Status Word (SW) is read from drive through Modbus communication block using DriveData interface (For more details on the structure refer to Chapter 1.4.2.2.3.3 “Structure: DrvData-Type” on page 2019).

Control Word (CW) will be built by the function block according to the ABB drives profile state machine. CW will be sent via DriveData and the used communication block to the drive. Function block provides standard start/stop signals to control the drive and standard diagnosis signals are read from the drive.
The function block should be used for DCS drives using ABB drive profile for Modbus protocol only. The data transfer to the DCS drive is realized via the IN_OUT variable DriveData, which must be connected to DrvModbusTcp or DrvModbusRtu function block.

**DrvModbusRead**

The function block 'DrvModbusRead' reads one or more parameters / values of the drive. The number of data to be read is specified at the input 'Nvar'. The first parameter number is specified at the input 'PrmNum'. All parameters must be accessible from consecutive Modbus registers in the drive. The values of the parameters are stored in the PLC memory area, defined at the input 'Data'.

The values in the PLC memory area are updated when the read job was performed without error. This is indicated by JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Enable is set from TRUE to FALSE.

As long as the Enable = TRUE a new read job is requested each time the further read job is terminated. The Modbus job is started from the Communication Block which is connected to the same 'DriveData' variable. It uses the Modbus function code 03 (read n words). The drive (Modbus device) from which the parameter is read is specified at this Communication Block. The Communication Blocks are available from the library e.g. DrvModbusTcp or DrvModbusRtu.

The function block is activated (Enable = TRUE) or deactivated (Enable = FALSE) via input Enable. If the block is active, the current values are available at the outputs. To start a new read job the input Enable must be set to TRUE. If the input values are valid, a request to perform a Modbus job is sent to the Communication Block via the 'DriveData' variable. If at least 1 input is invalid, no job is generated, and the error is displayed at the outputs Error and ErrorID instead.
**DrvModbusWrite**

Function block 'DrvModbusWrite' writes 'n' parameters to the drive. The number of parameters to be written must be available in the PLC memory area, defined at the input Data. The write job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

To start a new write job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the Communication Block which is connected to the same DriveData variable. It uses the Modbus function code 16 (write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

**DrvModbusTcp**

Function block DrvModbusTcp controls the Modbus TCP communication to ACS/DCS drives and provides the basic values (CW, Ref1, Ref2, SW, Act1, Act2) which are used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.
The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable. These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

<table>
<thead>
<tr>

</table>

To write the Control Word (CW), Reference Value 1 (Speed Reference) or Reference Value 2 (Reference Value 2) from the DriveData variable (DriveData.ControlWord, DriveData.Reference1, DriveData.Reference2) to the drive, the input EnableWrite has to be TRUE (default).

If the input SteadyWrite = TRUE (default = FALSE) these values are written steadily.
If the input SteadyWrite = FALSE (default) these values are only written if there was a change on any of those values.

These 3 values are written to the ACS drive starting at Modbus register 400001.

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
<table>

**ABB drives enhanced profile**

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

**Reading status information from drives**

The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (SW), Actual Value 1 (Speed Reference), Actual Value 2 (Actual Value 2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.StatusWord, DriveData.ActValue1 and DriveData.ActValue2.

Apart from these three parameters there is also an option to read 12 additional drive parameters.

Using the input NvarRead the function block can be configured to read between 0 and 12 parameters from the drive. All read data is then written to the array at the ReadValue output array. Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.
### Modbus register address in drive

If 32-bit parameters are mapped to DATA IN,

- The following field in DATA IN must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.
  (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from ReadValues fields must be recombined in the program.

Function block DATA IN has to be configured in drive in the following groups see also FENA-x1 manual.

<table>
<thead>
<tr>
<th>Drive</th>
<th>Parameter Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACS355</td>
<td>54.01 ... 54.10</td>

</table>

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information then job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used 'NvarRead' and 'NvarWrite' input number respectively.
If 32-bit parameters are mapped to DATA OUT,
- The next/following field in DATA OUT must be left open (= 0)
- The word order of the High-Word (HW) and Low-Word (LW) can be configured in the drive.
  (using FENA-X1: Par. 51.22)
- To retrieve the original 32-bit value from the drive in AC500 the HW and LW from WriteValues fields must be recombined in the program.

ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.
Please see also drive manuals which parameter must be set.
For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1
For ACSM1, DCS800 and DCS550 – Par 16.06 = 1

Diagnosis

If a Modbus TCP job tries to access a register in the drive which has no valid mapping information the job is aborted with an error.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModTcpMast job. The ModMastErrorIDLast will keep this Error ID until a new rising edge of the Enable is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization "VisuDrvModbusTcp".
- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

**DrvModbusRtu**

Function block DrvModbusRtu controls the Modbus RTU communication to ACS/DCS drives and is used for the basic control of drives with ABB Drives Profile or ABB Drives Enhanced Profile.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

**Reading status information from drives**

The function block continuously reads data from the drive starting at Modbus register 400004. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

With input NvarRead the function block can be configured to read in the same job between 0 ... 24 data more from the drive. These additional data are written to the array at the 'ReadValues' output. These data must be configured in the drive and are only accessible if the embedded Modbus is used.

The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
<table>
<thead>
<tr>
<th>Modbus register address in drive</th>
<th>Mapping configuration in drive</th>
<th>Written in AC500</th>

More details on the limits for the data read and write is explained in Chapter 1.4.2.2.2.4 “Limits for the data read and write between AC500 and drives” on page 2020. The value is dependent on the Drive used.

Writing control word and reference value to drives

The function block checks if there are changes of the Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) on the DriveData variable. If there is a change a write job is requested to send these 3 values to the ACS/DCS drive starting at Modbus register 400001.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
### Modbus register address in drive

#### Reading status information from drives

- The function block continuously reads data from the drive starting at Modbus register 400051. So at least the Status Word (wStatusWord), Actual Value 1 (iActValue1), Actual Value 2 (iActValue2) are continuously read from the drive and written to the DriveData variable.

- These values are stored in DriveData.wStatusWord, DriveData.iActValue1 and DriveData.iActValue2.

- Apart from these three parameters there is also an option to read 12 additional drive parameters in the same job.

- Using the input NvarRead the function block can be configured to read between 1 and 12 more parameters from the drive. All read data is then written to the array at the ReadValues output.

- Configuration in ACS drive is depending on configured parameters in group FBA DATA IN.

- The following table shows the performed Modbus read job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

---

More details on the limits for the data read and write is explained in Chapter 1.4.2.2.2.4 “Limits for the data read and write between AC500 and drives” on page 2020. The value is dependent on the Drive used.

**ABB drives enhanced profile**

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

The ABB Drives Profile Enhanced communication profile provides register mapped access to the Control, Status, Reference and Actual Values of the ABB Drives Profile Enhanced. The mapping of the registers has been enhanced to allow additional writing of up to 12 control and reading of up to 12 additional status parameters in a single Modbus job.
The function block checks if there are changes in any of the following values since last write job:

- Control Word (wControlWord),
- Reference Value 1 (iRefValue1),
- Reference Value 2 (iRefValue2) on the DriveData variable,
- values in the input array WriteValues – WriteValues[1..NvarWrite].

If there is a change a write job is requested to send the 3 control values and the values in WriteValues array (WriteValues[1..NvarWrite]) to the ACS/DCS drive starting at Modbus register 400001. Configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.

**Reconnection pause**

When one or more drives in the Modbus RTU lines are offline, all the other drives have to wait for the TimeOut to elapse until a line token is assigned to next drive. Reconnection pause input helps in skipping the drives which are offline from the next Modbus job and execute Modbus job operations only for the drives which are online.

“ReconnectPause” is time in seconds before next retry to connect after a timeout was detected. Timeout is detected with ModMastErrorIDLast = 16#120 (ERR_TIMEOUT).

This feature can be used with the DrvModbusRtu function block in both ABB Drives Profile and ABB Drives Enhanced Profile. User must configure the reconnect pause input value using the input variable “ReconnectPause”.

For the generic RTU block ModRtuToken (part of AC500_ModbusRtu library), also the value for the reconnect pause must be configured at input variable “ReconnectPause”.

**Diagnosis**

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects that an actual error occurred. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.
However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTU”.

- iWriteErrCnt: number of errors in write jobs since Enable = TRUE.
- wLastWriteErno: holds the error number of the last executed write job.
- iReadErrCnt: number of errors in read jobs since Enable = TRUE.
- wLastReadErno: holds the error number of the last executed read job.
- iReadWriteErrCnt: number of errors in read write jobs since Enable = TRUE.
- wLastReadWriteErno: holds the error number of the last executed read write job.

If several drives are used, for each drive a communication function block such as DrvModbusRtu must be programmed. Also, every other generic Modbus server device on the same Modbus RTU line must be programmed with its own ModRtuToken function block. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive/device, so only one drive/device at a time is communicating with the PLC.

ModRtuToken function block and ModRtuTokenType structure are part of AC500_ModbusRtu library. Kindly refer the same.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

If a Modbus RTU job tries to access a register in the drive which has no valid mapping information then the job is aborted with an error.

Therefore, the drive parameters in FBA DATA IN group and FBA DATA OUT must be configured according to the used ‘NvarRead’ and ‘NvarWrite’ input number respectively.

Modbus RTU using Embedded Fieldbus:
When embedded fieldbus is used for the Modbus RTU communication, user can read maximum of 24 parameters (based on the limitation in drive) from the DATA I/O parameters in the embedded fieldbus parameter group. These parameters can only be used for reading operation and cannot be configured to write data.

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
**DrvModbusRtuBroadcast**

Function block DrvModbusRtuBroadcast is a communication block which sends the broadcast messages via the Modbus RTU communication to all ACS/DCS drives and other Modbus devices connected to the same Modbus RTU line (physical line). The function block can be used with all drives with either ABB Drives Profile or ABB Drives Enhanced Profile but not a mix of both profiles.

As the broadcast job will be received by all devices on the same physical Modbus line it’s highly recommended to use this block only in case there are no other Modbus devices connected to this line and all drives use the same profile.

This function block does not perform any Modbus read operation, hence it does not read any values such as status word, actual value 1 and actual value 2 etc., from any of the drive.

This function block should not be used along with 'DrvModbusRead' and 'DrvModbusReadWrite23' function blocks. They will be ignored showing an error. This function block should be only used independently or in combination with 'DrvModbusWrite' function block for broadcasting write operation.

A successful broadcast message for writing control word, reference values and additional mapped parameters (only in case of Enhanced Profile) is indicated by JobDone = TRUE and ModMastErrorAct = FALSE. A next broadcast job for writing these values can once again started with a fresh rising edge at ‘SendCtrlValues’ input.

Apart from sending control values and up to 12 additional values from WriteValues array (only in case of ABB Drives Enhanced Profile) a normal Modbus write function block "DrvModbusWrite" can be used to send broadcast write messages to specific address on all drives connected to the Modbus RTU line. The requests to process broadcast write Modbus jobs is transferred via the DriveData structure at the InOut variable DriveData which can be connected to multiple instances of write function block 'DrvModbusWrite'.

After each successful broadcast write job a fixed pause of 250 ms is implemented before any other Modbus job within the same line will be started.

**ABB drives classic profile**

With input parameter EnhancedProfile = FALSE, the function block works for ABB Drives Classic Profile.

**Writing control word and reference value to drives**

A rising edge from FALSE to TRUE at input ‘SendCtrlValues' starts sending broadcast message with Control Word and Reference Values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) are taken from DriveData variable for sending broadcast message.

The following table shows the performed Modbus write job and the needed mapping in the drive as well as the area where the data is stored in the AC500.
ABB drives enhanced profile

With input parameter EnhancedProfile = TRUE, the function block works for ABB Drives Enhanced Profile.

With the ABB Drives Profile Enhanced profile, along with 3 control values Control Word, Reference Value 1, Reference Value 2, up to 12 additional values can be sent as broadcast message in a single Modbus job.

Writing control word and reference values to drives

A rising edge from FALSE to TRUE at input 'SendCtrlValues' starts sending broadcast message with Control Word and reference values to all the drives starting at Modbus register 400001.

Following control values: Control Word (wControlWord), Reference Value 1 (iRefValue1) or Reference Value 2 (iRefValue2) from DriveData along with values in the input array WriteValues – WriteValues[1..NvarWrite] are taken for sending broadcast message.

For the additional 12 values the configuration in ACS drive is depending on configured parameters in group FBA DATA OUT.

The following table shows the performed Modbus broadcast write job and the needed mapping in the drive as well as the area where the data is taken from the AC500.

### Diagnosis

The output ErrorID which reflects an actual error number is only valid for one cycle if output Error is set to TRUE. To capture this error number an external function must be programmed.

The output ModMastErrorAct reflects an actual error occurred in Modbus job. This output is only TRUE for one cycle. At that cycle the output ModMastErrorIDLast reflects the actual ErrorID from the ModRtuMast job. The ModMastErrorIDLast will keep this error ID until a new rising edge of the Enable input is given.

However, there are internal diagnosis variables available, which are not shown at any output, but can be accessed from the function block instance.

These additional diagnosis variables can be accessed by opening the function block instance or through the block visualization “VisuDrvModbusRTUBroadcast”.

- **iWriteErrCnt**: number of errors in write jobs since Enable = TRUE.
- **wLastWriteErno**: holds the error number of the last executed write job.

---

**For all drives, which are connected to same Modbus RTU line, one instance of broadcast block DrvModbusRtuBroadcast is enough and it must be connected to same LineToken of DrvModbusRtu function blocks which are used for communication between PLC and each drive on Modbus RTU line. All those communication function blocks of one Modbus RTU line must be linked together via one variable of type ModRtuTokenType, connected to the InOut LineToken. Via this variable the Modbus token is passed to the next drive / device, so only one drive / device at a time is communicating with the PLC.**
All the drives should be configured either in Classic Profile or Enhanced Profile and accordingly the function block DrvModbusRtuBroadcast should be parameterized. Mix of profile with few drives in Classic and few drives in Enhanced should not be used when using DrvModbusRtuBroadcast block, if using such configuration along with DrvModbusRtuBroadcast may lead to incorrect operation.

If the user changes drive profile while drive is online with PLC, function block outputs may give wrong indication.

The Modbus RTU broadcast job is sent to all devices on the same physical Modbus RTU line.

Therefore, if other Modbus devices than ACS / DCS drives are connected to the same line using the ModRtuToken communication block it’s highly recommended not to use the DrvModbusRtuBroadcast function block.

This might only be used, if the user is aware about the behavior of the connected devices if they receive the Modbus broadcast job.

If a Modbus RTU broadcast job is sent to access a register in the drive which has no valid mapping information then Modbus broadcast job is not aborted but will just send out the broadcast message without any error in the function block. This broadcast message is ignored by drives which have no valid mapping information.

Therefore, the drive parameters in FBA DATA OUT have to be configured according to the used ‘NvarWrite’ input number respectively.

- Please refer the respective drive / fieldbus module manual for the parameter settings if the drive setting is not mentioned in above table.
- ACS drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see also drive manuals which parameter must be set.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880
- Par 96.07 = 1

For ACSM1, DCS800 and DCS550 – Par 16.06 = 1
The function block 'DrvModbusReadWrite23' reads and writes one or more parameters of the drive via DriveData connected to Modbus TCP / Modbus RTU communication blocks with Modbus function code FCT = 23. This function block internally calls DrvModbusWrite to execute ReadWrite job with FCT = 23, used along with the internal structure for Fct23, DrvModFct23Type.

The number of parameters to be read is specified at the input 'NvarRead'. The first address for read operation is specified at the input 'PrmNumRead'. The values of the data are stored in the PLC memory area, defined at the input 'DataRead'.

The number of parameters to be written is specified at the input 'NvarWrite'. The first address for write operation is specified at the input 'PrmNumWrite'. The values of the data that should be written must be stored in the PLC memory area, defined at the input 'DataWrite'.

To start a new ReadWrite job the input Execute must be set from FALSE to TRUE (edge sensitive). The Modbus job is started from the communication block DrvModbusTcp or DrvModbusRtu which is connected to the same DriveData variable. It uses the Modbus function code 23 (Read and write n words). The drive (Modbus device) to which the parameter is written is specified at the Communication Block.

The values in the PLC memory area are updated when the ReadWrite job was performed without error. The ReadWrite job has been performed without error if JobDone = TRUE and ModMastErrorAct = FALSE.

If the Modbus job was finished with an error, the output ModMastErrorAct is set for one cycle. The Error ID returned by the Modbus job is shown at the output ModMastErrorIDLast. The output ModMastErrorIDLast will show that last Error ID until the input Execute is set from TRUE to FALSE.

After termination of this job, even if it was not successful, a next ReadWrite job can once again only be started with a rising edge at 'Execute' input.

Drive parameters are only saved temporarily, if changed via fieldbus. To make these changes permanent in the drive the special parameter "PARAMETER SAVE" must be set.

Please see drive manuals for the parameter details.

For ACS380, ACS480, ACS580, ACH580, ACQ580, ACS880 and DCS880 – Par 96.07 = 1

For ACM1, DCS800 and DCS550 – Par 16.06 = 1

### DrvControlModbusEng Diagram

- **DriveData Variable**
The function block DrvControlModbusEng is designed for user specific control of the drive by setting the Control Word (CW) by the user itself in the program. Therefore, the user should have a detailed knowledge of the ABB Drives Profile handling. The reference and actual values must be given in fieldbus equivalent, e.g. range -20000 ... +20000.

Inputs RefValue1, RefValue2 and the generated Control Word are written to the DriveData variable which transfers these values to a communication function block, e.g. DrvModbusRtu, DrvModbusTcp or DrvModbusRtuBroadcast communication function block writes to the drive. In the same way ActValue1, ActValue2 and the Status Word are transferred from the communication function block to the DrvControlModbusEng block, where they are written to the outputs.

The Control Word can be generated in 2 ways.

First way is to set the single bits of the Control Word separately at the inputs Off1, Off2 ... ControlWordB15 while the input UseControlWord = FALSE.

Second way is to set the input UseControlWord = TRUE and write the Control Word as a whole word directly to the input Control Word. The generated Control Word is written to the DriveData variable and for diagnosis purpose also available at output UsedControlWord.

The input and output names of the bits in Control Word and Status Word reflect the functions used with ABB Drive Profile. So the block should be used with ABB Drives Profile setting in the drive.

---

The function block does not execute any functionality expect data transfer to and from the DriveData variable. There is no special drive parameter setting necessary to use this block.

The programmer using this block should have a detailed understanding of how to set the Control Word according to the Status Word and the description of the used drive.

For standard speed and torque control application it is recommended to use the DrvControlModbusACS instead.
The function block DrvControlCANCiA402 is used for the control of ABB ACS Drive or non-ABB drives from AC500 using CANCiA402 profile. The CANopen CiA402 function block and visualization from the library can also be used for the 3rd party drives which comply to the CANopen CiA402 profile.
**Function: DrvModPara32Bit**

![Diagram of DrvModPara32Bit](image)

Creates the Modbus address for 32-bit parameters of the ACSxxx drives.

To access 32-bit parameters in ACSxxx drives using Modbus a special address calculation must be performed.

This block calculates the 6-digit address out of the 5-digit address used for 16-bit parameters.

Input is the 5-digit address: GGii, where GG = parameter group and ii = the index.

E.g. Par 12.02 ➔ address = 1202.

Output is the calculated address for 32-bit parameters according to the following rule:

\[
\text{DrvModPara32Bit} = 20000 + (200 \times GG) + (2 \times ii) \text{ e.g. Par. 14.54 ➔ output} = 22908
\]

This output can be connected directly to the input "PrmNum" of one of the blocks DrvModbusRead or DrvModbusWrite or inputs “PrmNumRead” and “PrmNumWrite” of the block DrvModbusReadWrite23.

**Structure: DrvDataType**

Structure DrvDataType is used for the DriveData variable to exchange the data for one drive.

Structure DrvDataType is used for the DriveData variable which must be connected to all function blocks related to the same drive.

Besides the element “sName” all variables should not be written by the user directly. They are read and written within the function blocks. The DrvDataType contains some more internal, invisible variables which are used for internal functionality and not meant for user access.

The following table shows the visible variables of DrvDataType.

Limits for the data read and write between AC500 and drives

The below table defines the limits for the reading of data from the drive and limits for writing data to drives from AC500.

If fieldbus adapter Plug (FBA) is used, then parameter group FBA DATA IN (e.g. 52) and group FBA DATA OUT (e.g. 53) is accessed in the drive. For the embedded fieldbus (EFB) parameters are used in EFB group (e.g. 58).

According to the table below, limits are defined for the variables ‘NVarRead’, ‘NVarWrite’ in DrvModbusRtu and DrvModbusTcp blocks.

1.4.2.3 PLCopen libraries

1.4.2.3.1 Common function block state machine

Most of the V3 function blocks follow the behavior model and style as recommended by PLC Open.

- Clear separation between “Edge triggered FBs” (“Execute”) or “Level triggered FBs” (“Enable”)
- Binary status outputs: “Done”, “Busy”, “Error” (exclusive)
- Standardized state machine
- CamelCase naming for function block and all inputs and outputs

Example: Edge_Triggered_Function_Block_EthOwnIP according to PLCopen
Currently the following “function block state machines” are used:

- “Edge Triggered” (Input “Execute”), for example EthOwnIP
- “Level Controlled” (Input “Enable”)
- “Level Controlled Continuous” (Input “Enable”, no “Done” output, for example PID)

In contrast to AC500 V2 POUs, either “Done” or “Error” is set, not both outputs at the same time in case of an error.

The state machines are explained in the following chapters.

Edge triggered (AbbETrig)

After a rising edge at the input “Execute” the state goes from “Dormant” to “Busy”. In the first cycle all inputs are sampled and stored. When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”.

The states “Done” or “Error” are stable for minimum one cycle and as long as “Execute” is “TRUE”. With a falling edge of “Execute”, the state goes via Reset to “Dormant”.

Description of standard inputs and outputs:

- “Execute”
  A rising edge starts the operation, the output “Busy” goes to “TRUE”. In the first cycle all other inputs are read and stored, afterwards they are ignored.
  A falling edge does not stop the operation.
  After “Done = TRUE” or “Error = TRUE” and “Execute = FALSE” all outputs will be reset.
- “Busy”
  Operation is running (while outputs “Done” and “Error” are “FALSE”)
- “Done”
  Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”
- “Error”
  Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”). This output is “TRUE” for at least one cycle or until “Execute” is set to “FALSE”.
  The output “ErrorID” gives more details about the error.
Level controlled (AbbLCon)

After a rising edge at the input “Enable” the state goes “Dormant” to “Busy”. All inputs are sampled and considered continuously.

When the task is completed successfully the state goes from “Busy” to “Done”.

In case of an error the state goes to “Error”.

The states “Done” or “Error” are stable for minimum one cycle and as long as “Enable is TRUE”. With a falling edge of “Enable”, the state goes via Reset to “Dormant”.

The Busy state can be aborted from outside by setting the “Enable” input to “FALSE”.

After Aborting is done the state goes back to “Dormant”.

Description of standard inputs and outputs:

- **“Enable”**
  A rising edge (“Enable = TRUE”) starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously. A falling edge (“Enable = FALSE”) aborts the operation.
  During Aborting the Busy is still “TRUE”. Afterward all outputs are reset.

- **“Busy”**
  Operation is running (while outputs “Done” and “Error” are “FALSE”)

- **“Done”**
  Operation is completed without error (while outputs “Busy” and “Error” are “FALSE”).
  This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”

- **“Error”**
  Operation is stopped with error (while outputs “Busy” and “Done” are “FALSE”).
  This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”.
  The output “ErrorID” gives more details about the error.

Level controlled continuous (AbbLConC)

This state machine is a special case of “Level Controlled”. Only difference is that this function block type is never done, for example a PID which never stops.

Therefore these function blocks have no “Done” output.
Description of standard inputs and outputs:

- "Enable"
  A rising edge ("Enable = TRUE") starts the operation, the output “Busy” goes to “TRUE”. All other inputs are read and considered continuously.
  A falling edge ("Enable = FALSE") aborts the operation.
  During Aborting the “Busy” is still “TRUE”. Afterward all outputs are reset.
- "Busy"
  Operation is running (while output “Error is FALSE”)
- "Error"
  Operation is stopped with error (while output “Busy is FALSE”).
  This output is “TRUE” for at least one cycle or until “Enable” is set to “FALSE”. The output “ErrorID” gives more details about the error.

**Error_ID**

Each library contains an enumeration “ERROR_ID”, which is valid for this library but not across all libraries

Only the following errors are unique:

- 16#5FFF FATAL_ERROR from state machine
- 16#4000 errors are used for input errors, same scheme like in V2:

**4000hex...4FFFhex - Block Input Error**

The error 4xoxhex is used in case of detected Function Block input parameter errors. The error is structured as follows:

![Error Structure Diagram]

- 0 = Invalid value
- 1 = Value too low
- 2 = Value too high
- 3 = Wrong combination of the parameters
- 1..FF = Number of the input
Compatibility with V2 function blocks

In order to ensure compatibility with V2 applications a lot of ABB function blocks are delivered together with a compatible version in classic style:

Names in CAPITAL letters, input “EN” and outputs “DONE”, “ERR” and “ERNO”:

The classic blocks internally use the PLCopen style function blocks. The inputs and outputs are mapped in the following way:

1.4.2.4 Motion control library

1.4.2.4.1 Preconditions for the use of the libraries

The user has to read the following instructions and documents before using the libraries:

- All pertinent state, regional, and local safety regulations must be observed when installing and using this product. When functions or devices are used for applications with technical safety requirements, the relevant instructions must be followed.
- Read the complete safety instructions of the user's manuals for the drives you are using, before installation and commissioning.
- Read all safety instructions of the AC500 PLC. See System description AC500 or chapter Regulations "Regulations" on page 2238 in the online help.
- Read the Important user Information. See chapter Safety Instructions in the online help "Safety instructions" on page 2230.

The version 1.0.0.x of the Motion Control Library Package PS5611-Motion has been released for:

- AC500 V3 PLCs, FW version 3.3.1x or higher
- Automation Builder version 2.3.x or higher

The PS5611-Motion libraries have been tested with the following product / firmware / software versions:
CM579-ETHCAT EtherCAT Communication Module firmware 4.4.3.21 or higher
ABB e190 Drive
CD522 module

In no event will ABB or its representatives be liable for loss of data, profits, revenue or consequential, incidental or other damage that may result from the use of other versions of product / software / firmware versions. The error-free operation of the PS5611 - Motion with other devices / software / firmware versions should be possible but can not be guaranteed and may need adaptations e.g. of example programs.

CAUTION!
Generally, the user in all applications is fully and alone responsible for checking all functions carefully, especially for safe and reliable operation.

The Function Blocks contained in the library can only be executed in RUN mode of the PLC, but not in simulation mode.

1.4.2.4.2 Overview
The PS5611-Motion is a Motion Control library for AC500 V3 CPUs, to create Motion Control applications based on Function Blocks according to the standard of PLCopen Motion Control Chapter 1.4.2.4.3 “PLCopen” on page 2033. These Function Blocks can be used for PLC-based Motion Control and cover a wide range of possible Motion Control functionalities. Starting from single axis movements to master-follower axes to perform electronic gearing and CAM functions.

This documentation contains the following chapters:
● Overview
In the subsequent chapters general informations are provided for a better understanding of Motion Control with AC500 PLC and PS5611-Motion. There is also a tabular overview of the available PLCopen Function Blocks and their compatibility with PLC-based Motion Control and the provided drive-based Motion Control axis implementations.
● PLCopen
The principle of the PLCopen Motion Control standard is explained as well as how PLCopen Function Blocks can be used to create PLC Motion Control application programs.
● PLC-based Motion Control
This chapter explains how PLC-based Motion Control with AC500 can be realized and how it can be used in combination with the available PLCopen Function Blocks.

Functionality of each function block is defined in the integrated documentation of the library.

Motion control with PS5611-Motion
With PS5611-Motion different Motion Control system structures are possible. Independent of the system structure a typical Motion Control application consists of the following system elements:
• An application program which contains PLCopen Function Blocks that defines the general application behavior and logics.
• A profile generator which generates a position profile based on the dynamic specifications of the application program to guide the axis to the desired positions.
• A position control loop which outputs a speed reference signal to minimize the following error.

To achieve the best system structure for an application these components can be separated into different devices. Each type of structure has its own kind of interface and type of signals which need to be transferred between the interacting devices.

All shown Motion Control system structures (central Motion Control with or without position control loop) can be combined together in the same application program for a Motion Control project.

PLC-based motion control

With PS5611-Motion the application program and also the profile generator are realized in the PLC. The implementation of the profile generator is based on a set of Function Blocks which are named Central Motion Control (CMC).

The profile generator of many possible axes is centrally placed inside the AC500 PLC. Therefore multi-axis motion functionalities become easily available and can be accessed by PLCopen Function Blocks. As a result, Motion Control functionalities are almost drive independent.

Available motion control functionalities:
• Simple axis Movements
• Electronic Gearin
• Electronic CAMs
• Position Profiles
• Velocity Profiles
• Acceleration Profiles

Then the output is a position reference signal which the drive will follow. A new position reference value will be calculated with every cycle of the PLC and has to be transferred to the drive, which demands real time capabilities to the PLC and to the communication channel. A real time fieldbus like EtherCAT is needed. The feedback of the actual position can be used for supervision purposes during operation and is needed to adjust the value of the position reference before the drive will be enabled.

AC500 as Motion Controller (Central Motion Control)

![System structure of PLC-based Motion Control with AC500 PLC and PS5611-Motion](image)
With PLC-based Motion Control it is also possible to include the position control loop to the AC500 PLC. In this case a speed reference signal will be transferred to the drive, which makes it possible to perform the full range of motion functionalities with standard drives. To close the position control loop, feedback of the actual position is mandatory.

**Overview of PLCopen function blocks**

The following tables give an overview of the defined Function Blocks, divided into administrative (not driving motion) and motion related sets. They give an overview which Function Block could be used for the different possible configurations.

These Function Blocks are part of the library ABB_MotionControl_AC500.library.

If there are restrictions concerning a certain drive ("XXX") which lead to a different or limited behaviour compared to the standard the respective chapter is supplemented with an additional paragraph "Notes for XXX".

The “KERNEL” Function Blocks are available in two variants.
The CMC_Estp_Kernel block is solely to be used in AC500-eCo V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs.

The CMC_Basic_Kernel block is designed to be used in standard V3 PLCs, and can either work with drives connected to a fieldbus or IOs.

### Overview of libraries

- Add the following libraries for the listed applications.
  - In some cases by adding a library, there will be other libraries added automatically.

<table>
<thead>
<tr>
<th>Application</th>
<th>Library to be added manually</th>

</tr>
<tr>
<td>Motion control with Eco V3 (CMC_Estp_Kernel)</td>
<td>ABB_MotionControlEco_AC500.library</td>
</tr>
</tbody>
</table>

The features of the Function Blocks provided with PS5611-Motion can be used from the PLC program according to PLCopen standard. Different drives and different Motion Control realizations could be used and can be combined with each other as well as different fieldbusses. ABB_Ecat_CiA402_AC500.library is editable and can be adapted based on the drive configuration and drive type.
Overview of data types

The following data types are used for the Motion Control library. The data types are defined in the library file ABB_MotionControl_AC500 compiled-library. The corresponding elements can be used for the Function Blocks inputs.

**Naming of function blocks and data structures**

**PLCopen**

All Function Blocks named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation. They may have additional inputs but according to PLCopen rules.

All Function Blocks named MCA_xxx are implemented corresponding to PLCopen rules with adaptations specific to AC500. They are AC500 specific extensions to the PLCopen library.
**PLC-based motion control**

All Function Blocks named CMC_xxx belong to the implementation of PLC-based Motion Control.

All data types named CMC_xxx belong to the implementation of PLC-based Motion Control.

All data types named MC_xxx are implemented according to PLCopen definition and follow the PLCopen documentation.

All data types named AXIS_xxx exist according to PLCopen definition. The content is ABB specific and not documented.

All Function Blocks named zCMC_xxx belong to the implementation of PLC-based Motion Control. These are not documented and not intended for customer use.

**Auxiliaries**

All Function Blocks named xxx_APP are not write protected and may be modified for adaptations.

### 1.4.2.4.3 PLCopen

Based on application requirements and project specifications, engineers are required to use or select a wide range of Motion Control hardware. In the past, this required unique software to be created for each application even though the functions are the same. PLCopen motion standard provides a way to have standard application libraries that are reusable for multiple hardware platforms. This lowers development, maintenance, and support costs while eliminating confusion. In addition, engineering becomes easier, training costs decrease, and the software is reusable across platforms. Effectively, this standardization is done by defining libraries of reusable components. In this way, the programming is less hardware dependent, the reusability of the application software increases, the cost involved in training and support reduced, and the application becomes scalable across different control solutions. Due to the data hiding and encapsulation, it is usable on different architectures, for instance ranging from centralized to distributed or integrated to networked control. It is not specifically designed for one application, but will serve as a basic layer for ongoing definitions in different areas. As such, it is open to existing and future technologies.

ABB is a member of the PLCopen organization. More information about PLCopen can be read on the [PLCopen website](https://www.plcopen.org).

![PLCopen logo](image)

**Fig. 28: PLCopen Motion Control logo**

Function Blocks according to PLCopen are designed for controlling axes via the language elements consistent with those defined in the IEC 61131-3 standard. It was decided by the task force that it would not be practical to encapsulate all the aspects of one axis into only one Function Block. The retained solution is to provide a set of command-oriented Function Blocks that have a reference to the axis, e.g., the abstract data type Axis, which offers flexibility, ease of use, and reusability.

Implementations based on IEC 61131-3 (for instance via Function Blocks and SFC) will be focused towards the interface (look-and-feel/proxy) of the Function Blocks. This specification does not define the internal operation of the Function Blocks.
PLCopen Motion Control Function Blocks can be used in any IEC 61131-3 programming language. The following picture shows an example of a Function Block used in Function Block Diagram (FBD) language.

![Diagram of HC_MoveAbsolute Function Block](image)

Fig. 29: Command for absolute positioning according to PLCopen standard

Application programs which use the manufacturer independent function blocks according to PLCopen will lead to the following advantages:

- Reuseable software structure for different platforms.
- Programming based on Function Blocks.
- Function Blocks can be used in any IEC 61131-3 language.

All function blocks which are defined by PLCopen will have the following qualities independently to the manufacturer of the motion control system:

- Same inputs/outputs
- Same functional behavior
- Same name

The following parts of the PLCopen motion control definition are completely or partly included in this product:

- Part 1: Function Blocks for Motion Control
- Part 2: Extensions
- Part 3: User Guidelines
- Part 4: Homing Procedures

**Programming guidelines**

This chapter explains some rules on the usage of the libraries and the structure Axis_Ref.

- A general rule is that all Function Blocks which are used for a specific drive are to be used in the same PLC-task. When multitasking is used for the PLC, it is allowed to have different drives in different tasks, but all blocks belonging to a specific drive need to be in the same task. There is no multithreading protection for the Axis_Ref instance.

- If Axis_Ref is used as input on a user defined Function Block or program or function, always use it as VAR_IN_OUT and never use it as VAR_INPUT or VAR_OUTPUT. The reason is that this would
  - Break the consistency and destroy data.
  - Consume a lot of computing power by copying data.

- The "Min update time" update time for the fieldbus, defined under PLC Configuration > Couplers[FIX] > [fieldbus master type] must not exceed the half of the scantime of the PLC-task. For example, if scantime of PLC-task is 5 ms, "Min update time" should not be greater than 2 ms.

- Any instance of a Function Block should be called only once per cycle and in only one specific task.

If the instance is used in several tasks, it has to be checked that is not called several times. Because this could corrupt the handshake from Function Block to Axis_Ref to CMC_Basic_Kernel and vice versa.
- Some PLCopen Function Blocks are only allowed to be called within the same task as the CMC_Basic_Kernel Function Block. This is mentioned in the Function Block descriptions.
- If PLCopen Function Blocks are called from a different task, they cycle time should be at least 2 times the cycle time for CMC_Basic_Kernel Function Block is.

### Axis data type Axis_Ref

The Axis_Ref is a structure that contains information on the corresponding axis. It is used as a VAR_IN_OUT in all Motion Control Function Blocks defined in this document. The content of this structure is implementation dependent and can ultimately be empty. If there are elements in this structure, the supplier shall support the access to them, but this is outside of the scope of this document. The refresh rate of this structure is also implementation dependent. According to IEC 61131-3 it is allowed to switch the Axis_Ref for an active Function Block, for instance from Axis1 to Axis2. However, the behavior of this can vary across different platforms, and is not encouraged to do.

**Axis_Ref data type declaration:**

```plaintext
TYPE Axis_Ref : STRUCT

(Content is implementation dependent)
END_STRUCT
```

### Example

```plaintext
TYPE Axis_Ref : STRUCT
AxisNo: UINT; AxisName: STRING (255);
……..
END_STRUCT
```

### The single axis state diagram

The following diagram normatively defines the behavior of the axis at a high level when multiple motion control Function Blocks are simultaneously activated. This combination of motion profiles is useful in building a more complicated profile or to handle exceptions within a program. (In real implementations there may be additional states at a lower level defined). The basic rule is that motion commands are always taken sequentially, even if the PLC had the capability of real parallel processing. These commands act on the axis' state diagram.

The axis is always in one of the defined states (see diagram below). Any motion command that causes a transition changes the state of the axis and, as a consequence, modifies the way the current motion is computed. The single axis state diagram is an abstraction layer of what the real state of the axis is, comparable to the image of the I/O points within a cyclic (PLC) program. A change of state is reflected immediately when issuing the corresponding motion command.

The response time of immediately is system dependent, coupled to the state of the axis, or an abstraction layer in the software.

The diagram is focused on a single axis. The multiple axis Function Blocks, MC_CamIn, MC_GearIn and MC_Phasing, can be looked at, from a single axis state diagram point of view, as multiple single-axes all in specific states. For instance, the CAM-master can be in the state Continuous Motion. The corresponding slave is in the state Synchronized Motion. Connecting a slave axis to a master axis has no influence on the master axis.

The state Disabled describes the initial state of the axis. In this state the movement of the axis is not influenced by the Function Blocks. The axis feedback is operational. If the MC_Power Function Block is called with Enable=TRUE while being in state Disabled, this either leads to Standstill if there is no error inside the axis, or to ErrorStop if an error exists.
Calling MC_Power with Enable=FALSE in any state, the axis goes to the state Disabled, either directly or via any other state. If a motion generating Function Block controls an axis, while the MC_Power Function Block with Enable=FALSE is called, the motion generating Function Block is aborted (CommandAborted).

The intention of the state ErrorStop is that the axis goes to a stop, if possible. There are no further inputs from Function Blocks accepted until a reset has been done from the ErrorStop state.

The transition Error refers to errors from the axis and axis control, and not from the Function Block instances. These axis errors may also be reflected in the output of the Function Blocks instances errors.

Issuing MC_Home in any other state than StandStill will go to ErrorStop, even if MC_Home is issued from the state Homing itself.

Function Blocks which are not listed in the single axis state diagram do not affect the state of the axis, meaning that whenever they are called the state does not change. They are: MC_ReadStatus; MC_ReadAxisError; MC_ReadParameter; MC_ReadBoolParameter; MC_WriteParameter; MC_WriteBoolParameter; MC_ReadActualPosition and MC_CamTableSelect.

Calling the Function Block MC_Stop in state StandStill changes the state to Stopping and back to Standstill when Execute = FALSE. The state Stopping is kept as long as the input Execute is true. The output Done is set when the stop ramp is finished.
1. In this state ErrorStop or Stopping, all Function Blocks can be called, although they will not be executed, except MC_Reset and Error – they will generate the transition to StandStill or ErrorStop respectively.

2. Power.Enable = TRUE and there is an error in the Axis.

3. Power.Enable = TRUE and there is no error in the Axis.

Visualizations

For usage with the PLCopen Library, a set of visualization objects is defined. These visualizations use the placeholder concept, which means that they could be used in an actual visualization several times and be instantiated by replacing the “placeholder” with an effective data-structure.

Two types of visualizations exist:

- As placeholder, an instance of Axis_Ref should be used. These are named: MC_VISU_Axis_name. Here the name could be statemachine or its actual.
- As placeholder, an instance of the respective PLCopen Function Block should be used. These visualizations are named MC_VISU_FB_name where "name" could be MoveAbsolute or MoveVelocity, so the complete element is named MC_VISU_FB_MoveAbsolute or MC_VISU_FB_MoveVelocity.

The background colour and the colour for the title of each element could be changed. The colours are defined in some global predefined variables in MC_VISU_COLOR_INFORMATION. By changing these values, different colours will be used.

**MC_VISU_COLOR_INFORMATION (GVL)**

Below, some existing visualizations are shown.

**MC_VISU_Axis_StateMachine** This shows the statemachine of the axis according to PLCopen definition. The active state is shown green except the ErrorStop which is shown red. Usually, it starts with Disabled. When no remote connection to the drive is available, it will switch to ErrorStop immediately.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

**MC_VISU_Axis_actual** This object shows some actual values.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.
**MC_VISU_Axis_FB_error**  
This object shows the error information connected to the PLCopen Function Blocks. This is NOT a drive error. If no error occurs in the execution of a Function Block, just the name is shown. If an error occurred, it shows the name of the Function Block as well as the error number and a short description. In the example below, the MC_Power Function Block recognized that no fieldbus connection to the drive was available.

The Placeholder of this visualization has to be connected to an instance of the data type Axis_Ref.

### Error codes

Besides the diagnosis information of the drive which is described in the respective drive documentation, there are a number of error codes directly related to the Function Blocks. These error codes are displayed at the output “ErrorID” of the Function Block.

</tbody>
</table>
Error handling

All access to the drive/motion control is via Function Blocks. Internally these Function Blocks provide basic error checking on the input data. Exactly, how this is done is implementation dependent. For instance, if MaxVelocity is set to 6000, and the Velocity input to a Function Block is set to 10,000, a basic error report is generated. In the case where an intelligent drive is coupled via a network to the system, the MaxVelocity parameter is probably stored on the drive. The Function Block must take care of the errors generated by the drive internally. With another implementation, the MaxVelocity value could be stored locally. In this case the Function Block will generate the error locally.

Both centralized and decentralized error handling methods are possible when using the motion control Function Blocks.

Centralized error handling is used to simplify programming of the Function Block. Error reaction is the same independent of the instance in which the error has occurred.

Decentralized error handling gives the possibility of different reactions depending on the Function Block in which an error occurred.
Fig. 32: Function Blocks with decentralized error handling

PLCopen parameter

Additional parameters are available by ReadParameter and WriteParameter Function Blocks.

General restrictions

Restrictions for the available function blocks

- As buffered mode, MC_Aborting is realized as a default. This does NOT mean that the axis stops when another movement is started while an ongoing movement is still active. It means instead that the new movement will take control immediately and change the velocity to its own velocity by using its own acceleration or deceleration.
- The buffered mode MC_Buffered could be reached with using the axis state StandStill as enable signal for the Execute of the next block.
- From the Extended Inputs and Outputs at the Function Blocks, the following are not realized:
  - BufferedMode: The realization just supports the MC_Aborting mode.
  - The following Outputs at ReadStatus are not supported: ConstantVelocity, Accelerating and Decelerating.
  - TorqueLimit for Homing Function Blocks.
**MC_Aborting Mode**

The diagram shows the behavior with BufferMode MC_Aborting, which is the only available BufferMode. When the second Block is activated, it will take control and will continue on its own velocity. The velocity is changed by using the acceleration value from the second Function Block. The movement will not be stopped in between. The first Function Block shows CommandAborted when the second Function Block is activated.

**MC_Buffered**

A behavior according to BufferMode MC_Buffered could be reached by using the Done output from the first Function Block to enable the Execute of the second Function Block.

### Behavior of the function block inputs and outputs

#### General rules

**Table 376: General rules**

| Output exlusivity | The outputs Busy, Done, Error, and CommandAborted are mutually exclusive:
<p>|                  | Only one of them can be TRUE on one Function Block. If Execute is TRUE, one of these outputs has to be TRUE. Only one of the outputs Active, Error, Done and CommandAborted is set at the same time. |
| Output status     | The outputs Done, InGear, InSync, InVelocity, Error, ErrorID and CommandAborted are reset with the falling edge of Execute. However, the falling edge of Execute does not stop or even influence the execution of the actual Function Block. It must be guaranteed that the corresponding outputs are set for at least one cycle if the situation occurs, even if execute was reset before the Function Block completed. If an instance of a Function Block receives a new execute before it has finished (as a series of commands on the same instance), the Function Block will not return any feedback, like Done or CommandAborted, for the previous action. |
| Input parameters  | The parameters are used with the rising edge of the execute input. To modify any parameter, it is necessary to change the input parameter(s) and to trigger the motion again. |
| Missing input parameters | According to IEC 61131-3, if any parameter of a Function Block input is missing (open) then the value from the previous invocation of this instance will be used. In the first invocation the initial value is applied. |
| Position versus distance | Position is a value defined within a coordinate system. Distance is a relative measure related to technical units. Distance is the difference between two positions. |
| Sign rules | Velocity, Acceleration, Deceleration and Jerk are always positive values. Position and Distance can be both positive and negative. |
| Error Handling Behavior | All Function Blocks have two outputs, which deal with errors that can occur while executing that Function Block. These outputs are defined as follow: |
|                  | Error Rising edge of Error informs that an error occurred during the execution of the Function Block. |
|                  | ErrorID: Error number |</p>
<table>
<thead>
<tr>
<th><strong>Function Block Naming</strong></th>
<th>In case of multiple libraries within one system (to support multiple drive/motion control systems), the Function Block naming may be changed to MC_FunctionBlockName_SupplierID.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Behavior of Done output</strong></td>
<td>The outputs Done, InGear, InSync... are set when the commanded action has been completed successfully. With multiple Function Blocks working on the same axis in a sequence, the following applies: When one movement on an axis is interrupted with another movement on the same axis without having reached the final goal, Done of the first Function Block will not be set.</td>
</tr>
<tr>
<td><strong>Behavior of CommandAborted output</strong></td>
<td>CommandAborted is set, when a commanded motion is interrupted by another motion command. The reset-behavior of CommandAborted is like that of Done. When CommandAborted occurs, the other output-signals such as InVelocity are reset.</td>
</tr>
<tr>
<td><strong>Inputs exceeding application limits</strong></td>
<td>If a Function Block is commanded with parameters which result in a violation of application limits, the instance of the Function Block generates an error. The consequences of this error for the axis are application specific and thus should be handled by the application program.</td>
</tr>
<tr>
<td><strong>Behavior of Busy output</strong></td>
<td>Every Function Block can have an output Busy, reflecting that the Function Block is not finished. Busy is SET at the rising edge of Execute and RESET when one of the outputs Done, Aborted, or Error is set. It is recommended that this Function Block should be kept in the active loop of the application program for at least as long as Busy is true, because the outputs may still change. For one axis, several Function Blocks might be busy, but only one can be active at a time. Exceptions are MC_SuperImposed and MC_Phasing, where more than one Function Block related to one axis can be active.</td>
</tr>
<tr>
<td><strong>Output Active</strong></td>
<td>The output Active is required on buffered Function Blocks. This output is set at the moment the Function Block takes control of the motion of the according axis. For un-buffered mode the outputs Active and Busy can have the same value.</td>
</tr>
<tr>
<td><strong>Enable and Valid/Status</strong></td>
<td>The input Enable is coupled to output Valid. Enable is level sensitive, and Valid shows that a valid set of outputs is available at the Function Block. The output Valid is TRUE as long as an output value of Valid is available and the input Enable is TRUE. The relevant output value can be refreshed as long as the input Enable is TRUE. If there is a Function Block error, the output is not Valid (Valid set to FALSE). When the error condition disappears, the values will reappear and output Valid will be set again.</td>
</tr>
</tbody>
</table>
Why is the command input edge sensitive?

The input Execute for the different Function Blocks described in this document always triggers the function with its rising edge. The reason for this is that with edge triggered Execute new input values may be commanded during execution of a previous command. The advantage of this method is a precise management of the instant a motion command is performed. Combining different Function Blocks is then easier in both centralized and decentralized models of axis management. The output Done can be used to trigger the next part of the movement. The example given below is intended to explain the behavior of the Function Block execution.

The following figure illustrates the sequence of three Function Blocks First, Second and Third controlling the same axis. These three Function Blocks could be for instance various absolute or relative move commands. When First is completed the motion its rising output First.Done triggers Second.Execute. The output Second.Done AND In13 triggers the Third.Execute.
The input ContinuousUpdate

Like described in the previous chapter, the input Execute triggers a new movement. With a rising edge of this input the values of the other Function Block inputs are defining the movement. Until version 1.1 of PLCopen there was the general rule that a later change in these input parameters does not affect the ongoing motion.

Nevertheless, there are numerous application examples, where a continuous change of the parameters are needed. The user could retrigger the input Execute of the Function Block, but this complicated the application.

Therefore, the input ContinuousUpdate has been introduced. It is an extended input to all applicable Function Blocks. If it is TRUE, when the Function Block is triggered (rising Execute), it will - as long as it stays TRUE – make the Function Block use the current values of the input variables and apply it to the ongoing movement. This does not influence the general behavior of the Function Block nor does it impact the single axis state diagram. In other words it only influences the ongoing movement and its impact ends as soon as the Function Block is no longer Busy or the input ContinuousUpdate is set to FALSE.
It can be that certain inputs like BufferMode are not really intended to change every cycle. However, this has to be dealt with in the application, and is not forbidden in the specification.

If ContinuousUpdate is FALSE with the rising edge of the input Execute, a change in the input parameters is ignored during the whole movement and the original behavior of previous versions is applicable. The ContinuousUpdate is not a retriggering of the input Execute of the Function Block. A retriggering of a Function Block which was previously aborted, stopped, or completed, would regain control on the axis and modify its single axis state diagram. Opposite to this, the ContinuousUpdate only effects an ongoing movement. Also, a ContinuousUpdate of relative inputs (e.g. Distance in MC_MoveRelative) always refers to the initial condition (at rising edge of Execute).

Example

- MC_MoveContinuousRelative is started at Position 0 with Distance 100, Velocity 10 and ContinuousUpdate set TRUE. Execute is Set and so the movement is started to position 100.
- While the movement is executed (let the drive be at position 50), the input Distance is changed to 130, Velocity 20.
- The axis will accelerate (to the new Velocity 20) and stop at Position 130 and set the output Done and does not accept any new values.

Unit of length

The only specification for physical quantities is made on the unit of length (noted as [u]) that is to be coherent with its derivatives i.e. (velocity [u/s]; acceleration [u/s²]; jerk [u/s³]). Nevertheless, the unit [u] is not specified (manufacturer dependent). Only its relations with others are specified.

Aborting versus buffered modes

Some of the Function Blocks have an input called BufferMode. With this input, the Function Block can either work in a Non-buffered mode (default behavior) or in a Buffered mode. The difference between those modes is when they should start their action:

- A command in a non-buffered mode acts immediately, even if this interrupts another motion,
- A command in a buffered mode waits till the current Function Block sets its output Done (or InPosition, InVelocity...).
- The library just supports the mode "aborting" (MCAborting)

The following examples describe the different behavior of these modes:
Example 1:
Standard behaviour of two following absolute movements

Fig. 35: Basic example with two MC_MoveAbsolute on same axis
Fig. 36: Timing diagram for example above without interference between Function Block 1 and Function Block 2

</tbody>
</table>
Fig. 37: Timing diagram for example above with Function Block 2 interrupting Function Block 1 (McAbort Mode)
If an on-going motion is aborted by another movement, it can occur that the braking distance is not sufficient due to deceleration limits.

In rotary axis, a modulo can be added. A modulo axis could go to the earliest repetition of the absolute position specified, in cases where the axis should not change direction and reverse to attain the target position.

In linear systems, the resulting overshoot can be resolved by reversing, as each position is unique and therefore there is no need to add a modulo to reach the correct position.
Examples

Example: A function block instance controls different motions of an axis

The following figure shows an example where the Function Block 1 is used to control AxisX with three different values of Velocity. In a Sequential Function Chart (SFC) the velocity 10, 20, and 0 is assigned to V. To trigger the input Execute with a rising edge the variable E is step-wise set and reset.

Fig. 38: Single Function Block with SFC

The following timing diagram explains how it works:
Fig. 39: Timing diagram for a usage of single Function Block

The second InVelocity is set for only one cycle because the Execute has gone low before the ActualVelocity equals CommandedVelocity.
Different instances related to the same axis can control the motions on an axis. Each instance will then be responsible for one part of the global profile.

**Example: Different function blocks instances control the motions of an axis**

![Cascaded Function Blocks Diagram]

*Fig. 40: Cascaded Function Blocks*

The timing diagram:
Fig. 41: Cascaded Function Blocks timing diagram
A corresponding solution written in LD looks like:

Fig. 42: Cascaded Function Blocks with LD
1.4.2.4 PLC-based motion control

PLC-based motion control architecture

With the Function Blocks of motion library a Motion Control profiler can be used inside the PLC. As shown in the following figure it is needed to provide the actual position of the drive. The output can be either a position or a velocity reference signal. The used output signal will then be used to move the axis in the desired way.

![Diagram of Compact Motion Kernel Function Block](image)

There are 2 possibilities to send a reference value to the drive:

- When the position control loop is closed by the PLC by a CMC_Basic_Kernel Function Block, the output Speed_Reference should be connected to the drive. The value of Speed_Reference can be scaled with the axis parameters Max_Rpm and Ref_Max.
- When the position control loop is closed by the drive, the output Position_Reference should be connected to the drive. The unit for the output Position_Reference is incremented as well as the input Drive_ActualPosition.

![Diagram of Application and Implementation Layers](image)

Fig. 43: Architecture for centralized Motion Control

In general the programming of a machine consists of two layers as shown in the figure above. In the application layer Function Blocks according to PLCopen Motion Control are used to program the application sequences with all necessary types of movements and administrative commands. Due to the standard PLCopen Motion Control this can be reused in any other machine programs that used PLCopen Function Blocks.
The axis implementation layer is responsible for the execution of the commands from the application layer and can be programmed for each axis in a different way depending on the used hardware components.

### Table 377: Needed function blocks for an application with PLC-based Motion Control

In case the velocity reference value is used from the kernel Function Block the position control loop is closed inside the drive. In this case, it is necessary to adjust the related parameters from the parameters Function Block. When the position reference will be used the position control loop is closed inside the drive. In this case, the internal control loop is just used to monitor the position and velocity.

*When the position reference is used for the drive the following aspects have to be taken care of:*
  - It is necessary to use a real time fieldbus, like EtherCAT.
  - The PLC cycle has to be synchronized to the fieldbus cycle.
  - The task calculation times may not exceed the used cycle time.

The drive’s status should be managed by a specialized Function Block that supports the used type of drive as shown in the figure above. The kernel Function Block is the main Function Block which is needed to operate an axis with PLC-based Motion Control. It must be used with the parameter Function Block which is the interface to input parameters which are used to setup the axis.
The drive has to be accessed outside the CMC_Basic_Kernel Function Block. Actual values and reference values might be transferred by a synchronized fieldbus or by I/Os. The Function Block CMC_Basic_Kernel has to be called every cycle and at least once before any Function Block MC... is activated.

The following figure shows an example with an axis simulation. The main data signals are drawn in bold lines. Here, the drive will receive a speed reference signal which means that the position control loop is closed inside the PLC by the Compact Motion Function Blocks. The time behaviour of the simulated drive can be set by the parameter T1 at the axis simulation Function Block. If the time constant is too slow and the axis parameter Control_Time is too short the simulated axis will run into instability – like a real drive. Sample values:

A different option to create a virtual or simulated axis is to engage the Enable_Virtual input at CMC_Basic_Kernel. This virtual axis will follow the speed reference without additional delay, whereas the CMC_Axis_Simu creates a first order delay.
The following figure shows an example with a CiA402 drive on an EtherCAT network. The main data signals are drawn in bold lines. Here, the drive will receive a position reference signal which means that the position control loop is closed inside the drive.

In this example the main signals are to be transferred via EtherCAT network. The drive control Function Block for the Microflex e190 can be found in the ABB_Ecat_CiA402_AC500.library.

**Kernel function block**

**Kernel Arithmetic**

The “KERNEL” Function Blocks are available in two variants.

The CMC_Estp_Kernel block is solely to be used in eco-V3 CPUs and to make use of the integrated stepper-IO. It connects automatically to the internal IOs.

The CMC_Basic_Kernel block is designed to be used in any V3 PLCs and can either work with drives connected to a fieldbus or IOs.
How does the parameter for jerk influence the axis movements

The diagram shows the result with different jerk values and the same velocity and acceleration. The time needed for acceleration with jerk=0 is:

\[ \text{Time1}=\frac{\text{velocity}}{\text{acceleration}}=(20/100)\text{s}=0.2\text{s} \]

The additional time with jerk=500 will be:

\[ \text{Time2}=\frac{\text{acceleration}}{\text{jerk}}=(100/500)\text{s}=0.2\text{s} \]

So the total time is:

\[ \text{Time}=\text{Time1}+\text{Time2}=0.2\text{s}+0.2\text{s}=0.4\text{s} \]

In the last example with jerk=100, the velocity and acceleration values are not reached.

Basic functionalities

How to connect a drive

The connection to a drive must be done with the inputs and outputs of the Function Block CMC_Basic_Kernel. All inputs and outputs of the kernel Function Block with the prefix “Drive_” are intended to be used with a drive, but in some cases not all of them are needed. In all cases the input Drive_ActualPosition has to be connected with the actual position of the axis. This value can be received by an IO module of the PLC or via a fieldbus.
Depending on which device closes the position control loop either the output Speed_Reference or Position_Reference output has to be used. The value of Speed_Reference can be connected to an analog output module or be transferred via a fieldbus. The value of Position_Reference should be exclusively sent via a real-time fieldbus like EtherCAT.

