartridges are installed on the DC surge arrester plate inside the wiring box.

Procedure for replacing one of the DC surge arrester cartridges:

1. Open the DC disconnect switches.
2. Open any AC disconnect switch downstream of the inverter or the AC disconnect switch (only on -S2 or -SX2 model).

Do not open the power module cover during the replacement operation.

3. Check for the absence of voltage on the DC surge arrester boards using the voltage detector (refer to paragraph 10 of “Inverter total de-energization and safe access” chapter on this manual).
4. Push the side snaps and pull out the cartridges.
5. Insert the new cartridge in the empty slot.
Replacing the AC surge arrester cartridge (-SX/SX2 models only)

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary steps to safely operate on the inverter.

Replacing the AC surge arrester cartridges may be necessary in the following circumstances:

1. “Alarm” LED flashing, “Power” LED steady ON.
2. Presence of “W019” Error in Inverter Log section of web user interface.
3. The inspection window of AC surge arrester cartridge is RED.

The AC surge arrester cartridges are installed inside the wiring box.

Do not open the power module cover during the replacement operation.

Procedure for replacing one of the AC surge arrester cartridges:

1. Perform the “Inverter total de-energization and safe access” procedure before operate on the inverter.
2. Push the side snaps and pull out the cartridges.
3. Insert the new cartridge in the empty slot.

![Diagram of replacing the AC surge arrester cartridge](image-url)
Replacement of the MEMORY board

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.

Replacing the MEMORY board is carried out on the wiring box and may be necessary in the following circumstances:

Inverter log Statistic (e.g. power production) lost after system shoutdown.

The MEMORY board is installed on the communication and control board 26.

Procedure to replace the MEMORY board:

1. Open any AC disconnect switch downstream of the inverter.
2. Open the DC disconnect switches and the AC disconnect switch (only on -S2 or -SX2 model).
3. Disconnect the quick fit input connectors.
4. Open the wiring box front cover.
5. Extract the communication and control board as explained in the chapter “Communication and control board”.
6. Remove the MEMORY board to be replaced.
7. Install the new MEMORY board.

6. Reconnect all the input strings and start the inverter.
Replacement of the COMM RS485 board

Some inverter parts may be subject to voltages that could be hazardous for the operator. **Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.**

Replacing the COMM RS485 board is carried out on the wiring box and may be necessary in the following circumstances:

1. **Communication issues on RS485 line.**

   The COMM RS485 board is installed on the communication and control board.

Procedure to replace the memory board:

1. Open any AC disconnect switch downstream of the inverter.

2. Open the DC disconnect switches and the AC disconnect switch (only on -S2 or -SX2 model).

3. Disconnect the quick fit input connectors.

4. Open the wiring box front cover.

5. Extract the communication and control board as explained in the chapter “Communication and control board”.

6. Remove the COMM RS485 board to be replaced.

7. Install the new COMM RS485 board.

6. Reconnect all the input strings and start the inverter.
Replacement of the buffer battery

Some inverter parts may be subject to voltages that could be hazardous for the operator. Before performing any work on the inverter, refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.

Replacing the buffer battery 47 is carried out on the wiring box 02 and may be necessary in the following circumstances:

1. LED error signal
2. Reset of the date and time settings

The battery is of the CR2032 type and is installed on the communication and control board 26.

Procedure to replace the buffer battery 47:

1. Open any AC disconnect switch downstream of the inverter.
2. Open the DC disconnect switches 18 and the AC disconnect switch 09 (only on -S2 or -SX2 model).
3. Disconnect the quick fit input connectors 18.
4. Open the wiring box front cover 07.
5. Extract the communication and control board 26 as explained in the chapter “Communication and control board”.
6. Remove the buffer battery 47 to be replaced
7. Install the new battery, taking care to handle it with insulating gloves in order not to compromise the charge and respecting the polarity shown on the diagram on the communication and control board 26
8. Reconnect all the input strings and start the inverter.
Procedure for dismantling the equipment

The dismantling operations must be carried out with the equipment disconnected from any voltage sources. Refer to “Inverter total de-energization and safe access” chapter on this manual to know all the necessary step to safely operate on the inverter.

Never open the power module (1) or wiring box (2) in the case of rain, snow or a level of humidity >95%. Always carefully seal all unused openings.

Even though the device is equipped with an anti-condensation valve, air with extremely high levels of humidity can lead to the creation of condensation inside the inverter.

As the inverter is almost completely insulated from the outside, condensation can also form after maintenance interventions in certain weather conditions.

During dismantling always protect the inverter parts that are installed and exposed to the weather elements!

Staff authorised to carry out the dismantling operations must be specialised and experienced in this job. They must also have received suitable training on equipment of this type.

The inverter consists of an power module (1), a wiring box (2) and a mounting bracket (3) which may be dismantled separately.

To dismantling and disassemble the power module (1) follow these steps:

- Disconnect any external voltage sources and isolate the equipment referring to the “Inverter total de-energization and safe access” chapter.

- Disconnect all internal connectors between power module (1) and wiring box (2) referring to “Mounting with a support bracket - Interface connectors connection” chapter (Follow the indications for connection procedure but in the reverse order).

