DCS800
DC Drives

**CoDeSys Exercise
Digital and analog
signal processing
G562e_a_b Part 3**

eLearning

© Copyright 11/8/2021 ABB. All rights reserved.
CODESYS_03R0101A_page 1

Welcome to the CoDeSys training module for the DCS800, ABB DC Drives.

If you need help navigating this module, please click the Help button in the top right-hand corner. To view the presenter notes as text, please click the Notes button in the bottom right corner.

Objectives

After completing this module, you will be able to

- Create a small program
- Document an application
- Set the task configuration
- Download a program into the drive

The ABB logo, consisting of the letters 'ABB' in a bold, red, sans-serif font.

- After completing this module, you will be able to
- understand the basics of the CoDeSys programming tool,
- create small applications,
- document your applications for better understanding,
- download a program into the drive,
- evaluate the risks for each application.

Help

Exercise 1: Digital signals

- Read two digital inputs (DI's)
- The signals are processed with an AND operator
- The result is written to a digital output (DO)

The diagram illustrates a ladder logic program with three blocks. Block 1, labeled 'block1' and 'DigIn', has nine digital input terminals labeled bDI1 through bDI9. Two lines from bDI1 and bDI2 connect to the first input of an 'AND' operator block. A second input of the 'AND' operator is connected to a constant value '1'. The output of the 'AND' operator connects to the 'bDOut' terminal of 'block2', labeled 'block2' and 'DigOut'. The 'wChannel' terminal of 'block2' is also connected to the output of the 'AND' operator. A mouse cursor is positioned over the 'AND' operator block.

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 3

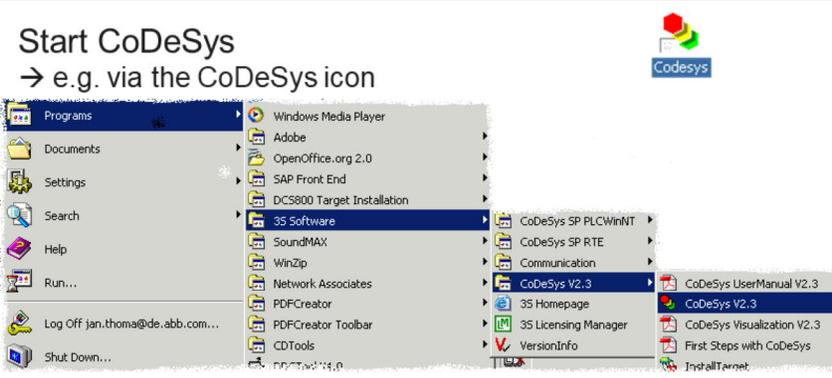

Let's start with the first example. It is a small program with three blocks which should handle the digital inputs and outputs of the drive. Two of the function blocks are specifically designed for DCS800. The first one reads the digital inputs. It is called "DigIn". By using the "DigOut" block you can set the digital outputs of the drive. The blocks are connected with an "AND operator" which can be found in the list with all IEC operators.

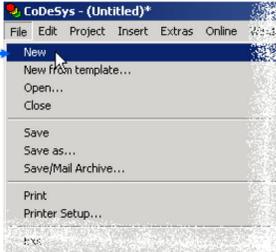

Help

Create a new project

- Start CoDeSys
→ e.g. via the CoDeSys icon

- Create a new project
→ File → New

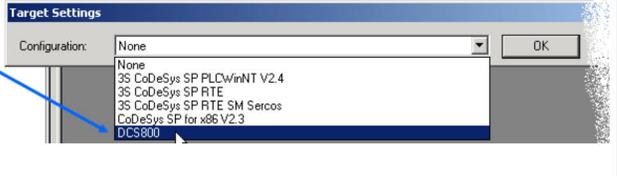

© Copyright 11/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 4

You can start CoDeSys by using a shortcut on the desktop or by finding CoDeSys in the start-menu. After CoDeSys has started up the last program edited will open automatically. To create a new application, click on “New” in the „File“ menu.