Example 1: Analog drive - Motor with incremental encoder

In this example the position control loop will be closed by the PLC, therefore the input Drive_ActualPosition and the output Speed_Reference are to be used.

In combination with the IO module CD522 and the corresponding Function Block CD522Encoder32Bit the position of the encoder can be used. For the effective resolution of the encoder parameter Inc_Per_R of the parameter Function Block has to be used.

The output Speed_Reference can be written directly to the global variable of an output channel of an analog module but can also be transferred via a fieldbus. The scaling of this output value can be done with the parameters Ref_Max and Max_Rpm of the Function Block CMC_Axis_Control_Parameter_Rial.

The scaling of the Speed_Reference value can be set with the inputs Ref_Max and Max_Rpm of the parameter Function Block.

In order to finish a homing sequence which is done by the Function Block MC_StepRefPulse the outputs Drive_Set_Ref and Drive_Set_Position from the kernel Function Block have to be connected with the inputs EN_RPI and START_VALUE of the CD552 IO module Function Block. Also the output RdyRpi of the CD552 IO module Function Block has to be connected with Drive_Ref_Ok from the kernel Function Block.

To enable and disable the drive Drive_Release could be connected to a binary output to activate the drive. Drive_InOperation could be connected to a binary input to get the information that Drive_Release was successful.
In this example the position control loop will be closed by the drive, therefore the input 
Drive_ActualPosition and the output Position_Reference are to be used. The inputs referring to 
the position control loop of the parameter Function Block do not have to be set.

For the effective resolution of the motor’s encoder parameter Inc_Per_R of the parameter 
Function Block has to be adjusted.

To enable and disable the drive Drive_Release and Drive_InOperation have to be connected to 
the control Function Block ECAT_CiA402_Control_App of the library 
ABB_Ecat_CiA402_AC500.library, which controls the status and control word of the drive.

All Function Blocks from this library are not password protected and free to be changed in 
order to be adapted for different drives. The library and the Function Blocks are marked with 
the ending _APP.

To enable and disable a drive

In order to enable a drive the Function Block MC_Power has to be used within the applicational 
layer. The kernel Function Block will then, if possible, output a rising edge on the output 
Drive_Release which can be connected to the drive-control Function Block which performs the 
needed actions on the drives control word to enable the drive. As soon the drive states enabled, 
this signal can be connected to the input Drive_In_Operation of the kernel Function Block. The 
axis state according to the single axis state diagram of PLCopen will then switch from Disabled 
to Standstill.

Fig. 45: Enabling sequence of a drive
As long as the drive is in state Disabled or ErrorStop the input Drive_Actual_Position will be copied to the output Position_Reference of the kernel Function Block. The output Speed_Reference will be zero.

When the axis is in operation, which means it is not in state Disabled or ErrorStop, then the output Position_Reference will be calculated by the kernel Function Block and the position control loop will be closed, which outputs non zero value for the output Speed_Reference in case of a following error. The input Actual_Position should then follow the position reference. The difference of both values is the following error and will be supervised by the kernel Function Block.

In case of drive problem, Drive_Inoperation should be reset. The Function Block will open the position control loop and Speed_Reference will be set to zero.

For the most drives the status is control by the drives control word whereas the drives status word represents its actual status. In order to enable the drive it might be necessary to pass through several drives states according a defined scheme which depends on the used drive. Therefore the library ABB_Ecat_CiA402_AC500.library is added to PS5611-Motion which contains Function Blocks to operate with different drives on an EtherCAT network. There is also the PS5605-DRIVES library package which can be used to control the state of a drive.

How to use the axis simulation

It is possible to use a simulated axis instead of a real drive. The axis simulation can be used in the following use cases:

- When the real drive is not available the simulation can be used to test all available motion functionalities to verify the application program.
- The simulation can be used to create a virtual master axis and synchronize other axes to it.

The simulation is realized by the Function Block CMC_Axis_Simu or Enable_Virtual = TRUE can be used at the KERNEL-block.

Homing will be possible if the limit-switches (data type CMC_Axis_IO) are simulated also. This is not done by CMC_Axis_Simu but could be realized in the PLC program.
Fig. 46: Example for Simulation

The drive velocity is simulated by PT1-Characteristic. The input $T_1$ gives the time constant for this PT1 as multiple of the cycle time. All other properties are simulated according to the CMC_Axis_Control_Parameter.

The value of the time behaviour from the axis simulation Function Block set by the input $T_1$ has to be at least four times smaller than the value of the axis parameter Control_Time from the parameter Function Block. If Enable_Virtual = TRUE is used, no delay will be applied to the simulated drive speed, and it will not be possible to test the position-control loop, but it will be fine to be used as virtual axis.

How to perform a homing

The homing of an axis is a procedure which consists of up to two phases. For each phase there are different Function Blocks available. The available Function Blocks are according to PLCopen and belong to the application layer. Available Function Blocks for each phase are listed in the table below.

Table 378: Overview of the available homing function blocks

<table>
<thead>
<tr>
<th>Function Block</th>
<th>Phase 1</th>
<th>Phase 2/Finish Homing</th>
</tr>
</thead>
<tbody>
<tr>
<td>MC_StepAbsSwitch</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>MC_StepDirect</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Phase 1</td>
<td>Phase 2/Finish Homing</td>
<td></td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------</td>
<td></td>
</tr>
<tr>
<td>MC_StepLimitSwitch</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>MC_StepRefPulse</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

In order to create a complete homing sequence one Function Block of each phase can be used.

**First phase**

The used Function Blocks will change the axis state to Homing and will move the axis to approach installed limit switches or a dedicated absolute switch in the desired directions. No manipulation of a position value will be done in this phase. The use of Function Blocks of this phase is optional for a homing.

The signals of the installed limit switches have to be written to a variable of the data type CMC_Axis_IO.

**Second phase**

Function Blocks from this phase will also change the axis state to Homing if this has not already happen and will finish the homing. Therefore a new position will be set to the axis. The axis state will then switch back to Standstill.

The use of a Function Block of the second phase is mandatory for a homing.

In general with AC500 PLC-based Motion Control there are two position values: One position value will represent the encoder counts of a drive or the CD522 module which is connected to the input Drive_ActualPosition of the kernel Function Block. The other position is a user defined scaled unit which is used for PLCopen Function Blocks.

There are different ways to finish the homing by manipulate and adjust a position value. Which value should be manipulated depends on the used drive or module and its capabilities. See the following types A, B and C.

**Type A**

The user defined position unit will be changed only. The Function Block MC_StepDirect must be used here. This type of homing is less complex than the other types but also less precise.

![Fig. 47: Homing Type A](image)

**Type B**

The drive or the CD522 module will change its own position value, the encoder counts.
The process will be started by the execution of the Function Block MC_StepRefPulse. The axis will start to move. The output Drive_Set_Ref of the kernel Function Block will then set the drive to sense for a digital signal. At the same time the kernel Function Block outputs a preset value which will replace the actual encoder count value at the moment the digital signal occurs.

This signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used.

In the same cycle when the new position value is set there also has to be a boolean signal stating a new position value at the input Drive_Ref_Ok of the kernel Function Block. The user defined position value will then be shifted accordingly.

Example of type B for phase 2: *Chapter 1.4.2.4.4.2.1 “How to connect a drive” on page 2066*

**Type C**

The encoder count position value will not be changed but involves registration capabilities of a drive or the CD522 module.
The process will be started by the execution of the Function Block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library). The axis will start to move. The output Drive_Set_Ref of the kernel Function Block will then command the drive or the CD522 module to activate the Touch Probe functionality. This will configure the drive to latch a position at the moment a digital signal occurs. The digital signal can be a Z-pulse of an incremental encoder but also any other signal from a sensor. This functionality may require a configuration of the drive or the CD522 module in order to be used. In combination with the latched position value there is a boolean signal which states that a new latch value has been received. In case of the module CD522 this encoder count position value has to be converted from encoder counts to equivalent user scaled units by the use of the function “CMC_Get_Units_From_Inc” (ABB_MotionControl_AC500.library) before it can be connected to the Function Block ECAT_HomingOnTouchProbe_APP.

To manage the Touch Probe objects of a drive within the CiA402 profile (e.g. Microflex e190) the Function Block ECAT_HomingOnTouchProbe_APP (ABB_Ecat_CiA402_AC500.library) can be used. This will also cover the conversion from encoder counts to user scaled units. At the end of the process the Function Block ECAT_HomingOnTouchProbe_APP will manipulate the user scaled position value according to the latched position from the drive and the users settings.

For further information see:
AN00220-001 - AC500 and MicroFlex e190 - EtherCAT Homing Methods

**How to Use a CAM curve**

The CAM functionality is only available in combination with the kernel Function Block CMC_Basic_Kernel.
The usage of a CAM function is based on the following elements:

- CAM table defined with the data type MC_PProfile.
- An instance of the Function Block MC_CamTableSelect.
- An instance of the Function Block MCA_Cam_Extra (optional).
- An instance of Function Block MC_CamIn.
- An instance of Function Block MC_CamOut.

1. Declare a CAM table as an array of the data type MC_PProfile in the program.
2. Write data to this array.
3. Use the address of the CAM table at the input CamTable of the Function Block MC_CamTableSelect.
4. Execute the Function Block MC_CamTableSelect to process the data of the CAM table with the Function Block's input parameters.
5. Additionally you can execute the Function Block MCA_Cam_Extra for optional parameters after the processing of the Function Block MC_CamTableSelect.
6. Execute the Function Block MC_CamIn to start the slave axis movement according to the CAM table data and parameters.
   - The axis will operate in the axis state Synchronized Motion.
7. To leave the axis state you can execute the Function Block MC_CamOut.
   - The axis state will switch to state Continuous Motion and maintains its last velocity as long as there is no other command.
8. You can also use any other motion command to interrupt the Synchronized Motion.

CAM table

CAM data is done with one table (two dimensional – describing master and slave positions together).

The data of the elements (array of data type MC_PProfile) can either be assigned within the declaration or can be assigned during runtime before the execution of the Function Block MC_CamTableSelect.

It can be filled with data in the following ways:

- To use a predefined variable list.
- To calculate the values within the program (before using the MC_CamTableSelect).
- To send values by any communication access to the PLC.

In order to use the new data it is necessary to execute the Function Block MC_CamTableSelect again. In case the CAM table is executed the Function Block MC_CamTableSelect may not be executed.

Elements of the data type MC_PProfile:

- The inputs MasterSyncPosition and MasterSyncDistance of the Function Block MC_CamIn can be used to define a distance to synchronize the slave axis onto the CAM table during the start. In case master axis moves with negative velocity the parameter MasterSyncDistance can be negative. The MasterSyncPosition should always be within the range of the CAM table master position.
- MasterSyncDistance = 0 will deactivate the synchronization. In this case the slave axis should be moved on the CAM curve before MC_CamIn is executed, otherwise a following error can occur.
The master position in the CAM table must be strictly monotonic rising.

The length of a CAM table is just restricted by the memory size of the PLC. When long tables are used, it is recommended to call CamTableSelect in a task with lower priority as it will need a considerable computing time.

It is possible to hold several CamTables as a pool and to switch from one to another. This has to be done at matching positions as no means for synchronization are available.

The offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.

The parameters at MC_CamTableSelect, MC_CamIn and function and MCA_Cam_Extra also modify the behavior:

<table>

<td>Just necessary when a CamTable is NOT &quot;periodic&quot; and will run in reverse direction (master with negative velocity) Reverse=FALSE, the CamTable is ready when the master leaves the position range in positive direction, e.g., when it moves from 359° to 0° on a rollover axes Reverse=TRUE, the CamTable is ready when the master leaves the position range in negative direction.</td>
</tr>
</tbody>
</table>
In this example, the slave will run from 0 to 2000 while the master runs from 0 to 1000. The slave will start and end with velocity \( v = 0 \), no matter which velocity the master has during start. The slave will reach the maximum velocity when it is at position 1000 and the master is at position 500.
How to use an external axis

To use multiaxis PLCopen Function Blocks with an externally sensed axis as master axis the following structure can be used for the axis implementation:

![Diagram of axis implementation structure]

**Fig. 51: Structure synchronization to an external axis**

The use of a feed forward filter Function Block is needed if the slave axis has to follow the position of the external axis. In this case there will be a time delay between sensing the position of the external axis and moving the follower axis along the sensed position. The filter Function Block will then add a certain distance to the external axis’ position depending of its speed.

The filter Function Block MATH_LINEAR_REGRESSION from the library ABB_MathFunctions_AC500.library can be used here.

**Fig. 52: Filter Function Block to feed forward an externally sensed position**

For an axis which is following the external axis, the value “mcActualValue” for the input “MasterValueSource” for multi-axis PLCopen Function Blocks has to be used.

When the filter Function Block MATH_LINEAR_REGRESSION is used to process an actual position, 2 different purposes are fulfilled:

- A jitter or noise can be compensated
- It is possible to calculate a forecast-position to compensate for a delay in position measurement

Process the actual position or any other master axis always before the slave axis.

Otherwise, an additional 1 cycle-delay is introduced.

The MATH_LINEAR_REGRESSION-block calculates the progress for a variable which is captured in equidistant periods of time and is assumed to follow a linear curve. It uses the Gauss “least squares” -algorithm to do so. The line is calculated in a way that the sum of squares for the distances from the measured points to the assumed straight line is minimized.

A noise or jitter influence of the value is compensated and a predictive value for the variable with an adjustable forecast horizon can be calculated.

Linear equation:

\[ \text{Line[i]} = \text{gradient} \times i + \text{offset} \]
Sum of squares:

\[
\text{sum} = \sum_{i=1}^{\text{history}} (x[i] - \text{line}[i])^2
\]

The gradient and offset for the line are calculated in a way that “sum” is minimized. Then these 2 values are used to calculate the forecast value:

\[\text{NEXT_VALUE} = \text{gradient} \times \text{FORECAST} + \text{offset}\]

FORECAST=0 would mean: value right now, no future or past considered.

When the ACTUAL value is a modulo value, for example a single turn encoder or a rollover axis, this has to be considered in the calculation. The 2 input values POSITIVE_LIMIT and NEGATIVE_LIMIT can be used to configure this. They define the upper and lower limit for ACTUAL. Also, the NEXT_BINARY will as a result be limited to these borders.

**Example**

![Fig. 53: Next Value_Forecast](image)

**How to use an encoder/drive with <> 32 bit position overrun**

The incremental position as actual position at the Function Block CMC_Basic_Kernel is usually assumed as position with a 32 bit position overrun. As well as it is the reference position which is sent to the drive.

Any modulo-axis configuration should be done inside the PLC.

Some drives are requested to correct their positions themselves for a non-linear axis which should constantly run into the same direction.

In this case, the drive has to be configured as a modulo-axis and the Function Block CMC_Basic_Kernel needs some additional Function Blocks to create the 32 bit value. See *Chapter 1.4.2.4.4.3.4 “Roll-Over axis” on page 2090.*
The Function Block CMC_Modulo2Binary will convert any position with any Modulo_Range to a 32 bit binary position.

The actual_position is assumed to run between 0 to Modulo_Range.

The actual_position should not change > 1/4 Modulo_Range between two scan cycles.

The Function Block CMC_Modulo2Binary will convert the 32 bit binary position reference from CMC_Basic_Kernel to a position reference which runs from 0 to Modulo_Range.

How to do position correction “on the fly”

Sometimes it is required to have a position correction "on the fly". For example, it can happen that a position is wrong due to mechanical slip and that a switch which is passed by during the movement is used to capture a position value.

In other cases, it is required to synchronize the position to a print mark, so an actual_position has to be corrected, but not the movement of the printed material.

For both applications, the Function Block MCA_SetPositionContinuous can be used. It will use ramps and a limited velocity for the correction, so it will be tolerable to execute it during an ongoing movement and while the axis is activated in a multi-axis movement.

The block can be used in any axis state except ERRORSTOP and HOMING.

Two different operation modes are possible:

1. SuperImp=FALSE
   - The actual_position will be modified.
   - The block will not cause any movement.
   - If a PLCopen block in DISCRETE_MOTION (positioning) is active during the execution, this block will not reach Done as the actual_position is modified.
   - If a slave axis is coupled to an axis while MCA_SetPositionContinuous is executed (with SuperImp=FALSE) it will follow.
   - This mode is possible while the axis is in state DISABLED.
2. SuperImp=TRUE
   - The actual_position will stay constant.
   - A mechanical movement is executed (without changing the axis state machine).
   - A slave axis will not follow.
   - This behavior is similar to a superimposed movement.
   - It is not possible when the axis is in state DISABLED.

The block can just be aborted by another MCA_SetPositionContinuous.

How to limit the movement

It is possible to limit the movement by position (software limit switches) and by velocity. By default, no software limit switches are activated in PS5611-Motion. It is possible to activate them by accessing some PLCopen parameter.

The functionality described below is just available with linear axes.

</tbody>
</table>
The following different behavior is possible:

- No limitation at all (default)
- Limit position with ERRORSTOP:
  - Limit position between SWLimitNeg to SWLimitPos, axis to state ERRORSTOP in case the position range is left.
- Limit velocity and acceleration:
  - Limit velocity to paraMaxVelocityAppl and acceleration/deceleration to paraMaxDecelerationAppl, create WARNING_VELOCITY, not state changes for axis, abort movement is optional when MaxPositionGap is reached due to limitation.
- Limit Position with ramp-down:
  - In addition, it is possible to limit the position between SWLimit2DecNeg and SWLimit2DecPos. paraMaxDecelerationAppl is used to ramp down.

When activated with EnableLimitPos or EnableLimitNeg, the reaction will be as follows:

- When the control position reaches the respective limit switch, the axis will go to state ERRORSTOP, and Drive_Release will be switched off. The actual position might be behind, depending on the following error. It is assumed that a drive or application specific braking is performed. The axis will be stopped behind the limit.
- The axis could be switched on again by MC_Power. A movement in the opposite direction will be possible.
- The functionality of EnableLimitPos and EnableLimitNeg is unchanged.

You can use the limitation of movement to achieve a soft or adjustable braking in advance before reaching the software limit switch. The limitation is activated by three boolean parameter and will calculate a position distance to the limit switch, which depends on the actual velocity and given deceleration ramp. “paraMaxDecelerationAppl” is used for deceleration. It will decelerate the axis by the given deceleration ramp when the calculated position is reached and stop at the software limit switch. The original behavior is not modified, so if also these software limit switches are activated, the axis might be set to state ERRORSTOP.
There are 2 different modes:

- **EnableLimitAbort = TRUE**
  
  Any ongoing motion will be aborted immediately (when the distance to stop is reached, as shown in the above diagram), a warning is shown.
  
  The axis will be decelerated to reach the software limit switch.

- **EnableLimitAbort = FALSE, EnableLimitDecelerate=TRUE**

  A warning is shown and the velocity is reduced, with respect to the given deceleration and position limit.
  
  The ongoing motion is not aborted. If it was just a "tight fit", e.g. in a master slave movement and the direction is turned soon enough, it might be possible to continue the movement.
  
  As the ongoing movement is not interrupted, an activated movement might not be completed, for example a MC_MoveAbsolute will never reach its target position. A warning is shown at function block CMC_Basic_Kernel.

When **EnableLimitPos = TRUE or EnableLimitNeg = TRUE**, and the values for SWLimitPos or SWLimitNeg are set, the axis will be set to state ERRORSTOP when these position limits are reached.

In addition, the function block will allow to limit the velocity. With **EnableLimitVelocity = TRUE**, it will monitor the velocity demand from the position reference and limit the position reference, so the given velocity limit will not be exceeded. A warning will be shown. The velocity used for limitation is MaxVelocityAppl.
The velocity limitation can be used to prevent short-term velocity peeks. The limited position will be catched up later, whenever possible. This can result in not-expected behavior. The WARNING issued by CMC_Basic_Kernel can be checked and used to stop a movement. The movement will be aborted automatically when the position is by MaxPositionGap behind.

- For a single axis movement, the commanded velocity is limited at the beginning. No position gap will occur.
- In a multi-axis movement, the slave axis follows a master. This can result in a position gap. A velocity peek from the master axis can be reduced by using the limitation. If the master is too fast because of the value for MaxPositionGap, the movement will be aborted.

When EnableLimit2Decelerate or EnableLimitAbort are used, the velocity is limited to MaxVelocitySystem with EnableLimitVelocity = FALSE. The function modifies the position reference. This modified position reference is used to control the drive. Whenever the limitation interferes the kernel will show a warning or an error. The warning or error message will disappear when the situation is cleared.

**Axis parameters**

The parameters for axis configuration and adjustment are set by the Function Blocks CMC_Axis_Control_Parameters.

Depending on the version of the kernel Function Block the corresponding version of the parameters Function Block has to be used. The instance will then be connected to the kernel Function Block by its instance name.
In this example the control structure is a simple position control loop with just proportional gain. When the application does not require minimized position following error it should be used this way as it is simple to adjust, robust and requires minimal performance. The proportional gain is then adjusted by Control_Time. Just change values at CMC_Axis_Control_Parameter when the position control loop is open (Drive_Release=FALSE, the axis state is Disabled). The values are sending to the control loop with a positive edge at "Enable". The CMC_Basic_Kernel block needs to be already enabled.

**Supervision**

**Pos_Lag_Percentage**

This parameter configures the position window for the supervision of the following error. The default value is 150[\%]. A value of 0[\%] will deactivate the supervision function.

The size of the position window depends on the setting of the parameters Control_Time and Max_Rpm. The size of the position window depends on the following equation:

\[
\text{Position Window [Increments]} = \left( \frac{\text{Inc Per R}}{\text{Max Rpm}} \right) \times \left( \frac{\text{Control_Time}}{1000} \right)
\]

\[
\text{Position Window [Units]} = \left( \frac{\text{U_per_Rev_Nominator}}{\text{U_per_Rev_Denominator}} \right) \times \left( \frac{\text{Max_Rpm}}{60} \right) \times \left( \frac{\text{Control_Time}}{1000} \right)
\]

**Example**

Position Window [Increments] = (10000) * (6000/60) * (50/1000) = 50000 [Increments]

Position Window [Units] = (1/1) * (6000/60) * (50/1000) = 5 [Units]

A value of 100\% will result in a position window which corresponds to the expected following error with the giving Control_Time at Max_Rpm. Therefore it is recommended to use values higher than 100[\%]. In case the parameter FF_Percentage is used smaller values can be used.

If the supervised position window is exceeded the axis state will change to ErrorStop.

**V_Check_Time**

After the configured time the drive’s actual velocity has to be at least 50 \% of the commanded velocity. This function can also be used in case the Position Reference is transferred to the drive.

A value of 0 will deactivate this supervision function.
If the supervised velocity window is exceeded the axis state will change to ErrorStop.

**Position control loop**

The default value is 100 which leads to a proportional gain of 10.

*In case the value of Control Time is too short the position control loop will run into instability.*

*In case the position control loop is not used this parameter must not be set to 0.*

The static following error depends on the axis velocity and can be calculated easily: Control Time multiplied by the axis velocity (\( p_{\text{error}} = v \times CT \)).

In general it should be aimed to reach a high position control loop gain with a short Control Time to achieve a small following error. As the reaction times take account in the possible Control Time of the complete system (parameters of the drive control loops, PLC cycle time as well as the communication fieldbus) should be considered.

As a basic rule the Control Time should be at least four times longer than the reaction time between the output of the Speed Reference and the input of actual position.
When the time $T_s$ and $T_t$ is measured, a control_time of $4(T_s+T_t)$ will result in an aperiodic damping of the position control loop. It is important to measure the values from inside the PLC (e.g. Trace) to have the complete reaction times included. Practical values for Control_Time might be from 50 - 500ms. The PLC cycle time as well as bus cycle times and mechanical reaction will influence the value.

**FF_Percentage**

The default value is 0.

In case a velocity feedforward has to be configured a value of up to 80 is recommended. For larger values than 80 the parameter Horizon needs to be used as the resulted position will overshoot otherwise.

A value of 100 adds a velocity to the Speed Reference output which corresponds exactly to the ongoing Position Reference value.

**Integral_Part**

The integral part of the position control loop can be used to eliminate a permanent positioning error, e.g. in case of hanging loads.

The time value can be regarded as the time the integrator needs to sum up the input value to reach the same value for its output.

> In case the Integral Part Time is too short the position control loop will run into instability.

**Horizon**

A communication delay of the Speed Reference value to the drive system can cause an overshoot during positioning caused by the velocity feedforward gain.

This function will compensate this communication delay to prevent an overshoot by time shifting the signals Velocity Feed Forward and Position Reference relatively to each other.

The value of Horizon can be approximately assumed to be the time delay of the communication delay.

The delay time might be caused by the cycle time of the control loop and by any delay in sending the speed reference, delay in the drive to build up the torque and delay to receive the actual position. To overcome this delay, a Horizon > 0 might be used. The feed forward reference will be created in advance, while the proportional gain is applied to the original motion profile. The delay is then compensated.

This function should not be used if the feed forward parameter FF_Percentage is 0.

A value of 0 will deactivate this function, which is the default value.

While this function is used, it will increase the needed PLC calculation time for this axis.
PLC cycle time

Cycle

This parameter represents the cycle time in which the kernel Function Block of the axis is called. If the configured cycle time is not correct the resulting acceleration and speed of an axis will be not correct also.

In case the task execution of the axis is synchronized to a fieldbus (e.g. EtherCAT) the cycle time of the fieldbus has to be used.

Roll-Over axis

When a rollover axis is used, the position control loop has to be closed inside the PLC, the drive should run in speed mode using the Speed Reference value of the Kernel Function Block.
If the Position Reference value is used, the drive must be able to perform a position over-run after 32 bit. If the drive’s position over-run is different, it can be adapted with the function blocks CMC_Binary2Modulo and CMC_Modulo2Binary from the library ABB_MotionControl_AC500.library. Incompatibility can cause an axis to trip after hours of operation.

The possible position following error has to be smaller than \( \frac{1}{2} \) Modulo_Range. Make sure that the modulo range is large enough.

Position following error = \((100 - \text{FF Percentage}) \times \text{Max Rpm} \times \text{Inc Per R} \times \text{Control Time} / 6000000\). This is the maximum value at constant velocity.

**En_Modulo**  
With this parameter the axis can be configured as a roll-over axis.

**Modulo_Range**  
The modulo range will be defined in drive position counts (DINT). It will result that the scaled unit position which is used by the PLCopen function blocks will stay within the defined range.

**Example**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>20000</td>
</tr>
<tr>
<td>Inc_Per_Rev</td>
<td>10000</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>360 (e.g. degree)</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
</tr>
</tbody>
</table>

The scaled units position will cover the range from 0 to 720 (degrees).

In some cases it is not suitable to set the modulo range of an application with the DINT value of the parameter Modulo_Range only. In such cases the parameters 2001 Modulo_Nominator and 2002 Modulo_Denominator can be used to scale the parameter Modulo_Range to a more precise value.

**Parameter Modulo_Nominator and Modulo_Denominator (supported with CMC_Basic_Kernel)**

These parameters can be used to modify the Modulo_Range in a way that fractions of an increment could be used for 1 modulo (=rollover) distance.

- Default: Modulo_Nominator=1 and Modulo_Denominator=1: the actual position for an axis is limited between 0 and Modulo_Range increments.
- Limitations: Modulo_Range*Modulo_Nominator < 2147483647. Otherwise: default values will be used.
- When modifying these parameters, the position control loop should be opened.
Example

En_Modulo            = TRUE
Modulo_Range         = 1024
Modulo_Nominator         = 10
Modulo_Denominator         = 3
Inc_Per_R            = 1024
U_Per_Rev_Nominator     = 80*5*3
U_Per_Rev_Denominator     = 10

Result of parameters Modulo_Range, Modulo_Nominator and Modulo_Denominator: The modulo range will cover one revolution of the toothed belt wheel.

Result of parameters U_Per_Rev_Nominator and U_Per_Rev_Denominator: One scaled unit corresponds to one mm of the tooth belt.

Example:  
Gearbox 10.1

<table>
<thead>
<tr>
<th></th>
<th>Option1</th>
<th>Option2</th>
</tr>
</thead>
<tbody>
<tr>
<td>En_Modulo</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>Modulo_Range</td>
<td>10240</td>
<td>10240</td>
</tr>
<tr>
<td>Modulo_Nominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Modulo_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Inc_Per_R</td>
<td>1024</td>
<td>10240</td>
</tr>
<tr>
<td>U_Per_Rev_Nominator</td>
<td>36</td>
<td>360</td>
</tr>
<tr>
<td>U_Per_Rev_Denominator</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>Max_Rpm</td>
<td>3000</td>
<td>300</td>
</tr>
</tbody>
</table>

The two options above describe exactly the same configuration. The Modulo_Range is equivalent to 10 motor revolutions and is 10240 increments. For the position, 1u means 1° and the resolution is 360°/10240inc = 0,035°/Inc = 1°/28,44 Inc.
The two options above describe exactly the same configuration. The gearbox is 10:3, so the Modulo_Range is equivalent to 1024*10/3 = 3413 + 1/3 increments. For the first option, the resulting modulo range is calculated 1024*10/3, for option2, it is 10240*1/3. For the position, 1u means 1° and the resolution is 108°/1024inc = 0,105°/Inc = 1°/9.481 Inc.

Scaling of the unit of length

Inc_Per_R  
With this parameter the number of the drive position counts each revolution of the motor (DINT) have to be entered.

U_Per_Rev_Denominator & U_Per_Rev_Nominator  
With these two parameters the number of units which correspond to one revolution of the motor have to be entered.

The units of length can be scaled to values like: mm, inch, degree, …

All dynamic paramters of the PLCopen function blocks like velocity, acceleration and jerk are based on seconds. Velocity [units/s], acceleration [units/s²], jerk [units/s³]

Example 1

\[
\begin{align*}
\text{Inc Per Rev} & = 10000 \\
\text{U Per Rev Nominator} & = 360 \\
\text{U Per Rev Denominator} & = 1
\end{align*}
\]

This will scale one unit to one degrees of the motor shaft. Correspondingly a velocity [units/s] of 360 will turn the motor shaft one revolution per second.

Example 2

In this example one unit will be scaled to one millimeter of the conveyor.

5 mm each tooth

80 teeth

Gearbox 1:5 ratio

Motor/Encoder 1024 counts per revolution

Fig. 60: Scaling units

How many units will pass after one revolution of the motor? (80*5mm) / 5 = 80

\[
\begin{align*}
\text{Inc Per Rev} & = 1024 \\
\text{U Per Rev Nominator} & = 80 \\
\text{U Per Rev Denominator} & = 1
\end{align*}
\]
Example 3  In this example one unit will be scaled to one millimeter of the conveyor.

5 mm each tooth

80 teeth

1:32 ratio

1024 counts per revolution

Fig. 61: Scaling units

How many units will pass after one revolution of the motor? (80*5mm) / 32 = 12,5 = 125 / 10

Inc_Per_Rev = 1024
U_Per_Rev_Nominator = 125
U_Per_Rev_Denominator = 10

Scaling of the speed reference output

These two parameters are used to scale Speed Reference output of the kernel FB in order to reach the intended velocity by the output value and to limit the highest possible output value.

Ref_Max  Highest possible output value of the Speed Reference output. The Speed Reference value that corresponds to the parameter Max_Rpm should be used.

Max_Rpm  Maximum speed of the motor in revolutions per minute.

Example

- Analog Drive: 1000 rpm at 2 Volts, 3200 rpm at 6,4 Volts (max.)
- Analog output module: 10 Volts output at digital value 27648
- Ref_Max = 17695 (= 27648 / 10 * 6,4)
- Max_Rpm = 3200

Access and modify parameters

All modifications will be effective immediately. There is no extra plausibility check and values are not checked for limitations.

Use this functionality with care.

Some parameters are collected inside a structure in Axis_Ref, and can be accessed and modified immediately. They are the same parameters as used with function blocks MC_WriteParameter and MC_ReadParameter © Chapter 1.4.2.4.3.6 “PLCopen parameter” on page 2042.

The differences are:
- Only available with CMC_Basic_Kernel
- The parameter values are LREAL instead of DINT and can be used with decimals.
- The parameters will be effective immediately.
- There is no check for consistency or limits.
- The parameters for position control can be checked and modified by accessing the structure Axis.parameter.position_control in addition.

**Possible to use different gain for forward/ backward movement, possible improvement for hydraulic axis or vertical movement**

See parameter KP/KP_BACK and KF/KF_BACK.

**Limitation for velocity and acceleration and deceleration**

From library version 3.1 on, these values are not limited to the 16-bit value range (32767). The limit for velocity is calculated by the values given at CMC_Axis_Control_Parameter and the acceleration is limited such that this velocity can not be reached faster than 1 cycle.
Programming guidelines

To achieve the best results for Motion Control the actual position has to be transferred in best possible quality (with minimal jitter) to the PLC. The position feedback is expected to be in increments as the data type is a DINT.

The kernel Function Block (CMC_Basic_Kernel or CMC_Estp_Kernel) has to be called every cycle and its task requires a fixed cycle time.

A variable of type Axis_Ref is used to connect to the PLCopen Function Blocks and their kernel Function Block.

The Function Block CMC_Axis_Control_Parameter has to be used for the axis configuration. Chapter 1.4.2.4.4.3 “Axis parameters” on page 2086

The signal of the limits switches and the absolute switch should be connected to the elements of the data type CMC_Axis_IO. The signal of the absolute switch must be TRUE in case the axis hits the sensor. The signal of a corresponding limit switch has to be true when the axis leaves the area surrounded by the limit switches. If needed the signal has to be inverted before it is connected to the elements of the data type.

Task configuration

The kernel Function Block and the transfer of axis IO data should be processed in a cyclic task. This task should be as short and real-time as possible to achieve the best motion control performance. It might be useful to set the task priority to 10 and the priority of all other task will be set to 11 or higher.

In order to save PLC processing time the most PLCopen function blocks as well as the application logic can also be processed in a task which runs on a lower priority than the real-time task with the axis implementation as shown in the figure below.

Optional:
Unsynchronized Task Execution

Synchronized Task Execution

All PLCopen function blocks which must be called in the same task than the kernel function block:

- MC_CombineAxes
- MCA_MoveByExternalReference

In case the position reference is transferred to the drive the task of the axis implementation should be synchronized to the fieldbus cycle. The following pictures show an example for EtherCAT:

Fig. 62: Task of axis layer
Fig. 63: Task of application implementation

**Visualization**

The structure of the position control loop is also as visualization element CMC_Visu_FB_Basic_Kernel. included in ABB_MotionControl_AC500.library. As placeholder, an instance of CMC_Basic_Kernel has to be used. The visualization shows all numbers as they are really used inside the block, the adjustment for different resolution or cycle times is already included.

**ABB specific data structures**

Not all data structures are defined by PLCopen. Some specific structures are described in the following chapter. In addition to the data in these arrays, the movement is modified by offset and scaling values at the respective Function Block. These offset and scaling values (except the time-scale) are transferred continuously. This will allow to follow a "Moving Target" by adjusting these values.
PositionProfile

The data type MC_PProfile is used for CamTable. An array has to be defined and provided at MC_CamTableSelect. Several CamTables could be defined and the axis could change between them on the fly. There is no routine of smooth movement from one table to the next so the user has to take care just to switch on appropriate positions. Details are described in the documentation included with the library.

```plaintext
ARRAY[1..3] OF MC_PProfile:=
  (Master_position:= 0 ,interpolation_point := 0 ,Velocity_ratio:= 0 ,Acceleration_ratio:= 0 ),
  (Master_position:= 50 ,interpolation_point := 25 ,Velocity_ratio:= 0 ,Acceleration_ratio:= 0 ),
  (Master_position:= 100 ,interpolation_point := 0 ,Velocity_ratio:= 0 ,Acceleration_ratio:= 0 );
```

Declaration example

**CAM_table**

This structure is used for time based profiles, e.g. MC_PositionProfile:

Interpolation types for profiles

The curves defined by an array of MC_PProfile hold master position points and according slave positions. When the master position is between 2 points, the according position for the slave is interpolated. Different types of interpolation are possible. The type is defined in MC_ABB_iTypes_Enum. The master could be a real axis or some virtual axis which could be created by just writing values for position and velocity to the Axis_Master variable as shown in the example. The same interpolation types could be used on MC_TProfile.

</tr>
</tbody>
</table>

The interpolations allow to run on smooth curves without the need to define a large number of points. The following chapter shows the results with different interpolation modes for a sinus-curve with 10 interpolation points. The following table gives the mean deviation.

<table>
<thead>
<tr>
<th>Interpolation Type</th>
<th>Mean deviation [ppm]</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCA_LINEAR</td>
<td>19686 =1.9%</td>
</tr>
<tr>
<td>MCA_SPLINE_NATURAL</td>
<td>151 =0.0151%</td>
</tr>
<tr>
<td>MCA_SPLINE_COMPLETE</td>
<td>25510 =2.5%</td>
</tr>
<tr>
<td>MCA_POLY3</td>
<td>131 =0.0131%</td>
</tr>
<tr>
<td>MCA_POLY5</td>
<td>0.37</td>
</tr>
</tbody>
</table>

The original curve is represented by y_sinus for position and v_sinus for velocity. The diagrams show the result which is achieved by different interpolation types.

MCA_LINEAR
Fig. 65: Results from linear interpolation

The velocity is constant between the interpolation points.

MCA_POLY3

Fig. 66: Results from polynomial interpolation

The result looks almost identical to the original curve. The mean deviation shows that MCA_POLY3, MCA_POLY5 and MCA_SPLINE_NATURAL produce results which follow the original curve really good and are almost identical. The spline interpolation produces a jerk-free curve without the need of providing velocity values and acceleration values in advance.
Fig. 67: Results from complete spline interpolation

In the beginning and the end, the curve does not follow the original curve. The reason is that it starts with velocity $=0$ and produces a jerk free result.

So the favoured result has to be considered in advance to choose the right interpolation method. With these different methods it is not necessary to provide a large number of interpolation points to get good results and smooth acceleration and deceleration ramps.

1.4.2.4.5 Examples

Example projects for the libraries can be found in the folder: \Users\Public\Documents\AutomationBuilder\Examples

1.4.2.5 High Availability Modbus TCP

1.4.2.5.1 HA-Modbus TCP - System Technology

The AC500 High Availability System

The AC500 High Availability system is designed for the demand of automation systems that require a higher availability, which is realized by redundant devices and communications. The redundancy concept reduces the risk of losing production due to failure of parts of the automation system and thereby minimizes scheduled idle times.

For instance, control can be taken over by the secondary station automatically if the primary station fails.

AC500 High Availability system implements redundancy based on standard AC500 PLCs:

- PLC
- Field communication
- SCADA communication
General differences in high availability and redundancy systems are in which way and how fast the switchover between redundancies happens. AC500 High Availability systems are hot-standby.

Redundant systems or redundancy functions:
- Always up and running (hot)
- Failure detection
- Switch over automatically in very short time

The AC500 High Availability system HA-Modbus TCP is the Ethernet based variant of HA-CS31 redundancy system.

![Figure 68: Principle AC500 HA-Modbus TCP architecture example based on Ethernet redundancy](image)

- For the data exchange/synchronization (=Sync) between the PLC A and the PLC B the protocol **UDP** is used e.g. via one of the Ethernet ports.  
  **Note:** To differ a "sync link" failure from an "other PLC" failure a so called *lifecom2* communication is used, which then should be routed via a different communication path than the Sync, e.g. the field or SCADA network.
- The field I/O connection is performed via the Ethernet protocol '*ModbusTCP' - connecting the CI52x devices (**CI521-MODTCP** or **CI522-MODTCP**).  
  For High availability/redundancy in a decentralized I/O station communication the Ethernet network redundancy mechanisms can be used (realized by external, managed switches). CI52x modules are not actively participating in ring recovery, however, smaller systems can be daisy chained if **MRP (Media Redundancy Protocol)** is used.
- SCADA connection is redundant by nature of the two Ethernet ports and can be extended with further redundancy level as well by managed switches. SCADA itself can also switch the primary PLC to ensure communication to the active PLC in case of a simple connection and a connection failure. If the redundancy mechanism of the OPC DA Server is not used, SCADA level itself has to be able to handle and differentiate primary and secondary PLC.
In most PLC applications the critical components to fail are, beneath PLC, typically the power supply or communication components such as wires or switches. Therefore a SPOF (Single Point Of Failure) has to be avoided by adding redundant devices or redundancy functions wherever a failure likelihood is high and failures are not tolerable.

HA core functionality typically can tolerate only a single failure in the different levels. Then, a repair of the failed part is highly advised to achieve and ensure redundancy again. As shown in the above figure, the I/O-network already provides a second independent redundancy layer by its redundancy mechanism (e.g. ring), which can keep up communication despite a break in the ring itself, without switching the PLCs: There a second failure in the PLC level could be tolerated, but it is highly advised to repair immediately anyway.

With a well-planned communication network, the PLCs can operate geographically separated. So even in catastrophic events with full mechanical destruction still one PLC will be available to control the process or infrastructure.

In order to achieve high availability, the CODESYS application must be enhanced with HA function blocks, from the HA-Modbus TCP library and the CI52x library.

- **HA control** function blocks manage the core HA functionality by collecting diagnosis and switching if necessary.
- **HA utility** function blocks provide standard functions in the application program with internal sync for integral data e.g. timers, counters, PI control.
- **CI52x library** contains a function block to configure and communicate to the CI modules and ensures that only the primary PLC writes to the outputs. The inputs are read by both PLCs.
- For both PLCs the same application must be used/downloaded.

For configuration of the CI52x Modbus TCPs, a separate Bulk Data Manager tool (BDM) is provided. Especially in larger systems usage of BDM is recommended to comfortably engineer and create CI52x related data in one place:

- Configuration and parameters of the used I/O modules
- Program code for variable naming, configuration, communication and HA functionality

The BDM tool can serve SCADA programming and documentation as well in an efficient manner.

### Differences HA-Modbus TCP (V2/ V3) and HA-CS31

The following table gives an overview of the different High Availability variants possible with AC500.

The figures are indicative, depend on chosen architectures, system size, network and CPU/CM modules used.

### Programming

|       | Codesys V2.3 | Codesys V2.3 | Codesys V3.5 |

### Interfaces

|       | Several CS31 and Ethernet interfaces | Several ETH ports, via CM597 | 2 ETH ports \(^5\) (+ 1 CAN Interface) |

### Overview of AC500 HA system alternatives

![Diagram of AC500 HA system alternatives]

1) Number of CI52x recommendation based on performance or max. number of sockets (CPU and CM modules)

2) Limited by CPU performance, number of CM574 modules number of CS31 clients and process data limits.

3) Depends on system size and CPU type

4) Some S500-eCo modules not yet usable, see release notes

5) Communication Module CM597 not available

6) see Chapter 1.4.2.5.1.6.1 “Task Configuration Recommendations for HA System” on page 2113

7) In switchover moment some telegrams delayed by \(~ 250 \text{ ms} (500\text{ms on V2 CPU ETH})\)

---

How to get and install the AC500 High Availability System Package

The AC500 HA-Modbus TCP is a zip file named `PS5601-HA-MTCP`. It contains a batch file and the package. The batch file installs the package with the help of Automation Builder and results in the following being available:
● Libraries for the different CPU versions (V2, V3). See installation path: C:\Program Files (x86)\Common Files\CAA-Targets\ABB_AC500\AC500_V12\library\ApplicationLibraries.

● Documentation. See documentation for HA-Modbus TCP system technology, function block documentation, Bulk Data Manager documentation, CI52x device documentation (see the following picture).

● AC500/ CP600 example projects, their PDF documentation (see the following picture).

● Bulk Data Manager (BDM) tool which helps efficient engineering in larger projects (see the following picture). This requires a separate installation.

This package is available only for sales registered customers/end-customers and only via ABB’s sales/support.

---

**Fig. 69: Libraries installation path and documentation, tool, examples installation path**

---

**Requirements**

**Hardware**

Two same type AC500 PLCs are required as central hardware components. Each PLC is equipped with at least two Ethernet ports in CPU or in a communication module. The two PLCs, called PLC A and PLC B, are linked by Ethernet to exchange and synchronize information (Sync). Connections to the AC500 peripheral field devices (I/O) are performed via Ethernet as well.

Peripheral devices for I/O usable are CI521-MODTCP or CI522-MODTCP which communicate via the Modbus TCP protocol with the PLCs. Based on the life systems status exchanged between PLC A and PLC B over the Sync, in the event of a fault in the system the primary PLC may switch automatically to the secondary in a fast, bumpless way: Allowing the process control and status data exchange to continue unnoticed by the process. Faults will result in error messages so that repair can be initialized.

HA-Modbus TCP library supports currently up to 100 CI52x, depending on CPU type. Each CI52x can support up to maximum of 10 S500-I/O modules on it.
Local I/O on a CPU can signal / interact for diagnosis or service with / from this CPU.

This local I/O is NOT redundant and will be not available in CPU failure case.

- SCADA/PC connection is done using ETH ports of both PLCs and one or several managed Ethernet switches depending on the redundancy requirements in the Ethernet levels.
- HA communication between PLC A and PLC B is done via two physical communications between PLC A and PLC B, using Sync (UDP) and lifecom2 (Modbus TCP or CAN).
- Field devices (CI52x modules) will be connected via Ethernet switches, forming a redundant network (if requested). For details on network configuration see Chapter 1.4.2.5.1.6.4 “Field I/O Network Topologies” on page 2115.

High availability system without connecting field devices (CI52x modules)
For a system without any CI521-MODTCP or CI522-MODTCP module connected in the network, set the global variable "xNoCiBus“ defined in HA_GLOBAL_VARIABLES to TRUE.

Effects of xNoCiBus = TRUE:
- CI modules are not connected in the high availability system. One of the PLCs will be primary.
- Data sync between the PLCs will be established.
- Change over of the PLC only happens if either the PLC is stopped or powered off.
- User has to define the HA and Application in different tasks Chapter 1.4.2.5.1.6.1 “Task Configuration Recommendations for HA System” on page 2113.

Example
HA hardware configuration based on V3 PLC. The Sync connection is via SCADA Network, lifecom2 is via field network (can be the other way round as well).
Support of I/O modules (S500/S500-eCo) depends on the version of the library package. See the version details of the library in the release notes.

Software

In order to achieve High Availability, the application must be enhanced with HA function blocks from the HA-Modbus TCP library. There is a separate specific bulk engineering tool called Bulk Data Manager (BDM), which enables a comfortable pre-engineering of the CI52x, all signal names and their communication, resulting in export files for the Automation Builder application. The same data and approach can also be used to start SCADA side setup efficiently from the same data source.
Functionality

Failures, Use Cases

The AC500 High Availability system performs a switch-over when the primary PLC is powered off, crashed or stopped or if the primary PLC loses fieldbus communication completely while the secondary still has it. In the following the different use cases and reaction times are outlined.
### HA use cases – Failures

| 11 | Manual switch over by user | Switch over to secondary PLC. CI52x outputs are frozen during switch over period |  |

*) Detailed diagnosis, see function block description

---

If lifecom2 is lost and if the PLC is in STOP mode: RUNTIME ERROR will not be TRUE. This is because Modbus is still responding even if PLC is in STOP mode.

---

The networks for larger systems are often seen as a separate entity and done by a separate company. Make sure to have the redundancy status information of the network at least in SCADA, to repair in time.

If the I/O field network responsibility is with the automation/PLC part, the redundancy status should be also monitored by the PLC. A warning to initiate repair may be created from the managed switches in the I/O field network.

Examples:

- Alarm output(s) wired e.g. to a CI52x input and related settings of the switch(es)
- Settings of the switch(es) to send e.g. SNMP traps, which can be received in PLC (AC500 SNMP library)
- Use of “automation switches” which can also communicate their status directly via Modbus.

---

Normally the HA-Modbus TCP library takes care of communication supervision, nevertheless if communication is cut completely, the CI52x communication interfaces and its I/O modules have to react on their own to achieve a bumpless or desired behaviour: The following parameters for the CI52x communication interfaces and I/O modules need to be considered:

- **CI52x: parameter “Timeout for Bus supervision”:**
  
  Allows to detect errors from CI side as well and take action to ensure a fail safe behavior if communication is cut. It can be set in 10 ms steps, if set to 0 no bus supervision is active [proposed value: 50 = 500 ms = default in Bulk data manager; should be set to a higher value of e.g. 65 if V2 CPU ports are used for field communication].

- **“Behaviour Outputs” at “Timeout for Bus supervision”:**
  
  This fail-safe parameter has to be consciously set: separate settings are possible for each module (and CI): “off”; “last” or “substitute”: 5 s, 10 s, ∞ s ¹)

Remarks:

¹) The parameters “Behaviour Outputs at comm. Error” is only analyzed if the Failsafe-mode is ON.

²) Both are CI52x parameters set e.g. via Bulk data manager tool in the program.
**System Structure**

A HA-Modbus TCP system is characterized by two AC500 PLCs with the following features:

- Identical application program with additional HA function blocks that are loaded in both PLCs
- Communication interface modules CI52x-MODTCP are connected via Modbus TCP
- Synchronization of both PLCs (sync and lifecom2 logical connections)

The application program should be divided into at least three main tasks/programs, which then communicate via internal structures of the libraries and dedicated internal memory areas for HA-Sync array and the Modbus CI52x memory(ies) CIModDataxx:

**Modbus Task**

- CIModCI52x updates INPUT and OUTPUT in each Modbus cycle for primary CPU. Secondary CPU only reads INPUT.

**Application Task**

- At the start of the Application task the InputRefresh program has to be called. It copies data from the Modbus via the structure CIModDataxx to the user variables, which were defined in BDM as signals (refer to BDM documentation, chapter 7)
- The main application programs should be in this task only and use these variables for the user defined functions. E.g. here the user programs and logic should be called and use utility blocks (which sync their historic data automatically) and HA_MOD_DATA_SYNC blocks for further user data which should be synced.
- Utility and HA_MOD_DATA_SYNC blocks data are stored in the HA Sync array.
- OutputRefresh program is called as a last step. It copies data from variables via structure CIModDataxx to Modbus, which were defined in BDM as signals (refer to BDM doc, chapter 7)

**HA task**

- HA_MOD_CONTROL uses UDP sync mechanism to share HA Sync array data with secondary CPU.

When inputs and outputs are accessed by Modbus, it will not allow application to read / write data because of the controlled access to common resources by multiple processes, this is implemented based on the concept of semaphore and ensures consistent data.
Sync Data

- User can use HA_MOD_DATA_SYNC_function block to synchronize data between Primary and secondary CPU.
- HA utility blocks also sync data between two CPUs (sync mechanism is inbuilt in these blocks). Both data will then be copied to HA Sync Array.
- HA SYNC Array is transferred via UDP to secondary CPU.

1 Eth Frame copies approx. 1412 data bytes of it. The number of Eth Frames needed to sync complete HA Sync Array depends on number of data sync bytes. Global variable iNoOfEthFrames gives the user this information, which should be used to calculate Application task cycle time. Check task configuration recommendation for details.

V2 needs one HA cycle to send 1 Eth frame data from Primary to secondary CPU and receive acknowledge from Secondary CPU. V3 CPU needs 2 HA cycle for above operation

- The HA program/ task should be called at highest priority as it is responsible for the core HA functionality and should be the fastest task.
- The Modbus task contains the Modbus communication function blocks at lower priority and (depending on CPU performance) also a faster cycle time to ensure sufficient update rates on the Modbus without overloading the CPU with communication.
- The application program parts should be called in the application task with even lower priority and a larger cycle time than above tasks.

The following picture indicates the placement of the main HA-Modbus TCP libraries function blocks to realize a High Availability System – with the tasks as described above.

Fig. 73: HA programming with the libraries: Red blocks are mandatory HA function blocks, dotted lines show optional function blocks

The main/ application program does not need to consider HA_MOD_DATA_SYNC separately, if it uses the HA utility function blocks from the HA-Modbus TCP library, as they internally synchronize necessary data.

Only for additional own calculated variables or function blocks where the user wants synchronization the use of the HA_MOD_DATA_SYNC function block is needed.
All the prepared sync data is synchronized with the secondary PLC. Typically only integral values (timers, counters, PID, ...) or settings which might have been received have to be synchronized, e.g. for fast start-up cases when a secondary CPU was restarted, as both PLCs are running and calculating closely in parallel and based on the same input values. For further information, please refer to library function block documentation and the example projects.

Following steps are performed:

- Status of the inputs connected to CI52x decentralized I/O stations is transferred to both PLCs simultaneously in every PLC cycle. They are received by the CI52x function block.
- In the HA program the HA_MOD_CONTROL function block collects all diagnosis, sync and lifecom2 data from the field and/or the other PLC. Then, it decides if a switchover is necessary based on a simple decision matrix.
- Data is synchronized as explained above.
- At the end of the program, the generated output values are send, by transferring from the primary PLC respective buffers to the CI52x-MODTCP communication interface module(s) via CI52x function block and Modbus TCP. The secondary PLC is prepared to send but stays “silent” (not sending output values).

### Task Configuration Recommendations for HA System

For a better performance of the HA system please consider the following recommendations in your project task configuration:

- Use the real time priorities for all HA related tasks (as proposed in the following table).
- Use the cycle times based on the formula (see the following table).
- If local I/O modules or coupler modules are used, consider their bus cycle options.
- Measure PLC and CPU load during operation. If the PLC load is higher than 40 % or CPU load higher than 60% then try the following steps (Note: watchdog stops the PLC at 80 % PLC load in V3 CPU):
  - Increase HA cycle time (e.g. to 8 ms / 12 ms / 24 ms, ...) and all others according to below formulas.
  - After each step check PLC load (must be < 40 %) and CPU load (must be < 60%).
  - Use a higher performant PLC type.
<table>
<thead>
<tr>
<th>Task</th>
<th>Priority</th>
<th>Cycle Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>HA</td>
<td>10 (high)</td>
<td>4 ms or higher (based on the target to keep CPU load &lt;60% or PLC load &lt;40% as HA base load)</td>
</tr>
<tr>
<td>Modbus</td>
<td>11 (medium)</td>
<td>Max ((HA cycle time *2), (3ms + roundup (#CI modules/2)))</td>
</tr>
<tr>
<td>Application</td>
<td>12 (low)</td>
<td>V2 CPU: Max ((Modbus cycle time *2), (iNoOfEthFrames * HA cycle time))</td>
</tr>
<tr>
<td></td>
<td></td>
<td>V3 CPU: 2 * Max ((Modbus cycle time *2), (iNoOfEthFrames * HA cycle time))</td>
</tr>
</tbody>
</table>

*iNoOfEthFrames* variable is defined in the Global variables of HA-Modbus TCP library.

**CPU choice, system size and performance indications (under above conditions):**

The graphs indicate values for the system configuration when using above formulas and assumptions for PLC- and CPU Load (PLC- and CPU Load are only different with V3 CPUs, where communication mainly increase CPU load).

![Modbus_cycle_time](image_url)
Example of a Utility Function Block – to enable bumpless Switch over

Consider the on-delay timer HA_MOD_TON (V2)/ HaModTon (V3).

Both PLCs require the same function block called in the program. Under normal operating conditions the elapsed time ET and output, Q of the timer is synchronized internally for both PLCs. ET and Q data are available and can be attached to local or global variables in the program as per application requirements. If PLC A shuts down due to a fault, the primary status switches over to PLC B.

In the event of a switch over, the moment the PLC B becomes the primary, the timer on this PLC will keep running. Till the time of PLC A failure the timer on the PLC B was synchronized, the actual process remains unaffected by the switch over.

Fault on Primary and Secondary PLC

The AC500 High Availability System itself only takes care of the first fault. In case of a second fault the primary PLC remains primary PLC until the second fault occurs. This results in no further switch overs (manual switch overs included). As the network with redundancy is expected to manage itself a second layer of independent redundancy exists without switching PLCs, but e.g. a ring also only can tolerate only one error, then repair is necessary.

Field I/O Network Topologies

Modbus TCP communication between PLC and communication interface modules CI521-MODTCP or CI522-MODTCP can be done using different network topologies. In the following subchapters different simple combinations with their pros and cons are explained.
If a CI52x module of a daisy chain is powered off, next following modules will lose connection/data provided there is no redundancy in the Ethernet network (e.g. ring and managed switch).

Star Topology (Non-redundant field device communication)

If no redundant field communication is required (e.g. for testing purposes) a star topology with a simple switch can be used. The switch (if managed and operating a ring or not) is a single point of failure, but PLCs are redundant.

Each CI52x module and PLCs in the network are connected to using one to one cable between device and Ethernet switch or a daisy chain of several.

Simple Ring Topology (smaller systems)

In a simple configuration, CI52x modules can be part of a ring if MRP protocol is used in the managed switches. Then the CI52x are connected from one to another device ("daisy chained") through e.g. two network switches. The redundancy protocol detects a closed ring and opens one port of a managed switch to avoid the ring. The user has to configure the necessary ring configurations and enable the ring manager for the used ring ports in one switch.

It is recommended that time interval between ETH cable disconnection and re-connection should be greater than 2-3 seconds.
**Standard Network Topology (large systems)**

In the standard redundant network, which is often done by 3rd party dedicated telecom companies, managed switches are used for every connection point to “the network”. It’s the networks (and operator) responsibility to repair any failure fast enough so that no influence on the HA system or its outputs occur.

The network can use other fast redundancy algorithms, also having other than ring structures, if redundancy links are activated fast enough.
Getting Started
HA-Modbus TCP Preconditions

HA-Modbus TCP is supported as of Automation Builder 2.0 and the before mentioned corresponding AC500 CPUs.