- Disjoint the power module (1) and wiring box (2) enclosures referring to “Mounting with a support bracket - Final Fastening operations” chapter (Follow the indications for the mounting procedure but in the reverse order).

- Slightly lift the power module (1) to allow the gasket protective covers insertion.
• Slide the gasket protective covers between power module 01 and wiring box 02 enclosures.

• Remove the power module 01 following the indications for the mounting procedure in the “Mounting with a support bracket - Assembly the Inverter to the bracket” chapter in the reverse order and the indication for lifting methods in “Type of lifting” chapter.

Never leave the power module 01 or the wiring box 02 disassembled on the field. In case is necessary to disassemble the power module 01 only, a IP65 protection covers for wiring box openings (long term installation) kit is available as accessory options.

To dismantling and disassemble the wiring box 02 follow these steps:
• Remove the power module 01 as previously described.
• Remove AC cables and protective earth cable.
• Remove any signal cables.
• Remove the wiring box 02 following the indications for the mounting procedure in the “Mounting with a support bracket - Assembly the Inverter to the bracket” chapter in the reverse order and the indication for lifting methods in “Type of lifting” chapter.

To dismantling and disassemble the mounting bracket 03 follow the indications for the mounting procedure in the “Mounting with a support bracket - Bracket assembly” chapter in the reverse order.
# Troubleshooting

Operations on the inverter to identify and address any faults may only be performed by the installer or by qualified personnel.

**Web User Interface and wireless communication troubleshooting**

The following table gives a list of main and most common errors or problems relating to the wireless communication between inverter and user devices.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Possible causes</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Web User Interface cannot be accessed.</td>
<td>ADMIN or USER password forgotten.</td>
<td>Reset the passwords by clicking on &quot;Forgot your password&quot;; The passwords can be reset after having entered the “Product Key” code that can be found on the “Communication Identification Label”.</td>
</tr>
<tr>
<td>The inverter is able to identify a wireless network but is unable to connect to it.</td>
<td>The signal between the inverter and the wireless router to which the board wants to connect is too weak.</td>
<td>Modify the position of the wireless antenna, the inverter or the router. Make sure that the inverter has not been installed near obstacles which could affect the communication with the wireless router (for example: metal cages or walls, walls in reinforced concrete, electromagnetic fields). Move the router as close as possible to the inverter. Install a wireless signal repeater in order to extend the network to which the inverter is to be connected; then connect the inverter to the repeater.</td>
</tr>
<tr>
<td>The wireless network to which the inverter is to be connected, could require the user to enter a username and password to allow navigation (for example, with a public wireless network or a hotel).</td>
<td></td>
<td>Unfortunately the inverter cannot be connected to these types of wireless networks. Connect the inverter to an alternative wireless network.</td>
</tr>
<tr>
<td>The Inverter has not identified the wireless network to which connection is required.</td>
<td>The wireless network to which the Inverter is to be connected, is set so as not to be identified (hidden network).</td>
<td>The Inverter is not able to connect to a hidden network. Set the wireless network to which the inverter is to be connected (visible network), then identify and connect the Inverter to the wireless network as normal.</td>
</tr>
<tr>
<td>The signal between the inverter and the wireless router to which the board wants to connect is too weak.</td>
<td></td>
<td>Modify the position of the wireless antenna, the inverter or the router. Make sure that the inverter has not been installed near obstacles which could affect the communication with the wireless router (for example: metal cages or walls, walls in reinforced concrete, electromagnetic fields). Move the router as close as possible to the inverter. Install a wireless signal repeater in order to extend the network to which the inverter is to be connected; then connect the inverter to the repeater.</td>
</tr>
<tr>
<td>The wireless board does not communicate correctly with the inverter inside of which it is installed (inconsistency in the detected data read by the board), or when working in “Access Point Mode”, it’s not possible to access the Web User Interface.</td>
<td>The wireless board of the inverter could be damaged.</td>
<td>Request a service intervention to check that the inverter wireless board is working correctly.</td>
</tr>
<tr>
<td>Wrong Inverter Date/Time settings.</td>
<td></td>
<td>Check if Date/Time has correctly set on the inverter; correct it if necessary.</td>
</tr>
<tr>
<td>Problem</td>
<td>Possible causes</td>
<td>Solution</td>
</tr>
<tr>
<td>---------</td>
<td>----------------</td>
<td>----------</td>
</tr>
<tr>
<td>Alternating difficulties in the local connection to the Web User Interface.</td>
<td>The inverter might not be correctly powered (for example, if the inverter is switched off at night, the Web User Interface cannot be accessed). The wireless connection signal between the device in use and the router or the Inverter, may not have sufficient power or it may be disturbed by obstacles which affect the communication.</td>
<td>Access to the Web User Interface only when the inverter is correctly powered. Make sure that the signal between the wireless devices which interact with the inverter are sufficiently high and that any obstacles such as metal cages or walls, walls in reinforced concrete or strong electromagnetic fields do not affect communication.</td>
</tr>
<tr>
<td>Although the Inverter has been configured correctly in “Station Mode” and works correctly on the local network, no data has been transmitted to the Aurora Vision®.</td>
<td>The MAC address used to register the inverter on the Aurora Vision® platform is not the same as the actual address associated with the inverter. The wireless network to which the inverter is connected, could be protected by a Firewall which prevents the remote exchange of data with the Aurora Vision® platform.</td>
<td>Make sure that the MAC address registered on the Aurora Vision® platform is actually the one associated with the inverter. If it is not, modify the registered MAC address. Contact the network administrator in order to have the Firewall configured so that the remote exchange of data between the Inverter and the Aurora Vision® platform is allowed.</td>
</tr>
<tr>
<td>It is not possible to access the Web User Interface using the IP address when the inverter is operating in “Station Mode – DHCP”.</td>
<td>An incorrect dynamic IP address is being used to access the Web User Interface or the IP address could have been modified by the wireless router to which the inverter is connected. The IP Address used to access the Web User Interface was lost.</td>
<td>Access the Web User Interface using via “AP Mode” (refer to dedicated section to know how to connect via “AP Mode”) and read the current IP Address in “NETWORK &gt; WLAN” section. Access the Web User Interface using the “Host Name” that could be obtained writing this url <a href="http://ABB-XX-XX-XX-XX-XX-XX.local">http://ABB-XX-XX-XX-XX-XX-XX.local</a> replacing the “X” with the hex digits of the MAC address of the inverter (it can be found on the “Communication Identification Label” placed on the side of the inverter or applied during the commissioning phase to the plant documentation). The DNS or multicast service must be enabled on router. Note: This connection method doesn’t work on Android devices. If possible, access the pages of the wireless router web server to which the inverter is connected and read the new dynamic IP address assigned to the Inverter.</td>
</tr>
<tr>