Select target

- Select target
→ Select *DCS800*
and click *OK*
- The *Target Settings* of the DCS800 are correct and there is no need to modify them

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 5

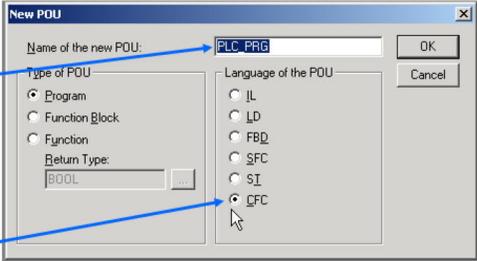

Select the DCS800 as target to get the correct settings between the drive processor and the software tool. If other PLCs are available, you can see them in the pull-down-menu, for example the “AC500”, and so on. The target file includes information about the communication channel and memory functions of the DCS800. For the DCS800 a serial communication between the PC and the drive is required.

Note, programs can be simulated by using the target setting “None”. The special function blocks for the DCS800 cannot be simulated with the system.

Help

Build a *PLC_PRG* in *CFC*

- The name of the program could be *PLC_PRG*
(**POU** = **P**rogram **O**rganization **U**nit)
- Programming language → Select *CFC* and click **OK**
(**CFC** = **C**ontinuous **F**unction **C**hart)

The other programming languages are:

- IL : Instruction List
- LD : Ladder Diagram
- FBD : Function Block Diagram
- SFC : Sequential Function Chart
- ST : Structured Text

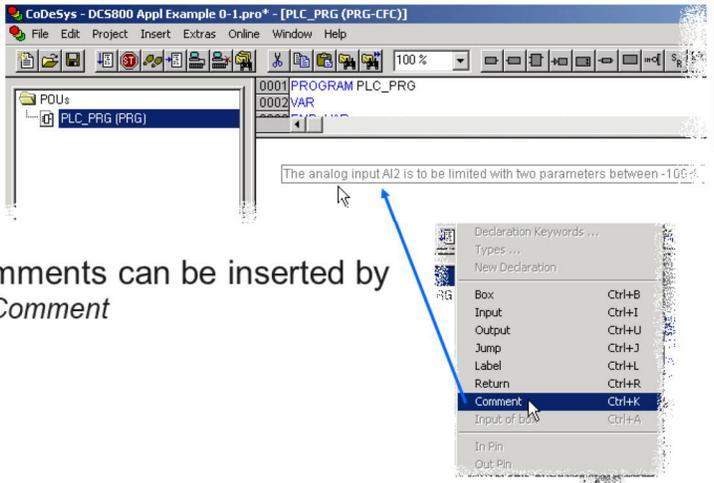

ABB

© Copyright 1.02.2008 ABB. All rights reserved.
CODESYS_03RD101A page 6

CoDeSys includes many programming languages. The „Instruction List“ is a text-based language. Programming in the language „Ladder Diagram“ is like a circuit schematic with symbols. It is often used in America. „Function Block Diagram“ is a graphic-based language with different function blocks. „Sequential Function Chart“ is a language which splits the program process into steps. „Structured Text“ is a text-based language like C-Code or Pascal. „Continuous Function Chart“ is a free programmable graphic-based language with function blocks.

Program window

- Now the first program window is open

- In CFC comments can be inserted by
→ *Insert* → *Comment*

© Copyright 1.02.2008 ABB. All rights reserved.
CODESYS_03RD101A page 7

ABB

Good programming style is signaled by perfect documentation. In CoDeSys it is possible to add comments for each step in the program. A click with the right mouse button in the "Editor Window" opens the context-menu from which the item „Comment“ can open the comment dialog box. In other programming languages this functionality is also available and should be used to facilitate understanding of the program for others. The last step of project development is to save the project.

Save project

- The project can be saved by
→ *File* → *Save as ...*
- File name, e.g.
→ Type in name and
click *Save*

© Copyright 1.02.2008 ABB. All rights reserved.
CODESYS_03RD101A page 8

The next step is to save the project in a program file with the extension “*.pro”. Choose “Save as...” in the “File” menu, type in a file name for the program and click “Save”. Now the application is saved.

It is recommended to save each project in a separate folder on your PC together with a description of the functionality for each file. It's also possible to print the complete project.

Help

Identification

- To identify an application it is important to fill out the *Project Information*
- Open *Project Information* by → *Project* → *Project Info*
- Now fill in the following:
 - *Title:* DEABB_Appl.
 - *Author:* Your name
 - *Version:* Test1_Vers10
 - *Description:* Short description
- The fields *Title* and *Version* will be shown in parameter group 4

Project Information

File name: test260106.pro

Directory: J:\3S Software\CoDeSys V2.3\Projects\TThoma

Change date: 31.1.06 16:13:28 / V2.3

Title: DEABB_Appl.

