The Company

We are an established world force in the design and manufacture of instrumentation for industrial process control, flow measurement, gas and liquid analysis and environmental applications.

As a part of ABB, a world leader in process automation technology, we offer customers application expertise, service and support worldwide.

We are committed to teamwork, high quality manufacturing, advanced technology and unrivalled service and support.

The quality, accuracy and performance of the Company’s products result from over 100 years experience, combined with a continuous program of innovative design and development to incorporate the latest technology.

The UKAS Calibration Laboratory No. 0255 is just one of the ten flow calibration plants operated by the Company and is indicative of our dedication to quality and accuracy.

Electrical Safety

This equipment complies with the requirements of CEI/IEC 61010-1:1993 “Safety requirements for electrical equipment for measurement, control, and laboratory use”. If the equipment is used in a manner NOT specified by the Company, the protection provided by the equipment may be impaired.

Symbols

One or more of the following symbols may appear on the equipment labelling:

Information in this manual is intended only to assist our customers in the efficient operation of our equipment. Use of this manual for any other purpose is specifically prohibited and its contents are not to be reproduced in full or part without prior approval of the Technical Publications Department.

Health and Safety

To ensure that our products are safe and without risk to health, the following points must be noted:

1. The relevant sections of these instructions must be read carefully before proceeding.
2. Warning labels on containers and packages must be observed.
3. Installation, operation, maintenance and servicing must only be carried out by suitably trained personnel and in accordance with the information given.
4. Normal safety precautions must be taken to avoid the possibility of an accident occurring when operating in conditions of high pressure and/or temperature.
5. Chemicals must be stored away from heat, protected from temperature extremes and powders kept dry. Normal safe handling procedures must be used.
6. When disposing of chemicals ensure that no two chemicals are mixed.

Safety advice concerning the use of the equipment described in this manual or any relevant hazard data sheets (where applicable) may be obtained from the Company address on the back cover, together with servicing and spares information.

1 INTRODUCTION

1.1 Description
The Model 8234 Chloride Monitor is a microprocessor based analyser using a chloride ion-selective electrode in conjunction with a mercurous sulphate reference electrode. This equipment is intended for continuous monitoring of low levels of chloride in power station cooling waters.

1.2 Training
Due to the specialised nature of the above instrument, it is recommended that, where the end users personnel have had no previous experience of maintaining this equipment, training be provided by this Company.

Such training is available via the local Company in the UK, or Overseas Agent elsewhere and may be carried out either on the users premises or at the factory.

1.3 Location and Function of Main Components – Fig. 1.1
Monitoring of chloride involves the addition of an acid reagent to the sample water so that measurement takes place in a solution of appropriate and effectively constant pH. Under these conditions the electrical potential developed between the chloride electrode and a mercurous sulphate electrode is proportional to the chloride ion concentration in the solution.

The 8234 chloride monitor has a liquid handling section in the lower half of a moulded plastic enclosure, and the electronics section in the upper portion.

Sample inlet and drain connections are at the base of the instrument. A peristaltic pump, mounted centrally, proportions sample and reagent through a heated mixing and reaction flowcell where the measurement takes place.

To maintain optimum measurement accuracy, it is necessary to carry out two point calibration by introducing 'low' and 'high' standard solutions of known concentration. The 8234 monitor uses solenoid valves to introduce these solutions automatically at programmable intervals under the control of the microprocessor.

Access to the electrodes, pump and calibration solution containers is by means of a hinged acrylic door, which is held open or closed by use of a push/push latch. The instrument case is also hinged to allow access to the electronics section and solenoid valves etc. for maintenance.

The electronics section consists of a microprocessor unit situated at the top left which controls the instrument functions, and a user junction box for all external electrical connections, at the top right behind the hinged case.

![Fig. 1.1 Location of Instrument Components](image-url)
2 INSTALLATION

2.1 Accessories
1 x reagent bottle 4 x calibration bottles
1 x chloride electrode 1 x spares kit
1 x mercurous sulphate reference electrode

2.2 Location
The monitor should be installed in a clean, dry, well ventilated and vibration-free location giving easy access, and where short sample lines can be used. Rooms containing corrosive gases or vapours (e.g., chlorination equipment or chlorine gas cylinders) should be avoided. It is also advisable to have adjacent drains near ground level, so that the waste outlet from the monitor can be as short as possible, together with maximum fall. Power supplies should also be adjacent. Ambient temperature: within the range 5 to 40 °C.

2.3 Mounting – Fig. 2.1
The monitor has a moulded plastic case, mounted onto a flat metal panel. To provide access, the case is hinged on the left hand side and has two lockable catches on the right hand side to hold the case in position in normal operation.

One keyhole slot is provided at the top of the flat panel to provide easy mounting on a wall or framework. Two further fixing holes are provided at the bottom of the flat panel. All holes are designed to take bolts or studs.

Mains and signal cables are connected through cable glands in the user junction box on the right hand side with the exception of the optional serial interface which connects directly into the microprocessor unit. Sample and drain pipework are brought in through the bottom of the case.

2.4 Sampling Requirement
In addition to being as close as possible to the monitor, the sampling point must provide a thoroughly mixed representative sample. The sample must also conform to the following conditions:

a) Sample flowrates must be between 5 ml min⁻¹ and 1250 ml min⁻¹.

b) Sample temperature should be within 20 °C of the ambient temperature and within the range 0 to 30°C.

c) Particles must be less than 10 mg l⁻¹ and the size must not exceed 60 μm. Above these levels it is essential that a filter is fitted in the sample inlet; a suitable filter is shown in Section 10 – Consumable Spares.

2.5 Sample Connections – Fig. 2.2
The inlet and outlet pipe connections are both located at the bottom of the case. A 6 mm (1/4”) hose adaptor is provided for the sample inlet and a 9 mm (3/8”) hose connection for the drain. The inlet and outlet pipes should be of an inert, flexible material such as p.v.c. The inlet pipe must incorporate a shut-off valve at its upstream end, while the drain outlet pipe should be short, venting to atmosphere as soon as possible.

Fig. 2.1 Overall Dimensions and Mounting Details

All dimensions in mm.
2.6 External Electrical Connections – Fig. 2.3

**Warnings.**

- A disconnecting device such as a switch or circuit breaker conforming to local safety standards must be fitted to the final installation. It must be fitted in close proximity to the instrument within easy reach of the operator and must be marked clearly as the disconnection device for the instrument.

- Although certain instruments are fitted with internal fuse protection, a suitably rated external protection device, e.g. a 3A fuse or miniature circuit breaker (m.c.b.), must also be fitted by the installer.

- Remove all power from supply, relay and any powered control circuits and high common mode voltages before accessing or making any connections.

- The power supply earth (ground) **must** be connected to ensure safety to personnel, reduction of the effects of RFI interference and correct operation of the power supply interference filter.

- The power supply earth (ground) **must** be connected to the earth (ground) stud on the junction box case – see Fig. 2.3.

- Use cable appropriate for the load currents. The terminals accept cables up to 14AWG (2.5mm²).

- The instrument conforms to Mains Power Input Insulation Category III. All other inputs and outputs conform to Category II.

- All connections to secondary circuits must have basic insulation.

- After installation, there must be no access to live parts, e.g. terminals.

- Terminals for external circuits are for use only with equipment with no accessible live parts.