## Alarm Messages of the Inverter

In order to understand and resolve warning (Wxxx) or error (Exxx) signals that appear in the Event or Dashboard section of the Web User Interface follow the table given in the following paragraph.

The equipment can notify errors/warnings in the Event or Dashboard section of the Web User Interface only if the input voltage is greater than the Vdcmin voltage (POWER Led flashing or lit; see chapter on operation).

The following table gives the complete list of errors/warnings relating to string inverters. Some error/warning codes may not be used depending on the inverter model installed.

<table>
<thead>
<tr>
<th>Error code</th>
<th>Error message</th>
<th>Name of Alarm and Cause</th>
<th>Solution</th>

<tbody>
<tr>
<td>- No code</td>
<td>- Ground F</td>
<td>Ground fault of photovoltaic generator:</td>
<td>• Measure the isolation resistance using a megohmmeter positioned in the photovoltaic array (positive terminal short-circuited at the negative pole) compared to ground. The measurement is strongly influenced by the environmental conditions, so must be made under the same conditions in which the error occurred.</td>
</tr>
<tr>
<td></td>
<td>- Red LED</td>
<td>The alarm is generated when a leakage current to ground is detected in the DC section of the system.</td>
<td>- If the value measured is lower than 1 megaohm, a check must be carried out by a technician/installer on the photovoltaic generator to identify and eliminate the problem.</td>
</tr>
<tr>
<td></td>
<td>- Missing Grid</td>
<td>Missing Grid: The inverter does not detect grid voltage (AC side).</td>
<td>• Check the grid voltage on the inverter's AC terminal block. Should it be absent, check any protection work on the line and the presence of grid voltage on the supply point.</td>
</tr>
<tr>
<td></td>
<td>- Yellow LED</td>
<td>Memory fault: The inverter has detected a communication problem with the memory board on which the inverter saves the daily value of energy produced.</td>
<td>• Remove the memory board and check the welding of all the connector's terminals. Subsequently reinsert the memory board and check that it is correctly inserted into the dedicated slot.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Waiting Sun: The inverter goes into the “Waiting Sun” stage when, following a W001 and/or W002 warning, the voltage from the photovoltaic generator is less than the activation voltage (Vstart).</td>
<td>• Check the input voltage on the inverter. If it does not exceed Vstart, check for the presence of sufficient irradiation and the correct composition of the system.</td>
</tr>
<tr>
<td>- W001</td>
<td>- Sun Low</td>
<td>Insufficient irradiation (Low input voltage on switching on the inverter): Incorrect configuration of the PV generator or an “on the limit” configuration for the inverter’s minimum input voltage.</td>
<td>• Check the input voltage on the inverter. If it does not exceed Vstart, check for the presence of sufficient irradiation and the correct composition of the system.</td>
</tr>
<tr>
<td>- W002</td>
<td>- Input UV</td>
<td>Insufficient irradiation (Low input voltage on switching off): Incorrect configuration of the photovoltaic generator or an “on the limit” configuration for the inverter’s minimum input voltage.</td>
<td>• Check the input voltage on the inverter. If it exceeds Vstart, contact customer assistance.</td>
</tr>
</tbody>
</table>

- Vdcmin:
  - Vdcmin (minimum DC voltage) is the minimum voltage at which the inverter can operate. It is typically higher than the voltage at which the inverter starts to produce power (activation voltage) to ensure the inverter can operate under a wide range of conditions.