AC500 V3 PLC is not supporting external couplers (e.g. Ethernet or CAN) therefore onboard ETH1, ETH2 and CAN ports are to be used for communication.

3000 is the sync array size: Either 3000 HA_DATA_SYNC function block instances alone or together 3000 instances of HA_DATA_SYNC + HA utility function block can be used.

The HA-Modbus TCP system takes care of the first fault only. This fault must be visualized by the programmer and overall system (e.g. HMI, SCADA) to the operator, to plan a repair as soon as possible as redundancy might be lost. If more than one error occurs in the same PLC, restart the system to reset the error.

The SCADA/ HMI has to be used to only read/ use data from the primary PLC. Parameters and control data should be always written to both PLCs or has to be synchronized via the function block.

Quick Start list and Guidelines for Usage

Configuration of the HA system is done by the following steps (for details see the example documentations):

- Install the hardware ➤ Chapter 1.4.2.5.1.4 “Requirements” on page 2105
- Install Automation Builder including the latest libraries ➤ Chapter 1.4.2.5.1.4 “Requirements” on page 2105

Redundancy switch over timing should match the settings in the program and CI modules for time-out and freeze periods.
• Install the Bulk Data Manager tool (BDM) ☞ Chapter 1.4.2.5.1.3 “How to get and install the AC500 High Availability System Package” on page 2104
• Create a new project in Automation Builder for the chosen CPUs
• Assign the IP addresses in ≥ 2 different Ethernet networks:
  – SCADA network: SCADA, connected PLC A and PLC B
  – Field network: connected CI52x communication interface(s)
• Configure a network switch in the field network (if managed / redundant)
• Run BDM tool to configure CI52x network, export the files
• Import the Bulk data export files to the Automation Builder project
• Add Modbus TCP configuration
• Add Callback stop function HA_MOD_CALLBACK_STOP and call it in the system event “stop”
• Add optional HA utility function blocks or function block HA_MOD_DATASYNC
• Add the task configuration ☞ Chapter 1.4.2.5.1.6.1 “Task Configuration Recommendations for HA System” on page 2113
• Compile and download to both PLCs (simplified in V3 via integrated download manager)
• Create a boot project and RUN
• Operation: Test use cases e.g. by putting the primary PLC to STOP mode and observe the switch over

Library Overview

The libraries in Codesys V3 have an integrated documentation, where all technical details can be found. For Codesys V2 a separate library documentation exists:

HA-Modbus TCP Library

The following function blocks are contained in the libraries:
HA-Modbus TCP
Library
Primary CPU currently can read-out the diagnosis info (CI52x Function block outputs) from CI module only once, hence secondary PLC will not be able to read the diagnosis information from the CI52x module. 

So if any change happens in CI52x diagnosis it is not reflected in secondary CPU.

This can lead to different diagnosis information of CI52x module in Primary and Secondary CPU.

Hence it is recommended to customers that diagnosis information should be handled in the application (e.g. SCADA).

Overview CAA_Callback.Library

The CODESYS runtime system provides different events for different purposes. Each event can be assigned to an event class. Further on each event arises from a certain source. With the functionality of this library it is possible to register user specific functions to handle these events.

CAA_Callback.Library

In the runtime system different events occur. Each event can be assigned to an event class. Further on each event arises from a certain source. The runtime system has an internal list of registered callback definitions. At each occurring event the runtime system checks its list of callback definitions and if applicable calls a callback function.

A callback definition consists of:
- Event
- Event class
- Event source
- Index of the function which should be called as soon as the event occurs.

Event e of class c from source s triggers the callback (e, c, s), if

\[
(e = e \text{ OR } e = \text{CB.ALL_EVENTS}) \text{ AND } \\left((c \text{ AND } c) > 0 \text{ OR } c = \text{CB.ALL_CLASSES}\right) \text{ AND } \\left(s = s \text{ OR } s = \text{CB.ALL_SOURCES}\right)
\]

A function which should be used as callback function, must have the following interface:

FUNCTION Callback<Name> : BOOL
VAR_INPUT
  dwSpec  : DWORD; (* CB.Event and CB.EventClass *)
  dwParam : DWORD; (* Application specific Parameter *)
  dwSource : DWORD; (* CB.EventSource *)
END_VAR

The data types are DWORDs in order to be compatible to CoDeSys V2.3. These however refer to the enumerations specified in brackets. Parameter dwSpec via function % CB.DecodeEvent and % CB.DecodeClass can be split in two variables of type % CB.Event and % CB.EventClass. The parameter dwSource can be converted to data type % CB.EventSource with the help of the DWORD_TO_INT conversion.

Remarks on the structure an the usage of callback functions:

The function name must have a prefix „Callback“.
The function must not contain any local variables.
The function must not be checked with breakpoints, ....
The function must be parameterized with property Enable system call,* !
Multiple callbacks may be assigned to one event. A callback (event, class, source, function index) however can get registered only once; if one tries to assign an identical callback, `CB.RegisterCallback` will dump an error.

After a reset of the PLC all registered callbacks will be deregistered immediately. Callbacks, which are possible registered on event AFTER_RESET (see `CB.Event`), will be called once before the automatic deregistration.

Regard that callback functions can be called immediately after the event has occurred. Thereby an currently running IEC task can be interrupted. The programmer must be aware that this might raise similar problems like there are in multitasking systems (data consistency etc.); besides that the run time of a callback function should be kept as short as possible, because it blocks the whole system.

The return value of the callback function is of no significance[1].

[1] Explanation: If the return value was of importance, then in case of multiple callback functions which are registered on the same event, it would not be clear which return value has priority.

**Sequence of execution**

( `CAA_Callback.Library` )

The execution of callbacks which are triggered by the same event follows the reversed order of definitions.[2]

[2] The reason: System components use the same mechanism and normally register callbacks before the application. Often the RESET event causes a system component to deallocate memory. If the application also has defined a callback on the same event, it might occur that the application tries to operate on deallocated memory area.

**Sequence of triggering**

( `CAA_Callback.Library` )

Some incidents trigger a sequence of events. These will be called in the following designated order:

<table>
<thead>
<tr>
<th>Event</th>
<th>STOP (only if PLC is running)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PLC reset</td>
<td>BEFORE_RESET</td>
</tr>
<tr>
<td></td>
<td>AFTER_RESET</td>
</tr>
<tr>
<td>Shutdown</td>
<td>SHUTDOWN</td>
</tr>
<tr>
<td></td>
<td>STOP (only if PLC is running)</td>
</tr>
<tr>
<td>Online Change</td>
<td>ONLINECHANGE</td>
</tr>
<tr>
<td>Program download</td>
<td>STOP (only if PLC is running)</td>
</tr>
<tr>
<td></td>
<td>BEFORE_DOWNLOAD</td>
</tr>
</tbody>
</table>
Data types / Enumerations

1.4.2.6.2.2.1 CB.Event (ENUM) ................................................................................. 2124
1.4.2.6.2.2.2 CB.EventClass (ENUM) .......................................................................... 2126
1.4.2.6.2.2.3 CB.EventSource (ENUM) ........................................................................ 2126
1.4.2.6.2.2.4 CB.Error (ENUM) .................................................................................... 2127
1.4.2.6.2.2.5 CB.Callback (STRUCT; Prefix cb) ......................................................... 2127
1.4.2.6.2.2.6 CB.gc_cbNull (VAR GLOBAL CONSTANT) ........................................... 2127

CB.Event (ENUM)

This enumeration describes all standardized events of the CAA_Callback.Library. An X in the table shown below indicates that each CAA PLC supports the respective event. The source of those events is CB.RUNTIME.

PLC-specific events can be used in the following number areas:
900-999, 1900-1999, 2900-2999, 3900-3999, 4900-4999, 5900-5999, 6900-6999, 7000-7999, from 10000

The value of each event at the same results in a classification:

| 1000-1999 | ONLINE_EVENTS |
| 2000-2999 | INFOS |
| 3000-3999 | WARNINGS |
| 4000-4999 | RTS_ERRORS |
| 5000-5999 | SYSTEM_EXCEPTIONS |
| 6000-6999 | INTERRUPTS |
| 7000-7499 | IO |
| 8000-9899 | FIELDBUS |
| 9900-9999 | TIMERS |
| ab 10000 | MANUF_SPEC |

<p>| CB.NO_EVENT | 0 | X |
| CB.ALL_EVENTS | -1 | X |
| CB.START | 1000 | start | X |
| CB.STOP | 1001 | stop | X |
| CB.BEFORE_RESET | 1002 | before reset | X |
| CB.AFTER_RESET | 1003 | after reset | X |
| CB.SHUTDOWN | 1004 | shutdown | X |
| CB.ONLINE_CHANGE | 1005 | after CodeInit at Online Change |
| CB.BEFORE_DOWNLOAD | 1006 | before program download | X |
| CB.TASKCODE_NOT_CALLED | 1007 | task code will not be called |
| CB.TIMER | 1008 | scheduler tick (not in case of stop) |
| CB.DEBUG_LOOP | 1009 | communication timer tick (if PLC is stopped on breakpoint) | X |
| CB.SCHEDULE | 1010 | scheduler tick (even at stop) |</p>

<td>CB.EventSource</td>
</tr>
</tbody>
</table>
CB.UnregisterCallback (FUN)
This function of the %CAA_Callback.Library can be used to delete callbacks.

Table 385: Input:
<table>
<thead>
<tr>
<th>hHandle</th>
<th>CAA.HANDLE</th>
<th>callback handle</th>
</tr>
</thead>
</table>

Table 386: Output:
<table>
<thead>
<tr>
<th>eError</th>
<th>CB.Error</th>
<th>error description</th>
</tr>
</thead>
</table>

CB.GetCallback (FUN)
This function of the %CAA_Callback.Library serves to get a function via its handle.

Table 387: Input:
<table>
<thead>
<tr>
<th>hHandle</th>
<th>CAA.HANDLE</th>
<th>callback handle</th>
</tr>
</thead>
<tbody>
<tr>
<td>pCallback</td>
<td>POINTER TO CB.CALLBACK</td>
<td>return: description of the callback conditions and the callback function</td>
</tr>
</tbody>
</table>

Table 388: Output:
<table>
<thead>
<tr>
<th>eError</th>
<th>CB.Error</th>
<th>error description</th>
</tr>
</thead>
</table>

CB.IsHandleValid (FUN)
This function of the %CAA_Callback.Library serves to check whether a callback handle is valid.

Table 389: Input:
<table>
<thead>
<tr>
<th>hHandle</th>
<th>CAA.HANDLE</th>
<th>callback handle</th>
</tr>
</thead>
<tbody>
<tr>
<td>peError</td>
<td>POINTER TO CB.Error</td>
<td>pointer on error ID</td>

</tbody>
</table>

Table 390: Output:
<table>
<thead>
<tr>
<th>xValid</th>
<th>BOOL</th>
<th>TRUE: handle is valid; FALSE: handle is invalid</th>
</tr>
</thead>
</table>

CB.GetNumberActiveCallbacks (FUN)
This function of the %CAA_Callback.Library provides the number of active callbacks.
Table 391: Input:

| peError | POINTER TO CB.Error | pointer on error ID |

Table 392: Output:

| ctNumCallbacks | CAA.COUNT | number of active callbacks |

**CB.GetHandleOfCallback (FUN)**

This function of the %CAA_Callback.Library gets a callback handle via the callback number.

Table 393: Input:

| ctNumber | UINT | callback number (value between 1 and %CB.GetNumberActiveCallbacks) |
| peError | POINTER TO CB.Error | pointer on error ID |

Table 394: Output:

| hCallback | CAA.HANDLE | callback handle |

**CB.PostEvent (FUN)**

This function of the %CAA_Callback.Library serves to trigger an event in order to call one or multiple callbacks.

The function returns immediately. The callbacks will be executed in the background. For this reason the function is suitable for triggering events e.g. in interrupt service routines.

Table 395: Input:

| eEvent | CB.EVENT | event |
| eSource | CB.EventSource | event source |
| dwParam | DWORD | parameter for the receiver of the event |

Table 396: Output:

| eError | CB.Error | error description |

**CB.SendEvent (FUN)**

This function of the %CAA_Callback.Library serves to trigger an event in order to call one or multiple callbacks with this event. It is recommended that IEC programs using this function do set IECPROGRAM as event source and ALL_CLASSES as event class. If the function is used by drivers, it is advisable to use DRIVER as event source. The function will not return before all callbacks have been executed. Thus it is made sure, that all interested parties have terminated their respective reaction until the function returns.
Table 397: Input:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

**CB.CallFunctionByIndex (FUN)**

This function of the `%CAA_Callback.Library` serves to call an IEC function indirectly via its POU index. The following constraints have to be regarded:

- The name of the function must have a prefix „Callback“.
- The function must have a return value of a data type of 4 byte length.
- The function must have exactly three parameters of a data type of 4 byte length.

Table 399: Input:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>pPOUFunc</td>
<td>CAA.PVOID</td>
<td>POU-Index of the function to be called</td>
</tr>
<tr>
<td>dwParam1</td>
<td>DWORD</td>
<td>first parameter of the function to be called</td>
</tr>
<tr>
<td>dwParam2</td>
<td>DWORD</td>
<td>second parameter of the function to be called</td>
</tr>
<tr>
<td>dwParam3</td>
<td>DWORD</td>
<td>third parameter of the function to be called</td>
</tr>
<tr>
<td>peError</td>
<td>POINTER TO CB.Error</td>
<td>pointer on error ID</td>
</tr>
</tbody>
</table>

Table 400: Output:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dwValue</td>
<td>DWORD</td>
</tr>
</tbody>
</table>

**CB.DecodeEvent (FUN)**

This function of the `%CAA_Callback.Library` serves to extract value eEvent of type `%CB.Event` from parameter dwSpec of the callback function.

Table 401: Input:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dwSpec</td>
<td>DWORD</td>
</tr>
</tbody>
</table>

Table 402: Output:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>eEvent</td>
<td>CB.Event</td>
<td>event name for the callback</td>
</tr>
</tbody>
</table>

**CB.DecodeClass (FUN)**

This function serves to extract class eClass vom Type `%CB.EventClass` from parameter dwSpec of the callback function.
**Table 403: Input:**

| dwSpec | DWORD | parameter of the callback function |

**Table 404: Output:**

| eClass | CB.EventClass | event class of the callback |

**CB.EncodeSpec (FUN)**

This function of the `CAA_Callback.Library` serves to create parameter `dwSpec` of type `DWORD`, which is necessary for callback functions, out of two values of type `CB.EventClass` and `CB.EventSource`.

**Table 405: Input:**

<table>
<thead>
<tr>
<th>eEvent</th>
<th>CB.EventEvent</th>
<th>parameter of the callback function</th>
</tr>
</thead>
<tbody>
<tr>
<td>eClass</td>
<td>CB.EventClass</td>
<td>parameter of the callback function</td>
</tr>
</tbody>
</table>

**Table 406: Output:**

| dwSpec | DWORD | parameter of the callback function |

1.4.2.6.2.4.4 Indirect function call (EXAMPLE).............................................. 2134

**Inserting Callbacks (EXAMPLE)**

( `CAA_Callback.Library`) The following code lines insert two callbacks. The first calls function BeforeResetFunction, which is called before the PLC is reset; the second calls function ErrorFunction as soon as an event of class RTS_ERRORS or SYSTEM_EXCEPTIONS occurs.

```c
cbNew.eEvent := CB.BEFORE_RESET;
cbNew.eClass := CB.ALL_CLASSES;
cbNew.eSource := CB.ALL_SOURCES;
cbNew.pPOUFunc := ADR(CallbackBeforeReset);
CB.RegisterCallback(cbNew);

cbNew.eEvent := CB.ALL_EVENTS;
```

```c
cbNew.eClass := CB.RTS_ERRORS OR CB.SYSTEM_EXCEPTIONS;
```

```c
cbNew.eSource := CB.ALL_SOURCES;
```

```c
cbNew.iPOUFunc := ADR(CallbackError);
```

```c
CB.RegisterCallback(cbNew);
```
Deleting Callbacks

1.4.2.6.2.4.2.1 Handleknown (EXAMPLE) ..................................................... 2133
1.4.2.6.2.4.2.2 HandleUnknown (EXAMPLE) ................................................. 2133

Handleknown (EXAMPLE)

This example of the `CAA_Callback.Library` assumes that the handle, which was returned during the registration of the callback, was stored:

(* define callback *)
caNew.eEvent := CB.BEFORE_RESET;
caNew.eClass := CB.ALL_CLASSES;
caNew.eSource := CB.ALL_SOURCES;
caNew.iPOUFunc := ADR(CallbackBeforeReset);

(* insert callback and store handle *)
ha := CB.RegisterCallback(caNew);

(* delete callback *)
IF CB.IsHandleValid(ha) THEN
CB.UnregisterCallback(ha);
END_IF

HandleUnknown (EXAMPLE)

Example of the `CAA_Callback.Library`:
If the handle is not known any more, the callback can be deleted as shown in the following example:

(* define callback *)
caDelete.eEvent := CB.BEFORE_RESET;
caDelete.eClass := CB.ALL_CLASSES;
caDelete.eSource := CB.ALL_SOURCES;
caDelete.iPOUFunc := ADR(CallbackBeforeReset);

(* browse all callbacks *)
FOR i:=1 TO CB.GetNumberActiveCallbacks() DO
 (* get handle *)
ha := CB.GetHandleOfCallback(i);

 (* if searched callback *)
IF CB.GetCallback(ha)=caDelete THEN
 (* delete callback *)
CB.UnregisterCallback(ha);
EXIT;
END_IF
Triggering callbacks (EXAMPLE)

The following example of the \texttt{CAA\textunderscore Callback.Library} simulates an event, which effects that the system will trigger the callbacks registered on this event:

\begin{verbatim}
CB.PostEvent
(     eEvent := CB.EXCPT\_OVERFLOW,
     eSource := CB.IECPROGRAM,
     dwParam := 0
);
\end{verbatim}

Indirect function call (EXAMPLE)

\begin{verbatim}
( \texttt{CAA\textunderscore Callback.Library})
1. Implementation of a function:
FUNCTION CallbackTestFunction : DWORD
    VAR_INPUT
    tTime    : TIME;
    udiCount : UDINT;
    dwState  : DWORD;
END_VAR

2. Indirect call of this function:
IF xCallTest THEN
    xCallTest := FALSE;
    dwValue := CB.CallFunctionByIndex
(     pPOUFunc := ADR(CallbackTestFunction),
     dwParam1  := TIME\_TO\_DWORD(TIME()),
     dwParam2  := UDINT\_TO\_DWORD(udiCount),
     dwParam3 := dwState
);
END_IF
\end{verbatim}
Overview CAA_CiA405.Library

This specification uses the standardized CANopen interface for IEC 61131-3 programmable devices like PLC.

The devices use communication techniques which conform to those described in the CiA Draft Standard DS-301 (Application Layer and Communication Profile), Draft Standard Proposal DSP-302 (Framework for Programmable CANopen Devices) and Draft Standard Proposal DS-405 (Interface and Device Profile for IEC 61131-3 Programmable Devices). These documents should be consulted in parallel to this specification.

References:
- /DS-301/ CiA Draft Standard DS 301 V4.02 CANopen Application Layer and Communication Profile
- /DS-405/ CiA Draft Standard Proposal DS 405 V2.0 CANopen interface and Device Profile for IEC 61131-3 Programmable Devices

In general, generating an application implements the handling of up to five interfaces:

**Fig. 80: Generating an application /handling interfaces**

This description just covers the interface:

A. that means, the access to a CANopen communication system from within an IEC 61131-3 program based on calls to function blocks

This description does not (yet) cover the interfaces:
B. utility functions for debugging, monitoring and network management
C. interface between CANopen tools and IEC 61131-3 programming environment
D. manufacturer specific interface between programming environment and PLC runtime
E. CANopen tool specific interface between configuration tool and network

NOTICE!
The figure describes not necessarily the use of different tools for programming and configuration. One tool may handle both functionality and hide the interfaces. An example is given by the programming tool CODESYS (see dotted line), where the CANopen configuration and the runtime software on the PLC is included.

Application interface
The needs of any application from within an IEC 61131-3 level it is to read from the device object directory of a CANopen connected node or to write to it (SDO). Further elements of a CANopen communication are Process Data Objects (PDO) which are supported in the process image within the IEC application as inputs (receive PDO; i.e.: %IX.. ) or outputs (transmit PDO; i.e.: %QW.. ). Received asynchronous error messages (EMCY) are registered in a buffer for each node. The network status is controlled by the Network management (NMT). Node guarding functionality is available with CANopen as well as synchronized communication for process data.

The chapters of the current description describe the needs of a function block library for CANopen communication.

Data types / Enumerations

1.4.2.6.3.2.1 CIA405.DEVICE_STATE (ENUM) .................................................. 2136
1.4.2.6.3.2.2 CIA405.SDO_MODE (ENUM) .................................................. 2136
1.4.2.6.3.2.3 CIA405.TRANSITION_STATE (ENUM) ..................................... 2138
1.4.2.6.3.2.4 CIA405.TRANSACTION_STATE (ENUM) .................................. 2138
1.4.2.6.3.2.5 CIA405.ERROR (ENUM) ......................................................... 2138
1.4.2.6.3.2.6 CIA405.EMCY_DATA (STRUCT) .............................................. 2138
1.4.2.6.3.2.7 CIA405.EMCY_ERROR (STRUCT) .......................................... 2138
1.4.2.6.3.2.8 CIA405.KERNEL_ERROR_INFO (STRUCT)............................ 2139
1.4.2.6.3.2.9 CIA405.DEVICE........................................................................ 2139
1.4.2.6.3.10 CIA405.SDO_ERROR............................................................. 2139
1.4.2.6.3.11 CIA405.CANOPEN_KERNEL_ERROR................................... 2139

Data types / Enumerations

The data types of the CIA405.Library described in this chapter are mandatory by means of function library needs.

CIA405.DEVICE_STATE (ENUM)

( CIA405.Library)
Type CIA405.STATE describes the state of the CANopen network layer, as defined in /DS-301/. The states INIT, RESET_COMM, RESET_APP, PRE_OPERATIONAL, STOPPED, OPERATIONAL correspond to the same states in /DS-301/. The state UNKNOWN must be used, if the actual state of the device is not known (in example, if no guarding of the device is performed). The state NOT_AVAIL must be used, if it is known, that the device is not available (in example, if guarding is performed and the device does not answer).

<table>
<thead>
<tr>
<th>State</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>INIT</td>
<td>0</td>
</tr>
<tr>
<td>RESET_COMM</td>
<td>1</td>
</tr>
<tr>
<td>RESET_APP</td>
<td>2</td>
</tr>
<tr>
<td>PRE_OPERATIONAL</td>
<td>3</td>
</tr>
<tr>
<td>STOPPED</td>
<td>4</td>
</tr>
<tr>
<td>OPERATIONAL</td>
<td>5</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>6</td>
</tr>
<tr>
<td>NOT_AVAIL</td>
<td>7</td>
</tr>
</tbody>
</table>

The state, delivered by $\text{CIA405.GET\_STATE}$, is:

- If node guarding / heartbeat is not active for the selected DEVICE: UNKNOWN (6) (even if a boot-up message is received)
- If heartbeat is active but the NMT-master is not the Heartbeat-Consumer: UNKNOWN (6).
- If node guarding / heartbeat is active and the device reports its NMT state: reported NMT state (value, defined in DS301 V4.02 chap. "Error Guarding Protocol")
- If node guarding / heartbeat is active and the device does not report its NMT state correctly before timeout, i.e. "node life time" (Nodes Guarding Protocol) respective "Heartbeat Consumer Time" (Heartbeat Protocol): NOT_AVAIL (7)

### CIA405.SDO_MODE (ENUM)

( $\text{CAA\_Cia405.Library}$)

The Parameter mode for $\text{CIA405.SDO\_WRITE}$ is one value of the following set:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO</td>
<td>0</td>
</tr>
<tr>
<td>EXPEDITED</td>
<td>1</td>
</tr>
<tr>
<td>SEGMENTED</td>
<td>2</td>
</tr>
<tr>
<td>BLOCK</td>
<td>3</td>
</tr>
</tbody>
</table>

In “Auto” mode the client uses the most efficient transfer protocol to transfer the data from or to the server. He queries the possibilities and compromise the best way for both parties. The SDO protocol is defined in /DS 301/.
CIA405.TRANSITION_STATE (ENUM)
( % CAA_Cia405.Library)
Type CIA405.TRANSITION_STATE describes the state transitions of the CANopen network layer, as defined in /DS-301/.

<table>
<thead>
<tr>
<th>State Description</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOP_REMOTE_NODE</td>
<td>16#04</td>
</tr>
<tr>
<td>START_REMOTE_NODE</td>
<td>16#05</td>
</tr>
<tr>
<td>RESET_NODE</td>
<td>16#06</td>
</tr>
<tr>
<td>RESET_COMMUNICATION</td>
<td>16#07</td>
</tr>
<tr>
<td>ENTER_PRE_OPERATIONAL</td>
<td>16#7F</td>
</tr>
<tr>
<td>ALL_EXCEPT_NMT_AND_SENDER</td>
<td>16#800</td>
</tr>
</tbody>
</table>

A flag to use in combination. Must be used if NMT command should be addressed to all devices (DEVICE=0) except to the CANopen-Manager.

CIA405._ERROR (ENUM)
( % CAA_Cia405.Library)
The error codes occur on the ERROR output on some building blocks are part of this set:

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>no error</td>
</tr>
<tr>
<td>10300</td>
<td>first library specific error</td>
</tr>
<tr>
<td>10301</td>
<td></td>
</tr>
<tr>
<td>10302</td>
<td></td>
</tr>
<tr>
<td>10303</td>
<td></td>
</tr>
<tr>
<td>10316</td>
<td></td>
</tr>
<tr>
<td>10317</td>
<td></td>
</tr>
<tr>
<td>10332</td>
<td>first manufacturer specific error</td>
</tr>
<tr>
<td>10399</td>
<td>last library specific error</td>
</tr>
</tbody>
</table>

CIA405.EMCY_DATA (STRUCT)
( % CAA_Cia405.Library)

<table>
<thead>
<tr>
<th>Device</th>
<th>DEVICE</th>
</tr>
</thead>
</table>

CIA405.EMCY_ERROR (STRUCT)
Type CIA405.EMCY_ERROR contains emergency error information, as specified in /DS-301/:
<table>
<thead>
<tr>
<th>EMCY_ERROR_CODE</th>
<th>WORD</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERROR_REGISTER</td>
<td>BYTE</td>
</tr>
<tr>
<td>ERROR_FIELD</td>
<td>ARRAY [1..5] OF BYTE</td>
</tr>
</tbody>
</table>

**CIA405.KERNEL_ERROR_INFO** (STRUCT)

( % CAA_CiA405.Library)

<table>
<thead>
<tr>
<th>wError</th>
<th>CANOPENKERNEL_ERROR</th>
</tr>
</thead>
<tbody>
<tr>
<td>usIDevice</td>
<td>DEVICE</td>
</tr>
</tbody>
</table>

**CIA405.DEVICE**

( % CAA_CiA405.Library)
Type CIA405.DEVICE represents the Node ID of a device.

<table>
<thead>
<tr>
<th>DEVICE</th>
<th>USINT (0..127)</th>
</tr>
</thead>
</table>

**CIA405.SDO_ERROR**

( % CAA_Cia405.Library)
Type CIA405.SDO_ERROR represents error information as defined in /DS-301/:

<table>
<thead>
<tr>
<th>SDO_ERROR</th>
<th>UDINT</th>
</tr>
</thead>
</table>

**CIA405.CANOPEN KERNEL_ERROR**

( % CAA_CiA405.Library)
Type CIA405.CANOPEN KERNEL_ERROR contains error information about the CANopen Kernel.

<table>
<thead>
<tr>
<th>CANOPENKERNEL_ERROR</th>
<th>USINT</th>
</tr>
</thead>
</table>

Global Constants

1.4.2.6.3.3.1 CIA405.CANOPEN_KERNEL_ERROR_CODES..................... 2139

**CIA405.CANOPEN_KERNEL_ERROR_CODES**
<table>
<thead>
<tr>

</tbody>
</table>
This chapter describes standard function blocks to access CANopen from IEC 61131-3. The function blocks described in this chapter are mandatory by means of function library needs. Optional function blocks in the sense of CANopen standardization are described too in order to assimilate all function blocks defined within DS-405. The following table can be used by IEC 61131-3 compliant systems to state the features covered.

<table>
<thead>
<tr>
<th>Function block</th>

General function block design issues

1.4.2.6.3.4.2.1 Data types vs. Data length......................................................... 2141
1.4.2.6.3.4.2.2 Timeout................................................................................... 2141
1.4.2.6.3.4.2.3 Additional parameters............................................................ 2142
1.4.2.6.3.4.2.4 Control mechanism.................................................................... 2143

Data types vs. Data length

(© CAA_Cia405.Library)

It is possible to represent transmission of data of arbitrary length within IEC 61131-3. However, the interfaces to function blocks allowing for that may be quite more difficult to use and understand. Therefore different function blocks are defined herein, for the transmission of a fixed (maximum) amount of data each as well as blocks for arbitrary length.

Timeout

(© CAA_Cia405.Library)
The interface is designed such that it is possible to wrap the calls with a timer block to implement timeouts. Additionally, it is allowed that lower level CANopen software implement their own timeouts and report such as errors to the caller.

### Additional parameters

Some systems may support or require additional information in the function blocks. For example, a PLC may have several CAN channels. In that case the function blocks require the channel number of the service. Another requirement will be to limit the time a function block takes until it reports to the caller if the function block is executed with or without success. Therefore a Timeout input (milliseconds) is required. Therefore these parameters are added to the function blocks.

In DS405 it is allowed and within `CAA_CIA405.Library` it is mandatory to add the following parameters to the function blocks:

**NETWORK: USINT; (*CAN channel number*)**

Selects the CAN channel on which the requested service has to be executed (range 1..64). A device with only one CAN channel available must accept either the number 1 only or must accept all numbers, i.e. must ignore the value at this input.

**CHANNEL: USINT; (*SDO channel number*)**

Selects the SDO channel on which the requested service has to be executed (starting from number 1). A device with only one SDO channel available must accept either the number 1 only or must accept all numbers, i.e. must ignore the value at this input.

The CAN channel number is not the same like the Net ID specified in the CANBus configurator. For calculating the CAN channel number use following formula: \( \text{Net ID} + 1 \)

**TIMEOUT: UDINT; (*milliseconds; maximum wait time for response*)**

The timeout defines the maximum wait time for a response of the function block. The time measurement starts with the rising edge on input ENABLE of the called function block. When the defined maximum time is reached without being a response to the requested service available, the function block terminates the execution and signals error timeout. For an infinite wait time for response the value 0 is used at this input.

Within the `CAA_CIA405.Library` one additional output to the function block `CIA405.GET_CANOPEN_KERNEL_STATE` is defined:

**DEVICE: CIA405.DEVICE; (*source of STATE *)**

DEVICE contains either the device number of the device to which the STATE is connected to (for example in case of reception of an unknown data format) or the number of the device where the kernel is located.

Within the `CAA_CIA405.Library` one additional input to the function block `CIA405.SDO_WRITE` is defined:

**MODE: CIA405.SDO_MODE; (*type of protocol *)**

MODE select the method for sending/receiving the data from the server regarding the SDO protocol specification in /CIA301/.
Control mechanism

In general the task of each defined function block of the CAA_Cia405.Library is to read or to write one or more parameters. Such parameters can be variables or states at CANopen connected devices (SDO, EMCY, NMT-state) or at the local node (own node number, CANopen kernel state). Therefore each function block performs the same behavior in general.

A typical behavior of the control signals ENABLE, CONFIRM and ERROR is shown at the SDO access:

![Request/Response diagram](image)

- **Fig. 81: Request/Response diagram**
  - The peak at the symbol ✗ shows the time when the event occurs. The symbol □ shows that the message is ignored. High level at ENABLE and CONFIRM signals TRUE; low level signals FALSE. High level at ERROR signals a value > 0; low level signals value = 0.
  - PLC cycles: the diagram shows, that there is no relation between the signal timing and the PLC cycles, i.e. the response can be available immediately or some PLC cycles later.
  - Timeout: the time control starts with a rising edge at ENABLE. Timeout event occurs, when there is no response available before time control reaches the timeout value. When timeout occurs, ERROR = 3 and ERRORINFO may contain additional error information using the SDO-Abort data format. If there is no additional error information available, ERRORINFO is 0.

**Request:**

The "no error" as well as the "error" condition shows, that immediately with the rising edge detected at Input ENABLE the Request event occurs, i.e. it is put to a lower level software. The outputs stay at their initial values. The program control is given back to the caller if the Response or Abort is not available immediately.

**A:Response:** As soon as the SDO-Response message is available the output CONFIRM is set TRUE and stays TRUE as long as the function block is called with input ENABLE=TRUE. When the function block is called with ENABLE=FALSE, CONFIRM is set FALSE, i.e. the initial value.
B: Abort: As soon as the SDO-Abort message is available the output ERROR is set to value 1 and more error information is available in the output ERRORINFO ("further error register" / DS405/). The outputs stay stable as long as the function block is called with input ENABLE = TRUE. When the function block is called with ENABLE = FALSE, ERROR and ERRORINFO are set to 0, these are their initial values.

C: ENABLE = FALSE before Response or Abort available: As soon as the function block is called with ENABLE = FALSE, the outputs are set to their initial values, i.e. CONFIRM = FALSE, ERROR = 0, ERRORINFO = 0. A possibly available Response or Abort is ignored as well as a later arriving Response or Abort.

D: Timeout: When the function block is called and timeout is detected and Response or Abort is not available, ERROR = 3 and ERRORINFO may contain additional error information using the SDO-Abort data format. If there is no additional error information available, ERRORINFO is 0.

Flow control

The function block stays in idle, i.e. all outputs are set to their initial values and it executes no operation, as long as input ENABLE is FALSE. The number of calls does not matter. As soon as ENABLE performs a rising edge, the function block will start execution, i.e. it will read the input values and put a request to a lower level software, e.g. to read or write a selected parameter. If the response to the request is available immediately, like the return value on a function call, the function block will set the outputs immediately and finish its task. For example, a function which gets the local node id, may work in that way. If the response is not available immediately, the function block gives the program control back to the caller with all output signals at busy state, e.g. CONFIRM = FALSE and ERROR = 0.

On each call of the function block, the availability of the response is checked and the timeout, if applicable. Changing input values except ENABLE are ignored.

If the response signals an error condition or the timeout is reached, the function block set the outputs to error state, e.g. CONFIRM = FALSE and ERROR <> 0 and finishes its task.

If the response signals success, the function block sets the outputs to confirm state, e.g. CONFIRM = TRUE and ERROR = 0 and, if it was a read request, the data outputs to the actual requested values and finishes its task.

NOTICE!

In /DS405/ it is not clearly defined if the function block starts execution again a) immediately, b) on the next call or c) after the next rising edge at input ENABLE. To give other function blocks the chance to access the same device on the same SDO-channel, it is recommended to wait at least one PLC cycle (b) before starting execution again. This avoids, that one function block, called with input ENABLE = TRUE forever, could block the communication to one device. A disadvantage may be in case a) and b), that the function block does not signalize when a new response, e.g. new data, is available. The user does not know how old the delivered data are. On write requests, the user does not know if the input data are transmitted to the device before they are changed. Further it is doubtful to transmit the same data several times. For this reasons it is recommended to do not start execution again when ENABLE stays TRUE (c). When ENABLE becomes FALSE all outputs are set to their initial values immediately. A possibly available response is ignored as well as an ongoing processed request. A rising edge at ENABLE starts the flow control from the beginning.
NOTICE!

In /DS301/ (V 4.02 chap. 9.2.2.1.7) is defined regarding the SDO-Abort: "The service may be executed at any time by both the client and the server of a SDO. If the client of a SDO has confirmed service outstanding, the indication of the abort is taken to be the confirmation of that service."

</tr>
<tr>
<td></td>
<td></td>
<td>initial: 0</td>
</tr>
</tbody>
</table>
The figure above shows the timing diagram for CIA405.SDO_WRITE4. After all data is provided to the inputs, ENABLE is set to TRUE (1). The SDO will be sent, and when the CANopen software reports success to the function block, output CONFIRM will be changed to TRUE (2). The caller will see this and change ENABLE to FALSE (3), which in turn will cause output CONFIRM to change to FALSE (4).

- With a rising edge on input ENABLE, the function block will sample the inputs and initiate the transmission of the SDO specified in DATA and DATALENGTH to the recipient specified with DEVICE, INDEX and SUBINDEX. The value of DEVICE is limited to a range of 1 to 127. For access to the local object dictionary it is allowed to use the value 0 for DEVICE.
- With TRUE on input ENABLE, the function block is allowed to continue execution. If a result is reported on the call by lower level CANopen software, outputs CONFIRM, ERROR and ERRORINFO are set accordingly.
- With a falling edge on input ENABLE the function block will terminate. If the transmission did not finish yet, it will be aborted if possible. Outputs CONFIRM and ERROR will both be set to FALSE respectively "no error".
- With a FALSE on input ENABLE, the function block will return immediately and not take any action.
- For behavior of ENABLE, CONFIRM and ERROR see chapter "Control mechanism" on page 2143.
- For inputs NETWORK and TIMEOUT see chapter "Additional parameters .
- The input DATA defined as ARRAY[1..4] OF BYTE contains the least significant data byte at the lowest array index. Example: the value 16#01020304 (hexadecimal) is assigned as ARRAY[1..4] OF BYTE := 04, 03, 02, 01

The result of a writing operation is reported (immediately after the writing call or afterwards) in outputs CONFIRM, ERROR and ERRORINFO with a rising edge on either CONFIRM or ERROR. In case of ERROR is equal to 1 (other error), ERRORINFO will give more specified information on the cause. This is especially true for the occurrence of an SDO Abort. Then ERRORINFO contains the Abort code.

It cannot be assumed in general that this function can synchronously complete; rather, it should be possible to have this function continue to be executed while the call to CIA405.SDO_WRITE4 returns and the PLC program is continued. Therefore, the result of a call may be available only several cycles after a rising edge has been applied to ENABLE.
CIA405.SDO_WRITE (FB)

( % CAA_Cia405.Library)

This function block can be used as alternative to the CIA_SDO_WRITEx function blocks. It supports the arbitrary length of data. The behavior and timing is the same as with % CIA405.SDO_WRITE4. The only difference is the data type of the variables DATA and DATA-LENGTH.

Extends % CIA405.CIA405BASE.

---

**CIA405.GET_CANOPEN_KERNEL_STATE (FB)**

( `CAA_CiA405.Library` )

Function block CIA405.GET_CANOPEN_KERNEL_STATE returns the current state of the CANopen Kernel.

Extends `CIA405.CIA405BASE`.

---

If the state is not known, the function block returns with the state UNKNOWN. This will occur, if the device is not guarded and Heartbeat is not running. If Guarding is performed and the device does not answer or it is known for other reasons, that the device is not available, the function returns the state NOT_AVAIL. If `DEVICE` is 0 or equal to the own Node-ID, the function block returns the state of the local communication process.

- Data output STATE is valid only if CONFIRM is TRUE. If CONFIRM is FALSE, the data output is invalid and may contain any value.
- The request for data is initiated only once with the rising edge at ENABLE. Another request is initiated not before the next rising edge at ENABLE is recognized.
- For behavior of ENABLE and CONFIRM see chapter `Chapter 1.4.2.6.3.4.2.4 "Control mechanism"` on page 2143.
- For inputs NETWORK and TIMEOUT see chapter `Additional parameters`.
- In case of an error during execution of the function block it is defined to deliver STATE = UNKNOWN (6) with CONFIRM = TRUE and ERROR = 0.
### Table 422: Output:

</tr>
</tbody>
</table>

**Fig. 86: Request/Response diagram**

- Data output STATE is valid only if CONFI RM is TRUE. If CONFI RM is FALSE, the data output is invalid and may contain any value.
- The request for data is initiated only once with the rising edge at ENABLE. Another request is initiated not before the next rising edge at ENABLE is recognized.
- For behavior of ENABLE and CONFI RM see chapter § Chapter 1.4.2.6.3.4.2.4 “Control mechanism” on page 2143.
- For inputs NETWORK and TIMEOUT and output DEVICE see chapter § Additional parameters.
- In case of an error during execution of the function block it is defined to deliver DEVICE = 0 (local device) with STATE <> 0 and ERROR = 0.
- The function block reports any error except a) SDO-Abort-indications created by an SDO-Client and b) EMCY messages received from a CAN device. SDO-Abort indications are handled by the function blocks § CIA405.SDO_READ and § CIA405.SDO_WRITE. EMCY messages are handled by the function blocks § CIA405.RECV_EMCY and § CIA405.RECV_EMCY_DEV.
- As soon as the STATE is reported, it is acknowledged to the lower level error handling. That means for example to clear the error message in the memory in order to enable the entry of another error message which will be reported on the next request for data.

Fig. 87: NMT service diagram

- For behavior of ENABLE and CONFIRM see chapter § Chapter 1.4.2.6.3.4.2.4 “Control mechanism” on page 2143.
- For inputs NETWORK and TIMEOUT see chapter § Additional parameters .
- NMTservice: the NMTservice event is the request to the addressed node (DEVICE=0 means: local device) to perform the requested state transition.
- confirm: the event confirm is the positive acknowledgement that the service is processed without error; for example the CANopen kernel returns no error to the function block.
- error: the event error is the negative acknowledgement that the service is processes with error; for example the CANopen kernel returns an error to the function block.
- Timeout: the time control starts with a rising edge at ENABLE. Timeout event occurs, when there is no acknowledgement returned to the function block before time control reaches the timeout value. When timeout occurs, ERROR = 3.
Function block CIA405.RECV_EMCY_DEV checks if an emergency object has been received from DEVICE.

</tr>
<tr>
<td>ERRORINFO</td>
<td>CIA405.EMCY_ERR OR EMCY code</td>
<td></td>
</tr>
</tbody>
</table>

**Fig. 88: Request/Response diagram**

CIA405.RECV_EMCY_DEV will check if an emergency object (/DS-301/) has been received from DEVICE. If the function block has finished its action without any error, output CONFIRM is changed to TRUE and ERROR to 0. ERRORINFO contains the information about the received emergency. An emergency was received if the error code of ERRORINFO is unequal 0. An error code with value 0 means that the device has currently no emergency.
A received emergency is not cleared and it is delivered with each call of the function block until the device sends an emergency reset.

If an error occurred while checking for an emergency, CONFIRM is set to FALSE and ERROR is set to the corresponding error value.

- For behaviour of ENABLE and CONFIRM see chapter “Control mechanism” on page 2143.
- For inputs NETWORK and TIMEOUT see chapter Additional parameters.
- Response: this event is the positive acknowledgement that the request is processed without error, i.e. the value of EMCY is available at the output ERRORINFO. If no EMCY was received, ERRORINFO = 0, i.e. all members of the structure CIA405.EMCY_ERROR are zero. For detailed description of CIA405.EMCY_ERROR see CIA405.EMCY_ERROR (STRUCT)
- error: this event is the negative acknowledgement and means that the request is processed with error, for example the CANopen kernel returns an error to the function block when accessing the value of EMCY. In this case ERRORINFO = 0. For detailed description of CIA405.CANOPEN_KERNEL_ERROR see CIA405.CANOPEN_KERNEL_ERROR
- Timeout: the time control starts with a rising edge at ENABLE. Timeout event occurs, when there is no acknowledgement returned to the function block before time control reaches the timeout value. When timeout occurs, ERROR = 3 and ERRORINFO = 0.

Recommendation: The function block should deliver the EMCY of the checked device on each call. Often the earliest EMCY contains the originally error information; later EMCYs often just results from following errors. A lower level software may work in the way, that a received EMCY does not overwrite an EMCY which is different from "No Error" ( is equal to "Reset Error" ). On the other hand, a received "No Error"- EMCY overwrites the stored EMCY in any case.

CIA405.RECV_EMCY (FB)

Function block CIA405.RECV_EMCY checks if an emergency object has been received from any DEVICE.

<table>
<thead>
<tr>
<th>Table 427: Input:</th>
</tr>
</thead>
<tbody>
<tr>
<td>NETWORK</td>
</tr>
<tr>
<td>ENABLE</td>
</tr>
<tr>
<td>TIMEOUT</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 428: Output:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIRM</td>
</tr>
<tr>
<td>ERROR</td>
</tr>
<tr>
<td>DEVICE</td>
</tr>
<tr>
<td>ERRORINFO</td>
</tr>
</tbody>
</table>
CIA405.RECV_EMCY will check if an emergency object (/DS-301/) has been received from any device. If the function block has finished its action without any error, output CONFIRM is changed to TRUE and ERROR to 0. ERRORINFO contains the information about the received emergency and DEVICE is set to the ID of the device sending the emergency object. An emergency was received if both DEVICE and error code of ERRORINFO are unequal 0.

If an error occurred while checking for an emergency, CONFIRM is set to FALSE and ERROR is set to the corresponding error value.

- For behavior of ENABLE and CONFIRM see chapter “Control mechanism” on page 2143.
- For inputs NETWORK and TIMEOUT see chapter “Additional parameters.”
- Response: this event is the positive acknowledgement that the request is processed without error, i.e. the value of EMCY received from DEVICE is available at the output ERRORINFO. If no EMCY was received, ERRORINFO = 0, i.e. all members of the structure CIA405.EMCY_ERROR are zero.
- error: this event is the negative acknowledgement and means that the request is processed with error, for example the CANopen kernel returns an error to the function block when accessing the value of EMCY. In this case ERRORINFO = 0.
- Timeout: the time control starts with a rising edge at ENABLE. Timeout event occurs, when there is no acknowledgement returned to the function block before time control reaches the timeout value. When timeout occurs, ERROR = 3 and ERRORINFO = 0.

Recommendation: In order to deliver all pending EMCY messages with each call of the function block in a loop and also to notify a "Reset Error"-EMCY at least once, a lower level software may work in the way, that for each device a storage for the received EMCY messages is managed as described in the recommendation for CIA405.RECV_EMCY_DEV (FB). The function block CIA405.RECV_EMCY scans the EMCY storages in a loop over all existing devices. If a device is found during the scan, for which the EMCY-storage contains an EMCY different from "No Error", the EMCY is delivered. Else if a device is found, for which an EMCY different from "No Error" was delivered at the last scan and for which the EMCY-storage now contains "No Error", this "No Error"-EMCY is delivered. Each device, for which a "No Error" was delivered at last, is skipped during the scan, that is a "No Error"-EMCY is delivered only once. On the next execution the search is continued. In order to get the information that a pending EMCY was cleared by receiving "Reset Error" from a device, this "Reset Error"-EMCY is delivered only once, i.e. DEVICE > 0 while ERRORINFO = 0. In order to get the information that all devices are error-free, the function block delivers DEVICE = 0 and ERRORINFO = 0 after a complete scan over the EMCY-storages of all existing devices.

Overview CAA_DTUtil.library

This library provides functions for handling date and time.

Data types / Enumerations

1.4.2.6.4.2.1 DTU.ERROR (ENUM)

DTU.ERROR (ENUM)

This data structure describes errors which might occur when using the functions of the CAA_DTUtility library. Error number range 5750 – 5799 is reserved for this library in the prefix registration for libraries (LibraryRegistry.chm).

<table>
<thead>
<tr>
<th>NO_ERROR</th>
<th>0</th>
<th>No error</th>

</tbody>
</table>

Global Constants

1.4.2.6.4.3.1 DTU.gc_tziTimeZoneCET (VAR_GLOBAL CONSTANT)

DTU.gc_tziTimeZoneCET (VAR_GLOBAL CONSTANT)

The global constant „DTU.gc_tziTimeZoneCET“ defines the time zone as well as the switch between summer and standard time of the Central European EU countries.

The switch is done according to the following rules:

- The switch to summer time (CEST) takes place on the last Sunday of March. The clock is set ahead by one hour at 2:00 a.m..
- The switch to standard time (CET) takes place on the last Sunday of October. The clock is set back by one hour at 3:00 a.m.
Reading and setting the realtime clock

1.4.2.6.4.4.1.1 Reading and setting the realtime clock............................... 2160
1.4.2.6.4.4.1.2 DTU.GetDateAndTime (FB prefix: gdt)............................ 2160
1.4.2.6.4.4.1.3 DTU.SetDateAndTime (FB prefix: sdt)............................ 2161
1.4.2.6.4.4.1.4 DTU.SetTimeZoneInformation (FB prefix: sti).................... 2161
1.4.2.6.4.4.1.5 DTU.GetTimeZoneInformation (FB prefix: gti).................... 2162

Reading and setting the realtime clock

(CAA_DTUtil.library)
Reading and setting of the realtime clock is already supported by modules of the library CAA_RealTimeClock.lib. These modules, however, might not take into account the time zone and a possible switch between summer and standard time.

If an automatic switch is desired all the same, the function blocks of the CAA.DTUtility library can be used for reading and setting the realtime clock. In this case the time switch is done via this library.

The switch between summer and standard time is not done until one of the function blocks DTU.GetDateAndTime or DTU.SetDateAndTime is called. For this reason it is recommended to read the system time cyclically via function block „DTU.GetDateAndTime“. If the runtime system supports the automatic switch between summer and standard time, the calls of the library will be forwarded directly to the corresponding functions of library CAA.RealTimeClock and the clock switch will be done by the runtime system.

DTU.GetDateAndTime (FB prefix: gdt)

This function block of the CAA_DTUtil.library reads the realtime clock. It returns the time of the local time zone (i.e. a possible switch to summer/standard time will be regarded)

The current time zone switch can be defined by „DTU.SetTimeZoneInformation“.

If a switch to summer/standard time has become necessary since the last polling of the time, this is done automatically.

At the start of the module the outputs „dtDateAndTime“ and „eTimeZone“ are reset. (DT#1970-01-01-00:00 and RTCLK_UNKNOWN). After successful operation they will contain the current local time.

Table 429: Input:

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>A rising edge will start the action</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>see: Guidelines for CAA libs</td>
</tr>
</tbody>
</table>

Table 430: Output:

<table>
<thead>
<tr>
<th>dtDateAndTime</th>
<th>DATE_AND_TIME</th>
<th>Current local time</th>
</tr>
</thead>
<tbody>
<tr>
<td>eTimeZone</td>
<td>RTCLK_PERIODE</td>
<td>Current time zone</td>
</tr>
<tr>
<td>xDone</td>
<td>BOOL</td>
<td>Action terminated successfully</td>
</tr>
<tr>
<td></td>
<td></td>
<td>see: Guidelines for CAA libs</td>
</tr>
</tbody>
</table>
**DTU.SetDateAndTime (FB prefix: sdt)**

This function block of the CAA_DTUtil.library sets the realtime clock. The current local time is passed in the parameter „dtDateAndTime“.

> **NOTICE!**
> If the time is within the not-unique interval shortly after the switch to standard (winter) time, standard time will be assumed. This case occurs in the Central European countries, if for example on the last Sunday of October the time is set at 2:30 a.m.. Here it is not clear, whether 2:30 a.m. is still summer time or already standard (winter) time. In this case the module assumes standard (winter) time.

**Table 431: Input:**

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>A rising edge will start the action</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtDateAndTime</td>
<td>DATE_AND_TIME</td>
<td>Current time</td>
</tr>
</tbody>
</table>

**Table 432: Output:**

</tr>
</thead>
<tbody>
<tr>
<td>xBusy</td>
<td>BOOL</td>
<td>Module is active</td>
</tr>
<tr>
<td>xError</td>
<td>BOOL</td>
<td>Error occurred</td>
</tr>
<tr>
<td>eError</td>
<td>WORD</td>
<td>Error ID for diagnosis (see DTU.ERROR)</td>
</tr>
</tbody>
</table>

**DTU.SetTimeZoneInformation (FB prefix: sti)**

With this function block of the CAA_DTUtil.library the specific information of the time zone can be modified.

The time zone setting will be kept even after a “Reset-Origin” of the controller and can only be modified by being overwritten again. If no automatic switch is desired, all elements of „tziTimeZoneInformation.stStandardDate“ and „tziTimeZoneInformation.stDaylightDate“ must be set to 0. (for further information see library CAA_RealTimeClock)

**Table 433: Input:**

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>A rising edge will start the action</th>
</tr>
</thead>
<tbody>
<tr>
<td>tziTimeZoneInformation</td>
<td>RTCLK.TIME_ZONE_INFO</td>
<td>Information on the time zone</td>
</tr>
</tbody>
</table>
DTU.GetTimeZoneInformation (FB prefix: gti)

This function block of the CAA_DTUtil.library reads the specific information on the time zone. (for further information see library CAA_RealTimeClock)

<table>

</thead>
<tbody>
<tr>
<td>eWeekday</td>
<td>RTCLK.WEEKDAY</td>
<td>Day of the week (0..6) 0=Sunday</td>
</tr>
</tbody>
</table>

2162 3ADR010583, 1, en_US 2020/12/10
DTU.DateConcat (FUN)

This function of the CAA_DTUtil.library converts year, month and day to the IEC 6-1131-3 format "DATE". In case of invalid entries D#1970-01-01 will be returned.

Table 439: Input:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>uiYear</td>
<td>UINT</td>
<td>Year (1970..2099)</td>
</tr>
<tr>
<td>uiMonth</td>
<td>UINT</td>
<td>Month (1..12)</td>
</tr>
<tr>
<td>uiDay</td>
<td>UINT</td>
<td>Day (1..31)</td>
</tr>
</tbody>
</table>

Table 440: Output:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dateDate</td>
<td>DATE</td>
</tr>
<tr>
<td></td>
<td>Date</td>
</tr>
</tbody>
</table>

DTU.DateSplit (FB prefix: ds)

This function block of the CAA_DTUtil.library provides year, month and day from the IEC 6-1131-3 format "DATE".

Table 441: Input:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>dateDate</td>
<td>DATE</td>
</tr>
</tbody>
</table>

Table 442: Output:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>uiYear</td>
<td>UINT</td>
<td>Year (1970..2099)</td>
</tr>
<tr>
<td>uiMonth</td>
<td>UINT</td>
<td>Month (1..12)</td>
</tr>
<tr>
<td>uiDay</td>
<td>UINT</td>
<td>Day (1..31)</td>
</tr>
</tbody>
</table>

DTU.TODConcat (FUN)

This function of the CAA_DTUtil.library converts hour, minute and second to the IEC 6-1131-3 format TIME_OF_DAY. In case of invalid inputs TOD#00:00 will be returned.

Table 443: Input:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>uiHour</td>
<td>UINT</td>
<td>Hour (0..23)</td>
</tr>
<tr>
<td>uiMinute</td>
<td>UINT</td>
<td>Minute (0..59)</td>
</tr>
<tr>
<td>uiSecond</td>
<td>UINT</td>
<td>Second (0..59)</td>
</tr>
<tr>
<td>uiMillisecond</td>
<td>UINT</td>
<td>Second (0..999)</td>
</tr>
</tbody>
</table>

Table 444: Output:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>todTime</td>
<td>TIME_OF_DAY</td>
</tr>
<tr>
<td></td>
<td>Time</td>
</tr>
</tbody>
</table>

DTU.TODSplit (FB prefix: tods)

The function block of the CAA_DTUtil.library FB provides hour, minute and second from the IEC 6-1131-3 format TIME_OF_DAY.
### Table 445: Input:

<table>
<thead>
<tr>
<th>todTime</th>
<th>TIME_OF_DAY</th>
<th>Time</th>
</tr>
</thead>
</table>

### Table 446: Output:

<table>
<thead>

Overview CAA_File.library
1.4.2.6.5.1.1 Overview CAA_File.Library....................................................... 2169
1.4.2.6.5.1.2 Directory paths and protocols................................................... 2169

Overview CAA_File.Library
This library provides function blocks for accessing file directory systems and files. The standar-
dized inputs and outputs of the function blocks are described in detail in the © CAA Guidelines
and will therefore not be described here. File access is only supported in binary mode. All input
values of the function blocks are stored in local internal variables. This does not apply for the
contents of memory structures where a pointer is passed on as an input for example "pBuffer"of
"FILE.Read" or "FILE.Write".

Directory paths and protocols
CAA_FILENAME which is described in “CAA_Types.library” should be usable for library
"CAA_File" in the following way. Separators between directory paths in "CAA.FILENAME" are
the slash (\") or the back-slash (\"). The interpretation of the directory path is tolerant to the
effect that either one or the other of these characters can be used.
Mixed usage should be avoided by an error message. The part of a “CAA.FILENAME” character string behind the last separator is the file name. The rest specifies the directory path. Only in the first part of the directory path may a series of colons be used for the specification of drive letters or for device identification. The function block $FILE.SetRoot$ provides for an enhanced portability of the applications, regardless of the many different options available to display a directory path. The starting point within the directory tree can thus be set centrally and it is then possible to navigate through the application relative to this starting point.

- Absolute paths in the local file system: C:/dir/Test.txt or /ram:2/home/Test.txt
- Relative paths in the local file system: ../Log/Test.txt or 'Log/Test.txt
- Complete path specification for a file in the local file system: file://C:/dir/Test.txt
- Complete path specification for a file on a FTP Server: ftp://<user>:<passwd>@<ip-addr>[:<port>]/home/user/Test.txt
- Complete path specification for a file on a HTTP Server: http://<ip-addr>[:<port>]/dir/Test.txt

Whether the appropriate resolver functions for FTP- or HTTP-Servers are available in the corresponding implementation, can be evaluated via function $FILE.GetProperty$. Only IP addresses are valid, the resolution of a name is not intended for in the functional scope of the library “CAA.File”.