- The relay contacts are voltage-free and must be appropriately connected in series with the power supply and the alarm/control device which they are to actuate. Ensure that the contact rating is not exceeded. Refer also to Section 2.8 for relay contact protection details when the relays are to be used for switching loads.

- Do not exceed the maximum load specification for the selected analog output range. The analog output is isolated, therefore the –ve terminal must be connected to earth (ground) if connecting to the isolated input of another device.

- If the instrument is used in a manner not specified by the Company, the protection provided by the equipment may be impaired.

- All equipment connected to the instrument’s terminals must comply with local safety standards (IEC 60950, EN61010-1).

**Notes.**

- An earthing (grounding) – stud terminal is fitted to the junction box case for bus-bar earth (ground) connection – see Fig. 2.3.

- Always route signal output and mains-carrying/relay cables separately, ideally in earthed (grounded) metal conduit. Use twisted pair output leads or screened cable with the screen connected to the case earth (ground) stud.

  Ensure that the cables enter the analyzer through the glands nearest the appropriate screw terminals and are short and direct. Do not tuck excess cable into the terminal compartment.

- Ensure that the IP65 rating is not compromised when using cable glands, conduit fittings and blanking plugs/bungs (M20 holes). The M20 glands accept cable of between 5 and 9mm (0.2 and 0.35 in.) diameter.
2.7 Connections, General
The external electrical connections are to be found in the user junction box with the exception of the optional serial interface which is connected directly into the microprocessor unit. The cables are passed through the cable glands on the right hand side of the junction box which are adjacent to the internal electrical terminals.

Caution. Slacken the terminal screws fully before making connections.

The connections are as follows:

a) Mains input 115 V (110 to 120 V) or 230 V (220 to 240 V). The mains voltage is selected by means of the voltage selector – see Fig. 2.3.

b) Current outputs 1 and 2 – two independent current outputs for external recording or control. One output is supplied as standard, the second is supplied as an optional extra – see Fig. 2.4 for details regarding current output range.

Information. Because the current output is isolated, the negative terminal must be connected to earth (ground) if connecting to the isolated input of another device.

c) Relay 1 and 2 – two concentration alarms.

d) Relay 3 – calibration mode indication. This indicates when the instrument is off line during a calibration.

e) Relay 4 – instrument ‘OUT OF SERVICE’ indication. This indicates that the monitor readings are suspect and it is in need of attention.

g) Optional serial interface – connected into the Microprocessor Unit. See supplementary instruction manual for details

Note. It is essential that all sample pipework to the monitor is kept as short as possible to reduce the effects on the sample due to the presence of algae which can build up. This problem is particularly acute in the pipework between the filter and the monitor because of the small sample flow. Small bore tubing is essential, e.g. 6 mm i.d.

Note. Sample pipework should be of flexible PVC.
2.8 Relay Contact Protection and Interference Suppression – Fig. 2.5
If the relays are used to switch loads on or off the relay contacts can become eroded due to arcing. Arcing also produces r.f.i. which can cause instrument malfunctions and incorrect readings. To minimize the effects of r.f.i., arc suppression components are required; these are resistor/capacitor networks for a.c. applications, or diodes for d.c. applications. These components can be connected either across the load or directly across the relay contacts.

For **AC applications** the value of the resistor/capacitor network depends on the load current and inductance that is switched. Initially fit a 100 R/0.022 μF RC suppressor unit (part no. B9303) as shown in Fig. 2.5A. If the instrument malfunctions the value of the RC network is too low for suppression and an alternative value must be used. If the correct RC suppressor unit cannot be obtained, contact the manufacturer of the switched device for details of the RC unit required.

For **DC applications** fit a diode as shown in Fig. 2.5B. For general applications use an alternative IN5406 type (600 V peak inverse voltage at 3 A – part number B7363).

**Note.** For reliable switching the minimum voltage must be greater than 12 V and the minimum current greater than 100 mA.

---

**Caution.** The protective earth must be connected to terminal 16.

---

**Note.** The mains and pump ON/OFF switches are situated on the right hand side of the junction box.

---

**Caution.** The AC power supply ground cable must be connected to the earth (ground) stud 🌿.

---

**Fig. 2.3 Location of User Junction Box Components**
## 2 INSTALLATION

### 3 SETTING UP

**Note.** Before proceeding any further, ensure that all switches are set to OFF on the right hand side of the electronics unit – see Fig. 2.3.

a) Ensure that all external electrical and plumbing connections have been made correctly.

b) Fill reagent and standard solution bottles and connect them to the monitor. (See Section 8.1 for details of these solutions.)

c) Fit the electrodes according to the instructions in Section 8.2.5.

d) Connect the electrical supply and switch on.

**Note.** The temperature controlled flowcell requires up to half an hour to reach the normal control temperature of 35 °C. During this time, ‘Temp. Control Error’ is indicated on the display and any calibrations are prevented by the microprocessor.

e) Verify that there is an adequate supply of sample to the monitor constant head unit.

f) Fit the pump platen on the peristaltic pump (see Section 8.2.6) and turn on the pump with the switch on the side of the monitor. Note that the peristaltic pump rotates, and check that sample and reagents are being drawn into the monitor by observing the progress of any small bubbles present in the inlet tubes.

g) Run the monitor for at least one hour to allow the temperature to stabilize, solutions to be pumped into the system and to purge the air from the pipework. Check for any leaks around the pipe connections and rectify as necessary.

h) When the monitor reading has stabilized, carry out a calibration – see Programming Page.

---

**Fig. 2.4 Selecting The Current Output Range**

**Fig. 2.5 Relay Contact Protection**
4.1 Principle of Operation
The monitor uses an ABB Chloride Ion-selective Electrode in conjunction with a mercurous sulphate reference electrode. The sensing tip of the chloride electrode is a pellet comprising a compressed mixture of mercurous chloride and mercuric sulphide, an ionic conductor in which chloride ions are mobile. The electrode is connected to the main electronic unit via a screened cable. When the electrode is in contact with a sample chloride solution, a potential is developed between it and the reference electrode which is proportional to the chloride ion concentration.

The electrochemical cell is completed by the reference electrode, which generates a stable reference potential and is also connected to the main electronic unit. It comprises a reference element in a salt bridge container, which isolates the element from the sample solution, while providing a stable contact between the element and solution via a porous ceramic liquid junction.

Range of measurement is:
- 0.0 to 5000 μg l⁻¹ as chloride (Cl⁻), or
- 0.0 to 8250 μg l⁻¹ as sodium chloride (NaCl)

Under typical circumstances, with appropriate standard solutions and calibration frequencies, accuracies better than ±5% of reading or ±5 μg l⁻¹ whichever is the greater, can be achieved.
4 LIQUID HANDLING SECTION

4.2 General Operation – Fig. 4.2
The sequence of events is:

a) The sample enters the constant head unit from below and any excess is allowed to overflow to drain. The constant head unit is fitted with a float switch to signal an 'Out of Sample' condition. This switch is used by the monitor to initiate the 'Out of Sample' alarm.

b) From the bottom of the constant head unit the sample is drawn through the normally open ports of the solenoid valves SV1 and SV2 by one channel of the peristaltic pump.

c) The reagent is drawn through another channel of the peristaltic pump, and is then mixed with the sample. The tube diameters are arranged so as to obtain the correct ratio of sample and reagent.

d) The electrodes are housed in a temperature controlled flowcell which includes a heat exchanger to remove the effects of sample and ambient temperature variations. The whole flowcell assembly is enclosed in an opaque cover to exclude light from the chloride electrode. The electrodes produce an electrical potential when exposed to the reacted sample, which is proportional to the concentration of the ion being measured. The electrodes are connected to the electronic section where, after digital conversion, the signal is processed by the microprocessor.

e) After measurement the sample flows to waste via the contaminated drain connection.

f) During calibration the monitor introduces two calibration solutions sequentially in place of the sample by means of the solenoid valves SV1 and SV2.