Author: Jan Thoma

Version: Test1_Vers10

Description: This is my first program. HelloWorld!

Buttons: OK, Cancel, Statistics, License info.

4 Information

01	FirmwareVer		-9.99
03	AppName	DEABB_Appl.	
04	ConvNomVolt	525	V
05	ConvNomCur	25	A
06	Mot1FexType	OnBoard	
07	Mot2FexType	NotUsed	
08	Mot1FexSwVer	0	
09	Mot2FexSwVer	0	
11	Com8SwVer	0	
12	ApplicVer	Test1_Vers10	

© Copyright 1.02.2008 ABB. All rights reserved.
CODESYS_03RD101A page 9

Providing a title and specifying a version of the application will allow for easier identification of the program. The project information will be shown in parameters of group 4. Parameter 4.03 shows the title field and 4.12 the version field. If no application is active, parameter 4.03 will show "No Application".

DCS800 library

1. Select tab *Resources*
2. Double click on *Library Manager*
3. Select *DCS800lib.lib*
4. Existing function blocks of the DCS800 library

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_GDR0101A page 10

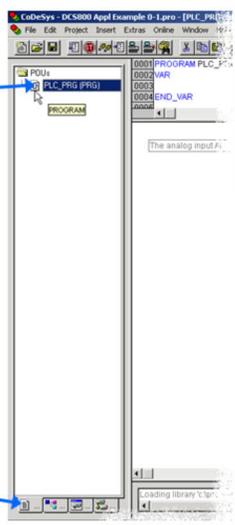

ABB

All DCS800 interface function blocks can be found in the DCS800 library. It is an external library which only works together with the DCS800 converter. Please note that the actual firmware-version of the drive should fit to the version of DCS800 library!

Inside the library you can find function blocks for reading and writing analog and digital values, event handling and arithmetic calculations. With CoDeSys it is also possible to read and write parameters with special DCS800 function blocks.

Change back to program window

1. Select tab *POU*
2. Double click on *PLC_PRG* to open the program window

The screenshot shows the CoDeSys software interface. On the left, a tree view displays the 'POUs' directory containing 'PLC_PRG (PRG)'. A blue arrow labeled '2.' points to this directory. On the right, the 'PROGRAM' window is open, showing the ladder logic for the selected program. A blue arrow labeled '1.' points to the 'PROGRAM' tab in the software's interface.

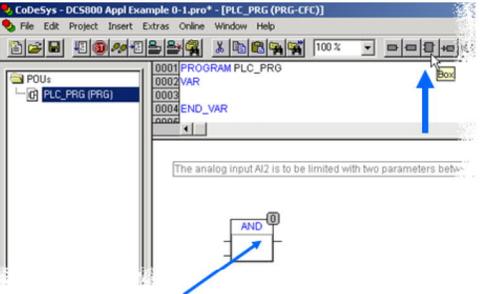

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_GDR0101A page 11

In CoDeSys the abbreviation “POU” stands for “program organization unit”. All programs, functions and function blocks can be found in the root directory. By clicking on a program in the directory you will open that program’s window. The default program name is PLC_PRG. It is possible to change this name because for the DCS800 it is not necessary to have a main program.

Insert function blocks

- Select the *Box* icon
- Drag the *Box* into the Editor window. The inserted box is always an *AND* - operator

The screenshot shows the CodeSys software interface. The top menu bar includes 'File', 'Edit', 'Project', 'Insert', 'Extras', 'Online', 'Window', and 'Help'. The 'Insert' menu is open, and the 'Box' icon is highlighted. The main editor window displays a ladder logic program with the following code:

```
0001 PROGRAM PLC_PRG
0002 VAR
0003
0004 END_VAR
0005
```

Below the code, a note states: 'The analog input AI2 is to be limited with two parameters below...'. A blue arrow points from the 'Box' icon in the menu to the 'AND' function block in the editor window. The 'AND' block has a small '1' in a circle next to it, indicating its execution order.

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 12

To insert a function block, please select the icon “box” in the menu. Now the box can be placed in the editor window. On the right side of each box, you will find a number. This number gives you information about the execution order of the function blocks. In a network of many function blocks it is necessary to check the correct execution order. An example is a multiplication of two variables. A multiplication should not be performed until both variables are updated. Otherwise, the calculation would be inaccurate.