Data types / Enumerations

Function blocks - File directory services

1.4.2.6.5.3.2.1 FILE.DirCreate (FB; Prefix fildcr) ............................................ 2173
1.4.2.6.5.3.2.2 FILE.DirOpen (FB; Prefix fildop) ............................................. 2173
1.4.2.6.5.3.2.3 FILE.DirList (FB; Prefix fildls) ............................................. 2174
1.4.2.6.5.3.2.4 FILE.DirRemove (FB; Prefix fildrm) ....................................... 2174
1.4.2.6.5.3.2.5 FILE.DirRename (FB; Prefix fildrn) ......................................... 2175
1.4.2.6.5.3.2.6 FILE.DirClose (FB; Prefix fildcl) ............................................ 2175

FILE.DirCreate (FB; Prefix fildcr)

This function block of the $CAA_File.library$ creates a sub-directory in the standard directory. If the sub-directory already exists, an error message is generated. There may be restrictions concerning the specification of the directory name, for example only capital letters allowed, for different targets. The function "FILE.GetProperty" shows these restrictions.

Table 455: Input:

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td>5105 - FILE.EXIST:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- Directory already exists</td>
</tr>
</tbody>
</table>

FILE.DirOpen (FB; Prefix fildop)

This function block of the $CAA_File.library$ opens a directory the entries (files and sub-directories) of which should be read with the help of the function block $FILE.DirList$. The return value is a handle. There may be restrictions concerning the specification of the directory name, e.g. only capital letters allowed, for different targets. The function $FILE.GetProperty$ shows these restrictions.
There is no natural text content in the image provided.

</tr>
</tbody>
</table>

### FILE.DirRename (FB; Prefix fildrn)

This function block of the %CAA_File.library can be used to rename a directory and is optional for the different targets. Whether this function block is implemented or not is explicitly stated and encoded in the return value of the function "FILE.GetProperty" (see description of %FILE.GetProperty). The directory cannot be renamed until access on the properties has been terminated via "FILE.DirClose". The function block can be used to move files or directories!

### Table 463: Input:

1.4.2.6.5.3.3.16 FILE.GetProperty (FUN).......................................................... 2184

FILE.Open (FB; Prefix filop)

This function block of the %CAA_File.library opens an already existing file or creates a new one. The return value is a file handle, which can then be used as an input "hFile" in the function blocks %FILE.Read, %FILE.Write, %FILE.Close. There may be restrictions concerning the specification of the directory name, e.g. only capital letters allowed, for different targets. The function %FILE.GetProperty shows these restrictions.

Table 467: Input:

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121</th>
</tr>
</thead>
<tbody>
<tr>
<td>sFileName</td>

<td>Absolute or relative path specifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td>No empty spaces</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use capital letters</td>
</tr>
</tbody>
</table>
eFileMode | FILE.MODE | Mode in which the file should be opened,
- FILE.MWRITE:
  - Write access; file will be overwritten or created
- FILE.MREAD:
  - Read access; file will be opened for reading only
- FILE.MRDWR:
  - Read- and write access; the file will be overwritten or created
- FILE.MAPPD:
  - File will be opened in WRITE mode, but the written data will be appended at the end of the file

xExclusive | BOOL | File access mode:
- TRUE: exclusive data access
- FALSE: multiple data access possible

**Table 468: Output:**

| xDone | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| xBusy | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| xError | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| eError | FILE.ERROR | Error ID |
| hFile | CAA.HANDLE | File handle |

**FILE.Close (FB; Prefix filcl)**

This function block of the %CAA_File.library terminates the file access, i.e. closes the file.

**Table 469: Input:**

| xExecute | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| hFile | CAA.HANDLE | File handle |

**Table 470: Output:**

| xDone | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| xBusy | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| xError | BOOL | see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121 |
| eError | FILE.ERROR | Error ID |

**FILE.Write (FB; Prefix filwr)**

This function block of the %CAA_File.library writes data into the file, which was previously opened via %FILE.Open. The contents of the memory area indicated by pointer "pBuffer" should not be modified during the write action! The size of the structure of the memory containing the bytes to be written as well as the number of bytes to be written will not be checked.

If the stability of the pointer on the data structures and their contents cannot be guaranteed in case of an online change, an online change must be avoided with the help of functions from the "CAA_Application.library".
### Table 471: Input:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xExecute</td>
<td>BOOL</td>
<td>see: % Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121</td>

<td>FILE.ERROR</td>
<td>Error ID</td>
</tr>
</tbody>
</table>

**FILE.Read (FB; Prefix filrd)**

This function block of the %CAA_File.library reads the file, which was previously opened via %FILE.Open. If less characters can be read than specified in "szBuffer", the function block returns an active "xDone" and indicates the current number of characters in "szSize". The size of the target memory structure for the bytes to be read and the number of bytes to be read will not be checked.

If the stability of the pointer on the data structures and their contents cannot be guaranteed in case of an online change, an online change must be avoided with the help of functions from the “CAA.Application library”.

### Table 473: Input:

</tbody>
</table>
FILE.Rename (FB; Prefix filrn)

This function block modifies the file name and is optional for the different targets. This does not work if the file is open via FILE.Open. Whether this function block is implemented or not is explicitly stated and encoded in the return value of the function "FILE.GetProperty" (see description of FILE.GetProperty). The function block cannot be used to move files or directories!

Table 475: Input:

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th></th>

<td>FILE.ERROR</td>
<td>Error ID</td>
</tr>
</tbody>
</table>

FILE.Copy (FB; Prefix filcp)

This function block of the CAA_File.library copies a file. The target file is created or - if already existent - overwritten. The overwrite mode can be defined with the input "xOverWrite". If the overwrite mode is activated, no write protection may be activated in the existing file.

The function block is optional for different targets. Whether this function block is implemented or not is explicitly stated and encoded in the return value of the function "FILE.GetProperty" (see description of FILE.GetProperty).

Table 477: Input:

## FILE.Flush (FB; Prefix filfl)

This function block flushes data from the file system cache to the disk for the file with given file handle hFile. Calling this function block guarantees that data will be stored on the disk.

### Table 481: Input:

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>Rising edge: Action start</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Falling edge: Resets outputs If a falling edge occurs before the function block has completed its action, the outputs operate in the usual manner and are only reset if either the action is completed or in the event of an error. In this case, the corresponding output values (xDone, xError, iError) are present at the outputs for exactly one cycle.</td>
</tr>
<tr>
<td>hFile</td>
<td>CAA.HANDLE</td>
<td>Handle of the directory or the file</td>
</tr>
</tbody>
</table>

### Table 482: Output:

<table>
<thead>
<tr>
<th>xDone</th>
<th>BOOL</th>
<th>Action successfully completed</th>
</tr>
</thead>
<tbody>
<tr>
<td>xBusy</td>
<td>BOOL</td>
<td>Function block active</td>
</tr>
</tbody>
</table>
FILE.GetAttribute (FB; Prefix filga)

With this function block of the CAA_File.library directory and file attributes can be retrieved. It is optional for the different targets. Whether this function block is implemented or not is explicitly stated and encoded in the return value of the function "FILE.GetProperty" (see description of § FILE.GetProperty).

<table>
<thead>
<tr>
<th>Table 483: Input:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>xExecute</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>hFile</strong></td>
</tr>
</tbody>

</tr>
</thead>
<tbody>
<tr>
<td><strong>xDone</strong></td>
</tr>
<tr>
<td><strong>xBusy</strong></td>
</tr>
<tr>
<td><strong>xError</strong></td>
</tr>
<tr>
<td><strong>eError</strong></td>
</tr>
<tr>
<td><strong>eFileAttrib</strong></td>
</tr>
</tbody>
</table>

FILE.GetPos (FB; Prefix filgp)

This function block of the § CAA_File.library returns the offset position currently set in the file. The file must be opened via § FILE.Open.

<table>
<thead>
<tr>
<th>Table 485: Input:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>xExecute</strong></td>
</tr>
<tr>
<td><strong>hFile</strong></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<tr>
<td>xError</td>
<td>BOOL</td>
<td></td>
</tr>
<tr>
<td>eError</td>
<td>FILE.ERROR</td>
<td>Error ID</td>
</tr>
</tbody>
</table>

FILE.EOF (FB; Prefix fileof)
( $CAA_File library)
This function block sets “xEOF” on “TRUE” if the current offset is equal to the end of the file. If the end of the file has not yet been reached, “FALSE” is returned.

Table 489: Input:

<table>
<thead>
<tr>
<th>xExecute</th>
<th>BOOL</th>
<th>see: $Chapter 1.4.2.6.1.1 “CAA Guidelines” on page 2121</th>
</tr>

1.4.2.7 MQTT client library

1.4.2.7.1 Function blocks

The function blocks in this library can only be executed in RUN mode of the Processor Module, not in simulation mode.

MQTT client library is based on OASIS MQTT specification (v3.1.1).

MQTT client protocol For further information see MQTT Client Protocol Chapter 1.5.6.3.5 "MQTT client protocol" on page 3429
The function block `MqttConnectWithCertBuffer` establishes a connection to a MQTT broker. This function block only has to be called once per connection. The input parameters of the function block are used to access to the broker.

Comparing to function block `MqttConnectWithCertFile` it is possible to establish a TLS connection with certificates from buffer. In this case copy the content of the certificate `.pem` file into a `STRING` variable. All line breaks from the file must be replace with the ST specific line break character `$n$`.

Each time a TLS connection is established to a broker, the AC500 calculates some key pairs. For AC500-eCo PLCs, this calculation can take up to 7 seconds. Hence, ensure correct configuration of your watchdog.
Input description

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

Set a reference to the connection.

MQTT_CONNECTION is used for other function blocks to reference to the established connection.

Set the IP address of the MQTT Broker. The IP address needs to be a string like ‘192.168.0.1’.

Set the port number of the MQTT broker.

Decide if using secure channel (TLS, Secure := TRUE) for communication.
### ServerCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set server certificate in PEM format. Only necessary if using a TLS connection. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientCert

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set (optional) client certificate in PEM format. Only necessary if using a TLS connection. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientKey

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set (optional) client certificate in PEM format. Only necessary if using a TLS connection and if using a client certificate. MQTT_MAX_PEM_CERT_LEN is an internal constant which is set to 3072.

### ClientId

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set client identifier which is used to identify the client to the server. Only necessary if using a TLS connection. MQTT_MAX_CLIENT_ID_LEN is an internal constant which is set to 250.

### Username

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_USERNAME_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set username for MQTT broker. MQTT_MAX_USERNAME_LEN is an internal constant which is set to 250.

### Password

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_PASSWORD_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set password for MQTT broker. MQTT_MAX_PASSWORD_LEN is an internal constant which is set to 250.

### LastWill

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Optional Last Will message.
### KeepAlive

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>600</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Time in seconds, which will be passed to the MQTT Broker and which is normally used by the Broker to disconnect clients if no communication was made for 1,5 * KeepAlive.

### Timeout

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>30000</td>
<td>-</td>
<td>Millisecond</td>
</tr>
</tbody>
</table>

Timeout for connect and all subsequent calls (ping, subscribe, unsubscribe, publish with QoS > 0).

### Output description

```plaintext
DECLARE
    Execute : BOOL
    Done : BOOL
    Busy : BOOL
    Error : BOOL
    ErrorID : MQTT_ERROR_ID
    IpAddress : STRING(MQTT_MAX_IP_ADDRESS_LEN)
    Port : WORD
    ServerCert : POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)
    ClientCert : POINTER TO STRING(MQTT_MAX_PEM_CERT_LEN)
    ClientKey : POINTER TO STRING(MQTT_MAX_PEM_KEY_LEN)
    ClientId : STRING(MQTT_MAX_CLIENT_ID_LEN)
    Username : STRING(MQTT_MAX_USERNAME_LEN)
    Password : STRING(MQTT_MAX_PASSWORD_LEN)
    LastWill : MQTT_MESSAGE
    KeepAlive : WORD
    Timeout : WORD
```

### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.
ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2216 if an error occurred while processing the function block.

MqttConnectWithCertFile

The function block MqttConnectWithCertFile establishes a connection to a MQTT broker. This function block only has to be called once per connection. The input parameters of the function block are used to access to the broker.

Comparing to function block MqttConnectWithCertBuffer it is possible to establish a TLS connection with certificates from file.

If your PLC does not have a persistent file storage like sdcard or flashdisk, consider using MqttConnectWithCertBuffer.
Input description

**MQTTCONNECTWITHCERTFILE**

- **Execute**: BOOL
- **Conn**: POINTER TO MQTT_CONNECTION
- **IpAddress**: STRING(MQTT_MAX_IP_ADDRESS_LEN)
- **Port**: WORD
- **Secure**: BOOL
- **ServerCert**: STRING(MQTT_MAX_FILE_PATH_LEN)
- **ClientCert**: STRING(MQTT_MAX_FILE_PATH_LEN)

<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set a reference to the connection.

MQTT_CONNECTION is used for other function blocks to reference to the established connection.

**IpAddress**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

IP address of the MQTT Broker. The IP address needs to be a string like ‘192.168.0.1’.

**Port**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>8883</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the port number of the MQTT broker.

**Secure**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>TRUE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Decide if using secure channel (TLS, Secure := TRUE) for communication.
<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>ServerCert</td>
<td>STRING(MQTT_MAX_FILE_PATH_LEN)</td>
<td>Empty string</td>

<tr>
<td>LastWill</td>
<td>MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>KeepAlive</td>
<td>WORD</td>
<td>600</td>
<td>-</td>
</tr>
</tbody>
</table>

File name of server certificate in PEM format. Only necessary if using a TLS connection.

File name of client certificate in PEM format. Only necessary if using a TLS connection.

File name of client private key in PEM format (optional). Only necessary if using a TLS connection and if using a client certificate.

Set client identifier which is used to identify the client to the server. Only necessary if using a TLS connection. MQTT_MAX_CLIENT_ID_LEN is an internal constant which is set to 250.

Set username for MQTT broker. MQTT_MAX_USERNAME_LEN is an internal constant which is set to 250.

Set password for MQTT broker. MQTT_MAX_PASSWORD_LEN is an internal constant which is set to 250.

Optional Last Will message.
Time in seconds, which will be passed to the MQTT Broker and which is normally used by the Broker to disconnect clients if no communication was made for 1.5 * KeepAlive.

### Timeout

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>WORD</td>
<td>30000</td>
<td>-</td>
<td>Millisecond</td>
</tr>
</tbody>
</table>

Timeout for connect and all subsequent calls (ping, subscribe, unsubscribe, publish with QoS > 0).