5 ELECTRONICS SECTION

5.1 Electronic Layout – Fig. 5.1
The electronic section comprises two separate sections:

- The User Junction Box at the top right hand side.
- The Microprocessor Unit at the top left hand side.

5.2 User Junction Box
This unit contains the relays for the heater, solenoid valves and alarms, and all the user external connection terminals, with the exception of the serial interface (if fitted).

Once installed there should be no need to remove the junction box cover on a regular basis. However, to assist in any fault finding procedure, there are light emitting diodes (l.e.ds) on the printed circuit board (p.c.b.) to indicate if the relays and heater are being energised.

Switches for the mains and pump/heater are situated on the right hand side of the junction box, together with a mains indication lamp and mains fuse – see Fig. 2.3.

Two additional fuses (F2 and F3) are located within the junction box. These are connected in the 24V AC circuits.

5.3 Microprocessor Unit
This contains the analogue input processing, microprocessor, alarm and current output generation, and (if fitted) the serial interface output.

The programme controls, digital and dot-matrix displays, alarm indication and status l.e.ds are all mounted on the front panel of the microprocessor unit.

Fig. 5.1 Electrical Connections Layout
5.4 Front Panel Controls – Fig. 5.2
The programme controls comprise eight tactile membrane switches. These switches are situated behind a hinged door below the display, access is via a screwdriver-operated catch. In normal operation the switches are used to view the measured ion concentration value, initiate a manual calibration, or to activate the ‘alarm hold’ facility.

When programming, the switches are used to sequence through a programming procedure as detailed. The procedure is set out in programming pages for Input, Current Output, Alarms, Real Time Clock and Monitor Calibration. Each programme page contains the programme functions, the values or parameters of which are programmable.

Switch functions are as follows:

**Mode**
Used for viewing the chloride concentration, electrode mV output, flowcell control temperature, electrode slope, date, time, the day of the next calibration and the date of the last calibration.

**Cal**
Used to enable or disable the automatic calibrations, enter the standard solution values and manually initiate a calibration sequence. Operating ‘Cal’ during a calibration aborts the sequence and returns to normal operation.

**Hold**
Used to inhibit any change in the alarm relay/LED status and the start of any auto calibration. The feature is used during maintenance (‘Hold’ LED illuminated).

**Note.** If the ‘Hold’ facility is inadvertently left switched in, it is automatically cancelled after a period of approximately 3 hours has elapsed.

**Enter**
Used for storing the programmed function parameters and values in the instrument’s nonvolatile memory.

**Note.** The instrument responds instantly to any programme change but the new value is lost in the event of a power interruption if it has not been ‘Entered’.

**Parameter Advance** – used for selecting a particular parameter from a programme page.

**↑** (Raise)
Used for increasing or decreasing a parameter value or stepping up or down through a selection of parameters applicable to a particular function.

**↓** (Lower)

**Note.** Continued pressure on the ‘Raise’ or ‘Lower’ switches causes the rate of change of the displayed value to increase. To make small adjustments, operate the switches momentarily.

**Page Advance** – used, via the security code, for selection of individual programme pages.

5.5 Displays – Fig. 5.2
Two blue vacuum fluorescent displays are provided:

a) The upper is a 5-digit 7-segment type display which indicates the measured variable.

b) The lower is a 20-character dot matrix type which provides user information during setting up and in normal operation.

5.6 LED Indication – Fig. 5.2
There are 5 l.e.d.s (indicators situated between the two displays) which provide information on the current status of the monitor. From left to right the indicators are as follows:

- A1 or A2
  Used to indicate a concentration alarm state (either high or low). This indicator is used in association with an external alarm relay output.

- Hold
  Used to indicate that the ‘Hold’ button has been operated.

- Cal
  Indicates when a calibration sequence is taking place.

- Fail
  Indicates that the monitor was unable to carry out a successful calibration.
Note 1.
'Cal Date' is the date when the first calibration is due and is updated every time an automatic calibration is carried out, i.e. 'Cal Date' = autocal date + 'Cal Interval'.

Note 2.
'Cal Time' is the time of the day when the autocalibration is required.

Note 3.
Operating during a calibration aborts the sequence and returns the system to normal operation. 'Next AutCal' is the date of the next autocalibration. If the instrument has been switched off, the next 'AutCal' is the present date + the 'Cal interval'. If the 'AutCal' is switched off, 'OFF' is displayed on the 20-character display.

Note 4.
'Last Cal' is the date of the last automatic or manual calibration.

Note 5.
'Last Cal' is the date of the last automatic or manual calibration.
6.1 Normal Operation
In normal operation (Operating Page 1) the lower, dot matrix, display gives indication of the units of measurement, millivolt value, sensor slope and time. Selection is made using the switch. Operation of the switch gives access to a second Operating Page (Operating Page 2) in which the standard solution values can be set and a manual calibration can be initiated. Either page can be selected at any time by using the or switches.

6.2 Programming Pages
Operation of the switch enables a series of ‘programming’ pages to be displayed. Unauthorised entries to this page are inhibited by a 5-digit security code which is displayed immediately after the page header.

In the programming pages, displayed values indicated ‘xxxxx’ are for viewing only and cannot be altered by the operator. Displayed values indicated ‘– – –’ can be altered using the and switches. When the desired reading is displayed, operate the switch. The I.e.d.s flash momentarily, to indicate that the value has been stored in the nonvolatile memory. Although the instrument operates satisfactorily if the switch is not operated, in the event of power interruption, the new values are lost. When power is applied again, the previously ‘entered’ values are restored. If previously programmed values are to be viewed only, it is unnecessary to operate the switch.
6.2.1 Operating Page 1
The values displayed in Operating Page 1 are for viewing only and cannot be altered in this page.

**Measurement Units**
The measurement units are displayed: Chloride μg l⁻¹ or Sodium Chloride μg l⁻¹

Advance to next parameter.

**Sensor Output**
The electrode output is displayed in millivolts.

Advance to next parameter.

**Control Temperature**
The measured flowcell temperature is displayed in degrees Celsius.

Advance to next parameter.

**Slope Check Value**
The slope value should be between 70 and 120%. If the value is outside these limits check the electrode.

Advance to next parameter.

**Date**
The date is displayed.

Advance to next parameter.

**Time**
The time is displayed.

Advance to next parameter.

**Next Calibration Date**
The date when the next automatic calibration is to be carried out is displayed. If the automatic calibration is disabled, 'OFF' is displayed in place of the date.

Advance to next parameter.

**Last Calibration Date**
The date of the last automatic or manual calibration is displayed.

Return to top of Operating Page.

or

Advance to Security Page (Section 6.2.3).
6.2.2 Operating Page 2

To gain access to the Calibration Page (Operating Page 2), operate the [Cal] switch.

