ABB Ability™ Asset Suite eSOMS Mobile Rounds 2.6.2
General availability from January 25, 2019

ABB is pleased to announce that eSOMS Mobile Rounds 2.6.2 is now available. Below are a few of the new features and enhancements available in this release.

New features and enhancements

- Mobile licensing can now be managed on a per-module, per-device basis.
- The web service URL on the Server Settings screen can now be entered via QR code, reducing manual entry errors. The scanning process automatically verifies that the URL is correct and available.
- Apache® Cordova™ has been upgraded from version 6.5.0 to 8.0.0, allowing support of newer operating systems and device hardware.
- The time needed to process historical readings during synchronization has been greatly reduced.
- Readings on the mobile device can now be exported to a Microsoft® Excel® file before being synchronized with the server. This allows data to be retrieved if the device is unable to sync for any reason, and entries can be manually added through the eSOMS web interface later.
- The time needed for a device to sync is now displayed and logged, to assist with the monitoring and troubleshooting of mobile synchronization issues.
- On-screen keyboard is now automatically selected to match the input data type. If numeric data is requested, a numeric-formatted keyboard is displayed; if alphabetic data is requested, a standard alphabetic keyboard is displayed. Users can also manually switch between the two.