### Output description

```plaintext
MQTTCONNECTWITHCERTFILE

- Execute : BOOL   Done : BOOL
- Conn : POINTER TO MQTT_CONNECTION  Busy : BOOL
- pAddress : STRING(MQTT_MAX_IP_ADDRESS_LEN)  Error : BOOL
- Port : WORD       ErrorID : MQTT_ERROR_ID
- Secure : BOOL
- ServerCert : STRING(MQTT_MAX_FILE_PATH_LEN)
- ClientCert : STRING(MQTT_MAX_FILE_PATH_LEN)
- ClientKey : STRING(MQTT_MAX_FILE_PATH_LEN)
- ClientId : STRING(MQTT_MAX_CLIENT_ID_LEN)

- **Busy**: BOOL
- **Error**: BOOL
- **ErrorID**: MQTT_ERROR_ID

### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2216 if an error occurred while processing the function block.
MqttPublish

MqttPublish publishes a MQTT message to MQTT Broker. The properties of the message (Topic, Payload, QOS, Retain Flag) can be set with the message input.

The Timeout that was set on the MqttConnect POU’s is used when a QoS Level of 1 or 2 is set for a message.

This means that this POU will wait for an answer from the broker until the Timeout is reached when the message is either QoS Level 1 or Level 2.

It will not wait for any answer when QoS Level is 0.

The application using this FB has to define if the message shall be re-published and how often that shall be done.

Input description

Execute

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.
### Conn

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.

### Message

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MESSAGE</td>
<td>See description of MQTT_MESSAGE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Defines the Message to be published.

### Output description

#### MQTT_PUBLIC

- **Execute**: BOOL
- **Done**: BOOL
- **Conn**: POINTER TO MQTT_CONNECTION
- **Busy**: BOOL
- **Message**: MQTT_MESSAGE
- **Error**: BOOL
- **ErrorID**: MQTT_ERROR_ID

#### Done

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### Busy

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

#### Error

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

#### ErrorID

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration "MQTT_ERROR_ID (Enum) " on page 2216 if an error occurred while processing the function block.
MqttSubscribe

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>
</tr>
<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

The function block MqttSubscribe is used to subscribe to a topic name like 'topic/name'. Wildcard symbols (#/+).

It can be used for subscribing like city/# or city/+/temperature. If the connection between the client and the broker is interrupted, the client needs to subscribe again to a topic after a new connect.

Input description

<table>
<thead>
<tr>
<th>Execute</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

<table>
<thead>
<tr>
<th>Conn</th>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>POINTER TO MQTT_CONNECTION</td>
<td>0</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Pointer to a valid connection structure created by MqttConnect.
### Topic

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING(MQTT_MAX_TOPIC_LEN)</td>
<td>Empty string</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Set the Topic name as a string. The topic name must look like ‘topic/name’. Wildcard symbols can also be used for subscribing (for example: ‘city/#’ or ‘city/+/temperature’). For further information see the MQTT specification.

### MaxQos

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_QOS</td>
<td>QOS_0</td>
<td>BASC_NORMAL, BASC_REVERSE</td>
<td>-</td>
</tr>
</tbody>
</table>

This input is used to signal the server which is the highest QoS level which can be handled. Can be reduced to relieve the client from high network load.

### Output description

**MQTTSUBSCRIBE**

- Execute : BOOL
- Conn : POINTER TO MQTT_CONNECTION
- Topic : STRING(MQTT_MAX_TOPIC_LEN)
- MaxQos : MQTT_QOS
- ErrorID : MQTT_ERROR_ID

**Done**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**Busy**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

**Error**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**ErrorID**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration “MQTT_ERROR_ID (Enum)” on page 2216 if an error occurred while processing the function block.
### MqttUnsubscribe

The function block MqttUnsubscribe is used to unsubscribe from a topic name like 'topic/name'. Wildcard symbols (#/+ can be used for subscribing like city/# or city/+temperature.

#### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Included in library</td>
<td>ABB_MqttClient_AC500.lib</td>
</tr>
<tr>
<td>Available as of firmware</td>
<td>V2.8</td>
</tr>
<tr>
<td>Type</td>
<td>Function block with historical values</td>
</tr>
<tr>
<td>Group</td>
<td>C interface</td>
</tr>
</tbody>
</table>

#### Input description

- **Execute**
  - **Data type**: BOOL
  - **Default value**: FALSE
  - **Range**: -
  - **Unit**: -
  
  A rising edge starts the operation, the output Busy goes to TRUE. In the first cycle all other inputs are read and stored, afterwards they are ignored. A falling edge does not stop the operation. After Done = TRUE or Error = TRUE and Execute = FALSE all outputs will be reset.

- **Conn**
  - **Data type**: POINTER TO MQTT_CONNECTION
  - **Default value**: 0
  - **Range**: -
  - **Unit**: -

  Pointer to a valid connection structure created by MqttConnect.
Output description

**Done**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is completed without error (while outputs Busy and Error are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**Busy**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is running.

**Error**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOL</td>
<td>FALSE</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Operation is stopped with error (while outputs Busy and Done are FALSE). This output is TRUE for at least one cycle or until Execute is set to FALSE.

**ErrorID**

<table>
<thead>
<tr>
<th>Data type</th>
<th>Default value</th>
<th>Range</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_ID</td>
<td>MQTT_ERR_NO_ERROR</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

Provides an error number from enumeration “MQTT_ERROR_ID (Enum)” on page 2216 if an error occurred while processing the function block.

### 1.4.2.7.2 Structures and enumerations

**MQTT_ERROR_ID (Enum)**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERR_NO_ERROR</td>
<td>0</td>
<td>No error.</td>
</tr>
<tr>
<td>MQTT_ERR_CONN_SERVICE_UNAVAIL</td>
<td>16#3001</td>
<td>The Network Connection has been made but the MQTT service is unavailable on the specified port.</td>
</tr>
<tr>
<td>MQTT_ERR_COMMUNICATION_TIMEOUT</td>
<td>16#3013</td>
<td>The timeout value for the communication has been exceeded.</td>
</tr>
<tr>
<td>MQTT_ERR_REC_PACKET_TOO_LONG</td>
<td>16#3017</td>
<td>Received topic is too long.</td>
</tr>
<tr>
<td>MQTT_ERR_PING_NO_ANSWER</td>
<td>16#301A</td>
<td>The MQTT broker did not answer the ping. MQTT client has passed the KeepAlive or MQTT broker is unreachable.</td>
</tr>
<tr>
<td>MQTT_ERR_CONN_CLIENT_ID_NOT_ALLOWED</td>

### MQTT_QoS (Enum)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOS_0</td>
<td>-</td>
<td>Fire and forget (At most once delivered).</td>
</tr>
<tr>
<td>QOS_1</td>
<td>-</td>
<td>Simple acknowledgement (At least once delivered).</td>
</tr>
<tr>
<td>QOS_2</td>
<td>-</td>
<td>Complex acknowledgement (Exactly once delivered).</td>
</tr>
</tbody>
</table>

### MQTT_Message

This structure is used for messages which can be published or used for LastWill on MqttConnect(FB).

<table>
<thead>
<tr>
<th>Variable name</th>
<th>Data type</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sTopic</td>
<td>STRING(MQTT_MAX_TOPIC_LEN)</td>
<td>Empty string</td>
<td>Topic where this message belongs to.</td>
</tr>
<tr>
<td>abyPayload</td>
<td>POINTER TO BYTE</td>
<td>0</td>
<td>Payload which should be sent.</td>
</tr>
<tr>
<td>dwLen</td>
<td>DWORD</td>
<td>0</td>
<td>Length of the payload.</td>
</tr>
<tr>
<td>eQos</td>
<td>MQTT_QOS</td>
<td>QOS_0</td>
<td>Quality of Service level.</td>
</tr>
<tr>
<td>xRetainFlag</td>
<td>BOOL</td>
<td>FALSE</td>
<td>True = message must be stored by the server, False = server must not store this message.</td>
</tr>
</tbody>
</table>

### MQTT_Connection

Internal data required by the library to operate. This structure allocates memory and it is used to identify the MQTT connection you want to work with.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Data type</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>abyConn</td>
<td>Array</td>
<td>MQTT_CLIENT_STRUCT_SIZE</td>
</tr>
<tr>
<td>abyTxBuf</td>
<td>Array</td>
<td>MQTT_TX_BUF_SIZE</td>
</tr>
<tr>
<td>abyRxBuf</td>
<td>Array</td>
<td>MQTT_RX_BUF_SIZE</td>
</tr>
<tr>
<td>abyMsgBuf</td>
<td>Array</td>
<td>MQTT_MSG_BUF_SIZE</td>
</tr>
</tbody>
</table>
### 1.4.2.7.3 Global variables

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Datatype</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_MAX_IP_ADDRESS_LEN</td>
<td>Word</td>
<td>15</td>
<td>Maximum length of the IP address.</td>
</tr>
<tr>
<td>MQTT_MAX_PEM_KEY_LEN</td>
<td>Word</td>
<td>2048</td>
<td>Maximum length of the PEM key.</td>
</tr>
<tr>
<td>MQTT_MAX_PEM_CERT_LEN</td>
<td>Word</td>
<td>3072</td>
<td>Maximum length of the PEM certificate.</td>
</tr>
<tr>
<td>MQTT_MAX_FILE_PATH_LEN</td>
<td>Word</td>
<td>255</td>
<td>Maximum length of the file path to the certificate files.</td>
</tr>
<tr>
<td>MQTT_MAX_CLIENT_ID_LEN</td>
<td>Word</td>
<td>250</td>
<td>Maximum length of the client id.</td>
</tr>
<tr>
<td>MQTT_MAX_USERNAME_LEN</td>
<td>Word</td>
<td>250</td>
<td>Maximum length of the user-name.</td>
</tr>
<tr>
<td>MQTT_MAX_PASSWORD_LEN</td>
<td>Word</td>
<td>250</td>
<td>Maximum length of the password.</td>
</tr>
<tr>
<td>MQTT_MAX_TOPIC_LEN</td>
<td>Word</td>
<td>255</td>
<td>Maximum length of the topic.</td>
</tr>
<tr>
<td>MQTT_CLIENT_STRUCT_SIZE</td>
<td>Word</td>
<td>336</td>
<td>Size of the internal connection structure representing the connection state.</td>
</tr>
<tr>
<td>MQTT_TX_BUF_SIZE</td>
<td>Word</td>
<td>1024</td>
<td>Size of the internally used output buffer.</td>
</tr>
<tr>
<td>MQTT_RX_BUF_SIZE</td>
<td>Word</td>
<td>1024</td>
<td>Size of the internally used input buffer.</td>
</tr>
<tr>
<td>MQTT_MSG_BUF_SIZE</td>
<td>Word</td>
<td>2148</td>
<td>Size of the internally used message buffer.</td>
</tr>
</tbody>
</table>

### 1.5 PLC integration

#### 1.5.1 Product overview and comparison

#### 1.5.1.1 Comparison of AC500 V3 terminal bases

With the latest Automation Builder version the following terminal bases are compatible with the AC500 V3 processor modules:

**Terminal base compatibility**

<table>
<thead>
<tr>
<th>Terminal Base</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5610</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5620</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5640</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TB5660</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The number of slots that are available on a terminal base for connecting communication modules or AC500-S modules differs within the terminal base range.
Table 500: Combination of TB56xx-2ETH(-XC) and PM56xx(-XC)

<table>
<thead>
<tr>
<th>Processor module</th>
<th>PM5630</th>
<th>PM5650</th>
<th>PM5670</th>
<th>PM5675</th>
</tr>
</thead>
<tbody>
<tr>
<td>TB5600-2ETH</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>
<td>0 slot</td>
</tr>
<tr>
<td>TB5610-2ETH</td>
<td>1 slot</td>
<td>1 slot</td>
<td>1 slot</td>
<td>1 slot</td>
</tr>
<tr>
<td>TB5620-2ETH</td>
<td>2 slots</td>
<td>2 slots</td>
<td>2 slots</td>
<td>2 slots</td>
</tr>
<tr>
<td>TB5640-2ETH</td>
<td>-</td>
<td>4 slots</td>
<td>4 slots</td>
<td>4 slots</td>
</tr>
<tr>
<td>TB5660-2ETH</td>
<td>-</td>
<td>-</td>
<td>6 slots(^1)</td>
<td>6 slots(^1)</td>
</tr>
</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

\(^1\) PM567x must have an index \(\geq C0\).

Supported devices
The AC500 V3 terminal bases can be equipped with the following supported devices:

Table 501: Comparison: TB56xx

### Default open Ethernet ports of PM56xx-2ETH

After startup without a PLC project the PM56xx-2ETH contains the following Ethernet ports and sockets:

<table>
<thead>
<tr>
<th>Protocol</th>
<th>Port</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABB NetConfig 1)</td>
<td>UDP 24576</td>
</tr>
<tr>
<td>Online access with driver 3S UDP BlkDrvUdp (with scan)</td>
<td>UDP 1740</td>
</tr>
<tr>
<td>Online access with driver 3S Tcp/Ip BlkDrvTcp (no scan)</td>
<td>TCP 11740</td>
</tr>
<tr>
<td>OPC UA server 2)</td>
<td>TCP 4840</td>
</tr>
</tbody>
</table>

Remarks:

1) The port 24576 for ABB NetConfig protocol can be disabled via PLC configuration by deleting the protocol node from configuration tree of Ethernet interfaces ETH1 and ETH2.

2) The port 4840 for OPC UA server is closed by default as of SystemFW V3.1.0.

All other ports are closed by default.

</tr>
</tbody>
</table>

For changing the default addresses, see *IP-Configuration tool* Chapter 1.5.6.2.2.4.2 “Configuration of the IP settings with IP configuration tool” on page 3267, or description of function key *®® Chapter 1.5.5.1.4.4 “Description of the function keys” on page 3121.*
1.5.1.3.5 Online access

Preferred driver for online access: 3S UDP block driver BlkDrvUdp. This driver allows to scan and select the connected PLC’s.

Alternative: 3S TCP/IP block driver. This driver requires at least 2 sockets:

- 1x driver “BlkDrvTcp” on port 11740
- 1x listen on port 11740 if PLC has established online connection

Online access can be established from:

- Automation Builder command ‘Login’
- CODESYS OPC DA server
- Panel CP600 series

Each established connection needs one socket. In addition one socket on port 11740 is listening.

1. Startup the PLC.
   ➞ One socket on port 11740 (listen).

2. Login from Automation Builder via driver “BlkDrvTcp”.
   ➞ 2 sockets on port 11740 (1x online, 1x listen)

3. Additional login out of OPC server with the same driver.
   ➞ 3 sockets on port 11740 (2x online, 1x listen)

4. Additional connect CP600 via driver “BlkDrvTcp”.
   ➞ 4 sockets on port 11740 (3x online, 1x listen)

1.5.2 PLC introduction

1.5.2.1 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.

No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.
NOTICE!

Avoidance of electrostatic charging
PLC devices and equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:
- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!

PLC damage due to operation conditions
Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!

PLC damage due to wrong enclosures
Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction
Do not use cleaning agent for cleaning the device.
Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!
Trouble-free functioning cannot be guaranteed outside of the specified data.

NOTICE!

PLC damage due to missing earthing
- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.
In the description for the devices (operating manual or AC500 system description), reference is made at several points to earthing, electrical isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the earthing via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the earthing (in this respect, see also VBG 4 and the relevant VDE regulations).

**CAUTION!**

Do not obstruct the ventilation for cooling!
The ventilation slots on the upper and lower side of the devices must not be covered.

**CAUTION!**

Run signal and power wiring separately!
Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

**WARNING!**

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

**WARNING!**

Splaying of strands can cause hazards!
During wiring of terminals with stranded conductors, splaying of strands shall be avoided.
- Ferrules can be used to prevent splaying.

**WARNING!**

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
Information on batteries

CAUTION!
Use only ABB approved lithium battery modules!
At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!
Risk of explosion!
Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations
Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.

Environment and enclosure information

This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2,000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.5.2.2 Cyber security in AC500 V3 products

Cyber security disclaimer
This product is designed to be connected to and to communicate information and data via a network interface. It is your sole responsibility to provide and continuously ensure a secure connection between the product and your network or any other network (as the case may be). You shall establish and maintain any appropriate measures (such as but not limited to the installation of firewalls, application of authentication measures, encryption of data, installation of anti-virus programs, etc.) to protect the product, the network, its system and the interface against any kind of security breaches, unauthorized access, interference, intrusion, leakage and/or theft of data or information. ABB Ltd and its affiliates are not liable for damages and/or losses related to such security breaches, any unauthorized access, interference, intrusion, leakage and/or theft of data or information.
Security details for industrial automation is provided in a whitepaper on ABB website.

Signed firmware updates

The firmware update files for the AC500 V3 PLC are digitally signed releases by ABB. During the update process, these signatures are validated by a hardware security component in the PLC. This way, the AC500 V3 PLC will only update with valid, authentic firmware, signed by ABB.

Open ports and services

The AC500 V3 PLC comes with minimal services opened by default. Only the services needed for initial setup and programming are open before any user application is downloaded. Details Chapter 1.5.1.3 “Ethernet protocols and ports for AC500 V3 products” on page 2224.

Secure shell access for ABB service

The AC500 V3 PLC contains a secure shell service to access core logging data in case of problems which need a deeper analysis. This service is inactive by default, which means that no one can access this privileged shell in the normal operating state.

To activate this service, local access to the PLC is necessary and activation is only valid until the next power cycle of the PLC. Once activated, the service run on TCP port 22. Each PLC also protects the secure shell access by an individual password.

1.5.2.1 Defense in depth

The defense in depth approach implements multi-layer IT security measures. Each layer provides its special security measures. All deployed security mechanisms in the system must be updated regularly. It is also important to follow the system vendor’s recommendations on how to configure and use these mechanisms. As a basis, the components must include security functions such as:

- Virus protection
- Firewall protection
- Strong and regularly changed passwords
- User management
- Using VPN tunnels for connections between networks

Additional security components such as routers and switches with integrated firewalls should be available. A defined user and rights concept managing access to the controllers and their networks is mandatory. Finally, the manufacturer of the components should be able to quickly discover weaknesses and provide patches.

References: CODESYS Security Whitepaper

Security zones

IT resources vary in the extent to which they can be trusted. A common security architecture is therefore based on a layered approach that uses zones of trust to provide increasing levels of security according to increasing security needs. Less-trusted zones contain more-trusted zones and connections between the zones are only possible through secure interconnections such as firewalls. All resources in the same zone must have the same minimum level of trust. The inner layers, where communication interaction needs to flow freely between nodes, must have the highest level of trust. This is the approach described in the IEC 62443 series of standards.

Firewalls, gateways, and proxies are used to control network traffic between zones of different security levels, and to filter out any undesirable or dangerous material. Traffic that is allowed to pass between zones should be limited to what is absolutely necessary because each type of service call or information exchange translates into a possible route that an intruder may be able to exploit. Different types of services represent different risks. Internet access, incoming e-mail and instant messaging, for example, represent very high risks.
Fig. 90: Security zones

Fig. 1 shows three security zones, but the number of zones does not have to be as many as or as few as three. The use of multiple zones allows access between zones of different trust levels to be controlled to protect a trusted resource from attack by a less trusted one.

High-security zones should be kept small and independent. They need to be physically protected, i.e. physical access to computers, network equipment and network cables must be limited by physical means to authorized persons only. A high-security zone should obviously not depend on resources in a less secure zone for its security. Therefore, it should form its own domain that is administered from the inside, and not depend on, e.g., a domain controller in a less secure network.

Even if a network zone is regarded as trusted, an attack is still possible: by a user or compromised resource that is inside the trusted zone, or by an outside user or resource that succeeds to penetrate the secure interconnection. Trust therefore depends also upon the types of measures taken to detect and prevent compromise of resources and violation of the security policy.

References: Security for Industrial Automation and Control Systems

1.5.2.2 Secure operation

The controller must be located in a protected environment in order to avoid accidental or intended access to the controller or the application.

A protected environment can be:

- Locked control cabinets without connection from outside
- No direct internet connection
- Use firewalls and VPN to separate different networks
- Separate different production areas with different access controls

To increase security, physical access protection measures such as fences, turnstiles, cameras or card readers can be added.

Follow these rules for the protected environment:

- Keep the trusted network as small as possible and independent from other networks.
- Protect the cross-communication of controllers and the communication between controllers and field devices via standard communication protocols (fieldbus systems) using appropriate measures.
- Protect such networks from unauthorized physical access.
- Use fieldbus systems only in protected environments. They are not protected by additional measures, such as encryption. Open physical or data access to fieldbus systems and their components is a serious security risk.
Physically protect all equipment, i.e., ensure that physical access to computers, network equipment and cables, controllers, I/O systems, power supplies, etc., is limited to authorized persons.

When connecting a trusted network zone to outer networks, make sure that all connections are through properly configured secure interconnections only, such as a firewall or a system of firewalls, which is configured for “deny by default”, i.e., blocks everything except traffic that is explicitly needed to fulfill operational requirements.

Allow only authorized users to log on to the system, and enforce strong passwords that are changed regularly.

continuously maintain the definitions of authorized users, user groups, and access rights, to properly reflect the current authorities and responsibilities of all individuals at all times. Users should not have more privileges than they need to do their job.

Do not use the system for e-mail, instant messaging, or internet browsing. Use separate computers and networks for these functions if they are needed.

Do not allow installation of any unauthorized software in the system.

Restrict temporary connection of portable computers, USB memory sticks and other removable data carriers. Computers that can be physically accessed by regular users should have ports for removable data carriers disabled.

If portable computers need to be connected, e.g., for service or maintenance purposes, they should be carefully scanned for viruses immediately before connection.

All CDs, DVDs, USB memory sticks and other removable data carriers, and files with software or software updates, should also be checked for viruses before being introduced into the trusted zone.

continuously monitor the system for intrusion attempts.

Define and maintain plans for incident response, including how to recover from potential disasters.

Regularly review the organization as well as technical systems and installations with respect to compliance with security policies, procedures and practices.

A protected local control cabinet could look like in picture 2, page 17. This network is not connected to any external network. Security is primarily a matter of physically protecting the automation system and preventing unauthorized users from accessing the system and from connecting or installing unauthorized hardware and software.

---

**Fig. 91: Isolated automation system**

Servers and workplaces that are not directly involved in the control and supervision of the process should preferably be connected to a subnet that is separated from the automation system network by means of a router/firewall. This makes it possible to better control the network load and to limit access to certain servers on the automation system network. Note that servers and workplaces on this subnet are part of the trusted zone and thus need to be subject to the same security precautions as the nodes on the automation system network.
For the purposes of process control security, a general-purpose information system (IS) network should not be considered a trusted network, not the least since such networks are normally further connected to the Internet or other external networks. The IS network is therefore a different lower-security zone, and it should be separated from the automation system by means of a firewall. The IS and automation system networks should form separate domains.
1.5.2.3 License and third party information

Information on Automation Builder licensing and Third Party software can be found in the "About" window of the Automation Builder Installation Manager.

See further information on PLC runtime licensing Chapter 1.5.6.2.2.2 “PLC runtime licensing” on page 3258.

1.5.2.4 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:
● DIN VDE 0100: "Regulations for the Setting up of Power Installations"
● DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
● DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

● DIN VDE 0113 Part 1 & Part 200: "Working & Process Machinery"
● DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
● DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

● DIN VDE 0110 Part 1 ↔ IEC 664
● DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
● DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

● Automation technology sector
● Dealing with dangerous voltages
● Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.5.2.5 Standardization

EN 61131-2:2007 compliance statement: AC500/S500 products fully comply with all of the requirements contained in all clauses of this standard, such as indicated by reference to this standard without qualification.

CULus Hazardous Locations approval

Underwriters Laboratories Inc. in accordance with

● UL 508 (Industrial Control Equipment)
● CSA C22.2 No. 142 (Process Control Equipment)
● ANSI/ISA 12.12.01
● CSA C22.2 No. 213 (Hazardous Location)

APPROVED for use in Class I, division 2, Group A, B, C, D Tx;
Installation instructions for cULus Hazardous Locations

- WARNING - Explosion Hazard - Do not disconnect while circuit is live unless area is know to be non-hazardous.
- WARNING - Explosion Hazard - Substitution of components may impair suitability for Class I, Division 2 or Zone 2.
- This equipment is suitable for use in Class I, Division 2, Groups A, B, C, D or non-hazardous locations.

WARNING: EXPOSURE TO SOME CHEMICALS MAY DEGRADE THE SEALING PROPERTIES OF MATERIALS USED IN THE RELAYS.

**Standardization:**

**PROFINET**
- IEC 61131-3: PLC Standardization
- IEC 61158: PROFINET Standardization
- IEC 11801: Wire and connection elements for Ethernet

1.5.2.7 Definitions: PLC system start-up

**Cold start**
- A cold start is performed by switching power OFF/ON if no battery is connected.
- All RAM memory modules are checked and erased (see Command 'Reset cold' Chapter 1.3.1.25.2.6.9 “Command 'Reset Cold'” on page 931).
- If no user program is stored in the Flash EPROM, the default values (as set on delivery) are applied to the interfaces.
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

**Warm start**
- A warm start is performed by switching power OFF/ON with a battery connected.
- All RAM memory modules are checked and erased except of the buffered operand areas and the RETAIN variables (see Command 'Reset warm' Chapter 1.3.1.25.2.6.10 “Command 'Reset Warm'” on page 931).
- If there is a user program stored in the Flash EPROM, it is loaded into RAM.
- The default operating modes set by the PLC configuration are applied.

**RUN -> STOP**
- RUN -> STOP means pressing the RUN function key on the PLC while the PLC is in run mode (PLC display "run").
- If a user program is loaded into RAM, execution is stopped.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The PLC display changes from "run" to "StoP".

**START -> STOP**
- START -> STOP means stopping the execution of the user program in the PLC's RAM using the menu item "Online/Stop" in the programming system.
- All outputs are set to FALSE or 0.
- Variables keep their current values, i.e., they are not initialized.
- The PLC display changes from "run" to "StoP".
Reset
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (exception: RETAIN variables) are set to their initialization values.
- Reset is performed using the menu item "Online/Reset" in the programming system or pressing the function key RUN for ≥ 5 s in STOP mode.

Reset (cold)
- Performs a START -> STOP process.
- Preparation for program restart, i.e., the variables (VAR) (also RETAIN variables) are set to their initialization values.
- Reset (cold) is performed using the menu item "Online/Reset (cold)" in the programming system.

Reset (original)
- Resets the controller to its original state (deletion of Flash, SRAM (%M, area, %R area, RETAIN, RETAIN PERSISTENT), Communication Module configurations and user program).
- Reset (original) is performed using the menu item "Online/Reset (original)" in the programming system.

STOP -> RUN
- STOP -> RUN means short pressing the RUN function key on the PLC while the PLC is in STOP mode (PLC display "StoP").
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The PLC display changes from "StoP" to "run".

STOP -> START
- STOP -> START means continuing the execution of the user program in the PLC's RAM using the menu item "Online/Start" in the programming system.
- If a user program is loaded into RAM, execution is continued, i.e., variables will not be set to their initialization values.
- The PLC display changes from "StoP" to "run".

Download
- Download means loading the complete user program into the PLC's RAM. This process is started by selecting the menu item "Online/Download" in the programming system or after confirming a corresponding system message when switching to online mode (menu item "Online/Login").
- Execution of the user program is stopped.
- In order to store the user program to the Flash memory, the menu item "Online/Create boot project" must be called after downloading the program.
- Variables are set to their initialization values according to the initialization table.
- RETAIN variables can have wrong values as they can be allocated to other memory addresses in the new project!
- A download is forced by the following:
  - changed PLC configuration
  - changed task configuration
  - changed library management
  - changed compile-specific settings (segment sizes)
  - execution of the commands "Project/Clean all" and "Project/Rebuild All".

Online change
- After a project has changed, only these changes are compiled when pressing the key <F11> or calling the menu item "Project/Build". The changed program parts are marked with a blue arrow in the block list.
- The term Online Change means loading the changes made in the user program into the PLC's RAM using the programming system (after confirming a corresponding system message when switching to online mode, menu item "Online/Login").
● Execution of the user program is not stopped. After downloading the program changes, the program is re-organized. During re-organization, no further online change command is allowed. The storage of the user program to the Flash memory using the command “Online/Create boot project” cannot be initiated until re-organization is completed.

● Online Change is not possible after:
  – changes in the PLC configuration
  – changes in the task configuration
  – changes in the library management
  – changed compile-specific settings (segment sizes)
  – performing the commands "Project/Clean all" and "Project/Rebuild All".

Data buffering

● Data buffering, i.e., maintaining data after power ON/OFF, is only possible, if a battery is connected. The following data can be buffered completely or in parts:
  – Data in the addressable flag area (%M area)
  – RETAIN variable
  – PERSISTENT variable (number is limited, no structured variables)
  – PERSISTENT area (%R area)

● In order to buffer particular data, the data must be excluded from the initialization process (see Initialization of Variables).

1.5.2.8 Device lists

1.5.2.8.1 Device list: Terminal bases

Terminal bases for AC500 (Standard):

### 1.5.2.9 Your tasks - Documentation from the user's point of view

#### 1.5.2.9.1 Consulting engineers

**Installation** Information on mounting and disassembling (including mechanical dimensions) is provided in chapter System Assembly, connection and construction Chapter 1.5.4 “System assembly, construction and connection” on page 3039.
Hardware

Information on hardware specifics on your devices is provided in the device description of the appropriate device.

1.5.2.9.2 Sales and export people

Installation

Information on mounting and disassembling (including mechanical dimensions) is provided in chapter System Assembly, connection and construction in Chapter 1.5.4 “System assembly, construction and connection” on page 3039.

Hardware

Information on hardware specifics on your devices is provided in the device description of the appropriate device.

1.5.2.9.3 Switch-gear cabinet manufacturers, design engineers

Installation

Information on mounting and disassembling (including mechanical dimensions) is provided in chapter System Assembly, connection and construction in Chapter 1.5.4 “System assembly, construction and connection” on page 3039.

Hardware

Information on hardware specifics on your devices is provided in the device description of the appropriate device.

1.5.2.9.4 Commissioning people

Installation of the software

www.abb.com/automationbuilder

Installation of the devices

1.5.2.10 PLC system description

1.5.2.10.1 AC500 product family

AC500 programmable logic controllers (PLCs): The AC500 (Standard), AC500-eCo, AC500-S and AC500-XC scalable PLC ranges provide solutions for small, middle and high-end applications. Our AC500 platform offers different performance levels and is the ideal choice for high availability, extreme environments or safety solutions. Our AC500 PLC platform offers interoperability and compatibility in hardware and software from compact PLCs up to high-end and safety PLCs.

Due to the flexible combinations of AC500 devices and components, AC500 PLCs can be used for controlling a wide variety of applications to fulfill your automation needs.

Features of AC500 PLCs:
- Scalable and consistently expandable system
- Different performance classes of Processor Modules (CPUs) available
- Several field busses available
- Parallel connection to several field busses which can be combined arbitrarily
The AC500 product family consists of the product groups:

- **AC500 (standard):**
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- **AC500-eCo:**
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- **AC500-S:**
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- **AC500-XC:**
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility.

  **AC500-XC system data** · Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099.

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O Modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

---

**Extensions in the product name**

AC500 devices support different protocols and technologies (e.g. Ethernet, PROFIBUS etc.) in variable number. AC500 devices with onboard interfaces for support of a certain protocol or technology can be identified easily by the extension in the product name of the AC500 device. For example the AC500 Communication Module PM592-DP provides onboard support for PROFIBUS DP, the AC500 Processor Module PM595-4ETH provides onboard support for four provided Ethernet interfaces.

Further extensions in AC500 device names:

- -ETH: Ethernet
- -ARC: ARCNET
- -DP: PROFIBUS DP
- -CAN: CAN/CANopen
- -ETHCAT: EtherCAT
- -PNIO: PROFINET
- -RCOM: RCOM/RCOM+
- -RS: Serial interface

---

**1.5.2.10.2 AC500/S500 system structure**

The AC500 product family provides a variety of modules and pluggable components for expanding the capabilities of the CPU with additional I/Os or other communication protocols. Depending on the features and functions of the processor module (CPU) compatible components can be added to a complete AC500 PLC system.

Example of an AC500 PLC system:
1 Plug-in communication module
2 Processor module
3 Plug-in I/O module
4 Plug-in function module (AC500-eCo)
   - Plug-in communication module (AC500-S), not displayed
   - Plug-in I/O module (AC500-S), not displayed

Centralized I/O extension

Fig. 94: S500 I/O modules directly connected to a processor module
1.5.2.10.3 AC500/S500: Short description hardware

Processor modules

AC500 processor modules contain the CPU with the core component of the PLC. The CPU is connected with the user memory, input and output module, communication port and other units via system bus and performs tasks by means of system programs preset in the system memory. The CPU adopts the function preset by the system program to command the PLC for operation.

Its functions include:

- To receive user program and data entered
- To diagnose work faults of the power supply and PLC circuit as well as syntax error in programming
- To receive the state or data of the site via the input interface and save it into the shadow register or data register
- To read the user program in the memory one by one and execute it after interpretation
- To update the state of related flag bits and output shadow register contents according to execution results and realize output control by means of output unit.

Processor modules are available in different performance classes. Only one processor module is required for a valid system architecture.

There are different types of processor module available that differ in the features and functions they provide, e.g. performance, LED display etc.

If required, processor modules are also available with an integrated Ethernet communication module (TCP/IP).
AC500 communication modules are required for
- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules
- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base. A separate voltage source is not required.

I/O modules
The I/O modules are the input / output unit which connects the PLC with the industrial production site. The PLC can detect controlled object data via the input interface and the data is taken as the basis for PLC control on the controlled object. In addition, the PLC sends processing results via the output interface to the controlled object to realize the control purpose.

External input equipment and output equipment need various signal levels while the information processed by the CPU in the PLC only can be the standard level. In order to realize such conversion, the I/O interface generally shall perform optical isolation and filtering to improve interference immunity of the PLC. In addition, the I/O interface generally can indicate the working state to facilitate maintenance.

The PLC provides multiple I/O interface for operation level and drive capability to users for selection such as digital input, digital output, analog input, analog output, etc. I/O interfaces of the PLC have the number of input / output signals taken as the number of PLC I/O points. The number of I/O points is an important basis for PLC selection. If the system is insufficient in the I/O points, it can be expanded via the I/O extension interface of the PLC.

The I/O modules for digital and/or analog inputs and outputs are available in different versions and allow flexible use thanks to configurable channels.

The modules can be simply plugged onto a terminal unit for a centralized I/O extension or for a decentralized I/O extension via communication interface modules.

Function modules extend the PLC system to perform special task control. Those modules often provide independent components such as a CPU, system programs, memory and interfaces connected with the PLC system bus.

It is connected with the PLC via the I/O bus to exchange data and independently work under cooperative management of the PLC.

Communication interface modules enable a decentralized I/O station. It contains embedded digital I/Os and a fieldbus interface.

Communication interface modules act as I/O slave devices within a master-slave-arrangement.
Terminal bases

On a terminal base the processor module and the communication modules are plugged.

For AC500-eCo processor modules and special AC500 (Standard) processor modules the terminal base cannot be removed.

Terminal units

On a terminal unit the I/O modules are plugged.
Terminal units enable simple prewiring without electronics and are available for 24 VDC and 230 VAC, optionally for spring or screw-type terminals.

Memory

In the PLC, the memory is mainly used for saving system programs, user programs and work data. The following memory types can be distinguished:

- Volatile memory:
  All saved data will be lost after power failure of the memory but the memory can provide high access rate and unlimited programming cycles. Common volatile memories mainly include SRAM and DRAM (including common memories such as SDRAM).

- Nonvolatile memory:
  All saved data will not be lost after power failure of the memory, but the memory is subject to low read-write rate and limited rewrite cycles. Common nonvolatile memories mainly include NORflash, NANDflash, EEPROM, SD card, etc.

AC500 PLCs store all user programs in the nonvolatile memory to get protected from power failure. The programs are exported to the volatile memory under operation of the PLC to ensure high-speed and efficient operation. If user program debugging is finished, the programs can be fixed in the nonvolatile memory when they need no change. The work data is subject to frequent change and access in the PLC operation. It is saved in the volatile memory to meet the requirements for random access.

The work data memory of PLC has the memory area for input and output relay, auxiliary relay, timer, counter and other logic devices. The state of these devices depends on initial setting and operation of the user programs. Some data maintains existing state by using built-in supercapacitors or backup batteries in case of power failure. The memory area for data saving in case of power failure is called the data retention area.
The PLC is equipped with a switch power supply for internal circuit. Compared with ordinary power supply, the PLC power supply has the higher stability and interference immunity. A number of PLC products provide 24 VDC stabilized voltage supply to meet external sensors.

1.5.2.10.4 Short description software

Configuration and programming of all AC500 control systems (CPUs) is done by using Automation Builder software.

Features:
- Standardized programming according to IEC 61131-3 - five programming languages (Structured Text (ST), Function Block Diagram (FBD), Instruction List (IL), Ladder Diagram (LD), Sequential Function Chart (SFC)), free graphical function chart (CFC), debugging functions for program test
- Application programming in C/C++
- Online diagnosis
- Debugging functions for the program test: Single step, Single cycle, Breakpoint
- Offline simulation - simulate commands without PLC being connected
- Sampling trace - timing diagrams for process variables
- Recipe management and watch lists
- Visualization
- Configuration of the communication interface modules (for PROFINET, EtherCAT, CANopen, Ethernet, Modbus)
- Programming - serial or via Ethernet networks
- Comprehensive libraries
- Export and import interfaces for devices, signals, applications, visualization, etc.
- Multi-user support and project compare
- Project scripting

IEC 61131-3 commands can be simulated without a PLC being connected, including the relevant malfunctions. After the program test, the application can be downloaded to the control system.

Sampling trace Timing diagrams for process variables and storage of data in a ring buffer with event trigger.
Recipe management and watch lists
Values of selected variables are displayed. Pre-defined values can be assigned to variables which can then be downloaded to the control system all at once ("Write recipe"). Actual values from the control system can also be pre-assigned for reading into the Watch and Recipe Manager, and stored in memory there ("Read recipe"). These functions are also helpful, for example, for setting and entering control parameters.

Visualization
Includes color change, moving elements, bitmaps, text display, allows input of setpoint values and display of process variables read from the PLC, dynamic bar diagrams, alarm and event management, function keys and ActiveX elements.

Programming
Serial or via Ethernet networks.

Engineering interface
Provides access from the programming system to an external project database in which the program source code of one or several automation projects is managed. Optionally, a version control system, such as Visual Source Safe, can be used in order to ensure data consistency of the program code for several different users and projects.

1.5.2.10.5 Control panels (HMI)
ABB control panels offer a wide range of features and functionalities for maximum operability. The panels are distinguished by their robustness and easy usability, providing all the relevant information from production plants and machines at a single touch.

Human Machine Interfaces - human control and operation of machines and processes.
Individual solutions for each application - this enables an operator at any time to have an overview on a profitable production and intervene manually if necessary.
Control panels with TFT graphical display and touch screen.
Available in various resolutions.

1.5.2.11 AC500-S
The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.
In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the AC500-S safety user manual is only available on our website.

1.5.2.12 Convert an AC500 V2 project to an AC500 V3 project
Instructions on how to convert a V2 project to a V3 project and differences between V2 and V3.
Keywords: Migration, conversion, V2, V3, differences between V2 and V3, application example, checkbox “Change to AC500 V3 PLC”

1.5.3 Device specifications

1.5.3.1 Status LEDs, display and control elements

Depending on the device type, various operating elements provided on the front panel can be used to control the devices of the PLC system and/or to change the operating mode.

Operating elements:

- Status LEDs:
  Indicates the availability of devices/components such as communication modules, communication interface modules or function modules. Functionality of the status LEDs depends on the specific module and is described in the device description of the appropriate module. Possible status: on/off/blinking

- I/O LEDs:
  Displays the status of the the inputs and outputs.

- LED display:
  Available for some processor modules. It can be used for simple configurations.

- Buttons and switches:
  Allows to change the current operating modes/status manually.

1.5.3.2 Terminal bases (AC500 standard)

1.5.3.2.1 TB56xx for AC500 V3 products

- TB5600-2ETH: 1 processor module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5610-2ETH: 1 processor module, 1 communication module, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5620-2ETH: 1 processor module, 2 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5640-2ETH: 1 processor module, 4 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- TB5660-2ETH: 1 processor module, 6 communication modules, with network interface 2 Ethernet RJ45, 1 CAN and 1 COM1
- XC version for use in extreme ambient conditions available

#### Remarks:

The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index \( \geq C0 \).

The following figure shows the TB5620-2ETH as example.

1. I/O bus (10-pin, female) to electrically connect the I/O terminal units
2. One available slot for the processor module
3. Slots for communication modules
4. Interface for CAN (5-pin terminal block, removable)
5. Power supply (5-pin terminal block, removable)
6. Serial interface COM1 (9-pin terminal block, removable)
7. RJ45 female connector for ETHERNET1 connection
8. RJ45 female connector for ETHERNET2 connection
9. Holes for screw mounting
10. DIN rail

#### XC version

**XC = eXtreme Conditions**

*Extreme conditions*

Terminal bases for use in extreme ambient conditions have no \( \times \) sign for XC version.

*The figure 3 in the Part no. 1SAP3... (label) identifies the XC version.*
Short description

Terminal bases TB56xx are used as sockets for processor modules PM56xx and communication modules.

Up to 10 I/O terminal units for I/O expansion modules can be added to these terminal bases.

The terminal bases have slots for one processor module and for communication modules as well as terminals and interfaces for power supply, expansion and networking.

</tbody>
</table>

Remarks:
The slots can be used for connecting communication modules or AC500-S modules. Note that only one AC500-S module can be connected at one terminal base.

1) PM567x must have an index ≥ C0.

NOTICE!
Risk of malfunctions!

- Unused slots for communication modules must be covered with dummy communication modules (TA524 ☞ Chapter 1.5.3.8.1.3 “TA524 - Dummy communication module” on page 3034) to achieve IP20 rating.
- I/O bus connectors must not be touched during operation.

Connections

I/O bus

The I/O bus is the I/O data bus for the I/O modules. Through this bus, I/O and diagnosis data are transferred between the processor module and the I/O modules. Up to 10 I/O modules can be added (see description for I/O bus in the system assembly chapter ☞ Chapter 1.5.4.4.1 “Serial I/O bus” on page 3044).

Power supply

The supply voltage of 24 VDC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals, when the ambient temperature never exceeds 60 °C.

### Faulty wiring on power supply terminals

**NOTICE!**
**Risk of damaging the processor module and terminal base!**
Exceeding the maximum voltage could lead to unrecoverable damage to the system.

The system could be destroyed.

**NOTICE!**
**Risk of malfunction!**
To ensure reliability and proper functionality of processor modules below index C0, the supply voltage must ramp-up from 0 V to 24 V within max. 2.5 s.

**NOTICE!**
**Risk of damaging the terminal base and power supply!**
Short circuits might damage the terminal base and power supply.

Make sure that the four clamps L+ and M (two of each) are not wrongly connected (e. g. +/- of power supply is connected to both L+/L+ or both M/M).

**NOTICE!**
**Risk of damaging the terminal base!**
Terminal base can be damaged by connecting the power supply terminal block (L+/M) to COM1.

Make sure that the COM1 terminal block is always connected to the terminal base even if you do not use COM1 to prevent this.

**NOTICE!**
**Risk of damaging the terminal base!**
Excessive current might damage the clamp and terminal base.

Make sure that the current flowing through the removable clamps never exceeds 8 A (with 1.5 mm² conductor).
NOTICE!
For applications using XC versions!
To ensure reliability and proper function, make sure the ambient temperature never exceeds 60 °C when the current flowing through the removable clamps is 8 A (with 1.5 mm² conductor).

Serial interface COM1
The serial interface COM1 is connected to a removable 9-pin terminal block. From firmware version V3.1 it is configurable for RS-232 or RS-485 (V3.0 RS-232 only).

Make sure that the terminal block is always connected to the terminal base, even if you do not use the interface.

For further information on connection and wiring please refer to Serial Interface COM1 of the Terminal Bases.

---

Ethernet interface
This interface is the connection to a processor module with onboard Ethernet e.g. PM56xx-2ETH.
TB56xx-2ETH for processor modules PM56xx-2ETH provide 2 independent Ethernet interfaces.

The two Ethernet interfaces can be configured as independent interfaces or with switch functionality.

In case of two independent interfaces they must be configured to different subnets.

For structured Ethernet cabling only use cables according to TIA/EIA-568-A, ISO/IEC 11801 or EN 50173.

</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

## Types of bus cables

Only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. See CANopen fieldbus Chapter 1.5.4.5.4.6 “CANopen field bus” on page 3082.

## Bus terminating resistors

Both ends of the CAN bus have to be terminated with a 120 Ω (≥ 1/4 W, ≤ 5 %) bus terminating resistor, to minimize signal reflection. The bus terminating resistor should be connected directly at the bus connector between the CAN signals (CAN_H and CAN_L). See CANopen fieldbus Chapter 1.5.4.5.4.6 “CANopen field bus” on page 3082.

## Technical data

The system data of AC500 and S500 are valid for standard version Chapter 1.5.4.5.1 “System data AC500” on page 3058.

The system data of AC500-XC are valid for the XC version Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

1.5.3.3 Processor modules

The AC500 product family consists of the product groups:

- **AC500 (standard):**
  AC500 standard PLCs offer a wide range of performance levels and scalability. The PLCs are highly capable of communication and extension for flexible application.

- **AC500-eCo:**
  AC500-eCo PLCs are cost-effective, high-performance compact PLCs that offer total interoperability with the core AC500 range and provide battery-free data buffering. All I/O modules can be freely connected in a simple, stable and reliable manner.

- **AC500-S:**
  AC500-S PLCs are designed for safety applications involved in factory, process or machinery automation area.

- **AC500-XC:**
  AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. These variants operate according to their product group and can, in addition, be operated under extreme conditions. AC500-XC PLCs can be used at high altitudes, extended operating temperature and in humid condition. Further, the devices provide immunity to vibration and hazardous gases. The AC500-XC series is consistent with standard devices in the overall dimensions, control function and software compatibility. 

The AC500 product family is characterized by functional modularity. As the complete AC500 product family shares the same hardware platform and programming software tool, the devices of the AC500 product groups can be flexibly combined.

S500 devices represent the I/O modules of the product group AC500 (standard), whereas S500-eCo devices represent the I/O Modules of the product group AC500-eCo. Both S500 and S500-eCo devices can be combined with devices of the AC500 product family in a flexible way.

1.5.3.3.1 AC500 (standard)

**PM56xx-2ETH for AC500 V3 products**

Processor modules with onboard interfaces:

- **PM5630-2ETH:** processor module, memory 8 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.
- **PM5650-2ETH:** processor module, memory 80 MB, with Ethernet support (onboard Ethernet) – 2 network interfaces RJ45, CAN and COM1 on the terminal base.

**Short description**

The processor modules are the central units of the control system AC500. The types differ in their performance (memory size, speed etc.). Each processor module must be mounted on a suitable terminal base.

The terminal base type (TB56xx) depends on the number of communication modules which are used together with the processor module.

**Table 516: Comparison: TB56xx**

**Remarks:**

1) in preparation

All terminal bases (TB56xx) provide the same communication interfaces (ETH1, ETH2, CAN and COM1). Technical Data Chapter 1.5.3.2.1.3 “Technical data” on page 2271

All other V3 processor modules can operate multiple communication modules via their communication module interface.

The communication modules are mounted on the left side of the processor module on the same terminal base.

On the right side of the processor module, up to 10 digital or analog I/O expansion modules can be connected to the I/O bus. Each I/O module requires a suitable terminal unit depending on the module type.

Terminal bases, terminal units, I/O modules, communication modules and accessories have their own technical descriptions.
Each processor module can be used as:

- Stand-alone processor module
- Stand-alone processor module with local I/Os
- Remote IO server
- Remote IO client

The processor modules are powered with 24 VDC.

**WARNING!**

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**Connections**

All terminals for electrical connection are available on the terminal base. For information on connection and available interfaces see the descriptions for

- **TB56xx** % Chapter 1.5.3.2.1 “TB56xx for AC500 V3 products” on page 2265.

---

**Processor modules PM56xx-2ETH can only be used with TB56xx-2ETH terminal bases.**

---

Storage elements

Lithium battery

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116.

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

The technical data, handling instructions and the insertion/replacement of the battery is described in detail in the chapter TA521 lithium battery Chapter 1.5.3.8.1.2 “TA521 - Lithium battery” on page 3030.

Memory card

AC500 processor modules are supplied without memory card. It must be ordered separately.

The memory card can be used
• to read and write user files
• to download a user program
• for firmware updates

Detailed information can be found in the System Technology chapter Chapter 1.5.5.1.2 “System processing” on page 3110.

AC500 processor modules can be operated with and without memory cards. The processor module uses a standard file system (FAT). This allows standard card readers to read and write the memory cards (MC502).

Only genuine MC502 memory cards are supported.

For more information on the technical data, handling instructions and the insertion/replacement of the memory card, please refer to the chapter memory card MC502 Chapter 1.5.3.8.1.1 “MC502 - SD memory card” on page 3028.
LEDs, display and function keys on the front panel

Detailed information on using the LEDs, display and the function keys such as startup procedure and error coding is described in the system technology section Display § Chapter 1.5.5.1.4 “LEDs, display and function keys on the front panel” on page 3118.

Technical data

The system data of AC500 and S500 are valid for standard version § Chapter 1.5.4.5.1 “System data AC500” on page 3058.

The system data of AC500-XC are valid for the XC version § Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

1.5.3.4 Communication modules (AC500 standard)

1.5.3.4.1 Overview

AC500 communication modules are required for

- a connection to standard field bus systems and
- for integration into existing networks.

AC500 communication modules

- enable communication on different field buses.
- are mounted on the left side of the processor module on the same terminal base.
- are directly powered via the internal communication module bus of the terminal base.

A separate voltage source is not required.
**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

*For information on mounting and demounting, please refer to the chapter mounting and demounting the communication modules Chapter 1.5.4.5.3.5 “Mounting and demounting the communication modules” on page 3075.*

The communication between the processor module and the communication modules takes place via the communication module bus, which is integrated in the terminal base. Depending on the used terminal base up to 6 communication modules can be connected.

- **TB56xx** Chapter 1.5.3.2.1 “TB56xx for AC500 V3 products” on page 2265

There are no restrictions concerning which communication modules can be arranged for a processor module.

Within the AC500 control system, the communication modules can be used as
- bus master or
- slave.

It depends on the
- selected protocol,
- the functionality of the communication module and
- the several field buses and networks.

The following name extensions of the device names describe the supported field bus/protocol:
- CMxyz-ETH: Ethernet
- CMxyz-DP: PROFIBUS
- CMxyz-PNIO: PROFINET
- CMxyz-ETHCAT: EtherCAT
- CMxyz-CN: CANopen
- CMxyz-RCOM: RCOM/RCOM+ protocol (and 2 serial interfaces)
- CMxyz-RS: 2 serial interfaces (COM1/COM2)

If a XC version of the device is available, for use in extreme ambient conditions (e.g. wider temperature and humidity range), this is indicated with a snowflake sign.

- CANopen master 1 Mbit/s
- XC version for use in extreme ambient conditions available
1 5 LEDs for state display  
2 Label  
3 Communication interface, 5-pin, Combicon, male, removable plug with spring terminals  
Sign for XC version

Purpose

Communication Module CM598-CN enables communication over the CANopen field bus. For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

The AC500 V3 CPUs only support CAN 2A/2B protocol on the communication module CM598-CAN. Chapter 1.5.6.2.7.1.1.2 "Configuration of the protocols CAN 2.0 A / CAN 2.0 B" on page 3288. Support of CANopen protocol is in preparation.
Electrical connection

Field bus interface

<table>
<thead>
<tr>
<th>Interface socket</th>
<th>5-pin COMBICON</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission standard</td>
<td>ISO 11898, potential-free</td>
</tr>
<tr>
<td>Transmission protocol</td>
<td>CANopen (CAN), 1 Mbaud max.</td>
</tr>
<tr>
<td>Transfer rate (transmission rate)</td>
<td>10 kbit/s, 20 kbit/s, 50 kbit/s, 100 kbit/s, 125 kbit/s, 250 kbit/s, 500 kbit/s, 800 kbit/s and 1 Mbit/s,</td>
</tr>
</tbody>
</table>

The CANopen connector has the following pin assignment:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminal block removed</td>
<td>1</td>
<td>CAN_GND</td>
<td>CAN reference potential</td>
</tr>
<tr>
<td>Terminal block inserted</td>
<td>2</td>
<td>CAN_L</td>
<td>Bus line, receive/transmit line, LOW</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>CAN_SHLD</td>
<td>Shield of the bus line</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>CAN_H</td>
<td>Bus line, receive/transmit line, HIGH</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>NC</td>
<td>Not connected</td>
</tr>
</tbody>
</table>

NOTICE!

Unused connector!

Make sure that the terminal block is always connected to the terminal base, even if you do not use the interface.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>
<tr>
<th>Bit Rate (speed)</th>
<th>Bus Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Mbit/s</td>
<td>40 m</td>
</tr>
<tr>
<td>800 kbit/s</td>
<td>50 m</td>
</tr>
<tr>
<td>500 kbit/s</td>
<td>100 m</td>
</tr>
<tr>
<td>250 kbit/s</td>
<td>250 m</td>
</tr>
<tr>
<td>125 kbit/s</td>
<td>500 m</td>
</tr>
<tr>
<td>50 kbit/s</td>
<td>1000 m</td>
</tr>
</tbody>
</table>

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:
<table>
<thead>
<tr>
<th>Length of segment [m]</th>
<th>Bus cable (shielded, twisted pair)</th>
<th>Max. transmission rate [kbit/s]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Conductor cross section [mm²]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>0...40</td>
<td>0.25...0.34 / AWG23, AWG22</td>
<td>70</td>
</tr>
<tr>
<td>40...300</td>
<td>0.34...0.60 / AWG22, AWG20</td>
<td>&lt; 60</td>
</tr>
<tr>
<td>300...600</td>
<td>0.50...0.60 / AWG20</td>
<td>&lt; 40</td>
</tr>
<tr>
<td>600...1000</td>
<td>0.75...0.80 / AWG18</td>
<td>&lt; 26</td>
</tr>
</tbody>
</table>

**Bus terminating resistors**

The ends of the data lines have to be terminated with a 120 Ω bus terminating resistor. The bus terminating resistor is usually installed directly at the bus connector.

---

**Fig. 96: CANopen interface, bus terminating resistors connected to the line ends**

<table>
<thead>
<tr>
<th></th>
<th>CANopen interface, bus terminating resistors connected to the line ends</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

1.5.3.4.4 EtherCAT

CM579-ETHCAT - EtherCAT master

1. 5 LEDs for state display
2. 2 rotary switches for address setting (not used)
3. Label
4. 2 communication interfaces RJ45 (ETHCAT1 and ETHCAT2)

**Intended purpose**

Communication module CM579-ETHCAT is for EtherCAT communication. The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved in a non-volatile way on a flash EPROM.

*Error codes*

**Electrical connection**

**Field bus interfaces**

The EtherCAT communication module provides 2 RJ45 interfaces with the following pin assignment. The pin assignment is used for the EtherCAT slaves (communication interface modules CI5xy-ETHCAT) as well.
### Table 533: Pin assignment RJ45 jack:

</tbody>
</table>

For further information regarding wiring and cable types see chapter Ethernet & Chapter 1.5.4.7 “Ethernet connection details” on page 3084.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-con- nector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.
State LEDs

The EtherCAT state is shown by the EtherCAT communication module's LEDs. Some LEDs are two-colored.

### 1.5.3.4.5 PROFINET

**CM579-PNIO**

- PROFINET I/O controller
- Integrated 2-port switch
- XC version for use in extreme ambient conditions available
1 5 LEDs for state display
2 2 rotary switches for address setting (not used)
3 Label
4 2 communication interfaces RJ45 (PNIO1 and PNIO2)
   Sign for XC version

**Intended purpose**

The communication module is for PROFINET RT communication.

The PROFINET communication module includes an internal Ethernet switch. The connection to the Ethernet can be established directly to the communication module. An additional switch is not necessary.

The communication module is configured via the dual-port memory by means of a system configurator. The configuration is saved in a non-volatile way on a flash EPROM.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.
**Functionality**

*) For planning and commissioning of new installations use modules in Active status only.
1.5.3.5 Terminal units (AC500 standard)

**Hot swap**

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Further information about hot swap: **System technology** Chapter 1.5.5.1.6 “Hot swap” on page 3148.

1.5.3.5.1 TU507-ETH and TU508-ETH for Ethernet communication interface modules

- TU507-ETH, Ethernet terminal unit, 24 VDC, screw terminals
- TU508-ETH, Ethernet terminal unit, 24 VDC, spring terminals
- TU508-ETH-XC, Ethernet terminal unit, 24 VDC, spring terminals, XC version
1 I/O bus (10 pins, female) to electrically connect the first terminal unit
2a Plug (2x 25 pins) to electrically connect the inserted Ethernet communication interface module
2b Plug (3x 19 pins) to electrically connect the inserted Ethernet communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other
4 2 holes for wall mounting
5 2 RJ45 interfaces with indication LEDs for connection with the Ethernet network
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The Ethernet communication interface modules plug into the Ethernet terminal unit. When properly seated, they are secured with two mechanical locks. All the electrical connections are made through the Ethernet terminal unit, which allows removal and replacement of the Ethernet communication interface modules without disturbing the wiring at the Ethernet terminal unit.

The Ethernet terminal units TU507-ETH and TU508-ETH are specifically designed for use with AC500/S500 Ethernet communication interface modules (e.g. CI501-PNIO).
**XC version**

**XC = eXtreme Conditions**

![Image](image_url)

**Extreme conditions**

Terminal units for use in extreme ambient conditions have no sign for XC version. The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

**Screwdriver (opens terminal)**

For information about wiring specifications see the description of the Terminal Units % Chapter 1.5.4.5.4.3 “Terminals at the terminal unit” on page 3078.

For a detailed description of the mounting, disassembly and electrical connection of the terminal units and the I/O modules, please refer to the “System Assembly, Construction and Connection” chapter % Chapter 1.5.4.5.3 “Mounting and demounting” on page 3068.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

The assignment of the other terminals is dependent on the inserted communication interface module.
NOTICE!
Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.
Protect unused connectors and slots with TA535 protective caps for XC devices TA535 Chapter 1.5.3.8.2.4 “TA535 - Protective caps for XC devices” on page 3039.

Technical data

The system data of AC500 and S500 Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.
The technical data are also valid for the XC version.

*) For planning and commissioning of new installations use modules in Active status only.

1.5.3.5.2 TU515, TU516, TU541 and TU542 for I/O modules

- TU515, I/O terminal unit, 24 VDC, screw terminals
- TU516, I/O terminal unit, 24 VDC, spring terminals
- TU516-XC, I/O terminal unit, 24 VDC, spring terminals, XC version
- TU516-H, I/O terminal unit, hot swap, 24 VDC, spring terminals
- TU516-H-XC, I/O terminal unit, hot swap, 24 VDC, spring terminals, XC version
- TU541, I/O terminal unit, 24 VDC, screw terminals
- TU542, I/O terminal unit, 24 VDC, spring terminals
- TU542-XC, I/O terminal unit, 24 VDC, spring terminals, XC version
- TU542-H, I/O terminal unit, hot swap, 24 VDC, spring terminals
- TU542-H-XC, I/O terminal unit, hot swap, 24 VDC, spring terminals, XC version

The input/output modules plug into the I/O terminal unit. When properly seated, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.
1. I/O bus (10 pins, male) to electrically connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit.
2. I/O bus (10 pins, female) to electrically connect other terminal units.
3a. Plug (2x25 pins) to electrically connect the inserted I/O modules.
3b. Plug (2x19 pins) to electrically connect the inserted I/O modules.
4. With a screwdriver inserted in this place, the terminal unit and the adjacent terminal unit can be shoved from each other.
5. Holes for wall mounting.
6. 40 terminals for signals and process supply voltage.
7. DIN rail.
8. White border signifies hot swap capability of the terminal unit.

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
– make sure the following conditions apply:
  – Digital outputs are not under load.
  – Input/output voltages above safety extra low voltage/
    protective extra low voltage (SELV/PELV) are switched off.
  – Modules are fully interlocked with the terminal unit with both snap-fits
    engaged before switching on loads or input/output voltage.
  – Never touch exposed contacts (dangerous voltages).
  – Stay away from electrical contacts to avoid arc discharge.
  – Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed
or inserted during operation.

H = Hot swap

Hot swap
System requirements for hot swapping of I/O modules:
– Types of terminal units that support hot swapping of I/O modules have the
  appendix TU5xx-H.
– I/O modules as of index F0.
The following I/O bus masters support hot swapping of attached I/O modules:
– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

The index of the module is in the right corner of the label.
NOTICE!
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

NOTICE!
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>These terminals are internally connected with assignment: process supply voltage UP = +24 VDC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>TU541, TU542 and TU542-H</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>These terminals are internally connected with assignment: process voltage UP = +24 VDC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Separate process supply voltage UP3 = +24 VDC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Separate process supply voltage UP4 = +24 VDC</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>These terminals are internally connected with assignment: process supply voltage ZP = 0 V</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Separate process supply voltage ZP = 0 V</td>
<td></td>
<td></td>

*) For planning and commissioning of new installations use modules in Active status only.

### 1.5.3.3 TU517 and TU518 for communication interface modules
- TU517, terminal unit, 24 VDC, screw terminals
- TU518, terminal unit, 24 VDC, spring terminals
- TU518-XC, terminal unit, 24 VDC, spring terminals, XC version
1 I/O bus (10 pins, female) to electrically connect the first terminal unit
2a Plug (2 25 pins) to electrically connect the inserted communication interface module
2b Plug (2 19 pins) to electrically connect the inserted communication interface module
3 With a screwdriver, inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
4 2 holes for wall mounting
5 10 terminals for connection with the bus system
6 30 terminals for signals and process supply voltages (UP and UP3)
7 DIN rail

The communication interface modules plug into the terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the communication interface modules without disturbing the wiring at the terminal unit.

The terminal units TU517 and TU518 are specifically designed for use with AC500/S500 communication interface modules (e.g. CI581-CN, CI541-DP):

- CANopen communication interface modules
- DeviceNet modules
- PROFIBUS DP communication interface modules
Extreme conditions
Terminal units for use in extreme ambient conditions have no sign for XC version.
The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

## Terminals

</tbody>
</table>

For information about wiring specifications see the description of the Terminal Units % Chapter 1.5.4.5.4.3 “Terminals at the terminal unit” on page 3078.

For a detailed description of the mounting, disassembly and electrical connection of the terminal units and the I/O modules, please refer to the “System Assembly, Construction and Connection” chapter % Chapter 1.5.4.5.3 “Mounting and demounting” on page 3068.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted communication interface module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 VDC
- Terminal 4.8: process supply voltage UP3 = +24 VDC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

The assignment of the other terminals depends on the inserted communication interface module (see communication interface modules for CANopen and PROFIBUS).
Technical data

The system data of AC500 and S500 (Chapter 1.5.4.5.1 “System data AC500” on page 3058) are valid for the standard version.

The system data of AC500-XC (Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099) are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

1.5.3.5.4 TU531 and TU532 for I/O modules

- TU531, I/O terminal unit, 230 VAC, screw terminals
- TU532, I/O terminal unit, 230 VAC, spring terminals
- TU532-XC, I/O terminal unit, 230 VAC, spring terminals, XC version
- TU532-H, I/O terminal unit, hot swap, 230 VAC, spring terminals
- TU532-H-XC, I/O terminal unit, hot swap, 230 VAC, spring terminals, XC version

1  I/O bus (10 pins, male) to electrically connect the previous terminal unit, the CPU terminal base or the communication interface module to the terminal unit
2  I/O bus (10 pins, female) to electrically connect other terminal units
3a Plug (2 25 pins) to electrically connect the inserted I/O modules
3b Plug (3 19 pins) to electrically connect the inserted I/O modules
4  With a screwdriver inserted in this place, the terminal unit and the adjacent I/O terminal unit can be shoved from each other
5  2 holes for wall mounting
6  40 terminals for signals and process supply voltage
7  DIN rail
8  White boarder signifies hot swap capability of the terminal unit

The input/output modules (I/O modules) plug into the I/O terminal unit. When properly plugged-in, they are secured with two mechanical locks. All the electrical connections are established via the terminal unit, which allows removal and replacement of the I/O modules without disturbing the wiring at the terminal unit.

The terminal units TU531 and TU532 are specifically designed for use with AC500/S500 I/O modules that incorporate 115-230 VAC inputs and/or 230 VAC relay outputs.

**WARNING!**
Risk of explosion or fire in hazardous environments during hot swapping!
Hot swap must not be performed in flammable environments to avoid life-threatening injury and property damage resulting from fire or explosion.
WARNING!
Electric shock due to negligent behavior during hot swapping!
To avoid electric shock
– make sure the following conditions apply:
  – Digital outputs are not under load.
  – Input/output voltages above safety extra low voltage/protective extra low voltage (SELV/PELV) are switched off.
  – Modules are fully interlocked with the terminal unit with both snap-fits engaged before switching on loads or input/output voltage.
  – Never touch exposed contacts (dangerous voltages).
  – Stay away from electrical contacts to avoid arc discharge.
  – Do not operate a mechanical installation improperly.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

H = Hot swap

Hot swap
System requirements for hot swapping of I/O modules:
– Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
– I/O modules as of index F0.
The following I/O bus masters support hot swapping of attached I/O modules:
– Communication interface modules CI5xx as of index F0.
– Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

The index of the module is in the right corner of the label.
**NOTICE!**
Risk of damage to I/O modules!
Modules with index below F0 can be damaged when inserted or removed from the terminal unit in a powered system.

**NOTICE!**
Risk of damage to I/O modules!
Do not perform hot swapping if any I/O module with firmware version lower than 3.0.14 is part of the I/O configuration.
For min. required device index see table below.

### Extreme Conditions

Terminal units for use in extreme ambient conditions have no \( \text{XC} \) sign for XC version.

The figure 4 in the Part no. 1SAP4... (label) identifies the XC version.

### Terminals

<table>
<thead>
<tr>
<th>Screw terminals</th>
<th>Spring terminals</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>1.8</td>
<td></td>
</tr>
<tr>
<td>1.9</td>
<td></td>
</tr>
</tbody>
</table>

For information about wiring specifications see the description of the Terminal Units \( \text{\textsection} \) Chapter 1.5.4.5.4.3 "Terminals at the terminal unit" on page 3078.

For a detailed description of the mounting, disassembly and electrical connection of the terminal units and the I/O modules, please refer to the "System Assembly, Construction and Connection" chapter \( \text{\textsection} \) Chapter 1.5.4.5.3 "Mounting and demounting" on page 3068.
The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the terminal unit and always have the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage $UP = +24\ \text{VDC}$
- Terminals 1.9 to 4.9: process supply voltage $ZP = 0\ \text{V}$

The assignment of the other terminals depends on the inserted decentralized communication interface module (see the description of the respective module used).

The supply voltage of 24 VDC for the module's circuitry comes from the I/O expansion bus (I/O bus).

### Technical data

The system data of AC500 and S500 ☞ Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC ☞ Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

<table>

*) For planning and commissioning of new installations use modules in Active status only.
1.5.3.6 I/O modules

**Hot swap**

System requirements for hot swapping of I/O modules:

- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:

- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

**NOTICE!**

Risk of damage to I/O modules!

Hot swapping is only allowed for I/O modules. Processor modules and communication interface modules must not be removed or inserted during operation.

**Conditions for hot swapping**

- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Further information about hot swap: System technology > Chapter 1.5.5.1.6 “Hot swap” on page 3148.

---

1.5.3.6.1 Digital I/O modules

**S500-eCo**

**DC561** - Digital input/output module

- 16 configurable digital inputs/outputs 24 VDC,
- Connection via Interfast
- Module-wise electrically isolated
Intended purpose

The digital input/output module DC561 can be connected to the following devices via the I/O bus connector:

- S500 bus modules (e.g. CI501-PNIO, CI541-DP, CI581-CN)
- AC500 CPUs (PM5xx)
- other AC500 I/O modules

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

The module contains 16 digital channels in 1 group, each channel can be used as a digital 24 VDC input or 24 VDC output.
The inputs/outputs are group-wise electrically isolated from each other. All other circuitry of the module is electrically isolated from the inputs/outputs.

### Functionality

<table>
<thead>
<tr>

</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 VDC)</td>
</tr>
</tbody>
</table>

### Electrical connection

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.*

The electrical connection is established out by using the 20-pin Interfast connector. For further information, refer to the Interfast documentation.

The assignment of the terminals:

<table>

</tr>
</tbody>
</table>
The arrow located next to the Interfast connector marks terminal 1.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DC561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

If DC561 with index A0 is used, the process supply voltage must stem from the same source as the power supply voltage of the CPU. The index consists of 1 letter, followed by 1 digit, and can be found on the type plate of the module next to the type designator "DC561".
The module provides several diagnosis functions \( \text{\textsuperscript{\textcopyright} Chapter 1.5.3.6.1.1.6 \textit{Diagnosis} on page 2332.} \)

The meaning of the LEDs is described in the section State LEDs \( \text{\textsuperscript{\textcopyright} Chapter 1.5.3.6.1.1.7 \textit{State LEDs} on page 2332.} \)

**I/O Configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:

1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

**DC562 - Digital input/output module**

- 16 configurable digital inputs/outputs in 1 group, 24 VDC
- Module-wise electrically isolated
1. I/O bus
2. 16 yellow LEDs to display the states of the inputs/outputs C0 to C15
3. Terminal number
4. Allocation of signal name
5. Terminal block for input and output signals (9-pin)
6. Terminal block for input and output signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs/outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs/outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*

</tbody>
</table>

**Electrical connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
Table 539: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DC562.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
Process supply voltage must be connected to UP/ZP of the module. The inputs and UP/ZP must use the same power supply.

The following figure shows the electrical connection of the digital input/output module DC562:

In this connection example, the inputs/outputs C0...C7 are connected as inputs and the inputs/outputs C8...C15 are connected as outputs.

The module provides several diagnosis functions "DC562 - Digital input/output module" on page 2335.

The meaning of the LEDs is described in the section "State LEDs" on page 2342.
I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
</tbody>
</table>

#### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = Module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or PNIO = module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.
**DI561 - Digital input module**

- 8 digital inputs 24 VDC / 24 VAC (I0 to I7) in 1 group
- Module-wise electrically isolated

---

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with Ci590-CS31-HA bus modules.

**Functionality**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>

**Electrical connection**

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using a removable 9-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter terminal blocks for S500-eCo I/O modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

![Block diagram of digital inputs]

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI561.

An external power supply connection is not needed.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

**Risk of malfunctions in the plant!**

A ground closure, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection of the digital input module DI561:
I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

*) For planning and commissioning of new installations use modules in Active status only.

**DI562 - Digital input module**

- 16 digital inputs 24 VDC / 24 VAC (I0 to I15) in 2 groups
- Group-wise electrically isolated
1. I/O bus
2. 16 yellow LEDs to display the signal states of the inputs I0 to I15
3. Terminal number
4. Allocation of signal name
5. Terminal block for input signals (9-pin)
6. Terminal block for input signals (11-pin)
7. 2 holes for wall-mounting with screws
8. DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.
The other electronic circuitry of the module is electrically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
Functionality

</tr>
</tbody>
</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

The assignment of the terminals:
<table>

</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI562. An external power supply connection is not needed.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions \(\Downarrow\) *Chapter 1.5.3.6.1.4.6 “Diagnosis” on page 2358.*

The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**

**Risk of malfunctions in the plant!**

A ground closure, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figure shows the electrical connection of the digital input module DI562:

![Electrical connection of DI562](image-url)
The meaning of the LEDs is described in section State LEDs \( \cong \) Chapter 1.5.3.6.1.4.7 “State LEDs” on page 2358.

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

<table>

Remarks:

1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself,
1...10 = decentralized communication interface module 1...10,
ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

### DI571 - Digital input module

- 8 digital inputs 100-240 VAC (I0 to I7) in 8 groups
- Module-wise electrically isolated
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs:

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI571.

An external power supply connection is not needed.

**WARNING!**
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.
Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital input module DI571:
**NOTICE!**

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions [Chapter 1.5.3.6.1.1.5.7 “Diagnosis” on page 2367](#).

The meaning of the LEDs is described in the section State LEDs [Chapter 1.5.3.6.1.1.5.8 “State LEDs” on page 2367](#).
Internal data exchange

<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of the modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

**Remarks:**

1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

**DI572 - Digital input module**

- 16 digital inputs 100-240 VAC (I0 to I15) in 2 groups
- Module-wise electrically isolated
1 I/O bus
2 16 yellow LEDs to display the signal states of the inputs I0 to I15
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for input signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
### Functionality

<table>
<thead>

<td>LED displays</td>
<td>For signal states</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Not necessary</td>
</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DI572.

An external power supply connection is not needed.

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions - Chapter 1.5.3.6.1.1.6.6 “Diagnosis” on page 2376.

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

Parameter | Remark
---|---
1) | In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) | With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10,
ADR = hardware address (e.g. of the DC551-CS31)

3) | With "Module" the following allocation applies depending on the master:
module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) | In case of module errors, with channel "31 = module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

### DO561 - Digital output module

- 8 digital outputs 24 VDC (O0 to O7) in 1 group
- Module-wise electrically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the outputs O0 to O7
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the outputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
Functionality

</tr>
</tbody>
</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

![Block diagram of digital outputs]

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital output module DO561:
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 μs if the process supply voltage UP/ZP is switched on. This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis "Chapter 1.5.3.6.1.7.6 "Diagnosis" on page 2383). The meaning of the LEDs is described in the section State LEDs "Chapter 1.5.3.6.1.7.7 "State LEDs" on page 2384.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Module error DO561

| 3 | 14 | 1...10 | 31 | 31 | 19 | Checksum error in the I/O module | Replace I/O module |
| 11 / 12 | ADR | 1...10 |
| 3 | 14 | 1...10 | 31 | 31 | 43 | Internal error in the module | Replace I/O module |
| 11 / 12 | ADR | 1...10 |
| 3 | 14 | 1...10 | 31 | 31 | 9  | Overflow diagnosis buffer | Restart |
| 11 / 12 | ADR | 1...10 |
| 3 | 14 | 1...10 | 31 | 31 | 26 | Parameter error | Check master |
| 11 / 12 | ADR | 1...10 |
Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

**DO562 - Digital output module**

- 16 digital outputs 24 VDC (O0 to O15) in 1 group
- Module-wise electrically isolated
1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other. All other circuitry of the module is electrically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO562.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the digital output module DO562:
**NOTICE!**

**Risk of malfunctions in the plant!**

The outputs may switch on for a period of 10 to 50 µs if the process supply voltage UP/ZP is switched on.

This must be considered in the planning of the application.
NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
– Never short-circuit or overload the outputs.
– Never connect the outputs to other voltages.
– Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see Diagnosis § Chapter 1.5.3.6.1.1.8.6 “Diagnosis” on page 2393).
The meaning of the LEDs is described in the section Status LEDs § Chapter 1.5.3.6.1.1.8.7 “State LEDs” on page 2393.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module
loses its configuration data. The whole station has to be switched off and on
again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.
The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configu-
ration.

**Remarks:**

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation depends on the master:
   Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

**DO571 - Digital output module**
- 8 digital normally open relay outputs 24 VDC / 24 VAC or 100-240 VAC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise electrically isolated
1. I/O bus
2. 8 yellow LEDs to display the signal states of the outputs O0 to O7
3. Terminal number
4. Allocation of signal name
5. Terminal block for output signals (11-pin)
6. 2 holes for wall-mounting with screws
7. DIN rail

### Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other. All other circuitry of the module is electrically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.
### Functionality

</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:

![Block Diagram]

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DO571.

The external power supply connection is carried out via the L+ (+24 VDC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/bus module and the DO571 must have a common power supply.

**WARNING!**
**Risk of death by electric shock!**
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:

**WARNING!**
**For screw terminals only: Danger of death by electric shock!**
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

**WARNING!**
**Removal/Insertion under power**
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.
Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the module:

![Diagram showing electrical connection of PLC module](image)

Fig. 99: Connection of 24 VDC actuators
**Fig. 100: Connection of 24 VAC or 100-240 VAC actuators**

**NOTICE!**

*Risk of damaging the I/O module!*

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

**Fig. 101: Power supply - the negative connection is realized via the I/O bus**
The L+ connection of the DO571 and the 24 V supply of the CPU/bus module must be connected to the same 24 V power supply.

The module provides several diagnosis functions (see Diagnosis Chapter 1.5.3.6.1.1.9.6 “Diagnosis” on page 2403).

The meaning of the LEDs is described in the section Status LEDs Chapter 1.5.3.6.1.1.9.7 “State LEDs” on page 2404.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500 the following interface identifier applies: 14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2. The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies: 31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master: Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10 Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1..10

4) In case of module errors, with channel "31 = Module itself" is output.

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital outputs:
### Table 546: Assignment of the terminals:

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DO572.

An external power supply connection is not needed.

---

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

---

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the module:
**NOTICE!**

Risk of damaging the PLC modules!

The PLC modules will be irreparably damaged if a voltage > 240 V is connected.

Make sure that all inputs are fed from the same phase. The module must not be connected to a 400 V voltage.

The module provides several diagnosis functions (see chapter Diagnosis ⇨ Chapter 1.5.3.6.1.1.10.6 “Diagnosis” on page 2413).

The meaning of the LEDs is described in the section State LEDs ⇨ Chapter 1.5.3.6.1.1.10.7 “State LEDs” on page 2414.

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus,
   - 11 = COM1 (e.g. CS31-Bus),
   - 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself,
   - 1...10 = decentralized communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or PNIO: 31 = module itself;
   - COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or PNIO = module type (2 = DO);
   - COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

**DO573 - Digital output module**
- 16 digital normally open relay outputs 24 VDC or 100-240 VAC (NO0 to NO15) in 2 groups, 2 A max.
- Group-wise electrically isolated

![Diagram of DO573 module]

1 I/O bus
2 16 yellow LEDs to display the signal states of the outputs O0 to O15
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the outputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

<td>20</td>
<td>M</td>
<td>Process voltage M (0 VDC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DO573.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

**WARNING!**

**Risk of death by electric shock!**

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:

**WARNING!**

**For screw terminals only: Danger of death by electric shock!**

The IP 20 protection degree is only provided if all terminal screws are tightened.

Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.
**NOTICE!**

**Risk of damaging the I/O module!**

The outputs are not protected against short circuit and overload.

- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules can be damaged by overload.

Make sure that the total current of each output common terminal (R0..7 and R8..15) does not exceed 10 A.

Never connect total currents > 10 A per group.

The following figure shows the electrical connection of the module:
Fig. 102: Connection of 24 VDC actuators
The module provides several diagnosis functions (see section Diagnosis "Chapter 1.5.3.6.1.11.6 "Diagnosis" on page 2424). The meaning of the LEDs is described in the section State LEDs "Chapter 1.5.3.6.1.10.7 "State LEDs" on page 2414.

Fig. 103: Connection of 100-240 VAC actuators

The module provides several diagnosis functions (see section Diagnosis "Chapter 1.5.3.6.1.11.6 "Diagnosis" on page 2424). The meaning of the LEDs is described in the section State LEDs "Chapter 1.5.3.6.1.10.7 "State LEDs" on page 2414.
The L+ connection of the DO573 and the 24 V supply of the CPU/bus module must be connected to the same 24 V power supply.

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself, 1...10 = decentralized communication interface module 1...10,
   ADR = Hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

### Technical data

The System Data of AC500-eCo apply

*) For planning and commissioning of new installations use modules in Active status only.

DX561 - Digital input/output module

- 8 digital inputs 24 VDC (I0 to I7) in 1 group
- 8 digital transistor outputs 24 VDC (O0 to O7) in 1 group
- Group-wise electrically isolated
1 I/O bus
2 8 yellow LEDs to display the signal states of the inputs I0 to I7
3 8 yellow LEDs to display the signal states of the outputs O0 to O7
4 Terminal number
5 Allocation of signal name
6 Terminal block for input signals (9-pin)
7 Terminal block for output signals (11-pin)
8 2 holes for wall-mounting with screws
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs and outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

### Functionality

<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 VDC)</td>
</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module’s scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
Table 548: Assignment of the terminals:

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per DX561.

The external power supply connection is carried out via the UP (+24 VDC) and ZP (0 VDC) terminals.

---

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The digital inputs can be used as source inputs or as sink inputs.

---

**NOTICE!**

**Risk of malfunctions in the plant!**

A ground closure, e. g. caused by a damaged cable insulation, can bridge switches accidentally.

Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.
The following figure shows the electrical connection of the inputs to the digital input/output module DX561:

**Fig. 105: Electrical connection of inputs - sink inputs**

The following figure shows the electrical connection of the outputs to the module:
NOTICE!
Risk of malfunctions in the plant!
The outputs may switch on for a period of 10 to 50 \(\mu\)s if the process supply voltage UP/ZP is switched on.
This must be considered in the planning of the application.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuits and overload.
- Never short-circuit or overload the outputs.
- Never connect the outputs to other voltages.
- Use an external 3 A fast-protection fuse for the outputs.

The module provides several diagnosis functions (see chapter Diagnosis \(\odot\) Chapter 1.5.3.6.1.1.12.6 “Diagnosis” on page 2436).
The meaning of the LEDs is described in the Displays section \(\odot\) Chapter 1.5.3.6.1.1.12.7 “State LEDs” on page 2437 chapter.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from
the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

* For planning and commissioning of new installations use modules in Active status only.

---

### DX571 - Digital input/output module

- 8 digital inputs 24 VDC / 24 VAC (I0 to I7) in 1 group
- 8 digital normally open relay outputs 24 VDC / 24 VAC or 100-240 VAC, 2 A max. (NO0 to NO7) in 2 groups
- Group-wise electrically isolated
1. I/O bus
2. 8 yellow LEDs to display the signal states of the inputs I0 to I7
3. 8 yellow LEDs to display the signal states of the outputs NO0 to NO7
4. Terminal number
5. Allocation of signal name
6. Terminal block for input signals (9-pin)
7. Terminal block for output signals (11-pin)
8. 2 holes for wall-mounting with screws
9. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs and outputs are group-wise electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.
The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

### Functionality

<td>External power supply</td>
<td>Via the terminal L+ (process voltage 24 VDC). The negative pole is provided by the I/O bus.</td>
</tr>
</tbody>
</table>

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using removable 9-pin and 11-pin terminal blocks. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, please refer to the chapter Terminal Blocks for S500-eCo I/O Modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the digital inputs and outputs:
Table 549: Assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per DX571.

The external power supply connection is carried out via the L+ (+24 VDC) terminal. The negative pole of the external power supply is realized via the I/O bus. Therefore, the CPU/bus module and the DX571 must have a common power supply.

---

**WARNING!**
**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions (see Diagnosis \(\$\) Chapter 1.5.3.6.1.13.6 "Diagnosis" on page 2449).
The digital inputs can be used as source inputs or as sink inputs.

**NOTICE!**  
Risk of malfunctions in the plant!  
A ground closure, e.g. caused by a damaged cable insulation, can bridge switches accidentally.  
Use sink inputs when possible or make sure that, in case of error, there will be no risks to persons or plant.

The following figures show the electrical connection of the inputs to the digital input/output module DX571:

**Fig. 108: Electrical connection of inputs - sink inputs**

![Diagram of sink input connection]

**Fig. 109: Electrical connection of inputs - source inputs**

![Diagram of source input connection]

The following figures show the electrical connection of the outputs to the module:
Fig. 110: Connection of 24 VDC actuators

Fig. 111: Connection of 24 VAC or 100-240 VAC actuators

The L+ connection of the DX571 and the 24 V supply of the CPU/bus module must be connected to the same 24 V power supply.
WARNING!
Risk of death by electric shock!
Hazardous voltages can be present at the terminals of the module.
Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For screw-type terminals only:

WARNING!
For screw terminals only: Danger of death by electric shock!
The IP 20 protection degree is only provided if all terminal screws are tightened.
Tighten all screws of unused load terminals of relay outputs if voltages > 24 V are connected to the relay group.

NOTICE!
Risk of damaging the I/O module!
The outputs are not protected against short circuit and overload.
- Never short-circuit or overload the outputs.
- Never connect inductive loads without an external suppression against voltage peaks due to inductive kickback.
- Never connect voltages > 240 V. All outputs must be supplied from the same phase.
- Use an external 5 A fast protection fuse for the outputs.

The meaning of the LEDs is described in the Displays section Chapter 1.5.3.6.1.13.7 “State LEDs” on page 2450.

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</table>

#### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = Module itself,
   1...10 = communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or PNIO: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = Module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

*) For planning and commissioning of new installations use modules in Active status only.

### S500

#### DC522 - Digital input/output module

- 16 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
I/O bus
Allocation between terminal number and signal name
Sensor power supply 24 VDC / 0.5 A
16 yellow LEDs to display the signal states at the digital inputs/outputs (C0 - C15)
1 green LED to display the state of the process supply voltage UP
4 red LEDs to display errors
Label
Terminal unit
DIN rail
Sign for XC version

Intended purpose
The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input/output unit.

- 2 sensor supply voltages 24 VDC, 0.5 A, with short-circuit and overload protection
- 16 digital configurable inputs/outputs 24 VDC (C0 to C15) in 1 group (2.0...2.7 and 4.0...4.7), each of which can be used
  - as an input,
  - as a transistor output with short-circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit % Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 % Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

### Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 VDC
Terminals 1.9 to 4.9: process voltage ZP = 0 VDC
1. I/O bus
2. 4.0 - 4.7: Connected with UP (switch) -> Input; Connected with ZP (load) -> Output
3. Switch-gear cabinet earth

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.3</td>
<td>+24 V</td>
<td>4 x sensor power supply sources (loadable with 0.5 A in total)</td>
</tr>
<tr>

<td>C0 to C7</td>
<td>8 digital inputs/outputs</td>
</tr>
<tr>
<td>3.0 to 3.3</td>
<td>+24 V</td>
<td>4 x sensor power supply sources (loadable with 0.5 A in total)</td>
</tr>
<tr>
<td>3.4 to 3.7</td>
<td>0 V</td>
<td>0 V (reference potential)</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C8 to C15</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>
CAUTION!
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC522.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of influences to the connected sensors!
- Some sensors may be influenced by the deactivated module outputs of DC522.
  - Connect a 470 Ω / 1 W resistor in series to inputs C8/C9 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions § Chapter 1.5.3.6.1.2.1.7 “Diagnosis” on page 2459.
Internal data exchange

</tr>
</tbody>
</table>

I/O Configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) With CS31 and addresses smaller than 70 and FBP, the value is increased by 1
2) Not with FBP
3) For a description of the counter operating modes, please refer to the Fast Counter section "Chapter 1.5.3.6.1.2.9 “Fast counter” on page 2543"
4) With FBP or CS31 without the parameter Fast counter

GSD file:

```
Ext_User_Prm_Data_Len = 9
Ext_User_Prm_Data_Const(0) = 0x04, 0xc5, 0x06, \n0x01, 0x02, 0x01, 0x00, 0x00, 0x00;
```

**Diagnosis**

In case of overload or short-circuit, the outputs switch off automatically and try to switch on again cyclically. Therefore an acknowledgement of the outputs is not necessary. The LED error message, however, is stored.
### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O-Bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)
With "Module" the following allocation applies depending on the master:

Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

<table>
<thead>
<tr>

</tbody>
</table>

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

The system data of AC500 and S500  "System data AC500" on page 3058 are valid for standard version.

The system data of AC500-XC  "System data AC500-XC" on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

</tbody>
</table>

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the configurable digital inputs/outputs**

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

</tbody>
</table>
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

*) For planning and commissioning of new installations use modules in Active status only.
DC523 - Digital input/output module

- 24 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input/output unit.

- 1 sensor supply voltage 24 VDC, 0.5 A, with short circuit and overload protection
- 24 digital configurable inputs/outputs 24 VDC (C0 to C23) in 1 group (2.0...2.7, 3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>

</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

**NOTICE!**

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

The device is plugged on a terminal unit ≡ Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 ≡ Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

### Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:
Terminals 1.8 to 4.8: process voltage UP = +24 VDC
Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Switch-gear cabinet earth

The assignment of the other terminals:

<table>

<td>8 digital inputs/outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>C16 to C23</td>
<td>8 digital inputs/outputs</td>
</tr>
</tbody>
</table>

**CAUTION!**
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC523.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**NOTICE!**
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC523.
Connect a 470 Ω / 1 W resistor in series to inputs C16/C17 if they are used as fast counter inputs to avoid any influences.

The modules provide several diagnosis functions "Chapter 1.5.3.6.1.2.2.7 "Diagnosis" on page 2472."
**Internal data exchange**

<table>
<thead>
<tr>

<td>0</td>
<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

**Firmware version**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) With CS31 and addresses smaller than 70 and FBP, the value is increased by 1
2) Not with FBP
3) For a description of the counter operating modes, please refer to the Fast Counter section "Chapter 1.5.3.6.1.2.9 "Fast counter" on page 2543"
4) With FBP or CS31 without the parameter fast counter

GSD file:

```
Ext_User_Prm_Data.Len = 11
Ext_User_Prm_Data(Const(0) =
0x04, 0xc0, 0x08, \n0x01, 0x02, 0x01, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00;
```
**Diagnosis**

In case of overload or short circuit, the outputs switch off automatically and try to switch on again cyclically. Therefore an acknowledgement of the outputs is not necessary. The LED error message, however, is stored.

### Channel error

| 4 | 14 | 1...10 | 2 | 0...23 | 47 | Short circuit at an output | Check connection |
|   |    |        |   |        |    |                            |                |
|   | 11 / 12 | ADR | 1...10 | | | | |

Remarks:
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself,
1...10 = decentralized communication interface module 1...10,
ADR = Hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = Module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

Technical data

The system data of AC500 and S500 ☞ Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC ☞ Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.
Only additional details are therefore documented below.
The technical data are also valid for the XC version.

</tbody>
</table>

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.
Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

The following drawing shows the circuitry of a digital input/output with the varistors for demagnetization when inductive loads are switched off.
Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a
- FBP interface module
- CS31 bus module
- CANopen bus module

*) For planning and commissioning of new installations use modules in Active status only.

DC532 - Digital input/output module

- 16 digital inputs 24 VDC, 16 configurable digital inputs/outputs
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input / output unit.

- 16 digital inputs 24 VDC in 2 groups (1.0...1.7 and 2.0...2.7)
- 16 digital configurable inputs/outputs 24 VDC (C16 to C31) in 1 group (3.0...3.7 and 4.0...4.7), of which each can be used
  - as an input,
  - as a transistor output with short circuit and overload protection, 0.5 A rated current or
  - as a re-readable output (combined input/output) with the technical data of the digital
    inputs and outputs.
- Optional with fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>

<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516 (Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311)</td>
</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit (Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311). Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 (Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter (Chapter 1.5.4.5 “AC500 (Standard)” on page 3058).
### Electrical connection

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

Terminals 1.8 to 4.8: process voltage UP = +24 VDC

Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

</tr>
</tbody>
</table>

**CAUTION!**
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DC532.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
   – connect or disconnect any signal or terminal block
   – remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**NOTICE!**
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DC532.
Connect a 470 Ω / 1 W resistor in series to inputs C24/C25 if using them as fast counter inputs to avoid any influences.
The module provides several diagnosis functions \( \text{\S} \) Chapter 1.5.3.6.1.2.3.7 “Diagnosis” on page 2484.

Internal data exchange

<table>

</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

\[\text{If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.}\]

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

```
Diagnosis

In case of overload or short circuit, the outputs switch off automatically and try to switch on again cyclically. Therefore, an acknowledgement of the outputs is not necessary. The LED error message, however, is stored.

Remarks:
1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

<table>

Technical data

The system data of AC500 and S500 "Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for the standard version.

The system data of AC500-XC "Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

</tr>
</tbody>
</table>

**NOTICE!**

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

### DI524 - Digital Input Module

- 32 digital inputs 24 VDC in 4 groups (1.0...1.7, 2.0...2.7, 3.0...3.7 and 4.0...4.7)
- Fast counter
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
Fig. 114: Digital input module DI524, plugged on a terminal unit TU516

4 1 green LED to display the state of the process supply voltage UP
5 4 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
* Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.
### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fast counter</td>
<td>Integrated, many configurable operating modes (only with AC500)</td>
</tr>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>

<td>Internal power supply</td>
<td>Via the expansion bus interface (I/O bus)</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 VDC)</td>
</tr>
<tr>
<td>Required terminal units</td>
<td>TU515 or TU516 [Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311]</td>
</tr>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit [Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 [Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035]).

### Electrical connection

> For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.5.4.5 “AC500 (Standard)” on page 3058].

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

**Table 550: Assignment of the other terminals:**

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>I0 to I7</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>I8 to I15</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>3.0 to 3.7</td>
<td>I16 to I23</td>
<td>8 digital inputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>I24 to I31</td>
<td>8 digital inputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DI524.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

---

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
The process supply voltage must be included in the earthing concept (e.g. earthing of the negative pole).

The module provides several diagnosis functions. Chapter 1.5.3.6.1.2.4.7 “Diagnosis” on page 2496.

Internal data exchange

<table>

</tr>
</tbody>
</table>
Without the Fast Counter | With the Fast Counter (only with AC500)
---|---
Counter input data (words) | 0 | 4
Counter output data (words) | 0 | 8

**I/O configuration**

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

**Parameterization**

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

2496 3ADR010583, 1, en_US 2020/12/10
### Remarks:

1) In AC500 the following interface identifier applies:
   
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   
   The FB-P diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   
   31 = module itself,
   
   1...10 = decentralized communication interface module 1...10,
   
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

### State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
<table>
<thead>
<tr>

</table>

¹) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

²) All of the LEDs CH-ERR1 to CH-ERR4 light up together

### Technical data

The system data of AC500 and S500 **Chapter 1.5.4.5.1 “System data AC500” on page 3058** are valid for standard version.

The system data of AC500-XC **Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099** are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

9 SIGN for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels.
### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via the expansion bus interface (I/O bus)</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP and UP (process voltage 24 VDC)</td>
</tr>
<tr>
<td>Required terminal unit</td>
<td>TU515 or TU516 [Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311]</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit [Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311]. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 [Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035]).

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.5.4.5 “AC500 (Standard)” on page 3058].

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

```
<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 to 1.7</td>
<td>O0 to O7</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>2.0 to 2.7</td>
<td>O8 to O15</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>3.0 to 3.7</td>
<td>O16 to O23</td>
<td>8 digital outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O24 to O31</td>
<td>8 digital outputs</td>
</tr>
</tbody>
</table>
```

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DO524.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:

The module provides several diagnosis functions see Chapter 1.5.3.6.1.2.5.7 “Diagnosis” on page 2505.

Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>4</td>
</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.
Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Diagnosis

In case of overload or short circuit, the outputs switch off automatically and try to switch on again cyclically. Therefore, an acknowledgement of the outputs is not necessary. The LED error message, however, is stored.

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module
   1...10, ADR = Hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 =
   expansion 1...10
   Channel error: I/O bus or FBP = module type (4 = DC); COM1/COM2:
   1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are group-wise electrically isolated from each other.
All other circuitry of the module is electrically isolated from the outputs.
Potential separation between the channel groups.
Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltages</td>
</tr>
<tr>
<td>Internal power supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External power supply</td>
<td>Via the terminals ZP, ZP3, UP, UP3 and UP4 (process voltage 24 VDC)</td>
</tr>
<tr>
<td>Required terminal unit</td>
<td>TU542 § Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311</td>
</tr>
</tbody>
</table>

The output module is plugged on the terminal unit TU542. Properly position the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 § Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter § Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 2.8 and 1.9 to 2.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module:

<table>
<thead>
<tr>
<th>Terminals 1.8 to 2.8:</th>
<th>Process voltage UP = +24 VDC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminals 1.9 to 2.9:</td>
<td>Process voltage ZP = 0 V</td>
</tr>
<tr>
<td>Terminal 3.8:</td>
<td>Process voltage UP3 = +24 VDC</td>
</tr>
<tr>
<td>Terminal 3.9:</td>
<td>Process voltage ZP3 = 0 V</td>
</tr>
<tr>
<td>Terminal 4.8:</td>
<td>Process voltage UP4 = +24 VDC</td>
</tr>
<tr>
<td>Terminal 4.9:</td>
<td>Process voltage ZP4 = 0 V</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Terminals 3.0, 3.1, 3.4, 3.5</th>
<th>Signal</th>
<th>4 digital outputs</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0, 4.1, 4.4, 4.5</td>
<td>O4 to O7</td>
<td>4 digital outputs</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus Module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DO526.

The external power supply connection is carried out via the UP, UP3, UP4 (+24 VDC) and the ZP, ZP3, ZP4 (0 VDC) terminals.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following block diagram shows the internal construction of the digital outputs:

```
1.0 1.1 1.2 1.3 1.4 1.5 1.6 1.7 1.8 UP +24V 1.9 ZP 0V 2.0 2.1 2.2 2.3 2.4 2.5 2.6 2.7 2.8 UP +24V 3.0 O0 3.1 O1 3.2 3.3 3.4 O2 3.5 O3 3.6 3.7 3.8 UP3 +24V 3.9 ZP3 0V 4.0 O4 4.1 O5 4.2 4.3 4.4 O6 4.5 O7 4.6 4.7 4.8 UP4 +24V 4.9 ZP4 0V
```
1 I/O bus
2 4.0 - 4.7: Connected with UP (switch) -> Input;
   Connected with ZP (load) -> Output
3 Switch-gear cabinet earth

CAUTION!
The process supply voltage must be included in the earthing concept (e. g. earthing of the negative pole).

The module provides several diagnosis functions ⇨ Chapter 1.5.3.6.1.2.6.7 “Diagnosis” on page 2515.
Internal data exchange

<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>1</td>
</tr>
</tbody>
</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software, versions ≥ 1.2.3.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus
   - 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself
   - 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies depending on the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

### State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
### Technical data

The system data of AC500 and S500 % Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC % Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### NOTICE!

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply and continuous overvoltage up to 30 VDC.

### No effects of multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

**DX522 - Digital input/output module**

- 8 digital inputs 24 VDC, module-wise electrically isolated
- 8 relay outputs
- Fast counter
- XC version for use in extreme ambient conditions available

---

1. I/O bus
2. Allocation between terminal number and signal name
3. 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4. 8 yellow LEDs to display the signal states at the digital relay outputs (R0 - R7)
5. 1 green LED to display the state of the process supply voltage UP
6. 2 red LEDs to display errors
7. Label
8. Terminal unit
9. DIN rail
10. Sign for XC version
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Digital configurable input/output unit.

- 8 digital inputs 24 VDC in 1 group (1.0...1.7)
- 8 digital relay outputs with one switch-over contact each (R0...R7). All output channels are electrically isolated from each other.
- Fast counter

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The device is plugged on a terminal unit \(\text{\textcopyright Chapter 1.5.3.5.4 "TU531 and TU532 for I/O modules" on page 2320}\). Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 \(\text{\textcopyright Chapter 1.5.3.8.1.4 "TA526 - Wall mounting accessory" on page 3035}\)).

Electrical connection

WARNING!

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter § Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and have always the same assignment, irrespective of the inserted module:

- Terminals 1.8 to 4.8: process supply voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 VDC

Table 551: Assignment of the other terminals:

<table>

</tr>
</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DX522.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions (see Diagnosis and State LEDs "Chapter 1.5.3.6.1.2.7.7 "Diagnosis" on page 2526).

The following figure shows the electrical connection of the digital input/output module DX522.

---

*Fig. 116: Electrical connection of the module*

1 I/O bus
2 Switch-gear cabinet earth
NOTICE!
- If the relay outputs have to switch inductive DC loads, free-wheeling diodes must be circuited in parallel to these loads.
- If the relay outputs have to switch inductive AC loads, spark suppressors are required.

CAUTION!
The process supply voltage must be included in the earthing concept (e.g., earthing of the negative pole).