Enable Automatic Calibrations
Select ‘Yes’ to enable or ‘No’ to disable the automatic calibrations.

Store.

Advance to next parameter.

MANUAL CAL SEQUENCE

Ion Standard 1
The displayed concentration value of 0 is fixed and cannot be altered. Because of the inherent difficulty of preparing accurately known low concentration standards, the monitor is designed to use a ‘zero’ chloride solution as the ‘Low’ standard solution (Std 1).

Advance to next parameter.

Ion Standard 2
Set the concentration value of the ‘High’ standard solution (Std 2); the minimum concentration which can be programmed is 75 μg l⁻¹.

Store.

Advance to next parameter.

Initiate Calibration (manual)
Select ‘Yes’ to carry out a manual calibration or ‘No’ to return to the top of the page.

Enter must be pressed to initiate a manual calibration.

Calibrating Standard 1
The upper display shows the Chloride concentration value. The display remains until a stable output is obtained from the electrodes.

Toggle between the two displays.

Electrode Millivolts
The electrode output can also be displayed during calibration.

Note. Pressing [Cal] during a calibration aborts the sequence and returns to normal operation.

When a stable output is detected the display automatically advances to the next parameter.

Continued on next page.
Continued from previous page.

Calibrating Standard 2
The upper display shows the chloride concentration value. The display remains until a stable output is obtained from the electrodes.

Toggle between the two displays.

Electrode Millivolts
The electrode output can also be displayed during calibration.

Note. Pressing [Cal] during a calibration aborts the sequence and returns to normal operation.

When a stable output is detected the display automatically advances to the next parameter.

Calibration Passed
A satisfactory calibration has been carried out.

or

Calibration Failed (slope)
The monitor was unable to obtain an acceptable slope value during calibration. The slope value required is 70 to 120%.

or

Calibration Failed (slow)
The monitor was unable to obtain a stable output from the electrodes during calibration.

Return to top of Operating Page 2.

or

Return to Operating Page 1.

6.2.3 Security Code Page
A security code is required to gain access to all subsequent programming pages. The code is preset at the factory to '0' but can be changed if required in the Current Output Page – see Section 6.2.5.

Security Code
Set the correct security code.

Advance to the first of the programming pages – Set Up Input Page.

Return to Operating Page 1.
6.2.4 Set Up Input Page

Page header.

Advance to next parameter.

Display Type (Chloride or Sodium Chloride)

Select display as Chloride (Cl) or Sodium Chloride (NaCl).

Store

Ion Units

Select the required display units.

Store.

Return to top of Set Up Input Page.

or

Advance to Current Output Page.
6.2.5 Current Output Page

The current output is assigned to the chloride concentration but is only operative if the relevant output modules are fitted – see Fig. 2.4.

**Page header.**

**Advance to next parameter.**

**Output 1 Calibration Hold**

Current Output 1 can be held during calibration, if required. Select ‘YES’ or ‘NO’.

**Store.**

**Advance to next parameter.**

**Output 1 Law**

Current Output 1 can be either logarithmic or linear. Select ‘Log’ or ‘Lin’.

**Store.**

**Advance to next parameter.**

**Output 1 Full Scale**

Current Output 1 full scale range: 100 to 5000 μg l⁻¹ chloride, 165 to 8250 μg l⁻¹ sodium chloride. Minimum span is 100 μg l⁻¹ chloride, 165 μg l⁻¹ sodium chloride.

Set the required concentration value for Current Output 1 full scale.

**Store.**

**Advance to next parameter.**

**Output 1 Zero**

Set the required concentration value for Current Output 1 zero. The minimum value which can be set if Log is selected is 5 μg l⁻¹ chloride (8 μg l⁻¹ sodium chloride).

**Note.** If the output 1 Law is linear (Lin), this parameter is omitted and the zero current output is automatically set to ‘0’.

**Store.**

**Advance to next parameter.**

**Continued on next page.**
...6.2.5 Current Output Page
Continued from previous page.

- **Output 2 Calibration Hold**
  Current Output 2 can be held during calibration, if required. Select ‘YES’ or ‘NO’.

- **Store.**
- **Advance to next parameter.**

- **Output 2 Law**
  Current Output 2 can be either logarithmic or linear. Select ‘Log’ or ‘Lin’.

- **Store.**
- **Advance to next parameter.**

- **Output 2 Full Scale**
  Current Output 2 full scale range: 100 to 5000 μg l⁻¹ chloride, 165 to 8250 μg l⁻¹ sodium chloride. Minimum span is 100 μg l⁻¹ chloride, 165 μg l⁻¹ sodium chloride.

- **Set the required concentration value for Current Output 2 full scale.**
- **Store.**
- **Advance to next parameter.**

- **Output 2 Zero**
  Set the required concentration value for Current Output 2 zero. The minimum value which can be set if Log is selected is 5 μg l⁻¹ chloride (8 μg l⁻¹ sodium chloride).

- **Note.** If the Output 2 Law is linear (Lin), this parameter is omitted and the zero current output is automatically set to ‘0’.

- **Store.**
- **Advance to next parameter.**

Continued on next page.
Continued from previous page.

**Test Output Zeros**
The instrument automatically transmits a current output zero test signal on both outputs.

**Example** – For a 4 to 20 mA current output range, 4 mA is transmitted.

Advance to next parameter.

**Test Output FSD**
The instrument automatically transmits a current output full scale test signal on both outputs.

**Example** – For a 4 to 20 mA current output range, 20 mA is transmitted.

Advance to next parameter.

**Alter Security Code**
Set the Security Code required, between 0 and 19999. This value must then be entered again to access the secure parameters from Operating Page 1.

Store.

Advance to next parameter.

**Proportional Output Percentage (to heater)**
Used as a diagnostic check to indicate the proportionally controlled current output (%) to the heater.

Return to top of **Current Output Page**.

or

Advance to **Set Up Alarms Page**.
6.2.6 Set Up Alarms Page
Alarm LED indication and relay output can be assigned either to the chloride concentration or switched off.

**Alarm A1 Enable**
Select ‘YES’ to enable or ‘NO’ to disable.

**Alarm A1 Action**
Select the alarm action required, ‘High’ or ‘Low’ – see Table 6.1.

**Alarm A1 Failsafe**
If failsafe action is required select ‘Yes’, otherwise select ‘No’ – see Table 6.1.

**Alarm A1 Hysteresis**
A differential set point can be set as a percentage of the set point value. The differential setting operates about the set point.

**Example** – A 5% differential setting operates 2.5% above and below the setpoint.

**Alarm A1 Delay**
If required, relay actuation and alarm LED indication can be delayed in the event of an alarm condition. If the alarm condition clears within the programmed delay time, the alarm function is not activated and the delay time is reset.

Set the required delay time between 0 and 60 minutes in 1 minute increments.

Return to Operating Page 1.
6.2.9 Set Up Temperature Control Page

**Note.** All parameters within this page are factory preset and MUST NOT be altered.

- **Control Temperature**
  The control temperature is adjustable between 30 and 45°C in 0.1 °C increments. For the 8234 model the temperature must be set to 35°C.

- **Cycle Time**
  The cycle time is adjustable between 5 and 60 seconds in 1 second increments.

- **Proportional Band**
  The proportional band is adjustable between 1 and 500% in 1% increments.

