Integrate the power of wind?

Naturally.

ABB is one of the largest suppliers of electrical products for the wind industry, but some of the most valuable solutions we provide are our collector and inter-connect substations. ABB uniquely combines our team of substation engineers and project managers dedicated to the US wind industry with our electrical system consulting group and reactive power technologies. Whether you choose one of our time-saving and cost-saving pre-engineered collector substations or a customized intertie substation designed to the local utility requirements, you know you're choosing a reliable, cost-effective substation with on-time delivery and lowered risk.