NOTICE!
Risk of damaging the PLC module!
The following things have to be considered when connecting input and output voltages to the module:
- All 230 VAC feeds must be single-phase from the same supply system.
- Connection of 2 or more relay contacts in series is possible; however, voltages above 230 VAC and 3-phase loads are not allowed.
- The 8 switch-over contacts of the relays are electrically isolated from channel to channel. This allows to connect loads of 24 VDC and 230 VAC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs. Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

Internal data exchange

</tr>
</tbody>
</table>

I/O configuration
The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>

</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   - 31 = module itself,
   - 1...10 = decentralized communication interface module 1...10,
   - ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.
State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) All of the LEDs CH-ERR1 to CH-ERR2 light up together

Technical data

The system data of AC500 and S500 © Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC © Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

**NOTICE!**

Attention:

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**No effects of multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

---

### Technical data of the fast counter

The fast counter of the module does not work if the module is connected to a
- FBP interface module
- CS31 bus module
- CANopen bus module

### Parameter | Value
--- | ---
Demagnetization with inductive DC load | A free-wheeling diode must be circuited in parallel to the inductive load
Switching frequency
  - With resistive load | Max. 10 Hz
  - With inductive load | Max. 2 Hz
  - With lamp load | On request
Max. cable length
  - Shielded | 1000 m
  - Unshielded | 600 m

### Ordering data

| Part no. | Description | Product life cycle phase *
--- | --- | ---
1SAP 245 200 R0001 | DX522, digital input/output module, 8 DI, 24 VDC, 8 DO relays | Active
1SAP 445 200 R0001 | DX522-XC, digital input/output module, 8 DI, 24 VDC, 8 DO relays, XC version | Active

*) For planning and commissioning of new installations use modules in Active status only.
DX531 - Digital input/output module

- 8 digital inputs 120/230 VAC
- 4 relay outputs with one switch-over contact each
- Module-wise electrically isolated

1 I/O bus
2 Allocation between terminal number and signal name
3 8 yellow LEDs to display the signal states at the digital inputs (I0 - I7)
4 4 yellow LEDs to display the signal states at the digital relay outputs (R0 - R3)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Digital configurable input / output unit.

- 8 digital inputs 120/230 VAC in 1 group (2.0...2.3 and 3.0...3.3)
- 4 digital relay outputs with one switch-over contact each (R0...R3). All output channels are electrically isolated from each other.

The configuration is performed by software. The modules are supplied with a process supply voltage of 24 VDC.

All available inputs/outputs are electrically isolated from all other circuitry of the module. There is no potential separation between the channels within the same group.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED displays</td>
<td>For signal states, errors and supply voltage</td>
</tr>
<tr>
<td>Internal power supply</td>

<td>TU531 or TU532 &amp; Chapter 1.5.3.5.4 “TU531 and TU532 for I/O modules” on page 2320</td>
</tr>
</tbody>
</table>

The device is plugged on a terminal unit & Chapter 1.5.3.5.4 “TU531 and TU532 for I/O modules” on page 2320. Position the module properly and press until it locks in place. The terminal unit is either mounted on a DIN rail or to the wall using 2 screws plus the additional accessory for wall mounting (TA526 & Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

### Electrical connection

**WARNING!**

Risk of death by electric shock!

Hazardous voltages can be present at the terminals of the module.

Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal unit and always have the same assignment, irrespective of the inserted module.
- Terminals 1.8 to 4.8: process supply voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process supply voltage ZP = 0 VDC

The assignment of the other terminals:

</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DX531. The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the module:
NOTICE!
- If the relay outputs have to switch inductive DC loads, free-wheeling diodes must be circulated in parallel to these loads.
- If the relay outputs have to switch inductive AC loads, spark suppressors are required.

CAUTION!
The process supply voltage must be included in the earthing concept (e.g., earthing of the negative pole).
NOTICE!
Risk of damaging the PLC module!
The following things have to be considered when connecting input and output voltages to the module:

– All 230 VAC feeds must be single phase from the same supply system.
– Connection of 2 or more relay contacts in series is possible; however, voltages above 230 VAC and 3-phase loads are not allowed.
– The 4 switch-over contacts of the relays are electrically isolated from channel to channel. This allows to connect loads of 24 VDC and 230 VAC to relay outputs of the same module. In such cases it is necessary that both supply voltages are grounded to prevent unsafe floating grounds.
– All input signals must come from the same phase of the same supply system (together with the used neutral conductor). The module is designed for 120/230 VAC max., not for 400 VAC, not even between two input terminals.
– All neutral conductor connections must be common to the same supply system, since the terminals 4.0 to 4.3 are interconnected within the module. Otherwise, accidental energization could occur.

NOTICE!
Risk of damaging the PLC module!
There is no internal short-circuit or overload protection for the relay outputs.
Protect the relay contacts by back-up fuses of 6 A max. (characteristic gG/gL). Depending on the application, fuses can be used for single channels or module-wise.

The module provides several diagnosis functions (see chapter Diagnosis and State LEDs Chapter 1.5.3.6.1.2.8.7 “Diagnosis” on page 2539).

</table>

I/O configuration

The module itself does not store configuration data. It receives its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.
Hence, replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.
Parameterization

The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)
With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = module type (2 = DO); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

Technical data

The system data of AC500 and S500 % Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC % Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.
### Parameter | Value
--- | ---
Process supply voltage UP |  
Connections | Terminals 1.8, 2.8, 3.8 and 4.8 for +24 VDC (UP) as well as 1.9, 2.9, 3.9 and 4.9 for 0 VDC (ZP)
Rated value | 24 VDC
Max. ripple | 5 %
Protection against reversed voltage | Yes
Rated protection fuse on UP | 10 A fast
Galvanic isolation | Yes, per module

#### Current consumption
- From 24 VDC power supply at the terminals UP/L + and ZP/M of the CPU/bus module: ca. 2 mA
- From UP at normal operation / with outputs: 0.15 A + output loads

Inrush current from UP (at power up): 0.004 A²s
Max. power dissipation within the module: 6 W (outputs OFF)
Weight (without terminal unit): Ca. 300 g

Mounting position
- Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)

Cooling
- The natural convection cooling must not be hindered by cable ducts or other parts in the switchgear cabinet.

#### NOTICE!
**Attention:**
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**No effects of multiple overloads:**
No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an external fuse.

---

### Technical data of the digital inputs

| Parameter | Value |
--- | --- |
Number of channels per module | 8 |
Distribution of the channels into groups | 4 groups of 2 channels each |
Terminals of the channels I0 to I7
| Chapter 1.5.3.6.1.2.8.3 “Electrical connection” on page 2533 |
Galvanic isolation | 2500 VAC from the rest of the module (I/O bus) |
Indication of the input signals | 1 yellow LED per channel |
| The LEDs are only operating if the module is initialized |
Monitoring point of input indicator | LED is controlled by process CPU |
**Technical data of the relay outputs**

### Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other. All other circuitry of the module is not electrically isolated from the inputs or from the I/O bus.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
Functionality

4 analog inputs, individually configurable for
- Not used (default setting)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Parameter | Value
---|---
Resolution of the analog channels | 11 bits plus sign
Voltage bipolar (-2.5 V...+2.5 V; -5 V...+5 V) | 11 bits plus sign
Voltage unipolar (0 V...5 V; 0 V...10 V) | 12 bits
Current (0 mA...20 mA; 4 mA...20 mA) | 12 bits
LED displays | 2 LEDs for process voltage and error messages
Internal supply | Via I/O bus
External supply | Via the terminals L+ (process voltage 24 VDC) and M (0 VDC); the M terminal is connected to the M terminal of the CPU via the I/O bus

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>R0</td>
<td>Burden resistor for input signal 0 for current sensing</td>
</tr>
<tr>
<td>2</td>
<td>I0+</td>
<td>Positive pole of input signal 0</td>
</tr>
<tr>
<td>3</td>
<td>I0-</td>
<td>Negative pole of input signal 0</td>
</tr>
<tr>
<td>4</td>
<td>R1</td>
<td>Burden resistor for input signal 1 for current sensing</td>
</tr>
<tr>
<td>5</td>
<td>I1+</td>
<td>Positive pole of input signal 1</td>
</tr>
<tr>
<td>6</td>
<td>I1-</td>
<td>Negative pole of input signal 1</td>
</tr>
<tr>
<td>7</td>
<td>R2</td>
<td>Burden resistor for input signal 2 for current sensing</td>
</tr>
<tr>
<td>8</td>
<td>I2+</td>
<td>Positive pole of input signal 2</td>
</tr>
<tr>
<td>9</td>
<td>I2-</td>
<td>Negative pole of input signal 2</td>

<td>R3</td>
<td>Burden resistor for input signal 3 for current sensing</td>
</tr>
<tr>
<td>11</td>
<td>I3+</td>
<td>Positive pole of input signal 3</td>
</tr>
</tbody>
</table>
The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 10 mA per AI561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

### Terminal Signal Description

NOTICE!

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

NOTICE!

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

NOTICE!

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions "Chapter 1.5.3.6.2.1.1.6 “Diagnosis” on page 2550.

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.
The following figures are an example of the electrical connection of analog sensors (voltage) to the input I0 of the analog input module AI561. Proceed with the inputs I1 to I3 in the same way.

The meaning of the LEDs is described in the Displays section Chapter 1.5.3.6.2.1.1.7 “State LEDs” on page 2551.

I/O configuration

The analog input module AI561 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)
With "Module" the following allocation applies depending on the master:

- Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
- Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1..10

In case of module errors, with channel "31 = Module itself" is output.

### Measuring ranges

**Risk of invalid analog input values!**

The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

<table>
<thead>
<tr>

*) For planning and commissioning of new installations use modules in Active status only.

### AI562 - Analog input module

- 2 configurable analog resistance temperature detector (RTD) inputs (I0 and I1) in 1 group
- Resolution: 15 bits plus sign
1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3. Terminal number
4. Allocation of signal name
5. Terminal block for input signals (11-pin)
6. 2 holes for wall-mounting with screws
7. DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other.

All other circuitry of the module is electrically isolated from the inputs.

*The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.*
Functionality

2 analog RTD-inputs, individually configurable for

- Not used (default)
- Pt100, -50 °C...+400 °C, 2-wire
- Pt100, -50 °C...+400 °C, 3-wire
- Pt1000, -50 °C...+400 °C, 2-wire
- Pt1000, -50 °C...+400 °C, 3-wire
- Ni1000, -50 °C...+150 °C, 2-wire
- Ni1000, -50 °C...+150 °C, 3-wire
- Ni100, -50 °C...+150 °C, 2-wire
- Ni100, -50 °C...+150 °C, 3-wire
- Analog input resistance 0 Ω...150 Ω
- Analog input resistance 0 Ω...300 Ω

Electrical connection

> For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The electrical connection is carried out by using a removable 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:
The assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>O0+</td>
<td>Current source of channel 0</td>
</tr>
<tr>
<td>11</td>
<td>I0+</td>
<td>Sense input of channel 0</td>
</tr>
<tr>
<td>12</td>
<td>I0-</td>
<td>Return input of channel 0</td>
</tr>
<tr>
<td>13</td>
<td>O1+</td>
<td>Current source of channel 1</td>
</tr>
<tr>
<td>14</td>
<td>I1+</td>
<td>Sense input of channel 1</td>
</tr>
<tr>
<td>15</td>
<td>I1-</td>
<td>Return input of channel 1</td>
</tr>
<tr>
<td>16</td>
<td>---</td>
<td>Reserved</td>
</tr>
<tr>
<td>17</td>
<td>SG</td>
<td>Shield grounding</td>
</tr>
<tr>
<td>18</td>
<td>SG</td>
<td>Shield grounding</td>
</tr>
<tr>
<td>19</td>
<td>UP</td>
<td>Process voltage UP (24 VDC)</td>
</tr>
<tr>
<td>20</td>
<td>ZP</td>
<td>Process voltage ZP (0 VDC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 5 mA per AI562.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

Risk of imprecise and faulty measurements!

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply. Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions  \(\text{Chapter 1.5.3.6.2.1.2.6 “Diagnosis” on page 2560.}\)

The following figures show the electrical connection of RTDs to the inputs of the analog input module AI562.

\[\begin{array}{|c|c|}

\end{array}\]

2-wires input 3-wires input

\[\text{With 2-wires connection, the resistance of the connection wires influences the accuracy of the measured value. Use 3-wires connection to achieve the guaranteed measuring accuracy.}\]

The meaning of the LEDs is described in the Displays section  \(\text{Chapter 1.5.3.6.2.1.2.7 “State LEDs” on page 2561.}\)

I/O configuration
The analog input module AI562 does not store configuration data itself.
Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:
In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

With "Module" the following allocation applies dependent of the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = Module itself" is output.

Measuring ranges

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.
Make sure that the analog signal at the connection terminals is always within the signal range.

Resistance temperature detectors

<table>
<thead>
<tr>

</tbody>
</table>

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.
Make sure that the analog signal at the connection terminals is always within the signal range.

### Technical data

The System Data of AC500-eCo apply
Only additional details are therefore documented below.
### Parameter | Value
--- | ---
Process supply voltage UP | Terminal 19 for UP (+24 VDC) and terminal 20 for ZP (0 V)
Connections | 24 VDC
Rated value | 0.04 A
Current consumption | 0.05 A²s
Inrush current (at power-up) | 5 %
Max. ripple | Protection against reversed voltage
Protection fuse for UP | Yes
| Recommended
Current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/Bus Module | Ca. 5 mA
Galvanic isolation | Yes, between the input group and the rest of the module
Isolated groups | 1 (2 channels per group)
Surge-voltage (max.) | 35 VDC for 0.5 s
Max. power dissipation within the module | 1.1 W
Weight | Ca. 120 g
Mounting position | Horizontal or vertical
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

### Technical data of the analog inputs

| Parameter | Value |
--- | ---
Number of channels per module | 2 configurable RTD (resistance temperature detector) inputs
Distribution of channels into groups | 1 (2 channels per group)
Resolution | RTD 0.1 °C / 0.1 °F
 | Resistance 15 bits + sign
Connection of the signals O0+ and O1+ | Terminals 10 and 13
Connection of the signals I0- and I1- | Terminals 11 and 14
Connection of the signals I0+ and I1+ | Terminals 12 and 15
Input type | Module ground referenced RTD for 2-wire and 3-wire resistance temperature detectors

**Diagram Notes:**

1. I/O bus
2. 1 green LED to display power supply, 1 red LED to display error
3. Terminal number
Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are group-wise electrically isolated from each other.

The other electronic circuitry of the module is electrically isolated from the inputs.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

Functionality

4 analog TC inputs, individually configurable for
- Not used (default)
- Voltage -80 mV ... + 80 mV
- Thermocouple J-type -210 °C...+1200 °C
- Thermocouple K-type -270 °C...+1372 °C
- Thermocouple R-type -50 °C...+1768 °C
- Thermocouple S-type -50 °C...+1768 °C
- Thermocouple T-type -270 °C...+400 °C
- Thermocouple E-type -270 °C...+1000 °C
- Thermocouple N-type -270 °C...+1300 °C

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.
After powering up the system, input channels, which are configured will have undefined values/diagnosis message for typically 45 seconds, if the wires of all configured channels are broken.

If the AI563 is connected to a PROFINET Bus Module, the firmware version of PROFINET Bus Modules must be 1.2 or above.

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs:

</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AI563.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**
**Risk of imprecise and faulty measurements!**
Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**NOTICE!**
**Risk of damaging the PLC modules!**
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.
NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions "Diagnosis" on page 2571.

The following figure shows the electrical connection of thermocouples to the inputs of the module:

The meaning of the LEDs is described in Displays "State LEDs" on page 2572 chapter.
I/O configuration

The analog input module AI563 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software. The parameter data directly influences the functionality of modules. For non-standard applications, it is necessary to adapt the parameters to your system configuration.

### Remarks:

- PLC Automation with V3 CPUs
- PLC integration > Device specifications

2020/12/10

3ADR010583, 1, en_US

2571
1) In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31-Bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

</tr>
</tbody>
</table>

Measuring ranges

AI563 needs 4 seconds for initialization after applying the process supply voltage to clamp UP/ZP. During these 4 seconds, the measurement values are set to '0'. After that, valid measurement values are provided by the module.

After an interruption of the process supply voltage > 10 ms, a re-initialization is performed by AI563.

Risk of invalid analog input values!
The analog input values may be invalid if the measuring range of the inputs is exceeded.

Make sure that the analog signal at the connection terminals is always within the signal range.

When a wire break occurs on a sensor wire, the temperature measurement value of the corresponding channel changes to Overflow (Hexadecimal 7FFF).

*) For planning and commissioning of new installations use modules in Active status only.

AO561 - Analog output module
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bit
1 I/O bus
2 1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for output signals (11-pin)
6 2 holes for wall-mounting with screws
7 DIN rail

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The outputs are not electrically isolated from each other.

The other electronic circuitry of the module is not electrically isolated from the outputs or from the I/O bus.

*The I/O module must not be used as communication interface module at CI590-CS31-HA bus modules.*
Functionality

2 analog outputs, individually configurable for

- Not used (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

<table>

</tr>
</tbody>
</table>

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.

The electrical connection is carried out by using a removable 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw-type terminals, cable mounting from the front or from the side). The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog outputs:
The assignment of the terminals:

<table>
<thead>
<tr>
<th>Terminal</th>

<tr>
<td>20</td>
<td>M</td>
<td>Process voltage M (0 VDC)</td>
</tr>
</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AO561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

**NOTICE!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.
**NOTICE!**

**Risk of damaging the PLC modules!**
The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

**NOTICE!**

**Risk of damaging the PLC modules!**
Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The module provides several diagnosis functions ↳ Chapter 1.5.3.6.2.1.4.6 “Diagnosis” on page 2582.

The following figures show the electrical connection of analog actuators to the analog output module AO561.

---

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behaviour and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.
I/O configuration

The analog output module AO561 does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:
In AC500 the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The PNIO diagnosis block does not contain this identifier.

With "Device" the following allocation applies:
31 = module itself, 1...10 = expansion module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

With "Module" the following allocation applies depending on the master:
Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or PNIO = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

AX561 - Analog input/output module

- 4 configurable analog inputs (I0 to I3) in 1 group
- 2 configurable analog outputs (O0 and O1) in 1 group
- Resolution: 11 bits plus sign or 12 bits

1  I/O bus
2  1 green LED to display power supply, 1 red LED to display error
3 Terminal number
4 Allocation of signal name
5 Terminal block for input signals (9-pin)
6 Terminal block for output signals (11-pin)
7 2 holes for wall-mounting with screws
8 DIN rail

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

The inputs are not electrically isolated from each other.
The outputs are not electrically isolated from each other.
All other circuitry of the module is not electrically isolated from the inputs/outputs or from the I/O bus.

The I/O module must not be used as a decentralized I/O module with CI590-CS31-HA bus modules.

Functionality

4 analog inputs, individually configurable for
- Not used (default)
- -2.5 V...+2.5 V
- -5 V...+5 V
- 0 V...+5 V
- 0 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

2 analog outputs, individually configurable for
- Not used (default)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

</thead>
<tbody>
<tr>
<td>Internal supply</td>
<td>Via I/O bus</td>
</tr>
<tr>
<td>External supply</td>
<td>Via the terminals L+ (process voltage 24 VDC) and M (0 VDC); the M terminal is connected to the M terminal of the CPU via the I/O bus</td>
</tr>
</tbody>
</table>

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.*

*If the output is configured as not used, the voltage and current output signals are undefined and must not be connected.*

The electrical connection is carried out by using a removable 9-pin and 11-pin terminal block. These terminal blocks differ in their connection system (spring terminals or screw terminals, cable mounting from the front or from the side). For more information, refer to terminal blocks for S500-eCo I/O modules. The terminal blocks are not included in the module's scope of delivery and must be ordered separately.

The following block diagram shows the internal construction of the analog inputs and outputs:
The assignment of the terminals:

</tbody>
</table>

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module increases by 5 mA per AX561.

The external power supply connection is carried out via the L+ (+24 VDC) and the M (0 VDC) terminals. The M terminal is electrically interconnected to the M/ZP terminal of the CPU/bus module.

**NOTICE!**
Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.
Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalisation of a low resistance to avoid high potential differences between different parts of the plant.

**WARNING!**
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
The module provides several diagnosis functions \footnote{Chapter 1.5.3.6.2.1.5.6 “Diagnosis” on page 2594.}

The following figure is an example of the internal construction of the analog input AI0. The analog inputs AI1...AI3 are designed in the same way.

![Diagram of internal construction of analog input AI0](image_url)

CAUTION!
Risk of damaging the analog input!
The 250 Ω input resistor can be damaged by overcurrent.
Make sure that the current through the resistor never exceeds 30 mA.

The following figures are an example of the electrical connection of analog sensors (voltage) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

![Connection of active-type analog sensors (voltage)](image_url)

![Connection of passive-type analog sensors (voltage)](image_url)

The following figures are an example of the electrical connection of analog sensors (current) to the input I0 of the analog input/output module AX561. Proceed with the inputs I1 to I3 in the same way.

![Connection of active-type analog sensors (current)](image_url)

![Connection of passive-type analog sensors (current)](image_url)
The following figures are an example of the electrical connection of analog actuators to the analog input/output module AX561.

The output signal is undefined if the supply voltage at the L+ terminal is below 10 V. This can, for example, occur if the supply voltage has a slow ramp-up / ramp-down behaviour and must be foreseen when planning the installation.

If the output is configured in current mode, the voltage output signal is undefined and must not be connected.

If the output is configured in voltage mode, the current output signal is undefined and must not be connected.

The meaning of the LEDs is described in the displays chapter “State LEDs” on page 2595.

I/O configuration

The IO module does not store configuration data itself.

Parameterization

The arrangement of the parameter data is performed with Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.
### Module ID

<table>

Remarks:

1) In AC500 the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The PNIO diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551-CS31)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or PNIO: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or PNIO = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

*) For planning and commissioning of new installations use modules in Active status only.

### S500

**AI523 - Analog input module**

- 16 configurable analog inputs (I0 to I15) in 2 groups (1.0...2.7 and 3.0...4.7)
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog inputs (I0 - I15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Functionality**

16 analog inputs, individually configurable for

- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

</tr>
</tbody>
</table>

**Electrical connection**

The modules are plugged on an I/O terminal unit “Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 “Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter “Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 V

The assignment of the other terminals:
<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>

</tr>
<tr>
<td>4.0 to 4.7</td>
<td>I8+ to I15+</td>
<td>Positive poles of the following 8 analog inputs</td>
</tr>
</tbody>
</table>

**CAUTION!**
The negative poles of the analog inputs are electrically connected to each other. They form an "Analog Ground" signal for the module. The negative poles of the analog outputs are also electrically connected to each other to form an "Analog Ground" signal.

**CAUTION!**
There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be electrically isolated in order to avoid loops via the earth potential or the supply voltage.

**CAUTION!**
Because of their common reference potential, analog current inputs cannot be circuitled in series, neither within the module nor with channels of other modules.

*For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AI523.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**
Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with --). Reserved terminals may carry internal voltages.
Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the module:

The modules provide several diagnosis functions Chapter 1.5.3.6.2.1.7 “Diagnosis” on page 2615.

Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the 8 analog channels.
The following measuring ranges can be configured. Chapter 1.5.3.6.2.1.6 “Parameterization” on page 2612.

<table>

</tr>
</tbody>
</table>

The function of the LEDs is described under Displays. Chapter 1.5.3.6.2.1.7 “Diagnosis” on page 2615.

The module AI523 performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as “unused”.

**Connection of resistance thermometers in 3-wire configuration**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module AI523 provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, the return line is necessary only once. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured

<table>

</tbody>
</table>

The function of the LEDs is described under Displays \( \text{Chapter 1.5.3.6.2.2.1.7 "Diagnosis" on page 2615} \\

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Connection diagram](image)

**Fig. 122: Connection example**

**CAUTION!**

The potential difference between AGND and ZP at the module must not be greater than 1 V, not even in case of long lines.

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very low current flows over the voltage line. The total current through the PTC should not exceed 50 mA.

This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method has to be preferred.

The following measuring ranges can be configured \( \text{Chapter 1.5.3.6.2.1.9 "Measuring ranges" on page 2617} \\

<table>
<thead>
<tr>
<th>Measure</th>
<th>Range</th>
<th>Channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>0 V...10 V</td>
<td>1 channel</td>
</tr>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

The function of the LEDs is described under Displays \( \text{Chapter 1.5.3.6.2.1.7 "Diagnosis" on page 2615} \\

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

The following measuring ranges can be configured "Parameterization" on page 2612 "Measuring ranges" on page 2617

| Current | 4 mA...20 mA | 1 channel used |

The function of the LEDs is described under Displays "Diagnosis" on page 2615.

CAUTION!
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10 volt Zener diode (in parallel to I+ and I-). But, in general, it is a better solution to use sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The converted analog value is available at the odd channel (higher address).
CAUTION!
The earthing potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

![Connection Diagram]

**Fig. 124: Connection example**

The negative pole of the sensor must be earthed next to the sensor.

The following measuring ranges can be configured:

- **Voltage**: 0 V...10 V with differential inputs, 2 channels used
- **Voltage**: -10 V...+10 V with differential inputs, 2 channels used

The function of the LEDs is described under Displays.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.
Fig. 125: Connection example

The following operating mode can be configured Chapter 1.5.3.6.2.2.1.6 “Parameterization” on page 2612 Chapter 1.5.3.6.2.2.1.9 “Measuring ranges” on page 2617

**I/O configuration**

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tr>
<tr>
<td>17</td>
<td>Analog input Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels *)</td>
</tr>
<tr>
<td>18</td>
<td>Analog input Ni1000, -50 °C...+150 °C (2-wire)</td>
</tr>
<tr>
<td>19</td>
<td>Analog input Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels *)</td>
</tr>
</tbody>
</table>

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</tbody>
</table>

Remarks:
1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1..10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1..10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1..10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

### Technical data

The system data of AC500 and S500 \( \text{Chapter 1.5.4.5.1 “System data AC500” on page 3058} \) are valid for standard version.

The system data of AC500-XC \( \text{Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099} \) are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) For planning and commissioning of new installations use modules in Active status only.
AI531 - Analog input module

- 8 configurable analog inputs (I0 to I7) in 2 groups (1.0...1.7 and 2.0...2.7 as well as 3.0...3.7 and 4.0...4.7)
  Resolution 15 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

### Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
Functionality

8 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...5 V, 0 V...10 V
- -50 mV...+50 mV, -500 mV...+500 mV
- -1 V...+1 V, -5 V...+5 V, -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- -20 mA...20 mA
- Pt100, -50 °C...+70 °C or 400 °C (2-, 3- and 4-wire)
- Pt100, -200 °C...+850 °C (2-, 3- and 4-wire)
- Pt1000, -50 °C...+400 °C (2-, 3- and 4-wire)
- Ni1000, -50 °C...+150 °C (2-, 3- and 4-wire)
- Cu50 (1.426): -50 °C...+200 °C (2-, 3- and 4-wire)
- Cu50 (1.428): -200 °C...+200 °C (2-, 3- and 4-wire)
- 0 Ω...50 kΩ
- Thermocouples of types J, K, T, N, S
- Resistance measuring bridge
- Digital signals (digital input)

Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter ¤ Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The modules are plugged on an I/O terminal unit ¤ Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 ¤ Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8, 2.8, 3.8, 4.8, 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:
Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 V
The assignment of the other terminals:

</tbody>
</table>

**CAUTION!**
Analog sensors must be electrically isolated against the earth. In order to avoid inaccuracy with the measuring results, the analog sensors should also be isolated against the power supply.

The "IxB" clamps (x=0..7) of the analog inputs are electrically connected to each other. They form an "Analog Ground Signal" (AGND) for the module.

The negative poles of the analog inputs Ix- may accept a potential difference up to ±20 VDC with regard to the common reference potential IxB (AGND, ZP). Observing this maximum voltage difference, analog current inputs of one module can be switched in series to each other and also with current inputs of other modules.

For the open-circuit detection (cut wire), each positive analog input channel Ix+ is pulled up to "plus" by a high-resistance resistor and each negative analog input channel Ix- is pulled down to "minus" by a resistor. If cut wire occurs, a maximum voltage (overflow or underflow) will be read in then.

The internal power supply voltage for the module’s circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AI531.
The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

*Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.*

---

**Fig. 126: Terminal assignment of the module**

The module provides several diagnosis functions © Chapter 1.5.3.6.2.2.2.7 “Diagnosis” on page 2642.

</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / displays Chapter 1.5.6.2.2.7 “Diagnosis” on page 2642.

The module linearizes the thermocouple characteristics. It supports the following possibilities of temperature compensation and handling with cold junctions:

**Internal compensation**

An internal temperature sensor which is located next to the terminal unit is used to detect the temperature of the cold junction. So the compensating cables must be connected directly to the terminal unit, where the cold junction is located.

The setting "Internal compensation (default)" for the parameter "Compensation channel" should be selected.

> To get more precise temperature measurements, the use of an external compensation method is recommended.

**External compensation with temperature input**

The temperature for the cold junction can be determined externally.

A measured or known temperature value (e.g. ambient temperature in the cabinet) is transferred to the module via the output data word to all required channels. The possible temperature range is from -25 °C to +60 °C and is monitored by the AI531.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with compensation box**

A compensation box balances the temperature difference between the cold junction and the reference temperature by generating a bridge voltage. The reference temperature is transferred via the output data word.

The compensation box must fit to the type of thermocouple and is located at the end of the compensating cables, where the cold junction is located. The cabling to the AI531 can be carried out with normal cables. The operating manual of the compensation box also has to be considered.

The setting "External with temperature value" for the parameter "Compensation channel" should be selected.

**External compensation with flanking channel**

A flanking channel of the same input group can be used for compensation, e.g. for channel 3, the channels 0, 1 and 2 can be selected as reference channels. The type of sensor for the reference channel can be selected in the parameters for the flanking channel. For example, a RTD sensor which is located next to the thermocouple terminal can be used as reference point for other channels.
The setting "Channel x" for the parameter "Compensation channel" should be selected. Refer to Channel configuration § Chapter 1.5.3.6.2.2.2.6 “Parameterization” on page 2638 for possible settings.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Internal data exchange

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Analog inputs (words)</td>
<td>8</td>
</tr>
<tr>
<td>Analog outputs (words)</td>
<td>1</td>
</tr>
</tbody>
</table>

I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

This means that replacing I/O modules is possible without any re-parameterization via software.

If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 expansion module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

States of the LEDs (see also section Diagnosis LEDs in the S500 system data):

### Technical data

The system data of AC500 and S500 (Chapter 1.5.4.5.1 “System data AC500” on page 3058) are valid for standard version.

The system data of AC500-XC (Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099) are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

</tbody>
</table>

*) For planning and commissioning of new installations use modules in Active status only.

### AO523 - Analog output module

- 16 analog outputs in two groups:
  - 8 channels configurable for voltage or current output
  - 8 channels for voltage output
  - Resolution 12 bits plus sign

- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 16 yellow LEDs to display the signal states at the analog outputs (O0 - O15)
4 1 green LED to display the state of the process supply voltage UP
5 2 red LEDs to display errors
6 Label
7 Terminal unit
8 DIN rail
9 Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Functionality**

</tr>
</tbody>
</table>

### Electrical connection

*For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter *Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.*

The modules are plugged on an I/O terminal unit *Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311*. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 *Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8 to 4.8 and 1.9 to 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, independent of the inserted module:

- Terminals 1.8 to 4.8: process voltage UP = +24 VDC
- Terminals 1.9 to 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>
<tr>
<th>Terminals</th>
<th>Signal</th>
<th>Description</th>

<tr>
<td>3.0 to 3.7</td>
<td>O8- to O15-</td>
<td>Negative poles of the following 8 analog outputs</td>
</tr>
<tr>
<td>4.0 to 4.7</td>
<td>O8+ to O15+</td>
<td>Positive poles of the following 8 analog outputs</td>
</tr>
</tbody>
</table>

*For the open-circuit detection (cut wire), each analog input channel is pulled up to “plus” by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.*

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per AO523.
The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

**Info**

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

*Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.*

The following figure shows the electrical connection of the module:

---

Attention:

By installing equipotential bonding conductors between the different parts of the system, it must be made sure that the potential difference between ZP and AGND never can exceed 1 V.

---

The modules provide several diagnosis functions ⇤ Chapter 1.5.3.6.2.2.3.7 “Diagnosis” on page 2663.
Connection of analog output loads (Voltage, current)

![Connection diagram]

**Fig. 143: Connection example**

The following measuring ranges can be configured

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 and 8...11 can be configured as current output (0 mA...20 mA or 4 mA...20 mA).

The function of the LEDs is described under Displays. Unused analog outputs can be left open-circuited.

### Internal data exchange

</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

That means replacing I/O modules is possible without any re-parameterization via software.

*If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.*
The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (3 = AO); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = Module itself" is output.

State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
### LED States and Color

### Technical data

The system data of AC500 and S500 \(\text{©}\) Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC \(\text{©}\) Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) For planning and commissioning of new installations use modules in Active status only.

AX521 - Analog input/output module
- 4 configurable analog inputs (I0 to I3) in 1 group (1.0...2.3)
  Resolution 12 bits plus sign
- 4 configurable analog outputs (O0 to O3) in 1 group (3.0...4.3)
  Resolution 12 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1 I/O bus
2 Allocation between terminal number and signal name
3 4 yellow LEDs to display the signal states at the analog inputs (I0 - I3)
4 4 yellow LEDs to display the signal states at the analog outputs (O0 - O3)
5 1 green LED to display the state of the process supply voltage UP
6 2 red LEDs to display errors
7 Label
8 Terminal unit
9 DIN rail
10 Sign for XC version

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

Functionality

AX521 4 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs, individually configurable for

- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

Electrical Connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter, Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The modules are plugged on an I/O terminal unit, Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526, Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and have always the same assignment, irrespective of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The negative poles of the analog inputs are electrically connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are electrically connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the earth potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuitied in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the I/O module.

Fig. 144: Terminal assignment

Attention:
By installing equipotential bonding conductors between the different parts of the system, it must be made sure that the potential difference between ZP and AGND never can exceed 1 V.

Attention:
The process voltage must be included in the earthing concept of the control system (e.g. earthing the minus pole).
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

![Diagram of 2-wire configuration](image)

**Fig. 145: Connection example**

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>

<td>2-wire used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
Fig. 146: Connection example

If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>
<tr>
<th>Sensor</th>

<td>3-wire configuration, two channels used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with electrically isolated power supply

By connecting the sensor's negative pole of the output voltage to AGND, the electrically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 "Parameterization" on page 2680 and for AX522 "Parameterization" on page 2705:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply

Fig. 147: Connection example

Fig. 148: Connection example
Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Connection diagram](image)

**Fig. 149: Connection example**

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

Fig. 150: Connection example

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**

The earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
The negative pole of the sensor must be earthed next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>-10 V...+10 V</th>
</tr>
</thead>
<tbody>
<tr>
<td>with differential inputs, 2 channels used</td>
<td>with differential inputs, 2 channels used</td>
<td></td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.
**Connection of analog output loads (Voltage, current)**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>[-10 V...+10 V]</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>0 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA). Unused analog outputs can be left open-circuited.

**Internal data exchange**

<table>
<thead>
<tr>
<th>Digital inputs (bytes)</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>4</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system. Hence, replacing I/O modules is possible without any re-parameterization via software.

</table>

### Channel error rules:

1. **In AC500, the following interface identifier applies:**
   - 14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   - The FBP diagnosis block does not contain this identifier.

2. **With "Device" the following allocation applies:**
   - 31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

3. **With "Module" the following allocation applies depending on the master:**
   - Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   - Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

4. **In case of module errors, with channel "31 = Module itself" is output.**

## State LEDs

During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.
### Measuring ranges

**Input ranges of voltage, current and digital input**

The represented resolution corresponds to 16 bits.

### Technical data

The system data of AC500 and S500 \(\text{\textcopyright} Chapter 1.5.4.5.1 \) “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC \(\text{\textcopyright} Chapter 1.5.4.6.1 \) “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

*) For planning and commissioning of new installations use modules in Active status only.

AX522 - Analog input/output module

- 8 configurable analog inputs (I0 to I7) in 1 group (1.0...2.7)
  Resolution 12 bits plus sign
- 8 configurable analog outputs (O0 to O7) in 1 group (3.0...4.7)
  Resolution 12 bits plus sign
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available
1. I/O bus
2. Allocation between terminal number and signal name
3. 8 yellow LEDs to display the signal states at the analog inputs (I0 - I7)
4. 8 yellow LEDs to display the signal states at the analog outputs (O0 - O7)
5. 1 green LED to display the state of the process supply voltage UP
6. 2 red LEDs to display errors
7. Label
8. Terminal unit
9. DIN rail
10. Sign for XC version

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g. CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

**Functionality**

8 analog inputs, individually configurable for
- Unused (default setting)
- 0 V...10 V
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA
- Pt100, -50 °C...+400 °C (2-wire)
- Pt100, -50 °C...+400 °C (3-wire), requires 2 channels
- Pt100, -50 °C...+70 °C (2-wire)
- Pt100, -50 °C...+70 °C (3-wire), requires 2 channels
- Pt1000, -50 °C...+400 °C (2-wire)
- Pt1000, -50 °C...+400 °C (3-wire), requires 2 channels
- Ni1000, -50 °C...+150 °C (2-wire)
- Ni1000, -50 °C...+150 °C (3-wire), requires 2 channels
- 0 V...+10 V with differential inputs, requires 2 channels
- -10 V...+10 V with differential inputs, requires 2 channels
- Digital signals (digital input)

4 analog outputs, individually configurable for
- Unused (default setting)
- -10 V...+10 V
- 0 mA...20 mA
- 4 mA...20 mA

4 analog outputs, individually configurable for
- Unused (default setting)
- -10 V...+10 V

Electrical Connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter "Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The modules are plugged on an I/O terminal unit "Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311. Properly position the modules and press until they lock in place. The terminal units are mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 "Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).
The electrical connection of the I/O channels is carried out using the 40 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 1.8, 2.8, 3.8 and 4.8 as well as 1.9, 2.9, 3.9 and 4.9 are electrically interconnected within the I/O terminal units and always have the same assignment, independent of the inserted module:

Terminals 1.8, 2.8, 3.8 and 4.8: process voltage UP = +24 VDC
Terminals 1.9, 2.9, 3.9 and 4.9: process voltage ZP = 0 VDC

The assignment of the other terminals:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

The negative poles of the analog inputs are electrically connected to each other to form an "Analog Ground" signal for the module.

The negative poles of the analog outputs are electrically connected to each other to form an "Analog Ground" signal for the module.

There is no galvanic isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be galvanically isolated in order to avoid loops via the earth potential or the supply voltage.

Because of their common reference potential, analog current inputs cannot be circuited in series, neither within the module nor with channels of other modules.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per I/O module.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figure shows the electrical connection of the I/O module.

Fig. 154: Terminal assignment

Attention:
By installing equipotential bonding conductors between the different parts of the system, it must be made sure that the potential difference between ZP and AGND never can exceed 1 V.

Attention:
The process voltage must be included in the earthing concept of the control system (e.g. earthing the minus pole).
Connection of resistance thermometers in 2-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the 8 analog channels.

![Connection Example Diagram]

*Fig. 155: Connection example*

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Temperature Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>2-wire used</td>
</tr>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire used</td>
</tr>
</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the I/O module provides a constant current source which is multiplexed over the max. 8 (depending on the configuration) analog channels.
If several measuring points are adjacent to each other, only one return line is necessary. This saves wiring costs.

With the 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

<table>
<thead>

</tbody>
</table>

The I/O module performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".
Connection of active-type analog sensors (Voltage) with electrically isolated power supply

![Connection diagram](image)

Fig. 157: Connection example

By connecting the sensor's negative pole of the output voltage to AGND, the electrically isolated voltage source of the sensor is referred to ZP.

The following measuring ranges can be configured for AX521 “Parameterization” on page 2680 and for AX522 “Parameterization” on page 2705:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply

![Connection diagram](image)

Fig. 158: Connection example
Current
0 mA...20 mA 1 channel used
Current
4 mA...20 mA 1 channel used

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

![Connection diagram](image)

**Fig. 159: Connection example**

**CAUTION!**
The potential difference between AGND and ZP at the module must not be greater than 1V, not even in case of long lines (see figure Terminal Assignment).

---

*If AGND does not get connected to ZP, the sensor current flows to ZP via the AGND line. The measuring signal is distorted, as a very small current flows through the voltage line. The total current through the PTC should not exceed 50 mA. This measuring method is therefore only suitable for short lines and small sensor currents. If there are bigger distances, the difference measuring method should be applied.*

---

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V *)</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

*) if the sensor can provide this signal range

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".
Connection of passive-type analog sensors (Current)

![Connection example diagram]

**Fig. 160: Connection example**

<table>
<thead>
<tr>
<th>Current</th>
<th>4 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**
If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second to an analog input, this input is switched off by the module (input protection). In such cases, it is recommended to protect the analog input by a 10-volt Zener diode (in parallel to I+ and I-). But, in general, sensors with fast initialization or without current peaks higher than 25 mA are preferrable.

Unused input channels can be left open-circuited because they are of low resistance.

Connection of active-type analog sensors (Voltage) to differential inputs

Differential inputs are very useful if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The use of differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
The earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise, problems may occur concerning the common-mode input voltages of the involved analog inputs.
The negative pole of the sensor must be earthed next to the sensor.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.
<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effect of incorrect input terminal connection</td>
<td>Wrong or no signal detected, no damage up to 35 V</td>
<td></td>
</tr>
</tbody>
</table>

**Connection of analog output loads (Voltage, current)**

**Fig. 163: Connection example**

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load max. ±10 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>

<td>1 channel used</td>
</tr>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

Only the channels 0...3 can be configured as current output (0 mA...20 mA or 4 mA...20 mA). Unused analog outputs can be left open-circuited.

**Internal data exchange**

<table>
<thead>
<tr>
<th>Internal data exchange</th>
<th></th>
</tr>
</thead>
<tbody>

<td>Digital inputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>0</td>
</tr>
<tr>
<td>Counter input data (words)</td>
<td>8</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

**I/O configuration**

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
Parameterization

The parameter data directly influences the functionality of modules.
For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

**Remarks:**

Analog value overflow or broken wire at an analog input
Check input value or terminal

Analog value underflow at an analog input
Check input value

Short circuit at an analog input
Check terminal

Analog value overflow at an analog output
Check output value

Analog value underflow at an analog output
Check output value
In AC500, the following interface identifier applies:
14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
The FBP diagnosis block does not contain this identifier.

With "Device" the following allocation applies:
31 = module itself, 1...10 = decentralized communication interface module 1...10, ADR = hardware address (e.g. of the DC551)

With "Module" the following allocation applies depending on the master:
Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO); COM1/COM2: 1...10 = expansion 1...10

In case of module errors, with channel "31 = Module itself" is output.

State LEDs
During the power ON procedure, the module initializes automatically. All LEDs (except the channel LEDs) are ON during this time.

Technical data

The system data of AC500 and S500 refers to Chapter 1.5.4.5.1 “System data AC500” on page 3058 and are valid for the standard version.

The system data of AC500-XC refers to Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 and are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### Parameter | Value
---|---
Galvanic isolation | Yes, per module

**Current consumption**
- From 24 VDC power supply at the terminals UP/L+ and ZP/M of the CPU/bus module: Ca. 2 mA
- From UP at normal operation: 0.15 A + output loads
- Inrush current from UP (at power up): 0.020 A²s

**Max. length of analog cables, conductor cross section > 0.14 mm²**: 100 m

**Weight**: 300 g

**Mounting position**: Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)

**Cooling**: The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

---

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**Technical data of the analog inputs**

#### 1.5.3.6.3 Digital/Analog I/O modules

**S500**

**DA501 - Digital/Analog input/output module**
- 16 digital inputs 24 VDC
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  - Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  - Resolution 12 bits plus sign
- Fast counter
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

Intended purpose

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).
**Functionality**

- 16 digital inputs 24 VDC
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD.
  
  Resolution 12 bits plus sign
- 2 analog outputs, voltage and current
  
  Resolution 12 bits plus sign
- Fast counter

</tbody>
</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DA501.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.
NOTICE!
Risk of damaging the PLC modules!
Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

NOTICE!
Risk of damaging the PLC modules!
The PLC modules must not be removed while the plant is connected to a power supply.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove or replace a module.

CAUTION!
Risk of imprecise and faulty measurements!
Analog signals may be distorted seriously by external electromagnetic influences.
Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

\[ \text{Fig. 164: Terminal assignment of the module} \]

The module provides several diagnosis functions \$\text{Chapter 1.5.3.6.3.1.1.7 “Diagnosis” on page 2739.} \]
Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI15 in the same way.

Fig. 165: Connection of the module

The meaning of the LEDs is described in the Displays Chapter 1.5.3.6.3.1.1.8 “State LEDs” on page 2742 chapter.

Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.
Fig. 166: Connection of configurable digital inputs/outputs to the module

**CAUTION!**
**Risk of influences to the connected sensors!**
Some sensors may be influenced by the deactivated module outputs of DA501.
If the inputs are used as fast counter inputs, connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays:

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA501 provides a constant current source which is multiplexed over the max. 4 analog input channels.
Fig. 168: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured (Chapter 1.5.3.6.3.1.1.6 “Parameterization” on page 2735):

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>3-wire configuration, 2 channels used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays (Chapter 1.5.3.6.3.1.1.7 “Diagnosis” on page 2739).

The module DA501 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

### Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured ➥ Chapter 1.5.3.6.3.1.1.6 “Parameterization” on page 2735:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays ➥ Chapter 1.5.3.6.3.1.8 “State LEDs” on page 2742.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 170: Connection of active-type analog sensors (current) with electrically isolated power supply to the analog inputs

The following measuring ranges can be configured in Chapter 1.5.3.6.3.1.1.6 “Parameterization” on page 2735:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays in Chapter 1.5.3.6.3.1.1.8 “State LEDs” on page 2742.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 171: Connection of active-type sensors (voltage) with no electrically isolated power supply to the analog inputs

CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured "Parameterization" on page 2735:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter "State LEDs" on page 2742.
To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs
The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 172: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured 

| Current | 4 mA...20 mA | 1 channel used |

For a description of function of the LEDs, please refer to the Diagnosis and displays / Displays chapter

**CAUTION!**
Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

**Fig. 173: Connection of active-type analog sensors (voltage) to differential analog inputs**

The following measuring ranges can be configured (Chapter 1.5.3.6.3.1.1.6 “Parameterization” on page 2735):

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>with differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>with differential inputs, 2 channels used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays chapter (Chapter 1.5.3.6.3.1.1.8 “State LEDs” on page 2742).

To avoid error messages from unused analog input channels, configure them as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured: "Parameterization" on page 2735:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 V DC</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays chapter: "State LEDs" on page 2742.

**Connection of analog output loads (Voltage)**

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
Connection of analog output loads (voltage)

The following measuring ranges can be configured “Chapter 1.5.3.6.3.1.1.6 “Parameterization” on page 2735:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>-10 V...+10 V</th>
<th>Load ±10 mA max.</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to the Diagnosis and displays / Displays chapter “Chapter 1.5.3.6.3.1.1.8 “State LEDs“ on page 2742.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured on page 2735:

- **Current:** 0 mA...20 mA
  - **Load:** 0 Ω...500 Ω
  - **1 channel used**

- **Current:** 4 mA...20 mA
  - **Load:** 0 Ω...500 Ω
  - **1 channel used**

For a description of the function of the LEDs, please refer to the Diagnosis and displays chapter on page 2742.

Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the Fast Counter</th>

<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module does not store configuration data itself. It gets its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
Parameterization

<table>
<thead>
<tr>
<th>Firmware version</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firmware version &gt; V2.0.0</td>
<td>The arrangement of the parameter data is performed by Control Builder Plus/ Automation Builder software.</td>
</tr>
</tbody>
</table>

The parameter data directly influences the functionality of modules.

For non-standard applications, it is necessary to adapt the parameters to your system configuration.

</tbody>
</table>

Remarks:

1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission

2) Not for FBP

3) With FBP or CS31 without the parameter "Fast Counter"

The fast counter of the module does not work if the module is connected to an FBP interface module or CS31 bus module.

4) For counter operating modes, please refer to the description of the fast counter ☞ Chapter 1.5.3.6.1.2.9 “Fast counter” on page 2543

5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe-mode is ON.

Internal value | Operating modes of the analog inputs, individually configurable
---|---
19 | 3-wire Ni1000 -50 °C...+150 °C *)

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

<tr>
<td></td>
<td>11 / 12</td>
<td>ADR</td>
<td>1...10</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Remarks:

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.
   The FBP diagnosis block does not contain this identifier.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation depending on the master:
   Module error: I/O bus or FBP: 31 = module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus or FBP = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicates the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1

<td>--</td>
</tr>
</tbody>
</table>

1) Indication LED is ON even if an input signal is applied to the channel and the supply voltage is off. In this case the module is not operating and does not generate an input signal.

2) Brightness depends on the value of the analog signal

3) All of the LEDs CH-ERR1 to CH-ERR4 light up together

## Technical data

### Technical data of the module

The system data of AC500 and S500 in Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.
The system data of AC500-XC ∘ Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

</tbody>
</table>

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the digital inputs**

<table>
<thead>
<tr>

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

</tbody>
</table>

*) For planning and commissioning of new installations use modules in Active status only.

### DA502 - Digital/Analog input/output module

- 16 digital outputs, 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- 4 analog inputs, voltage, current and RTD, resolution 12 bits plus sign
- 2 analog outputs, voltage and current, resolution 12 bits plus sign
- Fast counter
- Module-wise electrically isolated
- XC version for use in extreme ambient conditions available

**Intended purpose**

The device can be used as a decentralized I/O extension module for S500 Communication Interface Modules (e.g., CI592-CS31, CI501-PNIO, CI541-DP, CI581-CN) or as a centralized extension module for AC500 CPUs (PM5xx).

### Electrical connection

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter \* Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The electrical connection is carried out by using the 40 terminals of the terminal unit TU515/ TU516 \* Chapter 1.5.3.5.2 “TU515, TU516, TU541 and TU542 for I/O modules” on page 2311.

The assignment of the terminals:

</table>

The internal power supply voltage for the module's circuitry is carried out via the I/O bus (provided by a bus module or a CPU). Thus, the current consumption from 24 VDC power supply at the terminals L+/UP and M/ZP of the CPU/bus module increases by 2 mA per DA502.

The external power supply connection is carried out via the UP (+24 VDC) and the ZP (0 VDC) terminals.

**NOTICE!**

Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
**NOTICE!**

**Risk of damaging the PLC modules!**

The PLC modules must not be removed while the plant is connected to a power supply.

Make sure that all voltage sources (supply and process voltage) are switched off before you
– connect or disconnect any signal or terminal block
– remove or replace a module.

---

**CAUTION!**

**Risk of imprecise and faulty measurements!**

Analog signals may be distorted seriously by external electromagnetic influences.

Use shielded wires when wiring analog signal sources. The cable shield must be grounded at both ends of the cable. Provide a potential equalization of a low resistance to avoid high potential differences between different parts of the plant.

---

**Fig. 178: Terminal assignment of the module**

The module provides several diagnosis functions ☝️ Chapter 1.5.3.6.3.1.2.7 “Diagnosis” on page 2772.

---

**Connection of the digital outputs**

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 to DO15 in the same way.
For a description of the meaning of the LEDs, please refer to the Displays chapter "State LEDs" on page 2775.

Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC16 and DC17. DC16 is connected as an input and DC17 is connected as an output. Proceed with the configurable digital inputs/outputs DC18 to DC23 in the same way.
NOTICE!
Risk of influences to the connected sensors!
Some sensors may be influenced by the deactivated module outputs of DA502.
Connect a 470 Ω / 1 W resistor in series to inputs DC16/DC17 if they are used as fast counter inputs to avoid any influences.

For a description of the meaning of the LEDs, please refer to the Displays Chapter 1.5.3.6.3.1.2.8 "State LEDs" on page 2775 chapter.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection of resistance thermometers in 2-wire configuration to the analog inputs](image)

The following measuring ranges can be configured Chapter 1.5.3.6.3.1.2.6 “Parameterization” on page 2768 Chapter 1.5.3.6.3.1.2.9 “Measuring ranges” on page 2775:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays Chapter 1.5.3.6.3.1.2.8 “State LEDs” on page 2775.

The module DA502 performs a linearization of the resistance characteristic.
To avoid error messages from unused analog input channels, configure them as "unused".
Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module DA502 provides a constant current source which is multiplexed over max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

**Fig. 180: Connection of resistance thermometers in 3-wire configuration to the analog inputs**

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured:

- **Pt100**
  - -50 °C...+400 °C
  - 3-wire configuration, 2 channels used
- **Pt1000**
  - -50 °C...+400 °C
  - 3-wire configuration, 2 channels used
- **Ni1000**
  - -50 °C...+150 °C
  - 3-wire configuration, 2 channels used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays “State LEDs” on page 2775.

The module DA502 performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

Fig. 181: Connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog inputs

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

- **Current**: 0 mA...20 mA
  - 1 channel used

- **Current**: 4 mA...20 mA
  - 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays “State LEDs on page 2775.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs**

The following figure shows the connection of active-type analog sensors (voltage) without electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 183: Connection of active-type sensors (voltage) with no electrically isolated power supply to the analog inputs

CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following measuring ranges can be configured:  
Chapter 1.5.3.6.3.1.2.6 “Parameterization” on page 2768  
Chapter 1.5.3.6.3.1.2.9 “Measuring ranges” on page 2775:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays  
Chapter 1.5.3.6.3.1.2.8 “State LEDs” on page 2775.
To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs
The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured:

**Current**

- 4 mA...20 mA
- 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays:

**NOTICE!**

Risk of overloading the analog input!

- If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).
- Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
CAUTION!
Risk of faulty measurements!
The negative pole at the sensors must not have too large a potential difference
with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection of active-type analog sensors (voltage) to differential analog inputs](image)

**Fig. 185: Connection of active-type analog sensors (voltage) to differential analog inputs**

The following measuring ranges can be configured:

- Voltage 0 V...10 V with differential inputs, 2 channels used
- Voltage -10 V...+10 V with differential inputs, 2 channels used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays

Use of analog inputs as digital inputs

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 186: Use of analog inputs as digital inputs

The following measuring ranges can be configured “Parameterization” on page 2768 “Measuring ranges” on page 2775:

<table>
<thead>
<tr>
<th>Digital input</th>
<th>24 V</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays “State LEDs” on page 2775.

Connection of analog output loads (Voltage)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured:

- Voltage: -10 V...+10 V
- Load: ±10 mA max.
- 1 channel used

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays “State LEDs” on page 2775.

Unused analog outputs can be left open-circuited.

Connection of analog output loads (Current)

The following figure shows the connection of output loads to the analog output AO0. Proceed with the analog output AO1 in the same way.
The following measuring ranges can be configured 

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>Load 0 Ω...500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays 

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>Load 0 Ω...500 Ω</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>Load 0 Ω...500 Ω</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For a description of the function of the LEDs, please refer to Diagnosis and displays / Displays 

| Chapter 1.5.3.6.3.1.2.8 “State LEDs” on page 2775.

Unused analog outputs can be left open-circuited.

### Internal data exchange

<table>
<thead>
<tr>
<th></th>
<th>Without the Fast Counter</th>
<th>With the Fast Counter (only with AC500)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Digital inputs (bytes)</td>
<td>3</td>
<td>5</td>
</tr>
<tr>
<td>Digital outputs (bytes)</td>
<td>1</td>

<td>0</td>
<td>4</td>
</tr>
<tr>
<td>Counter output data (words)</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

### I/O configuration

The module itself does not store configuration data. It draws its parameterization data from the master device of the I/O bus (CPU or bus module) during power-up of the system.

Hence, replacing I/O modules is possible without any re-parameterization via software.
If the external power supply voltage via UP/ZP terminals fails, the I/O module loses its configuration data. The whole station has to be switched off and on again to re-configure the module.

Parameterization

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module ID 1)</td>
<td>Internal</td>
<td>Internal value 1815, type WORD, Default 1815, EDS Slot / Index 0x0Y01</td>
</tr>
<tr>
<td>Ignore module</td>
<td>Internal</td>
<td>Internal value Yes, type BYTE, Default No</td>
</tr>
<tr>
<td>Parameter length</td>
<td>Internal</td>

</tr>
<tr>
<td>Fast counter 2)</td>
<td>0 : 10</td>
<td>Internal value 0, type BYTE, Default 0, EDS Slot / Index Not for FBP</td>
</tr>
<tr>
<td>Behavior outputs at comm. error 5)</td>
<td>Off Last value 5 s, Last value 10 s Substitute value 5 s, Substitute value 10 s</td>
<td>Off Last value Off 0x00, EDS Slot / Index 0x0Y07</td>
</tr>
</tbody>
</table>

2) Setting:
- **On**: Error LED lights up at errors of all error classes, Failsafe mode off
- **Off by E4**: Error LED lights up at errors of error classes E1, E2 and E3, Failsafe mode off
- **Off by E3**: Error LED lights up at errors of error classes E1 and E2, Failsafe mode off
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>On +Failsafe</td>
<td>Error LED lights up at errors of all error classes, Failsafe mode on *)</td>
</tr>
<tr>
<td>Off by E4 + Failsafe</td>
<td>Error LED lights up at errors of error classes E1, E2 and E3, Failsafe mode on *)</td>
</tr>
<tr>
<td>Off by E3 + Failsafe</td>
<td>Error LED lights up at errors of error classes E1 and E2, Failsafe mode on *)</td>
</tr>
</tbody>
</table>

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission

2) For a description of the counter operating modes, please refer to the Fast Counter section  
   Chapter 1.5.3.6.1.2.9 “Fast counter” on page 2543

3) With CS31 without the parameter "Fast Counter"

The fast counter of the module does not work if the module is connected to a CS31 bus module.

5) The parameter Behavior outputs at comm. error is only analyzed if the Failsafe mode is ON.

Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

</tbody>
</table>

**Remarks:**

1) In AC500, the following interface identifier applies:
   14 = I/O bus, 11 = COM1 (e.g. CS31 bus), 12 = COM2.