- **Integral Action Time**
  The integral action time is adjustable between 1 and 1800 seconds in 1 second increments (1801 = ‘OFF’).

---

6.2.10 Electrical Calibration

Electrical calibration is carried out prior to despatch and should require no subsequent adjustment. However, if measurements become suspect or if the contents of the ‘CALIBRATION’ page are inadvertently altered, calibrate as detailed in the following sections.

**Note.** The calibration procedure involves modifying part of the original programme but, provided that changed values are not stored using the ‘Enter’ switch, the original programme, which was stored in the nonvolatile memory, can easily be reinstated at the end of calibration by switching off the instrument and switch on again.

If there is thought to be any risk that the original programme could be lost, it is advisable to make a note of the normal parameter settings. If the changed programme values are inadvertently ‘Entered’, the instrument can be reprogrammed on completion of the calibration procedure.

**Equipment Required**
- Millivolt source, range –200 to +200 mV.
- Electrode co-axial plug/lead assembly, supplied with monitor.
- Decade resistance box*, 0 to 1 k\(\Omega\) in 0.01 \(\Omega\) increments.
- Digital milliammeter, 0 to 20 mA – refer to Fig. 2.4 to identify the output range.

* Resistance boxes have an inherent residual resistance which may range from a few milliohms to one ohm. This value must be taken into account when simulating input levels, as must the overall tolerances of the resistors within the box.

**Preparation**

- a) Switch off the supply and disconnect the temperature sensor leads from terminals 1, 2 and 3 in the microprocessor unit. Make the following connections:
  1 & 3 (temperature sensor)
  2 (temperature sensor) \[ \quad \text{decade box} \]
- b) Insert the co-axial plug into the ISE socket above the flowcell and connect the millivolt source (inner +ve, outer –ve).
- c) Connect the milliammeter in place of the appropriate current output connections in the junction box – see Section 2.6.
- d) Switch on the supply and allow two minutes (30 minutes from cold) for the circuits to stabilise.
- e) Select the appropriate **Cal User Code** to gain access to the programming pages – see Section 6.2.8.
6.2.11 Electrical Calibration Page

Page header.

Advance to next parameter.

**Millivolt Input Zero**
Set the millivolt source to –200 mV.

Set the display to ‘–200’ mV.

Store. New value is accepted only when input is stable.

Advance to next parameter.

**Millivolt Input Full Scale**
Set the millivolt source to +200 mV.

Set the display to ‘+200’ mV.

Store. New value is accepted only when input is stable.

Advance to next parameter.

**Temperature Zero**
Set the resistance box to 96.09 \(\Omega\) (resistive equivalent of –10 °C).

Set the display to ‘–10 °C’.

Store. New value is accepted only when input is stable.

Advance to next parameter.

**Temperature Full Scale**
Set the resistance box to 142.29 \(\Omega\) (resistive equivalent of 110 °C).

Set the display to ‘110 °C’.

Store. New value is accepted only when input is stable.

Advance to next parameter.

Continued on next page.
Continued from previous page.

Adjust Output 1 Zero
The monitor transmits a zero signal, e.g. for a 4 to 20 mA output range, 4 mA is transmitted.

Set the milliammeter reading to the current output 1 zero level, i.e. 0 mA (zero-based ranges) or 4 mA (4 to 20 mA range).

Store.

Advance to next parameter.

Adjust Output 1 Full Scale
The monitor transmits a span signal, e.g. for a 4 to 20 mA output range, 20 mA is transmitted.

Set the milliammeter reading to the current output 1 full scale level, i.e. 1 mA, 10 mA or 20 mA as applicable.

Store.

Advance to next parameter.

Adjust Output 2 Zero
The monitor transmits a zero signal, e.g. for a 4 to 20 mA output range, 4 mA is transmitted.

Set the milliammeter reading to the current output 2 zero level, i.e. 0 mA (zero-based ranges) or 4 mA (4 to 20 mA range).

Store.

Advance to next parameter.

Adjust Output 2 Full Scale
The monitor transmits a span signal, e.g. for a 4 to 20 mA output range, 20 mA is transmitted.

Set the milliammeter reading to the current output 2 full scale level, i.e. 1 mA, 10 mA or 20 mA as applicable.

Store.

Advance to next parameter.

Alter Calibration Code
The calibration user code inhibits access to the Set Up Temperature Control Page and the Calibration Page – see Section 6.2.8.
Set a suitable user code, between 0 and 19999.
Store.
Return to top of Electrical Calibration Page.
or
Return to Operating Page 1.
7 CALIBRATION

7.1 Calibration Sequence

Calibration of the monitor is carried out by replacing the sample solution sequentially with two standard solutions of known concentration. This calibration sequence (see Table 7.1) can be initiated automatically at preset times, or manually on demand.

The electrode outputs obtained during calibration are used to calculate the calibration graph for the monitor; the accuracy of the standard solutions will, therefore, have a direct effect upon the overall accuracy of the monitor. Given the inherent difficulty of preparing accurately known low concentration standard chloride solutions, the monitor is designed to use a ‘zero’ chloride solution (that is, high-purity water) as one of the standard solutions. The concentration of the second standard solution should be chosen to suit the expected range of measurement; for example, if the range is expected to be 0 to 250 μg l⁻¹ then a 200 μg l⁻¹ standard could be used. (minimum concentration is 75 μg l⁻¹).

On initiation of the calibration sequence, either manual or automatic, the ‘Cal’ LED is illuminated and the Calibration Mode relay is energised. Two solenoid valves, SV1 and SV2 operate sequentially to shut off the sample and admit standard solutions of known concentration, one low and one high (STD1 and STD2), to the sample path.

Once a valve is energised, sufficient time (preset to suit the sensor response time) is allowed for the previous solution to be displaced, and for the sensor to respond to the new solution, before the sensor output is evaluated for stability by the microprocessor. When a stable output is achieved the next stage in the sequence is initiated.

After calibration the sensor outputs corresponding to the two standard solutions are used to calculate a new calibration graph for the monitor, thus compensating for any drift in sensor or liquid handling performance characteristics since the last calibration, and the new slope value can be displayed in Operating Page 1 (100% slope is the theoretical value).

If the values are within limits, ‘CALIBRATION PASSED’ is displayed.

‘CAL FAILED (SLOPE)’ is displayed if the slope value is outside acceptable limits and ‘CAL FAILED (SLOW)’ is displayed if the sensor output failed to stabilise within 15 minutes after the end of Cal Time 1 or Cal Time 2.

8 MAINTENANCE

8.1 Chemical Solutions
The reagent and standard solutions described below are required to maintain the monitor in operation. Where possible, they should be freshly made and stored in plastic (for example, polythene) bottles. Typical reagent solution consumption for a continuously operating monitor is approximately ten litres per month. The monitor uses 100 to 150 ml of each standard solution each calibration cycle. Consumption of the standard solution also depends on the frequency with which this cycle is carried out.

8.1.1 Reagent Solution 0.014 M Nitric Acid

**Warning.**
- Concentrated nitric acid must be handled with great care at all times – in particular, ensure that when diluting concentrated acid, it is added to water and not water to acid. Wear appropriate protective clothing i.e. rubber gloves and full face protection.
- Phenol must be handled with great care and must not be allowed to come into contact with the skin. Wear appropriate protective clothing, i.e. rubber gloves.