Help

Select the desired function

- The first function to use is a *DigIn* (DCS800 library)
→ Mark *AND* by clicking on it
- Get *DigIn*
→ Press **F2** on the keyboard and select *Standard Function blocks*
- Select *DigIn*
→ Select *DigIn*, click **OK** then press **Enter** (↵) on the keyboard

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 13

ABB

After a new block is inserted, the “block type” must be changed. To do this, select the type and press the F2 button. A new window with a list of all available operators and libraries with the several function blocks will open. In the menu “Standard Function Blocks” you can find the available function blocks of the several libraries. The menu “FBD Operators” includes all IEC functions like AND, OR, MUL and so on.

Help

Select and insert further functions

- In the same way insert an *AND* and a *DigOut* block

???

①

Digin

DigOut

bDOut

wChannel

The signal direction should be from the left to the right side!

ABB

© Copyright 1.02.2008 ABB. All rights reserved. CODESYS_03RD101A page 14

Two further function blocks are needed for this application program. The next step is to place an "AND" operator and a "DigOut" function block to the correct position in the editor window. In the programming language "continuous function chart" boxes can be adjusted freely in the editor window. Note that the numbers on the upper right side of the boxes show the execution order of the blocks. Normally the execution order should be from left to right according to the signal direction.

Help

Declare function blocks

- Click on the three question marks
- Type in a name (**Attention:** no spaces allowed!) for the block, then press **Enter** (↵) on the keyboard

■ A pop-up window opens

■ Click *OK* and the name will be saved

■ Declare the block *DigOut* the same way

ABB

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 15

Each function block should be named for identification purposes. This name is called "Instance". Click on the question marks on the function block and specify a name. A new window opens and shows the name of the block and the used type. By clicking "OK" the settings will be saved, and the name will be shown in the declaration window. These steps are required to use any function block. Operators and functions don't get a declaration.

Help

Connect function blocks

- Wires connect the function blocks
- Mark the connector
- Press and hold the left mouse button and drag the output line to another connector
- Release the mouse button

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_GDR0101A page 16

ABB

In programming language “CFC” the blocks have to be connected with wires. Click on an input or output and draw a line to another connecting point. It is not possible to connect outputs with each other. Note, in other programming languages a connection of inputs and outputs are drawn automatically.

Help

Connect function blocks

- Use the same method to make up all other connections between the function blocks

The diagram illustrates the connection of three function blocks. On the left is 'block1' with a 'DigIn' input and 14 digital input channels labeled bDI1 through bDI14. In the middle is an 'AND' block with two inputs and one output. On the right is 'block2' with a 'DigOut' output and a 'wChannel' output. Two lines connect the top two bDI inputs of block1 to the two inputs of the AND block. A single line connects the output of the AND block to the DigOut input of block2.

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 17

Connect all necessary function blocks in a similar fashion. The end result should look like the graphic with the three boxes.

In text-based programming languages like “Structured Text” or “Instruction List” connections are done with allocations. These connections are invisible but represented by variables!

Help

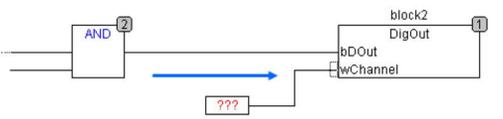

Insert the input

- Insert the missing input

- Select the *Input* icon

- Drag the *Input* into the Editor window and connect the *Input* with the *DigOut*

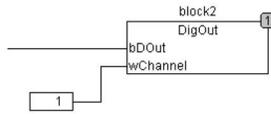

ABB

© Copyright 1.02.2008 ABB. All rights reserved.
 CODESYS_03RD101A page 18

Now the boxes are connected with each other, but a constant value is needed for the input "Channel" of function block "DigOut". The next step is to place an input box. Drag the input box into the editor window and connect it with the connector of function block "DigOut".

Declare the input value

- Click on the three question marks
- Type in a number for the *Input*, then press **Enter** (↵) on the keyboard

If the constant 1 is connected with *Input* “wChannel”, digital output 1 is selected.

In this example:

1 for DO1

In this example we define the constant “1” for the “Channel” input. The status of “DOut” will be written to the selected “Channel”. The result can be found in parameter 7.05!