2) With "Device" the following allocation applies:
   31 = module itself,
   1...10 = decentralized communication interface module 1...10,
   ADR = hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies depending on the master:
   Module error: I/O bus: 31 = Module itself; COM1/COM2: 1...10 = expansion 1...10
   Channel error: I/O bus = module type (1 = AI, 3 = AO, 4 = DC); COM1/COM2: 1...10 = expansion 1...10

4) In case of module errors, with channel "31 = module itself" is output.

5) Ch = 22...29 indicate the digital inputs/outputs DC16...DC23

6) Ch = 16...19 indicates the analog inputs AI0...AI3

7) Ch = 20...21 indicates the analog outputs AO0...AO1
### State LEDs

### Technical data

#### Technical data of the module

The system data of AC500 and S500 \(\text{Chapter 1.5.4.5.1 “System data AC500” on page 3058}\) are valid for standard version.

The system data of AC500-XC \(\text{Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099}\) are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.
<table>

</tr>
</tbody>
</table>

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

### Technical data of the digital outputs

<table>
<thead>

</tbody>
</table>

* Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

1.5.3.7 Communication interface modules (S500)

Hot swap

System requirements for hot swapping of I/O modules:
- Types of terminal units that support hot swapping of I/O modules have the appendix TU5xx-H.
- I/O modules as of index F0.

The following I/O bus masters support hot swapping of attached I/O modules:
- Communication interface modules CI5xx as of index F0.
- Processor modules PM56xx-2ETH with firmware version as of V3.2.0.

NOTICE!
Risk of damage to I/O modules!
Hot swapping is only allowed for I/O modules.
Processor modules and communication interface modules must not be removed or inserted during operation.

Conditions for hot swapping
- Digital outputs are not under load.
- Input/output voltages above safety extra low voltage/protective extra low voltages (SELV/PELV) are switched off.
- Modules are completely plugged on the terminal unit with both snap fit engaged before switching on loads or input/output voltage.

Hot swap
Further information about hot swap: System technology § Chapter 1.5.5.1.6 “Hot swap” on page 3148.

</tbody>
</table>

**CI581-CN**

- 4 analog inputs (resolution 12 bits plus sign)
- 2 analog outputs (resolution 12 bits plus sign)
- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available
Intended purpose

The CANopen bus module CI581-CN is used as decentralized I/O module in CANopen networks. Depending on the used terminal unit the network connection is performed either via 9-pin female D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (2.0...2.3)
- 2 analog outputs (2.5...2.6)
- 8 digital inputs 24 VDC in 1 group (3.0...3.7)
- 8 digital outputs 24 VDC in 1 group (4.0...4.7)
The inputs/outputs are electrically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Electrical connection

The CANopen bus module is plugged on the I/O terminal units TU517 [Chapter 1.5.3.5.3 “TU517 and TU518 for communication interface modules” on page 2317 or TU518 [Chapter 1.5.3.5.3 “TU517 and TU518 for communication interface modules” on page 2317 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The electrical connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 2.8 and 3.8: process supply voltage UP = +24 VDC
- Terminal 4.8: process supply voltage UP3 = +24 VDC
- Terminals 2.9, 3.9 and 4.9: process supply voltage ZP = 0 V

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
Do not connect any voltages externally to the digital outputs!
Reason: External voltages at an output or several outputs may cause other outputs to be supplied via that voltage instead of voltage UP3 (reverse voltage). This is not the intended use.

**CAUTION!**
Risk of malfunctions by unintended use!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7 and DC0..DC7.

</table>

At the line ends of a bus segment, termination resistors must be connected. If TU517 or TU518 is used, the bus termination resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external termination resistors are required, see illustration below).

The following figures show the different connection options for the CANopen bus module:
In the case of TU517/TU518, the termination resistors are not located inside the TU but inside the bus module CI581-CN. Hence, when removing the device from the TU, the bus termination resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The earthing of the shield should take place at the switch-gear cabinet. Please refer to the AC500 System-Data Chapter 1.5.4.5.1 "System data AC500" on page 3058.

**WARNING!**
**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.

- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

Electrical connection of CANopen bus module CI581-CN:

Fig. 192: Connection of the bus module CI581-CN

The module provides several diagnosis functions "Diagnosis" on page 2813.

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Measuring ranges" on page 2819 and Parameterization "Parameterization" on page 2809.

The meaning of the LEDs is described in the section for the state LEDs "State LEDs" on page 2817.

Bus length

The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.
<table>
<thead>
<tr>

Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.

![Diagram of digital input connection]

Fig. 193: Connection of the digital inputs to the module CI581-CN

Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection of resistance thermometers in 2-wire configuration to the analog inputs](image.png)

Fig. 195: Connection of resistance thermometers in 2-wire configuration to the analog inputs
Pt100  2-wire configuration, 1 channel used
Pt1000  2-wire configuration, 1 channel used
Ni1000  2-wire configuration, 1 channel used

For the measuring ranges that can be configured, please refer to sections Measuring Ranges © Chapter 1.5.3.7.2.2.10 “Measuring ranges” on page 2819 and Parameterization © Chapter 1.5.3.7.2.2.7 “Parameterization” on page 2809.

The module CI581-CN performs a linearization of the resistance characteristic.

To avoid error messages, configure unused analog input channels as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI581-CN provides a constant current source which is multiplexed over the max. 4 analog input channels.

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.

![Diagram of connection of resistance thermometers in 3-wire configuration to the analog inputs](image)
Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Connection Diagram](image)

**Fig. 197:** Connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog inputs

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges "Chapter 1.5.3.7.2.2.10 "Measuring ranges" on page 2819 and Parameterization "Chapter 1.5.3.7.2.2.7 "Parameterization" on page 2809.

To avoid error messages, configure unused analog input channels as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 198: Connection of active-type analog sensors (current) with electrically isolated power supply to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>0...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \Chapter 1.5.3.7.2.2.10 “Measuring ranges” on page 2819 and Parameterization \Chapter 1.5.3.7.2.2.7 “Parameterization” on page 2809.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
**Fig. 199: Connection of active-type sensors (voltage) with no electrically isolated power supply to the analog inputs**

**NOTICE!**

Risk of faulty measurements!

The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. $\pm 1$ V within the full signal range).

Make sure that the potential difference never exceeds $\pm 1$ V.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>$0\ldots10$ V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>$-10$ V$\ldots+10$ V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

For the measuring ranges that can be configured, please refer to the sections Measuring Ranges \( Chapter \) 1.5.3.7.2.2.10 "Measuring ranges" on page 2819 and Parameterization \( Chapter \) 1.5.3.7.2.2.7 "Parameterization" on page 2809.

To avoid error messages, configure unused analog input channels as "unused".

**Connection of passive-type analog sensors (Current) to the analog inputs**

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
2.0 AI0+
2.1 AI1+
2.2 AI2+
2.3 AI3+
2.4 AI-
2.5 AO0+
2.6 AO1+
2.7 AO-

Fig. 200: Connection of passive-type analog sensors (current) to the analog inputs

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

**CAUTION!**

**Risk of overloading the analog input!**

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Only use sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt Zener diode in parallel to I+ and I-.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful if analog sensors which are remotely non-isolated (e.g. the negative terminal is remotely earthed) are used.

Using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
**NOTICE!**

Risk of faulty measurements!

The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ± 1 V within the full signal range). Make sure that the potential difference never exceeds ± 1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

Fig. 201: Connection of active-type analog sensors (voltage) to differential analog inputs

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

The CANopen bus module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch’s value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

Parameterization

1) The parameter Behavior digital outputs at communication error is only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. Chapter 1.5.3.7.2.3 “Electrical connection” on page 2792. In this case, the start-up is disabled as long as the external voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

### Diagnosis

Structure of the Diagnosis Block via CANOM_NODE_DIAG
In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:
In AC500, the following interface identifier applies:

"-" = Diagnosis via bus-specific function blocks; 0 .. 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself

The identifier is not contained in the CI541-DP diagnosis block.

With "Device" the following allocation applies: 31 = module itself; 1..10 = decentralized communication interface module

With "Module" the following allocation applies:

31 = module itself

Channel error: module type (1 = AI, 2 = DO, 3 = AO)

This message appears if external voltages at one or more terminals DO0..DO7 cause other digital outputs to be fed by that voltage (voltage feedback, description in Electrical Connection © Chapter 1.5.3.7.2.2.3 “Electrical connection” on page 2792). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0..DO7 has overrun the process supply voltage UP3 (description in Electrical Connection © Chapter 1.5.3.7.2.2.3 “Electrical connection” on page 2792). Diagnosis message appears for the whole module.

This message appears if the output of a channel DO0..DO7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms seconds. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The state LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

Technical data

The system data of AC500 and S500 \(\text{\textsuperscript{\textregistered}}\) Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC \(\text{\textsuperscript{\textregistered}}\) Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) For planning and commissioning of new installations use modules in Active status only.

**CI582-CN**

- 8 digital inputs 24 VDC
- 8 digital outputs 24 VDC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 VDC, 0.5 A max.
- Module-wise electrically isolated
- Fast counter
- XC version for use in extreme ambient conditions available

1. I/O bus
2. Allocation between terminal number and signal name
3. 8 yellow LEDs to display the signal states of the configurable digital inputs/outputs (DC0 - DC7)
4. 8 yellow LEDs to display the signal states of the digital inputs (DI8 - DI15)
5. 8 yellow LEDs to display the signal states of the digital outputs (DO8 - DO15)
6. 2 green LEDs to display the supply voltage UP and UP3
7. 3 red LEDs to display errors (CH-ERR1, CH-ERR2, CH-ERR3)
8. 5 System LEDs: PWR/RUN, CN-RUN, CN-ERR, S-ERR, I/O-Bus
9. Label
10. 2 rotary switches for setting the CANopen node ID
11 10 terminals to connect the CANopen bus signals
12 Terminal unit
13 DIN rail
\* Sign for XC version

**Intended purpose**

The CANopen bus module CI582-CN is used as decentralized I/O module in CANopen networks. Depending on the terminal unit used, the network connection is performed either via a female 9-pin D-sub connector or via 10 terminals (screw or spring terminals) which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the CANopen network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For use in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**Functionality**

</tr>
</tbody>
</table>

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.
## Electrical connection

The CANopen bus module is plugged on the I/O terminal units TU517 "TU517 and TU518 for communication interface modules" on page 2317 or TU518 "TU517 and TU518 for communication interface modules" on page 2317 and accordingly TU509 or TU510. Properly position the module and press until it locks in place.

The electrical connection of the I/O channels is established using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

The terminals 2.8, 3.8, 2.9, 3.9 and 4.9 are electrically interconnected within the terminal unit and always have the same assignment, irrespective of the inserted module:

- Terminals 2.8 and 3.8: process supply voltage $UP = +24$ VDC
- Terminal 4.8: process supply voltage $UP3 = +24$ VDC
- Terminals 2.9, 3.9 and 4.9: process supply voltage $ZP = 0$ V

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter "AC500 (Standard)" on page 3058.

With a separate $UP3$ power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

## Possibilities of connection

### Mounting on terminal units TU509 or TU510

The assignment of the 9-pin female D-sub connector for the CANopen signals:

</tr>
<tr>
<td>1.9</td>
<td>CAN-GND</td>
<td>Ground potential of the CAN bus</td>
</tr>
</tbody>
</table>

At the line ends of a bus segment, termination resistors must be connected. If TU517 or TU518 is used, the bus termination resistors can be enabled by connecting the terminals Term+ and Term- to the data lines CAN+ and CAN- (no external termination resistors are required, see illustration below).

The following figures show the different connection options for the CANopen bus module:
In the case of TU517/TU518, the termination resistors are not located inside the TU but inside the bus module CI581-CN. Hence, when removing the device from the TU, the bus termination resistors are no longer connected to the bus. The bus itself will not be disconnected if a device is removed.

The earthing of the shield should take place at the switch-gear cabinet. Please refer to the AC500 System-Data Chapter 1.5.4.5.1 “System data AC500” on page 3058.

WARNING!
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!
Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

Electrical connection of CANopen bus module CI582-CN:

Fig. 208: Connection of the bus module CI582-CN

For a description of the meaning of the LEDs, please refer to the section for the state LEDs Chapter 1.5.3.7.2.3.9 “State LEDs” on page 2843.
Bus length
The maximum possible bus length of a CAN network depends on bit rate (transmission rate) and cable type. The sum of all bus segments must not exceed the maximum bus length.

<table>
<thead>

</tbody>
</table>

Addressing

A detailed description concerning addressing can be found in the documentation of ABB Control Builder Plus Software.

> The CANopen bus module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

> The range of permitted CANopen slave addresses is 1 to 127. Setting a higher address (> 128) does not lead to an error response, but results in a special mode (DS401). In this special mode, the device creates the node address by subtracting the value 128 from the address switch's value.

I/O configuration

The CI582-CN CANopen bus configuration is handled by CANopen master with the exception of the slave node ID (via rotary switches) and the transmission rate (automatic detection).

The digital I/O channels and the fast counter are configured via software.

</tbody>
</table>

Remarks:

1) The parameter Behavior DO at comm. error is applied to DC and DO channels and only analyzed if the failsafe mode is ON.

2) The state "externally voltage detected" appears if the output of a channel DC0..DC7 is to be switched on while an external voltage is connected. In this case, start-up is disabled while the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

3) The error state "voltage overflow at outputs" appears if external voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see Electrical Connection "Electrical connection" on page 2829). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters to "OFF". This parameter should only be disabled in exceptional cases as voltage overflow may produce reverse voltage.

Diagnosis

Structure of the diagnosis block via CANOM NODE_DIAG

<table>

<td>Diagnosis byte, flags</td>
<td>According to the I/O bus specification&lt;br&gt;Bit 7: 1 = coming error&lt;br&gt;Bit 6: 1 = leaving error</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The module performs reactivation automatically. Thus, an acknowledgement of the errors is not necessary. The error message is stored via the LED.

### Remarks:

1) In AC500, the following interface identifier applies:
   
   
   - "-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = position of the communication module; 14 = I/O bus; 31 = module itself
   
   The identifier is not contained in the CI542-DP diagnosis block.

2) With "Device" the following allocation applies: 31 = module itself, 1..10 = decentralized communication interface module

3) With "Module" the following allocation applies depending on the master:
   
   - Module error: 31 = module itself
   - Channel error: module type (1 = AI, 2 = DO, 3 = AO)

4) This message appears if external voltages at one or more terminals DC0..DC7 or DO0..DO7 cause other digital outputs to be supplied by that voltage (voltage feedback, see Electrical Connection Chapter 1.5.3.7.2.3.3 "Electrical connection" on page 2829). All outputs of the digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

5) The voltage at digital outputs DC0..DC7 and DO0..DO7 has exceeded the process supply voltage UP3 (see Electrical Connection Chapter 1.5.3.7.2.3.3 "Electrical connection" on page 2829). A diagnosis message appears for the whole module.
This message appears if the output of a channel DC0..DC7 or DO0..DO7 should be switched on while an external voltage is connected. In this case the start-up is disabled while the external voltage is connected. Otherwise, this could produce reverse voltage flowing from this output to other digital outputs. This diagnosis message appears for each channel.

Short circuit: After a short circuit has been detected, the output is deactivated for 100ms. Subsequently, a new start-up will be executed. This diagnosis message appears for each channel.

State LEDs

The LEDs are located at the front of the module. There are 2 different groups:

- The 5 system LEDs (PWR, CN-RUN, CN-ERR, S-ERR and I/O bus) show the operation states of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 \( \mathcal{O} \) Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC \( \mathcal{O} \) Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below. The technical data are also valid for the XC version.

#### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

**Technical data of the digital inputs/outputs if used as inputs**

Please refer to the Technical Data of the Digital Inputs. Deviation: Chapter 1.5.3.7.2.3.10 “Technical data” on page 2844. Deviation:

Terminals of the channels DC0 to DC7: Terminals 2.0 to 2.7

Due to the direct connection to the output, the demagnetizing varistor is also effective at the input. This is why the difference between UPx and the input signal must not exceed the clamp voltage of the varistor. The varistor limits the clamp voltage to approx. 36 V. Consequently, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.
Please refer to the Technical Data of the Digital Outputs "Technical data" on page 2844. Deviation:

13. DIN rail
Intended purpose

The EtherCAT bus module CI511-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)
- Cam switch functionality

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

</tbody>
</table>

Electrical connection

The EtherCAT bus module CI511-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter [Chapter 1.5.4.5 “AC500 (Standard)” on page 3058].

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage \( \text{UP} = +24\ \text{VDC} \)

Terminal 3.8: Process supply voltage \( \text{UP3} = +24\ \text{VDC} \)

Terminals 1.9, 2.9 and 3.9: Process supply voltage \( \text{ZP} = 0\ \text{V} \)

With a separate \( \text{UP3} \) power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

The assignment of the other terminals:

**WARNING!**

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**CAUTION!**

There is no electrical isolation between the analog circuitry and ZP/UP. Therefore, the analog sensors must be electrically isolated in order to avoid loops via the earth potential or the supply voltage.
CAUTION!
Because of their common reference potential, analog current inputs cannot be
circuited in series, neither within the module nor with channels of other mod-
ules.

For the open-circuit detection (cut wire), each channel is pulled up to "plus" by a
high-resistance resistor. If nothing is connected, the maximum voltage will be
read in then.

Analog signals are always laid in shielded cables. The cable shields are earthed at both ends of
the cables. In order to avoid unacceptable potential differences between different parts of the
installation, low resistance equipotential bonding conductors must be laid.

For simple applications (low disturbances, no high requirement on precision), the shielding can
also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI511-ETHCAT.

Fig. 214: Connection of the bus module CI511-ETHCAT
1 4 analog inputs, configurable for 0...10 V, -10...+10 V, 0/4...20 mA, Pt100/Pt1000, Ni1000
   and digital signals
2 2 analog outputs, configurable for -10...+10 V, 0/4...20 mA
3 8 digital inputs 24 VDC
4 8 digital outputs 24 VDC, 0.5 A max.
In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active
   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active
   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

NOTICE!
Risk of faulty measurements!
The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).
Make sure that the potential difference never exceeds ±1 V.

CAUTION!
The process supply voltage must be included within the earthing concept of the plant (e.g. earthing of the minus pole).

The module provide several diagnosis functions “Diagnosis” on page 2869.
The measuring ranges are described in the section Measuring Ranges “Parameterization” on page 2863 “Measuring ranges” on page 2872.
The function of the LEDs is described in the section State LEDs “Diagnosis” on page 2869.

Connection of resistance thermometers in 2-wire configuration
When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module C1511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.
The following figure shows the connection of resistance thermometers in 2-wire configuration.
Fig. 215: Connection of resistance thermometers in 2-wire configuration

1. Pt100 (2-wire), Pt1000 (2-wire), Ni1000 (2-wire); 1 analog sensor requires 1 channel

<table>
<thead>
<tr>

<td>2-wire, 1 channel used</td>
</tr>
</tbody>
</table>

The measuring ranges are described in the section Measuring Ranges > Chapter 1.5.3.7.3.1.7 "Parameterization" on page 2863 and Chapter 1.5.3.7.3.1.10 "Measuring ranges" on page 2872.

The module CI511-ETHCAT performs a linearization of the resistance characteristic.

In order to avoid error messages from unused analog input channels, it is useful to configure them as "unused".

Connection of resistance thermometers in 3-wire configuration

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI511-ETHCAT provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration.
Fig. 216: Connection of resistance thermometers in 3-wire configuration

1. Pt100 (3-wire), Pt1000 (3-wire), Ni1000 (3-wire); 1 analog sensor requires 2 channels
2. Twisted pair within the cable
3. Return line: The return line is only needed once if measuring points are adjacent to each other. This saves wiring costs.

With 3-wire configuration, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. I1).

In order to keep measuring errors as small as possible, it is necessary, to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The measuring ranges are described in the section Measuring Ranges & Chapter 1.5.3.7.3.1.7 “Parameterization” on page 2863 & Chapter 1.5.3.7.3.1.10 “Measuring ranges” on page 2872.

Unused input channels can be left open-circuited, because they are of low resistance.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply

The following figure shows the connection of active-type sensors (voltage) with no electrically isolated power supply.
Fig. 219: Connection of active-type sensors (voltage) with no electrically isolated power supply

1. Analog sensor requires 1 channel
2. Power supply not electrically isolated
3. The connection between the minus pole of the sensor and ZP has to be performed
4. Long cable

**NOTICE!**
Risk of faulty measurements!

The negative pole/earthing potential at the sensors must not have too large a potential difference with respect to ZP (max. ±1 V within the full signal range).

Make sure that the potential difference never exceeds ±1 V.

<table>
<thead>
<tr>

*) if the sensor can provide this signal range

The measuring ranges are described in the section Measuring Ranges © Chapter 1.5.3.7.3.1.7 “Parameterization” on page 2863 © Chapter 1.5.3.7.3.1.10 “Measuring ranges” on page 2872.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as “unused”.

**Connection of passive-type analog sensors (Current)**

The following figure shows the connection of passive-type analog sensors (current).
Fig. 220: Connection of passive-type analog sensors (current)

1 analog sensor requires 1 channel

<table>
<thead>
<tr>
<th>Current</th>
<th>4...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
</table>

The measuring ranges are described in the section Measuring Ranges \ Chapter 1.5.3.7.3.1.17 “Parameterization” on page 2863 \ Chapter 1.5.3.7.3.1.10 “Measuring ranges” on page 2872.

**CAUTION!**

If, during initialization, an analog current sensor supplies more than 25 mA for more than 1 second into an analog input, this input is switched off by the module (input protection). In such cases, it is recommended, to protect the analog input by a 10-volt zener diode (in parallel to I+ and I-). But, in general, it is a better solution to prefer sensors with fast initialization or without current peaks higher than 25 mA.

Unused input channels can be left open-circuited, because they are of low resistance.

**Connection of active-type analog sensors (Voltage) to differential inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.

With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).
Important: The earthing potential at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V within the full signal range). Otherwise problems can occur concerning the common-mode input voltages of the involved analog inputs.

The following figure shows the connection of active-type analog sensors (voltage) to differential inputs.

![Diagram of sensor connection]

**Fig. 221: Connection of active-type analog sensors (voltage) to differential inputs**
1. 1 analog sensor requires 2 channels

The measuring ranges are described in the section Measuring Ranges "Parameterization" on page 2863 and Chapter 1.5.3.7.3.1.10 "Measuring ranges" on page 2872.

In order to avoid error messages or long processing times, it is useful to configure unused analog input channels as "unused".

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital input. The inputs are not electrically isolated against the other analog channels.

The following figure shows the use of analog inputs as digital inputs.
**Fig. 222: Use of analog inputs as digital inputs**

1. 1 digital signal requires 1 channel

<table>
<thead>
<tr>

</tbody>
</table>

For further information regarding wiring and cable types see chapter Ethernet § Chapter 1.5.4.4.7 “Ethernet connection details” on page 3084.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.

At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

Addressing

The Ethernet bus module CI511-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI511-ETHCAT does not store configuration data itself.
The analog I/O channels are configured via software.

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.
## Diagnosis

In cases of short circuit or overload, the digital outputs are turned off. The modules perform reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

**Remarks:**

1) In AC500 the following interface identifier applies:

"-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI511-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:

31 = Module itself or ADR = Hardware address (e. g. of the DC551)
With "Module" the following allocation applies dependent of the master:

31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

Diagnosis message appears per channel. The message occurs if the output channel is not active.

**State LEDs**

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

Terminal unit
DIN rail

Intended purpose

The EtherCAT bus module CI512-ETHCAT is used as decentralized I/O module in EtherCAT networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)
- Cam switch functionality
The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

</tr>
</tbody>
</table>

**Electrical connection**

The Ethernet bus module CI512-ETHCAT is plugged on the I/O terminal unit TU507-ETH or TU508-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly chapter.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

- Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
- Terminal 3.8: Process supply voltage UP3 = +24 VDC
- Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.
The assignment of the other terminals:

<table>

**WARNING!**

Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

Risk of damaging the PLC modules!
- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figures show the electrical connection of the Ethernet bus module CI512-ETHCAT.
In case of voltage feedback, 2 cases are distinguished:

1. The outputs are already active

   The output group will be switched off. A diagnosis message will appear. After 5 seconds, the module tries automatic reactivation.

2. The outputs are not active

   Only the output with voltage feedback will not be set to active. A diagnosis message will appear.

CAUTION!

The process supply voltage must be included within the earthing concept of the plant (e.g. earthing of the minus pole).

The module provides several diagnosis functions \(\text{\textcopyright Chapter 1.5.3.7.3.2.9 "Diagnosis" on page 2889.}\)

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment. The pin assignment is used for the EtherCAT master (communication module CM5xy-ETHCAT) as well.
Table 616: Pin assignment RJ45 jack:

<table>

For further information regarding wiring and cable types see chapter Ethernet ♫ Chapter 1.5.4.4.7 “Ethernet connection details” on page 3084.

The EtherCAT network differentiates between input-connectors (IN) and output-connectors (OUT):

- At the EtherCAT slaves (communication interface modules), the ETH1-connector is IN and the ETH2-connector is OUT.
- At the EtherCAT master (communication module), the ETHCAT1 connector has to be used. The ETHCAT2 connector is reserved for future extensions.

Addressing

The Ethernet bus module CI512-ETHCAT does not consider the position of the rotary switches at the front side of the module. The function of the rotary switches is reserved for future expansions.
I/O configuration

In order to be able to use the CI51X-ETHCAT with device index C0 or above properly, please download the corresponding device description (.xml-)files from http://www.abb.com/plc and install them to the device repository of your Automation Builder. This will allow you to use up to 10 Expandable S500 I/O modules as well as the Extended Cam Switch Library with your CI51X-ETHCAT device.

The CI512-ETHCAT does not store configuration data itself. The analog I/O channels are configured via software.

</tbody>
</table>

2) The parameter resolution defines the angle resolution of the track. The value gives the number of increments related to 360°; e. g. the value 36,000 corresponds to an angle resolution of 0.01°.

3) The parameter zeroShift defines the zero shift. With it the encoder can be adjusted to the mounting position. The value of zeroShift is set in encoder-increments. It is not assigned to the parameter resolution of the cam switch.

4) The parameter EncoderBitResolution defines the resolution of the used encoder (in bits), e. g. with the default setting 18 bits the encoder has 196,608 divisions.
Channel parameters for the cam switch (max. 32x)

<table>
<thead>
<tr>
<th>Name</th>

*) The parameter behaviourDOatCommunicationFault is only analyzed if the Failsafe-mode is ON.

**Diagnosis**

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

1) In AC500 the following interface identifier applies:
"." = Diagnosis via bus-specific function blocks; 0 or 4 or 10 = Position of the Communication Module; 14 = I/O-Bus; 31 = Module itself
The identifier is not contained in the CI512-ETHCAT diagnosis block.

2) With "Device" the following allocation applies:
31 = Module itself or ADR = Hardware address (e.g. of the DC551)

3) With "Module" the following allocation applies dependent of the master:
31 = Module itself (Module error) or Module type (1=AI, 2=DO, 3=AO; channel error)

4) Diagnosis message appears for the whole output group and not per channel. The message occurs if the output channel is already active.

5) Diagnosis message appears per channel. The message occurs if the output channel is not active.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:
• The 5 system LEDs (PWR, NET, DC, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
• The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 refer to Chapter 1.5.4.5.1 “System data AC500” on page 3058 and are valid for standard version.

The system data of AC500-XC refer to Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 and are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

**Multiple overloads**

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

Intended purpose

The Modbus TCP bus module CI521-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital outputs 24 V DC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

| Required terminal unit                   | TU507 or TU508  
> Chapter 1.5.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2307 |

Electrical connection

The Ethernet bus module CI521-MODTCP is plugged on the I/O terminal unit TU507-ETH or TU508-ETH  
> Chapter 1.5.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2307. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526  
> Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).

The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.
For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
Terminal 3.8: Process supply voltage UP3 = +24 VDC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

<table>

**Do not connect any voltages externally to digital outputs!**

*Reason:* Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

---

**CAUTION!**

**Risk of malfunction by not intended usage!**

If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0..DO7.

---

**WARNING!**
Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.
Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI521-MODTCP.

**Fig. 228: Connection of the bus module CI521-MODTCP**

Further information is provided in the System Technology chapter CI52x-MODTCP Chapter 1.5.5.3.1 “Modbus communication interface module” on page 3200.

**Connection of the digital inputs**

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.
Fig. 229: Connection of the digital inputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays Chapter 1.5.3.7.4.1.8.2 “State LEDs” on page 2928.

Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
Fig. 230: Connection of configurable digital inputs/outputs to the module CI521-MODTCP

The meaning of the LEDs is described in Displays Chapter 1.5.3.7.4.1.8.2 “State LEDs” on page 2928.

Connection of resistance thermometers in 2-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 231: Connection of resistance thermometers in 2-wire configuration to the analog inputs

The following measuring ranges can be configured “Parameterization” on page 2918 and “Measuring ranges” on page 2930:

<table>
<thead>
<tr>
<th>Thermometer</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+70 °C</td>
<td>2-wire config, 1 channel used</td>
</tr>
<tr>

<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire config, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays “Diagnosis and state LEDs” on page 2924.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of resistance thermometers in 3-wire configuration to the analog inputs

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI521-MODTCP provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
Fig. 232: Connection of resistance thermometers in 3-wire configuration to the analog inputs

With 3-wire configuration, 2 adjacent analog channels belong together (e. g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e. g. I1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured ° Chapter 1.5.3.7.4.1.7 “Parameterization” on page 2918 and ° Chapter 1.5.3.7.4.1.9 “Measuring ranges” on page 2930:

<table>

<th>0...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays ➔ Chapter 1.5.3.7.4.1.8 “Diagnosis and state LEDs” on page 2924.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as “Not used”.

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
CAUTION!
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ± 1 V).
Make sure that the potential difference never exceeds ± 1 V (also not with long cable lengths).

The following measuring ranges can be configured "Parameterization" on page 2918 and "Measuring ranges" on page 2930.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays "Diagnosis and state LEDs" on page 2924.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs
The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
Fig. 236: Connection of passive-type analog sensors (current) to the analog inputs

The following measuring ranges can be configured  Chapter 1.5.3.7.4.1.7 “Parameterization” on page 2918 and  Chapter 1.5.3.7.4.1.9 “Measuring ranges” on page 2930:

| Current | 4...20 mA | 1 channel used |

The function of the LEDs is described under Diagnosis and displays / Displays  Chapter 1.5.3.7.4.1.8 “Diagnosis and state LEDs” on page 2924.

CAUTION!
Risk of overloading the analog input!
If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) to differential analog inputs

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

![Connection diagram](image)

*Fig. 237: Connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.*

</tr>
</tbody>
</table>

### Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

The IP address of the CI521-MODTCP Module can be set with the “ABB IP Configuration Tool” Chapter 1.5.6.2.2.4.2 “Configuration of the IP settings with IP configuration tool” on page 3267.

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

### I/O configuration

The CI521-MODTCP stores configuration parameters (IP address configuration, module parameters).

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization Chapter 1.5.3.7.4.1.7 “Parameterization” on page 2918.

</table>

1) With a faulty ID, the Modules reports a "parameter error" and does not perform cyclic process data transmission.

2) Counter operating modes, see description of the Fast Counter Chapter 1.5.5.1.10 “Fast counters” on page 3194.

3) Fixed Mapping means each module has its own Modbus registers for data transfer independent of the IO bus constellation. See Modbus TCP Registers description for details Chapter 1.5.5.3.1.2 “Modbus TCP registers” on page 3201.

Dynamic mapping means the structure of the IO Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.

4) If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

### Table 621: Error LED / Failsafe function

</tr>
</tbody>
</table>

*) In the operating modes with 3-wire configuration or with differential inputs, two adjacent analog inputs belong together (e.g. the channels 0 and 1). In these cases, both channels are configured in the desired operating mode. The lower address must be the even address (channel 0). The next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

</tr>
</tbody>
</table>

1) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.

2) The state "externally voltage detected" appears, if the output of a channel DC0..DC7 should be switched on while an externally voltage is connected. The state "externally voltage detected" is only analyzed if the Failsafe-mode is ON. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".
## Diagnosis and state LEDs

### Structure of the diagnosis block

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis Byte, slot number</td>
<td>31 = CI521-MODTCP (e.g. error at integrated 8 DI / 8 DO)</td>
</tr>
<tr>
<td></td>
<td></td>

<tr>
<td></td>
<td></td>
<td>2 = E3</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3 = E4</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 0 to bit 5, coded error description</td>
</tr>
<tr>
<td>5</td>
<td>Diagnosis Byte, flags</td>
<td>According to the I/O bus specification</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

Remarks:
In AC500 the following interface identifier applies:
"-" = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself
The identifier is not contained in the CI521-MODTCP diagnosis block.

With "Device" the following allocation applies: 31 = Module itself; 1..10 = Expansion module

With "Module" the following allocation applies:
31 = Module itself
Module type (1 = AI, 2 = DO, 3 = AO)

This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage. Chapter 1.5.3.7.4.1.3 "Electrical connection" on page 2900. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0...DO7 has overrun the process supply voltage. Chapter 1.5.3.7.4.1.3 "Electrical connection" on page 2900. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 100ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

---

State LEDs

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 \( \Rightarrow \) Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC \( \Rightarrow \) Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

### Relationship between input signal and hex code

The relationship between input signal and hex code is specified in Chapters 1.5.3.7.4.1.9.1 "Input ranges voltage, current and digital input" on page 2930 and 1.5.3.7.4.1.9.2 "Input ranges resistance temperature detector" on page 2930.

### Unused inputs

Unused inputs are configured as "unused" (default value).

### Overvoltage protection

Yes.

### Intended purpose

Modbus TCP bus module CI522-MODTCP is used as decentralized I/O module in Modbus TCP networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit. The bus module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs in 1 group (1.0...1.7)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the configurable digital inputs/outputs is performed by software.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

### Functionality

<table>

</tr>
</tbody>
</table>
Electrical connection

The Ethernet bus module CI522-MODTCP is plugged on the I/O terminal unit TU507-ETH. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526). The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter “Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC

Terminal 3.8: Process supply voltage UP3 = +24 VDC

Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Conditions for undisturbed operating with older I/O expansion modules

All I/O expansion modules that are attached to the CI52x-MODTCP must be powered up together with the CI52x-MODTCP if the firmware version of these I/O expansion modules is V1.9 or lower.

The firmware version is related to the index. The index is printed on the module type label on the right side.

Modules as of index listed in the following table can be powered up independently.

<table>

</table>
Do not connect any voltages externally to digital outputs!

This ist not intended usage.

Reason: Externally voltages at one or more terminals DC0...DC7 or DO8...DO15 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).

This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.

This limitation does not apply for the input channels DI0..DI7.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO8...DO15 and DC0...DC7.

**WARNING!**
*Removal/Insertion under power*

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**
*Risk of damaging the PLC modules!*

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the Ethernet bus module CI522-MODTCP.

*Fig. 242: Connection of the bus module CI522-MODTCP*
Further information is provided in the System Technology chapter **CI52x-MODTCP** Chapter 1.5.5.3.1 “Modbus communication interface module” on page 3200.

### Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.

![Connection of the digital inputs to the module CI522-MODTCP](image)

*Fig. 243: Connection of the digital inputs to the module CI522-MODTCP*

The meaning of the LEDs is described in Displays **Chapter 1.5.3.7.4.2.8.1 “State LEDs”** on page 2955.

### Connection of the digital outputs

The following figure shows the electrical connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.
The meaning of the LEDs is described in Displays Chapter 1.5.3.7.4.2.8.1 “State LEDs” on page 2955.

Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!
If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device Chapter 1.5.3.7.4.2.3 “Electrical connection” on page 2940.
The meaning of the LEDs is described in Displays "Chapter 1.5.3.7.4.2.8.1 "State LEDs" on page 2955.

Assignment of the Ethernet ports

The terminal unit for the Communication Interface Module provides two Ethernet interfaces with the following pin assignment:

Addressing

The IP address of the CI5221-MODTCP Module can be set with the "ABB IP Configuration Tool" Chapter 1.5.6.2.4.2 “Configuration of the IP settings with IP configuration tool” on page 3267.

If the last byte of the IP is set to 0, the address switch will be used instead.

Address switch position 255 is mapped to fixed IP 192.168.0.254 independent of other stored settings. This is a backup so the module can always get a valid IP address and can be configured by the “ABB IP Configuration Tool”.

Address switch position 0 is mapped to last byte equal 1 and DHCP enabled.

The factory setting for the IP is 192.168.0.x (last byte is address switch).

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI522-MODTCP stores configuration parameters (IP address configuration, module parameters).

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization Chapter 1.5.3.7.4.2.7 “Parameterization” on page 2947.

</tr>
</tbody>
</table>

Remarks:

1) With a faulty ID, the module reports a "parameter error" and does not perform cyclic process data transmission.

2) Counter operating modes · Chapter 1.5.3.6.1.2.9 “Fast counter” on page 2543
Fixed Mapping means each module has its own Modbus registers for data transfer independent of the I/O bus constellation. See \textit{Modbus TCP Registers} description for details \cite{chap1.5.3.1.2} "Modbus TCP registers" on page 3201.

Dynamic mapping means the structure of the I/O Date is dependent on the I/O bus constellation. Each I/O bus expansion module starts directly after the module before on the next Word adress.

If none of the parameters is set all masters / clients in the network have read and write rights on the CI52x-MODTCP device and its connected expansion modules.

If at least one parameter is set only the configured masters / clients have write rights on the CI52x-MODTCP device, all other masters / clients still have read access to the CI52x-MODTCP device.

</tr>
</tbody>
</table>

Remarks:

¹) The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

²) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

³) The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3 (see description in section). The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

</tr>
<tr>
<td>6</td>
<td>Reserved</td>
<td>0</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

*For diagnosis firmware version ≥ 3.2.6 is required.*

Remarks:
In AC500 the following interface identifier applies:

"." = Diagnosis via bus-specific function blocks; 0 ... 4 or 10 = Position of the Communication Module; 14 = I/O bus; 31 = Module itself

The identifier is not contained in the CI502-PNIO diagnosis block.

With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module

With "Module" the following allocation applies dependent of the master:

Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO8...DO15 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in Electrical Connection  Chapter 1.5.3.7.4.2.3 “Electrical connection” on page 2940. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage at digital outputs DC0...DC7 and accordingly DO8...DO15 has exceeded the process supply voltage UP3  Chapter 1.5.3.7.4.2.3 “Electrical connection” on page 2940. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DC0...DC7 oder DO8...DO15 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 2000ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.
The system data of AC500-XC 

Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.

Only additional details are therefore documented below.
The technical data are also valid for the XC version.

| Operation and error displays                 | 34 LEDs (totally)                                                   |
| Weight (without Terminal Unit)               | Ca. 125 g                                                           |
| Mounting position                            | Horizontal or vertical with derating (output load reduced to 50 % at 40°C per group) |
| Extended ambient temperature (XC version)     | > 60 °C on request                                                  |
| Cooling                                       | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet. |
**NOTICE!**  
**Attention:**  
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

### Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

Technical data of the configurable digital inputs/outputs

Each of the configurable I/O channels is defined as input or output by the user program. This is done by interrogating or allocating the corresponding channel.

<table>

</tbody>
</table>
*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

1.5.3.7.5 PROFINET

Comparison of the CIxyz-PNIO modules

The PROFINET IO devices combine the advantages of decentralized I/O modules with the reaction time of AC500 mounted central I/O modules. The devices for PROFINET provide the extension -PNIO in the device name.
The Communication Module CM579-PNIO acts as IO Controller in a PROFINET network. It is connected to the Processor Module via an internal communication bus. Depending on the Terminal Base, several Communication Modules can be used for one Processor Module.

The Communication Interface Modules CIxyz-PNIO act as IO Devices in a PROFINET network. Additionally the communication module CM589-PNIO(-4) can be used to setup a AC500 PLC to act as IO Device in a PROFINET network.

The difference of the CIxyz-PNIO devices can be found in their input and output characteristics

The characteristics for CM589-PNIO(-4) can be found in the device description for CM589-PNIO.

Input/Output characteristics of CI501-PNIO

The PROFINET Bus Module CI501-PNIO is used as decentralized I/O module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the Terminal Unit. The Bus Module contains 22 I/O channels with the following properties:

- 4 analog inputs (1.0...1.3), configurable as:
  - -10 ... +10 V
  - 0 ... +10 V
  - -10 ... +10 V (differential voltage)
  - 0 ... 20 mA
  - 4 ... 20 mA
  - Pt100, Pt1000, Ni1000 (for each 2-wire and 3-wire)
  - 24 V digital input function
- 2 analog outputs (1.5...1.6), configurable as:
  - -10 ... +10 V
  - 0 ... 20 mA
  - 4 ... 20 mA
- 8 digital inputs 24 V DC in 1 group (2.0...2.7)
- 8 digital transistor outputs 24 V DC (0.5 A max.) in 1 group (3.0...3.7)
- Resolution of the analog channels: 12 bits

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Input/Output characteristics of CI502-PNIO

- 8 digital inputs 24 V DC
- 8 digital transistor outputs 24 V DC, 0.5 A max.
- 8 configurable digital inputs/outputs 24 V DC, 0.5 A max.
- Module-wise electrically isolated
- XC version for usage in extreme ambient conditions available

**Intended purpose**

The PROFINET bus modules CI501-PNIO and CI502-PNIO are used as communication interface modules in PROFINET networks. The network connection is performed by Ethernet cables which are inserted in the RJ45 connectors in the terminal unit. An Ethernet switch in the communication interface module allows daisy chaining of the network.

For usage in enhanced ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

**Functionality**

The bus module contains 22 I/O channels with the following properties:

- 4 configurable analog inputs (2-wire / single-ended) or 2 configurable analog inputs (3-wire / differential) (1.0...1.3)
- 2 analog outputs (1.5...1.6)
- 8 digital inputs 24 VDC in 1 group (2.0...2.7)
- 8 digital outputs 24 VDC, 0.5 A max. in 1 group (3.0...3.7)

The inputs/outputs are electrically isolated from the PROFINET network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

</tr>
</tbody>
</table>

**Electrical connection**

The Ethernet bus module CI501-PNIO is plugged on the I/O terminal unit TU507-ETH or TU508-ETH \(\text{\textsuperscript{\(\textcircled{\textbullet}\)}}\) Chapter 1.5.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2307. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 \(\text{\textsuperscript{\(\textcircled{\textbullet}\)}}\) Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).
The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter $\text{* Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.}$

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:

Terminals 1.8 and 2.8: Process supply voltage $\text{UP} = +24 \text{ VDC}$

Terminal 3.8: Process supply voltage $\text{UP3} = +24 \text{ VDC}$

Terminals 1.9, 2.9 and 3.9: Process supply voltage $\text{ZP} = 0 \text{ V}$

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!

Reason: Externally voltages at an output or several outputs may cause that other outputs are supplied through that voltage instead of voltage UP3 (reverse voltage). This is not intended usage.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is connected at the outputs DO0...DO7.

The assignment of the other terminals:

**WARNING!**

**Removal/Insertion under power**

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

**NOTICE!**

**Risk of damaging the PLC modules!**

Overvoltages and short circuits might damage the PLC modules.
- Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
- Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.
For the open-circuit detection (cut wire), each analog input channel is pulled up to "plus" by a high-resistance resistor. If nothing is connected, the maximum voltage will be read in then.

Generally, analog signals must be laid in shielded cables. The cable shields must be earthed at both sides of the cables. In order to avoid unacceptable potential differences between different parts of the installation, low resistance equipotential bonding conductors must be laid.

Only for simple applications (low electromagnetic disturbances, no high requirement on precision), the shielding can also be omitted.

The following figures show the electrical connection of the Ethernet bus module CI501-PNIO.

Further information is provided in the System Technology chapter PROFINET.

Connection of the digital inputs

The following figure shows the electrical connection of the digital input DI0. Proceed with the digital inputs DI1 to DI7 in the same way.
The meaning of the LEDs is described in Displays Chapter 1.5.3.5.2.8.2 “State LEDs” on page 2993.

**Connection of the digital outputs**

The following figure shows the electrical connection of the digital output DO0. Proceed with the digital outputs DO1 - DO7 in the same way.
The meaning of the LEDs is described in Displays \( \Leftrightarrow \) Chapter 1.5.3.7.5.2.8.2 “State LEDs” on page 2993.

**Connection of resistance thermometers in 2-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 2-wire configuration to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured “Parameterization” on page 2982 “Input ranges voltage, current and digital input” on page 2995:

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Measuring Range</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Pt1000</td>
<td>-50 °C...+400 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
<tr>
<td>Ni1000</td>
<td>-50 °C...+150 °C</td>
<td>2-wire configuration, 1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays “Diagnosis and state LEDs” on page 2988.

The module CI501-PNIO performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".

**Connection of resistance thermometers in 3-wire configuration to the analog inputs**

When resistance thermometers (Pt100, Pt1000, Ni1000) are used, a constant current must flow through them to build the necessary voltage drop for the evaluation. For this, the module CI501-PNIO provides a constant current source which is multiplexed over the max. 4 analog input channels.

The following figure shows the connection of resistance thermometers in 3-wire configuration to the analog inputs AI0 and AI1. Proceed with the analog inputs AI2 and AI3 in the same way.
With 3-wire configuration, 2 adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1).

The constant current of one channel flows through the resistance thermometer. The constant current of the other channel flows through one of the cores. The module calculates the measured value from the two voltage drops and stores it under the input with the higher channel number (e.g. 1).

In order to keep measuring errors as small as possible, it is necessary to have all the involved conductors in the same cable. All the conductors must have the same cross section.

The following measuring ranges can be configured: Chapter 1.5.3.7.5.2.7 "Parameterization" on page 2982 Chapter 1.5.3.7.5.2.9.1 "Input ranges voltage, current and digital input" on page 2995:

<table>

</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays Chapter 1.5.3.7.5.2.8 "Diagnosis and state LEDs" on page 2988.

The module CI501-PNIO performs a linearization of the resistance characteristic.

To avoid error messages from unused analog input channels, configure them as "unused".
Connection of active-type analog sensors (Voltage) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of active-type analog sensors (Current) with electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (current) with electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured in Chapter 1.5.3.7.2.7 “Parameterization” on page 2982 and Chapter 1.5.3.7.2.9.1 “Input ranges voltage, current and digital input” on page 2995:

<table>
<thead>
<tr>
<th>Current</th>
<th>0 mA...20 mA</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current</td>
<td>4 mA...20 mA</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays in Chapter 1.5.3.7.2.8 “Diagnosis and state LEDs” on page 2988.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

Connection of active-type analog sensors (Voltage) with no electrically isolated power supply to the analog inputs

The following figure shows the connection of active-type analog sensors (voltage) with no electrically isolated power supply to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
CAUTION!
Risk of faulty measurements!
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V (also not with long cable lengths).

The following measuring ranges can be configured: Chapter 1.5.3.7.5.2.7 “Parameterization” on page 2982.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>1 channel used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>
<td>1 channel used</td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays Chapter 1.5.3.7.5.2.8 “Diagnosis and state LEDs” on page 2988.

To avoid error messages from unused analog input channels, configure them as "unused".

Connection of passive-type analog sensors (Current) to the analog inputs

The following figure shows the connection of passive-type analog sensors (current) to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.
The following measuring ranges can be configured on page 2982:

- Current
  - 4 mA...20 mA
  - 1 channel used

The function of the LEDs is described under Diagnosis and displays on page 2988.

**CAUTION!**
Risk of overloading the analog input!

If an analog current sensor supplies more than 25 mA for more than 1 second during initialization, this input is switched off by the module (input protection).

Use only sensors with fast initialization or without current peaks higher than 25 mA. If not possible, connect a 10-volt zener diode in parallel to AIx+ and ZP.

Unused input channels can be left open-circuited, because they are of low resistance.

To avoid error messages through unused analog input channels in measuring range 4 mA...20 mA, these channels should be configured as "Not used".

**Connection of active-type analog sensors (Voltage) to differential analog inputs**

Differential inputs are very useful, if analog sensors are used which are remotely non-isolated (e.g. the minus terminal is remotely earthed).

The evaluation using differential inputs helps to considerably increase the measuring accuracy and to avoid earthing loops.
With differential input configurations, two adjacent analog channels belong together (e.g. the channels 0 and 1). In this case, both channels are configured according to the desired operating mode. The lower address must be the even address (channel 0), the next higher address must be the odd address (channel 1). The converted analog value is available at the higher address (channel 1).

The analog value is calculated by subtraction of the input value with the higher address from the input value of the lower address.

The converted analog value is available at the odd channel (higher address).

**CAUTION!**
**Risk of faulty measurements!**
The minus pole at the sensors must not have a too big potential difference with respect to ZP (max. ±1 V).

Make sure that the potential difference never exceeds ±1 V.

The following figure shows the connection of active-type analog sensors (voltage) to differential analog inputs AI0 and AI1. Proceed with AI2 and AI3 in the same way.

The following measuring ranges can be configured:

<table>
<thead>
<tr>
<th>Voltage</th>
<th>0 V...10 V</th>
<th>With differential inputs, 2 channels used</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage</td>
<td>-10 V...+10 V</td>

</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays / Displays. See Chapter 1.5.3.7.5.2.8 “Diagnosis and state LEDs” on page 2988.
To avoid error messages from unused analog input channels, configure them as “unused”.

**Use of analog inputs as digital inputs**

Several (or all) analog inputs can be configured as digital inputs. The inputs are not electrically isolated against the other analog channels.

The following figure shows the connection of digital sensors to the analog input AI0. Proceed with the analog inputs AI1 to AI3 in the same way.

![Fig. 246: Use of analog inputs as digital inputs](image)

The following measuring ranges can be configured "Parameterization" on page 2982 "Input ranges voltage, current and digital input" on page 2995:

<td></td>
</tr>
</tbody>
</table>

The function of the LEDs is described under Diagnosis and displays “Diagnosis and state LEDs” on page 2988.

Unused analog outputs can be left open-circuited.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Pin</th>
<th>Signal</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet RJ45</td>
<td>1</td>
<td>TxD+</td>
<td>Transmit data +</td>
</tr>
<tr>
<td>2</td>
<td>TxD-</td>
<td>Transmit data -</td>
<td></td>
</tr>
<tr>
<td>3</td>

<tr>
<td>Counter output data (words)</td>
<td>8</td>
</tr>
</tbody>
</table>

Addressing

The module reads the position of the rotary switches only during power-up, i.e. changes of the switch position during operation will have no effect until the next module initialization.

I/O configuration

The CI501-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O device type and IP address configuration). No more configuration data is stored.

The analog/digital I/O channels are configured via software.

Details about configuration are described in Parameterization Chapter 1.5.3.7.5.2.7 “Parameterization” on page 2982.

</tbody>
</table>

Remarks:

²) Table 634 “Error LED / Failsafe function” on page 2984
3) The value 10 is used for mistake.
With a faulty ID, the modules reports a "parameter error" and does not perform cyclic process data transmission.

As for device index C0 the parameter is no longer evaluated.

Counter operating modes, see description of the Fast counter § Chapter 1.5.3.6.1.2.9 “Fast counter” on page 2543.

</table>

¹) The parameters Behaviour DO at comm. error is only analyzed if the Failsafe-mode is ON.
²) The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

Diagnosis and state LEDs

Structure of the diagnosis block via PNIO_DEV_ALARM function block

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>

<td></td>
<td></td>
<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Remarks:

1) In AC500 the following interface identifier applies:
   
   
   "." = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the communication module; 14 = I/O bus; 31 = Module itself
   
   The identifier is not contained in the CI501-PNIO diagnosis block.

2) With "Device" the following allocation applies: 31 = Module itself; 1...10 = Expansion module

3) With "Module" the following allocation applies:
   
   31 = Module itself
   
   Module type (1 = AI, 2 = DO, 3 = AO)
This message appears, if externally voltages at one or more terminals DO0...DO7 cause that other digital outputs are supplied through that voltage. Chapter 1.5.3.7.5.2.3 “Electrical connection” on page 2966. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage on digital outputs DO0...DO7 has overrun the process supply voltage UP3. Chapter 1.5.3.7.5.2.3 “Electrical connection” on page 2966. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 100 ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn’t support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

State LEDs

The LEDs are located at the front of module. There are 2 different groups:

- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 27 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

**Technical data**

The system data of AC500 and S500 © *Chapter 1.5.4.5.1 “System data AC500” on page 3058* are valid for standard version.

The system data of AC500-XC © *Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099* are valid for the XC version.

Only additional details are therefore documented below.

The technical data are also valid for the XC version.

</tbody>
</table>
### Parameter | Value
---|---
Output data length | 2 bytes
Reference potential for all digital inputs and outputs | Minus pole of the supply voltage, signal name ZP
Setting of the IO device identifier | With 2 rotary switches at the front side of the module
Diagnose | See Diagnosis and Displays "Chapter 1.5.3.7.5.2.8 "Diagnosis and state LEDs" on page 2988"
Operation and error displays | 32 LEDs (totally)
Weight (without terminal unit) | Ca. 125 g
Mounting position | Horizontal or vertical with derating (output load reduced to 50 % at 40 °C per group)
Extended ambient temperature (XC version) | >60 °C on request
Cooling | The natural convection cooling must not be hindered by cable ducts or other parts in the switch-gear cabinet.

---

**NOTICE!**  
**Attention:**  
All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**Multiple overloads**  
*No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.*

---

### Parameter | Value
---|---
Bus connection | 2 x RJ45
Switch | Integrated
Technology | Hilscher netX100
Transfer rate | 10/100 Mbit/s (full-duplex)
Transfer method | According to Ethernet II, IEE802.3
Ethernet | 100 base-TX, internal switch, 2x RJ45 socket
Expandability | Max. 10 S500 I/O modules
Adjusting elements | 2 rotary switches for generation of an explicit name
**Parameter** | **Value**
---|---
Supported protocols | RTC - real time cyclic protocol, class 1 *)
RTA - real time acyclic protocol
DCP - discovery and configuration protocol
CL-RPC - connectionless remote procedure Call
LLDP - link layer discovery protocol
MRP - MRP Client

Acyclic services | PNIO read / write sequence (max. 1024 bytes per telegram)
Process-Alarm service

Supported alarm types | Process Alarm, Diagnostic Alarm, Return of SubModule, Plug Alarm, Pull Alarm

Min. bus cycle | 1 ms

Conformance class | CC A

Protective functions (according to IEC 61131-3) | Protected against:
- short circuit
- reverse supply
- overvoltage
- reverse polarity
Electrical isolation from the rest of the module

*) Priorization with the aid of VLAN-ID including priority level

---

Intended purpose

The PROFINET bus module CI502-PNIO is used as communication interface module in PROFINET networks. The network connection is performed via 2 RJ45 connectors which are integrated in the terminal unit.

For usage in extreme ambient conditions (e.g. wider temperature and humidity range), a special XC version of the device is available.

Functionality

The CI502 Bus Module contains 24 I/O channels with the following properties:

- 8 digital configurable inputs/outputs
- 8 digital inputs: 24 VDC
- 8 digital outputs: 24 VDC, 0.5 A max.

The inputs/outputs are electrically isolated from the Ethernet network. There is no potential separation between the channels. The configuration of the analog inputs/outputs is performed by software.

Electrical connection

The Ethernet bus module CI502-PNIO is plugged on the I/O terminal unit TU507-ETH § Chapter 1.5.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2307 or TU508-ETH § Chapter 1.5.3.5.1 “TU507-ETH and TU508-ETH for Ethernet communication interface modules” on page 2307. Properly seat the module and press until it locks in place. The terminal unit is mounted on a DIN rail or with 2 screws plus the additional accessory for wall mounting (TA526 § Chapter 1.5.3.8.1.4 “TA526 - Wall mounting accessory” on page 3035).
The electrical connection of the I/O channels is carried out using the 30 terminals of the I/O terminal unit. I/O modules can be replaced without re-wiring the terminal units.

For a detailed description of the mounting, disassembly and electrical connection of the module, please refer to the System Assembly, Construction and Connection chapter & Chapter 1.5.4.5 “AC500 (Standard)” on page 3058.

The terminals 1.8 and 2.8 as well as 1.9, 2.9 and 3.9 are electrically interconnected within the terminal unit and have always the same assignment, independent of the inserted module:
Terminals 1.8 and 2.8: Process supply voltage UP = +24 VDC
Terminal 3.8: Process supply voltage UP3 = +24 VDC
Terminals 1.9, 2.9 and 3.9: Process supply voltage ZP = 0 V.

The assignment of the other terminals:

<table>

</tr>
</tbody>
</table>

With a separate UP3 power supply, the digital outputs can be switched off externally. This way, an emergency-off functionality can be realized.

Do not connect any voltages externally to digital outputs!
This is not intended usage.
Reason: Externally voltages at one or more terminals DC0..DC7 or DO0..DO7 may cause that other digital outputs are supplied through that voltage instead of voltage UP3 (reverse voltage).
This is also possible, if DC channels are used as inputs. For this, the source for the input signals should be the impressed UP3 of the device.
This limitation does not apply for the input channels DI0..DI7.

CAUTION!
Risk of malfunction by not intended usage!
If the function cut off of the digital outputs should be used by deactivation of the supply voltage UP3, be sure that no external voltage is conncted at the outputs DO0...DO7 and DC0...DC7.

The assignment of the other terminals:

WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

NOTICE!

Risk of damaging the PLC modules!

Overvoltages and short circuits might damage the PLC modules.

– Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
– Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

The following figure shows the electrical connection of the Ethernet bus module CI502-PNIO. Further information is provided in the System Technology chapter PROFINET.