- Activation voltage:
  - Activation voltage is the minimum voltage at which the inverter begins to produce power. It is lower than Vdcmin and is designed to ensure the inverter can operate efficiently even under low-voltage conditions.
Parameters of grid voltage outside range:
This error signal occurs when during the inverter's normal operation the grid parameters exceed the limits set by the operator.
- Grid voltage absent (after the signal the inverter goes to "Missing Grid")
- Unstable grid voltage (values too low or too high)
- Unstable grid frequency

- Check the grid voltage on the inverter.
- Should it be absent, check for absence of grid voltage on the supply point.
- If, on the other hand, the voltage tends to rise (when the inverter is connected) there is high line or grid impedance.
- Check the grid voltage also on the supply.
- If it is high, it means that there is high grid impedance. In this case, ask the operator to adjust the grid voltage. If the operator authorises a change to the inverter's parameters, agree the new limits with customer assistance
- If the voltage at the point of supply is much lower than that measured on the inverter, it is necessary to adjust the line (inverter-contactor).
- If the voltage and the grid frequency come back within the limits (also when the inverter is connected to the grid), contact customer assistance

Grid overvoltage:
This error signal occurs when during the inverter's normal operation the grid voltage exceeds the maximum limit set by the operator.

- Check the grid voltage on the inverter.
- Check the grid voltage also on the supply.
- If it is high, it means that there is high grid impedance. In this case, ask the operator to adjust the grid voltage. If the operator authorises a change to the inverter's parameters, agree the new limits with customer assistance
- If the voltage at the point of supply is much lower than that measured on the inverter, it is necessary to adjust the line (inverter-contactor).
- If the voltage and the grid frequency come back within the limits (also when the inverter is connected to the grid), contact customer assistance

Grid undervoltage:
This error signal occurs when during the inverter's normal operation the grid voltage exceeds the minimum limit set by the operator.

- Check the grid voltage on the inverter.
- Check the grid voltage also on the supply.
- If it is high, it means that there is high grid impedance. In this case, ask the operator to adjust the grid voltage. If the operator authorises a change to the inverter's parameters, agree the new limits with customer assistance
- If the voltage at the point of supply is much lower than that measured on the inverter, it is necessary to adjust the line (inverter-contactor).
- If the voltage and the grid frequency come back within the limits (also when the inverter is connected to the grid), contact customer assistance

Grid over-frequency:
This error signal occurs when during the inverter's normal operation the grid frequency exceeds the maximum limit set by the operator.

- Check the grid frequency in the inverter.
- Check the grid frequency also on the supply.
- If the voltage and the grid frequency come back within the limits (also when the inverter is connected to the grid), contact customer assistance

Grid under-frequency:
This error signal occurs when during the inverter's normal operation the grid frequency exceeds the minimum limit set by the operator.

- Check the grid frequency in the inverter.
- Check the grid frequency also on the supply.
- If the voltage and the grid frequency come back within the limits (also when the inverter is connected to the grid), contact customer assistance

Low “Bulk” voltage (DC-DC circuit):
The alarm (which is a warning and not an error) is generated when the voltage at the heads of the bulk capacitors does not reach the threshold for the operation of the inverter (internal unchangeable threshold).

- Raise the value of the activation voltage (Vstart) so as to have sufficient power from the PV generator at the time of the inverter's grid connection.
- Check the input voltage on the inverter.
- If it does not exceed Vstart, check for the presence of sufficient irradiation and the correct composition of the system.
- If it exceeds Vstart, contact customer assistance.

Battery Low:
The inverter has detected a backup battery voltage that is too low.

- Check that the date/time are set correctly and, if they are not, set them.
- Subsequently arrange to completely switch off the inverter (on both AC and DC) and wait a few minutes.
- Finally, restart the inverter and check whether the date/time are now correctly set or whether they have reset to 01/01/2000. In this case replace the battery with the inverter completely switched off (isolate AC and DC side) being careful to maintain the polarity.
<table>