To prepare from concentrated acid:
a) **slowly and carefully** add 64 (±1) ml of concentrated nitric acid to approximately 400 ml of de-ionised water in a 1 litre volumetric flask, swirling the contents continuously and cooling under running water if necessary.

**Note.** High purity nitric acid, e.g. BDH ‘Aristar’ grade, is recommended for low-level chloride measurement and is essential for sub-100 μg l⁻¹ measurements.

b) Allow this to cool to room temperature, and then make up to the mark with further de-ionised water to produce a 1.0 M solution.

c) Measure out 140 (±2) ml of the above solution and make up to 10 (±0.1) litres with more high purity water. Add 100 (±10) mg phenol to prevent bacterial growth.

d) Fill the reagent bottle with this solution.

8.1.2 Reference Electrode Filling Solution
The reference electrode contains a salt bridge solution of 1.0 M sodium sulphate. Prepare as follows:
a) Dissolve 14.2 (±0.1) g analytical grade anhydrous sodium sulphate in approximately 80 ml of high purity water.

b) Dilute the solution to 100 ml with more high purity water.

c) Store the solution in a tightly stoppered plastic bottle.

8.1.3 Standard Solutions
Two standard solutions of known chloride concentration appropriate to the measuring range are required to calibrate the monitor. The 'low' standard is a 'zero' chloride solution, which should be high-purity water with a conductivity < 0.07 μS cm⁻¹ at 25 °C. The 'high' standard is best prepared by diluting a stock solution (10000 μg l⁻¹) with high-purity water, obeying the following instructions:

1) Dry a few grams of analytical reagent grade sodium chloride at 140°C for four hours.

**Chloride as Cl⁻**

2a) Weigh out 1.648 (±0.001) g of the dried salt; dissolve it in approximately 200 ml of high purity water and make up to 1 litre in a volumetric flask with more high purity water. This is a 1000 mg l⁻¹ chloride solution.

2b) Pipette 10 ml of the 1000 mg l⁻¹ solution into a 1 litre volumetric flask and make up to the mark with high purity water. This is a 10000 μg l⁻¹ chloride stock solution.

**Chloride as NaCl**

2c Weigh out 1.000 (±0.001) g of the dried salt; dissolve it in approximately 200 ml of high purity water and make up to 1 litre in a volumetric flask with more high purity water. This is a 1000 mg l⁻¹ sodium chloride solution.

2d) Pipette 10 ml of the 1000 mg l⁻¹ solution into a 1 litre volumetric flask and make up to the mark with high purity water. This is a 10000 μg l⁻¹ sodium chloride stock solution.

3) Prepare the standard solution required by accurate dilution of the appropriate 10000 μg l⁻¹ stock solution.
8.2 Scheduled Servicing
The following servicing schedule has been produced as a general guide only. It may be necessary to amend the schedule to suit the particular installation and sample conditions.

8.2.1 Regular Visual Checks
It is recommended that the monitor and the sampling system is visually inspected on a regular basis to check the correct functioning of the system and to assure the integrity of the readings.

a) Check for leaks, particularly around the sample and drain pipework connections.
b) Confirm sample flow by checking delivery to the constant head unit and effluent from the drain.
c) Check liquid flow through sensor flowcell.
d) Check for excessive build-up of air in the flowcell.
e) Check liquid levels in the reagent and standard solution containers.
f) Check for malfunction indications on the instrument display.

Note. The mains and pump/heater switches are situated on the right hand side of the User Junction Box.

8.2.2 Four Weekly

a) Inspect all tubing and flowcell for leaks and deterioration.
b) Examine all tubing and flowcell for signs of accumulation of solid deposits. These tend to accumulate in the reference electrode compartment of flowcells and may be cleaned to drain by squirting high purity water from a ‘squeezy’ bottle into the de-bubbler vent on top of the flowcell, and the use of small bottle brush.
c) Clean monitor pipework if necessary.
d) Check the filling solution in the reference electrode and top-up if necessary.
e) Discard old reagent and standard solutions. Clean containers thoroughly before refilling with fresh solutions – see Section 8.1.

Note. It is vital that the containers are not topped up.
f) Examine the sample input pipe for leaks and deterioration.
g) Check the condition of the sample filter (if fitted) and fit a new one if necessary. Ensure that new filters are fitted correctly by taking note of the flow directions indicated on the filter bodies.
h) Ensure the drain is in good order and free from obstruction.

8.2.3 Twelve Monthly

a) Service pump, tubing and capstans – see Section 8.2.6.
b) Replace all internal plumbing tubing – see Section 8.2.7.
c) Carry out the normal 4 weekly schedule not already covered above.

8.2.4 Consumables Spares Kit
The monitor is supplied with a consumable spares kit (see Section 10). This consumable spares kit includes all the components which are recommended for replacement annually (refer to the details in the spares kit). This annual refurbishment ensures a high level of reliability from the monitor over a period of many years. The kit should be reordered when used so that all the items are available throughout the following year’s operation.

The kit contains the following:
- one set of pump tubing
- one set of pump capstans
- a complete set of plumbing tubing
- sundry items – ‘O’ rings, tube connectors, pump tube bungs and fuses
- plastic syringe and bottle brush – for cleaning pipework, valves, flowcell and constant-head unit.

8.2.5 Fitting the Electrodes
The chloride electrode is supplied with a protective end cap to prevent the tip from being scratched or chipped. To prepare for use, remove the end cap and carefully rinse the tip in distilled water.

a) Fit the chloride electrode into the plastic holder supplied, slide the retaining ‘O’ ring over the end of the electrode body and insert it into the sloping aperture of the flowcell. Screw down to compress the ‘O’ ring.
b) Connect the chloride electrode lead to the co-axial socket above the flowcell on the right hand side.
c) The reference electrode should have the silicone rubber sleeve moved away from the refill aperture. Remove teat and top-up electrode with filling solution if required.
d) Fit the ‘O’ ring supplied over the reference electrode body and insert the electrode into the left hand chamber of the flowcell so that the ceramic plug is between 5 and 10 mm from the bottom.
e) Connect the reference electrode lead to the co-axial socket above the flowcell on the left hand side.
8.2.6 Peristaltic Pump – Fig. 8.1
It is recommended that the pump tubing and pump capstans, supplied in the Consumable Spares Kit, are replaced after one year of operation. Carry out the following procedure 1 to 8:

1. Remove the pump platen by applying gentle downward force to the platen while turning the catch mechanism to the vertical position and pulling the catch forward.

2. Disconnect each pump tube from its respective tube connector at the rear of the case, pull through the grommets and discard.

3. Remove the retaining screw on the pump shaft and remove the capstans.

4. Fit all three new capstans, from the kit, on the hexagonal shaft so the rollers are offset from one another. Fit retaining screw.

5. If required, fit new pump tube bungs and shims, from the kit, to the left hand side of the pump.

Note. The bungs are designed to grip the pump tube when compressed by the platen. Two sizes of tube are used so it is essential that the correct size of bung is fitted. The sample tube, which is the larger of the two, is fitted at the front of the pump. It is important that the shims are always fitted.

6. Pass new pump tubes, from the kit, through the tube bungs and case grommets. Connect to the appropriate tube connector at the rear of the case.

7. Locate the tubes centrally on the pump rollers.

8. Lower the pump platen, only from directly above, on to the pump tubes until the catch mechanism locates in the hole in the case, and turn the catch lever to the horizontal position.