[Diagram of electrical connection]

Further information is provided in the System Technology chapter PROFINET.
Connection of the Digital inputs

The following figure shows the electrical connection of the digital input DI8. Proceed with the digital inputs DI9 to DI15 in the same way.

The meaning of the LEDs is described in Displays Chapter 1.5.3.7.5.3.8.1 “State LEDs” on page 3020.
Connection of the Digital outputs

The following figure shows the electrical connection of the digital output DO8. Proceed with the digital outputs DO9 - DO15 in the same way.

The meaning of the LEDs is described in Displays  Chapter 1.5.3.7.5.3.8.1 “State LEDs” on page 3020.
Connection of the configurable digital inputs/outputs

The following figure shows the electrical connection of the configurable digital input/output DC0 and DC1. DC0 is connected as an input and DC1 is connected as an output. Proceed with the configurable digital inputs/outputs DC2 to DC7 in the same way.

CAUTION!

If a DC channel is used as input, the source for the input signals should be the impressed UP3 of the device % Chapter 1.5.3.7.5.3.3 “Electrical connection” on page 3006.

The meaning of the LEDs is described in Displays % Chapter 1.5.3.7.5.3.8.1 “State LEDs” on page 3020.

Assignment of the Ethernet ports

The terminal unit for the communication interface module provides two Ethernet interfaces with the following pin assignment:

Addressing

The module reads the position of the rotary switches only during power-up, i.e.
changes of the switch position during operation will have no effect until the next
module initialization.

I/O configuration

The CI502-PNIO stores some PROFINET configuration parameters (I/O device identifier, I/O
device type and IP address configuration). No more configuration data is stored.

The digital I/O channels are configured via software.

Details about configuration are described in Parameterization Chapter 1.5.3.7.5.3.7 “Para-
terization” on page 3013.

Remarks:
The parameter Behaviour DO at comm. error is apply to DC and DO channels and only analyzed if the Failsafe-mode is ON.

The state "externally voltage detected" appears, if the output of a channel DC0...DC7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. The monitoring of this state and the resulting diagnosis message can be disabled by setting the parameters to "OFF".

The error state "voltage overflow at outputs" appears, if externally voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3. The according diagnosis message "Voltage overflow on outputs " can be disabled by setting the parameters on "OFF". This parameter should only be disabled in exceptional cases for voltage overflow may produce reverse voltage.

### Diagnosis

Structure of the Diagnosis Block via **PNIO_DEV_ALARM** Function Block.

<table>
<thead>
<tr>
<th>Byte Number</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Diagnosis Byte, slot number</td>
<td>31 = CI502-PNIO (e. g. error at integrated 8 DI / 8 DO)</td>

</tr>
<tr>
<td></td>
<td></td>
<td>Bit 7: 1 = coming error</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Bit 6: 1 = leaving error</td>
</tr>
</tbody>
</table>

In cases of short circuit or overload, the digital outputs are turned off. The modules performs reactivation automatically. Thus an acknowledgement of the errors is not necessary. The error message is stored via the LED.

Module errors:

- **Checksum error in the I/O module**: Replace I/O module
- **Timeout in the I/O module**: Replace I/O module
- **Different hard-/firmware versions in the module**: Replace I/O module
- **Internal error in the module**: Replace I/O module
- **Internal data exchange failure**: Restart
- **Overflow diagnosis buffer**: Check master
- **Parameter error**: Check master
- **Process voltage UP too low**: Check process supply voltage
- **Process voltage UP gone**: Check process supply voltage
- **No communication with I/O device**: Replace I/O module
- **Wrong I/O device type on socket**: Replace I/O module / Check configuration
- **At least one module does not support failsafe function**: Check modules and parameterization

</tbody>
</table>

Remarks:
In AC500 the following interface identifier applies:
"-" = Diagnosis via bus-specific function blocks; 0...4 or 10 = Position of the Communication Module; 14 = I/O-Bus; 31 = Module itself
The identifier is not contained in the CI502-PNIO diagnosis block.

With "Device" the following allocation applies: 31 = Module itself, 1..10 = Expansion module

With "Module" the following allocation applies dependent of the master:
Module error: 31 = Module itself
Channel error: Module type (1 = AI, 2 = DO, 3 = AO)

This message appears, if externally voltages at one or more terminals DC0...DC7 oder DO0...DO7 cause that other digital outputs are supplied through that voltage (voltage feedback, see description in Electrical Connection “Electrical connection” on page 3006. All outputs of the apply digital output groups will be turned off for 5 seconds. The diagnosis message appears for the whole output group.

The voltage at digital outputs DC0...DC7 and accordingly DO0...DO7 has exceeded the process supply voltage UP3 “Electrical connection” on page 3006. Diagnosis message appears for the whole module.

This message appears, if the output of a channel DC0...DC7 or DO0...DO7 should be switched on while an externally voltage is connected. In this case the start up is disabled, as long as the externally voltage is connected. Otherwise this could produce reverse voltage from this output to other digital outputs. This diagnosis message appears per channel.

Short circuit: After a detected short circuit, the output is deactivated for 2000 ms. Then a new start up will be executed. This diagnosis message appears per channel.

In case of an I/O module doesn't support hot swapping, do not perform any hot-swap operations (also not on any other terminal units (slots)) as modules may be damaged or I/O bus communication may be disturbed.

Diagnosis for hot swap available as of version index F0.

### State LEDs

The LEDs are located at the front of module. There are 2 different groups:
- The 5 system LEDs (PWR, STA1 ETH, STA2 ETH, S-ERR and I/O-Bus) show the operation state of the module and display possible errors.
- The 29 process LEDs (UP, UP3, inputs, outputs, CH-ERR1 to CH-ERR3) show the process supply voltage and the states of the inputs and outputs and display possible errors.

### Technical data

The system data of AC500 and S500 ☞ Chapter 1.5.4.5.1 “System data AC500” on page 3058 are valid for standard version.

The system data of AC500-XC ☞ Chapter 1.5.4.6.1 “System data AC500-XC” on page 3099 are valid for the XC version.
Only additional details are therefore documented below.
The technical data are also valid for the XC version.

</tbody>
</table>

**NOTICE!**

**Attention:**

All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.
Multiple overloads

No effects of multiple overloads on isolated multi-channel modules occur, as every channel is protected individually by an internal smart high-side switch.

</tbody>
</table>

*) Due to the direct connection to the output, the demagnetizing varistor is also effective at the input (see figure) above. This is why the difference between UPx and the input signal may not exceed the clamp voltage of the varistor. The varistor limits the voltage to approx. 36 V. Following this, the input voltage must range from -12 V to +30 V when UPx = 24 V and from -6 V to +30 V when UPx = 30 V.

### 1.5.3.8 Accessories

#### 1.5.3.8.1 AC500 (standard)

**MC502 - SD memory card**

- Secure digital card
- Solid state flash memory storage

![](SD_card.png)

**Purpose**

The SD memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without SD memory card.

AC500/AC500-eCo processor modules are supplied without SD memory card. It therefore must be ordered separately.

The MC memory card can be read on a PC with a standard memory card reader. AC500 processor modules are equipped with an MC memory card reader.

For AC500-eCo processor modules the device must be equipped with a MC503 SD memory card adaptor.

*The SD memory card has a write protect switch. In the position "LOCK", the card can only be read.*
The use of memory cards other than the MC502 SD memory card is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

NOTICE!
Removal of the SD memory card
Do not remove the SD memory card during access. Remove only when the RUN LED does not blink. Otherwise the SD memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

Unpack the SD memory card and insert it into the opening of the front face of the processor module until locked:

Fig. 249: Insertion: PM57x, PM58x, PM59x and PM56xx
To remove the SD memory card, push on the card until it moves forward. By this, the card is unlocked and can be removed.

</tr>
</tbody>
</table>

It is not possible to use 100 % of a device’s memory space. About 10 % of the total available space must remain unused at any time to maintain normal device operation.

Further information on using the SD memory card in AC500 PLCs is provided in the chapter Storage Devices § Chapter 1.5.7.2 “SD memory card in AC500” on page 3513.

### TA521 - Lithium battery

- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

The TA521 lithium battery is the only applicable battery for the AC500 processor modules and PM56xx. Chapter 1.5.3.3.1.1 “PM56xx-2ETH for AC500 V3 products” on page 2274. It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery. Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116.

The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

#### Handling instructions

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

### Battery lifetime

The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.
To avoid a short battery discharge, the battery should always be inserted or replaced while the process module is under power, then the battery is correctly recognized and will not shortly discharged.

Fig. 250: Insertion of the Lithium battery

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the TA521 battery from its package and hold it by the small cable.

3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = plus-pole = above).

4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.

5. Arrange the cable in order not to inhibit the door to close.

6. Pull-up the door and press until the locking mechanism snaps.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.
To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.
TA524 is used to cover an unused communication module slot of a terminal base and TB56xx. It protects the terminal base from dust and inadvertent touch.

Handling instructions

TA524 is mounted in the same way as a common communication module.

1.5.3.8.2 S500

**TA523 - Pluggable marker holder**

For labelling the channels of S500 I/O modules.
1 Pluggable Marker Holder TA523
2 Marking stripes to be inserted into the holder
3 Pluggable Marker Holder, snapped on an I/O module

**Purpose**

The Pluggable Marker Holder is used to hold 4 marking stripes, on which the meaning of the I/O channels of I/O modules can be written down. The holder is transparent so that after snapping it onto the module the LEDs shine through.

**Handling instructions**

TA525 - Plastic markers
Accessory to label AC500 and S500 modules.

1. Module without Plastic Marker TA525
2. Module with Plastic Marker TA525

Purpose
The Plastic Markers are suitable for labelling AC500 and S500 modules (CPUs, communication modules and I/O modules). The small plastic parts can be written with a standard waterproof pen.

Handling instructions
The Plastic Markers are inserted under a slight pressure. For disassembly, a small screwdriver is inserted at the lower edge of the module.

1.5.4 System assembly, construction and connection
1.5.4.1 Introduction
This chapter provides information on assembly, construction and connection of control systems of the product family AC500.

The AC500 product family consists of the sub-families:
- AC500 (standard): standard PLC that offers a wide range of performance levels and scalability.
- AC500-eCo: cost-effective PLC that offers total inter-operability with the core AC500 range.
- AC500-S: PLC for special safety requirements in all functional safety applications.

AC500 (standard) and AC500-S provide devices with -XC extension as a product variant. Those devices operate mainly identical to the appropriate AC500 product family, however, can be operated under extreme conditions "Chapter 1.5.4.6.1 "System data AC500-XC" on page 3099."

AC500 product family is characterized by functional modularity, i.e. the devices of all AC500 sub-families can be combined flexible.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section. Details that are only valid for a specific AC500 sub-family are described in separate sections.

As assembly, construction and connection for the devices of the AC500 product family is similar, information that is valid for all sub-families is provided within an overall section "Chapter 1.5.4.4 "Overall information (valid for complete AC500 product family)" on page 3044. Details that are only valid for a specific AC500 sub-family are described in separate sections."
Consider the safety instructions

In the description, special attention must be paid to designs using electrical isolation, earthing and EMC measures for the reasons stated. Consider the safety instructions for AC500 product family § Chapter 1.5.2.1 “Safety instructions” on page 2230.

1.5.4.2 Regulations

Appropriate system setup

The following regulations have to be taken into due consideration:

● DIN VDE 0100: "Regulations for the Setting up of Power Installations"
● DIN VDE 0110 Part 1 and Part 2: "The Rating of Creepage Distances and Clearances"
● DIN VDE 0160 and DIN VDE 0660 Part 500: "The Equipment of Power Installations with Electrical Components"

To ensure project success and proper installation of all systems, customers must be familiar and proficient with the following standards and must comply with their directives:

● DIN VDE 0106 Part 100: "Close proximity to dangerous voltages"
● DIN VDE 0160, DIN VDE 0110 Part 1: "Protection against direct contact"

The user has to guarantee that the devices and the components are mounted following these regulations. For operating the machines and installations, other national and international relevant regulations, concerning prevention of accidents and using technical working means, also have to be met.

AC500 devices are designed according to IEC 1131 Part 2 under overvoltage category II per DIN VDE 0110 Part 2.

For direct connection of AC Category III overvoltages provide protection measures for overvoltage category II according to IEC-Report 664/1980 and DIN VDE 0110 Part 1.

Equivalent standards:

● DIN VDE 0110 Part 1 ↔ IEC 664
● DIN VDE 0113 Part 1 ↔ EN 60204 Part 1
● DIN VDE 0660 Part 500 ↔ EN 60439-1 ↔ IEC 439-1

All rights reserved to change design, size, weight, etc.

Qualified personnel

Both the control system AC500 and other components in the vicinity are operated with dangerous contact voltages. Touching parts, which are under such voltages, can cause grave damage to health.

In order to avoid such risks and the occurrence of material damage, persons involved with the assembly, starting up and servicing must possess pertinent knowledge of the following:

● Automation technology sector
● Dealing with dangerous voltages
● Using standards and regulations, in particular VDE, accident prevention regulations and regulations concerning special ambient conditions (e.g. areas potentially endangered by explosive materials, heavy pollution or corrosive influences).

1.5.4.3 Safety instructions

The examples and diagrams in this manual are included solely for illustrative purposes. Because of the many variants and requirements associated with any particular installation, ABB cannot assume responsibility or liability for actual use based on the examples and diagrams.
No patent liability is assumed by ABB with respect to use of information, circuits, equipment or software described in this manual. No liability is assumed for the direct or indirect consequences of the improper use, improper application or inadequate maintenance of these devices. In no event will ABB be responsible or liable for indirect or consequential damages resulting from the use or application of this equipment.

The product family AC500 control system is designed according to EN 61131-2 IEC 61131-2 standards. Data, different from IEC 61131, are caused by the higher requirements of Maritime Services. Other differences are described in the technical data description of the devices.

NOTICE!

Avoidance of electrostatic charging

PLC devices and equipment is sensitive to electrostatic discharge, which can cause internal damage and affect normal operation. Observe the following rules when handling the system:

- Touch a grounded object to discharge potential static.
- Wear an approved grounding wrist strap.
- Do not touch connectors or pins on component boards.
- Do not touch circuit components inside the equipment.
- If available, use a static-safe workstation.
- When not in use, store the equipment in appropriate static-safe packaging.

NOTICE!

PLC damage due to operation conditions

Protect the devices from dampness, dirt and damage during transport, storage and operation!

NOTICE!

PLC damage due to wrong enclosures

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

Cleaning instruction

Do not use cleaning agent for cleaning the device.

Use a damp cloth instead.

Connection plans and user software must be created so that all technical safety aspects, legal regulations and standards are observed. In practice, possible shortcircuits and breakages must not be able to lead to dangerous situations. The extent of resulting errors must be kept to a minimum.

Do not operate devices outside of the specified, technical data!

Trouble-free functioning cannot be guaranteed outside of the specified data.
NOTICE!

PLC damage due to missing earthing
- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.

In the description for the devices (operating manual or AC500 system description), reference is made at several points to earthing, electrical isolation and EMC measures. One of the EMC measures consists of discharging interference voltages into the earthing via Y-type capacitors. Capacitor discharge currents must basically be able to flow off to the earthing (in this respect, see also VBG 4 and the relevant VDE regulations).

CAUTION!

Do not obstruct the ventilation for cooling!
The ventilation slots on the upper and lower side of the devices must not be covered.

CAUTION!

Run signal and power wiring separately!
Signal and supply lines (power cables) must be laid out so that no malfunctions due to capacitive and inductive interference can occur (EMC).

WARNING!

Labels on or inside the device alert people that dangerous voltage may be present or that surfaces may have dangerous temperatures.

WARNING!

Splaying of strands can cause hazards!
During wiring of terminals with stranded conductors, splaying of strands shall be avoided.
- Ferrules can be used to prevent splaying.
WARNING!

Removal/Insertion under power

The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.

Make sure that all voltage sources (supply and process voltage) are switched off before you

– connect or disconnect any signal or terminal block
– remove, mount or replace a module.

Disconnecting any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.

Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.

The devices must not be opened when in operation. The same applies to the network interfaces.

CAUTION!

Use only ABB approved lithium battery modules!

At the end of the battery’s lifetime, always replace it only with a genuine battery module.

CAUTION!

Risk of explosion!

Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.

Environment considerations

Recycle exhausted batteries. Dispose batteries in an environmentally conscious manner, in accordance to local-authority regulations.
This equipment is intended for use in a Pollution Degree 2 industrial environment, in overvoltage Category II applications (as defined in IEC publication 60664-1), at altitudes up to 2.000 meters without derating.

This equipment is considered Group 1, Class A industrial equipment according to IEC/CISPR Publication 11. Without appropriate precautions, there may be potential difficulties ensuring electromagnetic compatibility in other environments due to conducted as well as radiated disturbance.

This equipment is supplied as "open type" equipment. It must be mounted within an enclosure that is suitably designed for those specific environmental conditions that will be present and appropriately designed to prevent personal injury resulting from accessibility to live parts. The interior of the enclosure must be accessible only by the use of a tool. Subsequent sections of this publication may contain additional information regarding specific enclosure type ratings that are required to comply with certain product safety certifications.

Refer to NEMA Standards publication 250 and IEC publication 60529, as applicable, for explanations of the degrees of protection provided by different types of enclosure. Also see the appropriate sections in this manual.

1.5.4.4 Overall information (valid for complete AC500 product family)

1.5.4.4.1 Serial I/O bus

The synchronized serial I/O bus is the I/O data bus for the I/O modules connected with the processor modules or communication interface modules. Through this bus, I/O and diagnosis data are transferred.

Up to 10 I/O terminal units (for 1 I/O module each) can be added to one terminal base or to one AC500-eCo processor module. The I/O terminal units and the AC500-eCo I/O modules, have a bus input at the left side and a bus output at the right side. Thus the length of the I/O bus increases with the number of attached I/O modules.

The electrical connection of the I/O bus is performed automatically by telescoping the modules on the DIN rail. The I/O bus provides the following signals:

- Supply voltage of 3.3 VDC for feeding the electronic interface components
- 3 data lines for the synchronized serial data exchange
- several control signals
NOTICE!
The I/O bus is not designed for plugging and unplugging modules while in operation. If a module is plugged or replaced while the bus is in operation, the following consequences are possible:
- reset of the station or of the CPU
- system lockup
- damage of the module

WARNING!
Removal/Insertion under power
The devices are not designed for removal or insertion under power. Because of unforeseeable consequences, it is not allowed to plug or unplug devices with the power being ON.
Make sure that all voltage sources (supply and process voltage) are switched off before you
- connect or disconnect any signal or terminal block
- remove, mount or replace a module.
Disconnected any powered devices while energized in a hazardous location could result in an electric arc, which could create a flammable ignition resulting in fire or explosion.
Make sure that power is removed and that the area has been thoroughly checked to ensure that flammable materials are not present prior to proceeding.
The devices must not be opened when in operation. The same applies to the network interfaces.

With its fast data transmission, the I/O bus obtains very low reaction times. Depending on the device and on the version of firmware and Automation Builder, the following numbers of I/O devices can be connected to the I/O bus.

<table>

### 1.5.4.4.2 Mechanical encoding

**Fig. 251: Possible positions for mechanical encoding (1 to 18)**

**NOTICE!**

Terminal units and terminal bases have a mechanical coding which prevents that modules are inserted to wrong places for cases that might result in dangerous parasitic voltages or if modules could be destroyed.
The coding either makes it impossible to insert the module to the wrong place or blocks its electrical function (outputs are not activated).

The following figures show the possible encodings.

1.5.4.4.3 Earthing concept (Block diagrams)

NOTICE!

PLC damage due to missing earthing

- Ensure to earth the devices.
- The earthing (switch cabinet earthing, PE) is supplied both by the mains connection (or 24 V supply voltage) and via DIN rail. The DIN rail must be connected to the earth before the device is subjected to any power. The earthing may be removed only if it is certain that no more power is being supplied to the control system.
Block diagram:
Digital I/O modules
1.5.4.4 EMC-conforming assembly and construction

**General principles**

**General considerations** Electric and electronical devices have to work correctly on site. This is also valid when electromagnetic influences affect them in defined and/or expected strength. The devices themselves must not emit electro-magnetic noises.

Advant Controller components have a very high noise immunity.

When the wiring and earthing instructions are met, an error-free operation is given.

High electro-magnetic noises of nearby mounted applications must be taken in consideration during the planning phase.

An EMC compatible earthing concept will also guarantee an error-free operation here.
There are three important principles to be especially considered:

– Keep all connections as short as possible (in particular the earthing conductors)
– Use large conductor cross sections (in particular for the earthing conductors)
– Create low-impedance, i.e. good and large-sized contacts (in particular for the earthing conductors)

Pay attention to the following:

– Use vibration-resistant connections
– Clean metallic contact areas
– Use solid plug and screw-type connections
– Use earth cable shields with clips on a well-grounded metallic surface
– Do not use aluminium parts
– Do not use sheath wires
– Do not use toothed lock washers under screw connections

Fig. 259: Assembly: wrong

Fig. 260: Assembly: correct

Make a connection between the DIN rails and PE (Protective Earth). For this, use an earthing wire with a minimum conductor cross section of 10 mm².

The wire is connected to the DIN rail with an M6 screw.

A large-area contact of the DIN rail with the metallic mounting plate improves the EMC behaviour significantly, as the disturbances can be discharged more effective.

Cable routing

• Route cables meeting the standards.
• Sort the cables into cable groups:
  – Power current cables
  – Power supply cables
  – Signal cables
  – Data cables
● Rout signal cables and data cables separately from the power cables.
  – Separate cable ducts or cable bundles.
  – The distance should be 20 cm or greater.
● Lay signal and data cables close to earthed surfaces.

### Cable shields

- Use only shielded data cables. The shield should be earthed at both ends.
  A cable shield only earthed at one end can only protect from capacitively coupled interference and low-frequency disturbances (50 Hz hum).
- Avoid parasitic currents flowing through the cable shields.
  This can be done by installing current-carrying equipotential bondings.
- Use only cables with braided shields.
  Foil shields are not robust enough, cannot be contacted well and have poor HF properties.
- Use only metallic or metal-plated plugs for shielded data cables.
- Use only shielded cables for analog signals.
  For small signals earth the shield only at one end.
- Earth the cable shield directly with a clip when entering the switch-gear cabinet.
  Do not cut the shield until the cable reaches the module connected.

```
The connection between the PE bar and the shield bar must have a low impedance.
```

### Switch-gear cabinet

#### Connections

The connections between the switch-gear cabinet, the mounting plates, the PE bar and the shield bar must have a low impedance.

#### Earthing

Earth the switch-gear cabinet doors with short and highly flexible conductors.

#### Illumination

Only use filament lamps (bulbs) or fluorescent tubes with interference suppression.

#### For supplying the PC

Use the mains socket which is located inside the switch-gear cabinet.

☞ Chapter 1.5.4.5.2.1 “Switchgear cabinet assembly” on page 3062

### Reference potential

- Provide a uniform reference potential in the entire installation and earth all electrical appliances if possible.
- Route your earthing conductors in a star configuration so that no earth loops can occur.

### Equipotential bonding

The Installation of equipotential bondings are necessary if there are present or expected potential differences between parts of your application.
- The impedance of equipotential bonding must be equal or lower than 10 % of the shield impedance of the shielded signal cables between the same points.
- The conductor cross section of a equipotential bonding must be 16 mm² to withstand the maximum possible compensating current.
- Equipotential bondings and shielded signal cables should be laid close to each other.
- Equipotential bondings must be connected to PE with low impedance.

1.5.4.4.5 Power consumption of an entire station

The power consumption of a complete station consists of the sum of all individual consumptions.
● Consumers over terminals L+ and M on the AC500 terminal base/AC500-eCo CPU:
  – CPU itself
  – I/O modules attached on the I/O bus
  – Communication modules attached (AC500 terminal base)
● Consumers over the process supply voltage terminals ZP and UP of the AC500 Terminal Units / the L+/M or UP/ZP terminals of the AC500-eCo I/O modules:
  – Digital I/O modules
  – Analog I/O modules

The two supply voltages can be provided by the same power supply unit. The CPU and the I/O modules should, however, be fused separately. Of course also separate power supplies are possible.

**Calculation of the total current consumption**

**Example**

In the example, the AC500 control system consists of the following devices:

- CPU: PM5xx-ETH or PM5xxx-ETH
- 4 communication modules
- 7 I/O modules (digital and analog)
- As well as the required terminal bases and terminal units
Because of the high total current consumption of the digital I/O modules (from UP = 24 VDC), the supply is divided up into several electric circuits fused separately.

The maximum permitted total current over the supply terminals of the I/O terminal units is 8 A.

The total current can be calculated as follows:

\[ I_{\text{Total}} = I_{\text{LOGIC}} + I_{\text{UP}} \]

with the assumptions

\[ I_{\text{LOGIC}} = I_{\text{CPU}} + I_{\text{I/O bus}} + I_{C1} + I_{C2} + I_{C3} + I_{C4} \] (CPU + communication modules + I/O bus)

\[ I_{\text{I/O bus}} = \text{Number of expansion modules} \times \text{Current consumption through the I/O bus per module} \]

and

\[ I_{\text{UP}} = I_{\text{UP1}} + I_{\text{LOAD1}} + I_{\text{UP2}} + I_{\text{LOAD2}} + I_{\text{UP3}} + I_{\text{LOAD3}} + I_{\text{UP4}} + I_{\text{LOAD4}} + I_{\text{UP5}} + I_{\text{LOAD5}} + I_{\text{UP6}} + I_{\text{LOAD6}} + I_{\text{UP7}} + I_{\text{LOAD7}} \]

If one assumes that all outputs are switched on and are operated with their maximum permitted load currents (under compliance with the maximum permitted currents at the supply terminals), then the following values are the result for an example shown above:

<table>
<thead>
<tr>
<th></th>
<th>( I_{\text{CPU} ,*} )</th>
<th>( I_{\text{Cx} ,*} )</th>

\[ I_{\text{Total}} \approx 25.4 A \]

*) All values in this column are exemplary values

Dimensoning of the fuses

To be able to select the fuses for the station correctly, both the current consumption and the inrush currents (melting integral for the series-connected fuse) must be taken into consideration.
### 1.5.4.4.6 Decommissioning

**Secure decommissioning of a functional SPS**

1. Delete the runtime licenses ‡ Chapter 1.5.6.2.2.2.4 “Returning a license” on page 3263.
2. Delete certificates available on the CPU ‡ Chapter 1.7.2.4.1 “View ‘Security-Screen’ - ‘Devices’” on page 3599.
3. Delete applications ‡ Chapter 1.3.1.25.2.6.11 “Command ‘Reset Origin’” on page 932 ‡ Chapter 1.3.1.25.2.6.12 “Command ‘Reset Origin Device’” on page 933.
4. Delete applications from SD memory card, if available ‡ Chapter 1.3.1.15 “Copying files to/from PLC” on page 357.
5. If available, remove SD memory card and battery from CPU.
6. Delete all user accounts and user data ‡ “Tab ‘User’” on page 891.
7. Demount and dispose the hardware modules ‡ Chapter 1.5.4.5.3 “Mounting and demounting” on page 3068 ‡ Chapter 1.5.4.4.7 “Recycling and disposal” on page 3057.

**Secure decommissioning of a not functional SPS**

- The device is not functional and you cannot execute the steps for a secure decommissioning.
- Physically destroy the device.
- This ensures that the credentials that are stored in the device, can not be misused.

### 1.5.4.7 Recycling and disposal

Devices of AC500 product family must not be disposed as unsorted domestic waste. The devices contain valuable raw material which can be recycled. Remove the battery - if existing. Dispose the products according to the local regulations.

Devices of AC500 product family are free from pollutants and are no danger for the environment.
### 1.5.4.5 AC500 (Standard)

### 1.5.4.5.1 System data AC500

---

**NOTICE!**

Exceeding the maximum power supply voltage for process or supply voltages could lead to unrecoverable damage of the system. The system could be destroyed.

**NOTICE!**

Improper voltage level or frequency range which cause damage of AC inputs:

- AC voltage above 264 V
- Frenquency below 47 Hz or above 62.4 Hz

**NOTICE!**

Improper connection leads cause overtemperature on terminals.

PLC modules may be destroyed by using wrong cable type, wire size and cable temperature classification.

</table>
In order to prevent operating malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.

The connectors between the Terminal Bases and Processor Modules or Communication Modules must not be touched during operation. The same is valid for the I/O-Bus with all modules involved.

1) High requirement for shipping classes are achieved with additional specific measures (see specific documentation).

### Approvals and certifications

Information on approvals and certificates can be found in the corresponding chapter of the *Main catalog, PLC Automation*.

### 1.5.4.5.2 Mechanical dimensions

#### Switchgear cabinet assembly

*Information on EMC-conforming assembly and construction is provided within the overall functions section Chapter 1.5.4.4.4 “EMC-conforming assembly and construction” on page 3051.*

#### PLC enclosure

**NOTICE!**

**PLC damage due to wrong enclosures**

Due to their construction (degree of protection IP 20 according to EN 60529) and their connection technology, the devices are suitable only for operation in enclosed switchgear cabinets.

To protect PLCs against:
• unauthorized access,
• dusting and pollution,
• moisture and wetness and
• mechanical damage,

switchgear cabinet IP54 for common dry factory floor environment is suitable.

Maintain spacing from:
• enclosure walls
• wireways
• adjacent equipment

Allow a minimum of 20 mm clearance on all sides. This provides ventilation and electrical isolation.

It is recommended to mount the modules on an earthed mounting plate, or an earthed DIN rail, independent of the mounting location.
Fig. 262: Installation of AC500/S500 modules in a switch-gear cabinet

1 Cable duct
2 Distance from cable duct ≥20 mm
3 Mounting plate, earthed

**NOTICE!**

Horizontal mounting is highly recommended.

Vertical mounting is possible, however, derating consideration should be made to avoid problems with poor air circulation and overheating (see Chapter 1.5.4.5.1.1 “Environmental conditions” on page 3058).
By vertical mounting, always place an end-stop terminal block (e.g. type BADL, P/N: 1SNA399903R0200) on the bottom and on the top of the modules to properly secure the modules.

By high vibration applications and horizontal mounting, we also recommend to place end-stop terminals at the right and left side of the device to properly secure the modules, e.g. type BADL, P/N: 1SNA399903R0200.

### Mechanical dimensions AC500

**Dimensions: terminal bases**

![Diagram of terminal bases](image)

**Fig. 263: Terminal bases, side view and front view**
Mechanical dimensions S500

Dimensions: terminal units

Fig. 264: Terminal bases with processor modules, side view and front view

Fig. 265: Terminal units, side view and front view
Fig. 266: Terminal units and S500 modules, side view and front view

Fig. 267: Terminal base (for comparison)
1.5.4.5.3 Mounting and demounting

The control system is designed to be mounted to a well-grounded mounting surface such as a metal panel. Additional grounding connections from the mounting tabs or DIN rail (if used), are not required unless the mounting surface cannot be grounded.

During panel or DIN rail mounting of all devices, be sure that all debris (metal chips, wire strands, etc.) is kept from falling into the controller. Debris that falls into the controller could cause damage while the controller is energized.

All devices are grounded through the DIN rail to chassis ground. Use zinc plated yellow-chromate stell DIN rail to assure proper grounding. The use of other DIN rail materials (e.g. aluminium, plastic, etc.) that can corrode, oxidize, or are poor conductors, can result in improper or intermittent grounding.

Mounting/Demounting terminal bases and function module terminal bases

Demounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the Terminal Base/Function Module Terminal Base:

⇒ The Terminal Base is put on the DIN rail above and then snapped-in below.
3. The demounting is carried out in a reversed order.

**Mounting with screws**

If the Terminal Base should be mounted with screws, Wall Mounting Accessories TA526 must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on. TB560x and TB561x need one TA526, TB562x, TB564x and TB566x need two TA526.

---

By wall mounting, the Terminal Base is earthed through the screws. It is necessary that

- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is earthed
- the screws have a good electrical contact to the mounting plate
The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

1. On a clean work surface, mount no more than 3 modules (e.g. one Terminal Base and two Terminal Units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.
7. Repeat the steps for all remaining modules.

If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

Mounting and demounting the terminal unit

Mounting on DIN rail

1. Mount DIN rail 7.5 mm or 15 mm.
2. Mount the Terminal Unit.

The Terminal Unit is snapped into the DIN rail in the same way as the Terminal Base. Once secured to the DIN rail, slide the Terminal Unit to the left until it fully locks into place creating a solid mechanical and electrical connection.

When attaching the devices, make sure the bus connectors are securely locked together to ensure proper electrical connection. Max. 10 Terminal Units can be attached.
3. Demounting: A screwdriver is inserted in the indicated place to separate the Terminal Units.

Mounting with screws

If the Terminal Unit should be mounted with screws, Wall Mounting Accessories TA526 must be inserted at the rear side first. These plastic parts prevent bending of the Terminal Base while screwing on.

![Fig. 270: Fastening with screws](image)

**Practical tip**

The following procedure allows you to use the mounted modules as a template for drilling holes in the panel. Due to module mounting hole tolerance, it is important to follow these procedures:

- the screws have a conductive surface (e.g. steel zinc-plated or brass nickel-plated)
- the mounting plate is earthed
- the screws have a good electrical contact to the mounting plate
1. On a clean work surface, mount no more than 3 modules (e.g. one Terminal Base and two Terminal Units).
2. Using the mounted modules as a template, carefully mark the center of all module-mounting holes on the panel.
3. Return the mounted modules to the clean work surface, including any previously mounted modules.
4. Drill and tap the mounting holes for the screws (M4 or #8 recommended).
5. Place the modules back on the panel and check for proper hole alignment.
6. Attach the modules to the panel using the mounting screws.

**Note:** If mounting more modules, mount only the last one of this group and put the others aside. This reduces remounting time during drilling and tapping of the next group.

7. Repeat the steps for all remaining modules.

Mounting processor modules PM57x, PM58x, PM59x and PM56xx

1. After mounting the Terminal Base on the DIN rail, mount the Processor Module.
2. Press the Processor Module into the Terminal Base until it locks in place.

3. The demounting is carried out in a reversed order. Press above and below, then remove the Processor Module.

Mounting and demounting the I/O modules

After mounting the Terminal Unit, mount the I/O Modules.
1. Press the I/O Module into the Terminal Unit until it locks in place.

2. The demounting is carried out in a reversed order. Press above and below, then remove the module.
Mounting and demounting the communication modules

Communication Modules are mounted on the left side of the Processor Module on the same Terminal Base. The electrical connection is established automatically when mounting the Communication Module.

**NOTICE!**

Risk of damaging the PLC modules!

- Overvoltages and short circuits might damage the PLC modules.
  - Make sure that all voltage sources (supply voltage and process supply voltage) are switched off before you begin with operations at the system.
  - Never connect any voltages or signals to reserved terminals (marked with ---). Reserved terminals may carry internal voltages.

After mounting the Terminal Base, mount the Communication Modules.

1. First insert the bottom nose of the Communication Module into the dedicated holes of the Terminal Base. Then, rotate the Communication Module on the dedicated Terminal Base slot until it is locked in place.

**NOTICE!**

Risk of malfunctions!

- Unused slots for communication modules are not protected against accidental physical contact.
  - Unused slots for communication modules must be covered with dummy communication modules (*TA524 § Chapter 1.5.3.8.1.3 “TA524 - Dummy communication module” on page 3034*) to achieve IP20 rating.
  - I/O bus connectors must not be touched during operation.
2. The demounting is carried out in a reversed order.
Press above and below, then rotate the Communication Module and remove it.

1.5.4.5.4 Connection and wiring

For detailed information such as technical data of your mounted devices (AC500 product family) refer to the hardware device description of the appropriate device.

---

**NOTICE!**
**Attention:**
- The devices should be installed by trained persons with knowledge of wiring electronic devices. In case of bad wiring, the following problems could occur:
  - On the Terminal Base, the terminals L+ and M are doubled. If the power supply is badly connected, a short circuit could happen and lead to a destruction of the power supply or its fuse. If no suitable fuse exists, the Terminal Base itself could be destroyed.
  - The Terminal Bases and all electronic modules and Terminal Units are protected against reverse polarity.
  - All necessary measures should be carried out to avoid damages to modules and wiring. Notice the wiring plans and connection examples.

---

**NOTICE!**
**Attention:**
- All I/O channels (digital and analog) are protected against reverse polarity, reverse supply, short circuit and continuous overvoltage up to 30 VDC.

---

**NOTICE!**
**Attention:**
- Due to possible loss of communication, the communication cables should be fixed with cable duct or bracket or clamp during application.
Power supply

AC500 system power supply

As soon as the power supply of the Processor Module (CPU) is higher than the minimum Process and supply voltage (see “Chapter 1.5.4.5.1.1 “Environmental conditions” on page 3058), the power supply detection is activated and the Processor Module is started. Power supply of Processor Module and I/O modules should be powered on the same time, otherwise the Processor Module will not switch to run after startup.

When during operation the power supply is going down lower than the minimum Process and supply voltage (see “Chapter 1.5.4.5.1.1 “Environmental conditions” on page 3058) for more than 10 ms, the Processor Module is switched to safety mode (display shows “AC500”). A restart of the Processor Module only occurs by switching the power supply off and on again.

If an I/O module is disconnected during normal operation from power supply while Processor Module is still powered, the Processor Module will continue its normal operation on all other powered peripherals (I/O modules, communication modules and communication interfaces), but freezes the input image. After recovery of I/O Module power supply it will continue normal operation and inputs and outputs were updated.

Logic Controller Supply: AC500 logic controller power supply is provided through terminals L+ / M.

Process Power Supply: S500 process power supply is provided through terminals UP / ZP.

Logic Controller Supply is galvanic isolated from Process Power Supply.

As system power supply for AC500/S500, the ABB CP power supply series can be used.

Power supply for processor modules

The supply voltage of 24 VDC is connected to a removable 5-pin terminal block. L+/M exist twice. It is therefore possible to feed e.g. external sensors (up to 8 A max. with 1.5 mm² conductor) via these terminals.

CANopen field bus

Types of bus cables

For CANopen, only bus cables with characteristics as recommended in ISO 11898 are to be used. The requirements for the bus cables depend on the length of the bus segment. Regarding this, the following recommendations are given by ISO 11898:

<table>
<thead>
<tr>
<th>Length of segment [m]</th>
<th>Bus cable (shielded, twisted pair)</th>
<th>Max. transmission rate [kbit/s]</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Conductor cross section [mm²]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>0...40</td>
<td>0.25...0.34 / AWG23, AWG22</td>
<td>70</td>
</tr>
<tr>
<td>40...300</td>
<td>0.34...0.60 / AWG22, AWG20</td>
<td>&lt; 60</td>
</tr>
<tr>
<td>Length of segment [m]</td>
<td>Bus cable (shielded, twisted pair)</td>
<td>Max. transmission rate [kbit/s]</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td></td>
<td>Conductor cross section [mm²]</td>
<td>Line resistance [Ω/km]</td>
</tr>
<tr>
<td>300...600</td>
<td>0.50...0.60 / AWG20</td>
<td>&lt; 40</td>
</tr>
<tr>
<td>600...1000</td>
<td>0.75...0.80 / AWG18</td>
<td>&lt; 26</td>
</tr>
</tbody>
</table>

NOTICE!
Risk of telegram and data errors!
The use of wrong cable type and quality could lead to limitations in cable length, causing telegram and data errors.

NOTICE!
Risk of damaging the terminating resistor!
A bus-line short-circuit to the 24 VDC power supply can cause damage by exceeding the power rating of the terminating resistor.

NOTICE!
Risk of telegram and data errors!
Miss- or unterminated data lines can cause reflections on the bus, leading to telegram and data errors. For maximum cable length and transmission rate, the bus must always be terminated on both ends with the characteristic impedance of the cable type.

NOTICE!
Verification of termination (Make sure the power supply on all CAN nodes is turned off)!
To verify the termination, the DC resistance between CAN_H and CAN_L can be measured. The value should be between 50 Ω and 70 Ω.
Check for correct resistor values, short circuits and correct number of terminating resistors, if the measurement is showing deviations.

Installation hint

Ensure that the termination and FE connection will not be removed when removing CAN modules from the bus.

Branches are not allowed in a CAN network. Stubs should be avoided or kept as short as possible (< 0.3 m).
When connecting the cable take care to use one dedicated twisted pair for the CAN signals (CAN_L and CAN_H) and another free wire for CAN_GND. CAN_GND must be connected as reference, to avoid common mode problems causing telegram errors.

Keep the CAN bus wiring away from electrical disturbance and close to earth potential to minimize interference.

**Fig. 277: CAN Bus, connection and wiring**

**Ethernet connection details**

*Ethernet is also used for PROFINET, EtherCAT and Modbus TCP connection.*

### Wiring

#### Cable length restrictions

For the maximum possible cable lengths within an Ethernet network, various factors have to be taken into account. Twisted pair cables (TP cables) are used as transmission medium for 10 Mbit/s Ethernet (10Base-T) as well as for 100 Mbit/s (Fast) Ethernet (100Base-TX). For a transmission rate of 10 Mbit/s, cables of at least category 3 (IEA/TIA 568-A-5 Cat3) or class C (according to European standards) are allowed. For fast Ethernet with a transmission rate of 100 Mbit/s, cables of category 5 (Cat5) or class D or higher have to be used. The maximum length of a segment, which is the maximum distance between two network components, is restricted to 100 m due to the electric properties of the cable.

Furthermore, the length restriction for one collision domain has to be observed. A collision domain is the area within a network which can be affected by a possibly occurring collision (i.e. the area the collision can propagate over). This, however, only applies if the components operate in half-duplex mode since the CSMA/CD access method is only used in this mode. If the components operate in full-duplex mode, no collisions can occur. Reliable operation of the collision detection method is important, which means that it has to be able to detect possible collisions even for the smallest possible frame size of 64 bytes (512 bits). But this is only guaranteed if the first bit of the frame arrives at the most distant subscriber within the collision domain before the last bit has left the transmitting station. Furthermore, the collision must be able to propagate to both directions at the same time. Therefore, the maximum distance between two ends must not be longer than the distance corresponding to the half signal propagation time of 512 bits. Thus, the resulting maximum possible length of the collision domain is 2000 m for a transmission rate of 10 Mbit/s and 200 m for 100 Mbit/s. In addition, the bit delay times caused by the passed network components also have to be considered.

The following table shows the specified properties of the respective cable types per 100 m.

**Table 655: Specified cable properties:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>10Base-T [10 MHz]</th>
<th>100Base-TX [100 MHz]</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Class</td>
<td>C or higher</td>
<td>D or higher</td>
</tr>
</tbody>
</table>
The TP cable has eight wires arranged in four pairs of twisted wires. Different color codes exist for the coding of the wires, the coding according to EIA/TIA 568, version 1, being the one most commonly used. In this code, the individual pairs are coded with blue, orange, green and brown color. One wire of a pair is unicolored and the corresponding second wire is striped, the respective color alternating with white. For shielded cables, a distinction is made between cables that have one single shield around all pairs of wires and cables that have an additional individual shield for each pair of wires. The following table shows the different color coding systems for TP cables:

<table>
<thead>
<tr>
<th>Pairs</th>
<th>EIA/TIA 568 Version 1</th>
<th>EIA/TIA 568 Version 2</th>
<th>DIN 47100</th>
<th>IEC 189.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pair 1</td>
<td>white/blue</td>
<td>blue</td>
<td>green</td>
<td>red</td>

</tr>
</tbody>
</table>

Two general variants are distinguished for the pin assignment of the normally used RJ45 connectors: EIA/TIA 568 version A and version B. The wiring according to EIA/TIA 568 version B is the one most commonly used.

Cable types

**Crossover cable**

*Particular use*

Crossover cables are needed only for a direct Ethernet connection without crossover functionality. In particular for AC500 modules in product life cycle phase “Classic”.

Crossover cables are for a direct Ethernet connection of two terminal devices as the simplest variant of a network. From transmission lines of the first station to the reception lines of the second station.
Fig. 279: Wiring of a crossover cable

Straight-through cable

For networks with more than two subscribers, hubs or switches have to be used additionally for distribution. These active devices already have the crossover functionality implemented which allows a direct connection of the terminal devices using straight-through cables.

Fig. 280: Wiring of a straight-through cable

CAUTION!
Risk of communication faults!
When using inappropriate cables, malfunctions in communication may occur.
Only use network cables of the categories 5 (Cat 5, Cat 5e, Cat 6 or Cat 7) or higher within PROFINET networks.

Modbus RTU connection details

The Modbus RTU protocol is implemented in the AC500 Processor Modules.

Modbus is a master-slave (client-server) protocol. The client sends a request to the server(s) and receives the response(s).

Available serial interfaces can work as Modbus interfaces simultaneously.

The Modbus client operating mode of an interface is set with the Function Block COM_MOD_MAST.

Technical data

The Modbus operating mode and the interface parameters are set in the PLC configuration Chapter 1.5.6.2.10.1 “Configuring Modbus RTU on serial interface” on page 3325.

**Bus topology**  
Point-to-point with RS-232 or bus topology with RS-485. Modbus is a master-slave protocol. For further information on Modbus see chapter Communication with Modbus RTU Chapter 1.5.5.1.8 “Communication with Modbus RTU” on page 3166.

**1.5.4.5.5 Handling of accessories**  
This section only describes accessories that are frequently used for system assembly, connection and construction. A description of all additional accessories that can be used to supplement AC500 system can be found in the Hardware PLC device description.

**TA521 - Lithium battery**  
- Manganese dioxide lithium battery, 3 V, 560 mAh
- Non-rechargeable

**Purpose**  
The TA521 lithium battery is the only applicable battery for the AC500 processor modules and PM56xx Chapter 1.5.3.3.1.1 “PM56xx-2ETH for AC500 V3 products” on page 2274. It cannot be recharged.

The processor modules are supplied without lithium battery. It must be ordered separately. The TA521 lithium battery is used for data (SRAM) and RTC buffering while the processor module is not powered.

See system technology - AC500 battery Chapter 1.5.5.1.3.2 “AC500 battery” on page 3116.
The CPU monitors the discharge degree of the battery. A warning is issued before the battery condition becomes critical (about 2 weeks before). Once the warning message appears, the battery should be replaced as soon as possible.

**Handling instructions**

- Do not short-circuit or re-charge the battery! It can cause excessive heating and explosion.
- Do not disassemble the battery!
- Do not heat up the battery and not put into fire! Risk of explosion.
- Store the battery in a dry place.
- Replace the battery with supply voltage ON in order not to risk data being lost.
- Recycle exhausted batteries meeting the environmental standards.

**Battery lifetime**

The battery lifetime is the time, the battery can store data while the processor module is not powered. As long as the processor module is powered, the battery will only be discharged by its own leakage current.

To avoid a short battery discharge, the battery should always be inserted or replaced while the processor module is under power, then the battery is correctly recognized and will not shortly discharged.

---

### Insertion

**Insertion**

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.
2. Remove the TA521 battery from its package and hold it by the small cable.
3. Insert the battery connector into the small connector port of the compartment. The connector is keyed to find the correct polarity (red = plus-pole = above).
4. Insert first the cable and then the battery into the compartment, push it until it reaches the bottom of the compartment.
5. Arrange the cable in order not to inhibit the door to close.
6. Pull-up the door and press until the locking mechanism snaps.

---

*To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.*

---

Fig. 281: Insertion of the Lithium battery

---

**Ordering data**

**Insertion**

**PLC Automation with V3 CPUs**

**PLC integration > System assembly, construction and connection**

2020/12/10
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

Replacement
Replacement of the battery

To ensure proper operation and to prevent data loss, the battery insertion or replacement must be always done with the system under power. Without battery and power supply there is no data buffering possible.

1. Open the battery compartment with the small locking mechanism, press it down and slip down the door. The door is attached to the front face of the processor module and cannot be removed.

2. Remove the old TA521 battery from the battery compartment by pulling it by the small cable. Remove then the small connector from the socket, do this best by lifting it out with a screwdriver.

3. Follow the previous instructions to insert a new battery.

CAUTION!
Risk of explosion!
Do not open, re-charge or disassemble a lithium battery. Attempts to charge lithium batteries lead to overheating and possible explosions.

Prevent them from heat and fire and store them in a dry place.

Never short-circuit or operate lithium batteries with the polarities reversed. The batteries are likely to overheat and explode. Avoid chance short circuiting and therefore do not store batteries in metal containers and do not place them on metallic surfaces. Escaping lithium is a health hazard.
In order to prevent data losses or problems, the battery should be replaced after 3 years of utilisation or at least as soon as possible after receiving the "low battery warning" indication.

Do not use a battery older than 3 years for replacement, do not keep batteries too long in stock.

MC502 - SD memory card

- Secure digital card
- Solid state flash memory storage

The SD memory card is used to back-up user data and store user programs or project source codes as well as to update the internal CPU firmware. The processor modules can be operated with and without SD memory card.

AC500/AC500-eCo processor modules are supplied without SD memory card. It therefore must be ordered separately.

The MC memory card can be read on a PC with a standard memory card reader. AC500 processor modules are equipped with an MC memory card reader.

For AC500-eCo processor modules the device must be equipped with a MC503 SD memory card adaptor.

The SD memory card has a write protect switch. In the position "LOCK", the card can only be read.

The use of memory cards other than the MC502 SD memory card is prohibited. ABB is not responsible nor liable for consequences resulting from use of unapproved memory cards.

NOTICE!

Removal of the SD memory card

Do not remove the SD memory card during access. Remove only when the RUN LED does not blink. Otherwise the SD memory card and/or files on it might get corrupted and/or normal PLC operation might be disturbed.

Unpack the SD memory card and insert it into the opening of the front face of the processor module until locked:
Fig. 282: Insertion: PM57x, PM58x, PM59x and PM56xx

To remove the SD memory card, push on the card until it moves forward. By this, the card is unlocked and can be removed.

CP-C.1 - High performance range

The power supplies feature series and parallel connection as well as a true redundant setup via a redundancy module.

The CP-C.1 power supplies are ABB’s high performance and most advanced range. With excellent efficiency, high reliability and innovative functionality it is prepared for the most demanding industrial applications. These power supplies have a 50 % integrated power reserve and operate at an efficiency of up to 94 %. They are equipped with overheat protection and active power factor correction. Combined with a broad AC and DC input range and extensive worldwide approvals the CP-C.1 power supplies are the preferred choice for professional DC applications.

- Typical efficiency of up to 94 %
- Power reserve design delivers up to 150 % of the nominal output current
- Signaling outputs for DC OK and power reserve mode
- High power density leads to very compact and small devices
- No-load-proof, overload-proof, continuous short-circuit-proof
- Active power factor correction (PFC)

  - I/O module relay contacts must be operated with 24 V nominal only  |
| **Immunity to corrosive gases** | Operating: Yes, according to:  
ISA S71.04.1985 Harsh group A, G3/GX  
IEC 60721-3-3  3C2 / 3C3  |
| **Immunity to salt mist** | Operating: Yes, horizontal mounting only, according to IEC 60068-2-52 severity level: 1 |
NOTICE!
Risk of corrosion!
Unused connectors and slots may corrode if XC devices are used in salt-mist environments.

Protect unused connectors and slots with TA535 protective caps for XC devices
TA535 § Chapter 1.5.3.8.2.4 “TA535 - Protective caps for XC devices” on page 3039.

In order to prevent malfunctions, it is recommended, that the operating personnel discharge themselves prior to touching communication connectors or perform other suitable measures to reduce effects of electrostatic discharges.
NOTICE!

Risk of malfunctions!

Unused slots for communication modules are not protected against accidental physical contact.

- Unused slots for communication modules must be covered with dummy communication modules ([TA524](#) Chapter 1.5.3.8.1.3 “TA524 - Dummy communication module” on page 3034) to achieve IP20 rating.
- I/O bus connectors must not be touched during operation.

1.5.4.7 AC500-S

The AC500-S safety user manual must be read and understood before using safety configuration and programming tools of Automation Builder / PS501 Control Builder Plus. Only qualified personnel shall be allowed to work with AC500-S safety PLCs.

In order to have always the latest version and due to a different lifecycle compared to Automation Builder help, the AC500-S safety user manual is only available on our website.
1.5.5 System technology for AC500 V3 products

This chapter provides advanced information on the system technology of AC500 control systems from a general perspective. It provides information to link the details from the hardware descriptions (provided in the device specifications section) with detailed information on configuring/programming a corresponding library (provided in the individual library sections).

Configuration of a specific device with Automation Builder is described in the PLC configuration section.
1.5.5.1 System technology of CPU and overall system
1.5.5.1.1 Handling of remanent variables for AC500 V3 products

All operands supported by CODESYS are described in [CODESYS documentation] Chapter 1.3.1.8 “Configuring I/O links” on page 155. For the memory sizes of the different CPUs, see [Memory Sizes] Chapter 1.5.7.1.3 “Memory sizes” on page 3510.

This part of the documentation describes the declaration of remanent variables for AC500 V3 products.

Different handling of remanent variables in AC500 FW ≥V3.0.2

- No more %R memory area (use instead %M with {no_init}) [Chapter 1.5.5.1.1.4 "Initialization of %M variables" on page 3108]
- Creating of addresses for "VAR RETAIN PERSISTENT" variables automatically by IEC-Compiler

Adding a global list of persistent/retain variables

A global list of persistent variables will be added with the standard definition for persistent variables "VAR RETAIN PERSISTENT" (see Remanent variables).

First steps:
1. Expand the object path of your PLC
2. After right click on App select Add object in the context menu.
   The window Add object below: Application appears.

3. Select Persistent Variables and click “Add object”.

The object name can be chosen freely. In the application it will be reused to reference the persistent variables.
Declaring a new variable in global list

Declare a new variable in the window "GlobPersist".

Afterwards the variable can be selected in the program.

In this way the persistent variable can be accessed directly.

Do not use the same persistent variable in different IEC tasks, to avoid problems with consistency.

Declaring a new persistent/retain variable in local POU

It is also possible to declare a persistent/retain variable in a local POU and not in the global list of persistent variables.

It is not recommended to declare a large number of persistent variables locally, due to the potentially effect to performance.
The auto-declare mechanism declares **always** a persistent variable locally and not in the global list. If the program will be executed, the following warning appears in the message window:

⚠️ C0244: No VAR_PERSISTENT list is part of the application to enter instance path for variable PLC_PRG new_var1

The locally declared persistent variable has to be added to the global list.

---

**NOTICE!**

For the initialization of a Retain/Persistent variable the value of the global list is used **NOT** the value of the local declaration.

For further information see "RetainPersistentExample.project".

---

1. Right-click in window "PersistentVars".
2. Select option "Add all instance paths".
   - Afterwards the persistent variables are added.
The application can be downloaded to the PLC

**It is NOT recommended to declare a new persistent variable in the application due to performance problems.**

For example PM5650-2ETH:

1000 DWORD ≈ 600 µs additional cycle time of task.

---

**Initialization of %M variables**

After download or restart, all %M variables will be initialized to 0. This can be prevented by setting the "no_init" attribute.

In doing so the %M variables behave similar to the "VAR RETAIN PERSISTENT" variables.

In the example above variable "ProzMivar" has the attribute "no_init". This variable will not be initialized and keeps its last value.

The attribute "no_init" is always and only valid for the next following variable (see Attributes Chapter 1.3.1.24.6.2.26 "Attribute 'noinit'" on page 623).

The following two variables "Proz MivarField" and "Proz Mivar1" will be further on initialized to 0.

---

**Behavior of retain variables**

The declaration of the retain variables strictly follows the 3S standard (see Remanent variables).

For retain variables it does not matter if they are declared locally in a program or in the global variable list.

---

**PLC shell command for import and export of retain/persistent variables**

The syntax of the command is: **sram <direction><area><path>**

<table>
<thead>
<tr>
<th>Supported options:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Direction: i=import, e=export</td>
</tr>
<tr>
<td>Area: rp=Retain/Persistent, m=%M area</td>
</tr>
<tr>
<td>Path: Any pathname</td>
</tr>
</tbody>
</table>
The file will be stored in the user partition of the PLC. This data can be imported or exported via the FTP-Server or the Files dialog in Automation Builder.

If no path is indicated, the files are saved under "PlcLogic/<ApplicationName>/<ApplicationName>.ret or .prozm".

If a path is indicated, the files are saved under or accessed via "<path>/<ApplicationName>.ret or .prozm".

A non-existing path is created with the exception of the SD card. The path for the SD card must be an existing path. On the SD card a non-existing path leads to an error message.

<table>
<thead>
<tr>
<th>Data area</th>
<th>File extension</th>
<th>Path</th>
</tr>
</thead>
</table>
| Retain/Persistent    | .ret           | PlcLogic/<ApplicationName>/<ApplicationName>.ret  
                      |                | <path>/<ApplicationName>.ret               |
| %M (memory area)     | .prozm         | PlcLogic/<ApplicationName>/<ApplicationName>.prozm  
                      |                | <path>/<ApplicationName>.prozm             |

**Examples:**

<table>
<thead>
<tr>
<th>Application</th>
<th>Command</th>
<th>File</th>
</tr>
</thead>
<tbody>
<tr>
<td>myApp</td>
<td>sram e rp</td>
<td>PlcLogic/myApp/myApp.ret</td>
</tr>
<tr>
<td></td>
<td>sram e ep data</td>
<td>data/myApp.ret</td>
</tr>
<tr>
<td>Application</td>
<td>sram i m</td>
<td>PlcLogic/Application/Application.prozm</td>
</tr>
<tr>
<td></td>
<td>sram i m data</td>
<td>data/Application.prozm</td>
</tr>
</tbody>
</table>

If the path "data" does not exist, the path is created. The path for the SD card must be an existing path. The path "sdcard/data" leads to an error message if the path "data" does not exist on the SD card.