</thead>
<tbody>
<tr>
<td>W013</td>
<td>Clock Fail: The alarm occurs when there is a difference of more than 1 minute in the time shown on the Web User Interface compared to the internal time of the microprocessors and indicates a malfunction of the clock circuit.</td>
<td>• Error inside the inverter and cannot be checked externally. - If the alarm repeats persistently, contact customer assistance.</td>
</tr>
<tr>
<td>W015</td>
<td>Disconnection due to Anti-Islanding: The inverter has been improperly connected to an island grid.</td>
<td>• Check that the grid to which the inverter is connected is not an island grid. - If the grid to which the inverter is connected is an island grid, switch the inverter off and then on again: if the problem persists, contact customer assistance.</td>
</tr>
<tr>
<td>W018 *</td>
<td>Intervention of overvoltage surge arresters on DC side: Overvoltage surge arresters situated on the DC side are damaged.</td>
<td>• Observe the inspection window on each surge arrester (DC side). If it is red, the surge arrester is damaged and the cartridge must be replaced. - If the alarm status persists, even if all the surge arresters have a green inspection window, contact customer assistance.</td>
</tr>
<tr>
<td>W019 *</td>
<td>Intervention of overvoltage surge arresters on AC side: Overvoltage surge arresters situated on the AC side are damaged.</td>
<td>• Observe the inspection window on each surge arrester (AC side). If it is red, the surge arrester is damaged and the cartridge must be replaced. - If the alarm status persists, even if all the surge arresters have a green inspection window, contact customer assistance.</td>
</tr>
<tr>
<td>W021</td>
<td>Activation of reduction in power: Indicates that one of the power limitations has been triggered.</td>
<td>• Check which power limitation code is active and, on the basis of that, carry out the necessary checks that might relate to various factors including: - settings by the user - high grid frequency - high grid voltage - anti-islanding - low grid voltage - high internal temperature - high input voltage</td>
</tr>
<tr>
<td>W022</td>
<td>Variation in means of managing reactive power: Variation in the means of managing reactive power, this change can be made through the Web User Interface.</td>
<td>The variation in the means of managing reactive power is done directly by the customer/installer and is not an error. The information is only saved on the historic record of the events memorised by the inverter.</td>
</tr>
<tr>
<td>W023 *</td>
<td>Variation in the inverter’s date and time: Variation of the inverter’s date and time; this change can be made through the Web User Interface.</td>
<td>• The variation in the inverter's date and time is done directly by the customer/installer and is not an error. The information is only saved on the historic record of the events memorised by the inverter.</td>
</tr>
<tr>
<td>W024</td>
<td>Zeroring of the statistical energy data memorised in the EEPROM: Reset of the energy data saved in the inverter, this operation can be handled through the Web User Interface.</td>
<td>The zeroing of the partial energy values memorised by the inverter is done directly by the customer/installer and is not an error. The information is only saved on the historic record of the events memorised by the inverter. • The warning may also occur when the Memory Card on which the production statistics are saved is replaced</td>
</tr>
<tr>
<td>W025</td>
<td>Deactivation of reduction in power: Indicates that the inverter has come out of one of the power limitation states.</td>
<td>This type of warning does not need any check</td>
</tr>
<tr>
<td>W046</td>
<td>Connection to the grid unsuccessful The alarm is logged when a Missing grid or Input UV error occurs or due to the manual disconnection of the inverter during the grid connection sequence.</td>
<td>• Once the error occurs, the inverter tries to return to normal operation. If the problem persists after a number of attempts to connect the inverter, switch the inverter off and then on again. • If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>W047</td>
<td>FW update method unsuccessful The alarm occurs when a firmware update has not been completed.</td>
<td>• Complete any pending firmware updates. - If the problem persists once the firmware updates have been completed, switch the inverter off and on again. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>W048</td>
<td>Automatic disconnection from the grid due to time limit: If the inverter exceeds the set grid connection time limit set by the grid standard, it will automatically have to carry out a disconnection and reconnection to the grid to carry out the Riso test.</td>
<td>• The presence of this alarm is not an error as the automatic disconnection is prescribed by safety regulations. - If the inverter disconnects in a shorter time than expected, contact customer assistance.</td>

<tr>
<td>E018</td>
<td>Leak fault</td>
<td>High leakage current measured on the DC side (photovoltaic generator): The alarm is generated when, during normal operation of the inverter, a leakage current to ground is detected in the DC section of the system. It is also possible that the inverter generates the alarm E018 message also due to AC leakage currents connected to the capacitive nature of the photovoltaic generator compared to ground.</td>
<td>• Measure the isolation resistance using a megohmmeter positioned in the photovoltaic array (positive terminal short-circuited at the negative pole) compared to ground. The measurement is strongly influenced by the environmental conditions, so must be made under the same conditions in which the error occurred. - If the value measured is lower than 1 megaohm, a check must be carried out by a technician/installer on the photovoltaic generator to identify and eliminate the problem. - If the value measured is higher than 1 megaohm and the error signal persists, contact customer assistance.</td>
</tr>
<tr>
<td>E019</td>
<td>Internal error</td>
<td>Failure of test on sensor to measure the leakage current (DC side): Before connecting to the grid the inverter runs a self-test regarding the sensor for the leakage current. The test is carried out by &quot;forcing&quot;, in the sensor of the leakage current, a current with a known value: the microprocessor compares the value read with the known value. The error is generated if the comparison between the read value and the known value during the test does not fall within the allowed tolerance.</td>
<td>• Error inside the inverter and cannot be checked externally. By its nature, the alarm only occurs prior to connection to the grid. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
</tbody>
</table>
### Name of Alarm and Cause

**Failure of the test on the relay of the “Booster” (DC-DC circuit):**
Before connecting to the grid, the inverter carries out some internal tests. One of these tests concerns the correct operation of the booster relay. The test is carried out by “forcing” the switching of the relay and checking its operation. The error is generated if a problem is found in actuating the relay.

- **Solution:**
  - Error inside the inverter and cannot be checked externally. By its nature, the alarm only occurs prior to connection to the grid.
  - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.

**Failure of the test on the inverter’s relay (DC-AC circuit):**
Before connecting to the grid, the inverter carries out some internal tests. One of these tests concerns the correct operation of the inverter relay. The test is carried out by “forcing” the switching of the relay and checking its operation. The error is generated if a problem is found in actuating the relay.

- **Solution:**
  - Error inside the inverter and cannot be checked externally. By its nature, the alarm only occurs prior to connection to the grid.
  - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.