Task configuration

- Change to tab *resources*

- Open the *Task configuration*
- Open a new task
→ *Insert* → *Append Task*

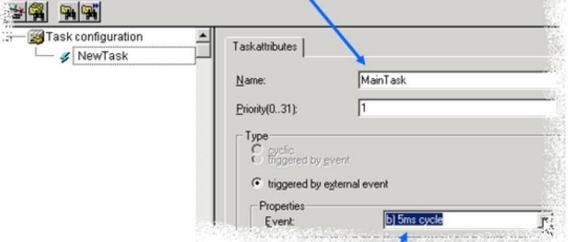

© Copyright 11/22/2008 ABB. All rights reserved.
 CODESYS_GDR0101A page 20

An important part of the DCS800 is the task configuration. The DCS800 only works in a task triggered mode. Switch from the main menu to the tab resources and then click on “task configuration”. Now a new window will be opened. To open a new task, select “Insert” in the menu bar and choose “Append Task”. This means that a new task will be added. It is possible to define several tasks for more than one program.

Task configuration

- Type in a name for this task
(**Attention:** no spaces allowed!)
- Declare the *Event*
→ Open the pull down menu and select e.g. *5 ms cycle*

Priority isn't supported!

© Copyright 11/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 21

In the “task attributes” you will find several settings to configure the task cycle. The next step is to define a name for the task setting. All tasks are externally triggered events from the DCS800. Only the task cycle can be selected! It’s possible to choose time cycles between 5 and 1000 milliseconds. Now one task is defined and can be used to trigger programs.

Task configuration

- Connect a task
→ *Insert* → *Append Program Call*
- Open the *Input assistant*
- Select the program
→ *PLC_PRG* and click *OK*

The screenshot shows the software interface for task configuration. The top window is titled 'Task configuration' and has a menu bar with 'Insert', 'Extras', 'Online', 'Window', and 'Help'. The 'Insert' menu is open, and 'Append Program Call' is highlighted. Below this, a tree view shows 'Task configuration' containing 'MainTask'. A second window, 'Input assistant', is open, showing a list of 'User defined Programs' with 'PLC_PRG (PRG)' selected. The 'OK' button is visible in the bottom right of the 'Input assistant' window. Blue arrows point from the text instructions to these specific UI elements.

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 22

The next step is to add a program to the task configuration. This can be done by selecting "Append Program Call" in the "Insert" menu. After doing so a new window will be opened. You can add a program call to a task by using the input assistant. In this case there is only one program existing, so it has to be selected.

Communication parameters

- Set communication
→ *Online* → *Communication Parameters...*
- To declare a new channel click on *New...*
- Type in a name for the new channel
- Click *OK* to accept

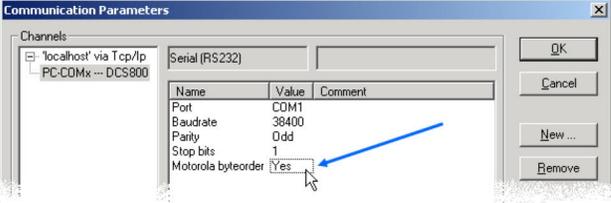

© Copyright 11/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 23

Don't select other devices! For DCS800 only
the serial communication is available.

To set up the connection between the PC and the drive system, the communication parameters have to be defined. You can find this part in the menu “Online” under “communication parameters”. If there is no existing communication channel available, click on “New” and declare the new channel. Type in a name for the new communication channel and select the device for DCS800, called Serial (RS232) driver. After that, click “OK” to apply the settings. These settings are saved on the PC for the next exercises.

Communication parameters

- Set the communication parameters like this:

- Change the port, if *COM1* is not used
→ double click on *COMx* to change the COM port
- Change the *Baudrate*, if applicable
→ double click on *Baudrate* to change the value
- The *Stop bits = 1* and *Motorola byteorder = Yes*
- Click *OK* to apply the settings

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 24

Select the COM-port that is used for communication. If you don't have a serial port on your PC, please use a PCMCIA adapter.

Help

Communication to DCS800

- Connect PC and DCS800
- Start communication with
→ *Online* → *Login*
 - **Attention:** the program is only downloaded into the DCS800 RAM if the Memory Card is used and DriveWindow Light is offline.
- Now the program is compiled. If there are no warnings and no errors it is downloaded into the drive.
- Start program with
→ *Online* → *Run*

© Copyright 11/22/2008 ABB. All rights reserved.
 CODESYS_03RD101A page 25

The next step is to connect the PC with the DCS800. In the menu “Online” click on the item “Log On” and the project will be compiled. After a successful compilation without any errors and warnings, the code will be downloaded to the DCS800 RAM. Afterwards activate the application program by clicking “Run”. Note, that the application program isn’t saved on the memory card, yet. This have to be done in another step.