Fig. 8.1 Peristaltic Pump

8.2.7 Replacement of Plumbing Tubing
All the following items are included in the Consumable Spares Kit.

a) Remove electrodes for short term storage.

b) Remove each section of the sample and reagent plumbing tubing in turn and replace with new tubing of the same length.

c) Remove drain tubing and replace with new tubing of the same length.

d) Using a syringe, clean constant head unit, solenoids and sample heating coil in flowcell with sodium hypochlorite solution.

e) It is recommended that the sample and drain tubing to and from the monitor is inspected and replaced if the tubing is in poor condition or shows evidence of any build-up of solids.
8.3 Shutdown Procedure

8.3.1 Short Term
The monitor can be left with the power switched off for up to 24 hours without any detrimental effects. When returned to normal monitoring mode, the monitor should be run on sample for 30 minutes, followed by a calibration – see Section 7.

The chloride electrode can be stored dry or immersed in a dilute chloride solution.

The reference electrode may be stored in high purity water or filling solution. Ensure that the electrode cannot dry out; failure to observe this results in a blocked ceramic junction, causing considerable delay when restarting the monitor.

If the chloride electrode is likely to be out of service for more than one day, remove the electrode from the monitor and store it dry with the protective end cap replaced to prevent the tip being scratched or damaged. The reference electrode is stored with its ceramic junction covered by a protective teat containing filling solution. Refit silicone rubber sleeve over the filling solution hole.

8.3.2 Long Term
When the monitor is required to be shut down for more than 24 hours, proceed as follows:

a) Switch of the monitor.

b) Close the sample valve up-stream of the monitor.

c) Remove the electrodes and store – see Section 8.3.1.

d) Clean constant head unit, and sample pipework (both inside and outside the monitor).

e) Remove pressure plate from peristaltic pump.

8.4 Unscheduled Servicing

The monitor indicates abnormal operation by means of signals on the 20 character dot matrix display and the l.e.d.s. The indications are listed in Table 8.1.

8.4.1 Malfunction of the Monitor
It should always be remembered that any unpredictable problems may be due to the standard or reagent solutions, or their flow through the flowcell. If any doubts exist regarding the integrity of the solutions, they should be replaced with freshly prepared solutions in the early stages of the fault finding investigations.

Note. The accuracy of the monitor is governed by the condition of these solutions which may be incorrectly made or contaminated.

In general, any problems are likely to be due to the electrodes, which may require refurbishment (see Section 8.4.3), but may be due to other parts of the liquid handling section of the monitor.

Mechanical components which are involved with the liquid handling, for example, pumps, valves, tubing and tubing connections etc., should be systematically checked for correct operation, and for leaks or blockages which change the chemical conditions around the electrode. The majority of all problems are found to be associated with the chemistry and the liquid handling section.

</tr>
</tbody>
</table>

Table 8.1 Unscheduled Servicing Messages
8.4.2 Monitor Diagnostic Information

Out of Service Alarm
This alarm relay output is a normally energised relay which de-energises in the following circumstances:

a) Loss of mains supply.

b) Calibration Failed – the calculated electrode slope value is outside the acceptable limits or the response of the electrode is too slow. The 'CAL FAIL' LED on the front panel is illuminated with the appropriate text on the 20-character display.

c) Flowcell temperature out of limits – the measured temperature is not within 5°C of the Control Temperature. 'TEMP. CONTROL ERROR' is indicated on the 20-character display.

d) 'OUT OF SAMPLE' alarm – a float switch in the constant head unit detects the loss of sample. 'OUT OF SAMPLE' is indicated on the 20-character display.

e) 'OUT OF SERVICE' alarm – displayed when the pump is switched off.

Note. The heater is switched off by the software when an 'OUT OF SAMPLE' condition is detected.

Calibration Fail Alarm
A calibration failed condition occurs after a two point calibration if the calculated slope value is less than 70% or if the electrode output is unstable. The failure could be caused by a number of factors which should be investigated.

In the 'CAL. FAILED (SLOPE)' case some indication of the problem may be obtained from the slope value.

Slope value just below 70%
- Check the reagent solution flows.
- Check condition of the reagent solutions.
- Check condition of the standard solutions.
- See Malfunction of the Electrode Section 8.4.3.

Slope value grossly abnormal
- Check operation of the solenoid valves and flow of the standard solutions.
- Check condition of the standard solutions.
- Check the reagent solution flows.
- Check condition of the reagent solutions.
- Check liquid level in reference electrode – see Malfunction of the Electrode Section 8.4.3.
- Check electrode connections in the co-axial plugs and sockets, and inside the microprocessor unit.

Calibration Failed (Slow)
In the 'CAL. FAILED (SLOW)' case the failure is usually due to slow electrode response, but may be due to an unstable (noisy or drifting) electrode output:

a) Check for air bubbles trapped on chloride electrode surface. Remove if necessary and ensure that the temperature sensor is not positioned too low down in the flowcell.

b) Check electrode connections in the co-axial plugs and sockets, and inside the microprocessor unit.

c) See Malfunction of the Electrode Section 8.4.3.

8.4.3 Malfunction of the Electrode

Caution. Suspected faulty electrodes cannot be disassembled to investigate any problems.

a) Check for surface deposits on the chloride electrode sensing pellet. See Section 8.5.

b) Check performance of chloride electrode by substitution.

c) Check level of filling solution in reference electrode; top up if necessary.

d) Check that the silicone rubber sleeve has been moved away from the filling solution hole in the reference electrode.

e) Reference electrode liquid junction partially or completely blocked, replace electrode if required.
8.5 Reconditioning the Chloride Electrode
In time the response time of the chloride electrode may become extended and the general performance deteriorates to an unacceptable level. The electrode pellet should then be abraded to expose a new surface to restore the original performance. The recommended abrasive is waterproof silicon carbide paper, grit size 800.

**Warning.** Handling mercurous chloride/mercuric sulphide dust can be injurious to health. Extreme caution must be taken when refurbishing the chloride electrode using the following procedure. Wear suitable protective clothing and a mask.

1) Spread the paper on a flat, hard surface.
2) Wet the paper with de-ionised water.
3) Hold the electrode vertically and press lightly onto the paper whilst using a slow, circular motion for approximately 10 seconds.
   This should expose a new surface.
4) Rinse the electrode in de-ionised water.
5) Assemble in flowcell and check the performance.

If the performance is still not acceptable, repeat the above procedure.

8.6 Microprocessor Unit Error Messages
The instrument incorporates an automatic self-diagnostic checking facility for detection of input and output errors. If such a fault occurs, one of the error messages detailed below is shown on the dot matrix display.

**'CHAN 1 INPUT ERROR'**
This error message is usually caused by an open circuit electrode input. This may be due to any of the following:

a) Electrode open circuit internally, e.g. broken connection, blocked liquid junction or low level of filling solution in reference electrode etc.

b) Air bubble build-up between electrodes.

c) Broken electrical connections between the electrode and the Microprocessor Unit input.

d) Co-axial plugs not correctly inserted.