**Timeout of the tests undertaken on the relays inside the inverter:**
Execution time for the self-test carried out on the relay of the DC_AC (inverter) circuit too high. It may indicate a problem connected to the aforementioned relays.

- **Solution:**
  - Error inside the inverter and cannot be checked externally. If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.

**Feeding of direct current to grid outside of range:**
The error is generated if the direct component of the current supplied to the grid exceeds the threshold of 0.5% of the rated operating current. In any case, the inverter does not stop because of the E023 error, but tries to connect to the grid again. The sporadic repetition of the error is a sign of serious grid distortions or sharp irradiation changes, while systematic repetition of the error signal will indicate a breakdown on the inverter.

- **Solution:**
  - Once the error appears, the inverter attempts to resume normal operation.
  - Should the error occur sporadically, it may be caused by a brusque transition of the grid voltage or of the input voltage, but is not due to a malfunction by the inverter.
  - If the error is connected to an internal fault, it will continue to appear and so it is necessary to contact customer assistance.

**Low value of isolation resistance:**
Before connecting to the grid the inverter measures the isolation resistance of the PV generator compared to ground. Should the measurement of the isolation resistance be below 1Mohm, the inverter does not connect to the grid and shows the “Riso Low” error. The causes may be:
- Damaged PV panel(s).
- Junction box(es) of the panels not correctly sealed, so as to permit infiltration by water and/or humidity;
- Problems in connections between panels (not perfectly fit);
- Poor quality of cable joints;
- Presence in the DC section of unsuitable or damaged overvoltage surge arresters outside the inverter (reduced ignition voltage compared to the characteristics of the strings of the PV generator));
- Presence of humidity inside any junction box.

- **Solution:**
  - Measure the isolation resistance using a megohmmeter positioned in the photovoltaic array (positive terminal short-circuited at the negative pole) compared to ground. The measurement is strongly influenced by the environmental conditions, so must be made under the same conditions in which the error occurred.
  - If the value measured is lower than 1 megaohm, a check must be carried out by a technician/installer on the photovoltaic generator to identify and eliminate the problem.
  - If the value measured is higher than 1 megaohm and the error signal persists, contact customer assistance.

**Internal reference voltage outside of range:**
Wrong measurement of reference voltage inside inverter.

- **Solution:**
  - Error inside the inverter and cannot be checked externally. If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.

**Grid voltage outside of range:**
Error in the internal measurement of grid voltage (set by law) to have a redundant measurement (2 measurements on the same parameter made by two different circuits).

- **Solution:**
  - Error inside the inverter and cannot be checked externally. If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.
### Error code and Solution

<table>
<thead>
<tr>
<th>Error code</th>
<th>Name of Alarm and Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>E028</td>
<td>Grid frequency outside of range: Error in the internal measurement of the grid frequency (imposed by regulations) to have a measurement redundancy (2 measurements on the same parameter carried out by 2 different circuits).</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E029</td>
<td>Internal overvoltage on the measurement of the &quot;Mid bulk&quot;: Error inside the inverter (only triphase models)</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E030</td>
<td>High leakage current (DC side): - Error on the internal measurement (performed when the inverter is connected to the grid) of the DC side (PV generator leakage current with respect to ground (required by regulations) to have a measurement redundancy (2 measurements of the same parameter carried out by 2 independent circuits)</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E031</td>
<td>Output relay damaged: Measurement of internal voltage on heads of the output relay outside of range. There is too great a difference in voltage between the input and output of the grid connection relay.</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E032</td>
<td>Imbalanced output currents: Measurement of the unbalance in the output voltage (made across the three phases) outside of range (only in three-phase models)</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E033</td>
<td>Low ambient temperature: Temperature outside the inverter below -25°C</td>
<td>• Wait for the temperatures to which the inverter is exposed to return to the operating range. - If the problem persists, contact customer assistance. You must remember to wait for the time necessary to allow the inverter to warm up.</td>
</tr>
<tr>
<td>E034</td>
<td>“IGBT” circuitry not ready: Error inside the inverter</td>
<td>• Error inside the inverter and cannot be checked externally. - If the problem persists (once the inverter has been switched off and back on again), contact customer assistance.</td>
</tr>
<tr>
<td>E035</td>
<td>Inverter awaiting “remote ON” command: The inverter has been switched off remotely (remote OFF) and remains in waiting state for the signal that will switch it on again (remote ON).</td>
<td>• Switch the inverter back on remotely. If the unit does not switch on, disable the remote on/off function and switch the equipment off completely and then switch it on again. - If the problem persists (once the Remote ON/OFF function has been reactivated), contact customer assistance.</td>
</tr>
<tr>
<td>E036</td>
<td>Average of the measurements of grid voltage outside of range: The average value of the grid voltage (sampled every 10 minutes) does not fall within the permitted ranges. The grid voltage in the point connected to the inverter is too high. This may be caused by a grid impedance that is too high. In the final stage of the timeout, the inverter limits the power to check whether the grid voltage has stabilised into regular parameters. If this does not happen, the inverter disconnects from the grid</td>
<td>• Check the grid voltage in the connection point to the inverter. - If the grid voltage differs from the range due to the conditions of the distribution grid, ask the operator to adjust the grid voltage. If the operator authorises a change to the inverter's parameters, agree the new limits with customer assistance.</td>
</tr>
<tr>
<td>E037</td>
<td>Low value of the isolation resistance (only with the “Amorphous” mode activated): This error can appear only if the “Amorphous” mode is enabled. This function is enabled only in inverters equipped with grounding kit and is used to monitor the voltage at the ends of the grounding resistor. The error appears when the voltage at the ends of the resistor connected between ground and pole of the photovoltaic generator exceeds 30V for more than 30 minutes or 120V for more than one second.</td>
<td>• Check for the presence and correct contact between the two terminals of the grounding resistance installed inside the inverter - Measure the isolation resistance using a megohmmeter positioned in the photovoltaic array (positive terminal short-circuited at the negative pole) compared to ground. The measurement is strongly influenced by the environmental conditions, so must be made under the same conditions in which the error occurred. - If the value measured is lower than 1 megaohm, a check must be carried out by a technician/installer on the photovoltaic generator to identify and eliminate the problem. - If the value measured is higher than 1 megaohm and the error signal persists, contact customer assistance.</td>
</tr>