Help

Test program with hardware

- The result of block *DigOut* is written into *DO CtrlWord* (7.05). To get the value displayed on digital output 1, set *DO1Index* (14.01) = 705 and *DO1BitNo* (14.02) = 0

7 Control Words			
01 MainCtrlWord	0	0x0	0xFFFF
02 AuxCtrlWord	0	0x0	0xFFFF
03 AuxCtrlWord2	0	0x0	0xFFFF
04 UsedMCW	47F	0x0	0xFFFF
05 DO CtrlWord	1	0x0	0xFFFF
06 RFE CtrlWord	2	0x0	0xFFFF

Settings for DO1

14 Digital Outputs			
01 DO1Index	705	-9999	9999
02 DO1BitNo	0	0	15
03 DO2Index	0	-9999	9999
04 DO2BitNo	0	0	15
05 DO3Index	0	-9999	9999
06 DO3BitNo	0	0	15

Result

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 26

Note that the result of function block “DigOut” will be written to the digital output control word in parameter 7.05. Bit 0 accords to digital output 1 and so on. To avoid writing two sources to one sink, the control word must be connected to the physical output in group 14. In this exercise digital output, one is used and that means that bit zero includes the boolean result. For this exercise we must write “705” in parameter 14.01. In parameter 14.02 must be written “0” to select bit 0. With this settings, the result of the application program will be sent to the correct physical output.

Help

Exercise 2: Analog signals

- Read two AI's
- The signals are processed via a SUB
- The result is written to an AO

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 27

ABB

The second exercise is a combination of two analog signals of the drive's analog inputs. Function block "AnIn", is a shortcut for "read analog inputs" It transfers the voltage at the analog inputs to an integer value which accords to the scaling of the drive. In this exercise, the value of analog input one should be subtracted from the value of analog input 2. The result is written to analog output 1 of the drive. This functionality gives the function block "AnOut" which characterizes the write to analog output function.

Help

Steps to build the program

- Create a new project
- Select target
- Build a *PLC_PRG* in *CFC*
- Insert function blocks
- Declare and connect the function blocks
- Insert and declare input
- Task configuration
- Build the project
- Configure the communication parameters
- Test program with hardware

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 28

The steps to create the program are the same as in the last exercise.

The first step is to create a new project. Select the target DCS800 and build the program in programming language CFC. Insert the function blocks and declare and connect the blocks. Set the task configuration and configure the communication parameters.

Test the program with the DCS800 hardware if the program has been correctly downloaded.

Help

Test program

- The result of the calculation is written into *CtrlWordAO1 (15.02)*
- To get the value displayed on analog output 1, set *IndexAO1 (15.01) = 1502*

Setting for connection to the physical analog output 1 (AO1)

15 Analog Outputs				
01	IndexAO1	1502	-9999	9999
02	CtrlWordAO1	4497	-32767	32767
03	ConvModeAO1	+/-10V Bi	0	4
04	FilterAO1	0 ms	0	10000
05	ScaleAO1	10000 mV	0	10000

Result from function block *AnOut*

ABB

© Copyright 11/22/2008 ABB. All rights reserved.
 CODESYS_03RD101A page 29

A function unique to the DCS800 is the output configuration. Function block “AnOut” does not write directly to the hardware. Mainly because problems can occur if two sources are written to one sink. To avoid this, the result of the function block will be written to a “control word”. If you want to connect control word with the physical output, there must be a connection between the output index and the control word in group 15. This means that in this exercise the control word “1502” must be written to parameter 15.01.

Help

Summary

Key points of this module

- Learn to create a program with CoDeSys
- Work with digital and analog signals
- Connect the PC with the drive and download the program

© Copyright 1/22/2008 ABB. All rights reserved.
CODESYS_03RD101A page 30

In this module you should have learned how to create small programs with the DCS800 Control Builder and how to work with digital and analog signals. Once the program is ready, you should also know how to connect the PC via “RS232” cable with the drive and how to download the application.