**'TEMP INPUT ERROR'**

**'PRT OUT OF LIMITS'**

**'TEMP REF. ERROR'**

**'THIRD LEAD ERROR'**
The above four error messages refer to electrical problems with the temperature sensor input, – usually an open or short-circuit connection.
## 9 SPECIFICATION

**Range**
- **Chloride**: Any two consecutive decades of concentration between 0 and 5000μg l⁻¹ chloride

**Repeatability**
±2% of reading

**Reproducibility**
±3% of reading

**Response time**
Less than 5 minutes for 90% step change

**Millivolt range**
-400mV to +400mV

**Millivolt resolution**
±0.1mV

**Control temperature range**
Preset to 35°C (95°F)

**Temperature resolution**
±0.1°C (±0.2°F)

**Displays**
- **Concentration**: 5-digit blue fluorescent
- **Information**: 20-character dot matrix blue fluorescent

**Status indication**
Two flashing LED’s in alarm state
- Single LED lit when ‘HOLD’ switch operated
- Single LED lit when calibration is in progress
- Single LED lit when the monitor is ‘Out of Service’

**Current outputs**
- As standard one isolated current output 0 to 1, 0 to 10, 0 to 20 or 4 to 20mA selectable via plug-in links
- Optional 2nd current output
- Maximum voltage load 15V

**Current output span**
Any 1 to 2 decades of display range, logarithmic or linear

**Computer interface**
Modbus via RS433/RS423 serial interface

**Alarms**
- Two high or low concentration alarms
- Remote calibration mode indication
- Remote monitor ‘Out of Service’ indication,
- Includes: Loss of Mains Supply
- Loss of Sample
- Calibration Failed
- Electronic Failure
- All voltage-free 250V 5A non-inductive changeover relay contacts

**Concentration alarm adjustment**
Programmable over assigned range

**Concentration alarm differential**
Programmable 0 to 5%

**Concentration alarm delay**
Programmable 0 to 60 minutes

**Calibration**
- Fully automatic two-point, plus manual initiation on demand

**Routine maintenance**
- Four-weekly: replenish reagents, clean flow system
- Twelve-monthly: replace plumbing, pump tubing and pump capstans

**Power supply**
110 to 120V or 220 to 240V 50/60Hz 100VA

**Power supply tolerance**
+6% to –10%

**Isolation voltage**
Input, output and power supply 1.5kV

**Weight**
Approximately 35kg (77lb)

**Dimensions**
- **Height**: 893mm (35.2 in.)
- **Width**: 541mm (21.3 in.)
- **Depth**: 207mm (8.2 in.)

**Degree of protection**
- **Electronics section**: IP65
- **Liquid handling**: Case IP31
- **Critical internal components**: IP65

**Calibration**
- Fully automatic two-point, plus manual initiation on demand

**Routine maintenance**
- Four-weekly: replenish reagents, clean flow system
- Twelve-monthly: replace plumbing, pump tubing and pump capstans

**Power supply**
110 to 120V or 220 to 240V 50/60Hz 100VA

**Power supply tolerance**
+6% to –10%

**Isolation voltage**
Input, output and power supply 1.5kV

**Weight**
Approximately 35kg (77lb)

**Dimensions**
- **Height**: 893mm (35.2 in.)
- **Width**: 541mm (21.3 in.)
- **Depth**: 207mm (8.2 in.)

**Degree of protection**
- **Electronics section**: IP65
- **Liquid handling**: Case IP31
- **Critical internal components**: IP65
## 10 SPARES

Warning. Switch off the monitor and electrically isolate it before carrying out the following steps.

A.1 Access the Transmitter Unit – Fig. A.1

Caution. Employ normal antistatic precautions while handling chips and PCBs.

Caution. To avoid damaging EPROM, base or PCB, it is essential that you use an approved IC extractor in this procedure, e.g., a PLCC Extractor, RS Stock Number: 404-727

A.2 Access the PCB – Fig. A.2

Unlock and open cover plate and hinge out to expose captive screws.

Unscrew captive screws and swing front cover upwards. Lock into position using the hinged stay on the right hand side.

Remove processor PCB. See Fig. A.3

Fig. A.1 Procedure to Open the Enclosure

Fig. A.2 Procedure to Access the Processor PCB

Fig. A.3 Procedure to Access the Processor PCB
A.3 Removing the PCB – Fig. A.3

1. Remove the four screws attaching the PCB to the assembly. Note that there are washers between the PCB cover and the PCB.

2. Withdraw the PCB and turn it over to reveal the component side.

3. Locate and change the EPROM IC1 – see Fig. A.4.

Fig. A.3 Procedure to Remove the PCB

A.4 Changing the EPROM – Fig. A.4

1. Extract IC1 using an approved tool – see Caution in Section A.1.

2. Fit the replacement IC – press home firmly.

3. Go to Section A.5 for reassembly instructions.

Fig. A.4 Replacing the Software EPROM

A.5 Completing the Procedure

1) Fit the PCB using the reverse procedure in Fig. A.3.

Important Note. Ensure that the washers are fitted between the PCB cover and the PCB.

2) Close the microprocessor section using the reverse procedure in Fig. A.2.

3) Close and lock the hinged cover – Fig. A.1.

4) The monitor may now be put into service.

5) Check program parameters – see Section 6.

6) Carry out a routine 2-point calibration.
PRODUCTS & CUSTOMER SUPPORT

Products

Automation Systems
- for the following industries:
  - Chemical & Pharmaceutical
  - Food & Beverage
  - Manufacturing
  - Metals and Minerals
  - Oi, Gas & Petrochemical
  - Pulp and Paper

Drives and Motors
- AC and DC Drives, AC and DC Machines, AC motors to 1kV
- Drive systems
- Force Measurement
- Servo Drives

Controllers & Recorders
- Single and Multi-loop Controllers
- Circular Chart and Strip Chart Recorders
- Paperless Recorders
- Process Indicators

Flexible Automation
- Industrial Robots and Robot Systems

Flow Measurement
- Electromagnetic Flowmeters
- Mass Flow Meters
- Turbine Flowmeters
- Flow Elements

Marine Systems & Turbochargers
- Electrical Systems
- Marine Equipment
- Offshore Retrofit and Refurbishment

Process Analytics
- Process Gas Analysis
- Systems Integration

Transmitters
- Pressure
- Temperature
- Level
- Interface Modules

Valves, Actuators and Positioners
- Control Valves
- Actuators
- Positioners

Water, Gas & Industrial Analytics Instrumentation
- pH, conductivity, and dissolved oxygen transmitters and sensors
- ammonia, nitrate, phosphate, silica, sodium, chloride, fluoride, dissolved oxygen and hydrazine analyzers.
- Zirconia oxygen analyzers, katharometers, hydrogen purity and purge-gas monitors, thermal conductivity.

Customer Support

We provide a comprehensive after sales service via a Worldwide Service Organization. Contact one of the following offices for details on your nearest Service and Repair Centre.

United Kingdom
ABB Limited
Tel: +44 (0)1453 826661
Fax: +44 (0)1453 829671

United States of America

Fax: +1 215 674 7183

Client Warranty
Prior to installation, the equipment referred to in this manual must be stored in a clean, dry environment, in accordance with the Company's published specification.

Periodic checks must be made on the equipment's condition. In the event of a failure under warranty, the following documentation must be provided as substantiation:
1. A listing evidencing process operation and alarm logs at time of failure.
2. Copies of all storage, installation, operating and maintenance records relating to the alleged faulty unit.
The Company’s policy is one of continuous product improvement and the right is reserved to modify the information contained herein without notice.