| E046       | Error during the automatic check of the string voltages (only in models with the “fuse-control” board): | - Section the inverter and check the polarity of the string(s) which the inverter has recorded as inverted.  
- Once all the strings have been correctly connected, activate the system once again; the inverter will once again check the correct polarity of the string inputs at the end of which it will carry out the checks for the grid connection.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E049       | Error in the “AC feed-forward” circuit: Error inside the inverter | - Error inside the inverter and cannot be checked externally.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E051       | Input voltage (Vin) higher than booster voltage (Vbulk): The error occurs if the input voltage exceeds the Bulk voltage (voltage on the DC-DC circuit inside the inverter) | - It is necessary to measure the input voltage inside the inverter with a voltmeter.  
- If it is higher than the maximum voltage of the operating range, the alarm is genuine and it is necessary to check the configuration of the PV generator. If the voltage has also exceeded the maximum input threshold the inverter could be damaged.  
- If it is lower than the maximum voltage of the operating range, the alarm is caused by an internal malfunction and it is necessary to contact customer assistance. |
| E057       | Error in the check of Pin vs Pout: | - Error inside the inverter and cannot be checked externally.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E058       | Communication error inside the inverter: | - Error inside the inverter and cannot be checked externally.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E074       | Error in the system configuration: Error inside the inverter | - Error inside the inverter and cannot be checked externally.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E077       | Riso test error: Problem detected during the Riso test phase. | - Error inside the inverter and cannot be checked externally.  
- If the problem persists (once the inverter has been switched off and back on again), contact customer assistance. |
| E079       | Incorrect Phases connection (Only triphase models) The phases have not been connected correctly to the AC output | - Invert two of the phases of the network wiring to the AC terminal block of the inverter. |
| E084       | Return current to photovoltaic field: The error occurs if the input voltage is particularly low (typically in the evening in conditions of low irradiation) and indicates a return current from the inverter to the photovoltaic panels). | If the error occurs in the evening or in conditions of low irradiation, it must not be considered a problem but a protection intervention for the photovoltaic field.  
- If the error occurs with good irradiation conditions, switch the inverter off and back on again; if the error persists, contact customer assistance. |

**Power limitation messages**

The equipment can signal possible output power limitations which may occur on the basis of:
- settings made by the user
- settings required by the grid standard of the country of installation
- protective devices inside the inverter

The limitation messages can only be verified on the Web User Interface on “Status Summary” section.
Registration on “Registration” website and calculation of security token (Admin Plus)

In order to obtain the security token needed to obtain the “Admin Plus” privileges in the web user interface, it is necessary to go through the following stages:

Stage 1 - Collection of information relating to the inverter.

Collect the following information relating to each inverter for which you wish to have the security token:

- **S/N** - Serial number of the inverter. This information can be found on the product label giving the identity details of the inverter. The serial number consists of 6 digits (the last 6 in models with a label giving a 10-digit S/N).
- **WK** - Production week. This information can be found on the product label giving the identity details of the inverter. The production week consists of 4 figures, indicating the week (first 2 digits) and the year of production (last 2 digits).

Stage 2 - Registration on https://registration.abbsolarinverters.com

- Go online and access https://registration.abbsolarinverters.com
- Set the desired language and click on the specific icon to start registration
- Insert the personal data requested and end the registration stage
- An email will be sent to the email address used with a link to complete the registration process.
- Once the registration process is over, a further email will be sent with the password to access the website.

The security token obtained enables access also to the advanced “Installer” mode present on the configuration software for inverters. The configuration software can be downloaded in a specific section of the website https://registration.abbsolarinverters.com
Stage 3 - Request for the security token

- Go online and access https://registration.abbsolarinverters.com
- Insert the Username (corresponding to the email used during registration) and the Password obtained at the end of Stage 2

- Access the section dedicated to requesting the security token

- Choose the inverter model from the drop-down list and insert Serial Number and Week of Production of the inverter which were obtained previously (Stage 1)
- Click on icon to request the security token.

Should there be an error in inputting data, the fields containing the error will be highlighted in red. If, on the other hand, the data are correct, the passwords will be shown in a new window and at the same time sent to the email address used for registration.

The security token enables the “Admin Plus” privileges which allows the inverter’s sensitive parameters to be changed. Proceed to changing the aforementioned parameters only when requested by the grid operator or by customer assistance.
Verification of ground leakage

In the presence of anomalies or report of ground fault (where provided), there may be a ground leakage from the PV generator (DC side).

To check this, measure the voltage between the positive pole and ground and between the negative pole (of the PV generator) and ground using a voltmeter whose input accepts a voltage sufficient for the dimensions of the photovoltaic generator.

Behaviour of a system without leakage

Due to the capacitive effect of the PV generator, during the first moments that the voltmeter is connected between one of the two poles and ground, it will measure a voltage of about Voc/2, which will tend to stabilize to around 0V if there is no ground leakage, as shown in the graph below:

The internal resistance of the voltmeter tends to zero the voltage present on the PV generator due to the capacitive effect.

How to make the measurement:
Behaviour of a system with leakage

If the voltage measured between one of the two poles and ground does not tend to 0V and stabilizes on a value, there is a ground leakage from the PV generator.

Example: When the measurement is made between positive pole and ground, a voltage of 200V is measured.

This means that if the system is made up of 10 modules in series and each one supplies 50V, the leakage can be located between the 4th and 5th PV module.

\[ V_a = \text{voltage measured between } + \text{ pole and } + = 200V \]
\[ V_b = \text{voltage measured between } - \text{ pole and } + = 300V \]

In all measurements with the ground of the inverter is indicated.
Measuring the isolation resistance of the PV generator.

The operator must always use the personal protective equipment (PPE) required by the laws of the country of destination and whatever is provided by their employer.

To measure the isolation resistance of the PV generator compared to ground, the two poles of the PV generator must be short-circuited (using a suitable sized switch).

Use of unappropriate sized switch could cause risk of fire or electric arc! Use only 1500V rated switch!

Once the short-circuit has been made, measure the isolation resistance (Riso) using a megohmmeter positioned between the two shorted poles and ground (of the inverter).

If the measured isolation resistance (Riso) is less than 33 kOhm, the inverter may not connect to the grid because of low isolation of the PV generator to ground.

The isolation resistance can be affected by the environmental conditions the PV generator is in (E.g.: PV modules wet from damp or rain), and therefore the measurement must be made immediately after the anomaly is detected.
Storage and dismantling

Storage of the equipment or prolonged stop

If the equipment is not used immediately or is stored for long periods, check that it is correctly packed and contact ABB for storage instructions. The equipment must be stored in well-ventilated indoor areas having no characteristics that could damage the components of the equipment.

Restarting after a long or prolonged stop requires a check and, in some cases, the removal of oxidation and dust that will also have settled inside the equipment if not suitably protected.

Dismantling, decommissioning and disposal

ABB is not responsible for any loss of the equipment, or part of it, which does not take place on the basis of the regulations and laws in force in the country of installation.

The symbol of the cancelled bin (where present) indicates that the product must not be disposed of with domestic waste at the end of its useful life. This product must be delivered to the waste collection point of the local community for recycling. For further information, refer to the public body responsible for waste disposal in the country.

Inappropriate disposal of waste can have a negative impact on the environment and human health owing to potentially dangerous substances. By cooperating in the correct disposal of this product, you contribute to the reuse, recycling and recovery of the product, and the protection of our environment.

Dispose of the various types of materials that the parts of the equipment consist of in dumps that are suitable for the purpose.

Port and network services used by the inverter

**IP Network Services**

Any network connected to the inverter must allow traffic to pass on the following ports. Network firewall rules (if present) must allow responses to the inverter over existing TCP connections.

<table>
<thead>
<tr>
<th>Direction</th>
<th>Service/Port</th>
<th>Protocol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>In</td>
<td>ssh/22</td>
<td>Tcp</td>
<td>For local debugging by ABB service personnel, the inverter utilizes encrypted SSH. To allow service personnel local access to the inverter.</td>
</tr>
<tr>
<td>Out</td>
<td>domain/53</td>
<td>Tcp/udp</td>
<td>The inverter must be able to resolve domain names, to ensure scalability and dynamic changes on the Internet (DNS). (required)</td>
</tr>
<tr>
<td>Out</td>
<td>https/443</td>
<td>Tcp</td>
<td>As an HTTP client, the inverter uses SSL/TLS protocol connections to Aurora Vision® servers for secure communication. The inverter uses this port for all services, including data transmission, firmware upgrade, configuration management, and remote command transmission. (required)</td>

Inverter network configuration

The inverter requires a valid network configuration in order to operate. This information can either be provided by a DHCP server provided by the customers network (the default), or the inverter can be configured with static network information. Regardless of how the inverter is configured, the following information is required.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>Allows the inverter to take part in the local network. This does not need to be a public IP address. In most cases this is a private IP address.</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>Used to determine if two computers are on the same network.</td>
</tr>
<tr>
<td>Gateway</td>
<td>The IP address of the computer which will forward network traffic from the local network to an external network</td>
</tr>
<tr>
<td>DNS Server</td>
<td>The IP address(es) of the computer(s) which resolve domain names.</td>
</tr>
</tbody>
</table>
